Plan showing the Proposed Harbour Improvements at Newcastle, as they were submitted to the Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

HARBOUR IMPROVEMENTS AT NEWCASTLE.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the last Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, to whom was referred the duty of considering and reporting upon "the expediency of carrying out certain works of harbour improvements, including shipping facilities, at Newcastle," have, after due inquiry, resolved that it is expedient the works should be carried out; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

The proposed improvements consist of the construction of a basin on the southern end of Bullock Island (now known as Carrington), which it is intended to line with a wharf or quay that will provide about 4,000 feet of wharfage accommodation; the erection of seven additional hydraulic cranes, with a loading capacity of 10 tons each; the reclamation of land near Honeysuckle Point, adjoining the Great Northern Railway; and the removal of about 20,000 cubic yards of rock which now obstructs the channel at the entrance to the harbour.

The estimated cost of the proposed works is £112,000, this amount being stated on sworn testimony to be sufficient to complete them; and the object in constructing the works is to increase the shipping facilities in the port of Newcastle, in accordance with a plan prepared some years ago, and by which the present arrangements at Bullock Island (now known as Carrington), were brought into operation.

According to the evidence given before the Committee, the proposed improvements are very necessary.

Four of the cranes which have been in use upon the wharf on the south side of the harbour have been removed from that wharf, in order to provide room there for the unloading and loading of general merchandise; and three of these, with the proposed new ones, will be brought into operation at Bullock Island—the intention being that, as far as possible, the whole of the coal traffic on the southern side of the harbour shall be centred in this locality.

The proposed basin, and the construction or completion in its vicinity of the necessary wharf accommodation, will provide the authorities with additional mooring space for vessels, and enable them to load coal from the western side of a portion of the present dyke as well as from the eastern. In the basin there will be, according to the Harbour-Master, room for a dozen vessels waiting their turn to load, and, as a mooring ground, it will be better than any other part of the harbour, as it will be out of the tideway.

The proposed reclamation of land at Honeysuckle Point may be made very profitable. The acting Engineer-in-Chief for Harbours and Rivers explains that the railway line at Honeysuckle Point runs close to Blane-street, and that the railway workshops are on both sides of the line. It is proposed to put the workshops on the further side of the line from Blane-street on, or adjacent to, the land which is

is to be reclaimed, and then to sell a portion of the Blane-street frontage, the proceeds from the sale of which, it is believed, will more than pay for the reclamation. The cost of the reclamation, so far as it is proposed to be carried out under the present plan, is set down at £10,000.

The removal of a portion of the rock which interferes with the safe navigation of the harbour, and which is to cost £12,500, appears to be very desirable, for the reason that it has been very much in the way, and is a serious danger to vessels meeting the tide.

In their consideration of these proposals the principal points upon which, in the judgment of the Committee, it appeared to be desirable to elicit information, in order that they might arrive at a just conclusion, were:—

- (1.) The accommodation existing at Newcastle at the present time for the carrying on of the coal trade of the port;
- (2.) The extent to which the trade was actually increasing, or would probably increase;
- (3.) The possible diverting of a portion of the present trade from Newcastle to Sydney, in consequence of the completion of railway communication between the two places;
- (4.) The probable duration of the Newcastle coal supply;
- (5.) The revenue derived by the Government from the port.

All the witnesses examined agree in stating that the present accommodation is insufficient. Mr. Hickson, Acting Engineer-in-Chief for Harbours and Rivers, says the proposed improvements are wanted very much, and that vessels have had to wait a long time for their turn under the cranes. "We have just finished," he states (*question 49*), "four additional hydraulic cranes, which have given great relief, but still we want much more accommodation"; and (*question 86*) "I have known a vessel wait for two months for a berth." The evidence of Captain Newton, Harbour-Master at Newcastle, is to the same effect. "The limited space," he states (*question 125*), "has of late been very severely taxed—it has been constantly complained of by shipmasters"; and (*question 127*) "a want of accommodation interferes greatly with the shipment of coal." Mr. F. R. Neild, Acting Railway Traffic Manager at Newcastle, says (*question 199*), "the want of facilities has always been a serious trouble." Mr. C. A. Goodchap, Commissioner for Railways, though he is not prepared to say there has been any want of facilities for the shipment of coal, at the same time considers the proposed new cranes to be absolutely necessary in view of the requirements of the trade yearly; and, in an appendix to his evidence (*Appendix B*), he strongly advocates the construction of the proposed basin, in order to improve the shipping facilities of the port, and the carrying out of the proposed reclamation to create "much-needed water frontage at Honeysuckle Point."

With regard to the extent to which the trade is actually increasing, Captain Newton states that the shipping is increasing more than the accommodation; and that, from his pilotage returns, he knows that but for the present strike at the collieries the export of coal this year would have largely exceeded the returns of former years, and the shipping returns would have eclipsed anything before known in Newcastle.

The question as to the railway communication between Newcastle and Sydney diverting any of the coal shipment from Newcastle to the Metropolis was dealt with principally during the examination of Mr. Goodchap, who was regarded by the Committee as well qualified to express an opinion upon the point; and Mr. Goodchap considers that the coal trade of Newcastle will not in this respect be affected in any material degree. He thinks (*question 395*) that there will be a good trade in coal on the Northern Railway line connecting Sydney and Newcastle, but that "it will not affect the established mines that now do business with Newcastle in a very large degree; that the coal which will be brought over this portion of the Northern Railway will be coal developed at Lake Macquarie, and between that and the Hawkesbury River." "The present mines," he says, "will continue to use the harbour of Newcastle and the shipping appliances at Bullock Island."

The

The probable duration of the coal supply in the Newcastle district is strikingly shown in evidence given by Mr. T. W. E. David, Geological Surveyor, Department of Mines, who, in the absence from Sydney of Mr. C. S. Wilkinson, Government Geologist, was examined by the Committee; and in an appendix to his evidence. He divides the productive coal measures of the district into three groups,—

- (1) The Upper or Newcastle measures,
- (2) The Middle or East Maitland measures,
- (3) The Lower or Greta measures,—

and he estimates that the unworked areas of the first will furnish an output of at least 2,000,000 tons annually for 200 years, the second 20,000 tons daily for 100 years, and the third 40,000 tons daily for 200 years. Evidence upon the question of supply was also obtained from Mr. John Dixon, Inspector of Collieries in the Northern District, and from Mr. John Mackenzie, Examiner of Coal-fields, and, though not of so definite a nature as that given by Mr. David, it supports the view that the probable life of the mines in the Newcastle district is sufficient to justify the carrying out of the proposed harbour improvements.

The revenue derived from the port appears to be less than it might be made, for though a substantial return is received from the haulage and shipment of coal, no wharfage dues on imports or exports are levied; and the evidence of Captain Jackson, Manager of Public Wharves, together with an appendix to his evidence, shows that if wharfage rates were levied, as they are in Sydney, the revenue would be very materially increased. There is also at Newcastle, in connection with the coal trade, the anomaly of the Railway Department collecting and crediting itself with the whole of the revenue derived from the shipment of coal, and yet not being charged with any portion of the cost which is incurred by the Government in the erection of cranes and the construction of wharves.

It will, however, be seen that the evidence generally, during the inquiry, was strongly in favour of the proposed works being adopted, and on Thursday, 13th September, the Committee agreed to the following resolution, which was moved by Mr. Watson and seconded by Mr. Kethel:—

“That the Committee consider it expedient that the harbour improvements at Newcastle, as proposed on the plan and explained in the evidence before the Committee, be carried out.”

JOHN LACKEY,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 22nd October, 1888.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

MONDAY, 27 AUGUST, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.
 The Hon. WILLIAM HENRY SUTTON.
 The Hon. JAMES WATSON.
 The Hon. FREDERICK THOMAS HUMPHERY.
 HENRY COPELAND, Esq.

ALEXANDER KETHEL, Esq.
 JOSEPH PALMER ABBOTT, Esq.
 JOHN RENDELL STREET, Esq.
 THOMAS MICHAEL SLATTERY, Esq.
 SYDNEY SMITH, Esq.

The Committee resolved to examine Joseph Barling, Esq., Under Secretary for Public Works, with reference to a suggestion from the Honorable the Minister for Works that certain of the proposals referred to the Committee by Parliament should be first considered, and with regard to the whole of the works in the list referred to the Committee.

Joseph Barling, Esq., Under Secretary for Public Works, sworn and examined:—

1. *Chairman.*] You know, I suppose, the list of proposed public works which has been submitted to the Committee from your department as those which might first be considered by the Committee? Yes.
2. The list, I take it, is one of works which are in a sufficient stage of advancement to be dealt with at once, if the Committee should decide in their favour? I think every one.
3. Can you tell us if any of the works have actually been commenced? The first, which is wharfage accommodation at Woolloomooloo Bay,—with reference to that, some improvements have been carried out there; but the special improvements referred to in this list, which are actually an extension of improvements already taken place, have not yet been begun. The detailed information, with regard to the works, of course, can be given by Mr. Hickson, the Acting Engineer-in-Chief for Harbours and Rivers.
4. The work at Woolloomooloo Bay, as represented in this proposal, has not, in fact, then been commenced? The work we wish to place before you has not been commenced.
5. With regard to the improvements of the Circular Quay? Part of the work on the eastern side has been commenced, but the improvements referred to here will extend to the western side as well as the eastern side.
6. And does that embrace the £120,000? The £120,000 is supposed to cover the whole; that is as near as I can give the information at the present moment.
7. There is a dredge for Sydney Harbour in the list? No steps have been taken with reference to that.
8. Then there are harbour improvements at Newcastle—has anything been done with reference to that matter? That is merely a continuation of works which have been in progress for a great many years. The improvements referred to here will include the erection of several steam and hydraulic cranes and a provision for further wharfage accommodation, which Mr. Hickson will be able to explain in detail.
9. Are all these works waiting now for the action of the Committee? Yes, or nearly all of them.
10. And you recommend in this list submitted by your department certain works as those of a more immediate nature? Yes. I may mention, with regard to this list, that although we have placed certain works in this order, it does not mean that Mr. Sutherland considers that one work is more urgent than another, but simply because it was supposed that those mentioned in the list might be dealt with very quickly by the Committee, as they did not appear to involve such large issues as others. Mr. Sutherland has promised to bring the Western Suburbs drainage scheme before the Committee at once; and I think I am right in saying the information respecting that matter is ready to be placed before the Committee. But with regard to the other works mentioned in this list, it was thought that they were of so simple a character they might be got through in a very short time.
11. *Mr. Kethel.*] May I ask what reason there is for delaying No. 6 on the list referred to the Committee by Parliament—improvements to the entrance of the Richmond River—and why the plans and specifications of that work are not ready, the work being one of a most urgent character? There is no reason why that work should not be taken into consideration at once, because the plans are ready; but I think Mr. Sutherland, looking through the whole list, supposed that with regard to this work to which you refer the Committee would probably have to visit the Richmond River. It is not that Mr. Sutherland considers it less urgent than the rest; but he thought it would take longer time. But we are perfectly ready for it.

J. Barling,
 Esq.
 27 Aug., 1888

HARBOUR IMPROVEMENTS AT NEWCASTLE.

FRIDAY, 31 AUGUST, 1888.

Present:—

The Honorable JOHN LACKEY (Chairman).

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

ALEXANDER KETHEL, Esq.

JOSEPH PALMER ABBOTT, Esq.

JOHN RENDELL STREET, Esq.

THOMAS MICHAEL SLATTERY, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee proceeded to consider the subject of the proposed Harbour Improvements at Newcastle.

Joseph Barling, Esq., Under Secretary for Public Works, sworn and examined:—

J. Barling,
Esq.

1 Aug., 1888.

12. *Chairman.*] You have submitted here a list of works which I understand the Department is better prepared to go on with than with others? Yes.

13. It consists of harbour improvements at Newcastle, improvements to the Circular Quay, improvements at Woolloomooloo Bay, and dredging plant for Sydney Harbour. The first work is harbour improvements at Newcastle, and the Committee in going into the matter would like to have some evidence of the necessity for the work, if you have that evidence to give; the circumstances under which the work is to be inaugurated, or whether it is a continuation of something already in progress; and any other facts connected with the initiation of the work which you may be able to give us? After I was examined by the Committee on the last occasion, I saw Mr. Sutherland and had a talk with him about the general business of the Committee, and he has desired me to make certain general statements, which, if it is the pleasure of the Committee that I should do so, I will read.

[*Mr. Abbott objected to the Minister for Works directly or indirectly sending messages to the Committee, and thereby placing evidence of a secondary nature before them, and it was decided that Mr. Barling should be examined irrespective of the Minister and on his own responsibility.*]

14. *Chairman.*] We have decided to take evidence upon the proposed improvements at Newcastle, and first of all we are desirous of knowing the reason or necessity for the works? In brief, the improvements include the construction of a basin on the southern end of Bullock Island, which it is proposed to line with a wharf or quay which will give, when complete, about 8,000 feet of wharfage accommodation, but the present proposal is to construct about 4,000 feet. This will be more particularly shown on the plan. They will also include the erection of seven additional hydraulic cranes with a loading capacity of 10 tons each; the reclamation of land near Honeysuckle Point, adjoining the Great Northern Railway; and the removal of about 20,000 cubic yards of rock which now obstructs the channel leading into the harbour, the locality of which will be indicated on the plan. Mr. Hickson, the Acting Engineer-in-Chief for Harbours and Rivers, is in attendance, and will produce large plans which will illustrate the improvements proposed, and he will be prepared to give a detailed explanation to the Committee. The works are entirely of an engineering and technical character, and it was thought it would be more satisfactory to the Committee if the engineer himself attended and explained them. I have also in attendance the Railway Traffic Manager at Newcastle, the Harbour Master at Newcastle, and Captain Jackson. These gentlemen will be prepared to show by statistics and their evidence generally the necessity for the proposed works. The first-named gentleman will be prepared with information showing the necessity for the additional shipping appliances and wharfage accommodation which the plans will disclose; Captain Newton will be able to show the necessity for the deepening operations which the scheme will also include; and Captain Jackson will be prepared with an outline of the revenue returns. Of course, the Public Works Department is not a revenue department. We merely construct the works, and the Treasury collects the revenue, and we thought it desirable that one of the revenue officers should attend and give evidence on that point. I think that gives a rough outline of our proposals, and the gentlemen I have named will be able to give more detailed information, which will show the character and necessity of the works.

15. Have you any record of any applications for, or memorials in favour of, this work? A great number, extending over many years.

16. This, then, is hardly regarded as a continuation of any special work? Works have been going on there for a great number of years.

17. But this is a new work, independent of the expenditure which has taken place there previously? It is; but it is part of the plan which has been in progress for many years.

18. It is part of the original plan? Well, I may say so; but it is just carrying out what the requirements of the trade show to be necessary from time to time.

19. The Traffic Manager, I suppose, will be able to speak to that point? Yes; he will show the necessity for extra crane accommodation, which the growth of the coal traffic makes necessary.

20. *Mr. Abbott.*] I suppose you, yourself, do not know anything of the necessity of the works? No; but the gentlemen I have named are personally acquainted with the works.

21. You say there are required seven or ten additional cranes: is the capacity of the crane one lift? Yes; we have cranes there capable of lifting 25 tons.

22. *Chairman.*] Is that the greatest capacity? I think so. I am speaking from memory, but I believe it is 25 tons.

23. *Mr. Abbott.*] Is that plan now before the Committee the one that has been prepared? Yes.

24. And what about the estimate to be submitted by the Minister? Mr. Hickson will give you that.

25. *Mr. Garrard.*] Is this extra accommodation purely for coal purposes—for coal shipment only? Well, it will not be wholly so, I think, but Mr. Hickson will explain that more fully. I may mention that, as you will see on the plan, it provides for rock excavation in the harbour. Of course, vessels go to Newcastle chiefly for coal, but not wholly so.

26. Can you tell us what the works have cost so far? Yes; but that will come more naturally from Mr. Hickson.

Robert

Robert Hickson, Esq., Acting Engineer-in-Chief for Harbours and Rivers, sworn and examined :—

27. *Chairman.*] Your name is? Robert Hickson.
28. You are Acting Engineer-in-Chief for Harbours and Rivers? Yes.
29. You have charge of the proposed works at Newcastle? Yes.
30. How long have you had these works in charge? Seven years.
31. You succeeded Mr. Darley, did you not? Yes.
32. Has any part of the work been undertaken up to the present time—any of these new works contemplated in this expenditure? No.
33. The main feature of this work is, I suppose, to give additional wharfage accommodation? Yes.
34. Will it be exclusively for coal purposes—for coal export? The wharfage accommodation will be exclusively for the export of coal.
35. I suppose that for some time it has been considered desirable that this accommodation should be provided? Yes; it has been wanted very much. Vessels have had to wait a long time for their turn under the cranes.
36. This proposed work is to provide for an increased shipment of coal? Yes.
37. Was the work designed by yourself or by some other engineer? It was mainly sketched out by myself, and approved of by Mr. Moriarty.
38. Do you know the estimate of the cost of the work? £112,000.
39. Will that complete it, do you think? Oh, yes, what we propose under the present arrangement. We provide seven additional crane berths.
40. Are these cranes to be worked by hydraulic power? Yes.
41. Are the present cranes worked by hydraulic power? Yes.
42. Do you find they work successfully? Yes.
43. *Mr. Street.*] Are you aware that great complaints have been made of the insufficiency of accommodation for the requirements of the trade of Newcastle? Yes, constantly.
44. *Chairman.*] From your own knowledge, are you aware of it? Yes.
45. You reside there, I take it? I did up to the last three months. I am now in Sydney.
46. Who is superintending these works now? The Assistant Engineer for Water Supply, Mr. Walsh.
47. How long have you been a resident at Newcastle? Seven years.
48. Then you have had an opportunity of observing the operations of the coal trade? Yes.
49. And have you been impressed with the necessity for these proposed works? Yes, very much impressed. We have just finished four additional hydraulic cranes, which have given great relief, but still we want much more accommodation.
50. Will you point out where these cranes which you recently erected are? [*Witness indicated on the plan before the Committee the position of the four cranes recently erected, and of those which have been at work at Bullock Island for some years.*] Four new cranes have been finished a few months and are in constant use. What we propose now is not to extend further in a northerly direction than what is shown on the plan, except for ballast jetties, for it would be too far away. We propose to make the basin, and as a start we are going to put up two ballast jetties on the south end of Bullock Island Wharf, and then construct a wharf along the portion of the dyke as shown on the plan.
51. How many additional cranes will that give? Seven new cranes.
52. Do you propose ultimately to have cranes on the opposite side—that is, the western side? We do not propose that at present.
53. And that is as far as this expenditure goes? Yes.
54. This £112,000 does not include the whole design? No. It includes £12,500 for the removal of a portion of rock in the harbour. All the vessels going out of Newcastle go out on a rising or flood tide, and a portion of this rock has been very much in the way. It is called the Lightship Rock.
55. It is not visible, is it? No; there is 12 feet of water on it at low-water. We propose to take off a corner of it, so as to give vessels more room. Also in the £112,000 there is a sum included of £10,000, which we propose to expend in reclaiming and utilizing a portion of land marked on this plan between the railway at Honeysuckle Point and Bullock Island. The main object of that is this: The railway goes along Blane-street, and the railway workshops are on both sides of the line. It is proposed to put the workshops on the further side of the line from Blane-street, and then the portion of the frontage of Blane-street indicated on this plan will be sold, and the money realized will more than pay the carrying out of this work of reclamation.
56. You propose to dredge the channel and fill in where you make this reclamation? Yes; we are getting a sand-dredge to do this.
57. The reclamation would then come close up to the railway line? Yes.
58. Then the present estimate includes that expenditure? It includes a portion of that expenditure;—the commencement of it.
59. That is as far as it would affect the cranes you are going to erect? Yes.
60. Do you know what the present export of coal is? I think it is about one million and three-quarters a year now, but the Railway Department can give you correct information on that point.
61. *Mr. Garrard.*] Do you mean one and three-quarter millions in value or in tons? Tons.
62. *Mr. Kethel.*] How many steam cranes is it intended to remove, or how many have been removed from the Newcastle wharf? We have taken away four; there are only two remaining now.
63. Where is it intended to place these? We are going to put three down at the south end of Bullock Island Wharf; the other one of the four is useless. The object of putting the three there is that the staiths at present on the Newcastle side will have to come down; but there is a certain class of coasting vessels which go to these staiths, and we are going to provide short berths at this new place for these coasters.
64. That is part of the present project? No; that is almost done. The cranes are down, and the foundations are almost ready for the three of them.
65. Is the removal of the cranes from the Newcastle wharf one of the reasons for this increased accommodation at Bullock Island? Partly; but it was necessary to take away these cranes in order to give more accommodation for vessels bringing general imports.
66. Is it part of this scheme to take away the whole of the lines of rails that go by the Market Wharf, and utilize the whole of the Newcastle Wharf for purposes of general trade apart from coals? It is nearly done, but that is not a part of this scheme.
67. *Chairman.*] Have you any information as to the revenue derived from the coal trade? The Traffic Manager can give you that exactly.

R. Hickson,
Esq.

31 Aug., 1888.

- R. Hicks, Esq.
31 Aug., 1888.
68. What quantity of coal do you say they are capable of putting on board during the year? I think one and three-quarter millions of tons were put on board last year.
69. The cranes are continuously at work? Oh, yes, day and night.
70. *Mr. Garrard.*] That quantity you mention includes the shipment at Stockton? It is the whole of the export from Newcastle.
71. *Mr. Kethel.*] What is the depth of water to which it is intended to dredge the harbour alongside the proposed wharves? 24 feet.
72. What depth is it now? Between the dyke point and the A.A. Company's shoots there is about 18 feet; further up, on the western side of the dyke, it dries at low-water.
73. Is it intended to add to the present hydraulic power and pumping machinery, or to erect fresh machinery; I understood the present power is not sufficient to work the cranes? It is intended to supplement it so far as to put in a new engine and new set of boilers, but the hydraulic accumulators are sufficient, I think.
74. *Chairman.*] What is your estimate of the time it will take to carry out these proposed works? To complete them will take something under three years.
75. That is as far as the expenditure of this estimate goes? Yes; but of course as we put up each crane we can use it; we can use them as we go on.
76. *Mr. Abbott.*] Will the construction of the works now proposed necessitate ultimately the construction of the whole of the design on the plan before the Committee? Oh, no.
77. These works will be complete in themselves? Complete in themselves.
78. You said something about a reclamation there—will that be for sale, or will it be utilized by the Railway Department? Of course, that I cannot say. They might lay down a railway on a portion of it, and sell the other.
79. Do you know what the staiths which it is proposed to remove cost? No; I cannot say.
80. They have never been used to any great extent, have they? Oh, yes, by small vessels.
81. Do you know what the wharfage accommodation now at the harbour of Newcastle is? We can load twelve of the largest vessels afloat at Bullock Island now.
82. How long would it take to load those twelve vessels? Well, there can be loaded about 2,000 tons in twenty-four hours from each crane. The difficulty with loading at the cranes there is not due to the crane power, but to the difficulty of getting the coal quick enough to the cranes and put into the vessel. The trimming takes time. 800 tons in ten hours is about what is done.
83. How long do these vessels generally occupy a berth at the cranes? I think you will get better information about that from the wharfinger.
84. How often are there twelve vessels in the harbour requiring that accommodation? It is very rarely that a crane is idle.
85. But how often is there a demand for any greater number than twelve large vessels to use these cranes? I think there is always a demand.
86. And are the vessels kept there waiting very long for a berth? I have known a vessel wait there for two months for a berth.
87. Having to wait its turn? Yes.
88. *Mr. Garrard.*] I should like to know the estimate of cost of the whole of the works on this plan before the Committee? From the bridge at Bullock Island upwards, as shown on the plan, is not our scheme. I think it is the suggestion of some one on Bullock Island.
89. Why have you a plan here representing something which is not your scheme! To construct and utilize these works you will have to do a considerable amount of dredging? Yes.
90. To what width do you propose to deepen from the proposed wharf on the western side of the dyke? About 500 feet at present, to be completed as the trade demands.
91. Then vessels will have to go in head first and come out stern first? Oh, no; there will be sufficient room for them.
92. Is it intended to remove the whole of those rocks in the fairway of the harbour? Oh, no; to do so, we should have to go right up to the wharf.
93. It is intended to remove only the piece coloured on the plan? Yes.
94. What proportion is that to the remainder? That is hard to estimate.
95. Will you show the Committee the position of the last or No. 8 crane on the wharf? [*Witness indicated the position on the plan.*]
96. And to provide berths at that wharf, was not that rock considerably dredged away? No; not since I have been at Newcastle; there is about 13 or 14 feet of water on that rock there.
97. At the site of the last crane? Yes.
98. What is the nature of the retaining wall along the inner dyke on Bullock Island—is it masonry? It is a timber wharf.
99. But with an internal wall? Yes, of broken stone.
100. Mere ballast? Yes; large stone that comes as ballast—blue-metal.
101. What is the nature of the soil where the work has already been done? Sand.
102. Is there any difference between a wall to retain sand and one to retain mud—do you think a retaining wall for sand would do for mud? Yes, much better, because there is no tide there; it will be still water.
103. Are the piles on the outside wharf wooden piles? Yes.
104. Do you purpose using the same inside? Yes.
105. Is there any considerable deterioration owing to the borers there? No; we copper the piles, and they stand very well.
106. Can you tell us the estimated cost of the whole of the works? No; I could not tell you now.
107. Are there any wharfage rates or tonnage rates collected at Newcastle now? I think there is a small tonnage rate, but the wharfinger can tell you.
108. How many cranes are there at Stockton? Two.
109. Do some of the staiths that it is proposed to take away belong to a private company? No. There are two there, which belong to the A. A. Co., but of course we cannot touch them.
110. What is the depth of water along the dyke? About 23 to 24 feet at low-water, and higher up 17 or 18 feet.
111. Is it a rocky bottom? Sand.

112. Do you not think it would be better to bring the coal further north along the dyke rather than have a congested traffic, according to your proposal? I do not think so. As far as the shipment goes, this inside place at the dyke will be very much better, and it will be still water there. There is a very strong rush of tide on the outside of the dyke.

R. Hickson.
Esq.
31 Aug, 1888.

113. *Chairman.*] Does this expenditure provide for the railway accommodation on that point? Do you mean laying sidings?

114. Yes? No, it does not.

115. Or laying rails? No, nothing to do with the railway.

116. *Mr. Abbott.*] Who is responsible for the estimated cost of £112,000? I am.

117. Did you estimate it at that amount? Yes.

118. *Mr. Garrard.*] Are the cranes for the inner portions of the works at the dyke included in your estimate? Yes, the cranes complete; seven cranes.

119. Hydraulic cranes? Yes; seven of them are in this estimate.

Captain Henry Newton, Harbour Master at Newcastle, sworn and examined:—

120. *Chairman.*] You are Harbour Master at Newcastle? Yes.

121. How long have you been there? I have been fifteen years in the service.

122. At Newcastle? Yes. Four years as Harbour Master.

123. And you are well acquainted with the proposed works at Bullock Island? Yes.

124. The works which we are now considering which embrace an expenditure of £112,000? Yes.

125. I suppose, in the performance of your functions of Harbour Master, you see the necessity daily of increased accommodation for shipping? Yes; the limited space has of late been very severely taxed. It has been constantly complained of by ship-masters. On some occasions I have had ships lying three, four, and five abreast.

126. Loading? No; lying light for the want of wharf accommodation; and such a thing is not conducive to the safety of vessels where they are subject to heavy freshets, as they are at Newcastle.

127. Of course you are of opinion that it is essential there should be sufficient harbour accommodation to prevent vessels from being delayed? A want of accommodation interferes greatly with the shipment of coal. When we have a tier of vessels lying four abreast of one another, the inside ship may receive her order to load at night-time, but as the orders for night-work are not given until 4 o'clock in the afternoon, it is very difficult to enable the vessel to comply with it. We have to break the tier of vessels, and that can only be done in fine weather. If the vessel cannot get to her berth when the order for her to load is received she would lose her turn.

128. Of course your anchorage space is more now than it was? Yes; but our shipping is increasing more than our accommodation.

129. Have you given attention to these proposed works? Yes.

130. Do you think they will obviate any delay in the shipment of coal? They are going to place three steam cranes in position that will no doubt give small vessels quicker despatch. Then there is to be 700 feet of wharfage going inside the basin, but I would rather see it 1,500 feet than 700 feet, because that 700 is actually only what is taken away from the four steam cranes on the eastern end of the wharf on the Newcastle side.

131. How do you mean taken away? There are three steam cranes near the end of the dyke which have been removed from the Newcastle side. There is a ballast wharf there, and I have had as many as six vessels there. Well, they are going to place three cranes there, and have a ballast wharf on the other side, reclaiming the ground.

132. But about the general utility of the work after it has been carried out; it will give considerable additional space for vessels engaged in the coal trade, will it not? Yes.

133. Do you think the accommodation represented in these proposed works will meet present requirements? For a very short time.

134. Then additional works will be required subsequently? Yes.

135. Have you given any consideration to the estimate set down for these works? I have heard the amount.

136. You have not gone into the figures to consider as to the money being sufficient for carrying out the proposal? No, I have not.

137. It embraces some reclamation near Bullock Island? Yes.

138. And the removal of some rock? Yes; I was the first one to apply for the removal of that rock. It is situated at the intersection of two channels, and ships coming in meet the tide and may go on the rock.

139. Vessels are liable to accident by reason of the rock remaining there? Yes; great care has to be exercised.

140. Does your knowledge extend back very many years with regard to Newcastle Harbour? Yes. I remember when coals were wheeled on board vessels in Newcastle Harbour.

141. How long ago was that? 1859. That was before I entered the service.

142. The harbour has been very much improved since then? In fact, by engineering skill and the expenditure of money, it has been made, I may say, a harbour from a creek.

143. I suppose you have no idea of the total expenditure of money on the improvement of the harbour from time to time? No.

144. Are there any wharfage dues paid now? Yes; there is a wharfage rate of $\frac{1}{2}$ d. per ton on ships taking in coal and wool. That realized about £7,000 for 1887.

145. That is being paid now? Yes.

146. Has that rate always been paid? Of late years.

147. Are the works—those that have been carried out, and those that are to be carried out—of a permanent character: Does the harbour, for instance, silt up again? Yes; the north channel silted up from a depth of 21 feet to 12 feet 9 inches in consequence of freshets.

148. *Mr. Abbott.*] What are the freshets? They are caused by floods in the river, and bring down large quantities of silt, causing a decrease in the depth by the silting up. The silt coming down in that manner has

Captain
Newton.

31 Aug, 1888.

Captain
Newton.
31 Aug., 1888.

- has caused a decrease in the depth by the silting up from 21 feet to 12 feet 9 inches, and for about 300 feet in width. We had to take the ships down in nearly the centre of the harbour. The channel has not been deepened again yet. We have two dredges working there now—the "Newcastle" and the "Hunter."
149. *Chairman.*] Then this dredging will still have to be carried on? Yes; I am of opinion that dredging will have to be carried on continuously.
150. *Mr. Abbott.*] Have you any idea of the export trade of Newcastle? I have. About 2,000,000 tons of coal, in round numbers, we exported last year, I think. The exact figures are 1,658,386 tons of coal shipped out of Newcastle, and independent of Sydney.
151. *Chairman.*] That does not include what was sent to Sydney? No; it is the foreign trade—the trade outside of New South Wales.
152. That would include all that goes to Melbourne and Adelaide? Yes.
153. *Mr. Abbott.*] Have you any idea of what the wool export is? I think that last year it was 46,000 bales.
154. It is increasing, I suppose? Yes.
155. *Chairman.*] Would that amount which you have stated represent what went out of the Colony, or merely what went from the port of Newcastle? Out of Newcastle.
156. But a great deal of that would come to Sydney? No; I think that amount was shipped out of Newcastle direct for foreign markets.
157. *Mr. Garrard.*] Was one reason of your availing yourself of the north channel the desire to avail yourself of the Stockton coal trade? No.
158. What width of channel would you require inside of the wharf on the western side of the dyke at Bullock Island for getting vessels safely in and out? We should require from 400 to 500 feet for the class of ships now coming to Newcastle.
159. What is the estimated width between these two lines shown on the plan before the Committee (*indicating the lines*)? I have not measured it.
160. What is the length of the longest vessel coming to Newcastle? The longest has been 480 feet.
161. And if you had three vessels abreast and only 400 feet of space how could you turn a vessel round? We should always have room to swing a ship where there is a tide running.
162. You are of opinion that there would be sufficient room there to enable you to swing a ship? Yes; most decidedly.
163. Is not that proposed dock on the western side of the dyke at Bullock Island dry now at low-water? Yes, dry at low-water.
164. Do you know whether there is any charge for wharfage on the Newcastle side? I do not think there is.
165. And what is the other amount you mentioned? A half-penny a ton.
166. Who would collect that revenue? The Custom House.
167. *Mr. Kethel.*] Will there be water space available inside the dock for vessels to lie there awaiting their turn for loading, and out of the tide-way—that is, of course, when it has been dredged out? Yes. It will, in fact, be better than any other place.
168. There would be accommodation, say, for a dozen vessels waiting to load? Yes; and it will be better for them, as they will be out of the tide-way.
169. Will there be any wharfage accommodation available for vessels inwards or outwards at the reclaimed land on the Honeysuckle Point side? I can scarcely answer that question.
170. Is there to be, on the Newcastle side, where this reclamation is to be carried out, a wharf for shipping accommodation? I believe there is. I proposed that there should be a timber wharf.
171. *Mr. Garrard.*] Are you under the impression that the whole of these improvements are to be carried out at once? No; my impression is not that. I should not say they could be all done now.
172. *Mr. Humphery.*] When that work has been accomplished, will there be sufficient accommodation for the full requirements of the port? Well, for this present year, if it had not been for the unfortunate strike now taking place, I believe the shipping returns would have eclipsed anything known in Newcastle before. If we make strides, as we have been doing of late years, these improvements would be nothing more than are required.
173. But in this scheme, is there any provision for future requirements, or is it only for those that are immediate? I think immediate.
174. *Mr. Kethel.*] Is it not a fact that the frequent delay in vessels waiting for their turn to load arises from the circumstance that a number of ships are chartered to load from one mine. Is not that the cause of the delay, rather than the scarcity of accommodation? I can answer that question this way: These last three months the coal has been pretty well equally divided. Some two years ago there was a rush of shipping, and the ships that were loading Wallsend coal had very great detention, and at times cranes stood idle; but with this last influx of shipping it has not been so. The cranes have been continually at work night and day, although the Wallsend ships have had long turns. They have had as much as fifty days.
175. *Mr. Suttor.*] Do you know the quantity of coal exported from Newcastle during the present year? No.
176. You said it was proportionately larger than what it has been in former years? I referred to the shipping. I have not gone into the number of tons of coal, but I know the quantity would largely exceed the returns of former years—that is, if it had not been for the present strike. I know it from my pilotage returns. My pilotage returns for this year up to the 31st July were £11,704 17s., and last year the amount was £14,834 for the whole year.
177. *Mr. Kethel.*] I understand that the vessels engaged in the coasting trade, or in fact most of the vessels in our trade, are exempted from that pilotage? Yes; and a number of the home ships are now exempt, and most of the steamers.
178. Then these pilotage returns you have given us refer to foreign shipping? Yes.
179. What is the rate of pilotage levied? Eight-pence—four-pence in and four-pence out, by registered tonnage.
180. *Mr. Sydney Smith.*] What is the distance from the point on the north shore at Stockton to the rock, part of which it is proposed to remove? I have measured it with the line, but I have not the measurement here.
181. I mean deep water? I think about 350 feet.

182. You know it is proposed to take away this rock? Yes.
183. Do you know the quantity of rock to be taken away? No; I do not know what quantity is to be taken away, but it has been surveyed by the engineer.
184. What depth of water is there between the rock and the wharf on the Newcastle side? Sometimes it is dry.
185. Could that not be utilized? There is no way of utilizing it at present. The tide ebbs and flows there. It is all rock. The wharf terminates there.
186. *Mr. Garrard.*] Will you point out the position of your boat-harbour there? [*Witness indicated the position on the plan.*]
187. Do I understand you to say that the rock at that point is sometimes dry at low-water? Yes; there is a passage that a boat will go down, but a little bit off the rock is bare.
188. I suppose you think that ought to be removed? I think all obstructions ought to be removed, and this rock is an obstruction, as it is dangerous to vessels meeting the tide.
189. *Mr. Kethel.*] To what depth of water is it intended to remove that rock; there is, I understand, at the present time 17 feet of water on the rock: To what extent is it intended to remove the obstruction? There is only 8 feet of water on it now in some parts. I think they ought to remove it to the depth of at least 22 feet at low-water. If they do not do that, it is no use touching it.
190. *Mr. Suttor.*] You do not know what is actually proposed in relation to it? No.
191. *Chairman.*] Do you know the depth of water required to take a vessel out of the harbour? Yes.
- 191½. And you think the removal of the rock will not be of sufficient benefit unless it is deepened to the extent of 22 feet at low-water? No, I do not.

Captain
Newton:

31 Aug., 1888.

Frederick Roscoe Neild, Esq., Acting Railway Traffic Manager at Newcastle, sworn and examined:—

F. R. Neild,
Esq.

31 Aug., 1888.

192. *Chairman.*] What is your name? Frederick Roscoe Neild.
193. You are Acting Railway Traffic Manager on the Great Northern line? Yes.
194. How long have you been Acting Traffic Manager? During Mr. Higgs' six months' leave of absence.
195. What capacity do you hold in your ordinary position? Traffic Inspector.
196. Over the Northern line generally? The Metropolitan District.
197. That embraces, I suppose, the coal traffic? The section over which the coal trade runs,—from Mullet Creek to Singleton; that is my district.
198. Then you have, in your experience as a Traffic Inspector, or as Acting Railway Traffic Manager, a great deal to do with the export of coal? As Mr. Higgs' *locum tenens* I have, but in my own capacity as Traffic Inspector I have nothing to do with the mineral trade.
199. Has your attention been given to the necessity for increased accommodation for the shipment of coal at Newcastle? The want of facilities has always been a serious trouble.
200. Do you think this inconvenience will be remedied by the course of improvements which it is proposed to commence at Bullock Island? I think so.
201. Do you know the number of staiths or cranes they propose to erect there? Seven cranes.
202. And you understand the design of the work generally? Yes; Mr. Hickson explained it to me yesterday.
203. You have seen from time to time the delays caused by the want of wharfage accommodation? There have been delays.
204. Sometimes vessels have had to wait in the harbour for their turn? That was more the case some time ago than just now.
205. It is not the case at present? No.
206. But the coal trade has been very great this year? Yes.
207. And it would have gone on in the same proportion but for the present strike? Yes.
208. Are you aware of the revenue which the Government derive from the export of coal generally? During the year 1887 it was £80,943.
209. What would that include? The haulage and shipment of coal.
210. Does it apply to any other export but that of coal? To coal only.
211. Of course coal is the largest export of Newcastle? Yes.
212. It preponderates over everything else? Yes.
213. Wool is being exported now, is it not? Yes.
214. Direct to foreign markets? Yes.
215. Do you recollect how many ships went out of Newcastle with wool last year? I could not say.
216. I suppose you have never given much attention to the engineering requirements of the harbour? No; I do not profess to know anything of them.
217. How long have you been in the Railway service? About twenty-six and a half years.
218. In this Colony the whole time? Yes.
219. *Mr. Garrard.*] Were the plans for the proposed wharfage accommodation submitted to the Railway Department? Not that I am aware of.
220. This is the first time you ever saw them, or rather yesterday, when Mr. Hickson showed them to you? Yes.
221. Do you not experience considerable difficulty at Bullock Island in getting the trains alongside the Bullock Island Wharf? We have had a great deal of difficulty, but it is in consequence of the unpreparedness of the yard.
222. Is it complete now? No, but it is better than it was.
223. You see this plan before the Committee; it is proposed to have a double line of rails [*indicating the position on the plan*]; do you prefer the way the Harbours and Rivers Department brings this line down this point, or would you prefer it going north? The scheme now proposed will be more concentrated, and will place us in a better position from a railway point of view. Our difficulty now is, that with our comparatively small staff our expenses are much increased. The expenses will be very much smaller when the work is concentrated.
224. You said the revenue was derived from the haulage and train work? Yes; the shipping charges are included in the haulage rates.
225. Are the shipping departments under the Railways or under the Harbours and Rivers? There is a combination; they erect them, and we work and maintain them.

226.

- F. R. Neild, Esq.
31 Aug., 1888.
226. Shipping facilities are provided to enable you to carry out your contract for haulage? Yes.
227. And should be charged against the Railways? Well, that is a matter of accounts. Certainly, if we collect the revenue, we are fairly chargeable with the cost.
228. Can you tell me whether the charge for the erection of the cranes and for harbour improvements has ever been charged against the railway lines? I am not in a position to state positively, but I believe not.
229. Nor the interest? Not so far as I am aware.
230. What is the profit to the Crown after the expense of haulage, and from the money received for haulage—what does it cost the department, for instance, to bring a train of 500 tons from Wallsend to Bullock Island? That is a matter which cannot be very quickly got at, because there are so many items of detail.
231. What proportion of the haulage rates is charged for crane purposes? I could not say; that is a matter which is done in the framing of the tariff in Sydney.
232. Can you give us the cost of a train of 500 tons from Wallsend, together with the cost of shipment, and the amount received from the Company for it? The train would be only about 160 or 170 tons.
233. *Chairman.*] You have the ascertained cost per mile for haulage? The cost per mile for all trains is about 4s. It would be about £3 or £3 5s. for about 160 tons.
234. From Wallsend to the ship—that would include the shipment? Yes.
235. *Mr. Garrard.*] What, then, would be about the charge for that to the Wallsend Company? About £6 10s.—10d. per ton.
236. The whole of that profit, then, goes to the credit of the railway, and nothing goes to a sinking fund, or to pay interest on the harbour improvements? It all goes to the railway.
237. *Mr. Suttor.*] Can you give us any information as to the export of wool from Newcastle, or as to the amount of wool brought down by train? No, I cannot. I was summoned to Sydney hurriedly, and all my information is in Newcastle; but Captain Paton is present, and might give the information.
238. *Mr. Garrard.*] You do not ship wool from your trucks, do you; you simply deliver to the consignees, who take delivery from the truck? We bundle it out of the truck into the dumping shed.
239. *Chairman.*] And the dumping shed is on the wharf? Yes.
240. *Mr. Kethel.*] So that these improvements now before the Committee do not affect the wool trade? No.

Captain John Jackson, Manager of the Public Wharves at Sydney, sworn and examined:—

- Captain J. Jackson.
31 Aug., 1888.
241. *Chairman.*] What is your name? John Jackson.
242. What position do you hold? Manager of the public wharves at Sydney.
243. Do your functions extend to Newcastle as well as Sydney? Sometimes, not always.
244. You exercise a supervision there? Whenever the Treasury requires my attendance there, I go.
245. You have some knowledge of the shipment of coal there? Not very much.
246. What is principally your work down there, then? I have been down there reporting on the Stockton wharves, and I was appointed to a Commission that inquired into the shipping facilities for inward shipping at Newcastle.
247. Have you any figures or other information that will enable you to say what the revenue derived from the shipping trade at Newcastle is? Yes; the shipment of coal amounts to about 1,750,000 tons, and at 4d. per ton at the cranes this would make £29,000. Out of this £29,000 is a sum of £14,000 which is paid to the contractor for shipping the coal. Then there are harbour, light, and pilot dues, £35,000, and tonnage dues £7,000, or £71,000 altogether.
248. What year does this represent? Last year.
249. Do you recollect what the amount for the year before was? I do not.
250. And what is about the annual expenditure in keeping up those works? About £55,000.
251. Would the difference be a clear profit to the State? No; these are the expenses including 4 per cent. on loan. There is a loan of £462,000, and 4 per cent. on that amount would be about £18,000.
252. Does it include that? Yes.
253. And repairs also; there must be some estimate for repairs that would not include renewals? No; only the allowance for wear and tear, or depreciation.
254. This estimate of £71,000 includes everything—exports generally? No; there is no export wharfage—no export or import. This is only craneage.
255. That would be coal only? Coal only.
256. *Mr. Watson.*] Are your duties in connection with the Wharfage and Tonnage Rates Act in Sydney? Yes.
257. Does that Act apply to Newcastle? It should.
258. Why was it withdrawn? I think it was withdrawn by yourself.
259. But it was in operation in Newcastle? I think so.
260. For how long? A month or two, I think. I know that it was cancelled at Newcastle, Wollongong and Kiama at the same time.
261. There is no export duty on wool at Newcastle? No, on no goods.
262. *Mr. Kethel.*] How is the item of tonnage made up? At the rate of a half penny per ton per day for ships loading while they lie at the wharves; that is on the gross tonnage.
263. The pilotage would be for services rendered? Yes; that is 8d. per ton.
264. Are there any statistics available to show us the amount of goods that have been landed on and shipped from the public wharves at Newcastle upon which wharfage could be levied? Yes. I have some statistics for 1886 in my office. At that time inward wharfage alone would amount to a little over £6,000; and the outward wharfage on wool alone to £1,000, at the rate of 4d. per bale.
265. *Mr. Watson.*] Do you know why wharfage should not be levied inward and outward at Newcastle the same as at Sydney? I do not see any reason why it should not; it would only be just.
266. *Chairman.*] You understand generally the work proposed to be carried out at Bullock Island? I do not know very much about it.
267. But I suppose during your visits to Newcastle your attention has been called to the necessity for increased accommodation? There is no doubt that more accommodation is required. Lately several of the cranes on the Newcastle side have been taken away to make an import and export wharf for goods other than coal.
268. *Mr. Kethel.*] That is, the wharf from the Market wharf downwards is to be devoted to merchandise? Yes.

269. *Chairman.*] You know nothing about the dredge service there, I suppose? No.
270. Do you know how many dredges there are there? I think three.
271. Do you know what the annual expenditure on them is, and whether they are kept continuously at work? No. I know that the last flood caused a silting up near the Stockton wharf of about 4 feet, and that gave a great deal of work.
272. You have no record of the annual cost? No.
273. *Mr. Kethel.*] Is the cost of the dredge service, or any part of it, charged in the £55,000 of expenses mentioned by you? The dredge service at Newcastle is, I think, about £15,000 a year, and is included in the £55,000.
274. *Mr. Humphery.*] Is the £29,000 for craneage charges collected by the Customs or by the Railway Department? By the Railway Department.
275. Was it included in the amount stated by Mr. Neild in the returns he gave? Yes.
276. What is the charge for using the cranes? Fourpence per ton.
277. You mentioned a sum of £14,000 for maintaining the cranes? Yes; that is paid to the contractor.
278. Then there is a profit on the difference between £14,000 and £29,000—that is in connection with the cranes already in use? Yes.
279. *Mr. Kethel.*] Will you furnish the Committee at its next meeting with a memorandum showing the imports and exports for 1886 referred to just now in your evidence? Yes.

Captain
J. Jackson.
31 Aug., 1888.

Robert Hickson, Esq., Acting Engineer-in-Chief for Harbours and Rivers, recalled and further examined:—

280. *Chairman.*] Are all the plans and specifications showing details of these works ready? No; all of them are not ready yet. Our estimate is based on the old plans.
281. And you propose to carry out these works on the same scale as the others? Yes; they are estimated on the same scale. I can give you at once the plans upon which the present proposals have been based.
282. That is, in regard to the excavation, the piling, and other work connected with it? Yes.
283. They are based on the same estimate as the other works? Yes; they are actually slightly less in regard to the estimate.
284. Will you let us have the plans at the next meeting of the Committee? Yes.

R. Hickson,
Esq.
31 Aug., 1888.

TUESDAY, 4 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. WILLIAM HENRY SUTOR.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

SYDNEY SMITH, Esq.

ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.

JACOB GARRARD, Esq.

The Committee further considered the proposed Harbour Improvements at Newcastle.

Mr. John Dixon, Inspector of Collieries in the Northern District, sworn and examined:—

285. *Chairman.*] Your name is? John Dixon.
286. And you are? Inspector of Collieries.
287. In carrying out the duties of your office, where are you mostly located? At Newcastle.
288. Do you exercise a supervision over the collieries generally? In the Northern District.
289. In carrying out the functions of your office, do you have to attend at all to the shipping of coal? No, not at all.
290. As an observer, or one interested in the coal trade, do you ever pay any attention to the shipping of coal at Newcastle? Well, I do pay some sort of attention as to how the harbour is going on. I have known the port for thirty-one years.
291. Have you been made aware of the circumstances under which you have been called here to-day—that is, as to the propriety of erecting additional works at Bullock Island for the purpose of carrying on the coal trade? The first intimation I had of it (I was called down here by a wire) was when I came here this morning.
292. You are aware, at all events, that it is proposed to construct new works at Bullock Island? Yes; I have heard it talked of in the Newcastle District.
293. Have you given attention to the proposal to open up shipping facilities for coal at Sydney as well as at Newcastle? Not at Sydney.
294. Have you not given attention to the probabilities of Newcastle being relieved by the shipment of coal at Sydney; at Darling Harbour for instance; or at North Shore? All my attention has been given to making Newcastle the proper place for the shipping of coal.
295. Have you heard it suggested at different times that the Northern Railway line may be used for the conveyance of coals for shipment? Oh, yes; I have heard it suggested.
296. You are aware of the output from the different coal-mines in the neighbourhood of Newcastle? Yes; I am aware of what most of them can do.
297. And of the life of the mines? Yes.
298. I mean the period that the mines are likely to last? Yes.
299. I suppose you are of opinion that the life of the mines in the Newcastle district is of a sufficient character to warrant the Committee in recommending these proposed works to be carried out? I certainly am of that opinion.
300. You think they will last a number of years? A great number of years.
301. Have any mines shown any signs of giving out, or of not being able to furnish the usual supply? No, none of them.

Mr. John
Dixon.
4 Sept., 1888.

Mr. John Dixon.
4 Sept., 1888.

302. *Mr. Suttor.*] I suppose it is a matter of calculation as to how long the mines will last without being exhausted? It is a very difficult matter to calculate. A great many persons think that a large quantity of coal can be obtained seaward, and I am one of these; and also that coal is likely to be got for a great length along the coast, going towards the south.

303. Then you think that practically, as far as we are concerned, these mines are inexhaustible? As far as my own opinion is concerned, I look forward to Newcastle having the same output, or increasing that output, for at least thirty years. I see nothing to hinder it, because there is plenty of coal about Newcastle that has not been touched.

304. *Mr. Garrard.*] On the basis of the present output? On the basis of the present output.

305. *Chairman.*] Have you made any estimate of the quantity of coal still in the Newcastle District generally? No.

306. No approximate estimate? No; but I know of seams practically untouched that have never yet sent a cart-load to market.

307. You say that you hold the opinion that the Newcastle seams extend under the sea? Yes, I do.

308. Are there instances of that in the old country? Where I come from, yes,—in the county of Northumberland and the county of Durham. I know where there are workings from 3 to 4 miles under the sea, and practically inexhaustible. They will go as far as a man can breathe.

309. What depths are the pits there? Some of them about 700 feet, and there is another near Sunderland 600 yards.

310. *Mr. Watson.*] You said just now that you had no evidence of any mines running out? Yes.

311. What about the Waratah mine? That has just tapped a new field again.

312. But the old mine? That worked out; but there are many thousands of tons to be got out of that mine yet from the pillars, and that is only a patch in the old Waratah Estate.

313. I suppose it is a kind of break in the seam? It is a break in the seam, but not of the same thickness. There has been a sort of break or washout. They are in the same seam now, but more in the dip of it.

314. *Mr. Kethel.*] In your calculation of the thirty years' supply of coal, do you confine yourself to the coal-fields in the Newcastle basin, or do you include the coal-fields of Lake Macquarie? I may say this: that I take in what is known as the Four-mile Creek.

315. *Chairman.*] How far is that from Newcastle? I think about 20 miles. I take Lake Macquarie, and the Hunter as far as Four-mile Creek. That is my estimate, taking in West Wallsend, Monkwearmouth, and back to the mountains.

316. Then, calculating at the rate of the present output, that would be about 60,000,000 of tons? Yes.

317. *Mr. Garrard.*] Irrespective of the coal under the sea? No; we must put that in too.

318. Suppose you exclude the estimate of the coal under the sea, how long do you think it would be before the coal supply worked out? I would not give it such a long period.

319. How much? That is difficult to say. There might be faults.

320. Would the exclusion of the coal under the sea bring it down to a twenty years' supply? I do not think it would.

321. *Mr. Kethel.*] Where are these seams to which you allude as having not yet been tapped? There are seams up Four-mile Creek.

322. That is beyond Maitland? That is beyond Maitland. They have simply been sunk to or bored to, and practically there has not been a load taken away from them yet. I believe there is a very large field of coal there. Then there is West Wallsend; that is barely opened yet.

323. Have you considered as to the probable extension of the Stockton seam away north to Port Stephens and to Raymond Terrace? It is my opinion that it does not extend that way. I believe I can limit the Stockton seam.

324. Then your estimate is simply confined to the Valley of the Hunter? Yes.

325. *Mr. Suttor.*] How many square miles of country are there in this estimate of yours? I cannot say; but it extends from Lake Macquarie back to the Hunter, and from the mountains out to West Wallsend.

326. Can you give us a rough estimate? Well, it would be about 12 by 20.

327. About 1,240 square miles? Yes.

328. How many square miles have been worked out? I could not estimate that without having the plans to enable me to calculate.

329. *Chairman.*] You think the coal resources of the district generally are quite sufficient to justify a reasonable expenditure for shipping facilities? I do.

330. You do not know the nature of the improvements that are proposed to be carried out? No; but I know what is proposed to be carried out at Bullock Island, that is with regard to reclaiming some land.

331. *Mr. Suttor.*] Do you think that the whole of the area of country you mentioned will be worked out in thirty years? I could not say, but I reckon it will last thirty years at the rate of the present output.

332. Not more than that? I could not say that, because you cannot say what will come into the market. I have of course seen many changes in Newcastle during the thirty years I have known it.

333. *Mr. Kethel.*] What is the deepest seam at present worked in the Newcastle coal-field? From 270 to 300 feet below the surface, except West Wallsend, which is 498 feet from the surface.

334. Is that the same seam which is worked further north, or a separate seam? The same as is worked by the A.A. Company, Wallsend, Burwood, and Minmi—what we call the No. 6 or Borehole seam.

335. Have you any reason to believe that there are any workable seams underlying this one? I believe so. We know of a seam 3-feet in thickness underlying the present one.

336. Would it pay to work a 3-feet seam at that depth? Yes.

337. You have reason to believe that there are workable seams below that depth? I believe so.

338. *Mr. Garrard.*] Is this 3-feet seam, which is under the present Borehole seam, included in your calculation? No; I am simply calculating the Borehole seam.

339. What is the distance between the Borehole seam and the 3-feet seam? About 30 or 40 feet, and I believe it is the intention of the A. A. Company to work it from its sea-pit. It will be a fiery seam, but it will be worked some day, no doubt.

340. And there may be seams which are workable lower than that? Yes.

341. That will considerably extend the life of the Newcastle coal-pits? Yes.

342. *Mr. Sydney Smith.*] Do I understand that in your calculation you are including only the mines now being worked? The present seam now being worked—the Borehole seam. There is another seam, called the Burwood seam, which was worked years ago, and no doubt will be worked again. 343.

343. *Mr. Kethel.*] Is that the seam behind Merewether's old house? Yes; it is workable there, and it is workable at South Waratah, and I believe it will be found workable in other places in the district?
344. Do you include in your estimate the output of the Great Northern mine and Cockle Creek? I was not including the Great Northern—not the present seam they are working.
345. *Mr. Street.*] Have you any knowledge of the insufficiency of the present cranes to carry on the trade of Newcastle. Do you know of your own knowledge that more accommodation is required to carry on the trade of the port? Of my own knowledge I have known vessels this year to lie there sixteen weeks. They could not get a berth at the cranes.
346. You believe there are not enough shipping facilities to work the trade? I believe there are not enough shipping facilities to work the trade as it should be worked. There is plenty of coal, and men to get it, but the ships cannot obtain it and get away.
347. *Mr. Watson.*] With reference to that vessel which lay there for sixteen weeks, was it not waiting for a particular coal? Well, it was like this: the vessel was lying under charter for a particular coal, but if a vessel came in connected with the intercolonial trade this intercolonial craft was loaded, and the other had to lie where she was. If there had been cranes enough the intercolonial trade would not have interfered with this vessel.
348. But was there this particular coal to load this vessel? Yes; there were vessels under charter for two coals,—Greta and Wallsend:

Mr.
John Dixon.
4 Sept., 1888.

George Alfred Tillett, Esq., Assistant Engineer for Harbours and Rivers, sworn and examined:—

G. A. Tillett,
Esq.
4 Sept., 1888.

349. *Chairman.*] You have brought plans connected with the proposed harbour works at Bullock Island? Yes. This plan which I produce represents the general type of the works proposed at Bullock Island.
350. And the proposed new work? Well, the proposed new work will be the same.
351. But are there no specific plans for the new work? No, none have been yet prepared.
352. The estimate then has been arrived at on the old plans? Yes; the new works will be of the same class.
353. Does that apply to the dredging and filling up, and the piling, and so on? Well, the plans in connection with the Bullock Island wharf will be the same as these.
354. And are the estimates based exactly upon the same cost? Yes.
355. Both in regard to the stone and wood work and dredging? Yes.
356. You know the general estimate of the Bullock Island work at present proposed? Yes.
357. And you regard that as a fairly approximate estimate? Yes.
358. *Mr. Watson.*] Then, as a matter of fact, you have no plans and specifications ready for this work? No.
359. And if the Committee concurred in the work as proposed you could not carry it out? No, not until we had the plans; but we should simply have to make tracings of these old plans, that is all.
360. *Mr. Suttor.*] What is the reason why the plans and specifications have not been prepared? As a rule, we never prepare plans and specifications until the money for the work has been voted.
361. What will the preparation of the plans and specifications cost? On an average, from 2 to 3 per cent. of the value of the work they represent.
362. And these works are expected to cost £112,000;—would the plans and specifications cost 3 per cent. on that amount? Not on such large works; perhaps not $\frac{1}{4}$ per cent. on a large sum like that.
363. I suppose the item of the cost of getting out the plans is something in consideration of the money not being voted? That would be one reason why the plans are not made out. We have all the materials necessary for forming a very accurate estimate of the work; but until the money is voted for carrying out the work it would be almost absurd to prepare plans for it.
364. *Chairman.*] You say you never do prepare plans until the money is voted for the work? No.
365. And that is the reason why it has not been done in this case? If we did prepare plans, we should have no further information on which to base the estimates than we have at the present time. If there were anything new to be done, it would require a further examination of the locality; but in the present case it is simply a continuation of the wharf.
366. The same class of soil is to be removed, I suppose; you do not anticipate meeting with rock where you did not meet it in the other case? No; we know it does not exist.
367. But if it did exist it would make the cost very much greater? Yes.
368. Do you know whether it is proposed to carry out the work by contract or by day labour? By contract; but the dredging will be done by day-work.
369. *Mr. Kethel.*] What is the class of work by which this is to be done? Piling.
370. Ordinary piling? Ordinary piling, of ironbark and turpentine.
371. Do you intend to sheath it with copper? Whatever timber is used would be sheathed with copper from the ground-line.
372. And would you have caps and joists and hardwood planking as on wooden walls? Yes.
373. And what kind of retaining wall would you have to prevent the soil from falling in at the back of the wharf? At the back of the timber work there would be a rough retaining wall of hand-packed ballast, and at the back of this retaining wall the ordinary dredge material.
374. Where would you obtain the stones from to make the facing? The greater part of the stone would be obtained at Bullock Island from ship's ballast.
375. What does it cost? I think nothing.
376. Do the ships deposit it there at their own cost, or do the Government men deposit it? The ships get rid of it themselves.
377. Then the greater part of the stone material, or the whole of it, would be obtained free of cost from ships visiting Newcastle? Yes.
378. And the whole of the earth required for filling-in purposes would come from the dredging in that part of the harbour proposed to be deepened? Yes.
379. There would necessarily have to be some stone foundations on which to put the hydraulic cranes; how would you have them founded? On iron cylinders sunk to a solid foundation and filled with concrete.
380. *Mr. Garrard.*] What is your estimate of the cost per ton for dredging? The actual cost is about 6d. per ton.

- G. A. Tillett Esq. 381. And what does it cost to deliver the silt? We have a price that has always been paid of 5d. per ton for a 40 yards' run, and 3d. per ton for each 40 yards after the first 40 yards.
- 4 Sept., 1888. 382. Is the 6d. per ton for the work done by your best dredge, or is it distributed over the whole of the plant there? It is distributed over all the dredging plant in Newcastle.
383. It is not confined to the dredge "Newcastle" only, but relates to the whole dredging plant at Newcastle? Yes.

Charles Augustus Goodchap, Esq., Commissioner for Railways, sworn and examined:—

- C. A. Goodchap, Esq. 384. *Chairman.*] Your name is Charles Augustus Goodchap? Yes.
- 4 Sept., 1888. 385. You hold the position of Commissioner for Railways? Yes.
386. And as such you have had a good deal to do in exercising a surveillance over the shipment of coal? Yes.
387. And in the conveyance of the coal from the mines to the shipping port? Yes.
388. Are you aware that they are erecting new coal cranes at Bullock Island? Yes; hydraulic cranes.
389. From what you know of the circumstances of the trade, do you think that the cranes proposed to be erected there will be required? Certainly.
390. Great inconvenience has been felt up to the present time through not having sufficient cranes, I suppose? No. We have had cranes at Newcastle which supplied the actual necessities of the traffic; but these have recently been taken away, with a view to giving ordinary merchandise those facilities it requires; and additional cranes were required at Bullock Island to replace the facilities granted at Newcastle. I am not prepared to say there has been any want of facilities; in fact, the facilities, so far, have always been in excess of the requirements.
391. But, through the removal of the cranes from Newcastle, the proposed cranes will be required at Bullock Island? Yes.
392. And they will have full work? Yes; they are absolutely necessary.
393. The railway line is not constructed the whole distance from Sydney to Newcastle, is it? There is a small break at Mullet Creek of 4 miles.
394. Is there any coal coming down on that Northern line now? No.
395. Do you look forward to a coal trade coming to Sydney in connection with the Northern railway line? Yes, I think there will be a good trade in coal, but it will not affect the established mines that now do business with Newcastle in a very large degree. I think the coal that will be brought over this portion of the Northern railway will be the coal developed at Lake Macquarie, and between that and the Hawkesbury River.
396. You think there will be sufficient coal this side of Newcastle without going to the old mines? I think the railway between Newcastle and Sydney will be used principally in bringing coal from mines yet to be developed. I think the present mines will continue to use the harbour of Newcastle and the shipping appliances at Bullock Island.
397. Have there not been considerable coal deposits discovered at Gosford and in its neighbourhood? Yes.
398. Would that come to Sydney? Yes.
399. And coal also from the neighbourhood of Lake Macquarie? Yes.
400. Is it likely that in the winter season and stormy times coals would be sent by rail to Sydney to meet immediate requirements? The railway might be used occasionally to meet hurried requirements, but I do not think storms are so severe at Newcastle as to prevent the use of the usual appliances.
401. But, on the whole, you think the proposed works at Newcastle are necessary? Yes.
402. *Mr. Watson.*] When do you expect to have the completed railway line opened to Waratah? I think it will be opened in February next.
403. Do you think the opening of that line will divert any of the coal traffic from Newcastle to Sydney? To a limited extent.
404. But not to interfere with these new cranes? No.
405. At what rate will you be able to carry coals to Sydney? Not under 5s. per ton.
406. And the present rate by sea is 4s.? Yes. But there is this difference in bringing it by rail. It is handled only once, and when it is sent by sea it is handled twice. That makes it small, and brings about a difference which is estimated at 1s. 6d. per ton.
407. That would be a difference in favour of the railway? To that extent.
408. Would that not be an inducement to people to send coal by rail? I think the difference between 5s. to Sydney and 4s. by sea would be immaterial.
409. But suppose you bring coal to Darling Harbour, so that it could be shipped at once? I am quite satisfied that coal will never be shipped from Darling Harbour.
410. But that was the original intention? Yes; I believe so. I think Mr. Moriarty erected some cranes there for the shipment of coal, but they have never been availed of. It is quite impossible to bring coal on a line which is used as a suburban line, and as an ordinary through line for ordinary merchandise and passenger traffic. A coal traffic could not be conducted on such a line.
411. But it was originally intended to have the line between Homebush and Waratah a double line? Yes.
412. And that was altered? Yes; but, although it has been made for the present a single line, the bridges and tunnels have been constructed for a double line.
413. Suppose the cranes had not been removed from the Newcastle side of the harbour to give facilities for the import and export of merchandise, would the shipping facilities have been sufficient for the present requirements? Yes, for the present requirements, but they are increasing year by year.
414. You are looking to the future? Yes; and there is also a proposal to remove the staiths, which are considered a great inconvenience.
415. At one time wharfage was collected at Newcastle, was it not? Yes, for a short time.
416. It was found inconvenient on account of the railways? Yes.
417. It diverted a good deal of traffic to Morpeth? Yes; and to the A. A. Company.
418. *Mr. Sydney Smith.*] Have you made any calculation of the cost from Newcastle to Sydney; I presume you calculate the cost of 5s. a ton as the cost from Newcastle to Sydney? It was in my mind that the Government would construct a railway to Long Nose Point, and I was calculating in that direction and from Lake Macquarie. It is 100 miles from Newcastle to Sydney, and the grades on that line are very severe. It would be absolutely necessary to charge at least 1d. a ton per mile to cover working expenses.

419. *Mr. Suttor.*] You know it is proposed to make a railway from Tempe to Long Nose? Yes.
420. Was there any suggestion to make that line a coal line? It is to be used, as I understand, exclusively for coals and minerals generally.
421. Carrying coals from the Illawarra Line and the Northern Line? Principally from the Illawarra Line, but coal will also come from the Western Line, and from the lines in the southern district, as distinguished from the southern coast district.
422. As you said before that it is not likely coal would be brought from Newcastle to Sydney, this line would not be used for the northern coal? I think coal will be brought, but from mines not now developed.
423. South of Lake Macquarie? Yes.
424. *Mr. Garrard.*] In reference to the management of the wharves at Newcastle, do I understand that the Harbours and Rivers erect and superintend the repairs of these cranes and wharves? No; the lessee keeps the cranes in repair.
425. But the Harbours and Rivers erect them, and hand them over to your Department, and then you let them out to the lessee? Yes.
426. What revenue do you get from him? We receive no revenue from the lessee. The cost of shipping is included in the charge for hauling the coal, and we have to pay the lessee 1½d. or 2d. per ton for all coal shipped by him at the cranes.
427. What charge for shipment does he make? He makes no charge, we include it in the haulage.
428. And he contracts to work these cranes, and do all the repairs? Yes.
429. Except the main pumping stations? No; he pays the wages of the firemen and stokers.
430. The cost of the erection of these wharves and cranes is not put against the expenditure on the railways. You have a free gift of these in the first instance? I think so.
431. And nothing is put by for a sinking fund, or to meet the interest on the loan? No.
432. Do you not think that some portion of that ought to be charged against the Railway revenue? I certainly think so.
433. In other words they are a free gift to the Railway Department? Well, they belong to the State, and the Railway Department makes use of them.
434. If you had to provide a sinking fund or the interest on the capital invested in these wharves, would that not increase your price for haulage? Yes.
435. *Mr. Kethel.*] Do the Railway authorities levy any wharfage rates of any kind on goods landed by a ship at Newcastle on the wharves? No.
436. Do they at Sydney, at Darling Harbour? The Darling Harbour wharf is one under the Treasury, and is not under the Railway Department.
437. Is it not a fact that when goods are landed on the Darling Harbour wharf, and shipped on trucks consigned to the interior, you charge wharfage to the consignee? I think we collect it on behalf of the Treasury.
438. *Mr. Garrard.*] You spoke of the old coal wharf from which the cranes have been removed as being devoted to the import and export of other goods? Yes.
439. Is that wharf still under the Railway Department? I believe it is still a public wharf.
440. The Railway Department's wharf? Well, that is a debateable question; it was at one time a railway wharf, but it was proclaimed a public wharf.
441. Has it been proclaimed a public wharf? Yes.
442. Who is supposed to collect the revenue? The Treasury. They issued a proclamation rescinding the collection of wharfage dues.
443. And re-investing the wharf in your name? No.

C. A.
Goodchap.
Esq.
Sept., 1888.

Captain John Jackson, Manager of the Public Wharves at Sydney, sworn and further examined:—

444. *Mr. Kethel.*] Will you explain to the Committee the returns handed in by you with reference to the amount of wharfage rates that would be realized at Newcastle if the rates were collected on the same basis as the charges at Sydney? The return shows that the approximate amount of wharfage on imports for the year 1886, if collected, would be £5,758 13s. 8d., and the outward wharfage for the same period, if collected, would be £1,274 15s. 4d. This does not include any cargo brought to Newcastle or taken from Newcastle by Sydney steamers.
445. As these are the returns for 1886, have you any means of arriving at an approximation of the amount, if the rates were collected, on the same basis during the present year;—have you any means of forming an estimate of that? No. Taking into consideration the number of ships that have arrived, I should say that the revenue which could be collected on goods going into Newcastle this year would be close on to £10,000.

Capt.
J. Jackson.
Sept., 1888.

THURSDAY, 13 SEPTEMBER, 1888.

Present:—

JOSEPH PALMER ABBOTT, Esq., (VICE CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

SYDNEY SMITH, Esq.

ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.

JACOB GARRARD, Esq.

The Committee further considered the proposed Harbour Improvements at Newcastle.

T. W. E. David, Esq., Geological Surveyor, sworn and examined:—

446. *Mr. Suttor.*] Have you a knowledge of the Newcastle coal-field? Yes. I have been engaged about two years preparing geological maps of the Maitland and Greta coal-mines and the East Maitland coal-measures, which extend within a few miles of the Newcastle field.
447. Can you give a rough estimate, in square miles, of the area of those fields? I am not prepared at all for what I am wanted this afternoon. I have not made any calculations, but I can state roughly what it is. From the entrance to Lake Macquarie up to Greta there are about 570 square miles. That is only taking the measures as far as Branxton, but they extend a great deal further west,—about 33 miles along the line up the Hunter from Newcastle.

T. W. E.
David, Esq.
13 Sept., 1888.

- T. W. E. David, Esq.
13 Sept., 1888.
448. Do the coal-measures extend beyond Branxton? Yes; at least as far as Rix's Creek. That would add considerably to the area.
449. Can you give us any idea as to the extent of the coal underlying that area? There are three seams of coal,—the upper or Newcastle series; the middle or East Maitland series; and the lower or Greta series. Those three series are not all continuous over that area, but where one series is absent another takes its place. It would take some time to calculate the amount of coal per square mile throughout the area, but I have just calculated it for about half that area. The Greta coal-measures would furnish a daily output of 40,000 tons for about 200 years. That is the Greta or lower series.
450. Have you any idea what the other series would yield? I may say that my estimate is taking the areas where I think the Greta series would be workable, because a considerable part of that area of the Greta series would be too deep to work. In making an estimate of 40,000 tons daily, I am only taking account of the Greta measures where the seams are within workable reach.
451. What is the quantity in the middle series? The middle coal-measures, or East Maitland coal-measures, speaking approximately, would furnish a daily output of 20,000 tons for 100 years. I am not sufficiently well acquainted with the upper series to give an estimate. So large an area of the upper series in the neighbourhood of Newcastle has been worked that I have not the necessary information for calculating the amount of coal in the unworked areas.
452. Do you think any system of coal-mining could be carried out under the sea in the neighbourhood of Newcastle, as I presume the seams extend under the sea? Yes, they are dipping underneath the sea. I should think the probability is that they could be worked at least a mile or two miles seawards.
453. Would not that give an enormously increased area of coal-fields, if you take that into account? That would come under the head of the upper series, which I have not calculated. I have not sufficient acquaintance with the worked areas to form even an approximate estimate.
454. Is the Greta series the lowest known? No; there is another series below it. At the only places where they show up at the surface they are so disturbed by intrusive igneous rocks that no attempt has been made to work them. Those measures below the Greta series occur at Stroud, Karua River, and Port Stephens.
455. What is the approximate depth of that series below the Greta series? There is greater unconformity between these Lepidodendron series. The Lepidodendron beds about Stroud and Port Stephens are much older than the Greta measures, or the middle and Newcastle measures.
456. Are they in such a position that they can be worked at a future date? They will not be workable about Newcastle. They would be far too deep at any point to the south of the Hunter River. The neighbourhood of Stroud or Port Stephens is the nearest place. One seam has been opened in this series, 7 miles on the road from Raymond Terrace to Stroud. The seam was 6 feet thick, but rather inferior.
457. What is the present output at Newcastle? I have no idea.
458. Can you give us any idea how long the Newcastle coal-fields can be worked under the present system? Not further than the particulars I have already given of the Greta and East Maitland series.

John Mackenzie, Esq., Examiner of Coal-fields, sworn and examined:—

- John Mackenzie, Esq.
13 Sept., 1888.
459. *Mr. Suttor.* Are you the Examiner of Coal-fields? Yes.
460. Are you acquainted with the coal-fields in the Newcastle District? Yes.
461. Can you give the Committee any idea of the extent and probable duration of those coal-measures, taking them all north of Lake Macquarie? They continue from Newcastle on to Gunnedah in the north-west.
462. What is your opinion generally as to the coal-fields about Newcastle? It is all one coal-field, in my opinion, from Newcastle to Wollongong. It dips under Sydney and comes up again on the Wollongong side.
463. Take from Lake Macquarie as far as the Hunter River, and the same distance beyond the Hunter, what supply of coal will be obtained from that area? For what purpose do you mean?
464. Commercial purposes? I should say it will last for almost an unlimited time, because at the present time the only seam of coal worked is the Borehole seam. That is the best seam of coal for household, steam, gas, blacksmith, and cooking purposes. But you must recollect that a time will come—seemingly quickly—when Newcastle and other places will be great manufacturing centres. There are other seams of coal that it will not now pay to work for steam or household purposes, but which will be used for stationary engines, and the smelting of iron, copper, silver, and other minerals; and in my opinion, as far as Newcastle itself is concerned, it is impossible for me or anyone else to say how long this coal may last for export, &c., from Newcastle harbour.
465. A previous witness gave evidence to this effect—“As far as my opinion is concerned, I look forward to Newcastle having a large output, and increasing it too, for at least thirty years.” Do you agree with that opinion? They are speaking of the Borehole seam. I am speaking of other seams which at present are not marketable for steam, gas, or household purposes.
466. What do you think will be the life of the Borehole seam? That entirely depends upon the distance from Newcastle which you speak of. It is really impossible to answer a question of this kind as to the continuance of a seam which at the present time is being worked from 8ft. to 4ft. 6in., but which may be worked in future at 4ft. 6in. only. There is a great area which at present is not considered workable.
467. Does the Borehole seam extend all over the field? No; it changes its character when you go southward. At Lake Macquarie a bore was put down by the Australian Joint Stock Bank, and the Borehole seam was proved to be of no value. It is utterly impossible to say how far the seam is going to extend. If it is a question respecting Newcastle harbour, I can say that I believe myself, as far as we can see at the present time, it does not depend upon the Borehole seam only. It will depend upon the industries that will be started in that district. There is no doubt that manufactures will be started there with which no other place in New South Wales can contend.
468. But will not those industries depend upon the vitality or inexhaustibleness of the coal-field? Yes. There are seams of coal there which at the present time you cannot sell at any price. You cannot sell coal from those seams because the coal that is now required is for steamers, locomotives, household, and gas purposes. But a time will come when seams of coal which are not so valuable as the Borehole seam, and which would not now command any sale at all, will be used for the engines employed for manufacturing purposes.

John
Mackenzie,
Esq.

13 Sept., 1888.

469. Have you made any estimate in your own mind as to the future of Newcastle, and how long it will take to exhaust the coal-fields? Nobody at the present time can say when they will be exhausted. You must not say that when the Borehole seam is exhausted the Newcastle harbour will be no good. My opinion is that industries will be started there which will make seams of coal now of no value of great value.

470. Can you not give the Committee any definite opinion? My opinion, as far as the Borehole seam is concerned, is that it will last for the next forty or fifty years, if you take it 20 miles away from Newcastle.

471. Is that the uppermost seam? It is the best-known lower seam. I have seen remarks made with respect to seams below the Borehole seam; but in my opinion there is no seam likely to be of any value at all below the Borehole seam at a less depth than 2,000 feet.

472. Are there seams above the Borehole seam? Yes; there are seams above it which we must not judge according to the present demand. We must look to the future. There must be manufactures in the Newcastle District, and those upper seams will be used for stationary engines for manufactures of all kinds. That must naturally be the case sooner or later.

473. Are those seams at present not suitable for domestic purposes? There is quite sufficient for the next thirty years to be obtained from the present seam.

474. *Vice-Chairman.*] Can you not say how long the seams now worked for marketable coal are likely to last, taking the present output as the basis? There is only one seam at and near Newcastle, and that is the Borehole.

475. You have referred to the coal now marketable;—how long will that last? That depends upon how far you go out of Newcastle.

476. Up to Greta? As far as Greta is concerned, I do not profess to give any opinion. It is dipping there to a very great depth, and I think when you get 30 miles away from Newcastle it is going a long way.

477. *Mr. Garrard.*] Do you know the quantity of coal taken away from Newcastle since the field was first opened? I cannot say from memory.

478. Taking Lake Macquarie as the southern limit of the field, and Port Stephens as the northern, and the western boundary 30 miles from the coast, how long do you think that the coal-measures will last at the rate of the present output? A borehole was put down at Lake Macquarie by the A.J.S. Bank and there was no seam of coal there of any value.

479. Well, there will be so much less to estimate. I am giving you that as a boundary? I tell you that there is nothing there of any value as far as the Borehole seam is concerned, and there is nothing at Port Stephens; but that does not say that I can tell you the number of tons between the two places.

480. Do you know the annual output at Newcastle just now? Over 2,000,000 tons.

481. Have you any idea how long that output is likely to last with the seams now being worked? The present output will last there, you may say, for the next fifty years. But I say it is not the seam of coal at present worked which has to be considered. There will be great manufacturing industries established.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Harbour Improvements at Newcastle.

APPENDIX.

A.

[To Evidence of Captain John Jackson.]

Sir, Public Wharves Office, Circular Quay, 4 September, 1888.
I have the honor to enclose a statement of the approximate wharfage dues on Imports and Exports, other than coal, at the Port of Newcastle, for the year 1886, if collected. Owing to the fact that neither weights nor measurement are given in the statistical returns, it is not possible to make it more exact. It is, however, within a very few pounds of the truth.

I have, &c.,

JOHN JACKSON,

Manager Public Wharves.

The Secretary to the Parliamentary Works Committee.

IMPORTS to Newcastle, with approximate amount of Wharfage, for the year 1886 :—

B.

[To Evidence of C. A. Goodchap, Esq.]

Sir,

Department of Railways, Sydney, 10 September, 1888.

When giving evidence on the 4th instant, before the Parliamentary Committee on Public Works, with reference to the proposed basin at Bullock Island, Newcastle, I contented myself with answering the questions which were put to me, and although I have a very strong opinion as to the indirect benefits which are likely to accrue from the adoption of that scheme, it did not occur to me to volunteer any statement on that head. But I am not satisfied that I should be discharging my duty if I refrained from directing the attention of the Committee to these advantages which might otherwise be entirely overlooked.

I beg, therefore, to place in your hands a few remarks on the subject, for such use as the Committee may consider expedient.

The basin referred to will be of immense importance in improving the shipping facilities of the port. Under existing circumstances ships (foreign going) are often delayed for want of room two or three weeks, and even more before they can get coal. This does not arise from want of cranes (which are quite equal to do all they have been called upon to do, and perhaps a little more), but to the inadequacy of the means of berthing vessels. Moreover, the existing berthing space is often not available in the case of large ships when the tides do not supply a sufficient depth of water. This disadvantage will be obviated, and the berthing facilities largely improved and extended by this basin.

But indirectly the formation of the basin can be made instrumental in the reclamation of land and the creation of much-needed water-frontage at Honeysuckle Point.

There is a large area there awash at high tide, and through it a channel has been formed. If the silt dredged from the basin were used to raise this land above the action of the tides (say) 4 feet and the channel referred to deepened some 10 feet, there would be available for sale a considerable area of land with water-frontage, the proceeds of which would probably recoup all the outlay required to carry out the entire scheme. The Government would thus have secured two important public requirements with the ultimate outlay of very little money, if indeed the balance did not prove (if a Dr. and Cr. account were kept) to be on the Cr. side of the account.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

The Chairman, Parliamentary Standing Committee on Public Works.

C.

[To Evidence of Mr. John Dixon.]

Sir,

Custom House, Newcastle, 4 September, 1888.

In compliance with the request of Mr. Dixon, Inspector of Collieries, I beg to enclose herewith a return showing the export of coal from Newcastle to foreign and intercolonial ports during the period from 1st January to 31st August, 1888.

I have, &c.,

WILLIAM R. LOGAN,
Sub-Collector of Customs.

Harrie Wood, Esq., Under Secretary for Mines, Sydney.

MEMO. showing the Export of Coal from Newcastle to Foreign and Intercolonial Ports from 1st January to 31st August, 1888.

WILLIAM R. LOGAN,
Sub-Collector of Customs.

Custom House, Newcastle, 4 September, 1888.

D.

[To Evidence of T. W. E. David, Esq.]

Sir,

As requested by your secretary yesterday, I beg to supplement the evidence given by me, before your Committee, with regard to the probable duration of coal in the Newcastle District, as follows:—

(a) In my evidence I divided the productive coal-measures into three groups—

1. Upper, or Newcastle measures.
2. Middle, or East Maitland measures.
3. Lower, or Greta measures.

A fourth group of coal-measures exists below the Greta, in a formation known as the Lepidodendron series, typically developed at Stroud, the Karua River, and near Port Stephens, &c.; but as no coal has as yet been profitably worked from this formation it has been left out of consideration in making the calculations as to the probable yield of the coal-measures in the Newcastle District. My rough estimate of the probable yield of the East Maitland and Greta coal-measures, within the prescribed area (viz., north and south from Lake Macquarie Heads to Fullerton Cove, and east and west from 1½ miles east of the South Pacific coast to Branxton), has already been given, namely, about 20,000 tons daily for 100 years for the East Maitland coal-measures, and 40,000 tons daily for 200 years for the Greta coal-measures. I have, since giving my evidence, checked the above approximate estimate, and consider it tolerably correct. As regards the probable yield of the Newcastle coal-measures, my calculations show that the unworked areas of the Borehole, Burwood, and Great Northern (Donaldson's) seams would furnish in the aggregate an output of at least 2,000,000 (two million) tons annually for 200 years.

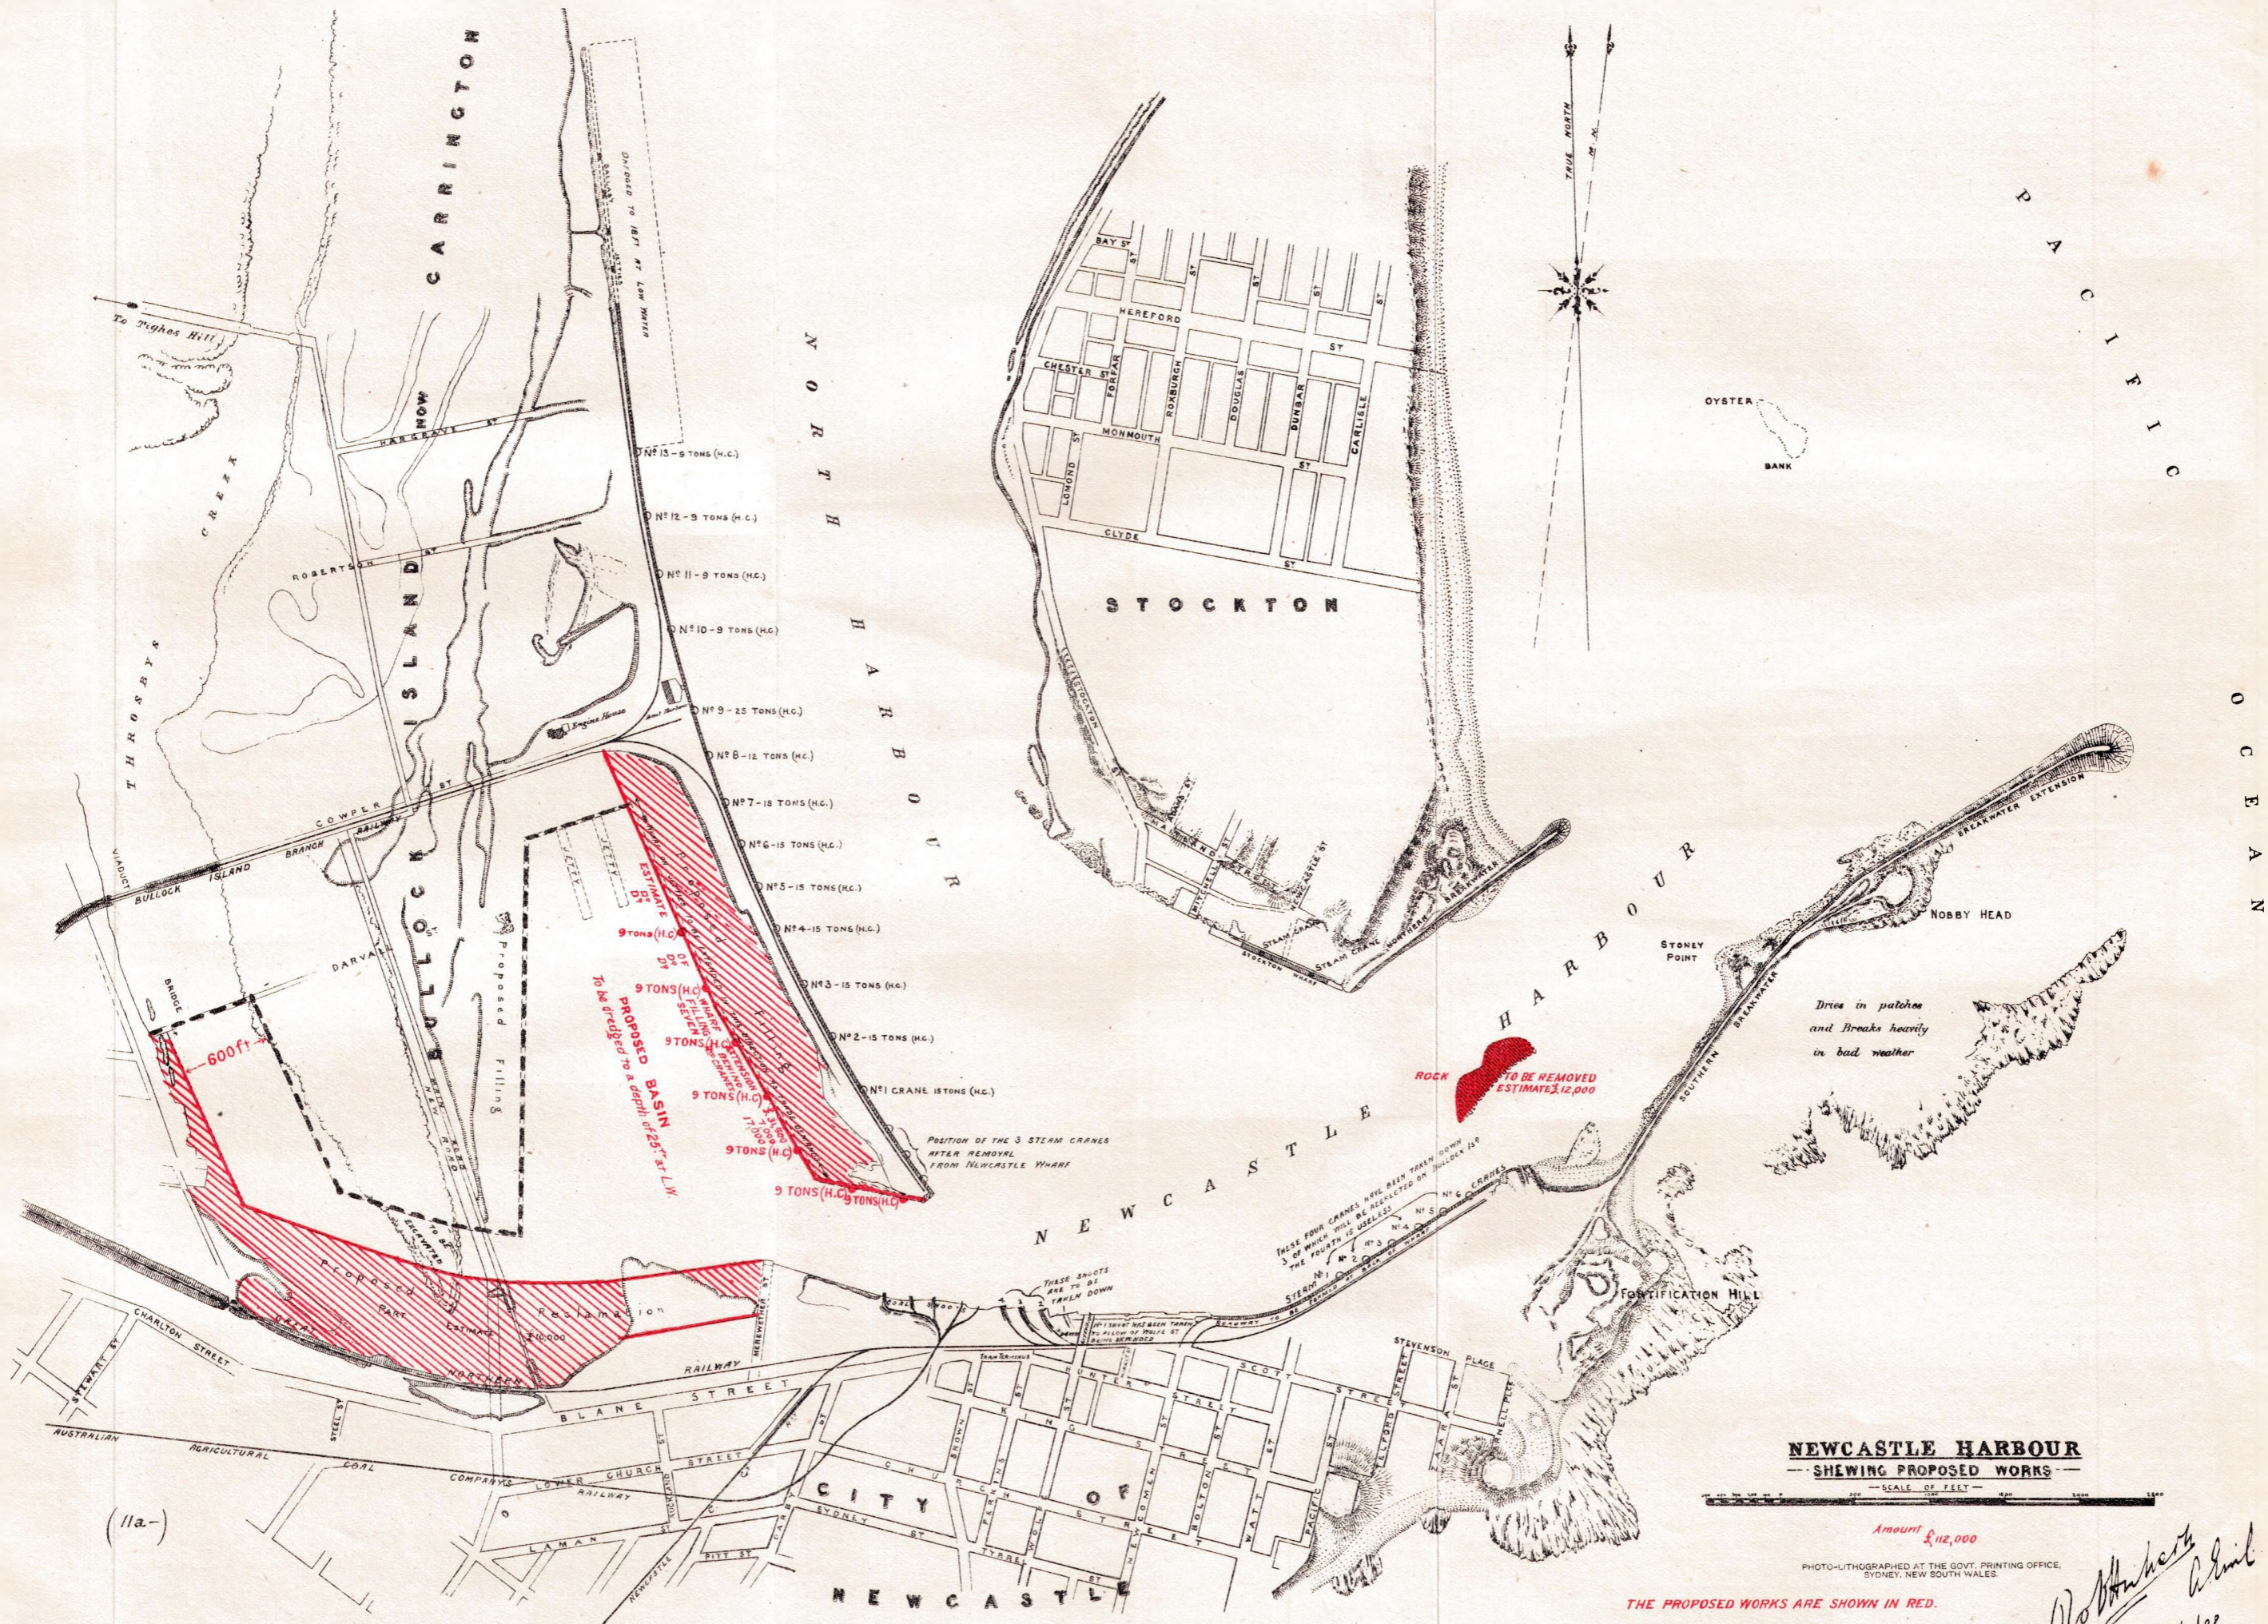

(b) As regards the northerly extension of the northern coal-field, I omitted to mention, when giving evidence, that this field does not cease at Singleton and Rix's Creek, but continues on, with slight breaks, first in a north-west, then in a north-north-east, direction to the Queensland border. Within this area I have seen a 7-ft. seam of workable coal at Piercefield, near Muswellbrook; two workable seams of 7 feet each near Gunnedah; and a 30-ft. seam, of which at least 7 feet was workable, at Ashford, near Inverell.

I have, &c.,

T. W. EDGEWORTH DAVID, B.A., F.G.S.,
Government Geological Surveyor,
Department of Mines, 25/9/88.

The Honorable the Chairman, Parliamentary Standing Committee on Public Works.

[One Plan.]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

NEWCASTLE HARBOUR IMPROVEMENTS BILL.

(MESSAGE No. 4.)

Ordered by the Legislative Assembly to be printed, 6 December, 1888.

CARRINGTON,

Governor.

Message No. 4.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends, for the consideration of the Legislative Assembly, the expediency of making provision to meet the requisite expenses in connection with a Bill to sanction the carrying out of certain harbour improvements at Newcastle, in the county of Northumberland.

Government House,

Sydney, 29th November, 1888.

APPENDIX.

To evidence of Alfred Lamb, Esq.	A
„ M. A. Conil	B
„ James Powell, Esq.	C
Plan, showing the Proposed Improvements to the Circular Quay, as they were submitted to the Committee, and also the alteration in the Messageries Maritimes Company's Wharf, referred to in the resolution agreed to by the Committee.	

In the course of their inquiry concerning these proposed improvements, the Committee examined a large number of witnesses, including merchants well acquainted with the shipping trade of Sydney, and owners or representatives of the owners of private wharves, their desire being to elicit full information, and have the subject of the wharfage accommodation of Sydney Harbour, and the necessity or otherwise of improving the Circular Quay as proposed, placed before them in all the aspects from which it may be viewed.

Necessarily, as is always the case, where matters are regarded from different points of view, the evidence will be found to some extent conflicting, but a careful examination of it will show that it is very much in favour of the improvements, and that even the testimony of those who came before the Committee hostile to the proposals is certainly not so unfavourable as to induce the belief that what is proposed to be done should not be carried out.

The strongest evidence given in opposition to the improvements came from three witnesses, two of whom have had a long experience in relation to wharfage matters in Sydney, and are still in positions which entitle them to speak with some authority on the subject. They are Mr. Alfred Lamb, a private wharfowner and a member of the Private Wharfowners' Association, and Mr. James Powell, Collector of Customs. The third witness directly opposed to the improvements is Mr. E. C. Batt, the representative of a company who are expending a large sum of money in providing extensive wharfage accommodation at the site of the old A.S.N. Co.'s Works, Pyrmont. Yet each of these three gentlemen, or at least the two former, notwithstanding that they expressed themselves generally as opposed to the Government expending money to increase the wharfage accommodation of the port, will be found to have admitted the necessity of providing for the objects which it is principally intended by the proposed improvements to secure. The first of the improvements is the transference of the vessels and men of the Marine Board, and the boats and men of the Custom House, from the eastern to the western side of the Quay. No objection is raised by these witnesses to that. The second of the improvements is the construction of two new berths for sailing vessels on the western side of the Quay, in place of the old wooden wharf at present there, used partly by the P. & O. Co., and partly by the Port Jackson S.S. Co. This is objected to by the three witnesses referred to on the general ground that it unnecessarily increases the wharfage accommodation of the port, and, further, that it is likely to assist in bringing about a return to the system of injurious competition among wharfowners in which the prominent feature was a reckless practice of giving rebates. Mr. Lamb, however, when questioned (*Question 365*) as to the advisableness of doing something to restore the wharf on the western side of the Quay, it being now in a condition of very much decay, admits that any expenditure to make the wharves more substantial in their present shape would be judicious. Furthermore, he says, (*Question 389*) that if the wharves on the western side were set apart for vessels with general merchandise—which it is the intention to do—they would probably be rather sought after by agents; and (*Questions 396–399*) that the Circular Quay being Government property, and a considerable quantity of material being imported by the Government in sailing vessels, it is desirable to have berths for sailing vessels on the western side. Mr. Powell is opposed to the new berths on the western side, but he, too, agrees (*Questions 979–980*) that, if the present wharf is in a dilapidated condition and should be renewed, the renewal of the wharf ought to be carried out, and, further, if it be necessary to renew the wharf an improvement in its present style should be adopted. The evidence of Mr. Batt is less important than that of Mr. Lamb or Mr. Powell by reason of the fact, as he himself states, that he has had nothing to do with commerce relating to shipping, except as an auctioneer having to do with wharf property and its sale; but he, also, though appearing before the Committee to protest, on behalf of his Company, against the Government spending money in improving their wharf properties, has nothing direct to urge against the proposed new berths for sailing vessels. Questioned as to whether he could point out on the plan before the Committee any portion of the proposed improvements which he thought should not be constructed, he answered (*Question 1062*), "I do not think so, for the reason that I have been more concerned with the general idea than trying to dissect the plans proposed by the Government." And, again, when asked (*Question 1064*) what portion of the proposed expenditure should not be incurred, he said he had not sufficiently studied the plan to answer the question,

The

The third of the proposed improvements is the alteration in the arrangements for the ferry traffic, and there is no objection on the part of these witnesses to that. Neither does there in reality appear to be—except, perhaps, by Mr. Batt, who, however, as already pointed out, merely objects generally to any Government wharfage improvement—to the fourth of the proposals, and one of the most prominent of the series, on the eastern side of the Quay: the additional accommodation for the mail steamers. “No doubt,” says Mr. Lamb, in answer to a question (*Question 364*), “an expenditure for such a purpose as the wharf for the P. & O. Co. is quite justifiable, because an income is assured before the work is constructed; the P. & O. Co. and the Orient Co. require special accommodation.” And Mr. Powell gives evidence to the same effect. “Any extensions of a remunerative character,” he remarks in a long statement he made to the Committee (*pages 34–35*), “required by the Government tenants at the Circular Quay should be favourably entertained; the full wharfage is paid by the importers of goods landed on the leased sections, and the question of rebate cannot enter.” Moreover, in his reply to a question (*Question 973*), he says, “The lengthening of the wharves for the lessees is, no doubt, a necessary work”; and (*Question 978*), when asked what portion of the whole of the improvements should not be carried out, he answers, “The portion on the west side” (which in his reply to *Questions 979–980*, already referred to, he admitted should be made). * * * * “All the other improvements, I think, should be carried out.” From this it will be seen that even the witnesses who, in a general sense, appeared antagonistic to the proposed improvements, are found, when their evidence is sifted, if not actually to concur in the proposals, to at least admit that they are of a character which it would not be unwise to adopt.

The form in which the Committee conducted their inquiry relative to these proposed works may be stated as follows:—

- (1.) The nature of the proposed improvements.
- (2.) The purposes for which the improvements are intended.
- (3.) Evidence in justification of the improvements—
 - (a) As to present accommodation for shipping at the Circular Quay.
 - (b) As to the present condition and the probable growth of the shipping trade.
 - (c) As to the condition of the harbour ferry traffic.
 - (d) As to the amount of revenue derived from the present accommodation, and the amount expected to be obtained from the improvements.
- (4.) Evidence against the improvements—
 - (a) As to the wharfage accommodation generally in Sydney Harbour, and whether it is sufficient for present and future requirements.
 - (b) As to whether the improvements would be carried out if the Circular Quay were owned by, or in the hands of, private persons.

The nature of the proposed improvements has already been stated.

The purposes for which the improvements are intended have to some extent also been referred to, but they require some further explanation in order that they may be clearly understood. The removal of the vessels and men of the Marine Board, and of the boats and men of the Custom House, from the eastern to the western side of the Quay, is necessary in consequence of the proposal to build the new wharf on the eastern side for the accommodation of the steamers of the P. & O. Co. The new boat sheds and slips will be constructed on the property recently purchased by the Government. The two new berths on the western side of the Quay are intended for the use of sailing vessels, the accommodation for those vessels at the Circular Quay at the present time being, it is alleged, insufficient, and the berths are also proposed as an improvement on the present old wharf, which is declared to be in such a worn-out condition that it must either be renewed or abandoned. The change in the arrangements for the accommodation of the ferry traffic is intended chiefly to lessen the danger which now exists through the necessity for the ferry steamers to cross each other in their trips to and from the Quay. The new wharf on the eastern side of the Quay, for the accommodation of the P. & O. Co., is to afford increased wharfage space to that company, in accordance with an understanding between the Government and the company, by which they are occupying their present wharf, which is regarded as a temporary one, until a permanent wharf for their use is built; and the lengthening of the Orient Co.’s wharf to the extent of

50 feet is for the purpose of making the length of that wharf more in accordance than it is at present with the length of the company's steamers. Part of the new wharf, which is to be built for the P. & O. Co., was intended for the use of the Messageries Maritimes Co., their present accommodation being somewhat interfered with by the proposed extension for the benefit of the Orient Co., but this arrangement is shown by evidence to be less desirable than an alteration in the plan relating to the improvements on the eastern side of the Quay, by which the wharf of the Messageries Maritimes Co. will be widened, and the accommodation made sufficient for their steamers.

Referring now to the evidence in justification of the proposed improvements, it will be found that the general body of the witnesses are emphatically of opinion that they should be carried out. First, as to the accommodation at present available for shipping at the Circular Quay. Captain Hixson, President of the Marine Board, thinks the proposed works necessary (*Question 56*), as "we certainly require more accommodation for shipping than we have at the present time, for large steamers especially"; and he considers (*Question 60*), that by these proposals the Circular Quay will be utilized to its fullest extent; and (*Question 65*), that "£120,000 is not an exorbitant amount of money for so great a scheme." Captain Pettit, Harbour-Master, regards the works as a great improvement on the present state of things, and he does not think that space could be economized better than by this plan. Captain Jackson, Manager of the Public Wharves, states that complaints are made at the present time of the want of accommodation, and that it is considered by shipping people that the works proposed will meet their requirements at the Circular Quay, to which they are always inclined to give a preference over other wharves. Mr. Angus Moir, Clerk of Works at the Circular Quay, thinks (*Question 217*) the works are very essential, and points out that the old wharf—meaning the wharf on the western side of the Quay—is completely gone underneath. Captain Thomas Summerbell, traffic manager of the North Shore Steam Ferry Co., says (*Questions 268-269*) he has very often been impressed with the necessity for increased accommodation for ocean-going steamers, and he thinks the proposed improvements will answer everything that is wanted. Mr. G. S. Yuill, manager of the Orient S.S. Co., complains that the wharf at present used by the steamers of his company is too short, and prejudicial to the proper working of the steamers. Furthermore, he states that the wharf occupied by this company is the only one in Sydney Harbour where the Orient steamers can lie with safety, and that there is no private wharf that affords such accommodation. Mr. James Weir, agent for the P. & O. Co., thinks the intended improvements necessary for the general accommodation of the port, and says that what is proposed to be done for the P. & O. Co.'s vessels is absolutely necessary to enable the company to carry on their increasing trade. Mr. Thomas Littlejohn, the Hon. S. A. Joseph, M.L.C., and Mr. R. G. Vallack, each engaged in extensive mercantile business in Sydney, and having much to do with shipping, also favour the proposals. The first-named thinks the improvements are exceedingly desirable. Mr. Joseph, who is President of the Sydney Chamber of Commerce, is of a similar opinion, and states (*Question 598*) that he has always preferred sending his ships to the Circular Quay, and (*Question 600*) that the same preference is shown by the captains of ships coming to Sydney. "We have a difficulty," he says, in answer to another question (*Question 613*), "in obtaining berths at the Circular Quay, where we require them very often." Mr. Vallack, who a few years ago was a prominent member of an association formed in Sydney to bring about a general improvement in the wharfage accommodation of the port, considers the Government will be perfectly justified in incurring this expenditure, as the money will be well spent.

The present condition of the shipping trade of Sydney is shown by the evidence to be of a satisfactorily progressive character, and its growth to very much larger dimensions than are now apparent is undoubtedly assured. All the witnesses examined agree upon this point, and it will be found from the evidence given by the representatives of the large steamship companies, whose vessels are berthed at the Circular Quay, that in the building of new steamers there is a tendency to increase their length and their tonnage very considerably.

As to the present condition of the harbour ferry traffic, and the proposed alterations in regard to the accommodation for the ferry steamers, it is perhaps sufficient

sufficient to say that the representatives of the North Shore Steam Ferry Co. and the Watson's Bay Co. are favourable to the changes, and that the Port Jackson Steam Ferry Co. are apparently not unfavourable, as, though no witness on their behalf was examined the manager of the company was invited to attend before the Committee and give evidence on the subject. The opinion of persons unconnected with the ferry companies, and who may be considered to represent the public, will be found in the evidence of the other witnesses who appeared before the Committee, and that opinion supports what it is proposed to do.

The question of revenue is dealt with chiefly in the evidence of Captain Jackson, who, as an officer of the Treasury, has much to do with its collection. The proposed works, he says (*Question 164*), will bring in a large revenue. The revenue from the Circular Quay last year, excluding the A.S.N. Co.'s wharf, was £24,000; this year, including the A.S.N. Co.'s wharf, it will be £42,000. Each of the proposed new berths will produce a revenue of £2,510 14s. 3d., that being the average of each berth at the Quay. The large steamship companies who lease wharves at the Quay pay each an annual rent of £2,500, and, in addition to this, wharfage rates on all goods landed and shipped are collected, which increases the sum received annually to between £5,000 and £6,000. The steam ferry companies also pay annual rentals. At the same time the expense of managing the Circular Quay is apparently very small, the amount for last year, including all wages, being £1,691. Mr. Alfred Lamb endeavours in his evidence to point out that the revenue derived from the Circular Quay may be seriously affected whenever there is a return by private wharfowners to a system of giving rebates; but the fact that the private wharfowners have entered into an arrangement with the Government not to give rebates shows at least that there will be no return to a rebate system if it can be avoided, and Mr. Lamb admits (*Question 422*) that the berths at the Quay, leased to the large steamship companies, "yield very handsomely to the Government," and with regard to leased berths the question of rebates has nothing to do. The character of Mr. Powell's evidence on this point is much to the same effect. It will also be found from the evidence given by Captain Jackson (*Questions 531-533*) that when the rebate system was at its height the Circular Quay was in advance of the private wharves, for, while private wharfowners were giving from 50 to 75 per cent., the Circular Quay could maintain its position by giving only 25 per cent.; and this circumstance appears to have induced the private wharfowners to wait upon the Colonial Treasurer and get him to cease giving rebates, on condition that they also abandoned the practice. There does not appear in the evidence anything to prove that the Government would not be similarly successful in any future competition of this kind.

The evidence against the proposed improvements came principally from witnesses whose names and statements have been referred to in what has already been said; but in dealing with the subdivisions of this portion of the plan followed by the Committee in their inquiry, there are one or two points worthy of notice, and to which attention has not yet been drawn. The evidence elicited with reference to the wharfage accommodation generally, in Sydney Harbour, disclosed the fact that though there are a large number of private wharves, some of them considerably improved, the Circular Quay is the most liked, more particularly because of the ease with which goods can be conveyed to or from the wharves. But the position of the private wharves is best shown in the evidence of Mr. E. C. Batt, who, it will be remembered, appeared before the Committee as the representative of a company providing extensive wharfage accommodation at Pyrmont. Questioned as to whether he was aware before his company commenced their enterprise that there was more wharfage accommodation in the harbour than was required, he said (*Question 1071*)—"I visited all the private wharves, and judged for myself of their facilities; I found they were so many years behind the time that I would not have the slightest hesitation, if there were three times as much accommodation as at present, in going on with our proposed plan I think they are bound to go to the wall in any case. I do not wonder at people going to the Circular Quay with their ships instead of to private wharves." Mr. R. G. Vallack is unquestionably of opinion that the present wharfage accommodation here is behind the wharfage accommodation of other parts of the world.

As to whether the proposed improvements would be carried out if the Circular Quay were owned by or in the hands of private persons, the evidence of most of the unofficial witnesses goes to show that they would. Mr. Littlejohn states (*Question 572*) he is sure that if this property belonged to private individuals it would have been improved to the extent proposed long ago. Mr. S. A. Joseph is of a similar opinion; he has very little doubt (*Question 588*) that the improvements would have been made years ago. Mr. R. G. Vallack mentions (*Question 682*) that not long since a syndicate of capitalists were prepared, if they could obtain certain powers from the Government, to carry out a general system of improved wharfage accommodation for Sydney, and were ready to deposit £100,000 or £150,000 as a guarantee for the completion of the work. He says also (*Question 691*) that if the project of improving the Circular Quay were put before the public as a matter to be taken up by them in shares, the shares would be appropriated in a few days, as "the possibility of the requirements of the port, and the natural accommodation and facilities afforded by Sydney Cove, are simply incalculable." Generally, too, it is admitted that the Government being the owners of the Circular Quay, and the property being the most advantageously situated for wharfage purposes, it is their duty to improve it and make the most they can of it.

The amendment in the plan representing the improvements laid before the Committee, intended to give the necessary accommodation to the steamers of the Messageries Maritimes Co., is based chiefly upon statements made by M. Conil, principal agent of the company. His evidence is to the effect that the company are building four or five new steamers for the trade with Sydney, and that, as each of these steamers will be 500 feet long, it will be necessary to have the berthing accommodation at present used by the company's steamers extended. The plan of the proposed improvements at the Quay provided for extended accommodation at the Messageries berth, but the proposed extension, instead of being any advantage, would, according to M. Conil, be positively dangerous to the safety of the vessels, as it would not be possible for the steamers to lie for anything like their whole length close alongside the wharf. It was to do away with this difficulty that the Committee decided to recommend such an alteration in the plan of the improvements as would give the Messageries Co. the accommodation they require. The additional cost is comparatively trifling, and the company are prepared to pay an increased rental.

The Committee have agreed to the following resolution which on Thursday, 4th October, was moved by Mr. Garrard and seconded by Mr. Suttor:—

"That the Committee consider it expedient the proposed improvements to the Circular Quay be carried out, but recommend the alteration of the design of the wharf for the Messageries Maritimes Co., on the eastern side, at a cost not exceeding £5,000, as shown on the amended plan."

JOHN LACKEY,

Chairman.

Office of the Parliamentary Standing Committee on Public Works,
22nd October, 1888.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

IMPROVEMENTS TO THE CIRCULAR QUAY.

TUESDAY, 4 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

SYDNEY SMITH, Esq.

ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.

JACOB GARRARD, Esq.

The Committee proceeded to consider the proposed Improvements to the Circular Quay.

Joseph Barling, Esq., Under Secretary for Public Works, sworn and examined:—

1. *Chairman.*] Your name is Joseph Barling? Yes.
2. And you are Under Secretary for Works? Yes.
3. You have come to give us some evidence with regard to the proposed improvements to the Circular Quay? Yes.
4. What do those improvements consist of? The plan produced embraces the whole of the improvements intended to be executed under the vote taken for the Circular Quay. These improvements consist, on the western side, of arrangements for accommodating the vessels and men belonging to the Marine Board, and the boats and men belonging to the Custom House, required by reason of the necessity for the removal of the present boat-sheds on the eastern side, to make room for other works which will be described further on. These will be constructed on the land lately purchased by the Crown. It is further proposed to remove the old wooden wharf on the western side, and to construct in place thereof a roadway, to be paved with wood blocks on concrete. In front of this will be two new berths, constructed of timber, each 450 feet in length, alongside of which will be a depth of water of 27 feet at low-water spring tides. On the southern side of the quay it is proposed to construct a new jetty for the Watson's Bay and other boats, 130 feet in length and 50 feet in width, and one for the Port Jackson S.S. Company, also 130 feet in length and 50 feet in width. These two new jetties will be fronting the Circular Quay, between Elizabeth-street and Phillip-street. The present floating jetty at Phillip-street is to be removed about 75 feet to the east. On the eastern side of the quay a new wharf is being constructed 624 feet in length, and also a new dock for the horse-ferry to North Shore, at the back of which wharf will be formed, and covered with wooden blocks, a road extending from the back of the Messageries Company's Wharf to the extreme of Macquarie Point. The present Orient Company's Wharf being insufficient for the large class of vessels using it, it is proposed to lengthen it 50 feet. Mr. Tillett, Assistant Engineer, on behalf of the Acting Engineer-in-Chief for Harbours and Rivers, who is absent from Sydney to-day, will be prepared to give a detailed description of the scheme which I have briefly sketched out. Captain Hixson, President of the Marine Board, and the Harbour Master are in attendance, and will give evidence as to the necessity for the proposed improvements. Captain Jackson will follow on the same lines, and will also be prepared to give information to the Committee on the financial aspect of the question. Mr. Moir, the Clerk of Works, under the Assistant Engineer-in-charge of the Circular Quay improvements, who is also absent from town, will be in attendance to give evidence as to the dilapidated state of the western side of the quay. That is a brief outline of what we propose, and of the evidence we propose to bring before the Committee.
5. The gross sum for the carrying out of this work is £120,000? £120,000.
6. *Mr. Garrard.*] What is the present contract for the work at the P. & O. Company's Wharf? That I have left to the Engineer to deal with.
7. *Mr. Humphery.*] Have you not already let a contract for a portion of this work? Yes, we have, for wharf extension; but that was let before the Public Works Committee came into existence, the work was so urgent.
8. Do you know the amount of the contract? I think it comes to £13,000; but you will have that answer from the Engineer.
9. *Mr. Suttor.*] Is that a part of the £120,000? Yes.
10. *Mr. Garrard.*] You say that contract was let before the Public Works Committee came into existence? Yes.
11. But since the Public Works Act came into existence? I think not; but I will produce evidence on that point. I will produce the bond and see. The date of the bond was the 17th of May, 1888, and the Public Works Act was assented to on the 5th June.

J. Barling,
Esq.

4 Sept., 1888.

George Alfred Tillett, Esq., Assistant Engineer for Harbours and Rivers, sworn and examined:—

- G. A. Tillett, Esq.
4 Sept., 1888.
12. *Chairman.*] Have you the plans of the proposed Circular Quay improvements? The only plan is that which is exhibited before the Committee. That is the only plan prepared with reference to the new works.
13. Have any plans been prepared with reference to the works now being carried out? The working plans have been prepared for the most northern improvement on the eastern side of the Circular Quay.
14. And the work is being carried out under those plans? Yes.
15. You have not the detailed plans of the work to be carried out altogether under this expenditure? No; some of the plans are in progress.
16. Can you describe to the Committee the nature of the work by that plan which you exhibit to us? On the western side of the quay arrangements are proposed for the accommodation of the Marine Board. Their vessels, seven in number, will be accommodated at the jetties or under the shed represented on this plan, and their ordinary pulling-boats also.
17. *Mr. Garrard.*] Is the slip to be worked by steam-power? By steam-power. There will be a retaining wall in the direction indicated on the plan formed of concrete, and extended to what is now the Mercantile rowing-shed. Then there will be some small establishments for the accommodation of the Custom-house men and their boats. The whole of these improvements are to be erected on the land lately purchased by the Crown. There is an addition to one of the old A.S.N. Co.'s jetties marked upon the plan, but it is not intended to be carried out now, and is not included in the £120,000. Then we propose to remove the whole of the old timber wharf, as shown on the plan, and replace it by a roadway consisting of iron piers and girders carrying buckle-plates; on the buckle-plates concrete will be spread, and on the concrete wooden blocks. The wharf will be constructed of timber, and will give two berths each 450 feet in length, and there will be 27 feet of water there at low tide. By the erection of these two berths the wharf now used by the Manly Beach steamers will be destroyed, and in place of it the Manly Beach steamers will be provided with a jetty at the south extreme of the Circular Quay, and the Watson's Bay boats in another position. The present floating jetty will be moved 75 feet. There is a lengthening of the Orient Company's wharf shown on this plan, but it is not included in the present vote. The Messageries Company's wharf will also be extended. The present site of the horse-ferry to North Shore will be destroyed by the new wharf, and the new wharf and the new horse-ferry will be at the extreme north point on the eastern side of the quay.
18. *Chairman.*] That embraces the whole of the works? With the filling in of the roadway and the wooden blocking right up to the point—that embraces the whole of the works to cost the £120,000.
19. *Mr. Kethel.*] Does that wooden blocking form part of the contract now proceeding, or is it included in the vote we are now considering? Part of the vote.
20. *Mr. Garrard.*] What is the estimate of cost of the addition to the Orient Company's wharf and the A.S.N. Co.'s pier, which you say is not included in this vote? The Orient Company's wharf, £1,200; and the estimated cost of the extension to one of the A.S.N. Co.'s jetties is £1,500.
21. You are not providing any facilities at either of these big berths for the unloading of locomotive boilers, or any other goods of that kind? No, nothing in the shape of cranes.
22. Has the attention of the Department been drawn to the necessity for such a thing? Not up to the present.
23. The new wharves on the western side are, I presume, for sailing vessels? For sailing vessels.
24. They usually bring these heavy goods? Yes; but no provision has been made for that.
25. What is your opinion with regard to this—do you think it is desirable, or a necessity, that there should be facilities for the unloading of these heavy goods? It may be desirable, but it is not a necessity.
26. Have you ever witnessed the unloading from vessels of large packages, such as locomotive boilers? I have.
27. Did it not afflict your righteous soul, as a technical man, to see it? It seemed a very tedious process; but there seemed to be no absolute necessity for cranes. In addition to what I have already explained, it is intended to erect three more iron sheds exactly of the same character as those which are on the eastern side of the Circular Quay. It is proposed to erect two on the western side and one on the eastern side.
28. Is your estimate of the cost based on the contract already let for the P. & O. Co.'s work? The estimate was made before that contract was let. It is based on the cost of the Messageries and Orient Companies' wharves and from the Orient Company's wharf south.
29. Which you consider to be proper estimates on which to base the present? Yes.
30. *Mr. Suttor.*] Are the new sheds included in the estimate of £120,000? Yes; the cost of the three sheds already erected has been £3,500 each shed.
31. *Mr. Garrard.*] Can you produce the drawings and specifications of the P. & O. Company's wharf now in course of erection? I can.
32. *Chairman.*] Can you put them on the table for inspection? Yes.
33. *Mr. Kethel.*] What distance do you intend to encroach on the waters of the harbour on the western side beyond the present line of the wharf? 50 feet.
34. Outwards? Yes, from the line of the present wharf.
35. Is that along the whole length of the proposed wharf from the northern end? On the northern end, and gradually reducing it to 15 feet at the southern extremity.
36. These jetties intended for the accommodation of the Customs and the Marine Board launches and boats,—are they to be constructed of wooden piles? Wooden piles.
37. Sheathed with metal? Sheathed with copper.
38. Do I understand, in connection with the proposed berths, the piles are to be iron? No, wooden; but the roadway at the back will be formed of iron cylinders with iron girders and buckle-plates, concrete being placed on the top, and then wooden blocks.
39. What is the nature of the wall at the back of that, at the water-line; is there a wall there at present? I think there is, though it is not worthy of the name of a wall. It is simply ballast.
40. Has that not something to do with the nuisance arising at the Circular Quay—does not the sewage come down by way of the old Tank Stream and catch on this old wall? I think it is very probable.
41. *Mr. Street.*] Can you tell me what increase of berth accommodation this will give? The increased accommodation will be two berths each of 450 feet, and a berth of 624 feet.

42. That will be about 1,500 feet more berthing accommodation than at the present time? Not more than there is at the present time. There will be 600 feet more than at the present time, but there will be 900 feet of additional berthing arranged and made more convenient than at the present time.
43. You really only increase the berthing by 600 feet;—will it increase it more? It will really increase it more, because the old wharf is quite unsafe at present. It will have to be pulled down whether these berths are constructed or not. We have now been repairing it, although what has been done to it can hardly be said to have been repairing it. If a plank has broken away, we have patched it up. Last year it became a question whether we should not barricade it.
44. *Mr. Garrard.*] I suppose the arrangement on the eastern side allows you to avail yourself of the frontage better than now? This echelon plan will allow vessels to overlap each other.
45. *Mr. Kethel.*] I understand the iron cylinders with iron girders between and with a floor of wooden blocks will be somewhat similar to what the Railway Department has carried out on the Redfern bridge? Yes; in widening the tunnel there.
46. The work you contemplate in widening the roadway at the Circular Quay would be somewhat similar to that? Yes. In arriving at the estimates of that we got it in this way: A very similar work has been carried out in Bombay Harbour, the exact cost of which was £70 per square of 100 feet. Taking into consideration the rate of wages at Bombay and the rate here, we have allowed £88 per square of 100 feet.

G. A. Tillet,
Esq.
4 Sept., 1888.

Captain Francis Hixson, President of the Marine Board, sworn and examined:—

47. *Chairman.*] Your name is? Francis Hixson.
48. You are Harbour Master of the Port of Sydney? I am President of the Marine Board.
49. And as President of the Marine Board you have a good deal to do with harbour improvements? Yes.
50. Are you officially consulted with reference to proposed improvements in the harbour;—is the Marine Board officially consulted? No; the Board have no power over the construction of public works.
51. But with reference to public works of this sort, is it usual to take evidence from the Chairman or members of the Board as to the necessity of the work? No.
52. Well, that is our object now, to ask you to give some evidence with reference to the proposed work at the Circular Quay shown on this plan. It is proposed to make an expenditure of £120,000 on different works shown on this plan. Has your attention been called to these works in any way before? Yes; I have seen that plan.
53. And you are to some extent aware of the nature of the works proposed? Yes.
54. You are aware that some of the works are now in progress—that on the P. & O. Company's side of the quay? Yes.
55. And there are some works going on on the other extreme point? I do not think those works are commenced yet.
56. From the experience you have had of the work of the port, do you think that these proposed works are necessary? I think they are. We certainly require more accommodation for shipping than we have at the present time, for large steamers especially.
57. Do you think the design proposed here a desirable one? Yes; I think it is a very good design.
58. You have had considerable experience in maritime works? Yes.
59. And the vessels of the present day require more accommodation than before? Yes. The tendency of the age is to have larger vessels—to increase the length of the vessels; and, therefore, to have additional and longer wharves than we have previously been accustomed to.
60. And do you think this project, if carried out here, will give the required accommodation? I think the present proposal is utilizing the Circular Quay to the fullest extent.
61. You think it is a fair adjustment of the wharfage accommodation to the different Companies, that is, to the different classes of business to be carried on, to the different mail steamers and ferry boats, and to the ordinary mercantile vessels—you think that the accommodation is proportionately arranged? Yes; I think it is a very fair proposal.
62. With reference to the ferry accommodation, do you think the proposal will meet that? I am not so sure of that. It is to a certain extent good; but I rather object to so many big steamers being concentrated at one place. I would rather see the North Shore steamers go to the western side, and the Port Jackson Company to where the North Shore steamers are now. I think we should distribute the traffic as much as we can.
63. *Mr. Kethel.*] That is only a matter of detail, and might be arranged afterwards? Yes, altogether a matter of detail. It would not interfere with the proposal on the plan.
64. *Chairman.*] You have not made any estimate of the cost of the work—any approximate estimate, I suppose? No; that is not my province.
65. Would you think the amount proposed to be expended on these works a reasonable one? Having in view the necessity for this increased wharfage accommodation for the P. & O. Company's vessels, the Orient Co.'s vessels, the Messageries Co.'s vessels, and for sailing vessels on the western side, I think that £120,000 is not an exorbitant amount of money for so great a scheme. There is a large revenue coming in from these vessels to pay interest on such a sum, and the jetties at the head of the cove are also remunerative. I think good interest will come from money expended on Circular Quay improvements.
66. Of course the depth of water is quite sufficient to meet the requirements of vessels at the present time? Yes; the water has been deepened to a greater extent than by nature.
67. We have had it in evidence here that on the western side they have a depth of 27 feet? Yes; that is at low-water.
68. I suppose it would be the same, or deeper, on the other side? We have 27 feet at all these new wharves, you might say.
69. The water is susceptible of being dredged to any depth, I suppose, or is it a rocky bottom? Mostly rock.
70. *Mr. Kethel.*] That is on the east side? On both sides. There might be considerable patches of mud, but it is mostly rock. A good deal of it has been blasted already.
71. Have you, as President of the Marine Board, or has the Board, been consulted as to the disposal of the space on the north-west corner of the cove? I have been consulted with regard to that.

Captain F.
Hixson.
4 Sept., 1888.

- Captain
F. Hixson
4 Sept., 1888.
72. And do the arrangements meet with your approval? It is about the best that can be done for us. They are turning us away from our old place near the P. & O. Company, and what they are doing for our future accommodation will answer reasonably well.
73. Could you suggest any improvement on the general scheme proposed, so as to make it more efficient? I do not know that I could. I have always been in favour of leaving the head of the cove for passenger steamers, and the other portion for big ships.
74. Would you be in favour of moving the Mercantile rowing-shed? No; we studiously left that there.
75. Is there water enough in that little bay for your requirements? Scarcely; it will have to be dredged, and the rock will have to be blasted.
76. That is between the present A. S. N. Company's wharf and the Mercantile rowing-shed? Yes.
77. *Mr. Suttor.*] Do you think there will be any danger in the concentration of the ferry traffic to which you alluded just now? I do not think it is attended with positive danger. The steamers have to proceed at reduced speed, and I do not think danger will arise such as might arise if the boats were navigated recklessly.
78. *Mr. Garrard.*] You are of opinion that it will conduce to the safety of the public if the Port Jackson steamers are brought over to the eastern side? Certainly; if you do away with the necessity for the Manly Beach and North Shore steamers to cross each other, you do away with a certain amount of risk to the travelling public.
79. You have seen the construction of the new wharves for the Orient and the Messageries Companies,—did the way in which they were constructed meet with your approval? Yes. I think they are well constructed and serviceable wharves. I do not profess to have considered the details thoroughly.
80. Do you know whether there has been any great drawback to the wharves here owing to there being nothing on them for the lifting out of heavy weights from vessels? Very great inconvenience.
81. Do you not think it would be an improvement if there were some provision on the wharves to lift heavy weights? A very great improvement.
82. Has not every port you have known some facilities of that kind? I believe they have, but we have nothing of the sort around the Circular Quay.
83. Are you aware whether there are any facilities of the kind on the banks of the Yarra? Yes; I know they have them there.
84. At present the ships coming here have to use their own tackle for the purpose? Altogether.
85. Does that not obstruct the traffic on the wharf? Yes; and not only that, but the trouble of rigging up the purchases on the vessels is very great.
86. *Chairman.*] You could not say from your own knowledge what return these works would yield to the Treasury on the amount expended upon them? No; I could not give you an idea, but Captain Jackson will be able to give you information with regard to that.
87. Has the question ever occurred to you whether it is wise for the Government to undertake works of this description;—whether it would not be better to leave them to private enterprise—to private wharf-owners or owners of wharf-frontages? Yes; I have studied that question. We are in a peculiar position here. There is a certain amount of the foreshores here in the possession of the Government, which is utilized by the Government in making wharves, while there is also a certain amount of wharfage owned by private proprietors, and consequently there is a clashing of interest.
88. You hardly know whether, if the Government declined to provide accommodation of this sort, private proprietors would be found to undertake it? The fact is that Sydney Cove and Woolloomooloo Bay give greater accommodation than any other bays in the harbour. Shipping are anxious to go to the Circular Quay or to Woolloomooloo Bay, because of the facilities for getting their goods away, compared with the facilities on the wharves in Darling Harbour; and the expense to importers is less at the Circular Quay and at Woolloomooloo Bay than at private wharves.
89. *Mr. Garrard.*] Did you ever see a proposal to construct a jetty approximately to the point on the plan represented as you observe by the letter "Y"? Yes.
90. You do not think that a feasible proposal? I do not think, considering the ferry traffic in Sydney Cove, that it would answer.
91. *Mr. Kethel.*] In what respect do you consider there are greater facilities at the Circular Quay than at private wharves? I mean in regard to the haulage from where the goods are delivered to the places where they have to be stored in town.
92. Are you not aware that most of the private wharves in Sydney have warehouses and sheds to a greater extent than the Government have at the Circular Quay for the protection of goods? Yes; I suppose they have.
93. Then the extra facilities merchants would have at the Circular Quay would be the easy access and easy gradients—no hills to pull up, for instance? That is all I mean. I know that as a rule agents of ships are anxious to get them into the Circular Quay.
94. Since there have been weather-sheds built? Yes.

Captain Henry Pettit, Harbour Master of Sydney, sworn and examined:—

- Captain
H. Pettit.
4 Sept., 1888.
95. *Chairman.*] Your name is? Henry Pettit.
96. You are Deputy Harbour Master or Harbour Master for Sydney? Harbour Master.
97. And in the performance of the duties belonging to your office you have, I presume, often brought under your observation the necessity for increased shipping accommodation? Very often.
98. Have you been made aware of the proposed improvements at the Circular Quay? I saw the plans in Mr. Barling's room this morning.
99. You never saw them before? No, never before.
100. You have heard of the proposed works at the Circular Quay—before? Yes, I have heard of them before.
101. You have seen that plan which is exhibited here? Yes.
102. You know the proposed works represented on that plan? Yes.
103. Do you think, from your observation, that these works are necessary? I think it will be a great improvement on the present state of things.

Captain
H. Pettit.
4 Sept., 1838.

104. It will give greater facilities to commerce and to the large vessels coming here now? Yes; and instead of giving accommodation to one of the P. & O. Company's steamers it will give accommodation for two; that is, taking the present Manly Beach wharf in.

105. You have had considerable experience in maritime matters in your time? Yes, a great deal.

106. You have been in different parts of the world, I suppose? No; I am a native of the Colony. My experience has been principally in Sydney.

107. If you were asked to give an opinion as to the proposed design, would your opinion coincide with what is here proposed? I do not think you could economise space better than is shown on this plan.

108. Are you aware of the gross amount of the vote that is required or intended to be set apart for the construction of these works? No; I have not heard the amount of the vote for it.

109. Have you heard any opinion expressed by seafaring men as to the character of the improvements? No, there is such a difference of opinion on that matter on the part of nautical men as to what is the best to do; but really my own experience here with regard to the class of vessels coming shows that the wharves which would have been suitable twenty years ago would not suit them at all now. They want considerable frontage and room; and in-and-out berths, such as the A.S.N. Company's old wharves, would not be suitable for the long ships coming here now with hatches so spread out as they are to take in cargo. A long frontage, such as is proposed in these improvements, gives them an opportunity for discharging and taking in cargo at one time.

110. Then by this plan they could go on loading at one hatch and unloading from another? Yes; in the space these two new berths would give most of the discharging hatches of the steamers would come in and could be worked. There are some boats that have their saloons amidships and the discharging hatches fore and aft. It would be awkward for them. You would have to put them to the longest jetties; but still the plan proposed would give the best accommodation. Then for sailing vessels you could accommodate four large ships, having them stern to stern. You might have four sailing ships bringing a London cargo, or two large steamers.

111. *Mr. Kethel.*] Are you aware that the new berth which is being formed on the north-east corner of the quay is to be 624 feet in length? Yes.

112. Do you not think that it is too long for one ship, and that such a length could be better utilized;—are there any steamers coming here upwards of 600 feet in length? The present steamers coming here run to 500 feet, but they do not want the whole of their ship to be accommodated. Certainly it is a long space to be taken up on the side of the quay. Still I do not see how you could make two berths of it for that class of steamers; and that particular berth is rather an exposed one. There is a tide there, and with a strong westerly gale it is a lee shore, and you get the whole force of the tide.

113. And you think by having that extra length you can keep the ship sufficiently into the southward to keep her out of the tide, and somewhat out of the wind? Yes.

114. *Mr. Garrard.*] I suppose some of that extreme length is to give a site for the horse-ferryboats? Yes; the northern end forms a dock. Then there is a portion of the wharf there which is to be utilized for the Messageries' boats, and that company talks of sending boats here over 500 feet in length.

115. What is their length now? About 430 or 440 feet long.

116. And you understand that they are building boats 500 feet? The captains have told me that the company is building boats of 500 feet.

117. So it will be absolutely necessary to have extra space for them? In that new berth they will have about 500 feet. It will give them a full 500 feet, without interfering with the lower berth.

118. The berths on the western side are probably for sailing vessels? They can be applied to either one or the other—sailing vessels or steamers.

119. Has your attention ever been directed to the want of appliances for unloading heavy weights, such as locomotives, from vessels at the Circular Quay? There are no appliances for that. Vessels are obliged to put up a derrick.

120. Which occupies a considerable time, and interrupts traffic on the wharf? Very often.

121. Do you think that, if proper appliances for unloading heavy weights were put there, it would be a very great facility? I think so. We used to have to employ an anchor and a good strong rope to guy the locomotive from the ship, and then lower away on tackles to get them off.

122. I suppose you entirely agree with bringing the Port Jackson Company from the western side of the quay to the eastern? I think there will not be so much crossing.

123. You mean that, for the traffic going down the harbour, the berthing accommodation should be on the eastern side? I think so. It keeps the outgoing boat on the proper side and the incoming boat on hers.

124. *Mr. Kethel.*] And you approve of the general arrangements for these improvements;—can you suggest any alteration in the design which you think would be an improvement, to assist in the berthing and navigation and general commerce of the quay? The present plan, I think, will accommodate the present class of vessels coming to the port, and will facilitate their operations.

125. You cannot suggest anything better? I could not suggest anything better. Of course you know in-and-out jetties would give a greater amount of accommodation than is provided by giving vessels breast frontages.

126. Would not the application of that principle give you a couple more berths? Yes, you could certainly make more berths; but whether, by adopting the saw-tooth principle, you could accommodate the number of hatches which are in the vessels we have now is another matter. It is such a different thing from the old class of vessels of some twenty years ago.

127. *Mr. Garrard.*] Do you not think that taking the horse-ferry boats so far out to the point, subject to the tide and to the north-easters, will render it difficult for them to make the dock? No doubt it is a very exposed place, and you are subject to the tide, and then the sewer empties there.

128. Do you not think if the dock were brought further into the cove it would be safer for the vessels and for the ordinary traffic? Well, by a mechanical contrivance, and by the end of the proposed wharf projecting, they might be given some protection, but it is certainly not a nice place for them.

129. *Chairman.*] There is hardly any alternative is there? No. This plan utilizes the space.

130. And then it is nearest to the point where the service is carried on at the other side of the water? Yes. No doubt by putting out good substantial jetties, well fended and protected, the boats could get in, but they will have to be worked very handily there. It is the one bad place we have in the harbour.

- Captain
H. Pettit.
4 Sept., 1888.
131. *Mr. Garrard.*] In fact, between Fort Macquarie and Kirribilli is one of the narrowest and most dangerous parts in our harbour? Yes.
132. And, therefore, to decrease the width increases the danger? Yes; but this does not decrease the width.
133. What is the length of these horse-ferry boats? The Binalong, the last new one, must be a vessel of over 120 feet. She is a very large boat, with great beam.
134. Therefore, if the dock is only 60 feet long, she will be projecting out for 50 or 60 feet? Well she is over 100 feet in length.
135. *Mr. Kethel.*] I understand that there is a shoal extending out at that point to the tinted line shown on the plan, and all vessels in the fair-way will have to keep out beyond that? Yes. I think the horse-boats will be within what is known as the buoy.
136. And no ocean-going vessel comes within that buoy? No.
137. Do you know the distance between the buoy and the retaining-wall? I should say 70 or 80 feet.
138. Do you remember how this wall was built, how far the reef of rocks extended, or was the wall built as far as the reef of rocks extended? The foundation-stones of the retaining-wall were laid at dead low water, spring tides, and any inequalities in the rocks were filled up with concrete or other substantial matter. The reef of rocks extends from low-water-mark about 60 feet, varying in places.
139. So that the fair-way of the harbour has never been further off than now, in consequence of the rocks? There has been nothing added to, or taken away from, the width of the harbour there.
140. Has the effect of the sewer emptying there been to fill up the harbour at that point? No doubt there has been a lot of silt deposited from the sewer there.
141. *Chairman.*] Is that sewer taken out at all into the harbour? About 50 feet, and it is supposed that the scour takes the stuff away.
142. The sewer was originally emptied near the bank? Yes, until the larger sewer was carried out.
143. *Mr. Kethel.*] Then this wharf will not encroach on the navigable waters of the harbour, nor, when the stern of a boat projects, will it interfere with any vessel in the fair-way? I do not think so; but if you had two colliers discharging coal outside a big steamer there it would make a perceptible difference in the width.
144. But otherwise there would be no difference in the fair-way of the harbour? No.
145. *Mr. Garrard.*] Vessels coming up the harbour have no business on this side, have they; they should be on the other side? Yes.
146. Vessels going outside keep on this side? Yes.
147. *Mr. Kethel.*] But vessels beating against a westerly wind keep on both sides? Yes, they do.

Captain John Jackson, Manager of the Public Wharves at Sydney, sworn and examined:—

- Captain
J. Jackson.
4 Sept., 1888.
148. *Chairman.*] Your name is John Jackson? Yes.
149. You are Manager of the Public Wharves at Sydney? Yes.
150. Have you given any attention to the proposed improvements at the Circular Quay? I have.
151. Have you seen any detailed plans of the proposed changes and improvements? Yes.
152. Have you seen the plan exhibited here? Yes.
153. You know the nature of the accommodation proposed to be supplied? I do.
154. And do you think it will meet the requirements of the trade? Yes.
155. You think it is of such a character as will be required? Yes. There is one portion of it which I am not in favour of. I think the ferry jetties might be slightly altered.
156. The way in which the ferry accommodation is proposed you do not quite agree with? No.
157. Do you think when the large wharves are constructed they will give the accommodation required here? The Circular Quay will not give sufficient accommodation; you never can make it give sufficient accommodation.
158. This is intended, is it not, more for the mail boats and the Messageries boats? Yes.
159. According to the design of the works to be carried out, are they of such a character that you concur in them? I do.
160. Some reference has been made to the difficulties experienced by commercial people in loading and unloading large vessels;—are there at the Circular Quay the modern appliances for loading and unloading? No.
161. And that is not included in any of these proposals? No.
162. Do you know the reason why? Well, only that ships prefer using their own tackle, and large steamers have their own cranes.
163. Then permanent cranes would be of no use? Perfectly useless.
164. Have you made any approximate estimate of the cost of these works? I do not know whether the estimated cost is reasonable or not, but I know the works will bring in a large revenue.
165. Have you made any calculation as to what the revenue is likely to be? Yes.
166. You know the gross cost of the works? Yes, and I can give you the revenue for the years 1887 and 1888.
167. Will you state it please under the different heads? Including the Circular Quay as it is at present, and excluding the A.S.N. Co.'s Wharf, the revenue from the Quay for 1887 was £24,000. That is from the north-east end of the wharf to the southern end of the late A.S.N. Co.'s Wharf. And the amount for this present year, including the A.S.N. Co.'s Wharf, will be £42,000.
168. That is estimated on the receipts up to the present time? The actual revenue received up to the 30th June, and paid into the Treasury, was £22,000, and the latter part of the year is always better than the former, because of the busier time.
169. Are there any other items you wish to give to the Committee? No.
170. That embraces the whole? Yes.
171. You come a good deal into contact with shipping people, do you not? Yes.
172. You have heard them complain of a want of accommodation? Yes.
173. And do they seem to concur in the opinion that what is now proposed will be sufficient for them? Well, formerly, they had so little accommodation that they were glad of any they could get.

174. But do they seem to think that the works proposed now will meet their requirements? Yes.
175. Have you heard any adverse opinions expressed by any of the commanders of ships, or by commercial men? No.
176. And you think that, on the whole, the proposed improvements and accommodation are desirable, and the best that can be provided? I do.
177. Have you heard anything said about the Government not permitting somebody else to provide this accommodation? No.
178. *Mr. Sydney Smith.*] You have mentioned that you do not approve of the arrangements for the ferry-boats? Yes.
179. In what way do you not approve of them? I do not approve of the Watson's Bay boats being so far over. That is in the arrangements only. I think they ought to go to the Point—to Macquarie Point or to Dawes' Point. I think the traffic will increase so much that they will have to go to the Point.
180. Does that refer to all the ferry-boats? The ferry-boats that go to Manly and other places.
181. In making your estimate of the revenue, you stated that the amount for 1888, based on the revenue to the end of June, would be £42,000; have you made any estimate of the revenue to be derived from the additional accommodation? I reckon that each berth which will be provided will give £2,510 14s. 3d. That is the average of each berth on the Circular Quay.
182. That will give a total revenue of how much? About £42,000.
183. I am speaking of the additional revenue? You would not get much additional revenue from the western side.
184. *Mr. Garrard.*] You said, in answer to the Chairman just now, that the large modern steamships have steam appliances of their own for lifting heavy weights out of their holds? Yes.
185. What are those appliances usually capable of lifting? About 5 or 6 tons. I do not think more.
186. Have you ever seen locomotive boilers, or any weight of 20 or 30 tons, come out of these steamships? No; such large weights come by sailing vessels.
187. How are they got out of vessels? By derricks.
188. A very cumbersome proceeding? Yes.
189. Do you not think it would be a great convenience if facilities for unloading heavy weights were provided at the Circular Quay? I think it would be if one berth were set apart for them.
190. Have you been to Melbourne lately—since that large crane was erected on the Yarra bank? I was there when it was erected.
191. And you think an appliance of that kind would be of advantage here? I do.
192. *Mr. Kethel.*] How many steamers of the P. & O. Company or the Messageries Company come here in the year? Thirteen from the P. & O. Company.*
193. How much wharfage do you collect from each of them per trip? They vary.
194. Inward and outward together? About £200.
195. Do you collect wharfage on all the goods? Yes.
196. Do you charge the Company for "laying" days when loading outwards? No; they pay £2,500 in lieu of tonnage dues, and then I collect all the wharfage.
197. On all the goods landed and shipped? Just so. That amounts in the case of the P. & O. Co. to about £5,500 a year.
198. So that actually these large berths to be devoted to the ocean mail steamers would, instead of the £2,500 that you have quoted as the average revenue, bring you in a revenue each of £5,500? Fully that.
199. What is the expense of managing the Circular Quay in the matter of wages and repairs? Repairs I am not able to give you.
200. In management? In 1887, £1,691. That includes all wages.
201. And there would be a slight outlay for staging? No; that is the whole of it.
202. *Mr. Sydney Smith.*] What portion of this charge would be for the P. & O. Co.'s berth? I could not distribute it among the berths. It is for the thirteen berths at the quay. We have just as much to do with the Messageries as with the P. & O., or as with any other berth at the Quay.
203. Do you know the amount of the contract for the work that is to be carried out for the P. & O. Co.? I think I saw it in the paper as about £13,000, including the ferry dock.
204. By the erection of that wharf you will get an additional £2,500 a year? You will get about £6,000 for the wharf, including the horse ferry.
205. *Mr. Kethel.*] Have you ever found any difficulty in berthing vessels alongside the wharf by reason of a want of water;—is there ample water for berthing ships? There is plenty of water at all the berths except that opposite the Custom-house, where there is a rock.
206. And that in the new arrangements will not be used for berths? No.
207. It is intended to put the passenger jetties there? It is the only thing it is fit for.
208. *Mr. Street.*] Do you think the projection at the southern end of the proposed P. & O. Co.'s Wharf will be any hindrance to the navigation of the harbour? No.
209. It was said by a former witness that a collier lying outside a steamer there might interfere with the navigation? I do not think it would.

*NOTE (on revision):—The number is twenty-six.

TUESDAY, 11 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. WILLIAM HENRY SUTOR.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

SYDNEY SMITH, Esq.

ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.

JACOB GARRARD, Esq.

The Committee further considered the proposed Improvements to the Circular Quay.

Mr. A. Moir.

Mr. Angus Moir, Clerk of Works at Circular Quay, sworn and examined:—

11 Sept., 1888.

210. *Chairman.*] Are you Clerk of Works in charge of the improvements now being made at Circular Quay? Yes.
211. Describe the nature of the improvements that are being carried out under your supervision? There is a wharf being constructed on the eastern side, where the Peninsular and Oriental boats are to be berthed.
212. Any other work besides that? Nothing at present.
213. Is it proposed to change the ferry wharves? Yes, I believe it is.
214. Is nothing being done on the western side of the quay now? Nothing since a shed was put up for the Peninsular and Oriental Company at its present wharf.
215. Is any work going on at the north-west side for the Marine Board? There is nothing going on there at present.
216. Is it proposed to make improvements there as well? Yes; I believe it is.
217. From your knowledge of the requirements of the trade, are you of opinion that the works proposed are essential? I think they are very essential. The old wharf is completely gone underneath.
218. Are the steamers coming here now much larger, and do they consequently require more space? Yes.
219. Are these works intended, among other things, to provide for that? Yes. When the improvements are made, the accommodation will answer very well.
220. What length of ship will this new wharf accommodate? A ship 525 feet long.
221. What will be the depth of water at low tide? With a little dredging we can easily get 30 feet.
222. What is the depth now? Where the P. & O. boats lie now there is about 28 feet at low-water.
223. How long have you occupied the position of Clerk of Works? Nine years last June.
224. During that time, have you seen the strides made by our trade and commerce? Yes.
225. Are you aware that there is a necessity for increased accommodation? Yes; we do want more accommodation.
226. As Clerk of Works, are your duties confined to carrying out the works, apart from designing them? Yes.
227. Have you merely to see that certain works are carried out according to the plans submitted to you? Yes.
228. *Mr. Kethel.*] What class of work are you carrying out on the eastern side where the wharf is being constructed—piles or stone? Piles.
229. Is it your opinion that such work is just as suitable for the purpose as an iron wharf with cylinders. Have you any experience as to the duration or cost of iron wharves? There is no doubt that an iron wharf would stand the longest.
230. How long, in your opinion, will a well-built wooden wharf last, under reasonable circumstances, if it is built as you are building this one, the piles being protected with sheathing? I should say fifty years.
231. Have you had any experience in the construction of iron wharves, on cylinders filled with concrete, similar to that at the head of Darling Harbour? I have had no experience, except with regard to the wharf you have just mentioned.
232. Do you know anything of the cost of constructing stone wharves, as contrasted with wooden wharves? Stone wharves cost about six times as much as wooden wharves.
233. Do you mean freestone? Yes.
234. If they were constructed of granite, would the cost be still higher? Yes.
235. So that, under the circumstances, is it your opinion, as a practical man, that we are justified in constructing these wooden wharves with driven piles, instead of carrying out more expensive, although more durable, works in iron or stone? I believe that if the piles were coppered right up to the heads, and even on the heads, it would make a great difference in the length of time they would last, because the piles generally go between the caps and high-water. I had experience of that in connection with the piles at Pymont Bridge six months ago. The piles were as good under water as they were the day they were put in.
236. Were they not attacked by the *teredo navalis*? No; the sewage kills that insect.
237. Were the piles protected with metal sheathing? Yes, up to high-water.
238. Where the metal sheathing was intact, even if the water was not filled with ammonia from the sewage, could the *teredo* get at the piles? On a great many of the piles the metal was torn away.
239. *Mr. Street.*] You have spoken of the unsafe condition of the western side of the wharf,—can you explain in what way it is unsafe, and whether it is absolutely necessary that some alterations should be made? All the girders are destroyed by the white ant, except the new girders, which have been put in from time to time.
240. In your opinion, is it absolutely necessary that something should be done to render that wharf safe? Yes. I have many times wondered that it has stood so long.
241. *Mr. Garrard.*] What timber was used in the wharf on the western side? Ironbark.
242. What timber are you now using on the eastern side? Ironbark.
243. Do you adopt any means to protect the timber from the white ant? Where there are any cracks or strains, we use carbolic oil.
244. What contracts are now let? Only for the woodwork.
245. Is the inner wharf stone or concrete? The contract now going on is only for the piles. 246.

246. What is the total cost? £13,000.

247. Are tenders invited for the inner portion? Not that I am aware of.

248. Of what do you purpose making the retaining wall? I do not think there is anything decided. I expect it will be of concrete. Mr.
A. Moir.
11 Sept., 1888.

249. Is it not strange to begin business by accepting a tender for the outside work before accepting one for the inner work? The boat-shed is in the way at present.

250. Do you anticipate that the outer work—the piling and planking—will be finished before the inner work? Yes.

251. How long has this contract been let? About four months.

252. What is the time for completion? Nine months.

253. Is the contractor well on with his work for the time he has had it in hand? He has only got the concrete in for the ferry-landing, and he has six piles in one place and twelve in another.

254. Is it possible for him to finish the work in nine months? I think so.

255. Is there any penalty attached to the contract? I think so.

256. *Mr. Kethel.*] Have you to supervise several other contracts besides this in course of construction in the harbour? Yes.

257. Especially the large works in Darling Harbour? Yes; I devote a large portion of my time to those works. I am only occasionally at the Circular Quay.

258. *Mr. Suttor.*] Is the old wharf built on piles? Yes.

259. What length are they? I can hardly tell; they are all covered with metal.

260. Are they standing well? Some are, and others are not. I have no idea how long they have been down.

261. Are the greater number of the piles in the old wharf quite sound? A good many of them are sound and a good many are bad. Some of them have been taken out.

Captain Thomas Summerbell, Traffic Manager of the North Shore Steam Ferry Company, sworn and examined:—

262. *Chairman.*] Are you Traffic Manager of the North Shore Steam Ferry Company? Yes; I have filled that position for about ten years. Capt. T.
Summerbell
11 Sept., 1888.

263. During that time, have you seen and been made aware of the increased demand for accommodation at the Circular Quay? Yes.

264. Have you felt the pressure very much, so far as your company is concerned? Yes; I have felt it a good deal from time to time.

265. Have you had additional accommodation given to you at various times? I think it is six or seven years since we have had additional accommodation given to us. That is at the head of the cove. Of course the Government are doing great things for us on the eastern side.

266. Do the Government propose to move your jetty? I think they propose to move the Watson's Bay and Manly Beach steamers.

267. Are you aware generally of the design proposed to be carried out by the Government in making these improvements? I have a pretty fair idea.

268. In your experience in connection with the duties of your office, have you been impressed at various times with the necessity for increased accommodation for ocean-going steamers? Very often; I have thought that there ought to be more accommodation for ocean-going steamers.

269. Do you think the accommodation now proposed to be given by the Government will meet the requirements of the trade? I think so. I have carefully noted the reports, and I have seen the plans, and I understand generally what is going to be done. I think the proposed improvements will answer everything that is wanted for many years, that is, so far as the berthing of ships is concerned.

270. Reference has been made to the difference between stone-work and ordinary pile-work;—as a practical man, which do you think it is most desirable for the Government to adopt? Speaking from my own experience, if the water were shallow, of course I would like stone-work. We have adopted that ourselves on our own property. But when there is any depth of water piles carried out in a good substantial manner are cheaper and much quicker; if there are 3 or 4 fathoms of water I should think there would be no objection to piles.

271. How long have the present piles been down at the Circular Quay? I cannot remember with regard to the Circular Quay, but I remember piles being driven in an old wharf which stood for forty years; except a few of them, they were as good as on the first day they were put in; they were ironbark. Turpentine was not used at that time.

272. Do you know the depth of the water in front of these wharves at low tide? At the P. & O. Company's wharf I should say there is about 28 or 30 feet of water.

273. Is that sufficient for present requirements? I think so. It would be a very large vessel that would draw 30 feet.

274. Are there not very large steamers coming here now? Yes.

275. What do they draw? They draw 26 and 27 feet, according to their water-marks.

276. As far as the trade connected with your jetty is concerned, do you think there will be sufficient convenience for carrying it on? I do not think so.

277. Will that not be the case under the proposed new arrangements? As far as I can understand the present proposals, there is to be no alteration in our jetties; that is to say, we are going to remain where we are, and no additions or improvements are to be made.

278. No increased accommodation? No.

279. The only alteration so far as the jetties are concerned will be the removal of the Watson's Bay jetty and the Manly Beach boats? Yes; they will be carried round to the east of us.

280. Does that become necessary through the extension of the wharf on the western side of the cove? Yes. I would like to say in passing that the ferry accommodation is entirely inadequate.

281. *Mr. Suttor.*] Do you think that the proposed works are an improvement on the old accommodation? The shifting of the Watson's Bay and Manly boats to the east is a very great improvement. I would, however, draw attention to the fact that the ferry steamers always will cross each other coming in and going out.

Capt. T.
Summerbell.
11 Sept., 1888.

282. Is there more liability to danger under the new plan? The danger is minimised, no doubt. The Chairman asked me about the accommodation at our jetties; it is entirely inadequate. No. 5 jetty was built five years ago for our boats, but the population has increased two or three fold since then, and our vessels are very much larger. Then we have only half of No. 4 jetty. I am largely interested there. There is very good accommodation for the shipping, but the passenger accommodation is very limited.
283. *Mr. Garrard.*] Is it not the fact that only the Neutral Bay and Mossman's Bay steamers will cross the other steamers? Yes.
284. Will not the ordinary traffic to Milson's Point and Lavender Bay be quite clear? Yes.
285. Do you think it is an improvement to shift the horse-ferry steamers? To answer that question conscientiously I must say it is not; still, what is now being made will answer every purpose. Mr. Darley invited me to his office twice to view the plans, and I offered one or two suggestions, and excellent accommodation is provided. We have got everything we can desire at that place.
286. What is the length of the boats you use there? 130 feet.
287. Will not the extreme end of the boat project into the channel? No.
288. Will it not be very difficult for your boat to make that dock in a strong north-west wind? I do not think so. I shall be extremely blamable if it is so, because the Department honored me by accepting a few suggestions, and I entirely approved of Mr. Darley's plan. I do not anticipate any difficulty.
289. Do you think there is any necessity for so long a berth for one vessel at the new P. and O. Co.'s wharf as is shown on the plan? It seems to me a very great length.
290. If it were possible to reduce it and to bring your dock further in, would it be better? There is no doubt it would be better; but we thought this plan got over all difficulty.
291. *Mr. Kethel.*] I understood you to say that in consequence of the increase in your traffic, and the increase in the size of your vessels, your jetty accommodation is inadequate? Quite so.
292. In what respect would you require that jetty to be altered to meet the increasing demands of your trade? In the length. It is divided into three parts; 40 feet for waiting-rooms, 40 feet for the platform, and 20 feet sloping. The vessels are 130 long, so that the length of the jetty is not sufficient. The stage is sometimes at an angle of 45 degrees, sometimes level, and sometimes it is the reverse way. If we had a floating pontoon there to lengthen the jetty it would get over all the difficulty. Sometimes the time taken up in waiting and screwing a vessel in and out is equal to the time taken in the transit across the harbour.
293. Do I understand you to say that a floating pontoon attached to the end of the jetty would meet all your requirements without carrying out the solid structure to any greater length than at present? That would be a very great improvement.
294. What rent do you pay to the Government for your jetty? £600 a year.
295. I presume that in asking for this additional accommodation you would be prepared to pay a fair amount of extra rent? Yes. I would be very glad to pay for the whole of the other jetty if the Department would let us have it. Then for berthing vessels we should have fender piles, which would greatly assist a vessel coming alongside.
296. How many would you propose to have there? For long vessels like ours we should have at least four.
297. Are not fender piles provided in various parts of the harbour where harbour steamers are berthed? Yes. Balmain has them.
298. Have you commanded ocean-going vessels? Coasting steamers.
299. You are, therefore, familiar with the entrance to our harbour. What is the depth of water on the shoal in the western channel abreast of the Sow and Pigs? I cannot recollect.
300. Questions have been put to other witnesses as to the depth of water alongside the wharves. Do you think the depth of water at the wharves is quite sufficient for any ocean steamers that can enter the port? I cannot recollect the depth of water at the place you have just referred to, but I think it used to be 27 feet or 28 feet. It has been very much deepened since I have been on the coast. The eastern channel has been dredged out.
301. On one or two occasions have ships of war had to wait at the Heads until the tide flowed in order to cross those shoaly places? I have understood such to be the case.
302. Is it your opinion that the depth of water that will exist alongside the berths for large ships at the Circular Quay will be sufficient for any vessel that can cross the shoal at the entrance to the harbour? I can hardly answer that, because I know that a great deal of dredging has been going on of late years. The eastern channel I know has been deepened; but I have not been outside the Heads three times since I have been in the Company's service.

George Skelton Yuill, Esq., Manager of the Orient Steamship Company, sworn and examined:—

- G. S. Yuill,
Esq.
11 Sept., 1888.
303. *Chairman.*] Are you the Manager of the Orient Steamship Company? Yes.
304. Have you had a great deal of experience of the want of accommodation at Circular Quay? Yes; we have suffered, but we have had nothing much to complain of lately.
305. Is additional accommodation now proposed to be provided? Yes; it is proposed to add a small piece to our wharf; it has been our complaint that our wharf is too short.
306. Did you find that to be prejudicial to the proper working of the Company's boats? Yes.
307. How long have your boats been trading here? I think we first came here in 1878.
308. Have you ever found any difficulty from an insufficient depth of water? Yes; not at our present wharf, but where the P. & O. Company's boats now lie, we touched twice.
309. Has that place been since deepened? Yes.
310. Is the place where you are now deep enough for practical purposes? Yes; it is a rocky bottom where we are now.
311. Have you any knowledge of the general tendency of the designs proposed by the Government, for the improvements at the Circular Quay? Nothing beyond what I have seen on the plan.
312. Have you formed any opinion as to the necessity for those improvements? The improvements, so far as the eastern side is concerned, seem to be very desirable. It is desirable that the mail steamers should be berthed at the Circular Quay if possible.
313. Have you had much to do with the construction of wharves? Not very much.
314. Would you be prepared to offer any opinion as to whether it would be better or more economical in the long run to build stone wharves or wharves on piles? Of course you must have the front of piles. You could not moor to a stone wall.
315. Will piles last a long time if the work is properly done? I think so. 316.

316. Have you suffered inconvenience in working your vessels, owing to a want of depth of water in any other part of the harbour? This is the only wharf in Sydney Harbour where our vessels could lie with safety. I refer to our present wharf, just opposite to where the P. & O. Company's boats now lie.
317. There are no private wharves giving such accommodation? No.
318. Have private wharves the necessary depth? There is a new wharf being made which will have the required depth.
319. Have you had any offer from private proprietors to give you accommodation? Yes.
320. What do you pay to the Government now for the use of your wharf? £2,500 a year.
321. Is that the rental you have been paying? Yes; but we get no wharfages. The Government get the wharfages besides, which makes the yield £3,000 or £4,000 a year.
322. Would you pay any more for additional accommodation? I do not think we could be asked to pay any more rent. We consider it a very high rent at present.
323. *Mr. Kethel.*] What is the average draught of water by your steamers with the hold full of cargo, and the bunkers full of coal? The largest vessels draw about 26 feet 6 inches.
324. Have your captains always been able to come up and down the harbour at all times, without being detained on account of insufficient depth of water? I do not think they have ever been stopped, but I cannot say exactly.
325. In the changes which have taken place of late years, have the steamers increased their draught of water, or has the change principally been an increase of length? The change has principally been in the length of the vessels. The new steamers draw a little more water than the old ones, but not in proportion to their extra length. Of course there is a great difference between a steamer discharging cargo alongside a wharf, and a steamer going along a channel or entering a port. She can go along on an even keel, or she can go in on a high tide; but when she is discharging cargo, as the cargo is taken out, her engines may put her down 4 or 5 feet astern.
326. Will the addition now proposed to be made to your wharf be sufficient for the requirements of your trade for some years to come? It is still too short.
327. How many hatches do your ships work? Three.
328. What distance are they apart? I think they vary from about 40 feet.
329. It is not your desire that the wharf should extend as far as the ship's bow, but all that you desire is to have the wharf where your farthest gangway is? That is one point; but it is rather dangerous to have too much of a ship's side exposed to a "southerly burster."
330. Do not your vessels lie nearly north and south? We lie about north-east.
331. Is your berth the shortest of the three? Yes; it is much the shortest.
332. Would you prefer to have it a little longer? Yes; it would be very much safer for the ships.
333. *Mr. Garrard.*] Do you prefer the eastern to the western side? Yes.
334. What is the length of your longest vessel? About 485 feet, I think.
335. And you have a 450-foot berth? No; 350 feet.
336. Do you think there is too much of your vessel projecting over the end of the wharf if the wind comes broadside on? Yes; the vessel might easily be torn away from her moorings.
337. In view of the advantages which you think would accrue from having a longer wharf, would you be prepared to pay an increased rent? We pay exactly as much as the Messageries Maritimes Co. do, although they have 480 feet of wharf and we have only 350 feet.
338. Do you not occupy a better position, and have they not to employ a tug? We have always to employ a tug.
339. Is that necessary? Yes. We would be very glad to have the Messageries Maritimes Co.'s berth instead of our present one.
340. Do you think that a small increase of 50 feet should be made on your wharf? I think it is most desirable. I think the vessels are in a dangerous position at present.
341. Has that increase been promised to you? There is nothing in the shape of a promise, but it has been proposed or suggested. We think it is not enough. I think if 50 feet were added to each end it would be enough.
342. Do you think there is a tendency to build still larger vessels? Yes.
343. Do you think their draught of water will increase very much? No. The tendency of the day is to follow the American style, which is to make big steamers, increasing their length.
344. Are not your vessels almost of the American size? No.
345. What is the size of your largest vessel? 6,500 tons. The American vessels are now close on 10,000 tons.
346. Do you know their draught of water? They draw more than ours; I think their largest vessel draws about 27 feet 6 inches.
347. *Mr. Kethel.*] When you speak of American vessels do you refer to the trans-Atlantic steamers? Yes.
348. *Mr. Sydney Smith.*] What is the length of the American vessels you refer to? I think the largest vessel is 520 feet long.
349. And your largest vessel is 485 feet? Yes.

Alfred Lamb, Esq., merchant and wharfowner, sworn and examined:—

350. *Chairman.*] Have you been engaged in commercial pursuits in Sydney for some years? Yes; more particularly in the shipping trade.
351. Are you the owner of a large wharf near Miller's Point? Yes; I have been a wharfowner in the neighbourhood of Miller's Point for the last twenty years.
352. Have you had a great deal of experience as to the accommodation necessary to be provided? Yes; I think I have had as much experience as most people.
353. Have you given any attention to the proposed improvements at the Circular Quay? This is the first time I have seen the plan. I have heard of the proposed extension on the eastern side, sweeping away the Government boat-sheds; I heard of that extension being proceeded with, but I did not know of any proposed extension on the western side until I saw this plan.
354. It is proposed to enlarge the steamers' berths on the western side also, and to remove some of the ferry jetties to the south-eastern side;—do you think that project is necessary? I think that any project

G. S. Yuill,
Esq.
11 Sept., 1888.

A. Lamb,
Esq.
11 Sept., 1888.

A. Lamb,
Esq.
11 Sept., 1888.

to increase the safety of the ferry traffic is advisable, but so far as the further extension of wharfage for commercial purposes is concerned, I certainly think it is going a little beyond the times. There will be ample wharf accommodation for mercantile purposes when the P. & O. Co.'s wharf is built for some time to come, because I know that for eight or nine months in the year the present wharves, private and Government, are not half supplied with shipping.

355. Supposing this accommodation were not provided by the Government, do you think that private wharfowners could supply the necessary accommodation for the shipping? I am perfectly certain that private wharfowners are prepared to do more than they are allowed to do. There is so much restriction placed upon the private wharfowners that they are not allowed to provide as much accommodation as they would like to. That has been my experience for twenty years. I built the first wharf round by the battery, and the trouble about putting that out was lamentable. It was the first wharf on piles in that part of the harbour,* and there was no end of difficulty about it; and the difficulty has not lessened. The private wharf-owners would give far more facilities, and they are prepared to do so, if they could get the same privileges as the Government are prepared to exercise themselves. They are not prepared to extend the same privileges to private owners.

356. In whose discretion rests the power of giving authority to extend jetties into the harbour or to improve wharf accommodation? The Minister for Lands under the direction of the Harbours and Rivers Department.

357. There is a joint authority? Yes.

358. Have you to obtain the concurrence of those officials before you can make improvements or extension? Yes; and pay a very heavy annual rent for the privilege.

359. Is this authority regularly exercised by the functionaries to whom you allude? Well, it is hard to say. Sometimes certain people get it, while others do not. It seems to be somewhat irregular.

360. Has it struck you that the traffic has been impeded in places by the injudicious construction of wharves? Up to the present I do not think that is the case except in one direction. Near Pymont Bridge a wharf seems to come out a tremendous distance—about 300 feet, I think. It is a private wharf on the eastern side erected by M'Ilwraith and M'Eachern. It has surprised everybody. If other wharves were run out to the same extent there would be considerable obstruction to the Government's own wharf.

361. In the opinion of commercial men are the Government constructing works which ought to be left to private enterprise? I think people are a good deal divided in opinion. Some people are always glad to see the Government spending money which will give them accommodation at no cost to themselves. On the other hand people who see Government expenditure here, there, and everywhere are of opinion that the Government do interfere with private enterprise. That applies to wharfage extension. Being a wharf-owner and particularly connected with the whole of the private wharves as Chairman of the Wharves Association, I am bound to know that our wharves are almost empty for more than half the year. That makes us feel that wharfage accommodation is superabundant.

362. Have you heard what is the estimated cost of these improvements? No; but I have seen a report in one of the papers.

363. The estimate is £120,000? I thought that applied to the extension on the eastern side for the P. & O. Company.

364. It includes the whole of the works on the eastern and western sides, the removal of these ferry services, and the improvements for the Marine Board? No doubt an expenditure for such a purpose as the wharf for the P. & O. Co., is quite justifiable because an income is assured before the work is constructed. The P. & O. Co., and the Orient Company require special accommodation. But even if it is true that, as Mr. Yuill says, the probability is that the companies will go in for building steamers after the American style, that only applies to the passenger traffic, and those enormous passenger steamers are not likely to come in eight or ten times a month, so that there is no necessity for more accommodation than is now being given. When the P. & O. Co. go to their new berth there will be further accommodation open on the western side.

365. *Mr. Suttor.*] We have heard that the wharf on the western side is very much decayed, and that it is absolutely necessary to restore it. Would it be better to restore that wharf in its present place or to make additions? I think any expenditure now to make the wharves more substantial in their present shape would be judicious expenditure, whereas the other expenditure to my mind is extravagant expenditure. There is no actual necessity for extended wharfage.

366. Do you think private wharfowners would be able to provide wharfage accommodation for very large vessels which come here? As a matter of fact, a very large private wharf is in contemplation. I know a very great effort is being made to bring it to the front. That is at Pymont—the old A.S.N. Company's property. There is accommodation there for seven of the largest vessels of the cargo type coming here. They do a great deal of the work. I have seventeen cargo steamers during the course of a year, and they do not require such enormous accommodation as these passenger boats do. There is this large accommodation being provided at Pymont on the old A.S.N. Company's property. There will be accommodation for at least five large vessels if not more. Then the Government are building a very large wharf there. It is almost completed. That wharf should I think, accommodate five or six vessels when the jetties are out. I have not seen the plan, but I have heard it described. It is near Goodlet & Smith's, this side of Pymont Bridge.

367. *Mr. Garrard.*] Is not that next to the railway line? Vessels are more likely to load and discharge there than at Pymont. Private people are spending money, and the Government are spending money in anticipation of bringing foreign trade there. Whether that is entirely in connection with coal I cannot say. I should say it is not from the appearance of it. It will do for far more than coals. At present there is very large accommodation at Woolloomooloo Bay, and there have not been more than three general cargo vessels per annum there since it has been built, so that it is lying idle to a very large extent.

368. *Mr. Suttor.*] If more encouragement is to be given to private enterprise, the Government should spend much less than they do? Yes.

369. *Mr. Humphery.*] Is it your opinion that in view of the increased length of wharfage for the P. & O. Company and the Orient Company, the present wharfage accommodation at Circular Quay is in excess of requirements? I would not say in excess of requirements; but I am perfectly certain that it is quite ample

* NOTE (on revision):—I have to correct this statement by excepting Macnamara's Wharf, which was built out on piles before I built out Parbury's.

A. Lamb,
Esq.
11 Sept., 1888.

ample for some time to come. It would strike any stranger not perfectly conversant with what is going on, and particularly people going to North Shore, that the Circular Quay is crowded. But that is because we are now in the thick of the wool season. Then, again, vessels are sent to the Circular Quay just for the purpose of taking business away from private wharfowners, because they will not give the owners or agents rebates. The vessels have been put there simply to coerce private owners to give rebates. Private wharfowners are at present under an arrangement with the Government, by which they will give no concessions to shipowners or agents to put the vessels at their wharves. Therefore the agents send the vessels to the Government wharves in order to coerce the private wharfowners into giving them rebates. That is really why they are filling up the Circular Quay at the present moment. In the months of July and August the quay was very full, and the private wharves were not over full. That is just about the position. A return was placed on the Table of the Assembly about May or June last, in answer to a question put by Mr. Dibbs to the Colonial Treasurer, as to whether rebates were being given to vessels going to the Government wharves. The answer given by Mr. Burns, from a report by Captain Jackson, the manager of the Circular Quay, was that the Government wharves were often empty because private wharfowners were giving rebates, and that unless the Government wharfinger were allowed to give some rebates, concessions, or "tip," really to the agents of the ships, the Government wharves would be empty. That in itself is sufficient proof that there is more wharfage accommodation than is ample at the present moment.

370. Is it your opinion that a large portion of the proposed expenditure of £120,000 is unnecessary? Certainly; and the improvements on the western side could be made for half the money. Looking at the plan, and seeing the extension on the eastern side, I think that about half of the proposed expenditure would be sufficient.

371. Have you had considerable experience in the erection of wharves? Yes; I have built several.

372. Can you state, in your opinion, what ought to cover the cost of extending the Orient Co.'s wharf 50 feet? That is a very small affair.

373. Is it your opinion that it would not cost anything like £120,000 to carry out necessary improvements at the present time? To meet the requirements, it certainly would not.

374. To meet all requirements, including the necessity for making some alteration in the ferry services? The alteration of the ferry services is a very small matter, and a very necessary matter.

375. *Mr. Kethel.*] Is it not a fact that the contracts, or part of the contracts, for converting the land you have referred to at Pymont into spacious wharves and warehouses are let, and are not the works in progress? Yes; the works are in very active progress.

376. Are you aware that it is in contemplation to move some of the large lines of ocean steamers from the Circular Quay to those berths as soon as they are completed? I have heard it contradicted to-day, but I have heard it stated. I can only say that I have not heard it officially. I have heard that an effort will be made to move the whole Orient Company over there. I do not know that it will come about. I do not think the Orient Company will ever be so foolish as to go there while they have such a berth as their present one.

377. As a wharfowner interested, you have expressed the opinion that it is wrong for the Government to enter into competition with private enterprise. But the Government having become possessed of the Sydney Cove wharfage, do you not think they are bound, by every means that their professional advisers can suggest, to improve that property so as to make it suitable to meet the demands of the traffic, even if they do a little wrong to private enterprise? No; because private owners will not lose their money simply because the Government choose to spend public money. Private enterprise will come into severe competition with the Government, which will bring down the Government rates. We have it on record that if private wharfowners give rebates and concessions the Government must do the same; and once it begins there is no limit to it.

378. Has the system of rebates totally ceased under the Private Wharfowners Association? Yes. There are one or two wharves outside the Association which have given rebates.

379. But the wharfowners of Sydney, as a rule, have refused to make any rebate on wharfage rates? Yes.

380. Are you aware whether the Government wharfinger still allows rebates, as he did some few months ago, to the amount of 15 per cent.? No. I have heard from Mr. Burns's own lips that he has strictly prohibited any rebate. I have every reason to believe that that is carried out by Captain Jackson. I am open to conviction. To show what the competition has been among private owners trying to get business, I may say that I have known a shipmaster to be met at the Heads and £100 put in his hands to induce him to go to a certain wharf. He went up and discharged at that wharf, and all that the wharfowners made out of the wharfage was £90, so that they lost £10 on the transaction.

381. *Mr. Garrard.*] The Government did not set that immoral example? I think the Government is as much to blame as anybody else in the matter. What I have related occurred years ago.

382. *Mr. Kethel.*] There is another phase of the question. When the competition between Government and private wharves was at its height some years ago, is it a fact that on frequent occasions 50 per cent. and 75 per cent. rebate was granted to the agents of ships to have them sent to certain wharves? Yes; six years ago that was done. That was going on when the private wharves were in open competition. That is one of the reasons why I worked hard to get all the owners to work together. A few months before that was done—when those rebates were given—these people had their places empty, and they could afford almost to let the ships come for nothing, so as to get their stores filled.

383. Is it your opinion that the wharf accommodation at present will be adequate to meet the whole demands of the traffic for many years to come, except in extending the size of the berths? Yes.

384. Is it a fact that in consequence of the great number of steamers which now conduct the goods traffic, and which are superseding sailing ships, one wharf will now grant as much accommodation for the traffic of the port as three wharves would have granted when the traffic was entirely done by sailing ships? I would not like to say so much as that, because the steamers are so much larger that they take almost as much accommodation to start with as two sailing vessels.

385. Will not a steamer come in with 1,000 tons of cargo and put it all out in a dozen working hours, while a sailing ship would take seven days to put out that cargo, and therefore the same berthing accommodation required for one sailing ship would accommodate two steamers bringing two or three times the amount of cargo? That is the position, provided the berths are made a little larger for the extra size of the steamers. Ships come and stop four or five weeks, but a steamer goes away in a few days. That does not necessitate the enormous accommodation that people imagine. 386.

A. Lamb,
Esq.
11 Sept., 1888.

386. Have you ever made any comparison between the relative durability of wooden wharves and wharves constructed of ordinary sandstone, and as to which is the most economical to construct, keeping in view the time they will last? I believe that our colonial timber, more particularly turpentine, is quite durable enough for all purposes of the sort. Against stone I have always heard the objection that the harbour is more liable to silt up where there is a stone wall than where the water has a free current under the piles. I can speak from my own experience. Twenty years ago I put down the first turpentine piles to any extent, at Lamb's old wharf, and those piles are standing now almost as good as when they were put down.
387. Is it your experience that turpentine possesses sufficient strength of fibre to bear any strain put upon it, although the fact is it does not nearly possess the strength of ironbark? I think so; it is only necessary to put the piles a little closer. That is more a question for a scientific man; it is a debateable point.
388. *Mr. Street.*] Are you aware that the agents of vessels would always give the preference to the berths at the Circular Quay, owing to the facilities for haulage? There is no doubt it is a popular wharf.
389. If the wharves on the western side were set apart for merchandise vessels, would not those berths be rather sought after by the agents? Probably, on even terms; but a very slight difference would turn the scale. I have seen an enormous steamer go up to Woolloomooloo Bay. Those considerations weigh a great deal.
390. Still it is a popular wharf, more particularly owing to the facilities for haulage? It is popular in some respects; but I have heard shipmasters complain about the open thoroughfare. Agents may like it. Except from the haulage point of view, I do not think it is a more popular place or a more convenient place in any way for a shipmaster, who is really the man to be considered. I do not think it is any advantage to the shipmaster or to the man who really pays the money.
391. Is it not the case that no facilities have been given for unloading heavy weights at the Circular Quay except the old-fashioned way of raising a derrick? Yes.
392. Are proper facilities provided at any other wharves in Sydney? Only at one. There is one heavy lifting machine at Mort's Dock. I think the best plan would be to have a floating crane. If a powerful crane were erected at a particular place several vessels would require it at the same time. There was some scheme here to get up a floating derrick; several people took an interest in it; but they found it would be a very expensive piece of machinery, and the project was abandoned.
393. Is there not such a derrick in the Thames? I think there are several; there is one in the docks.
394. *Mr. Garrard.*] With reference to the question put, by Mr. Street, and the proposal to erect a floating crane, which you have referred to, was not the real obstacle to that project the difficulty in getting such heavy weights up the inclines leading from many of the private wharves? There are not many enormous lifts. There is far more difficulty in getting pieces of machinery from the private wharves than from Circular Quay; but out of forty or fifty ships discharged in a year I do not suppose there are more than four or five heavy pieces.
395. You say that one obstacle to the proposal to get a floating crane was the heavy cost of maintenance;— would it not be better to have one fixed place for such a crane, as they have on the Yarra Bank? I do not think a crane would be a very expensive job if it were fixed, and it would be more of a convenience than otherwise.
396. Are you aware of the quantity of material imported by the Government? It varies very much.
397. You know it is considerable? Yes; it varies.
398. Does not a great deal of the material so imported come by sailing vessel? Yes.
399. Therefore, the Circular Quay being Government property, it is desirable to have berths for sailing vessels on the western side? Yes.
400. I understand you agree that it is desirable to have those improvements on the eastern side for large mail-steamers? Yes.
401. That accommodation is not provided by any private wharfowner at present? No; private wharf-owners can give it, but the mail-steamer companies prefer the Circular Quay, where their vessels can be seen.
402. Is that the reason? I think so.
403. Is there any private wharfowner in Sydney able to give sufficient accommodation—an average of 550 feet? Yes; there is a very fine wharf now in the market which could give that accommodation if the owners were allowed to build out, and were given the facilities given to other people.
404. In reference to building out, for instance, in the bay you refer to, if each wharfowner were allowed to run out a jetty, would they not meet at a point in the harbour between Dawes Point and Moore's Point? No; because it is very much in a bight.
405. The very fact of their running out to an extreme point would render it inevitable that they should come near to each other? That is quite likely, if they got out so far.
406. Have you not noticed a difficulty in berthing vessels at Dalton's Wharf and Moore's Wharf through the jetties extending far out? They might overlap each other, but if they kept within their own water there would be no difficulty.
407. Do you think that the Harbours and Rivers Department sometimes place difficulties in the way of private owners extending their wharves? They place difficulties in some people's way. They do not place difficulties in the way of gentlemen who have run out a wharf at one place.
408. If it is absolutely necessary to renew the wharf on the western side, do you not think the proposed echelon plan would be better than to have a straight berth? I think it is a very nice improvement indeed. I only question the necessity for it.
409. You know a great deal about the traffic of the cove. Do you not think that the shifting of the Manly Beach and Watson's Bay boats is preferable to the present state of things? Yes.
410. There will not be so much crossing of each other's boats? No.
411. Are the A.S.N. Co.'s wharves now used for ocean-going vessels? Yes; since the Government came into possession of them. In their present state they give accommodation for six more vessels of the ordinary size.
412. In any of the wharves in which you are interested, are the piles sheathed, or are they covered with the ordinary bark? It is only the Government who can afford to sheath piles.
413. Do you think it is desirable to sheath piles? No; it is a waste of money.
414. Do you think the natural cover of the bark is far preferable? Yes. I am speaking of turpentine. Ironbark piles require to be sheathed.

415. *Mr. Sydney Smith.*] I understand you have constructed wharves with turpentine piles. What is their life? Fourteen or fifteen years; I know from my own examination. There are other turpentine piles which were put down twenty years ago. I believe they are quite good yet, although I have not examined them for the last four or five years. Those were put down without bark, and I think if the bark were left on them they would last much longer. A. Lamb, Esq.
11 Sept., 1888.

416. How much longer? I have not had them down long enough to be able to say.

417. With regard to the improvements now proposed by the Government, supposing this were private property, and the P. & O. Co.'s wharf was not in proper repair, and would have to be renewed, do you not think it would be advisable to make the improvements suggested by the Government? A private wharf-owner would certainly look at the cost and the probable return.

418. You have referred to a return laid on the Table of the House in reply to a question. How long ago was that? It was about May or June last. A question was asked by Mr. Dibbs as to whether it was a fact that the Government Wharfinger was giving rebates for vessels at Circular Quay.

419. You have referred to M'Ilwraith's Wharf, which has been extended into Darling Harbour. Do you not think it is an obstruction to vessels to have a wharf projecting in that way? I think that if all were allowed to do the same thing the harbour would become impassable.

420. Supposing the opposite side were owned by private owners, and they wished to extend their wharves would it not be impossible to do so? They would simply meet. There would be no room to go down to the Government wharves. The present extension will almost make the Government wharf useless in course of time.

421. *Mr. Suttor.*] If you were told that the gross receipts from the Circular Quay were £40,000 per annum, and that the expenditure was only £1,700 per annum, do you think that an expenditure of £120,000 would be justified? It would depend upon whether the receipts are going to be £40,000 per annum.

422. We were told that the receipts this year were estimated to amount to about £40,000, and that the expenditure to collect it was only £1,700? Those receipts include those from the new purchases for which the Government have given a large sum. As for that being a good return for the value of the property there is nothing particularly good in it. At the same time it is being bolstered up now to a certain extent by the assistance of the private owners. If the private owners choose to give concessions we can reduce that very materially. Therefore it is not to be reckoned upon as a fixed rental. I know pretty well what the rentals are, although Mr. Yuill could not give an answer to the question. The Orient Co. and the P. and O. Co. each pay about £2,500 per annum, and the Government collect the wharfages, so that the berths yield very handsomely to the Government, each berth giving £6,000 a year or more. But it is very special accommodation for such large steamers. I say that the further expenditure of £120,000 will not necessarily increase the revenue to such a vast amount as they may expect. It is only an estimate, and we know how estimates are made up.

Mr. William Leslie, manager of the Watson's Bay and South Shore Steam Ferry Co., sworn and examined:—

423. *Chairman.*] Are you the manager of the Watson's Bay Ferry Co.? Yes; I have been the manager since the amalgamation, two and a half years ago. Mr. W. Leslie.
11 Sept., 1888.

424. Have you found sufficient accommodation for your trade at all times at the jetty you are using? Yes.

425. Is it proposed to shift your jetty? Yes; to shift it to the east end.

426. Will that give you the same accommodation as you had on the other side? It depends upon the kind of jetty that we are to get.

427. You are not aware of the proposed design of the jetty you are to get? No.

428. Have you sufficient accommodation where you are for the trade carried on? Yes.

429. Your trade is not so great as that of the North Shore Co.? No; it is not a twentieth part.

430. How many steamers have you? Five.

431. Have you given any attention to the proposed improvements at the Quay generally? Myself and Captain Summerbell looked over them on Friday last.

432. You would not be called upon to give special attention to the proposed improvements? No.

433. Do you think it is desirable that the proposed improvements should be made? I think alterations should be made.

434. Are you aware of any inconvenience which the large steamers have suffered? I am not aware of it.

435. *Mr. Kethel.*] Have you noticed the position in which it is intended to place the floating jetty—that is, to move it to the eastward about 100 feet;—when a vessel is berthed there loading or unloading, do you think there will be any room for a passenger steamer to get to and from the floating jetty? There is no room even for the jetty.

436. Assuming that the floating jetty is removed from its present position to the proposed position, 100 yards to the east, will there then be access for passenger boats if a ship is berthed at the place proposed in this plan? I should imagine there would not be any room. The ship would take all the room, unless the ship is kept more astern.

437. In your opinion it would not be judicious to move the floating jetty into the south-east corner unless the ships occupying that berth were kept well astern? Yes; I do not think there would be room in the present plan.

438. *Mr. Garrard.*] How many ships are berthed there? Two at present.

439. What is the length of your present wharf? About 120 feet. Our steamers are 95 feet long. Only one of our vessels can lie alongside at present.

440. By reducing the width of the outer end of your proposed new wharf, would it be possible to obtain three berths where only two berths are shown at present? Yes.

441. Could the same thing be done in the case of the Manly Beach wharf? Their vessels have much more beam than ours, and they are longer.

442. Do you think it is an improvement to shift the ferry steamers from the western to the eastern side? Yes.

443. *Mr. Street.*] As the vessels are berthed at present, is there much difficulty in navigation, coming in and going out? Yes; there is very considerable difficulty.

444. Do you think the traffic is dangerous as the steamers are berthed at present? Yes; it will be considerably improved by shifting the Manly boats. The danger will be lessened. There will be no crossing

Mr. W. Leslie. crossing then, because the Watson's Bay and Manly boats will keep on the eastern side, and the Neutral Bay, North Shore, and Parramatta boats will keep on the western side, and need not cross each other at all. I think that would be a great improvement.
 11 Sept., 1888.

445. *Mr. Garrard.*] Have you had large experience in various parts of the world? Yes, in these colonies, New Zealand, and at Home.

James Weir, Esq., Agent for the Peninsular & Oriental Steamship Co., sworn and examined:—

J. Weir, Esq. 446. *Chairman.*] Are you the agent of the P. & O. Co.? Yes; I have been so for the last six years.
 11 Sept., 1888. 447. Are you acquainted with the accommodation which the Government intend to provide at the Circular Quay? Yes.
 448. Do you think it is necessary? I do; for the general accommodation of the port.
 449. Do you consider that what is to be done for the P. & O. Co.'s vessels is absolutely necessary? I do.
 450. Are the Government giving you enlarged accommodation? Yes.
 451. Greater than before? We had nothing from the Government before. At the present time we are occupying what is called a temporary wharf, on the understanding that we will be moved to a permanent one as soon as it is built.
 452. Have your captains complained at any time of the difficulty of utilizing the wharfage accommodation on account of the insufficient depth of water? Yes; when we were at the old A.S.N. Co.'s wharf we suffered very much from that.
 453. Is that the case, since you have been at the present wharf? No; that is only a matter of a few months.
 454. Have you sufficient depth of water where you are now? Plenty.
 455. Do you think that the proposed accommodation will be of considerable value in carrying out your increased trade? Yes.
 456. Is it your opinion that the trade of this port is increasing and is likely to increase, and that therefore more accommodation is necessary? Yes.
 457. What is your opinion about the propriety of the Government constructing these works, and entering into competition with private enterprise. Have you heard that the Government are doing more than they should? I have not heard much of that.
 458. It is the fact that the Government own the principal frontages to the Circular Quay, and they being the proprietors, do you not think it is their duty to make the frontages as accessible as they can? Certainly; I think, as far as I can offer an opinion, that it would be the duty of the Government to provide a certain amount of accommodation.
 459. Have you given any attention to the proposed improvements generally? No; I would have done so if I thought I should be called upon to give evidence, but I am aware of what has been proposed.
 460. *Mr. Suttor.*] Would you rather deal with the Government or with private individuals in leasing or using wharves? It depends upon circumstances. I am quite ready to deal with the Government, but that would entirely depend upon circumstances. I may tell you in connection with that that the rents charged by the Government, which we are paying now, are considerably more than we were paying to the old A.S.N. Co. We then rented that wharf at £2,350 per annum,* and our wharfages were on an average, during my time, about £3,000 per annum, so that really we had a margin. But in dealing with the Government we shall have to pay £2,500 per annum and sacrifice all the wharfages. Of course that is a wonderful difference.
 461. The Government derive no other revenue from the berth you use besides the amount you pay? No; except the wharfages before referred to, and it is quite enough.
 462. *Mr. Kethel.*] When your Company occupied the old A.S.N. Co.'s wharf, did you collect the wharfages, and will the Government now charge you for your berth and collect the wharfages? Yes.
 463. *Mr. Sydney Smith.*] Is that really the state of the case? I can only give you an idea based on my experience at the time we collected the wharfages ourselves, and I think the average was quite £3,000 per annum.
 464. Did that include everything which the Government got from the berth, including your rental? The A.S.N. Co. received the rent, and my Company the wharfages, but the Government renting a wharf to us would receive the wharfages and an additional £2,500 for rent.
 465. Besides the £3,000? Yes; so that it ought to be a source of revenue to the Government of nearly £6,000 a year.
 466. *Mr. Garrard.*] What is the length of your longest ship? I think about 485 feet.
 467. Is that the largest of the fleet? Yes. We go on increasing in size, and it is difficult to say what it may ultimately be. The next may be 500 feet.
 468. Have the Government in their provisional agreement undertaken to give you 624 feet? No, 500 feet.
 469. Then if 624 feet is in course of construction to give a berth for your vessels, and you are only to get 500 feet, there will be 124 feet to spare? That is not for us. It is for some other Government purpose. We shall only get 500 feet. I think it is in contemplation to alter the Messageries Maritimes Co.'s berth.
 470. *Mr. Kethel.*] Have any of your steamers of the deepest draught ever experienced any difficulty in getting in or out of the berths, or in getting up and down the harbour? I cannot say that they have.
 471. Have you known the masters of any of them to have been obstructed by the reef at the Sow and Pigs? No. They know it is there, and the pilots keep out of its way.
 472. There is a shallow bar across the channel. Will the depth of water alongside your new berth be quite sufficient for any vessel that comes in? It will have to be deepened very considerably. I am not prepared to say what it is at present, but I think it is very little, 22 feet or so.
 473. Will 28 feet be ample? Yes; 28 feet will be sufficient, but 30 feet would be better.
 474. It will not hurt if they touch, as it is a soft silt bottom? We do not like them to touch at all.
 475. *Mr. Garrard.*] Can you tell us the length of the Messageries Maritimes Co.'s boats? No; but they are something over 400 feet. I may tell you in connection with that that they are building four steamers at the present time for this trade, and they will be 500 feet long. Robert

* NOTE (on revision):—Including £150 Municipal taxes.

Robert Hickson, Esq., M.I.C.E., Acting Engineer-in-Chief for Harbours and Rivers, sworn and examined:

476. *Chairman.*] Are you superintending the construction of the proposed improvements at the Circular Quay? Yes.

477. What is the length of the accommodation given to the Messageries Maritimes Co.? 480 feet.

478. Will that be sufficient to accommodate their steamers? That is what they have now. We are taking 50 feet off that, and giving it to the Orient Co., which will involve the Messageries Maritimes Co. going further over to the P. & O. Co.

479. Will they be able to do that? Yes; they can project over it a little.

480. Will that be a safe position for the steamer? I think so. It is only 24 feet beyond the present wharf. That will leave 600 feet of wharf; 500 is for the P. & O. Co., and the remaining 100 feet is for small vessels discharging coal.

481. So that you will have a frontage, independently of that used by the P. & O. Co.? Yes, of about 100 feet.

482. *Mr. Garrard.*] For what purpose will these vessels discharge coal? For general purposes. The wharfinger says that some place is wanted at the Circular Quay where small vessels can discharge coal, and he thought this would be the most convenient place.

483. Do you not think that would be very objectionable, coming alongside three lines of mail steamers? It will not be close to the passengers.

484. Do you not think it will be very objectionable? I do not think so.

485. From your experience of Newcastle, do you not know that there have been frequent complaints about bringing coal down past the city to the old wharf, and that one of the arguments used is that the change would get rid of the dirt and dust necessarily connected with this coal export? I cannot say that I ever heard that reason given. The reason for removing the coal trade from there is because the wharf accommodation is required for general cargo purposes.

486. Can you tell us of any place in the world where general merchandise and coal traffic are mixed up together, where there are facilities for separating them? I could not tell you from memory now.

487. One of these berths is for these coal vessels; what is the length of an ordinary brig? 120 feet.

488. She might project 20 feet over the fairway? She would project 20 feet beyond the point.

489. *Mr. Kethel.*] What is the length which you have allowed for the Orient steamers with the new addition? 400 feet.

490. Would it not be possible to change the alignment of the outer line of piles so as to enable the Messageries Maritimes Co.'s berth to be lengthened 50 feet, and to give 500 feet to the Orient Co., without interfering with the general scheme? There are some difficulties in the way. The main difficulty would be this: You would have to bring in the alignment considerably, and carry on another line 100 feet. You would get into shallow water, and you would have an enormous quantity of rock excavation to get deep water in this berth. I think it would alter the general design too much to bring the Messageries Maritimes Co.'s boats into the same line with the Orient Co.'s boats.

491. Do you not think that the coal trade to which it is intended to allot the outer end of that extension could be better conducted at what was recently known as Campbell's Wharf, or at some other wharf? I am hardly able to give an opinion on that point. Captain Jackson will be better able to do so. There is a special reason for that. All this was arranged before I came to town, and there was some special arrangement made by Captain Jackson for putting the coal vessels there. I think he can explain it.

492. Are you aware that the Messageries Maritimes Co. are constructing a number of steamers considerably longer than those at present trading here? Yes.

493. Are they not over 500 feet? They can go in there if they are 500 feet long.

494. *Mr. Sydney Smith.*] I understand you do not propose to extend the Orient Co.'s Wharf at present? Yes; it is proposed in the whole scheme.

495. It is not in this proposal now before us? Yes, it is.

496. I think we have it in evidence that it is not included in the present estimate? I think it is part of the present estimate.

497. Are you aware whether the Orient Co. is asking for additional accommodation? I have not heard.

498. Are you aware whether it has been represented to the Government that their vessels are in great danger on account of having small accommodation? I have not heard that.

499. Do you not think that, in making arrangements now to give additional accommodation to the various companies, it would be advisable to carry out a general scheme so as to give the Orient Co. and the Messageries Co. sufficient accommodation to berth their longest steamers? I think so.

500. Supposing the wharf is constructed as proposed, how would you give the extra accommodation—that is, 450 feet—to the Orient Co.? You cannot give it farther north, but you can in the south. But I think they have sufficient accommodation, because they can overlap at each end. There is 100 feet to spare at the extreme eastern end.

501. *Mr. Garrard.*] I understand that you prefer, if there is a necessity to lengthen the Orient Co.'s berth, to do so at the southern end? Yes; but it is not necessary to lengthen it. On looking over the papers I find that the proposal to add 50 feet to the Orient Co.'s Wharf is included in the estimate of £120,000.

502. *Mr. Kethel.*] Is the extension of the northern jetty at Campbell's Wharf also included in this Vote? Yes.

Captain John Jackson, Manager of the Public Wharves at Sydney, sworn and further examined:—

503. *Mr. Garrard.*] We have it in evidence that a wharf is being provided for the P. & O. Co., whose contract with the Government is for a berth of 500 feet. This berth on the plan, however, is 624 feet, leaving 124 feet extra. It is intended to allow the Messageries Maritimes Co.'s boat to overlap 50 feet, so that there will be a surplus length of 100 feet, which, we are told, is to be used for the purpose of unloading cargoes of coal. Has that been done on your recommendation? No, not absolutely; but it will be done.

504. Do you not think that the unloading of coal will be very objectionable so close to the berths of those large passenger-carrying palaces? I do not think so.

R. Hickson,
Esq.,
M.I.C.E.
11 Sept., 1888

Captain
J. Jackson:
11 Sept., 1888.

- Captain
J. Jackson.
11 Sept., 1888.
505. Do you know any place in the world where coal is handled so close to general cargo and passengers? Not exactly. In this case the wharf will be fenced in, and the way in which coal is now discharged at the Quay is that it is hoisted up and put into the carts.
506. By baskets? Yes.
507. There is the emptying of the baskets into the carts;—would not the prevailing winds have a tendency to blow the dirt and dust on to the P. & O. Co.'s boats? Yes; I admit it would.
508. Are there not also a considerable number of passengers by the horse-ferry who would also be incommoded? Yes, in a measure. The berth would not only be for coal, but also for timber.
509. There are 100 feet available for this purpose;—what is the length of the vessels coming from Newcastle? Not more than 110 or 120 feet.
510. So that they would project 10 or 20 feet? Only the fore hatches.
511. What would be the length of the timber vessels? They are only small ketches.
512. Do you not think it would be undesirable to have coal traffic so near to those floating palaces? Yes; to a certain extent I admit it would be undesirable.
513. If there is no necessity for an additional 100 feet there, and you could bring the ferry-boat 100 feet more under the shelter of the point, would it not be better? I think it would, but the contract is now let.
514. If there is a project to give greater length of berth to the Orient Co., would an increase of the wharf on the southern end be very objectionable? Yes; very much so. It would interfere with the berthing and unberthing of ships inside of it.
515. Would not the same objection apply in extending the wharf at the other end towards the Messageries Maritimes Co.'s berth? Not at all.
516. Is not their berth a kind of dock? They go in from the northern end, but on the other side they will have to come south and go alongside. You could not always get them south, because there would be two vessels lying inside, and perhaps two outside.
517. Do you propose to move the floating jetty to the position marked on the plan? No; it could not be done, because the jetty would be brought right on to the bows of the vessels.
518. Could you shift it further around where it is at present? Yes, but the other wharves would have to be curtailed.
519. In running out a jetty for the Watson's Bay Co., does this plan only provide two berths, one on each side? Yes.
520. Do you think it would be better if the outer end of that wharf were reduced in width, so as to give three berths instead of two? Yes; you could get two small steamers in, and have three berths instead of two.
521. If the Manly Beach Wharf were extended further, do you think there would be any objection? I do not think so.
522. I suppose there is hardly room to do it for them because their boats are wider? Yes.
523. *Mr. Sydney Smith.*] When you were here before did you state that you did not believe at all in the present arrangements for passenger traffic? No, not for the North Shore ferry traffic. I would sooner see it brought on to the western side, because there is a danger of crossing if the North Shore ferry is to be where it is now proposed. The Manly Beach and North Shore ferries come rather too close together under this proposal. The present proposed wharf for the North Shore boats is too large.
524. With regard to the accommodation proposed to be given to the Orient Co., what is the present length of their berth? 320 feet.
525. It is now proposed to give them 50 feet more. What is the longest boat they have? 430 feet.
526. Have you heard them complain of a want of sufficient accommodation? Yes.
527. Will the extra accommodation of 50 feet get rid of the danger? I think so.
528. Do you think there will be no necessity to extend it further for their long boats? No. They have applied for an extension on the southern side, but that is what I object to. If there is any necessity to extend it to the north it could be easily done.
529. *Mr. Kethel.*] It was stated that some of the Orient steamers have hatchways 400 feet apart, and if the new extension only increases the wharf to 380 feet it is evident that one of the hatches will be 20 feet outside the wharf berth. Is it not within your knowledge that the hatchways are 400 feet apart? No; I do not think so. The boats are only 430 feet long.
530. *Mr. Sydney Smith.*] If you extended the Orient Co.'s wharf 50 feet more, would it interfere with the Messageries Maritimes Co.'s wharf? Not if it runs in a certain way.
531. Do you remember a question being asked in the House by Mr. Dibbs as to whether or not the Manager of the Government wharves allowed rebates in the wharfage rates, when Mr. Burns replied that as the private wharfowners allowed rebates the ships landing at the Government wharves would not go to them unless the Manager was also allowed to give rebates? Yes; private wharves at that time were giving rebates of from 50 to 75 per cent. on inward cargo.
532. Did that take place in this year? Yes. I applied to Mr. Burns to allow me to give a rebate up to 25 per cent. The private wharfowners then waited upon Mr. Burns, and asked him to cease giving rebates, on condition that they also ceased from doing so. The matter ended there.
533. It was quite sufficient if you only gave 25 per cent? Yes; we were safe to get the ships at 25 per cent.
534. Is that arrangement now observed by the private wharfowners? I think they are beginning to work through it again slightly.
535. Are the Government aware of that fact? I do not want to acquaint the Treasurer of it just yet. It has not yet come to a proper head.
536. *Mr. Kethel.*] In the face of that fact, do you think we are justified in recommending the Government to expend such an enormous sum of money upon a commercial enterprise which must bring the Government into contact, collision, and opposition with private owners? It would not be opposition to give 25 per cent., while the private wharfowners are giving rebates of 75 per cent.
537. It is opposition in this way: The Government are starting in business as wharfowners, and they have spent during the present year something like £320,000 in purchasing property for which they have no use except to work the wharves for the purpose of making money? They pay for themselves, and give splendid interest.

538. *Mr. Garrard.*] Do you not recognise the fact that the Government are not now entering for the first time into competition with private owners ;—being owners, and having been owners for many years, of large wharf properties, they are, as business men, simply making the best use of them? Yes, without injuring others or cutting below others in the slightest degree.
539. *Mr. Kethel.*] I suppose you are aware that the wharfage accommodation, public and private, in Sydney, is about twice what is required to accommodate the traffic of the port? I do not know that.
540. Since you have been in charge of the Circular Quay, have you ever known a time when all the wharfage accommodation in the harbour has been occupied? I do. I have had ships lying down the harbour a whole week waiting for a berth.
541. At your wharf? No; at any wharf in Sydney.
542. Are you not aware that the splendid Dibbs' wharf has not been more than one-fourth occupied on an average? Repeatedly vessels have been waiting down the harbour for berths. Twenty-eight large home ships were lying in Woolloomooloo Bay in 1885, discharging inward cargoes. They could not be accommodated. Since then the private wharves have been greatly improved.
543. Do you know for what purposes those jetties are to be used which are now being run out in a northerly direction from Pyrmont down the harbour? They are for railway purposes.
544. *Mr. Sydney Smith.*] Will the erection of the wharves at Darling Harbour to a large extent relieve the wharves at Circular Quay? Not at all.
545. Do you know what is proposed to be done at Darling Harbour? It is proposed to bring wool down there.
546. Have you heard of any proposal to unload there all material required for the railways? Yes; but that does not come in at the Circular Quay at present. It has been taken in lighters. For the last two years no railway material has been landed at the Circular Quay wharf.
547. *Chairman.*] How long have you been in charge of the Circular Quay? Four years.
548. Is the trade making annual progress? When I went there the revenue amounted to £7,000 per annum. This year it will be close on £50,000.
549. *Mr. Kethel.*] That will be including the revenue from the recently-acquired A.S.N. Co's. property? Yes.
550. *Chairman.*] Do you believe that the trade of the port is increasing regularly? Yes; and very rapidly.
551. That being the case, I presume you are strongly of opinion that increased accommodation is required? Yes.
552. Going outside the question of competition with private owners, do you think that the Government are quite warranted; as owners of this property, in making adequate accommodation for the shipping? I do.
553. *Mr. Street.*] Do you say that ships coming here would always give the Circular Quay the preference? Yes.
554. Even when there is a difference in the rebates of 25 per cent. as contrasted with 75 per cent.? Yes.
555. What is the reason? Principally on account of the haulage. It is easier to take the goods away.
556. *Chairman.*] It is owing both to your proximity to the business part of the town and the easy grades? Yes. They prefer the Woolloomooloo wharf to the back wharves.
557. *Mr. Kethel.*] During previous years there were bitter complaints from merchants and consignees of goods to the effect that goods when landed from the ship's slings were placed in a public street, over which the authorities had no control, which was open to all prowlers, and where there was no shelter from the weather;—has that objection been removed? It is removed in a great measure. There is no cause of complaint now except on the western side, where the roads are narrow. On the eastern side complaints are very rare.
558. Do you have general cargo on the eastern side? Yes.
559. Was it to remove that objection that weather-sheds were erected at different parts of the Quay? Yes.
560. It was especially on the west side where the greatest complaints were made? Yes. There are complaints occasionally now, because the road is very narrow. It is not sufficient to give accommodation for ships. I think it is only right that when the Government gets a large revenue it should give some protection to the cargo. If it is landed at Woolloomooloo, there is a large shed.
561. *Chairman.*] Is it intended to do ultimately something of the same kind on the western side? Yes. There are three large sheds on the eastern side now.

THURSDAY, 20 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.
The Hon. WILLIAM HENRY SUTTON.
The Hon. JAMES WATSON.
The Hon. FREDERICK THOMAS HUMPHERY.
HENRY COPELAND, Esq.

ALEXANDER KETHEL, Esq.
JOSEPH PALMER ABBOTT, Esq.
JOHN RENDELL STREET, Esq.
JACOB GARRARD, Esq.
SYDNEY SMITH, Esq.

The Committee proceeded to further consider the proposed Improvements to Circular Quay.

[The Chairman reported that Mr. Campbell, Mr. Sutton, and Mr. Abbott had that morning visited the Circular Quay, and examined those parts of the Quay proposed to be altered or improved according to the plan and the evidence before the Committee.]

Thomas Littlejohn, Esq., merchant, sworn and examined:—

562. *Chairman.*] You are engaged in mercantile pursuits in Sydney? Yes.
563. Are you ex-chairman of the Chamber of Commerce? I was chairman five or six years ago.
564. Are you aware of the object for which you have been asked to attend here: that is, to give us some information with reference to the proposed improvements at the Circular Quay? I have some idea of what it is.
565. Are you aware of the nature of those improvements? Yes, to some extent. I have looked round the Quay this week.

Captain
J. Jackson.
11 Sept., 1888.

T. Littlejohn,
Esq.
20 Sept., 1888.

- T. Littlejohn, Esq.
20 Sept., 1888.
566. Of course you know that all the land around the Circular Quay is the property of the Government? Yes.
567. And that the object of this proposal is to improve it to a certain extent? Yes.
568. Have you given special attention to the proposed improvement of the wharfage accommodation? Yes.
569. Have you seen the plan? I have seen a reduced plan, which has been sufficient to acquaint me with the object of the improvements.
570. It is proposed to improve the accommodation especially on the east and west sides, where the P. & O. Co.'s vessels, the Messageries Maritimes Co.'s, and other mails steamers are accommodated, and, in addition to that, it is proposed to alter the traffic as far as the Manly Beach and Watson's Bay trade is concerned? Yes.
571. Do you think that those improvements are essential? I think they are exceedingly desirable.
572. In fact I suppose that if this property belonged to private individuals it would have been improved to this extent long ago? I am sure that is the case.
573. Is there anything in the proposed improvements which you think would militate against the public interest in any way? No. I approve of them generally; but instead of being an extension of wharfage accommodation, as far as the public is concerned, they will diminish it to a certain extent, for this reason: I understand that some of the wharves which used to belong to the old A.S.N. Co. will be taken for the use of the Government, so that there will be a berthage for two vessels at any rate lost there. Then there will be the berthage of one vessel lost opposite Mort's stores at the Circular Quay. That will be the loss of three berths. Instead of these berths you have only one new berth for the P. & O. Co.; so that these improvements are really a restriction of accommodation.
574. Has your attention been directed to the modern improvements in wharfage accommodation generally in other ports besides this? Not as an expert.
575. Do you think that these are reasonable improvements, at all events? Decidedly so. If you would allow me I should like to make one suggestion which has probably been before the Committee. It is this: The road that leads around beyond Hill, Clark, & Co.'s store up to the rocks is a higher level than the road next to the water. I should decidedly recommend that it should be reduced to the same level as the road next the water, for in some places it is four or five feet higher where you go round to the fort. It would be exceedingly inconvenient to leave that road at its present elevation.
576. Could it be done without any very great expense? I think so. Another thing that occurred to me was that it was a great mistake to ever allow Hill, Clark, & Co.'s stores to be erected on that corner.
577. Have you given any attention to the proposed alteration of the wharf adjoining the North Shore boat jetty at the extreme north-eastern end? That is for the horse ferry. It strikes me it is very suitable, and the only drawback to it will be the risk of collision with the Manly and Mossman's Bay boats; but that, I suppose, is not a very serious matter.
578. Is there any other suggestion, as a mercantile man, that you would like to make in reference to these improvements? No; not looking at the improvements as improvements. I do not know whether the mode of delivering cargo occupies the attention of this Committee at all, but there is very great room for improvement in that respect. If the same system which prevails in London at the docks in taking charge of cargo, and seeing that it reaches the proper hands, could be introduced here it would be a great advantage. No doubt it will come in time, as this city is growing so rapidly, but at present the arrangements are of the most primitive and unsatisfactory character.
579. The wharfage accommodation? No; the arrangements for receiving and delivering cargo to the different consignees. Having the wharves on open roadways is an exceedingly objectionable feature.
580. Does it apply to the Government wharves especially or to the wharfage generally? More especially to the Government wharves. Some of the private wharves have gates, and really, on some occasions, they have been able to give very great and satisfactory attention to the proper distribution of the ships' cargoes.
581. Of course in any place the Circular Quay would be regarded as a very valuable public property? Exceedingly so.
582. And in that light would be worthy of any reasonable expenditure that might be made upon it? It would.
583. You think that the proposed improvements are of a tolerably satisfactory character, at all events? Decidedly.
- The Honorable Samuel Aaron Joseph, M.L.C., sworn and examined:—
- Hon. S. A. Joseph, M.L.C.
20 Sept., 1888.
584. *Chairman.* Are you engaged in mercantile pursuits in Sydney and have you been so engaged for many years? Yes.
585. After looking at the plan now before the Committee, and as far as you are able to form an opinion, do you think that the proposed improvements at the Circular Quay are of a desirable character? I do.
586. Do you think that additional wharfage accommodation is necessary? Yes.
587. Do you think that this being a valuable public property it is essential that fair accommodation should be given? Certainly. It is a most desirable wharf property.
588. If the same property were in the hands of private individuals do you think that these improvements or better ones would have been made years ago? I think there is very little doubt of it.
589. Is there anything special in the proposed improvements that you would take exception to in any way as a man of mercantile experience? I think not; except that it does not give any very much increased accommodation.
590. Does it not enlarge the berthage accommodation in places? The new berth of the P. & O. Co. is the increased accommodation, but there will be only berthing room for the same number of ships that there is at present, I think, with that exception.
591. Does it not affect the trade between here and Manly Beach and North Shore by ferry, and remove all the jetties on to one side? Yes; they will not cross the Cove.
592. Do you recollect a proposal some years ago to take a jetty out into the centre of the Cove? Yes.
593. That, of course, was strongly objected to? I remember it; but I do not exactly recollect what the particular objections were.
594. Are you a wharf proprietor at all? No.
595. Are you of opinion that the trade of the port is increasing? Yes, considerably.
596. And is it likely to increase? It must increase.
597. That being the case, is it essential that public property such as this should be fairly and reasonably improved? I have no doubt of it myself.

598. *Mr. Watson.*] The last witness said that the facilities at the Circular Quay are not so great as they are at private wharves—Can you explain that in any way? No; I have never found that to be the case. I have always preferred sending all my ships to the Circular Quay, in preference to other wharves, principally on account of the haulage which is very much easier. The access for drays and all that sort of thing is very much easier than it is at most private wharves.

Hon.
S. A. Joseph,
M.L.C.
20 Sept., 1888.

599. Have you a large number of ships consigned to your firm? Yes.

600. Do you always give the preference if you can to the Circular Quay? Yes; I do not say that there are many greater facilities there, but it is more convenient, and I think that there is no doubt that the captains of ships always prefer going to the Circular Quay rather than to the other wharves.

601. But the Circular Quay could not be enclosed the same as some private wharves are, so as to protect goods landed from vessels? I do not see why it could not be.

602. Take the western side—Is not that on a public street? The wharves are not on a public street.

603. The western side is? I thought the street would be at the back of the wharves.

604. The Government attempted to close it up on one occasion, and they were prevented? I am quite of opinion that all discharging berths should be enclosed sheds, and that those sheds should be closed at night.

605. At the present time when vessels discharge on the western side, must not the goods be removed before night, or they would lie at the mercy of anyone? Yes; there are no sheds there except the P. & O. Co.'s shed.

606. Would it be a great convenience to consignees and shipmasters if there were enclosed sheds? No wharf can be considered complete without enclosed sheds.

607. On the whole do you think the Government are justified in spending £120,000 in improving the Circular Quay at the present time without sheds? I do not think the work would be complete without sheds. I am not prepared to say at once anything about the amount of money, because I have not given it sufficient consideration.

608. Still, do you think that the trade of the port would demand such an expenditure? I think the trade of the port warrants any reasonable expenditure to make the wharfage accommodation compatible with the increasing trade of the port.

609. *Mr. Kethel.*] You have occupied a prominent position in the mercantile community as Chairman of the Chamber of Commerce, and you have taken an active interest in the extension of the railway system into the city? Personally I have not taken an active interest in the extension of the railway into the city.

610. You are aware that there is at present an agitation on the subject, which has been considered several times by the Chamber of Commerce during past years? Yes. I have abstained from taking any prominent part in the question of the city railway extension, from the circumstance that being a Member of the Legislature I considered it better not to give any expression of opinion before it came before me in that place.

611. In relation to that, what I want to allude to is this: Is it wise, in your opinion, for the Government to carry out extensive alterations in the public wharves of the city at present, while the question of the route and system of the city railway has not been decided upon;—would it not be wiser for the Government to wait until Parliament had decided upon the system of railway extension connecting with the various wharves of the city, and then make all the wharfage improvements and extensions harmonize with the proposed system of railway extension? Without giving the matter further consideration it does not strike me at the moment that the railway extension into the city and the improvement of the wharves at the Circular Quay are so very intimately connected. Supposing there were a railway alongside the wharves, ships' cargoes could not be discharged into the railway trucks. In Melbourne there is a very different sort of system. They have there a large central goods depôt, and the railway discharges the whole of the goods into that depôt. They are taken from there by the consignees in whatever way they choose—by vans, carts, or anything of that kind. Precisely in the same way the consignees here take the goods off the wharf. They have an opportunity there of sorting such things as they require to send on by rail into the interior. But the large bulk of the railway traffic in imported goods is in sorted parcels, and not in the large bodies of goods landed from import ships.

612. I understand it to be your opinion that whatever wharfage improvements may be carried out by the Government the railway extension could be modified to suit them without interfering with the utility of the general system. Is it your opinion that if the railway system is extended into the city and connected with the various wharves its utility will not be affected by the present proposed improvements of the Circular Quay, and that the railway might be modified to meet exigencies? I think that great facilities might be afforded by there being a railway in close proximity to the wharves; but I do not think that the absolute question of wharf accommodation is sufficiently intimately connected with the extension of the railway into the city that it should be deferred until some scheme of railway extension is completed.

613. *Mr. Suttor.*] As a large importer, have you any difficulty in securing berths for your vessels coming here? No; I am not in the habit of hearing any complaints. We have a difficulty in obtaining berths at the Circular Quay, where we require them very often. As I have said before, on equal terms we always give the preference to the Circular Quay, unless there is some very great consideration otherwise.

614. Can you give us any idea at what rate the trade of the port is increasing? No; I have not prepared myself with any statistics of that sort. I do not think any opinion I could give would be sufficiently reliable to be of any service.

615. But it is increasing very rapidly? There is no doubt about that.

616. The import and export trade? Yes, and must continue to increase.

617. *Chairman.*] Do you think that wharfage improvements and accommodation are bearing a fair proportion to the increase of trade generally in the Colony;—are they keeping pace with the increased commerce of the Colony? I am inclined to think not. It has been my view for a long time, that there should be a Harbour Trust, and that the whole of the wharves should if possible be under the control of a Harbour Trust, so that they could be all under one general management, and the accommodation then would, under such a trust, be kept up in accordance with the increase of the trade.

618. *Mr. Copeland.*] Do you know the wharfage accommodation at Melbourne, on the Yarra, and at Sandridge and Williamstown? I am not very intimately acquainted with the Yarra accommodation, but I know Williamstown and Sandridge very well.

619. Have you seen the new wharfage accommodation along the Yarra? No.

- Hon. S. A. Joseph, M.L.C.
20 Sept., 1888.
620. Are you aware that recently they have built some 2 miles of wharfage accommodation along the Yarra to the New Cut? No; I have not seen it at all.
621. Would you be prepared to say, that, if the Government carried out these proposed new works, we should then be equal to Melbourne in accommodation for shipping? No. Not being acquainted with that accommodation, I should not be prepared to compare the two.
622. *Mr. Watson.*] If the railway were brought to the Circular Quay for goods traffic, do you think that much goods would go direct from the ships to the interior? I do not.
623. What proportion do you think would go? It might be the effect of considerably altering the trade. It might produce the effect that large importers in the interior would so indent their goods that they would come out in suitable packages to be forwarded direct from the ship to the interior; but from my experience of the trade as it is at present, I do not think that any considerable portion of goods would go direct from ships into the railway to go into the interior at once.
624. At the present time do all the goods imported go direct from the ships into the merchants' stores? Yes.
625. Do none go direct to the country? There is a certain proportion of certain classes of goods which goes direct to the country. A considerable proportion of heavy goods, such as building materials, cement, and that sort of material, goes direct from the ships into the country, but in other branches of trade there are sorted up orders which have to be kept by the importer in stores in Sydney, and sorted up from various orders, in accordance with the requirements of the interior storekeeper.
626. You have stated that you have experienced difficulties in getting berths at the Circular Quay. I presume it has only been in the wool season? Yes, the wool season and the approach of the wool season. I believe the preference is given to ships for the inward berth which are going to load outward from the quay.
627. Is it a fact that a large proportion of the ships coming to Sydney are fixed for different wharves before they leave London? Yes, a great many are.
628. Were it not for that a great many of them would go direct to the Circular Quay in preference to the other wharves? I think they would.
629. *Chairman.*] When you say that large goods are sent frequently direct from the ship's side to the country, are they not sent, as a rule, through the merchants, and has it not been the merchants' convenience that has been consulted? Yes.
630. Such as in the case of large railway contracts? Articles like galvanized iron. A wholesale importer having a parcel of galvanized iron or wire, knowing that he would have to discharge it from the ships, would probably seek some country orders, in order to have these heavy packages sent direct from the ships to the country rather than store them. By doing so he could offer some sort of inducement to the purchaser, because he would save the expense of double cartage, storage, and so forth.
631. But as a rule does merchandise generally go into the importers' stores and warehouses? Yes.
632. And in a very large proportion? Yes.
633. Are you prepared to say what proportion? No.
634. In fact, there are very few importers here who import direct for the interior? There are a considerable number I should think, but not to any large amount of tonnage; the tonnage of those who import direct is small compared with the amount of tonnage which comes into the port.
635. With reference to the railway communication to the Circular Quay, which has been referred to, do you think that a railway constructed to the Circular Quay would afford any very large amount of accommodation to mercantile men for the transit of goods? I do not think so.
636. Supposing that a railway were extended to the Circular Quay, with a certain number of intermediate stations where goods could be deposited, there would be the same expense of loading drays and taking those goods from the intermediate stations as there is at present in taking them from the wharves? The absolute expense of the extra distance which a dray travels is small in comparison with the expense of loading a dray. When the goods are once on a dray it is of very little importance—provided it is a fair road—whether the goods are taken half a mile or three quarters of a mile, or a mile. The extra cost is comparatively small.
- 636½. Does not the same apply pretty generally to the export of wool; wool does not come direct from the station to the ship, but goes into the merchants' stores or the woolbrokers' stores? A considerable quantity of wool goes direct from the railway to the ships. It does not go from the railway to the ships now because it has to go into the dumping store; but if any arrangement could be made whereby the wool could be dumped, the very large quantity of wool clips which are nearly always shipped would hardly ever go into the woolbrokers' stores.
637. Is it only recently that the system of dumping has been adopted on stations in the interior, which enables the clips to be sent direct into the ships from the railway? Yes; very recently, on very large stations.
638. And on very few stations? Yes, a few of the large stations.
639. On not more than half a dozen stations? I am not prepared to say on how many stations. There is a certain number of clips from large stations which come down already dumped, and I should think that if the Railway Department made arrangements for dumping wool at the large country termini there are plenty of station holders who intend to ship their wool; who would bring their wool dumped there, and then it would go direct on board ship.
640. But it would make very little difference to the station owner whether his wool was dumped in the town or in the country? No; the charge would be very much alike. The only saving would be something like 3d. per bale for cartage.

Richard G. Vallack, Esq., merchant, sworn and examined:—

- R. G. Vallack, Esq.
20 Sept., 1888.
641. *Chairman.*] Have you been a resident of Sydney for some years? Yes, about 35 years.
642. Have you been engaged in mercantile pursuits? Yes.
643. Has the wharfage accommodation been brought under your notice several times? I was for a long time working in connection with the Committee of the Wharfage Improvement Association, and I presume it is in consequence of my connection with that Association that I have been asked to attend here.
644. When was it formed? Four or five years ago, and it worked persistently for three or four years.
645. Did it result in any specific recommendations? Yes.

646. For wharfage improvement? Not so much perhaps for direct wharfage improvement, although that was always considered, as to urge upon the Government the resumption of all the wharves.

R. G.
Vallack, Esq.

647. Did it make that recommendation? Yes. In fact plans were prepared, and a model is in existence now at the Technological Museum. The model now there was prepared at very great cost, showing the improvements suggested by the Committee.

20 Sept., 1888.

648. How far did the water frontage extend which the Committee recommended? The whole of the Darling Harbour frontage on the eastern side.

649. To meet the Government property at the Circular Quay? Yes.

650. How was that Association established? A meeting of citizens was called to consider the want of proper wharfage accommodation in this port, and the result was that, after two or three meetings, a Committee was appointed, of which I was one, and that Committee worked at a considerable expenditure of time and money for a long time. When the matter was laid before Sir John Robertson he asked for some specific and definite proposition, which was made to him. Plans were called for by tender, and premiums were offered. These plans were sent in and submitted to the Government.

651. Did you make any specific recommendation as to the nature of the improvements to be made? Simply that the wharfage should be improved; that it could only be definitely and properly improved in view of future requirements by the resumption of the whole of the water frontages of Darling Harbour. I think it was on the recommendation of the Committee that the Government asked Sir John Coode to report. It was on the recommendation of the Committee that he came here. An estimate was made of the probable cost, and it was submitted to the Government.

652. Do you recollect the amount? No; but it was proved to the satisfaction of practical men on that Committee that it was a very feasible project, and that it would result in profit to the Government; as well as increased accommodation for the port.

653. Was it wholly on the ground of probable sources of profit that the Committee recommended the adoption of this scheme? Not at all. The Committee was appointed by citizens, who met to protest against the want of wharfage accommodation.

654. And they recommended the resumption of the whole of those water frontages? Yes.

655. Did they think that the commerce of the port would be better provided for in the hands of the Government than in the hands of private individuals? Yes; that was the opinion of a large number of commercial men in Sydney.

656. Do you think that since then the Government frontages have been improved in the same proportion as the frontages owned by private individuals? Unquestionably some improvements have been made on private properties since then, but the whole scheme was looked at more particularly with a view to the future development of the port rather than with a view to immediate requirements, although there were matters which required immediate adjustment. Many of the private wharves have since been largely improved, and perhaps as far as their accommodation will permit. But that is not wholly the case, because there are a great many defects in them now.

657. But great improvements have taken place in the wharfage accommodation? I would scarcely say great improvements. Mere individual effort cannot result in any great national benefit.

658. Have the improvements been in keeping with the increased trade of the port? That is perhaps more than I can say.

659. Are you engaged now in mercantile pursuits? Yes. I can only speak of this matter first of all from an importer's point of view. The firm I am connected with probably land 5,000 packages a year, from the United Kingdom chiefly; a great many from China, and a few from the United States. For want of sufficient accommodation we are frequently not only put to great inconvenience, but suffer serious damage to our goods. Not only did we ourselves feel this, but other merchants also, and therefore the meeting I have referred to was held, and action was taken by the Committee on behalf of the meeting.

660. Was this a meeting of the citizens? There were seventy or eighty prominent importers present.

661. It was not a general meeting of the public? No.

662. Have you given any attention to the proposed improvements at the Circular Quay? No. I see the plan now before this Committee.

663. Do you think that the whole of them are necessary? The three large mail companies will be berthed on the eastern side.

664. Will there not also be large freight accommodation on the western side? Yes. It is important to know if they will be provided with sheds for the receipt of cargo.

665. That is the case. What is your opinion respecting that accommodation? It will be necessary for these sheds to cover the whole of the wharfage accommodation where the ships will be berthed. I say that in view of damage sustained last week on the wharf through rain. We had to send tarpaulins to cover our goods.

666. It is not shown on the plan, but I am told that there will be sheds along the whole length. What is your opinion? Looking at it from a merchant's point of view, sheds are an absolute necessity.

667. There is sufficient room for the purpose of enclosing the sheds, so that the goods will be protected from damage? That is our desire, of course.

668. It has been stated that a street runs down on the western side, and that it would prevent the possibility of sheds being constructed there? Possibly so. It is most desirable that sheds should be erected in connection with the immediate discharge of ships. We have no docks here as they have in European countries, from which ships can discharge at once into sheds prepared for their reception. Here we have nothing of the kind, nor has private enterprise launched out largely in that direction. That is what importers largely complain of. I presume there will be some sheds in connection with these wharves, and it is an absolute necessity.

669. Are not a great many of the merchants here wharfowners themselves? Yes.

670. Are your firm wharfowners? No.

671. Have wharfage accommodation and properties increased largely in value during the last few years? No doubt they have.

672. As a State property, do you think the proposed improvements to the Circular Quay are absolutely necessary? Yes; a small basin like that cannot be indefinitely increased in its accommodation. There is an absolute congestion of traffic in that small basin, and large ships completely block the way. I see that it is proposed to move the Manly and other ferry boats towards the eastern side. That is a step in the right direction, but it does not go half far enough; the ferry boats should go outside of it altogether.

- R. G. Vallack, Esq.
20 Sept., 1889.
673. But on the whole do you think that the proposed improvements are of a desirable character? I do.
674. Are you aware of the proposed expenditure on those works? No.
675. Then you cannot give any detailed information as to the possibility of the amount being required? No; of course I hold the opinion that money properly expended for absolute improvements is always well spent, either by the Government or by private individuals.
676. Do you think that the trade of the port is gradually increasing? Yes; imports and exports are increasing.
677. And are they likely to increase? Yes; we build our faith on it.
678. *Mr. Copeland.*] Have you any knowledge of the wharfage accommodation in other seaport towns? Not technically; only as I have seen it. I know many of the docks at London, Plymouth, and other places. The English harbours have hardly any deep water-frontage, and docks are a necessity. They have to excavate their docks. Here we have docks already formed, with deep water alongside. Not simply for the protection of goods, but for the convenience of vessels they have had to excavate in England: I have no technical knowledge of wharfage.
679. Are you of opinion that the present wharfage accommodation here is behind the wharfage accommodation of other parts of the world? Most unquestionably. To be convinced of it you have only to see what New Zealand has done in that way. Auckland, Timaru, and several other ports are under Harbour Trusts. I may say in connection with this movement, which we took up on behalf of the merchants, we did suggest to the Government that a Harbour Trust should be formed, and our impression was that a Harbour Trust would be not only the best, but the only, efficient means of providing the necessary accommodation. We did not contemplate that in the immediate future large and expensive works should be constructed; but we looked forward to having all work done towards a given end; that a plan should be decided upon, and that that plan should always be worked to. For instance, you can never by independent individual effort get anything done towards facilitating transit of goods on the steep grades at present existing behind the private wharves. Besides, the wharves, at present, are not continuous. If you want to get from one wharf to another, you have to travel 500 or 600 yards, whereas 50 yards or less should be sufficient.
680. Do you think that the present wharfage accommodation would suffice for twice the present population of the Colony? That involves another consideration. In days gone by, when sailing ships only came here, taking three or four weeks to discharge a given quantity of goods, the wharfage accommodation required was much larger than is now required, when steamers discharge a given quantity in three or four days. If a Messageries Maritimes Co.'s boat comes in too late on Saturday to lodge her manifest, work is begun at half-past 12 on Sunday night and she clears out on Monday afternoon, after putting out 1,000 tons of cargo. A sailing ship, however, will lie at a wharf for three or four weeks, discharging and taking in cargo. In answering this question, that has to be taken into consideration. We have to consider whether or not the carrying trade of the future will not be mainly, if not altogether, carried on by steamers. If the whole of the trade of this port were carried on by steamers—I am speaking now of the ocean-going boats—I daresay that one-third of the wharfage accommodation would be sufficient, as compared with what it should be if the trade were all carried on with sailing ships, which require so much more accommodation, in consequence of the time they take in discharging and receiving cargo, during which time they lie alongside the wharf.
681. From what you know of the progress in marine matters, are not the probabilities such that we are more likely to have goods brought by steamers than by sailing vessels? The steam accommodation for the carriage of goods from Europe is being increased every day. New companies are being formed, and are building new ships.
682. Supposing these works were not carried on by the Government, do you think there is any probability of any congestion of traffic at all;—speaking of the next twelve or fifteen years, during which time we may expect that the population will increase twofold, do you think that if the Government did not take these works in hand, but left it to private enterprise to meet the requirements of the port, there would be any congestion of trade for want of wharfage accommodation? It is difficult to say. Of course if the Government could by one stroke obliterate the Circular Quay, and say that all that traffic must be thrown into Darling Harbour or anywhere else, no doubt trade would be congested. With regard to the means of providing wharfage accommodation, I may say that not long since one of our largest contractors offered on behalf of a syndicate, formed or to be formed, or after consultation with great capitalists, to carry out the works proposed if they could obtain powers from the Government. As a guarantee they were prepared to deposit something like £100,000 or £150,000 for the completion of the work.
683. In what time would they have completed those works? There would have been no necessity for immediate completion. They would only complete the works as the requirements of the port would determine. If, as we suggested, the Government resumed all those frontages, there would have been no necessity for a large and immediate outlay for the construction of wharves so much as for a general and gradual improvement as the requirements of the port would necessitate.
684. Do you think the trade is not suffering from want of accommodation at present? No.
685. Do you think it is not likely to suffer for a few years to come allowing for the natural increase of population? Yes. The very fact of merchandise being brought here by steamer lessens the necessity for additional wharfage accommodation immediately.
686. Do you think the goods will be brought here in steamers in an increasing ratio? Yes; but as the trade of the port expands so the necessity for accommodation will arise. I do not think we have too much accommodation for the shipping here.
687. Are you acquainted with the wharfage accommodation in Melbourne? Not intimately. I know the Yarra, Williamstown, and Sandridge. But I fancy they have a different system there. The ship's officer is no longer responsible when the goods are over the ship's side. The responsibility is then taken by the railway or some other authority. The goods landed in the Bay are not delivered from the ship's side to the merchants. They are brought to Melbourne by train; they are lodged in sheds, and thence delivered. I allude to the large ocean boats which do not go up the river.
688. Do you think there is an immediate necessity for the Government to enter into an expenditure of £120,000 to provide additional wharfage accommodation? I would like to know if you mean the improvement in wharfage accommodation contained in the plan before the Committee. There is scarcely any additional accommodation provided by this proposed plan.

689. Will not improved accommodation give increased accommodation? Looking at this plan I do not think the accommodation is increased by 10 per cent. The Pitt-street wharf is in a dilapidated condition. 690. I presume you are alluding particularly to the amount of space; but the accommodation will consist in the increased number of ships and so forth? Quite so; I understand your question. I think the Government will be perfectly justified in any outlay of this character which will make a permanent improvement in the accommodation of the harbour.

R. G. Vallack,
Esq.
20 Sept., 1888.

691. The Government may be justified, but do you think as a business man that the Government are called upon to enter into the expenditure of £120,000 of public money to provide this proposed accommodation? I will answer it in another way: If you were only to put this project before the public I guarantee that you would get £100,000—the value of the wharf—taken up in shares in seven days. The possibility of the requirements of the port, and the natural accommodation and facilities afforded by Sydney Cove are just simply incalculable. The Government will be perfectly justified in incurring this expenditure. As I said just now, the extra wharfage accommodation is not very much, but the necessity for sheds does certainly exist, and they should be erected. The old wharf on the western side is very dilapidated, and will have to be renewed in some form or another very soon. I do not think it would be extravagance to spend £120,000 on the accommodation. It is money well spent.

692. *Mr. Kethel.*] I understand you to say that the cause of the formation of the Wharfage Improvement Association was the fact that the firm with which you are connected and others had suffered serious loss by damage to goods when discharging from ships? Yes.

693. From what cause? Because there was no accommodation on the wharves. Goods were often, even on the Circular Quay, landed in a mud pool until they were taken away by the carts. Then there was such a congestion of ships that it was impossible to get them away.

694. Does that remark apply to the Circular Quay or to the private wharves? To the private wharves and the Circular Quay as it did exist.

695. Then in your opinion all wharves for discharging general cargo should be covered by shelter sheds? Yes.

696. Would that meet your objection? Yes.

697. You are aware, I presume, that the tendency of the improvements at the Circular Quay and other Government wharves is to draw the traffic of the port away from the private to the public wharves? I can scarcely say that. This is the only improvement suggested by the Government that I know of, except at Pymont. What the result of that will be is an unknown quantity.

698. We have it in evidence that the Circular Quay traffic has improved considerably in quantity during the last year or two. We have it also stated in evidence by a gentleman connected with the private wharves that many of the private wharves used for the purposes of foreign shipping are idle for half the year. Under those circumstances do you think it is justifiable on the part of the Government to expend more money to attract the trade of the port to public wharves, and thereby impoverish private wharf-owners and render their properties unprofitable? The Government is already possessed of this property. It is not as if the Government purchased this property for the purpose of coming into competition with private wharf-owners. It is already their property, and in the interests of the port they are bound to improve it.

699. *Mr. Campbell.*] What was the reason for recommending the Government to resume the private wharves? Because it was the general opinion of merchants—and I believe it would be found to be their opinion to-day if they were canvassed—that no one but the Government, or a body such as a Harbour Trust, with powers delegated from the Government for resumption, could ever satisfactorily complete the wharfage accommodation, as a continuous wharfage accommodation, for this port. I do not think any private effort will ever make it what it should be made.

700. Do you think that because the private owners do not provide the necessary accommodation, therefore the Government should take the matter into its hands? Yes. The private owners have awakened to a sense of their responsibility. A few years ago there was an iniquitous system of arranging for ships to come to inaccessible wharves. I have seen ships waiting twenty days for a berth arranged in England before they ever sailed. The particular wharf, on account of the large amount of rebate given, was already full, and there was no room for the ship when she arrived, so that £20,000 or £40,000 worth of goods had to lie idle for three weeks.

701. Was that in the case of private wharves? Yes.

702. Was that one of the reasons? Yes; it was one of the reasons. There came into connection with our arguments—although we did not trouble ourselves with it—the question of railway accommodation for the city. I believe the two will work together. I am not only expressing a private opinion, but also an opinion expressed by many merchants with whom the Committee of which I was a member came in contact. We spent probably £1,500, and lots of our own money as well as our time, to work out this inquiry to a satisfactory issue, and to bring it to a focus, and we were supported by donations from most of the merchants in the city. I daresay I could produce a list of men who gave £10 or £20 two or three times over in furtherance of the object we had in view. I think it shows that those engaged in importing all suffer from the want of accommodation. I think sixty or seventy importing firms subscribed to this object.

703. Was the effect of your action to have the private wharves improved? I think it was.

704. *Mr. Garrard.*] With regard to this new wharf, at the Circular Quay, you are aware that on the eastern side it is proposed to berth the three mail steamers. Do you think it is desirable that with the shipments to and fro from the mail steamers coal should be dealt with in any way by unloading it in close proximity to the steamers? It can be only a private opinion, and it can carry no other weight. Small vessels have always had a berthing place in the south-east corner of the Cove. I would like to know if it is intended to do away with that.

705. It is intended to take the outer end of the P. & O. Co.'s Wharf, where there is 120 ft. to spare, and to use it for the unshipping of coal from small colliers. What is your opinion on that? I would not have made provision for such accommodation; but I do not really know what are the requirements of coal in the immediate neighbourhood.

706. What I want to know is your opinion as to whether it is undesirable to have coal traffic closely associated with those mail steamers which have so much passenger accommodation? I should have thought myself that it was undesirable.

707. *Mr. Suttor.*] Would not the recommendations made by your Committee really give the Government a monopoly of all the wharfage accommodation in Sydney? Certainly it would, but it would have been taken

R. G. Vallack, Esq., taken out of the hands of the Government by the appointment of a Harbour Trust. Harbour Trusts exist in many ports, and one is largely at work in Melbourne. Such trusts have carried out their work very satisfactorily in New Zealand, and in parts of the United Kingdom. Even if it did take the work away from private wharfowners they would get a *quid pro quo*. There is a hardship in depriving a man of his own private property; still private wharfowners, like others, have to give way for the general good. Hardships would ensue, possibly, but I think that the *quid pro quo* for the resumption of the property would be satisfactory in most instances. A great deal of the wharfage property in Sydney is simply that which has been cribbed from the sea. Mr. John Young, who was one of our committeemen, pointed out 600 or 700 ft., reclaimed without saying "by your leave, or with your leave" for the harbour, and it is held by a man having no more title to it than I have.

20 Sept., 1888.

708. Has not private competition to some extent been in favour of importers and shipowners? I do not think so. For my part as an individual, I have never known anyone who would grumble at having to pay a fair charge for any accommodation that might be given, if the wharfage rates are fixed by the Government. If the wharfage rates are not sufficient to pay for the accommodation required, I do not think the merchants would grumble at having to pay what is equitable, fair, and sufficient.

709. We have been told here that in consequence of the rebates allowed by the private wharfowners some pressure was brought to bear on the Government to make reductions as well? From reports in the papers and so on, I have seen that it has been the case, and I believe that since then the Government and the private wharfowners have agreed not to allow any rebate at all. That is what I complained of just now: That some few years ago arrangements were made in London for goods to come to certain wharves here without any regard to their suitability; and if you were engaged in importing or landing many goods in this port, and they were put down at an inaccessible wharf where the gradients were very steep and the accommodation very slender, I think you would kick as well as we did. The rebates were made to a very large extent to the charterers or owners of the ships to send them to particular wharves. Rebates I believe were given to the amount of 60 per cent. on the ordinary wharfage rates, which showed either that the wharfowners were receiving too much under ordinary circumstances, or that they were losing money by the arrangements which they made, which is not a reasonable view to take. There is *prima facie* evidence that the rates charged were sufficient for a reasonable amount of accommodation.

710. [Mr. Kethel.] Are you aware of the wharfage rates charged by the Harbour Trust in Melbourne, simply for landing goods on the wharf without shelter? Our Committee did obtain that information, but I do not remember it. The conclusion which we came to roughly was that our wharfage rates are fair, perhaps not excessive, but tending that way rather than the other.

711. Are you not aware that the wharfage rates in Melbourne are more than double those of Sydney, and sometimes treble? I am not in a position to say. I do not know of my own knowledge that they are.

712. Is it not one feature of the Harbour Trust in Melbourne that whilst not giving the slightest accommodation to importers, the charges come to something like 5s. per ton during the present year—Have you any knowledge of that? No. I have never heard complaints against the wharfage rates here as being in any way excessive. In connection with the movement with which I was associated, we never heard that as a grievance from merchants or importers. After a comparison made with the rates charged in various ports, and estimating them all round, the impression remained with me that our wharfage rates are about a fair thing.

713. Did it ever strike you, in arriving at those averages, that the rates charged in Sydney, private and public, are less than in any other part of the world? I do not think so. I am not prepared to deny the statement, but speaking from the general impression on my mind I do not think that is the case. I do not think any objection would be made to increased wharfage rates if increased accommodation were given.

714. Are you acquainted with the Grafton wharf? Yes.

715. Do you know any other wharf anywhere that possesses greater facilities or accommodation than the Grafton wharf, with the exception of a heavy lifting crane? I was about to observe that there is an absence of any appearance of a lifting crane in connection with this scheme of the Government. I did not mention it, because in all probability this wharf will be engrossed by steamers. As they have the power in themselves to put heavy weights over the side, they do not perhaps require the assistance of a hydraulic or other crane. But sailing vessels, not having the same appliances as steamers, would require such assistance. There is an absence of such accommodation in this plan. The Grafton Wharf has been wonderfully improved of late years. But there is a very steep gradient from there up to the city.

716. But only in the case of one or two streets? The Committee to which I have referred intended that one principal object of resumption would be the reduction of those gradients.

717. You alluded just now to the fact that it is your opinion, as one who has taken an active part in the Wharfage Improvement Association movement, that the extension of the railway into the city and its connection with the wharves should form part of a harbour scheme? We were not appointed to consider that question, but it naturally cropped up; and when the design for the wharves which was worked out by Mr. Schultze, Civil Engineer, was perfected, there was provision made to bring the railway around the wharves in Darling Harbour. Of course the Railway Department, we presumed, would have to pay the cost of construction, and bear a proportion of the cost of the accommodation given when the resumption took place, if it ever came about.

718. Do you think it would be wise on the part of the Government, in view of the anticipated extension of the railway to the city and the foreshores, to defer for a time these improvements to the Circular Quay in order that they might be made to harmonize better with the railway? No. I think the day will come when the shipping of the port will be in touch with the railway; but I would not defer the one until the other is an accomplished fact.

719. Was that plan of Mr. Schultze's got up at the request of the Association? We called for competitive designs, giving 100 guineas for the first prize, and fifty guineas for the second. It was not remuneration sufficient for the labour bestowed on the designs, but they were worked out by competent gentlemen with the view of gaining some *éclat*.

720. Was Mr. Schultze's the prize design? Yes.

721. Are you aware that the design if carried out would reduce by two-thirds the wharfage accommodation of Darling Harbour as compared with the present accommodation? That is not true. Although this design was put forward by our Association in consequence of Sir J. Robertson's request that we should submit something

something tangible in the shape of a suggestion, we did not dictate or attempt to dictate to the Government on any particular point. We simply suggested that in the absence of a better plan being proposed something of this kind would meet the requirements of the port. We did not say that it was not capable of improvement.

722. Are you aware whether Sir John Coode has ever reported on the scheme? I believe that Sir John Coode asked for certain information from the Government. Sir John Coode in my presence said, he had spent two whole days in going down the eastern side of Darling Harbour examining the wharves. He was then provided by us with the levels of the various streets below Sussex-street, adjoining those wharves. Those were got from the Town Hall by permission of the Mayor. He then required further information, which it was not in our power to give, with regard to the depth of water in certain localities, the depth of mud, and the distance to which it was necessary to go before the bed-rock was reached. He said he would leave the matter in the hands of the Government to furnish him with certain data. I believe his request is pigeon-holed in the Government Departments to this day, and it was never taken notice of.

723. *Mr. Garrard.*] As it is intended by the Government wharf authorities to keep the berths where the P. & O. Co.'s boats are now moored for cargo sailing vessels, do you not think it would be desirable to have some mechanical appliances there for lifting heavy weights? Unquestionably that is the case. That does not apply to the berths where the steamers go.

724. Is it very desirable, seeing that heavy weights come by sailing vessels, to have lifting appliances there? Yes.

725. *Chairman.*] You say that your firm imports largely;—do you ever send goods direct from the ship's side to the interior? No; very seldom.

726. Do you ever have produce sent through your house to the interior? We are not agents of produce; occasionally we do.

727. Do you ever send wool direct from the interior? That is more than I can answer. It is five or six years ago since we made a speculation in wool. We shipped 300 or 400 bales.

728. Do you ever export tallow, hides, preserved meats, or anything of that sort? No.

729. If the railway system were carried to the Circular Quay and the other wharves, as proposed, do you think goods would be sent from the ship's side generally to the interior? That necessity grows every day. The importers who get their goods direct from the ship's side to the inland towns are growing in number every day. I suppose there would be ten instances of goods going in that way to one instance twelve or fifteen years ago. I have no data to go upon. I know there is a very large number of importing firms. Whether goods go through agents or merchants matters not. They go direct from the ship's side to the interior. The number of these firms is growing every day.

730. What is their number do you think? I think it would be impossible to tell.

731. Are there half-a-dozen whose places of business are in the interior? I could name scores.

732. Who import largely? That is capable of expansion or contraction. The bulk is not large, I dare say; but it is growing. There are six firms in the interior who would probably import (say) 300 or 400 tons a year, and several who would import smaller quantities from 50 tons to 150 or 200 tons.

733. Would they import directly and independently of Sydney merchants? No; many of them through Sydney merchants.

734. It is a mutual advantage to the Sydney merchant and the importer in the interior that the goods should go direct? Yes.

735. Therefore the Sydney merchant is a party to it? Yes.

736. It is not done independently by the country storekeeper? It is; but the merchant is an agent in this matter very likely. Either he may have a direct monetary interest in the goods which are being forwarded, the transactions taking place through him, or he may be simply an agent for the receipt and forwarding of the goods. But the number of importing firms in the interior towns is increasing every day.

737. It has been stated that, at certain times in the year, the wharfage accommodation is more than essential for the requirements of the port;—is that the case? I am not competent to give an opinion upon that point.

738. Is not the shipping trade a fluctuating one? Yes.

739. At certain times of the year are there not a great many more vessels here than at other times, such as during the wool season? Yes; both in exporting and importing there are seasons of the year when there is a greater demand for tonnage than at other seasons.

740. In those busy seasons it is essential to have suitable accommodation? Yes. I take it that the large wool stores built by Hill & Co., by Mort & Co., and Harrison, Devlin, & Co., and others, lie idle for a large portion of the year; but they have to provide accommodation for the busy season when it comes.

741. With reference to the project you spoke of, to which your Association gave the first prize, was it provided in Mr. Schultze's plan that there should be railway communication with all the wharves in Darling Harbour? Yes.

742. So that it did occur to you that there should be that accommodation for all the wharves? It would be a wonderful convenience to all concerned. But it was not simply confined to that. A roadway was to have been formed in connection with those wharves leading direct to the railway. Accommodation for a roadway 120 feet wide was provided for in that plan, to run alongside the wharves. Of course the railway scheme was shown in connection with the model in the Museum, but it was no part of the scheme referred to the Committee which was appointed to consider wharfage improvement.

743. Then in fact the road accommodation had as much to do with it as the railway accommodation? The road accommodation was part of our plan; not so the railway accommodation. The railway accommodation had nothing to do with us, but the roadway was part of our plan, because the resumption contemplated the erection of warehouses in connection with the wharves.

744. If railway communication were carried into the city as asked for, do you think it is essential that the railway accommodation should be conveyed to the different wharves as proposed in that plan? I do think so. Although it was not included in our first idea, I do not think there was any member of the Association who did not give his adhesion to it.

745. For the purposes of export and import? Yes; for the free transport of goods.

746. Do you think that goods would come direct to the different wharves to go to England, America, or Antwerp? Facilities for transport always increase business.

747. It would increase if you had the accommodation? Yes; it would focus there.

748. In the meantime you would have the roads leading to the wharves, and the merchants would get a direct benefit from the road communication? Yes.

M. A. Conil, M. André Conil, Principal Agent for the Compagnie des Messageries Maritimes, sworn and examined:—

20 Sept., 1888.

749. *Chairman.*] Are you the agent of the Messageries Maritimes Co. in Sydney? Yes.
750. Have you been acting in that capacity for some years? Yes; for six years.
751. Do your vessels trade between here and Marseilles? Yes; and they go on to Noumea from here.
752. Do you berth your vessels at the Circular Quay? Yes.
753. Have you seen the plan of improvements now before this Committee? No. I wrote to the Government last July asking for an extension of the Messageries Maritimes wharf to 540 feet. We have now 490 feet. I proposed an extension to 540 feet, because the Company are building four or five new steamers which will be 500 feet long. They will be running next year.
754. How many? Five new steamers for the Australian line. The present wharf cannot receive those new steamers. I see on the plan before the Committee a recess in the wharf which will be very inconvenient for the new steamers when they are coming to or leaving the wharf. I think they should widen the present wharf a certain distance, say 20 or 25 feet.
755. Is that part of the present project? Captain Jackson some time ago showed me a tracing which I now produce. Our present wharf is 490 feet long. It will be necessary to extend it to 540 feet and to widen the wharf, because there is not enough water. It will have to be dredged; but if you widen the wharf there will be sufficient depth of water without dredging. It will then be very easy to come to and leave the wharf. With the recess now shown on the plan it will be very difficult.
- 755½. Have you recommended that to the authorities? Yes.
756. To whom? To Captain Jackson who gave me this plan. He told me it was the intention of the Government to widen the Messageries Maritimes Co.'s wharf, and to extend it sufficiently to accommodate the new steamers. As it is proposed on this plan, however, it will be dangerous for the steamers.
757. Where are the new steamers being built? In the dockyard of the company near Marseilles. All the steamers of the company are built in their own dockyard.
758. Have you found your trade here increasing? Yes; we are satisfied.
759. Do you think that the trade of this port generally is increasing? Yes.
760. And that it is likely to go on increasing? Certainly. Since the beginning of the Messageries Maritimes Co.'s service the trade increases every year.
761. Have your company had any reason to regret their enterprise? No; the company has this year renewed its contract for fifteen years.
762. Do you get a subsidy from your Government? Yes; for fifteen years.
763. Have you any other subsidy besides that? Yes; we have a subsidy for the Brazilian line, for the Mediterranean, Japan, and different places.
764. Do you pay the Government here an annual rental for the use of your wharf? Yes; we pay the Sydney Government £2,500 for the shed and wharf.
765. Do you collect wharfage rates and other dues? The company does not. When I proposed an extension of the wharf the Government replied to me: "We will extend the wharf, and the company will pay a proportionate rent according to the expense for extension."
766. Do you know why the proposed improvement that you suggested has not been recommended? No.
767. *Mr. Humphery.*] The plan you now show will not provide you with the accommodation you require? No.
768. *Mr. Watson.*] As a matter of fact if the plan now before us is recommended by this Committee you will be unable to berth your new steamers? It will be possible, but very dangerous.
769. With a vessel requiring 540ft. will it not be impossible to lie alongside of 490ft.? Yes; it is impossible. The Government have proposed to extend it.
770. *Chairman.*] You will have to back your steamers in? Yes.
771. Under the proposed arrangement can you berth your new steamers? Certainly not, for if the plan proposed by the Government were maintained, our steamers would have great difficulty in coming alongside and leaving the wharf, and the operation would be dangerous.
772. Supposing the P. and O. Company's steamer is lying at the new wharf could you possibly berth one of your new steamers in the place set apart for it on this plan? It would be possible, but it would be dangerous. We should certainly be damaged.
773. *Mr. Suttor.*] For the proposed accommodation would you be prepared to pay extra rent? Certainly. When I wrote to the Government they replied asking that I should pay a rent proportionate to the expense they were put to in providing the additional accommodation. I pay £2,500 a year for 490 feet, and I want 40 or 50 feet more, and I will certainly pay for it in proportion to the expense incurred by the Government.
774. Have you informed the Government of that? Yes. The Colonial Treasurer wrote to me, and I wrote to him that I am prepared to pay.
775. Have you received any reply? No; the Government told me when I asked for an extension that they were prepared to make the extension, but that the Company must pay rent in proportion. I have accepted that. I have received a letter from Captain Jackson stating that the Orient Company have applied for an extension of their wharf by 100 feet, and that that extension can only be done in a northerly direction in front of my company's wharf. I have replied to that letter stating that if the extension is made only on one side it will be inconvenient for our steamers, and that it would be better to extend the Orient Company's wharf 50 feet on one side and 50 feet on the other. Captain Jackson told me some days ago that the Government has decided to put 50 feet on each side.
776. *Mr. Garrard.*] What is the beam of your vessels? Thirty-five feet.
777. *Mr. Copeland.*] Are you inconvenienced at your present wharf? No; because there is nothing before the steamer.
778. As a matter of fact you are not inconvenienced? When the P. & O. Co's. steamer is before us it will be very difficult to come in.
779. *Chairman.*] Your new steamers will be much larger? Yes; very much larger; like the steamer Ormuz. The present steamers will be sent to China. The first new steamer will arrive here in July or August next year.
780. Do you take merchandise as well as passengers from here? Yes; the steamer is always full of merchandise.
781. Do you take much wool? Chiefly wool, for various places—Marseilles, London, and other places.
782. How do you send the goods to London; do you tranship them? We have a cargo boat from Marseilles to London for goods only. When the steamer arrives at Marseilles the steamer tranships the goods for London.
783. And to other ports as well? Yes.
784. Do you bring any goods back again to this Colony in return? Yes; merchandise; the steamers are always full.
785. From all ports? Yes; from London, Belgium, and everywhere.

George

George Alfred Tillet, Esq., Assistant Engineer for Harbours and Rivers, sworn and further examined:—

786. *Chairman.*] Have you had a great deal to do with the proposed improvements at Circular Quay? Yes.

787. What is your office? Assistant Engineer for Harbours and Rivers.

788. Do you make any of the surveys of these proposed works? No.

789. Who actually made the surveys? An officer of the Department named Halligan.

790. The project has been recommended I suppose by the Harbour Master? Principally by the Harbour Master or Captain Jackson.

791. Has your attention been called to the accommodation required by the Messageries Maritimes Co.'s service? Yes.

792. Has it been pointed out to you that the steamers the company are now building are very much larger than the steamers they now use? It has been pointed out that the largest vessel they would probably bring into port would be 500 feet long.

793. Could those vessels be accommodated sufficiently by the project now before this Committee? I think so, without any difficulty.

794. What is the length of the wharf frontage proposed to be given to them? At present it is 480 feet.

795. Their new vessels will be 500 feet long? Yes.

796. Do you think the wharf frontage will accommodate vessels 500 feet long? The proposition is to allow the Messageries Maritimes Co. to occupy a portion of the new berth now being constructed for the P. & O. Co.'s steamers, whereby the Messageries Maritimes Co.'s steamers will have 530 feet frontage. That is to the north of the berth occupied by them at present.

797. How can that be done;—will not the bow of the Messageries Maritimes Co.'s boat protrude over the other wharf? It will be part of the wharf now shown in red on the plan, which is being erected for the P. & O. Co. There is a slight pencil line showing where the Messageries Maritimes Co.'s steamer will extend to. There is sufficient rounding in the bow of the Messageries Maritimes Co.'s steamer to fit into the recess shown in the wharf on the plan.

798. *Mr. Kethel.*] By how many feet will the proposed extension of the Orient Co.'s present berth encroach upon the berth of the Messageries Maritimes Co.'s steamers? If you look at it from that point of view we should be depriving them of 25 feet.

799. And the present length they have is 480 feet? Yes.

800. That will reduce the Messageries Maritimes Co.'s berth to 455 feet? There is only 40 feet taken from them, not 50 feet.

801. *Chairman.*] How many actual feet will the Messageries Maritimes Co. have when the extension of the Orient Co.'s wharf is taken off? 460 feet actually. That is looking at it from Mr. Kethel's point of view. He assumes that we take away part of the Messageries Maritimes Co.'s wharf, whereas we do not actually take any of their frontage. There is plenty of room for the vessel to back in and occupy the whole length of the wharf alluded to.

802. What is the beam of the steamer? 45 feet.

803. How can you take in a vessel of that beam into a recess of 40 feet;—you are to deprive the vessel of at least 30 feet of wharfage; that will leave her only 450 feet;—the new steamers will be 500 feet long and will require a wharf space of 540 feet? Mr. Kethel has taken 500 feet to be the length of the taffrail, whereas the level of the wharf is below the vessel, so that the edge of the taffrail may be taken over the edge of the wharf.

804. *Mr. Garrard.*] At low water would not the rail be level with the wharf? Never.

805. *Mr. Watson.*] There will be only 460 feet for the Messageries Maritimes Co.'s steamer when you take off 40 feet? No; 440 feet.

806. Supposing they bring here vessels 500 feet long, how are they to be berthed in that space? By allowing the vessels to project along the wharf now being built for the P. & O. Co.

807. Then there would be 60 feet to be taken from the P. & O. Co.'s Wharf? Yes.

808. What distance would the Messageries Maritimes Co.'s steamer be from the wharf to allow her to lie along there? The bows of the vessel would fit into the angle.

809. Would the round of the vessel fit in there? Practically she could not lie close to the wharf.

810. *Mr. Garrard.*] How much would it cost to run out a wharf on the echelon principle for the Messageries Maritimes Co.'s line, so as to do away with that provision in the plan for an angle? I could not state it exactly without some measurement.

811. *Mr. Kethel.*] Would it be much expense to so far depart from the present design as to make an echelon wharf, as suggested by Mr. Garrard, in order that the Messageries Maritimes Co.'s boat might overlap the P. & O. Co.'s Wharf in the same way as the Orient Co.'s boat will overlap the Messageries Maritimes Co.'s wharf;—is the bottom rock or mud? Two or three feet of mud with rock underneath it. The proposal you speak of has been gone into, and this matter of berthing the French vessel, as proposed on the plan, has been approved of by Captain Jackson, who has to do with the berthing of vessels. He is fully convinced that the proposed arrangement will meet all the requirements.

812. Are you aware that the agent of the Messageries Maritimes Co. has protested against this arrangement, and declares that it is not sufficient? I am not aware of that.

THURSDAY, 20 SEPTEMBER, 1888.

EVENING SITTING.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.

The Hon. WILLIAM HENRY SUTTON.

HENRY COPELAND, Esq.

ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee further considered the proposed Improvements to the Circular Quay.

Captain Henry Pettit, Harbour Master at Sydney, sworn and further examined:—

813. *Chairman.*] Are you the Harbour Master of the Port of Sydney? Yes; I have held that office for some years.

814. Have you had considerable experience in matters relating to the berthing of the vessels and the general

Captain
H. Pettit.

20 Sept., 1888.

Captain
H. Pettit.
20 Sept., 1888.

general management of the trade connected with the shipping in the port? Yes; for the best part of my life I have been connected with the harbour work.

815. With reference to the evidence you gave a few evenings ago, we are anxious to have from you some expression of opinion as to an apparent difficulty which has cropped up with regard to the accommodation for the Messageries Maritimes Co. under the proposed improvements. We have been examining M. Conil, the agent of the Company, and he complains that the accommodation proposed to be given to him will not be sufficient for the large vessels the company are now building. Are you aware that they are building vessels larger than those now used? Yes, I have heard that that is the case.

816. Do you know the length of their boats which come here at the present time? 430 feet.

817. The new boats will be 500 feet long? 515 feet I have been told; 500 feet between the perpendiculars.

818. We have been told in evidence that they are likely to have their large boats here in the course of a few months. In that case do you think that the proposed accommodation would be sufficient to meet the requirements of the new steamers? I do not think the present wharf would be suitable for them in its present state.

819. What is the length of their present wharf? The available length they have got is under 500 feet. They have a small portion at the southern end taken up with a landing stage, and the available length of the wharf is, I suppose, about 480 feet.

820. In that case it would be impossible to accommodate vessels 500 feet or over 500 feet long? It might accommodate their hatches, but a portion of the steamers would be projecting over the boundary of their present wharf into shallow water.

821. The bowsprit? The present class of steamers have straight stems, with nothing protruding from the stem.

822. Under these circumstances do you think that the proposed design would be sufficient for those large vessels? Not the present Messageries Maritimes Co.'s berth. They will be larger and will draw more water, and at the northern end of their berth there is only about 15 feet of water at low spring tides. At present they are kept off some 20 feet forward to keep them in sufficient water, even with their present light draught. If their larger boats take in their coal and load to 22 feet they would have to be kept some distance out to prevent them from taking the ground. There would be considerable distance between the steamer and the wharf. She would not touch the wharf at the northern end.

823. The agent of the Messageries Maritimes Co. suggested the propriety of accommodation being provided for him by building out some distance on the echelon principle south of the P. & O. Co.'s berth, so as to allow the bow of his vessel to overlap the P. & O. Co.'s steamer in front? That would make the wharf more easy of access, for I understand from the plan that there is a small portion left between the Messageries Maritimes Co.'s wharf and the proposed new wharf for the P. & O. Co. for the accommodation of small vessels. It will always be a source of trouble to the Messageries Maritimes Co.'s boat, because it will be taken up by coal-laden vessels. If the wharf were taken out in the northern corner on the echelon principle I think it would be far better. At the present time we have a great deal of difficulty in keeping the steamer's propeller clear of the wharf. We have to let go an anchor and ease the steamer in forward. Even with a light breeze from the westward we have great difficulty in berthing the steamer safely.

824. It is your duty to see that these vessels are properly berthed? It is part of my duty. Others may do it, but I am responsible. There are only three of us—myself and two assistants—and we have to do the whole of the removal work of the harbour.

825. Supposing that these proposed improvements were carried out, and the P. & O. Co.'s wharf and the Orient Co.'s wharf were occupied, and you had to find a berth for the large vessels of the Messageries Maritimes Co., could you do it with the arrangements as now proposed? I daresay it could be done by keeping the bow of the French steamer sufficiently far off with an anchor.

826. How would you do it? I should let go an anchor, and not let her bow go near the wharf.

827. Would not that be dangerous? Not dangerous, but inconvenient.

828. Would it not be dangerous in case of a storm? No. With a chain out, and a good anchor and fastening it would be perfectly secure. But there would be a lot of waste space, and there would be water between the ship and the wharf.

829. Then on the whole do you think that even with the proposed present arrangement there would not be much danger in berthing the Messageries Maritimes Co.'s boats? No.

830. Do you think it would be better if the plan were altered as already described? Yes; a great deal better.

831. Can you form an estimate of the probable cost of the alteration? I cannot.

832. Would it necessitate building out behind the P. & O. Co.'s wharf? It would not interfere with the water space in the Cove, because the northern end of the Messageries Maritimes Co.'s berth lies in an indent. If you berthed a ship of the stated tonnage and draft, in order to keep her in deep water, you would have to keep her bow out, and you would get no benefit from that part of the wharf.

833. As a man of large nautical experience, do you think it would be desirable to build out the wharf in the manner proposed? Yes; I think it would be a great improvement for the Messageries Maritimes Co.'s berth.

834. Do you think that it would be a more complete work? Yes. The P. & O. Co.'s boats could moor inside the Messageries Maritimes Co.'s boat's bow.

835. Of course you are aware that the company occupying this wharf pays largely for it, and would be prepared to pay a larger return on the increased outlay if it gets the accommodation asked for? It will be a very beneficial thing for the Messageries Maritimes Co.'s berth if it were built out as suggested at the northern end. I do not know how it would affect the new wharf for the P. & O. Co., but it would be a very great improvement for the Messageries Maritimes Co.

836. Do you think that the space of the P. & O. Co. would be affected by it? No. It would cause them to build a little further out. I do not see how it could affect the P. & O. Co.

837. Their position would be exactly the same as it is now? Yes.

838. *Mr. Garrard.*] Are you aware that the Orient Co. complains of a want of sufficient wharfage to work their hatches, and that, to meet their complaint, this proposed addition is to be made? Yes.

839. If the plan of an echelon wharf, which has been suggested to you, were carried out, is there anything to prevent the Orient Co. from having 90 feet instead of 50 feet;—is it not simply a question of taking it to the

Captain
H. Pettit.
20 Sept., 1888.

the northward provided there is sufficient berthing space for the P. & O. boats? The further out you bring the Orient Co.'s wharf the greater will the indent be into which the Messageries Maritimes Co.'s boat will have to be backed, and it will be all the more difficult to keep the propellers clear.

840. There is 120 feet of space more than is required by the Messageries Maritimes Co. and the P. & O. Co., so that the Orient Co.'s wharf might be lengthened at the northern end? Yes.

841. Is it more desirable to lengthen the Orient Co.'s wharf at the northern than at the southern end, because lengthening the southern end would interfere with other vessels? Yes; the northern end would be better.

842. What is the beam of the P. & O. Co.'s boats? 50 feet.

843. If the wharf were run out from 55 feet to 60 feet, would there be plenty of clearance between the P. & O. Co.'s boat's port quarter and the starboard bow of the Messageries Maritimes Co.'s steamer? Yes.

844. Would that be better for getting the vessel in and out? Yes. I would not recommend too much projection at the northern end of the Orient Co.'s wharf. Hauling up a steamer with twin screws in a narrow space would make it very risky for the propellers.

845. If the wharf were kept square I do not see how that could occur? That is true.

846. *Mr. Sydney Smith.*] What is the depth of water at the south end of the P. & O. Co.'s new wharf? It is shallow water, and it will have to be deepened considerably.

847. What is the present depth? At the northern end of the present Messageries Maritimes Co.'s wharf there is 14' or 15 feet of water at low water spring tides. It is rocky formation all along there, with very little silt on it.

848. Would it be very costly to get out? Yes; it would entail blasting and all that sort of thing.

849. How far out does that extend? As you go out the silt is deeper on it.

850. What is the depth of water? 23 feet at low water, and 15 feet alongside the wharf.

851. How many feet of wharf do you require for the P. & O. Co.'s boats? Over 500 feet. Their new boats are just 500 feet long.

852. Supposing the expenditure were too much to carry out the new proposal, how would it answer if we did not extend the P. & O. Co.'s wharf to the full distance south, which is now proposed so as to permit the Messageries Maritimes Co.'s wharf to extend further north? I do not see what could then be done with the vacant space between the two ships.

853. More space is required to accommodate the Messageries Maritimes Co.'s steamers as the present proposed wharf will be too short to accommodate their new boats. Supposing you were not to build out their wharf on the echelon principle, but simply to make it a straight line, would not that give ample room? You might then accommodate the three mail companies, if you allowed them to encroach one on the other.

854. By doing this would you not save expense, and at the same time give better accommodation to the Messageries Maritimes Co.'s boats, while you would not interfere either with the Orient Co. or the P. & O. Co.? That would be a very expensive undertaking. It is rocky formation where the P. & O. Co.'s wharf is being made, and the further you go towards the point, the rock is worse and the water shallower. It is very shallow also at the south end of the P. & O. Co.'s wharf.

855. Do you think that the additional expense would be very great? It is very expensive when you have to drill holes in the rock. From the experience I have had of berthing the steamers, I think that M. Conil's suggestion would be very useful and beneficial to the Messageries Maritimes Co. if it were carried out. It would also give more wharf accommodation, because a certain amount of the space now shown on the plan will be of no use whatever. Owing to the shallow water the steamer will have to lie off, so that that portion of the wharf will be of no use.

856. Is there only 12 feet of water at the south end of the P. & O. Co.'s wharf? About 13 feet or 14 feet. That is at the entrance to the present boat-shed.

857. Will that be of service to the P. & O. Co. any more than to the Messageries Maritimes Co.? I have not seen the boundary to which the P. & O. Co.'s wharf will come, but I suppose from the plan that it will come to the present Government shed for the "Nea."

858. What I wish to ascertain is this: We have at present more than sufficient accommodation for the P. & O. Co.'s boats at the new wharf now being made for them; if, however, that wharf were only extended to about within 60 feet of the northern end of the present Messageries Maritimes Co.'s wharf, would not that allow of sufficient accommodation being given for even the largest vessels that will come alongside the Messageries Maritimes Co.'s wharf? I think so. There is a vacant space at present between the two Cos.' wharves, and I heard the wharf manager say that he intended to use that space for small vessels.

859. That is intended to be set apart at the northern end of the wharf? If there is to be 100 feet to spare between the two berths, then of course the Orient Co. could have a longer space allowed them, and they could go farther northward, and the same would apply to the Messageries Maritimes Co.

860. *Mr. Garrard.*] Would not that plan, which has just been suggested to you, intensify the difficulty of getting steamers in and out? I think so.

861. The further you go into the bight, is it not harder work to moor the ships? Yes. We want to do away with that bight.

862. And the further out you get, the easier it is to work? Yes; without interfering with the working part of the harbour.

863. *Mr. Campbell.*] Have you been consulted about these improvements? No.

864. Has not even your opinion been asked in any way? No.

865. *Chairman.*] Do you think that the improvement suggested by the agent of the Messageries Maritimes Co. would be the most desirable course to adopt? I certainly think it would be a very great improvement for the Messageries Maritimes Co.

866. *Mr. Kethel.*] Do you thoroughly understand what it is that M. Conil requests? Yes.

867. *Chairman.*] That the wharf is to be carried out for some distance on the echelon principle at the south end of the P. & O. Co.'s wharf? I quite understand that.

868. *Mr. Kethel.*] Have you any idea what is the depth of water 50 feet off the northern end of the present Messageries Maritimes Co.'s wharf at the northern angle? About 20 feet at low water spring tides. That is 50 feet out from the present wharf face.

869. Then if the wharf were extended at the northern end (say) 50 feet out, there would be water enough for most steamers to lie alongside without deepening it? I think we could then carry the wharf into deep water, so that there will be no necessity for blasting or dredging.

Captain
H. Pettit.
20 Sept., 1888.

870. The ship's forefoot would be 25 feet out, which would give 75 feet out from the present line, so that the vessel could lie afloat at all times? Yes; and I think it would make a very good job of it.

871. You have stated that if the P. & O. Co.'s wharf is carried into the corner shown on the plan, the rock will have to be blasted in order to make the water deep enough for the stern of the P. & O. Co.'s steamers? Yes.

872. If the Government decide upon keeping out the wharf, as now suggested, would not the money saved by not having to blast away so much rock, largely pay the expense of forming a pile wharf in the manner suggested by M. Conil? There is no doubt it would relieve the cost a great deal. There would not be the expense and long job of drilling holes for the piles in the rock. If you went out 50 or 60 feet you would get into deep water, and there would be no necessity for blasting or dredging.

873. Would there be greater safety and less liability to accident or collision between the stern of the P. & O. Co.'s steamers and the bow of the Messageries Maritimes Co.'s steamers if berthed, as now proposed, than would be the case if the present plan were carried out? I think so.

874. Because, except by accident, it would be impossible for the two ships to come into contact? If the Messageries Maritimes Co.'s boat is kept flush with the company's wharf boundary you could not come into contact.

875. You have stated that you have to keep the bow of the Messageries Maritimes Co.'s boat at present some 15 feet off the wharf, and that, therefore, you have to drop one of the anchors in the stream. But in westerly winds do you not have to drop an anchor off the bow of all the mail steamers before mooring them? As far as the present P. & O. Co.'s berth on the western side is concerned, the anchor is merely let go for convenience in going away. It would entail the employment of two tugs to get the ships off the wharf if we had not an anchor down.

876. With the exception of the Messageries Maritimes Co.'s boats, where an anchor is laid out to keep the ship's bow from striking the rocks, the anchors are laid out for the other mail steamers for convenience and not for safety? Yes; the P. & O. Co.'s boat can lie alongside the western wharf without any risk of touching the ground.

877. *Chairman.*] That does not apply to the eastern wharf? No.

878. The anchor put out in the case of the Messageries Maritimes Co.'s boat is necessary for her safety? Yes.

879. Have the Messageries Maritimes Co.'s boats to lie now some distance off the wharf? When they come from Noumea and are light they can go close in. The vessel is kept as far back as possible, where the depth of water is greatest. When, however, the steamers are full of cargo and loaded with coals they are kept off the wharf with an anchor, or, what is called a "dummy," that is, a floating stage. It would be a great improvement to have a wedge-shaped piece of wharf, coming to nothing at one end and running out 50 feet at the other.

880. The Messageries Maritimes Co.'s steamers could then come up to the wharf loaded or unloaded? Yes. The officer might let go an anchor when the wind would be on the beam, merely to ease the ship, and might have a tug on the quarter, but that would be a matter of handling the ship.

881. Do you think it is desirable that, in view of the value of this State property the most complete improvements should be made? I think the class of ships we have coming to the port cannot be too well accommodated.

882. Do you think that if this frontage we are now talking of, which is to be occupied by the Messageries Maritimes Co. belonged to private individuals, the most complete accommodation would have been given before this time? I think so. I think private people would have heard more of the complaints of the masters and of the people having to do with the steamers.

883. Especially in view of the large return obtained in the shape of rent and wharfage rates? Yes. I think the Government ought to give very good accommodation, for the ships are very valuable and large, and if they came into contact with anything they would be likely to sustain serious damage.

884. As proprietors of this property, do you think that the Government ought to give the necessary accommodation for carrying on the commerce of the port? Yes; I would recommend that to be done.

885. *Mr. Kethel.*] Have you been made acquainted with the details of the proposed accommodation for the launches and boats of the various branches of the public service—the Customs, Police, and Marine Board? I have not been over the ground, but Captain Hixson told me where it was intended to provide that accommodation.

886. Do you know how it is to be laid out? No. I have not seen the plans of the proposed improvements.

887. *Mr. Sydney Smith.*] What is proposed to be done now with regard to dredging at the new wharf in order to make it suitable for the P. & O. Co.;—do you know if that is part of the new contract? It will require a lot of dredging to provide the necessary depth—not only dredging, but blasting I should think. Those vessels want 27 feet at low water.

888. In that case will they not have to dredge 13 feet there? Yes; or build the wharf sufficiently far out into deep water, and that would encroach too much on the water space in that part of the harbour. It is all rocky formation out to the sewer buoy. It is a very expensive place to deepen. I think it would facilitate matters very much if the Messageries Maritimes Co.'s wharf were built out in the manner suggested, so that the vessels of the two Companies would lie clear of one another, and not in a straight line.

889. *Chairman.*] Do you think that would be the most desirable course? Yes.

890. Can you give any information as to the probable cost of that work? The cost would be regulated a good deal by the blasting work. When you have to drill holes in the rock it is a tedious operation.

891. Would they have to drill holes in the rock to carry out the improvement we are now speaking of? I do not think they would have to do so for the outer piles. They might have to do so in the case of a few of the innermost piles. As they go to the deeper part, towards the Orient wharf, they would get sufficient hold in the mud.

892. Supposing this improvement were adopted, what width would it be necessary to make the northern part of the wharf? Mr. Kethel has mentioned 50 feet. Another 25 feet would leave ample space.

893. Would that interfere with the trade or traffic of the Cove? No. If the wharf were built as now suggested the vessel could steam right out from the wharf clear of the point. Now she cannot do that.

894. Could the vessel then be berthed at much less expense, and would it be easier in every way? They would still require to have the same appliances.

895. She does not back herself in absolutely? No; she always has a tug.

896. They take the precaution, to ensure absolute safety, to have the assistance of a tug? Yes. They could dispense with a tug at times, but at other times they could not; and the charge for a tug is small.

897. *Mr. Campbell.*] Have the Messageries Maritimes Co.'s boats been hitherto berthed satisfactorily? Yes. As M. Conil may perhaps have told you, they have made remarks about the wharf being too far in.

898. Has the berthing of their vessels been carried out without loss or accident? Yes.

[*The Committee decided to defer any further consideration of the proposed improvements to the Circular Quay until a plan was prepared showing how the wharfage accommodation on the eastern side could provide for the berthing of the steamers of the Messageries Maritimes Co. close alongside the wharf for their whole length, together with an estimate of the cost of such provision, and information concerning the necessity or otherwise for dredging operations, in order to obtain the required depth of water.*]

WEDNESDAY, 26 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTOR.

The Hon. FREDERICK THOMAS HUMPHERY.

HENRY COPELAND, Esq.

ALEXANDER KETHEL, Esq.

JOSEPH PALMER ABBOTT, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee proceeded to further consider the proposed Improvements to the Circular Quay.

Robert Hickson, Esq., M.I.C.E., Acting Engineer-in-Chief for Harbours and Rivers, sworn and further examined:—

899. *Chairman.*] You are Acting Engineer-in-Chief for Harbours and Rivers? Yes.

900. You have given evidence before with regard to the proposed improvements at the Circular Quay? Yes.

901. Do you see any occasion to alter the evidence you have already given? No.

902. Do you consider that the improvements proposed are necessary? Yes.

903. Since you gave evidence a few evenings ago it has been proposed to alter some of these wharves where accommodation is to be given to the Messageries Maritimes Co.;—have you been informed of that? Yes.

904. Are you aware of the proposed alteration? Yes; I have heard what it is.

905. It is proposed to enlarge the wharfage accommodation by means of an alteration of the shape of the wharf? Yes; pushing it out a little.

906. The northern end is to be carried out some 50 feet? Yes.

907. Do you think that that proposed alteration would meet the requirements of the Messageries Maritimes Co.? Yes; undoubtedly it would.

908. I mean for the boats they say they are building? Undoubtedly it would. The present wharf, as shown on the original plan, will accommodate vessels 500 feet long. That is shown by the model of a steamer which I now produce, and apply to the plan.

909. What is the length of the model which you now produce? 500 feet. It is a model of their new boats, 500 feet long.

910. Do the width and all other proportions of the model fairly represent their new boats? Yes.

911. Do you think that under these circumstances the proposed wharf, as designed, would give sufficient accommodation for a vessel of that size without any danger? I think so.

912. Have you in your engineering capacity had anything to do with the arrangement of shipping? Yes.

913. Do you think that the accommodation provided by the original plan would be sufficient? I think it would.

914. Supposing the Orient Company's steamer was at that company's wharf at the same time, what distance would it be from the Messageries Maritimes Co.'s boat? Very nearly 30 feet.

915. What distance would there be between the Messageries Maritimes Co.'s steamer and the P & O Co.'s steamer? The bow and stern of the two steamers would be against each other.

916. Would that be safe under all circumstances? Yes. They would not venture to touch.

917. Would it be safe in case of storms—"southerly bursters," or westerly winds? Yes.

918. Do you think that the present arrangement would be better than the proposed arrangement for increasing the width of the wharf at the northern end? I do not see that there is very much difference between the two. Perhaps the new arrangement proposed would be better, but it would cost more.

919. Do you think that if the company interested paid for the difference in the outlay the new proposal would be the better course to adopt? Yes.

920. Would it be safer? It would be more convenient, no doubt. I think the other proposal is quite convenient, because I see no difficulty in the way of working the steamers.

921. *Mr. Copeland.*] In allowing for these distances, have you considered the top gearing of these vessels—the mizen yards of the Messageries Maritimes Co.'s boat, and the foreyards of the Orient Co.'s boat? There are no yards on the mizen-masts of those steamers. The stern of one steamer would lie abreast of the bow of the other.

922. The bow of the Orient Co.'s boat would overlap the Messageries Maritimes Co.'s boat? Yes. The one inside has no yards. The outside one has. That would not matter very much, because, as a matter of fact, in the London docks those vessels lie alongside each other, and have to trim their yards accordingly.

923. *Mr. Humphery.*] Can you say approximately what the additional cost of the proposed alteration would be? £5,000.

924. *Mr. Kethel.*] Does not that seem to be a very large amount for such a small piece of wharf? That is because we have to build in deep water, and have to use longer piles. It is the whole length of the wharf.

925. Will you have to drill any holes, or will you have to drive the piles? I think we shall have to drill some, which will increase the cost, and we shall have to strip off a piece of the old wharf to tie in.

- Rober
Hickson, Esq.,
M.I.C.E.
26 Sept., 1888.
926. *Mr. Garrard.*] If the wharf is made as now proposed on the echelon principle, will the Messageries Maritimes Co.'s boat project 30 ft. over the P. & O. Co.'s boat? The wharf is 470 ft. long; the one steamer would project 40 ft. over the other.
927. What is the width of the proposed new echelon? Fifty feet at one end, running to nothing at the other.

James Powell, Esq., Collector of Customs, sworn and examined:—

- James Powell,
Esq.
26 Sept., 1888.
928. *Chairman.*] Have you had a great deal to do with the management of vessels in this harbour? Yes; in connection with the Wharfowners' Association.
929. Are you now Collector of Customs? Yes.
930. How long have you occupied that position? Seven years.
931. Has your attention been drawn at different times to the accommodation given by the wharfage at the Circular Quay, and by the other wharves in this port? Yes; for thirty-five years.
932. Has it appeared to you that the wharfage accommodation at any time has been insufficient for the requirements of the port? As my voice is bad, I have placed my views on the subject on paper, and I would be happy if you would receive it as my evidence. My statement is as follows: The sufficiency of the present wharfage accommodation to meet the requirements of the port of Sydney is in my opinion established. The nature and character of the accommodation afforded is open to criticism. There has existed in the past, and there now exists, an unhealthy competition between the Government and the private wharfowners. Every shilling spent by the Government in improving wharf property increases the competition without advantage to the general public. The question has not been so much to advance the trading interests of Sydney as to secure a certain share of tolls derived from the importation and exportation of goods. That there has been competition is in itself good evidence that the accommodation has been something in excess of requirements. It should be kept in mind that the toll imposed upon importers and exporters for the privilege of passing their goods over any wharf in Sydney is regulated by an Act of Parliament. The rates imposed by the 7 Vic. No. 12 varied considerably, with a general basis from 2s. 6d. to 3s. 6d. per ton. These rates continued to be collected at the public and private wharves until July, 1880, when a reduction was made on a general basis of 1s. 8d. per ton on imports, and 10d. per ton on exports. Tonnage rates for the use of wharf frontage were also imposed. It may be desirable to ascertain the cause of the reduction in the rates charged, and the reasons for interfering by legislation with the rates to be collected at the public, and indirectly with those charged at private wharves. There was at the time of the alteration in the rates more than sufficient accommodation for the discharge and loading of ships. The Government wharves (then comparatively unimproved) did not very actively compete with the private wharves. The public wharves were at times almost deserted, and ships discharged mainly at private wharves. The open secret was that shipowners, ship masters, or ship agents secured rebates of the total wharfage rates collected, sometimes to the extent of 75 per cent., very frequently to the extent of 50 per cent. and rarely less than 33 per cent. The unrivalled site belonging to the Government presented no advantages over the private wharves. The Government did not at that time openly give rebates, but during part of the time the rates were farmed, and the competition left the lessees (in some instances) with heavy loss. The importers of goods paid the rates of 3s. 6d. per ton simply as a toll, receiving no benefit or advantage of any kind except to take delivery of their property. They had no voice in the selection of a wharf for the discharge of their goods, and they knew that from 33 to 75 per cent. of the amount paid as wharfage was returned to persons who gave no service of any kind for the enforced bonus. At length the aid of the Government was importuned by the importers. It was urged that nothing was done for the money paid as wharfage, that the toll was a spoil to be clamoured for, and that the accommodation required for the safe keeping and protection of goods when landed was altogether uncared for. The accommodation necessary for the discharge of ships at public wharves was not considered. The efforts of private wharfowners to improve their properties did not conduce to their advantage. Shipowners and agents sought the highest rate of rebate obtainable with the best accommodation, but the rebate was the first consideration. The offer of the highest rebate from the owner of the least improved property was the lever used to get more favourable terms from those who had increased the accommodation for the benefit of importers. The way out of the difficulties, recognized by the Government, was to improve the Government wharf properties, and to sever the rebate knot by reducing by Act of Parliament the rates authorized to be collected at public and private wharves. A new scale of rates was fixed by the 44 Victoria No. 8, on a basis of 1s. 8d. per ton on goods imported, and half that sum on goods exported. The reduction of the rates did not stop the allowance of rebates. A powerful combination of wharfowners failed to maintain the collection (without rebate allowance), even at the rate of 1s. 8d. per ton. The Government allowed rebates on the reduced rates. The whole competition remained, and remains, proving that there is ample choice of, and therefore a redundancy of, accommodation. It is so common to read statements made about the vast increase of trade in the Colony, and the insufficiency of the wharfage accommodation to meet the expanded and always expanding shipping tonnage that figures quoted in support of such statements appear, until they are closely examined, almost unanswerable. In the year 1851—the year of the separation of Victoria from New South Wales, the trade of this Colony fell to 553 vessels, with tonnage measuring 153,002 tons register. In 1855 (including Queensland) the number of vessels entered was 1,152, of 353,323 register tonnage. In 1886 the steam tonnage entered was 1,494,003 register. The sailing tonnage was 620,615 register. The conditions have altogether changed. Those of us who can recall the clumsy appliances for dumping wool existing about, and subsequent to, the year 1853, know that the unloading and loading of a ship was a question of months. The tonnage of sailing ships at that time appears insignificant when compared with the tonnage (sailing and steam) of the present time. The time for unloading and loading is reduced to a minimum period. In the old days it was by no means uncommon for a large vessel to occupy a berth for fully two months—often much longer. Now a vessel of 3,000 tons enters, discharges, loads, and leaves Sydney within a fortnight of arrival. In support of my assertion that the present wharf accommodation is sufficient for the trade of Sydney, so far as area and extent are considered, I ask attention to the following: At the present time the Government wharf, Circular Quay, east and west side, accommodates the largest total of tonnage entering
Port

Port Jackson. The Circular Quay accommodates the largest tonnage, and berths the greatest number of ships in a year. All this is, however, due to private enterprise engaged in utilizing public property. The ships of the P. & O. Co., and the Orient Company, the Messageries, and the German Lloyds swell the tonnage at the Circular Quay, and the companies named, or three of them, put more ships during a year alongside their leased sections of the Quay than any private wharf can show, excepting the wharves occupied by local and intercolonial steam companies. Any extensions of a remunerative character required by the Government tenants at the Circular Quay should be favourably entertained. The full wharfage is paid by the importers of goods landed on the leased sections, and the question of rebate cannot enter. But it would be exceedingly difficult to convince an importer or exporter of goods discharged or laden at the Circular Quay that the Government would act fairly by taking 1s. 8d. per ton on goods landed at the leased wharves, and refunding 5d. per ton of the importers' money on goods landed at the next berth on the Quay. I think it can be clearly demonstrated that additional extensions at the Circular Quay and other Government water frontages in Port Jackson are not urgently needed, and that any proposed extensions (other than those previously referred to) would simply invite and establish unhealthy competition with all the attendant disadvantages of a return to heavy rebates. It may perhaps be desirable to know roughly what the present accommodation is in Port Jackson for the discharge of cargoes sea-borne. The Government wharves at the Circular Quay, Woolloomooloo Bay, and the head of Darling Harbour, represent one section. The associated wharfingers are represented by the Central, Dalton's, Dalgety's, Dibbs', Moore's, Parbury's, Saywell's, Smith's, Towns', Washington, and Walker's wharves. The Association can berth twenty-seven ships of large tonnage, and they can berth a ship of 750 feet with a depth of water to 28 feet. There are also the wharf properties occupied by the intercolonial and local steam companies, nearly all of which enter the lists in competition by giving rebates against Government and the associated wharfingers. In order to gain an idea of the inward tonnage subject to competition, I have made a careful analysis of the shipping statistics for 1887. I have rejected all intercolonial trade, because that tonnage is provided for outside general wharfage competition. The arrivals during 1887, were:—From Great Britain—Sailing ships, 123; tonnage, 154,289. Steamships, 86; tonnage, 205,882. From United States—Sailing ships (including timber cargoes) 45; tonnage, 41,852. Steamships, 12; tonnage, 22,367. Hongkong—Steamships, 51; tonnage, 75,176. From France—Sailing ships, 3; tonnage, 1,955. Steamships, 13; tonnage, 34,542. From Germany—Sailing ships, 12; tonnage, 8,626. Steamships, 14; tonnage, 27,816. From India—Steamships, 13; tonnage, 21,200. This is not a very formidable list of vessels to be accommodated when the extent of the existing accommodation is taken into consideration. I do not think any person can say that he has been unable to obtain a berth for a discharging ship during the past twenty years. The question then follows: Is it necessary to increase wharfage accommodation at the public charge, and what guarantee is there that such public outlay will give a fair return for the amount proposed to be expended. We have seen the Circular Quay when almost deserted by ships, and this has been brought about by the rebate system. Increase wharfage accommodation in excess of trade requirements, competition will follow, the rebate system will be continued, and the return for the expenditure of public money on wharf extension will be reduced. It appears to me, that the war of wharfage rebates and allowances can only be controlled by the creation of a Harbour Trust, embracing the control, working, and direction of the water frontages of Port Jackson. Such a trust would regulate with authority the trade of the port, and would put an end to unseemly competition between the Government and private owners of wharf property. It is so usual to hear complaints about charges, that surprise is not felt when complaints are made about the charge for wharfage. The main reason for complaint is that nothing is given in exchange for the payment beyond the mere use of the wharf as a landing place. There is, of course, the additional complaint that any rebate of wharfage given to shipowners or agents, is a gift of importers' money. It is a fact, however, that the wharfage rates are lower in Sydney than in almost any other port or place. The docks, in London, charge very much higher rates than those charged in Sydney. Yet in London competition is so severe, that dock and wharf properties are among the least paying of commercial ventures. Whenever a Harbour Trust is established in Sydney, the rates and charges for shipping accommodation will be far higher than they now are. A reasonable assessment of the Government wharf frontages, with a well ascertained statement of the amount spent thereon, would show that the investment has little to recommend it. The same applies equally to private wharf properties, the owners of which are in the hands and very much at the mercy of a class of customers who will take their ships wherever they can get the best rebate, irrespective of accommodation or consideration for the interests of those most concerned, viz., the importers and exporters.

James Powell,
Esq.
26 Sept., 1888.

- 933. Do you adopt that as your evidence before the Committee? Yes.
- 934. Are you aware of the special improvements which are proposed to be made at the Circular Quay? I have seen the plan in this room.
- 935. As a State property do you think it is advisable to spend the money proposed to be expended in making these improvements? I can only give an opinion in connection with the possibility of obtaining a return for the outlay. The improvements will undoubtedly beautify the place, and make it more attractive.
- 936. If this property were private property do you think that the owners would feel it to be their duty to improve it to the extent now proposed? I do not.
- 937. Do you know the amount proposed to be spent on it? I do not.
- 938. £120,000 is the proposed amount. Do you think that is an excessive expenditure? Not if there is a return to come from it. I do not see where the return is to come from.
- 939. Do you know what the return is now from the wharves belonging to the Government? At the present time I cannot say from memory. I have seen statements of the return.
- 940. Do you think that the system of rebates is still going on? I think it is, but I am not quite sure. It is not openly, perhaps; but I think it is going on.
- 941. Have you some doubt as to the probability of these improvements giving an adequate return for the money spent? Yes; with a view to the increased competition.
- 942. Do you think that the commerce of the port is increasing at a sufficient ratio to warrant the Government in improving their property to this extent? The commerce is undoubtedly increasing; but the facilities for discharging vessels are so great, and they are improving so fast, that the ratio of accommodation is not required for the increased number of vessels.

- James Powell, Esq.
26 Sept., 1888.
943. Of course the improvements here proposed apply to different sections of commerce. The suburban traffic is largely affected by them. Do you think that the improvements are necessary on account of the North Shore traffic, for instance? That does not give any wharfage revenue, I apprehend.
944. Do the companies not pay rent? Yes.
945. They say that it is a very good rental? I was speaking simply of wharfage charges for goods.
946. Has your attention been given at all to the passenger traffic between the Circular Quay and the different places of resort, such as Manly Beach, Watson's Bay, and other places? Only as a matter of daily notice.
947. As an ordinary citizen have you seen that this traffic is increasing, and that it requires more accommodation? Yes; that is evidently the case.
948. *Mr. Copeland.*] Do you think that at the present rate of increase of the population the present accommodation will be sufficient for the shipping trade which we may expect, say ten years hence? I think it would be very hard to forecast ten years.
949. Take the average increase in the population? Judging by the past, I think that the present accommodation will be amply sufficient for the next ten years. I am speaking of the accommodation of the port as it is, and not of the Circular Quay alone.
950. Are you alluding to all private and public wharves? Yes.
951. Do you think there is already sufficient wharfage accommodation to supply the increased population that we shall probably have ten years hence? I do; only judging by the past.
952. Have you any personal knowledge of the wharfage accommodation of other places besides Sydney—of Melbourne, for instance? Of London I have. Of course I have seen the accommodation at Melbourne, but I know nothing of the tonnage and returns.
953. Is it your opinion that with regard to covered sheds we have sufficient accommodation? Covered sheds are a great advantage undoubtedly; but I do not see the advantage arising from them particularly, unless they are locked sheds. Open sheds are merely protection for the goods from the weather.
954. Do you believe that it would be a benefit if we had locked sheds? Yes, and enclosed wharves.
955. Do you think that it would be well to have locked sheds around these wharves? I think that locked sheds on all wharves would be a very great safeguard to property, and also as far as the revenue is concerned.
956. Have you had any opportunity of seeing the increased wharfage at Melbourne which has been provided recently? I have; along the Yarra banks.
957. Did it not strike you that they have much more wharfage accommodation there than we have? Yes; it is more systematic in every way.
958. And for a population similar to our own? Yes.
959. That is undoubtedly the work of the Harbour Trust in Melbourne? Yes.
960. As a matter of fact, suppose we were to complete these proposed improvements, do you think that even then we should be equal to the wharfage accommodation at Melbourne? No; not as far as I have had an opportunity of seeing it.
961. Have you been down the Yarra to the New Cut? Yes.
962. Is there any reason why we should not have the same amount of wharfage accommodation here as they have in Melbourne? So far as the public wharfage is concerned we have not the area.
963. Is not that all the greater reason for utilizing the area we have? I am afraid the space is too small to do it on the scale on which they are doing it in Melbourne.
964. Is not that the best reason for doing the best we can with the area which we have? I think we have done that in leasing the wharves to the mail companies. I think private enterprise is doing what Government enterprise failed to do.
965. Is it your opinion that this proposed expenditure is not likely to be reproductive? It would be an embellishment, but I do not think it would be reproductive as long as competition for private wharves exists. A rebate of 50 or 60 per cent. would drive ships away from the Circular Quay at once.
966. Is rebate allowed by private wharfowners? Yes.
967. Are the Government allowing any rebate at present? I do not know. I know the Government have allowed rebate in the past.
968. Was not that before the passing of the Wharfage Rates Act? No. There has been a Wharfage Rates Act ever since I can remember.
969. How recently is it, do you think, that the Government have allowed a rebate? I think within three or four years, speaking from memory. I know that when I had to do with the Wharfage Association the Government were allowing rebate. That was eight years since. In fact, we were in active opposition against each other.
970. Are you of opinion that the Government could not compete against private wharves? I do not say that. I only doubt whether the Government should have anything at all to do with wharfage as a business.
971. By whom do you think it should be taken in hand? By private people or by a Harbour Trust. The wharfage is handed over to these lessees; at least the frontage is. The Government do not relinquish the wharfage rate. They take that.
972. *Mr. Humphery.*] What portion of these works do you think should be carried out at Circular Quay? I have not studied the plan sufficiently to be able to say.
973. *Chairman.*] Do you understand what the plan proposes? Yes; generally. I believe it is proposed to transfer the P. & O. Co.'s wharf to the eastern side of the Quay. That will necessitate the removal of the Government boat-shed to the other side of the Quay. That, I look upon as absolutely necessary if the P. & O. Co.'s boats are to go to the eastern side of the Quay. The lengthening of the wharves for the lessees is, no doubt, a necessary work.
974. Then there is the alteration of the ferry services? That is, no doubt, a necessary work.
975. Then there is the approach to the berths at the western side of the bay now occupied by the Marine Board? Yes.
976. There are some other improvements on the western side of the bay, where it is proposed to take some of the traffic? Yes. I am only offering a general objection to any increase of berthing accommodation which would be brought into competition with that which already exists.
977. Do you understand fully the improvements to be made? Yes.
978. *Mr. Humphery.*] In your opinion what portion of the improvements should not be carried out?
The

- The portion on the west side. That is, the enlargement of the berths there and the formation of two new berths where the P. & O. Co.'s steamers used to lie. All the other improvements, I think, should be carried out. The improvements I have referred to are only unnecessary in my opinion because they will not return anything like interest on the money spent on them.
979. *Mr. Garrard.*] Are you aware that the western portion of the quay is in a very dilapidated state, and will have to be renewed in some way or other? I am told that is the case.
980. If it is absolutely necessary to renew it, should not an improvement in the style of the wharf be adopted? Decidedly.
981. You have spoken of private wharf-owners providing sufficient accommodation, and keeping abreast of the necessities of the port;—what new accommodation has been provided? The accommodation at Grafton wharf.
982. Has not that been erected for some time? Yes; seven or eight years.
983. Are you aware that at the present moment a large increase of wharfage is being made at Pyrmont? Yes.
984. Do you not think that those who are expending such a large sum of money there, must have an idea that they will get a fair return for the capital they are spending in providing increased accommodation? No doubt they have.
985. Therefore, the Government being possessed of the valuable property known as the Circular Quay, should they not improve it to the utmost? I cannot say what they should do; but simply looking at it as any matter of private enterprise, the question is: will it pay?
986. If we have it in evidence that it will pay, in spite of any opposition by private owners, do you not think the Government should give these facilities? I think they should most undoubtedly, if it will pay.
987. Are you strongly of opinion that the wharfage of Port Jackson should be handed over to a Harbour Trust? No; I am not strongly in favour of it; but I am strongly in favour of uniformity of action.
988. Supposing a Harbour Trust were eventually formed, would it not simplify matters if a large portion of the harbour frontage was in the hands of the Government to pass over to the Harbour Trust? If the Government gave it to the Harbour Trust, it would facilitate matters very much. If the Government were the largest owners of the property, it would be a great advantage, but I very much doubt if they are.
989. That is, holders of the largest portion of it? Yes.
990. At any rate they are the holders of the Circular Quay? Yes.
991. Are you aware that the Circular Quay has always been a favourite berth irrespective of rebates, on account of the easy access compared with the back wharves? Yes; but it would never stand against rebates in whatever form it may be held.
992. Not rebates of 75 per cent., at any rate? No.
993. But has not the system of rebates been done away with for some time? Oh dear no!
994. You told us in your evidence that when the system of rebates was at its highest point the Government berths at the Circular Quay were deserted? Yes.
995. Do you not think the Circular Quay has been very well filled recently; and what has been the reason? The rebates have been taken off.
996. To a certain extent? Yes.
997. Were you not connected with the Wharfage Association? Yes; eight years since.
998. Are you aware of the dangerous character of the steam ferry traffic in the harbour through the Manly Beach and other down harbour boats crossing the North Shore boats? Yes.
999. Can you give an opinion as to whether or not it is desirable to shift the jetties of the Manly Beach and Watson's Bay ferries, as proposed in this plan? I am not competent to give an opinion, but it seems to be in accordance with common sense.
1000. I understand that the only objection you have to these improvements is with respect to the berths on the western side? If that side were leased in the same manner as the berths on the eastern side are I should see no objection to it at all.
1001. In this case the shifting of the mail steamers to the eastern side will leave the two berths on the western side vacant for large sailing vessels? Yes.
1002. Is it not a fact that nearly all heavy weights, such as locomotives, are landed at the Circular Quay? Yes.
1003. Because, I presume, of the easy get-away there is compared with the back wharves? I think it is possibly because the locomotives are Government property. Private wharf owners do not care to have them because they cannot claim wharfage dues.
1004. Independently of that, are you not aware that the private owners of heavy goods prefer to have them taken to the Circular Quay? There is no doubt that they would have an easier get-away from the Circular Quay.
1005. And other things being equal, the Circular Quay would have an advantage over the back wharves? Yes; but with rebates the ships would go anywhere.
1006. *Mr. Suttor.*] With regard to the question of rebates, do you not think it is rather a cut-throat business? Yes, it is and it always has been.
1007. How long do you think it will last? So long as the supply exceeds the demand.
1008. We have it in evidence that some wharfowners have not only given a rebate of the whole of the wharfage rates, but money to boot? I never heard of anything so bad as that; but I have heard of 75 per cent.
1009. We heard that one man paid to a master £10 more than the total amount received as wharfage rates? I never knew of that case; but I have known a rebate of 75 per cent. to be given. I have commonly given 60 per cent. myself, as representing the proprietors I had to deal with.
1010. Must not the wharfowner make his property pay interest on the money invested? No; not necessarily.
1011. That cannot go on for ever, I suppose? It seems to go on, because the wharves are mostly in private hands. At any rate there was competition when the rate was fixed at 3s. 6d., and there was also competition when the rate was reduced to 1s. 8d.; if it were reduced to-morrow, there would still be some competition.
1012. Can you give us any idea of the revenue from the Circular Quay? No; not at present. It is not derived from wharfage only; it is derived from rents of the wharves, and from various sources of income.

James Powell,
Esq.

26 Sept., 1888.

James Powell, Esq.
26 Sept., 1888.

It is not wharfage pure and simple. Of course by leasing the wharves a large return is secured; but it is only secured because the property is made the most of by those who use it, and the Government derive the benefit of the wharfage charges. If the Orient Company or any other of the Companies discharges two ships a month, the Government derives a very large sum from wharfage charges, in addition to the rents for which the property is leased.

1013. *Chairman.*] Are you not a very old colonist? Yes; thirty-five years in the shipping and Custom House business.

1014. Have you watched the increase of the commerce of Sydney during that time, and taken an interest in it? Yes.

1015. Have you given any attention to the necessity for providing railway communication as far as the Circular Quay? I have.

1016. Do you think that the extension of the railway to the Circular Quay and improvement of the wharfage accommodation there should work in one with the other? Yes; I think they should work in, but I do not think the results are likely to be of a character that some sanguine people anticipate. The quantity of goods taken away from the ship's side direct to the interior is very small; the trade of the interior is mostly a repack trade.

1017. Are there many country storekeepers or merchants whose goods go direct from the wharf into the interior? Very few, comparatively.

1018. In a very great number of cases are not the goods taken into merchants' warehouses, distributed, and sent into the interior, so that therefore they would not go direct from the ship's side by rail into the interior? Yes; that has been my experience.

1019. Do you think it is desirable on account of passenger traffic to extend the railway to the Circular Quay? Only in connection with the North Shore traffic.

1020. Do you think the railway would not be much affected by other traffic? No; not so much so far as ocean travelling is concerned.

1021. It is a fact that very little produce is sent away direct from the country—from the interior? Yes; it mostly goes through warehouses in Sydney, before it is shipped.

1022. If it were decided to carry out the improvements now proposed, do you think it is essential that they should be deferred, pending any future railway construction by the Government? I do not; but I should think it desirable to keep such a project in mind.

Edmund Compton Batt, Esq., sworn and examined:—

E. C. Batt, Esq.
26 Sept., 1888.

1023. *Chairman.*] Are you a member of the firm of Batt, Rodd, & Purves? Yes.

1024. Are you engaged in mercantile pursuits and general auctioneering business? Yes.

1025. Have you anything to do with wharfage accommodation? Yes, as far as it is concerned with land.

1026. Have you been made aware of the proposed improvements at the Circular Quay? I came here the other day and looked at the plan.

1027. In a general way do you know the improvements which are proposed to be carried out? Yes; I have noticed them on the plan.

1028. Do you think it is desirable in the interests of the public that those works should be carried out? I hardly like to give an opinion on that point. It is probably more of a question to be decided by those who know more than I do about shipping transactions. It would be impertinent on my part, perhaps, to give an opinion, except a general idea, that for the import and export of goods the nearest place to deliver them and take them away is the best for a wharf. I do not see how that would hold good for the Circular Quay.

1029. Do you allude to goods coming to the port or to goods coming from the country? I allude more particularly to goods which are sent away, which I take to be of the first importance from the Australian side of the question.

1030. Do you know the estimated cost of these proposed improvements? I have seen it stated in the papers to be £120,000.

1031. Have you had much to do with commerce relating to shipping? Nothing, except as an auctioneer in Sydney having to do with wharf property and its sale. I have made it a study lately because I am intimately connected with the agency of a large project at Pyrmont on what is called Darling Island. It is the A.S.N. Co.'s old site. My principal object has been to make a study of the question of easy transit and shipment of goods, so as to do away with the carriage of goods through the streets of Sydney, which is a great evil at present, and of which the Sydney Corporation has complained bitterly. I presume I am not saying what is outside the knowledge of anyone at the present time when I say that any person driving in George-street or Pitt-street during the wool season stands a very good chance of being blocked for five minutes at a time on account of the congested street traffic.

1032. Under any circumstances would you regard the frontage to Sydney Cove as a valuable property? Most certainly.

1033. Can you cursorily give us any approximate estimate of the value of that property? I may say that as a firm we are usually called upon to give that information professionally, and therefore I would prefer not to give an answer to the question on this occasion.

1034. Do you regard it as a valuable property? Yes, beyond all doubt. I think that the Government purchase of the A.S.N. Co.'s property was one of the cheapest purchases ever made.

1035. What was the price for that land? Speaking from memory, I think it was about £300,000.

1036. Estimating the value of the whole of Sydney Cove proportionately to the price paid for a frontage, it is a most valuable property? Most certainly.

1037. Do you think that if that property were in private hands the best possible improvements would have been constructed before this? I think it is possible they would have been.

1038. Supposing that this property belonged to yourself or to any company you represented, would you not probably make much greater improvements than are shown on this plan? Not if I had other property in view which I thought was much more suitable for the purpose.

1039. If it belonged to you, would you not make these improvements? It would be a comparative question. I hold that you could never take goods from the interior to the Circular Quay. While not wishing to say anything against the opinions of those who think differently, I hold that the Circular Quay is the proper place for public ferry traffic and for that principally.

1040. Do you represent a company which owns a large wharfage property in other parts of the harbour? In one part only. E. C. Batt,
Esq.,
26 Sept., 1888.
1041. That is in Darling Harbour? Yes.
1042. That you propose to connect with the interior ultimately by means of the railway? We are endeavouring to get the Government to see it in that light, and I think they view it favourably.
1043. Of course you have a large interest in the improvement proposed to be carried out in connection with that project? Yes.
1044. When completed I suppose you consider it will be better than any other wharfage property in the neighbourhood? I think so.
1045. Have you a very large frontage? Yes; about 2,150 feet.
1046. Has a considerable portion of that been reclaimed? No; a portion of it is reclaimed land; but I do not know that that has added materially to the actual water frontage. About 4 acres out of about 8½ has been reclaimed. That has not given us more water frontage; but it has given us more land; and we have paid pretty heavily to the Government for the resumption.
1047. What distance will you be from the Government railway when the work is completed? 1,500 feet. It is 1,500 only from their own line to the boundary of our property. Not only is that the case, but there is a reserved road all round Pymont Bay, kept purposely by the Government I suppose, 66 feet wide, which is suitable for railway purposes, so that no money would have to be paid for resumption.
1048. How many frontages will you have when your project is completed—Will you have a frontage to the east, to the north, and to the west? Yes, three; and then there is a street frontage to John-street on the other side.
1049. What is your average depth of water? From 27 feet to 30 feet.
1050. Is that the natural depth? We have dredged.
1051. Is that part of your work? Yes. We have applied to the proper officials of the Harbours and Rivers Department, and I believe we have arranged entirely for the rental of the wharf as it is. We have only applied for as much as will take us out to the natural depth required.
1052. Do you think that your project will be very convenient for Sydney commerce working between your wharves and the warehouses in Sydney? I think we shall have the advantage there over everybody.
1053. In what way? Easy grades, no extra storage, no extra handling of goods, and all the traffic from the interior delivered from the railway trucks as it comes down direct into the ships.
1054. If a shipment of merchandise were brought to your wharf how would you distribute it? Quite as easily as from the Circular Quay.
1055. In what way? By carting it around Darling Harbour. By going that way we are equidistant with the Circular Quay from the centre of Market-street, or we are somewhat nearer to it. Taking Market-street as the centre of the city, we are nearer to it than the Circular Quay is.
1056. Which part of Market-street? Taking the junction of Market-street and George-street as the centre of the city to which the traffic would be, we are favoured by distance.
1057. Do you understand the nature of the improvements generally at Sydney Cove? I do.
1058. I refer to the increased accommodation to be given to the large ocean-going steamers of the P. & O. Co., and Orient Co., and the Messageries Maritimes Co., and also to the ferry boats of the Manly Beach and Watson's Bay Companies? Yes; I am acquainted with what is proposed to be done. I am Chairman of the Watson's Bay Co., and our manager has spoken to me about the matter.
1059. Do you think that improvements are necessary for those purposes? I think that the avoidance of the crossing of the ferry boats is of very great importance. I think that if the Government provide railway communication between the present terminus and the Circular Quay by any route, whatever the passenger traffic will enormously increase the ferry traffic at the Circular Quay; and it is only a question of time when the whole of that Quay will be required for the ferry traffic.
1060. Do you mean a railway for the purpose of conveying traffic from the country into the city, or from the city into the country? Speaking personally, I have no idea that a railway will ever be run down to the Circular Quay for the conveyance of goods. There would be no room for it without resuming all the valuable properties around the Circular Quay. But there is a great passenger traffic to the city owing to the many thousands of people who live up the line, and who have to get into Sydney. The construction of a railway for that traffic is only a question of time.
1061. Will it be necessary to bring those passengers to the Circular Quay? I know that there is a very great outcry for it. If the railway were taken to the centre of the city, at Market-street, I should be quite content to walk from there to my office, but I think some people are of opinion the railway should go to the Circular Quay.
1062. *Mr. Humphery.* Can you point out on the plan any portion of the proposed improvements which you think should not be constructed? I do not think so, for the reason that I have been more concerned with the general idea than trying to dissect the plans proposed by the Government. I object on wider lines to the expenditure of public money where I think better uses can be found for it.
1063. Can you not state whether in your opinion the proposed expenditure should be carried out, having regard to the evidence you have heard from Mr. Powell? I think not.
1064. What portion do you think should not be carried out? I have not sufficiently studied the plan to answer that question.
1065. Have you observed that there is to be a new berth for the P. & O. Co.? Yes, and for the Messageries Maritimes Co.
1066. Is not that necessary? If it is necessary to take the P. & O. boats there, I have no doubt it is. My impression is that the Circular Quay is one of the best and safest of places to go to, and that it will always get part of the traffic; but if you supply a better place than the Circular Quay it is questionable whether you will want more accommodation there. I see that part of the proposed improvements consists of a coal wharf at the end of the P. & O. Co.'s wharf. I do not think that anyone who has travelled about in large steamers, and who has had to put up with the inconvenience of coaling, will look upon that as a good suggestion.
1067. What wharfage accommodation have you provided in your proposal? Room enough for the largest steamers afloat, with sufficient depth of water for any that may be built for the next twenty years.
1068. How many berths? Eight berths for the largest ocean going steamers.
1069. Do you think that the steamers now berthing at the Circular Quay will berth there if they can get equally

E. C. Batt,
Esq.
26 Sept., 1888.

equally good accommodation from you? I think they will of their own accord berth where they get the greatest facilities.

1070. Therefore you think the Government ought not to provide this accommodation? Yes; because the steamers will get at our wharves direct cargo from the interior, and heavy goods may be landed on the railway trucks. In addition to that, instead of having to lie outside for coal they can coal in one-fifth of the time alongside our wharves. One great object of this project is public as well as private, because it will open up the southern collieries. This is the nearest place they can ship coal from.

1071. You have heard the evidence of Mr. Powell with regard to the question of accommodation for the present traffic: were you aware of the fact that there were more berths than are required before you commenced your private enterprise, or did you think yours so superior that you could almost enjoy a monopoly? I visited all the private wharves, and judged for myself of their facilities. I found that they were so many years behind the time that I would not have the slightest hesitation, if there were three times as much accommodation as at present, in going on with our proposed plan. I heard Mr. Powell state that in the olden days a ship would lie alongside a wharf for two months, and I heard him quote the shortest time in which a steamer could now discharge and load. But steamers cannot discharge with any more speed at the private wharves because no accommodation has been provided. Nature has given the water frontage with a hill at the back which only one small dray at a time can climb. The traction cannot be improved on account of the narrow streets. I think they are bound to go to the wall in any case. I do not wonder at people going to the Circular Quay with their ships instead of to private wharves. It is quite possible there is room for both.

1072. It is quite probable that the Circular Quay and your proposed wharf extension will be the popular resorts for all the ocean-going steamers? I believe so.

1073. To the neglect of the existing private wharves? I think so. I have taken a lot of trouble, and I have joined with others in expending money in anticipation of that being the case, so that it is not merely idle words.

1074. Have you any objection to state what has been the expenditure on the improvement of your site? If we carry it out entirely as we have begun it, and as we have been working with our architects right through, I suppose that the expenditure will be £250,000. That is irrespective of the cost of the land.

1075. Of course you hope to obtain a very fair return from it? I have had estimates worked up by shipping men, and if we get anything like what they estimate, we shall be quite content.

1076. *Mr. Kethel.*] What description of goods do you anticipate will be shipped when you succeed in getting this work completed, and placed in direct communication with the interior by rail? Meat, wool, coal, and grain. Meat will be a very large item.

1077. In what form do you expect meat to come down—frozen? I expect it to come down from where it is killed, as at Riverstone and other places at present in existence. It has been pointed out to us by stock and station agents that such a place as we propose to provide is required. All second handling will be avoided. The meat will come down in trucks and will go direct into the frozen store, and it will never be touched until it goes straight away by train into the ship. Half the meat which has gone bad in being sent home has gone bad on account of the extra handling between the freezing-chamber and the ship.

1078. What is the usual mode at present adopted in shipping frozen meat from Sydney harbour? I believe it is sent down in trucks from wherever it is killed to Mort & Co.'s store or Richards' store. It remains there until it is wanted on board ship. I have seen it carried through Sydney on a hot summer's day, and very often it has been taken off in a lighter to the Orient Co.'s boat. That is done after the meat has been frozen; it begins to thaw, and then the mischief is done.

1079. That is one objection which you anticipate meeting and remedying? Yes. We anticipate a very large trade.

1080. As that trade is almost entirely conducted by steamers, do you think that the large steamers will frequent your wharves, and that you will secure a large proportion of the ocean-going steamers frequenting this port? Yes; for the reason that anything which comes down by railway can be shipped. The same thing applies to wool, but more particularly to any perishable article like frozen meat.

1081. Do you intend to provide freezing apparatus and cool storage for the meat, if it comes down before the ship is prepared to take it on board? Yes.

1082. Is there any other cool storage at public or private wharves? None at all. That is how failures have taken place in the past. The meat when it came down had been frozen a certain time, and before it was placed on board ship it began to thaw.

1083. When you spoke of coaling vessels at your wharves, did you mean that you would supply steamers with coal for cargoes, or merely that you would supply coal for the consumption of the steamers themselves which might be berthed alongside your wharves? For both purposes.

1084. Do you intend to erect hydraulic cranes for the railway waggons? Yes; travelling hydraulic cranes. I think that steamers will naturally come to a place where they can get coal with the least trouble.

Arthur Latimer M'Credie, Esq., sworn and examined:—

A. L.
M'Credie,
Esq.
26 Sept., 1888.

1085. *Chairman.*] Are you the architect for the new wharves at Pyrmont? Yes; architect and consulting engineer.

1086. Are the whole of the works being done under your surveillance? Yes.

1087. The wharves as well as the general works? Yes; the whole of the works.

1088. Several large buildings form part of the project;—are they under your control? Yes; we have designed them.

1089. This will be a very large work? Yes.

1090. Do you regard it as very complete? Yes.

1091. How long will it be before it is completed? It will take somewhere about three years before it is completed.

1092. Then I suppose the accommodation which it is proposed to provide, will be of a first-class character in every respect? Yes; complete in every way.

1093. It not only provides berthing accommodation, but storage accommodation as well? Yes.

1094. Storage for merchandise, wool, and frozen meat? Yes.

1095. Have you appliances for refrigerating? Yes.

1096.

A. I.
M'Creddie,
Esq.

26 Sept., 1888.

1096. And cool chambers for keeping the meat afterwards? Yes; for storing somewhere about 48,000 sheep.
1097. Do you look upon this as a growing trade? Yes; it is a growing trade.
1098. Are you an old colonist? Yes.
1099. Do you believe that the commerce of the port is largely increasing, and that it is likely to go on increasing? Yes.
1100. Do you suppose that the export of meat will become a large item in the exports of the colony? Yes; it is growing rapidly.
1101. Are large quantities of frozen meat now being sent away? Yes.
1102. By a private company? Yes.
1103. Have you given any attention at all to the improvements proposed at the Circular Quay? I have not seen them until to-night. Of course I have seen mention of them in the papers. Beyond that I did not know what improvements were to be made until I saw the plans to-night.
1104. As far as you know the proposed improvements, do you think they are necessary? That I could scarcely give an opinion upon unless I went into the matter. I have not had time to consider. Of course I know that the wharf on the western side of the Quay is in a dilapidated state.
1105. Do you think it is a valuable public property? There is no doubt about it.
1106. And as such, do you think it is desirable to improve it so as to give fair accommodation? Yes.
1107. Have you had any personal experience of the shipment of frozen meat? No; except in a professional way; I have fitted up the chambers.
1108. Had you anything to do with fitting up the Government chambers on Glebe Island? No.
1109. Or the chambers in connection with Mr. Mort's Fresh Food and Ice Co.? No.
1110. Have you had anything to do with the fitting up of chambers besides those which you are now designing? Yes; for the South Coast and West Camden Co. We fitted up those chambers.
1111. Was not that for butter and cheese? For frozen meat as well.
1112. Where were they constructed? In Sussex-street, near the corner of Liverpool-street.
1113. Do they receive meat for shipment? Yes; a considerable quantity for shipment. From there the meat is taken to the ship's side.
1114. Do you think it is likely that meat will be killed and frozen in the country to be brought to Sydney? For long distances it is almost necessary. If you can kill the animals and bring the meat down quickly at night to be stored in suitable chambers it will be done.
1115. Supposing meat were killed at Bourke or Hay would it be practicable to bring it from there to Sydney? It is a very long distance; unless they had cars specially constructed for conveying the meat it could not be done.
1116. Do you know the cost of keeping the temperature at a certain degree? No.
1117. Can you tell approximately what it would cost per lb. of meat to keep the temperature at a certain degree for say a distance of 500 miles? I believe it has not been properly decided yet; I believe the Government are going to have some tests made.
1118. In the case of the stores you are designing, will the trade there be to receive meat in its ordinary state, freeze it in the building, and store it there? Yes.
1119. But if the meat were frozen in the interior would you be prepared to keep it there until it was shipped? Yes.
1120. Do you intend to provide chambers for either one or the other? Yes.
1121. Have you gone into the cost of storage and keeping the temperature at a certain point so as to be able to say whether the cost would be so large as to make it probably unremunerative. It is not unprofitable.
1122. In what way have you been guided to that opinion? By experience.
1123. Do you mean of the different processes now in use here? Yes.
1124. I suppose that experience in America is of little use as a guide here because there they have natural ice? Yes; we have not got that here.
1125. Do you know whether the suburban traffic by the ferries to Manly Beach, St. Leonards, and other places requires additional accommodation? I can scarcely say as I have not studied the subject particularly.
1126. *Mr. Garrard.*] Do you know the state of the western side of the Circular Quay as to whether it is sound? I have casually looked at it, and I know it is in a very bad state.
1127. As a civil engineer do you favour the construction of wharves with wooden piles as against iron? Yes.
1128. Will the wharfage proposed to be built outside the stone wall at Darling Island be built on piles? Yes.
1129. Of what timber? Turpentine.
1130. Do you prefer that to ironbark? Yes.
1131. How do you put in the piles—do you sheath them or put them in with the bark on? We leave on the bark.
1132. What is the life of turpentine piles? About 50 years.
1133. You have not had 50 years experience of them? No.
1134. Do you think that at least 50 years will be their life? Yes. We have taken out piles which have been down thirty years.
1135. Has your attention ever been drawn to the inefficient means of unloading heavy weights coming here from other countries, such as locomotive boilers? Yes.
1136. Have you ever seen the operation carried out at the Circular Quay? Yes.
1137. Is it very cumbersome and inefficient? Yes.
1138. If a large crane capable of lifting heavy weights were erected at some part of the harbour, say the Circular Quay, do you think it would be a great benefit to the community? Yes.
1139. What weight will the cranes at your wharves be capable of lifting? 12 tons; the heaviest lift will be 12 tons.
1140. Could you not easily erect a larger crane, if necessary, to lift heavier weights? Yes.
1141. What is the depth of the water? 28 feet by dredging. That is on the eastern side facing Sydney.
1142. Is the model of the steamer now exhibited by you to the Committee made to a scale? Yes.

A. L.
M. Credie,
Esq.
26 Sept., 1888.

1143. What is its length? 500 feet with about 52 feet beam.
 1144. Can you give us an estimate of the probable cost of a pile wharf, 25 feet wide by 570 feet in length? It depends upon circumstances; whether it is pile driving or whether the bottom is flat rock, which would make it expensive.
 1145. Taking ordinary pile driving in the silt of Port Jackson, do you think that £5,000 would be ample for such a wharf? Yes; £5,000 would be sufficient.
 1146. Are you familiar with the proposed improvements at the Circular Quay? I had not seen them before to-night.
 1147. Are you aware that the down harbour and North Shore traffic in Sydney Cove crosses? Yes.
 1148. If it is proposed to shift the berths of the Manly Beach and Watson's Bay ferry boats from the western to the eastern side, do you think that will be an improvement and make it less dangerous? Yes.
 1149. *Mr. Kethel.*] Have you had much experience in designing and constructing wharves? Yes; a considerable amount of experience here and in Queensland.
 1150. With your experience as an engineer can you suggest any better method of improving the Circular Quay and its accommodation than is suggested by the present plan;—had you not the improvement of the Quay under your consideration several years ago? Yes; some considerable time since. I have not thought of it lately.
 1151. Can you suggest anything more desirable or profitable to improve the wharfage accommodation of the Circular Quay than what is suggested in this plan? It is rather short notice to answer that question; I would rather study the matter before answering.

Mr. William Henry Shortland sworn and examined:—

Mr. W. H.
Shortland.
26 Sept., 1888.

1152. *Chairman.*] Are you a member of the firm of Shortland and Sons, carriers? Yes. We have been carriers in the city for thirty-five or forty years.
 1153. Is that the name of the firm? The name of the firm is that of Richard Shortland, my father, who is now deceased. I have been engaged for twenty-one years in our own business; and I was for four years with Mr. Powell, the present Collector of Customs. When I left school I went straight into Mr. Powell's office, and so gained my experience of Custom House and shipping work.
 1154. Are you engaged in the same occupation still? Yes.
 1155. Have you had a good deal to do with carrying in the city? Yes; from locomotives to boxes of candles.
 1156. In connection with your occupation I suppose you carry to and from the various wharves in the city? Yes.
 1157. To the railway and other places? Yes.
 1158. I suppose there is a great deal of carriage between the different wharves and the city? Yes; we call our carrying heavy carrying. It is mainly confined to the city, and we have little to do with the suburbs.
 1159. In the pursuit of your occupation do you find a very great difference in the haulage from the various wharves? Yes; the haulage is very much greater from some than from others;—that is from the back wharves. We call the Circular Quay *the* wharf, and we call all the others the back wharves.
 1160. The Circular Quay is far more favoured than any other? Yes.
 1161. Does it cause you to make any difference in the cost of carriage? No; as a general rule we take our work at one price for all the wharves. The merchant does not know where a ship will discharge. We have an all round price.
 1162. It is immaterial what wharf the goods come to? Yes. Still there are some of our customers—I think only three—whose goods we take at a lower rate from the Circular Quay.
 1163. Are you provided with ordinary facilities for loading at the different wharves;—if you are carting merchandise from the Circular Quay wharves or from any of the other wharves, have you fair accommodation? Yes; we reckon that we have every appliance—shear legs, lifting gear, all sorts of vehicles from large boiler waggons to parcel vans.
 1164. Do you take the merchandise from the wharf or the ship? From the wharf.
 1165. In the case of very heavy machinery, such as locomotives, would that be removed from the ship to the wharf by the people interested in the ship? By the stevedore; he lands all the cargo on the wharf.
 1166. Then you take it from there? Yes.
 1167. Have you appliances to take it? Yes, to lift it from the wharf.
 1168. Then you do take heavy material, such as locomotives? Yes; we lift it from the wharf. We have taken the whole of Beyer, Peacock, & Co.'s locomotives. When the boilers and frames are fitted together and brought out in that manner in the ship, the total weight would be 21 tons. When the boiler stands alone I think the weight is 11 tons.
 1169. Do you take Government rails? No; I believe they are lightered.
 1170. They used to be taken from the Circular Quay some years ago? Yes; I think it is five years ago.
 1171. Do you remember shipments of Park Gate rails? Yes.
 1172. Rails with which great fault was found because they were badly selected in London;—were they not taken from the Circular Quay? Yes.
 1173. In the course of your occupation do you take for private individuals very much merchandise from the ship's side to the railway to go into the interior? Very little; there are very few customers whose goods are taken direct from the ship to the railway. Nearly all the imports of Sydney are taken into stores and warehouses.
 1174. Does very much of the produce of the country go direct from the railway into the ships? I should say that only the copper, tin, and lead, go direct.
 1175. Does the wool go into the ship direct? No; it passes down to the stevedores to be pressed.
 1176. It goes into the warehouses? Yes; unless it happens to be dumped. Even then I think it goes through the stevedore.
 1177. Do you pass down a good deal of wool? No; it is a Government contract. We have had no Government contract except the removal of locomotives from the Circular Quay.
 1178. Can you form an opinion as to the proportion of dumped wool that comes from the country and goes direct to the ship? I cannot give an opinion, as we do not handle the railway wool. 1179.

1179. Have you been made acquainted with the proposed improvements at the Circular Quay? No.
1180. Have you seen the plans proposing to give extended accommodation to the Orient, P. & O., and Messageries Maritimes Companies, to improve the ferry service accommodation, and to make some additional improvements to the wharves on the western side of the Cove? As carriers we should certainly favour broadside wharves. That is another reason for preferring the Circular Quay—the ships lie right alongside. When a ship is unloading from several hatches on a long jetty the jetty soon becomes blocked, and the carriers cannot get at the goods. The jetties are of no great width, and perhaps only a single dray can pass along. For quick loading there is nothing to beat the Circular Quay with its broadside wharf. Cowper-wharf is also a broadside wharf.
1181. Engaged in the carrying trade as you have been, you have had an opportunity of watching the increase of the commerce of the port;—has it increased to a large extent during the last few years? Certainly it has.
1182. Do you think it is likely to go on increasing for many years? Yes. I remember seeing ships discharging alongside the wharves for six or seven weeks at a time; whereas now they discharge in a fortnight.
1183. Do you think it is essential that these works should be carried out so that vessels discharging may have all the necessary accommodation? Yes.
1184. I presume that the greater the facilities are which are given for discharging and loading vessels the more likely is the enterprise to result successfully? Yes. I consider that shed accommodation enables ships to discharge much more rapidly than would be the case with a bare wharf. Steamers break bulk at other ports before they come here, and they are quite ready on the moment of arrival to commence discharging. The owner of the goods may not find out for twenty-four hours, through the Press, that the steamer has actually arrived. The steamer, however, can put the goods at once into a shed, and they are protected. A locked shed is far more serviceable than an open shed.
1185. Are the Circular Quay sheds open or locked? The Orient, P. & O., and Messageries Maritimes Co.'s sheds are locked.

Mr. W. H.
Shortland.
26 Sept., 1888.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Improvements to the Circular Quay.

APPENDIX.

A.

[To Evidence of Alfred Lamb, Esq.]

Sir,

Sydney, 21 September, 1888.

I have the honor to enclose for the information of the Committee a report from Captain Jackson, Manager of the Public Wharves, that was placed on the table of the Legislative Assembly on the 19th June, and to which I referred in my evidence before the Committee on the 11th instant. It will be observed it is stated in this report that under rebate competition with private wharves (except for loading) public wharves become empty except under the same system. It must be plain to anyone a rebate system does not increase the accommodation, therefore, the latter cannot be insufficient.

The evidence now of Captain Jackson before your Committee on the 11th and 19th instant, as it appears in the *Sydney Morning Herald*, placed alongside this printed Parliamentary report, is so contradictory that, beyond calling attention to it comment is unnecessary.

In the evidence above referred to figures are given as to the annual returns for wharfage at Woolloomooloo Bay. I believe I am right in stating, without having had actual access to the figures, that all returns from the public wharves are swelled up by the Government charging itself with wharfage on its own materials. In the figures mentioned is included the wharfage on an enormous quantity of water pipes for carrying the Nepean water to the City, a specially heavy importation not likely to benefit any Government wharfage returns again.

I have, &c.,

ALFRED LAMB.

The Honorable John Lackey, M.L.C., Chairman, Parliamentary Standing Committee on Public Works.

[Extract from "Votes and Proceedings of the Legislative Assembly," No. 103, Thursday, 21 June, 1883.]

(13.) Rebate from Wharfage Rates on Public Wharfs:—*Mr. Lyne*, for *Mr. Dibbs*, asked the Colonial Treasurer,—

(1.) Is it a fact that the management of the Circular Quay is allowing a rebate of 25 per cent. from the wharfage rates upon the cargoes of vessels discharging at certain public wharfs?

(2.) Has he given his sanction to a system of rebates in competition with the owners of private wharf property?

(3.) Is not the giving of rebates a violation of the law?

Mr. Burns answered,—

(1 and 2.) In answer to the Honorable Member's questions Nos. 1 and 2, I have obtained from Captain Jackson, Manager of Public Wharfs, the following report upon the practice of allowing rebate from the wharfage rates payable by ships discharging at public wharfs:—

"In compliance with your instructions, I have the honor to report, for the Colonial Treasurer's information, the manner in which the business of the public wharfs has been conducted.

"During the four (4) years that the public wharfs have been under my charge, I have endeavoured, as far as in my power to carry on the business on commercial principles (without which wharf business cannot be carried out to advantage), with what result is well known to yourself. During the first two (2) years, I found no difficulty to contend with, as nearly all the principal wharf-owners had formed themselves into an association, and no rebate of any kind was allowed, in consequence of which the public wharfs received a fair share of the shipping business of the port, the revenue of the Quay having increased during the two (2) years from £12,000 to over £18,000 per annum.

"During the latter part of 1886 it was found necessary to re-establish the rebate system (which had in fact been in use for twenty (20) years previous), in order to protect the revenue from the wharfs under my charge. I accordingly asked and obtained permission from the then Colonial Treasurer (Sir P. Jennings) to allow rebate of 10 per cent. on the net inward wharfages and 5 per cent. on the tonnage dues. This rebate was only given to the agents of one vessel, as I soon found that it was not sufficient inducement, as private wharf-owners at this time allowed from 30 to 45 per cent. This large rebate was the cause of every berth at both the Circular Quay and Cowper Wharf being vacant for over one month of the present year, and compelled me again, in the interest of the wharfs, to ask permission to increase the rebate already granted by the former Colonial Treasurer to 25 per cent., the minute of *Mr. Burns*' approval expressly stating that the authority was to be exercised with great care. This has only been allowed to four (4) vessels, three (3) at the Circular Quay and one (1) at Cowper Wharf.

"I beg to point out that the rebate allowed by the Government in no way competes with the private interest of wharf-owners, as in all cases the amounts given by them exceed what is allowed by the public wharfs by 10 or 20 per cent.

"So long as private wharf-owners continue to allow rebates, it is absolutely necessary that the business of the public wharfs be carried on under a similar arrangement, as otherwise vessels (except for loading) will go where rebate is given, and the public wharfs will be empty."

(3.) I am not aware that the giving of rebates is a violation of the law. I consider it to be perfectly legal.

B.

[To Evidence of M. A. Conil.]

Dear Sir,

Sydney, 21 September, 1888.

With reference to our conversation of yesterday *re* extensions of our wharf, I herewith enclose a letter which I received from the Colonial Treasurer on the 20th February, and which will give you complementary information about the matter.

I am, &c.,

A. CONIL.

The Hon. J. Lackey, Sydney.

Sir,

The Treasury, New South Wales, Sydney, 20 February, 1888.

I have the honor, by direction of the Colonial Treasurer, to acknowledge receipt of your letter of 7th instant, and to inform you, in reply, that there will be no objection to an extension of 50 feet to the wharf at the eastern side of the Circular Quay leased to you, provided you will undertake to pay a proportionate increase of rent for such extension.

I have, &c.,

G. EAGAR.

The Principal Agent,
Messageries Maritimes Co., Sydney.

C.

C

[To Evidence of James Powell, Esq.]

The Collector of Customs to The Secretary, Public Works Committee.

Sir, I have the honor to forward a Return, prepared in connection with my evidence given before the Public Works Committee, and to request that the Return may be received as an appendix to the evidence. Custom House, 5 October, 1888.

I have, &c.,
JAMES POWELL.

RETURN showing the number of Inward Cargo Ships berthed in Port Jackson during the year 1887, the wharves at which such ships were berthed, and their respective register tonnage.

NOTE.—Vessels consigned to the P. & O.S.N. Co. } At Circular Quay ;
Orient Co. }
Messageries Maritimes }
Eastern and Australian S.S. Co. }
China S.N. Co. } At Smith's Wharf ;

and intercolonial trading vessels, are not included in this Return, such vessels having fixed or leased berths for their constant trade irrespective of wharfage competition.

1887.

AUSTRALIAN STEAM NAVIGATION COMPANY.

CIRCULAR QUAY IMPROVEMENTS BILL.
(MESSAGE No. 6.)

Ordered by the Legislative Assembly to be printed, 6 December, 1888.

CARRINGTON,
Governor.

Message No. 6.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends, for the consideration of the Legislative Assembly, the expediency of making provision to meet the requisite expenses in connection with a Bill to sanction the carrying out of certain improvements to the Circular Quay, Sydney.

Government House, Sydney,

Plan, showing the proposed Improvements and Additions to the Wharfage Accommodation, Woolloomooloo Bay, as it was submitted to the Committee.	

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

WHARFAGE ACCOMMODATION, WOOLLOOMOOLOO BAY.

WEDNESDAY, 19 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.
The Hon. WILLIAM HENRY SUTTON.
The Hon. FREDERICK THOMAS HUMPHERY.
ALEXANDER KETHEL, Esq.

JOSEPH PALMER ABBOTT, Esq.
JOHN RENDELL STREET, Esq.
THOMAS MICHAEL SLATTERY, Esq.
JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee proceeded to consider the proposed improvements and additions to the wharfage accommodation, Woolloomooloo Bay.

Joseph Barling, Esq.; Under Secretary for Public Works, sworn and examined:—

1. *Chairman.*] Are you aware that we have under consideration the proposed improvements at Woolloomooloo Bay? Yes.
2. What is the estimate of the cost submitted for the work? £42,000. That is the sum asked from Parliament for the construction of the works.
3. Can you give us any information as to the circumstances under which the vote was initiated or the work undertaken? It was partly intended for the use of Her Majesty's navy, and to resume a piece of wharf originally constructed for that purpose in the bay. Captain Jackson will give particulars as to the necessity for the work.
4. Does the Imperial Government contribute anything to the work? No. There was an understanding come to between the Government of New South Wales, when Sir Alexander Stuart was Premier, and the Imperial Government, whereby certain lands were given up to the Colony by the Imperial Government in exchange for other places and works of which this wharf forms part. We have put up part of the wharf which is marked "Admiralty Wharf" on the plan now before the Committee. It is on the west side of Woolloomooloo Bay. We propose to use that wharf for general purposes, and erect a new wharf for the Admiralty.
5. I have in my hand a statement which I think comes from the Public Works Department, in which the cost of these proposed works is stated at £112,000;—will you look at this document and see if it is correct? I think this document is a mistake. The amount of £112,000 is a clerical error; it is an error of transcription; it should be £42,000.
6. Is there another vote of £112,000? Yes.
7. Is that the amount estimated for the Newcastle improvements? Yes.
8. Then the correct amount for these works at Woolloomooloo Bay is £42,000? Yes.
9. Is that the estimated amount submitted by the skilled officers of the Department after examination? Yes.
10. Have you a list prepared of the works proposed to be carried out for £42,000? Yes. It is as follows:—It is proposed to erect on the western side of Woolloomooloo Bay a wharf 588 feet in length, a portion of which, viz., 320 feet, is for the use of Her Majesty's ships, and the remaining portion for commercial purposes, and what is marked on the plan as Admiralty Wharf will be lengthened as shown, making a total length of 404 feet, the whole of which it is proposed to use for general commercial purposes. It is further proposed to fill in the part of the curved face of the wharf at the south-west corner, and thus construct a wharf having a straight face of 250 feet, and from the centre part of Cowper Wharf to run out a jetty 700 feet in length and 100 feet in width.
11. What is the length of the jetty now in existence at Woolloomooloo Bay? About 250 feet.
12. Has that been in use for some time? Yes, for some little time.
13. Have these proposed works ever been submitted to Parliament in any way? I think it is one of the votes passed.
14. Was it proposed by the Secretary for Public Works to refer the works to this Committee? Yes.
15. Is it within your knowledge that applications have been made at various times by maritime people to have these works carried out at Woolloomooloo Bay? I cannot say that it is.
16. Have any petitions been presented? No. It is a matter that came to our Department from the Treasury.

J. Barling, Esq.
19 Sept., 1888.

- J. Barling, Esq.
19 Sept., 1888.
17. Is it a proposal partly to carry out the arrangement of an exchange of sites with the Imperial Government? Yes. The main reason, I think, for changing the site of the Admiralty Wharf is the difficulty of getting proper foundations for stores.
18. *Mr. Garrard.*] Have the Admiralty authorities complained about the accommodation at present given? No. They have not complained, because it does not matter to them what the foundations may be, so long as they are provided. It would cost an immense sum of money to get foundations at the present site.
19. Has the Colonial Government to carry out that work? Yes. It was part of the arrangement made by Sir Alexander Stuart. We found it so difficult to get settled foundations on the present site that it was decided to change the situation.
20. Will it not be a great eyesore in the Domain if those buildings are shifted farther out? I hardly think so. If we are going to use the present wharf for commercial purposes, I do not think it will matter much to provide the other accommodation farther away.
21. *Mr. Kethel.*] Could you furnish the Committee with a memo. showing the nature of the arrangement entered into between the Government of New South Wales and the Imperial Government by which the Colony is committed more or less to this scheme? It is not in my Department; still, if you wish it, I can easily get the document.
22. *Chairman.*] Is it part of the general exchange by which the Imperial authorities got Garden Island? Yes.
23. *Mr. Abbott.*] Can you state what is the expenditure on Cowper Wharf at the present time? Captain Jackson will be able to give it.
24. Can you tell me what the whole of the works have cost from the beginning? I have not the figures with me at present, but I will send them in.
25. Can you state what revenue has been derived each year for the wharfage accommodation at present existing? The collection of the revenue does not come within my Department. Captain Jackson will be able to give information on that point.
26. *Chairman.*] Will you supply the Committee with all the papers you have referred to? Yes.

Robert Hickson, Esq., M.I.C.E., Acting Engineer-in-Chief for Harbours and Rivers, sworn and examined:—

- R. Hickson, Esq.
19 Sept., 1888.
27. *Chairman.*] Are you aware of the project to make certain improvements at Woolloomooloo Bay? Yes.
28. Do you know the amount required to effect these improvements? £42,000.
29. What do the works consist of? An extension of the Admiralty Wharf, on the west side, for a length of 588 feet. I think its present length is 250 feet. This is a further extension at a cost of £8,000. Then there is an extension and filling up a little bit of the harbour at a cost of £4,500 in round numbers.
30. Is it for filling up alone, or filling up and a wharf? It is a wharf and filling up with dredged material and ballast, which will not cost much. We generally get ballast—rough stones—in front, and fill up with rubbish behind.
31. What work follows that? Straightening part of the circular portion of the wharf. It is very awkward for a vessel to get in there at present. We intend to cut off a piece so as to make a straight berth of 250 feet, which a vessel can lie alongside. That is a timber wharf; it will cost about £1,800. Then there is a jetty 700 feet long by 100 feet wide, which will cost a little over £27,700.
32. Is that jetty considered to be a desirable work? Yes.
33. Have you recommended it? No. I think it was mainly recommended by Captain Jackson.
34. Who was the professional man who designed it? Mr. Moriarty.
35. It is in your Department that you have taken up the project? Yes.
36. Will the jetty of 700 feet be all piled? Yes; all timber.
37. What will be the exact cost? £27,740.
38. What will be the distance between that jetty and the present small jetty shown on the plan? Nearly 130 feet.
39. Will that be of sufficient space to allow of the use of the two jetties? Yes.
40. Will the long jetty of 700 feet affect injuriously the traffic of the bay generally? No.
41. If large vessels go there will they be able to turn? Yes; as a matter of practice, they will turn outside.
42. There was a project some years ago to carry out a similar jetty in Circular Quay;—was not that objected to because it would interfere with the traffic of the Cove? I do not know. It must have been before I came here.
43. Would that be the case in this instance? No; I think there is sufficient room.
44. Do you know anything of the conditions or circumstances under which this wharf has been conceded to the Admiralty? No; I do not know anything of the arrangement.
45. Have you formed any opinion as to the necessity of the work generally? From two or three visits which I have made to the place, I think there would be a very large business done, if there was sufficient accommodation.
46. Do you think the proposed works can be carried out at the estimated cost? I think so. I went through the estimates myself.
47. *Mr. Abbott.*] Do you know what the Cowper Wharf cost? No; but I could let the Committee know to-morrow.
48. What is the income? Captain Jackson will be able to tell you that. I think the wharf cost £18,000.
49. *Mr. Kethel.*] Have the Imperial authorities at any time complained of the accommodation at their disposal at Woolloomooloo? I have not been here long enough to be able to say. They have not done so to my knowledge.
50. At whose suggestion is the proposal made to change the site of the Admiralty Wharf? I do not know what are the arrangements with the Admiralty. I believe that the motive for moving from the present site is this: We want more wharfage accommodation in Woolloomooloo Bay, and it is more convenient to put the man-of-war ships on the outside than to have them coming backwards and forwards through the shipping.
51. Are you aware of a single instance in which a man-of-war ship has been brought alongside that wharf? No, because I do not think there is any place where they could go alongside. But I believe they intend to do so, and it is the object of the wharf.
52. *Mr. Abbott.*] Do you know anything about stores to be erected at Woolloomooloo Bay? No.

53. *Mr. Kethel.*] At whose suggestion is it proposed to extend the jetty 700 feet into the harbour? I believe it was proposed by Mr. Moriarty, after consultation with Captain Jackson. I believe that is how it originated. R. Hickson,
Esq.
19 Sept., 1888.
54. Are there any minutes referring to the reasons why a jetty of these peculiar dimensions should be made? I have not seen them.
55. Does it not strike you as peculiar to have a jetty 100 feet wide for commercial purposes? I think it is wanted for large vessels, which are proposed to be accommodated. You want plenty of room for landing cargo. I do not think it is too wide.
56. *Mr. Garrard.*] We have been told that the reason for shifting the Admiralty Wharf is because you find a difficulty in getting foundations for stores which the Colonial Government have undertaken to build for the Admiralty;—is that the case? I cannot say. I do not know the arrangement.
57. Is there any difficulty in erecting stores on the present site of the Admiralty Wharf? There is a difficulty all along there, because it is made ground, and the foundation is not good.
58. Do you know the character of the buildings to be erected there? No.
59. Who is dealing with that matter? The Colonial Architect.
60. Do you know what was promised to the Admiralty with reference to those stores? No.
61. Do you know if the Colonial Architect has complained of the want of good foundations there? No.
62. Do I understand that it is intended to bring the man-of-war vessels themselves alongside? Yes; I believe that is the intention.
63. If stores are erected on the proposed new site, will they not shut out part of the view from the Domain? Not very much. The land is very high above it.
64. How many ships will the new large jetty accommodate? A large and small one on each side. That will be four.
65. Do you think it would be better to diminish the width of the jetty on the outside, so that the vessels lying inside could overlap, thus giving another berth? I do not think so. You could only take off 25 feet from the width, and most of the vessels coming here are of greater beam than that. The vessels with large cargoes go outside, and that is where you want most room.
66. Do you know the width of the Sandridge Railway Pier at Melbourne? I think there are six lines of rails on it. It is a very wide pier, but I do not remember the exact width.
67. Are the foundations at the back of the proposed new site for the Admiralty Wharf better than those at the back of the present site? Yes. It is good hard ground.
68. *Mr. Kethel.*] On whose authority is the statement made that a solid foundation cannot be obtained in the rear of the present Admiralty Wharf;—have you any personal knowledge of the fact that good foundations cannot be obtained? I believe a foundation could be obtained, but at considerable expense. You would have to go down through a lot of made ground.
69. How far back does it extend behind the present wharf? I do not know.
70. Does not the sandstone cliff come down close to the railing of the Domain? At one end I believe it does; but it goes off immediately.
71. Do you speak from your own experience? No.
72. *Mr. Suttor.*] Is it part of your duty to give any opinion as to the desirableness of these works? No.
73. Are you simply instructed to prepare the plans? Yes; that is all I consider to be my duty.

Captain John Jackson, Manager of the Public Wharves at Sydney, sworn and examined:—

74. *Chairman.*] Are you the Manager of the Government Wharves generally? Yes.
75. Are you aware of the project to construct improvements at Woolloomooloo Bay, and the nature of those improvements? Yes. Captain
J. Jackson.
19 Sept., 1888.
76. Are you aware of the amount required to carry out those improvements? I believe it is £42,000.
77. Have you formed any opinion as to whether that money will carry out the works? No.
78. Have you formed any opinion as to the necessity for the works? Yes; there is a very great necessity for them.
79. Is there a large commercial traffic in Woolloomooloo Bay? Yes.
80. Do you know anything of an arrangement under which the Admiralty Wharf is proposed to be enlarged? It was proposed at one time to erect stores facing the Admiralty Wharf.
81. Is that wharf used by the Imperial authorities? No.
82. For what reason is it not used? Because they could not get a foundation for stores at the back of it.
83. Is it used for shipping? Yes.
84. By what kind of vessels? Commercial vessels.
85. Is it ever used for Imperial purposes? No.
86. You are aware that it is proposed to construct a long jetty into the bay? Yes.
87. Were you a party to its recommendation? Yes.
88. Do you think it is required in the interests of the public? I do; but I do not think it is wide enough.
89. What width would you have made it? 150 feet.
90. Would that affect the traffic to the smaller jetty? No.
91. If large vessels came, would it not affect the traffic? No.
92. Is the trade of that part of the city increasing? Yes. It would increase more if there were accommodation.
93. What is the nature of the trade carried on there generally? Coal, timber, and general cargo.
94. Are there any warehouses about there? Yes; just completed.
95. Would they be built on the wharf? In the neighbourhood of the wharf.
96. Have you formed any opinion as to whether the vote is sufficient for the works? No; that is not in my province.
97. Are you clearly of opinion that the trade requires more accommodation? Yes.
98. Do you think that the accommodation here proposed is of a suitable character? Yes.
99. Have you formed any opinion as to the revenue that will be received? During the present year the revenue from Cowper Wharf will be £3,800. In its present state it is not capable of doing any more.
100. What is your estimate of the revenue so soon as these proposed improvements shall have been carried out? The new jetty will be able to accommodate six ships, and each berth will be worth about £1,000 per annum. That will be £6,000, in addition to the £3,800 at present received.
101. *Mr. Abbott.*] How long have you been in your present position? Four years. 102.

Captain
J. Jackson.
19 Sept., 1888.

102. In what position were you before? Master of the ship "Gladstone."
103. Can you tell me what the wharfage accommodation of Sydney is at the present time? I can only state it approximately. I think that there is wharfage accommodation for forty-five large ships.
104. Is that exclusive of coasters? Yes, and of coastal and intercolonial steamers.
105. Do you know if any of the vessels in Sydney at the present time, or at any time since you have occupied your present position, have been inconvenienced through not being able to get wharfage accommodation? Yes.
106. When? In 1885.
107. What number? I had four ships lying out in the bay.
108. Was in on account of the whole of the wharfage accommodation being taken up? Yes; for a short time.
109. Was that an exceptional year? Very exceptional.
110. Has anything of that kind occurred since? I do not think so.
111. Or before? No. It was owing to a large contract with the Government for the delivery of water-pipes.
112. Do you know what Cowper Wharf cost? Only the timber portion, which cost £18,000. I do not know the cost of the other portion. £18,000 is exclusive of the small jetty.
113. What has been the revenue for Cowper Wharf, during the four years you have held your present position? In 1884, when I joined the service, it was £1,500. In 1885 it came up to, I think, over £4,000. That was on account of the large number of general-cargo ships going there. In 1886 it fell off, and I think it was only about £3,500.
114. What was it in 1887? It was close on £3,800.
115. Does that revenue include harbour dues and all other dues? That is only wharfage and tonnage dues.
116. Was there a large quantity of Government goods landed during that period? The wharfage for the Government amounted to about £460 in 1885; in 1886 it amounted to £32.
117. What kind of cargoes are discharged at Cowper Wharf? General cargoes, timber, and stone metal. General-cargo ships from London and New York go there. Only a few days ago there was a large steamer there.
118. Is the principal revenue derived from intercolonial vessels? Yes.
119. Are any of these wharves let to Mr. George Hill? No.
120. All the metal brought by Mr. Hill is discharged at Cowper Wharf? Not all of it. The principal portion of it is.
121. Do you know what he pays in a year? I think it is about £1,500.
122. It is only in one year that you ever knew vessels to be unable to get berths? Yes.
123. At the present time, what is the state of the harbour in that respect? The Circular Quay is full.
124. And the private wharves? A good many of the private wharves are full.
125. Is not the Circular Quay let to three companies? It is not let. They pay rent equivalent to tonnage dues, but the Government collects the wharfage.
126. *Mr. Humphery.*] What is the annual cost of the maintenance of Woolloomooloo Bay? It is the same every year—£487.
127. That is the salaries? Yes. There is another sum of £50 for cleaners.
128. Any repairs? No; not lately. There may have been small repairs, but nothing important.
129. Do you estimate that, deducting the annual cost, the return will be something over £3,000 a year at present? Yes.
130. When the proposed new jetty is constructed, do you estimate you will receive £10,000 a year? I should say £1,000 for each berth. That will give £6,000 a year additional.
131. That will be 25 per cent. on the proposed outlay? Yes.
132. *Mr. Kethel.*] It has been stated that a portion of the Woolloomooloo wharfage consists of an additional wharf for the Imperial Government. Are you aware at whose instance or request this new wharf is to be constructed for the Navy? No.
133. Do you know the reasons why it is proposed to make that new wharf? I believe it was originally intended to erect stores at the back of the present Admiralty Wharf, but it will cost a great deal to get foundations there.
134. On whose authority do you make that statement about the foundations? Mr. Williams, assistant-engineer. It will be necessary to go down 23 feet to get a foundation.
135. Is it intended to berth ships there? I think so.
136. Is it necessary to provide a wharf 300 feet or 400 feet long for Imperial ships' boats to land or take off munitions of war? I do not know.
137. As a nautical man, are you of opinion that such an extensive wharf should be devoted to Imperial purposes? My opinion is that it is not required.
138. Do you know that extensive warehouses and wharves have been erected at Garden Island for the Navy? Yes.
139. Have you any reason to believe that the Imperial Government really require large additional wharfage and storage on the mainland besides what they have got on the island? I do not think so.
140. Do you know for what class of naval stores the proposed warehouses are required? No.
141. How many foreign ships have you had at Woolloomooloo Wharf this year discharging general cargo, as distinguished from timber? Three.
142. Can you give any idea of the number that have discharged general cargoes there since you have been in charge during the last four years? I should say about fifty.
143. Is it not a fact that sometimes during a whole year not a single foreign ship discharges goods other than timber at that wharf? In 1884 there were no foreign ships there. They first commenced to go there when the Government imported pipes came out here.
144. The fact is that the ships having been sent to Woolloomooloo to discharge pipes for the Government also discharged their general cargoes there? Yes; but it was only a few. Since then ships have gone in without any Government cargo.
145. Is not the long haulage up the hill from Cowper Wharf into the city proper regarded as a great objection on the part of consignees? No.
146. Are you not aware of that fact? No. I am aware that they would sooner cart goods from Woolloomooloo than go to the back wharves. The great drawback to Woolloomooloo is the rough element in the neighbourhood and the pilfering which takes place.

Captain
J. Jackson.
19 Sept, 1888.

147. Is not the eastern section of Cowper Wharf almost entirely used for landing blue-metal and coals? The south-eastern corner is.
148. Is any rent paid for the use of that wharf in addition to the landing charges on these materials? No.
149. Is it not a fact that cargo has been lying there for weeks and the wharf made a storehouse? No; because ships are in at night and out in the morning.
150. Have I not seen cargoes lying there for upwards of a month at a time? That might have been the case. Before my time it was a coal-yard.
151. You anticipate that the long jetty will berth six ships; what class of ships do you allude to? The ordinary-sized sailing vessels.
152. Is that in addition to the present accommodation? Yes.
153. Do you mean that you will have five berths at the new jetty? No. Six additional berths; three on each side.
154. What description of ships—foreign-going vessels? Yes; ships of about 1,500 tons.
155. What is the usual length of a 1,500-ton ship, from the stern to the boom end? I should put the ship's boom end over the wharf. At the end of the wharf I would put it past the wharf. I do not reckon the ship's boom.
156. Well, the bowsprit? I should not reckon the bowsprit, except of one ship.
157. You would get three intercolonial ships berthed there? Yes.
158. Is it your experience that intercolonial vessels, whose cargoes consist almost entirely of agricultural produce, would yield the amount of revenue which you estimate to receive? No; not intercolonial vessels.
159. Do you think that ships would land produce there? No; I reckon on foreign-going ships.
160. Is it not a fact that ships with cargoes consisting of grain of every description prefer to land them where there are several warehouses within easy access? Yes.
161. Do you know whether warehouses are in course of erection at Woolloomooloo? Yes. They belong to Messrs. Holdsworth and Evans.
162. On the reclaimed ground? Yes; behind Cowper Wharf. At the present time I am given to understand Messrs. Hoffnung & Co. have purchased a large block of land there from Mr. Munro, on which they intend to erect warehouses.
163. Are there a great number of timber ships from Europe and America discharging timber at Woolloomooloo? No.
164. Is there not one there now? There are two from Puget Sound.
165. Have not the consignees of those vessels, and people interested in that branch of trade, asked the Government instead of constructing jetties to provide more storage accommodation for their cargoes? No; but I think it would be a capital thing.
166. But has it not come to your knowledge that an application has been made for more storage accommodation? No.
167. Will Mr. Hilliard be better able to answer that question? Yes.
168. As a seafaring man of considerable experience, do you think it conducive to the well-ordering of the harbour to project such a long jetty into comparatively narrow water? I do not think it will interfere with any shipping.
169. Would you not find considerable difficulty in berthing a large ship with the wind blowing into the harbour? No.
170. Have not nautical men a decided objection to wharfage improvements of this description, and was not a similar proposal in regard to the Circular Quay some years ago unanimously condemned by all seafaring men of experience amongst us? I never saw any difficulty in berthing ships at jetties.
171. Are you not aware that the intended projection of a jetty into Sydney Cove was abandoned on account of the opposition offered by the nautical authorities? Yes.
172. Notwithstanding that, do you recommend the construction of this jetty into the centre of Woolloomooloo Bay? Yes.
173. *Mr. Garrard.*] You say that you will have six berths at this jetty for 1,500-ton ships. What is the usual length of a 1,500-ton ship? About 250 ft.
174. How long is the jetty? 700 feet.
175. The approaches will take off 40 feet, so that the jetty will be 90 feet short. Is not that the case? They are not all 250 feet long. Some are only 230 feet. I reckon that the two end ships will project 50 feet outside the wharf when the six berths are taken up.
176. Then the outside ships can only work one hatchway? They seldom work more. The forebath is generally so small that they cannot work it.
177. Would you prefer a wharf 150 feet wide? Yes; because the ships lying at the long jetty will be general cargo mainly. I would also suggest a roadway in the centre lowered so as to bring the floors of the drays on a level with the wharf.
178. What was the objection to that in the Department? I do not know.
179. Did the Engineer-in-Chief raise any objection when you suggested it? Not that I am aware of.
180. Do you not think that with six new berths at the jetty and an additional one in the bight you could do without a further extension of the Admiralty wharf for some time to come? Yes; I do not think the Admiralty wharf is required for some years. I do not think they will ever use it.
181. That will give you an additional berth? But I do not think it is required.
182. Do you think that the main jetty and the straightening of the wharf on the south-western side will give you all the accommodation required? Yes; and to fill in the present Admiralty wharf.
183. Do you want to utilise it? Yes; I am doing it now.
184. Are you paying the Imperial Government anything for the use of it? No.
185. Then you really think it is necessary to keep control of the present Admiralty wharf, and if the Admiralty want anything they could get it farther north? Yes.
186. *Mr. Sydney Smith.*] What is the accommodation at present at Woolloomooloo Bay? Five berths such as they are. There is actually only one good berth. There is only one berth where you can lie properly alongside.
187. Have you had any complaints of want of accommodation at Woolloomooloo? Yes, frequent complaints. When ships have been in there there have been very great complaints of want of accommodation.

Captain
J. Jackson.
19 Sept., 1888.

188. How long have ships been waiting? They have not been waiting. When they were once in, there is no going out again; they have to take what they can get. At present there is a vessel discharging timber with a stage 20 ft. long.
189. Have the wharves ever been blocked with timber and stones stacked on them? No; that has been all removed as soon as a berth is required.
190. How long are they allowed? 48 hours by the Act; but with a large timber cargo it is impossible.
191. What is the depth of water at Woolloomooloo Bay alongside the wharf? 20 ft. It silts up very fast; it will be 24 ft. at the end of the big wharf. It varies from 12 ft. to 18 ft. alongside the Admiralty wharf. There is a patch of 12 ft. just opposite the new crane.
192. Can you dredge it? Yes; it is on mud.
193. What depth can you get by dredging? 30 ft., I believe.
194. *Mr. Campbell.*] In connection with the silting up, will not almost constant dredging be required? Yes; every eight or ten months. The silt is so very soft that ships go five or six feet into it.
195. Is there great drainage there? Yes, just alongside the wharf.
196. *Mr. Suttor.*] With regard to the estimated revenue of £10,000, is it based on the idea that the berths will be always occupied? No; the revenue for each ship of 1,500 tons will be £280. I calculate on having four ships at each berth every year.
197. Do you make allowance for berths not being occupied? Yes; I make allowance for their not being occupied for six months in the year.
198. *Chairman.*] Would you be good enough to show us how far the Government property extends on the south-eastern side of the wharf? [*Witness indicated the point upon the plan.*]
199. Regarding the property as a valuable one owned by the Government, are you of opinion that the improvements proposed are necessary? Yes.
200. Do you think it will be valuable in view of the probable increase of trade and commerce in the colony generally? I have not the slightest doubt about it.
201. *Mr. Kethel.*] I observe that part of the scheme is to fill in the present landing stages and afford other accommodation where steamers land their passengers on the south-western corner. Is not that where the Manly Beach and Watson's Bay boats land their passengers? Those boats do not go there now.
202. What are the landing stages now used for? Timber ships lie alongside.
203. Is any provision made in the proposed alteration of the passenger accommodation for that portion of the public who use Woolloomooloo wharf as a landing place? Yes; there is a jetty there.
204. Do you intend to use the present jetty for passengers? Yes; that is my idea.
205. Are there not two berths at that jetty for large-sized ships? They are very narrow.
206. How do you reconcile your statements when you say that you will have six additional berths, and that you intend to deprive yourself of two berths at this jetty? There will be three berths on each side of the new jetty. I do not reckon the jetty you refer to as a berth.
207. Have I not seen vessels discharging there? Small vessels; I have put a vessel there because I had no other berth.
208. You have stated that there is a ship discharging timber with a stage 20 feet long. Is that long stage necessary because of the shallowness of the water or on account of the wharf? On account of the wharf.
209. *Mr. Suttor.*] Do you think it is not desirable to carry out the work as proposed for the Imperial Government? I do not know whether the Imperial Government requires it.
210. Did you not say it is not required? I do not think it is necessary, as far as I know.
211. If that proposal is carried out, would it be a good alternative plan instead of making the proposed large jetty? I think the jetty will be more convenient.
212. But will not one work cost £8,000 while the other will cost £27,000? You could only berth two ships at the Admiralty Wharf, while you lose a valuable frontage. The jetty would only require 150 feet of frontage, while it would berth six ships.
213. Do you think it would not be possible to abandon the jetty, and carry out the Admiralty proposal? There would not be sufficient accommodation.

Capt. Henry Pettit, Harbour-master at Sydney, sworn and examined:—

Captain
H. Pettit.
19 Sept., 1888.

214. *Chairman.*] Are you Harbour-master of this port, and have you occupied that position for a number of years? Yes; for the last four years.
215. Have you been engaged in the same kind of work for a great number of years? Yes.
216. Have you given attention to the proposed improvements at Woolloomooloo Bay? Yes; I have seen the plans.
217. Do you recognise that portion of the bay where it is proposed to construct a long jetty? Yes.
218. You are a nautical man, and have had a lot of experience? Yes.
219. Do you think the proposal is a feasible one? The proposal will give very good accommodation for shipping in Woolloomooloo Bay.
220. Do you think it will cramp the action of vessels coming in and going out? No.
221. Is it a wide bay? Not particularly wide, but there is sufficient room to bring in vessels, either on one side or the other.
222. Is it much wider than Sydney Cove? No.
223. Do you recollect a project, some years ago, to carry out a jetty in Sydney Cove, which was strongly objected to? Yes.
224. Was it not contended that it would cause confusion in the shipping and bring about accidents, besides curtailing the facilities for getting about? Sydney Cove has a very great deal of traffic; but in Woolloomooloo Bay it is not so.
225. But taking a prospective view, have we not reason to believe that the traffic will increase in that bay as it has in Sydney Cove? Yes.
226. Do you think that the proposed works, as a whole, are essential for the improvement of a valuable Government property such as this is? I think that the proposed jetty will return very good interest on the money expended.

227. If that property were in the hands of private individuals do you think it would be improved to this and even to a far greater extent? Yes.

228. Do you know anything about the proposal to improve the Imperial frontage to the bay, the part now occupied by the Government? I see that there is a wharf on the western side of the bay, and that it is proposed to extend it farther to the north.

229. Do you recollect the place which used to be called the Centipede Rock? Yes.

230. Is that the locality? Yes.

231. Is that where the new wharf is proposed to be erected? Yes.

232. Do you know anything of the circumstances, under which an exchange took place between the Colonial Government and the Imperial Government, with regard to Garden Island, and under which this wharf was conceded to the Imperial Government? No.

233. Is the traffic in Woolloomooloo Bay very large now? No, not particularly. Small craft go there.

234. Would it be increased if there were proper accommodation? Last year, in the wool season, there was a great deal of shipping in the port, and the wharf manager contrived to get large-ships alongside the small jetty, and both sides were occupied during a part of the season.

235. Do you know the amount proposed to be spent on those improvements? No.

236. £42,000 is proposed for the whole of the works. Have you formed any opinion as to whether that amount will be sufficient to carry out the proposed works? No. I think the wharf manager would know what accommodation is required.

237. *Mr. Abbott.*] Was your opinion asked with regard to the necessity for these works before they were initiated by the Department? No. The first intimation I had was when I was summoned to give evidence here.

238. You were not asked whether or not sufficient accommodation already existed in Port Jackson before this work was proposed? I think that the wharf manager complained on several occasions.

239. Were you never called upon to give a report regarding the necessity for it? No.

240. Have you been Harbour-master about the same length of time as Captain Jackson has occupied his position? Yes.

241. Were you in the service before that? Yes; for the last 13 years.

242. Have you known any inconvenience to shipping to exist from want of wharfage accommodation in the port? A great many ships could not get berths during the wool season at the Circular Quay.

243. Could they go elsewhere? Yes.

244. Is there any wool trade at Woolloomooloo? No. Many ships would prefer to go to Woolloomooloo rather than to the back wharves. I have heard many shipmasters make that remark.

245. Do you know what the present wharfage accommodation in Port Jackson is;—how many ships would it accommodate at private and Government wharves? I have never particularly counted the number, but it would accommodate a great number.

246. Would it accommodate 100? That would depend upon the size and description of the ships. They vary from 500 to 100 feet long.

247. Has there ever been in your experience any great inconvenience from want of wharfage accommodation? No.

248. Do you think there is, in the interests of shipping, any real necessity for the construction of these works;—is there an absolute necessity for them? As far as getting berths is concerned I do not think at the present moment any shipping master is put to great inconvenience from want of accommodation. I have heard many remarks that if there were more accommodation at the Circular Quay, it was a very easy place for the carriage of goods, and it would be patronised a great deal more. There is no doubt there are a great many wharves, and I have never seen all the wharves full.

249. Do you think that wool ships would load at Woolloomooloo Bay;—do you not know that the wool comes into the city and is shipped through the warehouses, and that none comes direct from the railway to the ships? Occasionally pressed wool is brought down to the wool ships at the Quay.

250. But does it not all come through the commission agents in Sydney? Yes.

251. Do you think that any wool would go to Woolloomooloo at all? You would require to have stores there. It would go there if there was storage.

252. *Mr. Kethel.*] Are you aware that there is a large sewer draining the whole of Woolloomooloo and part of Surry Hills, flowing into Woolloomooloo Bay, near Cowper Wharf? Yes.

253. In relation to this proposed jetty where is the outfall of that sewer? It is very close to the eastern boundary of that jetty.

254. There is, I believe, a considerable deposit of silt and mud from that sewer which necessitates frequent dredging to keep the bay clear. Speaking as a nautical man of considerable experience, do you think that the construction of a jetty 100 feet wide and 700 feet long, close to the outfall of a sewer, will have a tendency to cause the bay to be silted up so that it could not be dredged? Very much of the mud that comes down is easily dredged away. At one time it was filled up there, but a short time ago a large steamer drawing 23 feet was alongside that jetty.

255. Are you aware that rainstorms cause a great accession to the silt at the mouth of the sewers, and that the last season in Sydney being exceptionally dry there has not been nearly the same quantity of silt carried down; but that if we have a recurrence of wet seasons we shall have a large quantity of accumulated dust and *debris* carried down? Yes.

256. Is it your opinion that the construction of a jetty close to the outfall of one of the greatest sewers in the city will not have a tendency to accumulate the fetid mud and slime from the sewer which will become a cause of danger—firstly, by silting up the harbour, and secondly, by causing a deposit of filthy slime to be permanent in and about the piles of that jetty? There is no doubt there is a deposit of silt there, but in my opinion a dredge periodically working can keep it clear. It is a matter of dredging. There is no tide there. As far as this sewage matter is concerned there is always the continual working of steamers which would not allow anything to remain stagnant there. It would require occasional dredging the same as the sewer off Macquarie Point, and the old tank stream sewer in Sydney Cove.

257. Can you suggest any means whereby the wharfage accommodation at Woolloomooloo Bay can be increased without running out a jetty, which many people believe to be objectionable? The shores of the bay adjoining the Domain might be utilised for wharves, but it would be a very expensive job.

258. *Mr. Garrard.*] Is that owing to the precipitous character of the land? Yes. By the expenditure of a great deal of money it might be made equally as good for wharfage accommodation as the Circular Quay, but it would be costly.

Captain
H. Pettit,
18 Sept., 1888.

Captain
H. Pettit.

9 Sept., 1888.

259. *Mr. Kethel.*] In reply to a question you said that you have been Harbour-master for four years, and that you were thirteen years previously in the Service;—what was your position in the Service before? I was Assistant Harbour-master.
260. And before that? I was a master in the tug service.
261. From that are we to understand that prior to your appointment as Harbour-master you had ample opportunity of being thoroughly conversant with the state of the shipping in the port? Yes; I have been connected all my life with shipping.
262. *Mr. Garrard.*] I suppose there is more silt washed down by summer thunderstorms than by ordinary rains? Yes. Thunderstorms bring down a great deal more silt.
263. And the silt off the streets, brought down by these sewers, is not offensive? No, not as a rule.
264. The sewage matter from the houses is the offensive matter? Yes.
265. Are you aware that a very extensive system is being carried out to convey the sewage to the ocean? Yes.
266. So that although silt may be washed down from the streets it will not be accompanied by offensive sewage matter? Not if there is a main outlet to the sea at Bondi.
267. *Chairman.*] With reference to the sewers emptying into the harbours at the edge of the bays, how many sewers have been extended into deep water? The only one I know of is the one at Macquarie Point. The buoy there denotes the shallow water off the Point. The sewer goes down to within a very short distance of the buoy.
268. Then the idea is that the sewer carries off the accumulation of silt? Yes.
269. Is it the only one where this extension has taken place? I do not know of any other.
270. What has been done in the case of Rushcutters' Bay? I do not know of any pipe being laid out there, because in Rushcutters' Bay there is no tide.
271. Is it not the accepted practice to get rid of the inconvenience of sewage, emptying into a place like Woolloomooloo Bay, by extending the piping into deep water? It is recommended to put it clear of the flats.
272. Where the tide is strong and there is a scour at certain seasons? Yes.
273. Is the tide active in Woolloomooloo Bay? No; there is a rise and fall, but no stream.

Mr. John William Hilliard, Wharfinger at Cowper Wharf, Woolloomooloo Bay, sworn and examined:—

Mr.
J.W. Hilliard.

19 Sept., 1888.

274. *Chairman.*] Are you the wharfinger at Woolloomooloo Bay? Yes.
275. Have you full opportunity of seeing the shipping traffic there? Yes.
276. Is it very large now? The revenue this year will be about £3,800.
277. From what class of vessels generally is it derived? From coasters and general cargo ships from London.
278. Are London ships berthed there? Yes.
279. Many? Not very many. In 1885 £5,000 was collected.
280. Have you noticed any inconvenience arising at various times owing to the want of accommodation for vessels? Yes. On several occasions I have seen ships go away from there to other wharves.
281. Do you know what the proposed improvements are at Woolloomooloo Bay? Yes.
282. Do you think that the proposed jetty, 700 feet long and 100 feet wide, will cause any inconvenience to the traffic of the bay? Not in the least. It is the very thing that Cowper Wharf wants.
283. If there was sufficient accommodation do you think the bay would be more frequented by ships? Yes. The masters are rather disgusted when they first go to the bay; but once there they express an opinion that they will go there again.
284. Are there any mercantile stores in the neighbourhood? There are four or five bonded stores now being built, and nearly finished. I believe that Hoffnung & Co. have taken up a large piece of ground for the purpose of erecting large stores.
285. Do you think it is likely that wool will be shipped from there at any time? I should not wonder if it were, provided there was a store to receive it.
286. During a busy season do you think it would be the case? Yes.
287. Are you of opinion that, as Government property, it is wise to improve the wharf to this extent? Yes.
288. *Mr. Humphery.*] Have you formed any opinion as to the probable income from the proposed new jetty? If we had a jetty 500 feet or 600 feet long and 150 feet wide we should have it full all the time. I think that if we had a jetty of that kind, instead of having a revenue of £3,000 or £4,000 a year we would have a revenue of £20,000. We would then have room for ten vessels.
289. What is your reason for saying that the jetty should be 150 feet instead of 100 feet wide? Because 50 feet on each side will be required for a loading berth, and another 50 feet would be required in the centre for a cart track.
290. Do you believe that vessels would come and make use of that jetty? Yes. Cowper Wharf has facilities which a great many other wharves have not. That is for getting away. The drays can come in and load and get right away without waiting. There are four streets there by which they can get away.
291. *Mr. Kethel.*] The Admiralty have a wharf on the western side of Cowper Wharf; what use is made of it by the Government? I have put metal on it principally, but two small cargoes of metal will fill it up. It is about 30 feet wide. I have to leave a roadway for carts to come up, so that there is only the centre space.
292. Do the naval authorities allow you to use their wharf in that way? I think it is turned over to Cowper Wharf now.
293. Have the naval authorities ever used it? Never.
294. Do they not send boats ashore to land ships' stores? No; they land at all parts of the wharf; sometimes at the jetty. They do not use it at all.
295. For what purpose do you intend to use the small jetty if the large one is extended? For colliers to discharge coal; it is very useful for it.
296. Will you make no provision for accommodation for passengers landed from steamers? They can come and land there.
297. Have you been much pressed for space at Cowper Wharf for landing cargoes? Yes.
298. For what description of goods have you been pinched for accommodation? Timber, metal, and sometimes coal.
- 299.

299. Have the people engaged in the importation of timber and landing it at Woolloomooloo Wharf expressed a desire that they should receive more accommodation, or have they expressed a desire that the Government should resume some of the adjoining land to make storage-yards rather than that a jetty should be extended into the bay? No; I have heard it rumoured that the Government would resume all the frontage to the wharf. Mr. J. W. Hilliard.
19 Sept., 1888.

Mr. Alexander Brown Portus, Superintendent of Dredges, sworn and examined :—

300. *Chairman.*] Have you a good deal to do with Sydney Harbour? Yes. I am Superintendent of Dredges. Mr. A. B. Portus.
19 Sept., 1888.
301. Do you know Woolloomooloo Bay? Yes.
302. Are you aware of the proposed improvements there? Yes; I know that a long jetty is to be run out. I am not aware of the other improvements.
303. The Naval Wharf is proposed to be extended, and other improvements are to be made, at a total cost of £42,000;—do you think such improvements are necessary? I think so, so far as the commerce of the port is concerned.
304. Do you know the accommodation that will be given by these improvements? Yes.
305. Do you think that the proposed jetty 700 feet long and 100 feet wide will interfere with the traffic of the bay in any way? It will to some extent.
306. On the whole, do you think that it would be desirable to construct that jetty? I think so.
307. In your official capacity have you been consulted? No.
308. Nor your opinion asked? No.
309. Have you had anything to do with the dredging of that bay from time to time? Yes.
310. Does the sewage empty itself there? Yes. There is a sewer at the foot of Forbes-street, another at Dowling-street, and another at Duke-street, and a great quantity of sewage comes in.
311. How far does the pipe go into the water? I cannot say. We have dredged close up to it.
312. Then the pipe empties close to high water? Yes. Generally speaking there is a deposit outside the mouth of the sewer.
313. Is the tide strong there? No.
314. Does your experience in dredging lead you to conclude that the sewage being taken out by pipes into deep water loosens the deposit, so that it is more easily removed by the tide? I do not think it makes much difference.
315. Is it not supposed that the scour is greater when the sewage is taken out some distance to where the tide is more active? The scour would remove it to some extent, but I know we have had to dredge at the mouths of all the sewers.
316. Do you recollect where the sewer at Fort Macquarie first emptied itself? Yes; some distance out.
317. Was it extended afterwards? I do not recollect it.
318. How long have you had control of the dredges? Eight years. I was in Newcastle before that.
319. Are you an engineer by profession? Yes; a millwright and engineer.
320. Does the harbour suffer much more in flood seasons from deposits from sewers and such things than it does in dry seasons, such as we have had recently? Yes; there is more dredging to be done in wet seasons.
321. Do you keep any record of the number of tons of silt removed from time to time in the different localities? Yes.
322. How many dredges are there in Sydney harbour? Three.
323. Actively at work? Yes.
324. Can you keep them at work at all times? Yes, except when it is very rough weather, when it is dangerous to send the punts with silt to sea.
325. The delay in continuous work would be attributable to that alone? Yes.
326. I suppose that to work the dredges economically they ought to be kept at work at all times? Yes.
327. But that you cannot do? Our most economical dredging was at Newcastle, when we were working night and day.
328. Is that the rule in dredging services? Yes.
329. Have you not been able to do it in Sydney? It was done in Sydney for four years, when the dredge was working at the Heads. That was before I came to Sydney.
330. Did you experience much difficulty in deepening Woolloomooloo Bay, and other places where sewers make deposits? No; there is no difficulty, except when vessels are sometimes in the way, and then there is a little delay.
331. Mechanically there is no difficulty? No.
332. What number of tons can you remove? That would depend upon the size of the dredge.
333. If an ordinary dredge were used to deepen the frontage to the wharf in this bay, how long do you calculate it would take you to do so? One of our dredges lifts about 700 tons per day, and another does the same. The large dredge is at present dredging over 2000 tons per day.
334. Can you send that to sea? Yes. These figures are approximate. The "Sampson," our largest dredge, has three punts of about 350 tons capacity. There is one steam hopper barge which takes 400 tons. They go three miles outside.
335. Have you all the modern appliances in your dredges? Yes.
336. Have not dredges been improved to a great extent during the last few years? As far as the size of dredges is concerned there is a decided improvement. The larger a dredge is, the more economically it is worked; I think we have kept pace with the times.
337. Do you think there would be sufficient inducement to warrant the Government in constructing these improvements at Woolloomooloo Bay? I think so, judging from the fact that the present jetty was very largely used some time ago. I think it is very largely used now, and the facilities offered by the Government are more than are offered at other wharves.
338. Are you aware that warehouses are being built in the neighbourhood of the wharf at Woolloomooloo Bay? There is a shelter shed at the wharf, but I am not aware that there are any warehouses there.
339. Would the small jetty continue to be used if the large jetty were built? It was constructed for the Manly Beach traffic at first, but it is not used for that now.
340. Is it proposed to construct a roadway along the large jetty? I am not aware.
341. Is it not usual to place a line of rails on such jetties, so that merchandise may be easily moved backwards and forwards? Yes.

- Mr. A. B. Portus. 342. As a property belonging to the State, do you think Cowper Wharf is of sufficient value to warrant these improvements? I think so.
- 19 Sept., 1888. 343. *Mr. Abbott.*] Do you know, as a matter of fact, whether the wharfage accommodation which exists in Port Jackson now is not more than ample for all the shipping that has ever come to it, taking into consideration all the public and private wharves? Judging from occasional observation, I imagine there is a necessity for increased accommodation. The accommodation offered by the Government is better than that provided by private individuals—the approaches are better.
344. Do you think the Government will get a fair return in revenue for the construction of such a work as this, having regard to what it has already cost them to construct works at Woolloomooloo Bay? It will very much depend upon how matters are arranged between the Government and private individuals. If private individuals offer rebates and other facilities to shipping which the Government cannot offer them, the Government may be at a loss.
345. Is that the case with regard to wharfage in Sydney? I do not know.
346. Was it not the case a short time ago? I do not know.
347. Was your opinion ever asked as to the necessity for these works? It is not usual to ask my opinion. I have generally to do with the dredging of the harbour. Mr. Moriarty and Mr. Darley have to do with those matters. I may have been asked, but I cannot charge my memory with it.
348. *Mr. Humphery.*] Can you state approximately what is the yearly cost of dredging Woolloomooloo Bay? I could by referring to my books.
349. Can you say whether the cost will be appreciably increased if these proposed wharfage improvements are carried out? The continuation of the jetty would not make the bay more difficult to dredge than it is now, because the distance of the jetty from the shore is sufficient to allow of dredging without hindrance.
350. If the return upon the cost hitherto is deficient, will it be a fair criterion as to the future cost? Yes.
351. *Mr. Kethel.*] You observe the distance between the old jetty and the proposed new one—perhaps 150 feet. In working a first-class dredge what room do you require for the punts to lie alongside and load, and to move the vessel about with the punts fast alongside, the dredge being as close as possible to the piles on each side;—do you think there is sufficient space there to enable one of your large dredges to dredge this portion of the harbour from side to side? The dredge “Sampson” can work well in about 110 or 120 feet.
352. Dredging between the jetties where the sewage out-fall occurs is principally done by the “Charon”? Yes; and the dredge “Hercules” constantly dredges there.
353. Could the “Hercules” work there conveniently with her punts;—do you think there is space between the two jetties to dredge successfully? Yes; the dredge “Hercules” could work very well with a distance of 130 feet.
354. You are aware that several sewers flow into Woolloomooloo Bay under Cowper Wharf, one on either side, and one perhaps right underneath the proposed jetty. In your opinion, would there be a tendency for the silt to accumulate amongst the piles under the jetty when extended where you could not reach it with any of your dredges? Yes, probably it would; but I do not see any great disadvantage from that, because the dredge would remove it from time to time.
355. How could a dredge get the stuff from among the piles? The sewage would fall down alongside the jetty.
356. Do you think that with a jetty 100 feet or 150 feet wide the action of the dredges beyond the outer piles would cause the central deposit to give way;—would it not remain and silt up to the water’s edge in course of time? I daresay it would, but there would be no great inconvenience if it did silt up.
357. If it was impure sewage would it not become a public nuisance and dangerous to health? I do not think it is a contingency of the future, because the sewage will eventually go to Bondi.
358. Is it not a fact that such a state of things exists at the present time among the piles on the wharves;—has not the deposit reached nearly to high-water mark, at all events above low-water mark, where it cannot be reached by any of the dredges? That may be the case where there is not sufficient width to go in.
359. *Mr. Garrard.*] I understand your largest dredge, the “Sampson,” a double-sided dredge, can work very well in a space of 120 feet? Yes.
360. As there will be a space of 130 feet between the two jetties, the “Sampson” could work there easily? Yes; the new dredge which is being constructed is 28 feet wide with no side ladders, and could work in a smaller space than the “Sampson.”
361. *Mr. Suttor.*] Do you think there would be an accumulation of sewage at Forbes-street? No, the dredge could go round from time to time, and keep it down.
362. Does the silt accumulate where the new jetty is to be erected? Yes; the dredge has to go there frequently. The worst place is between the two jetties.
363. What is the depth of water near the jetty? About 22 feet at low water.
364. *Chairman.*] Can you supply us with a report of the cost of dredging Woolloomooloo Bay, say for four or five years? Yes.
365. *Mr. Garrard.*] What is the bottom at 22 ft? Rocky, close in. That is on the eastern side, and very close in.
366. *Mr. Kethel.*] Have you been right down on the bed rock in the middle of the bay? No; only where the sewage is.

Mr. John Joseph Earl, timber-merchant, sworn and examined:—

- Mr. J. J. Earl. 367. *Chairman.*] Are you engaged in business as a timber merchant in Sydney? Yes.
- 19 Sept., 1888. 368. Where is your place of business? At Dawes Point.
369. Have you been long engaged in that business in Sydney? Yes; 40 years.
370. Have you been carrying on business at the same place all the time? No, principally at Darling Harbour,—Sussex-street, and at the head of Darling Harbour,—Liverpool-street.
371. Have you carried on business transactions at any time at Cowper Wharf or Woolloomooloo Bay? Yes, during the last three or four years.
372. Have you a place of business there? No; I receive cargoes there.
373. Foreign shipments? All foreign shipments.
374. Baltic and American timber? Yes; I had a cargo berthed there this morning.
375. Have you ever found a deficiency of wharfage accommodation at Woolloomooloo Bay? Yes, frequently. We want more wharfage accommodation now.
376. Have you had reason to complain from time to time of want of accommodation? Yes. 377.

Mr.
J. J. Earl.
19 Sept., 1888.

377. Have you heard of others being placed in the same circumstances? Yes, frequently.
378. Are you aware of the proposed improvements there? I now see the plan for the first time.
379. Do you think that these improvements are desirable ones? I think that the jetty, by all means, should be made.
380. Do you think that the traffic of the bay would be impeded by the construction of a jetty there? No.
381. Do you recollect a similar project being proposed for Sydney Cove? Yes.
382. Was that strongly objected to? It was. A gentleman lately deceased (Mr. Flood) had strong objections to it.
383. Do you think that the same objections would suggest themselves in this case? No. I think this would be a very great advantage.
384. Suppose that in twenty years the traffic of this bay increased to the same extent as the traffic of Sydney Cove has increased since you recollect it; do you think the jetty would then be an inconvenience? No. I do not think a jetty at the Circular Quay would be an inconvenience. I think it would divide the traffic and make it safer.
385. Do you know anything of the relative widths of Sydney Cove and Woollomooloo Bay? No. I should think that Sydney Cove is a little wider.
386. Do you know the two localities well? Yes.
387. Do you recollect the Centipede Rock? Yes. It was near the boat-harbour.
388. Do you know the small jetty now in existence? Yes.
389. Do you think the two jetties would cause great inconvenience? I think I would prefer to do away with the small jetty when the other is built. I have a ship berthed alongside the eastern side of the small jetty.
390. Its distance from the longer jetty is about 130 feet;—would that cause great inconvenience? Not very great; but I think it would be better without the smaller jetty, if you extend the longer jetty 600 or 700 feet.
391. Do you know anything about the proposed expenditure? No; I have never heard anything about it. I had some conversation with the Manager of the Circular Quay. I wanted him to try and get a place between the Admiralty Wharf and the mainland filled in, so as to use it as a timber-wharf. That led to other conversation with respect to the extension of the wharf out to Lady Macquarie's Chair; but I did not know then that the Admiralty had a right to any portion of it.
392. Do you know anything of the proposed alterations to the Admiralty Wharf? Nothing whatever; I only know the present one.
393. Do they use the present one very much? I never saw a boat of theirs alongside.
394. Is it used at all? It is used as a stone-wharf, I think, by the Kiama people. I have seen a lot of metal stacked on the wharf.
395. Do you think the traffic would be likely to increase if proper accommodation were provided? I am sure of that.
396. In view of the probable increase of traffic generally in the port in the course of years, do you think it is desirable to improve this State property to the extent proposed? I certainly do. I think it would be quite as good a paying property as the Circular Quay, in proportion to the amount spent upon it.
397. *Mr. Abbott.*] How long have you had a place of business at Woollomooloo? I have never had a fixed place of business there; I receive cargoes there. Timber cargoes have to go there because there is no other accommodation for them except at Dibbs' wharf, and that is sometimes occupied. There is another wharf—J. C. Ellis' wharf at Pyrmont, which is sometimes available for landing timber upon.
398. Are there not timber-ships at the Circular Quay? No; vessels having small lots of timber, mixed with other goods, sometimes discharge there.
399. *Mr. Humphery.*] It is said that the width of the proposed jetty is to be 100 feet;—is that sufficiently wide? It is not wide enough. It should be at least 130 feet wide. You must have a roadway. There must be room for several drays to pass, otherwise it will not be of any use, because you cannot get the goods away.
400. It should not be less than 130 feet, but I suppose 150 feet would be better? Yes; the wider the better; there will be more landing accommodation.
401. *Mr. Kethel.*] With reference to the accommodation that you required recently, and had reason to complain of at Cowper Wharf, was it the want of berths or the want of room to store your cargoes? The want of room to stack cargoes ready for delivery.
402. Principally? Yes. The wharf is generally filled up with coal, metal, and hardwood, and we sometimes have to wait two or three days to have that cleared away, and that causes expense and delay.
403. The principal portion of the cargoes which have been landed by you at Woollomooloo is what is known to the trade as Oregon? Yes, principally.
404. Is that generally discharged out of the bow port, or the gangway? Nearly always out of the stern or bow port; but in the case of several ships I have come across lately we have had to discharge from the hatch. That is one great evil at present—the curve in the wharf prevents ships from getting alongside. I have had a large ship during the last two months on which I had to run out a stage 25 feet long to reach the rail of the ship. That is a great disadvantage compared with getting the timber direct on the wharf from ships' tackles.
405. Have you ever suggested to the Government wharfage authorities that they should obtain more space for landing and stacking timber on Woollomooloo Wharf? Yes. I spoke of it two years ago, and even a longer time back. Mr. Bell was the first person I spoke to. I suggested that the best thing to do was to resume the block of land from Bourke-street in a line with the street at the back of the quay right away from the eastern extremity of the wharf.
406. Did Mr. Bell then occupy the position that Captain Jackson now occupies? Yes. I have since spoken to Captain Jackson about it.
407. If a timber-ship were discharging out of the bow or stern port, what amount of berthage would she require—would 50 feet be enough? Quite enough.
408. So you could put four timber-ships in the same space required by one ordinary merchandise vessel? Yes, if we had space to run the timber out. We could not berth and discharge four vessels at one time unless we had space to stack the timber.
409. I believe I am correct in saying that the greater number of the foreign ships discharging at the existing jetty are ships timber-laden? Yes. I have seen a few large steamers of 2,000 or 3,000 tons discharging their cargoes, and one or two English ships. The greater number are timber-ships. 410.

- Mr. J. J. Earl.
19 Sept., 1888.
410. Do you think that the proposed jetty is the most suitable improvement for landing and getting away cargoes of long timber? No; unless the ships discharged out of the hatches. Then it would answer very well.
411. How would you stow and get such long timber away;—would it not be extremely inconvenient? Yes.
412. Can you suggest any other means of improving Woolloomooloo Bay equal to or better than this proposal? No; I do not know that I could. There is one thing certain. If that jetty is constructed you can berth general-cargo ships with merchandise from England, and leave the timber-ships the whole space outside of that.
413. Did you not suggest some time since the construction of a quay from the present Admiralty Wharf out to Lady Macquarie's Chair? I did. Looking from the point down to the Admiralty Wharf it struck me, that it would be a very good place to berth all the mail-boats, and I do not think it would be a very expensive undertaking.*
414. Are you still of opinion that that would be a feasible plan? Yes; but I was not aware until now that the Admiralty claimed any portion of it. Of course they would have to give up that berth on the proposed wharf.
415. Is it only within the last few years that you have been largely using Cowper Wharf for a timber-wharf? Yes, about four years.
416. Prior to that, where did the greater number of ships discharge? At the Circular Quay and at Dibbs' Wharf.
417. I understand they will not allow timber to be landed at the Circular Quay, owing to its bulkiness? Yes.
418. Are there any objections to landing timber at Dibbs' Wharf and other wharves other than those which existed when you landed timber there? No. We find that purchasers prefer Cowper Wharf, because there is a better getaway. All the back wharves have steep gradient approaches, and you cannot take as much timber from any on a dray as you can from Cowper Wharf.
419. The wharves further up Darling Harbour are not sufficiently spacious for timber? On the Sydney side you cannot land timber, and on the other side I do not think there is water enough for a ship of any great tonnage. You have to partly discharge cargo before you get the ship into the wharf.
420. Is it not a fact that a larger proportion of the imported timber coming into Sydney now is discharged at private wharves—the consignees' own wharves—than at any previous time in the commercial history of the Colony? Yes. The operations of timber merchants are larger, and they are able to buy whole cargoes. Before they could only buy portions.
421. Many years after you were first interested in the trade nearly every cargo was submitted to the trade generally, but now it has become the practice for retail timber merchants to import their own cargoes and land them at their own private wharves? Yes.
422. Mr. Suttor.] Do you know if Cowper Wharf is used largely by other ships than those you speak of? Yes. All the berths are full. I have seen ships with general merchandise there.
423. Have you had difficulty in getting berths at Cowper Wharf? No; perhaps we have had to wait a day or two, but not longer. That might be the case at any wharf.
424. I suppose that sometimes you use private wharves? Yes, frequently. If I am going to store timber for any length of time, I take a private wharf, because they will not allow me to keep it on a Government wharf.
425. What is the advantage of using Cowper Wharf when your place of business is so far away? There is a better getaway. You can get quit of the timber much easier than at any other wharf, because there is a greater space to work at.
426. If there were greater facilities at Cowper Wharf, would it be used more? I am certain of it. Captain Jackson speaks of that portion of the wharf at the back of the Admiralty Wharf—that portion which has to be filled in—being kept as a bond or storage wharf. If so, it would pay very well; a rent would have to be charged. In fact it would be under his control.
427. Chairman.] But it belongs to the Admiralty? I am speaking on the assumption that the Admiralty will accept the position further on.

THURSDAY, 20 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.
The Hon. WILLIAM HENRY SUTTOR.
The Hon. JAMES WATSON.
The Hon. FREDERICK THOMAS HUMPHERY.
HENRY COPELAND, Esq.

ALEXANDER KETHEL, Esq.
JOSEPH PALMER ABBOTT, Esq.
JOHN RENDELL STREET, Esq.
JACOB GARRARD, Esq.
SYDNEY SMITH, Esq.

The Committee further considered the proposed improvements and additions to the Wharfage Accommodation, Woolloomooloo Bay.

[The Chairman reported that several members of the Committee—Mr. Campbell, Mr. Suttor, Mr. Kethel, Mr. Abbott, and himself—had that morning visited Woolloomooloo Bay, and, by personal observation, and inquiry from persons engaged at the wharves there, had made themselves better acquainted with the works represented in the proposals before the Committee.]

James Barnet, Esq., Colonial Architect, sworn and examined:—

- J. Barnet, Esq.
20 Sept., 1888.
428. Chairman.] Have you occupied your present position of Colonial Architect for many years? Yes.
429. Have you been charged with the different works to be carried out under an arrangement made between the Imperial and Colonial Governments with respect to naval matters? Yes, at Garden Island, Woolloomooloo Bay, and Spectacle Island. 430.

* NOTE (on revision):—I am told there is a depth of water 30 feet all the way from the baths to the point, immediately outside the straight ledge of rocks; and without encroaching on the Domain beyond the present line of the existing fence, an esplanade, 200 feet wide, could be formed, and the material for filling in and levelling is on the spot.

J. Barnet,
Esq.
20 Sept., 1888.

430. Have you had anything to do with other works? No; with the exception of the Admiral's house.
431. The reason why we have been brought to this investigation is that we have had placed before us proposed improvements at Woolloomooloo Bay. We find that an Admiralty wharf forms part of the wharf improvements we are now considering. They have been inspected by several members of the Committee, and we find that the works on the Admiralty wharf are *in statu quo*. Comparatively nothing has been done. There is a wharf, but no improvements of any moment carried out? No; the foundations for the store are found to be very difficult.
432. Is it proposed to build a store there? Yes.
433. Is it still intended to build a store there in addition to the store on Garden Island? I believe so. There is no store on Garden Island.
434. What works have been carried out on Garden Island? They have all to be carried out under my supervision. On Saturday, 16th June, I went over the Island with his Excellency the Governor and Sir Henry Parkes, and at their request I furnished them with a *precis* of the whole matter. That *precis* has just been read to the Committee.
435. Have you been aware of the interchange of certain lands between the Government of the colony and the Admiralty, for any time? Yes.
436. Were you Colonial Architect at the time the arrangement was first made, a good many years back? Yes.
437. Do you recollect what the exchange consisted of at that time? I do not. The whole of the lands were leased to the Colonial Government.
438. How far did Dawes' Battery extend? It included the Corporation baths.
439. Did it include Dawes' Point absolutely? Yes.
440. And the Queen's stores? They were not included. They were not surrendered. I think they are not leased to the Government.
441. What else is there? Victoria Barracks.
442. And Imperial lands all through the country? Yes—at Newcastle, Parramatta, Liverpool, and other places. I think there was also something in Brisbane. I think Fort Denison was included.
443. In exchange what was given? Garden Island.
444. And a condition that a residence should be purchased for the Admiral? Yes; also the erection of a store at Woolloomooloo Bay and at Spectacle Island.
445. When was that arrangement completed? About Sir Alexander Stuart's time.
446. Have the works at Garden Island been carried out at the expense of the Colony? Yes; entirely.
447. Do you know approximately what they cost? I cannot say from memory, but I stated the whole matter in a minute to the Colonial Secretary.
448. I find that there is a vote of £165,000 in 1888? Yes; it is in the present year's estimates.
449. And there is a past vote of £50,000? Yes; that is expended.
450. Is it still intended to carry out the improvements at Woolloomooloo Bay? I have had no instructions since I wrote that letter, describing the whole matter. When I met the Governor and Sir Henry Parkes at Woolloomooloo Bay, as well as at Garden Island, I produced a plan, and Sir Henry Parkes asked me to give him the particulars. I gave him a full history of the whole matter, pointing out that the erection of this store would encroach upon the Domain, as the plan would show.
451. What is the estimated cost of the proposed improvements at Woolloomooloo Bay? About £40,000.
452. I refer to the Admiralty portion of those improvements? As far as the store is concerned it will be £40,000.
453. Do you know whether it is the intention of the Admiralty to recommend that those improvements be carried out? I may say that the plans were made under the direction of an officer for the Admiralty, Mr. Fishenden. They were all approved, and copies sent Home to the Admiralty; and the store is a portion of what was approved of by the Admiralty.
454. Are you acquainted with the proposed improvements generally at Woolloomooloo Bay? No; I am not aware of them, except in connection with the Admiralty store. I know that Mr. Darley recommended that we should go further north to avoid the bad foundation. I pointed out that it would perhaps be better to allow the Admiralty people to have some of the newly purchased property at the Circular Quay.
455. Would not going further north at Woolloomooloo Bay encroach still more upon the Domain? I do not think so. It would encroach upon the baths, which are Corporation property.
456. How are they held? I do not know.
457. Have you formed any opinion as to the propriety of building upon the frontage where the baths are? No.
458. Do you think it is a suitable place for the baths at all? No; not in the present condition of the water.
459. Supposing it was not used as baths, do you think it should be taken from the public, who now hold it for recreation purposes as a frontage to the Domain? No; but we have progressed so rapidly with wharfage frontage that we do not know where to go. When we visited Woolloomooloo Bay, Capt. Hammill, of the Navy, was with us, and he expressed the opinion that Garden Island was the proper place for the store. The store was designed on the mainland principally to please the storekeeper of the time.
460. May not the present storekeeper hold a different view? He may. The objection the former storekeeper had was, that when contractors delivered the stores, it would be better to receive them on the mainland; but I think it is just as easy to receive them on the island. I was always opposed to building at Woolloomooloo Bay.
461. Can you form approximately an estimate of the value of the frontage given to the Admiralty in Woolloomooloo Bay? No.
462. You see from the plan that it is proposed to build a new jetty in the bay 700 feet long and 100 feet wide;—do you think that is a desirable improvement of the bay? That is a matter I have not studied.
463. Do you know whether the Admiralty improvements are nearly completed at Garden Island? The buildings I have had instructions for—that is, the barracks and the store—are completed, and the foundations are in for all the other buildings. Plans were submitted months ago. In fact, Sir Henry Parkes, when he was there the other day, asked what was the reason why the works were not going on, and I said they were simply awaiting his authority.
464. What was the cost of the Admiral's residence? I think it was more than £20,000.
465. Has there been further expenditure upon it since? Yes.

J. Barnet,
Esq.
20 Sept., 1888.

466. Is it a very complete residence? Yes; it is now.

467. *Mr. Copeland.*] What is your opinion in reference to the construction of a jetty, 700 feet long, running out right into the centre of Woolloomooloo Bay;—do you not think it will interfere with the navigation of the bay? I have never considered that matter. I recollect that some years ago when a similar proposal was made in regard to the Circular Quay it was very strongly objected to.

468. Will it not have the same effect as if the bay had been naturally divided in two? Certainly, it will have that effect.

469. Can you give the Committee any information as to whether the same objects could not be carried out on the frontage without interfering with the navigation? No, I cannot. Wharf matters are outside my line.

470. What is the nature of the stores intended to be kept in the proposed new building in Woolloomooloo Bay;—any explosives? No explosives. Ship chandlery more than anything else. The explosives are supposed to be kept on Spectacle Island. Anyone who visits the Circular Quay Admiralty Stores will see that they comprise almost everything that can be mentioned.

471. Is there any equally suitable place on the other side of Woolloomooloo Bay without interfering with the Domain? I cannot say. In my opinion the store should go to the island.

472. Your opinion is decided that it should go to the island? Yes. In its present position it will necessitate the removal of the stores twice.

473. Do you know if the opinion of the present Imperial storekeeper has been taken on the question? I am not aware. I know that the former storekeeper was very strong on the point of having the stores at Woolloomooloo Bay.

474. Is there plenty of water alongside the island for vessels to discharge stores? There is a wharf now erected where the Nelson could lie alongside of. It would only be necessary to lay down rails and build the store in a suitable situation.

475. Did the storekeeper at that time give any reasons for desiring to have the stores on the mainland? The principal reason he gave was that contractors should bring their goods to the store on the mainland instead of to the island; but I could not see the force of that reason. There were quarters for himself there, and perhaps that was the principal reason.

476. Is it intended to bring the Imperial vessels alongside these stores and load them as required? I think not. The stores have to be taken out in tenders to the ships. Ships bringing stores from England would come alongside.

477. You are not charged with the building of the proposed jetty? No; the agreement was that Mr. Moriarty was to do all the waterwork and put in the foundations. We were to work jointly so as to get the matter out quickly.

478. *Mr. Garrard.*] There is a plan here showing the original site of the Admiralty wharf, and also the proposed alteration. Do you recognize it as yours? No; it is not my plan.

479. Have you ever seen it before? I think I have.

480. Where did it come from? It is from the Harbours and Rivers Department.

481. It is a sketch plan showing how the site of the building might be altered? Yes; Mr. Darley proposed to put the stores underground.

482. Upon this there is a minute endorsed to the effect that you see no objection to the removal to the new site, but you objected to inflammable stores being together? Yes.

483. Can you tell us what plans you prepared originally for the Woolloomooloo site? The whole matter is shown on the plan I now produce.

484. Has this plan received the approval of the Admiralty? Yes; this is a copy of the plan which received the approval of the Commodore.

485. Were there any detailed descriptions given with it? No.

486. Do you recognise this paper as being the specification of the work to be performed? Yes.

487. Is the work there mentioned included in your plan? Yes.

488. *Mr. Campbell.*] Was anyone present representing the Admiralty when the works were recently visited by the Governor and Sir Henry Parkes? Yes; the Admiral and Captain Hammill.

PARLIAMETARY STANDING COMMITTEE ON PUBLIC WORKS.

Wharfage Accommodation, Woolloomooloo Bay.

APPENDIX.

[To Evidence of Mr. Alexander B. Portus.]

MEMO. of Dredging performed at Woolloomooloo Bay from 1st January, 1881, until 31st December, 1887.

The attached memo. affords the information asked for by Mr. Humphery last night in connection with the Woolloomooloo Bay proposed jetty.

It will be seen that 231,650 tons have been lifted, at a total cost of £11,402 11s. 6d. for dredging and towing. Of this quantity, 191,295 tons were sewage deposit; the balance was original bottom removed to deepen the channel and wharf berths for heavy-draught ships. The average cost of the dredging and depositing 3 miles outside of Sydney Heads has been 9½d. per ton.

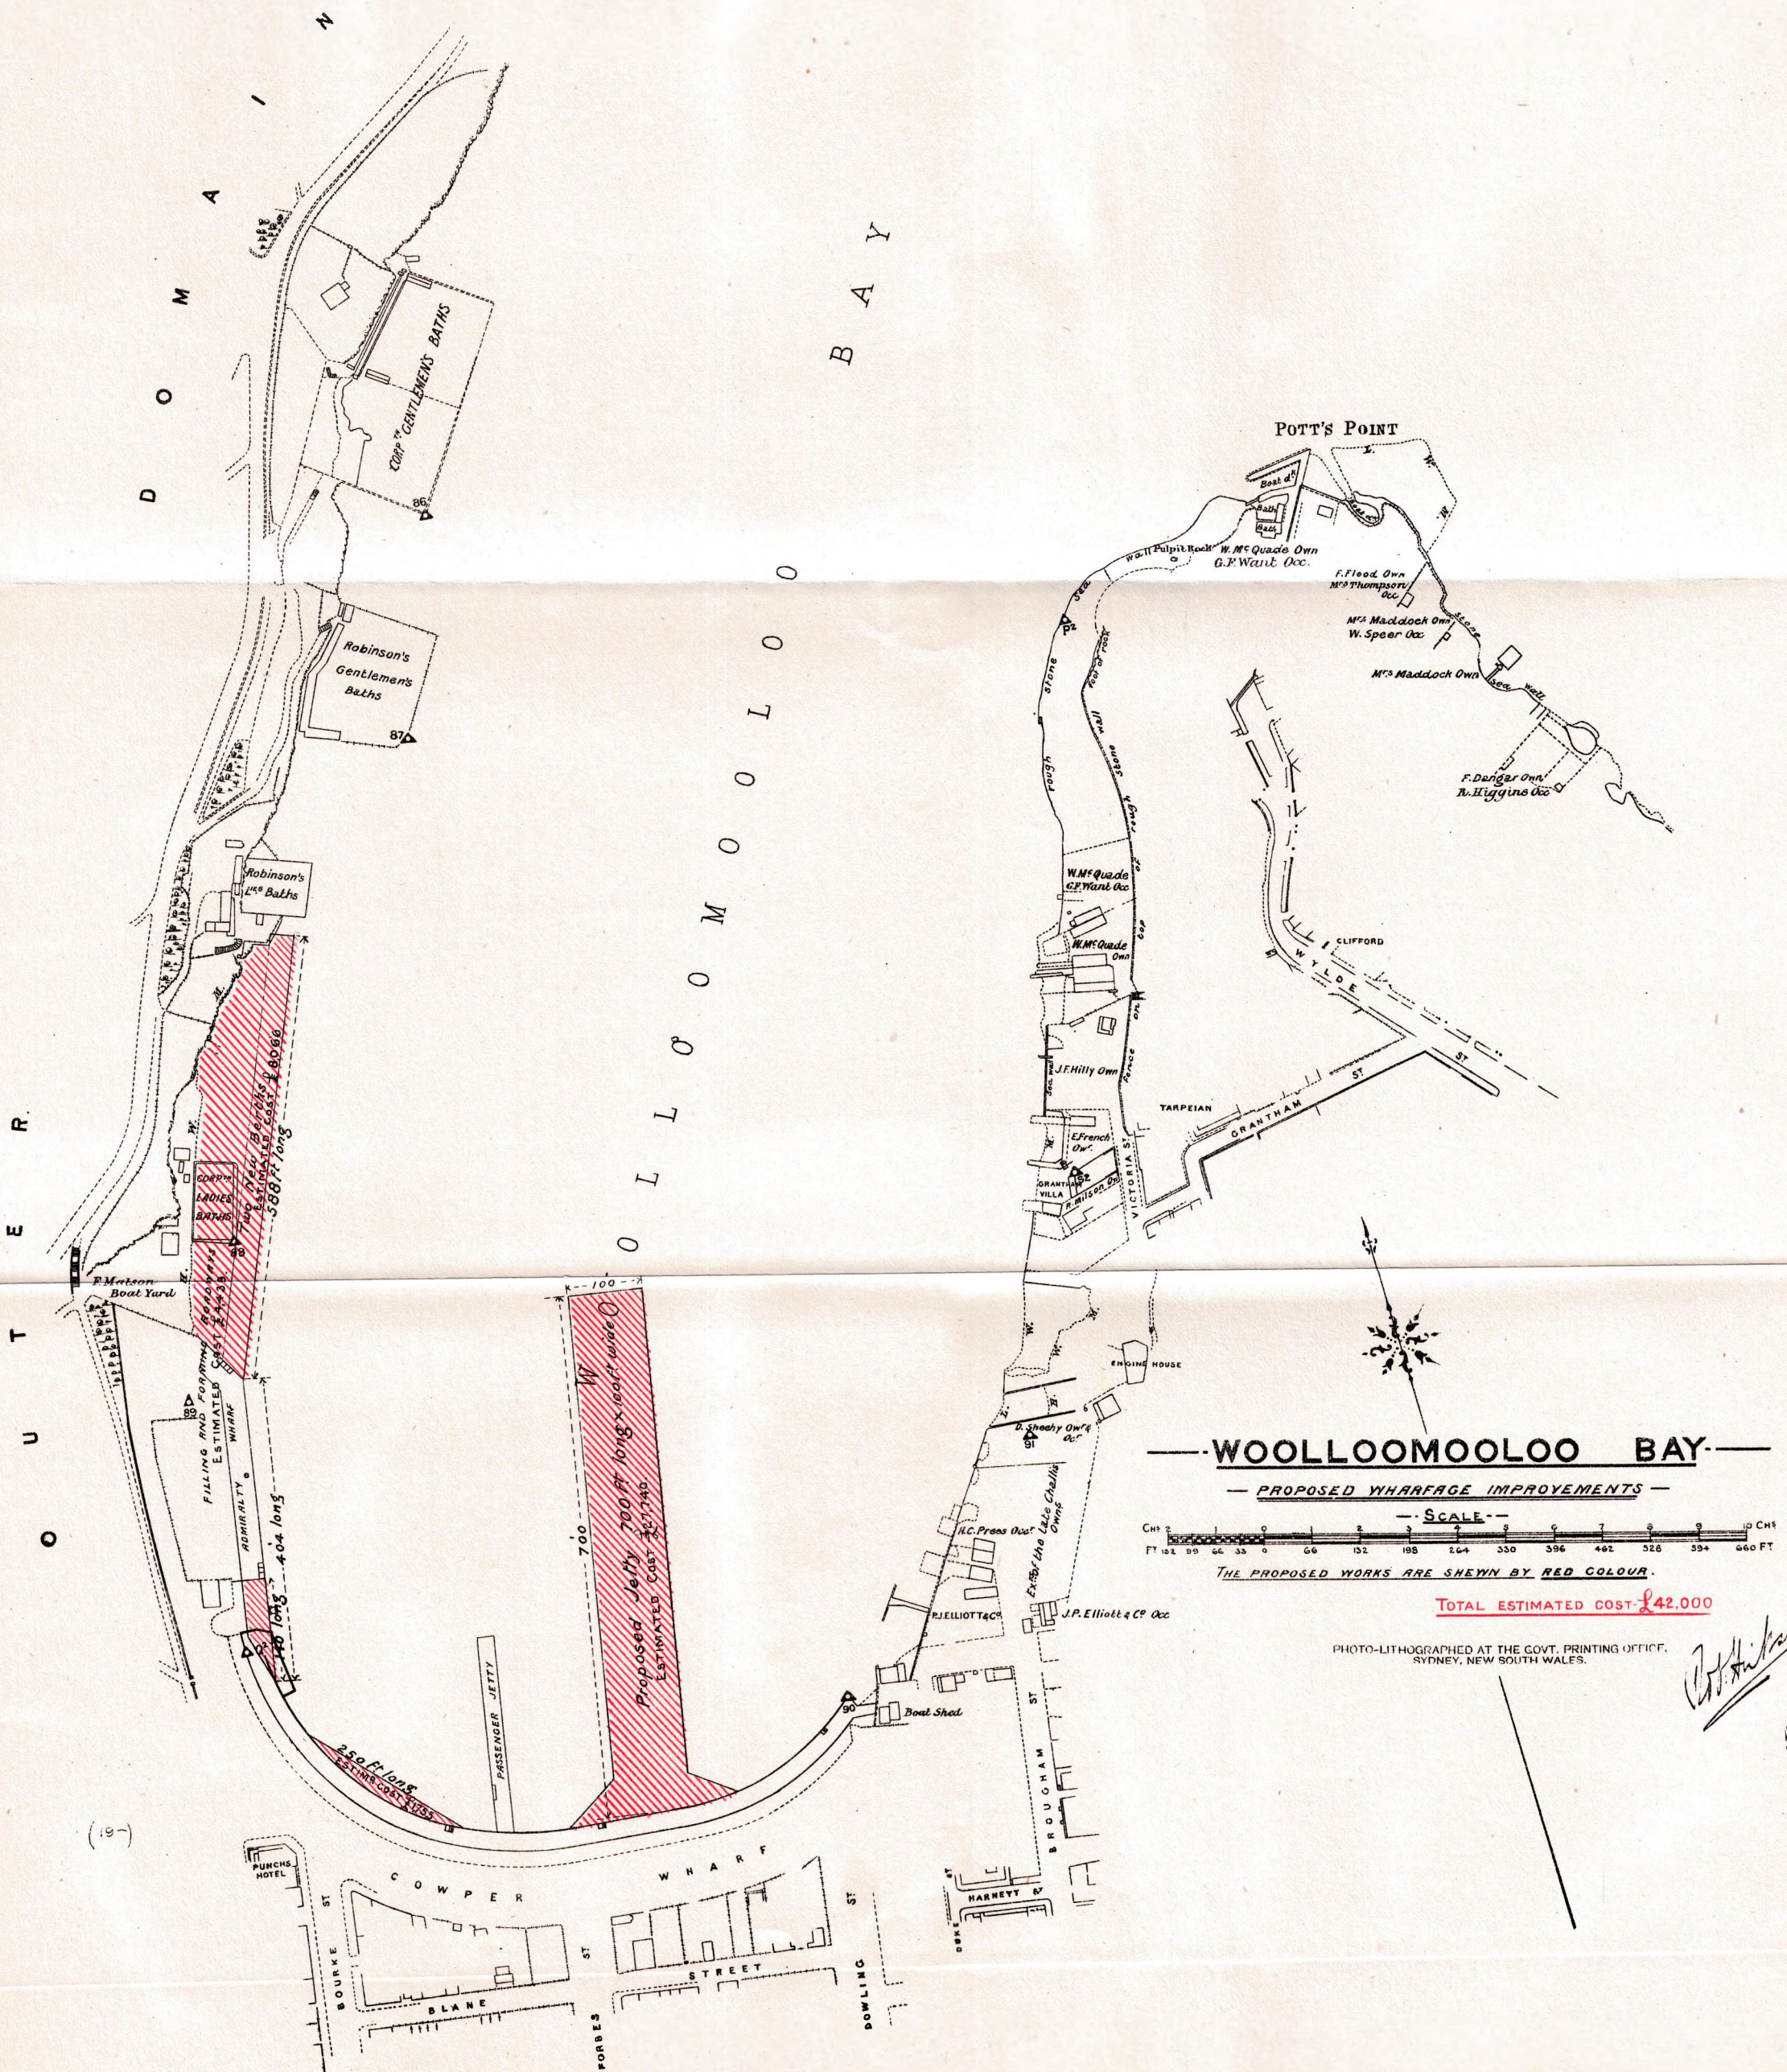

Sydney, 20 September, 1888.

To evidence of William Robeson Benson, Esq.—Return of inward cargo ships and steamers berthed at the Associated Wharves, from 1st January, 1887, to 31st October, 1888.....	C
The proposed new Admiralty Wharf—Letter from Rear-Admiral Fairfax	D
Plan, showing the proposed Improvements and Additions to the Wharfage Accommodation, Woolloomooloo Bay, as it was submitted to the Committee.	

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

WHARFAGE ACCOMMODATION, WOOLLOOMOOLOO BAY.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the present Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, to whom was referred the duty of considering and reporting upon "the expediency of carrying out certain improvements and additions to the Wharfage Accommodation, Woolloomooloo Bay," have, after due inquiry, resolved that it is not expedient the proposed works should be carried out; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

The proposed improvements and additions consist of a jetty 700 feet in length by 100 feet in width, extending into the bay from the centre part of Cowper Wharf, to cost £27,740; the construction, at a cost of £8,066, on the western side of the bay, from the northern end of what is known as the Admiralty Wharf to a point near Robinson's Ladies Baths, of a new wharf, 588 feet in length, 320 feet of this length to be set aside for the use of Her Majesty's ships, in lieu of the present Admiralty Wharf, which, with the 268 feet of the new wharf, it is proposed to use for general commercial purposes; the lengthening of the present Admiralty Wharf by 140 feet, in order to make the total length of that wharf 404 feet, at a cost, including the formation of roadways, of £4,439; and the filling-in of a part of the curved face of Cowper Wharf, at the south-west corner, so as to produce a wharf having a straight face of 250 feet, the cost of this alteration to be £1,755. The total estimated cost of the proposed works is £42,000.

It will be seen that the principal improvements or additions proposed are—first the jetty, and secondly the new wharf, part of which is to be handed over to the Admiralty in lieu of the wharf which at present exists in Woolloomooloo Bay for the use of Her Majesty's ships on the Australian station; and to these the Committee, during the course of their inquiry, directed most of their attention.

They examined a large number of witnesses, obtaining evidence not only from the Government officials who may be regarded as responsible for the proposals, but also from other officers in the Government service who are in the position to give a valuable opinion upon the scheme; from merchants interested in the shipping trade of the port; from nautical men directly connected with this trade; from carriers whose occupation it is to convey cargo to and from the wharves in Sydney; and from others, including an expert in the construction of wharfage accommodation, and Captain Kane, an officer of the Royal Navy, representing the Admiral at present commanding the British Squadron in these waters. In addition to this several members of the Committee visited Cowper Wharf, and by personal observation and inquiry of persons engaged there, made themselves more fully acquainted with the proposals before them.

The result of these efforts on the part of the Committee to elicit full information concerning the proposed works is the collection of a large amount of evidence, from which, after careful consideration, they have come to the conclusion that the expenditure which would be incurred upon the works is not justified, either by the requirements

requirements in connection with the wharfage accommodation of the port, or by the nature of the proposals regarding them as a scheme for the improvement in a desirable and proper manner of a very valuable Government wharf property.

The Committee do not mean that the wharfage accommodation at Woolloomooloo Bay should not be improved. They are convinced that improvement might be carried out advantageously, but any additional accommodation proposed should, they consider, be designed on the basis of a broadly and well conceived national work for the permanent improvement of the bay, rather than in a fragmentary and incomplete manner, with the object, chiefly, of bringing in an immediate increase of revenue.

Two circumstances connected with the scheme were apparent to the Committee throughout the inquiry, and these were,—a want of comprehensiveness, as well as a faultiness of design, in the proposed plan for improving the wharfage accommodation of the bay by means of the jetty; and an indefiniteness with regard to the arrangements with the Admiralty in respect of the present Admiralty wharf and the proposed new wharf in lieu thereof.

It will be found from the evidence that the proposed improvements and additions originated with Captain Jackson, the Manager of the Public Wharves; and though he considers the increased accommodation is required to meet the wants of the shipping which discharge their cargoes in Woolloomooloo Bay, and those which, with further accommodation, might be expected to discharge there, his main idea in recommending these works appears to have been to increase the revenue now derived from the wharf. The Committee, however, while they admit the importance of an increased revenue, do not regard this as the only or principal object to be secured in a plan for the improvement of the bay.

In Woolloomooloo Bay the Government possess what,—omitting from consideration the Circular Quay,—is the finest wharf site in the harbour, and, including frontages which in the future may have to be resumed and added to that at present in the hands of the Government, would be greatly superior to even the Circular Quay. Yet in this splendidly-situated natural dock, which, by a comprehensive and well-devised scheme, might be improved so as not only to produce a large revenue but afford ample accommodation for shipping visiting the port, it is proposed, on the plans submitted to the Committee, to construct, at great expense, certain works, the chief of which—the jetty—in the opinion of the Committee, would, by reason of its great length and position, disfigure the bay, and interfere with navigation, without being as serviceable to shipping as its originator supposes; while the next important—the new Admiralty wharf—is a work respecting which the Naval authorities appear indifferent, and those who may be considered as responsible for proposing it doubtful as to its necessity.

It is noticeable too that apart from Captain Jackson, no one, according to the evidence, in or out of the Government service, has been consulted with reference to the advisableness or otherwise of constructing the proposed works. Captain Jackson appears to have suggested the scheme, and the proposals went from the Treasury to the Department of Public Works, where they were handed over to Mr. Moriarty, Engineer-in-Chief for Harbours and Rivers, and he caused the necessary plans to be prepared. No one but Captain Jackson was consulted in the matter. Captain Pettit, Harbour Master of Sydney, having a large experience in shipping matters, was not referred to in any way. Nor was Captain Hixson, President of the Marine Board, or apparently anyone else. The whole scheme was that of Captain Jackson, and his principal object, as already mentioned, appears to have been an immediate increase of revenue.

That the expenditure upon the proposed works is not justified by the present requirements for wharfage accommodation in the port will be seen from evidence given relative to the existing accommodation for the berthing of vessels and the number of vessels visiting the port. This evidence bears upon the Woolloomooloo Bay proposals differently from the manner in which testimony of a similar character bore upon the proposals lately dealt with by the Committee for the improvement of the Circular Quay. In the latter case most of the improvements were of a character which removed them from the class that might be regarded as entering into competition with private enterprise, and those which were not necessary for the purpose of

of renewing a worn-out portion of the wharf on the western side of the Quay. In the case of Woolloomooloo Bay there are no such reasons to support the proposals as were apparent in the matter of the Circular Quay. The berths at the proposed jetty or the new wharf have not been, and there is no evidence to show they are likely to be, leased as most of the Circular Quay is. Doubtless there are reasons why the Government—being the possessors of a valuable wharf property—should endeavour in the public interest to do the best they can with it, but unless that endeavour, when it is directed towards improving the property, is guided by a desire to make the improvement of a comprehensive, permanently effective, and truly national character, the Committee consider that Parliament should hesitate before according to it its approval.

Another thing which influenced the Committee in their decision was the fact that if they recommended the construction of the jetty it would, were the evidence acted upon, have to be made of greater width than is proposed, and consequently at a much increased cost. The estimated cost of this work, as it was submitted to the Committee, is £27,740; the estimated cost, if the jetty were widened to 150 feet, as the witnesses generally say it should be, is £41,040, or half as much again, which would bring the total cost of the proposed improvements in the bay to £55,300, as compared with £42,000, the total estimated cost submitted in the first instance to the Committee.

On the occasion when several members of the Committee visited Cowper Wharf they found almost the whole of the wharf covered with blue metal, coal, and timber, much of this material bearing the appearance of having been there for some time, and it appeared to them, as it is shown in the evidence, that if measures were taken to keep the wharf clear of cargo after it has been discharged from vessels there would be considerably more accommodation available for shipping than under present circumstances there seems to be.

In their inquiry, the Committee elicited information upon the following points:—

- (1) The nature of the proposed improvements and additions.
- (2) The necessity or otherwise for the proposed works; the examination relative to this being directed towards obtaining evidence as to—
 - (a) Whether any general desire has been expressed for what is proposed.
 - (b) Whether the improvements will afford the accommodation anticipated.
 - (c) The revenue expected from them.
 - (d) Whether the works are likely to interfere with the navigation of the bay.
 - (e) Whether they are desirable in view of the importance of Woolloomooloo Bay as a State property which might be improved very advantageously by a comprehensive and well-devised scheme of wharfage accommodation.
- (3) Whether the proposals are justified by the extent of the shipping trade, and the wharf accommodation already available, including the proposed improvements at the Circular Quay.

In relation to the description of the improvements and additions already given, it is necessary, in order that they may be clearly understood, to say something further both of the proposed jetty and the new Admiralty Wharf. The jetty, which would be run out in the centre of the bay, Captain Jackson considers would afford accommodation for six 1,500-ton ships (three on each side), while the evidence of other witnesses is to the effect that it would not afford this accommodation. The new wharf for the use of Her Majesty's ships is proposed because, in accordance with the arrangements between the Government of this Colony and the Admiralty for the construction of certain works for the use of the Navy, it is necessary to build a naval store, and it is represented as difficult, unless at great expense, to obtain foundations for the store at the back of the present Admiralty Wharf, where up to the present it has been proposed to erect it. The straightening of the face of the wharf at the south-west corner of the bay is proposed because of the difficulty experienced by a vessel in lying abreast of a curved wharf; and to this part of the proposals, it may be said, the Committee entertain no objection. This improvement, the cost of which is £1,755, is, however, a matter of very small importance, and if considered necessary can be carried out without reference to the Committee.

The

The question of the necessity or otherwise for the proposed works forms, of course, the principal feature of the evidence, and it will be found fully dealt with. Examining it according to the plan just stated, and referring to the first point—whether any general desire has been expressed for what is proposed—the evidence leads the Committee to believe that there has not been an expression of such a desire.

Captain Jackson says there have been frequent complaints of a want of accommodation at Woolloomooloo Bay; but Mr. Joseph Barling, Under Secretary for Public Works, states that he is unaware of any applications by maritime people to have these works carried out, and that no petitions (or memorials) in favour of them have been received. Various witnesses will be found to have expressed themselves as of opinion that the proposed works would be remunerative, and that the superiority of Woolloomooloo Bay as a place for the berthing of vessels justifies the carrying out of improvements; but there is nothing to show that prior to the present proposals being brought forward there was any general demand for extensive additions to the existing accommodation.

As to the new Admiralty Wharf, those chiefly concerned in the arrangements for the accommodation of Her Majesty's ships here knew nothing about it until it was brought under the notice of Rear-Admiral Fairfax in a letter from the Committee asking whether the alteration from the old Admiralty Wharf to the new was approved of by the naval authorities. Notwithstanding that this part of the proposals referred to the Committee comprised a change in the arrangements between the Government and the Admiralty, by which a wharf already handed over to the naval authorities was to be taken from them and a new wharf constructed at a cost to the country of £8,000, and in a situation which, when a store was in course of being built at the rear, would probably necessitate an extensive encroachment upon the Domain, the Admiral was unaware of it, and when questioned regarding it was unable to say definitely, without reference to the Admiralty, whether the proposed alteration would or would not receive Admiralty sanction. Added to this there is evidence from Captain Jackson in which he declares that the new Admiralty Wharf is not necessary, as the present one has never been used for naval purposes; and from the Admiral, through Captain Kane, intimating that if certain arrangements of an inexpensive character are made in the city the store proposed to be erected at Woolloomooloo Bay might be built on Garden Island, and the bay, as far at least as this store is concerned, left free for commercial purposes in connection with the trade of the port.

With reference to whether the proposed works will afford the accommodation anticipated from them, the evidence shows that unless the jetty be widened considerably they will not. The width proposed is 100 feet, and Captain Jackson is of opinion that this would be too narrow. As ships would be discharging at each side of the jetty at the same time, and there must be a roadway along the centre of the jetty for the passage of drays, there would not, in the opinion of most of the witnesses, be sufficient space for the discharged cargo and the drays, and as one witness of experience put it "there would be a regular block." Moreover, there is a difference of opinion as to the number of vessels the jetty would accommodate. Captain Jackson says it would accommodate six of 1,500 tons, the length of each being from 230 to 250 feet. Forty feet of the jetty would be taken up by the approaches from the main wharf, and would not be available for berthing vessels, so that the berthing space would not exceed 660 feet, and this would have to accommodate, according to the evidence of Captain Jackson, three vessels, the total length of which would be something between 690 and 750 feet. But other witnesses, whose testimony in a matter of this kind must, from their experience in regard to the berthing of vessels, be considered valuable, are of opinion that the accommodation at the jetty would be much less than Captain Jackson anticipates.

The question of the extent of accommodation afforded bears directly on that of the revenue expected to be derived, and Captain Jackson represents the expected revenue at £1,000 per annum from each of the jetty berths, which would make a total increased yearly revenue from Woolloomooloo Bay of £6,000; but inasmuch as it is uncertain whether the jetty would afford the accommodation upon which this estimate of revenue is based, it is doubtful whether these figures can be regarded as accurate.

Whether

Whether the proposed works would, if carried out, be likely to interfere with the navigation of the bay, is a matter which relates chiefly to the jetty. The evidence upon this point is conflicting, but though it does not appear that the navigation of the bay would, by reason of the jetty, be made unsafe, it would, in the opinion of the Committee, be rendered in many cases difficult, as such a projection into the centre of the bay as this jetty, especially if it were widened to the extent considered necessary, would very materially lessen the space for the movements of vessels and boats.

Coming now to the importance of Woolloomooloo Bay as a State property, which might, by a comprehensive and well-devised scheme, be advantageously improved, it is the opinion of Mr. Norman Selfe, whose acquaintance with the question of wharfage improvement is well-known, and of others, that the bay offers an opportunity for a broad and perfect scheme of wharfage accommodation, and in this the Committee concur. "Looking at the thing on broad grounds," Mr. Selfe says (*Question 1157*), "I think the Government should utilize a number of side wharves on shore before they extend the accommodation. The facilities for building walls under water are now so great that I think it would add far more to the dignity of the port, if I may use such an expression, to build a grand stone quay down one side of the bay. When that is not enough, build one down the other side, and as a very last resource build a jetty in the middle of the bay. The sewage, as long as it is discharged into the bay, would certainly fill up against the jetty, and it would be difficult to dredge it away." Such a scheme as he here suggests could, he explains, be carried out gradually, as circumstances required. His idea, definitely stated, is,—“that the Government should begin at the south-east corner of the bay, and gradually build a continuous wall 1,500 feet long towards Potts' Point, levelling the rocks and filling in the space behind the retaining wall with the material, and making a broad quay.” On the other side he would “build the wharf as part of the continuous whole, and then give the Admiralty whatever might be arranged.” Or, he proceeds to point out—“The Admiralty have Garden Island, and in the course of a year or two, when it becomes inconvenient to have war ships here, it may be desirable to give them another spot, or they may desire to go elsewhere. A continuous quay might be made on this side, the same as on the eastern side. It is easy enough to enclose the Admiralty portion with strong walls which can be taken down, if it is ever thrown into a general system, at some future time.” The proposed jetty he regards as a piecemeal project, and unworthy of a national work.

The last point in the plan of inquiry respecting which further notice is necessary, is whether the proposals are justified by the extent of the shipping trade and the wharfage accommodation already available, including the proposed improvements at the Circular Quay. Captain Jackson considers that the shipping trade justifies the carrying out of the proposed improvements, but the evidence generally shows, indisputably, that if the private wharves are taken into consideration, there is more than sufficient wharf accommodation in the port of Sydney for the number of vessels coming here. Then, in addition to what at present exists, there will shortly be extra accommodation at the Circular Quay. These circumstances, as already pointed out, do not form sufficient ground for concluding that Woolloomooloo Bay should not be improved, but they are certainly reasons why a large amount of money should not be expended upon the proposed works. Mr. Norman Selfe, who is of opinion that there is plenty of wharf accommodation here, states that if the owners of private wharves had power to alter the levels of the streets forming the wharf approaches, those wharves would be equal to requirements for some years to come, and, on behalf of the Wharf Association, it is represented in the evidence that irrespective of shipping permanently provided for at their own wharves, there is wharf accommodation at the present time for 800 or 900 general cargo vessels per annum, while the average number of arrivals annually is 230.

On the grounds set forth in the foregoing portions of this report, the Committee consider that it is not expedient the proposed works should be carried out, and they are of opinion, that for the reasons which will be found in the evidence of Captain Kane, R.N., and in a letter from Rear-Admiral Fairfax, an effort should be made by the Government to have the proposed naval store and wharf provided at Garden Island instead of at Woolloomooloo Bay.

The

The following resolutions were passed by the Committee on Thursday, 6th December :—

Moved by Mr. Abbott, and seconded by Mr. Kethel—

“That in the opinion of the Committee the present requirements for wharfage accommodation in the port do not justify the expenditure necessary for the construction of the proposed wharfage improvements and additions at Woolloomooloo Bay.”

Moved by Mr. Abbott, and seconded by Mr. Kethel—

“That the Committee recommend that the Government enter into negotiations with the Imperial naval authorities with the view of providing the necessary accommodation at Garden Island in lieu of the proposed site for a naval wharf and store at Woolloomooloo Bay.”

JOHN LACKEY,
Chairman.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

(TAKEN BEFORE FIRST COMMITTEE.)

WHARFAGE ACCOMMODATION, WOOLLOOMOOLOO BAY.

WEDNESDAY, 19 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).	
The Hon. GEORGE CAMPBELL.	JOSEPH PALMER ABBOTT, Esq.
The Hon. WILLIAM HENRY SUTTOR.	JOHN RENDELL STREET, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	THOMAS MICHAEL SLATTERY, Esq.
ALEXANDER KETHEL, Esq.	JACOB GARRARD, Esq.
SYDNEY SMITH, Esq.	

The Committee proceeded to consider the proposed improvements and additions to the wharfage accommodation, Woolloomooloo Bay.

Joseph Barling, Esq., Under Secretary for Public Works, sworn and examined:—

1. *Chairman.*] Are you aware that we have under consideration the proposed improvements at Woolloomooloo Bay? Yes.
2. What is the estimate of the cost submitted for the work? £42,000. That is the sum asked from Parliament for the construction of the works.
3. Can you give us any information as to the circumstances under which the vote was initiated or the work undertaken? It was partly intended for the use of Her Majesty's navy, and to resume a piece of wharf originally constructed for that purpose in the bay. Captain Jackson will give particulars as to the necessity for the work.
4. Does the Imperial Government contribute anything to the work? No. There was an understanding come to between the Government of New South Wales, when Sir Alexander Stuart was Premier, and the Imperial Government, whereby certain lands were given up to the Colony by the Imperial Government in exchange for other places and works of which this wharf forms part. We have put up part of the wharf which is marked "Admiralty Wharf" on the plan now before the Committee. It is on the west side of Woolloomooloo Bay. We propose to use that wharf for general purposes, and erect a new wharf for the Admiralty.
5. I have in my hand a statement which I think comes from the Public Works Department, in which the cost of these proposed works is stated at £112,000;—will you look at this document, and see if it is correct? I think this document is a mistake. The amount of £112,000 is a clerical error; it is an error of transcription; it should be £42,000.
6. Is there another vote of £112,000? Yes.
7. Is that the amount estimated for the Newcastle improvements? Yes.
8. Then the correct amount for these works at Woolloomooloo Bay is £42,000? Yes.
9. Is that the estimated amount submitted by the skilled officers of the Department after examination? Yes.
10. Have you a list prepared of the works proposed to be carried out for £42,000? Yes. It is as follows:—It is proposed to erect on the western side of Woolloomooloo Bay a wharf 588 feet in length, a portion of which, viz., 320 feet, is for the use of Her Majesty's ships, and the remaining portion for commercial purposes, and what is marked on the plan as "Admiralty Wharf" will be lengthened as shown, making a total length of 404 feet, the whole of which it is proposed to use for general commercial purposes. It is further proposed to fill in the part of the curved face of the wharf at the south-west corner, and thus construct a wharf having a straight face of 250 feet, and from the centre part of Cowper Wharf to run out a jetty 700 feet in length and 100 feet in width.
11. What is the length of the jetty now in existence at Woolloomooloo Bay? About 250 feet.
12. Has that been in use for some time? Yes, for some little time.
13. Have these proposed works ever been submitted to Parliament in any way? I think it is one of the votes passed.
14. Was it proposed by the Secretary for Public Works to refer the works to this Committee? Yes.
15. Is it within your knowledge that applications have been made at various times by maritime people to have these works carried out at Woolloomooloo Bay? I cannot say that it is.
16. Have any petitions been presented? No. It is a matter that came to our Department from the Treasury.

J. Barling,
Esq.

19 Sept., 1888.

- J. Barling, Esq.
19 Sept., 1888.
17. Is it a proposal partly to carry out the arrangement of an exchange of sites with the Imperial Government? Yes. The main reason, I think, for changing the site of the Admiralty Wharf is the difficulty of getting proper foundations for stores.
18. *Mr. Garrard.*] Have the Admiralty authorities complained about the accommodation at present given? No. They have not complained, because it does not matter to them what the foundations may be, so long as they are provided. It would cost an immense sum of money to get foundations at the present site.
19. Has the Colonial Government to carry out that work? Yes. It was part of the arrangements made by Sir Alexander Stuart. We found it so difficult to get settled foundations on the present site that it was decided to change the situation.
20. Will it not be a great eyesore in the Domain if those buildings are shifted farther out? I hardly think so. If we are going to use the present wharf for commercial purposes, I do not think it will matter much to provide the other accommodation farther away.
21. *Mr. Kethel.*] Could you furnish the Committee with a memo. showing the nature of the arrangement entered into between the Government of New South Wales and the Imperial Government by which the Colony is committed more or less to this scheme? It is not in my Department; still, if you wish it, I can easily get the document.
22. *Chairman.*] Is it part of the general exchange by which the Imperial authorities got Garden Island? Yes.
23. *Mr. Abbott.*] Can you state what is the expenditure on Cowper Wharf at the present time? Captain Jackson will be able to give it.
24. Can you tell me what the whole of the works have cost from the beginning? I have not the figures with me at present, but I will send them in.
25. Can you state what revenue has been derived each year from the wharfage accommodation at present existing? The collection of the revenue does not come within my Department. Captain Jackson will be able to give information on that point.
26. *Chairman.*] Will you supply the Committee with all the papers you have referred to? Yes.

Robert Hickson, Esq., M.I.C.E., Acting Engineer-in-Chief for Harbours and Rivers, sworn and examined:—

- R. Hickson, Esq.
19 Sept., 1888.
27. *Chairman.*] Are you aware of the project to make certain improvements at Woolloomooloo Bay? Yes.
28. Do you know the amount required to effect these improvements? £42,000.
29. What do the works consist of? An extension of the Admiralty Wharf, on the west side, for a length of 588 feet. I think its present length is 250 feet. This is a further extension at a cost of £8,000. Then there is an extension and filling up a little bit of the harbour at a cost of £4,500 in round numbers.
30. Is it for filling up alone, or filling up and a wharf? It is a wharf and filling up with dredged material and ballast, which will not cost much. We generally get ballast—rough stones—in front, and fill up with rubbish behind.
31. What work follows that? Straightening part of the circular portion of the wharf. It is very awkward for a vessel to get in there at present. We intend to cut off a piece so as to make a straight berth of 250 feet, which a vessel can lie alongside. That is a timber wharf; it will cost about £1,800. Then there is a jetty 700 feet long by 100 feet wide, which will cost a little over £27,700.
32. Is that jetty considered to be a desirable work? Yes.
33. Have you recommended it? No; I think it was mainly recommended by Captain Jackson.
34. Who was the professional man who designed it? Mr. Moriarty.
35. Is it in your Department that you have taken up the project? Yes.
36. Will the jetty of 700 feet be all piled? Yes; all timber.
37. What will be the exact cost? £27,740.
38. What will be the distance between that jetty and the present small jetty shown on the plan? Nearly 130 feet.
39. Will that be of sufficient space to allow of the use of the two jetties? Yes.
40. Will the long jetty of 700 feet affect injuriously the traffic of the bay generally? No.
41. If large vessels go there will they be able to turn? Yes; as a matter of practice, they will turn outside.
42. There was a project some years ago to carry out a similar jetty in Circular Quay;—was not that objected to because it would interfere with the traffic of the Cove? I do not know. It must have been before I came here.
43. Would that be the case in this instance? No; I think there is sufficient room.
44. Do you know anything of the conditions or circumstances under which this wharf has been conceded to the Admiralty? No; I do not know anything of the arrangement.
45. Have you formed any opinion as to the necessity of the work generally? From two or three visits which I have made to the place, I think there would be a very large business done, if there was sufficient accommodation.
46. Do you think the proposed works can be carried out at the estimated cost? I think so. I went through the estimates myself.
47. *Mr. Abbott.*] Do you know what the Cowper Wharf cost? No; but I could let the Committee know to-morrow.
48. What is the income? Captain Jackson will be able to tell you that. I think the wharf cost £18,000.
49. *Mr. Kethel.*] Have the Imperial authorities at any time complained of the accommodation at their disposal at Woolloomooloo? I have not been here long enough to be able to say. They have not done so to my knowledge.
50. At whose suggestion is the proposal made to change the site of the Admiralty Wharf? I do not know what are the arrangements with the Admiralty. I believe that the motive for moving from the present site is this: We want more wharfage accommodation in Woolloomooloo Bay, and it is more convenient to put the man-of-war ships on the outside than to have them coming backwards and forwards through the shipping.
51. Are you aware of a single instance in which a man-of-war ship has been brought alongside that wharf? No, because I do not think there is any place where they could go alongside. But I believe they intend to do so, and it is the object of the wharf.
52. *Mr. Abbott.*] Do you know anything about stores to be erected at Woolloomooloo Bay? No.

53. *Mr. Kethel.*] At whose suggestion is it proposed to extend the jetty 700 feet into the harbour? I believe it was proposed by Mr. Moriarty, after consultation with Captain Jackson; I believe that is how it originated.

R. Hickson,
Esq.
19 Sept., 1888.

54. Are there any minutes referring to the reasons why a jetty of these peculiar dimensions should be made? I have not seen them.

55. Does it not strike you as peculiar to have a jetty 100 feet wide for commercial purposes? I think it is wanted for large vessels, which are proposed to be accommodated. You want plenty of room for landing cargo. I do not think it is too wide.

56. *Mr. Garrard.*] We have been told that the reason for shifting the Admiralty Wharf is because you find a difficulty in getting foundations for stores which the Colonial Government have undertaken to build for the Admiralty;—is that the case? I cannot say. I do not know the arrangement.

57. Is there any difficulty in erecting stores on the present site of the Admiralty Wharf? There is a difficulty all along there, because it is made ground, and the foundation is not good.

58. Do you know the character of the buildings to be erected there? No.

59. Who is dealing with that matter? The Colonial Architect.

60. Do you know what was promised to the Admiralty with reference to those stores? No.

61. Do you know if the Colonial Architect has complained of the want of good foundations there? No.

62. Do I understand that it is intended to bring the man-of-war vessels themselves alongside? Yes; I believe that is the intention.

63. If stores are erected on the proposed new site, will they not shut out part of the view from the Domain? Not very much. The land is very high above it.

64. How many ships will the new large jetty accommodate? A large and small one on each side. That will be four.

65. Do you think it would be better to diminish the width of the jetty on the outside, so that the vessels lying inside could overlap, thus giving another berth? I do not think so. You could only take off 25 feet from the width, and most of the vessels coming here are of greater beam than that. The vessels with large cargoes go outside, and that is where you want most room.

66. Do you know the width of the Sandridge Railway Pier at Melbourne? I think there are six lines of rails on it. It is a very wide pier, but I do not remember the exact width.

67. Are the foundations at the back of the proposed new site for the Admiralty Wharf better than those at the back of the present site? Yes. It is good hard ground.

68. *Mr. Kethel.*] On whose authority is the statement made that a solid foundation cannot be obtained in the rear of the present Admiralty Wharf;—have you any personal knowledge of the fact that good foundations cannot be obtained? I believe a foundation could be obtained, but at a considerable expense. You would have to go down through a lot of made ground.

69. How far back does it extend behind the present wharf? I do not know.

70. Does not the sandstone cliff come down close to the railing of the Domain? At one end I believe it does, but it goes off immediately.

71. Do you speak from your own experience? No.

72. *Mr. Suttor.*] Is it part of your duty to give any opinion as to the desirableness of these works? No.

73. Are you simply instructed to prepare the plans? Yes; that is all I consider to be my duty.

Captain John Jackson, Manager of the Public Wharves at Sydney, sworn and examined:—

74. *Chairman.*] Are you the Manager of the Government Wharves generally? Yes.

75. Are you aware of the project to construct improvements at Woolloomooloo Bay, and the nature of those improvements? Yes.

Captain
J. Jackson.
19 Sept., 1888.

76. Are you aware of the amount required to carry out those improvements? I believe it is £42,000.

77. Have you formed any opinion as to whether that money will carry out the works? No.

78. Have you formed any opinion as to the necessity for the works? Yes; there is a very great necessity for them.

79. Is there a large commercial traffic in Woolloomooloo Bay? Yes.

80. Do you know anything of an arrangement under which the Admiralty Wharf is proposed to be enlarged? It was proposed at one time to erect stores facing the Admiralty Wharf.

81. Is that wharf used by the Imperial authorities? No.

82. For what reason is it not used? Because they could not get a foundation for stores at the back of it.

83. Is it used for shipping? Yes.

84. By what kind of vessels? Commercial vessels.

85. Is it ever used for Imperial purposes? No.

86. You are aware that it is proposed to construct a long jetty into the bay? Yes.

87. Were you a party to its recommendation? Yes.

88. Do you think it is required in the interests of the public? I do; but I do not think it is wide enough.

89. What width would you have made it? 150 feet.

90. Would that affect the traffic to the smaller jetty? No.

91. If large vessels came, would it not affect the traffic? No.

92. Is the trade of that part of the city increasing? Yes. It would increase more if there were accommodation.

93. What is the nature of the trade carried on there generally? Coal, timber, and general cargo.

94. Are there any warehouses about there? Yes; just completed.

95. Would they be built on the wharf? In the neighbourhood of the wharf.

96. Have you formed any opinion as to whether the vote is sufficient for the works? No; that is not in my province.

97. Are you clearly of opinion that the trade requires more accommodation? Yes.

98. Do you think that the accommodation here proposed is of a suitable character? Yes.

99. Have you formed any opinion as to the revenue that will be received? During the present year the revenue from Cowper Wharf will be £3,800. In its present state it is not capable of doing any more.

100. What is your estimate of the revenue so soon as these proposed improvements shall have been carried out? The new jetty will be able to accommodate six ships, and each berth will be worth about £1,000 per annum. That will be £6,000, in addition to the £3,800 at present received.

101. *Mr. Abbott.*] How long have you been in your present position? Four years.

Captain
J. Jackson.
19 Sept., 1888.

102. In what position were you before? Master of the ship "Gladstone."
103. Can you tell me what the wharfage accommodation of Sydney is at the present time? I can only state it approximately. I think that there is wharfage accommodation for forty-five large ships.
104. Is that exclusive of coasters? Yes, and of coastal and intercolonial steamers.
105. Do you know if any of the vessels in Sydney at the present time, or at any time since you have occupied your present position, have been inconvenienced through not being able to get wharfage accommodation? Yes.
106. When? In 1885.
107. What number? I had four ships lying out in the bay.
108. Was it on account of the whole of the wharfage accommodation being taken up? Yes; for a short time.
109. Was that an exceptional year? Very exceptional.
110. Has anything of that kind occurred since? I do not think so.
111. Or before? No. It was owing to a large contract with the Government for the delivery of water-pipes.
112. Do you know what Cowper Wharf cost? Only the timber portion, which cost £18,000. I do not know the cost of the other portion. £18,000 is exclusive of the small jetty.
113. What has been the revenue from Cowper Wharf during the four years you have held your present position? In 1884, when I joined the service, it was £1,500. In 1885 it came up to, I think, over £4,000. That was on account of the large number of general-cargo ships going there. In 1886 it fell off, and I think it was only about £3,500.
114. What was it in 1887? It was close on £3,800.
115. Does that revenue include harbour dues and all other dues? That is only wharfage and tonnage dues.
116. Was there a large quantity of Government goods landed during that period? The wharfage for the Government amounted to about £460 in 1885; in 1886 it amounted to £82.
117. What kind of cargoes are discharged at Cowper Wharf? General cargoes, timber, and stone metal. General cargo-ships from London and New York go there. Only a few days ago there was a large steamer there.
118. Is the principal revenue derived from intercolonial vessels? Yes.
119. Are any of these wharves let to Mr. George Hill? No.
120. All the metal brought by Mr. Hill is discharged at Cowper Wharf? Not all of it. The principal portion of it is.
121. Do you know what he pays in a year? I think it is about £1,500.
122. It is only in one year that you ever knew vessels to be unable to get berths? Yes.
123. At the present time, what is the state of the harbour in that respect? The Circular Quay is full.
124. And the private wharves? A good many of the private wharves are full.
125. Is not the Circular Quay let to three companies? It is not let. They pay rent equivalent to tonnage dues, but the Government collects the wharfage.
126. *Mr. Humphery.*] What is the annual cost of the maintenance of Woolloomooloo Bay? It is the same every year—£487.
127. That is the salaries? Yes. There is another sum of £50 for cleaners.
128. Any repairs? No; not lately. There may have been small repairs, but nothing important.
129. Do you estimate that, deducting the annual cost, the return will be something over £3,000 a year at present? Yes.
130. When the proposed new jetty is constructed, do you estimate you will receive £10,000 a year? I should say £1,000 for each berth. That will give £6,000 a year additional.
131. That will be 25 per cent. on the proposed outlay? Yes.
132. *Mr. Kethel.*] It has been stated that a portion of the Woolloomooloo wharfage consists of an additional wharf for the Imperial Government. Are you aware at whose instance or request this new wharf is to be constructed for the Navy? No.
133. Do you know the reasons why it is proposed to make that new wharf? I believe it was originally intended to erect stores at the back of the present Admiralty Wharf, but it will cost a great deal to get foundations there.
134. On whose authority do you make that statement about the foundations? Mr. Williams, assistant-engineer. It will be necessary to go down 23 feet to get a foundation.
135. Is it intended to berth ships there? I think so.
136. Is it necessary to provide a wharf 300 feet or 400 feet long for Imperial ships' boats to land or take off munitions of war? I do not know.
137. As a nautical man, are you of opinion that such an extensive wharf should be devoted to Imperial purposes? My opinion is that it is not required.
138. Do you know that extensive warehouses and wharves have been erected at Garden Island for the Navy? Yes.
139. Have you any reason to believe that the Imperial Government really require large additional wharfage and storage on the mainland besides what they have got on the island? I do not think so.
140. Do you know for what class of naval stores the proposed warehouses are required? No.
141. How many foreign ships have you had at Woolloomooloo Wharf this year discharging general cargo, as distinguished from timber? Three.
142. Can you give any idea of the number that have discharged general cargoes there since you have been in charge during the last four years? I should say about fifty.
143. Is it not a fact that sometimes during a whole year not a single foreign ship discharges goods other than timber at that wharf? In 1884 there was no foreign ships there. They first commenced to go there when the Government imported pipes came out here.
144. The fact is that the ships having been sent to Woolloomooloo to discharge pipes for the Government also discharged their general cargoes there? Yes; but it was only a few. Since then ships have gone in without any Government cargo.
145. Is not the long haulage up the hill from Cowper Wharf into the city proper regarded as a great objection on the part of consignees? No.
146. Are you not aware of that fact? No. I am aware that they would sooner cart goods from Woolloomooloo than go to the back wharves. The great drawback to Woolloomooloo is the rough element in the neighbourhood, and the pilfering which takes place.

147. Is not the eastern section of Cowper Wharf almost entirely used for landing blue-metal and coals? The south-eastern corner is.
148. Is any rent paid for the use of that wharf in addition to the landing charges on these materials? No.
149. Is it not a fact that cargo has been lying there for weeks and the wharf made a storehouse? No; because ships are in at night and out in the morning.
150. Have I not seen cargoes lying there for upwards of a month at a time? That might have been the case. Before my time it was a coal-yard.
151. You anticipate that the long jetty will berth six ships;—what class of ships do you allude to? The ordinary-sized sailing vessels.
152. Is that in addition to the present accommodation? Yes.
153. Do you mean that you will have five berths at the new jetty? No. Six additional berths; three on each side.
154. What description of ships—foreign-going vessels? Yes; ships of about 1,500 tons.
155. What is the usual length of a 1,500-ton ship, from the stern to the boom end? I should put the ship's boom end over the wharf. At the end of the wharf I would put it past the wharf. I do not reckon the ship's boom.
156. Well, the bowsprit? I should not reckon the bowsprit, except of one ship.
157. You would get three intercolonial ships berthed there? Yes.
158. Is it your experience that intercolonial vessels, whose cargoes consist almost entirely of agricultural produce, would yield the amount of revenue which you estimate to receive? No; not intercolonial vessels.
159. Do you think that ships would land produce there? No; I reckon on foreign-going ships.
160. Is it not a fact that ships with cargoes consisting of grain of every description prefer to land them where there are several warehouses within easy access? Yes.
161. Do you know whether warehouses are in course of erection at Woolloomooloo? Yes. They belong to Messrs. Holdsworth and Evans.
162. On the reclaimed ground? Yes; behind Cowper Wharf. At the present time I am given to understand Messrs. Hoffnung & Co. have purchased a large block of land there from Mr. Munro, on which they intend to erect warehouses.
163. Are there a great number of timber ships from Europe and America discharging timber at Woolloomooloo? No.
164. Is there not one there now? There are two from Puget Sound.
165. Have not the consignees of those vessels, and people interested in that branch of trade, asked the Government, instead of constructing jetties, to provide more storage accommodation for their cargoes? No; but I think it would be a capital thing.
166. But has it not come to your knowledge that an application has been made for more storage accommodation? No.
167. Will Mr. Hilliard be better able to answer that question? Yes.
168. As a seafaring man of considerable experience, do you think it conducive to the well-ordering of the harbour to project such a long jetty into comparatively narrow water? I do not think it will interfere with any shipping.
169. Would you not find considerable difficulty in berthing a large ship with the wind blowing into the harbour? No.
170. Have not nautical men a decided objection to wharfage improvements of this description, and was not a similar proposal in regard to the Circular Quay some years ago unanimously condemned by all seafaring men of experience amongst us? I never saw any difficulty in berthing ships at jetties.
171. Are you not aware that the intended projection of a jetty into Sydney Cove was abandoned on account of the opposition offered by the nautical authorities? Yes.
172. Notwithstanding that, do you recommend the construction of this jetty into the centre of Woolloomooloo Bay? Yes.
173. *Mr. Garrard.*] You say that you will have six berths at this jetty for 1,500-ton ships. What is the usual length of a 1,500-ton ship? About 250 feet.
174. How long is the jetty? 700 feet.
175. The approaches will take off 40 feet, so that the jetty will be 90 feet short. Is not that the case? They are not all 250 feet long. Some are only 230 feet. I reckon that the two end ships will project 50 feet outside the wharf when the six berths are taken up.
176. Then the outside ships can only work one hatchway? They seldom work more. The forehatch is generally so small that they cannot work it.
177. Would you prefer a wharf 150 feet wide? Yes; because the ships lying at the long jetty will be general cargo mainly. I would also suggest a roadway in the centre lowered so as to bring the floors of the drays on a level with the wharf.
178. What was the objection to that in the Department? I do not know.
179. Did the Engineer-in-Chief raise any objection when you suggested it? Not that I am aware of.
180. Do you not think that with six new berths at the jetty, and an additional one in the bight, you could do without a further extension of the Admiralty Wharf for some time to come? Yes; I do not think the Admiralty Wharf is required for some years. I do not think they will ever use it.
181. That will give you an additional berth? But I do not think it is required.
182. Do you think that the main jetty and the straightening of the wharf on the south-western side will give you all the accommodation required? Yes; and to fill in the present Admiralty Wharf.
183. Do you want to utilize it? Yes; I am doing it now.
184. Are you paying the Imperial Government anything for the use of it? No.
185. Then you really think it necessary to keep control of the present Admiralty wharf, and if the Admiralty want anything they could get it farther north? Yes.
186. *Mr. Sydney Smith.*] What is the accommodation at present at Woolloomooloo Bay? Five berths, such as they are. There is actually only one good berth; there is only one berth where you can lie properly alongside.
187. Have you had any complaints of want of accommodation at Woolloomooloo? Yes, frequent complaints. When ships have been in there there have been very great complaints of want of accommodation.

Captain.
J. Jackson.
19 Sept., 1888.

Captain
J. Jackson.
19 Sept., 1888.

188. How long have ships been waiting? They have not been waiting. When they were once in, there is no going out again; they have to take what they can get. At present there is a vessel discharging timber with a stage 20 feet long.
189. Have the wharves ever been blocked with timber and stones stacked on them? No; that has been all removed as soon as a berth is required.
190. How long are they allowed? Forty-eight hours by the Act; but with a large timber cargo it is impossible.
191. What is the depth of water at Woolloomooloo Bay alongside the wharf? 20 feet. It silts up very fast; it will be 24 feet at the end of the big wharf. It varies from 12 feet to 18 feet alongside the Admiralty Wharf. There is a patch of 12 feet just opposite the new crane.
192. Can you dredge it? Yes; it is on mud.
193. What depth can you get by dredging? 30 feet, I believe.
194. *Mr. Campbell.*] In connection with the silting up, will not almost constant dredging be required? Yes; every eight or ten months. The silt is so very soft that ships go five or six feet into it.
195. Is there great drainage there? Yes, just alongside the wharf.
196. *Mr. Suttor.*] With regard to the estimated revenue of £10,000, is it based on the idea that the berths will be always occupied? No; the revenue for each ship of 1,500 tons will be £280. I calculate on having four ships at each berth every year.
197. Do you make allowance for berths not being occupied? Yes; I make allowance for their not being occupied for six months in the year.
198. *Chairman.*] Would you be good enough to show us how far the Government property extends on the south-eastern side of the wharf. [*Witness indicated the point upon the plan.*]
199. Regarding the property as a valuable one owned by the Government, are you of opinion that the improvements proposed are necessary? Yes.
200. Do you think it will be valuable in view of the probable increase of trade and commerce in the Colony generally? I have not the slightest doubt about it.
201. *Mr. Kethel.*] I observe that part of the scheme is to fill in the present landing stages and afford other accommodation where steamers land their passengers on the south-western corner. Is not that where the Manly Beach and Watson's Bay boats land their passengers? Those boats do not go there now.
202. What are the landing stages now used for? Timber ships lie alongside.
203. Is any provision made in the proposed alteration of the passenger accommodation for that portion of the public who use Woolloomooloo Wharf as a landing place? Yes; there is a jetty there.
204. Do you intend to use the present jetty for passengers? Yes; that is my idea.
205. Are there not two berths at that jetty for large-sized ships? They are very narrow.
206. How do you reconcile your statements when you say that you will have six additional berths, and that you intend to deprive yourself of two berths at this jetty? There will be three berths on each side of the new jetty. I do not reckon the jetty you refer to as a berth.
207. Have I not seen vessels discharging there? Small vessels; I have put a vessel there because I had no other berth.
208. You have stated that there is a ship discharging timber with a stage 20 feet long. Is that long stage necessary because of the shallowness of the water, or on account of the wharf? On account of the wharf.
209. *Mr. Suttor.*] Do you think it is not desirable to carry out the work as proposed for the Imperial Government? I do not know whether the Imperial Government requires it.
210. Did you not say it is not required? I do not think it is necessary, as far as I know.
211. If that proposal is carried out, would it be a good alternative plan instead of making the proposed large jetty? I think the jetty will be more convenient.
212. But will not one work cost £8,000 while the other will cost £27,000? You could only berth two ships at the Admiralty Wharf, while you lose a valuable frontage. The jetty would only require 150 feet of frontage, while it would berth six ships.
213. Do you think it would not be possible to abandon the jetty; and carry out the Admiralty proposal? There would not be sufficient accommodation.

Capt. Henry Pettit, Harbour-master at Sydney, sworn and examined:—

Captain
H. Pettit.
19 Sept., 1888.

214. *Chairman.*] Are you Harbour-master of this port, and have you occupied that position for a number of years? Yes; for the last four years.
215. Have you been engaged in the same kind of work for a great number of years? Yes.
216. Have you given attention to the proposed improvements at Woolloomooloo Bay? Yes; I have seen the plans.
217. Do you recognize that portion of the bay where it is proposed to construct a long jetty? Yes.
218. You are a nautical man, and have had a lot of experience? Yes.
219. Do you think the proposal is a feasible one? The proposal will give very good accommodation for shipping in Woolloomooloo Bay.
220. Do you think it will cramp the action of vessels coming in and going out? No.
221. Is it a wide bay? Not particularly wide, but there is sufficient room to bring in vessels, either on one side or the other.
222. Is it much wider than Sydney Cove? No.
223. Do you recollect a project, some years ago, to carry out a jetty in Sydney Cove, which was strongly objected to? Yes.
224. Was it not contended that it would cause confusion in the shipping and bring about accidents, besides curtailing the facilities for getting about? Sydney Cove has a very great deal of traffic; but in Woolloomooloo Bay it is not so.
225. But taking a prospective view, have we not reason to believe that the traffic will increase in that bay as it has in Sydney Cove? Yes.
226. Do you think that the proposed works, as a whole, are essential for the improvement of a valuable Government property such as this is? I think that the proposed jetty will return very good interest on the money expended.

227. If that property were in the hands of private individuals do you think it would be improved to this, and even to a far greater, extent? Yes.
228. Do you know anything about the proposal to improve the Imperial frontage to the bay, the part now occupied by the Government? I see that there is a wharf on the western side of the bay, and that it is proposed to extend it farther to the north.
229. Do you recollect the place which used to be called the Centipede Rock? Yes.
230. Is that the locality? Yes.
231. Is that where the new wharf is proposed to be erected? Yes.
232. Do you know anything of the circumstances under which an exchange took place between the Colonial Government and the Imperial Government, with regard to Garden Island, and under which this wharf was conceded to the Imperial Government? No.
233. Is the traffic in Woolloomooloo Bay very large now? No, not particularly. Small craft go there.
234. Would it be increased if there were proper accommodation? Last year, in the wool season, there was a great deal of shipping in the port, and the wharf manager contrived to get large ships alongside the small jetty, and both sides were occupied during a part of the season.
235. Do you know the amount proposed to be spent on those improvements? No.
236. £42,000 is proposed for the whole of the works;—have you formed any opinion as to whether that amount will be sufficient to carry out the proposed works? No. I think the wharf manager would know what accommodation is required.
237. *Mr. Abbott.*] Was your opinion asked with regard to the necessity for these works before they were initiated by the Department? No. The first intimation I had was when I was summoned to give evidence here.
238. You were not asked whether or not sufficient accommodation already existed in Port Jackson before this work was proposed? I think that the wharf manager complained on several occasions.
239. Were you never called upon to give a report regarding the necessity for it? No.
240. Have you been Harbour-master about the same length of time as Captain Jackson has occupied his position? Yes.
241. Were you in the service before that? Yes; for the last 13 years.
242. Have you known any inconvenience to shipping to exist from want of wharfage accommodation in the port? A great many ships could not get berths during the wool season at the Circular Quay.
243. Could they go elsewhere? Yes.
244. Is there any wool trade at Woolloomooloo? No. Many ships would prefer to go to Woolloomooloo rather than to the back wharves. I have heard many shipmasters make that remark.
245. Do you know what the present wharfage accommodation in Port Jackson is;—how many ships would it accommodate at private and Government wharves? I have never particularly counted the number, but it would accommodate a great number.
246. Would it accommodate 100? That would depend upon the size and description of the ships. They vary from 500 to 100 feet long.
247. Has there ever been in your experience any great inconvenience from want of wharfage accommodation? No.
248. Do you think there is, in the interest of shipping, any real necessity for the construction of these works;—is there an absolute necessity for them? As far as getting berths is concerned I do not think at the present moment any shipping master is put to great inconvenience from want of accommodation. I have heard many remarks that if there were more accommodation at the Circular Quay, it was a very easy place for the carriage of goods, and it would be patronised a great deal more. There is no doubt there are a great many wharves, and I have never seen all the wharves full.
249. Do you think that wool ships would load at Woolloomooloo Bay;—do you not know that the wool comes into the city and is shipped through the warehouses, and that none comes direct from the railway to the ships? Occasionally pressed wool is brought down to the wool ships at the Quay.
250. But does it not all come through the commission agents in Sydney? Yes.
251. Do you think that any wool would go to Woolloomooloo at all? You would require to have stores there. It would go there if there was storage.
252. *Mr. Kethel.*] Are you aware that there is a large sewer draining the whole of Woolloomooloo and part of Surry Hills, flowing into Woolloomooloo Bay, near Cowper Wharf? Yes.
253. In relation to this proposed jetty where is the outfall of that sewer? It is very close to the eastern boundary of that jetty.
254. There is, I believe, a considerable deposit of silt and mud from that sewer which necessitates frequent dredging to keep the bay clear. Speaking as a nautical man of considerable experience, do you think that the construction of a jetty 100 feet wide and 700 feet long, close to the outfall of a sewer, will have a tendency to cause the bay to be silted up so that it could not be dredged? Very much of the mud that comes down is easily dredged away. At one time it was filled up there, but a short time ago a large steamer drawing 28 feet was alongside that jetty.
255. Are you aware that rainstorms cause a great accession to the silt at the mouth of the sewers, and that the last season in Sydney being exceptionally dry there has not been nearly the same quantity of silt carried down; but that if we have a recurrence of wet seasons we shall have a large quantity of accumulated dust and *débris* carried down? Yes.
256. Is it your opinion that the construction of a jetty close to the outfall of one of the greatest sewers in the city will not have a tendency to accumulate the foetid mud and slime from the sewer which will become a cause of danger—firstly, by silting up the harbour, and secondly, by causing a deposit of filthy slime to be permanent in and about the piles of that jetty? There is no doubt there is a deposit of silt there, but in my opinion a dredge periodically working can keep it clear. It is a matter of dredging. There is no tide there. As far as this sewage matter is concerned there is always the continual working of steamers which would not allow anything to remain stagnant there. It would require occasional dredging, the same as the sewer off Macquarie Point, and the old tank stream sewer in Sydney Cove.
257. Can you suggest any means whereby the wharfage accommodation at Woolloomooloo Bay can be increased without running out a jetty, which many people believe to be objectionable? The shores of the bay adjoining the Domain might be utilized for wharves, but it would be a very expensive job.
258. *Mr. Garrard.*] Is that owing to the precipitous character of the land? Yes. By the expenditure of a great deal of money it might be made equally as good for wharfage accommodation as the Circular Quay, but it would be costly.

Captain
H. Pettit.
19 Sept., 1888.

Captain
H. Pettit.
19 Sept., 1888.

259. *Mr. Kethel.*] In reply to a question you said that you have been Harbour-master for four years, and that you were thirteen years previously in the Service;—what was your position in the Service before? I was Assistant Harbour-master.
260. And before that? I was a master in the tug service.
261. From that are we to understand that prior to your appointment as Harbour-master you had ample opportunity of being thoroughly conversant with the state of the shipping in the port? Yes; I have been connected all my life with shipping.
262. *Mr. Garrard.*] I suppose there is more silt washed down by summer thunderstorms than by ordinary rains? Yes. Thunderstorms bring down a great deal more silt.
263. And the silt off the streets, brought down by these sewers, is not offensive? No, not as a rule.
264. The sewage matter from the houses is the offensive matter? Yes.
265. Are you aware that a very extensive system is being carried out to convey the sewage to the ocean? Yes.
266. So that although silt may be washed down from the streets it will not be accompanied by offensive sewage matter? Not if there is a main outlet to the sea at Bondi.
267. *Chairman.*] With reference to the sewers emptying into the harbours at the edge of the bays, how many sewers have been extended into deep water? The only one I know of is the one at Macquarie Point. The buoy there denotes the shallow water off the Point. The sewer goes down to within a very short distance of the buoy.
268. Then the idea is that the sewer carries off the accumulation of silt? Yes.
269. Is it the only one where this extension has taken place? I do not know of any other.
270. What has been done in the case of Rushcutters' Bay? I do not know of any pipe being laid out there, because in Rushcutters' Bay there is no tide.
271. Is it not the accepted practice to get rid of the inconvenience of sewage, emptying into a place like Woolloomooloo Bay, by extending the piping into deep water? It is recommended to put it clear of the flats.
272. Where the tide is strong and there is a scour at certain seasons? Yes.
273. Is the tide active in Woolloomooloo Bay? No; there is a rise and fall, but no stream.

Mr. John William Hilliard, Wharfinger at Cowper Wharf, Woolloomooloo Bay, sworn and examined:—

Mr.
J. W. Hilliard.
19 Sept., 1888.

274. *Chairman.*] Are you the wharfinger at Woolloomooloo Bay? Yes.
275. Have you full opportunity of seeing the shipping traffic there? Yes.
276. Is it very large now? The revenue this year will be about £3,800.
277. From what class of vessels generally is it derived? From coasters and general cargo ships from London.
278. Are London ships berthed there? Yes.
279. Many? Not very many. In 1885 £5,000 was collected.
280. Have you noticed any inconvenience arising at various times owing to the want of accommodation for vessels? Yes. On several occasions I have seen ships go away from there to other wharves.
281. Do you know what the proposed improvements are at Woolloomooloo Bay? Yes.
282. Do you think that the proposed jetty, 700 feet long and 100 feet wide, will cause any inconvenience to the traffic of the bay? Not in the least. It is the very thing that Cowper Wharf wants.
283. If there was sufficient accommodation do you think the bay would be more frequented by ships? Yes. The masters are rather disgusted when they first go to the bay; but once there they express an opinion that they will go there again.
284. Are there any mercantile stores in the neighbourhood? There are four or five bonded stores now being built, and nearly finished. I believe that Hoffnung & Co. have taken up a large piece of ground for the purpose of erecting large stores.
285. Do you think it is likely that wool will be shipped from there at any time? I should not wonder if it were, provided there was a store to receive it.
286. During a busy season do you think it would be the case? Yes.
287. Are you of opinion that, as Government property, it is wise to improve the wharf to this extent? Yes.
288. *Mr. Humphery.*] Have you formed any opinion as to the probable income from the proposed new jetty? If we had a jetty 500 or 600 feet long and 150 feet wide we should have it full all the time. I think that if we had a jetty of that kind, instead of having a revenue of £3,000 or £4,000 a year we would have a revenue of £20,000. We would then have room for ten vessels.
289. What is your reason for saying that the jetty should be 150 feet instead of 100 feet wide? Because 50 feet on each side will be required for a loading berth, and another 50 feet would be required in the centre for a cart track.
290. Do you believe that vessels would come and make use of that jetty? Yes. Cowper Wharf has facilities which a great many other wharves have not. That is for getting away. The drays can come in and load and get right away without waiting. There are four streets there by which they can get away.
291. *Mr. Kethel.*] The Admiralty have a wharf on the western side of Cowper Wharf—what use is made of it by the Government? I have put metal on it principally, but two small cargoes of metal will fill it up. It is about 30 feet wide. I have to leave a roadway for carts to come up, so that there is only the centre space.
292. Do the naval authorities allow you to use their wharf in that way? I think it is turned over to Cowper Wharf now.
293. Have the naval authorities ever used it? Never.
294. Do they not send boats ashore to land ships' stores? No; they land at all parts of the wharf; sometimes at the jetty. They do not use it at all.
295. For what purpose do you intend to use the small jetty if the large one is extended? For colliers to discharge coal; it is very useful for it.
296. Will you make no provision for accommodation for passengers landed from steamers? They can come and land there.
297. Have you been much pressed for space at Cowper Wharf for landing cargoes? Yes.
298. For what description of goods have you been pinched for accommodation? Timber, metal, and sometimes coal.
- 299.

299. Have the people engaged in the importation of timber and landing it at Woolloomooloo Wharf expressed a desire that they should receive more accommodation, or have they expressed a desire that the Government should resume some of the adjoining land to make storage-yards rather than that a jetty should be extended into the bay? No; I have heard it rumoured that the Government would resume all the frontage to the wharf.

Mr. J. W. Hilliard.
19 Sept., 1888.

Mr. Alexander Brown Portus, Superintendent of Dredges, sworn and examined:—

300. *Chairman.*] Have you a good deal to do with Sydney Harbour? Yes. I am Superintendent of Dredges.

Mr. A. B. Portus.
19 Sept., 1888.

301. Do you know Woolloomooloo Bay? Yes.

302. Are you aware of the proposed improvements there? Yes; I know that a long jetty is to be run out. I am not aware of the other improvements.

303. The Naval Wharf is proposed to be extended, and other improvements are to be made, at a total cost of £42,000;—do you think such improvements are necessary? I think so, so far as the commerce of the port is concerned.

304. Do you know the accommodation that will be given by these improvements? Yes.

305. Do you think that the proposed jetty 700 feet long and 100 feet wide will interfere with the traffic of the bay in any way? It will to some extent.

306. On the whole, do you think that it would be desirable to construct that jetty? I think so.

307. In your official capacity have you been consulted? No.

308. Nor your opinion asked? No.

309. Have you had anything to do with the dredging of that bay from time to time? Yes.

310. Does the sewage empty itself there? Yes. There is a sewer at the foot of Forbes-street, another at Dowling-street, and another at Duke-street, and a great quantity of sewage comes in.

311. How far does the pipe go into the water? I cannot say. We have dredged close up to it.

312. Then the pipe empties close to high water? Yes. Generally speaking there is a deposit outside the mouth of the sewer.

313. Is the tide strong there? No.

314. Does your experience in dredging lead you to conclude that the sewage being taken out by pipes into deep water loosens the deposit, so that it is more easily removed by the tide? I do not think it makes much difference.

315. Is it not supposed that the scour is greater when the sewage is taken out some distance to where the tide is more active? The scour would remove it to some extent, but I know we have had to dredge at the mouths of all the sewers.

316. Do you recollect where the sewer at Fort Macquarie first emptied itself? Yes; some distance out.

317. Was it extended afterwards? I do not recollect it.

318. How long have you had control of the dredges? Eight years. I was in Newcastle before that.

319. Are you an engineer by profession? Yes; a millwright and engineer.

320. Does the harbour suffer much more in flood seasons from deposits from sewers and such things than it does in dry seasons, such as we have had recently? Yes; there is more dredging to be done in wet seasons.

321. Do you keep any record of the number of tons of silt removed from time to time in the different localities? Yes.

322. How many dredges are there in Sydney Harbour? Three.

323. Actively at work? Yes.

324. Can you keep them at work at all times? Yes, except when it is very rough weather, when it is dangerous to send the punts with silt to sea.

325. The delay in continuous work would be attributable to that alone? Yes.

326. I suppose that to work the dredges economically they ought to be kept at work at all times? Yes.

327. But that you cannot do? Our most economical dredging was at Newcastle, when we were working night and day.

328. Is that the rule in dredging services? Yes.

329. Have you not been able to do it in Sydney? It was done in Sydney for four years, when the dredge was working at the Heads. That was before I came to Sydney.

330. Did you experience much difficulty in deepening Woolloomooloo Bay, and other places where sewers make deposits? No; there is no difficulty, except when vessels are sometimes in the way, and then there is a little delay.

331. Mechanically there is no difficulty? No.

332. What number of tons can you remove? That would depend upon the size of the dredge.

333. If an ordinary dredge were used to deepen the frontage to the wharf of this bay, how long do you calculate it would take you to do so? One of our dredges lifts about 700 tons per day, and another does the same. The large dredge is at present dredging over 2,000 tons per day.

334. Can you send that to sea? Yes. These figures are approximate. The "Sampson," our largest dredge, has three punts of about 350 tons capacity. There is one steam hopper barge which takes 400 tons. They go three miles outside.

335. Have you all the modern appliances in your dredges? Yes.

336. Have not dredges been improved to a great extent during the last few years? As far as the size of dredges is concerned there is a decided improvement. The larger a dredge is the more economically it is worked; I think we have kept pace with the times.

337. Do you think there would be sufficient inducement to warrant the Government in constructing these improvements at Woolloomooloo Bay? I think so, judging from the fact that the present jetty was very largely used some time ago. I think it is very largely used now, and the facilities offered by the Government are more than are offered at other wharves.

338. Are you aware that warehouses are being built in the neighbourhood of the wharf at Woolloomooloo Bay? There is a shelter shed at the wharf, but I am not aware that there are any warehouses there.

339. Would the small jetty continue to be used if the large jetty were built? It was constructed for the Manly Beach traffic at first, but it is not used for that now.

340. Is it proposed to construct a roadway along the large jetty? I am not aware.

341. Is it not usual to place a line of rails on such jetties, so that merchandise may be easily moved backwards and forwards? Yes.

- Mr. A. B. Portus.
19 Sept., 1888.
342. As a property belonging to the State, do you think Cowper Wharf is of sufficient value to warrant these improvements? I think so.
343. *Mr. Abbott.*] Do you know, as a matter of fact, whether the wharfage accommodation which exists in Port Jackson now is not more than ample for all the shipping that has ever come to it, taking into consideration all the public and private wharves? Judging from occasional observation, I imagine there is a necessity for increased accommodation. The accommodation offered by the Government is better than that provided by private individuals—the approaches are better.
344. Do you think the Government will get a fair return in revenue for the construction of such a work as this, having regard to what it has already cost them to construct works at Woolloomooloo Bay? It will very much depend upon how matters are arranged between the Government and private individuals. If private individuals offer rebates and other facilities to shipping which the Government cannot offer them, the Government may be at a loss.
345. Is that the case with regard to wharfage in Sydney? I do not know.
346. Was it not the case a short time ago? I do not know.
347. Was your opinion ever asked as to the necessity for these works? It is not usual to ask my opinion. I have generally to do with the dredging of the harbour. Mr. Moriarty and Mr. Darley have to do with those matters. I may have been asked, but I cannot charge my memory with it.
348. *Mr. Humphery.*] Can you state approximately what is the yearly cost of dredging Woolloomooloo Bay? I could by referring to my books.
349. Can you say whether the cost will be appreciably increased if these proposed wharfage improvements are carried out? The continuation of the jetty would not make the bay more difficult to dredge than it is now, because the distance of the jetty from the shore is sufficient to allow of dredging without hindrance.
350. If the return upon the cost hitherto is deficient, will it be a fair criterion as to the future cost? Yes.
351. *Mr. Kethel.*] You observe the distance between the old jetty and the proposed new one—perhaps 150 feet;—in working a first-class dredge what room do you require for the punts to lie alongside and load, and to move the vessel about with the punts fast alongside, the dredge being as close as possible to the piles on each side;—do you think there is sufficient space there to enable one of your large dredges to dredge this portion of the harbour from side to side? The dredge “Sampson” can work well in about 110 or 120 feet.
352. Dredging between the jetties where the sewage out-fall occurs is principally done by the “Charon”? Yes; and the dredge “Hercules” constantly dredges there.
353. Could the “Hercules” work there conveniently with her punts;—do you think there is space between the two jetties to dredge successfully? Yes; the dredge “Hercules” could work very well with a distance of 130 feet.
354. You are aware that several sewers flow into Woolloomooloo Bay under Cowper Wharf, one on either side, and one perhaps right underneath the proposed jetty. In your opinion, would there be a tendency for the silt to accumulate amongst the piles under the jetty when extended where you could not reach it with any of your dredges? Yes, probably it would; but I do not see any great disadvantage from that, because the dredge would remove it from time to time.
355. How could a dredge get the stuff from among the piles? The sewage would fall down alongside the jetty.
356. Do you think that, with a jetty 100 feet or 150 feet wide, the action of the dredge beyond the outer piles would cause the central deposit to give way;—would it not remain and silt up to the water's edge in course of time? I daresay it would, but there would be no great inconvenience if it did silt up.
357. If it was impure sewage would it not become a public nuisance and dangerous to health? I do not think this is a contingency of the future, because the sewage will eventually go to Bondi.
358. Is it not a fact that such a state of things exists at the present time among the piles on the wharves;—has not the deposit reached nearly to high-water mark, at all events above low-water mark, where it cannot be reached by any of the dredges? That may be the case where there is not sufficient width to go in.
359. *Mr. Garrard.*] I understand your largest dredge, the “Sampson,” a double-sided dredge, can work very well in a space of 120 feet? Yes.
360. As there will be a space of 130 feet between the two jetties, the “Sampson” could work there easily? Yes; the new dredge which is being constructed is 28 feet wide, with no side ladders, and could work in a smaller space than the “Sampson.”
361. *Mr. Suttor.*] Do you think there would be an accumulation of sewage at Forbes-street? No, the dredge could go round from time to time, and keep it down.
362. Does the silt accumulate where the new jetty is to be erected? Yes; the dredge has to go there frequently. The worst place is between the two jetties.
363. What is the depth of water near the jetty? About 22 feet at low water.
364. *Chairman.*] Can you supply us with a report of the cost of dredging Woolloomooloo Bay, say for four or five years? Yes. [*Vide Appendix A.*]
365. *Mr. Garrard.*] What is the bottom at 22 feet? Rocky, close in. That is on the eastern side, and very close in.
366. *Mr. Kethel.*] Have you been right down on the bed rock in the middle of the bay? No; only where the sewage is.
-
- Mr. John Joseph Earl, timber-merchant, sworn and examined:—
- Mr. J. J. Earl.
19 Sept., 1888.
367. *Chairman.*] Are you engaged in business as a timber merchant in Sydney? Yes.
368. Where is your place of business? At Dawes' Point.
369. Have you been long engaged in that business in Sydney? Yes; forty years.
370. Have you been carrying on business at the same place all the time? No, principally at Darling Harbour,—Sussex-street, and at the head of Darling Harbour,—Liverpool-street.
371. Have you carried on business transactions at any time at Cowper Wharf or Woolloomooloo Bay? Yes, during the last three or four years.
372. Have you a place of business there? No; I receive cargoes there.
373. Foreign shipments? All foreign shipments.
374. Baltic and American timber? Yes; I had a cargo berthed there this morning.
375. Have you ever found a deficiency of wharfage accommodation at Woolloomooloo Bay? Yes, frequently. We want more wharfage accommodation now.
376. Have you had reason to complain from time to time of want of accommodation? Yes. 377.

377. Have you heard of others being placed in the same circumstances? Yes, frequently.
378. Are you aware of the proposed improvements there? I now see the plan for the first time.
379. Do you think that these improvements are desirable ones? I think that the jetty, by all means, should be made.
380. Do you think that the traffic of the bay would be impeded by the construction of a jetty there? No.
381. Do you recollect a similar project being proposed for Sydney Cove? Yes.
382. Was that strongly objected to? It was. A gentleman lately deceased (Mr. Flood) had strong objections to it.
383. Do you think that the same objections would suggest themselves in this case? No. I think this would be a very great advantage.
384. Suppose that in twenty years the traffic of this bay increased to the same extent as the traffic of Sydney Cove has increased since you recollect it; do you think the jetty would then be an inconvenience? No. I do not think a jetty at the Circular Quay would be an inconvenience. I think it would divide the traffic and make it safer.
385. Do you know anything of the relative widths of Sydney Cove and Woolloomooloo Bay? No. I should think that Sydney Cove is a little wider.
386. Do you know the two localities well? Yes.
387. Do you recollect the Centipede Rock? Yes. It was near the boat-harbour.
388. Do you know the small jetty now in existence? Yes.
389. Do you think the two jetties would cause great inconvenience? I think I would prefer to do away with the small jetty when the other is built. I have a ship berthed alongside the eastern side of the small jetty.
390. Its distance from the longer jetty is about 130 feet;—would that cause great inconvenience? Not very great; but I think it would be better without the smaller jetty, if you extend the longer jetty 600 or 700 feet.
391. Do you know anything about the proposed expenditure? No; I have never heard anything about it. I had some conversation with the Manager of the Circular Quay. I wanted him to try and get a place between the Admiralty Wharf and the mainland filled in, so as to use it as a timber-wharf. That led to other conversation with respect to the extension of the wharf out to Lady Macquarie's Chair; but I did not know then that the Admiralty had a right to any portion of it.
392. Do you know anything of the proposed alterations to the Admiralty Wharf? Nothing whatever; I only know the present one.
393. Do they use the present one very much? I never saw a boat of theirs alongside.
394. Is it used at all? It is used as a stone-wharf, I think, by the Kiama people. I have seen a lot of metal stacked on the wharf.
395. Do you think the traffic would be likely to increase if proper accommodation were provided? I am sure of that.
396. In view of the probable increase of traffic generally in the port in the course of years, do you think it is desirable to improve this State property to the extent proposed? I certainly do. I think it would be quite as good a paying property as the Circular Quay, in proportion to the amount spent upon it.
397. *Mr. Abbott.*] How long have you had a place of business at Woolloomooloo? I have never had a fixed place of business there; I receive cargoes there. Timber cargoes have to go there because there is no other accommodation for them except at Dibbs' wharf, and that is sometimes occupied. There is another wharf—J. C. Ellis' wharf at Pyrmont, which is sometimes available for landing timber upon.
398. Are there not timber-ships at the Circular Quay? No; vessels having small lots of timber, mixed with other goods, sometimes discharge there.
399. *Mr. Humphery.*] It is said that the width of the proposed jetty is to be 100 feet;—is that sufficiently wide? It is not wide enough. It should be at least 130 feet wide. You must have a roadway. There must be room for several drays to pass, otherwise it will not be of any use, because you cannot get the goods away.
400. It should not be less than 130 feet, but I suppose 150 feet would be better? Yes; the wider the better; there will be more landing accommodation.
401. *Mr. Kethel.*] With reference to the accommodation which you required recently, and had reason to complain of at Cowper Wharf, was it the want of berths or the want of room to store your cargoes? The want of room to stack cargoes ready for delivery.
402. Principally? Yes. The wharf is generally filled up with coal, metal, and hardwood, and we sometimes have to wait two or three days to have that cleared away, and that causes expense and delay.
403. The principal portion of the cargoes which have been landed by you at Woolloomooloo is what is known to the trade as Oregon? Yes, principally.
404. Is that generally discharged out of the bow port, or the gangway? Nearly always out of the stern or bow port; but in the case of several ships I have come across lately we have had to discharge from the hatch. That is one great evil at present—the curve in the wharf prevents ships from getting alongside. I have had a large ship during the last two months on which I had to run out a stage 25 feet long to reach the rail of the ship. That is a great disadvantage compared with getting the timber direct on the wharf from ships' tackles.
405. Have you ever suggested to the Government wharfage authorities that they should obtain more space for landing and stacking timber on Woolloomooloo Wharf? Yes. I spoke of it two years ago, and even a longer time back. Mr. Bell was the first person I spoke to. I suggested that the best thing to do was to resume the block of land from Bourke-street in a line with the street at the back of the quay right away from the eastern extremity of the wharf.
406. Did Mr. Bell then occupy the position that Captain Jackson now occupies? Yes. I have since spoken to Captain Jackson about it.
407. If a timber-ship were discharging out of the bow or stern port, what amount of berthage would she require—would 50 feet be enough? Quite enough.
408. So you could put four timber-ships in the same space required by one ordinary merchandise vessel? Yes, if we had space to run the timber out. We could not berth and discharge four vessels at one time unless we had space to stack the timber.
409. I believe I am correct in saying that the greater number of the foreign ships discharging at the existing jetty are ships timber-laden? Yes. I have seen a few large steamers of 2,000 or 3,000 tons discharging their cargoes, and one or two English ships. The greater number are timber-ships. 410.

Mr.
J. J. Earl.
19 Sept., 1888.

- Mr. J. J. Earl.
19 Sept., 1888.
410. Do you think that the proposed jetty is the most suitable improvement for landing and getting away cargoes of long timber? No; unless the ships discharged out of the hatches. Then it would answer very well.
411. How would you stow and get such long timber away;—would it not be extremely inconvenient? Yes.
412. Can you suggest any other means of improving Woolloomooloo Bay equal to or better than this proposal? No; I do not know that I could. There is one thing certain. If that jetty is constructed you can berth general-cargo ships with merchandise from England, and leave the timber-ships the whole space outside of that.
413. Did you not suggest some time since the construction of a quay from the present Admiralty Wharf out to Lady Macquarie's Chair? I did. Looking from the point down to the Admiralty Wharf it struck me that it would be a very good place to berth all the mail-boats, and I do not think it would be a very expensive undertaking.*
414. Are you still of opinion that that would be a feasible plan? Yes; but I was not aware until now that the Admiralty claimed any portion of it. Of course they would have to give up that berth on the proposed wharf.
415. Is it only within the last few years that you have been largely using Cowper Wharf for a timber-wharf? Yes, about four years.
416. Prior to that, where did the greater number of ships discharge? At the Circular Quay and at Dibbs' Wharf.
417. I understand they will not allow timber to be landed at the Circular Quay, owing to its bulkiness? Yes.
418. Are there any objections to landing timber at Dibbs' Wharf and other wharves other than those which existed when you landed timber there? No. We find that purchasers prefer Cowper Wharf, because there is a better get-away. All the back wharves have steep gradient approaches, and you cannot take as much timber from any on a dray as you can from Cowper Wharf.
419. The wharves further up Darling Harbour are not sufficiently spacious for timber? On the Sydney side you cannot land timber, and on the other side I do not think there is water enough for a ship of any great tonnage. You have to partly discharge cargo before you get the ship into the wharf.
420. Is it not a fact that a larger proportion of the imported timber coming into Sydney now is discharged at private wharves—the consignees' own wharves—than at any previous time in the commercial history of the Colony? Yes. The operations of timber merchants are larger, and they are able to buy whole cargoes. Before they could only buy portions.
421. Many years after you were first interested in the trade nearly every cargo was submitted to the trade generally, but now it has become the practice for retail timber merchants to import their own cargoes and land them at their own private wharves? Yes.
422. Mr. Suttor.] Do you know if Cowper Wharf is used largely by other ships than those you speak of? Yes. All the berths are full. I have seen ships with general merchandise there.
423. Have you had difficulty in getting berths at Cowper Wharf? No; perhaps we have had to wait a day or two, but no longer. That might be the case at any wharf.
424. I suppose that sometimes you use private wharves? Yes, frequently. If I am going to store timber for any length of time, I take a private wharf, because they will not allow me to keep it on a Government wharf.
425. What is the advantage of using Cowper Wharf when your place of business is so far away? There is a better get-away. You can get quit of the timber much easier than at any other wharf, because there is a greater space to work at.
426. If there were greater facilities at Cowper Wharf would it be used more? I am certain of it. Captain Jackson speaks of that portion of the wharf at the back of the Admiralty Wharf—that portion which has to be filled in—being kept as a bond or storage wharf. If so, it would pay very well; a rent would have to be charged. In fact it would be under his control.
427. Chairman.] But it belongs to the Admiralty? I am speaking on the assumption that the Admiralty will accept the position further on.

THURSDAY, 20 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.	ALEXANDER KETHEL, Esq.
The Hon. WILLIAM HENRY SUTTOR.	JOSEPH PALMER ABBOTT, Esq.
The Hon. JAMES WATSON.	JOHN RENDELL STREET, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JACOB GARRARD, Esq.
HENRY COPELAND, Esq.	SYDNEY SMITH, Esq.

The Committee further considered the proposed improvements and additions to the wharfage accommodation, Woolloomooloo Bay.

[The Chairman reported that several members of the Committee—Mr. Campbell, Mr. Suttor, Mr. Kethel, Mr. Abbott, and himself—had that morning visited Woolloomooloo Bay, and, by personal observation, and inquiry from persons engaged at the wharves there, had made themselves better acquainted with the works represented in the proposals before the Committee.]

James Barnet, Esq., Colonial Architect, sworn and examined:—

- J. Barnet, Esq.
20 Sept., 1888.
428. Chairman.] Have you occupied your present position of Colonial Architect for many years? Yes.
429. Have you been charged with the different works to be carried out under an arrangement made between the Imperial and Colonial Governments with respect to naval matters? Yes, at Garden Island, Woolloomooloo Bay, and Spectacle Island. 430.

*NOTE (on revision):—I am told there is a depth of water 30 feet all the way from the baths to the point, immediately outside the straight ledge of rocks; and without encroaching on the Domain beyond the present line of the existing fence, an esplanade, 200 feet wide, could be formed, and the material for filling in and levelling is on the spot.

J. Barnet,
Esq.
20 Sept., 1888.

430. Have you anything to do with other works? No; with the exception of the Admiral's house.
431. The reason why we have been brought to this investigation is that we have had placed before us proposed improvements at Woolloomooloo Bay. We find that an Admiralty Wharf forms part of the wharf improvements we are now considering. They have been inspected by several members of the Committee, and we find that the works on the Admiralty Wharf are *in statu quo*. Comparatively nothing has been done. There is a wharf, but no improvements of any moment carried out? No; the foundations for the store are found to be very difficult.
432. Is it proposed to build a store there? Yes.
433. Is it still intended to build a store there in addition to the store on Garden Island? I believe so. There is no store on Garden Island.
434. What works have been carried out on Garden Island? They have all to be carried out under my supervision. On Saturday, 16th June, I went over the Island with his Excellency the Governor and Sir Henry Parkes, and at their request I furnished them with a *précis* of the whole matter. That *précis* has just been read to the Committee.
435. Have you been aware of the interchange of certain lands between the Government of the Colony and the Admiralty, for any time? Yes.
436. Were you Colonial Architect at the time the arrangement was first made, a good many years back? Yes.
437. Do you recollect what the exchange consisted of at that time? I do not. The whole of the lands were leased to the Colonial Government.
438. How far did Dawes' Battery extend? It included the Corporation baths.
439. Did it include Dawes' Point absolutely? Yes.
440. And the Queen's stores? They were not included. They were not surrendered. I think they are not leased to the Government.
441. What else is there? Victoria Barracks.
442. And Imperial lands all through the country? Yes—at Newcastle, Parramatta, Liverpool, and other places. I think there was also something in Brisbane. I think Fort Denison was included.
443. In exchange what was given? Garden Island.
444. And a condition that a residence should be purchased for the Admiral? Yes; also the erection of a store at Woolloomooloo Bay, and at Spectacle Island.
445. When was that arrangement completed? About Sir Alexander Stuart's time.
446. Have the works at Garden Island been carried out at the expense of the Colony? Yes; entirely.
447. Do you know approximately what they cost? I cannot say from memory, but I stated the whole matter in a minute to the Colonial Secretary.
448. I find that there is a vote of £165,000 in 1888? Yes; it is in the present year's estimates.
449. And there is a past vote of £50,000? Yes; that is expended.
450. Is it still intended to carry out the improvements at Woolloomooloo Bay? I have had no instructions since I wrote that letter, describing the whole matter. When I met the Governor and Sir Henry Parkes at Woolloomooloo Bay, as well as at Garden Island, I produced a plan, and Sir Henry Parkes asked me to give him the particulars. I gave him a full history of the whole matter, pointing out that the erection of this store would encroach upon the Domain, as the plan would show.
451. What is the estimated cost of the proposed improvements at Woolloomooloo Bay? About £40,000.
452. I refer to the Admiralty portion of those improvements? As far as the store is concerned it will be £40,000.
453. Do you know whether it is the intention of the Admiralty to recommend that those improvements be carried out? I may say that the plans were made under the direction of an officer for the Admiralty, Mr. Fishenden. They were all approved, and copies sent Home to the Admiralty; and the store is a portion of what was approved of by the Admiralty.
454. Are you acquainted with the proposed improvements generally at Woolloomooloo Bay? No; I am not aware of them, except in connection with the Admiralty store. I know that Mr. Darley recommended that we should go further north to avoid the bad foundation. I pointed out that it would perhaps be better to allow the Admiralty people to have some of the newly purchased property at the Circular Quay.
455. Would not going further north at Woolloomooloo Bay encroach still more upon the Domain? I do not think so. It would encroach upon the baths, which are Corporation property.
456. How are they held? I do not know.
457. Have you formed any opinion as to the propriety of building upon the frontage where the baths are? No.
458. Do you think it is a suitable place for the baths at all? No; not in the present condition of the water.
459. Supposing it was not used as baths, do you think it should be taken from the public, who now hold it for recreation purposes as a frontage to the Domain? No; but we have progressed so rapidly with wharfage frontage that we do not know where to go. When we visited Woolloomooloo Bay, Captain Hammill, of the Navy, was with us, and he expressed the opinion that Garden Island was the proper place for the store. The store was designed on the mainland principally to please the storekeeper of the time.
460. May not the present storekeeper hold a different view? He may. The objection the former storekeeper had was, that when contractors delivered the stores, it would be better to receive them on the mainland; but I think it is just as easy to receive them on the island. I was always opposed to building at Woolloomooloo Bay.
461. Can you form approximately an estimate of the value of the frontage given to the Admiralty in Woolloomooloo Bay? No.
462. You see from the plan that it is proposed to build a new jetty in the bay 700 feet long and 100 feet wide;—do you think that is a desirable improvement of the bay? That is a matter I have not studied.
463. Do you know whether the Admiralty improvements are nearly completed at Garden Island? The buildings I have had instructions for—that is, the barracks and the store—are completed, and the foundations are in for all the other buildings. Plans were submitted months ago. In fact, Sir Henry Parkes, when he was there the other day, asked what was the reason why the works were not going on, and I said they were simply awaiting his authority.
464. What was the cost of the Admiral's residence? I think it was more than £20,000.
465. Has there been further expenditure upon it since? Yes.
- 466.

J. Barnet,
Esq.
20 Sept., 1888.

466. Is it a very complete residence? Yes; it is now.

467. *Mr. Copeland.*] What is your opinion in reference to the construction of a jetty, 700 feet long, running out right into the centre of Woolloomooloo Bay;—do you not think it will interfere with the navigation of the bay? I have never considered that matter. I recollect that some years ago when a similar proposal was made in regard to the Circular Quay it was very strongly objected to.

468. Will it not have the same effect as if the bay had been naturally divided in two? Certainly, it will have that effect.

469. Can you give the Committee any information as to whether the same objects could not be carried out on the frontage without interfering with the navigation? No, I cannot. Wharf matters are outside my line.

470. What is the nature of the stores intended to be kept in the proposed new building in Woolloomooloo Bay;—any explosives? No explosives. Shipchandlery more than anything else. The explosives are supposed to be kept on Spectacle Island. Anyone who visits the Circular Quay Admiralty Stores will see that they comprise almost everything that can be mentioned.

471. Is there any equally suitable place on the other side of Woolloomooloo Bay without interfering with the Domain? I cannot say. In my opinion the store should go to the island.

472. Your opinion is decided that it should go to the island? Yes. In its present position it will necessitate the removal of the stores twice.

473. Do you know if the opinion of the present Imperial storekeeper has been taken on the question? I am not aware. I know that the former storekeeper was very strong on the point of having the stores at Woolloomooloo Bay.

474. Is there plenty of water alongside the island for vessels to discharge stores? There is a wharf now erected which the "Nelson" could lie alongside of. It would only be necessary to lay down rails and build the store in a suitable situation.

475. Did the storekeeper at that time give any reasons for desiring to have the stores on the mainland? The principal reason he gave was that contractors should bring their goods to the store on the mainland instead of to the island; but I could not see the force of that reason. There were quarters for himself there, and perhaps that was the principal reason.

476. Is it intended to bring the Imperial vessels alongside these stores and load them as required? I think not. The stores have to be taken out in tenders to the ships. Ships bringing stores from England would come alongside.

477. You are not charged with the building of the proposed jetty? No; the agreement was that Mr. Moriarty was to do all the waterwork and put in the foundations. We were to work jointly so as to get the matter out quickly.

478. *Mr. Garrard.*] There is a plan here showing the original site of the Admiralty Wharf, and also the proposed alteration;—do you recognize it as yours? No; it is not my plan.

479. Have you ever seen it before? I think I have.

480. Where did it come from? It is from the Harbours and Rivers Department.

481. It is a sketch plan showing how the site of the building might be altered? Yes; Mr. Darley proposed to put the stores underground.

482. Upon this there is a minute endorsed to the effect that you see no objection to the removal to the new site, but you objected to inflammable stores being together? Yes.

483. Can you tell us what plans you prepared originally for the Woolloomooloo site? The whole matter is shown on the plan I now produce.

484. Has this plan received the approval of the Admiralty? Yes; this is a copy of the plan which received the approval of the Commodore.

485. Were there any detailed descriptions given with it? No.

486. Do you recognize this paper as being the specification of the work to be performed? Yes.

487. Is the work there mentioned included in your plan? Yes.

488. *Mr. Campbell.*] Was anyone present representing the Admiralty when the works were recently visited by the Governor and Sir Henry Parkes? Yes; the Admiral and Captain Hammill.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Wharfage Accommodation, Woolloomooloo Bay.

APPENDIX.

A

[To Evidence of Mr. Alexander B. Portus.]

MEMO. of Dredging performed at Woolloomooloo Bay from 1st January, 1881, until 31st December, 1887.

The attached memo. affords the information asked for by Mr. Humphery last night in connection with the Woolloomooloo Bay proposed jetty.

It will be seen that 281,650 tons have been lifted, at a total cost of £11,402 11s. 6d. for dredging and towing. Of this quantity, 191,295 tons were sewage deposit; the balance was original bottom removed to deepen the channel and wharf-berths for heavy-draught ships. The average cost of the dredging and depositing three miles outside of Sydney Heads has been 9³/₄d. per ton.

Sydney, 20 September, 1888.

MINUTES OF EVIDENCE.

(TAKEN BEFORE SECOND COMMITTEE.)

WHARFAGE ACCOMMODATION, WOOLLOOMOOLOO BAY.

THURSDAY, 15 NOVEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

JOSEPH PALMER ABBOTT, Esq.

HENRY COPELAND, Esq.

THOMAS MICHAEL SLATTERY, Esq.

JOHN RENDELL STREET, Esq.

DANIEL O'CONNOR, Esq.

The Committee proceeded to further consider the proposed improvements and additions to the wharfage accommodation, Woolloomooloo Bay.

Robert John King, Esq., sworn and examined:—

- R. J. King, Esq.
15 Nov., 1888.
489. *Chairman.*] You are engaged in mercantile pursuits in Sydney? Yes; and have been for some time.
490. You have had to do with the wharfage accommodation of the port amongst other things? I had a great deal in former days to do with the shipping.
491. Your firm was originally, I think, Thacker & Co., and then Thacker, Daniell, & Co.? Yes.
492. You are aware that the question now under the consideration of this Committee is the providing additional wharfage accommodation at Woolloomooloo Bay? Yes.
493. It is proposed to expend a considerable amount of money there in improving the wharfage accommodation for mercantile purposes generally, and for Admiralty purposes as well? Yes.
494. Have you seen the plans? Yes.
495. Have you given any attention to the necessity for improving the wharfage accommodation of our harbour? I have; and, I think, with some alterations of these plans, that it would be a great benefit if a portion of the trade—the discharging of inward cargoes—could be diverted to Cowper Wharf, so as to relieve the Circular Quay, and leave the wharf entirely for loading. At the present time it is very often impossible to get vessels into the wharves from the want of room.
496. Is the whole of Woolloomooloo Bay known as Cowper Wharf? I believe that name applies to the whole wharf; I have always heard it called Cowper Wharf.
497. You think it would be an acquisition for commercial operations if additional accommodation were given there? I think it would be a very great benefit indeed.
498. You are aware that it is the property of the Government? Yes.
499. You think the property is of so much value that it ought to be improved to its fullest extent? There are capitalists in Sydney who would be very glad to take it from the Government, and to lay out the money which the Government propose to expend upon it. I have consulted with several gentlemen about the matter, and I think there would be no difficulty at all if the Government wished to lease the property.
500. Are you aware of the character of the proposed improvements? Yes.
501. You know the jetty which it is proposed to erect? Yes.
502. And you are aware of the small jetty existing there now? Yes.
503. Do you think the proposed improvement a desirable one? I think that the proposed jetty should be widened, that on each side there should be about forty feet, with a roadway of fifty feet for the drays to go up. The drays would not then go in among the goods, and there would be very little labour in passing the goods on to them. If there were a fifty feet passage for the drays, trollies could carry the goods from the ships, and they would not get damaged, as is now the case on our wharves.
504. Then you would give sufficient room to enable the drays to be taken up right to the centre of the jetty, with room to load or unload at either side? Yes.
505. Would that be better, do you think, than a tramway? I think it would be better. There is only one handling. The trolley runs flush with the ships; the heavy luggage is then put on; and there is no second handling.
506. That would necessitate the jetty being considerably wider than is now proposed? It would need to be 130 feet wide; it is now 100 feet wide.
507. The additional thirty feet would give sufficient room, you think, for carrying out the different work that would be required in the way you describe? Yes.
508. You know nothing, I suppose, about the proposed Admiralty Wharf at Woolloomooloo Bay? Nothing beyond what I have seen on the plan.

509. Is it the fact that, from the means of access to the water being more level on that side, the wharf would be appreciated to a greater extent than some of the wharves in Sydney? I am sure it would. I have spoken to some of the draymen on the subject, and they would far sooner cart from Cowper Wharf than from any other wharf in Sydney, except of course the Circular Quay, where the get-away is very good. R. J. King,
Esq.
15 Nov., 1888.
510. Of your own knowledge, would the facilities for access to Cowper Wharf be greater than they are now to many of the wharves at Darling Harbour? Yes; I am sure they would.
511. The ascents are not so great, and necessarily the horse-power required to move goods to warehouses in the city or other places would be less? The haulage would be very much less from Cowper Wharf.
512. You have had a great deal of experience with shipping, I suppose, in the commercial establishments you have been identified with during a number of years? Yes.
513. And the nature of the access to the wharf has always exercised considerable influence upon the removing of goods? The preference has always been given to the Circular Quay, on account of the get-away being so good.
514. The Circular Quay is regarded as a wharf offering greater facilities for traffic than other wharves—those at Darling Harbour, for instance? Decidedly so.
515. And Cowper Wharf would be regarded in a similar light? I think so. I do not think Cowper Wharf is quite as good as, but it is the next best wharf to, the Circular Quay.
516. In point of facility of access? Yes.
517. *Mr. Abbott.*] You said just now that you would have the Circular Quay as a loading wharf, and use Woolloomooloo Bay for discharging at;—would a vessel load at one wharf and discharge at the other? That is what they invariably do at the present time. They discharge their cargoes at the back wharves, and then when they are ready to load wool they lie alongside the Government wharf at the Circular Quay.
518. Do you not think that a jetty 700 feet long running out into Woolloomooloo Bay would interfere a great deal with the navigation of that bay? No.
519. Do you not know that that system was objected to years ago as applied to the Circular Quay? I believe it was.
520. And generally condemned? Yes.
521. Have you seen the report of Mr. Powell in reference to the harbour accommodation of the port? I read something in the paper the other day about the Circular Quay; would that be the report you refer to?
522. Yes. Do you know that he stated that the present wharfage accommodation is ample for all the shipping that comes into the harbour—more than ample? Yes.
523. Is that the case? I rather question it.
524. Do you know that any ships are unable to get berths to discharge their cargo here—not particular berths, but unable to get accommodation at all? I believe that at times there is a difficulty; and that that was the reason why some ships first went to Cowper Wharf.
525. Can you mention any instance? Dangar, Gedye, & Co. were unable to get berths some time back, and they were the first to send ships to Cowper Wharf.
526. Is Cowper Wharf utilized now to the fullest extent? I have seen Cowper Wharf full, not room for another ship.
527. That is very rare, is it not? No; I have seen the wharf, and thought it a very busy place.
528. *Mr. Suttor.*] Do you know if many ships discharge at Cowper Wharf? A good many ships have discharged there; I have seen the wharf full of ships. I used to go by there very frequently, and I have seen five or six ships lying there at a time, some of them large London ships. About 50,000 tons of large pipes have been discharged at Cowper Wharf.
529. How long since? About eighteen months ago.
530. The pipes for the Sydney water supply scheme? Yes.
531. That is not likely to occur again? No; but these ships bring large general cargoes.
532. Do you know that there is a great deal of accommodation on the west side of the Circular Quay, and that it is proposed to erect wharves there;—would not the erection of those new wharves have the effect of giving all the additional accommodation required? My idea is that the small steamers will require all the accommodation at the Circular Quay.
533. But provided they make fresh accommodation for small steamers, such as the Watson's Bay boats—it is proposed to remove them to fresh wharves? Yes.

Captain Henry Coey Kane, R.N., H.M.S. Calliope, sworn and examined:—

534. *Chairman.*] You are the captain of Her Majesty's ship Calliope? Yes.
535. Are you acquainted with the site of the proposed Admiralty Wharf at Woolloomooloo Bay? Yes. Capt.
H. C. Kane.
15 Nov., 1888.
536. Have you given your attention to the nature of the improvements proposed to be made there? Yes; the Admiral has spoken to me about them.
537. A site has been reserved for an Imperial wharf? Yes, for many years past.
538. And for stores also? Yes; so I understand.
539. Some alteration of opinion has occurred as to the character of the site. This is an alternative site that we are now speaking of. The original site was objected to on the ground that it was not possible to find proper foundations for the stores? Yes.
540. Then it was considered desirable to alter the site to one further north? Considered desirable, but not in any way by the Admiral. The Admiral is in no way a party to the alteration.
541. We are anxious to know the opinion of the Admiralty with regard to the proposed new site to enable us to perfect the improvements proposed to be carried out;—do you know whether the Admiralty has given

Capt.
H. C. Kane.
15 Nov., 1888.

given any consideration to the site? The Admiralty has not yet had an opportunity of expressing an opinion on the subject, because the Admiral, although he received a letter about it a couple of months ago, was away, and the matter was very indefinite. It was understood that the question was going to be considered by this Committee. He therefore wrote a letter expressing in general terms his willingness to advise the Admiralty to assent to anything which would not prejudice the navy in what they had at present:

542. That is exactly the feeling as far as we are concerned. Then of course there is no strong opinion on the part of the Admiralty with reference to one site or the other so long as they get a desirable one? In view of the fact that there is no foundation for the store at the rear of the old site, there is no question something must be done. Whether the new site is the best that can be obtained may be a matter for consideration. The opinion of the Admiral is that there should be a pier of suitable length. The new pier is to be altogether 558 feet long, 320 feet of it to be devoted to the navy. That does not seem to be quite as much as existed in the old pier. It appears that the navy loses in that respect. That is one point to which the Admiral desires me to call attention. In the next place the stores should be as large and built practically on the plan which has now been approved for five years—on the 13th March, 1884. The plans having been approved for these buildings, the Admiral of course could not advise the Admiralty to agree to any reduction in the space or style of the buildings. Then this quay or pier in front of the store should be exclusively reserved for the navy. This, from a military and naval point of view, is very important. I think everyone will agree that we cannot get on with our work in a satisfactory way if all the larrikins of the town are allowed to loaf about the wharf, and if carts are coming backward and forward blocking up the road. In that connection I may mention that the present state of the frontage to the depôt at the Circular Quay is about as bad as it can be. We are experiencing what a bad thing it is to have a depôt without having the whole frontage of that depôt belonging to us.

543. Have you visited Woolloomooloo Bay? Yes; several times. I know the place fairly well. Of course I cannot give an opinion upon such technical points as to whether there is a good foundation behind the proposed site. The only point that struck me was as to whether or not there was sufficient space behind the new pier and in front of the hill to build the stores. I am told that it has been surveyed, and that by cutting into the hill it can be done. All that we want is to get the stores.

544. I suppose, generally, as far as the Admiralty are concerned, if the original conditions and stipulations are carried out as to the frontage and capacity of the stores they will have no objection? I do not think that under those circumstances there would be any objection on the part of the Admiralty.

545. As far as I can see the alteration has been made in the interests of the Imperial service, because it was found that the original site failed as far as the foundation of the stores was concerned? Undoubtedly it is in the interests of everybody that the agreement which was come to several years ago should be carried out.

546. But the original agreement could not be carried out because nature interposed? I am referring back to a more ancient agreement, by which the Colonial Government agreed to provide proper stores and so on for the navy, and a proper wharf. At the time this first agreement was made, in 1882, there was then no question about the particular site which was afterwards chosen. It was then merely whether or not it should be put in Woolloomooloo Bay. It was once a question whether it should be at Dawes' Point or Fort Macquarie. The agreement by the Colonial Government to provide suitable stores is relied on.

547. But this forms part of the original agreement upon which the exchange of Garden Island was made? Yes.

548. It is in carrying out that part of the agreement that our condition failed of putting stores on the original site. It is necessary to select a site further north, and we are anxious to know the opinion of the Imperial authorities? The Admiral desired me to state in his name that provided the new buildings are in accordance with the contract, and that the water frontage is sufficiently deep, there will be no objection on his part to change the site, and he will recommend the Admiralty to adopt it.

549. Mr. Copeland.] Has your attention been drawn to the jetty proposed to be run into the centre of the bay? I have seen it on the plan, but not *in situ*.

550. Do you think that jetty extending 700 feet into the bay will cause any difficulty in handling vessels and berthing them? It did strike me at the time that the extent of deep water on either side of the pier was not very much, and that there would be some difficulty in getting vessels alongside and away from it, but I do not think it is insuperable.

551. Would it do an injury to the bay to build such a jetty? Speaking in such general terms as I can, I think it is a step which would more or less injure the bay in several ways, but which might be undertaken to meet the necessities of commerce, which should come before everything.

552. Will it injure the bay with respect to the berthing of vessels? No doubt it will make difficulties in berthing vessels around the shore. It will be less easy to come alongside the present jetties than if the pier were not there.

553. Would you recommend that such a jetty should be taken into the centre of a narrow bay, supposing that it was properly a naval harbour under the control of the navy? No; but the conditions of a naval harbour and a commercial harbour are entirely different.

554. Could you manœuvre a vessel easily in that bay with a jetty 700 feet long? Undoubtedly not. It would be more easy in a schooner or coaster to come alongside one of the small piers or jetties which exist at present without the pier than with it. The pier would be an impediment undoubtedly. At the same time one thing has to give in to another.

555. Do you think that the additional length of wharfage accommodation would more than compensate for the inconvenience which would be caused with respect to the berthing of vessels? It is not a subject to which I have paid particular attention, nor is it one in which I feel I would be very competent if I had paid attention to it. It is entirely a commercial question. If you ask me if I could bring my ship alongside that pier without danger or difficulty I will say yes; but I am not prepared to go into the question as to whether or not it is a good thing for merchant vessels, because I do not know what are the conditions.

556. I understand you are erecting naval stores and wharves on Garden Island? Yes.

557. Then what necessity exists for additional stores here? The buildings which are being erected on Garden Island are not what are properly called stores. They are buildings for making repairs to ships, for making castings, in fact the general workshops you have in a factory like Mort's. The building which

is to contain all the rope, all the provisions, and the other hundred things required for the ships, was to be put on the main land. The question was raised at one time as to whether or not those stores should also be on Garden Island. There were several objections, one being that there was not room on Garden Island without removing a hill which exists there, and which would involve a great deal of expense. The main reason why the store, as distinguished from the factory, was proposed to be kept on the main land was the fact that it would be more convenient for the ships to go to the main land for their stores. A large number of stores are bought in the town, and these are continually coming in from all quarters. It was thought at the time that it would be inconvenient to have this depôt on an island, as it would necessitate constant lighterage backwards and forwards.

558. Will there be any explosives placed in these stores? No; they are all stored at Spectacle Island.

559. What is the length of the water frontage formerly proposed to be given? I think it was 400 feet, and the length proposed in the letter to the Admiral was 320 feet.

560. Do you think that it is absolutely necessary that the Admiralty should have absolute control over this wharf? I think so.

561. And that the public should be excluded? I think so. I think that is very necessary for the efficient carrying out of the service, which is for the well being of the Colony, and not merely a question for us. I may point out that an accession to the fleet, known as the Australian Squadron, will be coming out next year. We have now no fit place to put our stores, and what we are to do when the five extra ships come out, I do not know. The old depôt is decayed. We cannot stow things on the upper floors. They are crowded together in a most inconvenient manner down below. Five years ago the Government drew out the plans. Nothing has been done since.

562. Do you think that the necessities of the service will require such a large strip of water frontage to be locked up specially? Perhaps I had better put it that the Admiral thinks so. I am directed by the Admiral to express his opinion strongly on that point. It is quite certain that the Admiralty would, as far as lay in them, claim that part of the agreement, that the jetty as well as the stores should be exclusively devoted to the navy, and railed around, or otherwise separated from the Domain or general thoroughfare.

563. Would the navy use this particular wharf in future so that all traffic between the ships and the shore would be directed to this particular spot? All the traffic would. I do not mean to say that we should never land at Fort Macquarie steps. All our traffic, with regard to stores, would naturally be concentrated at this wharf. Of course, we would, I suppose, be allowed to land at Fort Macquarie steps as well as the rest of the world.

564. *Mr. Street.*] I think I understood you to say that you did not see any insurmountable objection to having the stores proposed to be erected at Woolloomooloo Wharf erected on Garden Island? That is a question which the Admiral spoke to me about, and, with the permission of the Committee, I will go into that, though it did not appear to me to be a question on which I should speak without being asked. The Admiralty having agreed to a definite plan which was proposed and sanctioned by the Government, the Admiral feels that it is not his place to initiate any change. On the other hand things have changed to a certain extent, and he thinks, as he has heard it mooted in some places, that if a change could be made to Garden Island, if Garden Island could be levelled right through—which will involve a considerable sum of money, but I do not know how much—if the same sized building as is shown on this plan were built on Garden Island, and if at the same time we had in some convenient position in the town an office for the paymaster, and a small receiving store, where the townspeople who contract to supply the navy with various articles, could deliver the goods, it is a question which might be submitted to the Admiralty whether it would not be better to have the depôt at Garden Island.

565. Your opinion is that it might possibly be a greater convenience for the service to have all your buildings within a short radius? I am rather of that opinion myself. I am not prepared to give it as the Admiral's dictum that it is so. I have for some little time past been in favour of that idea. Of course there are many considerations. It might cost much more, and it might not be convenient to give an office and receiving store in the town. But that is a feature which the naval authorities, and probably most people, will think is a necessity. You could not have a person who wanted to see the paymaster for five minutes to talk about a contract going over to Garden Island. On the other hand when he had to deliver some small goods he could not be expected to pay for lighterage, nor could we. Therefore the proposal to have the depôt at Garden Island would involve, in the opinion of the Admiral, an office and receiving-room at some convenient place in the town.

[*Mr. Suttor* : At this stage I wish to raise a point of order. The Public Works Act at Clause 12, says :—
“The Committee shall, subject to the provisions contained in the next following section, consider and report upon all public works (except fortifications and works connected with the military or naval defence of the Colony),” &c. It appears from Captain Kane's evidence that there can be no doubt that these works are connected with the naval and military defence of the Colony, and that being the case, I submit that it is clearly out of order for the Committee to deal with this matter in view of the express wording of the Act. I submit that it would be better to get the opinion of the Attorney-General on the point as to whether or not we can take these works into consideration.

Chairman : As far as my opinion goes, the course the questions have taken is quite in keeping with the object for which we have met to-day. We have met for the purpose of considering improvements in Woolloomooloo Bay generally. When we proceed to the consideration of these improvements we find that a portion of them are included in an agreement made and completed between the Imperial authorities and the Government of this country, completed and not pendent in any sense. That is for the exchange of land at Garden Island for Imperial lands in different parts of the city. Part of that agreement was that the Government should give the Imperial authorities a wharf at Woolloomooloo Bay, and construct stores on the wharf or behind it. It was subsequently found by the skilled men employed to carry out those works that there was a difficulty in getting foundations for the stores on the site first proposed. It was then proposed to alter the site of the Imperial wharf from one site to another. When we come to consider these improvements we desire to ascertain the opinion of the Imperial authorities as to the change of site, and it seems to me to be quite in order to ask these questions from the gentleman now giving evidence before the Committee as the representative of the naval authorities. I take it that there is nothing extraneous or irregular in the character of the evidence sought to be obtained from the gentleman who has so readily and kindly come here on behalf of the Imperial authorities.]

Capt.
H. C. Kane.
15 Nov., 1888.

566. *Mr. Street.*] Do you think that privacy and freedom from obstruction by the general traffic of the city could be better obtained by the erection of these stores at Garden Island rather than at Woolloomooloo Bay? I think they would. I think that the advantages of privacy and security of the stores would be increased by having them at Garden Island instead of at Woolloomooloo.

Capt.
H. O. Kane.
15 Nov., 1888.

Mr. William Glen Deuchar sworn and examined:—

Mr. W. G. Deuchar.
15 Nov., 1888.

567. *Chairman.*] In what occupation are you engaged? I am shipping clerk for Dangar, Gedye, & Co.
568. Have you had considerable experience in shipping business? Yes; for ten years. I manage the whole of the shipping business for the firm.
569. Have you had an opportunity of becoming acquainted with the shipping accommodation at the whole of the wharves in Sydney? Yes; we generally have most connection with the Circular Quay.
570. Is there a scarcity of wharf accommodation? At times there is. In 1885–86 we had the ships carrying pipes for the Sydney water supply, and on one occasion we had three ships lying in Neutral Bay for a week or ten days. We could not get a berth at the Circular Quay. At last we applied to the Government, and they authorized us to take the ships to Woolloomooloo Bay. We did so.
571. Have you ever known the same pressure to exist since? No.
572. Have you ever known a scarcity of wharf accommodation at the wool season or any other time? No. I think if many vessels came in at present from London, and we wanted berths at the Circular Quay, there would be great difficulty.
573. Is there a particular kind of commerce carried on at Woolloomooloo Bay? No; we have had ships there with general merchandise.
574. Is it not generally used for blue metal and timber? Yes.
575. Does that require a certain amount of accommodation? Yes.
576. Do you think that if the proposed improvements were carried out at Woolloomooloo Bay it would interfere with the commerce of the port? No; I think it would be the other way. As far as we are concerned it would be. We have ships coming here now, which we would be quite willing to send to Woolloomooloo instead of to the Quay, and that would give more space at the Circular Quay for steamers.
577. Do you think that the long jetty proposed to be constructed is a desirable improvement? Yes; my idea is that it should be about 130 feet wide,—50 feet for drays, and 40 feet on each side for goods.
578. Is Woolloomooloo Bay favourably regarded for facility of access? Yes; the grades are better than at some of the other wharves.
579. Do you think that the existing wharfage accommodation is sufficient for the commerce of the port? I think it is at present; but if it goes on increasing at the present rate there will not be sufficient accommodation.
580. During the wool season have you seen much inconvenience from the want of accommodation? Yes; we have sometimes been obliged to keep ships out for a week, and sometimes we have had to lighter the wool to the ship out in the stream. There is very often a rush of inward cargo vessels which have the preference for berths at the Circular Quay, and the wool ships are consequently shut out. If these improvements were carried out at Woolloomooloo Bay we would send general cargo ships there, which would leave space available at the Circular Quay for wool ships.
581. Do you think that if Cowper Wharf had belonged to private individuals these improvements would have been carried out before now? I think improvements would have been made, but I do not know to what extent.
582. *Mr. Watson.*] You said that during 1885 you had three vessels lying in Neutral Bay;—what did that arise from? We were bound to discharge their cargoes of pipes at the Circular Quay, and we could not get berths there.
583. Were there not other berths available? We would not be able to cart the pipes from the other wharves. The carters objected. They said they could not carry out their contract.
584. At the large wharves have they not machinery to lift the pipes? The expense would be much greater.
585. Then it was on the score of economy for yourselves that you wanted to go to the Circular Quay? No, not that alone. It was on account of the charterers of the ships.
586. You were acting as agents? We acted as their agents, and we did the best we could.
587. You do not put all the ships of your firm to the Circular Quay? No.
588. Will it be as convenient for carters to land goods at Woolloomooloo Bay as at the Circular Quay and other wharves? Not as convenient as the Circular Quay. I have heard it remarked by draymen that the Circular Quay is the best wharf in Sydney.
589. *Mr. Street.*] Do you say that the firm you are connected with give the preference to the Circular Quay? Yes; we are not interested in any wharf, and we prefer the Circular Quay when the ships are free. But some come in fixed for certain wharves.
590. Is any rebate given now by private owners? Not that I know of.
591. If rebates were given would not the other wharves compete very much with the Circular Quay? Yes; we would put our ships where we could get most.
592. Have you ever found a difficulty in getting accommodation for inward cargoes? Yes; in 1885 and 1886.
593. With regard to the ships detained for a time during the wool season, was that only for a short time? Yes; it was not a very great inconvenience.
594. *Mr. Suttor.*] Do you unload many ships at Woolloomooloo Bay during the course of the year? We have not had any ships there since the pipe ships, because we have always got accommodation at the Quay. But if these improvements were made we would put our ships there, and leave more space at the Circular Quay.
595. Are you aware that more accommodation is being provided at the Circular Quay? Yes.
596. Do you think that when that additional accommodation is provided at the Circular Quay there will be any necessity for this additional accommodation at Woolloomooloo Bay? I think it is required at the present time.
597. Is not Woolloomooloo Bay at a great distance from the city? Not greater than other wharves, except the Circular Quay.

598. Is it likely to be used if other wharves are available? It all depends. If the Circular Quay was full we would avail ourselves of Woolloomooloo Bay. We would sooner go to the Circular Quay. We have a large steamer coming in now, and I do not know that we shall be able to get accommodation at the Circular Quay. If there was no accommodation there we would send her to Woolloomooloo Bay.
599. If there was accommodation at the private wharves, would you prefer to go to Woolloomooloo Bay? Yes. Our ships generally load wool, and our reason for putting them at the Quay is that we only pay half dues there. That is $\frac{1}{4}$ d. a ton per day instead of $\frac{1}{2}$ d. The next best thing is to put them at Woolloomooloo Bay.
600. *Chairman.*] Have you considerable imports as well as exports? Regularly eight or ten ships every year. Sometimes a great deal more. We export largely—wool, tallow, hides.
601. Do you think that the wharfage accommodation is in excess of the commerce of the port at the present time? I do not think so.
602. Do you think that the commerce of the port is increasing very largely? Yes, very much.
603. Do you think it will go on increasing, and that consequently more accommodation will be required? Yes.
604. That being so, are you of opinion that these proposed improvements should be carried out at Woolloomooloo Bay? I think so, to a certain extent. Of course I am not aware of the whole of the improvements proposed. As far as we are concerned the jetty would be a very desirable improvement. If it were 130 feet wide it would be the best wharf in Sydney for unloading cargo; I will not say for loading, because there are no dumping stores, and unless they are erected we could not load wool ships there.
605. Do they dump now on many stations in the interior? Yes; they are now going in for dumping on every station which has over 1,000 bales.

Mr. W. G.
Deuchar.
15 Nov., 1888.

Mr. George James Harvison sworn and examined:—

606. *Chairman.*] Are you shipping clerk in Hoffnung & Co.'s? Yes; I have been so for five or six years.
607. Have you had a good deal to do with the shipping of the port during that time? Yes; with all shipping connected with the firm.
608. Have you had an opportunity of seeing the surroundings of the wharf accommodation and appliances? Yes.
609. Do you export as well as import? Yes; but not very largely. It is all intercolonial trade—general merchandise. We import very extensively from England and nearly all the ports.
610. What wharves do you do business with generally? Several of the ships come to the Circular Quay, Dibbs' Wharf, and Dalton's Wharf, and all round. We have ships occasionally at Woolloomooloo Bay.
611. Do you think that the commerce of the port is increasing largely? Yes; it has increased wonderfully during the last three or four years. I think it will go on increasing. The imports are certainly on the increase.
612. Do you know the wharfage accommodation at Woolloomooloo Bay? I have seen it frequently. We have had ships consigned there.
613. Have you found that it gave abundant facilities? It is far better than the back wharves, not for the accommodation there at present, but for the access to it. The haulage from the back wharves is very great. No one would attempt to bring up a couple of tons from those wharves with less than three or four horses. From Woolloomooloo you could bring a ton on a one-horse dray, and a couple of tons with two horses. That is a matter of considerable moment to importers. Another consideration is that to get to the back wharves you have to go through the busy part of the city where traffic is considerably impeded. In Woolloomooloo there is very little to obstruct the traffic.
614. Have your vessels had no difficulty in coming up to the wharf at Woolloomooloo? No. They drew a good depth.
615. Are you clearly of opinion that the commerce of the port renders it absolutely necessary to have additional wharfage accommodation? I have no doubt of it.
616. *Mr. Watson.*] What position do you hold in the firm of Hoffnung & Co.? I am despatch and shipping clerk.
617. Do you deal with exports? I deal with all the imports.
618. Not with the consignment of vessels? No; I have nothing to do with that.
619. Then you do not know anything of the shipping of the port so far as inward vessels are concerned? I have to deal with incoming shipments, but I have nothing to do with the vessels.
620. How many vessels do your firm get consigned to them? Twenty or thirty or something of that sort.
621. Who looks after them? Another man looks after the ships when they are consigned to us.
622. As a matter of fact, you know nothing of the vessels consigned to the firm? No.
623. Do you do not know anything about the accommodation? No; except as it concerns myself. I have nothing to do with the shipping.
624. *Mr. Campbell.*] Has your house any store or stores at Woolloomooloo? No; we have stores at the Circular Quay.

Mr. G. J.
Harvison.
15 Nov., 1888.

Captain Alexander Young sworn and examined:—

625. *Chairman.*] Are you master of the ship Gretna? Yes; she has traded to this port for some years from London. She is a wool ship, and I am loading wool now at the Circular Quay. She is 1,705 tons register.
626. Have you found any difficulty during the time you have been trading here in getting wharfage accommodation? Yes; I was detained a week three years ago, when I wanted to load wool at the Circular Quay.
627. Have you found any difficulty in getting a berth to discharge inward cargo? I had a little difficulty this voyage, but I got half a berth at Woolloomooloo Bay. I think Cowper wharf could be greatly improved. I discharged a cargo of timber there. I think 100 feet will not be sufficient width for the new jetty. It should be 150 feet wide altogether. That would allow a dray to turn.
628. How long have you been trading here? Eighteen years.

Capt.
A. Young.
15 Nov., 1888.

- Capt. A. Young.
15 Nov., 1888.
629. Have you seen a great increase in the commerce of the port? Yes; especially at the Circular Quay. It has been growing all that time. I do not see why it should not go on increasing.
630. Do you think that the proposed improvements at Woolloomooloo Bay are desirable? I think they are wanted very badly.
631. If the property belonged to private firms do you think that increased accommodation would have been given before now? Yes; long ago.
632. Do you think that the construction of a jetty would be detrimental to the commerce of a bay like that at Woolloomooloo? No; it would afford additional facilities.
633. Have you heard any opinion expressed as to Woolloomooloo offering greater facilities for haulage than some of the other wharves? I expressed that opinion myself before I had any idea of giving evidence.
634. Have you paid any attention to the improvements in wharves now going on around Darling Harbour? I have discharged at the Grafton, and several other wharves there. I know that most of the wharves have been improved, and are being improved.
635. Do you still think there is room for improvement at the Circular Quay? Yes; I think the present state of the Circular Quay would point to that. There is not a single berth vacant at the Circular Quay.
636. Can accommodation be got at private wharves? I do not know. It is a matter of drawing trade to the Circular Quay. All the wool ships would discharge at Woolloomooloo Bay, if there was no accommodation at the Circular Quay. Seeing that a very fair amount is obtained by the Government for ships berthed at the Circular Quay the accommodation might be better.
637. *Mr. Humphery.*] The new jetty will accommodate six vessels;—do you think that those six berths will be constantly occupied? I think so. If I had the same accommodation at Cowper wharf as there is at the Circular Quay, I would as soon discharge there as at the Circular Quay. If there was a jetty, and it was regulated more like a private wharf, I would prefer Woolloomooloo to the Circular Quay, because the latter is too open.
638. *Mr. Watson.*] You say you are charged a fair amount for wharfage accommodation at the Circular Quay. Have you been to Melbourne and Adelaide? Yes.
639. Are you aware that the wharfage rates there are double what they are at the Circular Quay? They are higher at Melbourne.
640. Why did you go to Cowper Wharf with timber? Because I knew I was going to load in Sydney, and preferred going to Cowper Wharf to any outside wharf.
641. Was there an outside wharf which could take your cargo? I think Smith's Wharf and several others could.
642. Do you not know that all timber ships which cannot go to the Circular Quay go to Woolloomooloo? No; a great many go to Johnston's Bay.
643. What is the advantage of discharging at Cowper Wharf with the view of ultimately coming to the Circular Quay? The advantage is that if we discharge at a Government wharf our rates at the Circular Quay are one-half while loading wool.
644. Can you not load wool at Lamb's Wharf? That is conditional on being consigned to Lamb's Wharf. He has his regular vessels; we are chartered to Burns, Philp, & Co.
645. With reference to this jetty, could you berth three ships at a jetty 700 ft. long? Not three vessels of our size. You might not always have ships of that size.
646. For the purpose of berthing three ships there would it not be advisable to make the jetty a little longer? Possibly that should be done, seeing that vessels are being made larger. There is room to make the jetty 1,000 ft. long without injuring the bay. You would then have more room to move ships alongside the jetty than there is in the London docks at any time.
647. If that jetty were run down the middle of Woolloomooloo Bay there could be no ships lying outside to load or unload? I think there would be quite room enough at the sides of the bay. There would be sufficient room to take in the largest vessels visiting your port.
648. *Mr. Campbell.*] Do you think that the existing passenger jetty will interfere with the proposed new jetty? I do not think so. There would not be room to swing a ship, but you could move her in and out. You would not be likely to have large ships at the small jetty. If there is 100 ft. of space that will be sufficient.
649. *Mr. Suttor.*] Have you had any difficulty in getting a berth since you were delayed three years ago? Not exactly a difficulty, except this trip; there was no berth at the Circular Quay and I do not think there is room at Cowper Wharf. I would not go there again with a general cargo.
650. It is proposed to make new berths on the western side of the Circular Quay;—do you not think that when they are finished they will be sufficient for present requirements? That is scarcely for me to say. You can always rely upon the Circular Quay being taken up for four months in the year with the loading of ships alone.
651. You have not had any great inconvenience during the last three years? I do not consider that I am at a loading berth now, but I had no choice. Three years ago there was one vessel lying out in the stream at the Circular Quay, and all her wool had to be lightered. There were three or four ships discharging at the west side of the Quay. If you had accommodation at Cowper Wharf those vessels might have been discharging there, and the loading ships could have got sufficient wharfage.
652. I suppose Cowper Wharf could only be used by vessels unloading? Yes; new stores might be put up there seeing the advancement of Sydney.

FRIDAY, 16 NOVEMBER, 1888.

Present:—

JOSEPH PALMER ABBOTT, Esq. (VICE-CHAIRMAN).

The Hon. GEORGE CAMPBELL.

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

HENRY COPELAND, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

JOHN RENDELL STREET, Esq.

DANIEL O'CONNOR, Esq.

The Committee further considered the proposed improvements and additions to the wharfage accommodation, Woolloomooloo Bay.

Captain Benjamin Jenkins sworn and examined:—

653. *Vice-Chairman.*] You have been a captain in the mercantile navy? Yes.
654. For how long? Over twenty years.
655. You are now a member of the Marine Board, are you not? Yes.
656. How long have you been living in Sydney? Since I first came here, nearly thirty-four years.
657. You have been a resident for many years? I have been trading here. I have always made Sydney my home since that time.
658. You know Woolloomooloo Bay very well, I suppose? Yes; I have taken cargo in there several times—timber.
659. You know Cowper Wharf that is there now? Yes.
660. And you have seen the plan of the proposed improvements to Woolloomooloo Bay, more especially that jetty? Yes; that long jetty.
661. How many large ordinary vessels can be berthed at Cowper Wharf at the present time without the jetty? I do not think they could berth more than three, leaving the jetties out.
662. Leaving the new jetty out, as the wharf is now? With the other jetty, of course, there is a vessel along each side—two vessels.
663. That would be five vessels? Yes.
664. What is your opinion about the advisability of constructing that proposed long jetty? It appears to be a very good idea; but I think it is narrow for that length. In my opinion three short ones would be better than one long one.
665. That is, I suppose, it is not wide enough to allow two ships to be taking in cargo, or discharging, on each side? No; the cargo would have to go down to the outer ships along the centre of the wharf.
666. Do you know the width of that jetty? No; I do not.
667. We are told it is 100 feet wide? That would not be wide enough to take two ships on each side.
668. What width would you say it ought to be? I should say it ought to be 140 or 150 feet.
669. Do you think there is any necessity for the Government to provide any more wharfage accommodation in Sydney than they already possess? I do not know. I have always considered that that wharf ought to be a timber wharf. That Woolloomooloo Wharf is admirably adapted for a timber wharf, for ships discharging long lengths of timber, simply because there is a get-away from it in different ways; and the wharves up here have not got that space.
670. Do you know whether the wharfage accommodation there is, at the present time, has ever been fully used, even for that purpose? No; I do not know that.
671. Then you do not know that there has been any demand for increased wharfage accommodation there for timber vessels? I wanted a berth there myself a short time ago, and, owing to the quantity of stone and things on the wharf, I could not get one.
672. But suppose the owners of that stone were compelled to take it away as quickly as it was discharged from the vessels, do you think then there would be any necessity for additional wharfage accommodation there? No; I think there ought to be enough, unless the trade increased of course.
673. But at the present time? At the present time I should think there would be enough.
674. I suppose you know that the stone is continually there—that the wharf is never cleared of it? No.
675. Do you think if the owners of that stone were compelled to remove it as quickly as it was landed, there would be plenty of accommodation for all the ships that would be likely to come there? Yes; I should think there would be.
676. Of course you would compel all ships discharging to do the same thing—clear their cargoes away as quickly as possible? The cargo should be allowed to remain a certain time on the wharf.
677. Do you think if the pier were built in the shape and position proposed, it might interfere with subsequent improvements to that part of the harbour? Undoubtedly it would.
678. Might it not interfere with other wharfage improvements to that part of the harbour—will they not be for all time bound to that system of wharfage, jetties—would it not interfere with the present wharfage accommodation? It certainly would, because you could not get vessels in on either side the same as you can now; still there would be two more vessels admitted that we could not get there now.
679. By reason of the jetty? Yes.
680. That is, the jetty would accommodate two more;—although the construction of the jetty would decrease the accommodation at Cowper wharf as it is, the jetty itself would increase the accommodation in the bay? Yes; about two ships more, I think.
681. Do you think it would be worth spending £42,000 to produce that result? I should not like to say that.
682. Do you think it would be worth while spending £27,000 in the present state of the wharfage accommodation? Even that I could not say.
683. Do you approve of this system of jetties at all for berthing ships? I do approve of them. At the Circular Quay you cannot put a ship well alongside; it is jammed up against it fore and aft, and 20 or 30 feet away amidships.
684. But do not ships at the Circular Quay come right up to the wharf; it is only a question of dredging? No; because it is curved.

Capt.
B. Jenkins.
16 Nov., 1888.

Capt.
B. Jenkins,
16 Nov., 1888.

685. Do you think if that jetty were constructed in that position there would be room to run out other jetties subsequently, and work ships at them? I do not think there would be much room for other jetties.
686. And by constructing that 700 feet of a jetty, you think you are only giving additional berthing accommodation for two more ships? Yes; that is what I think.
687. *Mr. Copeland.*] Do you think there would be only room to berth one ship on each side of that jetty, 700 feet long? Two on each side only.
688. That would be four vessels? Yes.
689. Supposing that long jetty were constructed would it not make it much more inconvenient to berth large vessels at other parts of the wharf? There would be less room certainly.
690. There would not be the same room to swing? No; it would be more difficult to swing large ships with that wharf out that way.
691. Supposing nature had divided that bay into two bays, would you not consider it less serviceable than it is now;—supposing a reef of rocks ran along where it is proposed to put that jetty would you not think it a misfortune? Yes.
692. Would you not have gone to the trouble to blast out that reef of rocks so as to clear the harbour of all impediments to navigation? Certainly; there would not be much room for anything but merely to haul vessels in and out. They could not do then as they do now, sailing in and out from that wharf.
693. Supposing larger vessels were to go there than go now, vessels as large as those that now go to the Circular Quay, would it not be a great inconvenience to have that jetty protruding 700 feet into the bay? Yes; it would. I do not think that you could put large vessels such as you have at the Circular Quay at either of those corners.
694. That is if you built that long jetty? Yes; they would have to be smaller vessels.
695. On the whole, you consider that that jetty protruding 700 feet into the bay would be a serious obstacle to the navigation of the bay? Yes, it would, of course.
696. Supposing you were holding a responsible position in the Government service, would you, from your nautical experience, recommend a jetty like that to be built;—supposing we were asking your advice from a professional point of view, would you recommend it to be built? I would not object to giving my opinion for building a jetty like that so that timber ships could be discharged.
697. You think, in point of fact, it would be an improvement, do you? More ships would be able to discharge there.
698. Would that counteract any disadvantage owing to the impediment to navigation? Well, a vessel that now sails in and out would not be able to do it then; it would have to be towed or hauled in. It could not sail in with impunity as it can now.
699. Do you know any other traffic besides the timber traffic that that proposed jetty would be serviceable for? It might for ironwork such as boilers or water or drain pipes, or anything of that sort. It would be a handy place to discharge them.
700. Would that jetty have any advantages over an ordinary wharf alongside the shore on account of its reaching out into the middle of the bay? You would have deep water; that would be the only advantage.
701. These wharves at the shore would, of course, be dredged? Yes; still you have to go out a certain distance.
702. There is no special kind of traffic a jetty like that would be required for other than timber? I do not think so.
703. I suppose these timber vessels generally discharge through bow or stern ports, do they not? Yes; the 'tween decks is generally put through the bow ports, and the other very often through the stern port, or sometimes both holes are through the bow port.
704. Would there be any convenience for discharging timber through the bow port at that wharf, supposing that jetty were not constructed? You could haul the vessel's bow on to the wharf. At the outer wharf there you would not be able to discharge through a bow port; you would want a lighter.
705. Unless you launched the timber overboard? Into a lighter or launched it overboard. It is much easier to moor a ship alongside a jetty like that than to moor her bow on.
706. *Mr. Humphery.*] How many vessels will Cowper Wharf accommodate at the present time? I think about five, with the short jetty.
707. If Captain Jackson says the new jetty will give additional berths for six vessels, is he correct or not? That is according to the size of the vessels.
708. Vessels of 1,500 tons? That would be 300 feet long.
709. Captain Jackson says the length of the jetty would accommodate six vessels of 1,500 tons each; is that correct? I do not think that jetty would support more than two vessels on each side.
710. *Mr. Watson.*] You have been a long time connected with the port of Sydney? Yes; since 1854.
711. You have a great deal of knowledge of the wharfage accommodation of the port? Yes.
712. From your experience and what you know, do you think additional wharf accommodation is necessary? I think additional wharfage is required for timber. It is very awkward for timber vessels.
713. Cowper Wharf is almost the only place at which you can discharge timber? Yes. If you take it to the Circular Quay the long lengths have to go through the city, and they block the Quay. I have always thought that it ought to be left for timber discharging.
714. Exclusively for a timber wharf? Yes.
715. Do you think London ships would go there to discharge, as well as to the Circular Quay, or around to the Blackwall? They could do so.
716. Would it be to their advantage? I should prefer any of the wharves up here to going down there.
717. Are there any wharves at Darling Harbour where you can discharge timber as at Cowper Wharf? No.
718. Where do Goodlet and Smith discharge? They have their own works at Pymont; I mean public wharves.
719. Suppose Woolloomooloo Bay belonged to you, and you thought it desirable to give further facilities; would you run out that jetty, or make it the same style as the Circular Quay? I think I should be inclined to put out short jetties.
720. Notwithstanding what you said just now about interfering with the navigation of the bay? Yes.
721. *Mr. Street.*] Do you think the necessities of the port are so great as to justify the expenditure of £27,000 upon that jetty at the present time? I said just now that I would not like to say such a thing; but really I do not think so.

722. *Mr. Garrard.*] How many timber vessels have you known to be unloading in Woolloomooloo Bay at the one time? I do not think I have ever seen more than two there.
723. The present Cowper Wharf would satisfy the requirements in that respect? Yes.
724. In the event of its being decided to run out this jetty, do you think it would be desirable to give it a more easterly inclination than it has now? I think it should run straight out in the bay.
725. More towards our prevailing north-east winds? Yes, straight out.
726. It would be very easy for vessels to go in there? It is awkward there now for vessels.
727. It only means drawing out in the bay a little further to turn? These big ships require some manœuvring, and must have room.
728. You think that if it is decided to carry out that wharf, it should be at least 140 feet wide? Yes; if you are going to make it 700 feet long, you must have it wider, on account of the two vessels working on each side; you would want room for the goods to go up and down.
729. Do you think it would be an advantage to have a sunk roadway in the centre? You would have to have room for drays to pass up and down freely.
730. That would only necessitate the wharf being wider on the two berths nearer the shore? You might taper it off that way if you thought fit.
731. If all Woolloomooloo Bay were yours, do you think the circumstances of the port would justify you in improving it to the best known extent? I do not think I should like to lay out that money.
732. You think there is sufficient wharfage accommodation to make it a very risky thing, if this were a private matter, to go to this expense? Yes.
733. *Mr. Sydney Smith.*] You are aware of the width of the wharf? 100 feet.
734. Do you think that two vessels lying on each side of the proposed jetty could discharge cargo without interfering with each other? It would do very well if it were half the length of what it is now.
735. As proposed, do you think they could discharge without inconvenience? They would inconvenience each other; there would be so many drays required on it at once. I think they would interfere with each other tremendously; there would be a regular block.
736. You would recommend that if the jetty were carried out it should be wider? 40 feet wider.
737. *Vice-Chairman.*] I think there has been some misunderstanding. You said that the increased accommodation would afford facilities for two more ships; you mean two more than the present facilities. Suppose the present wharf would accommodate five ships, then with the new wharf and the jetty there would be seven. I understood you to mean that though the jetty would give accommodation for many more vessels, it would take away some of the existing accommodation; and you think that altogether there would be only additional accommodation for two more vessels? That is what I think.
738. Between this long jetty and the short jetty a vessel could not be put at all? No; you see the width of the two ships would be there, and it would be all taken away.
739. And the base of the jetty would take away some of the present accommodation? Yes.
740. *Mr. Garrard.*] Are you aware that the base of this wharf that you say would deprive you of two berths is only about 108 feet wide? It would be more than that.
741. What berth that is now useful would you do away with? At the east and west of the long wharf.
742. That would be about 300 feet? Yes.
743. You would only lose one berth and gain four? You would lose two berths. I consider you would lose two berths and gain four.

Mr. James M'Mahon sworn and examined:—

744. *Vice-Chairman.*] You are a carrier? Yes.
745. What is the name of your firm? M'Mahon & Company, carriers.
746. You have seen the plan of this proposed new wharfage accommodation at Woolloomooloo Bay; a jetty is to be run out into the bay, towards Robinson's baths, 700 feet long and 100 feet wide;—do you, yourself, know anything as to the advisability or necessity of the erection of a wharf of this kind at a cost of £27,000? It would give more accommodation.
747. But is there, in your opinion, any necessity for that accommodation;—is there such a deficiency of wharfage accommodation in the harbour of Port Jackson at the present time as to necessitate an expenditure of £27,000 for additional accommodation? I could not say at the present time. There are times when the wharves are pretty well blocked up, and you cannot get sufficient accommodation.
748. Have you ever known an instance, since you have been a carrier, of such a thing happening, that ships could not get berths, because all the wharves were occupied; was it not rather because they could not get a choice of berths? No; I have known of no instance where ships could not get berthed at some place, with the exception of choice of wharves. There is a certain class of wharves where they cannot discharge certain goods. Locomotives, and very heavy boilers cannot be discharged at some places very easily.
749. I suppose most of the ships have their own particular wharves, which they like to go to? Well, I suppose so. That is very much amongst themselves. You generally find certain ships at certain wharves.
750. What evidence do you propose to offer the Committee with reference to this wharf? I was simply asked to come here to-day to say that it is quite as accessible as any other wharf in Sydney, with the exception of the Circular Quay, and I told two or three gentlemen who asked me, that in my opinion Woolloomooloo Bay Wharf was quite as accessible as any other wharf.
751. Has it any advantages over any other wharf? As it now is, it has advantages, from a carrier's point of view, because there is more scope to work in.
752. That is because it is not fully occupied, I suppose? Of course, I cannot speak nautically. A ship lying broadside gives you the whole 250 or 300 feet, whatever her length may be, for access; but if two vessels are discharging at a jetty 38 or 40 feet wide you cannot have the same access as if a ship was lying broadside.
753. The width of the jetty, 100 feet, would be far different from 38 or 40;—do you think 100 feet ample? I should think that to give sufficient accommodation it would require 120 feet.
754. *Mr. Garrard.*] Is it not a fact that what are called the back wharves are very difficult to get away from, owing to the steepness of the inclines? Some of them are; some are worse than others.
755. It is difficult to get from the majority of the back wharves to the central parts of the city? Well, all the wharves are pretty steep.

- Mr. J. M. Mahon, 16 Nov., 1888.
756. Circular Quay and Woolloomooloo Bay are an exception to the general rule? Circular Quay is, of course, an exception. You have level carriage from that to any part of the city.
757. Is not Woolloomooloo Bay much of the same character? No; it is nothing like the Circular Quay.
758. But better than the back wharves? Better than some of the back wharves.
759. Can you mention any wharf that is as easy to get away from as Woolloomooloo Bay? I could not say as the accommodation is at present.
760. You do not know of any private wharf in the city where the getting away is as easy as the getting away from Woolloomooloo Bay? That would depend upon circumstances. If there were only one or two vessels at a certain wharf the accommodation would be as good as that at Woolloomooloo Bay. For instance, take Sussex-street: The Grafton Wharf has not as steep an access as other wharves, but the narrow space coming away from there prevents carriers from getting access and egress as readily as they would to other places.
761. You spoke just now about there being a dearth of accommodation for the unloading of heavy weights;—where are these heavy weights usually unloaded? At the Circular Quay principally.
762. Do you think it desirable that the Circular Quay or Woolloomooloo Bay should have proper appliances erected for the unloading of these heavy weights? There are no appliances.
763. Do you think it desirable that there should be? I do.
764. Great loss of time and blockage of the traffic occurs at the present time owing to the means employed? Yes.
765. Have you been in Melbourne? No.
766. Do you know that there is a large crane for lifting these weights on the banks of the Yarra? No.
767. You think it would be desirable to have some means of lifting these heavy weights from vessels? I do.
768. At present there is no such appliance? There is no appliance, except what we term screw-jacking, or manual labour.
769. *Mr. Sydney Smith.*] Have you ever noticed a large quantity of metal or stone on the wharves at Woolloomooloo Bay? Yes.
770. And timber? And timber.
771. Has not that interfered greatly with other people having the use of the wharf? It did not affect us very much, because there are never more than two large ships, London ships, there at a time. The metal is discharged pretty well at the eastern side, and the timber at the western side, leaving the two middle berths for any English ships that may be discharging there. There are four or five outlets from Woolloomooloo Bay.
772. Supposing the metal and timber were taken away as quickly as it ought to be, do you think there would be a want of wharf accommodation in Woolloomooloo Bay at the present time? Not according to the amount of ships that comes there now.
773. You are aware of the proposed extent of the jetty, and of its width. It is proposed to unload vessels at each side. The length is 700 feet. Do you think that there would be any inconvenience felt if the jetty were 100 feet wide, with drays travelling along the jetty, and ships unloading on each side;—do you think there would be any inconvenience with cargo being discharged on both sides? Not if the jetty were the proper width.
774. What width would you propose, having regard to the length of the jetty, 700 feet, and the fact that vessels will be unloaded on each side, and that the cargo will be stacked on each side, and that drays will have to come backwards and forwards? Under the present system the cargoes would not be stacked much at the side, because they would be taken away as fast as they came out. When two vessels are discharging at the present jetties at the back wharves, which are only 38 or 40 feet wide, one each side, we have to work our passage up and down that 38 or 40 feet the jetty gives us, so you have an idea what room 120 feet would give you.
775. You reckon the width ought to be 120 feet? To give ample accommodation I think it should.
776. I understand from your experience of Woolloomooloo Bay, and you have had a good deal of experience there, that no inconvenience has been felt there from want of wharf accommodation? Not at the present time that I know of, because there are no more than two large English vessels in at a time.
777. In view of the present accommodation, and if the property were your own, would you feel justified in expending £27,000 in additional wharf accommodation? Well, taking it from a speculative point of view, it would be according to the interest I had in the ships. If I had influence with the shipping agents at home or here I certainly would have it done.
778. In an ordinary business way;—I mean without any influence at all? I daresay it would take seven vessels in the year to pay the interest on that.
779. *Mr. O'Connor.*] How long have you been a carrier? Thirty-four years.
780. In your experience you have found out, I suppose, that the trade is increasing proportionately every year? Yes.
781. You think the trade is greater now than it was last year? The wool trade alone up to to-day has increased 25 per cent.
782. In your opinion it is natural to suppose that it will go on increasing, so that the question after all is not to know what is required at the present day, but what will be prospectively required in the next two or three years? If it keeps increasing as it has during the last ten years I feel confident that you will want the whole of Woolloomooloo Bay.
783. *Mr. Suttor.*] I suppose you employ a large number of men and horses? I have about 207 horses and 106 men.
784. You do a great deal of carting from the wharves? Yes.
785. Have you carried much from Woolloomooloo Bay? I have carried a large portion of the cargoes discharged there. I had the carriage of the water pipes that were landed at Woolloomooloo Bay.
786. How long ago? About two years ago.
787. Have you carried much from there since? Yes; a few ships have been in there since.
788. How often are you employed on the average in carrying from Woolloomooloo? Every day.
789. What kind of stuff do you carry? General merchandise.
790. Much timber? Yes; a good deal of timber.
791. Have you ever carried timber from the Circular Quay? Not for many years; it is not unloaded there now.

- now. In years gone by it was the depot for timber, as Woolloomooloo Bay is at the present time. Opposite Mort's, and around the eastern side before the wharves were made, was all for timber.
792. It is proposed to make two new wharves for large vessels at the west side of the Circular Quay;—supposing timber were unloaded there would there be any difficulty in getting it away? Yes; there would be a difficulty from the length of it and the great traffic there is up George and Pitt streets—the only good outlets you have from the Circular Quay.
793. Is there difficulty in getting it from Woolloomooloo Bay? You have not the same traffic from the eastern or the southern portion of the City as you have along Pitt and George streets.
794. You think it would be convenient to carry timber from Woolloomooloo Bay? More convenient than from the Circular Quay.
795. Would that be a relief to the streets to any extent? I suppose so.
796. There is not much traffic in the streets about Woolloomooloo Bay, I suppose? Not so much traffic as there is down here.
797. To what part of the city is timber generally carried? Wherever it may be ordered;—to the buildings, back wharves, and one place or another.
798. Is it carried direct to the buildings being constructed, or is it taken to the timber-yards first? Some to the buildings, and some to the timber-yards.
799. I suppose the haulage is pretty easy from Woolloomooloo Bay? It is easy from Woolloomooloo Bay.
800. What would be the difference of haulage, as far as a horse is concerned, from Woolloomooloo Bay, and from some of the wharves at Darling Harbour, steep wharves? The difference would be from 7 cwt. to half a ton for a good horse.
801. That is half a ton from Woolloomooloo Bay? I could take 30 cwt. from Woolloomooloo Bay; a ton would be quite sufficient from the other wharves, taking it from the drayman's stand-point, if he had a good horse and wanted to work him properly.
802. *Mr. O'Connor.*] It would be a very good horse that would take a ton or half a ton from some of them? We are supposed to take that.
803. What is the name of that wharf in Lower Fort-street, near Cumberland-street, where the 'bus-stand is? Lamb and Parbury's.
804. What would two horses pull from there? That would depend upon the class of horse.
805. The best horses you have? Two tons.
806. *Mr. Suttor.*] Do the carters make any difference per ton for carrying from the different wharves, or is there a regular rate? One regular rate. We have to take the good with the bad, that is, the majority of us.

Mr.
J. M'Mahon.
16 Nov., 1888.

Mr. William Henry Shortland sworn and examined:—

807. *Vice-Chairman.*] Are you a member of the firm of Shortland and Sons, carriers? Yes.
808. Your business has been established for a long time? For a very long time, about forty years, during which I have been connected with it for about twenty-one. For four years I served in Mr. Powell, the Collector of Customs' office, when I left school.
809. Do you know of the proposal to run a jetty out into Woolloomooloo Bay from Cowper Wharf? I do.
810. Do you see any necessity for that at the present time? Yes. I should say that, next to the Circular Quay, this is the best wharf we have in Sydney, and a most desirable wharf in which to put improvements. It stands to reason that a good wharf like that has a superiority over what we call the back wharves, because it is so easy to come off that wharf. There is no necessity for carriers to keep trace-horses; and be put to the large expense they are now under in working the back wharves.
811. In the interests of the carriers who have to take the goods from the ships, you think it would be desirable to construct a wharf of the kind proposed for £27,000? I do; because there is likely to be an increase of business. It would be a saving to carriers, and a relief to the traffic of those crowded back wharves.
812. Would it cost the public less for the carriage of the goods;—we were just told by Mr. M'Mahon that you took one good thing with a bad? That is so. We have a regular rate, as a rule; still there are such places as bonded stores, where the question of carriage concerns them greatly. If a ship is unloaded at the Circular Quay they can afford to store goods in those bonds at a less rate than the owner of a bond at one of the back wharves, or far away; so he, as a general rule, has a differential rate with his carrier. The Circular Quay is, of course, always the cheapest rate.
813. To the public? Certainly to the public.
814. *Mr. O'Connor.*] You said that in the interests of the carriers you thought it would be well for the Government to expend £27,000 on these wharfage improvements. Did you mean that it would be expended at their interest, or did you mean this: That if you have to keep extra horses the charge to the public is higher? Yes; it is to a certain extent.
815. Then in reality it is not, after all, in the interests of the carriers but in the interests of the public? Certainly.

Mr. W. H.
Shortland.
16 Nov., 1888.

Captain John Vine Hall sworn and examined:—

816. *Vice-Chairman.*] You have been a captain of merchant vessels trading to this port? Yes.
817. For how long? I was not trading here very long. I have been living here, practising as a surveyor, for the last five years. I have made voyages to this port.
818. Are you commanding vessels now? No; I am practising as a marine surveyor here now.
819. You have seen the plan of the proposed wharfage accommodation at Woolloomooloo Bay;—it is proposed to run out a jetty 700 feet in length and 100 feet wide there? I see it now; I have not seen it before.
820. Do you know Woolloomooloo Bay and Cowper Wharf? Yes; I know them well.
821. What is your opinion, having regard to the existing wharfage accommodation in Port Jackson, as to the necessity for this work, which we are told will cost £27,000? I do not think that there is an absolute necessity for it. At the present moment, and (say) for the last six months, there has been no pressure on wharfage

Capt.
J. V. Hall.
16 Nov., 1888.

Capt. J. V.
Hall.
16 Nov., 1888.

wharfage accommodation at all; but I have known a time during the five years that I have been living here when Woolloomooloo Bay has been blocked up with London ships. That is several years ago.

821½. Was not that when they were bringing iron pipes for the Government? The ships I am speaking of were not discharging iron pipes; they were discharging general cargo; but that, of course, was an exception. Speaking of the present moment, and of the last six months or more, there certainly is no absolute necessity for the extension of the wharfage accommodation of Woolloomooloo Bay.

822. You know it is proposed to utilize the western side of the Circular Quay; there is to be a new wharf there? That is to be a mail-steamers' wharf.

823. No; that is to be on the eastern side. On the western side, where the Manly boats go, and the P. & O. boats are now. It will be relieved by these boats being located on the eastern side. Having regard to that fact do you think there is likely to be any necessity for this public work for some years? I could not honestly say I think there is now, or that there is likely to be in the immediate future a pressing necessity for this work.

824. Do you think, however, if there was any necessity for work of that kind, that Woolloomooloo Bay is a good place to find additional wharfage accommodation? Undoubtedly.

825. What do you think of the practice of running out jetties such as that proposed? I think it is a capital principle, but I would not run a wharf out blindfold into the middle of the bay like that. I should take one shore or the other, and measure my distance very carefully. For instance, looking at it very roughly, without measuring it, I should say that that jetty should either go considerably to the eastward or considerably to the westward. I would bring it so far to the eastward that there would be a space left of about 180 to 200 feet, and then there would be room to make a jetty facing the shore on the eastern side. I would leave room for another jetty on the western side by and by, because if it is necessary now, or within the next few years, to build this jetty, quite possibly in a few years more a second jetty will be wanted.

826. You think it is a bad thing to locate it right in the centre? Undoubtedly. You are spoiling your own space; you are not making the best of your room. It ought to be very carefully measured up, because you would probably have big steamers alongside this jetty, and if you had another jetty there must be room for another big steamer alongside it, with a collier alongside each. Two or three feet short in the width would make all the difference in the world when you have big steamers to deal with.

827. *Mr. Humphery.*] Do you think it is possible that these proposed wharfage improvements will be required within the next four or five years; that the increasing traffic of the port will render it desirable that they should be carried out? Well, it is a very difficult question to answer, unless one has studied the statistics of the port, which I cannot say I have done. It is very easy to give a haphazard answer, but I should not like to answer without having the statistics of the port before me. I spoke of Woolloomooloo Bay just now being so crowded with London ships. I quite remember that time, and all the wharves were pretty full then. There must have been some special increase of traffic for the time being. So far as I see, without having any special knowledge in the matter, speaking merely from my own observation, there is no pressing necessity for that wharf.

828. Do you think that the additional wharfage accommodation proposed would be constantly occupied? Well, judging from what they are doing at the Circular Quay, I should say yes; but I do not know whether, if I were a private wharf-owner, I should care for that competition on the part of the Government.

829. Do you think it would be remunerative work? Undoubtedly. I say again that I am only speaking haphazard, because I do not know what the exact percentage would be; but I should say that the probability is if you built that wharf that you would have it constantly full of shipping. You would have all the large outside steamers coming in there regularly, and probably have that wharf almost constantly full.

830. *Vice-Chairman.*] At the expense of others? Yes.

831. *Mr. Humphery.*] I suppose you think it would be unhealthy competition with private owners? Decidedly. If I were asked outside the question of Government competition with private enterprise—whether it would be a good thing to improve the Bay in that way I should say yes.

832. *Mr. Garrard.*] If it were your own property do you think there would be room to enter into competition with others? Certainly; if it were my own property I would put the wharf down in a minute.

833. This proposal of yours is, as I understand it, to run a jetty out parallel with the shore? Before I would make up my mind where the jetty should go I would measure up the space in the Bay carefully, having it in my mind that I might want to run two other jetties out at a subsequent time parallel to this one. I should so build the first one as to give myself as much room as possible for the other.

834. What is the width of large vessels of 2,000 tons? 48 feet—that is the outside.

835. It is not an unusual thing for a vessel lying alongside the wharf to have a collier alongside? You must have a collier; it is almost necessary in every case, whether the vessel is a steamer or a sailing-ship.

836. So there would have to be room for two colliers, one for each vessel? Yes; you would want nearly 200 feet space.

837. Between the two wharves, to allow an additional vessel berthing each side? Exactly.

838. If there is not sufficient width across Woolloomooloo Bay to give you that, one jetty will be sufficient? Quite so. Even then it would be just as well to place your jetty in such a way that when you ran the other jetty along the line of the shore you should not waste any room—to give as much room on the other side as possible.

Robert Hickson, Esq., M.I.C.E., Acting Engineer-in-Chief for Harbours and Rivers, sworn and further examined:—

R. Hickson,
Esq.,
M.I.C.E.
16 Nov., 1888.

839. *Vice-Chairman.*] Do you produce a return prepared by yourself in reference to the increased cost of the proposed jetty in Woolloomooloo Bay if the width is increased? Yes; it is as follows:—

ABSTRACT of Estimate for Wharfage Improvements, Woolloomooloo Bay.

Description of work.	Quantities.	Rates.	Amount.	Total.
	Sqrs.	£ s. d.	£ s. d.	£ s. d.
Large jetty, 700' x 100', with wings	730	38 0 0	27,740 0 0	
Widening Cowper Wharf	39	45 0 0	1,755 0 0	
Northern extension of Admiralty Wharf.....	218	37 0 0	8,066 0 0	
Filling and forming roadway	4,439 0 0	£42,000 0 0
Cost, with jetty 130 feet wide.				
Large jetty, 700' x 130'	940	38 0 0	35,720 0 0	
Widening Cowper Wharf.....	39	45 0 0	1,755 0 0	
Admiralty Wharf.....	218	37 0 0	8,066 0 0	
Forming roads	4,439 0 0	£49,980 0 0
Cost, with jetty 150 feet wide.				
Large jetty, 700' x 150'	1,080	38 0 0	41,040 0 0	
Widening Cowper Wharf	39	45 0 0	1,755 0 0	
Admiralty Wharf.....	218	37 0 0	8,066 0 0	
Forming roads	4,439 0 0	£55,300 0 0

840. That is your estimate of the increased cost? Yes.

841. And you hand it in as such from the Department? Yes.

FRIDAY, 23 NOVEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

JOSEPH PALMER ABBOTT, Esq.

HENRY COPELAND, Esq.

JACOB GARRARD, Esq.

ALEXANDER KETHEL, Esq.

SYDNEY SMITH, Esq.

THOMAS MICHAEL SLATTERY, Esq.

JOHN RENDELL STREET, Esq.

DANIEL O'CONNOR, Esq.

The Committee further considered the proposed improvements and additions to the wharfage accommodation, Woolloomooloo Bay.

Captain William Robertson sworn and examined:—

842. *Chairman.*] You are engaged in mercantile pursuits in Sydney? I have been engaged as stevedore at the Circular Quay for fourteen or fifteen years. Captain W. Robertson.

843. You have become acquainted with the trade carried on at the different wharves? Yes.

844. And before you settled down here? I was trading to the port for about twenty years before I settled down. It is twenty-two years since I first came to Sydney. 23 Nov., 1888.

845. And had opportunities of knowing the accommodation provided at the various wharves? Yes.

846. Where is your present place of business? We have two places—one on each side of the Circular Quay.

847. You carry on the wool trade? Wool dumping.

848. You are acquainted with Cowper Wharf at Woolloomooloo Bay? Yes.

849. You have had an opportunity of observing it since the wharf was first built, I take it? Yes.

850. Is there a large trade at that wharf? There is a good trade now, but with greater facilities I am sure the trade would be greater.

851. What is the nature of the trade carried on there mainly—timber, or general merchandise? General merchandise. There are sailing ships and steamers come there with timber and all sorts of cargo.

852. There is no wool sent from there? Not yet.

853. There are no appliances? No. I have no doubt eventually there will be.

854. Is it used specially for any particular branch of trade? I do not think so. It is available for all vessels.

855. Is it a fact that they have gone there in considerable numbers, from time to time, and been glad to avail themselves of the facilities it afforded? I think that ships, as a rule, if it were left in the hands of the captain, would go to Woolloomooloo or the Circular Quay in preference to any other wharf in Sydney.

856. One reason, I take it, is that the haulage is easier? Much easier.

857. You can get to and from it with greater facility? I think the dray proprietors prefer drawing goods from the Circular Quay or Woolloomooloo to any other wharves.

858. And that is a matter of considerable moment in working a wharf? Yes; it facilitates the discharge of the ship. The sooner the drays can get the cargo away the sooner the ship can get her cargo out.

859. Do you know anything of the depth of the water at Cowper Wharf? No.

860. Are you aware of the nature of the proposed improvements? I have only seen a rough outline of the wharf. I think it would be a very good improvement if carried out.

861. Do you know the length of the proposed jetty? No.

862. Are you aware of the width? I heard it was proposed to make it 150 feet.

863. It is only 100 feet? I think that is too narrow. 864.

Captain W.
Robertson.
23 Nov., 1888.

864. You think if the jetty were constructed it would be desirable to have means of access for drays down the centre? I think it would facilitate the discharging of the ships' cargo very materially.
865. And generally, from your knowledge of the trade of the harbour, you think it is desirable to have these improvements made? There is no doubt of it.
866. Of course you are aware that it is Government property now? Yes.
867. Do you think if it were private property it would be improved to the extent proposed in this project? I do not know that private enterprise would spend so much money.
868. Is it not the case that very extensive wharfage accommodation has been provided in various parts of the port by private enterprise? No doubt of that; but I think the facilities are better at the Circular Quay and Woolloomooloo Bay than any of them.
869. As it is now with the improvements? Yes.
870. Is it your opinion that as it is now it is sufficient to meet the requirements of the place? No; not by a long way. We got a berth yesterday for a ship that had been waiting fourteen days for one, and another I know that cannot get a berth for a week. They must come to the Circular Quay, because the wool is shipped there.
871. *Mr. Abbott.*] They are waiting for a particular berth? For any berth at the Circular Quay.
872. *Mr. Copeland.*] Can you suggest any better means of giving wharfage accommodation than this particular jetty that it is proposed to extend into the harbour? No; I think that jetty would be the greatest improvement that could be made, because it would make all the space available for other traffic and still accommodate the large ships alongside the jetty.
873. Do you not think it would make it very awkward for berthing other vessels on account of the narrow space between the foreshore and the jetty;—suppose there were a vessel at each side, and a collier alongside each? I do not think so, because it is almost like a dock. They move ships in the London docks in much less space than they would have here. In the London docks the ships go through places where there is barely breadth for them to pass.
874. Yes, but when they get into the dock there is generally a greater space than there would be here for them to swing? No; sometimes I have been pinching ships with handspikes to get them through a narrow passage. Neither wind nor sea could reach the ship there; you could move her anywhere almost to a hair's breadth.
875. You think that this jetty 700 feet long would be a real improvement to the facilities for shipping? There is no doubt about it.
876. *Mr. Kethel.*] I understood you to say that there were several ships waiting to get a berth anywhere at the Circular Quay just now? There were two; one I got a berth yesterday; the other I cannot get a berth for a week.
877. Are there no berths anywhere else in the harbour? That would not suit us.
878. What are the special reasons in favour of the Circular Quay in your case;—why would not another berth do? Because it would cost so much more money to get towed there.
879. Is it not because your wool dumping machinery and warehouses are alongside the Quay? No doubt about it.
880. Another reason I suppose is, that the ships berth alongside fore and aft the wharf, and they being broadside offer greater facilities for unloading? Yes.
881. That being the case that would not apply to the proposed jetty at Woolloomooloo? I cannot see any difference, if there is sufficient breadth on each side of where the drays go down to land the goods.
882. Are you aware that the objection that many carriers have to the jetty system of the private wharves is that the jetty becomes lumbered with cargo, and there is great confusion in loading the goods? I think the fault arises from the jetties being too narrow. A jetty 50 feet wide, with two ships discharging, would be blocked up in an hour.
883. That jetty is proposed to be 100 feet wide? It ought to be half a hundred feet wider.
884. How long have you been connected with shipping matters in Sydney? A little over fourteen years as a stevedore.
885. Did you take any part in the discussion that took place some years ago among commercial and nautical circles when it was proposed to run a jetty like this out from the middle of Sydney Cove? No; but the idea struck me the first morning that I landed in Sydney that it would be a grand idea. Since then my opinion has altered, because it would be a pity to block the traffic.
886. Are you aware that the opinion of all the nautical men in the port was against the proposal? No; as I say, it struck me it would be a good idea, but since then I have altered my idea.
887. *Mr. Garrard.*] One or more jetties? One jetty.
888. What made you alter your opinion? I think it would block the traffic; there are so many harbour steamers running.
889. Is there likely to be a large amount of harbour passenger traffic at Woolloomooloo Bay? I think the passenger traffic might be carried from Woolloomooloo Bay very successfully, because most of the travelling public come from Paddington, Waverley, and those places, and it could go to Woolloomooloo Bay as well as to the Circular Quay.
890. Do you not think the Circular Quay will always have the preference for harbour traffic? I daresay now the tram comes that way it will induce the traffic that way.
891. And there is less likelihood of Woolloomooloo Bay being availed of for passenger traffic? I could not say what will take place ten years hence.
892. *Mr. Kethel.*] If the proposed jetty and other improvements were made at Woolloomooloo Bay, would you be prepared to berth your ships there, and take your wool to them when you could not get a berth at the Circular Quay, in preference to any other part of the harbour? We would take it anywhere.
893. Supposing that the Government expended this money, do you think it likely that you and the gentlemen connected with you in the exportation of wool would put up machinery there and deliver wool at the wharf, or take your wool round there in any way in preference to any other part of the harbour? My idea is that it will come to that. We will have to put machinery up there before many years; but we can take it down now to Bradley's Head, and we could take it round to Woolloomooloo Bay.
894. Do you use your machinery in Windmill-street? We had machinery there, but we left that place many years ago.
895. Is the operation of wool dumping proceeded with there still? At the Central Wharf it is. We had plant at Dalton's Wharf, but when he bought that wharf we had to leave.

896. Have you had ships to load or unload at Woolloomooloo Wharf? I have unloaded several ships at Woolloomooloo. Captain W. Robertson.
897. What class of goods? General cargo from London. The San Francisco mail steamers too; we took a portion of the Zealandia's cargo in at Woolloomooloo Wharf. 23 Nov., 1888.
898. What is the reason you took her away from her usual berth? Those were all taken up.
899. Is it not a fact that they had a contract with the A. S. N. Co. to occupy that long jetty? I am not aware of it, but all the jetties there are occupied at the present time.
900. *Mr. Street.*] Do you consider that the scarcity of wharfage accommodation in Sydney harbour at the present time justifies so large an expenditure as the erection of this jetty would involve? I think so. I think any improvement the Government carry out in wharfage accommodation for vessels would repay them better than any works the Government have.
901. You think there is a scarcity of wharfage accommodation? In the height of the wool season there is always a scarcity. I have known ships three deep at the Circular Quay.
902. Do you think if this jetty were constructed there the wool would be lightered round or carted round? I have no doubt of it. Any vessel that cannot get wharfage accommodation moors out at Neutral Bay, and I have lightered over there. It does not matter where we take it to.
903. I suppose it is the busiest season of the year just now? Yes, from November till February.
904. How many ships have you had a difficulty in berthing during this season? There is a difficulty in berthing. There is not sufficient accommodation at the Circular Quay for the number of ships. The wool is increasing year by year, and a greater number of ships are employed.
905. Suppose this jetty were erected at Woolloomooloo Bay, that would not help the wool traffic? Ships could discharge there, and come round to the Quay to load. There is not accommodation for both inward and outward ships.
906. Do you know that more accommodation is being provided at the Circular Quay on the west side;—suppose you were told that two berths were to be provided on the west side for sea-going ships, instead of giving that part up to passenger steamers to Manly and other places? It would be a great help no doubt.
907. Do you not think that extra accommodation would be sufficient to provide for the shipping for some time to come? I do not think so. I do not think that two years hence it will be half enough.
908. Do you think the wool will increase so much as to require so much additional accommodation? I fancy the increase this year will be 100,000 bales.
909. What about next year after the drought? It may be less, but a good season will bring it up again.
910. Generally is there any great difficulty in getting berth accommodation? In the wool season.
911. The whole year round? In winter there is no difficulty, in summer there is.
912. You have only had difficulty with one ship this year? Two, within the last fortnight.
913. *Mr. Abbott.*] Do you think the Government can make their work as productive as private individuals can? I am pretty sure that any outlay on extra wharfage accommodation would pay the Government 25 per cent.
914. They are in just as good a position to make returns from that outlay as private individuals? Yes; I am sure of it.
915. You spoke about warehouses;—will you tell me the rent of warehouses about the Circular Quay? We pay for rent and the use of the plant at the Blackwall Stores £1,650 a year, independent of taxes.
916. You have recently leased from the Government some property that was the A. S. N. Co.'s, on the opposite side of the wharf,—what rent do you pay? We pay £100 for the six months we use it.
917. Have you as much accommodation in those stores as you have the other side? Nothing near it; this is only a very narrow shed.
918. Is it the big store, or the shed? Just a galvanized store, only about 28 feet wide and 264 feet long.
919. Have you any idea of the cost of construction? No; but it is only a galvanized shed; it cannot have been very expensive.
920. What is the comparative size of the stores,—those you lease for £1,600 and those you lease for £100? It would hold less than half the Blackwall Stores would hold; and then we have the use of the machinery there—six large wool-presses, engines, and wool-trucks. The Government gets about £4,000 a year wharfage for the wool that comes through that place.
921. They would get that anyway? Not if we left the Circular Quay.
922. Someone else would go there if you left it? ———
923. *Chairman.*] From your observation, do you think the commerce of this port is increasing? Yes, very rapidly.
924. Has it suffered any impediment or shock from the present protracted drought? It has hardly had time to be felt yet.
925. There is no large grain trade carried on at the Circular Quay? No; there never has been. Any grain I have had the handling of has generally come from Victoria. I have never handled any grain to be landed here.
926. Are there large quantities of grain from New Zealand? Not lately. Most of the grain I have had to do with has come from Victoria.
927. Do they not import oats and barley somewhat largely? Yes; but that does not come to the Circular Quay, as a rule.
928. *Mr. Watson.*] You are referring to what passes through your own hands? Yes. I have heard of some lots of New Zealand oats being landed here, but only now and again—not as a rule.

Captain John Jackson, Manager of Public Wharves, sworn and further examined:—

929. *Chairman.*] What is your appellation? Manager of Public Wharves.
930. That includes the whole of the Government wharves, I take it? Yes.
931. And necessarily, of course, the Woolloomooloo Bay Wharf—Cowper Wharf? Yes.
932. There has been a return prepared of the receipts for Cowper Wharf;—was that return prepared by your Department? Yes. Captain J. Jackson.
933. I see by that the receipts for some years have amounted to a considerable sum—upwards of £4,000? Yes; but I produce an amended return. [*Vide Appendix B.*] 23 Nov., 1888.
- 934.

- Captain J. Jackson. 934. Do you give this in as evidence? Yes.
935. Then the highest sum received in one year for wharfage rates, in 1886, amounted to £5,181 4s. 10d.?
Yes.
- 23 Nov., 1888. 936. Last year to £3,811? Yes.
937. This year, up to October 31, for ten months of the year only, it has amounted to £2,807 6s. 11d.? Yes.
938. Is the accommodation at Cowper Wharf usually largely availed of for purposes of commerce? Yes, very much. Of course there is a large number of coasting vessels; there is only one proper berth for large ships.
939. Is that generally occupied? Well, not at all times; there is a large steamer expected there to-morrow, and the Zealandia left the day before yesterday, so that there has only been two or three days between.
940. Would the accommodation for such large ships be considerably improved if the proposed jetty were constructed? I have not the slightest doubt about it.
941. It has been stated by some witnesses here that the jetty ought to be much wider than it is to admit of vehicular traffic, the traffic of drays down the centre? I quite agree with that.
942. You think it would be an improvement? As it is at present it is 700 x 100 feet; it is actually of very little use without a space for vehicular traffic in the centre.
943. You think it would be a matter of much greater convenience, and give greater facilities for the carrying on of the traffic of the wharf? Far greater.
944. What is about the width that would admit of that—130, or 150 feet? I should suggest 150.
945. Do you think that the extra width would interfere with the navigation of the bay in any way? I think not.
946. Not in any perceptible way? I think not.
947. As far as your observation of the trade of that part of the port is concerned, you think it is desirable that the improvements should be carried out? I do.
948. You have no hesitation in recommending it? No hesitation whatever.
949. *Mr. Humphery.*] What is the annual expenditure? £487.
950. Does that statement show the expenditure? No; there is only a salary that is expended.
951. Then the evidence you gave upon a former occasion as to the annual expenditure would be correct? Yes.
952. You still think that this jetty would give accommodation to six vessels? I do.
953. And have you altered your opinion as to the probable income for each berth? No; I have no reason to alter my opinion upon that.
954. You still think that there will be £1,000 a-year obtained for each berth in addition to the present income? I think so.
955. *Mr. Garrard.*] Do you think that there will be sufficient trade for this jetty in Woolloomooloo Bay, considering the increased wharfage accommodation you have at Darling Harbour on the Pyrmont side? I do not think that large ships will go to Darling Harbour. I think it will be more for railway traffic.
956. Do you not think that there will be a large amount of exports for foreign countries brought down by the railways? Yes, but not shipped from Darling Harbour wharves.
957. You think that the wharves at Pyrmont will be confined more to the intercolonial trade? I think so.

William Robeson Benson, Esq., Manager of the Wharf Association, sworn and examined:—

- W. R. Benson, Esq. 958. *Chairman.*] You are chairman of the Wharf Association? I am not the chairman; I am the manager.
- 23 Nov., 1888. 959. In connection with the duties of your office you have become aware, to a large extent, of the commerce of this port generally? Certainly.
960. And the extent to which that commerce is carried on at the various wharves of the port? Yes.
961. Amongst other wharves you are aware of the existence of Cowper Wharf, Woolloomooloo Bay? Yes.
962. Do you know anything about the proposed improvements there? No; I have not seen the plan of them.
963. There is a plan before you. You see from that plan that it is proposed to erect a new jetty? Yes.
964. Are you aware it is proposed that that jetty should be 700 feet long? Yes; so far as I have been informed, and having seen the plan.
965. And a width of 100 feet? Yes.
966. I suppose you have had practical knowledge of the working of the various wharves in the port? For the last seventeen or eighteen years.
967. Do you think that these dimensions are good ones for the construction of a jetty of the character proposed? My practical knowledge would tell me no, not at all.
968. What would be the nature of your principal objections to it? Am I called upon to give an opinion in regard to it?
969. You are simply asked for information;—we want to get information with reference to the propriety of carrying out certain improvements, and we heard that you were desirous and capable of giving us useful information? In the first place the jetty is too narrow. It is impossible to discharge at the same time two or three ships on each side of a jetty so narrow, unless you had trucks on the wharf to remove goods as soon as they came out of the ships. Then you might work it, but otherwise there would be great inconvenience.
970. What would you think would be a sufficient width—150, or 200 feet? 200 feet. The wider, of course, the better.
971. In that case do you think it would affect the traffic in that part of the harbour in any way? Any jetty extended 700 feet out into a narrow place like Woolloomooloo Bay, I think, could not but affect the traffic.
972. Is it your opinion that there is sufficient wharf accommodation in Sydney at the present time for the commerce of the port? It is far in excess of the requirements. To illustrate that, I may say that there are about fifty berths now open to navigation, excluding the China Navigation, E. & A., P. & O., Orient, and

W. R. Benson,
Esq.
23 Nov., 1888.

and Messageries steamers' wharves. Each wharf is capable of berthing a ship and a half, or 75 a month, which would be 900 a year. The average number of arrivals in the port is about 230, so that therefore shows that only one-fourth of the present accommodation is required for the shipping arriving in the port during the twelve months. Besides this, there are large wharves being constructed by the Government at Pymont, now almost completed, which, when completed, will berth at least three ships, and on the site of the old A. S. N. Company's property at Pymont there are wharves being constructed for six more ships. Then again there are the wharves leased by private individuals, who are under obligations by the terms of their leases to increase their accommodation, so that within the next twelve months you will have wharfage accommodation in this port for 1,200 ships, whereas the number of arrivals per annum is only 230.

973. Is it your opinion that the commerce of the port is increasing? It is increasing; but the wharfage accommodation is increasing in a greater ratio.

974. Is there any special demand in the trade for accommodation at certain wharves because of there being facilities of access to those wharves, or a better position? Not that I am aware of.

975. Supposing that the wharves which you speak of to the west of Darling Harbour, now being constructed, were completed, would they answer the purposes of wool-shipping with equal facility to those already in use? Well, the trade of the harbour is located on this side of the water, and it would take some great inducement to disturb it.

976. Is it the case that the access to the wharves being hilly or otherwise influences their trade to a large extent? The access to most of the wharves under my management is pretty fair. I have had no complaints in that direction.

977. Would carriers taking produce to the wharves and merchandise away charge any more per ton for removing it from Darling Harbour wharves than for removing it from the Circular Quay? Not that I am aware of.

978. I suppose that there are special rates of charges for the removal of goods? I think most of the carriers have one all-round rate to remove goods from any wharf. Many of them are under a contract on that plan.

979. You are a manager of the Wharf Association—is it a private company? It is an association of private wharf-owners.

980. Are there any recognised rates of wharfage at the different wharves throughout the port? The wharfage rates are fixed by Act of Parliament. At all the wharves under my management the Government rate, the schedule rate, is exacted.

981. There is a Government rate then? Yes.

982. Does that apply equally to Government wharves and private wharves? Exactly, as far as I know.

983. Then the competition between the Wharf Association and the Government wharves would be to get the most custom, the most ships at the various wharves? There is no rebate existing, as far as I know, between the Association of wharf-owners and the Government; so there is no competition in that respect.

984. There has been a rebate? There was a rebate up to the end of June last. I believe rebates were given on both sides.

985. I suppose that was found injurious to both interests? That was the reason of the formation of our Association—to work in unison with the Government to abolish the rebate system.

986. And has the intention under which the Association was formed been carried out and observed? Yes, strictly.

987. In all cases? Yes, as far as the Wharf Association is concerned.

988. And so far as the Government are concerned? So far as I am aware the Government have adhered to the letter of the law in that respect.

989. *Mr. Garrard.*] Does your estimate of the number of ships per annum include intercolonial ships? No; they are all provided for.

990. And did your statement exclude the intercolonial ships' wharves? Yes. The statement I made was irrespective of the intercolonial trade, which is provided for. They generally have one part of the harbour, with smaller wharves than those under my control.

991. Irrespective of the intercolonial trade, which has its own wharves? Irrespective of the intercolonial trade, the China Navigation Co., the E. & A., the P. & O., the Orient, and Messageries Companies' wharves, the average number of vessels arriving is 230, excepting timber ships, which are generally provided for by the timber merchants at their own yards.

992. What about sailing ships? I include sailing vessels carrying general cargo, and steamers except the lines I have mentioned.

993. I understand that you think that the improvements at Woolloomooloo Bay are not required? Certainly not.

994. Do you think that the improvements being carried out at Pymont, and by a private firm, at the old A.S.N. Company's site are not required? Well, outside the Pymont works and the Government works at Pymont, you have accommodation for 900 ships at the present moment, and 230 is the average number of arrivals; so that, therefore, we have accommodation about four times in excess of that required.

995. I suppose that the proprietors of the old A.S.N. Company's works would not have spent money there without having a reasonable chance of recouping themselves? They might have some motives in view, but private enterprise is sometimes astray as well as Government enterprise.

996. What motive could they have? Well, I did not divine their motives.

997. Do you think any proposition has been made to the Government to take it over? No; I am not aware of it.

998. *Mr. Street.*] How many wharves are included in the Association you represent? Twenty-nine berths.

999. Are they always occupied? No.

1000. How many ships could you berth in the year? About 500 over-sea vessels; being 270 in excess of the average number of arrivals.

1001. Do you know how many you have berthed this year already? No; I could not tell you.

1002. You could berth a very much larger number than you do? I think we could accommodate all the trade of the port, excepting of course, the mail lines of steamers, which I have mentioned before.

1003. That is all the ships with general cargoes arriving in this harbour from foreign ports? Yes.

1004. *Mr. Suttor.*] Is any season more busy than another? Yes; this is about the busiest time of the year.

1005. How many months does that extend through? About four months in the year.

1006.

- 34
W. R. Benson, Esq.
23 Nov., 1888.
1006. And how do you find the private wharves occupied at that time? Just now I have very few ships alongside.
1007. Could you give us any information in the shape of a return of the number of ships berthed at private wharves within the last two years? I could furnish you with such a return, and I should be happy to send it in to the Committee. [*Vide Appendix C.*]
1008. Stating the berthing accommodation and the actual berths occupied? Yes.
1009. *Mr. Copeland.*] I suppose that when these new wharves, which are being constructed at Pyrmont, are completed, they must reduce the necessity for building this increased accommodation at Woolloomooloo? Exactly so, because there will be more berths then, and fewer ships to occupy them in proportion.
1010. I suppose it is just possible that if increased accommodation had been given at Woolloomooloo Bay, it might have been the means of preventing these people from building new wharves on their own account? No; because they are already commenced, and many of them nearly completed.
1011. But if this increased accommodation had been gone on with previously by the Government that might have been the means of preventing these private persons from expending their capital? I cannot say.
1012. You said that the intercolonial vessels were already provided for;—do not a large number of intercolonial vessels discharge at Woolloomooloo? Not that I am aware of. There may be one occasionally, but the number is very small; in fact I do not know whether during the last two years there has been one there—they discharge principally ballast, coal, and timber. I think, in the last three years, there have been eight over-sea vessels there each year.
1013. Allowing for the increase in the intercolonial trade, do you think there is sufficient accommodation for these vessels for many years to come? Yes; I should imagine so.
1014. At the present time the wharves where the intercolonial vessels discharge are not fully occupied? No, I do not think so. I do not think the wharves in Sydney harbour are ever all occupied, or ever have been.
1015. I am directing your attention now principally to the intercolonial vessels;—you said that they are provided for? Yes; in this way: the intercolonial trade is now being principally done by steamers, and therefore the steamboat companies have their own wharves for the reception of the cargoes of their steamers.
1016. You think that there is plenty of accommodation at the present time—even in the busiest season? Yes; in fact I may say that the wharves are never full—not the whole of them.
1017. Not even in the busiest season of the year? No.
1018. Would it be requiring too much to ask for information as to what returns these private wharves are giving to their owners;—I suppose you could hardly be possessed of that information? If you take the capital value of the wharves, they have given a very small return; I should say about 3 per cent., irrespective of returns from Stores, Bonds, &c.
1019. That is 3 per cent. clear of the working expenses? Yes. I have never worked the question out in figures; I can only say approximately.
1020. Is it possible for you to furnish the Committee with that information accurately, with a view to guiding them to decide whether these improvements would be likely to be remunerative to the Government? I shall think over it, and if I can give you the information I will.
1021. *Mr. Humphery.*] Can you say if Cowper Wharf has much increased in favour of late years? I do not think it has, taking the number of vessels that have been berthed there during the last two or three years. Out of the eight ships berthed there each year during that time six or seven were laden with pipes consigned to the Government. The average number of ships going there would be eight per annum.
1022. Is it a fact that a preference is given to Cowper Wharf, next to the Circular Quay, over any of the other private wharves? Well, I should imagine that no ship-owner would go there in preference to some of the private wharves.
1023. *Mr. Copeland.*] You said just now that you did not think the business had increased very much at Cowper Wharf during the last few years? No.
1024. We have a return here showing that the revenue from Cowper Wharf in 1880 was only £514, the year before that it was only £314, whereas in 1886 it had increased to £5,181, and for ten months of the present year it has been £2,807, which would be at the rate of £3,100 per annum? Of course when the busy season is over, the revenue will fall off greatly.
1025. You see that the revenue has increased approximately about six times since 1880? The rates have probably increased there during the same period. Perhaps there are rents derived from stores and other buildings.
1026. This revenue is exclusively from berths? I am speaking of deep-sea vessels, not of intercolonial vessels.
1027. This includes all vessels? I was speaking only of deep-sea vessels.
1028. *Chairman.*] What number of vessels did you say had berthed there during the last three years? On an average eight, that is including, of course, the pipe-laden ships consigned to the Government.
1029. We have it here, in a published return, that the number of vessels altogether in 1886 was 521? Yes; but that is taking the small coasters and steam launches.
1030. There are 24 over-sea vessels, and 497 coasters? That includes timber ships. My figures do not include timber ships.
1031. Why do you omit timber-ships? I take no notice of them because I regard them as being specially provided for. As a rule they generally go to the yards of timber merchants who have water frontages.
1032. It is the case that timber-ships very frequently come to this wharf in preference to others? Possibly some years they went there, because whereas rent was charged on timber lying on a private wharf the timber was allowed to lie at Cowper Wharf without charge.
1033. *Mr. Copeland.*] Do you know whether the practice is amended now in that direction, whether they are compelled to clear the cargo away? There are so few ships go to private wharves, or to the Government wharves; they generally berth at the timber merchants; but I have not paid any attention to the matter.
1034. It is your opinion, from the position and site of the wharf, that it is deserving of being provided with fair accommodation for shipping and commerce? In the face of the fact that the wharfage accommodation is largely in excess of the requirements I cannot see the utility of doing so.
1035. Do you think that if the wharf belonged to the company you are connected with they would improve it to the greatest extent for the purpose of giving facilities to the shipping public? I am certain they would not.

1036. Suppose the wharf belonged to a company outside yours? Well, in view of there being so many wharves there must of course be competition, and therefore the revenue must tumble down perhaps 50 to 75 per cent.

1037. Do you think that the trade of this port is increasing? Yes.

1038. Largely increasing? Yes.

1039. Do you think it is likely to go on increasing? That is a question I cannot answer.

1040. You have not made up your mind on that point? No.

1041. It is the case that the population is increasing, and as the population increases does not trade necessarily increase;—I suppose that there are greater numbers that have to be fed and clothed? Yes; but the question is whether we should not produce many things ourselves that are now imported.

1042. On the whole you think that the wharfage accommodation of the port is sufficient for all present requirements? More than sufficient for many years to come, as far as my knowledge serves me to answer the question.

Alfred Lamb, Esq., merchant and wharf-owner, sworn and examined:—

1043. *Chairman.*] You have given evidence before I think on matters connected with wharfage accommodation? Yes.

1044. And you have had a considerable amount of experience in the management of and in the dealing with wharves in the city of Sydney? Yes, I have been connected with them pretty well all my life.

1045. And you are still engaged in the same occupation? Yes.

1046. What is the name of the wharf where you carry on your business? The Central Wharf.

1047. I suppose you are pretty well acquainted with most of the wharves round the port? Yes, I think I know pretty well all of them.

1048. Is it a fact that there are new and large wharves being constructed,—at Pymont especially? Yes.

1049. Anywhere else? And the Government wharf on both sides of the Pymont Bridge.

1050. One of these wharves is being constructed by private enterprise? Yes.

1051. What is the name of that wharf? I think it is generally known as the Pymont Wharf, the late A. S. N. Company's works.

1052. A large amount of capital is being expended there? A considerable amount, I believe.

1053. Can you form an approximate idea of the amount of the capital that is being expended there now? I believe already some £150,000 has been spent in purchasing and improving that property.

1054. It belongs to a private company, I take it? Yes.

1055. Do you think that they have good ground for the large improvements that they are undertaking? I think it is doubtful.

1056. Is it your opinion that the trade of the port is increasing largely? No doubt there is a fair increase.

1057. An ordinary increase? Yes.

1058. Notwithstanding the dearth in trade, and the bad times, and the drought that we have suffered from? There is a fair increase in shipping, and I should think a fair increase in the trade of the port.

1059. The population of the community is increasing too from immigration and other sources? I suppose that causes increased trade to some extent—it is bound to do so.

1060. Is the export trade largely increasing? Yes, the exports are largely increasing.

1061. In various products—mineral, pastoral, and others? In all products.

1062. A great deal of coal is sent away from this port, amongst other things, is there not? Yes.

1063. But more from Newcastle? Yes.

1064. Large quantities of wool too? The Customs statistics published every three months show that.

1065. And tallow;—there is not any large increase in the grain export? That varies more than anything else from the seasons we have; but still there is no foreign export of grain from this country yet.

1066. Is there a large import? Yes; an intercolonial import.

1067. Mostly from New Zealand, South Australia, and Victoria? Yes; but those are matters so generally stated by Customs statistics that one can hardly follow them without following the statistics.

1068. On the whole is it your opinion that the wharfage accommodation is keeping pace with the trade generally, with the commerce of the port? I am satisfied that wharfage accommodation is ahead of the requirements at the present time.

1069. You are aware of the proposed improvements at Woolloomooloo Bay and Cowper Wharf? Yes; I see them on the plan here.

1070. Do you think they are desirable? I do not think they are desirable because there is no necessity for them. This proposal to put out a large jetty not only interferes very much with the traffic of Woolloomooloo Bay, but increases the wharfage accommodation to an extent that, as I said before, is not required. Of course the evidence that has been already given is public property, and it is there shown by the people most conversant with this question that the wharfage accommodation is ample, and a good deal ahead of present requirements. The most practical man who gave evidence to that effect was Captain Pettit, the harbour-master, who berths all the vessels, and he said that he had never known a vessel to be delayed for a berth; and the opinions of those who have been closely connected with wharfage matters coincide with my experience. The improvement to this jetty by Government expenditure is simply Government taking upon itself an extension into the harbour to an extent that private enterprise is always prepared to do; but is limited from doing. Then when private proprietors do make these extensions they are taxed with a heavy rental, and have to make their revenue in competition with public wharves and the public expenditure. The Government building out a wharf such as this taxes itself with no such expenditure. If a private man were to build out a wharf like that the Government would charge him from £700 to £800 per annum. We are paying in that proportion for what we already have, and if we found the demand for wharfage was so great, I am certain every private wharf owner would be prepared to make any reasonable extension to provide accommodation. But the necessity has not arisen. From the number of vessels entering the port, and the berths available, it has been shown conclusively from the figures and evidence before the Committee that the berths are far in excess of the requirements of ships.

1071. Have you known it to be the case that wool ships have been delayed waiting for particular berths;—we have it in evidence that it is so? For about two months in the year, in the height of the season, a ship may be delayed for a particular berth; but it is absurd to say that there was necessity for a ship being delayed for a berth for any purpose.

W. R. Benson,
Esq.
23 Nov., 1888.

Alfred Lamb,
Esq.
23 Nov., 1888.

Alfred Lamb, Esq., 23 Nov., 1888. 1072. Viewing this prospectively, how long do you think that the present accommodation will be sufficient for the port, supposing the trade to go on increasing at the same ratio that it has done within the last three or four years? Well, that is hard to say; but I think that for the next ten years the accommodation would be sufficient, with what we know is actually going to be done, with the improvements at Circular Quay and this Pyrmont scheme, and the other public wharves that are being made. This property being Government property I take it that it is always there available, and a wharf could be built out in ten or twelve months. Therefore there cannot be any necessity for the Government building a wharf five or ten years before it is needed. Then, again, when this public expenditure is made, should it be made, the accommodation then, I say, being far ahead of the requirements, you come into the question of the revenue from these wharves being considerably reduced, because the competition to secure the shipping from the different wharves must necessarily reduce the revenue.

1073. Under the present circumstances, if Cowper Wharf were your property, would you improve it to the extent proposed? Well, I would prefer to sell it to somebody else, and let him do it.

1074. You know the nature of the improvements? I see it from this plan.

1075. Do you think they would be desirable improvements, supposing it were decided to improve the accommodation;—do you think that would be the character of accommodation that would be necessary or desirable? No; I think it would be very undesirable to block up the harbour with so long a jetty.

1076. Do you know the width of the jetty? It is 100 feet on this plan, but I have heard it mentioned that it might be 150 feet.

1077. Do you think that 100 feet would be wide enough for the purpose of carrying on the commerce of a place like that, where ships would be berthed, to facilitate the loading and unloading of vessels without unnecessary delay;—do you think it is desirable to have vehicular traffic down the centre? Vehicular traffic would have to go down the centre.

1078. Do you think that width would admit of it? You could do it; but the wider you made it the better.

1079. Could you carry vehicular traffic down a width of 100 feet? Oh, you could do it.

1080. It would give you a very limited space? The wider it could be the more convenient. But I am speaking more on the main question whether there is a necessity for an expenditure of this sort for wharfage purposes. I think the more the wharfage can be consolidated into one part, instead of distributing it, the more convenient it is. This wharf I look upon, and I think most people are of the same opinion, as adapted for the timber, produce, coal, and metal trade, for the eastern parts of the city. It is very suitable for that, and not really required for big shipping purposes at all.

1081. You think the accommodation will be sufficient for those purposes without the improvements? Certainly.

1082. *Mr. Copeland.*] This expensive wharf that is being built at Pyrmont—I suppose a number of gentlemen have formed themselves into a company or syndicate to carry out those works? Yes.

1083. I suppose they have gone into this business purely as a matter of speculation? Just so.

1084. And they expect to be remunerated for their expenditure? Yes.

1085. Do you not think that as trade increases there will always be found other persons ready to go into similar speculations, so as to get the wharfage accommodation up to the necessity of the times? I think you will always find private enterprise ready to do what is necessary.

1086. You think it has done hitherto what was necessary? Undoubtedly it has.

1087. Do you think these proprietors of this new wharf anticipate realizing payable results from their speculation? I presume they do, or they would have been very foolish to go into it. Whether they will is another question.

1088. Seeing that they have to pay rent that the Government would not have to pay for this accommodation at Woolloomooloo, is it not reasonably to be supposed that the Government would also be able to obtain remunerative returns for their expenditure? Whatever may be the returns if the supply is far in excess of the demand there must be severe competition, and those returns will naturally be considerably lessened.

1089. Speaking as an Australian, as a private individual, outside of your being a wharfinger, would you not consider it the duty of the Government, where they have a fine property like that, to put it to the best advantage and make it reproductive? As a citizen I think the Government have no right to spend the public money in building what is not required. They receive certain rents from private individuals who have done a great deal for the wharfage of the Colony, and there is undue competition brought on by the action of the Government in spending public money, if they continue to do so and increase the supply above the demand.

1090. But if we have a number of people who are always prepared to avail themselves of every opportunity for building a new wharf, the Government would never have any opportunity of making use of its facilities for giving wharfage accommodation;—if the Government always allowed private individuals to make provision for these necessities, we should never have an opportunity of using that fine water frontage and putting it to its best use? But it is not necessarily the function of the Government to provide wharfage for individuals.

1091. But considering the fact that the Government stands possessed of that foreshore, with all the capabilities of making good wharfage accommodation, would you think it desirable for the Government to allow their property to stand neglected and unoccupied, while private individuals were allowed to scoop the pool? But the pool becomes so very much reduced by the very action of spending the money to increase the accommodation.

1092. Do you not think the Government ought to come in and get their share, so as to obtain a more reasonable return for what they stand possessed of? If they are a business Government, and going to enter into every class of business and competition, I suppose there is nothing to be said about it; the public must submit to see the public money put into what may be a very questionable investment.

1093. But assuming that view of the question to be a sound one,—seeing that the Government are actually in possession of that valuable property, do you think they should allow it to remain unutilized, simply to allow private wharfingers to get all the business into their own hands? I say the Government have no right to spend the public money in providing what is unnecessary, or to an extent that is unnecessary.

1094. You think the Government should not construct railways because they would be competing with bullock drivers and other carriers? That is a very different question; the railways were things that private enterprise could not have undertaken in this country. Had the Government not taken the job in hand we should never have had them. Wharves are in a very different position; private people gave the wharfage accommodation long before the Government did.

1095. The private people also gave carriage on the land, and in other countries private enterprise has carried out the railways;—would you go a step farther, and say that the Government ought to allow the Circular Quay to remain unused from fear of competing with private enterprise? It is not lying unoccupied or unused; it is sure to be used so far as the demand will enable it to be used.

1096. Remember, the question here is not of the Government resuming land for the purpose of competing with private individuals; they have the foreshore, and the question is whether they would be justified in failing to use it? I do not think the Government would be justified in building that improvement, as it is presented here, in the public interest.

1097. *Mr. Garrard.*] You complained just now of the Crown preventing private wharfingers extending their wharves to meet the requirements of trade? In many instances. I referred the last time I was here to an instance where a wharf was extended to an extraordinary extent—a wharf from the other side of Pymont Bridge; but, as a rule, private individuals have not been allowed to extend their wharves to the extent they were prepared to do, and to pay the Government for that privilege. I dare say I have applied to build out five or six wharves in my time. In every instance where I have applied to go out 450 feet, I have been told it would interfere with the harbour, and I could only go out 350 feet. I say the argument has not held good; we have not interfered nearly to the extent that this proposed jetty will interfere. What the Government refuses to individuals it will take upon itself.

1098. Was not the curtailment of your applications in those cases to prevent your encroachment on your neighbours' water;—if each man were allowed to go out, there would be a time when they would meet in the middle, and block each other? They may have been curtailed on that account in some instances.

1099. The Central Wharf, for instance;—is that the reason that extension was not allowed? No; because you could narrow your jetty as you went out.

1100. In this case under consideration the jetty runs from the centre, and there would be no one interfered with, as the Government owns the property all round the bay? Yes.

1101. You do not object to the nature of the improvements if they were required;—your objection is that the commerce of the port does not require this extra extension? That is it; and I think all the evidence that has been given before you by practical people on this question, unless they have been people who, to a certain extent, were answerable for recommending these improvements, bears me out in what I say. Of course I have had an opportunity of seeing it.

1102 You referred to Captain Pettit's evidence;—have you seen question 226:—"Do you think that the proposed works, as a whole, are essential for the improvement of a valuable Government property such as this is? I think that the proposed jetty will return very good interest on the money expended"? Yes; but when he was asked if he ever knew of vessels being inconvenienced waiting for berths, he said he never knew it in his experience, and I say that is the most practical experience the Committee could possibly have as to the necessity for increased wharfage accommodation.

1103. Is it not a fact that the get-away from Woolloomooloo Bay is very much easier than from any of the back wharves? No; I do not think it is so very easy as has been represented in some quarters. We have certainly some steep pulls from some of the back wharves, but they are very short, and the steep pull from Woolloomooloo Bay is rather long. Take one with another, I do not think there is much to choose. If you take special things, such as long timber, Woolloomooloo Bay has the easier get-away. I say that Woolloomooloo Wharf is essentially fitted for timber, produce, metal, coal, and things of that sort. For general cargo purposes very few ships ever go there or ever require to go there, so the necessity for it does not exist to a large extent at all.

1104. *Mr. Kethel.*] It has been stated in evidence that ships have occasionally been waiting several days for a berth;—now, I would like to ask you with whom rests the power of sending a ship to any particular wharf to discharge her inward cargo, and perhaps to take her outward cargo;—is it the shipper in England, the ship's agent here, or the consignees and owners of the goods that form the cargo? It varies in many respects. If you could tell me that what is known as the brokers' ring in London was not in existence it would probably be in the power of the shipowner to send his ship to any wharf; but at the present moment it is in the power of the people in England who load the ship, or the agent who has the ship out here.

1105. Is it or is it not generally stated on the bill of lading signed by the captain what wharf he should discharge at, or that the agent shall have power to send him to such wharf as he pleases? The custom in England is the same, I think, pretty well all over the world. Ships that come to these colonies are generally chartered, and in the charter party the charterer has power to send the ship to any wharf he likes. In the same way, if I charter a ship to London, I have it in my power to send it to any wharf or dock that I like. It is not the question whether the accommodation is good or bad that necessarily attracts the ship. I think your experience, Mr. Kethel, will bear me out in that.

1106. It has been inferred that ships have had to wait for a berth because the owners of the goods desired an easy access to the ship, or the captain desired to get one wharf as preferable to another;—I wish to elicit whether the consignee of the goods or the captain has any voice in selecting the wharf? The owner of the goods, not being the charterer, never has a voice; the captain very seldom has a voice.

1107. *Mr. Street.*] How many ships are you capable of berthing at the Central Wharf in the course of the year? I have one large steamer and four large ships at the present time—that is five.

1108. Are you always full? I have never been full for the year through in the whole of my experience. I have never been full for more than two or three months in the year—that is the wool season. I could accommodate comfortably, loading and discharging, sixty to seventy vessels per annum, and I will undertake to say I have never had half that quantity. Some of them are only loading wharves, and a wharf with the capacity of mine could discharge there from sixty to seventy ships; and I do not think we have ever had more than about a dozen.

1109. *Mr. Garrard.*] Is your property a jetty running out? Yes.

1110. What is the width? They vary from 30 up to 40 feet.

1111. Would that allow vehicles to go down the centre when there is a ship on each side? It does, but it is a little inconvenient. We generally run the goods off in some way, but the drays do constantly go up and down; but my wharf is somewhat differently situated, because I do loading on one side and discharging on the other.

1112. *Mr. Suttor.*] Does the same rule apply to the other wharves as to yours with regard to the accommodation being taken up? Yes, decidedly. To show what one berth is capable of, take some statistics Mr.

Powell.

Alfred Lamb,
Esq.
23 Nov., 1888.

Alfred Lamb, Esq., Powell gave with regard to the Washington Wharf, only an ordinary wharf, neither particularly good nor bad. Where the agent had plenty of ships coming to his consignment he berthed there twenty-one ships in the year. For an average of three to four years he berthed eighteen ships, which shows that one berth can do eighteen ships. Now, if you take the berthing capacity in the harbour at the present time at about half of that, you will get berthing accommodation for 700 to 800 general cargo vessels per annum outside the big regular steamers; and those Government statistics will show you what I know is the fact, that there are not probably 300 vessels of the sort coming into the port. You cannot get over the facts.

23 Nov., 1888.

1113. Do these private wharves berth wool ships? Yes, two of them—Dalgety's and my own.

1114. Are they the only two? Yes, at the present moment.

1115. Do the others berth wool ships? They can berth them, but they have not the presses and appliances for loading them. Dibbs' Wharf and Mort's Wharf could do it.

1116. As a rule they do not berth wool ships? Not as a rule. Mine, for four months in the year, is almost entirely confined to wool-loading.

THURSDAY, 29 NOVEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES WATSON.

The Hon. FRÉDÉRIK THOMAS HUMPHERY.

HENRY COPELAND, Esq.

JACOB GARBAARD, Esq.

ALEXANDER KETHEL, Esq.

SYDNEY SMITH, Esq.

JOHN RENDELL STREET, Esq.

The Committee further considered the proposed improvements and additions to the wharfage accommodation, Woolloomooloo Bay.

Norman Selfe, Esq., M.I.C.E., M.I.M.E., &c., Consulting Engineer, sworn and examined:—

N. Selfe, Esq.

29 Nov., 1888.

1117. *Chairman.*] Are you aware of the character of the proposed wharfage improvements at Woolloomooloo Bay? Yes, so far as I have gleaned from half-an-hour's perusal of the report.

1118. Have you inspected the locality? I have known it for years.

1119. Have you inspected or seen any plan of the proposed improvements? Just the plan which is attached to the report of the previous proceedings of this committee.

1120. Have you had much experience in wharfage accommodation or many opportunities of acquiring knowledge as to such accommodation in Sydney Harbour generally? I designed and carried out all the principal wharves round Miller's Point, and introduced new systems of wharf-building, which have since been largely adopted. I have seen and made a study of the wharf system of New York, the great quays at Antwerp, and so on. I know exactly how the wharves are built in those places. I was instrumental in saving the Government of this country at least £100,000 about fourteen years ago by preventing them from building some proposed wharves along the Circular Quay. On that occasion the proposal was to put six or eight wharves where there are now only three, and the leading principles I advocated then, I am very glad to say, have been since adopted, and every main principle which was proposed to be adopted has been abandoned. Since building the wharves at Miller's Point I have spent two years in travelling round the world, and in the course of my travels I paid particular attention to wharfage accommodation and the construction of docks and harbours, such as the new Tilbury Docks below London, the docks and quays at Liverpool, and especially the quays in Northern Europe, where there is much more canal system. I was very much struck by the fact that, in most countries, they take the trouble to dig into the land to make water accommodation. In New South Wales we take a deal of trouble to fill up a very beautiful harbour which Nature has given us. We have done that for years. Many estuaries which used to be navigable are filled up, as for instance Long Cove.

1121. With regard to the proposed improvements to Sydney Cove, what was the character of the design? It was a design which the Government were about to carry out until it with others was referred to a Select Committee. It was proposed to build a number of small iron berths only suitable for vessels of the smallest class. Being engineer to Mort's Dock, and being well acquainted with the class of vessels then visiting the port, I saw at once that the improvements, if carried out, would be wholly useless for the modern class of ships. I had the honor of presenting a number of plans to the Select Committee, and they were reported to the House.* All the Government proposals were then abandoned for, I think, seven years, and then new plans were brought up which embodied every leading principle I had advocated in my own plans before the Select Committee.

1122. By whom was the design submitted? The Harbours and Rivers Department, or Mr. Moriarty.

1123. To Parliament? I do not think so. Parliament voted £89,000, I believe, as a first instalment towards the work. A Select Committee inquired into the matter, and a plan marked B,† was recommended, which showed the largest vessel, the "Sobraon," at a wharf with 60 feet frontage. Before the contract plans were made some of the berths were very much extended. The plan I have given you is the one for which tenders were called, and had it not been for a second Select Committee being appointed it was intended, the Engineer-in-Chief said, to accept by wire the tender which the Horseley Iron Company had sent in for its construction.

1124. The plan on the easel showing the proposed improvements at Woolloomooloo Bay is a copy, on a larger scale, of the plan you have in your hand? Yes.

1125. Is this a desirable project to carry out? It is a waste of material, I consider, to make a jetty as wide at the extreme end as at the shore end. At the point of the jetty cargo only would be deposited, whereas at the root of the jetty the whole of the traffic would be congested. I think there would be very much less taking up of the waters of the cove if the jetty narrowed at the end. It seems to be unnecessarily wide at the end. Two very large "tramps"—immense cargo vessels—can discharge at a wharf I built.

* NOTE (on revision):—Ordered by the Legislative Assembly to be printed, 25th June, 1874.

† Ordered by the Legislative Assembly to be printed, 24th April, 1873.

- built 450 feet long, and only 35 feet wide at the end. I mean ships like the s.s. "Aberdeen," and the "Wilcannia," which was here the other day. At the same time, there is a great advantage in width.
1126. Do you know the dimensions of the proposed jetty? 750 feet long by 100 feet wide. I reckon at the price given it is making ground at a cost of £17,000 per acre.
1127. Supposing it is deemed advisable to adopt the design, do you think the jetty is wide enough? I think it is too wide at the end, and if it is desirable at all I would widen it at the root to get plenty of egress for carts. Of course, the engineers may have reasons I am not conversant with. There may be something in the depth of water, but I think the jetty should trend more to the eastward, and more in a direct line with the bay. I notice the price comes to approximately £40 per square. There may be, as I said, something in the depth of water, but I built jetties of the very largest type at a maximum cost of £25 per square. I mean a 10 x 10 square.
1128. Supposing you approved of a jetty being constructed, would you recommend it being carried out straight out or on the eschelon principle? As straight a line as you can go. With a long straight wharf you can berth ships of any length, and you can berth three medium sized ones or two long ones. You do not economize space very much by having the other.
1129. From your knowledge of the trade at the different wharves do you think further accommodation is necessary? There is plenty of accommodation in Sydney.
1130. Do you think the necessity for further accommodation is of such a pressing character as to warrant the Government in spending £42,000 on these improvements, this being a State property? I hardly think it is. I notice that it is expected to return a revenue of £6,000 a year. Of course as a matter of business it would be a good speculation, and the Government might be justified in doing it on that account, but as a matter of fact there are a large number of wharves which would be very much improved if the owners had power to alter the levels of the streets. Round in the neighbourhood of Windmill-street and Miller's Point if it was possible to alter the grades reaching the wharves—which cannot be done without an Act of Parliament—the wharves would be equal to the requirements for some years to come.
1131. Has large wharfage accommodation been provided during the last few years in the port—in Darling Harbour? Yes, very large.
1132. Some large works are going on there now? Yes.
1133. They will afford very large additional accommodation? Yes.
1134. It is essential to get power from the Government to make these reclamations for wharves? The Government regulations have been increased in stringency extremely during the last two or three years. A wharf which paid a rent of £5 a year until recently is now charged £50 a year—that is for permission to extend a wharf into the water.
1135. I suppose great efforts are made by the owners of water frontages to get power to extend into the harbour? Yes. The Government policy has not been very definite; it has vacillated a great deal, it has been very unequal. At one time extensions could be got quite easily, and at other times they could not do anything. For instance, when Mr. Moore placed his property in my hands for improvement he wanted to extend the wharf. We had some difficulty in getting permission to make a small extension. I said, "Well, apply for a 150 feet extension," never thinking it would be granted; but it was granted, and the wharf was built. It goes right beyond the limit line. Mr. Moore was a fortunate man in obtaining a berth which will accommodate the largest vessel that may ever come to this port.
1136. Do you know of any similar cases? No; but I know of cases where extensions had been refused where no injury to the public could possibly have accrued.
1137. Who possesses the power of granting these concessions? I think it rests with the Lands Department and the Harbours and Rivers Department.
1138. Has the exercise of this power been governed by political influence? I could not say.
1139. Has the Minister ever overridden the recommendation of his officers and given the authority himself? I would not say that.
1140. The unequal character of the administration does not arise from that source? No; I think it arises from not having a hard and fast policy laid down on a sound basis. From Miller's Point to Dawes' Point there has been an arbitrary curved line laid down, which is called the limit of reclamation. I hold that any wharf might be extended to a straight line running between these points without encroaching on the fair way of the harbour. Farrelly's Wharf, which has been altered, and two or three other wharves, in that light, might be extended very much, providing the owners were agreeable to lose a certain portion of their frontage by coming to a point; and no injury to navigation could possibly ensue.
1141. Does that apply to other points in the harbour,—to Darling Harbour, or Farm Cove, or Woolloomooloo Bay? I am not very certain about the limit-line in Woolloomooloo Bay.
1142. Have you heard of any dissatisfaction expressed as to this authority being given to one and denied to another? Oh! Yes; but I cannot say anything of my own knowledge. I have seen permissions given where it appeared to me influence had been at work; but I could not say so of my own knowledge.
1143. You think on the whole the wharfage accommodation of Sydney is sufficient for the requirements at the present time? I do.
1144. Do you think the traffic of the port has been increasing in such a ratio as to require additional accommodation? I think the modern class of steamers and the facilities for discharging almost keep pace with the increased imports. They can put out 2,000 tons of cargo, and get everything removed from the wharf now in a fourth of the time it used to take to discharge one of the old fashioned 700-ton Aberdeen clippers. Ships are here to-day and gone to-morrow now.
1145. The appliances for discharging cargo are not stationary on the wharf, but floating? Every locality has a special system. I have often wondered why hydraulic cranes are not more used here, like they are in the Victoria and Albert Docks. The stevedores here have become used to a moveable sort of steam-engine. They are able to do the work with it, and as long as that is done in time it matters very little as to the means employed.
1146. It has been done effectually up to the present time? I think so.
1147. In that case you would not think it essential with regard to Government wharves to have hydraulic cranes? Most decidedly the Government should have them. I think I was the first to introduce them here. Some twenty-three years ago I made the first hydraulic machinery and lift ever made in the Colony.
1148. Still, the work has been tolerably effectually done by portable engines? Yes.

N. Selfe, Esq. 1149. *Mr. Copeland.*] In the matter of granting permission to extend a wharf do you imply that occasionally there has been favouritism shown, and political influence at work? I do not mean to imply it has arisen through the exercise of any improper or political influence, but because a proper policy has not been laid down for the guidance of a Minister.

29 Nov., 1888.

1150. Do you remember an instance where a Minister has granted to one person a concession which he has refused to another? I cannot call to mind a case at the present moment.

1151. Do you think the rents charged for water frontage concessions are higher than what would be charged if the water frontages were owned by private individuals? There is a want of uniform policy. In Wollongong the Government make the wharves and give the public the benefit of them; but here the public who provide the money and make the wharves are at a disadvantage. They are taxed here for improving the port.

1152. Do you consider it a tax to charge a man rent for the land he occupies? It is not land; it is water.

1153. It is land under the water? Yes; but a man can moor his punt and occupy the water. I take it that a man who has a water frontage and erects there a fine wharf at great expense is a benefactor to the country, and should rather have a premium than be taxed.

1154. Do you know any reason why the State should not derive revenue for land under water any more than for land on shore? I think the State should resume the water frontages and then there would be a distinct reason in it. But the public having possession of certain water frontages, it is rather hard that in some cases they should have to pay these rents.

1155. You are not prepared to say that as a rule the rents are excessive—that a larger amount is demanded than they ought to be called upon to pay? I know of a case where the proprietor said he would rather allow his wharf to tumble down as it was not worth the rent to him.

1156. Did he let it tumble down? I do not think he uses it.

1157. I understand you approve of the proposal to project a jetty 700 feet long right in the middle of Woolloomooloo Bay? I did not say that. If there is to be a jetty there I would make it taper; but looking at the thing on broad grounds, I think the Government should utilize a number of side wharves on shore before they extend the accommodation down the centre. The facilities for building walls under water are now so great that I think it would add far more to the dignity of the port, if I may use such an expression, to build a grand stone quay down one side of the bay. When that is not enough, build one down the other side, and as a very last resource build a jetty in the middle of the bay. The sewage, as long as it is discharged into the bay, would certainly fill up under the jetty, and it would be difficult to dredge it away. It would cost a great sum to build a jetty, and it would be far better, I think, on broad grounds to build a stone quay on the western side. There are several miles of walls in the new Tilbury Docks, which are 33 feet thick at the bottom. In Antwerp the walls are built right down into the mud. In New York there are many instances of their having made wharves by throwing in what they call rip rap, or what we call rubble. Where there is a very muddy bottom or no bottom, they throw in ballast until it consolidates, and after a time they erect a stone wall on it. I have no doubt the rock is within a reasonable depth in Woolloomooloo Bay, and if so there would be no trouble in building a retaining wall under water, and you could dredge close up alongside it.

1158. You are of opinion that it would be more judicious at present to build a wharf at the foreshore than project a jetty into the bay? Yes.

1159. Would the jetty be likely to interfere with the safe navigation of the bay? I do not think so: I think there is room there for handling vessels. In the London (Export) Docks there is a jetty of about the same size running out into the middle of the dock. I think Woolloomooloo Bay is well protected by Garden Island. From my knowledge generally of wharves I would say that there is no difficulty in the matter.

1160. You think there would be no difficulty in getting vessels to the wharves on the foreshore if the jetty were built there? I cannot say that as I am not a nautical man. I think if I were sitting in judgment on the plan I would like the engineer to give an estimate for building a strong wall from the present wharf to Potts' Point for a quay on the eastern side; and, if there must be a jetty, for one in the middle of the bay.

1161. Would there be any inconvenience in having two jetties together? I do not think so; I think it is pretty well protected there. It is simply a matter of warping the vessels.

1162. I suppose you know the eastern foreshore is private property? Yes.

1163. Supposing the Government were short of wharfage accommodation, would it not be more judicious for the Government to resume the water frontage and build wharves there rather than interfere with the bay by this long-projecting jetty? I think most certainly they should resume the land on the eastern side before they spend a penny in building a jetty. If the jetty is built it will certainly become a commercial centre; it will add immensely to the value of property down there.

1164. *Mr. Watson.*] Are you aware that the frontage marked red on the western side has been reserved for the use of the Imperial Government? Yes.

1165. Supposing you were the owner of the land fronting Woolloomooloo Bay, and had the right to resume this foreshore on the western side, would you build wharves in accordance with what you say, or run out a jetty? I would build a quay there first.

1166. In preference to running out a jetty? It would not be cheaper at once; but it would be a far better thing in the long run.

1167. Can you give any rough estimate of the cost? I only remember that the estimate for a continuous quay for Circular Quay, twelve or fourteen years ago, was about £65 per foot run; it was for a wall 45 feet high, giving 30 feet of water at low tide. You might safely say you could get a quay built all along there for £100 a foot, including the filling in of the space behind the wall.

1168. *Mr. Kethel.*] Do I understand you to say that before partially improving the bay, as proposed, it would be wise to get the details of a comprehensive scheme for improving the whole of the bay and allow whatever work is done now to form a part of the scheme? That is exactly what I said. I think this is simply nibbling, so to speak, at Woolloomooloo Bay, and we shall in course of time have (as we shall have all round the harbour) difficulties in making a grand work there, because there has been so much money already spent. I think the thing should be done on a broad principle, and a perfect scheme of wharfage accommodation for the locality should be prepared before any work is done at all.

1169. Have you noticed in going round the bay that the margin of space available for loading or unloading ships is exceedingly limited? The road is very narrow there.

1170.

1170. You are aware the Admiralty Wharf is intended to be removed 320 feet further north? I understand that from the proceedings of the Committee; but I do not see that it makes any difference in building a long quay and setting so many feet apart for the use of the Admiralty.

1171. Have you indicated to anyone the desirability of the Government constructing a wharf from the end of the present jetty to Mrs. Macquarie's Chair, excavating part of the hillside, and forming a part of a large quay? I have never made a proposal to anyone; but that is practically what I am suggesting now as part of a perfect scheme.

1172. *Mr. Garrard.*] Would you feel justified in making the improvements if you owned the property which is now in the hands of the Government and private individuals? I certainly think no more wharfage accommodation should be handed over to private individuals in the port.

1173. Supposing some of your clients had this property in their hands, do you think they would utilize it in somewhat the same way? I am sure they would, but they do not look for the good of the country; they look for an immediate return for their outlay.

1174. Your principal objection to running out a jetty is that the sewage matter would accumulate under it and become a nuisance? That is one; and another is that it is unworthy of a national work.

1175. You think the outer end of the jetty, if constructed, should not be so wide as the inner end? Yes. I can point out two or three jetties which are twice as broad at the root as they are at the point.

1176. How would you diminish the width of the outer end? I would take it off on the western side.

1177. And so give the jetty an easterly direction? Yes; but there may be special reasons for keeping the jetty as it is marked on the plan: there may be rocks or mudbanks.

1178. We have evidence to the effect that there is nothing in the bay to interfere with the erection of a jetty;—you think it would be better to go more into the centre of the bay, because the jetty would face the north-easterly winds more? Yes.

1179. Do you know the nature of the properties on the eastern side? I know there is no property there of any value, that is to say there is nothing to destroy.

1180. The cliffs are almost perpendicular near the water's edge, and the intervening space is occupied by small boats principally? Yes; but the stone would form material to fill up the space at the back of the retaining wall.

1181. *Mr. Suttor.*] By whom were the docks you observed in your travels provided? At Antwerp the works are national, I believe; the docks at Tilbury were carried out by a company. Almost every work of the kind in England is carried out by a company, except at Liverpool where there is a harbour board or trust, I understand.

1182. Is it done by private enterprise at Antwerp? No; it is built by the State, I believe.

1183. I suppose you consider that inasmuch as the Government have this large property it is desirable to make the most of it? I think Sydney is a city of lost opportunities, and if a wharf is built here, it will be another opportunity lost for making a great and permanent work.

1184. Will you point out on the plan where you think the wharfage accommodation should be constructed in the bay? My idea is that the Government should begin at the south-east corner of the bay, and gradually build a continuous wall 1,500 feet long towards Potts' Point, levelling the rocks and filling in the space behind the retaining wall with the material, and making a broad quay. On the other side I would build the wharf as part of the continuous whole, and then give the Admiral whatever might be arranged. The Admiralty have Garden Island, and in the course of a year or two, when it becomes inconvenient to have war ships here, it may be desirable to give them another spot, or they may desire to go elsewhere. A continuous quay might be made on this side, the same as on the eastern side. It is easy enough to enclose the Admiralty portion with strong walls which can be taken down if it is ever thrown into a general system at some future time.

1185. You are of opinion that a quay should be constructed round the whole of the bay? A complete plan should be made and estimates submitted before anything is done in piecemeal. I look upon that as absolutely essential.

1186. *Mr. Campbell.*] What would be the cost of a comprehensive plan? It would cost perhaps £100 a foot, or, say, £150,000 for the eastern side.

1187. *Mr. Suttor.*] It would be necessary to resume a quantity of land for that purpose? Yes; a great deal. The Government necessarily have to do the work on a very much more expensive scale than private individuals.

1188. Would the best use be made of the water by making a jetty, or would it be wiser to adopt your system? This bay can only be treated as a part of the harbour; and, looking at it from a national point of view—which I take it this Committee must do—this is not an improvement that would be any credit to Sydney.

1189. Is it desirable that the Government, owning this property, should come into competition with private wharfowners? I think that if a complete scheme such as I have shadowed forth were taken in hand it could be carried out gradually as the circumstances required. It could be built to accommodate one, two, or three ships at first, and the wharf to be extended in proportion as the traffic increased.

1190. *Mr. Copeland.*] Speaking roughly, how many years would it take to complete the whole scheme? It is simply a question of money available. It could easily be done in two years if it was necessary.

1191. Taking an estimate of the increase in imports and exports, and the growth of population, is there any reasonable expectation of such a wharf as you have suggested being utilized in the course of a few years? I think so. A very important point has occurred to me which I may mention to the Committee. There is bound to be, sooner or later, a high-level bridge to North Shore. So sailing-ships going to Darling Harbour will have to strike their top-gallant masts, and this will give an increased value to Woolloomooloo Bay. I think it is probable that a certain class of ships will make Woolloomooloo Bay the point of discharging. Possibly, the wool ships for a very long time will have to go up Darling Harbour, where so much provision has been made for them; but large sailing ships, with their lofty masts, perhaps 180 feet high, would like to go to Woolloomooloo Bay. Some masts are, perhaps, as high as St. James' steeple.

1192. You are aware that the work of striking the royal and top-gallant mast or even the top-mast is comparatively easy and could be done while the vessel is coming up the harbour? The royal and top-gallant mast could be struck; but it is a very serious thing to strike a top-mast.

1193. You are of opinion that by the time such a wharf was completed, in all probability we should have increased trade enough to utilize the accommodation? Yes. I may say, to prevent any misunderstanding, that

N. Selve, Esq. that a great many of my remarks have been made from my point of view as a citizen, having an interest in the improvement of the country, apart from my professional knowledge as an engineer. Of course, if I were engaged to improve the bay, I should simply try to carry out my instructions in the cheapest way; but I take it the Government should not be in the position of a private wharf-owner. This is a private wharf-owner's scheme.

Captain J. C. Rounding, Master Mariner, sworn and examined:—

- Captain J. C. Rounding, 29 Nov., 1888. 1193 $\frac{1}{2}$. *Chairman.*] Are you aware of the nature of the proposed improvements in Woolloomooloo Bay? Yes. I have paid several visits to the Bay in connection with the matter. I had vessels running there with coals when I was manager of a company here.
1194. You have written to the Committee, enclosing a statement of your views, together with a plan? Yes. I have based my plan on what I have seen in the old country, Calcutta, New York, and other places.
- 1194 $\frac{1}{2}$. We have not had time to examine your plan. I suppose it differs somewhat from the plan on the easel there? Considerably.
1195. Do you think the proposed improvements desirable? I certainly think improvements are desirable; but I do not approve of a jetty 700 feet long by 100 feet wide.
1196. Does your plan propose a jetty at all? Two jetties, 427 feet long by 100 feet broad, and 135 feet apart. I have got the soundings marked here, so as to give you an idea of what depth of water you will have alongside the wharf on the western side. At the northern wharf you have only 5 $\frac{1}{2}$, 7, 9, 10, 11, 12, and 13 feet. That will not accommodate any vessel with a decent draught of water.
1197. It could be deepened by dredging? Yes; but would cost a considerable amount of money. By extending the wharves out into the stream it would give greater frontage and more space for sheds, railway lines, cranes, &c. Two piers are better than one. It enables two ships to haul in there quite clear of one another, and it leaves any amount of room for taking in cargo over the side at the same time as you are working shore cargo. This question of jetties I have studied for some years. I sailed out of the Victoria Docks for fifteen years in steamers. I have gone into London with 10,000 bales of wool, put them out in eighteen hours, gone into dry dock, come out again, loaded 2,000 tons of cargo, and gone away with 600 passengers on board, in a week. We never could have done that unless we had a proper system of loading and discharging the ship. This jetty system in the Royal Albert and Victoria Docks was sound very convenient for the purpose. We had overside wool to put out as well as putting out wool on shore. The former had to be sent away to the Continent. That is the reason why I advocate two jetties in Woolloomooloo Bay. 135 feet is quite ample space between the jetties; and, in the event of business increasing, another jetty could be constructed on the eastern side, by making the two jetties only 427 feet long.
1198. Would you have two or three jetties of the same length? Two. Sailing ships will run about 230 or 240 feet each, and it will be a large steamer that is 427 feet long. I think the "Ormuz" is about the length.
1199. What is your idea as to the general wharfage accommodation of the port;—is it sufficient for the requirements? It is not. I was here twenty-one years ago, third officer of a sailing ship twice, and I must say that, bar private enterprise, there is no improvement at Circular Quay except the wood blocking, which has been done lately—no hydraulic cranes there yet. It is a waste of room. If we had that place in London it would have been devoted to this jetty system long ago—it would never have been allowed to lie waste like that. In London we have to dig out docks. I used to play cricket where the Tilbury Docks now are. But at Circular Quay there is a beautiful dock already made; the same in Woolloomooloo Bay.
1200. You think additional accommodation is required at the Bay? I do. I am interested in the Canadian and Pacific mail boats, which are very likely to be running here shortly. These ships, when they come from Vancouver Island, will most likely bring some timber. I have noticed that a considerable quantity of timber has been landed at Woolloomooloo Bay during the last few years. A slip lies end on to the wharf. They simply haul out the timber, and it lies all over the wharf—in fact, the wharf is blocked up with timber. We have virtually no wharf but this in Sydney which would accommodate this class of ships—say 450 feet long. They are 6,000 ton ships, 18 knot power, and about 450 feet long. I have sent a report on our wharfage accommodation to Sir George Stevens, President of the Canadian and Pacific Railway Company, and to Mr. W. C. Van Home, Vice-President of that company. Their ships could lie alongside this wharf and discharge their timber quickly. There are certain matters to attend to in the hold of a steamer, and when she is here for perhaps ten days it means a matter of push and go all the time. You do not want to work overtime more than you can help, as wages are too high. I look upon this wharf as a very good wharf for ships like these to go to—far better than Circular Quay. If you had 700,000 or 800,000 feet of timber to run out at Circular Quay I very much doubt whether the Government would allow it to be stored there. At Woolloomooloo Bay I have seen a ship discharge a general cargo on to the open wharf. It was simply lying about the wharf indiscriminately, and larrikins—men, women, and children—were running about among the cases, some of which contained raisins and preserved fruits, and, of course, some were pilfered.
1201. *Mr. Copeland.*] You are of opinion that whatever wharf accommodation is provided closed sheds should also be provided? Yes; good weather-proof covered-in sheds. The sides of the sheds should be arranged on rollers the same as they are at home, so that as a ship comes alongside the wharf any part of the shed will slide back telescope fashion. I think I recommended in my letter that if a railway should be run down the sides of the jetties the rails should be counter-sunk—made flush with the deck of the jetty—so as to cause no inconvenience to carts or horses.
1202. I am anxious to have your opinion as to whether the jetties should be carried out into the centre of the Bay, or whether the improvements should be confined to quays or wharves round the foreshores of the Bay? I propose to run two jetties out into the Bay 427 ft. x 100 ft., in lieu of one long jetty 700 ft. x 100 ft., as proposed in the Government plan. The former will accommodate eight average ocean-sailing vessels, or four large ocean steamers, and in the event of all the berths being full, and working cargo, they will not interfere with each other's working, &c. The latter long jetty will accommodate about six average ocean-going sailing vessels, or four large ocean steamers, and if all the berths are occupied at one time and working cargo, very great inconvenience and obstruction would arise. I have experienced this sort of thing myself. I certainly prefer the jetty improvements, but I consider the time has arrived

arrived that the whole of Woolloomooloo Bay should be in the hands of the Government or of a Harbour Trust, and that every possible new improvement—jetties and wharves—should be carried out as soon as possible for the better accommodation of our ever increasing tonnage, and because of the large revenue the Government would receive. A private company would have done this years ago; vessels, especially steamers, will always follow the best accommodation.

Captain J. C. Rounding,
29 Nov., 1888.

1203. Would it not be better to construct wharves on the eastern side in preference to projecting jetties into the middle of the Bay? No. Suppose you had a wharf all the way round the Bay, you could only accommodate about half the number of ships that I could get into the Bay by having jetties.

1204. Will not the jetties interfere considerably with the navigation of the Bay? Not at all. There is no wind, and, virtually, there is no tide in the harbour.

1205. It would not be so convenient to get to a foreshore as to a jetty? No. To put a ship alongside a jetty is a most simple thing. I have allowed more space, larger jetties, and greater width than we have in the Victoria and Albert docks in London. The firm I formerly belonged to has about 100 steamers. I have seen twenty-five of our ships lying in Calcutta and ten in London, at one time. We had 2,000 feet of space on the import side, and a similar space on the export side.

1206. You approve of the proposal to extend a jetty right out into the Bay? Yes; but not 700 feet long, because when the traffic increases you will have to construct jetties on the western side.

1207. I suppose you are aware the eastern foreshores are alienated? Yes.

1208. Do you think it would be in the interest of the public if the Government were to resume those frontages and extend round that side of the bay a system of quays or wharves somewhat similar to those you recommended for the western side? Oh, yes; but that is not contained in your plan. For the effective working of such a number of vessels as these improvements would accommodate, I should advise the reclamation of all land from Cowper Wharf to Blane-street; from the Domain, Bourke-street, to Brougham-street, and that it should be done before any alteration or construction of wharves. Such reclamations and improvements would pay handsome returns to the Government Treasury, and would be the finest wharfage accommodation in the southern hemisphere. The whole of these wharves should be railed off from the public.

1209. Would it not be more beneficial to carry out my idea than to project a jetty into the middle of the Bay? No. On that side, at low water, you run 14 feet, 12 feet, 10 feet, 9 feet. It would cost a tremendous amount of money to increase the depth to 24 feet.

1210. But you want something for filling up the space behind the retaining wall? I do not think so. I do not agree with that side; I believe in the western side. I should advise any line of mail steamers to berth at the western side.

1211. Don't you think it would be easy to make similar berths on the eastern side? Yes; but you would have to dredge a great deal to provide 22 feet at low water, and that means a very great expense. I would prefer to run the wharves further out and save dredging, and that would give larger space for sheds, railways, cranes, &c. There is only 14 feet of water here.

1212. You do not know of any impediment to dredging to that depth? Not as far as I have seen of the soundings. Whether they have made a correct survey of the Bay I cannot say.

1213. You think it would be well to resume that frontage and build a wharf? Yes. You would have the whole of the place, and it would be a handsome, well made, natural dock.

1214. *Mr. Watson.*] Have you been a resident of Sydney for long? Five years.

1215. Have you brought any ships into the port? No; I have not brought a ship in as commander.

1216. What is the name of the firm with which you were connected? It was the British India Steam Navigation Co. I was running down Torres Straits four years from London; I opened the line.

1217. How many steamers do they own? About 100, from 6,000 tons to 600 tons—all classes and all kinds. I have been in about half a dozen of them.

1218. Have you heard of any difficulty in getting accommodation in Darling Harbour? I cannot say that I have heard of any inconvenience being experienced; but I know the wharves in Sydney pretty well. I have taken an interest in this movement at Woolloomooloo Bay, and I have walked round nearly the whole of the wharves to see whether they would be thoroughly adapted to a ship of about 450 to 500 feet long, drawing 25 to 28 feet of water when she is going away.

Captain Francis Hixson, R.N., President of the Marine Board, sworn and examined:—

1219. *Chairman.*] You are President of the Marine Board, I believe? Yes; I have held that position for some considerable time.

Capt. Hixson,
R.N.

1220. We are taking evidence as to the propriety of giving increased wharfage accommodation at Woolloomooloo Bay? I understand so.

29 Nov., 1881.

1221. Have you given any attention to the proposed alterations or improvements? Yes.

1222. Referring to the plan on the easel there, do you think it would be desirable to construct a jetty on that principle out into the waters of the Bay? I see no objection to it.

1223. Do you feel justified in recommending it? Yes; I do not oppose it. There is no traffic in Woolloomooloo Bay which would interfere with the extension of a jetty there. The tendency of harbour steamer traffic is to recede from the Bay rather than to frequent it.

1224. Is it your impression that additional wharfage accommodation is required in Sydney Harbour? I have heard complaints that the Government are unable to berth ships at the present time.

1225. Have you heard or seen any evidence of the necessity for providing increased accommodation? I heard a day or two since that Captain Jackson, Wharfinger, was unable to give berths to ships which had applied to him for accommodation. I have nothing to do with making arrangements for the berthing of ships. My official position has nothing to do with the construction of wharves. I simply deal with the ships.

1226. You would have a general knowledge of the commercial requirements of the port? I think so.

1227. Do you think additional accommodation is desirable at the Bay? Yes.

1228. You think that if the wharf property had belonged to private individuals it would have been improved long ago? Yes.

1229. It is a very valuable asset in the national estate? Very much so.

1230. And a property which deserves improvement? I think so.

1231.

Capt. Hixson, R.N.
29 Nov., 1888. 1231. We have evidence given by experts that it would be desirable, instead of taking the jetty out into the Bay, to improve the water frontages on either side for some considerable distance and make a sort of Circular Quay—have you given any attention to that project? I have given no great attention to it; but for the shipping in the Bay, and for the nature of the traffic there, I think a long jetty run out in this way is a very good way of utilising the accommodation.

1232. You think that if a jetty is constructed its dimensions should be about 700 feet long by 150 feet wide? Yes.

1233. Witnesses have stated that the width is not sufficient—that it is not wide enough to admit of vehicular traffic down the centre of the jetty? I would be inclined to give more width, so as to give greater accommodation for the traffic. Ships will be placed on both sides of the jetty.

1234. You have not had under your observation the alterations on the naval portion of the Bay? No; they have not come under my official notice.

1235. Do you think one jetty would be better than two, or two better than one? I am rather inclined to favour a long jetty to afford berths on either side, as proposed. Ships have to be turned, and the waters being rather narrow, I favour one long jetty in preference to two shorter ones.

1236. *Mr. Humphery.*] Is it your opinion that if a jetty is constructed as proposed, the berths would be constantly occupied? I cannot say that, but I know that both Woolloomooloo Bay and Sydney Cove are favourite positions to which ships like to go.

1237. Do you think there would be a fair return for the expenditure? I am inclined to think there would be.

1238. *Mr. Watson.*] You said Captain Jackson was unable to give berths—on what grounds was he unable? Because he had no berths to give.

1239. Cannot they obtain berths anywhere else? I believe they could,

1240. What is the reason for applying for berths at Circular Quay? I could not tell you.

1241. Is it not for the convenience of getting wool from the stores? I am inclined to think so; but I am not certain.

1242. On what grounds is additional accommodation required? On the grounds that I have mentioned: that the wharfinger told me not long since, that he could not comply with applications for accommodation.

1243. Cannot they get accommodation elsewhere? I believe they could.

1244. Are you not aware that the wharves in Darling Harbour are half empty at the present time? I understand they are.

1245. *Mr. Kethel.*] Have you given much consideration to the planning out of wharfage accommodation since you have occupied your present position? I cannot say that I have given particular attention to it. That particular duty does not come under my cognizance.

1246. You have said that you would prefer a jetty being run out to improving the foreshores;—do I understand that you would prefer to leave the sides of the bay as they are, and run two jetties out to supply whatever accommodation may be required? What I am impressed with now is, that the present proposal would be less expensive, and probably less troublesome, than to construct a wharf round the whole of the foreshores.

1247. Supposing it were contemplated to have a comprehensive scheme of permanent wharfage improvements on the foreshores of Woolloomooloo Bay, are we to understand that you think that wooden jetties should form part of that scheme? I do not set up one scheme for another. I understood I was asked whether I was in favour of this particular proposal. I have not gone into the other matter sufficiently to give a reliable opinion.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.
Wharfage Accommodation, Woolloomooloo Bay.

APPENDIX.

B.

[To Evidence of Captain John Jackson.]

STATEMENT of Revenue from and Number of Vessels berthed at Cowper Wharf from 1866 to date.

Year.	Coasters.	Over-sea Vessels.	Total.

14, Change Alley, Pitt-street, November 28th, 1888.

D

THE PROPOSED NEW ADMIRALTY WHARF, WOOLLOOMOOLOO BAY.

REAR-Admiral Fairfax to His Excellency Lord Carrington, in reply to a letter from the Chairman of the Parliamentary Standing Committee on Public Works, on the subject of wharfage accommodation for the Royal Navy, proposed to be provided in Woolloomooloo Bay.

My Lord,

Orlando, at Sydney, 12th November, 1888.

In reply to letter, dated 26th September, 1888, from the Parliamentary Standing Committee on Public Works, forwarded by your Excellency, on the subject of wharfage accommodation for the Navy, to be provided in Woolloomooloo Bay, I beg to say that the arrangements between the New South Wales Government and the Admiralty have been completed some years ago, and without reference to their Lordships I could not concur in any extensive departure from the plans already approved.

If, however, as now appears, there is a difficulty in completing the wharf and buildings, as designed, in the assigned position, owing to want of foundation, I am satisfied that there will not be difficulty in obtaining authority to alter the position to the extent proposed, provided equal advantages in all respects are offered as were arranged in the former position, and as regards exclusive possession to the Navy of the wharf to the extent originally proposed, with the naval store buildings situated in the same relative position in the rear of the wharf.

Owing to increasing requirements, the want of the new naval store and wharf is very much felt, and further increase of the squadron is anticipated. I should be prepared to submit for Admiralty approval any approved change of position from the original plan which would accelerate the building of the new naval depôt: And should your Excellency's Government think any such change advisable with that view, I will endeavour to fall in with the arrangement and recommend its adoption if I find the plan proposed to be suitable and feasible.

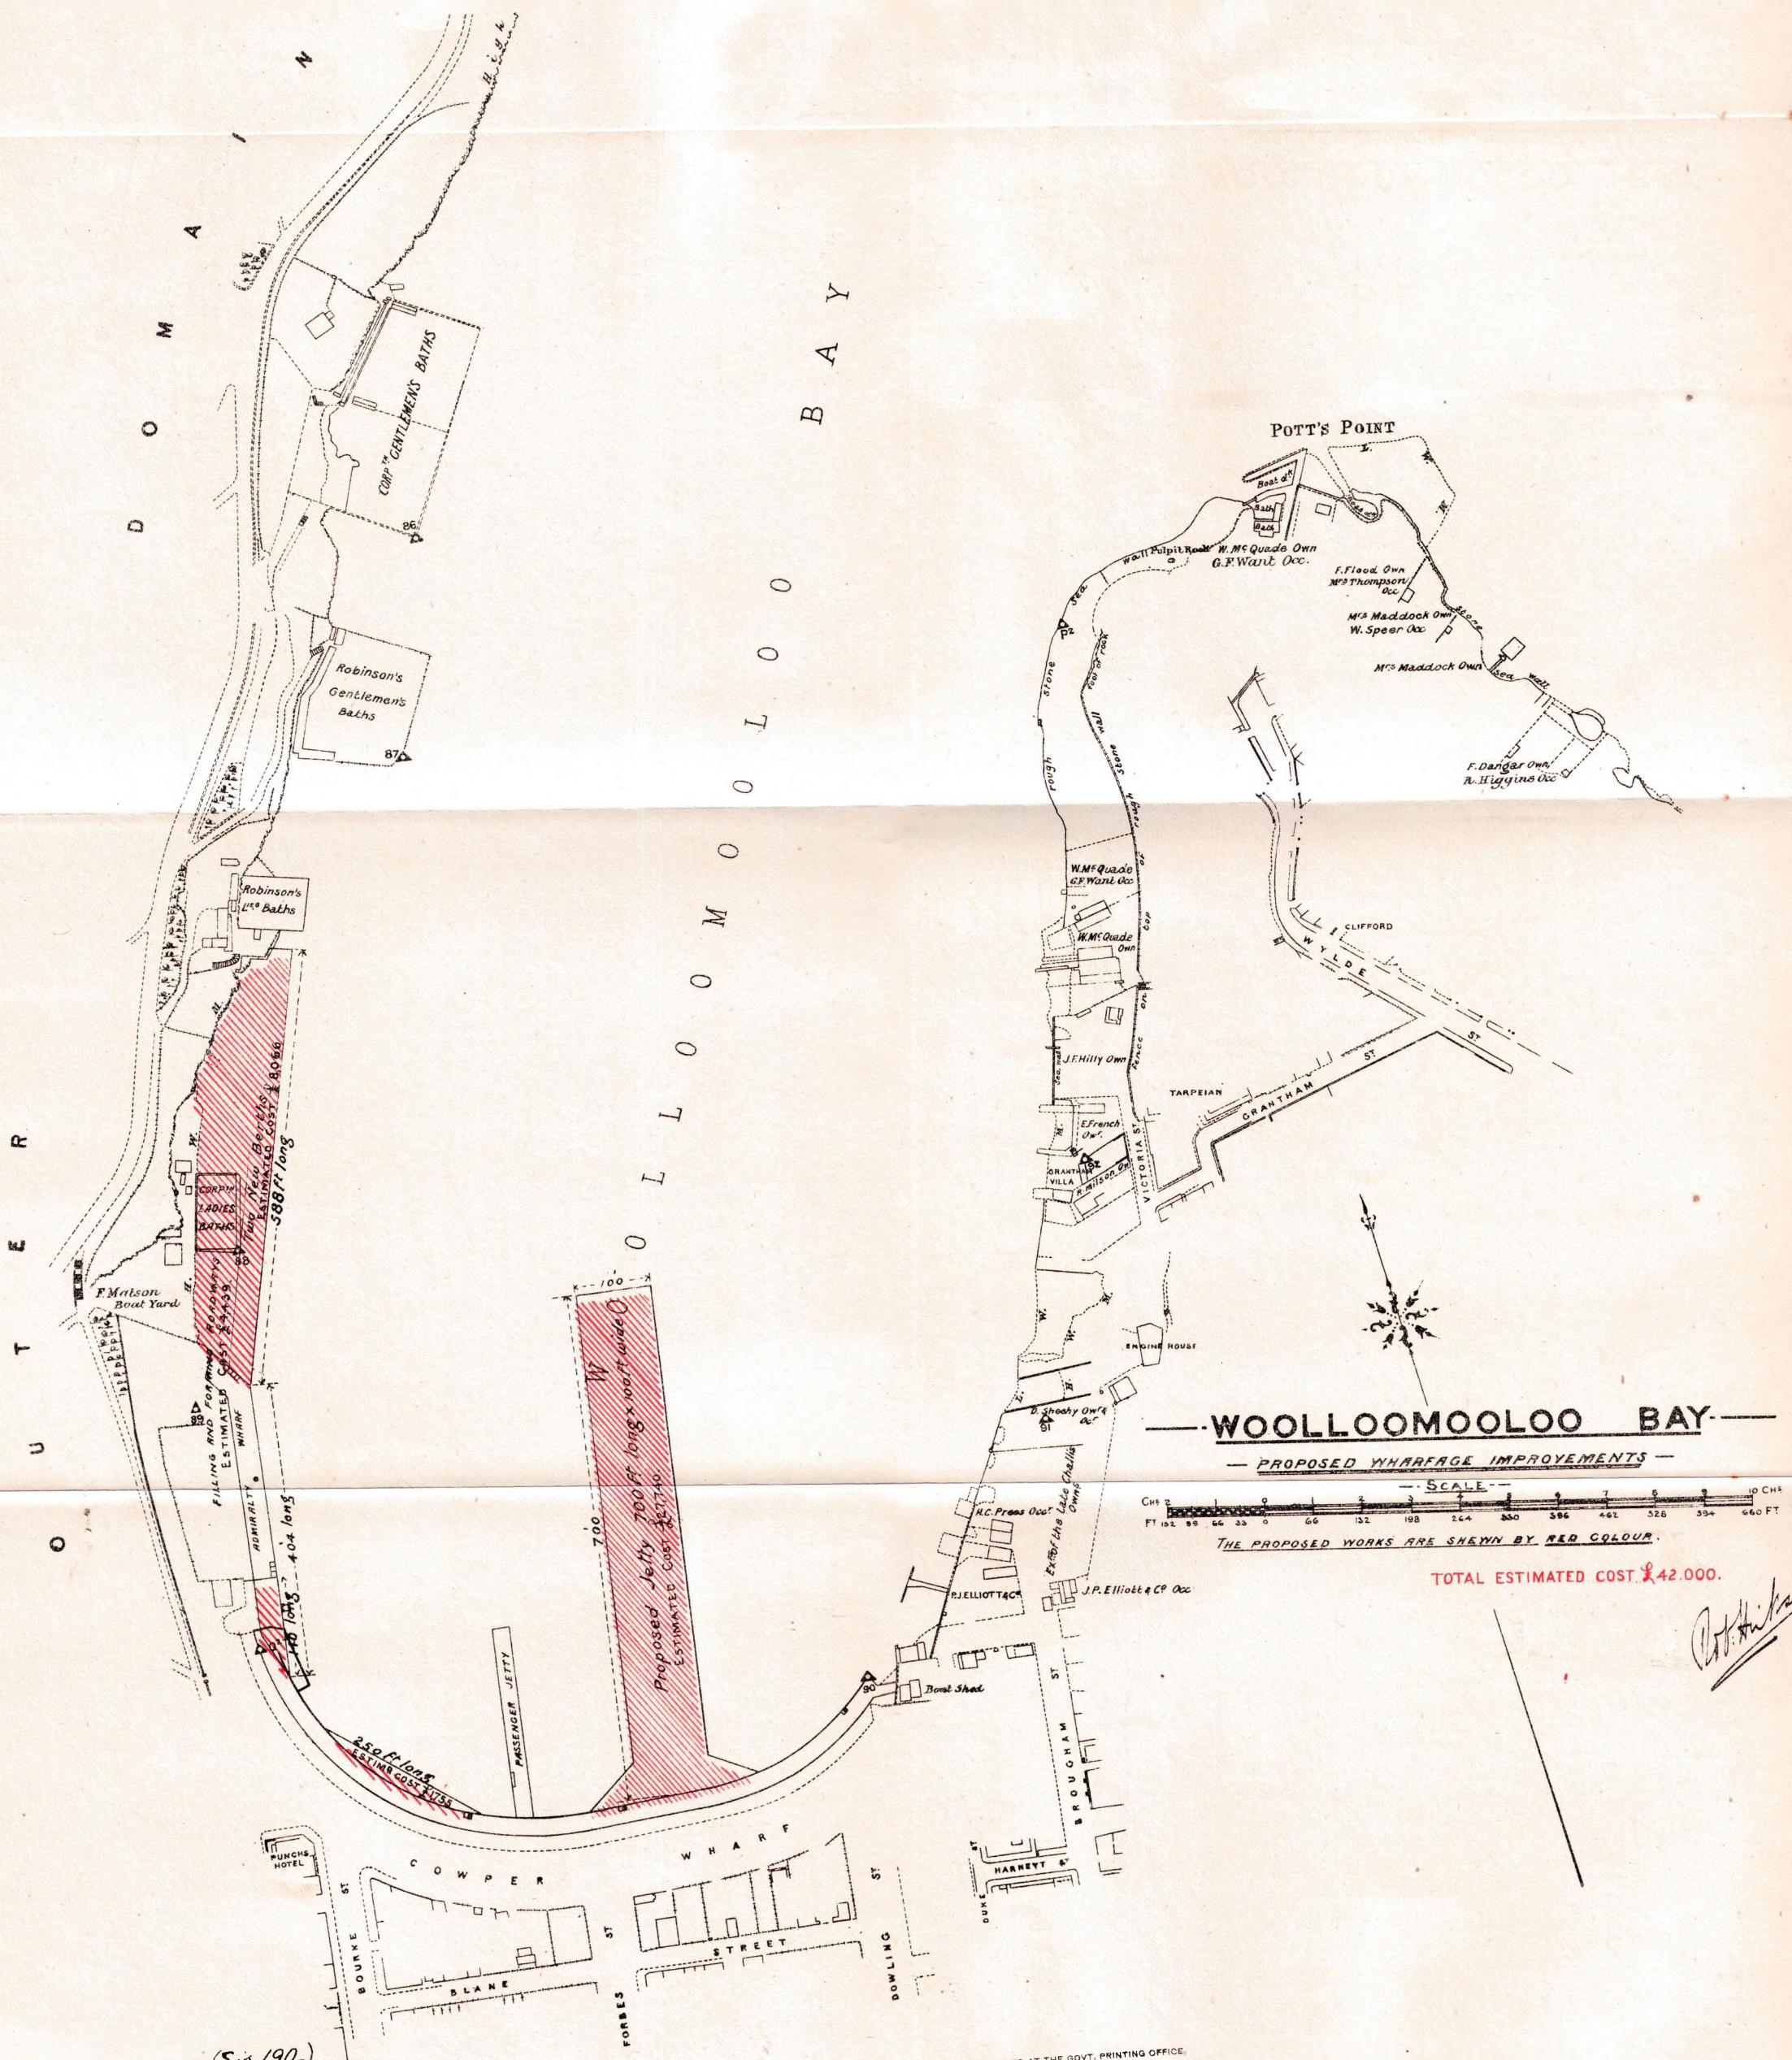

I have, &c.,

H. FAIRFAX,

Rear-Admiral and Commander-in-Chief.

His Excellency the Right Honorable Lord Carrington, G.C.M.G., &c., &c., &c.,
Governor and Commander-in-Chief, New South Wales.

O U T E R D O M A I N

No. 1.

Messrs. Flood & Co. to The Colonial Treasurer.

Sir,

Blackwall Stores, Circular Quay, 3 May, 1888.

In view of the approaching wool season, we beg to offer to rent from you, for a short or long term, as you may elect, either the whole or portion of shed on northern jetty at old A.S.N. Co's. premises.

We shall require additional accommodation and greater facilities for getting away the wool during the coming season, and do not wish to seek for same outside the Circular Quay, where we have for so many years carried on the whole of our business.

We trust you will look favourably on our application, and let us know early on what terms you will be inclined to let above premises.

We remain, &c.,
FLOOD & CO.

Manager, Circular Quay.—G.E., B.C., 4/5/88.

No. 2.

Report by Captain J. Jackson, Manager of Public Wharves.

Circular Quay, 7 May, 1888.

DURING the wool season, from September to February, only about one-half of the extensive sheds on the late A.S.N. Company's property will be required for import goods, as nearly the whole of the wharf accommodation will be taken up by vessels loading outwards; and also, taking into consideration the large amount of revenue that would be lost to the Quay if this firm removed their business to another wharf, I would recommend that 264 feet of the northern end of these sheds be leased to Messrs. Flood & Co. for three years, but only for six months of each year, from the 1st of September to the 1st of March, at a yearly rental of £200, on condition that any alteration they may require to make the sheds suitable for carrying on their business be done at their own expense, and that they insure that portion of the shed used by them in the amount of £2,000.

The Under Secretary for Finance and Trade.

J.J.

Approved.—J.F.B., 11/5/88.

No. 3.

The Under Secretary for Finance and Trade to Messrs. Flood & Co.

Gentlemen,

The Treasury, New South Wales, Sydney, 19 May, 1888.

I have the honor, by direction of the Colonial Treasurer, to acknowledge receipt of your letter of 3rd instant, and to inform you, in reply, that he is willing to grant you a lease of 264 feet of the northern end of the shed upon the late A.S.N. property, upon the following terms, namely:—

- (1.) The lease to be for the period from 1st September to 1st March in each of the years 1888-9, 1889-90, 1890-1, *i.e.*, three years.
- (2.) The rent to be £200 for each half-yearly period.
- (3.) Any alterations required in the sheds, to fit them for your purposes, to be carried out at your own cost, and only after leave obtained from the Government.
- (4.) The portion leased to you to be insured by you in a sum of £2,000 (two thousand pounds).

Awaiting your reply.

I have, &c.,
G. EAGAR.

No. 4.

Messrs. Flood & Co. to The Under Secretary for Finance and Trade.

Sir,

Blackwall Stores, Circular Quay, Sydney, 23 May, 1888.

We are in receipt of your letter of the 19th instant, in answer to our application of 3rd instant, for lease of shed on late A.S.N. property.

Considering we shall be at great expense making the premises suitable to our business, and that you will have the benefit of same for half the year, we think that £100 for the half-year would be an adequate rent.

We are prepared to accept a lease for three years, and also to keep the premises insured during our term in a sum of £2,000.

Kindly give this matter your early attention, and oblige,—

Yours, &c.,
FLOOD & CO.

Approved.—J.F.B., 25/5/88.

No. 5.

The Under Secretary for Finance and Trade to Messrs. Flood & Co.

Gentlemen,

The Treasury, New South Wales, Sydney, 29 May, 1888.

I am directed by the Colonial Treasurer to acknowledge the receipt of your letter of the 23rd instant, in reply to Treasury communication to you of 19th idem, and to state that he is prepared to accept the rent named therein.

A lease will be forwarded to you for execution in due course.

I have, &c.,
F. KIRKPATRICK,
(For the Under Secretary).

No. 6.

Agreement to let and take.

WE hereby agree to let and take the following premises, namely:—264 (two hundred and sixty-four) feet of the northern end of the shed upon the Government property at the Circular Quay, formerly known as the A.S.N. Co. Wharf—upon the following terms and conditions, namely:—

- (1.) The occupancy to be for the period from 1st September to 28th February, both days inclusive, in each of the years 1888-9, 1889-90, and 1890-1, to commence from the 1st September now next ensuing. At the end of each half-yearly period the premises revert to the lessor, until the commencement of the next following half-yearly period.
- (2.) The rent to be one hundred (£100) for each six months' term, and to be paid in advance to the Manager of the Circular Quay.
- (3.) If rent remains unpaid for seven days after demand, the lessor may enter upon the property, and the lessee to remove without prejudice.
- (4.) The lessee shall not re-let the whole or any part of the property leased without permission from the lessor.
- (5.) The lessee to keep the property in repair, ordinary wear and tear excepted.
- (6.) Any alterations required by lessee shall be carried out at his own expense, and the character of them shall be subject to the approval of the lessor.
- (7.) The lessee shall insure the property for a sum of two thousand pounds (£2,000), and shall keep the same insured during the currency of this lease; premium receipts to be lodged with lessor.

As witness our hands, this 14th day of August, 1888,—

Witness: JOHN JACKSON.

FLOOD & CO.,
Tenant.

For the Government of New South Wales.

J. F. BURNS,
Colonial Treasurer,

Witness: G. EAGAR.

Landlord.

No. 7.

Memorandum from Messrs. Flood & Co. to Captain Jackson.

Dear Sir,

17 Loftus-street, Sydney, 28 November, 1888.

In answer to your inquiry *re* wool through our portion of the sheds leased from the Government at the old A.S.N. Co.'s wharf, we estimate that the number of bales shipped through the above sheds will be about 100,000 for the six months.

Yours truly,
FLOOD & CO.,
(Per H. J. KING).

No. 8.

Report from Captain Jackson, Manager of the Public Wharves.

Lease to Messrs. Flood & Co. of Stores at the Circular Quay. (Supplementary to the answers made to questions by Mr. Melville, M.P., on 20th November last.)

Sir,

Circular Quay Office, 29 November, 1888.

In answer to your verbal inquiry I have the honor to state for the information of the Honorable the Colonial Treasurer, that apart from the rent paid by Messrs. Flood & Co. for a portion of the shed on the late A.S.N. Company's wharf, that firm will ship through this shed about 100,000 bales of wool (*see* memorandum herewith); this, at 4d. per bale, will give wharfage amounting to £1,666 13s., and to this must be added about £900 tonnage dues on vessels loading this wool, giving a revenue through leasing this shed of about £2,666 for six months. I beg further to state for the information of the Colonial Treasurer that, prior to taking the above wharf over on the 1st July last, it was leased to Messrs. Burns, Philp, & Co., at an annual rental of £8,000 exclusive of the stores, the annual rental for these amounted to £5,450, making the gross income from the whole of this property prior to the wharf being worked by the Government £13,450.

As this property has only been in my charge from the 1st of July last, I can only give the income that will be derived for the six months ending December 31st, as follows:—Wharfage and tonnage dues, £6,200; rent of stores, £1,800—to this must be added the annual value of stores and offices occupied by Government Department, £3,600; making the gross income from this property for the six months ending December 31st, £9,800, or £19,600 per annum, about 7½ per cent. on the cost of the property. The gross revenue from the Quay for the current year (inclusive of the above wharf) will amount to over £42,000.

I have, &c.,
JOHN JACKSON,
Manager.

The Under Secretary for Finance and Trade.

1888.

NEW SOUTH WALES.

AUSTRALIAN MUSEUM.

(REPORT OF THE TRUSTEES FOR 1887.)

Presented to Parliament, pursuant to Act 17 Vic. No. 2, sec. 9.

TO HIS EXCELLENCY THE GOVERNOR AND EXECUTIVE COUNCIL,—

The Trustees of the Australian Museum, incorporated by the Act 17 Victoria No. 2, have the honor to submit to your Excellency in Council, in accordance with the 9th section of that Act, this their thirty-fourth Annual Report.

1. The hours during which the Museum is open to the public have continued to be, as in previous years, from 10 until 5 o'clock (or in summer till 6 o'clock) daily, except on Mondays, when it is closed for the necessary purposes of cleansing, and except on Sundays, when the hours are from 2 o'clock only to 5. The record of the number of visitors in 1887 shows a decrease, the total number being 122,799, as against 127,231 in 1886. The largest attendance on one day was 2,658, namely, on Monday, the 3rd October; and the largest Sunday attendance was 1,233, on the 17th July. The average daily number throughout the year was 330 on week-days and 709 on Sundays. The orderly conduct of the visitors on all these occasions, and the apparently intelligent interest taken by a large portion of them in the exhibits, afford gratifying evidence of their value, as affording not merely amusement but also useful instruction.

2. The collections are still being increased, mainly by purchases, exchanges, and donations, but also by our collecting and dredging expeditions. A list of these additions, under their separate heads, with a report by the Curator, will be found in Appendices IV, V, VI, VII. An expedition, under the charge of Messrs. Cairn and Grant, to the Bellenden Ker Ranges, in Northern Queensland, resulted in obtaining for the Museum about sixty-eight species (198 specimens) of birds, and eleven species (35 specimens) of mammals, seven of which are new to the Museum, and three are new to science; besides a number of insects and other invertebrates. A list of these will be found in Appendix IX. The Trustees were enabled also during the year to send an expedition to Lord Howe Island, in company with the Visiting Magistrate, Mr. H. T. Wilkinson. Advantage was taken of this official visit, and Messrs. Etheridge, Thorpe, and Whitelegge were instructed by the Trustees to proceed there. A report of the expedition forms Appendix X, and a fuller account of the natural history of this interesting island will shortly be issued as a separate publication.

3. The Ethnological Hall referred to in last year's report has been fitted up with cases, and the valuable Ethnological collections, mostly acquired during recent years, are arranged there. It is anticipated that this will prove to be not the least interesting portion of the Museum. The removal of this collection to the new hall has cleared the galleries in the old wing, which are now being used temporarily for the display of foreign mammals and other specimens not of local interest. It has been found necessary to use a portion of the old wing for books for which there is no room in the Library, and one end of it has accordingly been fitted up with book-cases. Ultimately this wing is intended to be for the reception of the Geological Collections, but as no money has been allowed by the Government for cases during the present year, the work of fitting it up for their exhibition is necessarily postponed. The officers of the Institution are still suffering much inconvenience, and their work is in no small degree retarded, by reason of the want of additional accommodation.

1—A

1 <i>Gryllus</i> sp.	
1 Chrysalis of <i>Danais plexippus</i> , L.	Miss Hall
1 <i>Macrotoma</i> sp.	Master Haughton.
4 <i>Galerucella semipullata</i> , Ch.	Mr. A. Habbe.
1 <i>Chærocampa scrofa</i> , Bois	}
1 <i>Xylotrupes australicus</i> , Th.	
Small collection from Norfolk Island	Mr. James Henry.
1 <i>Belostoma indicum</i> , St. F. & S.	Mr. C. Hedges.
1 Larva of <i>Pielus</i> sp.	Mrs. Kidd.
1 Larva of <i>Sequosa triangularis</i> , Don	Mr. J. G. Lodwidge.
1 <i>Dasypodia selenophora</i> , Gn.	Mr. Chas. Moore.
1 Mantis sp.	Miss Manning.
1 <i>Carenum marginatum</i> , Bd.	Mr. E. J. B. M'Kenna.
Collection of Sydney Lepidoptera	Mr. J. A. Millington.
6 <i>Anobium paniceum</i> , F.	Mr. J. M'Creedy.
1 <i>Antheræa eucalypti</i> , Sc.	Mr. A. S. M'Gowan.
1 <i>Sequosa triangularis</i> , Don	Mr. W. A. Nicholas.
1 <i>Metamimas australasiæ</i> , Don	}
1 <i>Rhytiphora</i> sp. nov.	
Collection of Coleoptera	Mr. A. S. E. Peer.
1 <i>Chærocampa erotus</i> , Cr.	}
1 <i>Corydalis</i> sp.	
1 <i>Chærocampa celerio</i> , L.	Mr. P. R. Pedley.
1 <i>Chelepteryx collesii</i> , G. & cocoon... ..	}
1 <i>Perga</i> sp.	
1 <i>Danima banksiæ</i> , Don	Mr. T. Ranft.
1 <i>Percosoma</i> sp.	}
1 <i>Belostoma indicum</i> , St. F. & S.	
	Mr. J. H. Rose.
	Mr. A. W. Robey.
	Mr. S. W. Spain.
	Mr. J. M. Stevens.
	Mr. F. A. A. Skuse.
	Mrs. Schofield.
	Mr. H. Smithurst.
	Mr. Thos. Thorburn.

Specimen.	Donor.
<i>Minerals, &c.—continued.</i>	
Gem sand from diamond-fields at Mittagong	Mr. J. P. Fisher
Arsenical pyrites	Mr. J. J. Finn.
Auriferous and argentiferous ores, including gossan, cerussite, anglesite, pyromorphite, chloride of silver, gold, &c.	Mr. R. Hellyer.
6 Opals	Mr. F. F. Hoddinott.
Quartz crystals	Mr. M'Cooley.
Sandstone nodules	Mr. R. Male.
2 Specimens quartz, with gold	Messrs. Moss and party.
Various eruptive rocks and copper ore	
17 Specimens of eruptive and metalliferous rocks, including chlorite, copper pyrites, and arsenical pyrites	Mr. L. Nicholson.
Alluvial sand	
Magnetic iron	
Zircon (red), &c.	Mr. Pender.
Titanic iron	
Olivine (green)	
Axinite crystals	
Chabasite	
Molybdenite	
Tin-ore crystals	
Zircons	
Hyalite	
Diorite	Mr. D. A. Porter.
Mesotype in granite	
Stalactitic manganese ore	
Stibnite	
Titanic iron	
Analcite and chabasite	
Albite	
Hornblende crystals	
Specimens of copper ore	Mr. E. A. Rennie.
Agate pebble	Mr. E. M. Ryan
Auriferous quartz with mispickel	Mr. F. Ratte
Copper pyrites	
Galena	Mr. Steverlynck
Azurite	
A collection of rocks and minerals, illustrating the mode of occurrence of the diamond, with section of diamondiferous ground	Mr. J. W. Stone.
Cast of a large diamond	
Copper ore	
Iron ore	Mr. H. E. Stephenson.
Galena	
Collection of minerals	Mr. H. Smithurst.
Arragonite, in basalt	Mr. Scarr.
Alluvial gold, washdirt and decomposed granite	Mr. S. Sinclair.
Auriferous pyrites in quartz and burnt sand	
Dendritic gold in arsenical pyrites	Mr. Jack Smith.
Dendritic gold in serpentine	
2 Specimens of eruptive rocks	Mr. G. Troy.
2 Specimens of copper pyrites and gold	Mr. M. Walsh.
Crystal of tin-stone	
Quartz, with chlorite schist and pyrites	Mr. Woodford.
Pebbles of pink and white and pink limestone	
Graphite	Mr. Chas. Wooller.
Fluor spar	
Silicified wood	Mrs. E. Selkirk.
Calcareous deposit	
Myeline and other minerals	
Black sand, composed mostly of titanite iron with zircons	Mr. Richardson.
<i>Fossils.</i>	
Leaves (Daphnogene sp.)	Mr. W. Cumberland.
11 specimens fossil fish	Mr. A. Harber.
29 Permo-Carboniferous Brachiopoda, from Bowen River Coal-field, N. Q.	Mr. R. L. Jack.
34 Permo-Carboniferous Brachiopoda, from Mount Britton, N. Q.	
Fossil nut (concretion)	Mr. C. Kent.
Fern (Cycadopteris scolopendrina)	
Fish (Myriolépis sp.)	
Phacops caudatus	Mr. Kershaw.
Lower jaw of Nototherium	Mr. J. M'Master.
12 Specimens Permo-Carboniferous Brachiopoda	Mr. A. L. Morrissett.
1 Bivalve—Carboniferous	
1 Slab Brachiopoda	Mr. L. Nicholson.
Slab of stone showing fossils, viz., Gervillia, Trigonia, Ammonites, &c.	Hon. R. H. D. White.

Specimen.	Donor.	
<i>Ethnology.</i>		
Antiquities from Egypt	Egypt Exploration Fund.	
1 Tomahawk	Bundaburah Creek, N.S.W.	
1 Hammer		Mr. A. B. Ferrie.
1 Piece of tappa	British New Guinea	
2 Native dresses		Rev. W. Wyatt Gill.
1 Piece of native cord	Mauihiki, Harvey Group of Islands	
1 Girdle worn (anciently) by women after confinement to support and compress the abdomen.		Rev. W. Wyatt Gill.
3 Stone implements	New South Wales.	
6 Boomerangs		Mr. M'Cooley.
1 Shield		
9 Nulla nulla		
1 Food bowl from Solomon Islands	Lieut. Roche, R.N.	
1 Tomahawk	South Australia	
1 Stone for pounding grass seed		Mr. H. Shaw.
1 Stone axe	Viti or Fiji Islands	
1 Spear		Mr. H. E. Stephenson, J.P.
1 Etruscan armlet about 2,500 years old	Mr. Thomas Steel.	
1 Stone axe from June, N.S.W.	Mr. R. H. D. White.	
	Mr. Robt. Whitley.	
<i>Botanical.</i>		
1 Net fungus	Miss Agnes Copeland.	
1 Ball-nut fungus (<i>Ileodicyon gracile</i>)	Mr. Fry.	
1 Sample of gum	Mr. J. S. Skeet.	
2 Ball-nut fungus (<i>Ileodicyon gracile</i>)	Mr. G. Twemlow.	
<i>Medals.</i>		
1 Bronze medal—commemorative of the reception of H.R.H. Prince Albert Victor of Wales on the occasion of his receiving the Freedom of the City	Corporation, City of London.	
1 Bronze medal	Indian and Colonial Exhibition Commissioners.	
1 Diploma		
<i>Historical.</i>		
Historical relics	Mr. E. E. Lovett.	
Invitation Ticket, dated 12th July, 1814, to a dinner given by the officers of the late Royal British Volunteers to the non-commissioned officers and men	Mr. H. Small.	
Old newspaper—"London Packet," November, 1805	Mr. A. Stevens.	
4 Old French bank notes, 1792-93	Mr. W. H. Vosper.	
<i>Miscellaneous.</i>		
Hair-ball taken from sheep	Mr. B. B. Banes.	
Echidna eggs	Mr. C. Cropper.	
<i>Books for the Library.</i>		
1 Catalogue of the Library	Linnean Society of London.	
Catalogues of Books in the Departments of Zoology, Mineralogy, and General Library	Trustees of the British Museum.	
Catalogue of Fossil Mammalia. Part 4		
Various other Catalogues	N.Z. Institute and Colonial Museum.	
Official Record N.Z. Industrial Exhibition		
Transactions, vol. 19	Government Printer, Sydney.	
Brown: Manual of N.Z. Coleoptera. Parts 1-4		
Royal Commission—Conservation of Water, 1, 2, 3 Reports	Government Printer, Melbourne.	
Proceedings, Geographical Society of Australasia		
Census of Plants of N.S.W. Moore, 1884	Smithsonian Institute, Washington.	
Railway Guide, 1886		
Reports on Geological Surveys, 1851, &c.	Indian Museum, Calcutta.	
Reports on Lord Howe Island		
Spruson on Norfolk Island	Academy of Natural Sciences, Philadelphia.	
Curr's Australian Race		
Annual Report, 1884 (in 2 parts)	University of Sydney.	
Annual Report, 1885-6		
Lyddeker: Catalogue of Pre-historic Vertebrata	J. Brazier.	
Proceedings, 1871 to 1886		
Catalogue of Library	Free Public Library, Sydney.	
Calendar, 1887		
Trochidæ and other Genera of S.A. Part 1		
Sundry Exhibition Catalogues		
Supplement to Catalogue, 1888		
Reports, 1885-6-7		

Specimen.	Donor.

APPENDIX VI.

EXCHANGES.

Received from—	Forwarded to—
The Geographical Society of Australia.	
Birds :—6 species—6 specimens.	Collecting material.
Mr. James Dall, New Zealand. (5, 37.)	
Mammals :—1 species—1 specimen.	Birds :—35 species—36 specimens.
Birds :—16 species—21 specimens.	Birds' Eggs :—14 species—27 specimens.
Birds' Eggs :—A few specimens.	Mollusca :—84 species—227 specimens.
Insecta :—A few specimens.	Minerals :—4 species—5 specimens.
Mollusca :—A small collection.	
Echinodermata :—5 species—5 specimens.	
Queensland Museum, Brisbane. (19.)	
Birds :—2 species—2 specimens.	Casts :—18 specimens.
Fishes :—1 species—2 specimens.	
Hospital for Insane, Gladesville. (30.)	
Birds :—1 species—2 specimens.	Sundries.
L. Taizanowstki, Warsaw. (36.)	
Birds :—87 species—102 specimens.	
Royal Museum, Florence (Italy). (28.)	
Fishes :—32 species—34 specimens.	Zoophytes :—2 species—56 specimens.
	Ethnology—106 specimens.
Tasmanian Museum, Hobart. (1, 10, 22, 34.)	
Fishes :—13 species—17 specimens.	Reptiles :—3 species—3 specimens.
Fossils :—40 species—115 specimens.	Fishes :—8 species—8 specimens.*
	Skeletons :—4 species—4 specimens.
	Casts :—20 specimens.
	Ethnology :—1 specimen.
	Bottles (stoppered) :—3 dozen.
	Tubes (glass) :—2 dozen.
Mr. R. H. Newman, Tumut. (8.)	
Minerals :—Specimens of ores and rocks.	Books :—8 catalogues.
Mr. B. Dunstan, Sydney. (7.)	
Fossils :—A collection.	Minerals :—30 specimens.
Mr. F. M'Knight, Melbourne. (14.)	
Fossils :—5 species—18 specimens.	Fossils :—10 specimens.
Mr. E. W. Thompson, Sydney. (26.)	
Fossils :—20 species.	Minerals :—Sent in 1888.
Mr. George Blackmore, Sydney. (25.)	
Minerals :—17 specimens.	Minerals :—24 specimens.
Mr. J. Waterhouse, West Maitland. (24.)	
Fossils :—57 species.	
Natural History Museum, Newcastle-on-Tyne. (11.)	
	Mollusca :—21 specimens.
Royal Museum, Brussels. (21.)	
	Casts :—18 species—20 specimens.
Linnaea Naturhistorisches Institut, Berlin.	
Return to be made in 1888.	Mammal :—1 species—1 specimen.
Zoological Station, Naples. (4.)	
	Mammals :—4 species—4 specimens.
	Fishes :—6 species—6 specimens.
Professor Parker, Dunedin. (18.)	
	Mammal :—1 species—1 specimen.
Public Library, Art Gallery, and Museum of South Australia, Adelaide. (9.)	
	Birds :—2 species—3 specimens.
	Fish :—1 species—1 specimen.

Received from—	Forwarded to—
British Museum, London. (21.)	Mollusca :—1 species—60 specimens. Echinodermata :—2 species—2 specimens. Zoophyta :—1 species—3 specimens. Actinozoa—7 species—7 specimens.
Stavenger Museum, Norway. (29.) Collection of Norwegian birds.	Birds :—23 species—27 specimens.
Zoological Society, London. (31.) Specimens formerly received.	Birds :—1 species—2 specimens (alive).
Academy of Natural Science, Philadelphia. (33.) Books—Proceedings.	Books—Various publications.
Mr. H. Seebohm, London. (40.) Large collection of birds received in 1883.	Birds :—19 species—36 specimens.
Professor H. A. Ward, New York. (41.) Returns promised.	Echinodermata :—9 species—57 specimens.
Educational Museum, Tokyo, Japan. (42.) Fishes, &c., promised.	Birds :—125 species—169 specimens.
The University, Sydney. (27.)	Mammals :—2 species—2 specimens. And sundries, for anatomical purposes.
The N.S.W. Commissioners of the Adelaide Jubilee Exhibition. (16, 17.)	7 mounted groups of birds, &c. 22 mounted specimens of marsupials. 27 mounted specimens of birds. 3 mounted specimens of reptiles.

APPENDIX VII.

ADDITIONS TO THE MUSEUM LIBRARY, 1887.

Reg. No.	Book.
CLASS A.	
2217-18	Hudson (C. T.) and Gosse (P. H.) The Rotifera; or, Wheel Animalcules. 1 vol. text. 1 vol. plates. London, 1886. 2 vols. 4to.
2219-23	Gwyn Jefferies (J.) British Conchology; or, an Account of the Mollusca which inhabit the British Isles and the Surrounding Seas:— Vol. 1—Land and Fresh-water Shells. London, 1862. Vol. 2—Marine Shells. London, 1863. Vol. 3 " " 1865. Vol. 4 " " 1867. Vol. 5 " " 1869. 5 vol. 8vo.
2234	Sowerby (J. de C.) and Lear (Ed.) Text by J. S. Gray. Tortoises, Terrapins, and Turtles, drawn from life. London, 1872. 4to.
2235-6	Sowerby (J.) and Sowerby (G. B.) The Genera of Recent and Fossil Shells, for the use of Students. London, 1820-25. 2 vol. 8vo.
2241	Leuckart (R.) Trans. by W. E. Hoyle. The Parasites of Man. Edinburgh, 1886. 8vo.
2246-52	Bertkau (Philipp). Bericht über die Wissenschaftlichen Leistungen im Gebiete der Entomologie. Berlin, 1846-84. 7 vols. 8vo.
2257	Bertkau (Philipp). Bericht über die Wissenschaftlichen Leistungen im Gebiete der Entomologie. 1838-45. Berlin, 1840-47. 1 vol. 8vo.
2258-9	Marshall (G. F. L.) and Niceville (L. de.) The Butterflies of India, Burmah, and Ceylon. Calcutta, 1882-6. 2 vols. 8vo.
2296	Tryon (G. W.) Manual of Conchology; Structural and Systematic, with Illustrations of the Species. Vol. 8. Naticidæ, &c. Philadelphia, 1886. 8vo.
2297	Tryon (G. W.) Manual of Conchology; Structural and Systematic, with Illustrations of the Species. Second series. Vol. 2, Zonitidæ. Philadelphia, 1886. 8vo.
2342	Bewick (T.) A General History of Quadrupeds. Newcastle-on-Tyne, 1790. 8vo.
2349	Gray (J. E.) Synopsis of the Species of Whales and Dolphins in the Collection of the British Museum. London, 1868. 4to.

Reg. No.	Book.
CLASS A.— <i>continued.</i>	
2351-3	Lischke (C. E.) <i>Japanische Meeres Conchylien. Ein Beitrag zur Kenntniss der Mollusken Japans mit Besonderer Rücksicht auf die Geographische Verbreitung derselben.</i> 1st, 2nd, 3rd Theil. Coloured plates. Cassel, 1869-1874. 3 vols, 4to.
2354	Corse (John). <i>Observations on the Different Species of Asiatic Elephants and their mode of dentition.</i> 1799. 4to.
2335	Tomes (John). <i>On the structure of the Dental Tissues of the order Rodentia.</i> 1850.
	Tomes (John). <i>On the Structure of the Dental Tissues of Marsupial Animals, and more especially of the Enamel.</i> 1849. In 1 vol. 4to.
2363	Miall (L. C.) and Denny (A.) <i>The Structure and Life History of the Cockroach (Periplaneta Orientalis), an introduction to the Study of Insects.</i> London and Leeds, 1886. 8vo.
2364	Pfeiffer (L.) and Clessin (S.) <i>Nomenclator Heliceorum Viventium.</i> Cassellis, 1878. 8vo.
2365	Blyth (E.) Enlarged by W. B. Tegetmeier. <i>The Natural History of the Cranes.</i> London, 1881.
	Coues (E.) U.S. Northern Boundary Commission. <i>Natural History. No. 1. On the Muridæ.</i> Philadelphia, 1874. In 1 vol. 8vo.
2367	Allen (H.) <i>Smithsonian Miscellaneous Collections. No. 165. Monograph of the Bats of North America.</i> Washington, 1864. 8vo.
2368	Wallace (A. R.) <i>Various papers (9).</i>
	Clarke (J. W.) <i>On the Eared Seals of the Auckland Islands.</i> 1873. In 1 vol. 8vo.
2369	Cuvier (Baron G.) <i>The Animal Kingdom, arranged according to its organisation. A new Edition, with Additions by W. B. Carpenter and J. O. Westwood.</i> Wood and steel engravings. London, 1849. 8vo.
2372	Gould (John). <i>Introduction to the Trochilidæ, or Family of Humming Birds.</i> London, 1861. 8vo.
2373	Gould (John). <i>A Century of Birds from the Himalaya Mountains.</i> London, 1832. Imp. fol.
2410	Gould (John.) <i>A Monograph of the Trochilidæ or Family of Humming Birds, completed after the author's death by R. B. Sharpe.</i> Supplement, coloured plates. London, 1887. Fol.
2377	Tugwell (Rev. Geo.) <i>A Manual of the Sea Anemones commonly found on the English Coast.</i> London, 1856. 8vo.
2378-9	The Gardens and Menagerie of the Zoological Society delineated:— Quadrupeds, vol. 1. 1830. Birds. 1831. 2 vols. London, 1830-1. 8vo.
2404	Bleeker (P.), <i>Works on Ichthyology by.</i> Vol. 1 contains 22 papers.
2405	Vol. 2 contains 9 papers.
2406	Vol. 3 contains— <i>Enumeratio speciemum piscium hucusque in Archipelago Indico observatarum petro Equite a Bleeker.</i> Batavia, 1859. <i>Ichthyologia Archipelagi Indici prodromus petro Equite a Bleeker.</i> Batavia, 1860. 4to.
2412	Römer (Eduard.) <i>Monographie der Molluskengattung Venus Linné.</i> Band II. Cassel, 1864. 4to.
2416-7	U.S. Commission of Fish and Fisheries.
	Goode (G. B.), Editor. <i>Fisheries and Fishery Industries of the United States. Section 1, Natural History of useful Aquatic Animals.</i> Text 1 vol. Atlas with 277 plates, 1 vol. Washington, 1884. 2 vols. 4to.
2429-33	Shaw (G.) <i>General Zoology:—</i> Vol. 1 part 2, vol. 2 part 1, vol. 3 part 1, vol. 4 parts 1 and 2. 5 vols. 8vo.
2434	Brown (Captain Thos.) <i>The Book of Butterflies and Moths.</i> London, 1843. 12mo.
2435	British Birds. <i>The Water Birds.</i> Religious Tract Society. London. 12mo.
2451-76	<i>Systematisches Conchylien Cabinet von Martini und Chemnitz.</i> 26 vols. 4to.
	Band I Abt. 12— <i>Helix</i> , by L. Pfeiffer; <i>Anostoma</i> , by Fischer; <i>Boyssia</i> , by L. Pfeiffer; <i>Tomigerus</i> , by Spix; <i>Proserpina</i> and <i>Streptaxis</i> , by Gray.
	,, 12— <i>Helix</i> , IV Theil, by L. Pfeiffer.
	,, 13— <i>Bulimus</i> , <i>Partula</i> , <i>Achatinella</i> , <i>Achatina</i> , and <i>Azeca</i> , by L. Pfeiffer.
	,, 14— <i>Clausilia</i> , by C. H. Kuster; 15— <i>Pupa</i> , <i>Vertigo</i> , <i>Megaspira</i> , <i>Balea</i> , and <i>Tornatellina</i> , by C. H. Kuster.
	,, 15A— <i>Cylindrella</i> , by L. Pfeiffer; 16— <i>Carychium</i> , <i>Scarabus</i> , <i>Auricula</i> , and <i>Jamina</i> , by C. H. Kuster.
	,, 17— <i>Physa</i> , and <i>Planorbis</i> , by S. Clessin; 17B— <i>Limnæus</i> , <i>Amphipeplea</i> , <i>Chilina</i> , <i>Isidora</i> , and <i>Physopsis</i> , by C. H. Kuster.
	,, 18— <i>Trochatella</i> , <i>Helicina</i> , and <i>Lucidella</i> , by L. Pfeiffer; 19— <i>Cyclostoma</i> , <i>Choanopoma</i> , <i>Cyclophorus</i> , <i>Leptopoma</i> , <i>Megalomastoma</i> , <i>Pupina</i> , <i>Callia</i> , <i>Pomatias</i> , <i>Aulopoma</i> , <i>Craspedopoma</i> , <i>Myxostoma</i> , <i>Pterocyclos</i> , <i>Acicula</i> , <i>Geomelania</i> , <i>Hydrocena</i> , <i>Cataulus</i> , <i>Diplommantina</i> , by L. Pfeiffer.
	,, 20— <i>Ampullaria</i> , by R. A. Philippi; 21— <i>Paludina</i> , <i>Hydrocena</i> , and <i>Valvata</i> , by C. H. Kuster; 22— <i>Rissoa</i> , and <i>Rissoina</i> , by H. C. Weinkauff.
	,, 23— <i>Paludinella</i> , by C. H. Kuster; 24— <i>Melania</i> and <i>Melanopsis</i> ; 25— <i>Paludomus</i> , by A. Brot.

Reg. No.

Book.

CLASS A—*continued.*

- 2451-76 Systematisches Conchylien Cabinet von Martini und Chemnitz—*continued.*
- Band II Abt. 1—Natica, and Amaura; 2—Turbo, by R. A. Philippi.
 „ 3—Trochus, and Xenophora; 4—Delphinula, Scissurella, Globulus, Rotella; 5—Phasianella, Bankivia, and Lacuna; 6—Adeorbis, Skenea, Orbis, and Fossarus; 7—Solarium; 8—Risella, by R. A. Philippi.
 „ 9—Litorina, by C. H. Kuster and R. A. Philippi; 10—Neritina; 10A—Navicella, by E. von Martens.
- Band III Abt. 1A—Buccinum, Purpura, Concholepas, and Monoceros; 1B—Cassis, Cassidaria, Oniscia, Dolium, Eburna, and Harpa, by C. H. Kuster.
 „ 1C—Buccinum II Theil, Eburna, Buccinum, Volutaharpa, Buccinopsis, Neobuccinum, by W. Kobelt; 1E—Ricinula, by C. H. Kuster.
 „ 2—Murex, Ranella, Triton, Trophon, and Hindsia, by C. H. Kuster and W. Kobelt.
 „ 3A—Turbinella, Fasciolaria, by H. C. Kuster; 3B—Ficula, Bulbus, Tudicla, Busycon, Neptunea, Euthria, and Fusus, by W. Kobelt.
- Band IV Abt. 1—Strombus, Pterocera, Rostellaria, and Chenopus, by C. H. Kuster; 2—Conea; 3—Dibaphus, by H. C. Weinkauff.
- Band V Abt. 1—Olivia; 1A—Ancillaria, by H. C. Weinkauff; 2—Terebra, Mitra, Voluta, and Cymbium, by C. H. Kuster.
 „ 3—Cyprea, and Ovula; 4—Marginella, and Erato, by H. C. Weinkauff.
- Band VI Abt. 1—Sigareta; 1A—Haliotis, by H. C. Weinkauff.
- Band IX Abt. 1—Anodonta, by S. Clessin.

APPENDIX VIII.

REPORTS OF SCIENTIFIC ASSISTANTS.

ICHTHOLOGICAL DEPARTMENT.—J. Douglas Ogilby, Assistant.—During the year the Museum has become richer by 640 specimens of fishes. Of these, 146 have been received as donations; 53 obtained by exchange with different museums, in which class a most valuable collection received from the Florence Museum, through Professor Giglioli, deserves special mention; 174 received from the Museum collectors, the greater part of which were brought from Lord Howe Island by Messrs. R. Etheridge and party; 115 obtained from the harbour by means of the trawl-net; and the remaining 152 obtained from different sources by purchase. Among the fishes received during the year, 13 have been described as new species.

ENTOMOLOGICAL

ENTOMOLOGICAL DEPARTMENT.—A. Sidney Olliff, Assistant.—During the past year 1,760 insects have been added to the collection, the various orders being represented as follows :—Lepidoptera, 865 ; Coleoptera, 845 ; Orthoptera, 30 ; Neuroptera, 10 ; and Homoptera, 10. Of these no less than 1,200 were contained in a collection purchased from Mr G. Firth, Hamilton, New South Wales, which is by far the most important accession for the year. Besides many rarities, the collection comprised a fine series of lignivorous lepidoptera, mostly from the Hunter River District. Valuable donations were received from Messrs J. H. Rose, A. J. Gambell, C. Wensley, H. Smithurst, A. S. Peer, and others. Another important donation is the collection obtained by Mr. J. A. Millington in Norfolk Island, which formed the basis of a recent report on the insect fauna of that island ; the collection contained 35 species, and yielded no less than 11 new to science, of which the types have been added to the Museum collection. During the year about 350 species were collected for the Trustees, including a series of 20 species obtained by Mr. Etheridge and party in Lord Howe Island ; 40 species collected at Lithgow by Mr. Grant ; and 120 at Cassilis, New South Wales, by Mr. Olliff. Among these a considerable number are new to the Museum collection.

CONCHOLOGICAL DEPARTMENT.—John Brazier, Assistant.—During the year ending 31st December, 1887, a large number of specimens have been presented, the most interesting being by Miss Stephen, consisting of 1,500 specimens from all parts of the world, many of them quite new to the collection. The most important purchase was the collection of the late Hon. E. K. Cox, containing about 60 species and 2,000 specimens, a number of rare volutidæ being additions to the general collection in this department. Eighty-four species, numbering 226 specimens, have been sent away in exchange to New Zealand.

MINERAL DEPARTMENT.—F. Ratte, Assistant.—Forty donors, from various parts of the Colony, have contributed a number of specimens, estimated at about 250 ; and about 100 specimens, partly from New South Wales, have been acquired either by exchange or purchase, while about 150 specimens have been collected, mostly in the west. The Australian collection of minerals is intended to comprise from 10,000 to 15,000 specimens, and to be classified so that, by its means, information upon the geological constitution and mineral productions of any part of New South Wales, or even Australasia, could be easily obtained by visitors. There is, however, much to be done before this result can be attained. The general collection of minerals, which included already over 2,200 specimens, mostly from Europe and America, has been increased by 210 purchased specimens, some of which are of great rarity and value.

ETHNOLOGICAL DEPARTMENT.—J. Brazier, Assistant.—During the year a large number (1,157) of specimens have been purchased to fill up gaps in this department. Specimens have been secured from the Lachlan River, N.S.W. ; Harvey Group of Islands ; Rapanui, or Easter Island ; British New Guinea ; Solomon, Admiralty, New Ireland, New Britain, Gardner's, Sir Chas. Harvey's, and Fischer's Islands ; New Zealand. We are expecting other large consignments from our collectors in Western Polynesia. The number of specimens presented during the year is only 28 from New South Wales, South Australia, and Manihiki Harvey Group.

PALÆONTOLOGICAL DEPARTMENT.—R. Etheridge, jun., Assistant.—Mr. Etheridge commenced his duties at the Museum on June 1st, 1887, and since that date the palæontological stores placed in the basement and uppermost gallery of the Museum have been dealt with, sorted, and relegated to their proper places in the collection, or systematically packed away for future study. The fine collections of Lower Carboniferous Plants from the neighbourhood of Stroud have been named, so far as the Palæobotanical literature to hand will permit. A systematic overhauling of the Australian Fossils has been commenced, with the view of separating the collection into three sets, viz., an exhibition set for the cases ; a study set, for working purposes ; and duplicates, for exchange. So far, the Silurian and Devonian have been dealt with, but as they are the least known of our fossils, the number of duplicates separated must, of necessity, be at present very limited. With the view of keeping these in the most readily-accessible form, a room has been set apart and shelved for their reception in wooden trays of a uniform size, and all duplicates have been placed there so far.

E. P. RAMSAY,
Curator.

APPENDIX X.

PROGRESS REPORT, Lord Howe Island Collecting Party, August–September, 1887.

Sir,

Australian Museum, 25 September, 1887.

In compliance with your letter, No. 198, of August 22nd, 1887, instructing me to proceed to Lord Howe Island, in company with Messrs. Thorpe and Whitelegge, I have the honor to inform you that we left Sydney at 4:30 p.m. on that date, in the s.s. "Maitland," for Newcastle, arriving there at midnight, when we at once transhipped to the s.s. "Taupo," of the Union Steamship Co.'s line, and early on the morning of August 23rd proceeded direct for the Island.

We arrived at daybreak on August 25th, and immediately landed our baggage, arrangements for our accommodation being very kindly made by Mr. H. T. Wilkinson, the Visiting Magistrate, who was proceeding to Norfolk Island. I am also much indebted to one of the residents, Mr. T. B. Wilson, for the use of his store as a receptacle for our baggage and collections.

We commenced systematic collecting on the same date (August 25th), and were fortunate enough to secure what may perhaps be a new species of *Gerygone*. From August 25th to August 30th the weather was all that could be desired, and a large amount of work was accomplished by all members of the party. During this interval the northern portion of the island was thoroughly explored in relation to its avifauna and mollusca, both land and marine, Mr. Whitelegge also being fortunate in obtaining numerous specimens of land Planarians, probably five species in all. We devoted August 27th to an examination of the shore at the western foot of Mount Lidgbird and the south end of the Coral Reef, which commences at this point, passing in a north-westerly direction to join Phillip Point, at the northern extremity of the island. On this part of the reef we were highly successful in obtaining a number of Mollusca, Crustacea, Echinodermata, Corals, and a few Fish. We further devoted time to an examination of the Coral-rock Deposit, from which the remains of Sir Richard Owen's genus of extinct "horned lizard" (*Moiolania*) are derived, a subject which will be referred to later on.

On August 30th, we left our hut soon after daybreak, to ascend Mount Gower, 2,840 feet. The day was spent in examining the gullies and eastern slopes of Mount Lidgbird, and we were fortunate to meet with a new *Helix* and two new species of *Bythinella*. The whole of this part of Lord Howe Island is of a very inaccessible nature, composed of basaltic rocks, the surface much broken up, and covered with a dense palm and vine scrub, with here and there patches of tree-fern, the whole interspersed amongst a heavy growth of forest trees, and rendering examination and travelling very slow and tedious. Towards evening we arrived at the saddle uniting Mounts Lidgbird and Gower, and camped in Erskine Valley, on the west side of this divide. The remainder of the evening was spent by Mr. Thorpe and the guide in endeavouring to obtain specimens of the wood-hen (*Ocydromus sylvestris*); but during the entire day only one example was seen and shot, although we were now said to be in one of the chief haunts of this interesting and fast-decreasing bird. During the night the weather completely broke up, and the genial temperature of the previous days gave place to tempestuous squalls, heavy gales, and mist, which continued, with short intermissions, to within a day or two of our departure from the island. The next morning, August 31st, the whole of Mount Gower summit was enveloped in a thick mist, and taking into consideration the risky nature of the climb, it was deemed advisable, although with great regret, to abandon any further attempt at an ascent, especially as our time was limited.

On 1st September the party proceeded to the examination of Rabbit or Goat Island, a small eminence in the centre of the lagoon. The fauna was found to correspond with that of the main island, but

but we discovered a well-marked variety of the common *Helix* (*H. Sophiae*), and also a variety of *Helix Catletti*, Brazier. It was further observed that, even at this early date, the "Mutton Birds" (*Puffinus sphenurus*) were coming in to scrape out their burrows, an example being captured.

On 5th September a trip was made by Mr. Thorpe and myself to Mutton Bird Point, on the south-east coast of the island, but the birds (*Puffinus*) had not taken up their residence there to any great extent at this time of the year, although specimens were captured. On the return journey we explored Blenkinthorpe Beach, and obtained examples of the burrowing crab (*Ocypoda ceratophthalma*, Pallas).

During the remainder of our stay, and on the dates alternating with those mentioned, the members of the party, either collectively or singly, pursued various branches of investigation. In this manner a number of interesting insects, two species of lizard, a quantity of land and fresh-water shells, and, as before stated, land planarians were obtained. In the two last-named groups Mr. Whitelegge's efforts were highly successful. He was likewise fortunate in determining the presence of a *Hymenosoma*, a marine genus of Decapoda, in the watercourse of a gully running from the north peak of the island, at a height of 150 feet above sea-level. On 28th August two shallow but interesting caves were explored by us in the Coral-rock of North Bay. We anticipated meeting with bats here, but in their place we encountered thousands of moths (*Dasyppocia ymatodes*) clinging to the roofs, which were said to be blind, but are not so. We also procured an example or two of some poor stalactites.

The Coral Reef enclosing the lagoon on the west side, and some coral ledges at Ned's Beach on the east, were examined so far as the weather would permit. In fact the northern end of the former at North Bay, and its southern extremity under Mount Lidgbird, were thoroughly examined, but I regret to say the central, and probably most interesting portion, was for the reason stated left untouched. Mr. Whitelegge, I am exceedingly glad to state, found a specimen of the zoophyte, *Ceratella fusca*, Gray, of which the polyps have hitherto remained unknown, with these organs *in situ*, and protruded, and was able to kill them in that condition. On the ledges at Ned's Beach Mr. Thorpe met with a specimen of an *Echinoneus*, probably new, and Mr. Whitelegge afterwards found others. In his "Catalogue," Dr. Haswell does not assign a locality to the Decapod *Xanthodes atromanus*, Has., but it is more than probable that we have secured this species.

Dredging was attempted in the lagoon by Messrs. Unwin, Whitelegge, and myself, but this enclosed water appeared at this period of the year to be singularly unproductive of life. No attempt was made to dredge outside the reef. This would require much heavier gear than we were provided with, and the services of a steam launch would be indispensable.

On the 13th September Mr. Thorpe and myself visited the Admiralty Islets, having waited for some days for sufficiently calm weather to enable us to land. These rocks are veritable rookeries, and we were enabled to obtain a fine series of birds, including a large *Sula*. Eggs of *Sula*, *Onychoprion fuliginosa* and *Anous cinereus* were also secured.

The search for the remains of the Horned Lizard (*Meiolania*), one of the chief objects of the expedition, was vigorously carried out by the whole party. Numerous fragments of bones were found, and others obtained by purchase from the Islanders. The conditions under which these remains occur, however, convinced me very shortly after our arrival that their discovery is a pure matter of chance. The large superficial area of the Coral-rock in which the fossils are found, and the scrubby nature of the ground, preclude any well-regulated method of search at present. The majority of the specimens hitherto found, including the best and largest, have been met with quite accidentally during agricultural operations in the dark loamy soil which usually overlies the Coral-rock, and results from its decomposition and the surrounding basalt. Amongst the specimens obtained is the greater part of a pelvis, probably Lacertilian; two good tail-sheaths of *Meiolania platyceps*, Owen; portion of a Chelonian carapace; and a series of bones and fragments not yet determined. There are also some blocks of rock still to be developed which may yield good results.

I paid especial attention to the geology of the island, and have taken copious notes thereon, more especially as bearing on this interesting deposit of Coral-rock. I also visited the outcrop of basaltic rock on the beach, below Mr. Robins' house, containing veins and cubes of iron pyrites, which are said to contain 3 dwt. 14 gr. of gold, and silver 3 dwt., to the ton, and obtained specimens. Under the guidance of Captain T. Nichols, I also visited the beach on the west side of the island, between the Clear Place and Observatory Point, to inspect the stanniferous deposit said to exist there. The material pointed out to me I believe to be a basalt amygdaloid. It is stated that between 40 and 50 tons were shipped to Auckland, and found to contain 40 per cent. of tin. Examples of both the pyrites and amygdaloid have been assayed by Mr. Mengay, at the Department of Mines (Geological Survey Branch), and have been found destitute of both metals. I found the physical topography of the charts so utterly unreliable and faulty (excepting, of course, the outline), that it was impossible to insert geological lines correctly without an actual survey, and I am greatly surprised to find that Mr. Wilkinson has succeeded in producing so accurate a geological map as he has, and I most cordially congratulate him on it.

I omitted to mention that attention was paid to line-fishing, especially by Mr. Thorpe, and a number of fish procured. I have also to record the success of Mr. Unwin in this branch, especially around the Admiralty Islets.

Careful and copious notes were taken of the zoology, especially as bearing on the locality, numerical condition, habits, &c., of the fauna, and information collected in respect to the introduced animals. It will give me much pleasure to embody this in a separate report, should the Trustees desire it.

In conclusion, I have to acknowledge the cordial assistance rendered to the party by the following residents:—Captain T. Nichols, Messrs. Langley, Robins, T. B. Wilson, W. Nichols, — Johnston, C. Stevens, and H. Wilson. Great acknowledgments are also due to Mr. C. H. Unwin, of the Chief Secretary's Office, who, although on a pleasure trip, volunteered to remain at Lord Howe Island, and render us assistance.

We again arrived in Sydney on the evening of 17th September. The accounts have already been handed to you.

I have, &c.,

R. ETHERIDGE, JUNR.

(In charge of Lord Howe Island Collecting Party).

The Curator, Australian Museum, Sydney.

Schedule of Specimens obtained by the Lord Howe Island Collecting Party, July-August, 1887.

Mammalia—

Mus musculus, var.
Scotophilus morio, Gray.

Aves—

Ninox boobook, Latham.
Halcyon vagans, Lees.
Zosterops strenuus, Gould.
" *tephroleurus*, Gould.
Gerygone insularis, Ramsay.
" *Thorpei*, Ramsay (sp. nov.)
Merula vinitincta, Gould.
Rhipidura cervina, Ramsay.
Pachycephala gutturalis, Latham.
Aplonis fuscus, Gould.
Strepera crissalis, Sharpe.
Cuculus inornatus.
Chalcophaps chrysochora, Wagl.
Charadrius xanthocheilus, Gould.
Numenius uropygialis, Gould.
Limosa " Gould.
Ocydromus sylvestris, Sclater.
Prion turtur, Smith.
Puffinus brevicaudus, Brandt.
" *sphenurns*, Gould.
Procellaria, sp.
Anous cinereus, Gould.
" *stolidus*, Latham.
Onychoprion fuliginosus, Gmel.
Sula Australis, Gould.

Reptilia—

Phyllodactylus Güntheri, Boul.
Lygosoma lichenigerum, O'Shaun.

Pisces—

Serranus Dæmeli, Günther.
Plectropoma cinctum, Günther.
Trachypoma macracanthus, Günther.
Arripis salar, Rich.
Apogon, sp.
Atypus strigatus, C. and V.
Scorpius æquipinnis, Rich.
Plesiops nigricans, Rüpp.
Girella cyanea, Macleay.
Chironemus marmoratus, Günther.
Scorpena, sp.
Pterois zebra, C. and V.
Pempheris, sp.
Caranx, sp.
Seriola Lalandi, C. and V.
Antennarius Commersoni, Lacép.
Gobius, sp.
Salarias, sp.
Tetragonurus Wilkinsoni, Macleay.
Myxus elongatus, Günther.
Diplocrepis, sp.
Pomacentrus, sp.
Pseudoscarus, sp.
Labrichthys luculentus, Rich.
" *inscriptus*, Rich.
PlatyGLOSSUS, sp.
Hemirhamphus, sp.
Scombrosox Forsteri, C. and V.
Gonorhynchus Greyi, Rich.
Clupea, sp.
Anguilla Australis, Rich.
Muraena nebulosa, Ahl.
" *afra*, Bl.
Ostracion diaphanus, Bl.
" sp.
Tetrodon, sp.
Solenognathus, sp.

Mollusca—

Spirula Péroni, Lamk.
Onychoteuthis Banksi, Leach.
Sepia, sp.
Fusus Hanleyi, Angas.
Ranella leucostoma, Lamk.
Nassa mucronata, A. Ad.

Nassa elegans, Kiener.
" *paupera*, Gould.
Purpura succincta, Martyn.
" " var. *striata*.
" " var. *textilosa*.
" *amygdala*, Kiener.
" *Smithi*, Braz (sp. nov.)
Cominella Tritoniformis, Blainv.
Ricinula morus, Lamk.
Sistrum chaidius, Duclos.

L.—SOILS.

- a.* Soil derived from the decomposition of basaltic rocks.
- b.* Soil derived from the same and the Coral-rock.
- c.* Soil derived from the decomposition of the latter only.
- d.* So-called "Guano."

The collections obtained by the expedition have been carefully examined, and named by the Museum staff in charge of the various departments.

E. P. RAMSAY,
Curator.

[*Supplement to the Australian Museum Report for 1887.*]

1888.

NEW SOUTH WALES.

TECHNOLOGICAL, INDUSTRIAL, AND SANITARY MUSEUM.

(REPORT OF THE COMMITTEE OF MANAGEMENT FOR 1887.)

Presented to Parliament pursuant to Act 17 Vic. No. 2, sec. 9.

TO HIS EXCELLENCY THE GOVERNOR AND EXECUTIVE COUNCIL,—

The Trustees of the Australian Museum, incorporated by the Act 17 Victoria No. 2, have the honor to submit to your Excellency in Council, in accordance with the 9th section of that Act, this the Eighth Annual Report of the Committee of Management of the Technological, Industrial, and Sanitary Museum.

1. The business of the Museum has been conducted by the same Committee as in the previous year, namely,—Sir Alfred Roberts, M.R.C.S.E., Professor Liversidge, M.A., F.R.S., and Mr. Robert Hunt, C.M.G., F.G.S. Although Professor Liversidge has been absent from the Colony the whole of the year, he has been actively attending to the interests of the Museum in the countries he has visited.

2. The Museum has continued open every afternoon (Good Friday and Christmas Day alone excepted) during the whole of the year 1887. A statement of the number of visitors for the year will be found in Appendix II of this Report. An important falling off in the attendance is noticeable during the past year. This is doubtless due to the seriously overcrowded state of the building, a state of affairs which has been brought under notice by the Committee in past Reports; but the matter has now become of the utmost urgency in the interest of the usefulness of the Museum and the safety of the collections. The Committee is gratified, however, to learn that the somewhat difficult task of providing suitable accommodation for the large and rapidly increasing collections is engaging the earnest attention of the Honorable the Minister for Public Instruction.

3. The total number of specimens acquired during the year is 3,411. Besides the specimens, 325 books and pamphlets were acquired, and also 233 maps, drawings, diagrams, &c. These will be found alluded to in detail in the Appendices. Much care has been exercised in the selection of specimens acquired by purchase, and it will be observed that large numbers of specimens, many of them of considerable educational and money value, continue to be presented to the Museum. Attention may be invited to the following as the most noteworthy donations received during the year:—A collection of Indian economic products (chiefly vegetable), comprising no less than 1,296 specimens, in 108 frames, from the Government of India; splendid collections of copper ores and associated rocks, from Captain R. N. Williams and the Rev. J. Milne Curran, F.G.S., both of Cobar, New South Wales; three frames of the chief varieties of leather, from Messrs. Bevington & Sons, of London; and further selections from the educational publications of Messrs. W. & A. K. Johnston, of Edinburgh, and Messrs. George Philip & Son, of London and Liverpool, should be noted.

4. The thanks of the Committee are due to the gentlemen who have kindly lent specimens. The Committee has reason to believe that when the matter of lack of accommodation shall have been got over there will be no difficulty in acquiring loans of valuable objects for fixed periods.

5. Mr. Alfred Hawkesworth, the honorary wool-classer to the Museum, has not only been instrumental in securing a very large number of additional wool specimens, but he has been kind enough to devote several weeks to the systematic arrangement of the whole of the wool collection, which now amounts to over 1,000 Australian samples alone.

A descriptive catalogue of the wool section is now well advanced, and will shortly be printed. Many growers and wool-brokers have furnished valuable information.

The Committee of Management exhibited collections of Australian Economic Products at the late Adelaide Jubilee International Exhibition, and were awarded First Order of Merit for the following exhibits:—

1. Drugs and medicinal plants, and plants yielding volatile oil.
2. Carded wools, yarns, tweeds, and scarlet cloth.
3. Timber.
4. Barks.
5. Forty specimens of tanning materials.
6. Twenty-eight water-colour drawings of economic plants.
7. Twelve vegetable products used as food by the aboriginals.
8. Eighteen specimens of vegetable fibres.
9. Gums and resins taken from indigenous trees.
10. Collection of type samples of wool, from the several Australian Colonies, in the grease, washed, and scoured. Samples of the manufactured article in its various stages.

The Committee begs to add to this, its Report, the following Appendices:—

- I. Balance-sheet for the year ending 31st December, 1887.
- II. Attendance of visitors.
- III. List of specimens purchased.
- IV. List of specimens presented.
- V. List of specimens lent.
- VI. List of books purchased.
- VII. List of books, periodicals, &c., presented.
- VIII. List of diagrams, maps, photographs, &c., purchased.
- IX. List of diagrams, maps, photographs, &c., presented.
- X. List of articles received in exchange.
- XI. List of articles sent away in exchange.

The Common Seal of the Museum is affixed by order of the Board, this third day of July, 1888.

J. H. MAIDEN, Curator and Secretary. (L.S.) ALFRED ROBERTS, }
(L.S.) ROBT. HUNT, } Members of
(L.S.) A. LIVERSIDGE. } Committee.
(L.S.) ALFRED STEPHEN, Crown Trustee.

16,889	The Strass Tankard. 59-1.

APPENDIX III—*continued.*
PURCHASES (SPECIMENS).

Museum No.	Date and Description.
	November 16.
17,614 to 17,616	Three figures in clay, representing, on a reduced scale, the external casts left in the hot pumice and ashes by human victims of the catastrophe at Pompeii in A.D. 79. The reproductions were obtained by filling the space left by the putrefaction of the bodies with plaster-of-Paris.
	<i>Japanese Pottery, &c.</i>
	May 21.
	Collection of articles of Japanese manufacture, comprising pottery, cloisonné ware, articles in bronze and iron, books of brocade patterns, dresses, hangings for mantel-pieces, &c. :—
	JAPANESE "SHIPPO" OR CLOISONNÉ WARE.—In manufacturing the cloisonné, the first process of the Japanese workman is to bring the vase, plaque, or ornament into the desired shape. If a large-sized vase is required, a piece of copper, of about 16 in. by 24 in., is beat into a tube, and then soldered together so perfectly as not to leave any visible junction. By means of long-continued hammering the tube is bulged out in the middle and contracted at the top and bottom until it assumes the required shape; the bottom is then soldered in, and the upper edge finished, after which the surface is polished perfectly by acid. Now, the artist, who is provided with a drawing or design, begins to manipulate, and with a fine brush and Indian ink transfers the design to the vase. The next process, which is a very delicate one, consists in covering with a certain resin the whole of the outlines drawn on the vase, by which are fastened wire or ribbons (of the same metal), something after the manner of silver filigree work. After this, solder is applied, and the vase is taken to a dry fire, and the wire carefully brazed on and permanently fastened to its place. The next proceeding—one that requires great artistic skill—is the filling up of the spaces formed by the wires with the variously-coloured enamels to complete the design, and during this stage of the process the article is baked in a furnace six or eight times, according to the number of layers of enamel applied. The surface of the article at this stage is rough and uneven, and is therefore taken in hand by the polisher, who has to use great judgment in order to avoid damaging the article; and it rests with his portion of the business whether the result will be perfect or defective. He uses a kind of gritty stone, which is constantly wetted, and with this he grinds down the projections until the surface becomes perfectly bright and smooth. The last touch is then given by the article being polished with a kind of cork stick, which produces that brilliant surface so admired by lovers of this art.
14,968	Cloisonné Enamel Plate; diameter, 9½ inches. Price in Japan, 45 yen = £7 10s. Namikawa, Kyoto, Japan.
14,969	Cloisonné Enamel Vase; height, 4½ inches. Price in Japan, 15 yen = £2 10s. Namikawa, Kyoto, Japan.
14,970	Three Napkin Rings, of different designs; diameter, 1¾ inches. Price in Japan, 6 yen = £1. Namikawa, Kyoto, Japan.
14,971	Set of Seven Napkin Rings, to illustrate all the stages in the manufacture of cloisonné work; diameter, 1¾ inches. Price of the set in Japan, 7 yen = £1 3s. 4d. Namikawa, Kyoto, Japan.
	<i>Pottery and Metal-work:—</i>
14,953	Vase (one of a pair); height, 12 inches. Price in Japan—Pair, 7 yen 50 sen = £1 5s.; single, 3 yen 75 sen = 12s. 6d. Taizan, Kyoto, Japan.
14,954	Vase (one of a pair); height, 7¾ inches. Price in Japan—Pair, 2 yen 40 sen = 8s.; single, 1 yen 20 sen = 4s. Taizan, Kyoto, Japan.
14,955	Vase (one of a pair); height, 6 inches. Price in Japan—Pair, 2 yen = 6s. 8d.; single, 1 yen = 3s. 4d. Taizan, Kyoto, Japan.
14,956	Vase; height, 9¾ inches. Price in Japan, 1 yen 80 sen = 6s. Taizan, Kyoto, Japan.
14,957	White Enamel Plaque; diameter, 12½ inches. Price in Japan, 8 yen 80 sen = £1 9s. 4d. Taizan, Kyoto, Japan.
14,958	Vase; height, 12¾ inches. Price in Japan, 2 yen = 6s. 8d. Kinkozan, Kyoto, Japan.
14,959	Vase, one of a pair; height, 8½ inches. Price in Japan—Pair, 3 yen = 10s.; single, 1 yen 50 sen = 5s. Kinkozan, Kyoto, Japan.
14,960	Vase, one of a pair; height, 10¼ inches. Price in Japan—Pair, 6 yen = £1; single, 3 yen = 10s. Kinkozan, Kyoto, Japan.
14,961	Vase, one of a pair; height, 10¾ inches. Price in Japan—Pair, 8 yen = £1 6s. 8d.; single, 4 yen = 13s. 4d. Kinkozan, Kyoto, Japan.
14,962	Vase, one of a pair; height, 12½ inches. Price in Japan—Pair, 6 yen = £1; single, 3 yen = 10s. Kinkozan, Kyoto, Japan.
14,963	Plaque; diameter, 15½ inches. Price in Japan, 6 yen = £1. Kinkozan, Kyoto, Japan.
14,964	White Enamel Plaque; diameter, 12½ inches. Price in Japan, 8 yen 50 sen = £1 8s. 4d. Kinkozan, Kyoto, Japan.
14,965	Vase; height, 11¾ inches. Price in Japan, 20 yen = £3 6s. 8d. Tanzan, Kyoto, Japan.
14,966	Vase, one of a pair; height, 11¾ inches. Price in Japan—Pair, 10 yen = £1 13s. 4d.; single, 5 yen = 16s. 8d. Kinkozan, Kyoto, Japan.
14,967a	Tea-pot, with two spouts; height, 2¾ inches. Price in Japan, 1 yen = 3s. 4d. Tanzan, Kyoto, Japan.
14,967b	Box, circular shape; height, 1½ inch; diameter, 3½ inches. Price in Japan, 2 yen = 6s. 8d. Tanzan, Kyoto, Japan.
14,967c	Tea-pot; height, 3½ inches. Price in Japan, 1 yen 50 sen = 5s. Tanzan, Kyoto, Japan.
14,967d	Vase; height, 4 inches. Price in Japan, 15 sen = 6d. Tanzan, Kyoto, Japan.
14,967e	Teapot, hexagonal shape; height, 6 inches. Price in Japan, 3 yen = 10s. Tanzan, Kyoto, Japan.
14,967f	Vase, hour-glass shape; height, 5¼ inches. Price in Japan, 20 sen = 8d. Tanzan, Kyoto, Japan.
14,967g	Vase, one of a pair; height, 5¾ inches. Price in Japan—Pair, 1 yen 60 sen = 5s. 4d.; single, 80 sen = 2s. 8d. Tanzan, Kyoto, Japan.

APPENDIX III—*continued*.
PURCHASES (SPECIMENS).

Museum No.	Date and Description.
14,967 ^h	Vase, one of a pair; height, $4\frac{1}{4}$ inches. Price in Japan—Pair, 1 yen 60 sen = 5s. 4d.; single, 80 sen = 2s. 8d. Tanzan, Kyoto, Japan.
14,967 ^j	Jug; height, 3 inches. Price in Japan, 10 sen = 4d. Tanzan, Kyoto, Japan.
14,967 ^k	Vase, lidded; height, $3\frac{1}{2}$ inches. Price in Japan, 1 yen 20 sen = 4s. Tanzan, Kyoto, Japan.
14,972	Bronze Teapot; height, $6\frac{1}{4}$ inches; breadth, $4\frac{1}{4}$ inches. Price in Japan, 4 yen 50 sen = 15s. Jomie, Kyoto, Japan.
14,973	Bronze Bowl; height, $4\frac{1}{2}$ inches; breadth, $5\frac{3}{4}$ inches. Price in Japan, 7 yen = £1 3s. 4d. Jomie, Kyoto, Japan.
14,974	Bronze Inlaid Salver; diameter, $12\frac{5}{8}$ inches. Price in Japan, 28 yen = £4 13s. 4d. Jomie, Kyoto, Japan.
14,975	Bronze Vase, one of a pair; height, 6 inches. Price in Japan—Pair, 25 yen = £4 3s. 4d.; single, 12 yen 50 sen = £2 1s. 8d. Nogawa, Kyoto, Japan.
14,976	Bronze Vase, one of a pair; height, $4\frac{3}{4}$ inches. Price in Japan—Pair, 20 yen = £3 6s. 8d.; single, 10 yen = £1 13s. 4d. Nogawa, Kyoto, Japan.
14,976 ^a	Circular Bronze Box; breadth, $2\frac{9}{16}$ inches; depth, $\frac{1}{16}$ inch. Price in Japan, 5 yen = 16s. 8d. Nogawa, Kyoto, Japan.
14,977	Iron Inlaid Plates; diameter, $9\frac{1}{2}$ inches. Price in Japan, 50 yen = £8 6s. 8d. Ikeda, Kyoto, Japan.
14,988	Iron Inlaid Vase, one of a pair; height, 6 inches. Price in Japan—Pair, 18 yen = £3; single, 9 yen = £1 10s. Nishimura, Kyoto, Japan.
14,989	Bronze Vase, one of a pair; height, 6 inches. Nishimura, Kyoto, Japan.
14,990	Bronze Tray; size, $12 \times 9\frac{1}{2}$ inches. Nishimura, Kyoto, Japan.

Textile Fabrics:—

14,978 ^a	Grey Silk Dress (stuffed). Length of dress, nearly 2 yards. Yamanaka, Osaka, Japan.
14,978 ^b	Red Silk Dress (stuffed). Length of dress, nearly 2 yards. Yamanaka, Osaka, Japan.
14,980	Fukusa; outside of dark red silk, inside blue silk; size, 2 feet 11 inches x 2 feet $4\frac{1}{2}$ inches. Price in Japan, 7 yen = £1 3s. 4d. Yamanaka, Osaka, Japan.
14,981	Fukusa; outside of red silk, inside blue silk; size, 2 feet 11 inches x 2 feet 3 inches. Price in Japan, 6 yen = £1. Yamanaka, Osaka, Japan.
14,982	Fukusa; outside of red silk, inside blue silk; size, 2 feet 11 inches x 2 feet 3 inches. Price in Japan, 5 yen 50 sen = 18s. 4d. Yamanaka, Osaka, Japan.
14,983	Fukusa; outside of red silk, inside purple silk; size, 3 feet x 2 feet 3 inches. Price in Japan, 5 yen = 16s. 8d. Yamanaka, Osaka, Japan.
14,984 ^a	Book (18 pages), containing 142 Brocade Patterns; size, $16 \times 12 \times 2\frac{1}{2}$ inches. Ikeda, Kyoto, Japan.
14,984 ^b	Book (16 pages), containing 105 Brocade Patterns; size, $12 \times 9\frac{1}{2} \times 2\frac{1}{2}$ inches. Ikeda, Kyoto, Japan.
14,984 ^c	Book (26 pages), containing 105 Brocade Patterns; size, $12 \times 9\frac{1}{2} \times 2\frac{1}{2}$ inches. Ikeda, Kyoto, Japan.
14,984 ^d	Book (28 pages), containing 168 Brocade Patterns; size, $17 \times 11 \times 3$ inches. Ikeda, Kyoto, Japan.
14,985	Mantelpiece Hangings; size, 7 feet $3\frac{1}{2}$ inch x 1 foot $2\frac{3}{4}$ inches. Price in Japan, 11 yen = £1 16s. 8d. Nishimura, Kyoto, Japan.
14,986	Yellow Silk Shawl, craped; bordered with a fringe. Size, 4 feet 8 inches square. Price in Japan, 8 yen = £1 6s. 8d. Nishimura, Kyoto, Japan.
14,987 ^a	One Dozen Doyleys, of variously coloured cloth; diameter, about 10 inches. Price in Japan, 2 yen = 6s. 8d. Nishimura, Kyoto, Japan.
14,987 ^b	One Dozen Doyleys, of variously coloured satin; diameter 10 inches. Price in Japan, 2 yen 50 sen = 8s. 4d. Nishimura, Kyoto, Japan.

Netsukes:—

14,979 ^a	A hollow, circular, bronze casting, on which is a fly with gilt wings. Price in Japan, 17s. 6d.

17,466		
17,467		
17,468		
17,469		
17,470		
17,471		
17,472		Paper-knife.
17,473		Hair-comb (lady's).
17,474		} Necklaces.
17,475		
17,476		Bracelet.
17,477	Card-case.	
17,478	Bouquet-holder.	
17,479	Fan-stick.	
17,480	Brooch of oxidized silver.	
Technological Series, illustrating the Manufacture of Filigree Work:—		
17,481	Pure Silver, at 1000/1000.	
17,482	Refined Copper, for alloying the pure silver.	
17,483	Silver, at 960/1000.	
17,484	Silver, at 820/1000.	
17,485	Silver, at 800/1000.	
17,486	Silver, at 700/1000.	
17,487	Solder.	
17,488	Boracic Acid.	
17,489	Fused Boracic Acid.	
17,490	Chloride of Ammonium, for soldering.	
17,491	Piece of Silver in rods, as melted.	
17,492	Pair of Pincers employed for taking up the fine cut wire.	
17,493	Twisted Silver Filigree Wires.	
17,494	Part of Fan, outlined, with all pieces necessary to finish it according to the pattern of No. 17,479; Turin.	
November 30.		
17,746	Oblong Box, with sliding lid. The frame is of ebony with ivory inlay, the panels being of porcupine quills. Colombo.	
17,747	Ivory Paper-knife, with fine fretwork pattern. Loodiana, Delhi.	
17,750	Nest of five Spherical Wooden Boxes, in descending sizes, forming a ball; lacquered. Hyderabad, Scinde, India.	
17,751	Fan made out of a palm leaf (<i>Borassus</i> sp.), with mica ornament, and coloured. Calcutta.	
17,752	An oblong Basket, lidded, of plaited pandanus leaf, stained and unstained to form geometrical patterns.	
17,757	Cushion Cover. In Scinde (India) Work, composed of silver and silk thread worked into floral and other patterns.	
17,740	Brahmin Cow, suckling a calf. Executed in white marble. (Imperfect, the horns having been broken.) Jeypore, India.	
17,741	Elephant with howdah, carved out of potstone, and polished.	
17,742	Hindoo Idol (probably Brahma) carved out of potstone, and highly polished.	

APPENDIX III—continued.
PURCHASES (SPECIMENS).

Museum No.	Date and Description.
17,743	Elephant carved out of ebony, with ivory tusks. Colombo, Ceylon.
17,744	Tortoise-shell Paper-knife, in one piece. Colombo.
17,745	Sandalwood (<i>Santalum album</i>) Paper-knife, with inlaid ivory ornamentation. This work is known as Surat-ware, from its place of manufacture—Surat, India. The ivory is inlaid in geometrical patterns on a sandalwood base, and the ivory is then coloured with metallic and other paint.
17,749	Handkerchief-box of Surat-ware.
17,756	Lidded Limoges Jar, with landscape on lid. In brown glazed ware.
	<i>Belleek-ware.</i>
17,759	Oval Twig Basket.
17,760	Cardium on coral.
17,761	Shell and Coral Cream Jug.
	<i>Extract from "Marks and Monograms on Pottery and Porcelain" (Chaffers).—</i> "The leading characteristics of design in Belleek-ware are marine subjects, such as dolphins, sea-horses, nereids, aquatic plants, coral, &c.; these are produced in parian or biscuit, and a creamy porcelain like ivory; also covered with a glittering iridescent glaze like mother-of-pearl. The mark is printed or stencilled upon the ware in red, brown, or green, and represents one of the Irish round towers, the harp and a deerhound, as well as the three-leaved shamrock. This china is a real porcelain, the result of the simple vitrification of felspar and china clay." The ware derives its name from the place of its manufacture—Belleek, Lough Erne, county Fermanagh.
17,762	Tobacco Jar of terra-cotta, from Kobe (Hiogo), Japan.
17,764	Teapot.
17,765	Teapot.
17,766	Bronze Gong. Kobe (Hiogo), Japan.
17,767	Vase, in form of a shell with elephant's head at each of its four corners. Ivory ware.
17,768	Long-necked bottle of coloured ware (yellow and white) with floral sprays and figures.
17,770	Royal blue. Kaufmann.
17,772	Cup and Saucer, with painted scenic representations, figures, &c.
17,773	Symbolic figure, "Peace," chinaware. Holding a green leaf over the left shoulder.
17,774	Symbolic figure, "Wisdom," chinaware. In the attitude of an orator, holding a serpent in the left hand.
17,775	Octagonal-shaped doll's cup.
17,776	Coffee-cup and saucer with gilt rim and small coloured views.
17,771	Ink-stand, chinaware, coloured. Nos. 17,767-71 are Dresden-ware.
	December 15.
17,733	Mace of steel, engraved, chased by hand. Executed in Sydney.
17,738	Stout sprig of pink coral mounted in gold.
	BOTANY.
	September 6.
16,938	Herbarium (with index), comprising 25 fasciculi of plants indigenous to the British Isles, containing specimens of upwards of 1,100 of the 1,400 known species. Arranged according to the natural orders, with reference to descriptions in Hooker's Flora, fifth edition, and Lindley's Flora, fifth edition.
16,939	Herbarium, comprising 94 folio fasciculi of plants indigenous to the British Isles, containing about 1,050 species; with index.
16,940	Collection of American Ferns, and British, Continental, and American Plants.
16,941	Collection of European Plants.
	ECONOMIC BOTANY (AUSTRALIAN).
	January 1.
14,740	Collection of Barks of Trees indigenous to New South Wales; all obtained from the trunks:— Bark of <i>Acacia aneura</i> ; F. v. M. "Mulga." (Leguminosæ.) Found at Ivanhoe, N.S.W. The trunk bark, obtained 25 September, 1886. The tree attains a height of about 30 feet. The timber is exceedingly hard and fine-grained, and is capable of a high polish. It is much used by the natives in the manufacture of implements, weapons, &c. The leaves are much relished by stock.
14,741	Bark of <i>Acacia aneura</i> var; F. v. M. "Narrow-leaved Mulga." (Leguminosæ.) Found at Ivanhoe, N.S.W. Similar in habit, &c., to the preceding. Leaves are much relished by stock. Bark obtained September 30, 1886.
14,744	Bark of <i>Acacia calamifolia</i> (?); Sweet. "Nealy" or "Needle-bush." (Leguminosæ.) Found at Ivanhoe, N.S.W. Small tree about 12 to 15 feet in height. Timber exceedingly hard and tough, and possessed of a very agreeable perfume; used by natives for making weapons, &c. Stock will not eat the leaves even when in a starving condition. Bark obtained September 6, 1886.
14,747	Bark of <i>Acacia colletioides</i> ; A. Cunn. "Wait-a-while," or "Prickly Acacia." (Leguminosæ.) Found at Ivanhoe, N.S.W. A low-spreading bush, suitable for hedge-planting. Bark obtained October 2, 1886.
14,742	Bark of <i>Acacia homalophylla</i> ; A. Cunn. "Yarran." (Leguminosæ.) Found at Ivanhoe, N.S.W. A small ornamental tree attaining a height of 10 or 15 feet. Timber very hard and capable of a high polish. It is possessed of an agreeable odour, and is much used by the natives for their weapons, &c. The leaves are eaten by stock. Bark obtained September 25, 1886.

APPENDIX III—continued.
PURCHASES (SPECIMENS).

Museum No.	Date and Description.
14,743	Bark of <i>Acacia homalophylla</i> var; A. Cunn. "Narrow-leaved Yarran." (Leguminosæ.) Found at Ivanhoe, N.S.W. Similar in habit to the preceding. Bark obtained September 4, 1886.
14,745	Bark of <i>Acacia Oswaldi</i> ; F. v. M. "Miljee." A small bushy tree from 6 to 8 feet high. Timber exceedingly hard and tough, possessing a very disagreeable smell when fresh or green; used by natives for short weapons, such as clubs. Leaves eaten by stock. Bark obtained September 6, 1886.
14,746	Bark of <i>Acacia sentis</i> ; F. v. M. "Thorny Acacia." (Leguminosæ.) Found at Ivanhoe, near Hay, N.S.W. A small low-spreading tree from 8 to 10 feet high; the timber is soft, but exceedingly tough; the young twigs are armed with slender acute spines or thorns. Bark obtained October 2, 1886.
14,748	Bark of <i>Acacia</i> sp. (Leguminosæ.) Found near Cobar, N.S.W. A large tree attaining a height of 40 or 50 feet. Found only in the locality whence this specimen was obtained, about 60 or 70 miles west of Cobar. The timber is exceedingly hard and strong. Bark obtained August 12 and October 12, 1886.
14,754	Bark of <i>Acacia</i> sp. "Poplar." (Leguminosæ.) Found near Darling River. A slender-growing tree, plentiful on sandhills near the Darling River. Bark and leaves possess an extremely pungent flavour, resembling watercress, but much stronger. Wood very soft and light.
14,749	Bark of <i>Casuarina glauca</i> ; Sieb. "Belar." (Casuarinæ.) Found at Ivanhoe, N.S.W. A very common tree, attaining a height of 40 or 50 feet. The timber is exceedingly hard, but brittle. It is much used for fencing-rails. Bark obtained September 25, 1886.
14,752	Bark of <i>Eremophila longifolia</i> ; F. v. M. "Emu Bush." (Myoporinæ.) Found at Ivanhoe, N.S.W. A small ornamental tree, from 10 to 15 feet in height, bearing a profusion of dull red trumpet-shaped blossoms. The bruised leaves of this tree are used by the natives for tanning or preserving their water-bags, made of the entire skins of wallabies. Bark obtained October 4, 1886.
14,752a	Leaves of <i>Eremophila longifolia</i> ; F. v. M. (Myoporinæ.) Found at Ivanhoe, N.S.W. Leaves obtained November 19, 1886.
14,751	Bark of <i>Fusanus acuminatus</i> ; Syn. <i>Santalum acuminatum</i> ; D.C. "Quandong." (Santalaceæ.) Found at Ivanhoe, Hay, N.S.W. A small tree, attaining a height of 10 or 12 feet. The fruit of this tree is made into a preserve; the hard pericarps (quandongs) are strung together to form bracelets, necklaces, &c. The kernels contain a large quantity of oil. The timber is used by the natives for obtaining fire by friction. Bark obtained October 4, 1886.
14,753	Bark of <i>Grevillea striata</i> ; R. Br. "Beef-wood." (Proteaceæ.) Found near Darling River. A medium-sized tree, attaining a height of 40 feet; the timber is beautifully marked, resembling raw beef, hence its vernacular name. Bark obtained October 14, 1886.
14,750	Bark of <i>Hakea leucoptera</i> ; R. Br. (Proteaceæ.) Found at Ivanhoe, Hay, N.S.W. A tree attaining a height of 15 or 20 feet. Timber not used. Bark obtained 4 September, 1886.

October 9.

- 16,982 Bouquet of different dried grasses ornamented with peacock's feathers.
16,984 Fan, square shaped, made from a kind of rush, with border and handle of straw. Italy.
16,985 Fan, circular shaped, ornamented with coloured stars. Italy.

February 2.

- 14574-5 Two antimacassars, made by a New Caledonian convict, from the fibre of the "Giant Aloe." *Fourcroya gigantea*, Vent. (Amaryllidæ). These articles exhibit the fineness as well as the great strength of the fibre.

February 19.

Museum No.	Description.	Museum No.	Description.
<i>Oils:—</i>			
14,658	Laurel oil.	14,667	Strasburg turpentine.
14,659	Pine oil.	14,670	Bordeaux turpentine.
14,662	Stavesacre oil.	14,688	English oil of peppermint.
14,663	Peach kernel oil.	14,689	Oil of parsley.
14,664	Ginger grass oil.	14,690	Oil of petit grain.
14,665	Rusa oil.		
<i>Fruits and Seeds:—</i>			
14,677	Stavesacre seeds.	14,696	Linseed (Baltic).
14,680	Black cummin seeds.	14,697	Linseed (Calcutta).
14,685	Brazil nuts.	14,698	Soap berries. <i>Saponaria officinalis</i> .
14,693	Linseed (English).		
<i>Gums and Resins:—</i>			
14,660	Balsam of Copaiba.	14,669	Sap green.
14,672	Gamboge, in lump.	14,683	Indian bedellium.
14,673	Gamboge, in pipe.	14,691	Extract of monesia.
14,679	Hog gum.	14,694	Genuine Burgundy pitch.
<i>Miscellaneous:—</i>			
14,678	Curaçoa aloes.	14,687	Mocha aloes.
14,686	Zanzibar aloes.	14,682	Cake safflower.

APPENDIX III—continued.

PURCHASES (SPECIMENS).

Museum No.	Description.	Museum No.	Description.
November 10.			
17,355	Pods of <i>Acacia</i> , sp. India.	17,391	Split pericarp, with seed enclosed, <i>Dipterix odorata</i> . "Tonquin bean."
17,356	Pods of <i>Acacia concinna</i> .	17,392	Fruits of <i>Datura stramonium</i> .
17,357	Pods of <i>Acacia nilotica</i> . West Africa.	17,393	Necklace, made of the seeds of <i>Elæocarpus ganiteus</i> .
17,358	Nuts of <i>Anacardium occidentale</i> . "Cashew."	17,394	Nuts of <i>Entada scandens</i> .
17,359	Nuts, roasted, <i>Anacardium occidentale</i> . "Cashew."	17,395	Nuts of <i>Entada gigalobium</i> .
17,360	Nuts of <i>Acroloma sclerocarpa</i> .	17,396	Nankin cotton <i>Gossypium</i> sp., unginned. Malta.
17,361	Nuts and kernels of <i>Aleurites triloba</i> . "Candle nuts." Fiji.	17,397	Capsules of <i>Gossypium</i> sp. India.
17,362	Pods of <i>Amomum Grana-paradisica</i> . Malagueta, Cuba.	17,398	<i>Gynocardia odorata</i> . India.
17,363	Seeds of <i>Adenantha pavonina</i> . "Barbadoes pride." India.	17,399	<i>Guizotia oleifera</i> .
17,364	Seeds of <i>Arachis hypogæa</i> . "Ground nut." India.	17,400	<i>Guilandria Bonducella</i> .
17,365	Nuts, unhusked, <i>Areca catechu</i> . "Betel nut."	17,401	<i>Hyptæne Thebaica</i> .
17,366	Nuts, unhusked, <i>Areca catechu</i> . "Betel nut."	17,402	<i>Jatropha Curcas</i> . West Africa.
17,367	Nuts, dried and split, <i>Areca catechu</i> . "Betel nut."	17,403	<i>Juglans nigra</i> . Black walnuts. North America.
17,368	Seeds of <i>Abrus precatorius</i> . (Jequirity.) West Indies.	17,404	Nuts of <i>Lecythis ollaria</i> . Sapucaya nuts.
17,369	Nuts of <i>Aegle marmelos</i> .	17,405	<i>Lecythis ollaria</i> . Capsule.
17,370	<i>Attalea Cohune</i> ; Mart. Honduras.	17,406	<i>Myristica</i> sp. Wild nutmegs. British Guiana.
17,371	Fruit of <i>Bassia Parkii</i> . "Shea butter nuts." West Africa.	17,407	Pods of <i>Moringa pterygosperma</i> . Horse-radish tree.
17,372	Fruit of <i>Bassia longifolia</i> . India.	17,408	Seeds of <i>Moringa pterygosperma</i> .
17,373	Kernels of <i>Bassia latifolia</i> . India.	17,409	<i>Mucuna</i> sp. Horse-eye bean. British Guiana.
17,374	<i>Bassia</i> sp.	17,410	Seeds of <i>Nelumbium speciosum</i> . Egyptian Lotus.
17,375	Cones of <i>Balanthes Roxburghii</i> .	17,411	Seeds of <i>Ormosia dasycarpa</i> . Snake-wood.
17,376	Nuts of <i>Bertholletia excelsa</i> . "Brazil nut."	17,412	Seeds of <i>Ormosia</i> sp.
17,377	Pods of <i>Bombax malabaricum</i> .	17,413	<i>Pongamia glabra</i> . India.
17,378	Pods of <i>Bombax</i> sp.	17,414	Seeds of <i>Papaver somniferum</i> . Poppy.
17,379	Nuts of <i>Caesalpinia Bonducella</i> .	17,416	<i>Piper longum</i> . The unexpanded flowers.
17,380	Seeds of <i>Croton Tiglium</i> . "Croton."	17,417	<i>Quercus</i> sp.; Knopperrn. Galls found on certain oaks in Hungary, &c.
17,381	<i>Crescentia Cujete</i> ; Linn. (<i>Begonia-cææ</i> .) "Calabash."	17,418	<i>Quercus</i> sp. galls.
17,382	Pods of <i>Canavalia gladiata</i> ; D.C.	17,419	<i>Raphia vinifera</i> . Fruits.
17,383	Nuts of <i>Calophyllum inophyllum</i> . Ndilo.	17,420	Seeds of <i>Ricinus communis</i> . Castor oil.
17,384	Kernels of <i>Calophyllum inophyllum</i> . Ndilo.	17,421	Kernels of <i>Sterculia acuminata</i> . Kola.
17,385	Seeds of <i>Carapa guineensis</i> . "Tallicoonal." Fiji.	17,422	Nuts of <i>Sterculia acuminata</i> . Kola.
17,386	Nuts of <i>Caryocar tomentosum</i> . West Africa.	17,423	Nuts of <i>Sapindus saponaria</i> . "Soap-nut."
17,387	Nuts of <i>Cocos nucifera</i> . Coco-nut.	17,424	Galls of <i>Tamarix gallica</i> .
17,388	Seeds of <i>Coix lachryma</i> .	17,425	Nuts of <i>Terminalia belerica</i> ; Beleric (<i>Myrobalans</i>). India.
17,389	Seeds of <i>Coix</i> sp.	17,426	Nuts of <i>Terminalia belerica</i> .
17,390	Pods of <i>Caesalpinia coriaria</i> . "Divi Divi."	17,427	Nuts of <i>Terminalia chebula</i> ; Chebulie (<i>Myrobalans</i>).
November 30.			
17,753	Turned olive-wood inkstand.	17,428	Nuts of <i>Terminalia</i> sp.
17,754	Olive-wood section, showing bark. Palestine (?).	17,429	Seeds of <i>Thea camellia</i> . "Tea."
17,755	Olive-wood section, showing bark. Palestine (?).	17,430	Seed of <i>Thevetia neriifolia</i> . "Yellow coriander."
17,758	Bokhara plum (<i>Aloo Bokhara</i>), <i>Prunus bokhariensis</i> , Royle. This fruit is commonly met with in Indian bazaars, and is used much in the same way as prunes.		
17,763	Bannister brush of coir fibre. Kobe, Hiogo, Japan.		
December 2.			
17,722	A quantity of turmeric (<i>Lega</i>), packed in a cylindro-conical package of cocoa-nut palm spathes. Samoa. Dr. Seemann, in his "Flora Vitiensis," mentions that turmeric is used in Samoa as a medicine, but more especially by the Samoan women, who hold it in great estimation as a cosmetic.		
December 15.			
17,728	Package of Samoan tobacco.		
17,729	Necklace of seeds of <i>Adenantha pavonina</i> . (Samoa).		
17,730	Two Samoan cigars (tobacco in banana leaf).		
17,731	A quantity of Kava (<i>Piper methysticum</i>). Used by the Polynesians for making an intoxicating beverage. (Samoa).		
17,732	A bundle of fibre (Fan). (Samoa).		

APPENDIX III—continued.
PURCHASES (SPECIMENS).

Museum No.	Date and Description.
16,948	Bark of <i>Acacia aneura</i> ; F. v. M. "Mulga." (Leguminosæ.) Height, 20 to 30 feet; diameter, 6 to 12 inches. Collected on August 5, 1887, at Tarella, Wilcannia. Formation: Silurian, chocolate soil and loose stones.
16,949	Insect galls (Mulga apples) of <i>Acacia aneura</i> ; F. v. M. "Mulga." (Leguminosæ.) Obtained from the leaves; the galls have an agreeable taste. Collected on August 5, 1887, at Dry Lakes. Formation: Silurian, chocolate soil and loose stones.
16,950	Insect galls (Mulga apples) of <i>Acacia aneura</i> ; F. v. M. "Mulga." (Leguminosæ.) From the leaves; unedible. Collected on August 8, 1887, at Dry Lakes. Formation: Silurian, chocolate soil and loose stones.
16,989	Log of <i>Acacia aneura</i> ; F. v. M. "Mulga." (Leguminosæ.) Height, 20 to 30 feet; diameter, 6 to 12 inches. Collected on August 20, 1887, at Tarella, Wilcannia. Formation: Silurian, chocolate soil and loose stones.
17,000a	Log, dry, of <i>Acacia aneura</i> ; F. v. M. "Mulga." (Leguminosæ.) Height, 15 to 20 feet; diameter, 6 to 12 inches. Collected on August 30, 1887, at Gnalta, Wilcannia. Formation: Silurian.
16,951	Insect galls of <i>Acacia cyperophylla</i> ; F. v. M. (Leguminosæ.) From the leaves, unedible. Collected on August 8, 1887, at Dry Lakes. Formation: Probably Tertiary.
14,801-2	Bark and gum of <i>Acacia dealbata</i> ; Link. "Silver Wattle." (Leguminosæ.) Height, 20 to 30 feet; diameter, 12 to 18 inches. Collected on March 1 and 2, 1887, at Quidong. Formation: Limestone.
14,809	Bark of <i>Acacia glaucescens</i> ; Willd. "Myall." (Leguminosæ.) Height, 15 to 20 feet; diameter, 6 to 12 inches. Collected on April 8, 1887, at Quidong. Formation: Limestone.
14,814	Leaves of <i>Acacia glaucescens</i> ; Willd. "Myall." (Leguminosæ.) Height, 15 to 20 feet; diameter, 6 to 12 inches. Collected on April 8, 1887, at Quidong. Formation: Limestone.
15,092	Log of <i>Acacia melanoxylon</i> ; R. Br. "Blackwood." (Leguminosæ.) Height, 40 to 120 feet; diameter, 12 to 36 inches. Collected on May 22, 1887, at Bonang, Delegate. Formation: Mudstone, Silurian.
16,931	Piece of timber of <i>Acacia melanoxylon</i> ; R. Br. "Blackwood." Fashioned into a gunstock. (Leguminosæ.) NOTE.—Timber used for furniture, buggy naves, &c.
17,088	Bark of <i>Acacia pendula</i> ; A. Cunn. "Bastard Gidja," or "Nilya." (Leguminosæ.) Height, 10 to 12 feet; diameter, 4 to 6 inches. Collected on September 7, 1887, at Yandarlo. Formation: Silurian.
14,804-5	Leaves and bark of <i>Acacia penninervis</i> ; Sieb. (Leguminosæ.) Height, 20 to 25 feet; diameter, 8 to 12 inches. Collected on April 4, 1887, at Quidong. Formation: Limestone.
14,821	Gum of <i>Acacia penninervis</i> ; Sieb. (Leguminosæ.) Height, 20 to 25 feet; diameter, about 1 foot. Collected on March 22 and 23, 1887, at Quidong. Formation: Limestone.
16,991	Bark of <i>Acacia salicina</i> ; Lindl. "Native Willow." (Leguminosæ.) Height, 20 to 25 feet; diameter, 12 to 18 inches. Collected on August 15, 1887, at Tarella, Wilcannia. Formation: Silurian.
16,955	Bark of <i>Acacia salicina</i> ; Lindl. "Native Willow." (Leguminosæ.) Height, 30 to 40 feet; diameter, 12 to 18 inches. Collected on August 26, 1887, at Momba, Wilcannia. Formation: Red soil supposed to be recent.
17,093	Insect galls of <i>Acacia salicina</i> ; Lindl. "Native Willow." (Leguminosæ.) Height, 15 to 20 feet; diameter, 4 to 6 inches. Collected on August 20, 1887, at Cobham Lake.
17,092	Bark of <i>Acacia sentis</i> ; F. v. M. "Prickly Acacia." (Leguminosæ.) Height, 15 to 20 feet; diameter, 4 to 6 inches. Collected on August 20, 1887, at Cobham Lake. NOTE.—The fact of this species growing in a locality is looked upon as a sure indication of water.
16,992	Bark of <i>Acacia tetragonophylla</i> ; F. v. M. "Dead finish." (Leguminosæ.) Height, 10 to 12 feet; diameter, 6 to 8 inches. Collected on August 22, 1887, at Tarella, Wilcannia. Formation: Silurian.
16,999a	Log of <i>Acacia tetragonophylla</i> ; F. v. M. "Dead finish." (Leguminosæ.) Height, 6 to 10 feet; diameter, 4 to 6 inches. Collected on August 29, 1887, at Gnalta, Wilcannia. Formation: Silurian.
16,999	Small piece of wood of <i>Acacia tetragonophylla</i> ; F. v. M. "Dead finish." (Leguminosæ.) Collected on August 30, 1887, at Gnalta, Wilcannia. Formation: Silurian.
14,812	Bark of <i>Acacia vestita</i> ; Ker. (Leguminosæ.) Height, 20 to 25 feet; diameter, 10 to 18 inches. Collected on April 9, 1887, at Quidong. Formation: Limestone.
14,815	Leaves of <i>Acacia vestita</i> ; Ker. (Leguminosæ.) Height, 20 to 25 feet; diameter, 10 to 18 inches. Collected on April 9, 1887, at Quidong. Formation: Limestone.
14,779-80	Leaves and bark of <i>Angophora intermedia</i> ; D.C. "Apple-tree." (Myrtaceæ.) Height, 30 to 50 feet; diameter, about 3 feet. Collected on December 22, 1886, at Colombo, near Candelo. Formation: Granite.
16,903	Gum of <i>Angophora intermedia</i> ; D.C. "Apple-tree." (Myrtaceæ.) Height, 30 to 50 feet; diameter, 2 to 4 feet. Collected in June 30, 1887, at Colombo, near Candelo. Formation: Granite.
16,911	Log of <i>Angophora intermedia</i> ; D.C. "Apple-tree." (Myrtaceæ.) Height, 30 to 50 feet; diameter, 2 to 4 feet. Collected in June, 1887, at Colombo, near Candelo. Formation: Granite.
14,898	Timber of <i>Atherosperma moschata</i> ; Labill. "Sassafras." (Monimiacæ.) Height, 30 to 40 feet; diameter, 1 to 2 feet. Collected in March, 1885, at Bonang, Delegate. Formation: Mudstone, Silurian.

APPENDIX III—*continued.*
PURCHASES (SPECIMENS).

Museum No.	Date and Description.
15,088	Bark of <i>Atherosperma moschata</i> ; Labill. "Sassafras." (Monimiæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on May 19, 1887, at Bonang, Delegate. Formation: Mudstone, Silurian.
15,091	Log of <i>Atherosperma moschata</i> ; Labill. "Sassafras." (Monimiæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on May 21, 1887, at Bonang, Delegate. Formation: Mudstone, Silurian. Note.—Found in deep creeks of the jungle.
16,927	Leaves of <i>Atherosperma moschata</i> ; Labill. "Sassafras." (Monimiæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on May 22, 1887, at Bonang, Delegate. Formation: Mudstone, Silurian.
16,928	Bark of <i>Atherosperma moschata</i> ; Labill. "Sassafras." (Monimiæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on May 22, 1887, at Bonang, Delegate. Formation: Mudstone, Silurian.
16,916	Whole Plant of <i>Boronia rhomboidea</i> ; Hook. (Rutaceæ.) Collected on July 16, 1887, at Charlie's Forest, Braidwood. Formation: Conglomerate.
14,803	Resin (Sandarac) of <i>Callitris calcarata</i> ; R. Br. "Pine," "Murray Pine," or "Cypress Pine." (Coniferæ.) Height, 30 to 40 feet; diameter, about 1 foot. Collected on March 3 and 4, 1887, at Quedong. Formation: Limestone.
16,900	Leaves of <i>Callitris calcarata</i> ; R. Br. "Pine," "Murray Pine," or "Cypress Pine." (Coniferæ.) Height, 20 to 40 feet; diameter, 6 to 18 inches. Collected on April 8, 1887, at Quedong, Delegate. Formation: Limestone.
17,000	Piece of Timber of <i>Callitris verrucosa</i> ; R. Br. "Rock Pine." (Coniferæ.) Height, 20 to 25 feet; diameter, 6 to 12 inches. Collected on August 30, 1887, at Danbeney Range. Formation: Silurian.
18,997	Log of <i>Capparis Mitchelli</i> ; Lindl. "Native Orange." (Capparideæ.) Height, 12 to 15 feet; diameter, 6 to 12 inches. Collected on August 29, 1887, at Gnalta Peak, Wilcannia. Formation: Silurian.
17,001	Bark of <i>Cassia</i> sp. (Leguminosæ.) Height, 10 to 15 feet; diameter, 4 to 6 inches. Collected on August 29, 1887, at Gnalta, Wilcannia. Formation: Silurian.
14,800	Whole Plant of <i>Centipeda Cunninghami</i> ; F. v. M. "Sneezeweed." Height, 4 to 12 inches. Collected on February 28, 1887, at Quedong. Formation: Limestone.
14,816	Whole Plant of <i>Centipeda orbicularis</i> ; Laur. "Sneezeweed." Length, 2 to 8 inches. Collected on April 3, 1887, at Quedong. Formation: Limestone. Note.—Found in moist situations.
16,947	Whole Plant of <i>Codonocarpus cotinifolius</i> ; F. v. M. "Quinine," or "Medicine Tree." (Phytolacææ.) Height, 20 to 25 feet; diameter, 6 to 8 inches. Collected on April 6, 1887, at Dry Lakes, Wilcannia. Formation: Supposed to be Tertiary.
16,990	Log of <i>Codonocarpus cotinifolius</i> ; F. v. M. "Quinine," or "Medicine Tree." (Phytolacææ.) Height, 20 to 25 feet; diameter, 6 to 8 inches. Collected on April 6, 1887, at Dry Lakes, Wilcannia.
16,930	Whole Plant of <i>Cymbonotus Lawsonianus</i> ; Gaud. (Compositæ.) Collected on May 2, 1887, at Delegate.
16,930a	Whole Plant of <i>Cymbonotus Lawsonianus</i> ; Gaud. (Compositæ.) Collected on May 3, 1887, at Delegate. Formation: Limestone.
16,903	Whole Plant of <i>Cymbonotus Lawsonianus</i> ; Gaud. (Compositæ.) Collected on April 6, 1887, at Quedong, Delegate. Formation: Limestone.
16,917	Leaves of <i>Doryphora sassafras</i> ; Endl. "Sassafras." (Monimiæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on July 17, 1887, at Monga, Braidwood. Formation: Humus and decomposed shale.
14,900	Piece of Timber of <i>Elæocarpus holopetalus</i> ; F. v. M. "Maddagouri." (Tiliacææ.) Height, 30 to 40 feet; diameter, 1 to 2 feet. Collected in March, 1885, at Haydon's Bog, Delegate. Formation: Mudstone, Silurian.
14,796-8	Leaves, Bark, and Gum of <i>Eucalyptus amygdalina</i> , var.; Labill. "Peppermint." (Myrtacææ.) Collected on February 14 and 16, 1887, at Bombala.
16,899	Log of <i>Eucalyptus amygdalina</i> , var.; Labill. "Peppermint." (Myrtacææ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on June 17, 1887, at Bombala. Formation: Conglomerate.
14,901	Piece of Timber of <i>Eucalyptus amygdalina</i> , var.; Labill. "Cut-tail." (Myrtacææ.) Height, 200 to 300 feet; diameter, 6 to 8 feet. Collected at Haydon's Bog, Delegate.
16,898	Log of <i>Eucalyptus Gunnii</i> , var.; J. Hook. "Flooded," or "Red Gum." (Myrtacææ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on June 17, 1887, at Bombala. Formation: Conglomerate. Always found in damp situations.
15,083-5	Leaves, Bark, and Gum of <i>Eucalyptus Gunnii</i> , var.; J. Hook. "Flooded," or "Bastard Gum." (Myrtacææ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on May 8, 1887, at Delegate. Formation: Mudstone, Silurian.
16,933	Log of <i>Eucalyptus Gunnii</i> , var.; J. Hook. "Flooded," or "Bastard Gum." (Myrtacææ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on June 12, 1887, at Delegate. Formation: Granite.
14,786-7	Leaves and Bark of <i>Eucalyptus Gunnii</i> , var.; J. Hook. "Red gum." (Myrtacææ.) Height, 80 to 100 feet; diameter, 3 to 4 feet. Collected on January 6, 1887, at Delegate. Formation: Granite.
14,783-4	Leaves and Bark of <i>Eucalyptus hæmastoma</i> ; Smith. "Rough," or "Small-leaved Stringy-bark." (Myrtacææ.) Height, 40 to 60 feet; diameter, about 2 feet. Collected on December 23, 1886, at Colombo. Formation: Granite.

APPENDIX III—*continued.*
PURCHASES (SPECIMENS).

Museum No.	Date and Description.
14,785	Gum of <i>Eucalyptus haemastoma</i> ; Smith. "Rough" or "Small-leaved Stringy-bark." (Myrtaceæ.) Height 40 to 60 feet; diameter, about 2 feet. Collected on December 24, 1886, at Colombo. Formation: Granite.
16,913	Log of <i>Eucalyptus haemastoma</i> ; Smith. "Stringy Bark." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected in June, 1887, at Colombo. Formation: Granite.
15,087	Gum of <i>Eucalyptus macrorrhyncha</i> ; F. v. M. "Stringy Bark." (Myrtaceæ.) Height, 80 to 120 feet; diameter, 2 to 4 feet. Collected on May 15th and 16th, 1887, at Amboyne, Delegate. Formation: Limestone. Note.—The timber used for fencing and wheelwright's work.
16,923	Leaves of <i>Eucalyptus macrorrhyncha</i> ; F. v. M. "Stringy Bark." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on May 12, 1887, at Delegate.
16,924	Bark of <i>Eucalyptus macrorrhyncha</i> ; F. v. M. "Stringy Bark." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on May 12, 1887, at Delegate.
16,925	Insect galls of <i>Eucalyptus macrorrhyncha</i> ; F. v. M. "Stringy Bark." (Myrtaceæ.) Found on young plants and suckers. Collected on May 12, 1887, at Delegate.
14,781-2	Leaves and bark of <i>Eucalyptus melliodora</i> ; Cunn. "Box," or "Yellow Box." (Myrtaceæ.) Height, 30 to 50 feet; diameter, about 2 feet. Collected on December 23, 1886, at Colombo. Formation: Granite.
16,912	Log of <i>Eucalyptus melliodora</i> ; Cunn. "Box," or "Yellow Box." (Myrtaceæ.) Height, 80 to 100 feet; diameter, 2 to 4 feet. Collected in June, 1887, at Colombo. Formation: Granite.
14,792-4	Leaves, bark, and gum of <i>Eucalyptus odorata</i> , var; Behr. "White Box." (Myrtaceæ.) Height, 100 to 150 feet; diameter, 6 to 8 feet. Collected on February 5 and 6, 1887, at Wongrabbell. Note.—Timber soft when green, but becomes hard when dry; much used, and very durable.
14,810-1	Leaves and bark of <i>Eucalyptus polyanthema</i> ; Sch. "Box." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 3 to 4 feet. Collected on April 10, 1887, at Quiedong. Formation: Limestone.
16,904	Leaves of <i>Eucalyptus rostrata</i> ; Schl. "Red Gum." (Myrtaceæ.) Height, 80 to 100 feet; diameter, 2 to 4 feet. Collected on June 27, 1887, at Colombo, near Candelo. Formation: Granite.
16,905	Bark of <i>Eucalyptus rostrata</i> ; Schl. "Red Gum." (Myrtaceæ.) Height, 80 to 100 feet; diameter, 2 to 4 feet. Collected on June 27, 1887, at Colombo, near Candelo. Formation: Granite.
16,906	Insect galls of <i>Eucalyptus rostrata</i> ; Schl. "Red Gum." (Myrtaceæ.) Young saplings. Collected on June 28, 1887, at Colombo, near Candelo. Formation: Granite.
16,914	Log of <i>Eucalyptus rostrata</i> ; Schl. "Red Gum." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 2 to 4 feet. Collected in June, 1887, at Colombo. Formation: Granite.
16,993	Gum of <i>Eucalyptus rostrata</i> ; Schl. "Creek Gum." (Myrtaceæ.) Height, 30 to 40 feet; diameter, 1 to 2 feet. Collected on August 23, 1887, at Tarella, Wilcannia. Formation: Silurian.
16,994	Insect galls of <i>Eucalyptus rostrata</i> ; Schl. "Creek Gum." (Myrtaceæ.) Young plants. Collected on August 23, 1887, at Tarella, Wilcannia. Formation: Silurian.
16,996	Bark of <i>Eucalyptus rostrata</i> ; Schl. "Creek Gum." (Myrtaceæ.) Height, 50 to 70 feet; diameter, 12 to 30 inches. Collected on August 29, 1887, at Tarella, Wilcannia. Formation: Silurian.
17,002	Charcoal (obtained from limbs and branches) of <i>Eucalyptus rostrata</i> ; Schl. "Creek Gum." (Myrtaceæ.) Height, 20 to 30 feet; diameter, 1 to 2 feet. Collected on August 29, 1887, at Gnalta, Wilcannia. Formation: Silurian.
14,902	Piece of timber of <i>Eucalyptus Sieberiana</i> ; F. v. M. "Cabbage Gum." (Myrtaceæ.) Height, 40 to 60 feet; diameter, 1 to 2 feet. Collected in March, 1885, at Haydon's Bog, Delegate. Formation: Silurian, mudstone.
14,905a	Piece of timber of <i>Eucalyptus Sieberiana</i> ; F. v. M. "Cabbage Gum." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 1 to 2 feet. Collected on May 5, 1887, at Delegate. Formation: Silurian, mudstone.
16,896	Log of <i>Eucalyptus Sieberiana</i> ; F. v. M. "Cabbage Gum." (Myrtaceæ.) Height, 40 to 60 feet; diameter, 1 to 2 feet. Collected on June 16, 1887, at Bombala. Formation: Conglomerate.
14,903	Piece of timber of <i>Eucalyptus stellulata</i> ; Sieb. "Sally" or "Black Gum." (Myrtaceæ.) Height, 30 to 50 feet; diameter, 2 to 3 feet. Collected in March, 1885, at Haydon's Bog, Delegate. Formation: Silurian, mudstone.
16,895	Log of <i>Eucalyptus stellulata</i> ; Sieb. "Sally" or "Black Gum." (Myrtaceæ.) Height, 20 to 40 feet; diameter, 1 to 3 feet. Collected on June 16, 1887, at Bombala. Formation: Conglomerate.
14,799	Gum of <i>Eucalyptus stellulata</i> ; Sieb. "Sally" or "Black Gum." (Myrtaceæ.) Height, 30 to 50 feet; diameter, about 2 feet. Collected on February 17 and 18, 1887, at Bombala. Formation: Limestone.
14,807-8	Leaves and bark of <i>Eucalyptus Stuartiana</i> ; F. v. V. "Apple Tree." (Myrtaceæ.) Height, 80 to 100 feet; diameter, 2 to 4 feet. Collected on April 7, 1887, at Quiedong. Formation: Limestone.
14,820	Kino of <i>Eucalyptus Stuartiana</i> ; F. v. M. "Apple Tree." (Myrtaceæ.) Height, 80 to 100 feet; diameter, 3 to 4 feet. Collected on March 24 and 25, 1887, at Quiedong. Formation: Limestone.

APPENDIX III—continued.
PURCHASES (SPECIMENS).

Museum No.	Date and Description.
15,086	Gum of <i>Eucalyptus tereticornis</i> ; Smith. "Mountain Gum." (Myrtaceæ.) Height, 100 to 180 feet; diameter, 4 to 8 feet; found on mountain ridges. Collected on May 20, 1887, at Bonang, Delegate. Formation: Silurian, Mudstone. Note.—Timber is considered valuable.
14,905	Piece of timber of <i>Eucalyptus viminalis</i> ; Labill. "Ribbon Gum." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on May 5, 1887, at Delegate. Formation: Silurian, mudstone.
14,905b	Piece of timber of <i>Eucalyptus viminalis</i> ; Labill. "Ribbon Gum." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on May 5, 1887, at Delegate. Formation: Silurian, mudstone. Note.—The timber is used for wheelwrights' work.
16,926	Insect galls of <i>Eucalyptus viminalis</i> ; Labill. "Ribbon Gum." (Myrtaceæ.) Found on sapling. Collected on May 28, 1887, at Tingiringi Mountain, Delegate.
16,897	Log of <i>Eucalyptus viminalis</i> , var.; Labill. "Ribbon Gum," or "Manna Gum" (Myrtaceæ.) Height, 60 to 80 feet; diameter, 1 to 2 feet. Collected on June 17, 1887, at Bombala. Formation: Conglomerate.
14,806	Bark of <i>Eucalyptus viminalis</i> , var.; Labill. "Manna Gum." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 2 to 3 feet. Collected on April 6, 1887, at Quiedong. Formation: Limestone.
14,813	Leaves of <i>Eucalyptus viminalis</i> , var.; Labill. "Manna Gum," or "Ribbon Gum." (Myrtaceæ.) Height, 60 to 100 feet; diameter, 2 to 3 feet. Collected on April 6, 1887, at Quiedong. Formation: Limestone.
14,818	Manna of <i>Eucalyptus viminalis</i> , var.; Labill. "Manna Gum," or "Ribbon Gum." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 3 to 4 feet. Collected on March 28, 1887, at Quiedong. Formation: Limestone.
14,819	Kino of <i>Eucalyptus viminalis</i> , var.; Labill. "Manna Gum," or "Ribbon Gum." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 3 to 4 feet. Collected on March 26 and 27, 1887, at Quiedong. Formation: Limestone.
14,788-9	Leaves and bark of <i>Eucalyptus</i> sp. "Black Box." (Myrtaceæ.) Height, 80 to 100 feet; diameter, 3 to 4 feet. Collected on January 24, 1887, at Nangutta. Note.—Timber soft when green, but becomes hard when dry; much used and very durable.
14,790-1	Leaves and bark of <i>Eucalyptus</i> sp. "Cabbage Box." (Myrtaceæ.) Height, 80 to 100 feet; diameter, 3 to 4 feet. Collected on January 25, 1887, at Nangutta.
16,909	Leaves of <i>Eucalyptus</i> sp. "White Gum," or "Blue Gum." (Myrtaceæ.) Height, 80 to 100 feet; diameter, 3 to 4 feet. Collected on 26 June, 1887, at Colombo, near Candelo. Formation: Granite.
16,910	Bark of <i>Eucalyptus</i> sp. "White Gum" or "Blue Gum." (Myrtaceæ.) Height, 80 to 100 feet; diameter, 2 to 4 feet. Collected on June 26, 1887, at Colombo, near Candelo. Formation: Granite.
16,915	Log of <i>Eucalyptus</i> sp. "White Gum" or "Blue Gum." (Myrtaceæ.) Height, 60 to 80 feet; diameter, 2 to 4 feet. Collected in June, 1887, at Colombo, near Candelo. Formation: Granite.
16,988	Bark of <i>Eucalyptus</i> sp. "Bastard Box." (Myrtaceæ.) Height, 30 to 50 feet; diameter, 1 to 2 feet. Collected on August 9, 1887, at Dry Lakes, Wilcannia. Formation: Silurian.
17,089	Plant of <i>Euphorbia Drummondii</i> ; Boiss. "Poisonweed." (Euphorbiaceæ.) Collected on September 13 and 14, 1887, at Wonnaminta. Formation: Silurian.
17,091	Plant of <i>Euphorbia Drummondii</i> ; Boiss. "Poisonweed." (Euphorbiaceæ.) Collected on August 19, 1887, at Cobham Lake.
17,090	Plant of <i>Euphorbia erythrantha</i> ; F. v. M. "Poisonweed." (Euphorbiaceæ.) Collected on September 12, 1887, at Wonnaminta. Formation: Silurian.
14,904	Timber of <i>Exocarpus cupressiformis</i> , Labill.; "Native Cherry." (Santalaceæ.) Height, 20 to 40 feet; diameter, 1 to 2 feet. Collected on May 3, 1887, at Brown's Camp. Formation: Mudstone, Silurian.
16,953	Log of <i>Flindersia maculosa</i> ; F. v. M. "Leopard Tree." (Meliaceæ.) Height, 30 to 50 feet; diameter, 12 to 18 inches. Collected on August 15, 1887, at Tarella, Wilcannia. Formation: Silurian.
16,995	Gum of <i>Flindersia maculosa</i> ; F. v. M. "Leopard Tree." (Meliaceæ.) Height, 30 to 50 feet; diameter, 12 to 18 inches. Collected on August 9, 1887, at Tarella, Wilcannia. Formation: Silurian.
16,954	Log of <i>Grevillea striata</i> ; R. Br. "Beefwood." (Proteaceæ.) Height, 20 to 30 feet; diameter, 12 to 18 inches. Collected on August 13, 1887, at Tarella, Wilcannia. Formation: Silurian.
14,795	Plant of <i>Linum marginale</i> ; Cunn. "Flax." (Lineæ.) Height, 2 to 4 feet. Collected on February 12, 1887, at Bombala.
14,817	Plant of <i>Mentha gracilis</i> ; R. Br. "Pennyroyal." (Labiatae.) Height, 6 to 12 inches. Collected on April 12, 1887, at Quiedong. Formation: Limestone. Note.—Found chiefly in damp localities.
16,901	Plant of <i>Mentha saturojoides</i> ; R. Br. "Pennyroyal." (Labiatae.) Collected on April 7, 1887, at Quiedong, Delegate. Formation: Limestone.
16,998a	Log of <i>Myoporum Dampieri</i> , A. Cunn.; Syn. <i>Myoporum montanum</i> . R. Br. "Water-bush," or "Native Daphne." (Myoporinae.) Height, 15 to 20 feet; diameter, 6 to 10 inches. Collected on August 30, 1887, at Gnalta, Wilcannia. Formation: Silurian.
16,952	Gum of <i>Myoporum platycarpum</i> ; R. Br. (Myoporinae.) Height, 20 to 30 feet; diameter, 12 to 18 inches. Collected on August 3 and 4, 1887, at Netallie, Wilcannia. Formation: Probably Tertiary.

APPENDIX III—continued.
PURCHASES (SPECIMENS).

Museum No.	Date and Description.
14,899	Piece of timber of <i>Persoonia lanceolata</i> ; Andr. "Bonewood." (Proteaceæ.) Height, 15 to 20 feet; diameter, 12 to 18 inches. Collected in March, 1885, at Haydon's Bog, Delegate. Formation: Mudstone, Silurian.
16,998	Log of <i>Pittosporum phillyræoides</i> ; D. C. "Mock Orange," or "Native Willow." (Pittosporææ.) Height, 12 to 15 feet; diameter, 6 to 12 inches. Collected on August 29, 1887, at Gnalta, Wilcannia. Formation: Silurian.
16,902	Plant of <i>Polygonum plebejum</i> ; R. Br. (Polygonaceæ.) Collected on April 7, 1887, at Quidong, Delegate. Formation: Limestone.
15,089	Piece of timber of <i>Senecio Bedfordii</i> ; F. v. M. "Cottonwood." (Compositæ.) Height, 20 to 25 feet; diameter, 4 to 12 inches. Collected on May 19, 1887, at Bonang, Delegate. Formation: Mudstone, Silurian.
16,929	Down of <i>Senecio Bedfordii</i> ; F. v. M. "Cottonwood." (Compositæ.) Height, 16 to 20 feet; diameter, 4 to 12 inches. Obtained from under-surface of leaves. Collected on June 9 and 10, 1887, at Spring Creek, Delegate. Formation: Mudstone, Silurian.
16,932	Log of <i>Senecio Bedfordii</i> ; F. v. M. "Cottonwood." (Compositæ.) Height, 10 to 30 feet; diameter, 4 to 12 inches. Collected on June 14, 1887, at Bonang, Delegate. Formation: Mudstone, Silurian.
15,090	Log of <i>Telopea oreades</i> ; F. v. M. "Gippsland Waratah." (Proteaceæ.) Height, 8 to 40 feet; diameter, 4 to 24 inches. Collected on May 21, 1887, at Bonang, Delegate. Formation: Mudstone, Silurian. Note.—Timber said to be very elastic.

ECONOMIC ENTOMOLOGY.

May 4.

A collection of insects injurious to the vine, together with some specimens of leaves and roots—the former to show the galls caused by insects; the latter, the characteristic appearance of a vine-root infested by phylloxera. The insects are each mounted on glass slides, for the microscope.

Museum No.	Description.	Museum No.	Description.
<i>Phylloxera vastatrix radicitola</i> :—			
14,836	Ovum.	14,874	<i>Hoplophora aretata</i> (cum ovo); Riley
14,837	Ovum.	14,875	<i>Nothrus mutilus</i> ; Koch.
14,838	Putamen ovi.	14,876	<i>Nothrus mutilus</i> ; Koch.
14,839	Larva juvenis.	14,877	<i>Nothrus scaliger</i> ; Koch.
14,840	Larva juvenis.	14,878	<i>Nothrus scaliger</i> ; Koch.
14,841	Larva juvenis.	14,879	<i>Pelops acromios</i> ; Koch, Herm.
14,842	Larva semi-adulta.	14,880	<i>Pelops acromios</i> ; Koch, Herm.
14,843	Larva semi-adulta.	14,881	<i>Eremaas cymba</i> ; Nic.
14,844	Larva semi-adulta.	14,882	<i>Eremaas cymba</i> ; Nic.
14,845	Larva adulta.	14,883	<i>Leiosoma giloula</i> .
14,846	Larva adulta.	14,884	<i>Leiosoma giloula</i> .
14,847	Larva adulta.	14,885	<i>Zetes morticinus</i> ; Koch.

14,849	Larva ovum inventre gerens.	14,887	<i>Tegeocranus cymbida</i> ; Hall.
14,850	Larva hibernans.	14,888	<i>Troctes fotidus</i> .
14,851	Larva hibernans.	14,889	<i>Gamasus</i> sp.
14,852	Pellis larvæ.	14,890	<i>Bdella</i> sp.
14,853	Pellis larvæ.	14,891	Larva sp.
14,854	Larva cutem deponens.	14,892	Larva sp.
14,855	Larva cutem deponens.	14,893	<i>Trombidium</i> larva or <i>Psylla</i> larva.
14,856	Nympha.	14,894	<i>Coccus vitis</i> , larva feminæ.
14,857	Pellis nymphae.	14,895	<i>Coccus vitis</i> , larva embryonalis.
14,858	Pellis nymphae.	The following specimens are preserved in spirit:—	
14,859	Alata.	14,829	Leaves of American vine, cultivated in Europe, showing galls. (Two small green leaves.)
14,860	Alata.	14,830	Leaf of American vine, cultivated in America, showing galls. Nortons, Virginia.
14,861	Alata ova in ventre gerens	14,831	Leaf of American vine, cultivated in Europe, showing galls. Nortons, Virginia.
<i>Gallicola</i> :—			
14,862	Ova.	14,832	Root of vine, strongly affected with <i>Phylloxera</i> .
14,863	Ova.	14,833	Root of European vine, very slightly affected with <i>Phylloxera</i> .
14,864	Larva juvenis.	14,834	Root of European vine, with nodes caused by <i>Phylloxera</i> .
14,865	Larva juvenis.	14,835	Root of American vine, with nodes caused by <i>Phylloxera</i> .
14,866	Larva adulta.		
14,867	Larva adulta.		
14,868	Male.		
14,869	Female.		
<i>Insects injurious to the Vine, other than Phylloxera</i> :—			
14,870	<i>Polyxenus laguras</i> ; De Gur.		
14,871	<i>Polyxenus laguras</i> ; De Gur.		
14,872	<i>Hoplophora aretata</i> ; Riley.		
14,873	<i>Hoplophora aretata</i> (cum ovo); Riley.		

November 30.

17,736 Sprig of pink coral.

17,737 Sprig of dark red coral.

PURCHASES (SPECIMENS).

Museum No.	Description.
ECONOMIC GEOLOGY.	
February 19.	
14,666	Stockholm petroleum.
14,692	Crabs' eyes.
May 4.	
14,896	Marble; small slab of oblong shape for use as a paper-weight, polished. Marulan, N.S.W.
July 11.	
16,891	Lignite. From Bombala, N.S.W.
October 10.	
17,003	Ferruginous septa. Gnalta. Wilcannia, N.S.W.
17,004	Fossilized wood. Wonnaminta.
17,005	Green carbonate of copper. Broken Hill, N.S.W.
17,006	Gypsum. Wonnaminta. Wilcannia.
October 31.	
17,087	Salt (chloride of sodium), more or less impure. Cobham Lake.
November 30.	
17,739	Moonstone, polished. Ceylon.
November 16.	
A Collection of Asbestos in the raw state, together with a large number of articles, showing some of the uses to which it is now applied.	
17,617	Asbestos Fibre, in the rock, Canada.
17,618	Grey Asbestos; manufactured at Turin, Italy. Val d'Aosta, Italy.
17,619	White Asbestos; manufactured at Turin, Italy. Val d'Aosta, Italy.
17,620	First Quality Asbestos; manufactured at Turin, Italy. Val di Susa, Italy.
17,621	Grey Italian Carded Asbestos; used for making asbestos gaskets, packing steam-cocks, &c., and for places where millboard or rope-packing cannot be applied; also for filtration and other purposes. Manufactured at Turin, Italy.
17,622	White Italian Carded Asbestos; used for making asbestos gaskets, packing steam-cocks, &c., and for places where millboard or rope-packing cannot be applied; also for filtration and other purposes. Manufactured at Turin, Italy.
17,623	Carded Asbestos; used for making asbestos gaskets packing steam-cocks, &c., and for places where millboard or rope-packing cannot be applied; also for filtration and other purposes. Manufactured at Turin, Italy. Val di Susa, Italy.
17,624	Carded Canadian Asbestos; used for making asbestos gaskets, packing steam-cocks, &c., and for places where millboard or rope-packing cannot be applied; also for filtration and other purposes. Manufactured at Turin, Italy.
17,625	Asbestos, powdered and washed; manufactured at Turin, Italy.
17,626	Asbestos Millboard Washers; manufactured at Turin, Italy.
17,627	Italian Asbestos Millboard; for packing steam-joints, cylinder-covers, steam-chest covers, man-hole joints, pipe flanges, &c. Manufactured at Turin, Italy.
17,628	Canadian Asbestos Millboard; for packing steam-joints, cylinder-covers, steam-chest covers, man-hole joints, pipe flanges, &c. Manufactured at Turin, Italy.
17,629	Grey Asbestos Paper; manufactured at Turin, Italy. Valtellina, Italy.
17,630	White Asbestos Paper; for electric work, and very fine joints. Manufactured at Turin, Italy. Valtellina, Italy.
17,631	White Canadian Asbestos Paper; for electric work, and very fine joints. Manufactured at Turin, Italy.
17,632	Elliptical Washer of Asbestos, bound with copper wire. Manufactured at Turin, Italy. Trond'homme, Canada.
17,633	Asbestos Cloth, of Canadian fibre. Used for filtering or straining chemical liquids, for drop curtains in theatres, furnacemen's aprons and leggings, firemen's clothes, gloves, &c. Manufactured at Turin, Italy.
17,634	Plaited Canadian Asbestos Rope, about 1½ in. diameter. Manufactured at Turin, Italy.
17,635	Plaited Canadian Asbestos Rope, about 1 in. diameter. Manufactured at Turin, Italy.
17,636	Canadian Asbestos Packing (three-ply). Manufactured at Turin, Italy.
17,637	Canadian Asbestos Packing (six-ply). Manufactured at Turin, Italy.
17,638	Fine Asbestos Yarn (double-twisted) of Canadian fibre. Manufactured at Turin, Italy.
17,639	Italian Asbestos Packing (two-ply). Manufactured at Turin, Italy.
17,640	Plaited Italian Asbestos Rope, about 1½ in. diameter. Manufactured at Turin, Italy.
17641-45	Asbestos Millboard Washers. Manufactured at Turin, Italy.
17646-49	Asbestos Millboard Washers. Manufactured at Turin, Italy.

November 10.

Wools (New South Wales.)

Merino Wools:—

17,140	A very high type of wool, a combination of the Spanish and French merino. J. Penzer, Yarrandah, Dubbo, New South Wales. 34.	17,156	High-class stud ram's wool; greasy combing. H. C. White, Havilah, Mudgee, New South Wales. 25.
17,164	A very useful specimen of combing wool, of Tasmanian blood. J. Penzer, Yarrandah, Dubbo, New South Wales. 34.	17,148 ^a	Ewes' wool; superior combing. T. W. Hammond, Old Junee, Riverina, New South Wales. 15.
17,146	Very superior combing from the celebrated Goonoo Goonoo Stud Flock. Peel River Limited Liability Company, Goonoo Goonoo, New South Wales. 12.	17,148 ^b	Greasy wool (ewe's); breech, or lowest part of fleece, from superior combing fleece. Old Junee, Riverina. 15.
17,146	Very fine combing wool from the celebrated Goonoo Goonoo Stud Flock. Peel River Limited Liability Company, Goonoo Goonoo, New South Wales. 12.	17,149	Stud ram's wool; very superior combing. James Lee, Larras Lake, Molong, New South Wales. 17.
17,154 ^a	Greasy wool of merino ram. This specimen of ram's wool is taken off a fleece which was pronounced, by Dr. Bowman, to be the most valuable wool exhibited in the Indian and Colonial Exhibition of 1886. G. J. Mulholland, Oura, Wagga Wagga, New South Wales. 22.	17,149	Stud ram's wool; superior combing. James Lee, Larras Lake, Molong, New South Wales. 16.
17,154 ^b	A fine combing wool from the progeny of Tasmanian rams. G. J. Mulholland, Oura, Wagga Wagga, New South Wales. 23.	17,153	Hogget's wool; a very useful combing. Chisholm Bros., Kippiland, Goulburn, New South Wales. 28.
		17,158	Finecombing wool of hoggets. Chisholm Bros., Kippiland, Goulburn, New South Wales. 28.
		17,145	A deep combing wool from hogget ram, 13 months old. Chisholm Bros., Kippiland, Goulburn, New South Wales. 11.
		17,147	Ewe hogget's wool; strong combing. Collaroy Company, Limited. 14.
		17,155	Greasy wool; deep grown combing. J. M. L. Macdonald, Wallabadah, New South Wales. 24.
		17,160	Superior combing wool from hogget. Cowabee, Colmar (?). 30.

APPENDIX III—continued.

PURCHASES (SPECIMENS).

Museum No.	Description.	Museum No.	Description.
17,141	Fine combing wool. Wantabadgery, Wagga Wagga, New South Wales. 5 and 6.	17,162	Greasy wool (ewe's); superior combing. Alex. Sloane, Mulwalla, New South Wales. 32.
17,150	Ewe's wool; superior combing. Wantabadgery, Wagga Wagga, New South Wales. 18.	17,143	Greasy wool (ewe's); strong combing. Alex. Sloane, Mulwalla, New South Wales. 8.
17,141	A low or strong combing wool. Wantabadgery, Wagga Wagga, New South Wales. 5.	17,157a	Combing wool; scoured. W. Gibson & Co., Union Works, Bourke. 26.
17,139	Wool of sheep shorn in grease; strong or deep grown combing. The Hon. W. Wilson, Goonambil, Cowra, New South Wales. 1.	17,157b	Clothing wool; scoured. W. Gibson & Co., Union Works, Bourke, New South Wales. 27.
17,139	Wool of sheep shorn in grease; strong or deep grown combing. The Hon. W. Wilson, Goonambil, Cowra. 2.	<i>English Breeds of Wool:—</i>	
17,153	Greasy wool; superior combing (two samples.) Alex. Sloane, Mulwalla, New South Wales. 21.	17,152	Romney Marsh (Kent). Demi-lustre. E. B. Woodhouse, Mount Gilead, Campbelltown, New South Wales. 20.
		17,142	Romney Marsh (Kent). Demi-lustre; low quality. Mount Gilead, Campbelltown, New South Wales. 7.

Victoria.

<i>Merino Wools:—</i>	
17,170	Ewe's wool, 2-tooth; very superior combing; value, 11d. per lb. J. Ware, Mingah, Victoria. 40.
17,165a	A very high-class wool from a stud ram, 2-tooth. This stud flock is much sought after for improving or crossing with other strains. C. Ayrey, Waranooke, Victoria. 41.
17,165b	A very high-class wool from ewe the progeny of the preceding. C. Ayrey, Waranooke, Victoria. 35.
17,172	Very fine type of merino stud ram's wool, one of the most valuable strains in Victoria. T. Dowling, Jellalabad, Victoria. 43.
17,179	A very superior hogget wool from "Retreat" ewes. An excellent type of wool. George Carmichael, Retreat, Victoria. 50.
17,180	Stud ewe's wool, 8-tooth; a fine combing wool. Molesworth & Mattheson, Moranghurt, Victoria. 51.
17,171	Ewe's wool; a fine useful style of combing wool. R. Ramsden, Brunybrungle, Victoria. 42.
17,181	Specimen of pure combing wool from one of the most valuable strains of merino blood. T. Russell, Wurrott Station, Victoria. 52.
17,173	Pure merino ewe's wool; age, 15 months. Very superior combing wool; value, 13d. per lb. Thos. Russell, Yarrina, Cressy. 44.
17,167	Ewe's wool; a most useful combing wool; 17 months 17 days old; 355 days' growth. Thos. Russell, Warrook, Rokewood, Victoria. 37.
17,168	Ewe's wool, 2-tooth; an excellent style of combing; 368 days' growth; value, 1s. 2d. per lb. Thos. Russell, Warrook, Rokewood, Victoria. 38.
17,169	"Comeback" wool, from sheep aged 3 years; 349 days' growth. This style of wool has been realizing very high prices, and shows a Leicester strain; value, 1s. 2d. per lb. Josiah Austen, Greenvale, Victoria. 39.
17,166	Ewe-hogget's wool; 360 days' growth; age, 17½ months. A useful fine merino wool; value, 11d. per lb. E. Bryan Wright, jun., Spring Vale, Victoria. 36.
17,178	Wool of sheep shorn in grease (two samples); value, 12d. per lb. Victoria. 49.
17,176	Hogget's wool, washed in hot water; an excellent combing wool; value, 2s. 6d. per lb. (two samples). Victoria. 47.
17,177	Cross-bred wool, washed; value, 1s. 2d. per lb. Victoria. 48a.
17,177	Cross-bred wool, washed; value, 1s. 2d. per lb. Victoria. 48b.
17,175	Wool of merino sheep, scoured; value, 1s. 9d. per lb.; combing (two samples). Victoria. 46.
17,174	Lamb's wool; very superior; value, 3s. 6d. per lb. Victoria. 45.
17,151	White merino wool, scoured; value, 4s. 2d. per lb. Sir Samuel Wilson. 53.

Queensland.

<i>Merino Wools:—</i>	
17,196	Ewe's wool, greasy; fine combing. George Clark, East Talgai, Hendon, Queensland. 69.
17,196	Ewe's wool, greasy; fine combing. George Clark, East Talgai. 68.
17,195	Ewe's wool, washed; fine combing. George Clark, East Talgai. 68.
17,197	Ewe's wool, greasy; fine combing. George Clark, East Talgai. 67.
17,203	Stud ram's wool; superfine combing; average growth, 381 days; partly hand, partly grass fed. 77.
17,286	Stud ram's wool. (Same remarks as 77.) 58.
17,200	Stud ram's wool. (Same remarks as 77.) 74.
	Nos. 77, 58, 74, bred by Hodgson & Ramsay, Eton Vale, Darling Downs, Q.
17,159	Hogget ram's wool; fine combing. Marshall & Slade, Glengallen, Warwick. 28.
17,183	Hogget ram's wool; fine combing; weight, unskirted, 17 lbs. 10 oz. Marshall & Slade, Glengallen, Warwick. 55.

APPENDIX III—continued.

PURCHASES (SPECIMENS).	
Museum No.	Description.
17,185	Ram's wool; strong combing, 395 days' growth, greasy. C. B. Fisher, Ellangowan, Darling Downs, Q. 57.
17,198a	Ram's wool; fine combing, greasy. C. B. Fisher, Ellangowan. 72.
17,198b	Ewe's wool; strong combing, greasy. C. B. Fisher, Ellangowan. 71.
17,184	Ewe's wool; strong combing, greasy. C. B. Fisher, Ellangowan. 56.
Nos. 56, 57, 71, 72 are from the well-known strain of sheep called "Fisher blood," the progeny of sheep bred in South Australia, and which produce a heavy strong combing and great weight of fleece. 56.	
17,182	4-tooth ewe's wool, combing; wool of 337 days' growth. Shanahan & Jennings, Darling Downs, Q. 54.
17,192	4-tooth ewe's wool; strong combing, 337 days' growth. Shanahan & Jennings, Darling Downs, Q. 64.
17,193	4-tooth ewe's wool; 337 days' growth; 8 lb. 4 oz. Shanahan & Jennings, Darling Downs. 65.
<i>South Australia.</i>	
17,208a	Wool of sheep shorn in grease. 103.
17,208b	Wool of sheep shorn in grease; a beautiful specimen of high-class combing wool. 104.

17,208k	Same description as 109. 112.
17,215a	Three samples of superior combing wool (ram's), from Baila Station. J. Anderson, White River, Port Lincoln. 157-159.
17,215b	Three samples of fine combing wool, from Baila Station. J. Anderson. 160-162.
17,215c	Ram's wool; strong combing, from Baila Station. J. Anderson. 163.
17,215d	Ram's wool; clothing, Baila Station. J. Anderson. 164.
17,217a	Five samples of strong combing wool. Sir Thomas Elder, Lyndhurst Station. 166.
17,217b	Two samples of wool (pieces). Sir Thomas Elder, Lyndhurst. 166.
17,217c	Stained pieces. Sir Thomas Elder. 166.
17,214a	Nine samples of combing wools. Sir Thomas Elder, Beltana. 147-155.
17,214b	Sample of belly wool. Sir Thomas Elder, Beltana. 156.
17,212	Three samples of wool. Bred by Smith & Swan, Fowler's Bay. 140-142.
17,216	Wool of sheep shorn in grease. Edmund Bowman, Martindale, Mintaro. 165.
17,222	Wool of sheep shorn in grease. Mark Kopp. 171.
17,213a	Ram's wool (two samples). E. Salter, Angaston. 143-144.
17,213b	Hogget's wool (two samples). E. Salter, Angaston. 145-146.
17,210a	Twelve samples of wool, from fine to strong combing. Bred on Cordilla Station; Sir Thomas Elder, owner. 123-134.
17,208l	Same description as 109. 113.
17,208m	Same description as 109. 114; 103-114 from Yalluin Station.
Museum No.	Description.
17,187	Ewe's wool; combing, hot-water washed. Gore & Co., Yandilla, Darling Downs, Q. 59.
17,199	Ewe's wool; fine combing. Gore & Co., Yandilla. 73.
17,194	Ewe hogget; fine combing, 315 days' growth, hot-water washed. Gore & Co., Yandilla. 66.
17,190a	Ewe's wool; super combing. Queensland Co-operative Pastoral Co., Limited, Pikedale, Darling Downs, Q. 63.
17,190b	Ewe's wool; fine combing, 365 days' growth. Queensland C. & P. Co., Limited. 70.
17,201	Wool of wethers; super clothing. Queensland C. & P. Co., Limited. 76.
17,291	Wool of wethers; super combing. Queensland C. & P. Co., Limited. 62.
17,188-9	Black merino wool; greasy, 370 days' growth. W. Allan, Dalveen, Warwick, Q. 60-61.
17,218	Wool of stud ram "Young Zulu"; cut 15 lb. of wool. Bred by John Murray, Murrayvale, Mount Crawford, South Australia. 167.
17,211a	Ram's wool; strong combing. 137.
17,211b	Ram's wool; strong combing. 138.
17,211c	Ram's wool; strong combing. 137, 139. 137, 138, 139, bred by John Murray, Murrayvale, Mount Crawford, South Australia. 139.
17,209a	Superior combing wool. 115.
17,209b	Superior combing wool. 116.
17,209c	Superior combing wool. 117.
17,209d	Medium combing wool. 118.
17,209e	Medium combing wool. 119.
17,209f	Medium combing wool. 120.
17,209g	Strong combing wool. 121.
17,209h	Strong combing wool. 122. 115-122 bred by the Honorable A. B. Murray, from Murrayvale ewes.
17,206	Eight samples of wool, from superior to strong combing. Bred by W. Cuvier, Esq., Anabranch, West Moona Station. 91-98.
17,220	Stud ram's wool. Bred by James Saunders & Co., Canowie. 169.
17,204a	Stud ram's wool. 78.
17,204b	Stud ram's wool. 79.
17,204c	Flock hogget's wool. 80.
17,204d	Flock hogget's wool. 81. 78-81 bred by B. Scppelt, Scppelsfield.
17,207	Four samples of combing wool, from fine to strong. Bred by E. C. & J. L. Stirling, Nalpa Station. 99-102.
17,210b	Sample of wool from the neck. Sheep bred on Cordilla Station. 135.
17,210c	Belly wool. Sheep bred on Cordilla Station. 136.
17,221	Wool of sheep shorn in grease; mark, H & W over B. 170.
17,205a	Six samples of strong combing wool from Moolooloo. 82-87.
17,205b	Three samples of wool from breech, unskirted; Moolooloo. 88-90.
17,224	Three samples of strong combing wool; mark, D & P. 173.
17,223	Wool of 6-year old ram, cut 15 lb.; mark, D & P. 172.
17,226	Wool of sheep shorn in grease (heavy in grease); value, 5½d. per lb. 175.
17,225	Scoured wool; value, 12d. per lb. 174.
17,225	Scoured wool; value, 13d. per lb. 176.

APPENDIX III—continued.

PURCHASES (SPECIMENS).

Museum No.	Description.	Museum No.	Description.
<i>New Zealand.</i>			
<i>Merino Wools:—</i>			
17,240	Ram's wool. Cut 9½ lb. 189.	17,234	Hogget's wool. Cut 7 lb. 183.
17,267	Ewe's wool. Cut 10¼ lb. 216.	17,250	Wool of wether. Cut 8½ lb. 199.
17,236	Ram hogget. Cut 12 lb. 185.	17,261a	Wool of sheep shorn in grease, worth 10½d. per lb. 219.
17,245	Ewe hogget. Cut 10¾ lb. 194.		
<i>Half-bred Wools:—</i>			
17,257	Ewe's wool. Fleece 7 lb., skirted. 206.	17,248	Wool of wether. Fleece, skirted, 4 lb. 197.

		17,577	Ulysses.
		17,578	Caracalla.
		17,579	Venus du Capitole.
		17,580	Thalie.

ETHNOLOGY.

Musical Instruments.

March 28.

- 14,761 Taki-goto. Of hardwood, 4 ft. 6 in. long, with thirteen strings of silk neatly twisted. This instrument is provided with thirteen movable bridges, by means of which the pitch of the strings is regulated; the bridges are of wood, about 2½ in. in height. The Taki-goto is learnt chiefly by Japanese ladies moving in the upper circles of society. It is rather an expensive instrument, and requires much practice. The performer places it on the floor, and sitting in the usual Japanese attitude, bends over it and twangs the strings with her fingers, the tips of which are encased in plectra, resembling thimbles, which terminate with a little projecting piece of ivory, in form like a finger-nail. Modern. Japan.
- 14,762 Sime-Daiko, or small drum. The body in lacquer-ware, ornamented with embossed flowers and foliage in gold. Diam., 13½ in.; height, 5¼ in. With folding stand. This drum is suspended in a wooden frame by silken cords, and is beaten on its upper part with sticks. Modern. Japan.

May 12.

- 14,906 Complete suit of Japanese armour, being the uniform and accoutrements of a noble (Daimio).
- 14,907 Gilt helmet with crest
- 14,908 Spear with coverings.

APPENDIX III—continued.

PURCHASES (SPECIMENS).

Museum No.	Description.
14,909	Spear with coverings.
14,910	Lance, 7 feet long, with steel blade.
14,911	Long sword.
14,912	Short sword.
October 9.	
16,967	Foot of hookah of silver inlaid in iron. Syria.
16,968	Basin for ablutions, with lid. Brass. Used by the Druses. Syria.
16,969	Dagger with silver inlaid in iron. Syria.
16,970	Head ornament of silver, worn by a Druse bride. Syria.
<p>The following note is taken from Vice-Admiral J. W. Dowell's work entitled, "Cruising in Many Waters." At page 134 he says:—"A silver horn on the forehead, of about a foot high, cannot be pleasant to the wearer, nor could I admire it. It is hollow, and being placed upright on the head, it is secured under the chin by a silken cord, and a veil carried over it falls low down in front."</p>	
16,971	Cap or head ornament used by Druses. Silver. Syria.
16,972	Water-bottle, inlaid with silver, used by Druses. Syria.
<p>"The Druses are a curious people of mixed Syrian and Arabian origin, inhabiting the mountains of Lebanon and Antilebanon, Syria."</p>	

MECHANICS.

May 21.

Tools of a Japanese Carpenter:—

14,991	Sharpening-stone, of fine-grained hard sandstone. Used for putting an edge on tools that are very dull. Size, $8\frac{1}{4} \times 3 \times 2\frac{3}{8}$ in. Nishimura, Kyoto, Japan.
14,992	Sharpening-stone, soft and shaly in composition. Used in the same manner as our oilstone, for putting a fine edge on tools. Size, $9 \times 3 \times 2\frac{1}{2}$ in. Nishimura, Kyoto, Japan.
14,993	Sharpening-stone, of flaky structure and very brittle. Used for putting the finest edge on tools. Size, $8\frac{3}{8} \times 3 \times 1\frac{1}{8}$ in. Price in Japan, 11 sen = 4d. Nishimura, Kyoto, Japan.
14,994	Adze, steel head, with curved wooden handle. Dimensions of head, $5\frac{3}{4} \times 3\frac{3}{4}$ in.; length of handle, $24\frac{1}{2}$ in. Price in Japan, 38 sen = 1s. 3d. Nishimura, Kyoto, Japan.
14,995	Small saw, with teeth at back as well as in front, with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $6\frac{3}{4} \times 2\frac{1}{2}$ in.; handle, 9×1 in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
14,996	Saw, similar to 14,995, but of larger size, with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $9\frac{3}{4} \times 2\frac{7}{8}$ in.; handle, $9\frac{3}{4} \times 1$ in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
14,997	Saw, with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $14\frac{1}{2} \times 1\frac{3}{8}$ in.; handle, $11\frac{3}{4} \times 1$ in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
14,998	Saw-set, with three gauges. Length, 4 in. Nishimura, Kyoto, Japan.
14,999	Saw, with blade tapering, from $4\frac{1}{2}$ in. to 4 in., with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $16\frac{1}{2}$ in.; handle, $15\frac{1}{4} \times 1\frac{1}{8}$ in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
15,000	Saw file, with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $1\frac{1}{2} \times \frac{1}{2}$ in.; handle, $4 \times \frac{5}{8}$ in. Price in Japan, 3 sen = 1d. Nishimura, Kyoto, Japan.
15,001	Saw file; similar to 15,000. Size of blade, $2\frac{3}{8} \times \frac{5}{8}$ in.; handle, $4 \times \frac{5}{8}$ in. Price in Japan, 4 sen 5 rin = 2d. Nishimura, Kyoto, Japan.
15,002	Saw, with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $8\frac{3}{8} \times \frac{7}{8}$ in.; handle, $8\frac{3}{4} \times 1$ in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
15,003	Saw; somewhat similar to an ordinary keyhole saw. Size of blade, $7\frac{1}{4} \times \frac{1}{4}$ in.; handle, $6\frac{1}{2} \times \frac{5}{8}$ in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
15,004	Saw; similar to No. 14,999. Blade tapering, from $4\frac{1}{8}$ in. to $2\frac{3}{4}$ in., with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $13\frac{1}{2}$ in.; handle, $13\frac{1}{4} \times 1\frac{1}{8}$ in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
15,005	Saw, similar to No. 14,999. Blade tapering, from $3\frac{1}{2}$ in. to 2 in., with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $10\frac{1}{4}$ in.; handle, $10\frac{1}{4} \times 1$ in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
15,006	Saw, similar to No. 14,999. Blade tapering, from $2\frac{3}{4}$ in. to $2\frac{1}{4}$ in., with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $10\frac{1}{4}$ in.; handle, $9\frac{1}{4} \times 1$ in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
15,007	Saw, similar to No. 14,999. Blade tapering, from $3\frac{1}{8}$ in. to $1\frac{7}{8}$ in., with pine (probably <i>Cryptomeria japonica</i>) handle. Size of blade, $6\frac{1}{2}$ in.; handle, $9\frac{1}{4} \times 1$ in. Note: The teeth of these saws are pitched in the opposite way to those of English saws. Nishimura, Kyoto, Japan.
15,008	Drilling tool, with tetragonal blade and pine (probably <i>Cryptomeria japonica</i>) handle. Length of blade, $1\frac{3}{8}$ in.; handle, 8 in. Nishimura, Kyoto, Japan.

APPENDIX III—continued.
PURCHASES (SPECIMENS).

Museum No.	Description.
15,009	Drilling tool, with tetragonal blade and pine (probably <i>Cryptomeria japonica</i>) handle. Length of blade, $1\frac{1}{2}$ in.; handle, $9\frac{1}{4}$ in. Nishimura, Kyoto, Japan.
15,010	Drilling tool, with triangular point and pine (probably <i>Cryptomeria japonica</i>) handle. Length of blade, $2\frac{7}{8}$ in.; handle, $10\frac{1}{2}$ in. Price in Japan, 4 sen = $1\frac{1}{2}$ d. Nishimura, Kyoto, Japan.
15,011	Drilling tool, with tetragonal blade and pine (probably <i>Cryptomeria japonica</i>) handle. Length of blade, $2\frac{3}{8}$ in.; handle, $10\frac{1}{2}$ in. Nishimura, Kyoto, Japan.
15,012	Drilling tool, with triangular point and pine (probably <i>Cryptomeria japonica</i>) handle. Length of blade, $3\frac{3}{4}$ in.; handle, $11\frac{1}{2}$ in. Price in Japan, 4 sen 5 rin = 2d. Nishimura, Kyoto, Japan.
15,013	Screwdriver, the blade having an iron shoulder. Handle of hardwood, hooped with iron. Length of blade, 3 in.; handle, $4\frac{1}{4}$ in. Nishimura, Kyoto, Japan.
15,014	Gouge, with pine (probably <i>Cryptomeria japonica</i>) handle. Length of blade, $1\frac{3}{4}$ in.; handle, $7\frac{1}{2}$ in. Nishimura, Kyoto, Japan.
15,015	Gouge, with pine (probably <i>Cryptomeria japonica</i>) handle. Length of blade, $2\frac{5}{8}$ in.; handle, $10\frac{3}{8}$ in. Nishimura, Kyoto, Japan.
15,016	Gouge, with pine (probably <i>Cryptomeria japonica</i>) handle. Length of blade, $4\frac{3}{8}$ in.; handle, $5\frac{1}{2}$ in. Nishimura, Kyoto, Japan.
15,017	Gouge, with pine (probably <i>Cryptomeria japonica</i>) handle. Length of blade, $2\frac{1}{4}$ in.; handle, $8\frac{3}{4}$ in. Nishimura, Kyoto, Japan.
15,018	Mortising chisel, with handle of cedar (?). Length of blade, $4\frac{7}{8}$ in.; handle, $4\frac{1}{4}$ in. Nishimura, Kyoto, Japan.
15,019	Chisel, with handle of hardwood, hooped with iron. Length of blade, $6\frac{1}{8}$ in.; handle, 3 in. Nishimura, Kyoto, Japan.
15,020	Chisel, with handle of hardwood, hooped with iron (socketed). Length of blade, $6\frac{1}{2}$ inches; handle, 3 inches. Nishimura, Kyoto, Japan.
15,021	Chisel, with handle of hardwood, hooped with iron (socketed). Length of blade, $5\frac{3}{4}$ inches; handle, $2\frac{3}{4}$ inches. Nishimura, Kyoto, Japan.
15,022	Carving tool, with handle of hardwood (socketed). Length of blade, 6 inches; handle, $3\frac{1}{2}$ inches. Nishimura, Kyoto, Japan.
15,023	Carving tool, with handle of hardwood, hooped with iron (socketed). Length of blade, $3\frac{5}{8}$ inches; handle, $3\frac{3}{8}$ inches. Nishimura, Kyoto, Japan.
15,024	Carving tool, with handle of hardwood, hooped with iron (socketed). Length of blade, $3\frac{1}{2}$ inches; handle, $3\frac{3}{4}$ inches. Nishimura, Kyoto, Japan.
15,025	Pincers, of ordinary make; size, $9\frac{7}{8}$ x $2\frac{1}{4}$ inches. Price in Japan, 18 sen = 7d. Nishimura, Kyoto, Japan.
15,026	Wood-shaver, the blade tapering from $\frac{3}{4}$ inch to a point, with handle and sheath of pine (probably <i>Cryptomeria japonica</i>). Length of blade, 5 inches; handle, $5\frac{1}{4}$ inches. Nishimura, Kyoto, Japan.
15,027	Carving tool or paring chisel, with handle of hardwood. Length of blade, $6\frac{1}{2}$ inches; handle, 4 inches. Nishimura, Kyoto, Japan.
15,028	Carving tool, with handle of hardwood, hooped with iron. Length of blade, $6\frac{1}{4}$ inches; handle, $3\frac{5}{8}$ inches. Nishimura, Kyoto, Japan.
15,029	Carving tool, with handle of hardwood. Length of blade, $6\frac{1}{4}$ inches; handle, $4\frac{1}{8}$ inches. Nishimura, Kyoto, Japan.
15,030	Carving tool, with handle of hardwood, hooped with iron. Length of blade, $6\frac{1}{2}$ inches; handle, $2\frac{3}{4}$ inches. Nishimura, Kyoto, Japan.
15,031	Carving tool, with handle of dark-coloured hardwood, hooped with iron. Length of blade, $6\frac{3}{8}$ inches; handle, $3\frac{5}{8}$ inches. Nishimura, Kyoto, Japan.
15,032	Carving tool, with handle of hardwood, hooped with iron (socketed). Length of blade, $9\frac{1}{4}$ inches; handle, $3\frac{1}{2}$ inches. Nishimura, Kyoto, Japan.
15,033	Carving tool, with handle of light yellow-coloured wood (socketed). Length of blade, $6\frac{3}{8}$ inches; handle, $10\frac{1}{4}$ inches. Nishimura, Kyoto, Japan.
15,034	Carving tool, with handle of hardwood (socketed). Length of blade, $9\frac{1}{8}$ inches; handle, $7\frac{1}{8}$ inches. Nishimura, Kyoto, Japan.
15,035	Mortising chisel, the blade having an iron shoulder. Handle of hardwood, hooped with iron. Length of blade, $9\frac{1}{2}$ inches; handle, 5 inches. Nishimura, Kyoto, Japan.
15,036	Mortising chisel, the blade having an iron shoulder. Handle of hardwood hooped with iron. Length of blade, 9 inches; handle, 4 inches. Nishimura, Kyoto, Japan.
15,037	Hammer, the head having one tapering point and one ordinary circular face, with handle of hardwood. Size of head, $3\frac{1}{8}$ inches x 1 inch; handle, $8\frac{1}{4}$ inches x $\frac{1}{2}$ inch. Price in Japan, 7 sen 5 rin = 3d. Nishimura, Kyoto, Japan.
15,038	Hammer, similar to No. 15,037, but of larger size, with square face and handle of hardwood. Size of head, 5 inches x 1 inch; handle, $9\frac{1}{2}$ inches x 1 inch. Nishimura, Kyoto, Japan.
15,039	Hammer, with two circular faces, and handle of hardwood. Size of head, $3\frac{1}{8}$ x $1\frac{1}{4}$ inches; handle, $9\frac{1}{2}$ inches x 1 inch. Price in Japan, 16 sen = $6\frac{1}{2}$ d. Nishimura, Kyoto, Japan.
15,040	Instrument for marking timber by means of a cord passing over a circular spindle turned by a small iron crank. The piece of bamboo is used in connection with the marker. Size, $6\frac{1}{2}$ x 3 x 3 inches. Price in Japan, 32 sen = 1s. 1d. Nishimura, Kyoto, Japan.
15,041	Mortise-gauge of dark-coloured hardwood. Size, $3\frac{3}{4}$ x $2\frac{7}{8}$ x $1\frac{1}{8}$ inches. Nishimura, Kyoto, Japan.
15,042	Cutting-gauge, of hardwood. Size, 9 x $5\frac{3}{8}$ x $1\frac{7}{8}$ inches. Nishimura, Kyoto, Japan.
15,043	Rabbet-plane, of light-coloured wood veined somewhat similar to beech. The iron is 5 inches x $\frac{5}{8}$ inch to a point. Size, $9\frac{1}{2}$ x $2\frac{1}{2}$ inches x 1 inch. Nishimura, Kyoto, Japan.

APPENDIX III—continued.
PURCHASES (SPECIMENS).

Museum No.	Description.
15,044	Rabbet plane, of hardwood somewhat resembling oak. Iron, $4\frac{1}{2}$ inches in length, widening to the cutting point, which has a curved sharpened edge. Size, $9\frac{1}{2}$ x $2\frac{1}{2}$ inches x $\frac{1}{2}$ inch. Nishimura, Kyoto, Japan.
15,045	Rabbet plane, of hardwood somewhat resembling oak. Iron, 5 inches x $\frac{5}{8}$ inch, similar to the ordinary English rabbet plane iron. Size, $9\frac{1}{2}$ x $2\frac{5}{8}$ inches x $\frac{5}{8}$ inch. Nishimura, Kyoto, Japan.
15,046	Rabbet plane, of light-coloured hardwood somewhat resembling oak. Iron, $5\frac{3}{8}$ x $1\frac{1}{8}$ inches, similar to iron of No. 15,045. Size, $9\frac{1}{8}$ x $2\frac{5}{8}$ x $1\frac{1}{8}$ inches. Nishimura, Kyoto, Japan.
15,047	Smoothing plane, of wood somewhat resembling beech. Iron, $1\frac{3}{4}$ x $1\frac{1}{4}$ inch, similar to English make, but much thicker. Size, 4 x $1\frac{1}{2}$ inches x 1 inch. Nishimura, Kyoto, Japan.
15,048	Wood-scraper, of light-coloured hardwood. Iron, $3\frac{1}{2}$ x $1\frac{3}{4}$ inches, similar to English make, but much thicker. Size, 5 x $2\frac{1}{4}$ inches x 1 inch. Nishimura, Kyoto, Japan.
15,049	Round plane, of wood somewhat resembling oak. Iron, 4 x $1\frac{3}{8}$ inches, similar to English make, but much thicker. Size, $9\frac{5}{8}$ x $1\frac{1}{2}$ x $1\frac{1}{4}$ inches. Nishimura, Kyoto, Japan.
15,050	Hollow plane, of wood somewhat resembling oak. Iron, $4\frac{3}{8}$ x $1\frac{1}{2}$ inches, similar to English make, but much thicker. Size, $9\frac{1}{2}$ x $1\frac{1}{2}$ x $1\frac{3}{8}$ inches. Nishimura, Kyoto, Japan.
15,051	Single-tooth gauge, of light-coloured wood. Size, 5 x $3\frac{1}{4}$ x $1\frac{1}{2}$ inches. Nishimura, Kyoto, Japan.
15,052	Hollow plane, of wood somewhat resembling oak. Iron, $4\frac{1}{2}$ x $\frac{3}{4}$ inches, similar in thickness to an English iron used for the same purpose. Size, $6\frac{3}{4}$ x $1\frac{1}{4}$ x 1 inches. Nishimura, Kyoto, Japan.
15,053	Round plane, of wood somewhat resembling oak. Iron, $4\frac{1}{2}$ x $\frac{5}{8}$ inches, similar in thickness to an English iron used for the same purpose. Size, 8 x $1\frac{3}{8}$ x 1 inches. Nishimura, Kyoto, Japan.
15,054	Plane, of wood somewhat similar to beech. Iron, $4\frac{1}{2}$ x $2\frac{1}{4}$ inches, very thick in make. Size, $9\frac{3}{4}$ x $2\frac{5}{8}$ x $1\frac{1}{8}$ inches. Nishimura, Kyoto, Japan.
15,055	Plane, with curved face, similar to a plane used by English cabinet-makers, but very much smaller, and with a much thicker iron. Size, 4 x $1\frac{1}{2}$ x $1\frac{1}{4}$ inches. Nishimura, Kyoto, Japan.
15,056	Plane, of wood somewhat resembling oak. Iron, $4\frac{1}{2}$ inches in length, $2\frac{1}{2}$ inches in width, $\frac{1}{8}$ inch in thickness. Size, 10 x $2\frac{7}{8}$ x $1\frac{1}{8}$ inches. Nishimura, Kyoto, Japan.
15,057	Plane, of wood somewhat similar to beech. Iron, 3 x $2\frac{1}{4}$ inches, exceedingly thick. Size, $10\frac{1}{4}$ x 3 x 1 inches. Nishimura, Kyoto, Japan.
15,058	Square and measure. A similar instrument is used by European blacksmiths at the forge. Length, $19\frac{1}{16}$ inches; width, $9\frac{1}{2}$ inches. Price in Japan, 38 sen = 1s. 3d. Nishimura, Kyoto, Japan.

MODELS.

February 2.

Models in papier-mâché, coloured to nature, of the following:—

- | | |
|--------|----------------------------------|
| 14,568 | Human head. |
| 14,569 | Human thoracic cavity. |
| 14,570 | Human hand. |
| 14,571 | Human foot. |
| 14,572 | Horse's hoof and leg below knee. |

These models are each in several pieces, giving facility for examining the internal as well as the external parts.

March 20.

- | | |
|--------|--|
| 14,758 | Model of Japanese country-house. |
| 14,759 | Model of seigoku-bune, or sailing vessel of ancient Japan. |
| 14,760 | Model of Japanese dwelling-house. |

APPENDIX IV.
DONATIONS (SPECIMENS).

Museum No.	Description.
MISCELLANEOUS.	
February 18.	
14,699	Specimen of Jean Scherbel's Patent Cardboard Box and Claw Clamps for holding the corners together. (Donor: Fred. Walsh, Esq., International Patent and Trade Marks Office, Sydney.)
July 10.	
16,892	Specimen of Calico dyed with quercitron bark for yellow. (Donors: Messrs. J. Keys & Sons.)
16,893	Specimen of Calico dyed with old fustic for yellow and mordanted with alumina. (Donors: Messrs. J. Keys & Sons.)
16,894	Specimen of Calico dyed with logwood for black. (Donors: Messrs. J. Keys & Sons.)
APPLIED ART.	
November 7.	
17,126	"Martin-ware" Vase, 9 $\frac{3}{4}$ " x 7 $\frac{1}{2}$ ". Southall, England. }
17,127	"Martin-ware" Vase, 9 $\frac{1}{2}$ " x 6 $\frac{1}{4}$ ". Southall, England. } (Donor: Sir Alfred Roberts.)
ECONOMIC BOTANY.	
January 1.	
14,565	Sample of Pituri (<i>Duboisia Hopwoodii</i> , F.v.M.), in semi-circular bag. From the Herbert River (Pituri Creek), Queensland—latitude 23° south, longitude 139° east. (Donor: Herbert Butcher, Esq., Tintinallogy, N.S.W.)
February 2.	
14,567	<i>Portulaca oleracea</i> , Linn., "Purslane seeds" (<i>Portulacæ</i>). Used by the aborigines of the Western District for food. (Donor: K. H. Bennett, Esq., Ivanhoe, near Hay, N.S.W.)
February 24.	
14,755	Two bunches of Rose Apples. <i>Eugenia myrtifolia</i> , Sims; Syn. <i>Jambosa australis</i> , D.C. Found in New South Wales and Queensland. (Donor: The Curator.)
March 2.	
14,757	Six cobs of Corn growing on one stem. Grown by donor—Mr. Luck, Yarragee, Moruya.
April 20.	
14,764	Billet of Wood. Resembling ebony in appearance, and used by natives for making clubs; &c., Normanby Island, New Guinea. (Donor: Dr. Alex. M'Kinlay, late of H.M.S. "Swinger.")
April 20.	
14,765	Bark, used by the natives of the Engineer Group, Eastern New Guinea. Grated down into a paste; as an application for rheumatism, it acts as an active rubefacient. (Donor: Dr. Alex. M'Kinlay, late of H.M.S. "Swinger.")
14,767	Resin from St. Agnan Island, Louisiades Group. When chewed into a white paste, used by the natives for decorating their face and body, also for marking torches. (Donor: Dr. Alex. M'Kinlay, late of H.M.S. "Swinger.")
May 26.	
15,059	<i>Monstera deliciosa</i> , Lieb. (<i>Aroideæ</i>). The Fruit. The fleshy spadix, bearing perfumed and well-tasted fruits, is habitually sold in the Mexican market, where it rivals the pineapple in estimation. Mexico. (Donor: Chas. Moore, Esq., F.L.S., Director, Botanic Gardens, Sydney.)
May 31.	
15,071	<i>Castanospermum australe</i> , Cunn. et Fraser. "Moreton Bay Chestnut" The pod. (Donor: Chas. Moore, Esq., F.L.S., Director, Botanic Gardens, Sydney.)
June 23.	
15,093	<i>Quercus macrolepis</i> , Kotschy. "The Smyrna Oak." The fruit, a valonia, contains a fair proportion of tannin. (Donor: Mr. Henry Smithurst.)

APPENDIX IV—continued.

DONATIONS (SPECIMENS).

Indian.

June 24.

From the Government of India, the Collection of Economic Vegetable Products of India, consisting of Gums and Resins, Food Substances, Medicinal Products, &c., as below enumerated:—

Gums, Resins, &c.

Museum No.	Description.	Museum No.	Description.
15,947	Gum of <i>Acacia arabica</i> ; Willd. "Gum-arabic." (Leguminosæ.)	15,965	Gum of <i>Cochlospermum gossypium</i> ; DC. "Kuteera or false tragacanth." (Bixineæ.)
15,948	Gum of <i>Acacia catechu</i> ; Willd. "A gum-arabic." (Leguminosæ.)	15,966	Gum of <i>Ferula NARTHEX</i> ; Boiss. (Umbelliferae.)
15,949	Extract of <i>Acacia catechu</i> . "Catechu or Cutch."	15,967	Caoutchouc of <i>Ficus elastica</i> ; Bl. "India-rubber." (Urticaceæ.)
15,950	Gum of <i>Acacia leucophlœa</i> ; Willd. "A gum-arabic."	15,968	Gum of <i>Gluta travancorica</i> ; Beddome. (Anacardiaceæ.)
15,951	Gum of <i>Acacia modesta</i> ; Wall. "A gum-arabic."	15,969	Gum of <i>Melia azadirachta</i> ; Linn. "Neem or Margosa." (Meliaceæ.)
15,952	Gum of <i>Acacia sundra</i> ; DC. "A gum-arabic."	15,970	Gum of <i>Moringa pterygosperma</i> ; Gærtn. "Horse-radish tree gum." (Moringaceæ.)
15,953	Resin of <i>Ailanthus malabarica</i> ; DC. "Matti-pawl." (Simarubeæ.)	15,971	Gum of <i>Odina Wodier</i> ; Roxb. (Anacardiaceæ.)
15,954	Gum of <i>Albizia lebbek</i> ; Benth. "Sirissa." (Leguminosæ.)	15,972	Resin of <i>Pinus excelsa</i> ; Wall. "Bhotan Pine." (Coniferae.)
15,955	Gum of <i>Albizia procera</i> ; Benth.	15,973	Gum of <i>Pistacia lentiscus</i> ; Linn. "Mastic." (Anacardiaceæ.)
15,956	Gum of <i>Anogeissus latifolia</i> ; Wall. "Dhowra gum." (Combretaceæ.)	15,974	Gum of <i>Pterocarpus marsupium</i> ; Roxb. "Kino." (Leguminosæ.)
15,957	Gum of <i>Balsamodendron Mukul</i> ; Hook. "Mukul resin" (Burseraceæ.)	15,975	Gum, variety, of <i>Pterocarpus marsupium</i> ; Roxb. "Kino."
15,958	Extract of <i>Berberis lycium</i> ; Royle. (Berberideæ.)	15,976	Resin of <i>Schleichera trijuga</i> ; Willd. (Sapindaceæ.)
15,959	Gum of <i>Bombax malabaricum</i> ; DC. "Silk-cotton tree gum." (Malvaceæ.)	15,977	Resin of <i>Shorea assamica</i> ; Dyer. (Dipterocarpeæ.)
15,960	Gum of <i>Boswellia serrata</i> ; Roxb. "Olibanum." (Burseraceæ.)	15,978	Resin of <i>Shorea robusta</i> ; Gærtn. "Sal resin."
15,961	Gum of <i>Buchanania latifolia</i> ; Roxb. (Anacardiaceæ.)	15,979	Gum of <i>Sterculia urens</i> ; Roxb. "Kuteera." (Sterculiaceæ.)
15,962	Gum of <i>Butea frondosa</i> ; Roxb. "Pulas or dhak." (Leguminosæ.)	15,980	Gum of <i>Styrax benzoin</i> ; Dryand. "Benzoin." (Styraceæ.)
15,963	Resin of <i>Calophyllum inophyllum</i> ; Linn. "Ndilo." (Guttiferæ.)	15,981	Gum of <i>Terminalia bellerica</i> ; Roxb. "Myrobalan." (Combretaceæ.)
15,964	Resin of <i>Canarium strictum</i> ; Roxb. "Black dammar." (Burseraceæ.)	15,982	Gum of <i>Terminalia tomentosa</i> ; W. & A

Dyes, Tans, &c.

15,983	Powder of Abir.	16,003	Bark of <i>Albizia lebbek</i> ; Benth. "Sirissa." (Leguminosæ.)
15,984	Powder, variety, of Abir.	16,004	Bark of <i>Albizia procera</i> ; Benth.
15,985	Bark of <i>Acacia arabica</i> ; Willd. "Babul." (Leguminosæ.)	16,005	Root-stock of <i>Alpinia galanga</i> ; Swz. "Galangale." (Scitamineæ.)
15,986	Pods of <i>Acacia arabica</i> . "Babul."	16,006	Flower of <i>Althæa officinalis</i> ; Linn. "Mallow." (Malvaceæ.)
15,987	Seeds of <i>Acacia arabica</i> . "Babul."	16,007	Alum.
15,988	Leaves of <i>Acacia arabica</i> . "Babul."	16,008	Ash of <i>Amarantus spinosus</i> ; Willd. (Amarantaceæ.)
15,989	Gum of <i>Acacia arabica</i> . "Gum-arabic."	16,009	Fruit of <i>Anacardium occidentale</i> ; Linn. "Cashew." (Anacardiaceæ.)
15,990	Extract of <i>Acacia catechu</i> ; Willd. "Catechu or Cutch."	16,010	Leaves of <i>Anogeissus latifolia</i> ; Wall. (Combretaceæ.)
15,991	Extract, variety, of <i>Acacia catechu</i> . "Catechu or Cutch."	16,011	Nut of <i>Areca catechu</i> ; Linn. "Betel Nut." (Palmeæ.)
15,992	Bark of <i>Acacia catechu</i> . "Catechu or Cutch."	16,012	Yellow Arsenic; (Mineral.)
15,993	Pods of <i>Acacia concinna</i> ; DC.	16,013	Bark of <i>Artocarpus integrifolia</i> ; Linn. "Indian Jack Bark." (Urticaceæ.)
15,994	Bark of <i>Acacia farnesiana</i> ; Willd.	16,014	Bark of <i>Baccaurea sapida</i> ; Mull.-Arg. (Euphorbiaceæ.)
15,995	Leaves of <i>Acacia leucophlœa</i> ; Willd. "Panicked acacia." (Leguminosæ.)	16,015	Leaves of <i>Baccaurea sapida</i> ; Mull.-Arg. (Euphorbiaceæ.)
15,996	Bark of <i>Acacia leucophlœa</i> . "Panicked acacia."	16,016	Bark of <i>Barringtonia acutangula</i> ; Gærtn. (Myrtaceæ.)
15,997	Bark of <i>Acacia jacquemontii</i> ; Benth. "Babul."	16,017	Bark of <i>Bassia latifolia</i> ; Roxb. "Mahwa." (Sapotaceæ.)
15,998	Ash of <i>Achyranthes aspera</i> ; Linn. (Amarantaceæ.)	16,018	Bark of <i>Bauhinia purpurea</i> ; Linn. (Leguminosæ.)
15,999	Wood of <i>Adenanthera pavonina</i> ; Linn. "Barricari." (Leguminosæ.)	16,019	Bark of <i>Bauhinia variegata</i> ; Linn. "Mountain Ebony." (Leguminosæ.)
16,000	Leaves of <i>Adhatoda vasica</i> ; Nees. "Malabar nut." (Acanthaceæ.)		
16,001	Rind of fruit of <i>Ægle marmelos</i> ; Correa. "Bael." (Rutaceæ.)		
16,002	Pulp of fruit of <i>Ægle marmelos</i> ; "Bael."

15,751	Seeds of <i>Sida cordifolia</i> ; Linn.	15,796	Bark of <i>Tetranthera laurifolia</i> ; Jacq. (Laurineæ.)
15,752	Silajit of Silajatu.	15,797	Bark of <i>Tetranthera monopetala</i> ; Roxb. (Laurineæ.)
15,753	Mineral, Silicate of magnesia.	15,798	Fruit of <i>Thespesia populnea</i> ; Corr. "Bhendi." (Malvaceæ.)
15,754	<i>Smilax China</i> ; Linn. (Liliaceæ.)	15,799	Stems of <i>Tinospora cordifolia</i> ; Miers. (Menispermaceæ.)
15,755	Root of <i>Smilax ovalifolia</i> ; Roxb. (Liliaceæ.)	15,800	Root of <i>Tinospora cordifolia</i> .
15,756	Leaves of <i>Solanum Melongena</i> ; Linn. "Bringall or egg plant." (Solanaceæ.)	15,801	Plant of <i>Tragia involucrata</i> ; Mull.-Arg. (Euphorbiaceæ.)
15,757	Root of <i>Solanum Melongena</i> .	15,802	Nuts of <i>Trapa bispinosa</i> ; Roxb. "Singhara." (Ornagraceæ.)
15,758	Potato of <i>Solanum tuberosum</i> ; Linn.	15,803	Plant of <i>Trianthema pentandra</i> ; Linn. (Ficoideæ.)
15,759	Fruit of <i>Solanum xanthocarpum</i> ; Schrad.	15,804	Fruit of <i>Tribulus terrestris</i> ; Linn. (Zygophylleæ.)
15,760	Grass of <i>Sorghum halepense</i> ; Pers. (Gramineæ.)	15,805	Plant of <i>Trichosanthes dioica</i> ; Roxb. (Cucurbitaceæ.)
15,761	Grain of <i>Sorghum vulgare</i> ; Pers. "Great millet or guinea corn."	15,806	Seeds of <i>Trigonella Fœnum-græcum</i> ; Linn. "Fœni grek." (Leguminosæ.)
15,762	Bark of <i>Soymida febrifuga</i> ; A. Juss. (Meliaceæ.)	15,807	Wheat of <i>Triticum sativum</i> ; Lam. "Wheat." (Gramineæ.)
15,763	Root of <i>Sphæranthus indicus</i> ; Linn. (Compositæ.)	15,808	Root of <i>Tylophora asthmatica</i> ; Wight & Arn. (Asclepiadeæ.)
15,764	Plant of <i>Spinacia hispida</i> ?	15,809	Root of <i>Typhonium orixense</i> ; Schott. (Aroideæ.)
15,765	Seeds of <i>Spinacia oleracea</i> ; Mill. "Spinach." (Chenopodiaceæ.)	15,810	Gambier of <i>Uncaria Gambier</i> ; Hunter. (Rubiaceæ.)
15,766	Leaves of <i>Spinacia oleracea</i> . "Spinach."	15,811	Bulb of <i>Urginea indica</i> ; Kunth. (Liliaceæ.)
15,767	Bark of <i>Spondias mangifera</i> ; Pers. "Hog plum or wild mango." (Anacardiaceæ.)	15,812	Root of <i>Valeriana officinalis</i> ; Linn. (Valerianeæ.)
15,768	Fruit of <i>Spondias mangifera</i> . "Hog plum or wild mango."	15,813	Root of <i>Vanda Roxburghii</i> ; R. Br. (Orchideæ.)
15,769	Leaves of <i>Sterculia colarata</i> ; Roxb. (Sterculiaceæ.)	15,814	Resin of <i>Vateria indica</i> ; Linn. (Dipterocarpeæ.)
15,770	Bark of <i>Stereospermum chelonioides</i> ; DC. (Bignoniaceæ.)	15,815	Seeds of <i>Vernonia anthelmintica</i> ; Willd. "Purple Fleabane." (Compositæ.)
15,771	Bark of <i>Stereospermum suaveolens</i> ; DC.	15,816	Plant of <i>Viola cinerea</i> ; Boiss. (Violaceæ.)
15,772	Bark of <i>Streblus asper</i> ; Lour. (Urticaceæ.)	15,817	Plant of <i>Viola odorata</i> ; Linn.
15,773	Seeds of <i>Strychnos Nux-vomica</i> ; Linn. "False angustura." (Loganiaceæ.)	15,818	Root of <i>Viola serpens</i> ; Wall.
15,774	Seeds of <i>Strychnos potatorum</i> ; Linn. f. "Clearing nuts."	15,819	Leaves of <i>Vitex Negundo</i> ; Linn. (Verbenaceæ.)
15,775	Plant of <i>Suæda nudiflora</i> ; Moq. (Chenopodiaceæ.)	15,820	Root of <i>Vitex Negundo</i> .
15,776	Mineral, Sulphur.	15,821	Leaves of <i>Vitex trifolia</i> ; Linn.
15,777	Plant of <i>Svertia Chirata</i> ; Ham. (Gentianaceæ.)	15,822	Plant of <i>Wedelia calendulacea</i> ; Less. (Compositæ.)
15,778	Root of <i>Sygodium flexuosum</i> ?	15,823	Root of <i>Withania somnifera</i> ; Dunal. (Solanaceæ.)
15,779	Bark of <i>Symplocos cratagoides</i> ; Hamilton. (Styraceæ.)	15,824	Flower of <i>Woodfordia floribunda</i> ; Salisb. (Lythraceæ.)
15,780	Bark of <i>Symplocos racemosa</i> ; Roxb.	15,825	Seeds of <i>Wrightia tinctoria</i> ; Br. (Apocynaceæ.) Sent under this name; probably <i>Holarrhena antidysenterica</i> .
15,781	Bark of <i>Tamarindus indica</i> ; Linn. "Tamarind." (Leguminosæ.)	15,826	Fruit of <i>Xanthium strumarium</i> ; Linn. (Compositæ.)
15,782	Shells of <i>Tamarindus indica</i> . "Tamarind."	15,827	Plant of <i>Xanthium strumarium</i> ; Linn. (Compositæ.)
15,783	Tamarind of <i>Tamarindus indica</i> . "Tamarind."	15,828	Seeds of <i>Xanthoxylon alatum</i> ; Roxb. (Rutaceæ.)
15,784	Galls of <i>Tamarix articulata</i> ; Vahl. (Tamariscineæ.)	15,829	Bark of <i>Xanthoxylon alatum</i> .
15,785	Twigs of <i>Tamarix dioica</i> ; Roxb.	15,830	Seeds of <i>Zea Mays</i> ; Linn. "Maize." (Gramineæ.)
15,786	Bark of <i>Tectona grandis</i> ; Linn. (Verbenaceæ.)		
15,787	Wood of <i>Tectona grandis</i> .		
15,788	Bark of <i>Terminalia Arjuna</i> ; Bedd. (Combretaceæ.)		
15,789	Fruit of <i>Terminalia belerica</i> ; Roxb. "Belleric myrobalans."		
15,790	Bark of <i>Terminalia Catappa</i> ; Linn.		

APPENDIX IV—continued.

15,272	Seeds of Shorea robusta; Gartin. "Sal." (Dipterocarpeæ.)	15,305	Flour of Zea Mays. "Maize."
15,273	Fruit of Solanum gracilipes; Dene. (Solanaceæ.)	15,306	Fruit of Zizyphus Jujuba; Lam. "Jujube." (Rhamnææ.)
15,274	Fruit of Solanum Melongena; Linn. "Brinjal or egg plant."	15,307	Fruit (variety) of Zizyphus Jujuba. "Jujube."
15,275	Grain of Sorghum vulgare; Pers. "Great millet or guinea corn." (Gramineæ.)	15,308	Fruit of Zizyphus nummularia; W. & A.
		15,309	Fruit of Zizyphus vulgaris; Lamk.
		15,310	Fruit of Zizyphus xylopyra; Willd.
SPICES.			
15,311	Bulbs of Allium cepa; Linn. "Onion." (Liliacæ.)	15,316	Seeds of Brassica juncea; H. F. & T. T. "Indian mustard."
15,312	Bulbs of Allium sativum; Linn. "Garlic."	15,317	Seeds of Brassica nigra; Koch. "Black mustard."
15,313	Fruit of Amomum subulatum; Roxb. (Scitamineæ.)	15,318	Fruit of Capsicum annuum; Linn. "Spanish pepper." (Solanaceæ.)
15,314	Seeds of Apium graveolens; Linn. "Wild celery." (Umbelliferae.)	15,319	Seeds of Carum copticum; Benth. (Umbelliferae.)
15,315	Seeds of Brassica campestris; Linn. "Turnip." (Cruciferae.)	15,320	Cloves of Caryophyllus aromaticus; Linn. "Cloves." (Myrtaceæ.)

APPENDIX IV.—*continued.*

DONATIONS (SPECIMENS).

Museum No.	Description.	Museum No.	Description.
15,321	Leaves of <i>Cinnamomum obtusifolium</i> ; Nees. (Laurineæ.)	15,334	Plant of <i>Mentha sativa</i> ; Linn. "Mint." (Labiatae.)
15,322	Bark of <i>Cinnamomum zeylanicum</i> ; Breyn. "Cinnamon."	15,335	Nutmeg of <i>Myristica moschata</i> ; Willd.; "Nutmegs." (Myristaceæ.)
15,323	Kernel of <i>Cocos nucifera</i> ; Linn. "Coco-nut." (Palmae.)	15,336	<i>Myristica moschata</i> . "Mace."
15,324	Leaves of <i>Corchorus olitorius</i> ; Linn. "Jute." (Tiliaceæ.)	15,337	Seeds of <i>Nigella sativa</i> ; Linn; var <i>indica</i> . "Black cumin." (Ranunculaceæ.)
15,325	<i>Coriandrum sativum</i> ; Linn. "Coriander." (Umbelliferae.)	15,338	Seeds of <i>Papaver somniferum</i> ; Linn. (Papaveraceæ.)
15,326	Flower of <i>Crocus sativus</i> ; Linn. (Irideæ.)	15,339	Seeds of <i>Peucedanum graveolens</i> ; Benth. "Dill." (Umbelliferae.)
15,327	Seeds of <i>Cuminum Cyminum</i> ; Linn. "Cumin." (Umbelliferae.)	15,340	Seeds of <i>Piper Cubeba</i> ; Linn, f.; "Cubebs." (Piperaceæ.)
15,328	Seeds (variety) of <i>Cuminum Cyminum</i> . "Cumin."	15,341	Seeds of <i>Piper nigrum</i> ; Linn. "Black pepper."
15,329	Rhizomes of <i>Curcuma longa</i> ; Roxb. "Turmeric." (Scitamineæ.)	15,342	<i>Tamarindus indica</i> ; Linn. "Tamarinds." (Leguminosæ.)
15,330	<i>Elettaria Cardamomum</i> ; Maton. "Cardamoms." (Scitamineæ.)	15,343	Leaves of <i>Trichosanthes dioica</i> ; Roxb. (Cucurbitaceæ.)
15,331	<i>Ferula Narthex</i> ; Boiss. "Assafætida." (Umbelliferae.)	15,344	Seeds of <i>Trigonella Fœnum-græcum</i> ; Linn. "Fenugreek." (Leguminosæ.)
15,332	Seeds of <i>Fœniculum vulgare</i> ; Gærtu. "Fennel." (Umbelliferae.)	15,345	Seeds of <i>Vernonia anthelmintica</i> ; Willd. "Purple fleabane." (Compositæ.)
15,333	Leaves of <i>Melia Azadirachta</i> ; Linn. "Neem or Margosa." (Meliaceæ.)	15,346	Rhizome of <i>Zingiber officinale</i> ; Roscoe. "Ginger." (Scitamineæ.)
July 5.			
16,890	Quantity of indigenous tobacco (sun-dried) wrapped in portion of spathe of sago palm. Obtained from natives of the village of Tumu, 50 miles north of Cape Blackwood, Gulf of Papua, New Guinea. Theodore Bevan, Esq., F.R.G.S., Sydney.		
August 8.			
16,918	Resin of grass-tree gum of <i>Xanthorrhœa hastilis</i> , R.Br. From New South Head Road, towards Bondi. J. H. Maiden, Esq., F.R.G.S., Sydney.		
August 22.			
16,922	A quantity of seeds and fruits of the Mahwa-tree, <i>Bassia latifolia</i> ; Roxb. The Government of India, through F. B. Wauson, Esq., Deputy Conservator of Forests, Chata, Nagpur Division.		
July 5.			
16,934	Sago meal or flour ($\frac{1}{2}$ lb.) From Evorra village, Jubilee River, 16 miles north-east of Bald Head, New Guinea, See Proc. Linn. Soc.; N.S.W., for 1887. Theodore F. Bevan, Esq., F.R.G.S., Sydney.		
September 14.			
16,943	Bark of <i>Eucalyptus maculosa</i> . "Spotted gum." Spring Hill, Mittagong. Mr. C. E. Fraser, Mittagong.		
September 30.			
16,957	Bark of <i>Exocarpus cupressiformis</i> ; Labill. "Native cherry." Near Ryde, 30/7/87. J. H. Maiden, Esq., F.R.G.S., Sydney.		
16,958	Bark of <i>Acacia longifolia</i> ; Willd. "Golden wattle." Near Ryde, 30/7/87.		
16,959	Bark of <i>Banksia integrifolia</i> ; Linn, fil. "Coast honeysuckle." Oatley's Grant, 23/7/87.		
16,960	Bark of <i>Banksia serrata</i> ; Linn, fil. "Common honeysuckle." Oatley's Grant, 23/7/87.		
16,961	Bark of <i>Acacia longifolia</i> ; Willd. "Golden wattle." Oatley's Grant, Illawarra Railway line, 23/7/87.		
16,962	Bark of <i>Etaeocarpus grandis</i> ; F. v. M. Sydney, 20/7/87.		
16,963	Bark of <i>Rhus rhodanthema</i> ; F. v. M. Sydney, 20/7/87.		
16,964	Leaves of <i>Rhus rhodanthema</i> ; F. v. M. Sydney, 20/7/87.		
16,965	<i>Rhus</i> sp. (probably <i>coriaria</i>); Sumach. Sydney, 20/7/87.		
October 27.			
17,072	Twigs of <i>Alstonia constricta</i> ; F. v. M. "Feverbark-tree." The Rev. J. Milne Curran, F.G.S.		
October 31.			
17,073	Oblong mat of <i>Pandanus</i> "Screw-pine." Fibre, woven in a loom (native), unstained; transversely disposed on one side, and at equal intervals are nine ornamental bands of fibre, stained black, in geometrical patterns worked into the mat; length, 6 ft. 9 in.; breadth, 2 ft. 6 in. (exclusive of fringe). Santa Cruz Islands. Mrs. Selwyn, Sydney.		
17,074	Basket of woven screw-pine fibre, the fringe of the handle being bast from a Tiliaceous plant. By way of ornament, oblong flaps of screw-pine cloth are stretched, four on each side. Each flap is ornamented with black geometrical patterns; about 9 in. square (exclusive of handle). Santa Cruz Islands.		
17,075	Boat-shaped bowl dug out of wood and carved after the fashion of a bird. Inlaid with mother-of-pearl stem and stern; blackened. Greatest length, 15 $\frac{1}{4}$ in.; breadth, 3 $\frac{1}{2}$ in.; height, 4 in. Solomon Islands.		
17,076	Comb of whale-bone, twenty-three teeth; shape, sub-triangular; the handle beautifully ornamented with very fine screw-pine plait, stained yellow and red. Greatest length, 7 in.; width at end of teeth, 2 $\frac{3}{8}$ in. Ulana, Solomon Islands.		
November 13.			
17,138	Bark of <i>Acacia implexa</i> . County of Camden, New South Wales. Rev. Dr. Woolls, F.L.S.		

APPENDIX IV—*continued*.

DONATIONS (SPECIMENS).

November 26.

Samples of tea, about 6 oz. weight. Messrs. Griffiths Bros., Melbourne.

Museum No.	Description.	Museum No.	Description.
17,704	Pekoe. Java.	17,709	Pekoe siftings. Java.
17,705	Pekoe, black leaf. Java.	17,710	Pekoe Souchong. Java.
17,706	Orange Pekoe. Java.	17,711	Souchong. Java.
17,707	Flowery Pekoe. Java.	17,712	Broken leaf. Java.
17,708	Broken Pekoe. Java.		

December 16.

- 17,727 | Pod and preparations from *Strophanthus hispidus*; DC. (Apocynæ.) A new remedy in certain diseases of the heart. It has superseded *Digitalis* under some circumstances. West Africa. Messrs. Burroughs, Wellcome, & Co., Melbourne.

December 12.

- 17,734 | *Owenia acidula*; F. v. M. "Mooley fruit, or native nectarine." (Meliaceæ.) Eaten by aboriginals. Grown on Yancarnia, Wilcannia. Mrs. Robert Kennedy, Wonnaminta.

December 29.

Gums, resins, and kinos, as follows. Charles Moore, Esq., F.L.S., Curator, Botanic Gardens, Sydney.

Museum No.	Description.	Museum No.	Description.
17,779	Gum of <i>Acacia homalophylla</i> ; A. Cunn.	17,791	Kino of <i>Eucalyptus maculata</i> ; Hook.
17,781	Gum of <i>Albizzia procera</i> ; Benth.	17,788	Kino of <i>Eucalyptus melliodora</i> ; A. Cunn.
17,783	Resin of <i>Araucaria Bidwilli</i> ; Hook.	17,789	Kino of <i>Eucalyptus obliqua</i> ; L'Herit.
17,782	Resin of <i>Araucaria Cunninghamii</i> ; S. Richmond River.	17,790	Kino of <i>Eucalyptus rostrata</i> ; Schl.
17,784	Resin of <i>Callitris columellaris</i> ; F. v. M.	17,786	Kino of <i>Eucalyptus sissilis</i> ; F. v. M.
17,785	<i>Callitris verrucosa</i> ; R. Br.	17,778	Gum of <i>Macrozamia Perowskiana</i> ; Miq. Botanic Gardens, Sydney.
17,792	Kino of <i>Eucalyptus amygdalina</i> ; Labell.	17,780	<i>Sterculia rupestris</i> ; Benth.
17,787	Kino of <i>Eucalyptus leucocylon</i> ; F. v. M.		

ECONOMIC GEOLOGY.

February 17.

Samples to illustrate the manufacture of Portland cement. Messrs. Macdonnell & Busch, Bond-street, Sydney.

Museum No.	Description.	Museum No.	Description.
14,637	Sample of Medway clay.	14,646	Brick—one part cement, three parts sand; gauged, January 19, 1887.
14,638	Chalk and clay, after mixing and before drying. "Wet slurry."	14,647	Brick—one part cement, four parts sand; gauged, January 19, 1887. Seven briquettes of "neat" cement bearing these marks:—
14,639	Chalk and clay, after drying and before burning. "Dry slurry."	14,648	Set 27/7/84. No. F 190.
14,640	Portland cement clinker, after burning and crushing and before going into the millstones.	14,649	Set 10/11/84. No. G 449.
14,641	Ground cement.	14,650	Set 1/12/84. No. 576.
14,642	Portland cement clinker, after burning and before crushing and grinding.	14,651	Set 23/12/84. No. 586, tested to 14,628 on the 6th January, 1886, and not broken.
14,643	Brick of neat cement; gauged, January 22, 1887.	14,652	Set 5/8/85. No. 94.
14,644	Brick—one part cement, one parts and; gauged, January 21, 1887.	14,653	Set 31/12/85. No. 13.
11,645	Brick—one part cement, two parts sand; gauged, 20 January, 1887.	14,054	Set 6/12/85(?). No. $\frac{3}{4}$ ².
		14,655-7	Three circular tablets, about 3 inches diameter, of neat cement; dated 31 December, 1885.

April 17.

- 14,763 | Psilomelane (Manganese ore) from Newbabin Station, near Nymagee, New South Wales. Mr. E. C. Pettitt, Nyngan, New South Wales.

April 30.

- 14,826 | Silver ore from the "Silver King" Mine, Sunny Corner, near Bathurst, New South Wales. Mr. W. Adam, Sydney.

May 7.

- 14,897 | Meerschau (silicate of magnesia), from the Gwydir River, New South Wales. Mr. Alex. McPherson, Sydney.

July 4.

- 15,094 | Small slab of Portovenere marble, polished on one side. Portovenere, Italy. Mr. W. H. Gilding, Sydney.

August 19.

- 16,921 | Bottle of crude Petroleum oil from the Gisborne Oil Well, New Zealand. William Fleming, Esq., Sydney, through Theodore Bevan, Esq.

APPENDIX IV—*continued.*

DONATIONS (SPECIMENS).

Museum No.	Description.		
August 27.			
16,935	Collection of Cobalt ores and associated rocks obtained from the Cobalt Mines, at Port Macquarie, New South Wales. Uriah Dudley, Esq., Port Macquarie.		
September 1.			
16,937	Prehnite from Prospect Waterworks. A. Godhard, Esq., Prospect Waterworks.		
October 27.			
Copper ores and associated rocks from Cobar. The Rev. J. Milne Curran, F.G.S., Cobar.			
Museum No.	Description.	Museum No.	Description.
17,011	Quartz with green carbonate of copper; Girilambone Mine, Cobar.	17,031	Slate out of which 17,030 is obtained. Cobar.
17,012	Veinstone; Girilambone Mine, Cobar.	17,032-3	Fibrous malachite.
17,013-4	Specimens of a vein, full size; Girilambone Mine.	17,034-5	Galena found with copper in the Cobar Mine.
	These are typical of veins in the Girilambone District, and, though of no thickness, extend to great depths.	17,036	Redruthite. Cobar.
17,015-7	Carbonates, blue and green, from upper part of Cobar lode.	17,037-8	Fibrous malachite on ironstone. Cobar.
17,018-20	Carbonates of copper in impure steatite; Cobar, New South Wales.	17,039-40	Rocks associated with copper ores. Cobar.
17,021	Slate, forming country around the Cobar lode.	17,041	Azurite. Cobar.
17,022	Black slate, with magnetic iron pyrites, from the lowest levels in the Cobar Mine.	17,042	Steatitic slate wall of lode. Cobar.
17,023-4	Pyrrhotite and chalcopyrite from Cobar Mine.	17,043-7	Green carbonates of copper. Cobar.
17,025	Chalcopyrite (copper pyrites). Cobar.	17,048-50	Native copper. Cobar.
17,026-7	Pyrrhotite and chalcopyrite. Cobar.	17,051-2	Azurite crystals. Cobar.
17,028-9	Malachite, forming incrustation. Cobar.	17,053-4	Green carbonates of copper. Cobar.
17,030	From lowest level of Cobar Mine.	17,055	Volcanic ash indurated and interbedded with silurian rocks.
		17,056	Fine-grained (steatitic) sandstone, used for making fire-bricks for smelting furnaces.
		17,057-64	Green carbonates of copper. Cobar.
		17,065	Azurite and green carbonate of copper.
		17,071	Azurite. Cobar.
		17,825	Mass of azurite crystals.
October 31.			
17,077	Cerargyrite or Horn Silver. Broken Hill Mine. Mrs. Robert Kennedy, Wonnominjita, N.S.W.	17,082	Kopai (powdered gypsum). Used instead of lime for making mortar, mixed with more than its own quantity of sand.
17,078	Carbonate of silver. Broken Hill Mine.	17,083	Limestone.
17,079	Fossilized wood (3 specimens).	17,084	Cuprous Silver ore. Day Dream Mine.
17,080	Chloro-bromide of silver.	17,085	Tin ores (3 specimens). Lady Don Claim, Poolamacca.
17,081	Slab of gypsum.	17,086	Silver ores (2 specimens).
Copper ores from the Cobar mines. R. N. Williams, Esq., manager, the Great Cobar Mines, Cobar, N.S.W.			
17,094	Chalcopyrite.	17,108-10	Blue carbonate of copper, crystallized (9 specimens); silky crystals of malachite, with azurite crystals.
17,095	Slate, with dendritic manganese oxide, forming country to the north of the copper lode. Cobar.	17,111	Mass of azurite crystals, with fibrous malachite, imbedded in impure steatite.
17,096-7	Native copper (2 specimens).	17,112	Green carbonate of copper, in impure steatite.
17,098-100	Malachite on impure steatite (6 specimens).	17,113-15	Chalcopyrite (6 large specimens).
17,101-4	Blue carbonate of copper on impure steatite (12 specimens).	17,116-18	Redruthite (9 large specimens).
17,105-7	Blue and green carbonates of copper (six specimens).		
November 11.			
17,129	Nodules of sand and small pebbles concreted by a ferruginous cement. Mittagong.	Mr. C. E. Fraser,	
17,130	Brown clay, with ironstone.		
November 18.			
17,703	Graphite, from New England, New South Wales.	Messrs. Pike & Erskine, Sydney.	
December 2.			
17,713	Sixteen small rubies, from the MacDonnell Ranges, South Australia.	Mr. W. Gardner, through Mr. Thomas Colyer, Sydney.	
17,715	Graphite, from New England, New South Wales.	Mr. Charles Wooller, Sydney.	
17,723	Rock crystal (fragment), Mauritius.	Monsieur B. de Montille, Sydney.	

APPENDIX IV—*continued.*
DONATIONS (SPECIMENS).

Museum No.	Description.
	December 3.
17,725	Stalactitic limonite, from near Cowan Creek, Berowra, Great Northern Line: J. H. Maiden, F.R.G.S., Sydney.
	December 27.
17,777	Green carbonate of copper, from near Port Macquarie. Mr. Charles Wooller; Sydney.

ECONOMIC ZOOLOGY.

February 17.

Specimens to illustrate the various processes in the manufacture of Leather. Messrs. Bevingtons & Sons, St. Thomas-street, London, S.C.

Museum No.	Description.	Museum No.	Description.
<i>Sheepskin in process of manufacture:—</i>			
14,577	Sheepskin with wool on.	14,602	Horsehide imprinted with artificial grain by brass roller. "Rolled and grained."
14,578	Sheepskin after the wool has been removed by the application of lime. "Pelt."	14,603	Horse-hide prepared with boiled linseed oil and prussian blue. "First coat."
14,579	Sheepskin after saturation in lime-water. "Limed pelt."	14,604	Horse-hide enamelled with boiled linseed oil and prussian blue. "Second coat."
14,580	Sheepskin after the superfluous flesh has been removed by working with the two-handled knife. "Fleshed."	14,605	Horse-hide varnished with boiled linseed oil, prussian blue, and lampblack. "Third coat."
14,581	Sheepskin (grain side) after splitting by machine. "Skiver."	14,606	Horse-hide softened and finished for shoemakers' use. "Enamelled horsehide."
14,582	Sheepskin (flesh side) after splitting by machine. "Lining."	<i>Goatskin in process of manufacture:—</i>	
14,583	Skiver cleansed from lime and fatty matter. "Puered."	14,607	Goatskin as imported from Switzerland.
14,584	Skiver further cleansed by immersion in fermented bran and water. "Drenched."	14,608	Goatskin unhaired after saturation in lime-water. "Unhaired."
14,585	Skiver made into leather by infusion of sumach. "Tanned skiver."	14,609	Goatskin after removal of superfluous flesh by the two-handled knife. "Fleshed."
14,586	Skiver leather partially bleached with sulphuric acid, for dyeing. "Cleared."	14,610	Goatskin cleansed from lime and fatty matters. "Puered."
14,587	Skiver dyed rose-colour with cochineal. "Dyed."	14,611	Goatskin further cleansed with fermented bran. "Drenched."
14,588	Skiver leather prepared with white of egg, for glazing. "Cleared."	14,612	Goatskin made leather by infusion of sumach. "Tanned."
14,589	Skiver leather marked with toothed boxwood roller. "Rolled."	14,613	Goat leather extended after tanning and dried in the air. "In crust."
14,590	Skiver leather glazed with finer-toothed boxwood roller. "Cut through."	14,614	Goat leather partially bleached with sulphuric acid for dyeing. "Cleared."
14,591	Skiver leather smoothed and glazed with hardwood roller. "Finished for book-binding, &c."	14,615	Goat leather dyed maroon colour with Orchilla Weed. "Dyed."
<i>Horsehide in process of manufacture:—</i>			
14,592	Horsehide as imported from South America.	14,616	Goat leather shaved and thinned with the currier's knife. "Shaved."
14,593	Horsehide with hair removed by saturation in lime-water. "Unhaired."	14,617	Morocco leather prepared with white of egg for glazing. "Seasoned."
14,594	Horsehide after removal of superfluous flesh by the two-handled knife. "Fleshed."	14,618	Morocco leather after first glazing with toothed boxwood roller. "Rolled."
14,595	Horsehide cleansed from lime and fatty matter. "Puered."	14,619	Morocco leather after second glazing with a finer toothed boxwood roller. "Cut through."
14,596	Horsehide cut down to an even substance with curriers' knife. "Bate-shaved."	14,620	Morocco leather after third glazing with smooth hardwood roller. "Dum-mied."
14,597	Horse-hide after cleansing with fermented bran and water. "Drenched."	14,621	Morocco leather grained up and finished for furniture-makers' and coach-makers' use. Coloured morocco."
14,598	Horsehide tanned with bark and terrajaponica. "Tanned."	<i>Calfskin in process of manufacture:—</i>	
14,599	Horsehide thinned to required substance with curriers' knife. "Shaved."	14,622	Calfskin as imported from Russia.
14,600	Horsehide oiled and dried in the air. "Dried out."	14,623	Calfskin with hair taken off after saturation in lime-water. "Unhaired."
14,601	Horsehide seasoned and stretched to obliterate wrinkles. "Seasoned and set."	14,624	Calfskin cleared from loose integument with the two-handled knife. "Fleshed."
		14,625	Calfskin cleansed from lime and fatty matter. "Puered."
		14,626	Calfskin further cleansed with fermented bran and water. "Drenched."

APPENDIX IV—*continued.*

DONATIONS (SPECIMENS).

Museum No.	Description.	Museum No.	Description
14,627	Calfskin made into leather with alum, salt, and flour. "Tawed."	14,632	Calf leather prepared with mordant for dyeing.
14,628	Calf leather extended and softened by rubbing on a sharpened iron. "Staked."	14,633	Calf leather dyed black with logwood and copperas. "Dyed."
14,629	Calf leather after washing in water to remove superfluous alum and salt. "Washed."	14,634	Calf leather softened and cut down to an even substance by the moon knife. "Pared."
14,630	Calf leather after saturation in yolk of egg. "Egged."	14,635	Calf leather extended and smoothed.
14,631	Calf leather rendered soft and pliable by working over a sharpened iron. "Second staking."	14,636	Calf leather oiled and finished for the use of boot and shoe makers. "Kid calf."
April 27.			
14,823	Clothing wool, very superior. Nangas, Gundagai, N.S.W. W. H. Chard, Esq. (Messrs. W. H. Chard & Co.), Sydney.	14,824	Clothing wool, superior. Near Young.
		14,825	Clothing wool, superior. Bulga, near Cobar.
May 18.			
14,907	Fine clothing wool, scoured.—J. R. Chappel, Esq., Dundee, New England (through Messrs. W. H. Chard & Co., Sydney.)		
September 3.			
16,942	A number of tubes filled with assorted coloured yarns for the loom.—Messrs. John Vicars & Co., Sydney.		
September 27.			
16,944	Hair of Angora Goat. Beefwood, near Wilcannia, N.S.W.—Mr. P. Mathers, Beefwood, near Wilcannia.		
16,945	Small bottle of Emu oil. In many parts of this country it is used as a cure for rheumatism, but more especially for bruises and sprains.—Mr. P. Mathers, Beefwood, near Wilcannia.		
October 11.			
17,010	Stud rams' wool, combing, (12 samples); Darr River Downs, Western Queensland Messrs. Williams & Co., per A. Fiskén, Melbourne.		
17,009	Stud ewes' wool (11 samples), combing; Darr River Downs.—Messrs. Williams & Co., per A. Fiskén, Melbourne.		
17,008	Flock ewes' wool, clothing (5 samples); Darr River Downs.—Messrs. Williams & Co., per A. Fiskén, Melbourne.		
17,007	Lambs' wool (3 samples); Darr River Downs.—Messrs. Williams & Co., per A. Fiskén, Melbourne.		
December 2.			
Queensland merino wools.—Messrs. A. Crombie & Co., Strathdarr, Western Queensland.			
17,716	Wool of stud ram "Jimboru," 12 years of age. 1.	17,720	Wool from 6 and 8 tooth ewes with lambs. 32-40.
17,716a	Wool of stud ram "Tasman," aged 10 years. 2.	17,717	Wool from shirled hoggets (shorn as lambs). Very superior combing. 41-47.
17,716b	Wool of stud rams, station-bred, sons of Nos. 1 and 2. 3-5.	17,717a	Wool from shirled hoggets (shorn as lambs). Combing. 49-55.
17,716c	Wool of stud rams, sons of Nos. 1 and 2; station-bred. 6-9.	17,721	Wool from ewe hoggets (stud), by stud rams; 12 months' growth. 56-58.

March 2.

14,756 | Piece of bark stripped from a Norfolk Island pine (*Araucaria excelsa*) by lightning, Ryde, January 29, 1887. Mrs. E. F. Barlow, Wondoo, Ryde.

March 20.

14,766 | One krone of silver. Date, 1882; country, Norway and Sweden. Mr. W. H. Steadman, c/o Colonial Mutual Insurance Co.

May 4.

Herbarium specimens mounted in recessed frames and folding in book fashion. Messrs. Rabone, Feez, & Co., Sydney.

14,827 | *Castanea vesca*, Linn. (Spanish chesnut, male and female).

14,828 | *Juniperinus sabina*, Linn. (common savin).

June 6.

15,072 | Two sets of Highland bagpipes, full size; No. 1 made in 1840, No. 2 made in 1850; the former from *Lignum Vitæ* wood, the latter from Tulip wood. Made by the father of donor, Mr. George Sherar, Sydney.

June 10.

15,077 | Danish coins, current:—1 ore = $\frac{1}{4}$ d.; date, 1874.

15,078 | Danish coins, current:—2 ore = $\frac{1}{2}$ d.; date, 1874.

15,079 | Danish coins, current:—10 ore = 1 $\frac{1}{4}$ d.; date, 1857.

15,080 | German coins, current:—5 Pfennig = $\frac{1}{2}$ d.

15,081 | 1 Groschen = 1d, obsolete.

15,082 | American coin, current:—1 cent = $\frac{1}{2}$ d.

} Mr. S. L. Haurowitz, Sydney.

September 30.

16,966 | Bamboo representing one year's growth, 65 feet. Gladesville, N.S.W. Sir Alfred Roberts, Sydney.

December 2.

17,714 | Lead sinkers for line-fishing for schnapper, &c. They are cigar-shaped, and the line passes through the core. The sinker is not fixed to the line, as is usually the case, but is capable of sliding along it. Designed by the donor, Mr. John Fagan.

APPENDIX V.

LOANS:

Museum No.	Date and Description.				
February 2.					
14,566	Large iron model of a "Manhe's process" copper converter. See "Proceedings of the Association for 1886." Engineering Association of N.S.W., Sydney.				
February 21.					
14,700-1	Two breech-loading rifles, with flint-locks; one taken to pieces to show the mechanism, the other in working order. In use in the United States Navy. Made by J. H. Hall and H. Ferry in 1834. Mr. John Fagan, Sydney. Mr. Fagan, to whom the Museum has from time to time been indebted for many interesting exhibits, has furnished the following description of the above-mentioned rifles:—The barrels of the rifles are turned outside and slightly tapered towards the muzzle. They are bored in sixteen parallel grooves, which have a quarter of a turn in the entire length, which ends within a short distance of the muzzle. The fore-sight is brazed near the end of the muzzle, declining a little to one side; the backsight is dovetailed into the barrel near the breech, which can be moved or adjusted to suit the tip of the foresight. Two arms are fixed in the barrel, in which the elevating breech works; the breech itself is cut out of a solid piece of steel by rose cutters and milling tools. The diameter of bore is $\frac{9}{16}$ of an inch, tapering slightly to the muzzle. The powder chamber, the springs, and the whole of the lock are in the back part of the elevating breech. The breech opens at an angle towards the barrel, which allows room to place the bullet or cartridge. In pressing the trigger either at half or full cock the breech will close and lock itself before the hammer and flint can fall upon the cup which holds the powder, and which is cut out of the top of the breech. A lid covers the breech, and is held down by a spring, but when struck by the flint a spark can pass into the cup. There are four springs connected with the breech. The stocks are of American walnut, and the barrels are attached to them by three brands. The action of the breech is similar to that of the Martini-Henry, but reversed.				
June 8.					
15,073-76	Proof pieces of the new gold coinage, consisting of two sovereigns and two half sovereigns. The Deputy Master of the Mint.				
July 14.					
15,072a	Diploma and medal for two sets of Highland bagpipes made in 1840 and 1850 respectively. Mr. George J. Sherar, Ivy-street, Redfern.

1,978	Report, British and Foreign School Society. Presented by the Council.	

PERIODICALS AND MAGAZINES.

The Publishers of the following Journals have generously continued to contribute copies of their publications to the Reading-room of the Museum during the year, viz.:—

Amateur Photographer (London).	Hatters' Gazette (London).
American Mail and Export Journal (New York).	Horological Journal (London).
American Monthly Microscopical Journal (New York).	Ironmonger (London).
Bookseller (London).	Ironmonger (Supplement).
Boot and Shoe Trades Journal (London).	Iron (London).
Brewers' Guardian (London).	Iron and Steel Trade Journal.
British and Colonial Printer and Stationer (London).	Jeweller and Metal-worker (London).
British Trade Journal (London).	Manufacturer and Builder (New York).
Builders' Weekly Reporter (London).	Mechanical News (New York).
Building World (London).	Mineralogical Magazine (London).
Bullettino Telegraphico (Rome).	Oil and Colourman's Journal (London).
Burgoyne's List.	Paper-maker's Journal, and Annual Directory of Paper-makers (London).
Cabinet-maker (London).	Paper Trade Review (London).
California Architect (San Francisco).	Pharmaceutical Journal.
Canadian Magazine (Montreal).	Plumber and Decorator.
Colliery Guardian (London).	Printer's Register (London).
Cooke's Illustrations of British Fungi.	Reveu Coloniale Internationale.
Co-operative Index to Periodicals (London).	Sanitary Record (London).
Decorators' Gazette (London).	Sugarcane (Manchester).
Educational Record (London).	Stationery Trades Journal (London).
Exporter (London).	Telegraphic Journal and Electrical Review (London).
Engineering (London).	Textile Recorder (Manchester).
Fireman (London).	Therapeutic Gazette.
Forestry (Edinburgh).	Tropical Agriculturalist.
Gas and Water Review (London).	Timber Trades Journal (London).
Hardware Trade Journal (London).	

The Publishers of the following have been good enough to occasionally forward copies of their journals to the Museum:—

Australian Journal of Pharmacy.	Educational Record.
Brewers' Gazette.	Industrial Review.
British Mercantile Gazette (London).	Iron Age (New York).
Chamber of Commerce Journal.	Leather Trades Circular.
Chemical News.	Mechanical Progress.
Chemical Review (London).	Mechanical World.
Decoration.	Mineralogical Magazine.

APPENDIX VII—continued.

DONATIONS (BOOKS AND PERIODICALS).

Paper and Printing Trades Journal.	Practical Engineer.
Paper-maker's Circular (London).	Sanitary World (London).
Paper-making.	Scientific American (New York).
Phillips' Machinery Register.	Textile Manufacturer.

APPENDIX VIII.

PURCHASES (DIAGRAMS, MAPS, &C.)

February 24.	July 19.
Photographs mounted on Cardboard of:—	Hungarian Roasting Furnace.
Combing Machine.	Swedish Roasting Furnace.
Screw Gill Lap Machine.	Swedish Refining Hearth.
Gill Preparer, Nos. 1, 2, 3, and 5.	August 1.
Screw Gill Box, two heads of one delivery each.	Crucible Furnace.
Screw Gill Box, one head of one delivery.	Double Refining Hearth for Iron.
Worsted Drawing Frame (French system).	Spectacles Furnace.
Worsted Roving Frame.	Lignation Furnace.
Worsted Dandy Roving Frame.	August 23.
Worsted Spinning Frame.	Furnace for Smelting Tin Ores.
Calico Loom, with Yorkshire Tuppets (for worsted goods).	Furnace for the Manufacture of Crown Glass.
Wrought Iron and Steel Double Forge Hearth, with Reheating Furnace.	Furnace for Smelting Iron Ores.
Wrought Iron and Steel Forge Hearth, with Reheating Furnace.	September 6.
February 5.	Portfolio of Indian Art. No. 27.
Furnace for Smelting Ores. Broken section.	Portfolio of Italian Art. Parts 3 to 5.
Gooch's Link Motion.	Portfolio of Persian Art. Part 7.
Gooch's Link Motion.	Portfolio of Swedish Art. Part 5.
Large Puddling Furnace Gas Regenerator.	Photographs of Burmese and Madras Art-ware.
Oven for Wood-charcoal.	Drawing of Davis's Breeze Oven.
"Newcomen" Model.	November 15.
Glass Levelling Furnace.	Anthracite Blast Furnace.
Furnace for Making Coke.	Bessemer Converter.
July 12.	December 12.
Cupellation Furnace (German patent).	Clarke & Rowley's Map of New South Wales.
Mansfield Roasting Furnace.	

DIAGRAMS (COLOURED TO NATURE) OF NEW SOUTH WALES ECONOMIC PLANTS.

Acacia bincervata; DC. "Black-wattle." (Leguminosæ.) Use: Timber, tan, gum.	Alphananthe phillippinensis; Planch. "Elm." "Tulipwood." (Urticæ.) Use: Timber, fibre.
Acacia decurrens, glabrous var; Willd. "Black-wattle." (Leguminosæ.) Use: Tan.	Aphananthe phillippinensis; Planch. "Elm." "Tulipwood." (Urticæ.) Use: Timber, fibre.
Acacia decurrens, glabrous var; Willd. "Black-wattle." (Leguminosæ.) Use: Tan.	Baloghia lucida; Endl. "Brush bloodwood." (Euphorbiacæ.) Use: Dye, timber.
Acacia dealbata; Link. "Silver-wattle." (Leguminosæ.) Use: Timber, tan, gum.	Backhousia myrtifolia; Hook. et Harv. "Water myrtle." (Myrtacæ.) Use: Timber.
Acacia melanoxylon; R. Br. "Black-wood." "Light-wood." (Leguminosæ.) Use: Timber, tan.	Banksia integrifolia; Linn fil. "Coast honeysuckle." (Proteacæ.) Use: Timber.
Acacia pendula; Cunn. "Weeping myall." (Leguminosæ.) Use: Timber, tan.	Banksia marginata; Cav. "Honeysuckle." (Proteacæ.) Use: Timber, tan.
Acacia podalyriifolia; Cunn. A silver-wattle. (Leguminosæ.) Use: Timber, tan.	Banksia serrata; Linn fil. "Common honeysuckle." (Proteacæ.) Use: Timber, tan.
Acacia pubescens; R. Br. (Leguminosæ.) Use: Tan.	Brachychiton acerifolium; F. v. M. "Flame-tree." "Lace-bark-tree." (Sterculiacæ.) Use: Timber (poor), fibre.
Acacia penninervis; Sieb. "Blackwood." "Hickory." (Leguminosæ.) Use: Timber, tan.	Brachychiton luridum; F. v. M. "Sycamore." "Hat-tree." (Sterculiacæ.) Use: Timber, fibre.
Acacia verniciflua; Cunn. (Leguminosæ.) Use: Tan.	Callistemon salignus; DC. "River tea-tree." "Stonewood." (Myrtacæ.) Use: Timber.
Acronychia Baueri; Schott. "Brush ash." (Rutacæ.) Use: Timber.	Callicoma serratifolia; Andr. "Native beech." (Saxifragæ.) Use: Timber.
Acronychia Cunninghamii; Hook. Syn., Medicosma Cunninghamii; Hook. fil. (Rutacæ.) Use: Timber.	Cargillia Australis; R. Br. "Black plum." (Ebenacæ.) Use: Timber, food.
Aegiceras majus; Gært. "River mangrove." (Myrsinæ.) Use: Tan.	Cargillia pentamera; F. v. M. "Black myrtle." "Grey plum." (Ebenacæ.) Use: Timber, food.
Alphitonia excelsa; Reiss. "Red ash." (Rhamnæ.) Use: Timber.	Cargillia pentamera; F. v. M. "Black myrtle." "Grey plum." (Ebenacæ.) Use: Timber, food.
Alyxia ruscifolia; R. Br. (Apocynæ.) Use: Timber (small).	Castanospermum Australe; Cunn. et Fraser. (Leguminosæ.)
Angophora intermedia; DC. "Narrow-leaved apple-tree." (Myrtacæ.) Use: Timber.	Casuarina suberosa; Otto et Dietr. "Sheo-oak." (Casuarinæ.) Use: Timber.
Angophora lanceolata; Cav. "Apple-tree." "Red-gum." (Myrtacæ.) Use: Timber.	

APPENDIX VIII—continued.

PURCHASES (DIAGRAMS, MAPS, &C.).

- Casuarina glauca*; Sieb. "She-oak." "Belar." (Casuarinææ.) Use: Timber, tan.
- Ceratopetalum gummiferum*; Smith. "Christmas bush." (Saxifrageææ.) Use: Timber, ornament.
- Ceratopetalum apetalum*; D. Don. "Coachwood." "Leather-jacket." "Lightwood." (Saxifrageææ.) Use: Timber.
- Citriobatus multiflorus*; Cunn. "Orange Thorn." (Fittosporææ.) Use: Timber, food.
- Clerodendron tomentosum*; R. Br. (Verbena-cææ.) Use: Timber.
- Clerodendron tomentosum*; R. Br. (Verbena-cææ.) Use: Timber.
- Cupania nervosa*; F. v. M. A Tamarind. (Sapindacææ.) Use: Food, timber.
- Commersonia echinata*; R. et G. Forst. (Sterculiacææ.) Use: Fibre.
- Var *platyphylla*; Andr. (Sterculiacææ.)
- Dysoxylon Muelleri*; Benth. "Turnip-wood." (Incliacææ.) Use: Timber.
- Dysoxylon Fraserianum*; Benth. "Rosewood." (Incliacææ.) Use: Timber.
- Dysoxylon Fraserianum*; Benth. "Rosewood." (Incliacææ.) Use: Timber.
- Elæocarpus cyaneus*; Ait. (Tiliacææ.)
- Elæocarpus cyaneus*; Ait. "Native olive." "White boree." (Tiliacææ.) Use: Timber.
- Elæocarpus grandis*; F. v. M. "Blue fig." (Tiliacææ.) Use: Timber.
- Eucalyptus corymbosa*; Smith. "Bloodwood." (Myrtacææ.) Use: Timber, Kino.
- Eucalyptus amygdalina*; Labill. "Peppermint tree, &c." (Myrtacææ.) Use: Timber, Kino oil.
- Eucalyptus crebra*; F. v. M. (Myrtacææ.)
- Eucalyptus pilularis*; Smith. "Blackbutt." (Myrtacææ.) Use: Timber, Kino.
- Eucalyptus piperita*; Smith. "Peppermint." (Myrtacææ.) Use: Timber, Kino oil.
- Eucalyptus stricta*; Sieb. (Myrtacææ.) Use: Timber (small).
- Eucalyptus Sieberiana*; F. v. M. "Native" or "Mountain ash." (Myrtacææ.) Use: Timber, kino.
- Eugenia Smithii*; Poir. "Lillypilly." (Myrtacææ.) Use: Timber, tan, food.
- Eugenia Smithii*; Poir. "Lillypilly." (Myrtacææ.) Use: Timber, food.
- Eugenia myrtifolia*; Sims. "Brush myrtle." (Myrtacææ.) Use: Timber.
- Eugenia Ventenatii*; Benth. "Drooping myrtle." "Large-leaved water-gum." (Myrtacææ.) Use: Timber, food.
- Eupomatia laurina*; R. Br. "Balwarra." "Rose bush." (Anonacææ.) Use: Timber.
- Euphorbia pilulifera*; Linn. "Asthma herb." (Euphorbiacææ.) Use: Drug.
- Ficus scabra*; Forst. Syn., *Ficus aspera*. "Rough-leaved fig." (Urticææ.) Use: Timber (inferior).
- Ficus rubiginosa*; Desf. "Port Jackson fig." (Urticææ.) Use: Timber, resin.
- Harpullia Hillii*; F. v. M. Tulipwood. (Sapindacææ.) Use: Timber.
- Harpullia pendula*; Plonch. Tulipwood. (Sapindacææ.) Use: Timber.
- Harpullia pendula*; Plonch. Tulipwood. (Sapindacææ.) Use: Timber.
- Helicia glabriflora*; F. v. M. (Proteacææ.) Use: Food.
- Hymenosporum flavum*; F. v. M. "Wollum-Wollum (of N.S.W. Aborigs.) (Pittosporææ.) Use: Timber.
- Lagunaria Patersoni*; G. Don. "Tulip-tree." (Malvacææ.) Use: Fibre, timber.
- Lagunaria Patersoni*; G. Don. "Tulip-tree." (Malvacææ.) Use: Fibre, timber.
- Laportea photiniphylla*; Wedd. "Narrow-leaved nettle-tree." (Urticææ.) Use: Fibre, timber.
- Macadamia ternifolia*; F. v. M. "Queensland nut." (Proteacææ.) Use: Food.
- Macadamia ternifolia*; F. v. M. "Queensland nut." (Proteacææ.) Use: Food.
- Melaleuca leucadendron*; Linn. Syn., *Melaleuca minor*; Smith. A variety of this species yields Cajuput oil. (Myrtacææ.) Use: Timber, oil.
- Melaleuca nodosa*; Smith. "Swamp tea-tree." (Myrtacææ.) Use: Timber.
- Melaleuca pauciflora*; Turcz. (Myrtacææ.) Use: Timber.
- Melaleuca styphelioides*; Smith. "Prickly-leaved tea-tree." (Myrtacææ.) Use: Timber.
- Melia azedarach*; Linn. "White cedar." "Capo lilac." (Meliacææ.) Use: Timber.
- Mollinedia macrophylla*; Tulasne. Syn., *Kibara macrophylla*. (Monimicææ.) Use: Timber.
- Myoporum acuminatum*; R. Br. Syn., *Myoporum tenuifolium*; G. Forst. (Myoporinææ.) Use: Timber.
- Nephelium leiocarpum*; F. v. M. "Tamarind wood." (Sapindacææ.) Use: Food, timber.
- Nephelium leiocarpum*; F. v. M. "Tamarind wood." (Sapindacææ.) Use: Timber, food.
- Nephelium tomentosum*; F. v. M. (Sapindacææ.) Use: Food, timber.
- Nephelium Beckleri*; Benth. (Sapindacææ.) Use: Food, timber.
- Notelæa ligustrina*; Vent. "Native olive." (Jasminææ.) Use: Timber.
- Notelæa punctata*; R. Br. (Jasminææ.) Use: Timber.
- Persoonia salicina*; Pers. "Geebung." (Proteacææ.) Use: Timber.
- Phyllanthus Ferdinandi*; Muell.-Arg. Syn., *Bradleya australe*. "White beech." "Lignum vitæ." (Euphorbiacææ.) Use: Timber.
- Pisonia inermis*; G. Forst. (Nyctagineææ.) Use: Timber.
- Pittosporum phyllæroides*; DC. "Willow-bush." (Pittosporææ.) Use: Timber, forage.
- Pittosporum phyllæroides*; DC. "Willow-bush." (Pittosporææ.) Use: Timber, forage.
- Pittosporum undulatum*; Vent. "Mock orange." "Native laurel." (Pittosporææ.) Use: Timber, perfume.
- Pittosporum undulatum*; Vent. "Mock orange." "Native laurel." (Pittosporææ.) Use: Timber, perfume.
- Pithecolobium pruinatum*; Benth. (Leguminosææ.) Use: Timber.
- Pithecolobium pruinatum*; Benth. (Leguminosææ.) Use: Timber.
- Podocarpus elata*; L'Herit. "Colonial deal." "White pine." (Coniferææ.) Use: Timber.
- Podocarpus elata*; L'Herit. "Colonial deal." "White pine." (Coniferææ.) Use: Timber.
- Pseudomorus Brunoniana*; Bur. "Mail." (Urticææ.) Use: Timber.
- Rhodamnia trinervia*; Blume. "Black-eye." "Brush turpentine." (Myrtacææ.) Use: Timber.
- Rhus rhodanthema*; F. v. M. "Deep yellowwood." (Anacardiæææ.)
- Sambucus xanthocarpa*; F. v. M. "Native Elder." (Caprifoliacææ.) Use: Timber, food.
- Sideroxylon (Achras) australe*; Benth. et Hook fil. "Black plum." (Sapotacææ.) Use: Timber, food.
- Stenocarpus sinuatus*; Endl. "Silver oak." (Proteacææ.) Use: Timber.
- Stenocarpus salignus*; R. Brown. "Silver oak." (Proteacææ.) Use: Timber.

APPENDIX VIII—continued.

PURCHASES (DIAGRAMS, MAPS, &C.)

- Syncarpia laurifolia; Ten. "Turpentine-tree." (Myrtaceæ.) Use: Timber, resin.
 Syncarpia leptopetala; F. v. M. "Brush turpentine." "Myrtle." (Myrtaceæ.) Use: Timber.
 Sterculia accrifolia. (Sterculiaceæ.)
 Sterculia quadrifida; R. Brown. "Kurrajong," "Calool." (Sterculiaceæ.) Use: Timber (poor), fibre.
 Tristania conferta; Robt. Brown. "White box, Bastard box." (Myrtaceæ.) Use: Timber.
 Tristania conferta; Robt. Brown. "White box, Bastard box." (Myrtaceæ.) Use: Timber.
 Tristania laurina; Robt. Brown. "Swamp mahogany." (Myrtaceæ.) Use: Timber.
 Tristania laurina; Robt. Brown. "Swamp mahogany." (Myrtaceæ.) Use: Timber.
 Tarrietia argyrodendron; Benth. "Stavewood." (Sterculiaceæ.) Use: Timber.
 Hylomelum pyriformic; Smith. "Native" or "Wooden pear." (Proteaceæ.) Use: Timber.

APPENDIX IX.

DONATIONS.

 Synoptical guide for rearing silkworms. Presented by Chas. Dickins & Son, Adelaide.

APPENDIX X.

EXCHANGES (OUTWARDS).

Date.	Description of Specimens.	To whom sent.
1887		
11 Jan.	Casts of 6 nuggets	The Secretary, Free Library, Melbourne.
	Casts of 6 meteorites	
30 Sept.	50 specimens of vegetable products	The Secretary, School of Arts, Deniliquin.
	1 specimen of chalcopyrite (copper ore)	
	19 specimens of rock and minerals	The Secretary, Chamber of Commerce, Adelaide, S.A.
	33 specimens, rock and minerals	
	47 specimens, rock and minerals	The Secretary, Free Library, Melbourne. (For Technological Museum.)
	43 specimens, rock and minerals	
7 Oct.	65 specimens, rock and minerals	Dept. of Mines, Melbourne.
	46 specimens, vegetable products	
	49 specimens, rocks and minerals	
	53 specimens, vegetable products	The Registrar, School of Mines, Ballarat.
	30 specimens, wool	
11 Oct.	6 gifts of Froebel (Kindergarten)	Gt. W. Griffin, U.S. Consul, Sydney.
	1 box geometrical models	
	1 box stereometrical models	The Director, Educational Museum, Tokio, Japan.
	Diagrams, &c., illustrating the manufacture of pins, pens, needles, and paper	
	100 specimens of minerals	
	3 casts of nuggets	
	1 cast of meteorite	
	1 cast of cobaltite crystal, Tunaberg, Sweden	
	88 specimens of vegetable products	

1888.

NEW SOUTH WALES,

EDUCATION.

(AMENDED REGULATIONS UNDER THE "PUBLIC INSTRUCTION ACT OF 1880.")

Presented to Parliament, pursuant to Act 43 Vic. No. 23, sec. 37.

Department of Public Instruction, Sydney, 25th September, 1888.

PUBLIC INSTRUCTION ACT OF 1880: AMENDED REGULATIONS AS TO TRAINING, EXAMINATION, AND CLASSIFICATION OF TEACHERS.

HIS EXCELLENCY the Governor, with the advice of the Executive Council, has been pleased to approve of the following amended Regulations, in substitution for those relating to the Training, Examination, and Classification of Teachers, of date 12th February, 1886.

JAMES INGLIS.

Examination and Classification.

74. The attainments of Teachers, Students of the Training Schools, and Candidates for employment as Teachers, will be tested by written and oral examinations, and their skill in teaching will be determined by their ability to manage a school or class; and, according to such attainments and skill they will be classified in the following grades:—The First, or highest class, will have three grades, distinguished as A with Honors, A (without Honors), and B; the Second Class will have three grades, distinguished as A with Honors, A (without Honors), and B; and the Third Class will have three grades, distinguished as A, B, and C. A classification awarded to a Teacher, a Student of the Training School, or a Candidate for employment, after his first successful examination, will be provisional only, and will be confirmed at the end of three years from the date of examination if the Inspectors' reports upon his school work be fully satisfactory: Provided that the classification of any Teacher in the School Service shall be liable to reduction or cancellation for inefficiency, gross neglect of duty, or serious misconduct on the part of the person holding such classification.

Assistant teachers.

80. Assistant teachers may be appointed to schools in which the average daily attendance exceeds seventy. They may be (a) persons who have served for four years at least as a pupil-teacher, or (b) persons who have been examined and classified.

Pupil teachers.

81. Pupil-teachers may be employed to serve not less than four years in any school in which the average attendance has been not less than fifty for the three months preceding; provided that the teacher holds a classification not lower than Class II.

SUBJECTS OF EXAMINATION FOR TEACHERS AND PUPIL-TEACHERS.

84. The subjects in which teachers, students of Training Schools, and pupil-teachers shall be examined for classification are those stated hereunder.

FOR A THIRD-CLASS CERTIFICATE.

Reading—Full value, 800 marks. Prose and Poetry.

Writing—Full value, 800 marks. Specimens of Copy-setting in round hand, half-text, and small hand.

Arithmetic—Full value, 1,000 marks. Simple and Compound Rules, Reduction, Proportion, Practice, Simple and Compound Interest, Vulgar and Decimal Fractions.

Text Books—Barnard Smith's Arithmetic, or Hamblin Smith's Arithmetic.

Grammar—Full value, 1,000 marks. Including Punctuation, Paraphrasing, Parsing, Analysis of Sentences, Meanings and Applications of Words, Saxon and Latin Prefixes and Affixes, Dictation and Composition.

Text Books—M'Leod's Grammar, and Laurie's Composition.

Geography—Full value, 1,000 marks. Europe and Australia in detail. Mapping in connection with those Continents.

Text Books—Hughes' Class Book of Geography. Geography of New South Wales (Wilkins')

History—Full value, 600 marks. Outlines of British History from the Conquest to the reign of Victoria inclusive; date of Accession of each Sovereign; leading Men; and most important Events. General sketch of Australian History.

Text Books—Nelson's Royal History of England. Sutherland's History of Australia.

School Management—Full value, 800 marks. Organization, Discipline, and Instruction of Schools—in outline.

Text Books—Gladman's School Method. Public Instruction Act and Regulations.

Domestic

Domestic Economy—(Female Teachers only)—Full value, 500 marks. Plain Needlework, Food, Clothing, Household Management.

Text Book—Hassall's Domestic Economy.

Drawing—Full value, 500 marks. Black-board, Freehand.

Text Books—As prescribed in the Standard of Proficiency.

Vocal Music—Full value, 500 marks. Rudiments of Music, either notation.

Text Books—Curwen's Standard Course, or Sutton's Theory of Music.

FOR A SECOND CLASS-CERTIFICATE.

Reading—Full value, 500 marks. Prose and Poetry from any English Reading Book.

Writing—Full value, 500 marks. Specimens of Copy-lines, Letter-writing, Ornamental Writing.

Arithmetic—Full value, 1,000 marks. The full Course, with Elementary Mensuration.

Text Books—Barnard Smith's Arithmetic.

Hamblin Smith's Arithmetic.

Todhunter's Mensuration (for Males, Chap. I to XX inclusive. For Females, Chap. I to XIII inclusive.)

Grammar—Full value, 1,000 marks. Including Spelling, Punctuation, Parsing, Paraphrasing, Meaning and uses of Words, Etymology and Analysis.

Text Books—Hunter's Grammar.

Lennie's Grammar (revised).

Morell's Grammar and Analysis.

Subject for Special Study—"Julius Cæsar."—(Shakespeare.)

Geography—Full value, 800 marks. Physical Geography.

Europe, Australasia, and North America, in detail.

Mapping within these limits.

Text Books—W. Hughes' Class Book of Geography, and

Edward Hughes' Physical Geography, or

Geikie's Physical Geography.

History and English Literature—Full value, 700 marks:

History— } British History, from the Conquest to the present times.
 } Australian History.

Literature—Elizabeth to Cromwell inclusive.

Text Books—Nelson's Royal History:

Sutherland's History of Australia.

Smith's Smaller History of English Literature.

Art of Teaching—Full value, 500 marks. Organization, Discipline, Method, and Instruction of Schools, in greater detail.

Text Books—Gladman's School Method.

Public Instruction Act and Regulations.

Sanitary Science (Female Teachers only)—Full value, 500 marks.

Text Books—Wilson's Healthy Life and Healthy Dwellings.

Drawing—Full value, 500 marks. Geometrical and Model Drawing.

Text Books—Nesbit and Brown's Handbook of Model and Object Drawing:

Rawle's Practical Plane Geometry.

Vocal Music—Full value, 500 marks. Rudiments of Music, either notation, with increased proficiency.

Text Books—Curwen's Standard Course, or

Sutton's Theory of Music.

* *Alternative Groups for Males.*

Group I.

Euclid—Full value, 1,000 marks. First three Books of Euclid's Elements, with Deductions.

Algebra—Full value, 1,000 marks. To Quadratic Equations, including Surds.

Text Books—Hamblin Smith's Algebra.

Todhunter's Euclid.

Group II.

Latin—Full value, 2,000 marks. Grammar, Composition. Cæsar, De Bello Gallico. Books I to IV inclusive.

Text Books—Dr. Smith's Smaller Latin Grammar. "Principia Latina," Part I; and Hine's Latin Syntax, Part I.

* *Alternative Groups for Females.*

Group I.

French—Full value, 1,500 marks. Grammar, Composition. Translation from an easy author.

Text Books—Voltaire's Charles XII. Books I to IV inclusive.

Havet's French Class Book (complete), or

Hallard's French Grammar.

Group II.

Latin—Full value, 1,500 marks. Grammar, Composition. Cæsar, De Bello Gallico. Books I, II.

Text Books—As for Males.

Group III.

Euclid—Full value, 750 marks. Books I and II, with easy Deductions on them.

Text Books—As for Males.

Algebra—Full value, 750 marks. To Quadratics, omitting Surds.

Text Books—As for Males.

Group IV.

Any two of the following Sciences:—

Experimental Physics—Full value, 750 marks.

Text Book—Balfour Stewart's Lessons on Elementary Physics.

Chemistry—Full value, 750 marks. Inorganic.

Text Book—Roscoe's Lessons in Elementary Chemistry.

Geology—Full value, 750 marks.

Text Book—Lyell's Student's Elements of Geology.

Zoology—Full value, 750 marks.

Text Book—Huxley's Lessons in Elementary Zoology.

Botany—Full value, 750 marks.

Text Book—Oliver's Lessons in Elementary Botany.

Physiology—Full value, 750 marks.

Text Book—Huxley's Lessons in Elementary Physiology.

FOR

* *Note.*—These groups of subjects are styled Alternative, because candidates are allowed to choose from them the group in which they wish to be examined. Candidates are required to confine themselves to one group.

3

FOR A FIRST-CLASS CERTIFICATE.

- Reading*—Full value, 500 marks. Prose and Poetry from a standard author.
Writing—Full value, 500 marks. Specimens of Copy-setting and Letter-writing; Ornamental Printing; Principles of Writing.
Arithmetic—Full value, 1,000 marks. The whole theory and practice.
Text Books—Hamblin Smith's Arithmetic.
 Barnard Smith's Arithmetic.
 Colenso's Arithmetic (as revised by Hunter).
 Todhunter's Mensuration (for Males only).
Grammar—Full value, 1,000 marks. Including Orthography, Punctuation, Parsing, Paraphrasing, Analysis, Composition, Etymology, Prosody, and Style.
Text Books—Mason's English Grammar.
 Bain's Higher English Grammar.
 Meiklejohn's Book of English.
Geography—Full value, 800 marks. Physical Geography.
 Astronomical Geography.
Text Books—Geikie's Physical Geography.
 Lockyer's Astronomy.
Art of Teaching—Full value, 700 marks. Organization, Method, Discipline, with a knowledge of the Constitution of the Human Mind.
Text Books—Gladman's School Method.
 Tate's Philosophy of Education, or
 Morell's Mental Philosophy.
Sanitary Science—(Female Teachers only)—Full value, 500 marks.
Text Book—Wilson's Healthy Life and Healthy Dwellings.
Drawing—Full value, 500 marks. The full D Certificate.
Text Book—Dennis' Perspective.
Vocal Music—Full value, 500 marks. Rudiments of Music, either notation.
Text Books—Curwen's Standard Course, or Sutton's Theory of Music.
History—Full value, 700 marks. History of England in detail. History of Australia.
Text Books—Smith's Student's Home.
 Creasy on the English Constitution. Chapters 10, 11, 15, 16.
 Sutherland's History of Australia.
English Literature—Full value, 800 marks. Elizabeth to Anne.
Text Book—Morley's English Literature. Chapters VII to XI inclusive.
For Special Study—Shakespeare's "Merchant of Venice."
 Milton's "Paradise Lost." Book I.
 Addison's Essays, 12 (Clarendon edition), Nos. 3, 15, 25, 61, 105, 106, 135, 159
 165, 409, 458, 487.
 Bacon's Essays, 6, Blackie's edition, Civil and Moral.

Alternative Groups for Males.

Group I.

- Algebra*—Full value, 1,000 marks. Including the Binomial Theorem.
Text Books—Colenso's Algebra, or
 Hamblin Smith's Algebra.
Euclid—Full value, 1,000 marks. Books I to VI, with Deductions.
Text Books—Potts' Euclid, or
 Todhunter's Euclid.
Plane Trigonometry—Full value, 1,000 marks.
Text Books—Todhunter's Trigonometry for Schools and Colleges; or
 Hamblin Smith's Trigonometry.

*Group II.

- Latin*—Full value, 2,000 marks. Virgil, first two Books of *Æneid*; Livy, Book 21. Questions on Grammar. Composition.
Text Books—Dr. Smith's Larger Latin Grammar.
 Abbott's Latin Prose Composition.
 Ihne's Latin Syntax.
Greek—Full value 1,000 marks.
Text Books—Xenophon's "Anabasis." Books I and II.
 Smith's Larger Greek Grammar.
 Abbott's Greek Prose Composition.
French—Full value, 1,000 marks. Grammar, Translation, Composition.
Text Books—Souvestre's "Un Philosophe sous les Toits."
 Racine's "Athalie."
 Havet's French Grammar.
 Hallard's French Grammar.
German—Full value, 1,000 marks. Grammar, Translation, Composition.
Text Books—Schiller's "History of the Thirty Years' War." Chapters I to IV.
 Goethe's "Faust."
 Otto's German Grammar.

* NOTE. In this group at least two languages must be taken, one of them being Latin.

† Group III.

- Natural Science*—Full value, 750 marks. Experimental Physics.
Text Book—Ganot's Physics.
Chemistry—Full value, 750 marks. Inorganic.
Text Book—Roscoe's Class-book of Elementary Chemistry (Macmillan).
Geology—Full value, 750 marks.
Text Book—Jukes' or Geikie's Geology.
Zoology—Full value, 750 marks.
Text Book—Huxley's Zoology.
Botany—Full value, 750 marks.
Text Book—Oliver's Manual of Botany.
Physiology—Full value, 750 marks.
Text Book—Huxley's Physiology.
Sanitary Science—Full value, 750 marks.
Text Book—Wilson's Handbook of Hygiene.

† NOTE.—Any four of these Sciences may be taken.

Group IV.

Group IV.

Euclid—Full value, 1,000 marks. Books I to VI, with Deductions.

Text Books—As in Group I.

Algebra—Full value, 1,000 marks. Inclusive of the Binomial Theorem.

Text Books—As in Group I.

Latin—Full value, 1,000 marks. Cæsar, De Bello Gallico. First two books.

Virgil's *Æneid*. Book I.

Text Books—As in Group II.

Group V.

Euclid—Full value, 1,000 marks. Books I to VI, with Deductions.

Text Books—As in Group I.

Algebra—Full value, 1,000 marks. Inclusive of the Binomial Theorem.

Text Books—As in Group I.

And any two Sciences of the Science Group already specified in Group III. Full value 1,000-marks.

Group VI.

Latin—Full value, 2,000 marks. Virgil's *Æneid*. Books I, II.

Livy. Book XXI.

Horace's Odes. Books I, II.

Grammar and Composition.

Text Books—As in Group II.

Together with any two of the following Sciences, namely, Chemistry, Physics, Physiology, Geology.

Full value 1,000 marks.

Text Books—As in Group III.

Alternative Groups for Females.

Group I.

French—Full value, 1,500 marks. Grammar, Translation, Composition.

Text Books—Souvestre's "Un Philosophe sous les Toits."

Corneille's "Le Cid."

Racine's "Athalie."

Havet's French Grammar.

Hallard's French Grammar.

Group II.

German—Full value, 1,500 marks. Grammar, Translation, Composition.

Text Books—As for Males.

Group III.

Latin—Full value, 1,500 marks. Grammar, Translation, Composition.

Text Books—As for Males.

Group IV.

Euclid—Full value, 800 marks. Books I to IV, with Deductions.

Text Books—As for Males.

Algebra—Full value, 700 marks. To Quadratic Equations inclusive.

Text Books—As for Males.

Group V.

Any three of the following Sciences :—

Experimental Physics—Full value, 500 marks.

Chemistry—Full value, 500 marks.

Geology—Full value, 500 marks.

Zoology—Full value, 500 marks.

Botany—Full value, 500 marks.

Physiology—Full value, 500 marks.

Text Books—As for Males of First Class.

NOTE.—In lieu of the Alternative Subjects of examination herein prescribed for a Second-class or a First-class Certificate, the subjects of the Sydney University Arts' Course (as set forth in the by-laws and annually published in the Calendar) will be taken up in the Training Schools by those students who have passed the University Matriculation examination and who may desire to compete, in subsequent University examinations, for the special privilege of remaining a third year in Training and proceeding to the final examination for the B.A. degree.

SUBJECTS OF STUDY FOR PUPIL-TEACHERS.

Before Appointment—Candidates.

Reading—Full value, 50 marks. To Read an advanced Class Book, sanctioned by the Minister, with ease, fluency, and expression, to Spell well, and to understand the meaning of the passage read.

Writing—Full value, 50 marks. To write from Dictation, in a neat hand, a simple Prose Narrative, with correct spelling and punctuation.

Dictation—Full value, 100 marks.

Arithmetic—Full value, 100 marks. To know the Arithmetical Tables, and to work the rules in Vulgar Fractions, Proportion and Practice, as in Barnard Smith's Arithmetic.

Grammar—Full value, 100 marks. To Parse and Analyse correctly a passage taken from an ordinary Class-book; to know the Elements of Grammar.

Geography—Full value 100 marks. To understand the Geographical Terms, to be acquainted with the Map of the World, and to have a knowledge of the Geography of Australia.

Drawing—Full value, 50 marks. Freehand Tests, as prescribed for a Third Class in the Standard of Proficiency.

Vocal Music—Full value, 50 marks. As prescribed for a Third Class in the Standard of Proficiency.

Skill in Teaching—To Teach a Junior Class in the presence of an Inspector.

Pupil-teachers—Class IV.

Reading—Full value, 50 marks. To Read the Fifth Reading Book, sanctioned by the Minister, with fluency and expression, give synonymous words and phrases, and answer upon the subject matter; to repeat from memory fifty lines of Poetry.

Writing—Full value, 50 marks. To write neatly and correctly from Dictation or from Memory.

Dictation—Full value, 50 marks.

Arithmetic—Full value, 100 marks. To work Questions in Proportion, Vulgar and Decimal Fractions, and Practice.

Text Book—Barnard Smith's Arithmetic.

Grammar—Full value, 100 marks. To Parse, Paraphrase, and Analyse a Passage; Meanings of Words; Etymology.

Text Books—Lennie's Grammar (revised).

Laurie's Spelling and

Dictation Class Book.

Geography—

Geography—Full value, 80 marks. New South Wales, in detail; Europe. The Physical Features and Chief Towns in each Country.

Text Books—Wilkins' Geography of New South Wales.
Hughes' Class Book of Geography.

History—Full value, 70 marks. English History to William I.

Text Book—Nelson's Royal History of England.
Australian History—Sutherland's. Chaps. I to V.

Drawing—Full value, 50 marks. Black-board Practice.

Vocal Music—Full value, 50 marks. Stimpson's Singing Class Book, Chaps. I to VIII.

Geometry (for Males)—Full value, 100 marks. Euclid. Book I. Propositions I to XXVI.

Text Book—Todhunter's Geometry.

Algebra (for Males)—Full value, 100 marks. Hamblin Smith's Algebra. Chaps. I to V inclusive.

Latin (for Males)—Full value, 100 marks. Smith's "Principia Latina" to Exercise XXIV inclusive.

**French* (for Females)—Full value, 100 marks. De Fivas' "Grammaire des Grammaires," to Exercise XXX inclusive.

School Management—Full value, 50 marks. The Kindergarten Principle (Lyschinska). Gladman's School Method.

Needlework (for Females)—Full value, 50 marks.

Pupil-teachers—Class III.

Reading—Full value, 50 marks. To read with improved intonation and expression.

Writing—Full value, 50 marks. Specimens of Penmanship; three hands.

Arithmetic—Full value, 100 marks. Compound Interest, Profit and Loss, and Square Root—as in Barnard Smith's Arithmetic.

Grammar—Full value, 100 marks. Parsing of Difficult Sentences, with a good knowledge of Syntax, and the Analysis of Sentences; Meanings of Words; Force of Affixes; Latin Roots; Composition.

Text Book—Lennie's Grammar (revised).

Geography—Full value, 80 marks. Australia; Polynesia.

Mapping, confined within these limits.

Text Books—Collins' Geography of Australia and Pacific Ocean.
Collins' Australian and Primary Atlas.

History—Full value, 70 marks. English History: William I to Richard III inclusive.

Australian History—Sutherland's. Chaps. VI to X.

Text Books—Nelson's Royal History of England.
Sutherland's History of Australia.

Drawing—Full value, 50 marks. Freehand Drawing.

Vocal Music—Full value, 50 marks. Stimpson's Singing Class Book, Chaps. IX to XII inclusive.

Geometry—Full value, 100 marks. Euclid. Book I.

Algebra—Full value, 100 marks. Fractions and Simple Equations, to Chap. XIV inclusive.

Latin—Full value, 100 marks. Smith's "Principia Latina," to Exercise XXXIII.

French (for Females)—Full value, 150 marks. "Grammaire des Grammaires, to Exercise LX. (See note*, Fourth Class Pupil-teachers.)

School Management—Full value, 50 marks. Gladman's School Method. The Kindergarten Principle (Lyschinska).

Needlework (for Females)—Full value, 50 marks.

Pupil-teachers—Class II.

Reading—Full value, 50 marks. A standard author, with correct intonation and emphasis.

Writing—Full value, 50 marks. Specimen of Penmanship; three hands, with increased skill.

Arithmetic—Full value, 100 marks. Cube Root, Discount, Stocks, Proportional Parts—as in Barnard Smith's Arithmetic, or Hamblin Smith's Arithmetic.

Grammar—Full value, 100 marks. Increased skill in Parsing, Paraphrasing, and in the Analysis of Sentences; Meanings of Words; Affixes; Roots; Composition.

Text Book—Hunter's Grammar.

Geography—Full value, 80 marks. Asia: Physical Features and Chief Towns of each Country of Asia and North America.

Physical Geography: Waves, Tides, Currents.

History—Full value, 70 marks. English History: Henry VII to Anne, inclusive.

Australian History—Sutherland's. Chapters XI to XVI.

Drawing—Full value, 50 marks. Model Drawing.

Vocal Music—Full value, 50 marks. Stimpson's Class Book, Chaps. XIII to XV inclusive.

Geometry—Full value, 100 marks. Books I and II, with Deductions in Book I.

Algebra—Full value, 100 marks. Simple Equations and Surds, to Chapter XXIV inclusive.

Latin—Full value, 100 marks. Smith's "Principia Latina," to Exercise XLVIII.

French (for Females)—Full value, 150 marks. "Grammaire des Grammaires," to Exercise XC. (See note*, Fourth Class Pupil-teachers.)

School Management—Full value, 50 marks. Gladman's School Method. The Kindergarten Principle (Lyschinska).

Needlework (for Females)—Full value, 50 marks.

Pupil-teachers—Class I.

Reading—Full value, 50 marks. To read with ease and expression from a standard author.

Writing—Full value, 50 marks. Specimen of Penmanship; three hands, with increased skill.

Arithmetic—Full value, 100 marks. Application of Rules and Principles. Mensuration of Surfaces.

Text Books—Barnard Smith's Arithmetic.
Todhunter's Mensuration.

Grammar—Full value, 100 marks. Parsing, Paraphrasing, Prosody, Analysis of Sentences, Meanings of Words, Formation of Words, Derivations, Composition.

Text Book—Hunter's Grammar.

Geography—Full value, 80 marks. Physical Geography. Physical Features and Chief Towns of each of the Countries of Africa and South America.

Mapping within these limits.

History—Full value, 70 marks. English History: George I to present time. Australian History—Sutherland's. Chapters XVII to XXII.

Drawing—Full value, 50 marks. Advanced proficiency expected in the three sections.

Vocal Music—Full value, 50 marks. Stimpson's Class Book, Chaps. XVI to end.

Geometry—Full value, 100 marks. Books I and II, with Deductions.

Algebra—Full value, 100 marks. Quadratic Equations, with Surds, to Chap. XXVI, inclusive.

Latin—Full value, 100 marks. Smith's "Principia Latina," to end. Cæsar, De Bello Gallico. Chaps. I to III. Easy translations.

**French* (for Females)—Full value, 150 marks. "Grammaire des Grammaires," to the end. (See note*, Fourth Class Pupil-teachers.)

School Management—Full value, 50 marks. Gladman's School Method. The Kindergarten Principle (Lyschinska).

Needlework (for Females)—Full value, 50 marks.

*NOTE.—From female pupil-teachers in country districts the following will be accepted in lieu of French, where it can be shown that the examinee has no means of acquiring a knowledge of the language in question :—

Latin, or
Euclid and
Algebra. } As for Males.

NOTE.—The course herein prescribed is for all pupil-teachers alike. It is recommended, however, that the Sydney University Matriculation subjects (as set forth in the by-laws and annually published in the Calendar) be also studied by those pupil-teachers who may desire or intend, after admission to the Training School, to present themselves at the Matriculation examination and to compete, in subsequent University examinations, for the privilege of remaining three years in training and proceeding to the final examination for the B.A. degree.

Examinations.

85. Examinations of teachers will be held yearly in each Inspector's District. Teachers who desire to be examined, with a view to a higher certificate, must at least one month before the date of examination apprise the Inspector of their wish, and furnish him with a list of the alternative subjects upon which they are prepared for examination.

Eligibility of Teachers for appointment to certain Schools.

90. Teachers who have gained their classifications by examination, or by promotion under Regulation 86, shall be eligible for appointment to any school or department, in accordance with the following Schedule :—

Class of Schools or Department.	Teacher's Classification.
I	I. A. with Honors, or I. A.
II	I. B.
III	II. A. with Honors.
IV	II. A.
V	II. B.
VI	II. B.
VII	III. A.
VIII	III. B.
IX	III. C.
X	III. C.

TRAINING SCHOOLS.

Classes of Candidates.

97. The Minister may authorise to be received into the Training Schools, annually, three classes of candidates, namely, *First Class, or Scholarship Candidates*—Thirty Pupil-teachers whose term of service has expired and who have obtained the highest marks among those passing the entrance examination successfully; *Second Class, or Half-scholarship Candidates*—Twenty Pupil-teachers whose term of service has expired and who have obtained, after the first 30, the next highest marks among those passing the entrance examination successfully, and are prepared to pay half the cost of their maintenance while in training; *Third Class, or Non-scholarship Candidates*—Other Pupil-teachers whose term of service has expired, untrained teachers who have had charge of schools, and persons entering the Teaching profession for the first time, who have passed the entrance examination successfully and are prepared to pay the whole cost of their maintenance while in training.

Conditions of Admission.

99. Before admission, every candidate must make a declaration that he intends, in good faith, to follow the profession of a teacher in schools under the Minister, and that he will accept a situation in any district, as the Minister may see fit. He must also procure a guarantee from two responsible persons that the whole expense of his training defrayed by the State will be refunded, if, from any cause whatever, he shall not enter the service of the Minister, or shall leave it in less than a period to be agreed upon at the time of his admission to training.

Term of Training.

100. Entrance examinations will be held yearly, in December; and the period of training will be one year, two years, or three years, as may be found expedient.

Allowances during Training.

101. The following allowances may be made to students who satisfy the aforementioned conditions and pass successfully the prescribed examinations :—To Scholarship Students, £6 per month; and to Half-scholarship Students, £3 per month. When the school is prepared to receive students into residence, these allowances are not paid; board and lodging being provided instead.

Examinations.

103. Oral examinations of the students will be held periodically to test their attention and progress; and written examinations will take place yearly, in December—when classifications will be awarded according to attainments and teaching skill to students who have completed their course. No certificate will be given until the Inspector's Report shows that the student is successful in the management of a school.

NOTIFICATION OF RESUMPTION OF LAND UNDER
44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honourable
to wit. } CHARLES ROBERT, BARON CARRINGTON,
a Member of Her Majesty's Most
(L.S.) Honourable Privy Council, Knight
CARRINGTON, Grand Cross of the Most Distinguished
Governor. Order of Saint Michael and Saint
George, Governor and Commander-in-
Chief of the Colony of New South
Wales and its Dependencies.

WHEREAS the parcel of land hereinafter described is required for the purpose of the erection thereon of a Public School and of buildings to be used in connection therewith: And whereas I, as such Governor as aforesaid, with the advice of the Executive Council of the said Colony, have sanctioned the acquisition of the said land for a site for a Public School: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, with the advice of the said Executive Council, in pursuance of the power and authority given to or vested in me by "The Lands for Public Purposes Acquisition Act," by this notification, published in the Gazette, and a newspaper circulated in the Police District wherein the said land is situated, that is to say, in the "Illawarra Mercury" newspaper, declare that the parcel of land hereinafter particularly described has been resumed for the purpose of the erection thereon of a Public School and of buildings in connection therewith: And that the said land hereinafter described is resumed with the intent that by the publication in the Government Gazette, and in a newspaper circulated in the Police District of Wollongong, of this notification of the said land being so resumed, the said land shall forthwith become and be vested in the Minister of Public Instruction of the said Colony and his successors, on behalf of Her Majesty, for the purposes of the said Act, for an estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rights-of-way, or other easements whatsoever; and that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the Minister of Public Instruction as a Trustee, as in the said Act is provided: And I declare that the following is the parcel of land herebefore referred to as resumed by this notification, that is to say:—

All that piece or parcel of land, being allotments 1 to 6 and 13 and 14 of section C of the Hillborough Subdivision, which originally formed part of John Buckland's 1,920 acres grant, situated at Balgownie, parish of Wonona, county of Camden, containing by admeasurement 1 acre 3 roods 38 $\frac{3}{4}$ perches: Commencing on the north side of a 50-link road, at its inter-

section with the east side of a road left in the original subdivision of John Buckland's 1,920 acres grant aforesaid, being a point bearing north and distant 50 links from a post marked A over B at the north-west corner of lot 27 of that subdivision; and bounded thence on the south by the north side of the 50-link road aforesaid bearing south 89 degrees 48 minutes east 4 chains 99 $\frac{1}{10}$ links; thence on the east by the west side of a street one chain wide bearing north 0 degrees 12 minutes east 3 chains 97 links; thence on the north by the south boundary of allotments 7 and 15, section C, bearing north 89 degrees 30 minutes west 5 chains 1 $\frac{1}{10}$ links; and thence on the west by a fenced line, being the east side of the road left in the original subdivision aforesaid, bearing south 3 chains 99 $\frac{1}{10}$ links, to the point of commencement.

In testimony whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this twenty-third day of August, in the year of our Lord one thousand eight hundred and eighty-eight, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,

JAMES INGLIS.

GOD SAVE THE QUEEN!

George, Governor and Commander-in-
Chief of the Colony of New South
Wales and its Dependencies.

WHEREAS the parcel of land hereinafter described is required for the purpose of the erection thereon of a Public School and of buildings to be used in connection therewith: And whereas I, as such Governor as aforesaid, with the advice of the Executive Council of the said Colony, have sanctioned the acquisition of the said land for a site for a Public School: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, with the advice of the said Executive Council, in pursuance of the power and authority given to or vested in me by "The Lands for Public Purposes Acquisition Act," by this notification, published in the Gazette, and a newspaper circulated in the Police District wherein the said land is situated, that is to say, in the "Bulli and Clifton Times," newspaper, declare that the parcel of land hereinafter particularly described has been resumed for the purpose of the erection thereon of a Public School and of buildings in connection therewith: And that the said land hereinafter described is resumed with the intent that by the publication in the Government Gazette, and in a newspaper circulated in the Police District of Wollongong, of this notification of the said land being so resumed, the said land shall forthwith become and be vested in the Minister of Public Instruction of the said Colony and his successors, on behalf of Her Majesty, for the purposes of the said Act, for an estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rights-of-way, or other easements whatsoever, and that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the Minister of Public Instruction as a Trustee, as in the said Act is provided: And I declare that the following is the parcel of land hereinbefore referred to as resumed by this notification, that is to say:—

All that piece or parcel of land said to form part of Jane Rose's 60 acres grant, portion 4 (on map), now the property of F. Robbins, situated at Robbinsville, parish of Southend, county

of Cumberland, containing by admeasurement 1 acre: Commencing on the east side of a one-chain road separating that portion from portion 26 (on map), Samuel M'Auley's 104 acres 2 roods, being a point bearing north 0 degrees 51 minutes east and distant 12 chains 54 $\frac{1}{2}$ links from the south-west corner of the first-mentioned portion; and bounded thence on the west by that side of that road bearing north 0 degrees 51 minutes east 2 chains 50 links; thence on the north by a fenced line bearing north 86 degrees 13 minutes east 4 chains 1 $\frac{1}{2}$ links; thence on the east by a line bearing south 0 degrees 51 minutes west 2 chains 50 links; and thence on the south by a line bearing south 86 degrees 13 minutes west 4 chains 1 $\frac{1}{2}$ links, to the point of commencement.

In testimony whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this twenty-third day of August, in the year of our Lord one thousand eight hundred and eighty-eight, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,

JAMES INGLIS.

GOD SAVE THE QUEEN!

TUMUT.

CARRINGTON, Order of Saint Michael and Saint
Governor. George, Governor and Commander-in-
Chief of the Colony of New South
Wales and its Dependencies.

WHEREAS the parcel of land hereinafter described is required for the purpose of the erection thereon of a Public School and of buildings to be used in connection therewith: And whereas I, as such Governor as aforesaid, with the advice of the Executive Council of the said Colony, have sanctioned the acquisition of the said land for a site for a Public School: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, with the advice of the said Executive Council, in pursuance of the power and authority given to or vested in me by "The Lands for Public Purposes Acquisition Act," by this notification, published in the Gazette, and a newspaper circulated in the Police District wherein the said land is situated, that is to say, in the "Grenfell Mining Record" newspaper, declare that the parcel of land hereinafter particularly described has been resumed for the purpose of the erection thereon of a Public School and

of buildings in connection therewith: And that the said land hereinafter described is resumed with the intent that by the publication in the Government Gazette, and in a newspaper circulated in the Police District of Grenfell, of this notification of the said land being so resumed, the said land shall forthwith become and be vested in the Minister of Public Instruction of the said Colony and his successors, on behalf of Her Majesty, for the purposes of the said Act, for an estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rights-of-way, or other easements whatsoever, and that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the Minister of Public Instruction as a Trustee, as in the said Act is provided: And I declare that the following is the parcel of land hereinbefore-referred-to as resumed by this notification, that is to say:—

All that piece or parcel of land situate at Aramagong, parish of Brundah, county of Montegale, containing 2 acres, being portion 941, and forming part of Kenneth M'Kenzie's conditional purchase portion 223: Commencing at the intersection of the west side of the road, as fenced, from Grenfell to

Morangarell with the north side of a road 1 chain 50 links wide forming the south boundary of portion 223; and bounded thence on the south by that side of that last-mentioned road bearing south 89 degrees 52 minutes west 5 chains 13½ links; thence on the west by a line bearing north 4 chains 1 link; thence on the north by a line bearing east 4 chains 84½ links; and thence on the east by the west side of the road first above-mentioned bearing south 4 degrees 10 minutes east 4 chains 1 link, to the point of commencement.

In testimony whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this nineteenth day of November, in the year of our Lord one thousand eight hundred and eighty-eight, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,

JAMES INGLIS.

GOD SAVE THE QUEEN!

1888.

NEW SOUTH WALES.

UNIVERSITY OF SYDNEY.

ADDITIONAL BY-LAWS—ADOPTED BY THE SENATE AT A MEETING HELD ON MONDAY, THE 17TH OF SEPTEMBER, AT THE ROOMS OF THE ROYAL SOCIETY.)

Presented to Parliament, pursuant to Act 14 Vic. No. 31, sec. 21.

To stand as By-law 8, Chapter XI.

NOTWITHSTANDING the provisions of By-laws 6 and 7, matriculated students who are students in a training institution for teachers organised under the Department of Public Instruction may be admitted to the First-year Examination in the Faculty of Arts, without having attended the University lectures, upon presenting a certificate from the Under Secretary for Public Instruction to the effect that they have attended the course of instruction in such training institution for one year after matriculating. Students of a training institution who have passed the First-year Examination may be admitted to the Second-year Examination in the Faculty of Arts without having attended the University lectures of the second year upon presenting a similar certificate to the effect that they have attended a second course of instruction in such training institution for one year after passing their First-year Examination. All such students, having passed the Second-year Examination, shall have the status of students, commencing the third year in the Faculty of Arts.

To stand as By-law 1, Chapter XXV.

All appointments of Public Teachers of the University other than Professors shall be terminable by a notice of not less than six calendar months, which may be given by the Senate or by the Teacher at any time. This By-law shall not apply to any case in which the Senate shall direct that the appointment shall be for a limited period.

W. M. MANNING, Chancellor.
H. E. BARFF, Registrar.

Laid before the Executive Council on the 11th October, 1888.—Min. 88-48.—ALEX. C. BUDGE, Clerk of the Council. CARRINGTON.

APPENDIX.

Ground Plan showing the proposed New Central Police Court, as it was submitted to the Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

NEW CENTRAL POLICE COURT.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the last Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, to whom was referred the duty of considering and reporting upon "the expediency of erecting a new Central Police Court," have, after due inquiry, resolved that it is expedient the work should be carried out; and, in accordance with the provisions of sub-section IV of clause 13 of the Public Works Act, report their resolution to the Legislative Assembly:—

The new building is intended to take the place of the old Central Police Court in George-street, and the site on which it is proposed to erect the building is that formerly occupied by a tannery, and, more recently, by what is known as Hardie's mill, having a frontage to Liverpool-street of 72 feet, running back 78 feet, and opening into a square of 206 feet by 182 feet, with a frontage of 90 feet to Union-lane, and 161 feet to a right-of-way, 10 feet wide, off Union-lane, with another right-of-way into George-street. The accommodation to be provided will be more extensive and, it appears from the evidence, much more convenient, than that afforded in the old Central Police Court, and in other important respects the new building and the arrangements in connection with it should prove very beneficial. The cost of the work is estimated at £48,000.

The proposal to purchase a suitable site for a new Central Police Court appears to have occupied the attention of Ministers presiding over the Department of Justice for the past ten years, during which period the matter has been under consideration at various times and from different points of view. In 1878 the attention of the Department was called to the inadequate accommodation and the general unsuitableness of the present building, and on many subsequent occasions the desirableness of either rebuilding on the present site or erecting a new Court elsewhere was urged. The latter course appears to have been regarded as the wiser plan, and in 1885 the site in Liverpool-street was purchased by the Government of the late Sir Alexander Stuart for £32,000.

The Committee, in their inquiry concerning this matter, did not examine many witnesses, but at the same time no evidence bearing upon the case and likely to assist the Committee in coming to a right conclusion was omitted.

The witnesses who were examined numbered five, and their evidence appeared so complete and convincing that further testimony was not considered necessary. Mr. Barling, Under Secretary for Works, gave a short general statement of the subject; Mr. A. C. Fraser, Under Secretary of Justice, narrated the circumstances connected with the proposal to build a new Court, from official documents; Mr. Barnett, Colonial Architect, explained what had been done in regard to the preparation of plans, and described the proposed new building in detail; and Mr. George Read, Acting Inspector-General of Police, and Mr. C. Delohery, Clerk of Petty Sessions

Sessions and Acting Stipendiary Magistrate, were examined for the purpose of ascertaining how far the proposal before the Committee met with the approval of the police authorities and the magistrates.

The principal points upon which the Committee elicited information, and which will be found prominent in the evidence, were :—

- (1.) The condition of the present building, and why it has been decided to abandon it and the site upon which it stands ;
- (2.) The reasons for the choice of the proposed new site ;
- (3.) The accommodation to be provided in the new building ;
- (4.) The extent to which the proposed change of site and accommodation in the new building are approved by those immediately interested in the business of the Court.

Numerous complaints, Mr. A. C. Fraser states, have from time to time been made, "not only by the Bench, but by Members of Parliament, the police, the legal profession, and the general public, respecting the unhealthiness of the present premises"; and, referring to the reasons for obtaining a new site, he says, "The reasons advanced for removing from the present position are the general decay of the buildings, the unhealthiness occasioned by too close proximity to the markets (30 feet), its insufficient accommodation, its unsightly appearance, the bad smells arising from the adjoining water-closets and urinals, the noise occasioned by outside traffic, and the proposal to utilize the site for other public purposes." In 1881 the Colonial Architect reported that the building was in a dilapidated and dangerous state, and recommended that no further expenditure should be incurred in making alterations and additions to it; and about the same time it was condemned by the City authorities as "in part unfit for human habitation or accommodation of the occupants." At present, the Colonial Architect states in his evidence (*questions* 27, and 28), "it is in a disreputable condition," and not worth repairing or spending money upon.

The proposed site is one of several which at different times have been under the consideration of Ministers of Justice, and it was decided upon because, after inspection, it was found to be suitable, from its central position and its extent, and from the reasonableness of the price asked for it. The Colonial Architect describes it as "central, removed from noise of traffic, of large area, without street-frontage, and therefore not requiring an expensive style of building." The Acting Inspector-General of Police considers the site to be "fairly central," and Mr. Delohery, though according to his evidence he does not like the position as well as the present one, admits (*questions* 75, and 76) that it is infinitely superior as far as relates to noise from the streets and the presence of loiterers.

As to the accommodation which will be provided in the proposed new building, it will, the evidence shows, be sufficient for all requirements. Everything has been planned upon a scale larger than that of the accommodation afforded by the old building; and several important and desirable improvements have been introduced. One of these is the erection of barracks for the accommodation of fifty foot police, who, by this means, will be available at all times for any emergency that may arise. The new building, in the opinion of the Acting Inspector-General of Police, will afford ample accommodation; and the evidence of Mr. Delohery is to the same effect.

The fourth point of importance upon which the witnesses were examined—the extent to which the proposal and plans submitted to the Committee meet with the approval of those chiefly interested in the business of the Central Police Court—is dealt with in what has already been stated. From that it will be seen that both the change of site and the accommodation to be provided in the new building are approved by those immediately concerned in the business of the Court; and further testimony on this point may be obtained from the answers given to questions 15, 18, 22, 59, and 63.

The

The Committee, on the evidence, consider it desirable that the new building should be proceeded with; and on Thursday, 13th September, they agreed to the following resolution, which was moved by Mr. Humphery and seconded by Mr. Watson :—

“That the Committee consider it expedient that the new Central Police Court should be erected as proposed on the plans and explained in the evidence before the Committee.”

JOHN LACKEY,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 22nd October, 1888.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

NEW CENTRAL POLICE COURT.

THURSDAY, 13 SEPTEMBER, 1888.

Present:—

JOSEPH PALMER ABBOTT, Esq. (VICE-CHAIRMAN).

The Hon. WILLIAM HENRY SUTOR.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY,

ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee proceeded to consider the subject of the proposed new Central Police Court.

Joseph Barling, Esq., Under Secretary for Public Works, sworn and examined:—

1. *Vice-Chairman.*] Are you the Under Secretary for Public Works? Yes.
 2. Do you know anything concerning the new Central Police Court? Yes. The site on which it is proposed to erect the building is that formerly occupied as a tannery, and more recently known as Hardie's Mill. It has a frontage to Liverpool-street of 72 feet, running back 78 feet, and opening into a square of 206 feet by 182 feet, with a frontage of 90 feet to Union-lane, and 161 feet to a right-of-way, 10 feet wide, off Union-lane, with another right-of-way into George-street. The buildings comprise:—Charge, Summons, and Occasional Courts; hall for public and witnesses in waiting; quarters for caretaker; closets, urinals, &c., for each department; lockup, with necessary cells for men and women; yards, closets, &c. In connection with the lockup will also be charge-room, office, sergeants' rooms, and strong and store rooms for stolen articles, superintendent's office, doctor's room, waiting-room for police, &c.; police barracks, with usual accommodation for fifty men, are proposed as well. A complete system of drainage has been arranged for connecting with the sewer in Liverpool-street. The cost of the work, including barracks, is estimated at £49,000. Mr. Fraser, the Under Secretary for Justice, is here, and will give you a statement of the circumstances which have led to the proposal for the new building; Mr. Barnet, the Colonial Architect, will describe the plans; Mr. Read, the Acting Inspector-General of Police, will show the necessity for the new Court; and Mr. Delohery, one of the Stipendiary Magistrates, is also present to give evidence.

J. Barling,
Esq.

13 Sept., 1888.

Archibald C. Fraser, Esq., Under Secretary of Justice, sworn and examined:—

3. *Vice-Chairman.*] Are you the Under Secretary for the Department of Justice? Yes.
 4. Have you been connected with that Department for a number of years? I have been connected with the Department of Justice as Under Secretary for 18 months, and with the Crown Law Offices for many years.
 5. Do you know anything of the proposal to build a new Central Police Court? Yes. My knowledge of the matter is gained from the official documents. The proposal to purchase an eligible site for the erection of a new Police Court, in lieu of the one now used, has occupied much attention on the part of several Ministers for years past. In 1878, Mr. Crane, then Acting Police Magistrate at the Central Police Office, first called the attention of the Department to the inadequate accommodation and the general unsuitability of the building. Numerous complaints, from time to time, have since been made, not only by the Bench, but by Members of Parliament, the police, the legal profession, and the general public, respecting the unhealthiness of the present premises, and urging the desirableness of either rebuilding on the same site, and resuming the ground now used as Public Markets, or erecting a new building elsewhere. The latter proposal appears to have been generally considered the wiser course. Much difficulty, however, was experienced in procuring an eligible site, as the several positions offered to the Government for this purpose were reported upon as unsuitable, either because the title was imperfect, or the area too small. In a minute, dated 5th September, 1883, the Colonial Architect reported that, for the purpose of erecting a commodious building, at least 3,920 square yards (or more than three-quarters of an acre) were required. In September, 1883, Mr. Abigail, M.P., first suggested to Mr. Cohen, then Minister of Justice, the Liverpool-street site, which, after inspection, was found to be suitable, from its central position and extent, and the price asked for same being considered reasonable. In a minute, dated 22nd September, 1884, Sir Alexander Stuart, then Colonial Secretary, authorized the purchase of the land referred to from Messrs. Milson and Bennett, on behalf of the Government,

A. C. Fraser,
Esq.

13 Sept., 1888

A. C. Fraser, Esq.,
13 Sept., 1888.

for the sum of £32,000, which purchase was duly completed on the 19th January, 1885. On the 9th December following, Mr. Garvan, then Minister of Justice, wrote a minute, setting forth certain reasons in favour of erecting the new Police Office on the site of the old building, and suggested that the Immigration Barracks might be temporarily used for the conduct of business whilst the new building was being erected. The Cabinet approved of this suggestion, but nothing further appears to have been done in the matter pending further inquiry as to what funds were then actually available. Attention having been called by certain Members of Parliament in the House, and the metropolitan Press, to the delay in proceeding with the work, for which at various times the sum in all of £75,000 had been voted, Mr. Garvan, then Minister of Justice, in December, 1886, instructed the Colonial Architect to prepare an estimate of the building proposed to be erected on the site of the present Police Court in George-street. The following is a copy of his report:—"Two-storey building, in stone, £55,000; ditto, in brick and cement, £42,000. Three-storey building, in stone, £70,000; ditto, in brick and cement, £58,000.—J.B. Colonial Architect's Office, 10th December, 1886." Mr. Barnet reported that the estimated cost of the foundation in Liverpool-street would be about £11,900. It was explained that in consequence of the site having been formerly used as a tannery it was necessary for the foundations to be sunk much deeper than they otherwise would have been. The Colonial Architect suggested that tenders should be at once called for the work, but as the ground had been purchased subject to existing leases further delay ensued, pending negotiations for the purchase of leasehold interests. On the 17th October, 1887, Mr. Clarke directed the Crown Solicitor to take steps for the immediate resumption of the leases referred to, but afterwards employed Messrs. Mills & Co., of King-street, to negotiate for a surrender of these leases. On the 23rd November, 1887, Mr. Mills submitted a report. The total amount claimed by the lessees was £7,447 6s. 8d.; the amount offered by Mr. Clarke, and accepted by the lessees (Duesbury, Troedel, and Slade) was £3,950. Mr. Slade's interest (£1,250) is now being dealt with by the Crown Solicitor, and it is expected will shortly be got in, but the deed requires to be sent to England for completion. Mr. Troedel's interest (£2,000) is also in a similar position, the papers having to be sent to England before the property can be vested in the Crown. At the present time there are only two Crown tenants in occupation of portions of the ground, one of whom (Twiss) pays a weekly rental of 10s., and the other (Slade) a monthly rental of £9. 3s. 4d. From this it would appear as if the Government could resume the tenancies in question at a month's notice. It has been estimated that the cost of the new Police Court buildings (exclusive of the purchase money, £32,000, paid for the site, and £3,950 value of leasehold interest) would be about £37,000 if constructed of brick and cement, and £44,000 if built with a stone front. The reasons advanced for removing from the present position are the general decay of the buildings, the unhealthiness occasioned by too close proximity to the markets (30 feet); its insufficient accommodation, its unsightly appearance, the bad smells arising from the adjoining water-closets and urinals, the noise occasioned by outside traffic, and the proposal to utilize the site for other public purposes. Sir George Innes and Mr. Suttor (Ministers of Justice) both concurred that the place was wholly unsuited for the purpose for which it was used; and the latter, in his minute of 26th July, 1880, thought that the present building ought to be pulled down, and gave instructions to Mr. Crane "to look out for a suitable building for immediate occupation," but no suitable building could be obtained at the time. The Colonial Architect, in a minute of 20th January, 1881, reported that the building was in a dilapidated and dangerous state, and recommended that no further expenditure should be incurred in making alterations and additions to the old building. The Mayor (Mr. Harris), the City Health Officer (Dr. Dansey), the City Building Surveyor (Mr. Sapsford), the Inspector of Nuisances (Mr. Seymour), all reported that the buildings "were in part unfit for human habitation or accommodation of the occupants," and notice was served on Sir George Innes (then Minister of Justice) to make certain alterations and improvements within seven days from the 31st January, 1881, but the Attorney-General gave it as his opinion that the Mayor was acting *ultra vires*, and no further action was taken in the matter. The reasons advanced in favour of the Liverpool-street site appear amongst others to be chiefly because it was a better site, inasmuch as the position was a central one, the locality was quiet and healthy, and commodious premises could be erected on a site less valuable than that situated in George-street. There is nothing to disclose in the papers as to what has actually been done towards the erection of the new offices in Liverpool-street; but the Minister of Justice has lately given instructions to sell at an early date the balance of machinery, &c., and the building material of any tenement not actually occupied on the land resumed in Liverpool-street. Instructions have also been given for the demolition and sale on 10th October next of the building material of the present Central Police Court, and Messrs. Hardie & Gorman have been informed to this effect. In the meantime, Mr. Clarke, in a minute of 25th February, 1888, has approved of the renting of the ground floor and first floor of a building numbered 342A, Castlereagh-street, Sydney, and known as the Oddfellows' Hall, for the term of two years from 1st March, 1888, at a yearly rental of £500, payable quarterly. It has been ascertained from the Colonial Architect that the plans and specifications of the proposed new building in Liverpool-street have been prepared, and are now with the Public Works Inquiry Committee for their approval, prior to the work being proceeded with. The following is a statement of votes taken at various times for the purchase of a site and the erection of new Police Court buildings:—
"1882.—The sum of £25,000 was provided from surplus revenue, but was subsequently written off.
1884.—Further sum, surplus revenue, since written off, £10,000. 1884.—Revote of 1882, since written off, £25,000. 1884.—Under Loans Act, 43 Vic. No. 26, £40,000, from which there is a balance amounting to £8,800. 1888.—Under Loans Act, 52 Vic. No. 17, £30,000, or a balance available of £38,934."
6. Mr. Garrard.] If the title of the new site is not yet complete, how can you go into occupation of the land without a certain amount of risk to the Crown;—have you not just stated that it is necessary to send Home some of the conveyances to get them signed? The freehold of the land is conveyed to the Government, and it only now requires a surrender of leases, and these are the deeds sent to England for signature.

James Barnet, Esq., Colonial Architect, sworn and examined:—

J. Barnet,
Esq.,
13 Sept., 1888.

7. Vice-Chairman.] Have you, as Colonial Architect, been instructed to prepare plans and specifications for a new Central Police Court? Yes; since 1880, I think. In 1880 the necessity for the building was brought forward, and at the request of the then Minister for Justice (Sir J. G. L. Innes), the Colonial Architect, in January, 1881, reported upon a store in York-street, owned by Mr. Solomon, proposed to be

be used as a temporary Police Office. The report was to the effect that the building was not suitable for the purpose required. Later on in the same month, leasehold land, between Park and Market Streets, facing Elizabeth-street, was offered by Mr. Long for a temporary building, for which an estimate was prepared, amounting to £2,200. No further instructions were received until August, 1881, when the Minister for Justice asked for an estimate of cost for additional accommodation to the present building, which was furnished with plan, the estimate being £3,000. This was approved, and the amount included in draft Estimates for 1882. It was, however, omitted from the printed Estimates placed before Parliament, and a sum of £25,000, since written off, was voted for the erection of a new building, without reference to the Colonial Architect, who had received no instructions in the matter. This sum of £25,000 having been voted for a new building, the Colonial Architect asked by letter to the Works Department, of 9th March, 1882, if the site had been decided; and, if so, that particulars of accommodation required in the building might be furnished, to enable him to prepare plans for the work. The matter then stood over until September, 1883, when the Minister for Justice asked the Colonial Architect for a report, in conjunction with Mr. Dillon; S.M., and the Inspector-General of Police, as to a suitable site for a new building. Three sites were inspected, viz.: Vacant land on the east side of Pitt-street, between Goulburn and Campbell Streets; land in Pitt-street, between Bathurst and Liverpool Streets, on which stands St. Andrew's School; and land between George and Pitt Streets, off Liverpool-street, formerly used as a tannery. The last-named was reported as the most suitable, being central, removed from noise of traffic, and being of large area, without street frontage; therefore not requiring an expensive style of building. Sketch plans suitable for each site were submitted to the Minister for Justice, who stated he could not see why the building should not be erected on the site at the corner of Pitt and Liverpool Streets which had recently been purchased by the Government. In the following month—October, 1883—the Colonial Architect was requested to prepare plans to suit the site at the corner of Pitt and Liverpool Streets, before referred to, the particulars of accommodation required being furnished by the Departments concerned. The plans were completed and submitted in March following, with report that the site being so limited it was found necessary to place two Courts on the first floor, and that, for the same reason, there would be no space for witnesses but the passages; and it would therefore be doubtful whether a building on this site would give more accommodation than was provided by the old building. The building for this site, as planned, was estimated at £36,000 with brick and cement front, or £44,000 for stone front. Nothing further was done until October, 1885, when, in accordance with instructions, sketch plans were prepared and submitted to suit the site of the old tannery in Liverpool-street, before referred to; but the matter remained in abeyance until September, 1886, when the Colonial Architect, as instructed, reported on utilizing the old Immigrant Barrack for Police Court purposes, estimating cost of alterations at £4,000; and at the same time estimating cost of erecting new Police Court on the site of the present building, in accordance with plans submitted, at £55,000 for a two-storey building, and £70,000 for a three-storey building; and for erecting a building on the before-named Liverpool-street site, including Coroner's Court, at £43,500. In October, 1886, plans were, in accordance with instructions, prepared for alterations to the Immigration Barrack, to suit the building for a temporary Police Court, but the work was not carried out; and in December following the then Minister for Justice, Mr. Garvan, recommended as the most suitable site for new Police Court buildings that on which the present buildings stand, and that temporary accommodation for the Police Court should be provided in the Immigration Barrack. This was approved by the Cabinet, but the matter was deferred for want of funds. In March, 1887, the Cabinet approved of the Immigration Barrack being altered for a Police Court, at a cost of £2,000; the Minister for Justice, at the same time, asking for a report on land in York-street, next the Wesleyan Chapel; which the Colonial Architect reported as too small, and again recommended the land in Liverpool-street. Plans for alterations to Immigrant Barrack were then prepared and submitted with form of notice inviting tenders for the work, but it was now decided by the Minister for Justice that the barrack should be added to and utilized for Supreme Court purposes instead of Police Courts. In September following, the Inspector-General of Police pointed out the necessity for the purchase of a site on which to erect a barrack for fifty men, but the Minister for Justice considered this barrack should form an addition to the plan for proposed new Police Courts. A plan was prepared accordingly, the additional cost for the barrack being estimated at £4,500. On 11th October, 1887, the Colonial Architect submitted a plan for the foundation of a building to be erected on the site of the old tannery, Liverpool-street, before alluded to, as part of the scheme to give work to the unemployed, with form of notice inviting tenders for the work, which was approved by the Minister, and notice sent to the *Gazette*. It was, however, afterwards withdrawn, and papers in accordance with instructions forwarded for consideration of the Minister for Justice, who instructed the Crown Solicitor to take steps for the resumption of leases held by tenants of portions of the land referred to. No further instructions have been received by the Colonial Architect; but on the 27th April, 1888, he submitted a letter to the Works Department respecting funds that would be required to meet the cost of proposed Central Police Court. £30,000 was therefore included in the Loans Estimate for this year, in addition to which there is a balance of £8,934, remaining from Loans 1884; making the total sum of £38,934 now available towards erection of the proposed new Police Courts.

8. How many Court-rooms will there be in the new building? Three—two Courts and an occasional Court.

9. Will that afford as much accommodation as was given in the old Central Police Court? There is just the same number of Court-rooms.

10. Are the new court-rooms the same size as those in the Central Police Court, or are they larger? They are all larger.

11. Is the accommodation altogether larger? Yes; everything is on a larger scale.

12. Have you provided much accommodation for the public—that is, the idling public—in those Court-rooms? No, not much. There are no galleries. There is room for about three dozen people in each Court. There is an entrance to the Magistrates' rooms from George-street. The police-station plans are incomplete.

13. Will there be as much prison accommodation as there is now at the old Central Police Court? There will be more. The prisoners will come down the stairs shown on the plan, and under the Court.

14. *Mr. Kethel.* Have you made provision to prevent such an occurrence as recently took place at the Central Police Court, by having the prisoners more under the supervision of the police? It is contemplated to construct iron bars on one side of the cells, so that the constable-in-charge can see into the cells. I may say that I received a letter recently from Mr. Fosbery, who visited the new municipal buildings.

J. Barnet,
Esq.
13 Sept., 1888.

- J. Barnet, Esq.
13 Sept., 1888.
- buildings at Glasgow, which I have seen. They have cells there with open bars in front. In Greenock lock-up, which I have seen, there are about twenty-five cells, and they have an elevator to bring up the prisoners; and they have the Court so arranged that if a prisoner is discharged he goes out without being seen by the public in the Court. The London lock-ups are very poor.
15. *Mr. Suttor.*] Would it not be better if the prisoners' dock were nearer the Bench instead of being across the room, and behind the lawyers' table? That matter rests with the Magistrates. We always try to meet the wishes of the Magistrates.
16. *Mr. Kethel.*] Have you submitted these plans and the details of the fitting up of the Courts to the Department of Justice before finally deciding upon them? This building is under two Departments—the Colonial Secretary for the lock-up, and the Minister of Justice for the Court. It first goes from me to the Minister.
17. Do you submit the plans for their approval? I submit them to the Secretary for Public Works. He sends them to the Minister of Justice and the Colonial Secretary, and they approve.
18. Do they make such alterations as they desire? There is seldom anything of that kind, because we always consult the officers beforehand.
19. Have these plans been finally approved of by the Department? No; they have been submitted. The question of accommodation for fifty police is under consideration.
20. Does the estimate of cost which you have given us include the cost of cells and police barracks? Yes.
21. *Vice-Chairman.*] Does the sum of £40,000 which you have mentioned include the cost of foundations? Yes; the foundations are very costly here.
22. Where do you gather information to enable you to prepare accommodation—from the Magistrates and the officials? As far as the Court-rooms are concerned, we get it from the Magistrates—principally Mr. Delohery.
23. *Mr. Garrard.*] Has he had long experience at the Central Police Court? Yes.
24. *Vice-Chairman.*] Will the accommodation for fifty police be placed over the Court? No; the Court will be a one-storey building. One plan made provision for a room upstairs for the Coroner, but that has since been provided elsewhere.
25. *Mr. Kethel.*] Will the walls be constructed strong enough to allow of another storey being added? They will be strong enough; but if another storey were added there would not be much light in the Court. There will be a gate entrance from George-street. The front elevation stands back from Liverpool-street about 70 feet. Only the front is intended to be constructed with stone. It will be sandstone. There will be no basement. We have only an underground passage for prisoners.
26. *Mr. Suttor.*] Have you inspected the old Central Police Court building? Yes.
27. In what condition is it? It is in a disreputable condition.
28. Is it worth repairing or spending money upon it? No; it is very damp, and the old buildings are rotten.
29. *Mr. Watson.*] What is the estimated cost of the proposed new buildings complete? £48,000.
30. And that includes the foundations? Yes.
31. *Vice-Chairman.*] Do you think it can be done for that sum? Yes.
32. *Mr. Garrard.*] Do you not think that it is a very great waste to erect a one-storey building on valuable ground like this site? It is much more convenient for the public. There is a great objection to having Courts upstairs. That is the objection to the other site.
33. *Mr. Watson.*] When can you begin this work? We could begin to-morrow, if we had the land.
34. When will it be completed? In eighteen months or two years.

George Read, Esq., Acting Inspector-General of Police, sworn and examined:—

- G. Read, Esq.
13 Sept., 1888.
35. *Vice-Chairman.*] Are you the Acting Inspector-General of Police? Yes.
36. Have you been a long time in the Police Force stationed in Sydney? Thirty-three years.
37. Do you know the old Central Police Court? Yes.
38. Are you intimately acquainted with it and the lock-up? I have known them during the whole period I have been in the Colony.
39. Are they suitable for the purposes for which they are used? No.
40. Why? The Court does not contain sufficient accommodation, and the situation, owing to the constant noise of the traffic in George and York Streets, is unsuitable. The lock-up is also deficient in accommodation; and for sanitary reasons it is unsuitable for the purpose.
41. Is the noise a great disadvantage in the conduct of Court business? Yes.
42. Have you seen the plans of the proposed new Central Police Court in Liverpool-street? Yes.
43. What do you think of that site for a Central Police Court and lock-up? I think it is fairly central. I know the district thoroughly, as it is my own.
44. Is it more central than the present site? No; I do not think it is, because the greater number of arrests are made in the centre of the city—about the theatres and principal hotels and the neighbourhood adjacent to Darling Harbour.
45. Have you given attention to the plans of the Court-house? I have looked at them. I have not gone very carefully into the plans of the Court.
46. Do you see on the plans before the Committee the accommodation proposed to be provided for three Courts? Yes.
47. Do you think that they afford sufficient accommodation for the purposes for which they are intended? I think so. The tendency now is to afford the near suburbs the convenience of a Court, which has the effect of diminishing the business in the city. I think therefore that these buildings will afford ample accommodation.
48. Do you more particularly direct your attention to the accommodation for prisoners? Yes.
49. What do you think of the accommodation provided for that purpose in these plans? I think it is very good and ample.
50. The Colonial Architect has told us that it is proposed to erect barracks there to accommodate fifty police;—is that something new? It is in Sydney; but it is the practice in most large towns to have a barrack in the centre of the city, so as to have a number of men available on the shortest notice for any emergency which might arise.
51. Would those men live there constantly? Yes.
52. Are they unmarried men? Yes, all of them.
53. At present, where are those men kept? They provide themselves with accommodation wherever they can get it.

- 54. If they are suddenly required, have you to look for them? Yes; we have to send to their homes to G. Read, Esq. get them.
- 55. Do you know the accommodation proposed to be given to those fifty men? Yes; I have had ^{13 Sept., 1888.} conversation with the Colonial Architect on the subject.
- 56. Will they be foot police? Yes, all foot police.
- 57. Would it be a great convenience to the Police Force and the administration to be able to keep those fifty men in one place? Yes, and a public benefit. For instance, in the event of any serious disturbance at an election, or the occurrence of a riot, it would be a very great advantage to know where to go to get a considerable body of men in a very short time.
- 58. *Mr. Street.*] Have you sufficiently examined the plans to be able to say that the accommodation meets with your approval, and that it will provide all that is necessary for some time to come; have you had sufficient time to examine the plans? Yes, I think so; I saw them some time ago, and thought them complete.
- 59. Were you consulted with regard to the accommodation required? Yes; and I think the accommodation will be ample for all the future in that part of the city. We have a commodious lock-up at the north end of the city, and it is in contemplation to have another lock-up at the south end. We have one fairly good one there already; but it is thought that it might be in a better situation. As the land on which it stands is exceedingly valuable, the proceeds of the sale of that land would be more than sufficient to provide another lock-up in a better situation.

Cornelius Delohery, Esq., Clerk of Petty Sessions and Acting Stipendiary Magistrate, sworn and examined:—

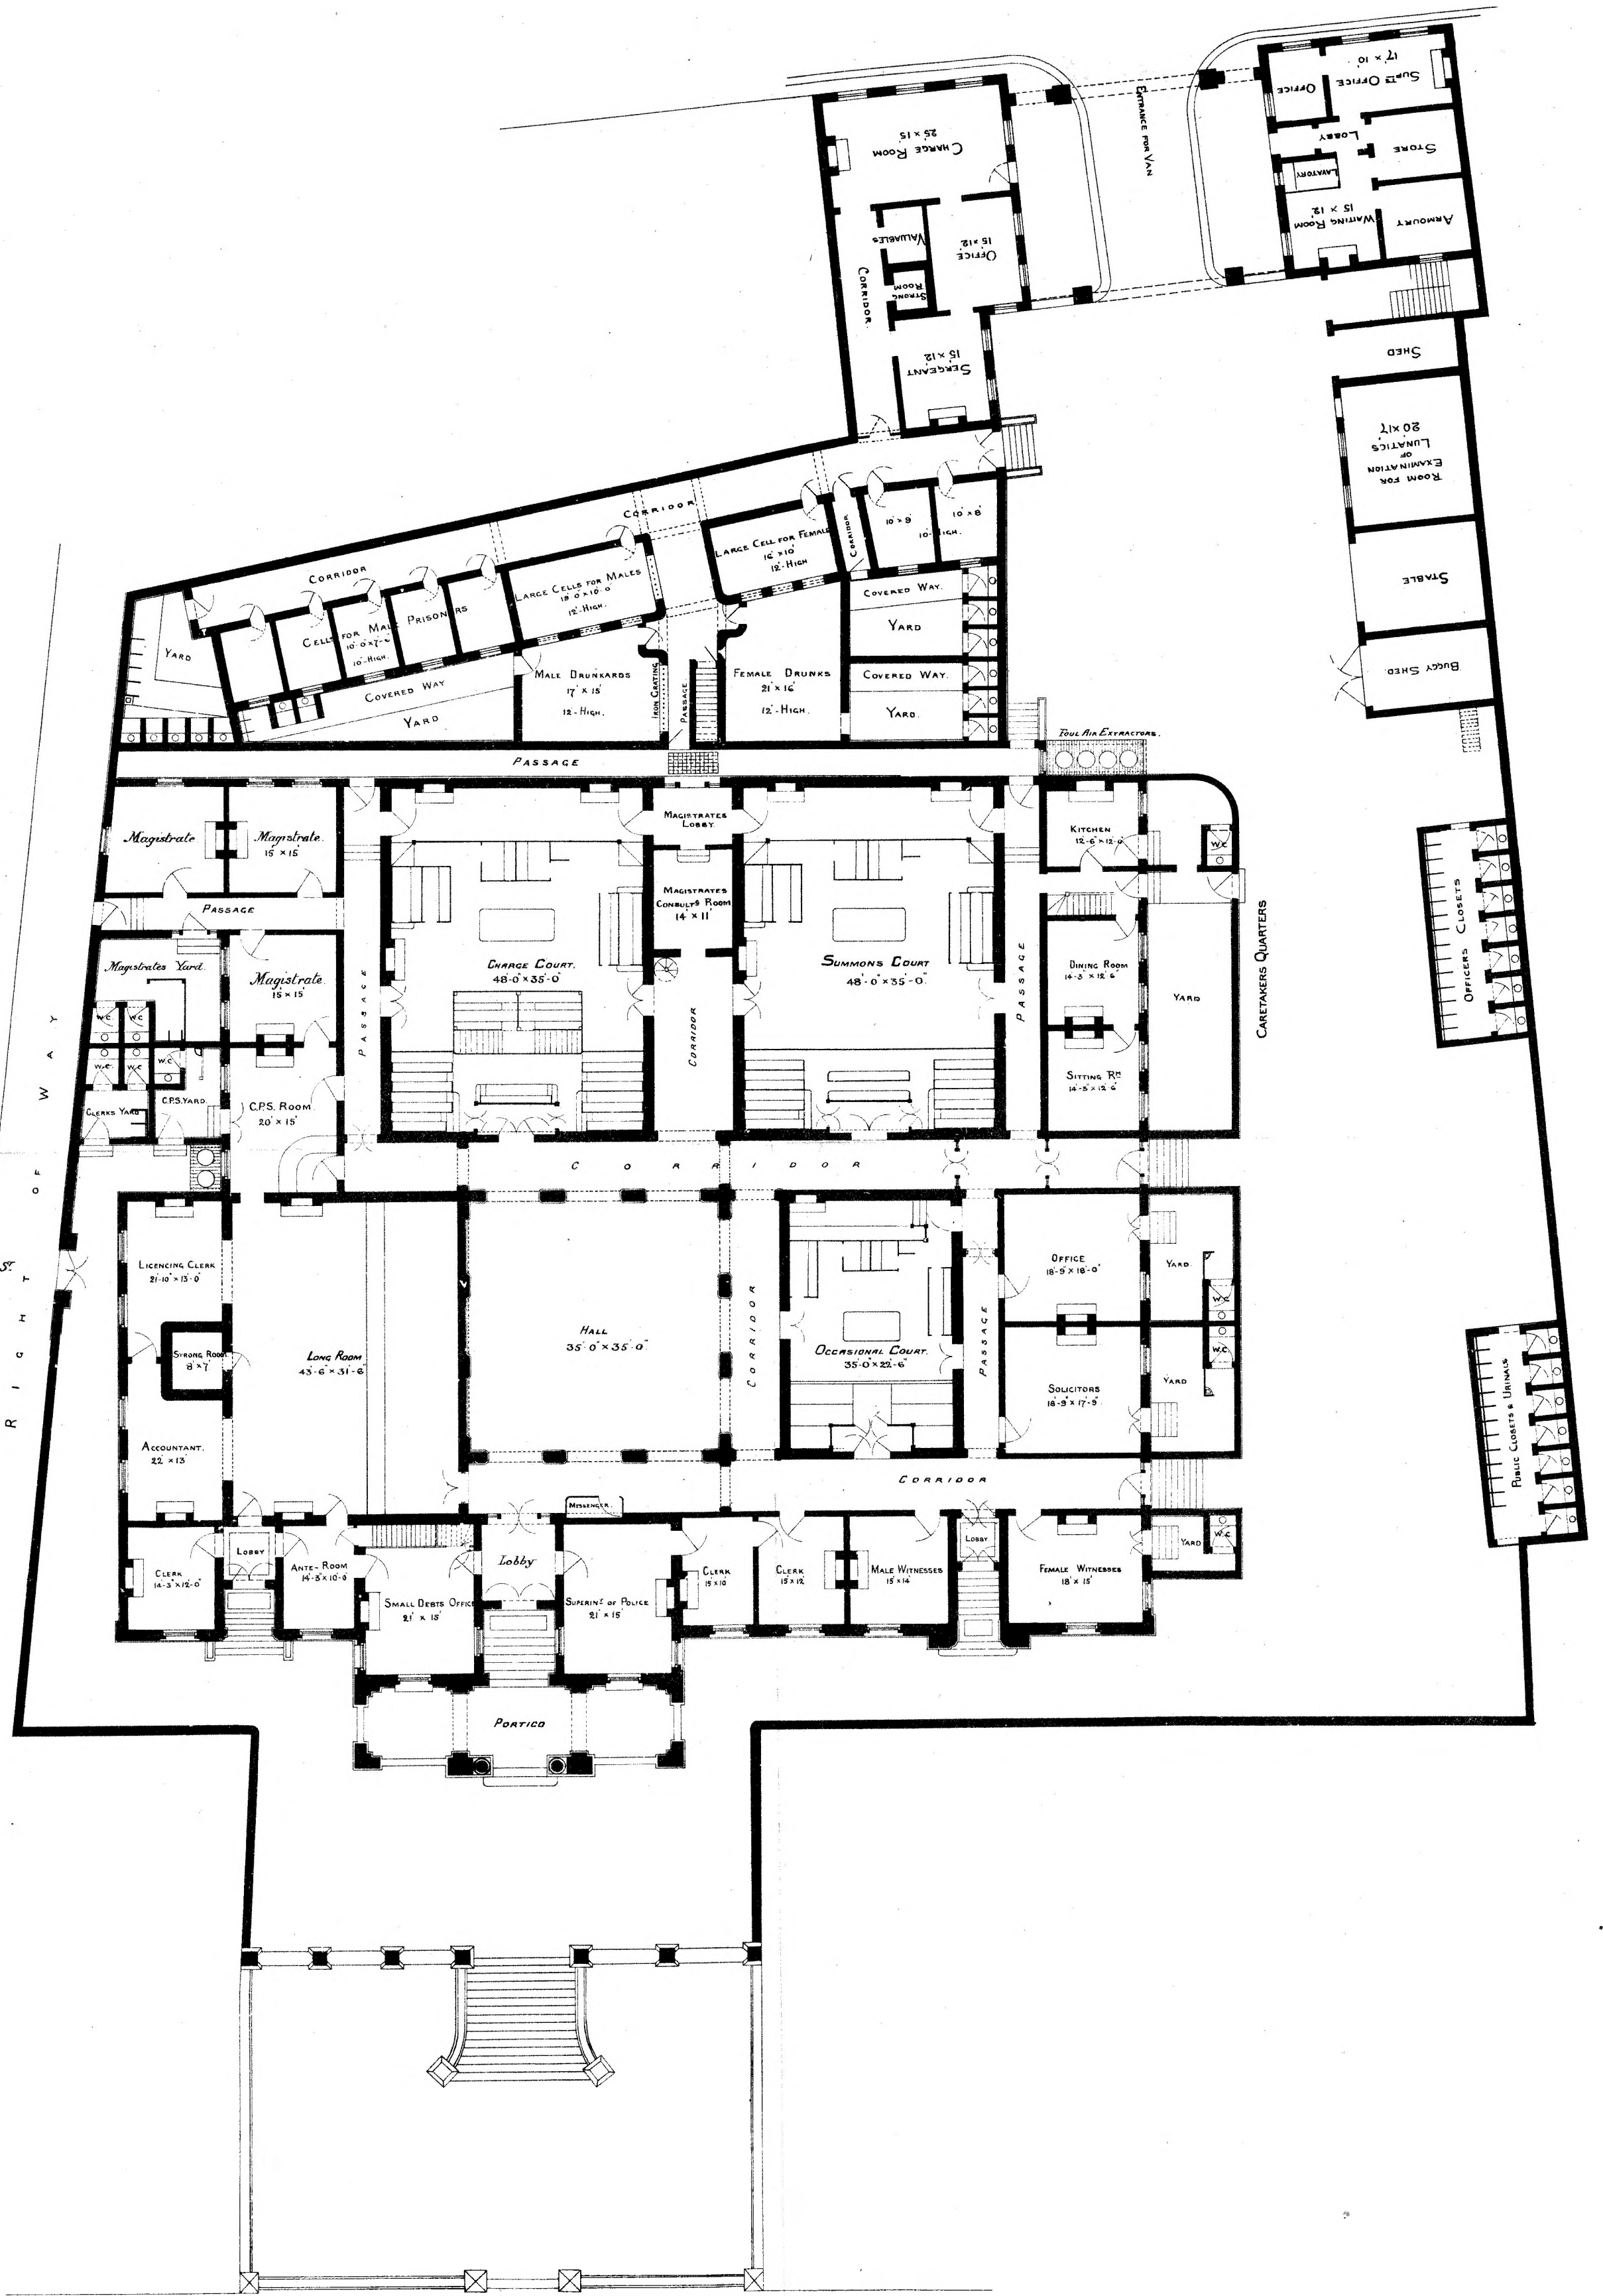

- 60. *Vice-Chairman.*] Are you Clerk of Petty Sessions and Acting Stipendiary Magistrate at the Central Police Court? Yes. C. Delohery, Esq. ^{13 Sept., 1888.}
- 61. How long have you been there? Thirty years. I was in Maitland for twelve years.
- 62. Have you examined the plans of the proposed new Central Police Court? Yes.
- 63. Have you been consulted at all? Yes. I suggested nearly all the first plan.
- 64. What is your opinion as to the accommodation proposed;—will it be sufficient for the requirements of the Central Police Court? Quite.
- 65. Will the Court accommodation be as extensive as it is at present? It will be more extensive.
- 66. Does that also apply to the offices? Yes.
- 67. Have you now sufficient office room at the Central Police Court? No.
- 68. Are the present buildings suitable for the Central Police Court? No, they are not; principally because of the situation. The noise in both streets interferes with the business very much, and there is a great stench from the markets.
- 69. What is your opinion as to the position of the Liverpool street site;—is it sufficiently central? I do not like the position altogether. The present position is more central. You could not have a better position than that.
- 70. Except for the lock-up, will it not be central enough for the public? It will do; but it would be better in its present position.
- 71. Is not the city extending southwards? That does not matter. Our district only extends to Cleveland street, and therefore it does not matter how far south the city goes.
- 72. Is not the Court at one end of the district now? Yes; but the population is there.
- 73. Has not the population increased enormously in the south during the last ten years? I do not think so, because all the land is occupied, and there is no more land to occupy. The city is increasing beyond that, but it is in other districts.
- 74. *Mr. Kethel.*] Have not the residents' dwellings which used to be so numerous in the northern part of that district become stores and warehouses, and, consequently, the population is shifting? That is the case.
- 75. *Vice-Chairman.*] Is not the proposed new site infinitely superior to the old site, so far as noise from the streets is concerned? Yes. It is surrounded by buildings, and there will be no noise.
- 76. Will it not be an advantage to have the Court off the street, so that loiterers may not so easily stroll in? Yes.
- 77. Is there not a little too much accommodation provided for the Magistrates in the plan of the new building. What does each Magistrate want a room for? I do not think there is too much accommodation. The Magistrates each have a room in the Water Police Court.
- 78. I am not asking you what they have at the Water Police Court. Would not every clerk like to have a room to himself? Of course we could make one room do.
- 79. There is no private work to be transacted there; it is all public business, is it not? Of course they could do with one room. We are using one room now.
- 80. Are the new Courts as large as the old ones? I think they are not quite as large.
- 81. That is not a disadvantage? I do not think it is. The others are too large, and allow too many people to be in at one time. The new ones are of a nice workable size.
- 82. Is it generally admitted that there is an absolute necessity for new Courts? Yes; everyone admits that. The present building is a disgrace to the city.
- 83. *Mr. Suttor.*] Have you examined the arrangements in the different Courts—the position of the witness-box, the position of the Magistrates, and so on? Yes.
- 84. Do you think that what is now proposed is a good arrangement? Yes. We have had a great many alterations in the plans.
- 85. According to this arrangement the prisoner and the witness will be over 20 feet apart? Yes, quite that distance.
- 86. Do you not think it would be better to have the witness and the prisoner closer together, so that the prisoner could hear every word? That might be done. Very often prisoners, if they are hard of hearing, are brought out of the dock, so as to be closer to the witness. The dock might certainly be brought a little closer.
- 87. Would it not be more convenient to have the dock where the reporters' table now is? It is not advisable to have the prisoner at the side. In Sydney the dock is always placed in the centre.

NEW SOUTH WALES.

POLICEMEN IN PLAIN CLOTHES AT BURWOOD.

(PAPERS RELATING TO MAN FIRED AT BY FOUR.)

Ordered by the Legislative Assembly to be printed, 20 November, 1888.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 7th November, 1888, That there be laid upon the Table of this House,—

“Copies of papers relating to the case of the man who was fired at by four policemen in plain clothes at Burwood.”

(*Mr. Walker.*)

Inspector Larkin to Inspector Anderson.

Sir,

No. 5 Police Station, 17 July, 1888.

I have the honor to report for your information an occurrence that took place this morning, between our plain-clothes constables and three men who were driving along the Parramatta Road towards Sydney in a light spring-cart.

Owing to some burglaries recently perpetrated in the western suburbs, I thought it advisable to employ some of the most efficient and the most trustworthy men in the subdivision to perform plain-clothes duty, with the view of bringing the offenders to justice. I was possessed of information that the burglars used a light spring-cart, consequently I directed the men to be on the alert for anything of that description found about at unseasonable hours.

About 1 o'clock this morning, Senior-constable Skinner and Constable M'Kee saw three men in a spring-cart on the Parramatta Road, driving at a very rapid pace in the direction of Burwood. Skinner called on them to stand, but instead of doing so they increased their speed until they were lost sight of by the police.

About 3:20 a.m. the senior-constable, in company with three other constables in plain clothes, saw a van containing three men corresponding with the one above mentioned coming from the direction of Burwood. The senior-constable called on the driver to pull up, and at the same time said, “I am a police-constable.” The driver took no notice of the challenge, but seemed to increase his speed, when the senior-constable fired a shot in the air from a small pocket-revolver, with the view of intimidating the occupants of the van.

The police subsequently succeeded in overtaking the van, but not before one of its occupants who carried a parcel escaped. We concluded that parcel contained the property which was stolen from the residence of Mr. Willis, at Burwood, about an hour and a half previous.

I since saw the vanman, and from what he told me I concluded the two men that he promiscuously picked up on the road were the persons who robbed Mr. Willis' dwelling.

The revolver used by Senior-constable Skinner was his own private property, and carried by him without my knowledge; and although I considered it my duty to report the whole of the facts for your information, I am quite satisfied the senior-constable fired the revolver in the air.

I have, &c.,

N. LARKIN, Inspector.

1888-9.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

PURCHASE OF SITE FOR POLICE BUILDINGS, PARRAMATTA.
(CORRESPONDENCE RESPECTING.)

Ordered by the Legislative Assembly to be printed, 15 January, 1889.

The Colonial Architect to The Under Secretary for Public Works.

Department of Public Works,
Colonial Architect's Office, Sydney, 11 June, 1887.

Sir,
I do myself the honor to report that, in accordance with verbal instructions from the Colonial Secretary, I have inspected the property at Parramatta known as the "Woolpack Inn," with the view of ascertaining its value and adaptability for Court-house purposes.

2. The ground upon which the buildings are erected has (according to accompanying plan*) ^a *Appendix A. frontage of, say, 157 feet to George-street, by a depth of 398 feet to Marsden-street; it is of sufficient area and suitable for a Court-house, but the buildings, which are old and not in good condition, could not be utilized, except the stables, which might answer for police purposes, if required.

3. The probable value of the property I consider may be given as follows:—

157 feet frontage to George-street, with depth of 150 feet to Marsden-street,	£2,826
at per foot, £18	1,984
248 feet remaining frontage to Marsden-street, at per foot, £8	400
Value of old buildings, say	£5,210
Total	£5,210

Or, in round numbers, £5,200.

This valuation is based on such information as could be gained on the spot; but having only indirect and superficial means of ascertaining the value of country properties, it may perhaps be considered desirable to obtain another opinion in the matter.

I have, &c.,
JAMES BARNET,
Colonial Architect.

The Principal Under Secretary.—J.R., B.C., 14/6/87. Submitted, 14/6/87.

The Colonial Secretary to Mr. John Taylor.

Parliament House, Sydney, 23 June, 1887.

My dear Mr. Taylor,
I have arranged with the Manager of the City Bank for you to make a valuation of the Woolpack property, George-street, Parramatta. This is to be done for the Government, and without any reference to the City Bank; but the Bank is to pay your charge.

I should be glad if you would examine the property and report to me not later than Saturday.

Yours, &c.,
HENRY PARKES.

The Principal Under Secretary to Messrs. Hardie & Gorman.

Appendix A.

Gentlemen,

Colonial Secretary's Office, Sydney, 24 June, 1887.

In transmitting to you the accompanying plan of the premises known as the Woolpack Inn, Parramatta, I am directed by the Colonial Secretary to request that you will be good enough to favour me with a report as to the value of the property in question.

2. The ground upon which the buildings are erected has, according to the plan, a frontage of, say, 157 feet to George-street, by a depth of 398 feet to Marsden-street.

I have, &c.,

CRITCHETT WALKER,

Principal Under Secretary.

Mr. John Taylor to The Colonial Secretary.

Sir,

Real Property Sale Rooms, Church-street, Parramatta, 25 June, 1887.

In accordance with your letter of instruction of the 23rd instant, requesting me to examine the property at Parramatta, known as the Woolpack Hotel, and to make a valuation of the property for the Government, and report same to you, I beg to state I am thoroughly conversant with the particulars of the property, and did this day fully examine the buildings and land, and have the honor to report as follows:—

The situation of the property is at the north side of George-street, at its intersection with Marsden-street, a very central and convenient site for a family hotel or a public institution, and, although George-street is one of the main streets of the town, that portion west of Church-street, where the Woolpack property is situated, is not considered of the same importance for business purposes as the portion east side of Church-street. The ground frontage of the Woolpack property to Marsden-street does not occupy a commanding position for either business or private residences.

The building upon the land, used as the hotel accommodation, is very commodious, and has been built many years. The principal walls appear sound, but, as a whole, it is very much out of repair. The out-buildings are in very bad order, excepting the stone-built extensive stable, lofts, and covered-way, which are all good, and a solid structure.

I have made a separate estimate of value of the buildings and land, showing the buildings at their present estimated value, and the land as a subdivision to make the highest possible price.

I have also considered the value of the property as a whole for an investment, and I may here mention that the municipal assessment for this year was at a rental of £700 per year, and the agent for the property appealed to the Appeal Court for a reduction of assessment, and the Court reduced the amount to £400 per year. I am of opinion the sum should not have been less than £500 per year, a rental easily obtained.

My estimate of the present value of the property is £7,000, compiled as follows, viz.:—

The main building (hotel), with outbuildings and offices	£1,700
Stone-built stables and covered way	650
Ground frontage to George-street, 158 feet 4 inches by 125 feet deep, at £18 per foot	2,850
200 feet frontage to Marsden-street (opposite the hospital), by a full depth of the land from that street, at £9 per foot	1,800
Total value	<u>£7,000</u>

I declare the above amount to be a full value of the property.

JOHN TAYLOR,

Auctioneer and Valuator.

Messrs. Hardie & Gorman to The Colonial Secretary.

Sir,

Sale Rooms, 133, Pitt-street, Sydney, 28 June, 1887.

In accordance with the Principal Under Secretary's instructions of the 24th instant, we yesterday inspected the property known as the "Woolpack Inn," situated at Parramatta. The land has a frontage of about 157 feet to George-street, and a frontage along Marsden-street of 398 feet.

The hotel erected on the land is two stories high, and of brick. The stables at rear are of cut stone, and other out-buildings of wood.

We value the property at £9,500 (nine thousand five hundred pounds).

We return plan lent us.

We have, &c.,

HARDIE & GORMAN.

The Principal Under Secretary to Mr. John Taylor.

Sir,

Colonial Secretary's Office, Sydney, 2 August, 1887.

I am directed by the Colonial Secretary to request that you will be so good as to make a careful examination and valuation of the following properties, viz.:—

1. The present Court-house, land, and buildings, corner of George and Church Streets.
2. The site on the Sydney Road purchased a short time ago for Court-house.
3. The property—land and buildings—known as the Police Barracks, Macquarie-street.

2. I am desired to inquire what each of the foregoing properties would realise in the market at the present time, and in each case whether there is a prospect of increasing value.

I have, &c.,

CRITCHETT WALKER,

Principal Under Secretary.

Mr.

Mr. John Taylor to The Colonial Secretary.

Sir, Real Property Sale Rooms, Church-street, Parramatta, 9 August, 1887.

In compliance with your letter of instruction, dated 2nd August (instant), requesting me to make a careful examination and valuation of the following properties situate in the Town of Parramatta, viz. :—

1. The present Court-house, land, and buildings at the corner of Church and George Streets.
2. The site in Church-street (called Sydney Road) purchased a short time since for a Court-house.*
3. The property, land, and buildings known as the Police Barracks, Macquarie-street, and to report the value of each of the properties, together with my opinion in each case whether there is a prospect of increasing value.

I have the honor to report that I have inspected the properties and given careful consideration to their respective values in the present real property market, and beg to state as follows :—

1. The building and land known as the Court-house and Police Office, situated at the corner of Church and George Streets.—The buildings are of stone, substantial, and in good order and repair, but to be used for any other business purposes than what they are now occupied for their value would be considerably lessened. The land has a frontage to Church-street of 144 feet 5 inches, and to George-street of 142 feet 8 inches, and my estimate of the value of the whole property is £8,000.
2. The vacant land situate near the Railway Station on the south side having a ground frontage to* Church-street of 277 feet by depths from that street of 150 feet on the north boundary, and 184 feet on the south boundary, and my estimate of the value of this land is £3,000. With respect to this vacant land, I am aware that the Government, through the Hon. Henry E. Cohen (then Minister for Justice), paid a considerable higher price for the property than the amount I now value it at, and in justice to my present valuation, I must beg to state that the price paid by the Government was far in excess of the value obtainable for the land from any other source at the time of purchase.
3. The land and buildings known as the Police Barracks.—The buildings are brick built, very old, and much out of order.

The land comprises an area of about 4 acres, and the highest results for price would be best obtainable by a subdivision, and I have enclosed a sketch* of a proposed subdivision which I have used, together with a calculation, as a whole, to appraise the land, and my estimate of the value of this property is £2,700. * Appendix B.

The total value of the three properties referred to I estimate at £13,700.

With reference to a prospect of increasing value, from my experience of land and real property sales in Parramatta—over a period of thirty years—say, even during the past ten years, and judging from the present demand for investment in real property, I am inclined to the opinion that between the present time and the end of this year either of the particular properties herein valued is likely to command as high a price or value by public competition as may be expected for several years to come.

I have, &c.,

JOHN TAYLOR,

Auctioneer and Land Valuator.

Minute by The Colonial Secretary.

It is proposed to purchase the property in Parramatta known as the "Woolpack," for £8,500. Some time ago a site for a new Court-house was purchased by Mr. H. E. Cohen (then Minister of Justice) for, I believe, £5,000; but this site is out of the way, being on the Sydney Road, and the erection of a new Court-house upon it would give much dissatisfaction. It is now proposed to sell this piece of ground, the present Court-house at the corner of George and Church Streets, and the land in Macquarie-street now occupied by the police. The buildings on this latter piece of land are in so decayed a state that they ought to be pulled down. It is believed that these three properties would sell for a sum not less than £15,000. They have been valued by Mr. John Taylor, a cautious valuator, at £13,700. He only sets £3,000 upon Mr. Cohen's purchase.

The Woolpack property is in one of the best positions in the town. A new Court-house might be erected upon the property fronting the main street (George-street); and the hotel buildings would supply quarters for the police and all other Government officials; and the total cost would not exceed the estimated proceeds from the sale of the other properties.

Hardie & Gorman's valuation of the Woolpack property is £9,500. I recommend the purchase.

HENRY PARKES,

11/8/87.

Cabinet approve of purchase of Woolpack property; the question relating to Court-house to be reconsidered.—H.P., 11/8/87.

The Manager of the City Bank to The Colonial Secretary.

My dear Sir Henry,

I agree to the purchase, by the Government, of the Woolpack, at £8,500, the cost to be made on approval of the title by the Crown Solicitor, and completion of the conveyance by the Bank, and wait your further advice on the subject.

I remain, &c.,

W. NEILL,

Manager.

The

* The correspondence relating to this property was laid upon the Table of the Legislative Assembly on the 18th May, 1886.

The Principal Under Secretary to The Manager of the City Bank.

Sir, Colonial Secretary's Office, Sydney, 13 August, 1887.
 In reply to your letter of the 12th instant, I am directed by the Colonial Secretary to inform you that the Government agree to purchase the property known as "The Woolpack Hotel," Parramatta, for the sum of eight thousand five hundred pounds (£8,500), and to inquire when possession can be given, as it is desired, as soon as practicable, to remove the police to the building.

2. I am to request that you will communicate with the Crown Solicitor regarding the title of the property.

I have, &c.,

CRITCHETT WALKER,
 Principal Under Secretary.

The Assistant Manager of the City Bank to The Colonial Secretary.

Sir, The City Bank, Sydney, 13 August, 1887.
 I am instructed by the Manager to say that possession of "The Woolpack," Parramatta, purchased by the Government, may be had at once, and on your signifying the name of the official to take possession an order for that purpose in his favour will be at once prepared and forwarded to you.

The Manager will put himself into immediate communication with the Crown Solicitor as to the title.

I have, &c.,

J. HENDERSON,
 Assistant Manager.

Minute by The Colonial Secretary.

It is intended to sell the land in Macquarie-street, Parramatta, on which the old barrack buildings remain in a decayed condition, and I want Mr. Fosbery to go up to Parramatta and look at the "Woolpack," with a view to the police taking up their quarters there without loss of time. If he could arrange to take possession on behalf of the Government on Wednesday next, I think I could arrange to inspect the premises at the same time.

Write to Mr. John Taylor, and ask him to advise as to the disposal of the Macquarie-street land.

H.P., 13/8/87.

The Inspector-General of Police, B.C., 12 August, 1887.—C.W., P.U.S. Very urgent.

The Inspector-General of Police to The Principal Under Secretary.

Sir, Police Department, Inspector-General's Office,
 Sydney, 15 August, 1887.
 In compliance with the Colonial Secretary's desire, I have the honor to report for his information that I have inspected the site and premises of the "Woolpack Inn," at Parramatta. If it be intended to erect a new Court-house in that town, the site is central and suitable; but I conclude that a portion of the present premises would have to be removed, to afford sufficient space for the new building, as the inn is only about 75 feet from the main frontage. The buildings contain extensive accommodation, far in excess of any requirement of this Department, but are considerably out of repair. The stabling, however, is very good.

The present Police Barracks are in need of such considerable repairs that I am inclined to think the cost would be greater than that of erecting new premises. The Lock-up, adjacent to the Court-house, is a new building, with good quarters for the keeper, and centrally situated, answering all our requirements in that regard.

The site purchased near the Railway Station, for a new Court-house, is not, in my judgment, an eligible one.

It might be worthy of the consideration of the Government whether the land in Macquarie-street, forming part of the Police Reserve, would not be a good site for a new Court-house, as the old hospital buildings opposite thereto will probably have to be taken down before long.

I have, &c.,

EDMUND FOSBERY,
 Inspector-General of Police.

Seen.—H. P., 17/8/87.

Minute by The Inspector-General of Police.

Police Department, Inspector-General's Office, Sydney, 15 August, 1887.
 Noted and returned.
 I have instructed Sub-Inspector Latimer, of Parramatta, to attend on Wednesday to take possession of the premises known as the "Woolpack Inn," on behalf of the Government.
 If the Colonial Secretary desires that I should meet him there on Wednesday, will he be good enough to let me know what train he will leave Sydney by?

I visited Parramatta yesterday, and inspected all the buildings, and have already reported thereon.

EDMUND FOSBERY,
 I.G.P.

The Principal Under Secretary to Mr. John Taylor.

Sir, Colonial Secretary's Office, Sydney, 15 August, 1887.
 I am directed by the Colonial Secretary to request that you will be so kind as to advise as to the disposal of the Macquarie-street land, Parramatta, referred to in my letter of the 2nd instant.

I have, &c.,

CRITCHETT WALKER,
 Principal Under Secretary.

Mr.

Mr. John Taylor to The Colonial Secretary.

Sir,

Real Property Sale Rooms, Church-street, Parramatta, 16 August, 1887.

I have the pleasure of replying to your letter of the 15th instant, requesting me to advise as to the disposal of the Macquarie-street land, Parramatta, and referred to in your letter of the 2nd instant.

I beg to state that I am of opinion that the highest possible value to be obtained for the land is to make a subdivision into allotments of about $\frac{1}{4}$ acre each. In some instances the lots would have to be a little larger or smaller, according to the present formation of the whole, and the land upon which the buildings stand should be regarded in the subdivision so as to preserve the whole of each building if possible in a lot; and I would advise a sale by public auction at Parramatta about the month of October next, upon the same terms as the Government now offer for sales of Crown lands.

I have, &c.,

JOHN TAYLOR,

Auctioneer and Land Valuator.

The Crown Solicitor to The Principal Under Secretary.

Sir,

Crown Solicitor's Office, Sydney, 18 August, 1887.

I have the honor to inform you that Mr. Neill, Manager of the City Bank, has handed to me this morning a bundle of documents said to relate to premises at Parramatta, known as the "Woolpack Hotel," recently agreed to be purchased by the Colonial Secretary, but of course there has not been sufficient time to investigate the Title.

I notice that it is stated in to-day's paper that possession of the premises is to be taken to-day. I think, therefore, that Mr. Neill should be requested to state that the fact of possession being taken shall not operate as a waiver of the right of the Crown to require a good title to the land to be shown, or if he fails to do so, that possession of the premises should not be taken until the title has been approved of.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

Submitted, 18/8/87. Approved.—H.P., 18/8/87.

The Principal Under Secretary to The Manager of the City Bank.

Sir,

Colonial Secretary's Office, Sydney, 18 August, 1887.

Referring to my letter of the 13th instant, regarding the purchase by the Government of the property known as the "Woolpack Hotel," Parramatta, I am directed by the Colonial Secretary to request that you will be good enough to state that the fact of possession being taken shall not operate as a waiver of the right of the Crown to require a good title to the property to be shown.

I have, &c.,

CRITCHETT WALKER,

Principal Under Secretary.

The Manager of the City Bank to The Principal Under Secretary.

Sir,

The City Bank, Sydney, 19 August, 1887.

In reply to your letter of the 18th instant, I beg to state that the fact of the Government having taken possession of the property known as the "Woolpack Hotel," Parramatta, purchased by them from the Bank, will not in any way operate as waiving the right of the Crown to require a good title to the property in the Bank to be shown.

I have, &c.,

WILLIAM NEILL,

Manager.

The Crown Solicitor to The Under Secretary of Justice.

Sir,

Crown Solicitor's Office, Sydney, 11 November, 1887.

In reference to the purchase of the "Woolpack Hotel" at Parramatta, from the City Bank, I have the honor to request that I may be informed whether possession of the premises has been taken on behalf of the Crown, as I am about to complete the purchase.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

Urgent. Forwarded to Works Department with reference to previous papers, and for favour of report. The Under Secretary for Public Works.—A.F., B.C., 14 Nov., 1887. Principal Under Secretary.—J.R., B.C., 21/11/87. Will Mr. Fosbery kindly say whether possession has been taken of the premises.—C.W., B.C., 2/12/87. Yes.—E.F., B.C., 2/12/87. The Crown Solicitor.—C.W., P.U.S., B.C., 2 Dec., 1887.

The Crown Solicitor to The Principal Under Secretary.

Sir,

Crown Solicitor's Office, Sydney, 5 December, 1887.

"Woolpack Hotel," Parramatta.—The City Bank to the Queen.

I have the honor to inform you that this matter has been completed, and to forward herewith voucher for payment of the purchase money, the amount of which may be paid to the City Bank, as is therein authorized, as the Government are in possession of the land.

I have, &c.,

JOHN WILLIAMS.

The Principal Under Secretary to The Under Secretary for Finance and Trade.

Sir,

Colonial Secretary's Office, Sydney, 6 December, 1887.

In transmitting to you the accompanying claim in favour of the City Bank, the amount of the purchase money for premises at Parramatta, known as the "Woolpack Hotel," amounting to £8,500 (eight thousand five hundred pounds), I am directed to state that the Colonial Secretary approves of the payment of the amount in question, and to request that you will invite the Colonial Treasurer to have the goodness to cause the same to be paid from the Advance Account, and provision to be made on Further Supplementary Estimates.

I have, &c.,

CRITCHETT WALKER,
Principal Under Secretary.

PRISONS ACT.

(ADDITIONAL REGULATIONS FOR REFORMATORY TREATMENT OF MALE OFFENDERS.)

Presented to Parliament, in pursuance of Acts 4 and 37 Vic. Nos. 29 and 14 respectively.

Department of Justice,
Sydney, 15th November, 1888.

ADDITIONAL REGULATIONS FOR REFORMATORY PRISON TREATMENT OF MALE OFFENDERS,
FROM THE AGE OF 16 TO 25 YEARS, UNDER SENTENCES UP TO SIX MONTHS.

His Excellency the Governor, with the advice of the Executive Council, has been pleased, under section 5 of 4 Victoria No. 29, to make the following additional Regulations for Reformatory Prison Treatment of Male Offenders from the age of 16 to 25 years, under sentences up to six months.

WILLIAM CLARKE.

THERE shall be a seventh class of prisoners, from the age of 16 to 25 years, under sentences not exceeding six months, being first convictions, who shall be treated during such sentences under the following conditions of "separate treatment":—

- 1. Each prisoner shall occupy a separate cell, and shall be employed upon such suitable work as may be furnished to him.
- 2. He shall be allowed exercise for one hour each day, and a longer period if thought necessary by the Surgeon.
- 3. He shall, if coming under the regulations as to eligibility for school, be allowed one hour daily for performing tasks to be set for him by the Schoolmaster, and one hour for reading such instructive and reforming books as may be selected for him by the Chaplain. He shall at all times be provided with a Bible.
- 4. He shall not, under any pretence, attempt to communicate with another prisoner. He must neither read aloud, sing, whistle, dance, nor make any noise in his cell, exercise ground, in the corridor, or chapel.
- 5. He shall rise immediately upon the first bell being rung, wash his hands and face, and make up his bedding neatly in such form as may be directed.
- 6. He shall keep his person, cell, and the furniture therein in the highest state of cleanliness.
- 7. He shall wash his feet twice in summer, and once in winter, weekly, and shall bathe once a week.
- 8. He shall not be allowed to alter his clothing, and shall keep it clean and in proper repair.
- 9. He shall, on hearing his cell door open, at once, if not in bed, stand up in the centre of his cell, facing the door, with his hands by his side and his heels close together.
- 10. In marching to or returning from the exercise grounds or chapel, he shall keep five yards distant from any other prisoner.
- 11. Any prisoner requiring assistance or instruction, or having anything to communicate, may ring his gong for the officer on duty; but all conversation not strictly necessary is to be avoided, and on no account is the gong to be rung without sufficient reason.

12. At the order "Prepare for exercise," the prisoner shall, as soon as the door is opened, move out of his cell to the exercise circle, and take up the position assigned to him by the Officer; at the word "One," he shall stoop down and take hold of the rope handle attached to the marching chain; at the word "Two," he shall at once assume an erect position, retaining hold of the marching chain, and so remain at attention until the Officer calls "Walk round." During wet or very hot days he may (by permission of the Officer) remain in his cell, or take such exercise as may be practicable and directed, in the corridor.

13. He shall be very respectful to all officers of the Government, and shall never pass a superior officer of the prison without touching his hat.

14. The Scale of Dietary will be—16 oz. bread; 8 oz. meal; 8 oz. meat; 8 oz. potatoes; 1 oz. sugar; ½ oz. soap; ½ oz. salt.

They shall be required to perform any such work capable of being performed in a cell.

The Surgeon shall visit daily each prisoner of the seventh class in his prison.

Each prisoner shall be weighed monthly, and reports of weight shall be laid before the Surgeon at the commencement of each month.

The prisoners shall be allowed the usual monthly visits, but in each case the Gaoler must be satisfied that the visitor is a person to whom it is desirable to permit the privilege.

Correspondence will be permitted in terms of Regulation No. 31.

Each prisoner of the seventh class shall be provided with a plank bed, which shall be used without a mattress or substitute therefor for a period of one month. A coir pillow of 4½ inches in diameter will be allowed.

After a period of one month a coir mattress will be allowed; but, in case of misconduct, the Visiting Justice may direct the prisoner, apart from any cell or other punishment, to be deprived of his mattress for a period not to exceed fourteen days.

These Regulations shall take effect from 1st January, 1889.

1888.

NEW SOUTH WALES.

LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION OF LAND IN THE TOWN OF YASS.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16.

NOTIFICATION OF RESUMPTION OF LAND UNDER 44 VICTORIA, No. 16.

New South Wales, } By His Excellency The Right Honourable Charles Robert, Baron Carrington,
 to wit. } a Member of Her Majesty's Most Honourable Privy Council, Knight Grand
 (L.S.) } Cross of the Most Distinguished Order of Saint Michael and Saint George,
 CARRINGTON, } Governor and Commander-in-Chief of the Colony of New South Wales and its
 Governor. } Dependencies.

WHEREAS the parcel of land hereinafter described is required for the construction of an extension of the gaol at Yass, and the Government has sanctioned the carrying out the said extension, for which public funds are lawfully available: Now, I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification published in the Gazette and in a newspaper, that is to say, in the "Yass Courier," circulated in the Police District wherein the said land is situated, declare that the land hereinafter described has been resumed for the public purposes hereinbefore mentioned, to the intent that, upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purposes of the said last-mentioned Act, for an estate of inheritance in fee-simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever, and to the intent further that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a Trustee with the powers stated in the said last-mentioned Act: And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land, being allotment No. 5 of section No. 1, in the town of Yass, parish of Hume, county of Murray: Commencing at the south corner of allotment No. 7, section No. 1; and bounded on the north-east by the south-west boundaries of allotments Nos. 7, 8, 9, and 10, being a line bearing about north 45 degrees west 5 chains; thence on the north-west by the south-east boundary of allotment No. 16, being a line bearing south about 45 degrees west 1 chain; thence on the south-west by the north-east boundary of allotment No. 4, being a line bearing about south 45 degrees east 5 chains to the north-west side of Rossi-street; thence by a part of the north-west side of Rossi-street, being a line bearing about north 45 degrees east 1 chain, to the point of commencement,—containing 2 roods.

In testimony whereof, I have hereunto set my hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this twenty-fifth day of October, in the year of our Lord one thousand eight hundred and eighty-eight, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,
 JOHN SUTHERLAND.

GOD SAVE THE QUEEN!

LEGISLATIVE ASSEMBLY,
NEW SOUTH WALES.

WATER CONSERVATION COMMISSION.

(LETTER FROM MR. CHARLES ROBINSON.)

Ordered by the Legislative Assembly to be printed, 25 October, 1888.

[Laid upon the Table of the Honorable the Legislative Assembly of New South Wales by the Secretary for Mines, Copy of a letter respecting the Return in connection with the Water Conservation Commission, ordered to be printed on the 4th July, 1888.]

Copy of Letter received from Mr. Charles Robinson.

Sir,

Sydney, 3 August, 1888.

Owing to the form in which some of the items of expenditure by the late Commission on the Conservation of Water is presented in the Parliamentary Return ordered on the motion of Dr. Ross, M.P., I am made to appear in what to me is, I believe, a new character—that of a *bon vivant*. I refer more particularly to the item of £53 5s. 4d., p. 6, as follows:—

Claimant.	Date or period of supply or service.	Nature of service.	Amount paid.	Date of payment.	Certified by.	Paid to.
Charles Robinson.	1885. May 5, 6, 8, 10, 11, 13, 14, 15, 18, 20, 21, 24, 26, 27, 28, 29, 30, 31.	Secretary and shorthand writer—fares, £1 10s.; steamer fares (4), £2 10s.; hotel expenses, £2 5s.; lunch, £1 5s. 3d.; Werris Creek, refreshment, 3s.; fruit, 10s.; gratuities to servants, 15s.; hire of vehicle, £1 5s.; hire of vehicle and gratuities, 10s. 6d.; Mr. Donkin's expenses, Sydney to Narrabri, £1; fruit, 5s.; gratuities, 15s.; expenses to Sydney (Messrs. Lyne and Murray), £2; hotel expenses, Wee Waa, £1 5s.; dinner, £1 2s. 6d.; hotel expenses, Pilliga, £2 19s.; dinner, £1 5s.; gratuity, Walgett, 12s. 6d.; gratuities, do., 10s.; breakfast, £1; dinner, £1 2s. 6d.; hire of vehicle, £5; expenses, Mr. Barton, £2 10s.; expenses, shorthand writers, £2 17s. 6d.; vehicle hire, £2; breakfast, &c., £1 10s.; gratuity to coach-driver, 10s.; travelling expenses, £1 10s.; gratuities to servants, Bourke, £1 5s.; breakfast, £1 7s. 6d.; hotel expenses, £4 17s. 6d.; supper, £1 5s.; hire of vehicle, £1 2s. 6d.; hire of vehicle and hotel expenses, £1 18s. 6d.; dinner at Mount Victoria, 15s.; telegrams, 3s. 7d., exchange, 3s.—6s. 7d.	£ s. d. 53 5 4	1885. 8 June	W. J. Lyne	Charles Robinson.

These are not my personal expenses, but petty disbursements I made on the part of the Commissioners and their staff, on a journey from Sydney, *via* Newcastle, Tamworth, Gunnedah, Narrabri, Walgett, Brewarrina, Bourke, Nyngan, and Dubbo, at which, and some other minor places, they took evidence.

Speaking from memory, the party consisted of—Mr. Lyne, M.P., Mr. Russell Barton, M.P., Mr. R. L. Murray, M.P., Mr. Franklin, Mr. M. Mordie, Mr. Gipps, Mr. Donkin (members of the Commission), Mr. M'Kinney and Mr. Czarlinski (engineers), Mr. Laing and Mr. Friend (shorthand writers), Mr. Hall reporter of the *Herald*, Mr. Thompson (reporter of the *Telegraph*), and myself.

It is because I find that I am supposed to have lavishly indulged myself in high-priced dinners, &c., at the public expense, that I deem it necessary to offer this explanation, which I should be glad if you would submit for the information of the Honorable the Minister for Mines.

A similar explanation applies to the item of £64 10s. 10d., on page 15 of the Return, which, for the convenience of accounting, is put down to me, although, as a matter of fact, a large proportion of it was incurred by another officer of the Commission, whose duties devolved on me during the latter portion of the journey.

I have, &c.,
CHARLES ROBINSON.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

STORAGE RESERVOIR AT POTTS' HILL, AND SECOND LINE OF
PIPES TO CROWN-STREET.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the last Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, to whom was referred the duty of considering and reporting upon the expediency of "Constructing a Storage Reservoir at Potts' Hill," and of "laying a second pipe between Potts' Hill and Crown-street," in connection with the Sydney Water Supply, have, after due inquiry, resolved that it is expedient the proposed works should be carried out; and, in accordance with the provisions of Sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

These works were separately referred to the Committee for consideration; but, as they are very closely connected, each being a part of the general scheme of water supply for Sydney and its suburbs, they were considered by the Committee together.

Very early in the inquiry it became known to the Committee from the evidence given that while they were asked by the resolution of the Legislative Assembly to inquire into and report upon the expediency of constructing the Storage Reservoir at Potts' Hill at an estimated cost of £120,000, a contract for a portion of the work, amounting in value to £55,000, had already been let, and the formation of the reservoir had been commenced. This contract is shown by the evidence to have been let before the date when the names of the members of the Committee were gazetted, and an error appears to have been made in the wording of the resolution referring the work to the Committee, for it will be seen from a statement by the Under Secretary for Public Works that while the estimated cost of the whole work is £120,000, the intention with regard to the Committee was to ask their sanction to that part of the work which remains to be done outside the present contract, viz., the pitching of the reservoir and the laying of the necessary pipes to connect with the mains, the estimated cost of which portion of the entire work is £65,000.

The proposed reservoir, a Minute of the Engineer-in-Chief for Harbours and Rivers states, will be an open one, and it will be the distributing centre for the suburbs north of the Parramatta River and the North Shore, "to which," the Minute proceeds to say, "must be added the southern and other suburbs, which must be supplied from the main scheme, and for which this will be the most suitable distributing point." It is further recommended as a "splendid 'stand-by' for the city itself, in the event of the necessity occurring at any time to repair the works between Potts' Hill and Prospect, including the emptying of the 6-foot pipes which cross the Duck River Valley, for the purpose of cementing their inside surfaces, which it will be desirable to do from time to time."

The proposed second line of pipes is to meet the necessity that would arise if a breakage should at any time occur in the pipes composing the present line, a circumstance which, unless such a provision as is now proposed were made, might
very

very seriously inconvenience the population depending upon the present line of pipes for their daily water supply. It is also pointed out that the second pipe-line is required to meet the wants of the people in regard to water supply, which in a few years will be apparent from the increased population in the suburbs. The necessity for this second line of pipes was put before the Committee prominently in a Minute by the Engineer-in-Chief for Harbours and Rivers, dated in February of this year. "At present," he says, in this document, "Sydney is depending upon one line of pipes only between these points (meaning between Potts' Hill and Crown-street), and I consider the risk is altogether too great, for if a pipe burst, and this may happen any day, the city might be suddenly left without water, with the exception of the small quantity that could be pumped from Botany, and in some positions it might take several days to lay in a new pipe. Experience with cast-iron pipes in Europe," the Minute goes on to say, "shows that they may give way at any time, from no apparent cause, even after they have been laid and at work for many years."

The Committee have carefully inquired into these representations, and, as already mentioned, they are of opinion that the proposed works should be carried out. Not only did they examine a number of witnesses upon the proposals; they added to the evidence obtained by them in that manner the information derivable from a personal visit to the site of the reservoir and an inspection of the route regarded as the most suitable for the second line of pipes. On Thursday, 27th September, they proceeded by train to Rookwood, and thence by vehicle to Potts' Hill, where, with the assistance of the Government engineers, they carefully examined the plans of the reservoir and the second pipe-line, and also the site of the reservoir, and the work at present in progress there; and at the termination of the inspection at Potts' Hill they drove along the proposed route for the second line of pipes, examining it the whole of the way.

In taking the evidence which will be found accompanying this report, the Committee endeavoured, not only to learn the nature of the proposed works, but to clearly understand the advantages likely to be derived from them at the present time, and in the future, and generally to inform themselves as to the reasons in support of the proposals, and whether the works were absolutely necessary, or such as it would be wise to carry out. The form of their inquiry may therefore be stated as follows:—

- (1.) The nature of the proposals.
- (2.) The present arrangements for supplying Sydney and its suburbs with water.
- (3.) The advantages to be derived from the proposed Works.
- (4.) Whether the existing facilities for storing water are such as to render the large expenditure on the new reservoir unnecessary.
- (5.) The condition of the Botany Waterworks, and whether they could be utilized to an extent which would provide for any emergency intended to be met by the second pipe-line.
- (6.) The cost of the proposed works, and the provision that will be made to meet the expenditure.

These points will be found to be very fully dealt with in the evidence of the witnesses examined. Mr. Barling, Under Secretary for Public Works, describes very clearly the nature of the proposed works, and his description is supplemented by evidence obtained from Mr. Hickson, Acting Engineer-in-Chief for Harbours and Rivers, under whose superintendence the reservoir is being constructed. The object in regard to the reservoir, Mr. Hickson points out (*Question 8*), "is to provide a supply of water, either in case anything should happen to the pipe-line from Potts' Hill towards Prospect, or if that pipe required to be cleaned"; and with reference to the proposed line of pipes, "the second pipe-line from Potts' Hill down to Sydney is required in case anything should happen to the one pipe-line now existing." If a pipe burst, he states (*Question 68*), or any accident happened on the present line, Sydney would be dependent upon the small quantity of water at Crown-street—not half a day's supply, and it might take three or four days to repair the damaged pipe. The risk which now exists is further seen in the fact that the present pipe-line is being worked to almost its utmost capacity. It is capable of transmitting during twenty-four hours a supply of 17,000,000 gallons, but the daily

daily supply for Sydney, which amounts to about 10,000,000 gallons, is sent through during the twelve hours of the day, instead of being spread over the twenty-four, and this, as will be seen by Mr. Hickson's evidence (*Questions 156-158*), must increase the possibility of a break and a consequent interruption in the supply. Mr. Hickson also states (*Question 100*), that as far as his experience has gone in England, and other places where there are large populations, it is usual to have duplicate pipes to provide for accidents, and (*Question 110*) in consideration of the population dependent on the water supply from the Nepean, he considers it essential there should be a duplicate service here; especially, he points out in answer to other questions, as it will be necessary very soon to provide for a supply to suburbs not at present receiving the water in consequence of not having yet been reticulated. The route for the proposed second line is not fully determined, the surveys in relation to it not yet being complete, but the route examined by the Committee is most favoured. This is recommended because for almost the whole of the way it passes along roads or streets, and only a small piece of land will have to be resumed. The route adopted in the case of the existing pipe-line would not do for the second line, because, in the event of a pipe in the existing line bursting, injury might be done to the second pipe line; the earth would probably be washed away from underneath the pipes, which would then drop down, and both lines would be disabled. The proposed reservoir, Mr. Hickson informed the Committee, will have a capacity of 100,000,000 gallons, or ten days supply for Sydney.

Evidence as to the nature of the proposals referred to the Committee was also obtained from Colonel Rowe, President of the Water and Sewerage Board; Mr. J. Trevor Jones, Engineer to the Board; Mr. W. C. Bennett, Commissioner and Engineer for Roads and Bridges; and Mr. F. A. Bishop, Civil Engineer; and the testimony of those gentlemen is in favour of what it is proposed to do. Colonel Rowe thinks (*Question 370*) the reservoir very necessary; and (*Question 371*), with regard to the proposed pipe line, that "in view of the enormous supply of water which we require at present, and the increasing supply necessary to meet the demands of the public, it would be prudent to have the second line of pipes; in fact," he proceeds to say, "it is absolutely necessary for many purposes besides that one." Further, he states (*Question 407*), he had consulted with Mr. Jones as to reducing the size of the duplicate pipe line by adopting a 3-foot instead of a 4-foot pipe; but after considering the matter, he came to the conclusion that, having regard to what the population is likely to be in ten or twenty years' time, such a proceeding was not desirable. "I think," he says, "the only safe course is to duplicate the main. Independently of the future supply, suppose that a break-down took place in the present pipe which would take three or four days to repair. We have only half a day's supply in our present reservoirs, and if a break occurred which would take two or three days to repair, I do not know how we could supply the people with water; and if a fire took place in the meantime the city might be half destroyed." Mr. Trevor Jones, whose extensive experience as an engineer in connection with the Sydney water supply makes his evidence specially valuable, will be found to strongly advocate the proposed works. He regards them (*Question 525*) as a necessary part of the water-works, and (*Question 483*), he has no doubt of the completeness of the plan for the construction of the reservoir, or, as will be found from his replies to several other questions, of the importance of laying down a second line of pipes. His reasons for advocating the proposals are generally similar to those advanced by the engineers of the Harbours and Rivers Department; but it will be noticed that his evidence goes more into detail, and that throughout it is favorable both to the proposed works and the plan submitted for carrying them out. He is afraid that perhaps the estimated cost of the pipes is a little low, as since the estimate was made pipes have gone up considerably in price, but this is the only point in the scheme to which he raises any question. As for the necessity for the second pipe line, he states (*Question 486*) that if a break were to occur in the present line it would take a long time to repair it, and "Sydney would in the meantime be without water; it would be a calamity." During the course of the inquiry the question arose as to whether in view of the probable rapid growth of population it would not be wise to lay down a line of pipes of larger delivering capacity than that proposed, and the Acting Engineer-in-Chief for Harbours and Rivers was specially examined upon this point. He did not, however, think it necessary to lay down pipes of a larger size than those proposed in the scheme before the Committee.

The pitching of the reservoir, which was a special portion of the work connected with the proposals intended to be referred to the Committee, will be found dealt with in the evidence of Mr. Hickson (*page 7*), and in that of Mr. W. C. Bennett and Mr. F. A. Bishop, and, according to that evidence, appears to be necessary in order to ensure the reservoir's stability.

The present arrangements for supplying Sydney and its suburbs with water are described with much fullness in the evidence, and it will be seen that, though the present provision for the daily water supply is, as far as it goes, admirable, it cannot be regarded as perfect without some safeguard, such as the works proposed, against the possibility, if not the probability, of the supply being subjected to sudden and serious interruption.

The advantages to be derived from the proposed reservoir and second pipe line, the third point mentioned in the form of the Committee's inquiry, are apparent from much that has already been said. But, in addition to this, it will be seen by an examination of the statements made on the part of some of the principal witnesses, that both the storage capacity and the power of delivery will be so increased by the new works that they will be equal for some considerable time to come to any demand made upon them by the city and the suburbs. Before the proposed second line of pipes is well in use, Mr. Trevor Jones says (*Question 510*), he anticipates that the increased consumption in Sydney and its suburbs will amount to such a quantity as will require a second pipe. It is possible, he explains, that the city and suburban supply will so increase that it will not be met three or four years hence by the present pipe. Upon this point he was asked (*Question 546*) whether the Water and Sewerage Board receive many applications for water services in the suburbs, and he replied, "Yes; they might be counted perhaps by the thousand streets; the applications since the Board was formed have been immensely numerous." Mr. Jones also shows (*Question 684*) that while in 1881 the daily consumption of water in Sydney was 3,500,000 gallons, he estimates (*Question 699*) "that 30,000,000 gallons will not be too much for us six years hence, on a hot day." Mr. Hickson states (*Question 770*), that with the additional pipe-line, about 34,000,000 gallons can be delivered into Sydney each day, and that when two other proposed pipes are put down—one to North Shore and the other to the southern suburbs—the delivering capacity will be 39,000,000 gallons. Then, above this quantity, there will be a reservoir surplus of 10,000,000 or 11,000,000 gallons, which, if necessary, will be available for distribution over the locality between Prospect Reservoir and the new reservoir at Potts' Hill. This surplus over the 39,000,000 gallons is explained by the circumstance that while the delivering capacity of the pipes below Potts' Hill will be 39,000,000 gallons, the quantity of water which can be delivered daily from the Prospect Reservoir to Potts' Hill, through the line of 6-foot pipes connecting those two places is 50,000,000 gallons. Mr. W. C. Bennett points out (*Question 865*), that the Potts' Hill Reservoir will not only be useful in connection with a suburban water supply; it will double the value of the 6-foot pipes from Prospect, as it will utilize them at night as well as in the day.

With reference to the question whether the existing facilities for storing water are such as to render the expenditure proposed for the new reservoir unnecessary, it is perhaps sufficient to supplement the evidence to which attention has already been drawn by stating that Mr. W. C. Bennett, who was a member of the Commission responsible for the present water supply, explains that it was part of the original project to have a balance reservoir; and the advantages to be gained from it are not only those which witnesses other than Mr. Bennett will be found to have described; it will bring what he terms "the head" of water home to Sydney, and render available the night discharge of the large pipes. "If you have this reservoir," he says, (*Question 865*) "for the gradual receipt of the water during the night, it doubles the value of the large pipe, and the larger such a reservoir is the better, because, when the daily discharge begins, it will not fall so quickly in a large reservoir as it will in a small one, and consequently a higher head is kept up longer."

As to whether the Botany waterworks could be utilized in any emergency to an extent that would meet the requirements intended to be met by the second line of pipes, the evidence shows clearly that they could not. Colonel Rowe states (*Question 387*), that it would be impossible, in the event of the
Nepean

Nepean scheme failing, or the pipes getting out of order, for the Botany works to make up the deficiency and supply the city. The engines are very old and antiquated, and if they were renewed it would have to be done at considerable expense; and then the present pipe, Mr. Trevor Jones points out, is not large enough to permit of powerful machinery driving water through it at the velocity necessary to provide the quantity now required for Sydney. Of equal, if not greater, significance is the statement, also made by Mr. Jones, that the Botany water is gradually becoming contaminated, and in a very short period will not, he considers, be trustworthy. The engines at Botany are at the present time kept in readiness in view of any accident occurring in connection with the Nepean supply, but when the proposed second line of pipes has been laid and brought into use it is probable the Botany works will be abandoned, as Sydney will then be regarded as secure against any casualty in relation to its daily consumption of water.

The last matter that requires notice in this report is the question of cost, and the provision that will be made to meet the expenditure. There is nothing in the evidence to show that the estimated cost of the reservoir, or of the second pipe-line, is excessive. Mr. Trevor Jones thinks the estimate of what the pipes will cost a little under what will actually have to be paid for them; but beyond this nothing is said by the witnesses that gives rise to an impression that the estimate of cost has not been carefully prepared. As to the provision for meeting the expenditure, that, it is explained, will be in the hands of the Water and Sewerage Board. The control of the new reservoir and the pipe-line will, on their completion, with the liability incurred by their construction, be passed over to the Board, and they will fix and collect the water rates necessary to provide for the payments which, in consequence of the expenditure, will have to be periodically made. This part of the subject will be found by the evidence to have been very fully gone into by the Committee, as they were desirous of understanding as clearly as possible the arrangements which the Board, under the circumstances, will require to put into operation:

The resolutions relating to these proposed works were passed by the Committee on Wednesday, 17th October, as follows:—

Moved by Mr. Suttor, and seconded by Mr. Campbell, and agreed to—

“That the Committee consider it expedient that the Storage Reservoir at Potts’ Hill be completed, as proposed on the plans and explained in the evidence before the Committee.”

Moved by Mr. Street, and seconded by Mr. Suttor, and agreed to—

“That the Committee consider it expedient that the laying of the second line of pipes between Potts’ Hill and Crown-street, as proposed on the plan and explained in the evidence before the Committee, be carried out.”

JOHN LACKEY,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 22 October, 1888.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC
WORKS.

MINUTES OF EVIDENCE.

STORAGE RESERVOIR AT POTTS' HILL AND SECOND LINE OF PIPES
TO CROWN-STREET.

WEDNESDAY, 26 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.

ALEXANDER KETHEL, Esq.

The Hon. FREDERICK THOMAS HUMPHERY.

JOSEPH PALMER ABBOTT, Esq.

HENRY COPELAND, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee proceeded to consider the proposed construction of a storage reservoir at Potts' Hill, and the laying of a second line of pipes between Potts' Hill and Crown-street, in connection with the Sydney water supply.

Joseph Barling, Esq., Under Secretary for Public Works, sworn and examined:—

1. *Chairman.*] Are you aware of the proposed improvements to be carried out in connection with the Potts' Hill Reservoir? Yes.
2. Would you describe shortly the nature of the works? Yes. The works comprise a reservoir and a second pipe line. The proposal to construct a distributing reservoir at Potts' Hill in its present shape was first brought under the attention of the Minister for Works on the 28th July, 1887, by a minute from the Engineer-in-Chief for Harbours and Rivers, Mr. Moriarty, who described it in the following terms:—"The proposed reservoir will be an open one, and it will be the distributing centre for the districts lately proposed to be added to the Sydney water scheme, viz., the suburbs north of the Parramatta River and the North Shore, to which must be added the southern and other suburbs, which must be supplied from the main scheme, and for which this will be the most suitable distributing point. It will also form a splendid 'stand by' for the city itself in the event of the necessity occurring at any time to repair the works between Potts' Hill and Prospect, including the emptying of the 6-foot pipes which cross the Duck River Valley for the purpose of cementing their inside surfaces, which it will be desirable to do from time to time." For various reasons the matter remained in abeyance for some time, but in May of this year the present Minister for Works, Mr. Sutherland, obtained the authority of the Cabinet to carry out the work. Tenders were accordingly invited for the first part of the work in June last, resulting in the acceptance of the offer of Messrs. Gummow & Co., the amount of the contract being £49,763 14s. This tender was accepted on the 2nd July. I may say that the Public Works Committee was gazetted on the 13th July or eleven days subsequent to the acceptance of the tender. At the same time a portion of the work amounting to about £6,000 was given to a party of the unemployed. The estimated cost of the whole work is £120,000, but the sanction of the Committee is asked for the portion which yet remains to be done outside the present contract, viz., the pitching and laying the necessary pipes to connect with the mains. This is estimated to cost about £65,000. I may mention that the North Shore and western suburbs scheme referred to in Mr. Moriarty's minute, a portion of which I have read, is already contracted for, and is in course of being carried out, and orders have been given by the Minister for Works to undertake the surveys in connection with the southern schemes, also referred to in that minute. I propose to call Mr. Hickson, the Acting Engineer-in-chief for Harbours and Rivers, to give evidence as to the engineering details of the scheme, and the President of the Water and Sewerage Board, with the Engineer to the Board, Mr. Jones, will also attend to prove the necessity for the work. With reference to the second line of pipes it is proposed to lay down a second pipe-line in connection with the Sydney water supply from Potts' Hill to Crown-street Reservoir, being a length of 61,000 feet. The route will be different from the one followed by the present pipe line, as it is considered undesirable for the two sets of pipes to follow the same course. The estimated cost of the proposed new pipe line is £165,000, which is based on the cost of the present pipe-line. The pipes proposed to be used are spigot and faucet cast-iron, the same as the present pipes, being 48 inches in diameter, and capable of delivering about 17,000,000 gallons in twenty-four hours. The main necessity for undertaking this work now, is that in case of the breakage of any of the pipes composing the present line, Sydney might be seriously inconvenienced.

J. Barling,
Esq.

26 Sept., 1888.

J. Barling,
Esq.
26 Sept., 1888.

inconvenienced during the time the break was being repaired. It is patent also, independently of this, that in a few years the additional water supply will be required owing to increased population in our suburbs, the extension of the water mains and the increased demand which always follows an abundant water supply. I propose to call Mr. Hickson, the Acting Engineer-in-Chief of the Harbours and Rivers Department, to fully explain the engineering details of the proposal, and Colonel Rowe, the President of the Water and Sewerage Board, and Mr. Jones, the Engineer to the Board, will give evidence as to the necessity for the work. With the permission of the Committee I will now read the minute which first brought the matter under attention. It is dated the 15th February, 1888, and is as follows:—

Minute Paper.

The Engineer-in-Chief for Harbours and Rivers to The Under Secretary for Public Works.

*Subject:—*Sydney Water Supply—Reporting necessity for laying a second pipe to Sydney; recommending that the sum of £165,000 be placed on the Loan Estimates for 1888.

Harbours and Rivers Branch, Sydney, 15 February, 1888.

I BEG to recommend that a sum be placed on the Loan Estimates for the purpose of laying a second pipe between Potts' Hill and Crown-street, a distance of 11½ miles.

At present Sydney is depending upon one line of pipes only between these points, and I consider the risk is altogether too great, for if a pipe burst, and this may happen any day, the city might be suddenly left without water, with the exception of the small quantity that could be pumped from Botany, and in some positions it might take several days to lay in a new pipe.

Experience with cast-iron pipes in Europe shows that they may give way at any time for no apparent cause, even after they have been laid and at work for many years. On the Glasgow, Liverpool, and other large water works some fractures take place almost every year.

I estimate the cost of providing and laying a second line of 48" and 42" pipes to Sydney as follows:—

Pipes and castings delivered in Sydney	£140,000	0	0
Laying, inspection, &c., &c.	25,000	0	0
Total	£165,000	0	0

E. O. MORIARTY.

3. Are these works now being carried out under the superintendence of Mr. Hickson? Only the Potts' Hill reservoir. We have done nothing with regard to the second line of pipes.

4. Does Mr. Hickson now occupy the position of Mr. Moriarty? Yes; in the absence of Mr. Darley, who succeeds Mr. Moriarty.

Robert Hickson, Esq., M.I.C.E., Acting Engineer-in-Chief for Harbours and Rivers, sworn and examined:—

R. Hickson,
Esq., M.I.C.E.
26 Sept., 1888.

5. *Chairman.*] Have you control of the works proposed to be carried out at Potts' Hill? Yes.

6. Is the pipe contract to be carried out under you? Yes.

7. Is this a sort of auxiliary work to the general water supply of Sydney? Yes.

8. And the object of it is to convey the water to other portions of the suburbs not provided for in the first water supply system? Yes; the object of the Potts' Hill Reservoir is to provide a supply of water, either in case anything should happen to the pipe line from Potts' Hill towards Prospect, or if that pipe required to be cleaned. The second pipe line from Potts' Hill down to Sydney is required in case anything should happen to the one pipe line now existing.

9. Have you two pipe lines between Prospect and Potts' Hill? No.

10. Does this provide for a second pipe line there? No; only between Potts' Hill and Sydney. This reservoir will give a supply to Potts' Hill in case anything should go wrong with the pipe between Potts' Hill and Prospect.

11. What is the capacity of the proposed reservoir? 100,000,000 gallons.

12. How long would that supply Sydney? For about ten days at the present rate of consumption.

13. Does this give a supply to the higher levels about Sydney? It does not alter the height at all.

14. How are the higher elevations provided for? The water is pumped from Crown-street.

15. What are the functions of the reservoir at Petersham? It supplies Petersham and the neighbourhood about there. It is only local.

16. Are there any other reservoirs besides that along the line? No; nothing between Crown-street and Potts' Hill, except Petersham.

17. Is it part of the project at all to have reservoirs for local use anywhere? No; except at North Shore.

18. Supposing any of the towns in the neighbourhood of the water pipe line, between the catchment area and Sydney, required water, is there any provision for supplying them? They can be supplied.

19. Would that necessitate the establishment of an independent reservoir? That depends on circumstances. At Campbelltown it is proposed to give a supply from the canal leading from the Nepean down to Prospect. We do not propose to make a special reservoir, but to take it direct from the canal.

20. But if any large supply were given, would it not be necessary to have a reservoir? Yes.

21. What distance is Potts' Hill from Crown-street? 11½ miles.

22. What distance would it be from Potts' Hill to the reservoir at Prospect? It is about 10 miles.

23. Is there any reservoir at all between Potts' Hill and Prospect? No.

24. Was it not proposed originally to have a reservoir to supply Parramatta and its suburbs? I do not know.

25. Was it contemplated that all the towns in the neighbourhood of Sydney, between here and Parramatta, should be supplied? No doubt it was.

26. In what way was that provided for? I cannot tell you. I may say that this is new to me; but there is an officer in the Department who can give you all the information required with regard to the scheme itself.

27. Have you only recently come into charge of this work? Yes; it was carried out under Mr. Moriarty.

28. Has it been tolerably successful in all respects up to the present time? Yes.

29. During the late drought was there any want of water in Sydney? No; we have now in fact nearly twelve months supply at Prospect, supposing not a drop of rain came, and it is not half-full.

30. Are the works at Prospect nearly complete? Yes.

31. Has the dam there subsided recently? It has not given at all for over three weeks. We have taken steps to prevent it.

32. Has anything been done with the provision made for the temporary supply before the permanent supply was provided? The Water and Sewerage Board have that in hand.
33. That is Hudson's scheme? Yes; it has been taken up in some places, and the pipes used to some extent, but it has been handed over to the Water and Sewerage Board, and I do not know what they purpose doing with it.
34. This work now proposed by your Board is specially for supplying some of the suburbs? Yes, and keeping a duplicate supply for Sydney.
35. Have you visited the works along the line? I have been twice at Potts' Hill. I have been from there up to the canal at Prospect, and right up to the tunnels.
36. Are the canals and tunnels working satisfactorily? Yes; I walked through the tunnels the other day.
37. Are they answering satisfactorily? Yes.
38. Are the dams at the Pheasant's Nest working well? Yes; they are as tight as a bottle. We took advantage of the late drought to get the tunnels thoroughly examined, and the result was most satisfactory.
39. Do you still keep a record of the amount of water which passes from the catchment area? Yes; it is still kept.
40. Do you find any alteration (from the fact of the dams having been constructed or the passage of the water having been impeded) in the quantity which passes? No; there is no difference.
41. Does it not sometimes have that effect when the natural course of the water is impeded? It diverts the water to some other place, but there is the same quantity of water.
42. What is the catchment area at the Pheasant's Nest? About 350 square miles.
43. Has that been all reserved? Yes.
44. Has the water been spoiled by vegetation or anything of that kind? No; it is very pure.
45. Is it not usual that vegetation grows very quickly in new dams? We have not noticed anything at Prospect; much depends upon the nature of the water.
46. How long would the storage of water at Prospect last in case of drought? About two years.
47. You do not actually bring the supply through Prospect? We can do so or not; but we are doing it now.
48. When completed it will be a storage that you can bring the daily supply direct? Yes.
49. Do you recollect the elevation at Potts' Hill? 175 feet above high-water, Sydney.
50. Will that be a sufficient height for all purposes? No; we should have to pump to the high ground at North Shore.
51. What about the highest portions of large buildings in Sydney? They are supplied by pumping from Crown-street.
52. Does by far the greater quantity of water come to Sydney by gravitation? Yes.
53. Has it not been asserted in the newspapers that it is not a gravitation system? Yes; but by far the greater proportion of the water comes by gravitation.
54. *Mr. Garrard.*] By which line are you going to give a supply to the southern suburbs, Kogarah and Cook's River? By a new pipe line branching off from Potts' Hill.

R. Hickson,
Esq., M.I.C.E.
26 Sept., 1888.

THURSDAY, 27 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.
The Hon. FREDERICK THOMAS HUMPHERY.
HENRY COPELAND, Esq.

ALEXANDER KETHEL, Esq.
JACOB GARRARD, Esq.
SYDNEY SMITH, Esq.

[The Committee met at noon at the Redfern Railway Station and proceeded by train to Rookwood, and thence by vehicle to Potts' Hill, where, with the assistance of Mr. Hickson, Acting Engineer-in-Chief for Harbours and Rivers, and Mr. Houston, Resident Engineer, they carefully examined the plans of the proposed storage reservoir, and of the second line of pipes between Potts' Hill and Crown-street, and also the site of the reservoir and the work at present in progress there. At the termination of the inspection at Potts' Hill, the Committee, accompanied by the Acting Engineer-in-Chief for Harbours and Rivers, drove along the proposed route for the second line of pipes from Potts' Hill to Crown-street, examining it the whole of the way.]

THURSDAY, 27 SEPTEMBER, 1888.

Evening Sitting.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. WILLIAM HENRY SUTTON.
The Hon. FREDERICK THOMAS HUMPHERY.
HENRY COPELAND, Esq.

ALEXANDER KETHEL, Esq.
JACOB GARRARD, Esq.
SYDNEY SMITH, Esq.

The Committee further considered the proposed storage reservoir at Potts' Hill and the laying of a second line of pipes between Potts' Hill and Crown-street.

Robert Hickson, Esq., M.I.C.E., Acting Engineer-in-Chief for Harbours and Rivers, sworn and further examined:—

55. *Chairman.*] As Acting Engineer-in-Chief for Harbours and Rivers, have you control of the works now being carried out at Potts' Hill? Yes.
56. Did you accompany this Committee to-day when we made an examination of Potts' Hill and the works proposed to be carried out there? Yes.
57. And of the proposed line of pipes from there to Crown-street? Yes.

R. Hickson,
Esq., M.I.C.E.
27 Sept., 1888.

- R. Hickson, Esq., M.I.C.E., 27 Sept., 1888.
58. Has a contract been entered into for the main work at Potts' Hill—the excavation? Yes, and for forming the bank.
59. Does that include the completion of the reservoir generally? No; it includes excavation, the forming of the bank, and the puddle wall inside the bank.
60. What other work will require to be done afterwards? It will require to be pitched or protected in some way. Pitched, I think.
61. What is the amount of the contract for the work now in hand? £55,000.
62. And is the estimated cost of the whole work generally £120,000? Yes.
63. Will the laying of the pipe line from there to Crown-street be a separate contract? Yes.
64. That will have to be undertaken subsequently? Yes.
65. Have the surveys been completed for the pipe line? The levels have not been taken for all the proposed routes. We have taken them for two or three.
66. Has the Department professionally decided upon any particular line? It has not definitely decided.
67. As far as you have examined the proposed lines, are you inclined to the line we went over to-day? Yes; I think it is the best line.
68. Would you state what are the main objects of the proposed duplicate line? We would require it in the event of a break-down in the present line. If a pipe burst, or any accident happened on the present line, Sydney would be dependent upon the small quantity of water at Crown-street, and it might take three or four days to repair the damaged pipe. The small quantity of water at Crown-street would only last a short time. I think there are only 3,500,000 gallons there—not half a day's supply.
69. Is there any other object in constructing a duplicate line between Potts' Hill and Sydney? I have described the main object. Another object would be to meet the not far distant demands of more water being required than the present line can bring down.
70. Those will be the suburbs south of the proposed line? Yes, and North Shore also.
71. Will not the North Shore be connected with the reservoir directly across the railway bridge on the Parramatta River? Yes.
72. What point will it be taken to? The pipes will first be brought to Ryde, near the station, where a reservoir is being built.
73. How about the reticulation—Will that point be sufficiently high to supply the water to North Shore? No; it will be pumped from there to a reservoir, to be built on the high land at North Shore.
74. Will that be far from the reservoir at Ryde? Yes; I think it is about four miles. The survey is not completed for that, but that is the project.
75. What is the name of the point on which the reservoir will be built? Willoughby.
76. Will the water go by gravitation from there to the different parts of North Shore? Yes.
77. To the highest parts? I think so.
78. What is the height of Crows Nest and about there? I cannot tell you, but I think the whole of North Shore can be supplied. That scheme, however, is only in its infancy.
79. Are the surveys completed? No.
80. It is a project in contemplation? Yes.
81. What is the state of affairs with regard to the southern suburbs which we came through to-day? The surveys are not yet completed.
82. Will they be supplied from the pipe line which we went over? No.
83. As far as you have considered the matter would you recommend that the pipe to supply the southern suburbs should connect directly from Potts' Hill or from some portion of the pipe line further down? Direct from Potts' Hill.
84. Do you know if there is any estimate in the Department of the population of the suburbs which we came through to-day, south of the Liverpool Road; or, in other words, of the supply that will be required by those suburbs? The Water and Sewerage Board, I think, has all that information.
85. Have you given a great deal of attention to this matter yourself since you have had charge of the water supply? Yes.
86. You were not connected with the scheme in its inception? No.
87. How long have you taken it up? The last two months.
88. Since then have you had to make yourself acquainted with the duties and with the project in its various stages? Yes.
89. You were not employed on the works in any way previously? No.
90. Were they carried out entirely by the Engineer-in-Chief for Harbours and Rivers, or under his superintendence and direction? Yes.
91. Have you had experience before as an engineer of works of this description? Yes; at home; and I have carried out the Hunter River district supply under Mr. Moriarty.
92. Is that the supply which gives water to the whole of the mining townships from Maitland downwards? Yes.
93. Where is it drawn from? From the Hunter River itself, at a point 2 miles above West Maitland.
94. Is there a reservoir? Yes; there is a large reservoir. The water is pumped direct from the river if the water is clear, or from the reservoir, to a place called Buttai, about $5\frac{1}{2}$ miles, and to an elevation of 300 feet above sea-level, from whence it flows by gravitation to Newcastle and the mining townships.
95. Is that below West Maitland? Between West Maitland and Newcastle.
96. Is that supply taken back again from East Maitland? No. There is another pumping engine, which supplies East Maitland, West Maitland, and Morpeth.
97. Then the supplies to the mining townships lower down, towards Newcastle, are carried out by gravitation? Yes. That work was carried out under my superintendence.
98. Then you have had considerable experience in the construction of waterworks? Yes.
99. Do you think that on the whole the works at Potts' Hill are desirable? Yes.
100. Is it usual, as far as your experience has gone in the Old Country, or in other places, to have duplicate pipes to provide for accidents where there are large populations? Yes. In the only waterworks I carried out at home we had duplicate pipes.
101. Is it usual to have duplicate pipes? Yes.
102. Do you know anything about the Glasgow water supply? No; except from reading.
103. Do you know whether or not they have a duplicate pipe there? I cannot say off-hand.
104. Is the Glasgow supply in principle a good deal like our own? Yes.

105. It is taken from Loch Katrine, conveyed into a large reservoir, and from there taken to the City of Glasgow? Yes. R. Hickson,
Esq., M.I.C.E.
106. Do you recollect if they have duplicate pipes between the reservoir and Glasgow? I cannot say, but I think they have. 27 Sept., 1888.
107. In large works of this character it is usual to have duplicate pipes? Yes.
108. Are you aware of the estimated cost of the excavation at Potts' Hill, and of the pipe line between there and Crown-street? Yes.
109. Do you think the cost is reasonable? Yes. I have gone over the figures myself in detail since I have taken up the work, and I think the estimated cost is fair and reasonable.
110. Do you think that in consideration of the population dependent on this water supply it is essential that there should be a duplicate service? Yes.
111. When this duplicate line shall have been completed do you think that the general water supply of Sydney will be a fairly complete one? I think it will be very complete.
112. During the late drought has there been any scarcity of water even under present circumstances? No.
113. If the present water supply had not been in existence do you think that we should have had great complaints of scarcity of water? I think so.
114. Such complaints did not exist during the late drought? No. We have a reserve now of 2,500,000,000 gallons.
115. What will be your average store when the present dam is completed? About 7,000,000,000 gallons.
116. With the present population, what supply would that give? The Water and Sewerage Board will be able to give better information than I can on that point, but I think about two years' supply.
117. That is supposing no additional water were coming in? Yes.
118. In the construction of the water supply generally do you know whether any consideration was given to the matter of, intermediate supply. You are aware that there are several towns between the catchment area at the Pheasant's Nest and Sydney or the suburbs of Sydney. I allude to Campbelltown, Liverpool, Fairfield, Parramatta, and perhaps Granville. Was any provision made for the supply of those places? Two of them have been brought under my own notice since I came here, namely, Campbelltown and Liverpool. For Campbelltown I have made a recommendation which, I think, the Water and Sewerage Board are going to carry out. That is, to give a supply from the canal. Liverpool is still under consideration.
119. That was a portion of the project in the first instance? Yes.
120. Was provision also made for manufacturing industries that may exist now or that may be likely to exist in future? The design was all carried out by Mr. Moriarty, and I do not know the details.
121. Do you know whether provision was made for irrigation? I cannot say.
122. Have you given any attention to irrigation? No.
123. Have you had any experience of irrigation during your professional career? No.
124. Is the Railway Department using this water supply on any portion of their lines? I do not think so. They are not using it at any place that I know of. At Campbelltown, I think they will use it.
125. Are they applying for it at Liverpool? Yes.
126. Have you had any application from Parramatta? No.
127. Is there a connection with the water supply between Granville and the main supply? No.
128. *Mr. Copeland.*] What is the present inflow at Prospect Reservoir? Just at present there is nothing coming in. The canal has been shut off for some two or three weeks.
129. What is the cause of that? We are taking this opportunity, when a very small quantity of water is coming down, to examine the tunnels, and also to clean out the aqueducts and repaint and tar them.
130. Were the tunnels found to be in good order? In very good order indeed. Very little stuff had to come out.
131. Then the rumours in the newspapers about the tunnels giving way were not true? There was not the slightest foundation for them. I examined the tunnels very closely, and walked through them with a candle. I examined every portion of them.
132. So far the whole of the works are standing quite well? Yes; they could not be made better.
133. What was the inflow before the water was taken off? It varies greatly from day to day.
134. What was the average? I cannot tell you, because the water was shut off shortly after I came up to Sydney.
135. What is the total capacity of the one pipe you have down now? About 17,000,000 gallons per day.
136. What is the present consumption? About 10,000,000 gallons per day.
137. I suppose when the second pipe is laid the total capacity will be about 34,000,000 gallons? Yes; about double.
138. So that would be likely to supply three times the present population? Yes, I think so.
139. Do you know whether the consumption is increasing very much? I believe it is.
140. Have you any idea what the ratio of increase is? No. The Water and Sewerage Board have all that information under their control. Their engineer can tell you the details.
141. Are the Botany Works now dismantled? I do not think so. I think they are ready to start at any time.
142. Then, in the event of the present pipe giving way, you would be able to fall back upon the Botany supply for a few days? I believe that could be done. I have not been down there, but I believe it is in readiness to start if required.
143. If those works were maintained and ready for steam to be got up, I suppose there would be no real necessity for this second pipe, that is, so far as provision against accident is concerned? As far as I know the engines for the Botany supply are in a very bad state. They are not reliable. But that of course is only heresay. The engineer of the Board can give you all the particulars about that.
144. Have you been connected practically with any gravitation scheme in any other place? Yes, with a small gravitation scheme in the north of Ireland, where I was working for a short time; but it was a very small one. The Hunter River district scheme is partly a gravitation scheme. The water is pumped to a certain point, and it gravitates from there to all the small towns.
145. Have you ever examined the proposal made some time ago for having a gravitation scheme for Sydney? No.
146. I refer to what is known as the Kenny Hill scheme? No.
147. I suppose you can form no idea as to the difference in cost of maintenance between that scheme (or any other gravitation scheme) and the system of pumping water? No. 148.

R. Hickson,
Esq., M.I.C.E.
27 Sept., 1888.

148. Have you gone into the figures of the probable cost of pumping to the various reservoirs when this scheme is completed? No.
149. Do you know what the cost is at present for pumping? No; that is under the Water and Sewerage Board.
150. Is the proposal to lay a second pipe made entirely with a view to supply Sydney with water in the event of the other pipe breaking away? Not entirely; but mainly.
151. Could all the suburbs that are now requiring water be supplied from the present line of pipes? If they were fully reticulated they could not be supplied.
152. You say that the present daily consumption is 10,000,000? Yes, about that.
153. And the present pipe is bringing down a daily supply of 17,000,000 gallons? It can do so in twenty-four hours.
154. Do you think that if the suburbs were properly reticulated you would have an additional consumption of 7,000,000 gallons? The supply of 17,000,000 gallons comes down in twenty-four hours, but we want that quantity brought down in about eight hours. That is the time during which the heavy draw is made on it.
155. Have you ever in the Department considered the question as to the advisability of maintaining the Botany waterworks in order, in preference to adopting this more expensive system of laying down a second pipe? I think Mr. Moriarty has done so. It has never been brought before me, and I have never had occasion to do it.
156. *Mr. Humphery.*] When you say that the supply to the city is to be given in eight hours, are we to understand that the 17,000,000 gallons that can be supplied now is spread over twenty-four hours? The present pipe is capable of taking down 17,000,000 gallons in twenty-four hours; but it is very well known that in all water supplies the great draw is from eight to ten hours per day.
157. Are you now receiving 10,000,000 gallons during eight or ten hours per day? Very nearly. I suppose it is spread over twelve hours, because during the night hardly anything is taken.
158. Then you are working the existing line of pipes up to its utmost capacity? Yes; I believe that is almost the case.
159. If all the suburbs were supplied with water, even the duplicate pipe would scarcely be sufficient? It would be sufficient with Potts' Hill Reservoir.
160. But you will have little to spare when the pipes are duplicated if you extend the supply to Ryde and the suburbs on the southern side which are not yet supplied? This does not affect the question, as the north and south suburbs will be supplied by independent pipes.
161. Is it a matter of absolute necessity to proceed with laying the second line of pipes, in order to give a supply to the suburbs at present without it? I think so.
162. It is not altogether for the purpose of supplying the town in the event of the present line breaking down, but to assist the existing pipe line? Yes; when the suburbs are fully reticulated.
163. Is it your opinion that the sum of £120,000 will cover the cost of the storage reservoir at Potts' Hill and also on the second pipe line? £120,000 is only for Potts' Hill. The pipe line is £165,000.
164. The cost will be £285,000 for constructing the Potts' Hill Reservoir and laying the second pipe line? Yes.
165. Are you of opinion that that sum will cover the cost? I think so. I went into the estimates carefully, and I think it will cover it.
166. *Mr. S. Smith.*] Where do you propose to run this line of pipes? There has been two or three different routes surveyed and examined. It is not fully surveyed; but I think that the line I have pointed out to the Committee is the best line. That will have to be determined by careful levels.
167. I understand you would recommend the Committee to adopt the route we went over to day? Yes; I think it is the best line.
168. What will be the length from where the pipe branches off from the old pipe line to the place where it joins again? By one line the distance to Crown-street is $11\frac{1}{2}$ miles. The line we went over to-day is nearly half-a-mile shorter.
169. What is the length of the present pipe line? $10\frac{3}{4}$ miles or $10\frac{1}{2}$ miles.
170. So that the proposed route will be shorter than the old line of pipes? It will be a little longer; about a quarter of a mile longer.
171. I suppose that the reason for recommending a different route is because if the second line were carried along the present line of pipes there would be a danger in case of a break away that the new line would be damaged also? Yes; the earth would be washed away underneath the pipes, which would drop down, and both lines would be disabled.
172. Is that the main reason for recommending that the new line of pipes should be laid along a different route? Yes.
173. Will you be obliged to resume much land in carrying out this new route? Only one small piece will have to be resumed where we went over it.
174. The other portion will go along the road? Yes; along streets and roads the whole way.
175. What will be the cost of the resumption of that piece of land? I do not know. Land costs a great deal when you get near Sydney.
176. Will you be called upon to resume any land near Sydney? The land I refer to is a short distance east of Burwood Road.
177. What will be the total cost of the laying of the pipe, including the resumption of land? £165,000.
178. When the Potts' Hill Reservoir is completed, what will be the quantity of water stored there? 100,000,000 gallons.
179. Will all that be available? Yes; we practically take it from the bottom.
180. 17,000,000 gallons per day is the quantity you can at present take by the line of pipes from the present reservoir down to Potts' Hill? 17,000,000 gallons from Potts' Hill down to Sydney.
181. As to the works at Botany, do you know whether any proposal has been made as to what should be done with those works? Nothing has come before me in connection with them.
182. Do you not think it is a matter which should receive some consideration in view of the fact that it is now proposed to spend over £200,000 on these new works? It did come under the consideration of Mr. Moriarty, who planned out this scheme.
183. Are you aware that a large sum of money has been spent at Botany? Yes; there must have been a great deal of money spent there.
184. Did I understand from you that the engines there are not in very good repair? That is only hearsay. I have not been down there.

185. What quantity of water can the Botany engines send to town? I cannot tell you. The engineer of the Water and Sewerage Board, who has worked these engines for a long time, can give you that information. That does not come under my Department now.

R. Hickson,
Esq., M.I.C.E.

27 Sept., 1888.

186. *Mr. Garrard.*] What is the size of the pipe from the outlet of the canal to Potts' Hill screening tanks? 6 feet.

187. The capacity of that 6 feet pipe would be about equalized by the two lines of 4 feet pipes? The capacity of the 6 feet pipe is a little more.

188. Is the principal reason for erecting the Potts' Hill Reservoir the necessity for supplying the northern and southern suburbs, or the necessity for an auxiliary to the city reservoirs? It is for both. The Potts' Hill Reservoir is mainly to provide for the event of an accident to the 6 feet pipe, or of having to shut it off for any purpose, when the water supply to Sydney would be stopped for a time. This work will give a reservoir holding a supply for a certain number of days, so that if anything occurs, we shall still have a supply at Potts' Hill to keep the city going.

189. That is about a week's supply? Yes; rather more.

190. The total cost of the Potts' Hill Reservoir when finished will be £120,000. The amount of the present contract for excavating and forming the bank is £55,000. What is the balance of £65,000 for? Pitching the slopes and laying the necessary pipe connections into the reservoir.

191. Are the slopes to be pitched all round the reservoir? Yes.

192. Do you produce a plan showing the embankment of the Potts' Hill Reservoir? Yes; this is a section of the bank.

193. What is the total height of your dam? It varies, as the ground is uneven.

194. I speak of the dam proper, not the sides. What is the height of the embankment? 22 feet.

195. What will be the depth of the water when the reservoir is fully charged? 4 feet less than that.

196. The maximum height of the water will be 4 feet less than the total height of the embankment? Yes.

197. That will hold how many gallons? 100,000,000 gallons.

198. Will practically the whole of that water be available for the pipes to Sydney? Yes; the whole of it.

199. What is the length of this dam? The bottom is 1,143 feet long by 843 feet wide. The top is 1,206 feet long, and 906 feet wide.

200. *Mr. Copeland.*] Is that the width at high water level? That is the width at the top, 4 feet above the water level.

201. *Mr. Garrard.*] Your estimate of the capacity of the reservoir is given from the highest level of the water, and not from the embankment line? Yes.

202. Is it necessary to have the top of the embankment at least 4 feet above the water line? Yes. On a large surface of water like that there will be considerable wash—a sea, in fact; and we want the top of the bank to resist that. I may also say that we have such a surplus of material that we have to put it somewhere.

203. What is the nature of the puddle trench you are putting in your dam—what is the width and height of it? 2 feet at the top, and it varies of course according to the depth, from 4 feet I think.

204. What is the average depth you have to go below the ordinary surface of the ground? I cannot tell that until we open up the trench.

205. Have you not already opened it out? No.

206. Are you not now filling in the puddle wall? A small portion. The average depth is only 2 feet.

207. You do not expect to go deeper? No.

208. Is that puddle trench made on the same principle as the one at the Prospect Reservoir? Yes.

209. Are you aware of any defect in the embankment at the Prospect dam? Yes; there is a small slip at one portion of the dam.

210. Is there anything wrong in that puddle wall against which you are now providing in this wall? No; there is nothing wrong. The water does not come through the dam at all.

211. Are you making this puddle in exactly the same way as the puddle was made at the Prospect dam, or have you gained experience? It is being made practically the same, except that it is being made a little drier than the first part of the puddle at Prospect dam was made.

212. The difference is that you are making it drier than it was made at Prospect? Yes; than what it was at first.

213. Do you think there is quite sufficient core to prevent any soakage through the embankment? Yes.

214. The reason for the very large back to the dam is not that it is absolutely necessary, but because you have a lot of surplus material that may be put there? Yes.

215. Is there an absolute necessity for pitching the four sides of the dam? I think it is necessary to pitch it all round.

216. Is the Prospect Reservoir only pitched at the dam? That is all.

217. If it does not require pitching on the sides of the Prospect dam, why should it require pitching here? It is quite a different case. This is practically a dam all round. There is the same slope all the way round. Prospect has only one dam across, and the water lies on the surface.

218. But on the upper or western side of this dam you really have untouched ground, and no made ground at all? There is not much made ground, but there will be some. There will be a very small quantity, but still when we are carrying out the work, owing to the action of the water on the upper portion, it will be absolutely necessary to pitch it first of all for the protection of the bank, and secondly; to prevent the continual drip of mud and sludge into the reservoir.

219. Then your reason for having it pitched all round is because you are disturbing the natural soil, while at Prospect the natural soil was not disturbed? No; except where the dam is.

220. The present line of pipes from Potts' Hill to Crown-street I understand are able to convey 17,000,000 gallons in twenty-four hours? Yes.

221. The supply going through at present being about 10,000,000 gallons? Yes; the present consumption is about 10,000,000 gallons.

222. Between Potts' Hill and Petersham Reservoir is it intended to tap the new line of pipes, or has the present line of pipes been tapped for reticulation purposes? I think the Water and Sewerage Board have tapped the present line in one or two places, but I am not sure.

223. Is it intended to tap the new line of pipes? It is not intended to tap them except when necessary to convey water to a reservoir.

224. The purpose is for the mains to lead direct to the reservoirs, and that there should be a separate reticulation leading from the various reservoirs to the streets? Yes.

- R. Hickson,
Esq., M.I.C.E.
27 Sept., 1888.
225. Is it undesirable to intercept or tap the mains? I think so, except for a reservoir.
226. You do not intend to tap this new line at any point between Potts' Hill and Petersham to supply the northern or southern suburbs? No.
227. That will be done by means of direct lines of pipes from the Potts' Hill Reservoir? Yes.
228. So that if the route is going along the railway bridge at Strathfield there will be three miles of pipes from Homebush right to Potts' Hill, running parallel? They will not be parallel. One branches off Potts' Hill from the line of pipes, going north. One will branch off from Potts' Hill, going to the right and to the south. The exact route is not yet decided.
229. Has there been any accident or any defect in the line of mains now existing between Potts' Hill and Crown-street—any bursts of a serious character? I think there were one or two at first, but that was before I came down. None have come to my knowledge. Mr. Darley told me there had been one or two.
230. What pitching do you propose for the reservoir? Sandstone.
231. Is there any stone in the neighbourhood? There is a stone that will be good enough a mile or a mile and a-half away from the works. I have not seen it myself, but the resident engineer told me of it.
232. How is this work being carried out now—by contract? Yes?
233. Are there any of the unemployed engaged separately on it? Yes; but they are doing the work by contract. It is a sub-contract.
234. Is the clay used for the puddle trench of this reservoir of as good quality or better than that used at Prospect? It is quite as good.
235. Is it any drier than at Prospect. Yes?
236. *Mr. Suttor.*] What did you say was the amount of the present large contract? £55,000.
237. Does that include the amount to be paid to the unemployed? Yes.
238. How much will the unemployed get? The large contract is for £49,763; the amount to be paid to the unemployed will come to about £5,500.
239. That is for the reservoir alone? Yes.
240. I suppose there is no rule according to which accidents may be expected? No; they may occur at any time.
241. I suppose that these pipes as a rule have a fair length of life? Yes; when they are good.
242. What would be the life of a really good pipe? I cannot say from my own personal knowledge. I do not know the case of any waterworks where the pipes had to be renewed.
243. They are looked upon as almost everlasting? Yes; practically.
244. *Mr. Copeland.*] With reference to the unemployed, how have they contracted with the Government? They have a sub-contract based on the prices of the contract let to Gummow & Co., the contractors for the main portion of the dam. We have to supply them with some material, and the prices were arranged between one of their representatives and myself, and submitted to the Minister.
245. Do you know how many of the unemployed are at work? I think about fifty now.
246. Are the whole of those fifty men parties to the contract or only one of their number? Two men on their behalf; but in paying over the money to those two the resident engineer sees that they pay the money over to each labourer in proportion to the work done, and he sees each man sign a receipt, so that these men cannot come on the Department afterwards and say that they were not paid, nor can those two men go off with all the money.
247. The two men who have contracted do not sub-let to the other men. Do the other men stand in equally in the contract according to the work done? Yes; they submit a pay sheet.
248. Have you any idea what their earnings are per week? They have not been earning very much during the last ten days because we had to stop them. They got ahead of the other contractors. The portion they have got is complete in itself: that is, they do the whole of the excavation, the whole of the bank, and the whole of the puddle opposite their own corner, and they cannot get up any higher on their bank than the other contractors, and we have arranged that they should dovetail in with each other. They are waiting until the contractors get up to their level, therefore they have not been earning very much during the last ten days.
249. When they were in full work how much were they making? I cannot say; but they are perfectly satisfied, and they are working remarkably well. They are a very steady lot of men.
250. You do not know anything like what their average earnings are? No; but I could get the pay-sheet.
251. Are they getting paid the same rate as the contractors for the large contract? No; we do not give them the same rate because Gummo has to supply everything, while we supply the employed with some things. We give them water and do the rolling for them. At least we have arranged with Gummo and Co. to do the rolling of the bank for them. On account of that, there is a certain amount taken off the price paid to them, and we pay the contractors for the rolling of the bank.
252. Are you getting the work done by the men employed at as cheap a rate as by the other contractors? Just about the same.
253. Are they doing the work equally as well? Quite as well.
254. Are they doing the work in a satisfactory way? Yes.
255. Under the supervision of some of the departmental officers? Yes; the resident engineer is always on the spot.
256. Are the large pipes you are putting in cast iron pipes? Yes.
257. Have tenders been called for the additional line of pipes? No.
258. Do you know if it is possible to make these pipes in this Colony? I do not think they could be made with the present appliances in foundries. It is a special line, and special appliances are required for casting pipes.
259. How many miles of pipes would be required? About 11 miles.
260. Of additional pipes? Yes.
261. What weight of castings would that amount to? I cannot tell you off hand. I can get it.
262. I should be glad if you would get the information as to the total weight and the estimated cost, with a view to ascertaining whether the work could be done in the Colony. What is the length of the pipe? 12 feet by 4 feet in diameter.

Thomas Rowe, Esq., President of the Water and Sewerage Board, sworn and examined:—

- 262½. *Chairman.*] Are you the president of the Water and Sewerage Board? Yes.
263. For how long have you been in that position? Since the formation of the Board. I think about six months.
264. Are you an architect by profession? Yes.
265. Have you been engaged in the practice of your profession in Sydney for a great number of years? For thirty years.
266. Have you given considerable attention to the water and sewerage works of Sydney during that time and before you occupied your present position? I have had to do so in my professional work. I was also for four years an alderman of the city of Sydney and borough mayor.
267. Had you experience as an architect and engineer before you came to this Colony? No. I have been forty years here.
268. Since you have occupied the position of President of the Water and Sewerage Board have you had necessarily to give a lot of attention to the works proposed to be carried out under your Board? I have endeavoured to do so. There has been a great deal to be accomplished in a short time.
269. Have you examined the works proposed to be carried out between Potts' Hill and Sydney? Yes.
270. Have you given very much attention to the Nepean scheme—that is, the system from which Sydney has been supplied? I have traced a good deal of it down from the Pheasant's Nest. I have not been down the whole distance. I have seen a great deal of the works.
271. Do you know the catchment area above the Pheasant's Nest? No. I have not travelled over it. I know the sources and the force of the supply, but I have never travelled over the catchment area.
272. Have you been up the Cordeaux at all? No.
273. Or the Cataract? No.
274. Do you know the site of the dam at the Pheasant's Nest? Yes.
275. Have you been through the tunnels? No; at the time I passed the tunnels were charged with water.
276. You did not traverse the tunnels? It was impossible to do so.
277. Before the water was laid on did you? No.
278. Have you held any investigation before the Board since you have been in office as to the character of the works, or the state they are in? Yes. We spent two days inspecting the works along the line.
279. Have you taken any evidence during that time as to the character of the works? No.
280. All the information you have had in reference to them has been merely the information derived from your own personal inspection? Yes.
281. Were you accompanied by the members of your Board? Yes.
282. How many members are there on the Board? Seven in all.
283. Have you inspected the Prospect Reservoir? Yes.
284. And the large embankment or dam there? Yes.
285. How long is it since you were there? It must be three months ago.
286. Was the subsidence in existence then? Yes.
287. Did it seem to be of a very alarming character, in any sense, from your professional point of view? Not in my opinion. I think it was a natural consequence.
288. In a large work like that such a subsidence would naturally occur? I think so.
289. Subsidence always occurs in such large earthworks? Yes. That is my opinion.
290. Are you aware whether the sinking of the dam at all affected the puddled part inside—the backbone, as it is called? I do not think it affected the core of the dam. I do not think the water reached it in any way whatever.
291. As far as your experience of the works has gone, has the water been vitiated at all by its course through the canals or tunnels between the upper sources and the present dam? I have no knowledge of its being vitiated in any way.
292. Is the water delivered now in Sydney in a pure and generally good state? I have that impression.
293. Have you heard any complaints made? I have heard a few complaints in connection with the reticulation of the suburbs. That is quite natural until the pipes are flushed out. It is no fault in the quality of the water.
294. Are you aware, approximately, of the quantity of water required in Sydney for present purposes? From 8 to 9 million gallons per day.
295. What is the aggregate supply of the stores from which you are now getting it—That is, entering the Prospect Dam? I believe it has been from 5 to 7 million gallons per day of late. It has reached as much as 15 million gallons per day and more.
296. When you say it has been from 5 to 7 million gallons per day, do you mean during the recent drought? Yes.
297. Are you aware of the rainfall along the coast, or of the Sydney rainfall? No.
298. You know, generally, I take it, that the rainfall during the last year has been very much less than the ordinary rainfall? Yes.
299. Are you prepared to say how much per cent. less the rainfall has been? No; but I am fully aware that it is something considerably less.
300. Would that account in some measure for the paucity of the supply to the Prospect Dam? Certainly.
301. Do you know the extent of the catchment area above the Pheasant's Nest? I know it is thousands of acres, but I have forgotten the exact area; about 350 square miles.
302. Have you given any professional attention to the character or configuration of the country above the Pheasant's Nest? No. We have been organizing the department very busily during several months, and it has been impossible to go into everything.
303. That would be more in connection with reticulation and the disposition of the work? My work is more in connection with the reticulation, and whatever time we can give to the larger subjects we are always glad to do so.
304. Did you, before your accession to your present position as President of the Water and Sewerage Board, give very much attention to the different schemes which have been proposed for supplying Sydney with water? I have always taken a deep interest in the matter.
305. Have you formed any professional opinion which would warrant you in expressing an opinion with regard to the various schemes proposed? No; I could not go that far.

T. Rowe, Esq.
27 Sept., 1888.

- T. Rowe, Esq.
7 Sept., 1888.
306. Do you think that the present scheme for supplying Sydney is a fairly complete one? I think it is an excellent one. I think it is a grand scheme.
307. If the present supply had not been in existence should we have had loud complaints of the scarcity of water during last year? We could not have supplied the demands for water. We never got more than 5 or 6 million gallons from Botany at the utmost with two engines going. We never got more. Where would the other 3 million gallons have come from during the past year?
308. Do you know if the machinery which used to supply Sydney from Botany is in existence? Certainly. We have the fires banked up there, and the engines are ready to work again at a moment's notice. Within at least half an hour they could be in full play.
309. Are those works, as well as the Sydney water supply, now under your superintendence? Yes.
310. That is the reticulation? Yes.
311. Have you anything to do with the engineering part of the works—that is repairs or reformation in case of damage, or anything of that kind? Yes; the Board has to do that now.
312. How far does that extend—does it extend to the general pipe system—does it affect the trunk lines? Not at present. Those works will be handed over when completed.
313. Will that apply to the Prospect Dam as well? The entire works, right to the source.
314. Was the Botany supply originally in the hands of the Corporation? Yes.
315. Has that been handed over to your Board? Yes.
316. Are you keeping that as an alternative supply in case of anything going wrong? Yes; in case of a breakdown.
317. Does that apply to the Botany dams generally as well as to the machinery and engine power? Yes; but there is a difficulty about part of the watershed at present. The Cooper Estate, which was leased by the Corporation for £2,000 a year, is likely to be interfered with. A syndicate has been formed which professes to have purchased it. We still think we have a claim, and we have placed the matter in the hands of our solicitor to get counsel's opinion as to whether or not we have taken over this lease from the Corporation. If this syndicate formed a township it would materially affect the watershed as to the quantity and purity of the water. There is another light in which to look at it. If they do away with the present dams, in flood-time the water might overpower the lower dam at Botany, and so break away the supply we have to fall back upon. We regard it as a serious matter.
318. What proportion of the general catchment area would be affected by that sale? It is on the Bunnerong Road, on the right hand side going to Botany, beyond Randwick Racecourse.
319. That would be a material part of your catchment area? Yes.
320. Do you know what extent of the area it would be? About 1,000 acres.
321. Is it a thousand? Yes. It is proposed to be purchased by a syndicate. Whether the information is correct or not I do not know.
322. Was it private property before? Yes; it was Sir Daniel Cooper's property.
323. Did it form part of the catchment area of the Sydney water supply? Yes; as private property.
324. Does that principle apply to no other property about there except this special property? I do not know.
325. Would the water catchment be affected by the properties on the higher elevations about Waverley? I think not.
326. They do form part of the catchment area? They do. It is part of the natural formation. There has always been trouble about that, but there have been filter-beds and such things put along there to provide against contamination. Another difficulty arising from this Cooper Estate is that if it were taken from us and cut up into a township there would be drainage which would ultimately affect the remaining portion of the watershed.
327. So far as the catchment area of the Botany supply is concerned at present there is not much population to vitiate the water? Not very much.
328. Is there some? Yes; but not enough to affect it very seriously.
329. Does it cost a very large annual outlay to keep up the Botany system? No; not at present. We have reduced the staff down to a mere nothing. There are just two men in charge. The engineer lives on the spot, but he comes to town daily to attend to other duties at Crown-street.
330. Is your Board partly elected and partly nominated? Yes.
331. Is it partly elected by the Municipalities about Sydney? Yes.
332. Three are nominated by the Government and two elected by the Municipalities? Yes.
333. Then the Board consists of five members altogether? No; there are seven members. Two aldermen are elected by the suburbs, and two by the city. Three members are appointed by the Government, two of whom are officials in the Harbours and Rivers Department and Roads and Bridges Department.
334. Do they elect their own president, or is he appointed by the Government? He is appointed by the Government. We are of opinion that the constitution of the Board is an excellent one. We find it works very well.
335. Has it worked satisfactorily so far? Yes, excellently well. The composition of the Board seems to be a very good one.
336. Have you had very much to do with the new sewerage works? They have not been handed over yet.
337. They are not thoroughly completed? The idea is to pass a short Bill to hand over the portions that are completed, in order to go on with the reticulation of the sewerage.
338. Is your Board appointed under an Act of Parliament passed some years ago? Yes, in 1880.
339. Under which come the sewerage and water supply? Yes.
340. Are there any other works besides these which come under the category of your duties? No.
341. Is the suburban sewerage system committed to your charge as well? It will be.
342. Is that provided for in the Act? Yes.
343. Does that apply also to water reticulation? Water and sewerage.
344. Are there not limits to the suburbs? Within the County of Cumberland.
345. All inside the County of Cumberland? Yes.
346. Will the works in each case be carried on by mutual arrangement—That is, will the municipalities become parties to it, and be responsible for a portion of the payment, the Government contributing the other portion? The Government, I presume, will carry out the main trunk lines the same as with the water, and the Board will carry out all the ordinary operations, and paying the interest on the entire outlay, which will be proportionally divided amongst the various municipalities, city and suburban.

347. Since the Nepean supply has been brought into operation, have you used the Botany supply at all? T. Rowe, Esq.
Not since the Board was formed. 27 Sept., 1888.
348. According to the professional view of the case, would the supply from Botany be vitiated through the water not being taken from it regularly? I do not think it would be vitiated. The danger is that the pipes might possibly be choked, if they were not used, owing to fungoid growth. I do not think the water itself is likely to be contaminated.
349. I refer more particularly to the pores of the sandhills—The whole source of that supply is a natural sponge—Would the sponge principle, under which the water is supplied, be affected through being kept closed for a certain time? No; I do not think it would.
350. Have you had a good deal of experience of the Botany water supply during your long residence in the Colony? Yes.
351. Have you seen the value of the supply from year to year? Yes. Since I have been here I have been acquainted with the Botany water supply.
352. Is it a very good supply? Yes; an extraordinary water supply.
353. In common with others, have you been astonished that the supply has been so great, considering the demand and considering the small area? Yes; it is very surprising.
354. Have you seen in any part of the world a better class of water than you get from Botany? I suppose there is better water. There is a want of lime in that water. But it is a very pleasant, soft water; but there must be a superior water even to that of Botany for general use.
355. Have you had any experience of the London water supply from the Thames? About three years ago I had. I do not think it is equal to our water.
356. And that is a much better system now than it was twenty years ago? Yes; it is all filtered, but it is not equal to our water.
357. Is it not the case that there is a large population living near the various sources from which the Thames supply is secured? Certainly.
358. Would not that necessarily vitiate the quality of the water supply? It is well protected and filtered, and they do not allow drainage to go near it.
352. Still, is there not a natural percolation of animal and other matter where population is located, and where land is being worked? Yes; there is always a danger of that.
360. Is it not a fact that where the soil is renewed by cultivation the water from that soil is affected? Yes; there is always a danger in that respect. The watershed of London is vastly different from the surroundings of Botany.
361. In what respect? The inhabitants are vastly more numerous.
362. All the soil in fact is enclosed in gardens, and those gardens are richly manured? Yes.
363. And the water from those gardens give the stores that supply London? Yes. I think there is no comparison between the two water supplies.
364. One point in connection with the Nepean water supply is that there is no settlement upon the catchment area? Very little.
365. And another point, I take it, is that the sources of supply are of a sandstone character? I believe so.
366. You have never visited it yourself? No.
367. Is it not the case that a sandstone formation supplies the best and purest water for drinking purposes? Certainly.
368. And the whole of this area, with the exception of an infinitesimal portion, has been secured for the purpose of catching water? Yes; I believe so.
369. Have you examined the site of the new reservoir at Potts' Hill? Yes.
370. Do you think it is a desirable acquisition to the water supply of Sydney? I think it is very necessary.
371. Do you think that the duplicate pipe system proposed is a desirable one? In view of the enormous supply which we require at present, and the increasing supply necessary to meet the demands of the public, I think it would be prudent to have the second line of pipes. In fact it is absolutely necessary for many purposes besides that one.
372. Has any provision been made for a portion of this water to be used for manufactories and for purposes other than for household use? I have always understood that the supply was intended to be used for all purposes; for manufacturing as well as for household purposes.
373. Do you think that the supply would be sufficiently copious to enable manufactures to be carried on at any future time? Yes.
374. Have you given any attention to irrigation from a professional point of view? No.
375. Have you had any experience of it? No.
376. I refer to the means of collecting water for irrigation? No. I would not profess to give an opinion on a thing of that kind.
377. As President of the Board, are you aware of the estimated cost of these works? Yes.
378. The reservoir itself and the pipe line also? Yes.
379. The estimated cost of the reservoir is £120,000? Yes.
380. The contract for excavation alone is £55,000? Yes.
381. The difference between £55,000 and £120,000 is made up of pitching and other things necessary to the completion of the work? Yes.
382. Will that come under the head of a separate contract or will it be carried out under the Harbours and Rivers Department? By the Harbour and Rivers Department. We have nothing whatever to do with these works.
383. You only take the works after they are completed? Yes.
384. Then you understand the estimated cost of the pipe line which we drove over to-day? Yes.
385. Have you formed any opinion as to whether it is a reasonable estimate or an exorbitant one, or not sufficient? I do not profess to give an opinion on matters of that kind. It is properly a hydraulic engineer's duty.
386. On the whole you think it is a desirable work? Yes, as a duplicate service, and for many reasons.
387. Do you think it would be better than to have to fall back on the Botany works in the case of the Nepean scheme failing or the pipes getting out of order? It would be impossible for the Botany works to make up the deficiency and supply the city. It could only give at the very utmost five or six million gallons per day, and that of course would not be continuous. The engines are very old and antiquated, and

- T. Rowe, Esq. and you could not tell when they might break down. There are three old, and one auxiliary new one, and they would have to do an enormous amount of work, and the western suburbs could not be supplied at all.
- 27 Sept., 1888. It could only supply the eastern suburbs and the city.
388. Even if the second line of pipes is established you will not abandon the Botany supply? I think it will be abandoned and utilized for manufacturing purposes. It may be abandoned as a water supply.
389. I think I have heard it stated that the machinery and the works, which were connected with the Botany supply, are very inferior, or that they are getting worn out? They are very antiquated, very old, and may give way.
390. I mean the Crown-street engines, which are now connected with the Nepean supply? They are also defective. We have ordered new engines from England to supplant them.
391. Not only defective, but the principle is an old one? Yes; they are not modern; and they are not powerful enough. Instead of having two inferior engines we prefer to have one superior engine.
392. With a view to a perfect and continued supply you have recommended the use of an improved engine and a new one? Yes. We require to pump a larger quantity of water to Paddington in order to supply the high buildings of Sydney, which we cannot do satisfactorily at present. We can only supply certain parts of the city satisfactorily. When we have a new and more powerful engine we should be able to pump a greater quantity of water to Paddington, and thereby supply a larger number of high buildings in Sydney now being erected, and buildings higher still which will be erected.
393. Do you supply the greater part of the city now by gravitation? The greater portion.
394. Can you state the approximate portion of the city which you so supply? No. Mr. Jones will be able to give that information.
395. Then your improved engine will facilitate the reticulation from Crown-street to the higher levels of Sydney? When pumped to Paddington. We should pump to Paddington in order to supply the higher buildings of Sydney, and furnish the higher levels of Sydney with a better supply in case of fire.
396. Do you recollect what are those higher levels? It affects some of the high buildings even in George and Pitt Streets. The water scarcely rises to the uppermost storeys. It seriously affects the elevated buildings; and in case of fire there will be positive danger.
397. Then it is proposed to supply the higher portions of St. Leonards from Ryde? Yes; from Potts' Hill by way of Ryde.
398. The water will then be pumped from Ryde to a higher level a short distance away? Yes, at Chatswood; and it will gravitate from there down to North Shore.
399. Will that reach all parts of North Shore? Yes.
400. *Mr. Copeland.*] Do you say that the water supply from Botany is of very good quality? Yes; it is always considered to be of very good quality.
401. Do you think it is better or not so good as the water from the Nepean? I consider the Nepean is the better water of the two. There is less corrosion in the pipes in travelling from the source. There is less fungus matter corroding inside the pipes from the new source than from the old source.
402. Have you any idea what it would cost to supply new engines of a modern type to the Botany works? The only guide which I have is the new Crown-street engine, which will cost from £10,000 to £12,000. The same engine would do for Botany. That is the only idea that I can give.
403. Do you think that at a cost of £10,000 or £12,000 for a new modern engine, the water from the Botany supply could be used in case of an emergency? Of course the distance for pumping would be greater, and there would be a larger head of water. That would be a very low estimate. Perhaps it would be nearer £20,000. Pumping from Crown-street to Paddington is different from pumping from Botany to Crown-street. The engine would have to be more powerful, so that £10,000 or £12,000 would be under the cost.
404. As an alternative scheme to the one now proposed have you ever considered whether it would be as well to obtain new engines for Botany, and depend upon that supply in case the present pipe broke, or was destroyed, simply as a temporary supply? I have never looked at it in that light. I thought Botany was to be given up in consequence of the large amount of money laid out for this new scheme of water supply and its probable success. I always looked at it in that light. Of course the Botany supply is always liable to contamination through increase of population.
405. But you are aware that this proposed new pipe is estimated to cost £255,000 along with the reservoir. If the anticipated danger could be guarded against by the outlay of £20,000 or £25,000 at Botany, would you not consider that was a judicious plan? No, I should not. I should think the scheme a very imperfect one, to put it in that way.
406. Do you think the Botany water supply could not be utilised in lieu of the proposed second pipe? Not to the extent that the present system requires; not even if we had twice the present supply of water at Botany.
407. I am not suggesting this by way of a permanent thing, but merely to avoid any difficulty that might arise through one of the present pipes bursting? I do not think it would be advisable. I reasoned with Mr. Jones, the Board's engineer, as to reducing the cost by making the 4-foot duplicate pipe a 3-foot pipe, but after considering the matter I came to the conclusion that it was not desirable to do so, looking forward to what the population was likely to be in ten or twenty years time. I think the only safe course is to duplicate the main. Independently of the future supply, suppose that a break-down took place in the present pipe, which would take three or four days to repair. We have only half a day's supply in our present reservoirs, and if a break occurred which would take two or three days to repair, I do not know how we could supply the people with water; and if a fire took place in the meantime the city might be half destroyed.
408. Can you tell me if there is any settlement taking place on the watershed of the Nepean supply? I do not know of any new settlement at present.
409. Is the whole of the land in the present watershed reserved? I believe so. We have not got a plan of the entire catchment area yet, but we have applied to the Government for it. I do not think people are settling upon that land.
410. Is there any danger of the water becoming contaminated? I am not aware of anything of the sort. The Board has been applied to frequently for permission to cut timber, and many other things; but we have refused anything of the sort.
411. You do not know whether the whole of the land is reserved? I am not certain. I do not believe that there are any more persons living on the land now than there were when it was handed over to the Board. As to the number of inhabitants upon the area, I could not tell you. 412.

412. It seems to me you can only be sure of that if you know that the whole of the land is reserved, and not composed of private lands? There must necessarily be some private land here and there.
413. If there is any private land, is there anything to prevent the owners of that private land from establishing industries of such a kind as would be likely to contaminate the water? I should think it is provided for, but I have no knowledge of it.
414. In addition to your position as President of the Water and Sewerage Board, do you also occupy the position of Colonel of the Engineer Corps? Yes.
415. Are you the highest officer in the Corps? Yes; I command the Engineer Corps.
416. Is there any Imperial Engineer officer in the Colony occupying a higher position than yourself? There is an Imperial officer, but he is not over me—only as instructor. He is not senior to me.
417. Is he an engineer officer? Yes.
418. Have you ever been consulted on the question of the defence of the water supply? Never.
419. What would be your opinion, in view of a possible invasion, as to the necessity for protecting the water supply? The danger is lessened considerably by the new scheme. The danger existed under the old scheme at Botany. Under the new scheme there is no very great danger unless an enemy got past Parramatta by the Hawkesbury, and could fight his way over towards the water mains. There is no other danger that I know of.
420. I suppose it would be a very serious matter if an enemy did get possession of the water supply? Certainly; it would be a serious matter.
421. Almost as serious as forcing his way in to Sydney Harbour? It would be a very serious matter; but I do not see that it is at all possible for an enemy to affect our present water scheme.
422. Is there no part of the scheme more vulnerable than other parts, or no part where there is special necessity for protection? I do not know of any. I have not looked at it in that light.
423. If you occupied the position of Colonel of any invading Company of engineers, is there no particular part of the water supply towards which you would direct your forces with the object of destroying it? No; I really do not know any. I should have very faint hope indeed of reaching the water supply of the city from the seaboard anywhere.
424. Do you believe it would be a very serious thing? I admit that it would be a very serious matter.
425. But you do not think there is anything to fear? I do not, indeed.
426. Supposing an invading force succeeded in effecting a landing at the Hawkesbury or any other part of the coast? That is the only part where I think it is possible to land; but there is very little chance of an enemy reaching the mains of our water supply.
427. In that case you think there is no danger? I have never thought that there was any danger whatever in that respect.
428. Is it customary in other countries to have the water supply of large cities in any way specially protected from danger? I have not met with it in my own experience. One would naturally suppose that they would be protected from danger; but I have not observed that that is the case in my travels, and I have been in Italy, France, and Germany.
429. Do you think there is no necessity to take special action to protect the water supply? I do not think it is necessary. I do not think there is the least danger in that respect.
430. *Mr. Suttor.*] Do you know if the attention of the Government has been called to the fact of the Cooper Estate being sold, and the desirability or otherwise of doing anything. Has your Board called attention to it? No. We are obtaining counsel's opinion, and after we have obtained that opinion we shall certainly inform the Government with reference to it.
431. Are you aware that a great deal of work has been done in the Centennial Park? Yes.
432. What works have been carried on there? Forming it into a park, making roads, cutting down bushes, planting, and beautifying the natural features of the place.
433. And a great deal of the manuring of the land there? Yes; I think they are slightly manuring it.
434. Is it not proposed to sell certain portions of the park for building sites? Yes; the hills around the park.
435. Will not that to a great extent affect the purity of the water supply? Certainly; it must very much tend to affect the Botany supply, unless a very expensive sewerage scheme is carried out.

John Trevor Jones, Esq., Engineer to the Water and Sewerage Board, sworn and examined:—

436. *Chairman.*] Are you Engineer to the Water and Sewerage Board? Yes.
437. Are you an engineer by profession? Yes.
438. Have you been a long time engaged in the practice of your profession? Since 1854. I was a surveyor before then, and I have been connected with water supply and mining in Victoria. I was afterwards City Engineer in Sydney.
439. Since that have you been engaged in your present occupation? Yes. I am a Civil Engineer of the University of Melbourne, in the sense of having attended lectures and passed in that subject without graduating in all subjects.
440. Had you to do with water supply in Victoria? Yes; for six years.
441. Did you follow your occupation at home? No; I was too young. I was a draftsman, but that did not give me much experience.
442. What water supply had you to do with in the neighbouring Colony? With the Malmesbury, which supplies Sandhurst and Castlemaine; with the Harcourt Reservoir, the Expedition Pass, the Clunes, and the Geelong water supplies. I had something more or less to do with several others, but not in the position of designing any works.
443. Had you anything to do with the Melbourne city supply at any time? No; not professionally.
444. Did you occupy the position of City Engineer in Sydney? Yes, and had charge of the Botany water supply.
445. Did you find that to be a good supply on most occasions? Yes; of course it failed during very dry seasons to give a constant supply, and we were obliged to have recourse to an intermittent system from want of water on several occasions. The quality of the water was excellent.
446. The supply was not sufficient for the demand at all times? Not always, but nearly so.
447. Is the catchment area of the Botany supply very small? Yes; about 6 square miles. It is a very peculiar one of course, being a bed of sand.

J. T. Jones,
Esq.
27 Sept., 1888.

- J. T. Jones,
Esq.
27 Sept., 1888.
448. Have you ever given any attention to the idea submitted by some skilled men that the Botany supply had any other source than the rainfall within its own area? There was no occasion to adopt any theory. The rainfall was quite sufficient to supply all the water that came.
449. Have you formed any opinion as to the probability of the water coming from any extraneous source? Yes; I formed the opinion that it did not come from any extraneous source.
450. Would the sea-water filter at all into the Botany supply? No; it never would in the slightest degree. You may have observed that on the foreshore of any place you can dig a well in the sand, and if the land rises above the water's surface you will get fresh water. That is because the height of the water on the land is greater than in the sea. Therefore, the stream will set in towards the sea, and no matter how slow it is, it is sufficient to keep the salt water back. You will find that to be the case on the beach at Sandringham now.
451. Will the old water supply at Botany be interfered with by the increase of population from time to time? I should not very much like to supply the city with water from it after three or four years. Some land has been recently sold upon it whereupon it is intended to build residences upon the banks of the stream.
452. Is that part of the Cooper estate? Yes.
453. That forms part of the catchment area? Yes; the principal part of it.
454. Is that out towards Botany? Yes; between the Bunnerong Road and Botany.
455. Has it never been secured for water supply purposes? No; it was offered once to the Corporation, but they did not seize the opportunity.
456. How long ago? I think it was about twelve or thirteen years ago, before I took charge.
457. Do you recollect the circumstances? No; I was not in Sydney; but I heard from a very good source that that was the case.
458. At what price per acre was it then offered? I heard it was offered for £100 per acre.
459. What was the area? 1,000 acres for £100,000.
460. Are you aware at what price the land has been recently sold? I have been told that it has been sold for £325,000. That is for 1,000 acres.
461. So that the price is £325 per acre for what was previously offered at £100 per acre? Yes.
462. Do you know anything of the project to erect buildings on some portions of the Centennial Park, which are to be sold for that purpose? Yes.
463. High-class residences? Yes.
464. Are you aware whether that project is still proposed to be carried out? I firmly believe it is.
465. Is it part of the project in connection with the improvement of the Centennial Park? It is; I firmly believe.
466. Would not the drainage from those buildings go into the Botany water supply? Already the drainage from far more objectionable buildings is actually flowing into the water supply. I erected a series of filter dams to intercept it, but still the water is running through the sand below, and it is a little more deteriorated every year, according to tests which I have made.
467. Would that apply to the drainage from Waverley, Randwick, and other places? Yes.
468. But is there not a series of filter dams right from there down to Botany? Yes; there are about nineteen altogether.
469. Then when the water reaches the pond at which the engine is, it ought to be tolerably pure? Yes; the water was quite pure there. I could only get any impurity just under the first filter, high up. Above one side of the dam the water would be filthy. I had that water tested, and it was found to be such water as should not be given to the citizens. I had to filter it through another dam; it had only two dams to go through, because we intercepted that water with Busby's Bore, and delivered it by gravitation into the city.
470. Does Busby's Bore tap the water supply considerably above the lower dam? Yes; at the Centennial Park, at 100 feet above high-water mark.
471. How is Busby's Bore connected with the supply at the Sydney end? It is brought from the Centennial Park under the corner of Victoria Barracks, and then under the court-house at Darlinghurst. Then it runs along Oxford-street, across College-street, and into Hyde Park; near the middle of Hyde Park pipes carry the water away.
472. Does it not come to the corner of Park-street and Elizabeth-street? Not quite.
473. Is it not conveyed some distance by ordinary pipe? Yes.
474. Do you remember whether it was delivered in past days at the corner? Only by recollecting that I saw it when on a visit.
475. Then Busby's Bore does not actually come to that point? No; it delivers from pipes from where I have stated.
476. Have you given any attention professionally to the proposed works in connection with the Potts' Hill Reservoir? I have given a little; but I have not gone minutely into the details; I have examined the details fairly well, so as to get a general impression.
477. From the examination you have made are you of opinion that the estimated cost is a fair and reasonable one? I am afraid that perhaps it is a little low, for the reason that, while it is a fair estimate for the time when the present line of pipes was laid, pipes have since gone up considerably in price.
478. Are you aware how long ago this estimate was made? No; but I am judging from the amount now, and I know that it estimates that you can get the pipes laid at £8 per ton. You could at the time the other line was laid get the pipes at five guineas per ton landed in Sydney. Now smaller pipes, which ought to be much cheaper, cost us £6 5s. per ton. Both iron and freight are now higher.
479. Will that apply to large works like this, seeing that the pipes on which you are basing your calculation would be for small works? There are large pipes, and they will cost more per ton than small pipes. It is safe to add £1 per ton to the cost of the pipes required for this contract.
480. Do you know the estimated cost of the excavation at Potts' Hill which we saw to-day? Yes.
481. Have you made any calculation as to the accuracy of that estimate? No.
482. Have you had much experience of excavation such as that? Yes.
483. Do you think that the idea proposed to be carried out there is a safe one with reference to the pitching, the dam, and the embankment? I have no doubt on that score. The soil in which the excavation is made is composed of very retentive pure clay; and the puddled dam is designed in such a way as to intercept any percolation, apart altogether from the immense width of the soil which is put on the bank

bank owing to the quantity they have to spoil. The size of the bank itself is sufficient safeguard either against percolation or accident. As for the pitching on the surface I deem it to be necessary to prevent the erosion that arises from the lap of the water in windy weather; and as the water will be at varying levels the pitching ought to be pretty extensive, both up and down, to resist the effect of the water.

J. T. Jones,
Esq.
27 Sept., 1888.

484. Did you pay attention to-day to the principle on which the piping was to be connected with the main piping for Prospect? Yes; I knew that before.

485. Do you think the principle is a good one? Yes. In fact, all the Nepean works are good.

486. Do you think that a duplicate pipe is essential? I certainly think that in every water supply a duplicate pipe should be made. I have two reasons for supposing that a duplicate pipe is necessary. One is to act as a stand-by in case of an accident, which, while it is improbable, is yet possible. The strength of these pipes is in excess of what is required, but there may be a flaw in the casting, and that would render a break possible. If a break were to occur it would take a long time to repair the line, and Sydney would in the meantime be without water. It would be a calamity.

487. Have any breaks taken place in the pipes up to the present? Yes; two.

488. Did they impede the supply generally? We had the Botany supply to fall back upon then.

489. How long ago was that? Immediately after the pipes were tried.

490. Just after the temporary system was abandoned? Yes.

491. That was the time when the colour of the water in Sydney was so impure for a day or two? That impurity was not owing to the break, but owing to the rainy season which followed, and the canals were not properly protected.

492. I suppose that is incidental to a new work in any part of the world? Yes; I never saw new works started without some such occurrence.

493. Have you since had any complaints as to the character of the water? No; the water has been splendid.

494. Have you visited the catchment area above the Pheasants' Nest? Yes; but I have not seen the whole of it. I have been through it all except the head of the Nepean.

495. Is not that the proper source? No; I think we get quite as much from the Cataract and the Cordeaux.

496. Is not that at the head of the Nepean? No; I refer to the head of the Nepean itself where it parts from the Cordeaux.

497. But are not they the watersheds which supply the Nepean? Yes; they are all tributaries.

498. The water got for the purposes of supply is above the Cataract, is it not? Yes; all above the Cataract.

499. Is there not a tunnel from the Cataract to the Cordeaux? The Cordeaux is at the Pheasants' Nest, and a $4\frac{1}{2}$ -mile tunnel from that leads to the Cataract, and a dam is made there to divert the Cataract and the other two rivers into a tunnel 2 miles long.

500. Therefore the great catchment area is entirely above that? Yes.

501. The settlement about Picton would not affect this supply? No, I do not think it would.

502. It goes down into the Cow pastures, and from there into the Nepean, at Penrith? Yes.

503. Actually there is no settlement on the catchment area above there? No, so far as I know.

504. It has been stated to-day that there are one or two mining settlements there.—Do you think they should be allowed to remain? With extreme precautions they might. If it is very valuable I do not think they ought to be disturbed, because you can secure the river against impurities.

505. Still, with a view to having the catchment area as pure as possible, would it not be desirable to keep off any settlement? Yes, in that respect, certainly.

506. Do you know anything of the mineral work which is being carried on there.—Is it gold or coal? Coal is the only thing I have heard of.

FRIDAY, 28 SEPTEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. WILLIAM HENRY SUTOR.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHREY.

HENRY COPELAND, Esq.

ALEXANDER KETHEL, Esq.

JOSEPH PALMER ABBOTT, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee proceeded to further consider the proposed Storage Reservoir at Potts' Hill and the laying of a second line of pipes between Potts' Hill and Crown-street.

John Trevor Jones, Esq., Engineer to the Water and Sewerage Board, sworn, and further examined:—

507. *Chairman.*] Were you present yesterday when this Committee made an inspection of the proposed new works at Potts' Hill? Yes.

J. T. Jones,
Esq.

508. And also when we traversed the proposed line of pipes from Potts' Hill to Crown-street? Yes.

509. I think you have stated that the proposed works were of such a character that you concurred with them? Yes; they meet with my approval. I cannot see how a scheme for a city like this can be complete without such an auxiliary.

28 Sept., 1888.

510. Independently of the supply which it would give to Sydney in the case of the main line of pipes giving way, would it be of great value for the purpose of supplying the southern suburbs, which is part of the project? Yes. Before the pipe is well in use I anticipate that the increased consumption in Sydney and its suburbs will amount to such a quantity as will require a second pipe. It is possible that the supply for Sydney and its suburbs cannot be met three or four years hence by the present single pipe.

511. I think you have stated that you are still keeping up the Botany supply? We keep the machinery in readiness.

512. The dams, of course, are still intact, the supply is there, and the whole machinery is ready in case of necessity to use it as a supplementary or auxiliary supply? Yes.

513.

- J. T. Jones, Esq.
28 Sept., 1888.
513. Do you think that the Potts' Hill project is of greater value than the Botany supply? Yes. With a small 30-inch pipe from the Botany supply it would be very difficult, in the event of the failure of the present pipe from Potts' Hill, even with very powerful pumps, to keep Sydney well supplied. Another reason is that I consider the supply for Botany, within a very short period, will not be trustworthy.
514. For what reason do you think it will not be trustworthy? I have reason to believe that a considerable portion of the land which forms the Botany watershed has been sold.
515. With a view to sub-division and settlement? Yes.
516. Will that vitiate the purity of the water? Yes; it will render it suspicious at any rate.
517. Are you of opinion that the Botany supply will be very much affected by the improvements now being carried on at the Centennial Park? No.
518. Is there not a great deal of removal of the soil at the Centennial Park? Yes; and no doubt there will be some manuring of the surface. That would tend to vitiate the water, but it has to travel so far afterwards, and filter through so many yards of sand, that I hardly think any impurity will occur. The tendency of running water is to purify itself, and in a very remarkable degree, as I am able to prove. I had water proved by a chemist to be unsuitable for consumption at the one point; and three chains away from there, after it had trickled among grass, I took up a bucket of the same water, without telling the chemist anything about where the water came from. I submitted it to him and he pronounced it perfect. So I believe that notwithstanding anything which may happen to vitiate the water in the Centennial Park, it will become purified by the time it reaches the lower dam, and even before that.
519. How many dams altogether are there? Ten in the lower, and nine, I think, on the Lachlan Reserve.
520. Then the percolation in the course which the water takes from the catchment area above down to the last of the dams necessarily clarifies it? It does not all percolate. When it runs low down we are obliged to run it through the pipes. But every bit of it is percolated in the upper dams.
521. Does it not pass through aquatic vegetation which has the same effect? Yes. That has undoubtedly the property of depriving it of various germs. I am almost certain of that. We had a sample of the water tested every quarter, from every place where there was the slightest suspicion; and it was always classed as No. 2. That perhaps would sound rather detrimental if I did not explain that No. 1 water is perfectly pure water. Of course no water collected in that way could be perfectly pure.
522. On the whole do you think that the different contracts, as far as you are aware, connected with the excavation of the Potts' Hill Reservoir are within a reasonable cost? I have not examined them. My attention has not been drawn to them.
523. Do you know the gross amount of the contract? No; only roughly. I understand that it is £65,000.
524. No; it is £55,000? That seems a reasonable amount.
525. As far as you have formed an opinion on the project now under consideration, do you think that it is satisfactory? I think so. It is a necessary part of the waterworks. I have two reasons for thinking so. The one is that if anything should happen to the 6-foot pipe which fills the reservoir, or if anything were required to be done to it, you would have to stop the supply to Sydney while performing the operation. But when you have this reservoir at Potts' Hill you will be able to stop that pipe and apply any remedy or make any repairs you wish without stopping the supply of water to Sydney. The second reason is that that pipe, if it had to feed the city only, as the city consumed the water, would cause fluctuation—that is to say, it would be necessary during the night, when the consumption is very small, to restrict the flow through that pipe, and prevent it from doing full duty. It would not be doing half its work. With the reservoir it will be flowing uniformly all the time.
526. Then the reservoir would form an independent supply of its own for the time being? It would last a week at all events.
527. Do you think that it would be sufficient to give time for ordinary repairs in the event of a burst between the Prospect Dam and the reservoir at Potts' Hill? Yes; I think it is a very ample provision.
528. And do you think that it is very desirable? Yes. Of course, with such an accession the water supply might be compared with the most perfect water supplies in the world, and it is more perfect than most water supplies in the world; but I do not see why Sydney should not possess such a water supply.
529. Have you given much attention to the proposed lines of pipes? I have.
530. Two or three routes have been traversed? Yes. Both Mr. Hickson and myself are agreed that the one we traversed yesterday is the best so far. It might be well for the Board to examine the others, but we have paid attention to it, and have obtained the opinions of those whom I respect, and the line we traversed yesterday is the favoured one with us all.
531. Do you think that it is the most desirable one? Yes; one advantage being that it is shorter and straighter, and utilizes the tunnel already made for it at Redfern. It crosses the railway at a place where there is a tunnel to go under without interfering with anything. All the other proposed lines inconveniently intersect the railway once or twice.
532. Is your Board given powers of reconstruction in any way, or power to make an alteration in the pipe service beyond ordinary repairs or improvements? I think that, like a railway, it is contemplated that the Board shall take over the maintenance of the works, but I think it is intended that the Government shall take in hand any contemplated large extension.
533. For instance, would you feel warranted in carrying out the deviation of a pipe line? Not a main trunk pipe when it is laid, unless the Government should hand over that power to the Board.
534. Do you recollect if you have that power now under the present Act? I believe not. The Act does not contemplate that condition of things at all, so far as I remember.
535. As far as the Botany supply is concerned, has your Board an intention to keep it in a state of repair, or in sufficient order to meet emergency or accident, as a supplementary or auxiliary service? I think it is contemplated to leave it alone when this second pipe is laid. Sydney will then be secured against any casualty.
536. Would you get rid of it altogether? I think they intend to sell the land and do away with the service altogether.
537. What is the diameter of Busby's Bore? It varies. It is 2 feet in lateral width, and 4 ft. 6 in. in height generally, but it is very irregular.
538. Does it pass under several buildings in the city of Sydney? It passes under Marshall's Brewery and a few buildings behind it. It passes under part of Darlinghurst Court.
539. Then it comes through Oxford-street to the corner of Hyde Park? Yes.

540. Would it not pass under several of the buildings in Oxford-street? No. It goes straight along Oxford-street about 4 feet from the kerbstone. J. T. Jones, Esq.
541. Have you examined it? I have walked right along it several times.
542. Is it in a fair state of repair? No; but it is quite capable of being put in repair. Being composed of loose rubble without mortar, in many places the pressure has dislodged some of the stones, but they could be easily replaced if required. 28 Sept., 1888.
543. Is it intended to keep it in existence or to close it up if the Botany supply ceases? It is being utilized just now. There is a soakage in it. You may remember in the history of that tunnel that it supplied water to Sydney several years before it penetrated to the swamps. There was a soakage from Surry Hills. That stream of water is still flowing in the tunnel, and has to be got rid of. On my advice, Mr. Bennett has utilized it to scour the sewers. He has put a connection into the sewers by which the sewers can be scoured out.
544. Can it be kept for that purpose? I see no objection to that.
545. It will have to go under repair for that? No. For some time there was ground for suspicion that the water was being polluted in Riley-street, and I immediately lined it with iron pipes. That is the only dangerous part. If the masonry came in the iron pipes would take the place of the masonry.
546. Do you have many applications for water services in the suburbs of Sydney? Yes. They might be counted perhaps by the thousand streets. The applications since the Board was formed have been immensely numerous.
547. Do they come direct or from the municipalities? No; sometimes they go to the municipalities who endorse them, and send them on to the Board; but they generally come from the residents who club together and send a petition to get an extension.
548. Would not the water service be supplied to the municipality instead of to individuals? No; there is no intention to do that. The Board has refused to do that, even in the case of Liverpool and Campbell-town. The Board says it will supply the water on the same terms as to any other suburb, dispensing the water, and charging rates for it.
549. What rates are you charging now? We are now charging 6d. in £1 upon the assessed annual rentals or values of the property. The system of counting the rooms has been abandoned by the Board.
550. The property is not valued? The Board generally adopt local municipal valuations.
551. Is it a condition before you give a water service that the property is valued? Yes.
552. Then you charge them 6d. in the £? Yes. We had to adopt the valuations of the municipalities at first, owing to the hurried way in which the Board was brought together. It will hereafter be necessary for the Board to provide its own valuation, or perhaps to scrutinize the municipal valuations closely.
553. *Mr. Garrard.*] Do you charge 2½ per cent. on ⅓ of the annual value? Yes.
554. *Chairman.*] What is the nature of the arrangement between the Board and the Corporation now? With regard to water, no arrangement whatever.
555. They are using the Nepean service? Nothing else is used except Nepean water.
556. In what way is that paid for? The Corporation has nothing to do with it. The Board sends out its papers and collects the money directly.
557. Do you recollect what the city income is for water? It came to £83,000, plus the meter rate. It came to £90,000 altogether, including the meter rates; and there was a great want of certainty about it, because at the last a lot of people refused to pay when they found that it was not legal to pay the Corporation. But I had estimated last year's revenue from all sources at £90,000 13s. 6d.
558. You cannot tell what was actually received? Yes; up to the present date; but we have not received all this year's rates yet. The papers have yet to be issued for the last half-year.
559. Have you made any approximate estimates? £120,000 is what we shall receive this year altogether.
560. Is that for the city service? No; city and suburbs.
561. How far do the suburbs extend now? It takes in the whole of Waverley, Bondi, and Randwick. From Randwick to Waterloo, Alexandria, St. Peters, Marrickville, Petersham, Ashfield, Burwood, Homebush.
562. Are they all supplied? Yes; and part of North Shore.
563. Does that supply go from Waverley? No; it goes from Paddington to a portion of North Shore, and we have a small pump at North Shore to lift it to a level of 316 feet above high-water mark.
564. Does that reach the highest point of North Shore? It will give a fair service to North Shore unless we go very far inland in the direction of Lane Cove. At present North Shore is supplied by a 9-inch submarine pipe under the harbour. It is not an effective supply, being too small.
565. From your observation do you find that the consumption of water is increasing owing to the citizens having a greater supply than they had before? Yes; it is increasing per head; but the consumption is not rising so rapidly as I expected it would. I thought that the knowledge that there is an ample provision of water would have caused the consumption to rise faster than it has. I think the habit of carefulness with water has been so inculcated among the people of Sydney that they are economical by nature. They are much more economical than the same number of people in Victoria.
566. Do you regard the late drought as a protracted one? Yes; it was quite exceptional.
567. Was the rainfall considerably less than usual? It was 40 inches below last year; and it was about 29 inches below the average.
568. Do you know whether this deficient rainfall in Sydney has also prevailed in the neighbourhood of the sources from which the new supply is derived? I think so. It has influenced them very largely.
569. Have they had a similarly low rainfall? Yes.
570. Do you still keep a record of the quantity of water which passes at the Cataract? Yes; the Harbours and Rivers Department has got that.
571. Is the measurement still accurately kept? Yes; accurately and carefully kept.
572. So that you can tell in a moment the rainfall in one year as compared with another year? Yes; we can compare them very easily.
573. Have you been advised as to the number of inches of rain which have fallen this year at the head of the Cataract? No; I have not.
574. You have heard, I suppose, that the rainfall has been equally as low there as it has been in the neighbourhood of Sydney? I have found that, although the rainfall there may have been a little more than it was in Sydney, it was not very much more.

- J. T. Jones, Esq.
28 Sept., 1888.
575. There are certain rivers along the coast—George's River, and portions of the Nepean, not connected with the water supply, which would show the rainfall as well as the ordinary measurement? Yes.
576. Is the work of collecting the revenue of the water supply very great? It is. It has been very expensive so far, because the preliminaries in bringing it under a proper system were rather extensive. I have no reason to anticipate that the cost will increase as the amounts increase. The same staff will be able to collect a larger amount next year.
577. After your arrangements had been made do you think the cost will not be so great? I am sure it will not, because the books have had to be framed, and it caused considerable labour. Assessments of all sorts were made, and abstracts of other books taken which will not be necessary in future.
578. Do you know whether your Department has made any estimate of the actual net return you are getting from the outlay upon the waterworks? Yes; a very careful one.
579. What is the amount? It is under the estimate. Six pence in the pound has been found too little to pay the interest. We have now to pay interest on nearly £2,250,000; so that we have first of all to pay about £100,000 a year as interest, and we have of course to make the rates sufficient to cover the maintenance of the works, the collection of the rates, and other necessary expenses as well as the interest on outlay which is the first charge upon the revenue. It is expected that the revenue next year, under altered circumstances, will be £143,000.
580. Do you propose to increase the rates generally? Yes. Chiefly for the smaller tenements. It does not much affect the higher ones. But it affects them all round in a measure.
581. As the population increases, I presume you estimate that the works will yield a larger return? The expenses will begin to diminish. That is to say, the outlay for extensions will begin to diminish and the revenue will largely increase, so that the rate may be reduced again hereafter. But the Board seems to consider it to be its duty to pay interest on the sum expended.
582. Do you find the works, as handed over to the Water and Sewerage Board, in thorough good order? In splendid condition.
583. Does that apply to the engine power, the different reservoirs, and other works? I allude, of course, to the works handed over by the Government, and not to those handed over by the Corporation. The Corporation works were very much behind.
584. In what state is the Crown-street Reservoir? Excellent.
585. Is it a faithfully constructed work? Yes.
586. And in decent repair? It is in such good repair that although I emptied it with a view to giving it a coat of cement last year, I refrained from doing so because it was in such perfect repair.
587. Do you think that the revenue from the water supply is sufficient to justify the increased expenditure which is now asked for the reservoir at Pott's Hill, and the second line of pipes to Sydney? I am of opinion that it ought to be made sufficient at all risks. There is an objection to a large expenditure at this early stage. That is a natural objection, but I do not think the charge is too much for the revenue of a wealthy city. A house here of £100 rent does not pay as much by a long way for water as a similar house in Melbourne does, and their water supply has not cost anything like what ours has cost. Their rate is much higher than ours.
588. Are you of opinion that the proposed work is of such great value that its cost is justified? Yes; I am quite of that opinion.
589. What is the present population which you are supplying with water? We are now supplying nearly 60,000 houses. If we take five individuals for each house that will nearly always bring out the right figure. We are therefore supplying 300,000 people. Five is perhaps a little over the real number for each house, but it is over four.
590. Is that about the number you are supplying at present? About 250,000 is what we estimate we are supplying at present.
591. How many can you supply when the work is complete? We can then supply 500,000 people with liberal supplies of water, but I think that the supply will have to be liberal in future because so much use is made of it for trade purposes. I think that demands will be made for larger quantities in future.
592. *Mr. Humphery.*] Do you say that the revenue is not sufficient to pay interest on the expenditure and the costs of constructing the works? The revenue for this year is not sufficient.
593. Did you estimate the revenue for this year at £120,000? It was estimated at that amount, but it is apparent it will not realize so much.
594. Did I understand you to say that £20,000 had been received by the Corporation last year? I think that if all dues had been paid, the Corporation would have received a little under £90,000.
595. Did you estimate that you would receive £120,000 this year? Yes.
596. What did you actually receive? We cannot tell yet. The year is not yet over, but we can foresee that £105,000 will be this year's revenue. We must make next year's revenue £143,000.
597. Will not that be more than 4 per cent. on £2,250,000, after deducting all expenses? The expenses are very heavy.
598. Are they £50,000 a year? I cannot venture to say what the amount is; but I think the expenses are £40,000.
599. Is not the sum expended £2,250,000? It will be £2,500,000 at the end of this year.
600. Will you be expected to pay 4 per cent. on that? Yes.
601. That will be £100,000 a year?
602. If your income is £140,000 a year would not the difference between interest and revenue be enough to cover the expense for maintenance? All money spent on reticulation and extension goes to capital, and is not charged to maintenance.
603. Four per cent. on £2,250,000 will be £90,000 a year? Yes.
604. You will have £50,000 to cover the expense of your Department, and collecting rates. Will not that be ample? I know that we were astonished at the amount that had been expended. The expenditure was above our estimate. I would like to refer you upon this subject to our Secretary, who has made this his business. Mine has been more confined to the engineering work. I have supplied the figures. He has manipulated the amounts, and brought them out in a very concise and business-like manner. I did not anticipate that I should have to go into this question, otherwise I would have supplied myself with the necessary information.
605. Did you say that the pipes between Botany and Sydney are 30-inch pipes? 28-inch pipes practically, because there is about an inch of rust inside of them.
- 606.

606. What quantity of water could be conveyed by those pipes? It depends upon the pump. We have lifted as much as 6,000,000 gallons per day, working day and night.

607. Would the duplicate lines of pipes from Potts' Hill convey three times that quantity? Yes.

608. So that the Botany supply, even as an auxiliary to the present 48-inch pipe supply, would not be nearly as useful as the proposed second line of pipes? No. It would not be a satisfactory substitute at all. A question was put to Mr. Hickson, or Colonel Rowe, last night, as to whether, if more powerful machinery were put at Botany it would not be a good substitute for the proposed works at Potts' Hill. The only objection to that is, that the pipe is not large enough for heavy powerful machinery to drive water at what is accepted as the velocity that it will travel through pipes. 4 to 5 feet per second is the greatest velocity allowed or recommended by engineers in such pipes, and that pipe is not sufficient. It would not provide a sufficient quantity for Sydney at that velocity.

609. *Mr. Copeland.*] What number of tons of pipes would be required for this second line from Potts' Hill? There are 3,300 pipes 12 feet long. I think £90,000 is the statement of the cost made to me by the Public Works Department.

610. What I want to know is the weight? 11,000 tons. I am trusting to my memory in making that statement.

611. What is the length of piping required? 10 miles.

612. What is the diameter? They are to be 4 feet in diameter.

613. What is the length of each pipe? 12 feet long, as laid in the ground without including the socket.

614. What is the thickness of the iron? $1\frac{1}{2}$ inches.

615. Can you say positively what is the total weight of the pipes? $3\frac{1}{2}$ tons each.

616. Can you say whether it would be possible to get these pipes manufactured in the Colony? Certainly it would be possible.

617. Do you know whether it is the intention of the Department to call for tenders for them in the Colony? I think it is the intention to leave it open for all the world.

618. They could be manufactured in the Colony? I have no doubt of it. Of course they would be very much more expensive.

619. Are they cast-iron? Yes. Some pipes of a similar character have lately been made for the Sewerage Department by a little firm in Darlington. They are of excellent quality, and made as well as any pipes I ever saw. They are of the same diameter, I think.

620. In all probability if tenders were called for by the Department they would be responded to by manufacturers in the Colony? I hope so. I fancy of course that they would try for it.

621. Did you state that the rate the Board proposed to charge for this year was 6d. in the £ on the annual value of the property? Yes; on the annual value, less the usual 10 per cent. for outgoings.

622. You do not propose to charge according to the number of rooms? No; that is abandoned.

623. What is the charge in Melbourne? 8d. in the £ on the annual value, less outgoings.

624. And you propose to charge 6d. in the £? We propose to increase it to 8d. next year. We are bound to do so in order to produce the revenue necessary to carry on.

625. Do you think that if the rate is increased to 8d. in the £ the works will pay? It will just pay all expenses. The Board never wish to have any balance over if they can so adjust it.

626. Can you state whether any new settlement is taking place on any portion of the water-shed or catchment area of the Prospect Dam? No; I am not aware of any. Several applications have been made for mining sites; but they have been answered, I believe, to the effect that it is entirely illegal. That would be high up at the head of the Cataract River.

627. Do you know whether the land has been reserved for the water supply? Yes; so far that they are proclaimed as reserves; but I think there is another formality to go through.

628. Is there any action being taken to beautify or adorn the lands in the vicinity of these large sheets of water? There are no large sheets of water. There is only the natural river. At the Pheasant's Nest there is a small 10-foot dam thrown across it, and the sheet of water is not much larger than twice the size of this room.

629. What is the superficial area of the Prospect Dam? I do not know the acreage. I think it is 2,000 acres.

630. Is not that a large sheet of water? Yes; an enormous sheet of water. I did not know that you alluded to that. I thought you alluded to the catchment area.

631. Has any action been taken to plant ornamental trees there? Nothing.

632. Do the Board propose to take any action in that direction? I do not know. It may be the Board's intention to do so; but at present they have hardly had time to consider it. I may say that there have been general discussions as to the necessity for doing away with the shallow water on the immediate foreshore, as it causes disturbance to the soil.

633. Is it not the custom in other Colonies and countries to beautify these places? That is the case with small places, but I do not remember any large sheet of water being decorated. There is not the slightest objection to it.

634. Is not that done at Ballarat? Yes; the Gong Gong Reservoir is planted and decorated.

635. Has not something been done at the Yan Yean? Not in my time.

636. Do you think it would be objectionable to have fish in the Prospect Dam? No; I think it would be rather a good thing.

637. I suppose you are aware that they have perch, carp, and other fish in other large reservoirs? Yes.

638. Do you think it would be at all injurious? No. Quite the contrary.

639. Would it be rather beneficial to the water? I have always believed that it would keep the water fresher.

640. Would it not be desirable to have a large public sheet of water like that stocked with fish, and made a place of resort for picnic parties and that sort of thing? With restrictions, I certainly think that would be desirable.

641. Would it be a difficult thing to get from the railway to the Prospect Dam? There is about 3 miles of very level land to travel from one of the stations. It is quite accessible as far as the 3 miles are concerned. It is only about 6 miles from Parramatta.

642. Do you know whether tenders have been called for those pipes? None have been called for yet.

643. *Mr. Watson.*] Do you use any meters now? Yes. A large number. There are over 2,000 in use altogether.

- J. T. Jones, Esq.
28 Sept., 1888.
644. You do not always charge by valuation? No. The valuation is always the minimum charge upon any premises. It is a sort of rate upon the house. You can have a meter for your private house at your own option, and if your meter should exceed what we call the water rate you would have to pay the excess.
645. What do you charge per thousand in that case? 1s. 6d. per 1,000 gallons.
646. Was it originally the intention of the Board to have a sliding scale? It has a sliding scale.
647. What is it? It begins with 6d. in the £ this year. That is for all properties up to £300 a year. Then it drops down to 4d. in the £ for the difference between that and any other amount up to about £3,000. Then I think it is 3d. in the £.
648. Supposing any gentleman had a property valued at £500 a year, would he have to pay only 4d. in the £? After the first £300 it would be 4d. in the £; but for the first £300 he would have to pay 6d. in the £. You might have a valuable house paying less than houses of small value if a sliding scale were not adopted.
649. Have you ascertained whether the room system would produce more revenue than the valuation system? I have not had the means of determining it actually; but it makes a wonderful difference in small houses. In some houses in town where the rates were about 7s. a year under the old system, they have suddenly jumped up to £30 and £40 under the new system.
650. You do not use a meter for every house? No.
651. How do you select them? We do not select them. If people use any water over and above the domestic supply they are forced to have a meter. They may require water for an engine, for a garden, or for any purpose other than domestic purposes, then a meter is enforced, and we ascertain how much is used.
652. Did you not mention, in reply to Mr. Copeland, that if the water pipes were manufactured in the Colony they would cost much more than imported ones? Yes. That has been my experience in Melbourne and here.
653. How much more would they cost? The last contract in Melbourne was £8 3s. 6d. per ton, and we can buy the best pipes for £6 10s.
654. The colonial pipes would cost 25 per cent. more? Yes.
655. What is the freight on those pipes? We got them delivered in our own yard at £6 10s. per ton free from blemish. Finding it very difficult to manage the receipt of the pipes from the ships I got the City Council to enter into contracts for delivering the pipes actually in our yard. That has been found very satisfactory, and much cheaper than the other way.
656. Mr. Kethel.] How did you arrive at the charge of 3s. 6d. per room on all properties connected with the water supply last year? How did you arrive at the consumption per room? They were not limited to any consumption. They got as much water as they liked; 3s. 6d. per room was a guess quantity. It was 5s. per room at first, but it was found that that charge produced a surplus. Then it was reduced to 4s., and afterwards to 3s. 6d. It was a matter of experiment.
657. Then we understand you have based the charges for water supply not on what the people do use, but on what the exigency of your business requires? Yes; that is the case.
658. You are supplying I think 10,000,000 gallons per day to the city and suburbs? Yes.
659. If you sold all the water at the rate you now charge by meter, that is 1s. 6d. per thousand gallons, what revenue would that bring in? £273,750.
660. And your revenue for the present year you estimate will only be a little over £100,000? Yes.
661. How do you account for the immense waste shown in the difference between those figures? What becomes of the water not paid for? It is always considered by engineers dispensing water that the water is for the convenience of everybody, and should not be limited in any way for domestic purposes; but when it is used for other purposes it is expected that it should be paid for *pro rata*.
662. Have you any idea what becomes of the water that is not paid for. Is it used legitimately? It generally goes for bathing. You may say that everyone who uses a bath uses 60 gallons every morning.
663. Is water supplied by the Board for any other purpose which does not return a revenue? Only for charitable institutions, watering streets, and flushing sewers.
664. Are you aware that there is a large daily consumption of the water by the Municipal Council of Sydney? Yes; that is the case. The City Council is using a large quantity of salt water, but they flush the sewers with fresh water.
665. Have you no power to charge them for that? No.
666. On the ground that the use of the water is conducive to public health? Yes.
667. I understand that the present pumping engines at Crown-street are condemned as being unfit for the heavy strain that will be put upon them? Yes.
668. What steps have you taken to supply others in their place? We have ordered from England a 300-horse power Worthington direct acting engine of the very newest type and the most economical in working.
669. I believe you cabled for that? Yes.
670. Was the necessity for that engine so extremely urgent as to require the cable to be used? Yes, it was an extremely urgent case. The engines at Crown-street are now cracked in both cranks, and they are in imminent danger of giving way altogether, in which case we could supply the Paddington Reservoir by means of the old Botany pumps, but not to the extent of the consumption. The smaller pumps, which I took you to see in the small room, are themselves nearly rotten, and I am amazed to see them doing such heavy work as they now do. This new engine will replace them, but we do not mean to immediately do away with them; we shall keep them for emergencies until still another engine is imported of this new type.
671. I understand that there are a number of other engineers in various parts of the world who construct engines of very great excellence for pumping water? Yes, but nothing like the excellence of the Worthington engines.
672. What are their essential points of excellence which influenced yourself and the Board's advisers to order this special type of engine? First of all, there is what is called the direct-acting engines for pumping. It was seen that it was not absolutely necessary to have fly-wheels for them as for other engines, because the exact action of the pump is merely reciprocal, running backwards and forwards. The action was so simple that it was seen that all that was necessary was to put the piston at one end, and the pump plunger at the other end. This was carried out, and it was found to cheapen pumping very much

J. T. Jones,
Esq.

28 Sept., 1888.

much. However, while it was economical in the original cost of the pump it was expensive in the consumption of coal. Moreover, they thumped against the end of the caps of the cylinders at every stroke in a way that endangered their safety, and they made a great noise, which rendered them unfit for working in a populous neighbourhood.

673. What type of engines have you? Direct-acting, similar to those made by Worthington, Black, Tangye, and several others, whose names I have forgotten. There are a great many firms who make direct-acting engines. They began to adopt Worthington's plan of making them silent in working by having the duplex system. Shortly afterwards Worthington invented what is called compensating cylinders. By these means the efficiency of the pump has been greatly improved, and they have made the pump do the same work with half the former quantity of coal.

674. Do you know that there is great dissatisfaction among engineering experts in consequence of the Board cabling home for the engine, and that it is boldly asserted that other engines could have been cheaply purchased here quite equal to the one to be imported? The only engine that has pretensions to equal it in efficiency is the latest produced by Hathorne & Davey, and that will not come up to the Worthington in cheapness or efficiency. Moreover, they have not yet got that pump ready. They only invented it a short time since.

675. Was it under your direction that pumping engines were last year, or the year before, placed at Marrickville or some of the south-western suburbs? Yes; in 1886.

676. Were they manufactured in a remarkably short space of time by a Sydney firm? No; they were bought from Tangye's shop ready made. There was an engine placed at Botany; but it was already made in California. Mr. Selge brought it out.

677. What portion of the work did the Atlas Company perform in connection with that? I do not know. They never told me.

678. Would it not be worth while to ascertain if a colonial firm could have done that work and supply you with it as soon as you could get it by cabling to England? They could not give us such an efficient pump. They could have made a pump to answer an emergency. I wanted to get an engine on the efficiency of which I could depend to do the work, no matter who made it.

679. Were you consulted as to the type of engine and pump? Yes; and I strongly recommended the one now coming. That is the Worthington pump and engine. I did so after very close scrutiny and careful deliberation with Mr. Darley and several other gentlemen whose opinions I value very highly.

680. What provision has been made in connection with the Prospect Reservoir to prevent vegetation growing into the water so as to partially pollute the water? Nothing whatever.

681. Is it intended to allow the rank vegetation that grows on the banks of creeks and dams to grow right into the water? I think it is very doubtful as to whether it is not beneficial.

682. Do you not think it would be desirable to clear away the trees? Yes; the trees by all means, but I think that the growth in the water itself tends to absorb impurities. Water which was unfit for consumption at one dam was pronounced by the city analyst to be fit to be placed in the reservoir after flowing through grass and vegetation for a distance of 3 to 5 chains.

683. At what rate do you think that consumption of water is increasing and will increase when the proposed reticulation is completed? I think that 30,000,000 gallons per day will be used in hot weather.

684. What was the average daily consumption of Sydney when you first took charge of the water system? 5,000,000 gallons, almost exactly. Then came the dry year of 1881, and the supply falling short, I looked to see where it was going. I discovered that it was being wasted, and I brought down the consumption to 3,500,000 gallons per day. It remained at that for a year and a half. Then it began to rise, owing to the extensions in the suburbs. But I made great savings. It was very lavishly used in Sydney.

685. What was the amount of water which the Hudson Bros. were bound to deliver per day? 3,500,000 gallons.

686. Was it estimated that that would be sufficient to meet the immediate requirements of Sydney? Yes.

687. That was to supplement the Botany supply? Yes. It was a great blessing to Sydney, because the water got very scarce.

688. Is it your opinion that this duplicate pipe line which we are now considering in connection with the excavation and completion of the reservoir at Potts' Hill will be ample; or do you think it would be wise within the next few years to initiate a scheme such as was suggested some time ago to supply the city with water from Kenny Hill? I think there will be plenty of water for years. The merit of the Prospect scheme for quantity is almost unrivalled. It will last us for many years, and it will give us ample time to consider the necessity for further extension. I have no doubt that when the city grows to the size of New York the future will demand such an addition, and the Kenny Hill site will be looked at and examined carefully as to whether it will not be a good supplementary scheme, and I have reason to believe that it will be.

689. I believe the present catchment area is identical with that proposed for the Kenny Hill scheme. Would there be a sufficient additional supply of water to enable you to design and carry out that scheme? Plenty, without any detriment to the supply. It would be filled during flood time from the superfluity of water.

690. Would such a scheme be preferable to that suggested a year or two ago, to place powerful pumping engines some short distance beyond Penrith, where there is a long stretch of water of the Nepean? I thought there were several farms in that vicinity, which would make it objectionable. I do not know that country very well.

691. *Mr. Sydney Smith.*] Is there any objection to the Penrith scheme other than pollution? I have not sufficiently examined that to know exactly what quantity could be obtained. Moreover, I have not formed any estimate of the cost of the line of pipes, and the pumping. I am not in a position to answer.

692. What is the pumping capacity of the new engine for Crown-st.? 5,000,000 gallons in ten hours. The large bulk of the water is used during ten hours of the day. At night it falls off; so that the engine is obliged to work at more than double rate to meet the consumption.

693. Did you give great consideration to the Kenny Hill Scheme? Yes; but I never had an opportunity of surveying the ground, nor had time to make an examination of it. When I first came here, having been always used to gravitation schemes, I was enthusiastically in favour of gravitation schemes; but I no sooner examined the present Nepean scheme, than I was obliged to admit its fitness for the supply; and, therefore

J. T. Jones,
Esq.
28 Sept., 1888.

therefore, it weakened my advocacy of the Kenny Hill scheme. Although I was a great admirer of the present scheme, at the same time I regretted that it did not deliver the water at a higher point in the city.

694. Have you given any consideration to any other scheme? Mr. Manning's scheme drew my attention for some time, but it would not answer on account of the smallness of the catchment. I never gave much favour to that scheme.

695. With regard to the quantity now flowing out of the Prospect Reservoir, I understand that it is capable of delivering 16,000,000 gallons? From Prospect we can get 50,000,000 gallons.

696. I mean from the Potts' Hill Reservoir with the present line of pipes? 17,000,000 gallons.

697. How many gallons come into Sydney at present? 10,000,000 per day.

698. Have you ever gone into any estimate as to the total number of houses that will be supplied by the Sydney water supply when you have all your pipes laid down? No. I have not gone into any careful estimate of that, but I should judge that we should then have to supply 20,000,000 gallons per day.

699. There is a large number of people not supplied at present, and when you have made provision for supplying those houses with water, can you inform us what estimated quantity of water will be required for that purpose? I estimate that 30,000,000 gallons of water will not be too much for us six years hence on a hot day. I fancy that when we have spread the water over the suburbs, the effect will be very much the same as it was in Melbourne. A large quantity will be used for gardens. Then the climate is warmer here, and it induces people to bathe more than in Melbourne. People indulge in plunge bathing for a longer period of the year than they do in Melbourne. Here and in Melbourne, when the cold weather sets in, there is a tremendous difference in the amount of plunge bathing. In Sydney there are more warm days during which plunge bathing is enjoyable than in Melbourne. Therefore I think that Sydney people will eventually be very large consumers of water. I think 30,000,000 gallons per day will be required in six years.

700. How many million gallons can you deliver at Potts' Hill by the present line of pipes? The 6-foot pipe that comes into Potts' Hill is estimated to give 50,000,000 gallons.

701. And this additional pipe to Potts' Hill? It will deliver 18,000,000 gallons per day at Crown-street.

702. So that in six years time you will require all the water delivered into Sydney by the two lines of pipes? Not quite. Melbourne has exceeded 30,000,000 gallons per day on hot days.

703. To how many houses is the water supplied in Melbourne? I am not quite sure, but I think 60,000 houses are supplied. They had that some time ago.

704. Can you inform the Committee how many houses are supplied now and how many are likely to be supplied as soon as you have laid all the pipes required at present? 70,000 in round numbers. I anticipate that it will be required for half as much again.

705. 60,000 houses are now supplied with water by the Prospect scheme? Yes.

706. How many do you estimate have yet to be supplied? I fancy that 20,000 more houses will be placed under reticulation.

707. So that if the people in this Colony use the same quantity of water as the people of Melbourne, and we have 60,000 houses supplied, we shall require more than 30,000,000 gallons per day? Yes.

708. How long will it take you to complete the line of pipes and supply all the houses? I hope to be practically finished with the reticulation at the end of next year.

709. So that at the end of next year you will be supplying 70,000 houses? Yes; I estimate that, but I am not quite sure. Although I think it will be under that, I am preparing for it.

710. You think the number will be over 50,000? Yes; I am certain it will be, it is 60,000 now.

711. That is over the number actually supplied in Melbourne? On reflection I think I have understated the Melbourne numbers.

712. Taking the same proportion for consumption, you will require over 30,000,000 gallons per day at the end of next year? In Melbourne there is a difference. They have extended their water supply to places where we would hardly consider it justifiable to do so. They have supplied it to remote country farms where there is no houses for miles; and they use large quantities for irrigation and fruit-growing.

713. Is there any reason why we should not use water here for that purpose? No. I think it is well to contemplate that purpose as desirable.

714. Is it a good thing to encourage? Yes.

715. Is there any reason why we should not use the same quantity as in Melbourne, if we put the water to the same good purpose? I have every reason to believe that we will exceed the consumption of Melbourne.

716. I understand that they charge 8d. in the £1 for the water? Yes.

717. Do you know their total revenue? No.

718. Have you given any consideration to the supply of water by meter? Yes.

719. What is your opinion with respect to it? I am of opinion that it would be the best system, except for one strong objection. That is, the cost of the meters. A meter fixed in position costs between £5 and £6. When you remember that there will be 50,000 houses to be supplied you will see at once that meters would cost a very large sum of money, and in the future the number will be largely increased. Such a system would entail the purchase of large quantities of meters and the maintenance of a large staff to keep them in order. The whole cost of such a system would add so much to the necessities of the revenue that it quite discouraged the Board from entering upon the question. In order to enforce the use of the meters everywhere the Board would have to buy them and rent them out, because there are people so poor that they could not afford to pay £5 or £6 in the first instance. Therefore the only solution would be that the meters should be rented. That would necessitate the Board's being responsible for their being good perfect meters, and it would entail the Board's taking charge of them, and keeping them in good repair. All this was found to be so expensive that it would increase the water rate by a very large amount. It is found to be better policy as long as we can to give as much water as people require, and only to use meters when forced to do so. In Europe they use meters universally. In France, Germany, and Switzerland every water supply fixes a meter like gas companies. But then their supply is very limited. They have no such supplies as English communities have.

720. Have you ever made any estimate of the quantity of water used per house, taking the average number of houses, irrespective of factories and such like? I have not separated the amount as far as water is concerned. I have as far as money is concerned.

721. Do you charge 1s. 6d. per 1,000 gallons by meter? Yes.

722. Then I understand that at the end of next year you will be using 30,000,000 gallons per day? No.
723. That is if the same proportion of water is used here as in Melbourne? No; the consumption will not rise so suddenly. It is only as people get used to it that the consumption rises. I only anticipate such a consumption at the end of five or six years.
724. What quantity do you estimate will be required next year? I do not suppose the consumption will rise to more than 18,000,000 gallons.
725. What would be the revenue from that at 1s. 6d. per 1,000 gallons? It would amount to £328,500. It will not be sold at that price.
726. So that at the present rate when you charge per meter you would receive £325,500 per annum? Yes.
727. On what amount have you to pay interest? About £2,250,000 at the end of August.
728. At 4 per cent. that would be £90,000.—How much do you reckon for working expenses? £60,000 for last year.
729. That is £150,000 per annum? Yes; but I am only speaking from memory. I have reason to doubt whether this figure is quite correct on reflection.

J. T. Jones,
Esq.
28 Sept., 1883.

THURSDAY, 4 OCTOBER, 1888.

Present:—

JOSEPH PALMER ABBOTT, Esq. (VICE-CHAIRMAN).

The Hon. GEORGE CAMPBELL.

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

ALEXANDER KETHEL Esq.

JOHN RENDELL STREET, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee proceeded to further consider the proposed Storage Reservoir at Potts' Hill, and the laying of a Second Line of Pipes from Potts' Hill to Crown-street.

Joseph Barling, Esq., Under Secretary for Public Works, sworn, and further examined:—

730. *Vice-Chairman.*] It appears that a portion of this contract has been let for the construction of a storage reservoir at Potts' Hill? Yes.
731. Can you give the Committee that contract, or the particulars of it? Yes.
732. How far has the contract been let for the construction of this storage reservoir? Simply for the excavation, at present. There is a lot of other work, such as pitching, to be done. £49,763 14s. is the estimated amount of the contract now let, and the work now being done by the unemployed will bring it up to about £55,000. That is principally for excavation and forming the bank. The work we are now asking the Committee to sanction is the pitching.
733. Then a portion of the work for the construction of the reservoir has been let? Yes; actually let.
734. *Mr. Garrard.*] Has the contract been let since this Committee came into existence? The contract was approved by the Secretary for Public Works on the 13th June.
735. *Vice-Chairman.*] Is not the contract dated the 27th July? Yes; but the Minister's approval of the acceptance of the contract is dated 13th June.
736. *Mr. Garrard.*] What was the date of the passing of the Act, which constitutes this Committee? The 5th of June; but I may be permitted to point out that the 13th clause provides that it is after the first gazetting of the Parliamentary Committee that the works come under the consideration of this Committee.

J. Barling,
Esq.

4 Oct., 1887.

Reginald Bloxsome, Esq., Secretary of the Water and Sewerage Board, sworn, and examined:—

737. *Vice-Chairman.*] Are you the Secretary of the Water and Sewerage Board? Yes.
738. *Mr. Sydney Smith.*] Have you any information to supply to the Committee with reference to the Potts' Hill Reservoir and the second line of pipes to Sydney? I take it that any information with regard to that is partly an engineering question. The information I was asked to bring here was more with reference to the financial business of the Board, and statistics with regard to the population and reticulation of Sydney, and the revenue and expenditure.
739. Have you any information to give with regard to the revenue now derived, or likely to be derived, by the Board, from the water supply? Under the Corporation rating the revenue from water for domestic purposes, and by meter, was nearly £80,000 a year. The present rating by the Board will bring it up next year to £116,000, which we find is a great deal too small.
740. What amount do you think is necessary? Nothing less than £150,000 a year.
741. Do you know if the Board has power to assess a sufficient rate to obtain that revenue? Yes.
742. Is it their intention to assess it at a higher rate? It is not their present intention to assess it at a rate that will bring in that amount, but they intend to raise the rate they have already struck next year.
743. To enable them to get a larger amount to pay interest and working expenses? Not to pay the whole just yet.
744. How far do they propose to go in that direction? To about £130,000. We hope to get that by raising the rate 2d. in the £.
745. Can you tell us what is the interest payable on the outlay? Yes; the amount spent on the Nepean water scheme up to the 25th May last, with interest added, was £2,500,000. That, at 4 per cent., is £100,000 a year. Then there is the interest on £85,000 of debentures which were taken over by the Government from the City Corporation. That is £4,300 a year. That makes £104,300. Then there is one debenture of £5,000 falling due next year. The general expenses of the Board are £32,000 a year. The debenture of £5,000 forms part of the £85,000 I have referred to.
746. The whole interest will be £104,300, including the debenture falling due next year? Yes. Then there is provision to be made for the mains already laid underground. Their present value is £241,500. The average life of these mains from the present moment will be about thirty years. That will involve the payment of £14,000 a year for interest and sinking fund, bringing up the total to £150,300 to be provided.

R. Bloxsome,
Esq.

4 Oct., 1887.

R. Bloxsome, Esq.
4 Oct., 1888. provided yearly. There is still to be added to that—which I have not got—the amount spent by the Government on the Nepean scheme since May last, and whatever it will be up to 31st December this year, with interest added, and the interest also on £2,500,000 for nine months, which will be £75,000. That will be added on to the capital account.

747. Have you any idea what is the population you supply? About 275,000 is the population which the reticulation serves at present.

748. Are you actually serving that number? Yes; the calculation usually is $4\frac{1}{2}$ or 5 persons to a house, and we supply over 61,000 houses. That will give about 275,000 persons.

749. What does that take in? The city and suburbs.

750. How far out in the suburbs? It goes right beyond Strathfield. But there are heaps of places in between which are not reticulated.

751. A large number of people are not yet supplied? Yes.

752. *Mr. Garrard.*] But the mains are in to supply this large number not now supplied? Yes; most of the trunk mains are.

753. *Mr. Sydney Smith.*] Have you any idea what is the population which is not now supplied, and which will have to be supplied? I cannot say; they are so scattered, and it would be hardly fair to take the population of the city and suburbs and simply subtract the number we are now supplying. I do not know where the limits would be.

754. Still there is a very large population yet to be supplied? Yes; I suppose that the population of the city and suburbs is between 400,000 and 500,000; but I do not know what it is.

755. Have you taken into your calculation of the expenditure of the Board the cost of this storage reservoir at Potts' Hill and the second pipe to Sydney? No.

756. That will require an additional expenditure of 4 per cent? Yes.

757. Roughly stated, the cost will be something like £300,000, so that you will have to pay interest on that at 4 per cent., amounting to an additional £12,000 a year? Yes.

758. *Vice-Chairman.*] You have not to pay interest until the work is completed? No; we have nothing to do with the works until they are completed and handed over to us, and then we have to deal with them.

759. *Mr. Watson.*] But will not the accrued interest be added to the capital when you take over the works? Exactly. The present rating in Sydney I believe is one of the cheapest rates in the world for water supply. It is infinitely cheaper than in Melbourne or Adelaide. The Glasgow waterworks are the nearest approach to ours, as I believe has been already stated before this Committee. They commenced with a rate of 1s. 4d. in the £. After about fifteen years they gradually let the rate down to 8d. in the £. But it is a rate of 8d. right through, with no sliding scale such as we have here and in Melbourne. Therefore they get an enormous revenue. Although their reticulation has been finished for some time, their expenses are £36,000 a year, and they are only expending about £18,000 on extensions—a mere bagatelle. Our Board is expending over £120,000 a year in extensions, and their yearly expenses, I am happy to say, are only £32,000 a year, which sum will be still less when the control of the sewerage is handed over to the Board, because then very many of the salaries and expenses now debited solely to the water, will be divided between the water and sewerage accounts.

760. *Mr. Sydney Smith.*] What rate do you propose for next year? 8d. in the £1, with a sliding scale, so as to assimilate it as nearly as possible to Melbourne.

761. What rate have you been charging? 6d. in the £ for this six months, with a sliding scale.

762. What is the highest rate you can charge? We cannot charge more than 5 per cent. on the municipal rate. The municipal rate is 1s. in the £ right through, without a sliding scale, and 1s. in the £ would easily pay all that is required.

763. *Mr. Watson.*] What is your sliding scale? 6d. up to a valuation of £300; 5d. between £300 and £700; 4d. between £700 and £1,000. 3d. between £1,000 and £4,000, and 2d. beyond that. It graduates too much. Melbourne has not such a series of gradations.

764. What system do you adopt with regard to meters;—do you put them into every house, or merely where they are applied for? Only where they are applied for for domestic purposes; but everyone is obliged to have a meter who uses the water for any purpose other than domestic purposes, such as for stables or gardens.

765. Does all the water pass through the meter, or does the water go direct to the house for domestic purposes without passing through the meter? Not necessarily. If a man chooses he may have a meter on for the whole of his premises as well as for a stable and garden. But he must have a meter on for his stable and garden.

766. *Vice-Chairman.*] *Mr. Jones* stated that if a meter was on you would still charge the minimum rate, whether the meter indicated that that quantity of water was taken or not; and that anything beyond that would be charged for at water rate—is that the case? Yes.

767. *Mr. Watson.*] Supposing a certain quantity was used for the house, and there was not so much used as the house was taxed for, and a certain quantity passed through the meter for all purposes, would you charge for all the water that passed through the meter? If a person has a meter on for the house, the minimum amount he pays is the assessed annual rate. Supposing the water he consumes does not equal that the amount is all right. He does not get a refund. But if he consumes more than his assessed rate would pay for, he has to pay at the rate of 1s. 6d. per 1,000 gallons.

768. But if one pipe goes direct into the house and another pipe passes through the meter, you cannot arrive at that? He would have to pay the assessed rate for the house besides what he would have to pay for the water that went through his meter.

Robert Hickson, Esq., M.I.C.E., Acting Engineer-in-Chief for Harbours and Rivers, sworn, and further examined:—

R. Hickson, Esq., M.I.C.E.
4 Oct., 1888. 769. *Mr. Sydney Smith.*] I understand that 50,000,000 gallons of water per day empty into Potts' Hill by the pipe leading to that place from the Prospect Reservoir? Yes. It is capable of delivering 50,000,000 gallons per day.

770. How many million gallons per day can you deliver into Sydney when this additional pipe is laid? About 34,000,000 gallons.

771. So that you will be able to deliver 16,000,000 gallons per day more than you can send away to Sydney when you have the two pipes laid? Yes. But there are two other pipes to be put in; one to North Shore and the other to the Southern suburbs, so that the capacity of those four pipes will be 39,000,000 gallons.

772. *Mr. Garrard.*] What will be the capacity of the two pipes north and south, irrespective of the pipes to Sydney? 5,000,000 gallons.
773. What will be the total quantity taken away from Potts' Hill when all the pipes are connected? 39,000,000 gallons.
774. *Mr. Sydney Smith.*] Is that the full quantity which can be taken away? Yes. Then we have each morning stored in the reservoir about 10,000,000 gallons.
775. How long will it take to deliver those 10,000,000 gallons? Supposing we empty the reservoir in the daytime, it will fill up at night, so that we shall start each morning with the reservoir full.
776. But you cannot distribute 50,000,000 gallons with those pipes? No; 39,000,000 gallons.
777. You are only capable of taking 50,000,000 gallons from Prospect? Yes. We can take 39,000,000 gallons down, and we start each morning with 10,000,000 gallons.
778. But the capacity of the pipes is only 39,000,000 gallons? At night the reservoir will fill up.
779. According to the evidence, we can bring in 50,000,000 gallons per day from the Prospect Reservoir to Potts' Hill, but we can only take away 39,000,000 gallons with all those pipes? We can only take 39,000,000 gallons through the pipes.
780. *Mr. Garrard.*] Is it intended to draw away any water from the 6-foot main to supply any intervening places between Prospect Reservoir and Potts' Hill? Not that I am aware of at the present time.
781. Is it possible to do so? Yes, it is possible.
782. You will have 39,000,000 gallons coming to Sydney; therefore, if the 6-foot pipe carries 50,000,000 gallons you will have a surplus of 11,000,000 gallons to distribute between Potts' Hill and Prospect Reservoir? Yes; without lessening the quantity going down to Sydney.
783. *Mr. Sydney Smith.*] Has any proposal been submitted to the Government with regard to taking any water between Potts' Hill and the Prospect Reservoir? No; I only know of one, and that is to supply Campbelltown.
784. What quantity do you think they would require? Nothing has come before me on the subject.
785. *Mr. Garrard.*] Is it not proposed to supply Granville from the 6-foot main? I have not heard of it.
786. *Mr. Sydney Smith.*] Are you aware of the quantity that will be required at the end of next year for the supply of Sydney and suburbs? No; I have made no calculation. The Water and Sewerage Board have done that.
787. What sized pipe would be required to convey the additional quantity of 11,000,000 gallons per day into Sydney? It would require as nearly as possible a 5-foot pipe.
788. What would be the cost of such a pipe alone, as I presume there would be very little difference in the cost of laying it? It would cost £240,000 as against £165,000.
789. What extra quantity of water would that take into Sydney? 13,000,000 gallons.
790. How much does your present single pipe take down? 17,000,000 gallons per day.
791. How much would a 5-foot pipe take down? 30,000,000 gallons per day.
792. Nearly double the quantity; and at what additional cost? £75,000.
793. Do you think it would be wise to put down a 5-foot pipe? I think that 39,000,000 gallons per day is enough to meet all demands for a great number of years.
794. If we have it in evidence that when the two pipes now proposed are put down they will only be sufficient to supply Sydney with water for six years, do you think it would be advisable to put down a pipe of larger capacity? I think it would if the supply will only be sufficient for six years; but I would be very much surprised if that is correct.
795. If we have reliable evidence to that effect would it not be advisable to increase the capacity of the pipe to a size sufficient to carry the full quantity of water now coming into Potts' Hill? I think it would, presuming that the statement as to six years is correct.
796. *Mr. Kethel.*] Have you ever estimated the number of gallons per head of population which is required to be provided in constructing a water supply? It is usual to provide for from 30 to 40 gallons per head per day. A great deal depends upon the circumstances. If it is for a town where there are likely to be many manufactories you would require to supply more. In country towns it would be less.
797. Are you aware of the quantity per head supplied in the city of Melbourne, including factories and everything? Yes. Last year the quantity was $47\frac{1}{2}$ gallons per head per day.
798. At the same rate of consumption have you ever calculated the quantity to be supplied to the population of Sydney and suburbs when the duplicate pipe is laid and in full work? No. I do not know what is the population of Sydney.
799. We have 400,000 people in Melbourne supplied with $47\frac{1}{2}$ gallons per head per day. Sydney and its suburbs being hotter and more dusty let us allow 50 gallons per head per day. If you deliver 40,000,000 gallons per day will not that supply a population of 800,000? Yes.
800. I believe the population of Sydney and suburbs from here to Parramatta is about 400,000? I have heard that it is.
801. With the supply available for Sydney and its suburbs when the proposed duplication of the pipe is completed, and the two accessory pipes for the northern and southern suburbs are completed, will you be able to supply a population of 800,000 with an average consumption of 50 gallons per head per day? Yes.
802. Under these circumstances, is it your opinion as an engineer that it is desirable to increase the delivering capacity of the pipes beyond what is now proposed? I do not think it is necessary to increase it.
803. Have you ever calculated or ascertained from experience the probable duration of these pipes in service from the time they are laid down until it is necessary to remove or replace them? It is not known. I have known an engineer to estimate the life of cast-iron pipes at 350 years.
804. In a serviceable condition? Yes. But that, of course, simply means that it is not on record.
805. I suppose a great deal depends on the nature of the water that flows through the pipes, and the mineral and vegetable substances held in suspension? I can only say that in my own experience I never knew a pipe that required to be taken up through being worn out.
806. Is it never choked up? Not in my experience.
807. In the event of this Committee recommending the substitution of a 5-foot pipe for a 4-foot pipe would

R. Hickson, would the capacity of that pipe be very much greater? Yes; 30,000,000 gallons as compared with Esq. M.I.C.E. 17,000,000 gallons.

4 Oct., 1888. 808. Does the volume of water passing through a large pipe flow much faster because there is a smaller portion of it coming into contact with the pipe? There is less friction.

809. Therefore the larger the pipe the greater would be the flow of water? Yes.

810. Mr. Garrard.] What is the size of the pipe you propose to use for North Shore? 24 inches; and the same for the southern suburbs.

811. Is there any provision, such as valves, for supplying suburbs between Potts' Hill and Prospect Reservoir? There are scour valves which could be used, but they were only placed there as scour valves. I do not know of any valves put in for the purposes of supply.

812. Supposing a request were made by Rookwood, or any other suburb in that locality, to be supplied with water, would you supply them from the 6-foot pipe, or direct from the canal? I should think that for Rookwood the supply would be taken from the 24-inch pipe.

813. That is the North Shore pipe? Yes. It would not be taken from the 6-foot pipe.

814. What about Auburn or Granville? I do not know enough about the geography of those places to be able to say.

815. At present, we understand, you have 11,000,000 gallons of a surplus over and above what the four lines of pipes will take away from Potts' Hill, which can be used for intervening places? Yes.

816. I suppose the life of these cast-iron pipes depends upon their outside covering as much as upon the quality of the water flowing through them;—is there not as much oxydisation outside as inside? No. It mainly depends upon the quality of the water going through. There is very seldom any oxydisation on the outside if there is a proper covering.

817. Have you had much experience in taking up old pipes? No. I have seen some taken up, but they were not down many years.

818. Is there any means provided for cleansing the 4-foot mains? No; there is no special means.

819. Have you made an inspection of the 6-foot pipes? Yes.

820. Was there much growth inside? No, not much. There was a little rust.

821. Is not there much to fear from growth inside the pipes diminishing the supply? No; practically there is no growth worth speaking of.

822. Do you think it is necessary to pitch the reservoir all round? I do.

823. Because of the wash of the water? Yes; against the clay sides.

824. I understand there is no pitching at the Prospect Reservoir except at the dam? No.

825. There is no necessity for pitching there on account of the natural surface of the ground? Yes.

826. Whereas at the Potts' Hill Reservoir the natural surface of the ground will be disturbed or made up all round? Yes.

827. What is the capacity of the 24-inch pipe at North Shore? About 2,500,000 gallons per day.

828. Do you think that is sufficiently large for North Sydney? I am not prepared to answer that. It was all done before I came; but, no doubt, it was carefully gone into.

WEDNESDAY, 10 OCTOBER, 1888.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

The Hon. FREDK. THOS. HUMPHERY.
HENRY COPELAND, Esq.
ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.
JACOB GARRARD, Esq.
SYDNEY SMITH, Esq.

The Committee further considered the proposed storage reservoir at Potts' Hill, and the laying of second line of pipes between Potts' Hill and Crown-street.

Wm. Christopher Bennett, Esq., Commissioner and Engineer for Roads, sworn and examined:—

W. C.
Bennett,
Esq.

10 Oct., 1888.

829. Chairman.] Do you occupy the position of Commissioner and Engineer-in-Chief for Roads and Bridges? Yes.

830. In your capacity as engineer, have you given much attention to the proposed works between Potts' Hill and Sydney? Not particular attention. I was a member of the original Commission which recommended the works, and I have always taken a great interest in them.

831. We are now speaking of the second pipe between Potts' Hill and Sydney? I have not given much consideration to it.

832. Do you know the nature of the project, and the line on which this additional pipe is to be constructed? Yes; it is to increase the available supply of water in Sydney.

833. Have you traversed the line by which the duplicate supply is proposed to be brought? I have not seen the line since it was laid out, but I know the country generally.

834. As far as you have been able to make yourself acquainted with it, do you think it is a desirable work? Yes.

835. What is its principal merit, as far as you know? It will bring a larger supply into Sydney; and it will enable the Board to supply at higher levels by keeping the reservoirs replenished and full.

836. Will it be useful in the event of any accident happening to the present line of pipes between Potts' Hill and Sydney? Yes. It will give opportunities for repairing and cleaning.

837. Will it give a higher service than the original pipe? I think not. They all deliver into Crown-street. By keeping the Crown-street Reservoir full it will give a few feet higher service.

838. I suppose that even a few feet would be a matter of great moment in the supply of the town, and would have a considerable influence with respect to the higher levels—for instance, in Macquarie-street? Yes.

W. C.
Bennett,
Esq.
10 Oct., 1888.

839. And Waverley also? Yes. Besides, it will be indispensable in a very short time to meet the demands on the water supply.
840. Do you know under whose supervision this work is to be carried out? It was designed under Mr. Moriarty's supervision.
841. Is it being carried out by those occupying his place now? Yes.
842. Have you given any attention to the prices at which the works are to be carried out? No. I have not seen the estimates.
843. Do you think that you have sufficient knowledge of the work to express your opinion in favour of it? Yes; decidedly. I think if it is not indispensable now, in a very short time it will be.
844. *Mr. Garrard.*] Do you know the capacity of the proposed Potts' Hill Reservoir? I believe it is 100,000,000 gallons.
845. Do you know the site on which it is proposed to construct it? No; not the exact site.
846. Have you been out there since the site was marked off? No.
847. If it is proposed to pitch each of the four sides of the reservoir, do you think that is absolutely necessary, or is it only necessary to pitch it where the dam proper is? So much depends on the nature of the material that it is impossible to give an opinion of that sort without seeing it.
848. Do you know the Prospect Dam? Yes.
849. Is it not the dam portion only of that reservoir which is pitched? Yes, only the dam portion.
850. There would be a considerable wash, I suppose, on the ordinary sides that are not pitched in case of a high wind? Yes; but the slope is so gentle, and being a natural shore, even the wash can do it no harm there.
851. Because it would play upon the natural surface of the ground? Yes. It cannot work a hole that anything can go through.
852. It is different where the natural surface is disturbed; and in that case, do the sides require pitching? No; I do not think so. You require pitching on the face of the dam to protect the dam from the action of the water. On the natural slope of the ground it does not matter.
853. We have it in evidence that it will cost £65,000 to pitch the sides of this reservoir. Can you say whether it is absolutely necessary to pitch the sides of this reservoir? No; I have not seen the plan.
854. Is it not a fact that, as a rule, in small reservoirs of this capacity, pitching is only used on the dam proper? As a rule the pitching is on the dam, but for some reason it may be necessary here. There is no doubt pitching will keep the reservoir much cleaner, and I dare say that is the reason why it is proposed to be pitched. It is a subsidiary reservoir, and it is necessary to keep the water clean. If it were not pitched the water would wash against the sides and get foul with mud, which it takes a long time to precipitate.
855. You cannot tell us whether £65,000 is a reasonable estimate for that work? No; I cannot. In view of the purpose for which the reservoir is to be made, I have no hesitation in saying that it is necessary to pitch it, in order to keep the water pure and unmixed with clay, because that clay is particularly difficult to precipitate in water. I have no doubt that is the reason why it is proposed to pitch the reservoir.
856. Were you one of the Commission appointed to inquire into the inauguration of this water supply for Sydney? Yes.
857. It received your approbation, I suppose? Yes.
858. I understood you to say to the Chairman that if it was not indispensable at present it would in a very short time be indispensable to have a reservoir at Potts' Hill? That was the second pipe line I referred to; but I think the reservoir is very desirable. It will bring the head home to Sydney, and render available the night discharge of the large pipes. There are three other pipes drawing on it every day, and if the head is not kept well home in those pipes it decreases the discharge *pro rata*.
859. Do you know anything of the difference of level between Potts' Hill and Crown-street? Between the top of the water at Potts' Hill and the top of the water at Crown-street the difference would be 34 feet. I think that, under the circumstances, this dam being away from the pure water in the Prospect reservoir, it would not do to contaminate that water by putting it into an unpitched reservoir. I would have visited the site of the reservoir had I known that the questions would have reference to the construction of this particular dam; but I thought they would refer to the questions involved in the original project.
860. *Chairman.*] Was it not always a part of the original project to have an auxiliary service in addition to the reservoir at Prospect? Yes; to have a balance reservoir. There were one or two proposed.
861. That would be for other purposes besides the mere supply of Sydney? It was for the supply of Sydney chiefly.
862. Was it not for a suburban supply? Yes. When I say Sydney, I include the suburbs.
863. Are you aware that the project now submitted has partly for its object the suburban supply? Yes.
864. Do you think the construction of the Potts' Hill Reservoir will be useful in carrying out that idea? Yes; it will bring the head home.
865. Do you recollect any other reasons which make it useful? It will utilize the 6-foot pipe at night as well as in the day. In water supply the draught on the pipes is for a certain portion of the day. If you have this reservoir for the gradual receipt of the water during the night, it doubles the value of the large pipe; and the larger such a reservoir is the better, because, when the daily discharge begins, it will not fall so quickly in a large reservoir as it will in a small one, and consequently a higher head is kept up longer.
866. And besides that it will give both the suburbs and city an alternative supply in case of accident? Yes; in the case of any accident occurring above it, this new reservoir will give a supply until repairs can be made.
867. Do you think that is a reasonable feature in a large work of this sort? It is an indispensable feature.
868. When the additional pipe from Potts' Hill to Sydney shall have been completed, what proportion, do you think, of the general service to Sydney and suburbs will be supplied by gravitation? A very large proportion, but I cannot give it exactly.
869. Five-sixths or seven-eighths? I should say about three-fifths.
870. The balance will be supplied by pumping? Yes.
871. What places will be so supplied? The higher portions of North Shore, Waverley, Paddington, and the higher parts of Sydney.
872. The tops of the houses in Macquarie-street? Yes; and the higher levels are daily becoming more important, because the buildings are getting higher.

F. A. Bishop, Esq., Civil Engineer, sworn and examined:—

- F. A. Bishop, Esq. 873. *Chairman.*] Are you an engineer by profession? Yes; a civil engineer.
874. Have you been long resident in this Colony? About two years.
- 10 Oct., 1888. 875. During that time, have you been engaged in the work of your profession? Very little. I have been trying to recover my health, and the first year I did nothing.
876. Have you been made acquainted with the project for supplying Sydney with an alternative supply of water from Potts' Hill? I know something about it. I was Chairman of a Commission appointed to arbitrate between the Potts' Hill and Kenny Hill schemes last June.
877. That is outside our province. We take it that that is settled. We are now considering a work submitted to us by Parliament which consists of the construction of a storage reservoir at Potts' Hill, and a second pipe between Potts' Hill and Crown-street? Yes. I simply made that answer to show you how I became acquainted with the subject.
878. Have you visited Potts' Hill? Yes.
879. Do you know the site of the proposed reservoir? Yes.
880. Have you been there since the work has been commenced? No.
881. Do you know the proposed course of the second pipe between Potts' Hill and Sydney? Not definitely. I judge that it would be some distance from the line of the first pipe.
882. Are you aware of the cost of the work at the Potts' Hill Reservoir? Only in a general way from what I see in the newspapers.
883. Do you understand the principle on which it is being carried out? Yes.
884. Do you understand the object of the second pipe? I think so.
885. Do you consider the work is a desirable one? I do.
886. Is it usual in large works of this sort to have a duplicate service in case of accident? It is quite common.
887. Do you think it is necessary? I do.
888. Of course you have not gone into the details of the expenditure at all? No.
889. It does not come within your province until called in professionally? That is the only way.
890. *Mr. Garrard.*] Do I understand you to say that you have not taken into consideration the cost or estimated cost of the works at Potts' Hill? No; except so far as reading is concerned. I gave it some thought, but I never made any calculations.
891. I understand you were Chairman of a Commission appointed to inquire into the relative merits of Potts' Hill *versus* Kenny Hill? Yes.
892. In the course of that investigation, did you not go into the question of the estimated cost of the Potts' Hill scheme? Yes, to some extent.
893. For you to determine properly, would it not require more accurate calculations as to the relative cost of the two schemes? I do not know that it would in the way in which we took it. We took the evidence of Mr. Gipps on the one hand, and of Mr. Moriarty and his assistants on the other.
894. You took the figures submitted to you by the Harbours and Rivers Department on the one side, and the figures submitted by a gentleman who took an opposite view on the other side? Yes.
895. Without checking in any way those figures by actual calculations? No; not closely.
896. You took those two sets of figures as correct without minute investigation? Pretty generally so.
897. You went more upon the general scheme? Yes; perhaps that would be correct.
898. Have you had large experience in the construction of reservoirs? Yes.
899. Can you enumerate any of the works you have been connected with? In California.
900. What were the largest waterworks you have been connected with? The largest reservoir was not completed when I took ill. One, I think, embraced about 500 acres; another about 1,100 acres. Those were the largest dams.
901. Did you throw a dam across a valley? Yes.
902. Is that the usual way? Yes, generally, with large ones. They take advantage of the natural surface of the ground.
903. Has it always been the custom to pitch the dam portion of reservoirs? When there is any large stretch of water that is the custom; but in small reservoirs I have not thought it to be of sufficient consequence to do so. It depends very much upon the sweep of the wind.
904. Even if there was a considerable sweep of wind you would not pitch the natural sides of a reservoir? I do not see the necessity for it.
905. Do you know the position of this proposed Potts' Hill Reservoir? Yes; from seeing it and from the maps.
906. Do you think it is absolutely necessary that the four sides should be pitched? I am not sufficiently familiar with it to answer that question.
907. It is always necessary to pitch the dam, but it is not always necessary to pitch the sides? I would say this: My impression is that the sides of this reservoir are composed partly of excavation, and are chiefly artificial, and to whichever side the direction of the wind tends I should say that side ought to be pitched.
908. Do you know the proposed construction of the dam across this reservoir? Yes; I saw the plans some time ago.
909. Do you know the extent of the puddle core or wall? I do not remember.
910. Do you know anything of the nature of the clay found there or being used? I do not know what is beneath the surface; but I have seen places near there from which I could get a good idea.
911. Do you think that a core at the base (say) 4 feet 6 inches thick is sufficient for an embankment 20 feet high? Yes, I should think so.
912. It depends largely, of course, upon the nature of the clay and puddle? Yes; and very much upon what is beneath.
913. What is your usual custom in mixing puddle for works of this description—do you prefer to make it as dry as possible? It ought to have a fair amount of water. It should be thoroughly macerated.
914. Have you visited the Prospect Dam? I have.
915. Do you know the way in which that core was made? I know from description, from the plans, and from parts that I saw.
916. Was it mixed in the way in which you would like to have it mixed? I have seen them mixing for it. I can say that it was quite satisfactory; it was quite as good as I could do it, I am sure.

917. Do you think it is desirable to tap either of the mains leading from Potts' Hill to the city to draw off a supply for the suburbs. Is it usual to tap the mains for an intervening supply? It depends upon circumstances. I would rather draw from the reservoir, if I could.
918. Were you a long time in California? Yes; about 34 years.
919. Do you favour cast-iron, as against wrought-iron, for pipe-mains? It depends on circumstances. For reticulating a city, I prefer cast-iron; for bringing water a long distance, I prefer wrought-iron, or steel.
920. You know that it is proposed to bring a second line of cast-iron pipes from Potts' Hill to the Crown-street Reservoir;—would you prefer wrought-iron to cast-iron in a main of that description? I think under the circumstances I would prefer cast-iron in this case, mainly on account of durability.
921. What is the life of cast-iron as against wrought-iron? That is rather hard to tell. We only had experience for about twenty-four years in California of wrought-iron pipes. Many are good to-day, although they were very imperfectly laid.
922. Have you seen the present line of pipes to Crown-street? Yes; a portion of them.
923. Do you think they are a good style of pipe? I do.
924. Is the same kind of pipe quite suitable for duplication? Yes.

F. A. Bishop,
Esq.
10 Oct., 1888.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Storage Reservoir at Potts' Hill, and Second Line of Pipes to Crown-street.

APPENDIX.

A.

[To Evidence of J. Barling, Esq.]

Sir,
Information having been asked touching the water supply of Melbourne, as throwing light upon the cognate questions relating to the Sydney water supply, I put myself into communication with the Water Supply Department of Melbourne for the purpose of obtaining the most recent and authentic information on the subject, and have now the honor to transmit a copy of my letter, together with the reply thereto, which I have received this day, and trust that the information thus obtained will be of service to the Committee.

Department of Public Works, Sydney, 3 October, 1888.

I have, &c.,

J. BURLING,

Under Secretary.

The Honorable the Chairman of the Parliamentary Standing Committee on Public Works.

My dear Sir,
The Parliamentary Standing Committee on Public Works of this Colony is inquiring into the question of an additional pipe-line in connection with the existing water supply, and the following information respecting the Melbourne water supply would considerably assist the deliberations of the Committee, viz. :—

The maximum quantity which your supply is capable of delivering to city and suburbs daily.

The average daily consumption.

The greatest quantity that has been delivered in any one day.

The average consumption for each year during the last decade.

The estimated population which you now supply.

If this information can be available by Wednesday next, when the Committee meets again, it would be very acceptable.

Any other information which you consider would be of service, and which is readily obtainable, might also be forwarded.

Apologising for thus troubling you, and trusting I may be in a position to reciprocate at some future time,

I am, &c.,

J. BURLING.

C. Le Cren, Esq., Secretary, Department of Public Works, Melbourne.

Department of Public Works, Melbourne Water Supply Branch,

Treasury Gardens (Gipps-street Entrance), 2 October, 1888.

Sir,

I have the honor to acknowledge the receipt of your letter, dated 29th ult., and in reply to inform you that :—

1st. The maximum quantity of water which can be delivered in Melbourne and suburbs daily is 33,000,000 gallons; but such quantity could be increased for a few days from the various service reservoirs in the suburbs, the combined storage capacity of which is 36,000,000 gallons.

2nd. The average daily consumption is 19,000,000 gallons.

3rd. The greatest quantity that has been delivered in Melbourne in any one day, 32,000,000 gallons.

4th. The average daily consumption for each year during the last decade :—

1879	8,800,000 gallons.	1884	12,357,000 gallons.
1880	9,700,000 do	1885	13,675,000 do
1881	10,500,000 do	1886	14,709,000 do
1882	11,300,000 do	1887	16,226,000 do
1883	11,600,000 do	1888	19,000,000 do

5th. The estimated population which is at present supplied with Yan Yean water, 400,000.

For the year ending 30 June, 1887, the number of tenements supplied was 73,424. The total expenditure to that date, £2,495,554; and the total revenue received, £2,397,852.

I have, &c.,

FRED. B. FORCE,

Acting Secretary.

The Secretary, Public Works Department, Sydney.

(MINUTES AND REPORTS RESPECTING THE PROSPECT DAM.)

Ordered by the Legislative Assembly to be printed, 6 December, 1888.

[From the *Evening News* of December 3, 1888.]

THE PROSPECT DAM.

WHEN the Government could no longer ignore the reports published in the *Evening News* respecting the condition of the Prospect Dam, Mr. Whitton and Mr. Bennett were instructed to inspect the embankment and report to the Secretary of Public Works. This was in last June, and at the time the reports of the two officers were published we advised Mr. Sutherland not to place too much reliance upon them, as they were evidently drawn up for the purpose of allaying any disquietude that might exist in the public mind. It was impossible to deny that cracks and subsidences had taken place; but the ingenuity of the two gentlemen, assisted by the explanations and opinions of Mr. Moriarty and the other professional men who are responsible for the construction of the dam, was taxed to its utmost to account for the flaws, and enable the Engineer-in-Chief for Railways, and the head of the Department of Roads and Bridges to assure Mr. Sutherland that the dam was perfectly secure, and would remain so for all time. This they did in the most emphatic language. Mr. Bennett's ultimatum was, "I am of opinion that the dam is perfectly safe. The material of which it is composed is admitted by all to be of the very best description." Mr. Whitton was equally sanguine and satisfied, for he concluded his report as follows: "I see nothing in the subsidence of the puddle wall, or in the lateral movement of the inner slope of the embankment, to raise the slightest doubt as to the perfect stability of this portion of the reservoir." May we suggest to Mr. Sutherland or the Government that these reports should be referred back to their authors, and that they should be instructed to revisit the Prospect Dam now to see how they can reconcile the opinions they expressed five months ago with its present condition. In our issues of last Monday and Saturday we published two accounts of what has been going on since the embankment was officially pronounced to be perfectly safe, with a description of the failure of the dam, so far as it has gone. In addition to our reports, the *Daily Telegraph* published one on Friday which is a significant confirmation of the reports and articles that have been appearing in the *Evening News* during the last twelve months or more. Our contemporary writes somewhat reservedly; but as it has only just realised its responsibility in the matter, having accepted all that Mr. Whitton and Mr. Bennett wrote as engineering gospel, it could scarcely be expected to go further as a beginning in the right direction than it did on Friday. The *Telegraph* has discovered that "there is room for all sorts of degrees of uncertainty and disquietude," and from the unusual activity on the part of some of the officers of the Department there is ground to hope that the officials have at last been roused out of their obstinate belief in the stability of the dam. (1.) Within the last few weeks the depth of water in the reservoir has been reduced 3 feet, and, so far as the dam is concerned it is probable that the late drought was not an unmixed evil. Had there been a wet season, and had the water risen to anything like the full capacity of the reservoir, (2) the only leakage right through it might not be the "stream," described by our reporter as running from the base of the embankment on its lower side. We do not believe there is a professional authority in the country, not even in the Public Works Department, who would express the opinion that the embankment could withstand the force of the full quantity of water it has been constructed to retain. So far from this being the case, the question for consideration now is, how long it will resist even at the low level to which the water has been reduced? If the Departmental ostriches have not pulled their heads out of the sand in which they have been buried for the last twelve months, it is time that they were forced to do so by Parliament. We are well aware of the magnitude of the issues we are attempting to raise by our continued references to this subsiding and leaky embankment. If it is authoritatively condemned as unsafe, it is doubtful if it can ever be rendered secure, but if this is possible,

possible, it would probably cost more to repair or protect it than it has done to construct it. (3.) Of the enormous quantity of water now in the reservoir, only about 3 feet of the depth can be run off, the remainder being below the level of the outlet-pipe, so that to get at the foundations of the embankment, the failure of which are believed to be the cause of the subsidences higher up, the reservoir would have to be pumped out. Even were this done there is no certainty that the embankment, which is giving way in so many places, could be rendered permanently secure. A correspondent, who seven months ago predicted the gradual but certain collapse of the work, and described in advance what has taken place since, said the dam might be secured by driving a row of piles all along a few feet from the inner side of the embankment, and filling in the space for some distance up the face with substantial masonry. This work he said would have to be done by divers, so that the cost of it would be enormous. If, however, the work is gradually giving way, it is no use-counting the cost of preventing its total destruction, provided it is possible to do so. Whatever the expense may be, it will have to be undertaken. As already intimated, it is the imperative duty of Parliament, or some of its members, to take this matter seriously in hand. It is no use depending upon the Government, for it will only continue to be hood-winked by officials. That offshoot of the Public Works Department, the Water and Sewerage Board, is equally unreliable. Its members visited the Prospect Dam some months ago, and the President, Mr. Rowe, on behalf of himself and his colleagues, expressed the most unbounded satisfaction with the manner in which the dam had been constructed, and the utmost confidence in its stability. No doubt the members of both Houses of Parliament were lulled into a false security by the official assurances that the embankment was as firm as a rock and as immovable as a mountain. Either one House or the other should now obtain a report for itself, and not leave it to the press to take all the responsibility of investigating and exposing this costly monument of Departmental incapacity and obstinacy.

Memo. *re* leading article in *Evening News*, of 3rd December, 1888.

<i>Statement in paper.</i>	<i>Remarks.</i>
(1.) Within the last few weeks the depth of the water in the reservoir has been reduced 3 feet.	The facts of the case are as follows:—The water in the reservoir stands now at the same height as it did in December, 1887, just twelve months ago. It gradually rose 3½ feet, reaching its greatest height in April last. Between that date and the end of August it fell 6 inches, since which to the present date it has gradually fallen to its present height.
(2.) The only leakage right through it might not be the stream described by our reporter as running from the base of the embankment on its lower side.	The only water appearing from the base of the embankment on its lower side is, in my opinion, what passes through the stone drains in the back bank for the purposes of drainage, and which were specially constructed for the purpose. This water is perfectly clear and brackish, and has been flowing from the drains ever since the embankment was raised slightly over the surface of the ground. If this water was fed by the reservoir direct, it would be soft, discoloured, and would be always increasing in quality, as the water in the reservoir lifted. This latter is not the case. The greatest quantity of this drainage water appears, as might be expected, where the bank is the largest, and where consequently a large surface was exposed as a catchment area; and this place is some 3,000 feet away from the nearest slip, and at a part of the embankment where there is no sign of settlement.
(3.) Of the enormous quantity of water now in the reservoir only about 3 feet of the depth can be run off, the remainder being below the level of the outlet-pipe, so that to get at the foundations of the embankment, the failure of which are believed to be the cause of the subsidences higher up, the reservoir would have to be pumped out.	About 8 feet in depth of the water can be run off by gravitation to Sydney by canal,—25 feet with gravitation through the two 48-inch pipes to the valley below the dam, and the remaining 25 feet will flow out by siphon action, also through the two 48-inch pipes and discharge in the valley below the dam as before. The time required to remove the lower 50 feet would be about twenty days, no pumping being required.

ROBT. HICKSON.

Minute by The Secretary for Public Works.

Slip at Prospect Dam.

Department of Public Works, Sydney, 3 December, 1888.

WITH reference to the interview I have had with Mr. Mestayer, M.I.C.E., this afternoon, at which I requested him to visit the Prospect Dam and make a report to me on its present condition, and to his acceptance of the commission, I now wish to give specific instructions for his guidance. He will notice from reading the papers, and from the information which I have given him, that further movements have taken place in the Prospect embankment, which have been the subject of many newspaper articles, and have caused a considerable amount of apprehension in the public mind. I have already instructed Messrs. Whitton and Bennett to report on the subject, and they have visited the dam, and are now engaged in preparing their report.

As the matter, however, is so important that it would not be right for me to leave one stone unturned in arriving at the true facts of the case, I have thought it desirable to call in the aid of experts who are unconnected with the Department. I understand that Mr. Mestayer is an engineer of considerable standing, especially in matters appertaining to hydraulic engineering.

I wish him, therefore, to at once visit the Prospect Dam and carefully examine its present condition, and also to ascertain the kind of material that has been used in its construction, and its adaptability to the purpose for which it has been used. I wish him to point out the cause of the movements which have taken place, their significance as bearing on the stability of the structure, and what, in his opinion, will be the best course to take under the circumstances.

I wish him to give me a report on the construction of the dam and subsidiary works as a whole, and whether, in his opinion, the design is in accordance with the best engineering knowledge on the subject, and whether also the works have been faithfully carried out according to the design.

In carrying out these duties, as I wish to get an entirely unbiassed opinion on the subject, he will consider himself quite independent of either the officers of the Harbours and Rivers Department or of the engineers outside the Department who have previously reported on the subject.

Mr. Hickson and all the officers of the Department will be so good as to give Mr. Mestayer every assistance in the way of answering questions he may put to them, and will place at his disposal any plans and other information which they may possess, or which may be in the Departmental records.

I wish Mr. Mestayer to undertake this work at once, and shall be glad if he will as quickly as possible take in hand the duties confided to him, in the carrying out of which I desire especially to impress upon him their great importance and the necessity for giving a plain unvarnished recital of the facts as they present themselves to his investigation.

JOHN SUTHERLAND.

Mr. Hickson please note and return.—W.B., B.C., 4/12/88. Noted.—R.H., 5/12/88. Under Secretary Public Works, B.C.

Memo. by Mr. A. Williams.

Prospect Dam.

In compliance with your instructions, I examined this work, and find that the face of the water side the dam has slipped and settled more or less for a considerable distance.

I beg to briefly state what I consider to be the cause, the effect, and the remedy.

It is my opinion that this movement is caused by the excessive moisture of the puddle-core forcing its way through, and meeting, in all probability, a saturated strata, caused by the percolation of the storage water from the face.

The effect is to leave the puddle-core unsupported, and its displacement will follow as a matter of course, and so destroy all confidence in the security of the dam. It is, therefore, imperatively necessary to stop this movement, and also to stop all possibility of future movement to this or any part of the dam.

The remedy is the weighting of the foot of the slope, to counterbalance the top weight that is crushing the lower part out of place.

A section of this class of work is now done by placing bluestone ballast at the foot of one of the slips. I consider that although this work will have a good effect, that it is not the best way of doing this work. It has no bond. It does not give the greatest weight for its cube measurement, and the water passes freely through this loose ballast, and consequently does not prevent the bank from getting soft by the constant soakage of the water.

I think the class of work that would give the best results is a solid bank, built with a face almost perpendicular to the water, and constructed with fascines and clay. This can be built along the whole face of the dam to any required height. Such a bank would have a much greater weight per cubic yard than stone ballast.

It would be a water-tight sea-wall in itself, with a continuous bond, and it would have the greatest power for resisting a back pressure than any rough stonework could possibly have. This work would be by far the most economical, as clay can be got to any extent close to the dam, and the ti-tree, with which the fascines must be made, abounds in the district.

The cheapest class of labour can be employed.

The present stone surface-pitching would have to be removed along the present water-line, and up the slope to the top level of the fascine bank, and the face of the present dam would have to be cut down into flat benches, upon which the base of the fascines embankment would be bedded.

I consider the question of piling at the toe of the dam to be quite out of character with the work, and it would be a dangerous, useless, and costly experiment.

The fascine embankment will be a costly work, but a work, in my opinion, that will give by far the best results, at about half the cost of rough stonework.

ALFRED WILLIAMS.

The Acting Engineer-in-Chief, 1/12/88.

Minute by The Acting Engineer-in-Chief for Harbours and Rivers to The Under Secretary for Public Works.

Subject :—Prospect Dam.

Harbours and Rivers Branch, Sydney, 30 November, 1888.

In reporting to you some days ago that there was an indication of a second slip on this dam, I confined myself to the question as to whether the contractor could be held liable or not. I now submit for your consideration, first, what I consider the cause of the slip, and secondly, what steps, in my opinion, should be taken to make the structure safe.

The dam, as you are aware, consists of an embankment of earth 30 feet wide at top, an inner slope of 3 to 1, protected with pitching, and an outer slope of 2½ to 1. In the centre of this bank a puddle wall has been erected 8 feet wide at top of bank, increasing in width on both sides by a batter of 1 in 8 as far as the original surface, and extending into the original ground to such a depth as was found necessary to get into a water-tight stratum. To show the care that was taken with this very important part of the work, it is only necessary to say that in one place the puddle wall was carried down to a depth of 45 feet below the original surface.

I may here be permitted to say that this embankment is built upon the most approved principles and in accordance with all recognized designs of such structures. The question may then very well be asked, why is it showing signs of weakness?

This is a point on which there may be various opinions; as having had some little experience on works of this sort I submit mine.

Before, however, going into details I would just briefly state what has taken place.

The first slip which took place before I took temporary charge of this office occurred at a portion of the embankment which is only about 35 feet high; the inner slope slipping in a horizontal direction about 25 feet. This was reported on by me on 7th August, and at my suggestion the matter was referred to Messrs. Whitton, Bennett, & Bishop, who had previously reported on this same slip, and the result was that a large quantity of stone was put at the toe of the bank with marked success, though at a considerable cost.

My attention was only drawn to the second slip (the one now specially under consideration) on the 22nd instant, when I took the first opportunity of visiting the works. To a casual observer there is not much to notice at this particular place. It is only when closely examined a slight rounding in the line of pitching is noticeable. The total outward movement being about 2" 6" with a depression at the top of the embankment. At other places on the top of the bank longitudinal cracks are to be seen at both sides of the puddle wall, extending in width from 2 inches to 8 inches and of various lengths, the extent of which it would be impossible to see unless the top of the bank was more opened up and exposed.

There is a decided rounding of the pitching extending over a length of some 1,000 feet of the straight portion of the embankment, but the officer in charge assured me the slope was originally built in that form, and that no change of any description has taken place at this place. If this be the case, which I have no reason to doubt, it is an important matter to bear in mind when I further on deal with what I consider to be the cause of the slips.

In the erection of this embankment, not only must it have caught a considerable quantity of rain, but also in making the puddle and forming the bank a quantity of water was used. This water had all to gravitate towards the centre, as in forming banks of this class it is usual to put the material in in layers with an inclination from the outside to the centre.

The outside slope being formed of coarse material, intermixed with stones, did carry away, and no doubt is still carrying away this water, and as a result has not shown the smallest sign of weakness. The inner slope is formed of selected materials, and thus devoid of this means of allowing the water to pass through, practically dams the water back.

As the whole length of the dam, some 7,000 feet, was built under the same circumstances in every way, the natural question suggests itself, why should a small portion of it, some 600 feet, and where the depth is only 35 feet, be effected, whereas other places, where the depth varies from 65 to 85 feet deep shows no sign of slipping.

For a solution of this, I think one must look to local causes, and I am reluctantly compelled to come to the conclusion that the material in the part of the bank which has given way is not as good as in other portions of the work, nor as good as it should be. In stating this, I wish it to be clearly understood, I am only forming my opinion from what is to be seen at the *present time*. I was not in any way connected with the work during its construction, and cannot therefore say what quantity of this inferior material may have been used, but that there is some of it in the bank is to my mind beyond doubt, as it can be seen here and there on the surface and in the disturbed portions of the work. The material I speak of is what a navy would call "sugar," it is white, has no consistency, and melts away when brought into contact with water.

Of course it is quite possible that this theory may be incorrect, and that it is only a matter of time till the whole of the inner slope gives way from inherent weakness in itself, but this I cannot believe to be the case. If such a very deplorable state of affairs should occur, it could only be from the existence of a large quantity of defective material, and with the supervision that was exercised over this work one can hardly imagine this possible.

The important matter to consider now is the remedy to be used. Though I do not consider the permanent stability of the dam is endangered, yet I am bound to say the matter is of serious import. If the quality of the material in the bank is of doubtful character, it would be very hard to say what might not occur if, after this long continued fine weather, we had heavy and lasting rains.

If this embankment was an ordinary one without any water to deal with in the reservoir, the remedy would be simple enough, viz., put in some trench drains and so get rid of the disturbing element, water; but we have got to deal with the matter as it stands, viz., with water for some distance up on the inside or defective slope, and which not only cannot possibly be got rid of, but must, if the rainy weather sets in, be allowed to rise and so secure a further supply of water for Sydney, which at present is low enough.

I am confident myself that the only way to deal with it under the existing circumstances is by placing some counteracting force at the toe of the dam of such a weight or extent as would counter-balance the tendency of the bank to slip out.

There are three ways this object might be obtained—

- 1st. By putting piling at the toe of the slope.
- 2nd. By placing a heavy water-tight structure, such as faggots and clay at the toe of the slope and filling in between it and the slope with the same class of material with which the embankment is constructed, and
- 3rd. By weighting the toe of the bank with stone.

With regard to the first (while I have used this remedy with complete success at a portion of the dam at West Maitland, which slipped on a greasy bed), I confess there are great difficulties in the way of adopting this plan in the present case. The embankment being of such large dimensions would necessitate a very strong and expensive system of piling with strut piles, braces, &c. This would all have to be put in under difficult circumstances, viz., with a lot of water in the reservoir, and would also entail the filling up of the space between the piling and the slope with heavy material.

As to the second system to make it effective, it would be necessary to carry the faggot bank above the highest high water, otherwise when the water fell in the reservoir below the level of this bank all the impounded water (and there would be a great deal of it, as the embankment would absorb a large quantity) would be pressing against the faggots, and having only the *weight* of the faggots as a resistance, would push them out.

Having

Having thought this matter over very carefully and anxiously, as of course one cannot get rid of the grave responsibility there is in having charge of such a work, I cannot suggest any better system than that now adopted, viz., weighting the toe of the bank with stones, it may seem a clumsy brute force sort of way of meeting the difficulty, but as it is impossible, no matter how bad the material in the bank may prove to be, to remove it now; it seems to me to be the only practical way of dealing with the matter.

If, as I suppose, this defective material exists to some extent in the embankment, the water in the reservoir itself has no doubt, something to say in dissolving it, and assisted by the water from behind, causes the outward motion.

With regard to the puddle wall, which of course is the main feature in the embankment, which the outward motion of the slips would lead one to imagine, that it has been subject to a corresponding movement, I am of opinion it will be found that this, if not actually *not* the case, has only occurred to an unappreciable extent. I know from my own personal observation that when the first slip took place, which as I said before extended about 25 feet in a horizontal direction, the puddle wall only subsided vertically, there being little or no horizontal movement noticeable on the top.

And indeed a strong proof that this must be the case throughout, rests in the fact that no movement has taken place on the outside of the puddle wall. If this wall of puddle had gone over in a horizontal direction, some portion of the outer earthwork must have followed it.

What no doubt has taken place, is what I have represented in this sketch, and what, I may add, I proved by a shaft to have taken place in the bank before mentioned in Maitland, viz., the alteration of the shape of the puddle wall as shown in dotted lines, which far from doing any damage, actually made it wider on the original surface line.

ROBT. HICKSON.

Minute by The Secretary for Public Works.

Subject:—Prospect Dam.

Department of Public Works, Sydney, 3 December, 1888.

UNDER date of 23rd April last, Mr. Ryan, the engineer in charge, at Prospect, reported that a settlement had taken place of the puddle wall of the dam for a length of about 350 feet, between centre-line pegs numbered 51 and 55, to which, however, as it seemed to be a purely local one, he considered very little importance should be attached. On receipt of this report Mr. Moriarty visited the dam, and on the 26th reported the circumstances to me, stating that an allowance of 5 per cent. had been made in the height of the dam to provide against such a settlement, which, in works of the kind, is always looked for to a greater or less degree, and that the subsidence had not then reached the degree allowed. No further settlement having then taken place, he hoped the work had come to its proper bearings. Further reports having appeared in the daily papers as to the settlement, the matter was referred to in the Legislative Assembly on the 4th May. Upon this I wrote a minute, in which I pointed out the desirability, as tending to allay public apprehension, of obtaining engineering opinion on the subject from sources outside the branch charged with the construction of the work; and with that end in view, I directed Messrs. Whitton and Bennett to visit the dam, in company with Mr. Moriarty, and report separately on the matter. Shortly after the services of Mr. Bishop, an eminent hydraulic engineer, being available, he was commissioned by me to report also. In the middle of June the reports from these gentlemen were received. They all agreed that there was nothing in the settlement which had taken place that should raise doubt as to the stability and safety of the dam. These reports were laid before the House, and were ordered to be printed on the 20th June.

In the meantime steps were taken to remedy the settlement, but on the 7th August, Mr. Hickson, who had succeeded Mr. Moriarty in charge of the Department, reported that the subsidence was assuming such formidable dimensions that he deemed it his duty to again bring the matter under notice, with a view of again obtaining the opinion of Messrs. Bishop, Whitton, and Bennett, as to the best means to adopt to put a stop to any further slip. He stated that Mr. Moriarty had visited the dam with him, and had urgently advised that a row of piles faced with stones should be at once put in at the toe of the bank, but he was aware that difference of opinion existed as to the best course to adopt in the emergency. I immediately concurred in the suggestion of Mr. Hickson, and requested the gentlemen named to consult and furnish a joint report. On the 13th idem the report was received, but as Mr. Bishop differed from Messrs. Bennett and Whitton as to the remedy, though they all agreed as to the cause, that gentleman furnished a separate report.

Messrs. Whitton and Bennett considered that the foot of the slope should be weighted with large stones to prevent any further settlement or moving forward. Mr. Bishop, however, was of opinion that the better and more economical course to pursue was to continue loading the embankment, as had already been begun, as the slide would then go on until the proper angle of repose had been obtained. As, however, Messrs. Darley and Hickson were of the same opinion as Messrs. Whitton and Bennett, as to the course to be pursued, I finally considered their recommendation should be adopted, and it has been carried out.

On

On the 24th ultimo it was verbally reported to me that the second slip, to which reference has been made in the newspapers, had occurred. I immediately despatched Mr. Hickson to report, and on his return I conferred with him and Messrs. Whitton and Bennett, and requested them to immediately visit the dam and report to me. They proceeded to Prospect on Saturday, and on my arrival at the office this morning I at once sent for them in regard to the matter. During the discussion which took place they informed me that there was no danger to be apprehended from the condition of the dam. They stated that, to a casual observer, the slip would not be noticeable, but they concurred that great care would have to be taken in dealing with the matter. If this were done, however, they considered that no danger need be apprehended in regard to the stability of the dam. They pointed out that the remedial measures taken had been perfectly successful, no movement having taken place since the toe of the embankment had been fully protected with stone.

Tuesday, 4th December.

Mr. Hickson's report on the Prospect dam I now submit for the information of my colleagues; but I am informed Messrs. Whitton and Bennett cannot promise their reports until to-morrow, or possibly the day after. I may mention that I have engaged Mr. Gordon, a well-known engineer of Victoria, to report on the matter, and I expect him here in a few days. I have also commissioned Mr. Mestayer, late hydraulic engineer of the South Australian Government to visit the work and report also. This gentleman will enter upon his duties at once.

JOHN SUTHERLAND.

J.W., 4/12/88. J.W.B., 4/12/38.

Memo. by The Acting Engineer-in-Chief for Harbours and Rivers.

Re quantity of water in Prospect dam.

	Gallons.
Total quantity of water in Prospect reservoir up to 28th November, 1888	5,950,000,000
Total quantity available by gravitation	1,700,000,000
Quantity coming in to Prospect immediately before the late rains was reduced to, per day	500,000
Quantity now coming into Prospect—	
2nd December	18,000,000
3rd December	28,000,000
Quantity going to Sydney, per day	10,000,000

ROBT. HICKSON,
4/12/88.

Engineers-in-Chief J. Whitton and W. C. Bennett to The Secretary for Public Works.

Sir,

Sydney, 5 December, 1888.

Acting under your directions, we again visited the Prospect reservoir, accompanied by Mr. Hickson, and carefully examined the embankment where the second slip has occurred.

This slip is on the first bend of the embankment going north, between pegs 42 and 47, extending for a length of 300 feet, and is about 700 feet from the first slip, upon which we reported in August last. [*See accompanying tracing.*]

We are informed that the movement was first noticed about three months ago, and appeared in the shape of a slight opening on the top of the bank, on the back line of the puddle-wall. This opening increased at a very slow rate, until about two or three weeks ago, when the top settlement assumed a more rapid and defined form.

Mr. Ryan reports as follows:—"The depth of water at present in the centre of the movement is about 24 feet. The recorded horizontal movement, by instrument test to 30th November, amounts to 1' 2 $\frac{5}{8}$ " in eight days. The total horizontal movement is about 2' 3". "The vertical movement on range pegs on slope is not perceptible, which proves that to the present the slide is horizontal only. The embankment has been to its finished height at this point for five months."

The height of the bank is 49 feet.

When the first slip occurred, upon which we reported on 13th August last, a very feasible reason was given to us why a slip at this point might have been expected, viz.:—"That the lower portion of this bank having been saturated with water for a considerable time before the upper portion was formed, the weight thus added was sinking into and sliding upon the wet surface of the original and lower portion of the embankment."

On examining this second slip the pitching is seen to be out of line and slightly bulged forward towards the water; a settlement has also taken place at the top of the embankment, with cracks varying in width from a few inches to a foot, and of various lengths.

The depth to which these extend cannot be ascertained without opening out the bank.

It was pointed out during our inspection that a rounding of the pitching had taken place on the highest portion of the dam, where the depth is from 60 feet to 80 feet; upon a straight portion of it, about 4,000 feet in length; but this we noticed on our first inspection in June last, and so far as we could ascertain no movement since that date has taken place; but from what we have now seen of the material used in the bank at No. 2 slip, observations should be taken with instruments to ascertain if any movement is now perceptible.

The resident engineer told us on our first visit, when pointing out this rounding to him, that it was done intentionally so as to provide for the necessary settlement which must take place in the embankment.

The No. 2 slip appears to us to have been occasioned by excessive moisture, either from rainfall during the wet season of 1887, or, as we are told, by the constant leaking of the contractor's water-pipes which

which were used for the puddle-wall. The bank adjoining the puddle-trench was formed in layers, 6 inches in thickness, sloping towards the puddle-wall, and thus all the water falling upon this slope would gravitate towards the puddle-trench. This probably excessive moisture would not in itself have caused the slip, and we must therefore look at the material of which the embankment is formed.

This material appears to be composed of red and white clay, the latter being used in too large a proportion, and as this is thoroughly saturated with water it is not of sufficient consistency to retain its position in the bank.

The directions in the specification as to the manner in which these banks were to be made are most complete, and as we are told the work was carried out in strict accordance with it we can only conclude that the inferior clay used, together with the quantity of water with which the bank is saturated, is the cause of the slips.

The recommendation we made with reference to the manner of treating the first slip, viz., by weighting the toe of the bank with large stones, appears to have been successful, as, although the work is not yet completed, the motion of the slip has been arrested, and no movement has been perceptible for some weeks. We recommend either that a similar course be pursued with the second slip, or that weighting only from the top be adopted until the bank has found its natural slope, as no danger to the bank need be apprehended, so long as the puddle-wall remains unbroken. Piling would be useless as the depth of water at the toe of the slip is 25 feet.

The design of this dam and the careful selection and application of material provided for in the specification are in strict accordance with all the best and most successful works; and the introduction of special superintendents, skilled in the execution of such works and trained under the ablest acknowledged head of this branch of engineering in England, and the use of material which, under ordinary circumstances, is admittedly of a superior character, if used in proper proportions, should have commanded success in the construction of these works.

Nevertheless some portions of the work have failed to the extent of slipping in two places on the western or inside slope of the east embankment, and this we can only attribute to the undue proportion of white (or pipe)-clay in this part of the embankment (shown on tracing as Nos. 1 and 2 slips), combined with the complete saturation of the clays of which the bank is formed.

It is impossible to say what other slips may take place in the embankments of this dam, as we were not present during the construction of the works; but we can confidently state that nothing has yet occurred which, in our opinion, could justify any other assumption than that the dam is at the present time perfectly safe.

The works must, however, be carefully watched, so that should any indications of further slips appear they may be promptly dealt with, and the best means adopted to render the dam safe and effective for the purpose for which it was designed.

We have, &c.,

JOHN WHITTON,
WILLIAM C. BENNETT.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SYDNEY WATER SUPPLY.

(FURTHER REPORTS AND MINUTES AS TO THE CONDITION OF THE PROSPECT DAM.)

Ordered by the Legislative Assembly to be printed, 12 and 13 December, 1888.

Engineers-in-Chief J. Whitton and W. C. Bennett to The Secretary for Public Works.

Prospect Dam.

Sir,

Sydney, 11 December, 1888.

We know of no way of ascertaining whether the puddle-wall has broken or not above the level of the water in the reservoir, but so long as the water is retained in the reservoir without any discharge through the embankment the puddle-wall up to that height may be considered perfectly safe.

We have no reason to believe that the puddle-wall is not in perfect order, but the fact can only be determined by the water being admitted to a greater height. The officers superintending the work only could give a reliable opinion on this point, and to strip off the inside slope of the dam to examine the condition of the puddle-wall would be fraught with the greatest possible danger to the whole embankment.

On carefully considering the steps to be taken with reference to the disturbance No. 2 (which can hardly at present be called a slip) we think that weighting the toe with stone in a similar manner to that done to No. 1 slip will be the best course to adopt under present circumstances.

If the puddle-wall has been properly made we have every confidence in the ultimate security of the dam.

We have, &c.

JOHN WHITTON.

WILLIAM C. BENNETT.

Minute by Mr. Assistant Engineer Hickson.

Harbours and Rivers Branch, Sydney, 12 December, 1888.

Subject :—Forwarding Mr. Williams' report and plan for remedying the defects in the Prospect Dam.

I FORWARD herewith, for the information of the Minister, a plan and report of Mr. Williams, showing how he proposes to remedy the defects in the Prospect Dam. It is, in my opinion, nothing more or less than a new dam inside the present one, with this serious defect, that instead of its being founded on a solid foundation it is founded on what is supposed to be an unsound inner slope.

If this inner slope is fit to carry the structure Mr. Williams proposes it is certainly fit to stand by ss/2452. itself, and therefore is quite safe in its present form.

Mr. Williams proposes removing a portion of the top of the present dam, which "he considers a source of danger and quite unnecessary," and place it on the inner slope, or, in other words, he takes this material off the part of the dam which has never shown any sign of settlement and places it on a part that has sunk, and may, if it is proved to be made of inferior material, sink more.

To carry this out Mr. Williams proposes running the water out of the dam for three months, and arranging the time when the rivers are in full flood, so as to keep a constant supply of water to Sydney. Mr. Williams does not explain how this time is to be arranged. I fear it would be an exceedingly difficult thing to do, and rather a dangerous experiment as regards the water supply for Sydney. I am confident under no circumstances should a drop of water more than is required for Sydney be allowed to escape out of the reservoir.

I recommend that these papers be sent to the gentlemen now engaged by the Minister reporting on this dam.

B.C., Under Secretary for Public Works.

ROB. HICKSON.

Submitted.—J.B., 12/12/88.

Most undoubtedly; and all the original plans and papers as well. In fact everything on the subject, and every source of information, should be placed at their disposal. My object is to get the fullest inquiry, untrammelled in every respect, no matter what the result may be.—JOHN SUTHERLAND, 12/12/88.

[Enclosure.]

[Enclosure.]

PROSPECT DAM.

MEMO.—I herewith beg to submit with this supplementary report three sections, showing the formation of the fascine embankment, which I propose to construct along the whole face of the dam.

They show the top of the dam to be 10 feet lower than the present level, as I consider this top weight to be a source of danger, and to be quite unnecessary.

The width of the dam on the high level water-line is now 70 feet.

I propose that this shall be made to 140 feet, and thus lessen the top weight by 160·166 cubic yards.

The fascine embankment would be 25 feet high, with a base of 20 feet, and a face slope of half to one.

The fascines would be neatly made of ti-tree bush, clipped to a uniform face, and laid in alternate layers as headers and stretchers, each layer to be carefully bedded with puddle clay, well tramped down.

This work would have a neater appearance, and be stronger and better in every respect than the cheaper but very efficient kind of slop mud banks that I have constructed at Cook's River.

The durability and strength of a bank of this kind is beyond all question, as it would be only a repetition of the great Dutch dykes that resist the waves of the German ocean, and upon the strength of which rests the security of large cities.

The whole of the present pitching above the low permanent water level would have to be removed. This could again be used for the erection of a strong parapet wall along the face of the work, to form a bust wall that would break the wash of the waves when the water in the reservoir was at its full height. And it can also be used for road making.

The present surface of the bank would have to be cut down into broad level benches, commencing at the low permanent water line, and this work would necessitate the drawing off of the water to this level for about three months.

This can be done without interference with the City water supply, by arranging the time when the rivers are in full flow. The bottom line of the fascine work once in place, the water could then be allowed to accumulate as the embankment progressed.

To build this embankment at a lower level is unnecessary, neither is it required to throw in loose stone below this permanent water line, as such work would only displace a nearly equivalent weight of water which is weighting the toe of the embankment almost as well as any work that could be placed there for weight purposes.

The water to this level will never be disturbed. The work in hand is to secure the bank, upon which the water is always fluctuating, from bulging or slipping. Suppose the water to be at its highest level, and soaking for many months into the face of the bank, and then this water is drawn off again to its lowest level, there would remain the old grounds of fear and risk of the work again slipping.

My design is to avoid this by placing the work on a greater base, and reducing the top crushing weight, and to form an irresistible water-tight face that will give the required weight and stability to the embankment, and so place the security of the dam beyond the possibility of a doubt, and set at rest for ever all anxiety and risk to the lives and properties that are annually increasing in this important district below this great pen of water.

My estimate of the cost of this additional work, as shown on plan, is £66,205.

To the Acting Engineer-in-Chief.

See separate reports herewith, M.P., 88/2452.—W.S.

ALFRED WILLIAMS, 11/12/88.

The Secretary for Public Works to A. Bennett, Esq.

Department of Public Works, Sydney, 11 December, 1888.

My dear Mr. Bennett,

You will have observed from the papers which have been laid upon the Table of the House that I have appointed two engineers outside the Department—one having only recently come to the Colony, and the other a resident of the sister colony of Victoria—for the purpose of inquiring into the present state of the Prospect Dam. I have given them the utmost freedom of action, and have instructed them as far as possible to keep themselves from the influence of the Department, and report to me the true facts of the case, whatever they may indicate.

My object, however, in writing to you is to ask you to be so kind as to assist me in this matter. From the interest your paper has taken on the subject of the Prospect Dam, it is clear that you must have obtained a great deal of information, and much valuable information, on the subject; and I have now to ask that you will be so good as to place this information, so far as you are able, at the disposal of the two gentlemen who have been appointed for the inquiry, namely, Mr. Mestayer, late hydraulic engineer to the South Australian Government, and Mr. George Gordon, an engineer of eminence in Victoria.

I have instructed these gentlemen to obtain information from every possible source, and it is for this reason that I ask you to be so good as to place any information you may have at their disposal.

I feel sure that, from a national point of view, you will accede to my request; and if you will furnish me with the names of those who have supplied you with information, I will take care that their evidence shall be taken and considered. My only object is to elicit the truth.

I am, &c.,

JOHN SUTHERLAND.

P.S.—To show the extent of the power entrusted to these gentlemen, I enclose you copy of the instructions to Mr. Mestayer, in similar terms to which instructions are being prepared for Mr. Gordon.

Minister's
Minute, dated
3rd December,
already printed

Minute by The Secretary for Public Works.

Department of Public Works, Sydney, Friday, 7 December, 1888.

Subject:—Prospect Dam—The report of the experts, Messrs. Whitton, Bennett, Hickson, and Williams, dated 5th December, 30th November, and 1st December, respectively.

I HAVE carefully read over these reports, and with regard to Mr. Williams have called upon that gentleman to furnish me with an estimate of the cost of the remedial works which he proposes as well as a statement as to whether his recommendations, if adopted, would involve the emptying of the reservoir, a point of prime importance at the present time.

With respect to the report of Messrs. Whitton and Bennett, they point out that there is no danger to the dam, so long as the puddle wall remains unbroken. As this is a matter of vital importance, I want to ascertain definitely whether this has taken place or not. I should gather that in the opinion of these gentlemen it has not, but the consequences impending if the other view is correct, are so serious, if not appalling, that no time should be lost in setting at rest this all important point.

I have therefore to ask Messrs. Whitton and Bennett to be so good as to address themselves to this question, with the view of allaying public apprehension, and as to the measures to be taken to secure

secure the present slip for which two courses have been proposed, viz., either to weight the toe, as was done in the case of the first slip, or to weight only the top until the bank had found its natural slope. I should be glad to know definitely which course Messrs. Whitton and Bennett recommend. I shall be glad of as early a reply to my questions as possible.

JOHN SUTHERLAND, 10/12/88.

B.C., Messrs. Whitton and Bennett.—J.B. Very urgent, 10/12/88.

FURTHER Correspondence respecting the Prospect Dam,
ordered on the 13th December to be appended to the
Papers previously laid upon the Table.

The Editor, *Evening News*, to The Secretary for Public Works.

Town and Country Journal and Evening News Office,
Market-street, Sydney, 12 December, 1888

Dear Sir,

Mr. Bennett desires me to acknowledge receipt of your letter and enclosure of yesterday and to say that he will be only too happy to supply your officers with any information in his power in reference to the condition of the Prospect Dam, in the security of which he takes a deep interest.

Such members of the staff of the *Evening News* as have reported upon the dam will willingly see Mr. Mestayer and Mr. Gordon, and afford those gentlemen whatever assistance they can to facilitate their investigations. At the same time I should mention that all information which representatives of the *Evening News* have obtained has been published in that journal and commented upon, and I assume that such information and comments touching a subject of such great importance have been preserved in your Department.

Should that not, however, be the case I have an index by me that will enable me to lay my finger at any time upon the various reports, &c., that have appeared on the subject in the *Evening News*. These I will be glad to point out to any accredited officer of your Department who may desire to see them..

I may add that it is very gratifying to Mr. Bennett and myself, as it must be to the public, to observe the steps you have taken to have a thoroughly independent examination made by competent engineers, of the dam, with a view of ascertaining its actual condition and so set the public mind at rest, if possible, as to its stability.

I have, &c.,

JAS. A. HOGUE,
Editor, *Evening News*.

The Secretary for Public Works to The Editor, *Evening News*.

Dear Sir,

Sydney, 12 December, 1888.

I have to thank you for your letter of this date, in which you offer to place your services at the disposal of the engineers I have appointed to inquire into the present state of the Prospect Dam, and I shall take care to request them to avail themselves of your kind offer.

My only desire is to get at the true facts of the case from whatever source I can obtain them. I have, from the first, been fully impressed with the necessity of the most searching investigation.

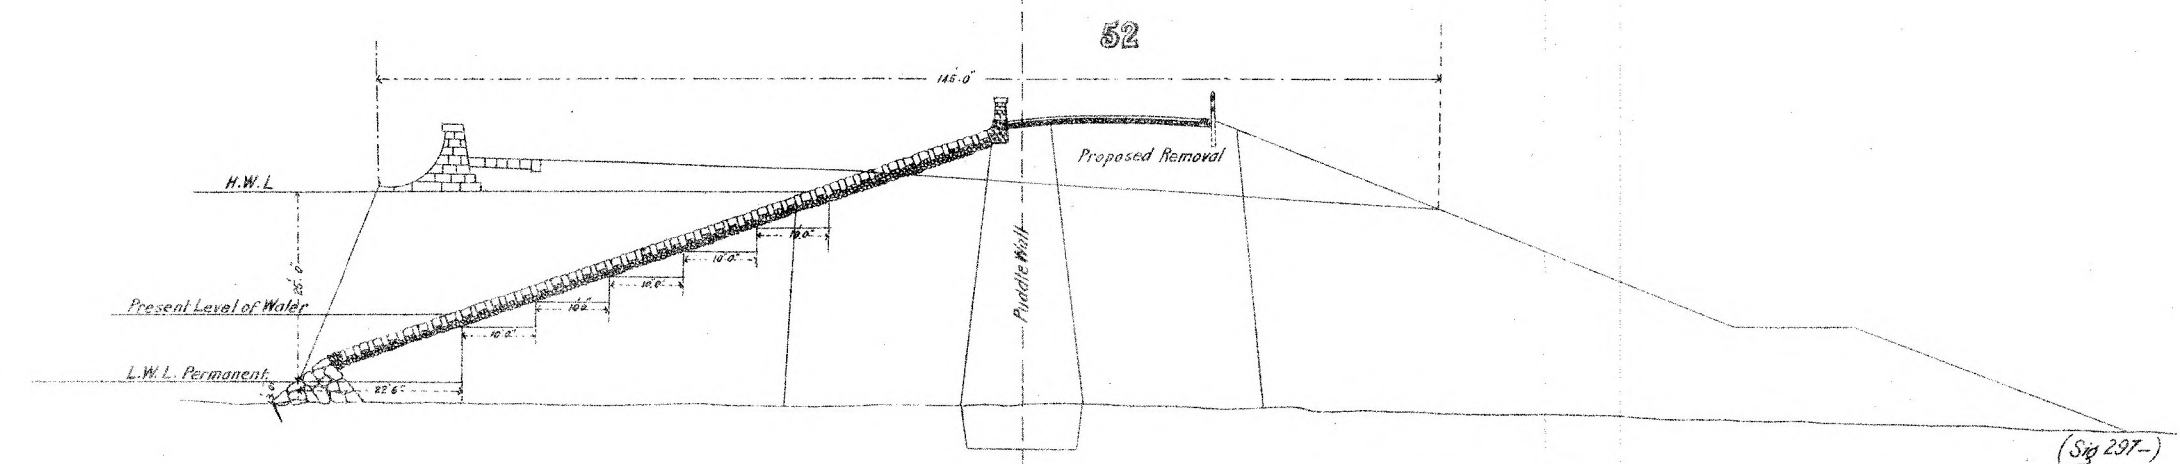

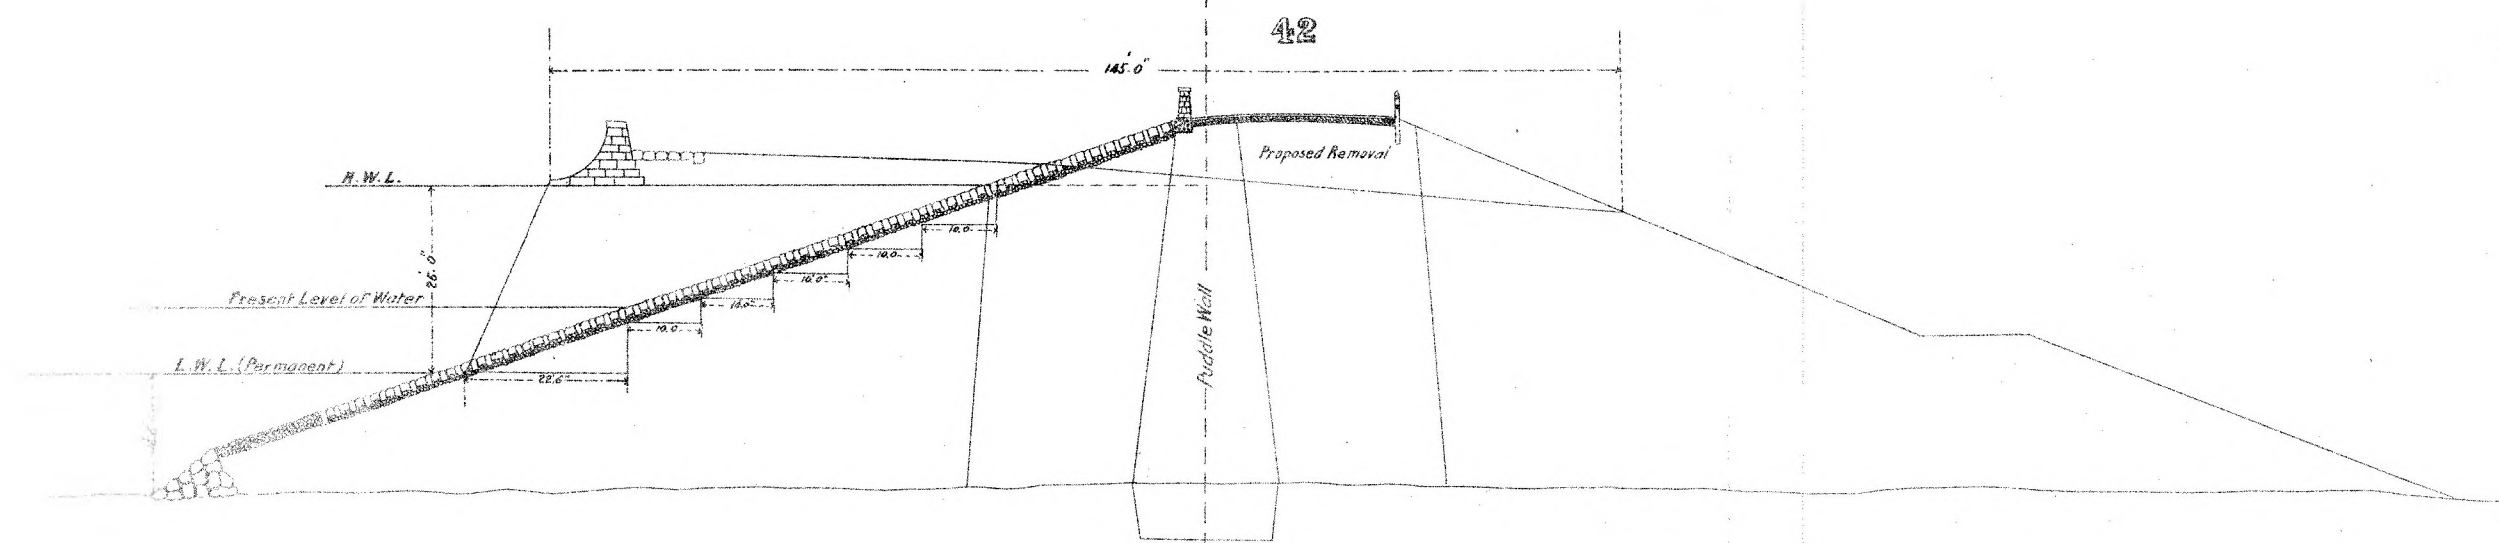

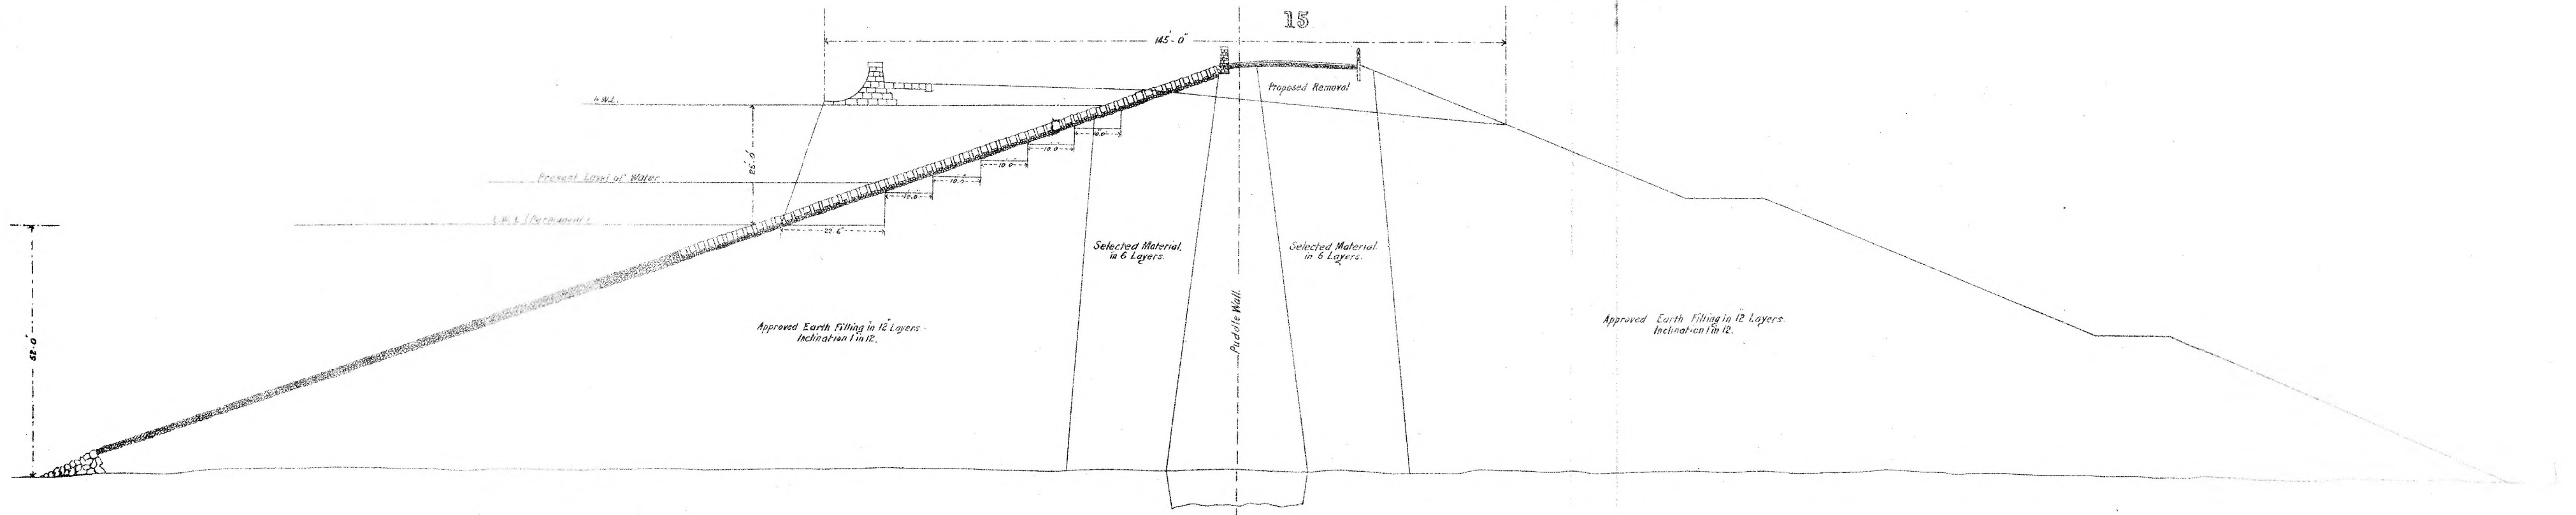

Yours faithfully,

JOHN SUTHERLAND.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

SYDNEY WATER SUPPLY.

(REPORTS, &c., ON THE PROSPECT DAM BY MESSRS. GORDON AND MESTAYER.)

*Ordered by the Legislative Assembly to be printed, 15 January, 1889.**[Laid upon the Table of the House, further reports, minutes, and correspondence in connection with the Prospect Dam.]*

PROSPECT DAM.

15 January, 1889.

I HAVE carefully read and considered the reports which have been furnished by Messrs. Gordon and Mestayer in connection with this important matter. A perusal of all the correspondence will, I think, show that I have neglected no opportunity of obtaining information from every source which has been open to me in relation thereto.

I have from the first been fully impressed with the necessity of ascertaining all the facts of the case, and making them public without a single reserve, and this, I think, I have accomplished.

A perusal of the reports obtained will, I think, show that if the measures recommended by the two able engineers which I have employed are carried out no fears need be apprehended of the ultimate success of this great work. I have now to direct Mr. Hickson to carry out as quickly as possible the works recommended by these gentlemen, and if I have not an opportunity of doing it myself, I would urge my successor to place all the papers on the Table of the House at his earliest convenience. With regard to the termination of the contract recommended by Mr. Gordon, I have taken steps to secure this, but I have been met with the statement on the part of the contractors that there are outstanding claims unsettled, amounting to something like £33,000. This is the first time I have heard of their existence, and upon making inquiries of the Harbours and Rivers Department I am told that they are also unaware of it. The whole matter requires careful investigation.

JOHN SUTHERLAND

Report on the Prospect Dam.

By G. GORDON, M. Inst., C.E., 7 January, 1889.

THE points on which I am desired by the Honorable the Secretary for Public Works to report are:—

- I. On the dam and subsidiary works as a whole; whether the design is in accordance with the best engineering knowledge, and whether the work has been faithfully carried out according to the design.
- II. The present condition of the dam.
- III. The kind of material of which it is composed, and its adaptability to the purpose for which it has been used.
- IV. The cause of the movements, and their significance as bearing on the stability of the dam.
- V. The best course to pursue under the circumstances.

2. Having made a personal inspection of the dam, and had levels, measurements, and borings, and an examination by a diver made in my presence, and having examined the persons named in Appendix II, and inspected original drawings, &c., I have given the subject my most careful consideration, and I now have the honor to report as follows:—

1.—The Dam and Subsidiary Works as a whole.

3. Assuming the scheme of bringing the Nepean water into Sydney, of which the Prospect Dam forms an important part, to have been, after full consideration, finally adopted as the best, I am of opinion that the general design of the dam and its subsidiary works leaves nothing to be desired. It is in full accordance with examples of similar structures by some of the most eminent engineers in England, and in some particulars, I think, it is in advance of several important modern works in Europe. It seems to me complete in all its parts, simple in design, and therefore easily worked. As far as the general design is concerned, it seems to me to have been departed from in constructing the works only in two particulars; the connecting main has been laid on the lower instead of the upper side of the dam, and the brickwork stop in the tunnel has been purposely left out. Both are, I think, improvements.

4. I shall have occasion to refer to the specification again under III; I would here remark that so far as it applies to the dam it seems to me to be rather too strict and explicit for a work of this magnitude, the conditions of which had in part to be ascertained as the work proceeded, and not to leave enough latitude to the engineer. At the same time I admit that high authorities could be cited in favour of every clause in it. But for such a work the specification should be made applicable according to the spirit or intention and object of the design, rather than to its literal expression in the specification and plan, and it seems to me that in some particulars it would under this specification have been difficult to exercise a desirable latitude without coming into collision with the contractors. Judging by the evidence, I am of opinion that the contractors carried out the work as nearly as possible according to the specification, and in fact that they were very strictly kept to it, although Mr. Ryan, the executive engineer, and other witnesses, say there was a constant battle going on between the officers of the Department and the contractors. This is by no means an unusual state of affairs on large works. All the evidence, both of contractors and others goes to prove that Mr. Ryan was unremitting in his attention to the work and scrupulously exacting as to the conditions of the specification. There are on every work some occasions on which deviations from the specification are unavoidable, owing to the weather or other accidental causes.

5. As to the tower, tunnel, and outlet works generally, I had an opportunity of seeing them in progress in August, 1884, and was impressed by their substantial character and the care that was being taken in their construction. As they seem now to be in perfect order I shall not need to refer to them again.

II.—The Present Condition of the Dam.

6. The first slip at No. 54, which began in April last and continued up to November 12th, appears now to have been very nearly stopped in its horizontal movement by the deposit of stone on and outside the lower part of the slope in the middle portion of the slip. While the filling up of the slip went on in July and up to August 6th, the forward horizontal movement was as much as 1 foot per diem. After the 7th August it averaged 1·08 inches per diem to the 31st, and during the whole of September it only moved 1 inch. In October and part of November the movement was dependent on the work of filling and trimming going on on the inner slope, the aggregate movement up to November 12th being 20 inches. Since that date sometimes no movement has been detected for days together, but the bank has not yet quite attained a state of equilibrium, inasmuch as movements of $\frac{1}{8}$ " to $1\frac{1}{2}$ " in a day have been measured, amounting in the aggregate to $6\frac{1}{2}$ " from November 12th to December 20th. The forward movement of the stone filling which was observable for some time in the axis of the slip, and which reached a total observed amount of $10\frac{1}{2}$ ", has almost ceased, no motion being detected from the 27th November to the 18th December, except $\frac{3}{8}$ " on the 11th December. There is still some forward movement at the ends of the slip where the stone filling is incomplete.

7. From the sections shown to me that had been taken from time to time it is evident that this slip has a forward rolling motion, the toe having apparently resisted for some time any tendency there may have been in the lower part of the bank to slip forward. The motion is roughly indicated by arrows on the section at 54 on plan No. 1 attached.

8. As the front bank slipped away from the nearly vertical puddle wall, it is probable—indeed it may be said to be certain—that the latter subsided under its own weight into the space thus formed in front of it. It is extremely plastic, and it is recorded that the level of the top was found on the 2nd May, 1888, to have gone down 5 feet. After being remade, it went down 3 feet to 21st June, and 6 feet and upwards to 22nd September, when it was again fully rebuilt, but had subsided about 5 feet up to the 20th ultimo.

The Second Slip.

9. The second slip at T.S., No. 44, was first observed in November last, and observations of the daily movement were begun on the 23rd of that month. Before my arrival Mr. Mestayer had put down two bores, called No. 1 and No. 2, on the 7th and 10th December, respectively, at the reduced levels of 185·87 and 186·50, the water level in the reservoir being 178·79 and 178·75. On the 14th December

December I put down a bore, called No. 4, in the axis of this slip, at the R.L. of 179.59, near the water's edge, the water level being 178.72. This bore was put down to the original bottom at about 26 feet. At 14 feet (R.L. 165.57) water was met with which rose 4 ft. 6 in. in the bore (to R.L. 170.0); below that, at 16 feet, we found stiff dry yellow clay. At 20 feet it was slightly sandy. The water then rose to 1 ft. 5 in. below W.L. of reservoir or R.L. 177.22. On examining the same day No. 1 bore, the water was met (in the shape of thick slurry) at R.L. 172.62, and in No. 2 (clean water), at R.L. 177.42, with slurry at 174.25. On again trying the level of the water in No. 4 it was found at 174.24. As, in boring, this level was pierced in dry clay, and as the level of water first struck was considerably lower, also because in boring Nos. 1 and 2 no water was met with, although it afterwards rose in the bores to the heights above-mentioned, I conclude that there is no wet stratum on which the bank slides, but that the movement is in the whole mass, and the excess water is distributed through it. In all these bores the clay was generally similar, being of various colours, with a considerable admixture of white clay; in general it was stiff and dry, sometimes hard, and evidently, from the water not percolating into No. 4 from the reservoir, quite water-tight from the outside, although there is water higher up in the bank which finds its way into the bore-holes.

10. A bore, No. 3, was put into the puddle wall at the top of this slip. The puddle was thoroughly well worked, and very smooth and plastic, but to my mind not stiff enough. On the augur being withdrawn the bore-hole partly collapsed before the tool could be put down again. It is said by Inspector Davis that this was put in harder than that in the lower parts.

11. The puddle wall has subsided vertically 14.82 feet, or 12.73 below the intended ultimate level. The horizontal movement of the puddle wall has not yet been ascertained at this place, but it must have moved forward with the inner slope. The total horizontal movement of the face from 22nd November to 20th December is stated at 4.46 feet, and it was pretty uniform, averaging nearly 2 inches a day.

12. On the 19th December I sent Mr. Cameron, diver, down the slope at this place to examine the face of the bank and the toe. As well as could be measured with a steel tape down the slope from a mark above water, it was found that the top of the stone dyke had moved forward about 3 feet. The diver reported that the form of this slip is quite different from that at 54. There is no steep face to the bank and pitching near the bottom, but the toe appears to have been pushed out horizontally, the outer slope of the dyke being flatter, and the original surface of the bottom being forced forward and raised like a blister. This action extends both ways from section 44 as far as he could go, probably 200 feet on each side, but it diminishes each way, and there is more disturbance towards the east than towards the west. The broken stone between the dyke and the pitching is not thrown up or disturbed; the slope seems to the diver to be pushed out bodily, and the stones of the dyke are displaced. There were a good many loose stones which seemed to have come from the rough stone above the dyke, but they may have come from the dyke itself. The top of it is not of a uniform height, being 2 or 3 feet higher in some places than in others. The diver shifted the gear to section 47, and found the toe similar to the last place, but there was less bulge in the ground. In some places the dyke is twisted. Going from section 47 towards the first slip the action seemed to die out, but there were still indications of it. The results of the diver's examination are sketched on section 44, where the disturbance is at its greatest.

See sketch on drawing, Appendix E.

Plan 2.

13. Although the section of this slip is quite different from that of the first, it is, I think, probable that the movement of the bank began in the same way, and is due to the same cause; but in the first slip the foundation and the toe offered greater resistance, and caused the slipping clay to rise and roll over the dyke, while in the second the toe offered comparatively no resistance to the greater weight behind it, the bank being nearly one and a half times as high as at the first slip. In both cases the bank is seeking a flatter slope.

At and near Section 18.

14. On the 14th December I desired that a bore, No. 5, should be put down next day at section 18, which is nearly the highest part of the dam, and the cores kept for inspection on the 17th. They showed that the bore went through similar clay to the former bores. The bore was about a foot above the water level. Muddy water was struck at 10 ft. (about 168 R.L.), which in about three minutes rose to the top of the hole. When the men left off on Saturday the water was about 11 ft. below the surface of the reservoir. On removing the plug on Monday the water rose and ran over. At 8 to 10 ft. soft clay was met with, "as soft as the puddle in No. 3 bore," which at 4 ft. I found like soft putty, and at 6 ft. rather softer. On Monday the 17th the bore was put down to 42 ft. (the length of the rods), and finished in very stiff brown and gray clay. When the rod was taken out from 42 ft. depth the water stood at 3 ft. 6 in. from the top of the hole, or 2 ft. 7 in. below the reservoir water. I have shown this bore on drawing No. 3, as also the two additional bores Nos. 6 and 7 put down by Mr. Mestayer after I had left, in order to show the different levels at which water was struck, and at which it settled afterwards in the bores (see paragraphs 9 above and 26 below).

15. On the 17th the diver was sent down at No. 19, and reported that the toe was intact, and just the same as when he was down last for Mr. Bishop in May; but in about 12 ft. of water he came on a step or ridge in the rough stone which seemed to have been disturbed and had a wavy appearance. On the 20th the diver went down (by my instructions) at No. 17. At the bottom he found some loose stones which were not there when he was down in May last, they seem to have come from the rough stone; there are also some very loose stones in the dyke itself. Between 16 and 17 there is a great oozing out of white clay, of which the diver brought a specimen, extending some distance, and completely covering the slope. It runs over the bank "like paste" in some places, and extends pretty well up to shallow water. He noticed very little spuing at No. 19 when he was down on the 17th. He does not think this spuing runs down to the bottom. At 19 he got on the clean original bottom, and at that point there was no disturbance. He found places where there was some spuing when he was down for Mr. Bishop, but cannot remember where they are, as he made no notes at the time. At Nos. 16 and 17 he also found the ridge or step which he found at 19; it is not continuous but irregular, and not in a straight line. He did not find it where the spuing had taken place. None of this spuey material is found at the second slip, or between it and the first.

16. The puddle wall at No. 18 has subsided 4 ft. 7 in., or to 9 in. below the intended ultimate level. It has moved forward 2 ft. 4½ in. It is evident, therefore, that the bank of this place is not quite stable, although the movement is as yet very much less than at the slips. The curb at this section is

75 ft. 6 in. from the centre line, and it was intended to be 73 ft., and the line of curb seems to the eye to be somewhat bulged outward from the north end of the dam all along, but this cannot be verified by instrumental measurement, as no exact records exist of its original position. There is a curve in the rough stone toward the water side looking from the east bank, where it leaves the solid, but this is also subject to the remark just made.

At Section 5.

17. The puddle-wall is here in its right position—horizontally. It has subsided 1 ft. 9 in., that is to say, it is not yet quite down to the ultimate level, so that there is nothing to show that any undue movement has taken place at this place.

18. The rear slope of the dam seems to be in perfect order. The contractors were engaged at the time of my visits in soiling the slopes, but I could see nothing to cause any suspicion of undue or unequal settlement, nor has such, so far as I have been able to learn, ever been stated to exist.

19. The dam is at its present level quite water-tight, the leaks that have been said to exist are entirely imaginary.

20. I do not believe that the puddle-wall is fractured or cracked in any part, or that it is possible it should be.

III.—The kind of material of which the dam is composed, and its adaptability to the purposes for which it has been used.

21. The two materials we have to deal with under this head are the puddle in the middle of the dam and the clay of which the inner slope of the dam is built up. The former is made of the best, indeed the only clay available; and it has been well worked and made into a perfectly water-tight puddle. It is to my thinking not quite stiff enough; but as it is a "short" or friable clay, not in the least tough, it is better that it should be rather too soft than too stiff. I believe it would be found sufficiently dense in the lower parts of the wall. One of the difficulties the resident engineer says he had with the contractors was the too great quantity of water used in its manufacture. On the other hand, the contractors say the clay was of such a sticky and adhesive nature that the cutting and cross-cutting with spades specified and insisted on could not be done without a large quantity of water. In addition to this, the trench was subject to be flooded by leakage from the pipes supplying the water on the dam, and by the rainfall on the inner slope, which, according to specification, had a reverse slope of 1 in 12, and from which the surplus water had to be carried across the puddle before it could reach the drains in the outer slope. The contractor's engineer, Mr. Moline, also says that owing to the puddle being brought up in perfectly horizontal layers (longitudinally) it was difficult or impossible to thoroughly drain off surplus water. In July, 1885, the resident engineer wrote strongly to the contractor respecting the too lavish use of water. Although this is the only written objection on the subject, the letter implies, I think, that this had been the subject of verbal complaints. (Appendix III.)

22. I believe that though it may be liable to greater subsidence than was reckoned on in its higher parts, and may in this way give trouble, it is perfectly safe in regard to being watertight.

23. The inner slope is principally, if not entirely, composed of clay from the flat behind the reservoir. Wherever bores have been put down they show a similar material—brown, yellow, red, and white clay. It cannot be said to be a good material for a bank, even if the most objectionable part (the white clay) had been excluded; and I am informed it was so mixed up with the other that it would not have been possible to exclude it from the dam. There is better material in Prospect Hill, and a good deal of it has been used apart from that required to bare the stone in the quarry. Some of it is mixed with stone, but some is free from it. These seem to be the only materials available.

24. Had these different materials been put in alternately in thicknesses of, say 3 feet each (3 layers of 12 in.), they would I think have made a very good bank. The evidence is somewhat conflicting on the question why only clay was used. Mr. Ryan says the contractors were at liberty to use earth from any of the places mentioned in the specification. Mr. Moline, while admitting that Mr. Ryan objected to pure clay being used, says he would not allow the earth from Prospect Hill to be brought on the work in trucks, or any stony or gravelly material to be used in the inner slope, relying on clause 17 of the specification. This is one case in which I think the specification binds the Resident Engineer too much, although Mr. Ryan says his chief allowed him every reasonable liberty. There are difficulties in modifying the contract *vis-à-vis* of the contractors.

25. I think the plan of depositing the material in the bank in layers sloping inwards, 1 in 12, is not suitable to this material, because, as the outer part of the embankment was always higher than the part next the trench, all the water falling on the bank in storms, as well as that specified to be used, is confined between the puddle wall and the slope, and cannot escape except to a small extent by evaporation. The practice of engineers differs in this respect, as well as regards the use of water in consolidating earth work. I think it would have been impossible to avoid the use of white clay entirely in this bank, and, therefore, I think alternating horizontal layers of clay and a more free material should have been adopted. (See para. 24.)

IV.—The cause of the movements and their significance as bearing on the stability of the Dam.

26. I think the causes of the movements are:—First, the character of the material employed in the inner slope, which will not stand at a slope of 3 to 1. Secondly, an excess of water used or allowed to accumulate in the inner slope of the dam—its presence in excess of what the clay will retain being shown by the filling of the bore-holes from a higher level than that of the reservoir water—and the excess tending to cause the material to take a flatter slope and to do this irregularly, and, so to say, in patches. There exists an erroneous impression that the water in the reservoir is destroying the bank, and that therefore its entire disappearance or dissolution is only a matter of time. The material is not washed out (except to a small extent in the case of white clay, see para. 15), but it is shifting in order to obtain a flatter slope. I think more vertical subsidence will take place in the puddle-wall than has been allowed for in the higher parts, and also generally, because it is said that the bank was not so well consolidated by carting and rolling for 3 feet or so on the inner side of the trench under the water-pipes, thus giving an opportunity for the puddle to squeeze laterally and compress this wet and ill-rammed

ill-rammed ground. Near the first slip the progress section shows that there was a deep depression here in the puddle wall, and I was informed that the water in the trench had to be dammed back in steps on the puddle, and that it sometimes got into the trench where it was being put in; and although it is possible to attach too great importance to this fact, I believe that this circumstance has increased at this place the over-saturation of the inner slope. I consider the rear slope of the dam perfectly stable; the inner slope is not so, nor is the puddle wall at present, but I think the inner slope can be brought to a state of stability, when it will serve its purpose of supporting the puddle wall.

27. In the meantime I do not think there is any risk of the dam breaking, even under a considerably greater depth of water than there is at present, or of any loss of water and consequent scarcity in Sydney.

V.—The best course to adopt under the circumstances.

28. What seems to me most urgently needed at present is the stoppage of the second slip, the first having been nearly brought to a stand-still. In my opinion this can only be done by reducing the slope of the bank, and opposing weight to its present tendency to slip. The broken stone used at the first slip would, I think, have been better deposited from a staging outside the toe, and clear of the shifted material, and I believe this is recognised by the engineers, but they were without the necessary appliances. Immediate action was needed, and it was not anticipated that new slips would take place. In deeper water I think barges or rafts towed by small steamers should be employed. It is impossible to say at present how much of this work will be needed, seeing that the place where the toe is most perfect is in the deepest part of the dam, where the work is oldest, and the greatest opportunities of slipping have existed; but there seems no doubt at all that it will be required from T.S., thirty-five, or so nearly up to the first slip, a distance of 1,600 feet, and for this part of the dam I would recommend *that the work be put in hand at once*, if it has not already been begun. I fear it will be necessary for a much greater length, for in whatever way the now slight movement at 18, and the oozing out of bad material at 16 and 17 will develop themselves. A flattening of the slope above L.W. to 4 to 1 will be necessary, and to do this under water a deposit of heavy material to form the foot of the new slope seems indispensable.

29. I regard the drawing off of the water in the reservoir as out of the question altogether; and even were it not so as regards the supply to Sydney, any incipient slip would be encouraged and new ones started—while, in all probability, the cheaper rate at which a new toe could be formed with dry materials would be more than balanced by the additional amount of damage to be made good.

30. The outer mound of stone of all sizes mixed being formed, the space between it and the present slope could be filled with a cheaper material—such as quarry-chips or screenings and strong earth deposited in bags and covered with broken stone. I have sketched the plan I would recommend on plan No. 4 attached to this report.

31. The precise mode of dealing with the bank from 15 to 20 can only be decided after the nature of the movements now beginning there have been ascertained. If the toe-dyke remains unmoved, and no bulge appears in the bank under the curb, I think the oozing can be stopped by a deposit of screenings; the slope above L.W. (170.0) to be flattened to 4 to 1, in the manner shown on plan 5 by red lines; the screenings covered with quarry rubbish and earth in bags supported by a mound of rubble 10 feet high and 6 feet wide on top; but if the bank shows a tendency to slip in the same way as at 44 or 54, then a much larger mound and a flattening of the slope under L.W. will be necessary. This I have shown on the same drawing in blue lines, and it will be seen that if it is ever found necessary it will be an addition to the deposit of screenings, which I would recommend to be put on at once unless the oozing out of clay is found to have ceased. In making this new slope of 1 to 4 above L.W. it may be possible to avoid taking up much of the pitching by giving it time to settle. It will be well not to raise the water in the reservoir higher than will give an ample reserve for Sydney, because, if raised, the water would, in my opinion, retard any movement that may be going on with the water at its present level, and make its true character more difficult to determine, while, if the movement were altogether checked by the rise of the water, it would certainly reappear on its being lowered again in summer; neither is it necessary to permanently finish off the crest of the dam. The width of the crest is reduced in front by 8 feet, but if it be desired to keep the 30-foot width on top, which, I think, is more than is necessary, it may still be got by adding to the rear slope at the top without making the slope too steep.

32. A slight movement in a high part of the dam would probably be best detected by the horizontal movement of the puddle wall, for the longitudinal cracks along the top might be caused by its vertical subsidence, especially where the trench was very deep, the added percentage having only been reckoned on the height from the base of the bank, and not for the whole height of the puddle; and I would therefore recommend that trenches be cut across the dam at every alternate T section at least, and the position of the puddle wall both as to level and horizontal position with reference to the centre line be observed daily, as also the position and levels of a series of pegs on the slope at each trench down to the curb measured and recorded in the accurate and careful manner adopted by Mr. Jacobs in observing the present slips. Beyond the water lines soundings should be taken. By this means any movement in the body of the dam, apart from subsidence, can hardly fail to be detected. (It should be stated that neither the contractors or their engineer, nor the resident engineer, suspected any slipping while the dam was being constructed. Mr. Davis, inspector, says he noticed that the inner slope took more filling than the outer, but he does not appear to have attached much importance to this.) Further, that if the services of Mr. Cameron, diver, are available, he should examine the face of the dam below water, going down at such distances as would allow him to cover the whole of the length, and reporting fully what he finds each time, and to do the whole work at least twice and oftener if any change is observed the second time.

33. The setting of the pitching and other work on the dam should be discontinued, and I would suggest that the present contract should be terminated by mutual agreement. The work remaining to be done by the contractors is neither important nor of much value, and the bank should, while these investigations are going on, be entirely in the hands of the officers of the Department; indeed if my recommendations are adopted it would be necessary to stop traffic on account of the trenches.

34. When cracks appear they should be dug out so as to allow of their being filled in and well rammed from the bottom to the top, but I do not think this work is of very great urgency in dry weather until the slipping has stopped. It is well however to prevent any more rain-water getting into the dam.

Where

Where the cracks are caused by the subsidence of the puddle wall, *i.e.*, when they occur between it and the earth filling front or rear. I think they should be filled up by forcing the puddle to expand laterally by weighting it on the top.

35. With such a watertight material as is used in the front slope I do not think there is any necessity for the puddle wall going higher than the H.W.L. or R.L. 195'00.

Estimate.

36. An estimate of the cost of the remedial measures must necessarily be contingent on the behaviour of those parts of the dam in which the movement is as yet uncertain (see paragraph 28 above). I therefore divide the estimate into five parts, of which the first, amounting to £12,050, refers to the work I have designated as urgent (paragraph 28). The second and third are contingent on the state of the dam as found in. If it slips as it has done at 44, No. 3 must be added to No. 2, not substituted for it, and that part may cost from £23,850 to £42,400. No. 4 is not urgently needed at present; No. 5 is.

37. I would state while in order to save time Mr. Mestayer and I conducted this inquiry together, as regards borings, diving operations, and also in taking some of the evidence, our joint work stopped there; and we have not conferred together on any of points III, IV, or V, referred for our separate and independent reports.

38. I have much pleasure in saying that all the persons to whom I applied for information, who were more immediately connected with the work, whether as engineers or contractor, seemed to be anxious to give all the information in their power, and I have to thank them for their willing co-operation with me in this inquiry.

Summary.

39. It may be convenient if I state briefly the results of my inquiry under the different heads.

- I.—*The general design of the Dam* and subsidiary works is in accordance with the best engineering knowledge, and the only ways in which the spirit of the original general design have been departed from are, in my opinion, 1st, a too close following of high authorities in the construction of such works, and 2nd, the choice of material.
- II.—*The present state of the Dam.*—The only part of the dam which seems to be perfectly stable is a short length at each end, and while the amount of movement in the highest part of the dam is as yet slight, it requires most careful watching. The slip at No. 54 seems to be now at rest, and that at No. 44 approaching that condition, but if the bank were made up, or the water lowered, it would probably again begin to move.
- III.—*The material* composing the inner slope of the dam is too clayey and, while quite water-tight, will probably cause a good deal of trouble and expense before it finally assumes a permanent form. The puddle in the wall is highly plastic and quite water-tight, but rather soft.
- IV.—*The prime cause of the movement* is the too clayey nature of the material forming the inner slope and the imprisonment of an excessive quantity of water in the bank during construction. This, I believe, can be remedied, but at a considerable cost. The state of the dam need not cause any alarm for its ultimate safety or stability, or any apprehension of a scarcity of water in Sydney, but prompt action is necessary.
- V.—*The best course to pursue.*—To terminate the present contract in order to allow of a thorough examination of the bank which should be undertaken *at once*; to stop the pitching of the slope; to construct at once a rubble bank from No. 35 to No. 51, or thereabouts, outside the toe and fill in behind it with suitable heavy material to a slope of not less than 4 to 1 below low-water and to reduce slope above low-water also to 4 to 1. To begin a similar rubble wall wherever there is any sign of the toe moving or of the slope bulging, and to continue in such places the treatment recommended at 35 to 51; to load the puddle wall; to let the treatment of the portions of the bank, where white clay is oozing out on the surface, depend on the movement or stability of the bank, and where there is any considerable amount of this oozing to cover it with screenings immediately; to allow the water to rise in the reservoir sufficiently to afford a proper reserve, but not higher, until the movement of the bank is checked; to use the greatest dispatch in carrying on the repairs.

G. GORDON,
M. Inst. C.E.

APPENDIX I.—ESTIMATES.

Estimate No. 1.

For repairs from T.S. 35 to T.S. 51, recommended at once (para. 28).

	£	s.	d.
Rubble mound, 25,718 cubic yards, at 6s.	7,715	8	0
Screenings, 1,185 " " 7s.	414	15	0
Filling, 9,130 " " 4s. 6d.	2,054	5	0
Rubble on face, 2,667 " " 6s.	800	2	0
Contingencies, 10 per cent.	1,065	10	0
	£12,050	0	0

Estimate No. 2.

For flattening slopes of dam and stopping oozing out of white clay from T.S. 5 to T.S. 35 (para. 28).

	£	s.	d.
Rubble mound, 17,222 cubic yards, at 6s.	5,166	12	0
Screenings at back of do. and over 100 ft. × 500 ft. × 2 ft., 5,037 cubic yards, at 7s.	1,762	19	0
Rubble stone face, 12,333 cubic yards, at 6s.	3,699	18	0
Filling below L.W., 40,000 } 49,000 cubic yards, at 4s. 6d.	11,050	0	0
" above " 9,000 }			
Contingencies	2,170	11	0
	£23,850	0	0

Prospect Reservoir.

REPORT on the Embankment of the Prospect Reservoir and Works in connection therewith; made in pursuance of instructions received from the Honorable the Secretary for Public Works, by L. L. MESTAYER, Assoc. M. Inst. C.E., Hydraulic Engineer.

R. L. Mestayer, Esq., A.M.I.C.E., to The Honorable The Secretary for Public Works.

Sir,

I have the honor to report that, upon receiving your instructions, I made immediate arrangements to inspect the Prospect Reservoir embankment, and undertake the investigation with which you had entrusted me.

These instructions (*Appendix A*) may conveniently be resolved into the following divisions, viz. :—

- I. To visit the Prospect Dam and report upon its present condition.
- II. To ascertain the kind of material that has been used in its construction, and its adaptability to the purpose for which it has been employed.
- III. To point out:—
 - (a) The cause of the movements that have taken place.
 - (b) Their significance as bearing on the stability of the structure.
 - (c) What will be the best course to take under the circumstances.
- IV. To report on the construction of the dam and subsidiary works as a whole, whether the design is in accordance with the best engineering knowledge on the subject and whether the works have been faithfully carried out according to the design.

I propose to consider each division separately in the order named, and it may not be amiss for me to mention in this place that, having visited these works in March, 1887, and again early in June of last year, I had, prior to undertaking this investigation, some personal knowledge of the character of the work and the manner in which it had been executed.

I.—The present condition of the Dam.

On the 5th of December last, I visited the works, and after a careful examination of the plans, sections, and specifications of the reservoir and subsidiary works—especially of the plans and sections that had been prepared of those portions of the embankment that had given way, and the records of observations that had been taken up to that time—I went carefully over the ground with the resident engineer, Mr. R. H. Ryan, and took note of all the information he had obtained relating to the movements.

My last visit to the works was made on the 2nd instant, and the report which I now have the honor to present, is based entirely upon information and evidence obtained at various times, and from many different sources, during this period.

I found on examining the embankment, that considerable movement had occurred at three different positions, which were altogether in excess of anything which could have been produced by natural subsidence of the materials of which the embankment had been formed, viz.:—

- (a.) The first slip between sections 51 and 55, where a large section of the water slope, about 300 feet long, had moved bodily forward 27 feet. This forward movement was naturally accompanied by extensive subsidence of the top portion of the embankment between the puddle-wall and inner slope, and the formation of extensive fissures running longitudinally above the puddle-wall which (owing to the support from the embankment being withdrawn) had subsided about 17 feet and followed the moving portion of the embankment.
- (b.) A second slip between sections 42 and 46, which had at that time reached a total forward movement of 152 feet, accompanied by subsidence of the inner portion of the top of the embankment and the formation of fissures running longitudinally over the outer and inner edges of the puddle-wall, similar, but to a much lesser extent to those formed at the site of the first slip.
- (c.) Extensive subsidence of those portions of the top of the embankment between the puddle-wall and the water slope from sections 4 to 30, accompanied by the opening of fissures varying from a few feet to several chains in length, some of them being from 10 to 14 feet in depth, and from 1 to 18 inches in width.

The subsidence of the earth at this point, had, up to the time of my first official visit to the works, been ascribed to natural settlement of the material.

This being the deepest portion of the embankment, the results of the natural settlement would necessarily be more strongly defined than at the more shallow portions of the embankment; but, although recognizing the force of this argument, I was struck by the similarity between the fissures that had opened here and those at the other point, where decided slips had taken place, and finding that up to that date no regular observations had been taken at this latter point to ascertain whether any forward movement was taking place, I instructed Mr. Ryan to have daily observations taken for this purpose, similar to those being made at the side of the two first-mentioned movements. This has been done regularly since that date, and the result is that no movement has been detected during the last four weeks; but, in order to ascertain whether any movement other than subsidence had taken place previously at this—the deepest—portion of the dam, I have had sections taken and plotted upon the original sections to which the work was constructed, and these show clearly that a forward movement has taken place, amounting to a maximum of 18 inches at section 18, and extending right and left of this, the total length moved lying between sections 15 and 21.

The fact of this movement having occurred is further confirmed by the examination of the bank under water by the diver.

In order to ascertain the condition of the interior of the bank, I have had borings put down at eleven different points, and in Appendix B is given the results in detail. Generally speaking, they indicate that the bulk of the embankment is solid and dry; but in most cases there are indications of the presence of moisture in some one portion or other of the embankment in quantities more than sufficient to exercise a most injurious influence upon the materials of which the bank is composed.

As the depth of water on the inner toe of the embankment varied from 20 to 50 feet, I could not personally examine it, but the services of a diver were placed at my disposal, and with his assistance a careful examination has been made of that portion of the embankment under water, extending from section 16 to section 50.

This examination has fully confirmed the fact of a forward movement having taken place at section 18, a bulge occurring on the slope about 36 feet from the waters edge, as though the upper portion of the bank had slid forward upon the lower. No movement of the stone dyke at toe of embankment was observable at this point.

The examination of the water slope of the embankment by the diver also revealed the fact of the slip at section 44 being different in character from those at section 18 and section 54. In these two latter cases the upper portion of the bank has moved forward upon the lower portion, the plane of movement lying apparently at a point about 40 feet below the top of the embankment at section 18, and about 29 feet below the top of the embankment at section 54, the stone dyke at the toe of the embankment retaining its original position at both these sections, but at the former place (section 44) the stone dyke has been forced from its position, driving the ground before it and opening cracks of many feet in length in the solid ground in front of the moving portion, some of the cracks being, the diver states, "large enough to take in the whole of a man's leg."

The stone dyke all along this portion was very much distorted, many of the stones displaced, and several of them forced completely out of the dyke, which appeared from its form to be gradually overturning.

Between sections sixteen and seventeen—almost the deepest portion of the embankment—a large amount of soft material had spued out of the bank. Samples of this were brought up by the diver, and consisted principally of white and pale yellow clay of the consistency of stiff paste.

The diver reports having seen a little of this in one or two other places, but not in noticeable quantity, as at this particular portion of the embankment.

In order to ascertain the condition of the puddle-wall I have had the ground opened and the puddle-wall exposed at different points. The original line of the puddle-wall was then set out, and measurements carefully taken to the inner edge. It was thus found that the puddle-wall at section 18 had moved inwards (towards the water) about 2 feet 4 inches and had subsided 459 feet, being 7 inches more than had been originally allowed for.

At section 5 it had subsided 173 feet, being 7 inches less than the 5 per cent. allowed for, and the centre of the puddle-wall was in its original position, showing that no movement other than natural subsidence had taken place at this point.

At section 24 the puddle had subsided 3 ft. 9 in., being 4½ inches more than allowed for in the construction of the wall.

This excess of subsidence of the puddle-wall beyond the percentage allowed, is just what might have been expected, and will go on for some time yet, as it appears from the evidence given by Mr. Ryan that the 5 per cent. addition was made only on the height of the puddle-wall above the ground line, and that no allowance was made for subsidence of the material in the trench.

This

This I consider an error of judgment, the portion of puddle-wall in the trench being very moist, and exposed to a pressure from the material above ground of from 2 to 5 tons per square foot, will certainly be compressed to a greater or lesser extent, especially where the strata passed through are at all porous.

Samples of the puddle-wall were taken out at each place and carefully examined. The whole of them were very uniform, and showed every indication of the puddle being of first-class quality, thoroughly well worked, but of a softer consistency than I should have considered advisable.

I have carefully examined the back of the embankment, but can find no indication in any portion of it, of any movement other than natural subsidence. Particular attention was given to the lower portion of this side of the embankment owing to rumours that had been circulated of a leak having occurred at or near the deepest portion; but there is nothing to justify any such statement—in fact everything goes to prove the direct opposite; and I have no hesitation in asserting positively that there is not the slightest leak through the puddle-wall up to the present time, nor is there anything to indicate the slightest probability of such an occurrence in the future. Dry stone drains were built in this portion of the embankment to remove the surplus water from it during the time of its formation, and to serve as outlets for the portion of rainfall absorbed after its completion. The water now trickling from the foot of the back slope at two or three places in every case issues from the outlets of these stone drains, and is not more than would naturally be looked for, considering the large area of bank exposed to the weather, and the heavy rains which have lately fallen.

When I first examined the embankment on the 5th of December last there was no flow of water from any of these drains, but on the 19th of December there was a slight stream from the two draining the deepest portion of the embankment.

The whole of the ground at the foot of the embankment, except at the outlet of these drains, is perfectly dry and firm; and none of the witnesses whom I have examined have been able to indicate any point—except the outlets of these drains—where any moisture has at any time been noticed.

When the back slope of the embankment is turfed, very little, if any, water will find its way down these drains.

In Appendix C is given the total movement at each of the places where any slip has occurred, and also the daily movement since I have had the work under observation.

II.—The kind of material that has been used in the construction of the embankment, and its adaptability to the purpose for which it has been used.

This division of my investigations has a most important bearing upon the questions I have afterwards to consider, viz., the causes of the movements and their significance—and has consequently received my most careful attention.

I have spared no pains to obtain the fullest information from all sources, and all the evidence I have obtained from persons totally unconnected with either the Government Department or the contractors goes to confirm the particulars given me by the Resident Engineer and by Mr. Shand the contractors' representative. There is consequently no conflict of evidence so far as regards the materials used.

The puddle-wall consists of carefully-selected yellow and red clays, excavated from the flat immediately below the embankment.

That portion of the embankment next to the puddle-wall consists of selected material taken from the same place as the puddle, and consists principally of yellow and red clays, similar to that of which the puddle was formed, worked in 6-inch layers.

The remainder of the embankment has been formed of somewhat similar materials, from the same site, together with a large amount of earth from the hill at the east end of the embankment and the material excavated from the puddle-trench.

This was all carefully inspected before being deposited, the finer material being deposited on the water side of the embankment, and the stone and coarser material at the back, all of it being worked in 12-inch layers, and every endeavour appears to have been made to thoroughly consolidate each layer by rolling and diverting the traffic over every portion of it in turn.

These layers were all formed with an inclination of 1 in 12 towards the puddle-wall.

The puddle is of a quality fully equal to any I have seen in the colonies. It is not quite as tough as puddle is usually made in England; but that is to be accounted for by the different character of the clay, none of the clays that I have yet seen in the colonies being as strong or suitable for puddle as the majority of the clays found in England.

The material, however, employed here is undoubtedly of very good quality, and quite suitable for forming a sound and perfectly water-tight puddle-wall.

I have taken samples from the puddle-wall, both by means of open cuttings and by boring into the heart of it; and all the samples, although taken from very different points and from various depths, are remarkably uniform, and prove that the puddle is of exceedingly good quality; but it has been put in softer than I consider necessary.

It is with very great regret that I find myself unable to speak as well of the material used for the embankment, especially for that side of it next the water.

The bulk of this portion is clay, taken from the same side as the clay for the puddle, and all the material which was not considered suitable for puddle was brought into the bank.

I do not consider that clay alone ever makes a good bank. It would be much better if mixed with an equal bulk of coarse gravel. In this particular case a considerable portion of the material consisted of inferior clay and decomposed shale, whilst the earth from the hill at the east end of the embankment contained a quantity of what appeared to be a dark, almost black, clay, resulting apparently from the decomposition of the diorite rocks; both this and the inferior light-coloured clay from the flat are unsuitable for the water-face of the embankment, as in the presence of water they run down to slurry of a specially slippery nature.

The borings which I have taken fail to show the presence of these inferior materials in beds or patches of any depth, and from the care that has unquestionably been taken to ensure complete mixture and thorough

thorough consolidation of the whole of the materials, I should not have anticipated anything different; but as these materials form a by no means small proportion—in some places amounting to one-fourth of the whole—I cannot but believe that they have appreciably affected the water-resisting capability of the remainder of the material, and in the presence of any large quantity of water the mixed material would not naturally stand at a slope of 3 to 1.

So far as the back of the embankment is concerned, I consider the materials quite suitable for the purpose, as even if the grey and black clays existed there in a much larger proportion than in the water-side of the embankment no evil result could ensue, owing to the draining of the bank by the stone drains and the admixture of rougher and coarser materials, which would have a tendency to prevent the formation of any plane of movement such as appears to have been formed where the slips have occurred.

All other materials that have been used in the construction of these works are, in my opinion, of the very best quality, and in every way suitable for the purposes for which they have been employed.

III.—(a) The causes of the movements. (b) Their significance as bearing upon the stability of the structure. (c) The best course to take under the circumstances.

(a) I have no doubt that the principal cause of the movements is excess of water in the embankment, which has acted upon the inferior materials (the white and black clays already referred to), disintegrating and decomposing them, and forming a slippery surface, inclined to the horizon at an angle insufficient to support the upper portion of the embankment.

This water can have obtained access to the embankment in three different ways, viz. :—

1stly. Upwards from the ground, as suggested by Mr. Gipps, in consequence of the puddle-wall having blocked the passage for the flow of the underground water through the porous strata intersected by it, and causing an accumulation of water at a pressure sufficient to enable it to force its way between the puddle-wall and the side of the trench, or through the ground underneath the embankment.

2ndly. By percolation of the water in the reservoir through the water-face of the embankment.

3rdly. By the accumulation in the embankment of rain falling upon the working-faces during the progress of the work, and sinking into the subjacent layers, partly also from the excess of water used in forming the puddle, and leakage from pipe supplying the puddlers.

It was asserted by one of the witnesses (Mr. Lamond) that the movement was caused by water in the ground which rose and fell as though subject to tidal influence, and he considered that this water was acting upon the puddle-wall, converting it into "soup," and causing the whole mass to settle down bodily. A direct settlement, however, will not account for the movements which have occurred, and would, moreover, have affected the back of the embankment quite as much as the front portion.

The oscillations of water-level referred to by Mr. Lamond have not been observed by other witnesses, not even by the man who had charge of the trial-shafts, and even if existing could not have had the effect suggested by Mr. Lamond.

If the movements are due to water in porous strata underlying the reservoir breaking through the ground under the embankment owing to the action of the puddle-wall in arresting the natural flow, one would expect that the movements would in all cases be alike, and that the planes upon which motion has taken place would be at or near the same level as compared with the natural surface of the ground; also that borings put down through the embankment would all strike water at the junction of the bank with the original ground surface; but so far from this being the case, the bottom is in all cases where it has been reached by boreholes, hard and dry, water being met with many feet above the surface.

If the water were finding its way up through the puddle-trench, it would be found in greater abundance in the boreholes nearest to the puddle; the exact reverse is, however, the case.

Also, at the site of the slips at sections forty-four and fifty-four, where the greatest movement has occurred, no water-bearing strata were cut through, the puddle-trench being exceptionally dry at this part.

The gravel bed in which only was any quantity of water encountered underlies the deeper portion of the embankment, where the movement has been but small; and the water in the embankment at this part is 47 feet 6 inches above the original surface.

I conclude, therefore, that the water is not coming from the ground, nor is it coming up the puddle-trench.

If the water is finding its way into the embankment from the reservoir, it would necessarily follow that the level of the water in the different boreholes would stand at the same level which should correspond with that of the water in the reservoir; also that of two boreholes on the same section, one near the water and the other near the puddle-wall, if any difference did occur, the water should stand at a lower level in the hole near the puddle-wall than in that near the water, owing to the frictional resistance of the material through which the water had to pass.

Here, again, however, the facts show the exact opposite; the boreholes on section eighteen giving a water-level in the hole nearest the puddle-wall of 9 inches *above* that in a hole 25 feet nearer the water. Again, in sinking the first borehole on section eighteen (Appendex B, Bore No. 5), the water rose above the surface of the ground, continued flowing for some minutes, and the following morning, when the plug closing the hole was removed, the water rose above the ground and overflowed, although the ground at this point was 9 inches above the level of the water in the reservoir.

This fully proves that the water met with is not forcing its way into the embankment from the reservoir.

The only remaining alternative is that the water has accumulated in the embankment during its construction, and all the facts observed in connection with the movements, together with the results obtained from the boreholes, which I have put down, can be completely explained on this hypothesis; while the evidence given by different witnesses fully establishes the fact of a very large amount of water—chiefly due to the wet season of 1887—having fallen on the exposed work.

The natural disadvantage of having such an exceptionally wet season had undoubtedly been aggravated by the unsuitable nature of some portions of the material, and also by the manner in which the embankment

embankment was formed, viz., in layers sloping inwards to the puddle-trench, in consequence of which the whole amount of rainfall was thrown inwards to find its way into the puddle-trench, or downwards into the lower portions of the embankment by absorption and percolation through surface cracks and irregularities, which were bound to exist in spite of the means taken to consolidate the material.

The difference in the height of the different planes of sliding would, in this way, be accounted for, since different lengths of the embankment having been carried up at different times, the water would manifestly settle at different levels; especially as the varying quality of the materials employed would result in the formation of layers of varying resistance to the passage of the water, and varying also very much in their capacity for absorbing it.

During the very dry weather immediately succeeding the wet season of 1887 the work on the embankment was pushed forward very rapidly, 21 feet being made up during the first seven months of 1888 at section 15 and other portions at similar speed.

This rapid piling on of pressure has squeezed the super-saturated portions of the embankment comparatively dry, forcing the water away from near the puddle-wall—where, the embankment being highest, the pressure of course is greatest—towards the water-face of the embankment. This water, forced in all directions through the material composing the embankment under considerable pressure, has disintegrated and decomposed the weaker and inferior clays and decomposed shale; and where many of these water-ways—small individually—intersected or even traversed the same plane, the cohesion of the mass of earth has been reduced to such an extent as to render it incapable of supporting the strain thrown upon it, and a forward movement has taken place.

The water having been gradually driven from the puddle-wall to the water-face is to a certain extent retained there by the pressure of the water rising in the reservoir, and that portion of the bank would consequently become more disintegrated and softened than that nearer to the puddle-wall, and its effective resistance to the thrust behind it proportionately reduced.

The mechanical action of the water has, I believe, been the principal cause of the movements that have taken place, but the evidence given by Mr. Mackay goes to indicate that this action has probably been much intensified by the chemical decomposition of some portions of the material, notably the white and black clays, which under the influence of moisture rapidly oxidise, and in so doing increase considerably in bulk. My own observations on the behaviour of these materials when exposed to the influence of water and air entirely confirm this, and the expansion of the clays, due to their chemical decomposition, would call into action a force tending to move the bank bodily towards the water, even if the angle of repose were more than has been provided for. If the movement is due to this action alone it will soon cease, and when that occurs the bank will rapidly consolidate.

From a careful consideration of all the facts I have gathered, and the evidence obtained, I conclude that the movements have been occasioned by the combined action of six different causes, none of which alone would, under ordinary conditions, have injuriously affected the stability of the embankment, but which, when found united at any particular section, would have been sufficient to overcome the natural cohesion of the material and produce a greater or lesser amount of motion, depending primarily upon the amount of moisture present, and, in a secondary degree, upon the relative intensity of the different causes, more especially upon the proportion which the inferior white and black clays bear to the bulk of the material, and the consequent energy of the action occasioned by their disintegration and decomposition.

This conclusion is, I consider, materially strengthened by the fact of the greatest movement having occurred at the site of the first slip. During December, 1887, and January, 1888, there was a large accumulation of water at this point, owing to the damming back of the water from the excavation for the puddle-trench between sections 57 and 59; this water being prevented from reaching the puddle-trench could not be drained off at all, and the whole of it had to sink into the bank or dry up. That the greater portion of it sank into the bank is certain, and I have not the slightest doubt that the magnitude of the slip, which has occurred at this point, is due entirely to the excessive saturation received by this portion of the embankment at that time.

Causes operating to effect the movements, arranged in the order which I consider best represents their relative effect.

- 1st. The large amount of water contained in the water-face of the embankment, arising principally from exceptional rainfall during 1887, and to a smaller extent from excess of water used in puddling.
- 2nd. The inferior character of some of the materials employed, more especially the white clay from the flats below the embankment, and the dark decomposed diorite from Prospect Hill.
- 3rd. The chemical decomposition of these materials under influence of excess of moisture.
- 4th. The inclination of the formation layers towards the puddle-wall by which the rainfall was directed into the work.
- 5th. The rapid construction of the embankment during 1888, by which the pressure was brought too rapidly upon the wetter portions of the interior.
- 6th. The rising of the water in the reservoir, which, preventing the gradual draining of the embankment, has increased the decomposing and disintegrating action of the contained water.

(b.) The significance of the movements as bearing on the stability of the structure.

If the view I have taken of the causes of the movements is correct there is evidently ample scope for very wide divergence of opinion as to their significance and the greater or lesser probability of their creating a permanent source of weakness of the whole of the embankment. Very much depends upon the comparative influence of each cause, and more especially upon the result of the prolonged action of water upon the inferior materials.

Before forming any definite opinion on the subject, I endeavoured to collect all the facts that could be obtained in any way bearing upon the subject, and although the time which has been occupied in this investigation has not been sufficient to enable me to assert positively that there is not the slightest fear of the movements rendering the structure insecure, there is the greatest probability, short of actual certainty, that no further movements will take place, and that no serious injury has been caused to the embankment by the present movements which will imperil its safety.

I do not consider that there is any reason to anticipate further movement through increasing the depth of water in the reservoir; on the contrary, the increased pressure brought to bear on the water-face of the embankment will be in a direction opposed to the present line of movement, and, while checking this, will also tend to compress the material, and—provided that all forward movement is arrested—will bring together the drier surfaces immediately above and below the present planes of movement, thus rendering the whole more homogeneous.

All the borings indicate that the great bulk of the material is firm and comparatively dry, so much so that it would bear the addition of much more water than can by any possibility exist in it at the present time, if only the water were uniformly distributed instead of being concentrated at a few places as at present.

I believe that this uniform distribution of the water will be effected by gradually increasing the pressure upon the water slope of the embankment, and that the excess of moisture now present at the sites of the slips, and probably also to a lesser extent in other portions of the work will, under the influence of continued pressure be disseminated throughout the drier portions of the material and gradually absorbed. There is not, in my opinion, the slightest probability of the water penetrating the embankment to any depth, the material is of too compact and now absorbent a nature for this to be possible, and the surface being protected by the broken stone, and pitching from all wave action will be proof against the greatest pressure that can be brought to bear upon it when the reservoir is filled to its utmost capacity.

When I visited the works on the 2nd instant, a strong wind was blowing, causing a considerable wash all along the face of the inner slope. Two witnesses—Mr. Gipps and Mr. Rutherford—have stated that under similar circumstances they found the water near the bank so thick and cloudy from suspended clay that it was quite unfit to drink. I made a careful inspection of the water and did not at any place find any indication of this, the water being as clear at the edge of the bank as it was in the centre of the reservoir, showing that the lighter portions of the material which had caused the cloudiness observed by these witnesses having been washed away the surface was now quite unaffected by the wash of the water.

The spueing out of the white clay observed by the diver between sections 16 and 17, and to a lesser extent in other places, is, in my opinion, the result of the surface action of the water, owing to a larger proportion of this material being immediately underneath the broken stone at these points; and this material being the most readily acted upon by the water, has expanded and forced its way through the stones.

This action will certainly occur at all places where any of the white clay will come to the surface of the inner slope, but will not in any way affect the strength of the embankment.

That the movements of the embankment have not injured the puddle-wall is certain, the material of which it is composed being in such a plastic condition that it will adapt itself readily to the varying pressure without cracking.

The only portion of it which has given way to any extent is at the site of the first slip, where it has subsided and filled up the space left by the forward movement or that portion of the embankment. When this is filled up solid and the puddle-wall carried up again to its proper height, the wall will be as strong here as at any other part of the work.

Most of the longitudinal cracks and fissures that have been observed along the top of the embankment, have doubtless been occasioned by the forward movement of portions of the embankment, many however, especially those over the back edge of the puddle-wall, are due solely to natural subsidence.

The material of which this dam has been constructed is about the very worst that could have been used if a perfectly regular and uniform subsidence were to have been attained. The puddle-wall will settle gradually and comparatively uniformly, not so the embankment. The rolling, watering, and kneading it has received from the traffic has so far consolidated it that it will allow the puddle-wall to shrink completely away from it before settling.

As this occurs, gaps will be formed under the surface and down the back and front edges of the puddle-wall for many feet in depth, when suddenly, owing perhaps to rain softening the surface; perhaps to a little heavier traffic than usual, the crust of earth overlying the fissure breaks down and a crack opens of greater or lesser extent.

There is nothing to fear from this so long as the cause of the cracking is subsidence only, and since the nature of the material forbids any hope of the bank-settling completely for many years, it necessarily follows that the appearance of the cracks along the top of the embankment must be expected for some time to come.

Under ordinary circumstances the formation of surface cracks should not occasion any anxiety. Seeing, however, that a large portion of this embankment is in a condition of unstable equilibrium, or at all events very closely approximating thereto, any formation of surface cracks must be carefully watched, and accurate instrumental observations maintained to determine whether they are due to subsidence only, or whether they must be considered as indications of further movement in the bank.

(c.)—*The best course to take under the circumstances.*

In considering the various means which might be adopted to stop any existing movements, prevent others from taking place, and make good the injuries which the embankment may have sustained by those that have already occurred, it is necessary to determine first of all whether existing circumstances will permit of lowering the water in the reservoir sufficiently to expose the whole of the embankment where the disturbances have occurred.

To do this would mean practically emptying the reservoir, so far as its functions of supplying the city is concerned.

If the quantity of water coming down the aqueduct was considerably in excess of the daily consumption in Sydney—ten million gallons in twenty-four hours—this might have been done, the 30-inch main below the reservoir being capable of delivering nearly 50 per cent. more than this; but on examining the records of the intake I found that the daily supply from the aqueduct had frequently fallen below 1,000,000 gallons in twenty-four hours.

I concluded therefore that lowering the water was out of the question, and that the *best course to take under the circumstances* must be such as can be carried out successfully, without interfering with the present supply to the city.

This

This latter condition has largely influenced the recommendations which I have the honor to make, as, could the water have been drawn off, I should have advocated a very different method of dealing with the work.

At the site of the first slip, sections 51.50 to 55.50, the present distorted embankment should be at once cut down to an uniform slope from the top inside edge to the horizontal bench formed by the stone which has been tipped over the lower portion, the water slope to be finished to the original section down to this level; the horizontal benching, where of exposed earth, to have a 3-in. layer of stone, broken to a 3-in. gauge punned into the earth, a final layer of 12 in. of broken stone, similar to that now on the water slope, being spread over the surface.

The top of the embankment to be carefully examined, all unsound and loose parts opened up by trenches, which must be refilled with the gravelly soil from the Prospect Hill excavation, mixed with the material excavated from the trenches and from the slope of the bank, the filling to be in 6-in. layers, watered and rammed as solid as possible.

The puddle-wall where it has sunk to be brought up to the 200-foot level, thus allowing a slightly larger margin for settlement than before.

I do not consider it necessary to tip any more stone at the toe of the bank, as movement has ceased for some weeks, and the recent borings show that dry material now exists in places which were wet when the first borings were made in July last by Mr. Bishop.

The bank itself has consequently a greater resisting power than it had at that time. Added to this, the weight of stone already deposited is largely in excess of any thrust that can theoretically be brought upon it, although, owing to its being loosely packed, its effective resistance is far less than that of masonry of equal weight, or even of carefully-built dry rubble.

I do not consider that carrying up the embankment to its full height will cause any further movement other than that due to fully consolidating those portions of the embankment which have been loosened, and possibly a slight amount due to settling and compacting the stone.

At the site of the second slip, section 42 to 46, I do not think a more efficient system can readily be adopted for arresting the movement than depositing stone in front of the dyke and upon the toe of the embankment.

This stone, however, must not be tipped from the bank, but taken in boats or rafts and deposited directly on the place it is to occupy. By this means fully three-fourths of the quantity that would otherwise be required will be saved, time and expense largely economized, and the weight concentrated at the spot where it will be most effective. The quantity required will not, I believe, exceed 3,000 cubic yards, but in order to allow for the difficulty of depositing it in position I have taken the quantity at 4,000 yards in preparing the estimate of cost.

About 400 square yards of the pitching will have to be taken up and relaid and the top of the embankment treated similarly to that at the site of the first slip.

The movement at section 18 has not been sufficient to render any readjustment of the pitching necessary, and unless some further movement does take place—which I do not consider probable—I should not advise any interference with the present slope, but simply make up the embankment to its proper level, and open out all fissures and unsound places, making them up solid with similar material, and in the same manner as already described.

If, however, any further movement occurs at this point it will have to be dealt with in quite a different manner from that adopted in the other two cases; the plane of disturbance is about 10 feet below the present water-level, and could be reached by a trench which would allow of the water causing the slip being pumped out.

This operation would be both difficult and costly, although from the small depth at which the fault occurs it could, I am satisfied, be executed without danger. The water once removed there would be no chance of the slip recurring, and the trench could be filled in as solid as any portion of the embankment.

I have not given an estimate of this work, as it forms no part of my proposals for dealing with the embankment in its present condition, but it is put forward as the probable solution of a possible but very remote contingency.

I consider it of importance that the top of the embankment should be made sound without delay; the cracks now existing being merely blinded with loose material serve as channels to convey the rain falling on the surface into the interior of the bank, where it is not required, and can be productive of nothing but harm. A careful watch should be kept for any indications of cavities forming in future from the unequal subsidence of the materials, and immediate steps should be taken to fill them up solid with suitable materials.

This being a duty distinctly devolving upon the contractors, under Clause 24 of the general conditions of the specification, and in no sense to be considered as arising out of the movements upon which I have been instructed to report, I have not taken its cost into account in preparing my estimate. (*Appendix F.*)

IV.—To report on the construction of the dam and subsidiary works as a whole, whether the design is in accordance with the best engineering knowledge on the subject, and whether the works have been faithfully carried out according to the design.

The design of these works is undoubtedly in accordance with the best engineering knowledge on the subject, and, taken as a whole, they could not be better calculated to serve the purpose for which they are intended.

I have carefully studied the specification and contract-drawings, and closely examined every portion of the works.

The specification is clear and precise in its terms, and taken in conjunction with the contract drawings, contains provision to meet any contingency liable to arise, and every particular necessary for the satisfactory carrying out of the contract.

The

The contractors have carried out their portion of the work in a thoroughly sound and substantial manner, and the serious disturbances which have occasioned so much anxiety and apprehension regarding the stability of the structure, are most certainly not due to any laxity of supervision on the part of the engineers, nor to any attempt on the part of the contractors to evade their responsibility.

When discussing the causes of the movements, I stated that sloping the layers of material of which the embankment is composed, inwards towards the puddle trench was, in my opinion, one of the causes which had to some extent operated in inducing them. It is but right that I should mention here that some of the first engineers in this branch of the profession advocate this particular method of forming embankments, while others of equal standing prefer to form them in horizontal layers. Taken by itself there is nothing to object to in this mode of construction, and with some soils it has decided advantages:

The special conditions which have combined to render this mode of construction so unsuitable in this present instance could not have been foreseen at the time the work was commenced.

It would, in my opinion, have been preferable to fill the deeper portions of the puddle trench with cement concrete up to an uniform level; the puddle wall would then have been of an uniform height throughout the work, instead of varying from 20 to 75 feet in depth below the ground surface as at present.

The method of working the puddle also by cutting and cross-cutting, is not, in my opinion, so well adapted as pugging to produce a puddle of first-class quality. Much more water has to be used, and there is great risk, especially with some kinds of clay, of the material becoming injured by the excess of water, and its toughness and consequent suitability for the intended purpose materially impaired.

The strict supervision on the Prospect Works appears to have been sufficient to guard against this; but the samples of puddle I examined were decidedly softer than any I have used in my own practice, and judging from them there can be no doubt that the puddle in the lower portions of the trench must be softer still.

This is to some extent an advantage in this particular case, the additional plasticity of the puddle allowing it to follow the movements of the bank without cracking, and so long as the puddle wall remains unbroken, it will be impossible for water from whatever source it may arise to penetrate to the outer slope of the embankment.

The whole of the work in connection with the outlet tunnel, valve tower, and waste weir, is of the very best description, and could not, in my opinion, be improved upon either in design or execution.

It has been my aim in the foregoing Report to comply as closely as possible with the instructions of the Honorable the Secretary for Public Works, to give "a plain unvarnished statement of all the facts," I have ascertained respecting the construction and execution of these works; and to state as concisely as possible the opinions I have arrived at upon the several points submitted to me.

I cannot conclude this report without acknowledging the great assistance I have received in making this investigation from the officers in the Public Works and the Harbours and Rivers Departments. All the resources of these Departments were placed unreservedly at my disposal, and any application I made for information, plans, or documents in their possession was fully and promptly responded to.

My special acknowledgments are due to those gentlemen who—some of them at considerable personal inconvenience—attended to give evidence on various matters coming within their personal knowledge, and it is matter for congratulation that although evidence has been obtained from so many and such varied sources, and from persons whose interests were in some instances diametrically opposed, the discrepancies are so few and unimportant in character.

11th January, 1889.

I have, &c.,
R. L. MESTAYER.

APPENDICES.

J. Barling, Esq., J.P., Under Secretary for Works,—

Sir, Beresford Chambers, 52, Castlereagh-street, Sydney, 13 January, 1889.

Re Prospect Dam, I have the honor to forward herewith the complete appendices referred to in my report on the above work, including the estimate, Appendix F, a copy of which was forwarded to the Honorable the Secretary for Public Works on Saturday morning.

I have, &c.,
R. L. MESTAYER.

APPENDICES.

- A.—INSTRUCTIONS.
- B.—COPIES OF BORINGS.
- C.—TABLE SHOWING DAILY MOVEMENTS.
- D.—SECTION AT T.S. 54.
- E.—SECTION AT T.S. 44.
- F.—ESTIMATE.

(A.) INSTRUCTIONS.

Minute by the Secretary of Public Works.

Subject :—Slip at Prospect Dam.

Department of Public Works, Sydney, 3 December, 1888.

WITH reference to the correspondence I have had with Mr. Mestayer, A.M.I.C.E., this afternoon, at which I requested him to visit the Prospect Dam, and make a report to me on its present condition, and to his acceptance of the Commission, I now wish to give specific instructions for his guidance. He will notice from reading the papers, and from the information which I have given him, that further movements have

have taken place in the Prospect embankment which have been the subject of many newspaper articles and have caused a considerable amount of apprehension in the public mind. I have already instructed Messrs. Bennett and Whitton to report on the subject, and they have visited the dam and are now engaged in preparing their report.

As the matter, however, is so important that it would not be right for me to leave one stone unturned in arriving at the true facts of the case, I have thought it desirable to call in the aid of experts who are unconnected with the Department. I understand that Mr. Mestayer is an engineer of considerable standing, especially in matters appertaining to hydraulic engineering.

I wish him, therefore, to at once visit the Prospect Dam, and carefully examine its present condition, and also to ascertain the kind of material that has been used in its construction, and its adaptability to the purpose for which it has been used. I wish him to point out the movements which have taken place, their significance as bearing on the stability of the structure, and what, in his opinion, will be the best course to take under the circumstances.

I wish him to give me a report on the construction of the dam and subsidiary works as a whole, and whether, in his opinion, the design is in accordance with the best engineering knowledge on the subject, and whether also the works have been faithfully carried out according to the design.

In carrying out these duties, as I wish to get an entirely unbiassed opinion on the subject, he will consider himself quite independent of either the officers of the Harbours and Rivers Department or of the engineers outside the Department who have previously reported on the subject.

Mr. Hickson and all the officers of the Department will be so good as to give Mr. Mestayer every assistance in the way of answering questions he may put to them, and will place at his disposal any plans and other information which they may possess, or which may be in the Departmental records.

I wish Mr. Mestayer to undertake this work at once, and shall be glad if he will as quickly as possible take in hand the duties confided to him, in the carrying out of which I desire, especially to impress upon him their great importance, and the necessity for giving a plain unvarnished recital of the facts as they present themselves to his investigation.

JOHN SUTHERLAND.

(B.)

BORE-HOLE No. 1.—Borings taken at T.S. 44, 13 December, 1888.

Hole 58 ft. 9 in. from centre of puddle trench. Reduced level of ground 179.57; reduced level of water in reservoir, 178.79.

	3 ft. yellow clay.
	5 ft. do shales.
	7 ft. do and blue clay ¹
	9 ft. do do
	11 ft. do red, and blue clay.
	13 ft. do do
	15 ft. do do
	17 ft. do and red clay.
Wet clay level ...	19 ft. do do showing wet.
	20 ft. do do
	21 ft. do do
	23 ft. do do
	25 ft. do clay.
	28 ft. do do
	31 ft. do and blue clay.
	33 ft. red clay and gravel bottom.

NOTE.—At 19 ft. a narrow band of what appeared to be a dark sandy clay was met in what was moisture. December 8th, at 11.30, I put a rod down this hole and found 24 feet of slurry and water.

BORE-HOLE No. 2.—Borings taken at T.S. 44.25, December 10th, 1888.

Hole 58 ft. from centre of puddle trench, 7 ft. 9 in. above W.L. Reduced level of ground 186.50; reduced level of water in reservoir, 178.75.

	2 ft. 6 in. red clay.
	4 ft. yellow and white sandy clay.
	6 ft. red and blue clay.
	8 ft. yellow and blue clay.
	10 ft. do do
	12 ft. yellow, blue, and white clay.
	14 ft. do do
	15 ft. yellow and blue clay.
	16 ft. yellow and blue clay; particles of dark clay through.
	17 ft. yellow and blue clay.
	18 ft. yellow clay.
	19 ft. do
20 ft. 9 in. wet clay level ...	20 ft. do
	21 ft. do
	22 ft. do
	23 ft. do
	24 ft. do

NOTE.—At 20 ft. 9 in. there appeared to be wet clay showing on the rods, which did not show itself until we had bored to the 23 ft. level.

BORE-HOLE

BOREHOLE No. 3.—Borings taken at T.S. 44. 13th December, 1888.

Hole on centre line of puddle-trench; reduced level of ground, 198·77; reduced level of water in reservoir, 178·72.

13 ft. 6 in. level of puddle	4 ft.	yellow and blue clay, dry and loose.
	6 ft.	do do do
	8 ft.	do do do
	10 ft.	yellow sandy shale and clay, dry and loose.
	14 ft.	puddle.
	15 ft.	do
	16 ft.	do
	18 ft.	do
	20 ft.	do

BOREHOLE No. 4.—Borings taken at T.S. 44. 13th December, 1888.

Hole 80 ft. 5 in. from centre of puddle-trench; reduced level of ground, 179·57; reduced level of water in reservoir, 178·72.

	3 ft.	yellow and red clay.
	6 ft.	do do
	8 ft.	do do
	10 ft.	yellow clay.
	12 ft.	do and shale.
	14 ft.	do (water).
	16 ft.	yellow sandy clay and shale.
	18 ft.	red shale and clay.
	20 ft.	yellow and white sandy clay.
	22 ft.	yellow, red and white.
	24 ft.	yellow and blue clay and shale.
	26 ft.	yellow clay and gravel (surface).

NOTE.—The water rushed in at the 14-ft. level when the rods were put down the second time.

BOREHOLE No. 5.—Borings taken at T.S. 18. 15th December, 1888.

Hole 79 ft. 1 in. from centre of puddle-trench; reduced level of ground, 179·44; reduced level of water in reservoir, 178·71

Water level	4 ft.	dark black clay.
	6 ft.	yellow sandy clay.
	8 ft.	do do (wet).
	10 ft.	yellow and black clay and ironstone gravel water.
	11 ft.	red and blue clay and gravel.
	14 ft.	red, blue, and yellow sandy clay.
	16 ft.	yellow and blue sandy clay.
	18 ft.	do do
	20 ft.	yellow, blue, and white clay.
	22 ft.	yellow, red, and brown clay and shale.
	24 ft.	do do do
	26 ft.	do do do
	28 ft.	do do do
	30 ft.	do do do
	32 ft.	do do do
	34 ft.	yellow and blue sandy clay and gravel.
	36 ft.	yellow and blue sandy clay.
	38 ft.	do do do
	40 ft.	do do do
42 ft.	yellow and sandy clay and gravelly loam.	

NOTE.—At 10 ft. upon drawing the rods the water rose with a rush, and rose over the surface of the hole, and continued running about 3 minutes. Dec. 17, —Upon drawing plug the water ran over surface of hole and rose about 9 in. from 1 o'clock to 2 p.m.

BORE-HOLE No. 6.—Borings taken at T.S.; 18, December 27th, 1888.
Hole 30 ft. from centre of puddle-trench. Reduced level of ground, 196.56; reduced level of water
in reservoir, 180.79.

4 ft.	yellow clay and gravel.
7 ft.	do and brown clay.
10 ft.	brown sandy clay.
12 ft.	do gravelly clay.
14 ft.	do clay.
16 ft.	do and yellow clay and gravel.
18 ft.	do do do
20 ft.	yellow sandy clay.
22 ft.	do do
24 ft.	do do
26 ft.	do do
28 ft.	do do
30 ft.	do do

December 28th.—At 15' 6" upon putting the auger down brought up soft mud and water which rose to 15' 7".

December 31st.—Slurry 15' 4" from surface.

January 2nd, 1889.—Slurry 15' 9" from surface.

January 3rd.—Slurry 15' 8" from surface.

BORE-HOLE No. 7.—Borings taken at T.S. 18, December 27th, 1888.
Hole 55 ft. from centre of puddle trench. Reduced level of ground, 187.73. Reduced level of water
in reservoir, 180.79.

3 ft.	yellow and black clay.
5 ft.	do do
7 ft.	do do sandy clay.
9 ft.	do sandy clay.
11 ft.	do do
13 ft.	do and black sandy clay.
15 ft.	do sandy clay.
17 ft.	do do
19 ft.	do do
20 ft.	do do

December 27th.—Cut the water at 19' 6", and it rose to 8 feet from the surface.

„ 28th.—Water 7 feet 10 inches from surface.

„ 31st.—Do 7 „ 3 „ do do

Jan. 2nd, 1889.—Do 7 „ 1 „ do do

„ 3rd. „ Do 7 „ 1 „ do do

BORE-HOLE No. 8.—Borings taken at T.S. 24, December 28th, 1888.
Hole on centre line of puddle trench. Reduced level of ground, 195.17. Reduced level of water in
Reservoir, 180.79. This boring was put down to determine the depth of puddle. Puddle was struck
at 8 ft. 6 in.

BORE-HOLE No. 9.—Borings taken at T.S. 24, December 28th, 1888.
Hole 30 ft. from centre of puddle trench; reduced level of ground, 195.17; reduced level of water
in reservoir, 180.79.

4 ft.	yellow sandy clay.
6 ft.	yellow and black clay.
8 ft.	yellow clay.
10 ft.	do do
12 ft.	do do
14 ft.	yellow and blue clay sandy.

22 ft.	do do
24 ft.	do do
26 ft.	do do
28 ft.	do do
30 ft.	do do

material, such as stone, is placed on top of earth undergoing the chemical changes, and under the conditions mentioned, the result will be to press out the lighter portion of the material—which analyses, in this case, let me see, is nearly one-half of the whole—the stone sinking downwards by the displacement. Where the soil is in contact with water, as in the case where slips outwards have occurred at the Prospect Dam, the process is very rapid, the light stuff being literally strewed out upon the water, where it is forming ugly blemishes upon the magnificent proportions of the huge earthwork.

I would suggest that, as the changes going on in the embankment cannot be stopped, the better course would be to meet the alterations as they go on, and so aid in the process of absolute solidity. This can be done by using water from the reservoir to soak—not to saturate—the soil. This would increase the process of oxidization, the sinkage and shrinkage being met by applying loamy soil, which would be washed into any small cracks or crevices. Large gaps and slips could not occur under this course of treatment. Thus the material of the embankment would solidify gradually downwards upon the solid earth below and against the puddle-wall behind. The said puddle-wall is, to every visible appearance, a most solid and perfect work.

Examination of the whole earth embankment along the inside face of the dam shows that the changes mentioned have occurred most rapidly where the greater proportion of loose clay-matter has been deposited, and where the westerly winds have had fullest opportunity for exerting their influences. This is just what might be expected. If all the bank facing the water had been of loamy earth no such rapid changes would have been likely to occur; and it might be worthy of consideration whether, where such masses of material have to be dealt with, it would not be a desirable course to have chemical analyses made, in order to have a knowledge of the changes which must occur when the stuff is moved and placed under different conditions from its natural state. Where clay has to be dealt with, so intricate and obscure is much of it in composition, that investigation of the kind seems to me a very necessary proceeding to ensure safety.

In order to meet the fretting or withering action upon the earthwork slope by the water in the reservoirs, when moved into wavelets by the winds, I would suggest that slabs of colonial hardwood—which does not float, being more dense or heavier than water—would answer the purposes of protecting the moving earth below. They would be fastened so as to lie upon, without pressing or shifting, the material under them; and as the stuff settled down solid the stone cubes could be laid in position, as being the very best material for the purpose.

I have now the pleasure of submitting the foregoing for your attention and consideration in such manner as you may consider most fitting, either in a private or public sense. I do not intend doing anything more in the matter. My desire has been to try and help to get at the cause of the troubles at Prospect Dam. The leisure of a brief holiday and the use of the apparatus in the Agricultural Department here have made the investigations possible and pleasant. I will be glad to give any further information in my power either to yourself or to any of the professional gentlemen concerned whom you may entrust with the same. I will be in Sydney during Wednesday, Friday, Saturday, and Sunday, January 2, 4-6. I leave for Port Macquarie, Monday.

I have, &c.,

ANGUS MACKAY, I.C.S.,
Inst. Agriculture, B.T.E.

Sir,

Department of Public Works, Sydney, 2 January, 1889.

I have the honor to acknowledge the receipt of your valuable and interesting letter of the 31st ultimo, in regard to the nature of the clay and soil used for forming the puddle-wall, and for making up the sloping embankments of the Prospect Dam, and to convey to you the thanks of the Secretary for Public Works.

I am desired to say that Mr. Sutherland will be glad to avail himself of your offer to give evidence on this important subject, and to ask you to be so good as to call at this office at 2 o'clock p.m. to-morrow (Wednesday), in reference thereto.

I have, &c.,

J. BARRLING,
Under Secretary.

ANGUS MACKAY, Esq., F.C.S.,
Technical College, Sydney.

Appendix II to Report of 7th January, 1889.

NOTES of Evidence taken *in re* Prospect Dam by G. Gordon.

1. I examined the following persons, and I give below the substance of the information obtained from them:—

	Page.
1. Mr. Moline, engineer to the contractors	21
2. Mr. Shand, manager for the contractors	21
3. William Nicholas, who was in charge of the borings made by my orders, and was an inspector on the works	21
4. Mr. Ryan, resident engineer	21
5. Mr. J. A. Hogue, editor <i>Evening News</i>	21
6. Mr. Stewart Wearne, correspondent of the <i>Evening News</i>	22
7. Mr. Rutherford	22
8. Mr. E. Jackson, brick and masonry inspector	22
9. Mr. Davis, inspector	22
10. Mr. Lamond	22
11. Mr. Weston (by letter)	23
12. Mr. Murray (examined by Mr. Mestayer in my absence)	23
13. Mr. Cameron, diver	23
14. Mr. Bramston	23
15. Mr. F. B. Gipps, C.E. (examined by written questions)	23
16. Mr. Buckett	23
17. Mr. Mayer	23

2. The evidence, except in the case of Mr. Weston, was taken down by Mr. Robinson, shorthand writer, and written out in duplicate for Mr. Mestayer and myself (except that of Messrs. Moline and Shand, whose evidence was taken down by another shorthand writer). I examined Messrs. Moline, Shand, and Ryan separately from Mr. Mestayer. The others we examined together, except Mr. Murray, who was examined by Mr. Mestayer only, and Mr. Gipps, whose evidence I got in answer to written questions put through Mr. Mestayer.

3. Mr. Louis Moline, 15/12/88, stated that he took charge of the works for the contractors about August, 1884, and was there till February, 1887; when he took charge there had been a great flood, and the puddle-trench got filled with water; the same year the flume in the lowest part of the valley burst, and the trench was again filled with water; it was baled out and all the slush taken out before work was resumed; a second flume at a higher level by 14 feet was put in at sections 24 to 25; after that the bank was kept high enough to collect any storm-water that might come in; the second flume was kept in for a considerable time afterwards, the trench and bank being properly stepped down, leaving an opening for an approach to the flume; a trench was dug in the solid and filled in in 6-in. layers when the flume was removed; the channel through the rear half was filled with stone; the material for the bank was chiefly got from the flat below the dam; none was taken from the upper or water side of the dam; there was not a sign of a slip; the material varies a good deal; Mr. Ryan objected to pure clay being used, but the whole country is clay, and the contractors could not help themselves; the bank was always watered as specified; it was watered by means of water-carts; a line of pipes was laid on the inner (or north) side of the puddle-wall, and the puddle was watered by hose from them; these pipes leaked or burst sometimes; the puddle would hold water "like a cup"; the frequent storms of rain did more than anything else to put water on the bank, and after rain it would lodge in the bank; sometimes the horses could not travel over it for a day or so; Mr. Ryan insisted on the clay in the puddle-wall being brought up in quite level steps, longitudinally, thus ; this made it difficult to drain

off surplus water from long lengths; Mr. Ryan often urged that less water should be used in the puddle, but it could not be chopped with less; the centre (middle) part of the dam is harder than that put on more recently; in 1886 cracks 2 inches wide occurred, owing to the subsidence of the puddle-wall; a deep part at No. 54 was pumped out after a heavy flood; does not think that has anything to do with the slip; the filling was both rolled and carted over; the specification was adhered to—"we could not get away from it"; considers the clay chopping needless, and that more water was put into the clay than was needed; the work was nearly all day-work; the clay-puddle was all day work; contractors objected to the water being let into the reservoir so fast; thinks that if the dam had not been filled so quickly there would have been a better chance for the water to get out of the bank; thinks there was less friction than usual between the engineer and the contractors; occasionally had to appeal to the chief engineer, who upheld the decision of his officer.

4. Mr. Robert Shand managed for Mr. M'Guigan (the contractor); after his death acted as executor; previously to this had never managed a contract for M'Guigan, but was more a confidential clerk; had charge of correspondence, pay, &c.; does not know that any part of the dam is different from any other part; so far as he knows the specification was adhered to to the letter; Mr. Ryan was very strict as regards that; the bulk of the material of the bank was got from the flat; it was all pretty much the same, and it was pretty well distributed; had a scheme for running a line into the hills and bring material down on to the bank; drained the surplus water into the stone drains in the rear half of the bank; was warned to give plenty of water both to puddle and bank; unless closely watched men will put more water on than ordered for ease in chopping; there was a man (now dead) who had nothing to do but to regulate the supply of water (Barge); puddle put in under his and Davis's inspection; both men were brought out from home; contractors had only to follow their directions; the men were entirely under their orders; the weather varied—1887 was very wet, last year dry; in 1884 or 1885 were stopped for want of water; got on very well with the engineer until lately, and carried out instructions; now there is a dispute about extras; often complained of undue strictness.

5. William Nicholas, inspector, took charge, first, at the 162-foot level; was on the trench, not on the bank, on the wet season; the contractors got rid of most of the water by draining into the stone drains; sometimes work had to wait, principally in the trench work.

6. Mr. Ryan, resident engineer (from beginning of work): Did not make the design of the work; it was made in the office, as also the specification. Work was carried out as far as possible according to the specification. The material of the dam at No. 18, where the flume was, is the same as the rest, and the puddle was brought up the same way; had a constant battle with the contractors; sometimes puddle was too wet; sometimes layers of banks too thick; sometimes surface soil was brought on to bank. After heavy rain men did not run water off as soon as possible. Complained of rainwater and of constant bursting of pipes flooding the work, but only once in writing (copy of memo. of July 20, 1885, attached). The slip was first noticed (22/4/88) nearly at No. 54, and bulging was noticed on the 24th; communicated with Mr. Moriarty. It was decided to change the section of the puddle-wall at the top where it was not at its full height, by making a set off of 4 feet on the inner side at 195 R.L. The puddle-wall, where settlement had long been going on, was opened on 2nd May, 1888, and found at 194.65; refilled it to 199.57; reopened again June 21st, when it was 196.39; rebuilt it then, and afterwards at different dates between September 5th and 22nd, when it was 182.70; rebuilt to 199.41; stone filling in front of slip was begun on 28th August, 1888; measurements of slip were made from nearly the commencement; no movement of stone since 26th November at middle of slip; still putting stone at ends of slip, where there is a slight movement. About 5,800 cubic yards of stone has been deposited up to 20th November; saw no sign of movement during construction of dam; were stopped for want of water previous to heavy rains in 1885; there was nothing unusual at any time; there was at 54 a quantity of water that had to be dammed back.

7. The Honorable the Secretary for Public Works forwarded to Mr. Mestayer and myself copies of correspondence that had passed between him and Mr. Bennett, proprietor of the *Evening News*, and we called on him to ask if he had any information he could furnish us with. Mr. Bennett referred us to the Editor, Mr. J. A. Hogue, and we saw him on the 18th December. Mr. Hogue informed us that Mr. J. Norton, now no longer connected with the paper, had furnished most of the information that had appeared in the *Evening News*. Mr. W. Stewart Wearne, now at Prospect, had also written several of the later reports. Mr. Hogue also gave us the names of Mr. Buckett, publican, near Prospect, Mr. Rutherford,

Rutherford, who was a sub-contractor on the works, Mr. Ives, M.L.A., Mr. Davies, M.L.C., and Mr. Gipps, C.E., as persons who could supply information. Mr. Rutherford furnished the information in *Evening News* of 3rd December, and predicted collapse of dam. Mr. F. B. Gipps gave information on which it was stated (2nd May, 1888) that portions of the puddle-wall consisted of rubble and rubbish. Mr. J. Norton wrote all the articles up to end of June. All the information supplied had appeared in the *Evening News* of April 23rd, 24th, 25th, 28th, 30th; May 2nd, 10th, 11th, 12th, 25th (report by Mr. Gipps); June 8th, 9th, 15th, 21st; July 31st; August 1st. It was found afterwards, on going through the file of the *Evening News*, that on July 28th, November 26th, 29th, December 1st, 3rd, 7th, 10th, 12th, 13th, and 14th the subject was treated of.

8. Mr. Norton.—I sent a telegram to Mr. Norton, asking him if he were disposed to give evidence, but I received no reply until on the 21st he came to Mr. Mestayer's office. He said he was too busy to give any information until about the end of the next week, but he would send a letter and state when and on what terms he would do so. As I left Sydney on the 22nd, I have no evidence from Mr. Norton.

9. Mr. Mestayer and I also wrote to Messrs. Ives and Davies; Mr. Ives replied, but he had no definite information to give as to the mode of construction of the dam; Mr. Davies did not reply.

10. Mr. S. Wearne.—On the 19th December, Mr. Mestayer and I examined Mr. Stewart Wearne at Prospect, and it appeared that most of the reports given by him to the *Evening News* were founded on information given him by Mr. Buckett, publican, and Mr. Rutherford, sub-contractor, and that he could not speak to many of the alleged occurrences from personal observation. Some of the statements, as, for instance, that the water was undermining the dam, were only expressions of his own opinion; he made no measurements of the slips, but "judged approximately"; he saw that some of the pitchers were displaced through the bulging; some dimensions (in article of August 1st) were given him by Mr. Rutherford; the statement that "the embankment was commenced straight off without cutting the natural surface" was information supplied to him (there is direct evidence to the contrary); in the paper of December 1st "leaks in the dam" were mentioned; Mr. Wearne stated that at this time a small stream of water appeared which had not appeared before (on this see Mr. Rutherford, page 22); he did not ascertain whether the small stream came from the stone drains; is not an engineer, and he wished the proprietors of the paper to send up a professional man, but this was not considered necessary. The article of December 3rd, in which it was stated that there was a small stream of water coming from the dam, was written by Mr. Norton; he is not an engineer, and knows less about the subject than he (Mr. Wearne) does; with regard to the disappearance of a horse and dray in the dam, Mr. Wearne did not see it; the horse sank up to the shoulder.

11. Mr. Wearne did not give Mr. Rutherford's name at this time, but said he would write to him for permission to do so; he had other informants.

12. Mr. Rutherford, Mr. Wearne's informant, was examined on the 21st; he was a sub-contractor, and did the pitching of the dam; he knows nothing of the construction of the dam; he did not notice anything wrong with the dam when he started the pitching; there was no bulging of the slope then; does not remember the date when he first noticed the slip; he told Mr. Copeland, one of the Inspectors, who disbelieved him; the pitching there was not finished, and he was shifted to another place; he had nothing to do with the construction of the dam, and only saw it when he rode past it; he did not see the earlier portion constructed; he did not, as stated in the *Evening News*, predict the collapse of the dam; what he said was that there would be a slip; it had begun, and he thought it would increase; has been about a year on the bank; has noticed the water very muddy for about a chain out all along the bank, when a breeze was blowing on to the bank; thinks the clay is too "soapy"; knows Mr. Wearne, of the *Evening News*, and corrected some information for him which he had got from a publican near Prospect; the information was very inaccurate; the "tunnels" spoken of are cracks, 8 or 9 feet deep; the extreme width he saw was 18 in. at the top; if anything of any greater size had opened he would have been sure to see or hear of it; has never heard of a horse and cart going down into one of the cracks, and if it had happened he must have seen or heard of it. Mr. Wearne asked him, some time ago, about the water flowing from the back of the embankment; told him he did not think it was from the dam; "it cannot be a leak"; the articles in the *Evening News* were certainly very highly coloured; they were what might be expected from a reporter wanting to create a sensation; while he was there about 20 feet of the bank (in height) was constructed, and it appeared to be done very thoroughly in 6-inch layers; nothing to lead him to believe there was anything wrong done; there were rows between the contractors and inspectors about not having sufficient water in the dry weather; there was not sufficient water in the puddle; has been on two or three dams in Victoria; never saw a bank so well constructed as this; the whole fault is in the clay; is sure the curb is not in the same position that he laid it in; thinks it fully a foot nearer the water; it was set out sometimes by Mr. Jacobs, sometimes by the contractors; thinks the contractors were compelled to do their work well, there were so many inspectors; Mr. Ryan and the contractors were always quarrelling.

13. Mr. E. Jackson, brick and masonry inspector:—The stone dyke at the toe was built simultaneously with the bank; they grew together; the embankment was made up against the dyke.

14. Mr. Davis, Inspector:—Came to the work in October, 1881; was specially brought out from England, where he had had experience in dam-making; has tested the puddled clay here under a small stream of water 1 foot high for twenty-four hours; it had then a slight dish in it; the contractors did everything we wanted, and they seemed willing to abide by the specification; we could not find much fault with them; after heavy rain the water used to lie about, but the contractors brought it into stone drains and ran it off; the (inner) bank is a watertight bank; the bank is moving; about eighteen months ago I found the bank had settled a good deal; when water got accidentally into the puddle-trench it was completely taken out; Mr. Moriarty thought we were getting the puddle too soft, but "I showed him that as the trench was rough it was necessary to be soft in order to fill in thoroughly"; his orders were to get the puddle so that the men could barely stand on it, and it was brought up soft "so that you could not sink into it with your boots"; it was made harder as it approached the top.

15. Mr. Lamond was examined on the 20th December; he was on the dam from the beginning to the finish; drove the engine of the contractor's sawmill. (He afterwards said he left on 14th July, 1883.) Mr. Lamond made a long statement in support of a theory of his that the puddle-trench should not have been put down lower than the water level in the ground, and that the damage is caused by this water causing the puddle to swell and lift the top; that water level was 15 feet from the surface; the water

in

in the trial shafts was salt; thinks the puddle at the bottom of the trench is like soup; did not see how it was worked in the trench; puddle-wall and bank were about 12 or 13 feet high when he left; the puddle-wall was about a foot below the bank; saw no sign of water working up when puddle was put in; the salt water never came to the surface; it was 15 feet below it.

16. Mr. Weston stated in a letter that he was employed on the tunnel works from 1883 until their completion; he had nothing to do with the puddle-trench, but has often heard contractors complain of the strictness of the engineer as to the preparation and placing of the puddle; has had considerable experience on public works in England, and never was under an engineer so strict and attentive to his duties as Mr. Ryan.

17. Mr. Weston's name was given us by Mr. Murray, another sub-contractor on the tunnel works; I was not able to be present when Mr. Murray was examined by Mr. Mestayer; many of his statements are directly contradicted by the evidence of all the other witnesses who speak to these points; I attach no importance whatever to Mr. Murray's evidence on this account; Mr. Ryan had to request the contractors to dismiss him from the work.

18. Mr. Cameron, diver, attended on the 21st and recapitulated his report of the first two days' operations, and reported what he had found on the 20th December; I have stated fully the result of his examination of the work in paragraphs of my report, and shown it on plans 1 to 3.

Mr. Bramston attended to offer a suggestion of a mode of supporting the dam, a modification of one which, he said, had been successfully applied to a miners' dam at Eaglehawk, Victoria; he proposed a breakwater of screw-piles and cylinders or concrete blocks on the inside of the dam, and near it, but not touching it (instead of the log breakwaters used at Eaglehawk). It was explained to him that the circumstances being quite different the plan would not be applicable in this case, and he expressed himself as satisfied.

19. Mr. F. B. Gipps, C.E., was in Victoria when I was in Sydney, and I wrote to him saying I would leave with Mr. Mestayer a number of questions which I would have put to him. To these and others put by Mr. Mestayer I received Mr. Gipps' replies on the 7th instant. He had visited the dam occasionally, perhaps two or three times in the year from the beginning; he saw the puddle put into the trench; he denies entirely Mr. Hogue's statement (*see page 6 ante*) that he was responsible for the statement in the *Evening News* that portions of the puddle-wall consisted of "rubble and rubbish"; he never made such a statement, and says it is incorrect, having seen the puddle-wall from its inception; considers the puddle well made, and of good material; thinks decidedly that the material in the inner slope was inferior; it was almost entirely clay or soluble shale; never saw on the inner slope any layers of any great extent entirely of white clay; considers the dark clay from Prospect Hill worse than the white clay; has seen layers of both these clays in the dam, but cannot say that they extend to any great width or depth; the clays appear to be intimately intermixed; never saw the bank or puddle in a wet or sloppy condition; thought too little water was used; never noticed any tendency in the bank to slide before the first slip took place; has noticed all along the bank that the wash caused by the wind makes the water very thick; has seen nothing to lead him to suppose that the contractors had not carried out their work properly. Mr. Gipps goes on to state his theory of the cause of the slips, viz., that the ground water rises under hydrostatic pressure between the puddle-wall and the bank; this is inconsistent with the facts that water is sometimes found in the bank at a higher level than the water in the reservoir, and that on the other hand most of the bores were put down through dry clay.

20. Mr. Buckett, publican, was examined by Mr. Mestayer. Mr. Buckett's name was given to us by Mr. Hogue, of the *Evening News*. He objects to his name appearing in the papers; Mr. Buckett says that what he has to say is only what he heard from the workmen; he knows nothing about "rubble and rubbish" in the puddle-wall, and never heard of it; has seen nearly the whole of the work, but did not watch it closely; sometimes he was not on the bank for a month, sometimes two or three times a week; tells only what has been told to him; knows nothing of the work, and cannot say anything as to the truth or otherwise of what was told him; he thought the dam was unsafe when the first slip took place; he says the ground at the front toe, near the second slip, was very spuey; could not ride over it in wet weather; saw trenches opened in the bank at the first slip; in some places the stuff was dry and had no solidity; thinks soakage coming from the outer toe is from the drains; never saw or heard of a stream of muddy water coming away from it; while the work was in progress the bank was often flooded, and also the puddle-trench; the puddle was so soft that the men could barely walk on it.

21. Mr. Mayer was also examined by Mr. Mestayer. He knew nothing about the dam but what he had read in the papers, and had never seen it; he attended to suggest a remedy, which consisted in the application to the face of the slope of a layer of ti-tree confined between ironbark barks, kept in place by means of wood or iron "girders," and covered with ironbark slabs, 2 inches apart. Mr. Mayer's suggestion is applicable to the protection of a slope from the wash of water, but would not in any way counteract the internal movement of the dam.

G.G., 7/1/89.

APPENDIX III to REPORT of 7/1/89.

MEMORANDUM from R. H. Ryan to R. Shand, Esq., for Contractor.

Harbours and Rivers Department, Prospect Reservoir Works, 20 July, 1885.

I WISH to direct the serious attention of contractor to the manner in which the puddle in embankment is at present prepared and finished. The disposition to have it imperfectly cut and the tendency to use too large a quantity of water is clearly manifest.

For contractor's information and guidance as to what is required I may inform him that the puddle, when finished in place, should be of the consistency and compactness, as nearly as may be, of well-prepared brick-clay as same is placed in the mould in the process of hand brick-making, should not be left sloppy or miry, but to finish in a tough, dense, and somewhat putty-like condition. As this is the portion of the work which must keep back the water, any divergence of the puddle from this state may have a result totally disastrous to you as also to others concerned in the undertaking.

G. Gordon,

G. Gordon, Esq., to The Under Secretary for Public Works.

Sir, Colonial Chambers, 86, Collins-street West, Melbourne, 8 January, 1889.

I have the honor to forward, under separate cover, sealed and addressed to the Honorable the Secretary for Public Works, my report on the Prospect Dam; also in separate cover, five plans to illustrate it and Appendices II and III to Report, being an abstract of the evidence. I had already prepared the greater part of this before I knew that the evidence was to be printed, and I intended it for the information of the Honorable the Minister, and not for publication. Although superseded by the evidence itself, it may yet be convenient.

Mr. Moline has no objection to his evidence being published.

I purpose, in accordance with your letter of the 2nd instant, to go to Sydney on my return from Gippsland, unless I hear from you to the contrary. Please telegraph.

I have, &c.,

G. GORDON.

Received this day and handed unopened to Mr. Sutherland.—J.B., 10/1/89. Specially submitted for instructions.—J.B., 10/1/89. I do not think it will be necessary now for Mr. Gordon to come to Sydney.—JOHN SUTHERLAND, 11/1/89. Telegraph to above effect.—J.B., 11/1/89. Telegram sent.—11/1/89. Put with papers.—J.B., 11/1/89.

R. L. Mestayer, Esq., to The Under Secretary for Public Works.

Re Prospect Dam.—Mr. W. A. Harper's evidence.

Dear Sir, Beresford Chambers, 52, Castlereagh-street, Sydney, 15 January, 1889.

Mr. W. A. Harper is ill and, for the present, confined to his bed. His brother called this morning and promised to let me know as soon as he was well enough to come to town, so that an appointment might be made when he would attend and give any information in his power.

I am, &c.,

R. L. MESTAYER.

Submitted.—J.B., 15/1/89. Seen.—J.S.

R. L. Mestayer, Esq., to The Under Secretary for Public Works.

Dear Sir, Beresford Chambers, 52, Castlereagh-street, Sydney, 9 January, 1889.

I have just received the cutting from *Daily Telegraph* of 5th instant sent from your office. I saw this report of Mr. Harper's at the time, but did not think it called for any special action such as examining Mr. Harper as a witness, seeing that the report itself contains Mr. Harper's views very fully and clearly stated. If you still think, however, that it would be advisable to examine Mr. Harper, I will write and ask him to call on me as soon as possible.

I am, &c.,

R. L. MESTAYER.

I am so anxious to obtain information from any and every source which is open to me that I think the evidence of this gentleman should be obtained, as it is the only way to give it a proper bearing on the subject of Messrs. Gordon and Mestayer's inquiry and investigation.—JOHN SUTHERLAND, 9/1/89.

Write.—J.B., 9/1/89. R. L. Mestayer, Esq., A.M.I.C.E., 10/1/89. Put all the papers together.—J.B., 10/1/89.

The Under Secretary for Public Works to R. L. Mestayer, Esq., A.M.I.C.E.

Sir, Department of Public Works, Sydney, 10 January, 1889.

With reference to your letter of the 9th instant, enclosing a report made by Mr. W. A. Harper, A.M.I.C.E., on the condition of the Prospect Dam, which appeared in the *Sydney Daily Telegraph* of the 5th instant, and inquiring whether that gentleman should be called to give evidence in connection with the inquiry now being conducted by Mr. Gordon and yourself, I have the honor to inform you that Mr. Secretary Sutherland is very anxious that every possible item of information in respect of the Prospect Dam procurable shall be obtained and considered by you when drawing up your report, and to request that you will be so good as to place yourself in communication with Mr. Harper accordingly.

I have, &c.,

J. BARLING,

Under Secretary.

Extract from *Telegraph*, Saturday, 5th January, 1889.

THE PROSPECT RESERVOIR.

THE following report on the Prospect Dam, by Mr. W. A. Harper, A.M. Inst. C.E., was made at the request of Messrs. Want, Johnson, & Co. on September 20, after the first slip. Mr. Harper was asked to furnish an entirely independent report, he being hampered with no conditions whatever:—

"I do myself the honor to inform you that in accordance with your instructions I visited the works on Wednesday, September 6, with Mr. Chapman, to report on the present state of the embankment, and the following will give you my views on the character of the works:—

"First puddle-wall.—This work has been perfectly constructed of the finest clay throughout of the best quality in the district, and under the most rigid supervision. I have no hesitation in saying that (with the reservation that the best clays procurable are not of first-class description) the construction of the wall is such that no fears of its safety need ever be entertained, providing the bank which supports it remains intact. I examined portions of the wall now exposed, which show it to be a concreted mass of impervious clays so well laid and wrought that no pressure would cause the slightest percolation through it. It is homogeneous in density, and considerably exceeds the theoretical thickness required for a wall constructed of first-class materials, deposited on the most approved principles. With this fact laid down,

viz.,

viz., that the construction of the puddle-wall is perfect, it is surprising to find that in one portion of the bank the wall has subsided over 6 ft., and in order to understand the reason of this very serious depression one must direct his attention to other causes which have so disturbed the continuity of its mass in this one particular locality.

"Second embankment.—The outside mass is composed in all reservoir dams of any ordinary materials, in many cases entirely of surface loams; in the case of the Prospect the material used is procured from large cuttings in the adjacent hills, and is the inferior or second-class earth of quite suitable character for the work. No slips or extraordinary subsidence occurs throughout its whole length; in fact it remains, as it should, seeing the number of years it has taken to deposit, almost at its permanent level.

"The inside mass presents quite a different appearance; it is cracked in many places for a chain in length, and in some cases a series of parallel cracks occur at the same place, clearly indicating a gradual subsidence of the lower layers since the admission of the water. This I do not consider of serious importance, for undoubtedly the whole of the lower layers, as the superincumbent mass becomes more saturated, will gradually consolidate, and in such a huge body of material it is not surprising that local surface disturbances may appear from time to time, becoming less frequent until the whole mass becomes charged with the maximum quantity of moisture it will absorb. At the same time I consider a properly-laid embankment where the deposition has extended over a number of years should not subside essentially after completion, if the material is suitable, laid in thin layers, thoroughly saturated when laid, and well consolidated by continuous wheeling and pulverising.

"At a point where the height of the dam is comparatively small, about a quarter of a mile from its northern end, a very serious disturbance has taken place. The whole inner face of the embankment (for a distance of about 300 ft.) has been violently projected into the reservoir, and also the whole of the inner portion of the bank at this point has slipped, and now bulges out at least 8 ft. beyond the line of the present water-level. This slip has caused the portion of the bank opposite it to subside at least 6 ft., and has so torn away the puddle-wall, which is still evidently in a semi-consolidated condition in its lower portions, that the wall itself has also subsided, with bank, some 6 ft. in the centre.

"The diagrams appended hereto illustrate the present condition of bank at this point. I consider this slip a very serious misfortune; I cannot see any special reason (in the meantime) why this particular spot should have given way; and consider it quite as probable that any portion of the inner mass may act in a similar way; in fact, the deeper portion of the bank should be more liable to slip at a lower level, on account of the greater weight it carries. The same conditions apply to the whole work, similar material, and the same process of laying along its whole length. The system of depositing the material in continuous layers prevents the accumulation of any particular class of earth in one place, and insures homogeneity in character over the whole surface.

"The problem to solve is, why this particular part of the bank should act in this manner while the balance remains, with the exception of the surface cracks before mentioned, in apparently a stable condition. I hold that there is no reason for the disturbance being peculiar to this locality, and must draw the conclusion that any part of the remainder may, at any time while the process of saturation is proceeding, begin to act in a similar manner; and without fearing any immediate danger to the structure on account of the superior nature of the puddled core, I consider the method being carried out of repairing the breach is most unjustifiable and dangerous. The first duty was undoubtedly to lower the water as much as possible, not necessarily below the outlet level, and carefully investigate the cause of the mishap by cutting a cross-sectional trench through the dam at the centre of the slip.

"This could have been done without much expense and carried down to the necessary level, and the line of slip carefully ascertained, to enable a reliable conjecture as to the cause being formed.

"The work now being done I consider worse than useless, viz., the tipping of most expensive stones pell-mell over the projecting portion into the water—it may be literally termed throwing money into the sea; and in addition to its uselessness in preventing a continuation of the slip, I consider it the very best way to assist such depression by extending it further and sinking more rapidly. Had the stones been systematically deposited from the toe upwards, they would have assisted matters materially, but I doubt then even their efficacy in holding back a slipping bank. The cause of this depression and its line of fracture still remains unknown. The bank is still slipping, the subsidence being fully 9 inches during the twenty-four hours prior to my inspection, as clearly shown by the levels on the surface drains cut the day before.

"Time alone will prove how much further this subsidence may still extend. It is possible that the complete saturation of the mass may soon cause it to assume its permanent angle of repose; but this in no way undervalues the urgent necessity for at once determining the secret cause of this unnatural bulging out.

"One naturally directs his attention in attempting to conjecture the possible reasons of the fault to the class of materials employed and the work of the contractor. As to the latter, all doubts of bad workmanship may be at once set aside, for there is a permanent resident engineer-in-charge, with a full staff of assistant engineers and inspectors, so that each load of material deposited has been most rigidly supervised. The onus of construction is thus thrown entirely on the engineer-in-charge, who has undoubtedly adhered strictly to the instructions laid down in his specifications.

"As to the quality of the material, I have serious misgivings. It is an inferior loamy clay, subject, on account of its composition, to very great expansion and contraction, according to the quantity of moisture allowed to enter it.

"It is most unstable, and has no plasticity, becoming semi-liquid with the addition of a very small quantity of moisture, and porous when dry. I consider it one of the worst materials that could possibly be used in a bank, and, in my opinion, should have been protected from the possibility of absorbing too much moisture by a puddled lining of approved clay between it and the layer of broken metal on which the pitchers are laid. The cost of this layer would have been small, and I have used a puddle lining 18 inches thick to protect similar material, with the result that no water ever entered the main body of the bank.

"The metal layer and pitching is carried out in a most superior manner—better I have never seen. The stone is of first-class quality, and the pitchers are larger than I have ever seen used.

"A proper investigation at the point before-mentioned would probably at once prove beyond all doubt the agencies at work, and dispose of the unpleasant uncertainty existing as to the future of the structure

structure. In addition, the original lines of the work might be still adhered to, the protuberance removed and restored to its original shape, and the everlasting eyesore dispensed with, which, under the present scheme of patching, will remain as a permanent stigma on the engineers of a work which, on account of its magnitude, would otherwise be classed as one of the great undertakings of modern engineering."

NOTE.—We are informed that 42 to 44 has slipped, as predicted by Mr. Harper, who indicates that the remainder may at any time, while the process of saturation is proceeding, begin to act in a similar manner.

Refer to Mr. Mestayer, who, I understand, will examine Mr. Harper.—J.B., 7/1/89.

Minute by The Under Secretary for Public Works.

Subject :—Prospect Dam.

Department of Public Works, Sydney, 5 January, 1889.

It was suggested by Mr. Mestayer, A.M.I.C.E., before whom Mr. Angus Mackay, F.C.S., of the Technical College, Sydney, gave evidence to-day in regard to the nature of the clay and soil used for the formation of the Prospect Dam, respecting which he had submitted a report, that it was desirable Mr. Mackay should officially visit the dam for the purpose of taking samples of the material used in connection therewith, and making an analysis thereof. Mr. Mackay intimated that he could not be released from his engagements for a period of six weeks. Mr. Mestayer, however, expressed the opinion that, notwithstanding this lapse of time, it would be better to have the result of that gentleman's analysis in order that the investigation into the whole matter may be complete.

J.B., 8/1/89.

Appd.—J.S., 7/1/89. Write.—J.B., 8/1/89. Angus Mackay, Esq., F.C.S., 9/1/89. Seen.
Resubmit on 16 Feb., 1889.—R.H., 12/1/89.

The Under Secretary for Public Works to Angus Mackay, Esq., F.C.S.

Sir,

Department of Public Works, Sydney, 9 January, 1889.

With reference to your call at this office on the 5th instant, when you expressed your willingness to officially visit the Prospect Dam as soon as you could be released from your engagement, in order that you may take samples of the material used in connection with its formation, and make an analysis thereof, I am directed to inform you that the Secretary for Public Works will be glad if you will proceed to the dam as soon as you can make it convenient to do so, and furnish him with the result of your investigation.

I have, &c.,

J. BARLING,

Under Secretary.

G. Gordon, Esq., to The Under Secretary for Public Works.

Dear Sir,

Colonial Chambers, 86, Collins-street West, Melbourne, 29 December, 1888.

I said I thought I would send in my report about the end of this week. That was before I knew I was to send an estimate. As I have not yet received the cross-section I want for this purpose, it will be next week before I can be ready. I have finished the draft of my report, but I will not write it out till I get Mr. Gipps' evidence, which I expect daily; not that I think it will induce me to alter the report, as I know from the report in the *Evening News* what his views are, but there may be something in his evidence requiring attention. If some of my recommendations are adopted the closing of the contract will be a necessity.

With the compliments of the season.

Yours, &c.,

G. GORDON.

The cross-sections will be sent to you to-day.—*Pro A. Engineer-in-Chief, J.S., B.C., 31/12/88.*
Under Secretary, Public Works. Please see that they go without fail to-day.—J.B., 31/12/88.
Sent, 31/12/88.

G. Gordon, Esq., to The Under Secretary for Public Works.

Dear Sir,

Colonial Chambers, 86, Collins-street West, Melbourne, 4 January, 1889.

I have written to Messrs. Ryan, Moline, and Shand, asking their permission to have the evidence published. I have no doubt about their being quite willing. I have asked Mr. Ryan and Mr. Shand to inform you directly. I do not remember to have told the other witnesses whom I examined in company with Mr. Mestayer that the evidence was only for my own information.

I had not expected to be wanted so soon again in Sydney, and I have an engagement for next week in Gippsland—a water supply or irrigation scheme,—but I shall be glad to go over on my return. By that time Mr. Sutherland will have read my report, and if there is anything in it needing explanation I shall be glad to afford it. If the matters on which Mr. Sutherland wishes to see me refer to anything other than the dam will you kindly mention what they are, that I may be prepared.

Yours, &c.,

G. GORDON.

I wish to see Mr. Gordon chiefly about the dam, but when he is here will consult him about locking the Darling, concerning which we have further information. The time mentioned by Mr. Gordon will suit.—JOHN SUTHERLAND, 7/1/89. Write.—J.B., 7/1/89. Geo. Gordon, Esq., C.E., 8/1/89.

G. Gordon

G. Gordon, Esq., to The Under Secretary for Public Works.

Dear Sir, Colonial Chambers, 86, Collins-street West, Melbourne, 31 January, 1888.

I enclose evidence of Moline and Shand. I thought it better to send the original, and I have kept a copy. The pencil notes are mine, as some of the evidence would not be quite intelligible to any one who did not hear it and the questions that were put.

Yours, &c.,
G. GORDON.

P.S.—I told all the witnesses connected with the works whom I examined that the information they gave was for my own use only, and not for publication.—G.G.

R. L. Mestayer, A.M.I.C.E. Geo. Gordon, Esq., M.I.C.E., 2/1/89. Register and place with other papers.—J.S., 7/1/89.

The Under Secretary for Public Works to R. L. Mestayer, Esq.

My dear Sir, Department of Public Works, Sydney, 2 January, 1889.

I have to-day received from Mr. Gordon the notes of evidence taken from Messrs. Moline and Shand. Mr. Gordon says he gave a promise that the information should not be made public, and by direction of Mr. Sutherland I have written to Mr. Gordon asking him to obtain the permission of the witnesses to have their evidence printed and placed with the reports.

Mr. Sutherland desires me to say that he wishes all evidence taken to be made public, as he thinks it is of the utmost importance to expose everything to the public view with regard to the Prospect Dam.

Yours, &c.,
J. BARLING,
Under Secretary.

P.S.—The evidence is enclosed herewith.

The Under Secretary for Public Works to G. Gordon, Esq.

Dear Sir, Department of Public Works, Sydney, 2 January, 1889.

I have to acknowledge the receipt of your letter of the 31st ultimo with the notes of evidence of Messrs. Moline and Shand. I also note your postscript, in which you state that you informed the witnesses that the evidence they gave was for your use only, and not for publication. With reference to this, Mr. Sutherland desires me to say that he wishes any evidence taken in connection with the subject of your inquiry, made public, and he will thank you if you will have the goodness to obtain the permission of the witnesses to have this done in the present case.

I presume we shall have the pleasure of seeing you in Sydney again in the course of a few days. There are matters Mr. Sutherland will be glad to see you upon.

Yours, &c.,
J. BARLING.

Mr. E. Limond to The Secretary for Public Works.

Dear Sir, 63, Church-street, Newtown, 21 December, 1888.

I waited on Messrs. Gordon and Mestayer yesterday, 12 noon, when not only my statement was unbelievable, but I was told it was all lies about water being under the puddle. I cannot rest under this imputation; but shall take other steps to prove to the public that my assertions are correct. The *Evening News* has not published my evidence as yet.

Yours, &c.,
EDWIN LIMOND.

I have seen Mr. Gordon about this, and he absolutely denies the truth of these allegations.—J.S., 21/12/88. Resubmit.

New South Wales Electric Telegraph, 29 December, 1888.

J. Barling, Esq., Public Works Office.

Your message of to-day to Edwin Limond, 63, Church-street, Newtown, is undelivered. Address is vacant. H.J.S.P., Manager.

Shall we search for him?—J.B., 31/12/88. Find him.—J.S., 31/12/88.

Telephone message from Newtown Police, 2nd January, 1889, 3 p.m., to Inspector-General of Police.

MR. EDWIN LIMOND resides at No. 73, Church-street, Newtown. He is a most respectable man, and lately worked at the Prospect Reservoir.

Telegraphed to Limond, 2/1/89.

Tell him to call at 11 a.m., Monday, and the Minister will then take his evidence.—J.B., 29/12/88. Edwin Limond, Esq., 29/12/88.

PROSPECT DAM.

MINUTES of evidence given by Mr. Limond, at the Public Works Office, on 3rd January, 1889.

Present:—Mr. Barling, Under Secretary for Public Works; Mr. Bennett, Commissioner and Engineer-in-Chief for Roads and Bridges.

MR. BARLING, addressing Mr. Limond, said:—You have expressed your willingness to give evidence to the Minister on the subject of the slip which has occurred at the Prospect Dam, where I believe you have been working, and you have attended before Messrs. Gordon and Mestayer for the purpose, but not being satisfied with the way you were treated by those gentlemen, you have attended, at the request of Mr. Sutherland, to give your evidence here. I may mention that Mr. Sutherland has been called away to the Executive Council, and is, therefore, unable to examine you personally, so he has asked me to take your evidence, which he will read after it has been transcribed. Mr. Bennett is here to ask you any questions upon engineering matters. I may add that any expenses incurred by you in coming here will be cheerfully paid. Will you now be good enough to state what you know about the matter.

Mr.

Mr. Limond said :—Here is the reference I received from Mr. McGuighan, for whom I went to work at the Prospect Dam about Christmas, 1882. The puddle-trench was then about being commenced. I was engaged to build a saw-mill for cutting timber, required for the trench and the buildings. I chose a site for the mill about 2 chains from the puddle-trench, in order that I might get water from one of the trial-shafts that was there, several of these shafts being about 50 feet deep, so I was told. In all these shafts there was water about 15 feet from the surface. I got the engine in position and started to work, but was unable to use the water for more than a week, as I found it was salt; but during the time we did use it we had to raise and lower the pump by which it was obtained several times, as the water rose and fell, as if under tidal influence. I then stopped using the water, and had fresh water brought to me for the engine. They kept sinking the puddle-trench. I was told by Mr. McGuighan the depth was to be 15 feet, but I was astonished afterwards to see them sinking deeper and below the water-line in the trial-shafts. One day I spoke to Mr. McGuighan about it, and asked him if they were not doing wrong going so deep; he answered and said he thought so too, but he was going according to the specifications. So they sunk to about 30 feet, some parts more than this, down to the silicate reef, engines being kept all the time pumping to keep the trench clear of water. Having got to the reef, the puddle was put in with clay, carted in with drays. When I left in July, 1883, the wall or embankment was up to a considerable height above the level of the ground. Therefore, I say, the puddle-trench was made too deep; the bottom is like soup, being thoroughly impregnated with the water which is there, and the moisture rising through the heavy dry clay, upwards, is causing it to swell and shift; it is that which is moving the whole of the bank. Any working-man who has worked upon clay-works will see in a moment that what I am stating is a fact. The only way to prove it is to sink a trial-shaft in the side of the by-wash, and drive in the level of the puddle-trench to the bottom of it, and see if my words are not true. If they are not true, I will forfeit my life. I am positive that, allowing for soakage and drainage, there is at least 10 feet of water standing at each side of the walls. I also noticed that in the heaviest rains the water never rose in the shafts to the surface.

EDWIN LIMOND,
4/1/89.

Mr. Bennett.] What were you engaged at previous to your going to work at the Prospect Dam? I was previously, for fifteen years, in New Zealand, on the diggings, and on water-works, road-making, and bridge-building.

What big dams were you employed upon? Waimea Water-race and Reservoir, the Leviathan Dam and Water-race, and Hohnnui Water-race and Dam. At the Waimea Water-race one of the dams was over 100 feet high and built of stone, and another was considerably higher. The other two were of clay and about 60 ft. or 80 ft. in height, the facings of the dams being of piles with clay thrown on the surface.

What have you been doing since you left the dam? I left to manage a mill, and in the interval I went to Spears', at Woolloomooloo Bay, where I lost two of my fingers. I then went 'bus-driving. Afterwards I was with Hudson Brothers for about four or five months. Since then I have been driving a cab, which I am now doing.

With reference to the rise and fall of the water in the trial-shafts you spoke of, did you attribute it to tidal influence? Yes.

Did you observe any alteration in the time of the rise and fall? Yes; it shifted every day like the tide. Others observed it besides me. One was Mr. Rothery, an engineer and fitter, who is still on the works.

Mr. Barling.] You were saying to me this morning that you considered the shingle met with in sinking the puddle-trench to be the bed of an old river or creek? Yes.

What was the width of it? The width of the old creek-bed was about 5 or 6 chains, cutting the dam at right-angles.

What do you consider should be done to remedy the matter? In my opinion nothing can be done to save the old wall. I suggest that a wall 8 or 10 feet thick be built 30 or 40 feet in front of the present embankment, the outside of stone and the inside of concrete, the foundations to be sunk 10 or 12 feet; it should be built at an angle of 1 in 4 or 1 in 5, and be well backed up with earthwork. I estimate the cost of this at from £70,000 to £80,000. I am positive that the influx of water after a heavy rainfall will cause the bank to give way, as the outlets are not sufficient, and before the by-wash could be reached the dam would be gone.

MINUTES of further evidence respecting the Prospect Dam, given by Mr. Limond before the Honorable the Secretary for Public Works and the Under Secretary for Public Works, at the Public Works Office, on Monday, 7th January, 1889.

Mr. Sutherland.] Since giving your evidence in regard to the slip at the Prospect Dam you have visited the dam, and you now wish to correct some of the evidence that you gave. Will you now state what you wish to correct, or desire to add to your previous statement? In stating the depth of the trench I made an error; I said 35 feet, but I find from the plans* in the possession of Mr. Shand, which have been shown to me by that gentleman, that the depth varies from 45 feet to 75 feet, and a depth of 45 feet at the bed of the old creek of which I have spoken.

*Appendix C.

With

With regard to the wall I suggested should be built, I desire to say that I abandon that idea altogether, unless it is carried the whole length of the embankment. I think the securing would be better done from the inside. When I was at the dam yesterday I found that water was oozing from the embankment near the scouring outlet close to the bed of the old creek. I took a bottle of the water, which I have brought with me.

EDWIN LIMOND.

By the directions of the Minister, an officer of the Department was instructed to accompany Mr. Limond to Prospect, and obtain a properly-certified bottle of the water he referred to as oozing from the embankment. This was done on the 8th January, and the water so obtained was sent to Mr. Hamlet for analysis on the 9th January.

The Under Secretary for Public Works to A. Bennett, Esq., *Evening News* Office.

Sir,

Department of Public Works, Sydney, 29 December, 1888.

With reference to your leader of the 27th instant, on the subject of the Prospect Dam, in which the following statement appears, viz. :—"An application was made to us by Mr. Mestayer a few days since for the names of those who had written certain reports in the *Evening News*, and also the names of those persons who had given our reporters the information on which some of their statements were founded; but so far as we know, not one of those, who may be termed the *Evening News* witnesses, has been examined." I am directed by Mr. Secretary Sutherland to ask if you will be so good as to mention the names of the witnesses you refer to, and whom you think have not been examined by the engineers appointed to inquire into the matter.

I am to say that Mr. Sutherland read the paragraph with very great surprise, as he has given the most emphatic instructions that all information obtainable should be considered, and if you will kindly give the names of the gentlemen you refer to, care will be taken that their evidence shall be received in the fullest possible manner, as it is the desire of the Minister to exhaust every channel of information on the subject that is available.

I am to add that Mr. Sutherland will consider it an especial favour if you will at your earliest convenience comply with this request.

I have, &c.,

J. BARLING,

Under Secretary.

J. Hogue, Esq., *Evening News* Office, to The Under Secretary for Public Works.

Town and Country Journal and *Evening News* Office,

Dear Sir,

Market-street, Sydney, 31 December, 1888.

In reference to your letter of 29th instant, I desire to point out that in the *Evening News* article you quote from the expression occurs, "So far as we know not one of those," &c., &c., "has been examined." I furnished to Mr. Mestayer, as far as I can now remember, the following names:—Mr. J. Wearne, Mr. J. Norton, Mr. F. B. Gipps, C.E.; Mr. Rutherford, contractor; Mr. Buckett, hotelkeeper; Mr. Ives, M.L.A.; and the Hon. John Davies, M.L.C.

Yours, &c.,

JAS. A. HOGUE.

All the gentlemen mentioned were written to the same day that Mr. Hogue gave me their names, and they were asked to give evidence in the course of the three following days. Mr. Rutherford came as requested; Mr. Wearne was examined by us at Prospect the following day; Mr. Gipps was in Melbourne, but called and gave his evidence as soon as he came back; Mr. Ives replied to the letter stating he had no evidence to give; the Hon. J. Davies has not replied to the letter, and Mr. Norton has refused to give any evidence. Mr. Buckett's evidence was only taken yesterday owing to a misunderstanding about the name, this not being the name given me by Mr. Hogue.

Be seen that they are all examined.—J.S., 31/12/88. Resubmit Wednesday morning.—J.B., 31/12/88.

The Under Secretary for Works to J. A. Hogue, Esq., *Evening News* Office.

Dear Sir,

Department of Public Works, Sydney, 3 January, 1889.

Mr. Sutherland desires me to acknowledge receipt of your letter of the 31st ultimo, in which, at his request, you gave the names of the witnesses whom you supposed had not been examined in regard to the Prospect Dam. I have only had an opportunity of seeing Mr. Mestayer to-day, and he has given me the enclosed memorandum with respect to the matter, from which you will see that your supposition that the *Evening News* witnesses had not been examined, is incorrect. With regard to Mr. Norton every endeavour has been made to obtain his evidence, but as yet without result, as will be seen from the attached copies of correspondence that has taken place, but Mr. Sutherland hopes that the letter sent him yesterday will have the desired effect.

I can assure you that Mr. Sutherland is leaving no stone unturned in obtaining information on the subject, no matter from what source it is to be derived, and where witnesses object to give their evidence to either Mr. Mestayer or Mr. Gordon he is prepared to take it himself.

I am, &c.,

J. BARLING.

[Enclosures.]

Copy of Memorandum by Mr. Mestayer on letter from Mr. Hogue, of 31st December.

ALL the gentlemen mentioned were written to the same day that Mr. Hogue gave me their names, and they were asked to give evidence in the course of the three following days. Mr. Rutherford came as requested; Mr. Wearne was examined by us at Prospect the following day; Mr. Gipps was in Melbourne, but called and gave his evidence as soon as he came back; Mr. Ives replied to the letter stating he had no evidence to give; the Hon. John Davies has not replied to the letter, and Mr. Norton has refused to give any evidence. Mr. Buckett's evidence was only taken yesterday, owing to a misunderstanding about the name, this not being the name given by Mr. Hogue.

Copy of Telegram addressed to J. Norton, Esq., on 27/12/88.

MINISTER will be glad if you can give your evidence respecting the Prospect Dam at once. Can you call at the office of Mr. Mestayer, Beresford Chambers, 52, Castlereagh-street, for this purpose, on Saturday morning at 10 o'clock. Any expense incurred will be paid by the Department.

J. BARLING,

Under Secretary for Public Works.

Copy

Copy of Reply from Mr. Norton.

In reply to your telegram, could not possibly come to Sydney to give evidence *re* Prospect Dam before to-morrow week.
Newcastle, 28 December, 1888.
J. NORTON,
"Terminus Hotel."

Copy of further Telegram addressed to J. Norton, Esq., on 29/12/88.

MINISTER will instruct Mr. Mestayer to proceed to Newcastle to take your evidence at an early time which may suit your convenience. Reply.

J. BARLING,
Under Secretary for Public Works.

Copy of Mr. Norton's Reply.

USELESS to send Mestayer here for my evidence, *re* Prospect Dam, as I decline to afford information before present Board, being doubtful of its utility and impartiality.
Newcastle, 31 December, 1888.

J. NORTON.

Copy of Mr. Sutherland's Minute thereon.

Seen. I regret that Mr. Norton refuses to give evidence, as we offered to pay all expenses.—JOHN SUTHERLAND,
31/12/88
Copy of letter to Mr. Norton 2/1/89, was also sent herewith.

The Under Secretary for Public Works to J. Norton, Esq.

Sir, Department of Public Works, Sydney, 2 January, 1889.
I am directed by the Secretary for Public Works to acknowledge the receipt of your telegram of the 31st ultimo, in which you say it is useless to send Mr. Mestayer for your evidence in regard to the Prospect Dam, as you decline to afford information on the subject. Mr. Sutherland very much regrets that you should have come to this conclusion. He is most anxious to obtain all the particulars possible, and will be obliged if you will consent to give evidence before himself at any convenient time which may be named by you.

I am to point out that the matter is of great national importance, and Mr. Sutherland thinks he is justified in appealing to your patriotism as a public man to give him all the information you can, as it is clear you have devoted very considerable attention to the subject, and have collected a mass of evidence which he thinks may be very useful.

I have, &c.,
J. BARLING,
Under Secretary.

Up to this date no answer has been received from Mr. Norton.—D.C.M'L., 15/1/89.

Telegram from Mr. J. Norton to The Under Secretary for Public Works.

In reply to your telegram, could not possibly come to Sydney to give evidence, *re* Prospect Dam, before to-morrow, Saturday, week.

J. NORTON,
"Terminus Hotel."

Telegraph that I will instruct Mr. Mestayer to proceed to Newcastle to take his evidence at any early time which may suit his convenience.—JOHN SUTHERLAND, 29/12/88. Wired, 29/12/88.

J. Norton, Esq., to The Under Secretary for Public Works.

USELESS to send Mestayer here for my evidence, *re* Prospect Dam, as I decline to afford information before present Board, being doubtful of its utility and impartiality.

Seen. I regret that Mr. Norton refuses to give evidence, as we offered to pay all expenses.—JOHN SUTHERLAND, 31/12/88.

The Under Secretary for Public Works to R. L. Mestayer, Esq.

My dear Sir, Department of Public Works, Sydney, 27 December, 1888.
Mr. Sutherland desires me to enclose for your information an extract of a leading article from the *Evening News* of this day's date upon the subject of the Prospect Dam.

I am further desired to point out to you the extreme importance of taking any evidence which may present itself to you in connection with the subject of your inquiry, however trivial or absurd it may appear to you as an engineer—because it is largely on statements of this character that the public mind has been exercised of late, and it is desirable to get at the source of the many statements which have been spread abroad with regard to the state of the dam.

I am, &c.,
J. BARLING.

The Under Secretary for Public Works to G. Gordon, Esq.

My dear Sir, Department of Public Works, Sydney, 27 December, 1888.
Mr. Sutherland desires me to enclose for your information an extract from the *Evening News* of this date, bearing on the subject of the Prospect Dam, and to ask that you will be so good as to come to Sydney again before sending in your final report. Mr. Sutherland further wishes me to point out to you the extreme importance of taking any evidence which may present itself, no matter how trivial or absurd it may seem to you as an engineer—because it is by such statements that a great deal of the uneasiness now existing in the public mind with regard to the dam has been raised.

I am, &c.,
J. BARLING.

[Enclosure

[Enclosure to two preceding letters.]

[Extract from the *Evening News* of Thursday, 27th December, 1888.]

THE PROSPECT DAM.

THE coming event of Messrs. Gordon and Mestayer's report on the Prospect dam has cast its shadow before, and the fore-shadowing is not a pleasant one to contemplate. Though the report has not been drawn up, the Minister for Works was able to tell the Assembly on Friday what the most important part of it will be when it does come. The *Hansard* report of what the honorable gentleman said contains the following:—

There are two gentlemen now holding a very serious inquiry into the state of the Prospect Dam, from its first foundation till the time they took evidence on the subject. They will not be prepared to give in their report before some time next week. I sent for Mr. Gordon to-day, and he assured me that there was not the slightest danger of the dam giving way. Alterations and a large expenditure of money will have to take place; and I have given instructions to those gentlemen, not only to make recommendations but also to state what will be the cost of carrying out the recommendations.

It appears from Mr. Sutherland's remarks that Mr. Mestayer agrees with Mr. Gordon, for speaking of the two gentlemen, he concluded by saying,—

They are certain that there is not the slightest foundation for the fear of the dam going.

This remarkable communication to the Assembly can have no other effect than that of destroying the confidence of the public in the report of Messrs. Gordon and Mestayer when it is produced. Their instructions to hold the investigation were issued on the 13th December, and assuming that they commenced work the following day, their inquiries into the state of the Prospect Dam from its foundation had extended over a week and a day when they assured Mr. Sutherland that there was not the slightest fear of it collapsing. It is true that, according to the Minister for Works, the investigation was not concluded when he saw Mr. Gordon; but what is of most importance is to know on what evidence Mr. Gordon and Mr. Mestayer came to the conclusion that the dam is in no danger. It may be taken for granted that they went out to see it; but for the practical purpose of their commission, looking at the embankment was, comparatively speaking, a waste of time. The Department has been taxing its resources during the last eight or nine months to patch the work up, and most probably when Mr. Gordon and Mr. Mestayer were taken to see it most of the cracks had been filled up, and unless it had burst through again the stream of thick yellowish water our reporter saw running from the base of the embankment on its lower side was stopped up. Looking at the work in its patched-up condition would therefore give the two gentlemen only a very imperfect idea of what has been going on in the way of cracks, slips, subsidences, and the actual flow of water through the embankment. What they required to do was to take the evidence of disinterested men who had been carefully watching the dam since the first slip was discovered, and if they have not done this the investigation on which they guarantee the soundness of the work is useless, and their opinions are not worth one penny of the money they will cost. An application was made to us by Mr. Mestayer a few days since for the names of those who had written certain reports in the *Evening News*, and also the names of those persons who had given our reporters the information upon which some of their statements were founded; but so far as we know, not one of those who may be termed the *Evening News* witnesses has been examined. If there has been any examination of witnesses at all, it has been carried on in a remarkably secret manner; and it is perfectly certain that during the few days that elapsed between the appointment of the two gentlemen and Mr. Gordon's statement to Mr. Sutherland it would have been impossible to take all the evidence necessary to enable them to give a definite opinion respecting the stability of the dam; but what is that opinion, as stated by Mr. Sutherland, worth? In the first place, it contradicts those of Mr. Hickson and Mr. Williams, two officers of the Department, who recently reported upon the condition of the embankment. The only interpretation to be put upon the opinions of those two gentlemen is that the dam is in a dangerous condition, so that the statement of Mr. Gordon that there is not the slightest fear of it giving way is in direct opposition on this particular point to the opinions of Mr. Hickson and Mr. Williams. Even the Engineer-in-Chief for Railways, who guaranteed the soundness of the work six or seven months ago as confidently as Mr. Gordon and Mr. Mestayer do now, reported to Mr. Sutherland the week before last that the dam now requires to be "carefully watched." Messrs. Gordon and Mestayer not only contradict Mr. Hickson, Mr. Williams, and Mr. Whitton, but, if Mr. Sutherland reported Mr. Gordon correctly, they contradict themselves. They say that "there is not the slightest danger of the dam giving way," but that alterations and a large expenditure of money will have to take place. If the dam is in no danger, what will this money have to be spent for? The fact is that every shilling Mr. Gordon and Mr. Mestayer may recommend to be expended will be for securing the dam, and will therefore be a contradiction of the statement that it is not in the slightest danger. We are dealing with the two professional gentlemen entirely on the basis of the speech made by Mr. Sutherland in the Assembly. The honorable gentleman may have misunderstood Mr. Gordon, but if he did not, and the verbal report submitted to the House is a correct one, the engagement of Mr. Gordon and Mr. Mestayer will only add another unsatisfactory chapter to the record of extravagance and blundering connected with the Prospect Dam.

The Under Secretary for Public Works to R. L. Mestayer, Esq.

Sir,

Department of Public Works, Sydney, 27 December, 1888.

I am directed by Mr. Secretary Sutherland to forward herewith a letter which has been received from Mr. James J. Maher on the subject of the Prospect Dam, and to inform you that a telegram has been sent to the writer requesting him to be good enough to attend at your office on Saturday morning at 10 o'clock, in order that you may take any evidence on the subject that he has to give.

I am to inform you that Mr. J. Norton, late of the staff of the *Evening News* has also been requested to attend at your office on Saturday morning at 10 o'clock to give evidence on the same subject.

Mr. Sutherland desires that the fullest information possible should be obtained from these gentlemen, and will be glad if you will take whatever evidence they are prepared to give.

I have, &c.,

J. BARLING,

Under Secretary.

[Enclosure.]

Dear Sir,

Beresford Chambers, 52, Castlereagh-street, Sydney, 29 December, 1888.

The bearer Mr. J. J. Maher has called upon me this morning, in accordance with the telegram sent to him by you, and given me his evidence as to what he considers the cause of the slip, and the remedy he proposes.

As I understood from you that Mr. Maher's expenses would be paid by your Department, I have given him this note to certify to the fact of his having attended as requested.

I am, &c.,

R. L. MESTAYER.

Submitted.—J.B., 30/12/88. Give him three days at 30/- per diem and his travelling fares, and say that if any part of his recommendation is adopted a substantial recognition will be awarded.—JOHN SUTHERLAND, 31/12/88. Mr. Mestayer,—What expenses do you recommend?—J.B., B.C., 31/12/88. See voucher 88-4,704 for £6 ls.—T.J.C., 10/1/89. Mr. Maher informed, 31/12/88. Maher has been paid.—Per A. Eng.-in-Chief, J.S., B.C., 12/1/89. Under Secretary for Public Works. Place with other papers.—D.C.M.L., 14/1/89. Attach to voucher.—J.S., 4/1/89. Mr. Cremen.

The Under Secretary for Public Works to R. L. Mestayer, Esq.

Sir,

Department of Public Works, Sydney, 22 December, 1888.

With reference to the instructions which have been given to you in regard to the work of reporting upon the Prospect Dam, I am desired by the Secretary for Public Works to request that you will be so good as to give a detailed estimate of any works which you may recommend should be carried out. I am to add that Mr. Gordon has been similarly instructed.

I have, &c.,

J. BARLING,
Under Secretary.

J. A. Hogue, Esq., Editor of *Evening News*, to The Secretary for Public Works.

Town and Country Journal and Evening News Office,

Market-street, Sydney, 12 December, 1888.

Dear Sir,

Mr. Bennett desires me to acknowledge receipt of your letter and enclosure of yesterday, and to say that he will be only too happy to supply your officers with any information in his power in reference to the condition of the Prospect Dam, in the security of which he takes a deep interest. Such members of the staff of the *Evening News* as have reported upon the dam will willingly see Mr. Mestayer and Mr. Gordon, and afford these gentlemen whatever assistance they can to facilitate their investigations. At the same time I should mention that all information which representatives of the *Evening News* have obtained has been published in that journal and commented upon, and I assume that such information and comments, touching a subject of such great importance, have been preserved in your Department. Should that, however, not be the case, I have an index by me that will enable me to lay my finger at any time upon the various reports, &c., that have appeared on the subject in the *Evening News*. These I will be glad to point out to any accredited officer of your Department who may desire to see them.

I may add that it is very gratifying to Mr. Bennett and myself, as it must be to the public, to observe the steps you have taken to have a thoroughly independent examination made by competent engineers of the dam, with a view to ascertaining its actual condition, and so set the public mind at rest, if possible, as to its stability.

I have, &c.,

JAMES A. HOGUE,
Editor, *Evening News*.

Answered. See letters sent to Messrs. Gordon and Mestayer on the subject.—J.B., 15/10/88.
Put away.

The Secretary for Public Works to J. A. Hogue, Esq., Editor, *Evening News*.

Dear Sir,

Parliament, New South Wales, Sydney, 12 December, 1888.

I have to thank you for your letter of this date, in which you offer to place your services at the disposal of the engineers I have appointed to inquire into the present state of the Prospect Dam, and I shall take care to request them to avail themselves of your kind offer.

My only object is to get at the true facts of the case from whatever source I can obtain them.

I have from the first been fully impressed with the necessity of the most searching investigation.

Yours, &c.,

JOHN SUTHERLAND.

The Under Secretary for Public Works to R. L. Mestayer, Esq.

Sir,

Department of Public Works, Sydney, 15 December, 1888.

I am directed to enclose for your information copies of correspondence, which has taken place between the Secretary for Public Works, and Mr. Alfred Bennett, proprietor of the *Evening News*, and have to request that you will be so good as to put yourself in communication with that gentleman, with a view to obtaining any information he may have at his disposal with regard to the Prospect Dam.

I have, &c.,

J. BARLING,
Under Secretary.

The Under Secretary for Public Works to G. Gordon, Esq.

Sir,

Department of Public Works, Sydney, 15 December, 1888.

I am directed to enclose for your information copies of correspondence, which has taken place between the Secretary for Public Works and Mr. Alfred Bennett, proprietor of the *Evening News*, and have to request that you will be so good as to put yourself in communication with that gentleman, with a view to obtaining any information he may have at his disposal with regard to the Prospect Dam.

I have, &c.,

J. BARLING,
Under Secretary.

The Under Secretary for Public Works to G. Gordon, Esq.

Sir,

Department of Public Works, Sydney, 10 December, 1888.

I am directed by the Secretary for Public Works to forward herewith for your information and guidance, a copy of the instructions which have been given to Mr. Mestayer, A.M.I.C.E., who as you are aware has also been appointed to inquire into, and report upon the condition of the Prospect Dam, and to request that you will be good enough to take them as referring to the inquiry entrusted to you. The object of Mr. Sutherland is to obtain a full and impartial statement of the facts of the matter as they appear to you as an engineer of experience, altogether unconnected with the Department having charge of the work.

I am to add that Mr. Hickson has been instructed to place everything required at your service; including original plans and documents, and all officers of the Department have been enjoined to give you all possible information, and to reply to any inquiries you may desire to make in the course of your investigations.

I have, &c.,
J. BARLING,
Under Secretary.

Copy of instructions to Mr. Mestayer which were forwarded herewith were laid on the Table of the House on the 6th December, 1888.

G. Gordon, Esq., to The Under Secretary for Public Works.

Dear Sir, 13 December, 1888.

I visited the Prospect Dam yesterday and examined the second slip and two boreholes put down by Mr. Mestayer on the 7th and 10th inst.

I should like to put down another bore in the same line, *i.e.*, in the axis of the slip near the water's edge, and another in the puddle-wall on the same line, and still another in the part of the dam that has not shown any inclination to slip. In order to save time I asked Mr. Ryan to have the places prepared for these, and also to have a trench dug across the top of the bank at a place I pointed out, so as to be ready for my putting down the bores to-morrow. Mr. Hickson says he can get me the services of a diver and I ask permission to employ one to examine the toe of the bank, and I ask authority for the works mentioned above and leave to examine the plans of the accessory works, and to get some tracings made.

Yours, &c.,
G. GORDON.
