Mr. Hickson,—Please attend to this.—J.B., B.C., 13/12/88. Submitted.—J.B. Appd. I give Mr. Gordon the fullest authority to carry out his investigation in the way he thinks best.—J.S., 14/12/88. I have arranged for these matters as instructed by the Minister.—R.H., B.C., 18/12/88. Under Secretary for Public Works. Put with papers.—J.B. 19/12/88.

Treasury Minute.

Subject :—The Dam at Prospect.

The Treasury, New South Wales, Sydney, 28 November, 1888.

SOME doubt having been expressed in Parliament as to the safety of the dam at Prospect, I would submit, for the consideration of Mr. Sutherland, the desirability of his appointing some officer or officers to inspect and report on the state of the dam. J.F.B.

The Under Secretary for Public Works.—G.E., B.C., 28/11/88. Submitted.—J.B., 28/11/88.

I can assure my honorable colleague the matter he refers to is causing me a great deal of anxiety; and previous to the date of his minute the Acting Engineer-in-Chief for Harbours and Rivers had visited the dam, and placed me in possession of the latest information on the subject. Subsequently I have been in close consultation with Messrs. Whitton and Bennett. These gentlemen have concurred in what they consider the best course to pursue under the circumstances, but previous to taking any action they are to visit the dam in company to-morrow, and on Monday I shall have the result of their conference before me, when I shall immediately place the matter before the Cabinet. I may also mention that Mr. Williams, one of the Assistant Engineers for Harbours and Rivers, has visited the dam alone, and his report will also be placed before the Cabinet.—JOHN SUTHERLAND, 30/11/88. Under Secretary, Finance and Trade.—J.B., B.C., 30/11/88. Seen.—J.F.B., 30/11/88.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY WATER SUPPLY.

(CORRESPONDENCE RESPECTING APPOINTMENT OF A RESIDENT ENGINEER AT THE PROSPECT RESERVOIR.)

Ordered by the Legislative Assembly to be printed, 13 December, 1888.

Questions.

- (5.) THE PROSPECT DAM:—MR. STEVENSON asked the Secretary for Public Works,—
 - (1.) Is it a fact that an engineer was imported from England to superintend the construction of the Prospect Dam?
 - (2.) Was this course taken because there was no competent person in New South Wales to carry out the work?
 - (3.) Does the present report of the Acting Engineer-in-Chief for Harbours and Rivers, in reference to the state of the Prospect Dam, show that the interests of the Colony have been served by this importation?

Answers.

(1, 2, and 3.) These questions will be more fully answered by placing copies of the papers on the subject upon the table of the house.

The Engineer-in-Chief for Harbours and Rivers to The Under Secretary for Public Works.

Sydney Water Supply—Asking for authority to send home for an engineer to take charge of the construction of the Prospect Reservoir.

Department of Public Works, Harbours and Rivers Branch,
Sydney, 25 June, 1880.

I BEG to bring under the attention of Mr. Secretary Lackey, the necessity for obtaining at once an experienced person to take charge of the construction of the large reservoir at Prospect, for which we are about calling tenders.

Of all the works in connection with the Sydney Water Supply, this perhaps most requires, in the superintendence of its construction, an officer of special qualifications; and such a one, with the requisite experience, so far as I know, is not to be found here. I have therefore been in communication with Mr. John Fowler, C.E., of London, on the subject, and he informs me that he knows of a gentleman who has had large experience in this class of work at home whom he could recommend for the situation. I would therefore ask Mr. Lackey's sanction to telegraph for him; salary to be at the rate of £500 per annum, with passage paid to the Colony.

E. O. MORIARTY.

B.C., Under Secretary Public Works, 4/9/80. Appd.—J.L., 8/7/80. Mr. Moriarty for telegram., B.C., 8/7/80.—J.R. I have since heard from Mr. Fowler, and now recommend that the following telegraphic message be sent to him through the Agent-General:—"Send Ryan, salary £500 and passage."—E. O. MORIARTY. Telegram forwarded through Colonial Secretary.—Appd., J.L., 9/9/80. Mr. Moriarty, B.C., 10/9/80.—J.R.

The Agent-General to The Colonial Secretary.

Sir,

5, Westminster Chambers, Victoria-street, S.W., 25 March, 1881.

I have the honor to inform you that, in accordance with your telegram of the 25th February last, Mr. Fowler has arranged the agreement with Mr. R. H. Ryan for service under the Government.

Mr. Ryan has consented to accept £550 per annum and a house, with travelling allowance; passage of himself to Sydney to be paid by the Government. I am not able to send to you by this mail a copy of

the agreement, because it is not yet signed by Mr. Ryan; but the terms thereof have been decided, and I expect Mr. Ryan will sail by the "Cuzco" Orient steamer, about the middle of May. I apprised you of this in my telegram of the 18th instant, as follows:—"Ryan sails 'Cuzco,' May."

I have, &c.,

SAUL SAMUEL.

81-1461, U.S. Works, B.C., 27/2/1881. Cablegram for Agent-General:—"Ask Fowler to arrange Ryan's engagement, &c."—Works, B.C., 9/3/81. The Secretary for Public Works.—H.P., 5/5/81. The Under-Secretary for Public Works, B.C., 6/5/81.—C.W. Harbours and Rivers, B.C., 7/5/81.—J.R. Noted.—E.O.M., 12/5/81. Messrs. C. and S. to note.—J.B., 12/5/81. Noted.—J.C., 14/5/81.

J. Fowler, Esq., to The Engineer-in-Chief for Harbours and Rivers.

My dear Sir,

2, Queen's Square Place, Westminster, S.W., 8 April, 1881.

I beg to advise you that, in pursuance of a telegram which arrived from the Colony (10th September, 1880), I have drafted out an agreement with Mr. Ryan as per enclosed copy, and handed it to the Agent-General, who has adopted it, subject to the usual legal formalities of detail. Mr. Ryan proposes to leave, if possible, by one of the Orient steamers on the 11th May, and it may be well to recall the circumstances under which Mr. Ryan has been engaged:

On December 3rd, 1879, you wrote to me at considerable detail; and there was a clause in the letter as follows:—

"I should like to hear of a man who has seen some good dam work. The Prospect dam will be a big work, 80 feet in height and a mile and a quarter long; it is the only thing on the whole of the Sydney water about which I feel at all anxious, and I must have a thoroughly competent man to superintend it."

I forwarded the copy of this clause to Mr. Hawksley, who has probably as large an experience as any existing engineer in the construction of dams and water-works, and I received in reply the following letter from Mr. Charles Hawksley (the son and partner of Mr. Hawksley, senr.), recommending a gentleman not indicated by name at the time:—

Dear Sir,

30, Great George-st., Westminster, S.W., 11 February, 1880.

Your favour of the 4th instant reached me in the north of England. I know a gentleman who would, I think, just suit your requirements, having had experience in reservoir construction. On learning whether he would be disposed to accept the appointment, I will again communicate with you.

I am, &c.,

CHARLES HAWKSLEY.

J. D. Baldry, Esq.

After receiving this letter, I wrote to you, under date of February 13th, 1880, mentioning this, and suggesting that the appointment should be made in England, as qualified men were unwilling to go out without a fixed engagement.

Mr. Hawksley called on me soon after, and brought with him a letter (enclosed herewith) from Mr. Ryan to Mr. Hawksley; after this I had from time to time conversations with Mr. Hawksley, senior and junior, both of whom spoke in high terms of Mr. Ryan; the result of this was that I wrote to you, under date of July 2nd, suggesting that as Mr. Hawksley considered Mr. Ryan to be a competent man, probably it would be convenient if Mr. Ryan were mentioned by name in your communication with the Government.

After this several communications passed between the Government and the Agent-General respecting the appointment of Mr. Ryan, which has resulted in his engagement, draft copy of which I have referred to.

I think you will find Mr. Ryan a zealous and assiduous assistant, with an earnest determination to see the work done effectively. The following copy of a letter of March 17, 1881, from Mr. Hawksley, senr., I think will satisfy you that his opinion is very favourable to Mr. Ryan.

Dear Sir,

30, Great George-street, Westminster, S.W., March 17th, 1881.

Mr. Ryan informs me you desire to have an expression in writing of my opinion of him as a civil engineer, heretofore acting under my direction as the resident engineer of the Corporation of Waterford, during the construction of the water-works of that city.

I have much pleasure in stating that the works executed under Mr. Ryan's superintendence have in every respect given me perfect satisfaction, and that I have found in Mr. Ryan a careful, intelligent, honest, and qualified coadjutor.

I am, &c.,

THOMAS HAWKSLEY.

J. D. Baldry, Esq.

Mr. Ryan having to give up the appointment of engineer to the city of Waterford, which he has held for some time, to accept the present engagement, cannot sail from England earlier than May.

I am, &c.,

JOHN FOWLER

(*pro* J. D. BALDRY).

The Agent-General to The Colonial Secretary.

Mr. Ryan's Appointment.

Sir,

5, Westminster Chambers, Victoria-street, S.W., 8 April, 1881.

In continuation of my letter of the 25th ultimo, No. 56-81, I have now the honor to forward for your information a copy of the agreement entered into with Mr. Ryan for service under the Government; and in accordance with the understanding made with him I propose to pay the cost of his passage in the s.s. "Cuzco" (seventy guineas), to sail on the 11th May.

I have, &c.,

SAUL SAMUEL.

The Secretary for Public Works.—H.P., 20/5/81. The Under Secretary for Public Works, B.C., 21/5/81.—C.W. Harbours and Rivers, B.C., 25/5/81.—J.R.

[Enclosure.]

[Enclosure.]

ARTICLES of Agreement made and entered into this 31st day of March, 1881, between Her Most Gracious Majesty Victoria, Queen of Great Britain and Ireland, for herself, her heirs, and successors, and the Right Honorable Lord Augustus William, Frederick Spencer Loftus, G.C.B., Governor of her Colony or Dependency of New South Wales, for himself and his successors, acting for and on behalf of the Government of the said Colony, and hereinafter called the Government, by Saul Samuel, of 5, Westminster Chambers, Victoria-street, in the city of Westminster, Esquire, Agent-General in Great Britain, for the said Colony of the one part, and Robert Henry Ryan, of the City Hall, Waterford, civil engineer, of the other part, whereby it is mutually agreed as follows:—

1. The Government, upon and subject to the terms and conditions hereinafter contained, engage the said Robert Henry Ryan as a civil engineer, to assist in the carrying out of the works in connection with the water supply in Sydney, or such other works of a similar engineering character as the Government may direct, for the term of four years from the date of his embarkation for the Colony, provided that the said Robert Henry Ryan shall so long perform his duties to the reasonable satisfaction of the Government and of the engineer hereinafter named. Provided always that, if the said Robert Henry Ryan do not perform his duties to such reasonable satisfaction as aforesaid, it shall be competent for the Government at their absolute discretion to put an end to this agreement and the engagement hereby made, upon giving six months notice in writing to the said Robert Henry Ryan, such notice to be expiring at any time.
2. The Government will pay to the said Robert Henry Ryan a salary at the rate of five hundred and fifty pounds per annum, to be deemed to accrue *de die in diem*.
3. The Government will pay the passage and travelling expenses of the said Robert Henry Ryan from London to Sydney, and will also allow him all reasonable and proper travelling expenses (the amount thereof to be decided by the Government) when travelling in the Colony on the business of the Government away from his residence.
4. For the considerations aforesaid the said Robert Henry Ryan will not later than the thirty-first day of May next leave England by steamship for Sydney, and forthwith on his arrival there report himself to and place himself under the instructions of E. O. Moriarty, Esquire, the Engineer-in-Chief for Harbours and Docks for the Government of New South Wales, or such other Engineer for the Harbours and Docks for the time being.
5. The Government will provide the said Robert Henry Ryan from time to time with an unfurnished residence free of expense, and until they shall provide such a residence they will pay to the said Robert Henry Ryan the usual allowance in such cases.
6. The said Robert Henry Ryan shall and will during the continuance of these presents devote his whole time and attention to the service of the Government as directed by the Engineer of Harbours and Docks or other superintending engineer of the Government, under whose directions he may for the time being be working, and use his utmost exertions to carry out the instructions and directions of such engineer, and promote the interest of the Government, and will not directly or indirectly during the continuance of these presents engage in any other business or occupation whatever.
7. In the event of this agreement being determined by the Government under the provisions of clause 1 hereby, the Government will provide the said Robert Henry Ryan with a free passage to London on the expiration of the notice determining his engagement.
8. The said Robert Henry Ryan hereby undertakes to execute a duplicate of this agreement in Sydney, with such variation as may be necessary to make the same valid and effectual in the Colony, when called upon by the Government to do so.

In witness whereof the said Saul Samuel, as such Agent as aforesaid only, and not so as to make himself personally liable, and the said Robert Henry Ryan, have hereunto set their hands the day and year first above written.

ROBERT HENRY RYAN.

Witness to the signature of the said Robert Henry Ryan,—
PATRICK HIGGINS,
Morgan-st., Waterford, Clerk and Storekeeper, Waterford Corporation.

1888.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

WATER SUPPLY.

(REPORT ON, AT BROKEN HILL.)

Ordered by the Legislative Assembly to be printed, 28 November, 1888.

Mr. E. B. Price to The Colonial Secretary.

Sir,

Harbours and Rivers Office, Balranald, 19 October, 1888.

I have the honor to report, that in compliance with telegraphed instructions from the Engineer-in-Chief for Harbours and Rivers, I left for Melbourne by coach on the evening of the 3rd instant, and received at "Menzie's Hotel" full instructions from you to proceed immediately to Broken Hill and to report on all questions affecting the water supply, sanitation, and general prosperity of the district.

I reached Broken Hill on the morning of Tuesday, the 9th instant, having lost two days in Adelaide through there being no mail trains on Saturday or Sunday.

On arrival I at once placed myself in communication with some of the leading people of the town, in order that they might make arrangements to point out all matters they wished to bring under my notice.

In the afternoon, accompanied by Mr. Inspector Low, of the Mines Department, I visited most of the wells in the town, and took samples—particulars are given later on—and in the evening was waited on by the Progress Committee, who discussed various matters affecting the welfare of the district.

On Wednesday morning I drove with some members of the Progress Committee to Stephens' Creek and followed down its course to below Mount Gipps. I examined the wells in the bed of the creek, and also the sites for the dams in the proposed scheme for supplying Broken Hill by pumping from an impounding reservoir. On my return I visited the office of the Roads and Bridges Department and obtained some necessary information from perusal of official papers.

On Thursday morning I visited the Proprietary Company's mine, and tasted the condensed water used by the miners; and also had an interview with the representative of the Australian Water and Mineral Boring Company, who propose to bore for artesian water on the plain near the "Rat-hole" Tank. I then drove out, accompanied by Mr. Clark, of the Roads and Bridges, and inspected the various wells and tanks adjoining the tramway line to Silvertown, and the "Rat-hole" tank beyond Umerumberka. In the evening I was waited on by a deputation from the Amalgamated Miners' Association, who pointed out the necessity for a mining inspector being appointed.

On Friday morning, the 12th inst., I left with Mr. Harry Stockdale and drove to the site of his proposed service reservoir at Mount Taylor, and then followed as closely as possible the pipe-line as far as Kars Station, where we stayed the night, and the next morning went on to Speculation Lake, from which it is proposed to pump, and followed in the pipe line from there to the Darling at Menindie, from which point it is proposed to draw a supply when the lake fails. I returned here by the first coach which arrived this morning.

In order to explain some points in this report it is necessary to describe generally the situation of Broken Hill, and its adjoining townships, Broken Hill South, and Round Hill.

Broken Hill town is built in a flat valley about 1 mile wide, with a gentle slope to the north-east. The valley is bounded on the south-east by the Broken Hill lode, which rises from 200 to 250 feet above the main street. Along the lode are the workings of the principal mines, and all drainage naturally finds its way to the centre of the town, except where stopped by dams. To the north-west the side of the valley rises more gradually to an elevation of from 30 to 70 feet, beyond which the ground falls away again. In consequence of this situation the drainage of the whole town, except a small portion to the north-west, must flow first towards the centre of the town, and then in a north-easterly direction towards Stephens' Creek, which is about 8 miles distant.

South Broken Hill is entirely distinct, being built on the low ground on the opposite side of the lode. Its drainage is into one of the tributaries of Stephens' Creek.

Round

Round Hill is some 4 miles to the north-east of Broken Hill, and is built on the undulating plain at the base of the hill of the same name. Its natural drainage is also into a tributary of Stephens' Creek.

The population of Broken Hill is estimated at 12,000, and is increasing, though at present slowly. Some months ago the population was fully 15,000, but it fell off suddenly after the "boom." The increase now going on should be permanent, as it is natural and not produced through any mania.

Once public confidence is regained in the smaller and undeveloped mines a more rapid increase is to be expected. Honest endeavours appear at last about to be made to develop many of these undertakings, and to prove what they are really worth.

South Broken Hill has a population of about 500 which is increasing very fast.

The population of Round Hill I would estimate as 200 and not increasing.

I have no doubt that in a few years Broken Hill will be a great city. The district seems full of minerals. Quartz-reefs appear on many hills, which may prove gold yielding when opened up; but at present silver alone is thought of, and all other mines thrown in the shade by the great Proprietary mine with its 100 feet lode increasing in thickness as it descends.

The question of sanitation, in my opinion, takes precedence of all others in urgency. Sanitary matters in Broken Hill are as bad as they can well be, and for this reason the dryness of the season is to be looked upon as a blessing rather than a curse.

There are no drains of any kind. Only one street ("Argent") is formed, even in part, but it has no curbing or pathways; and the side-channels (or where they should be) are choked with dust and rubbish of all sorts.

It appears to be the custom to unpack all cases in the street, and to leave the residue of straw, paper, &c., *in situ* till removed by the next dust storm. This has been slightly remedied during the last few days by the efforts of the Voluntary Sanitary Association.

The principal hotels and residences are provided with earth-closets with removable pans, which are emptied occasionally by the proprietor in any convenient place near the town, and the contents covered with sand. The other houses either have no conveniences or have movable closets over shallow pits; when necessary the closet is removed to another site, and the pit filled with sand. The majority of the huts and tents scattered over the slopes of the hill appear to have no sanitary arrangements whatever. All house slops are simply flung into the street or on to the surface of the back yards.

At present the dry sand acts as a deodorizer, and prevents the awful state of the town from being so apparent. After a slight fall of rain the smells are very bad.

Should heavy rain now fall it will flood the cesspits and carry the sewerage down the hill and through the backs of the houses into the main streets; fermentation will set in, and typhoid fever be the result.

Strong and prompt measures are necessary to avoid this evil. I would recommend the immediate appointment of a sanitary inspector, with an assistant. If possible, let a military man be chosen who has had experience of camp regulations in India or other hot climates. He should be given as much power as possible, so as to be able to enter all premises, and fill all cesspits with quick-lime and earth, empty earth-closets, and take any steps necessary to prevent the contamination of the soil. He should also clear the streets from rubbish, and compel people to sweep the space in front of their houses. All rubbish should be carted to some of the numerous depressions to the south of the town, and buried in deep trenches. The inspector's duties should also extend to the mines and outlying townships.

Better sanitary arrangements are needed both above and below at the various mines. In the event of a mining inspector being appointed, he might undertake these duties with regard to the mines.

Some months must elapse before the new municipal body will be in a position to act promptly, and even then prosecutions must first be instituted against offending persons; in the meantime some one is required to do this work thoroughly in the first instance, and prosecute, if necessary, afterwards.

The gaol accommodation for a town of 12,000 inhabitants is most inadequate. Three small iron cells are provided, each about large enough for one prisoner in a hot climate. There is no enclosed exercise yard. More than a dozen prisoners have been confined here at one time. More police are required, and a proper gaol, constructed on enlightened ideas, in which confinement does not necessarily entail a risk to life. The court-house consists of an iron shed on a back lane, and can only be a temporary arrangement. A much larger building on a suitable site is urgently needed if justice is to be administered without danger to the presiding magistrates and others.

I am informed that His Honor the Chief Justice intends bringing these matters forward, so I will leave them in more able hands.

In connection with the administration of justice, it appears strange that Broken Hill should have no stipendiary magistrate. The Warden of Silverton has far too many matters to attend to, and it is hardly right to depend almost entirely on the gratuitous services of the J's.P., many of whom find it difficult to give up so much of their time as is now required.

The proposed incorporation of the town will give universal satisfaction, and there are many able men willing to offer themselves for election. The election, I am informed, cannot take place before December; some weeks must then be lost in drawing up by-laws, in having them approved of, and finally gazetted. So at the soonest it will be the middle of January before any action can be taken to rectify the present condition of the town. It is during this interval that a special sanitary officer is required.

The water supply suitable for domestic purposes is at present derived from three sources:

(1.) *Rain-water caught in iron tanks.*

This supply is almost exhausted, only a few of the larger hotels having any left. In any case the water should not be used without filtering, owing to the dirt and lead deposited on the roofs. Owners of tanks would be wise if, when the next rain falls, they were to catch the first rush of water in a separate tank, as it will contain nearly all the deposit from the roof.

(2.) *Water pumped from the various wells about the town.*

This supply is very fair in quality and quantity. Samples from several of the wells are sent herewith. The wells are all about 100 feet deep, and are sunk principally through the country stone, and as far as I can judge are free from any hurtful components. The water is slightly brackish to taste, but so slightly

slightly that some of the better wells are very nice to drink, and all are well suited for general use. The following is a copy of the analysis of the water from the well at Stephens' Brewery, by A. Thomas, F.C.S., of Adelaide.

[COPY.]

Chloride of sodium	68.33	grains
Carbonate of lime	14.63	"
Carbonate of magnesia	13.91	"
Sulphate of lime	3.04	"
Oxide of iron and alluminum... ..	1.15	"
Organic matter... ..	0.29	"
Total solids in 1 gallon =	101.35	"

The quantity of water which can be supplied by each well varies from 1,500 to 6,000 gallons per day. The total daily supply from seven wells which are completed, and which were examined by me, is estimated by the owners at 24,500 gallons. The supply of most of these well has been largely increased by putting in short horizontal drives. The price charged at the wells varies with the quality from 2s. to 3s. per 100 gallons. Carting is about 1s. 6d. extra. Nothing like the full quantity can be sold at this rate. Probably 15,000 gallons per day is disposed of.

The number of wells could easily be multiplied ten times without crowding. Full particulars are given in appendix.

(3.) *Water Carted from Stephens' Creek Soakages.*

Stephens' Creek is about 8 miles from Broken Hill, and flows generally from west to east. Its bed is about 300 feet lower than the town.

The catchment area is estimated at 170 square miles, so that a heavy fall of rain causes a high flood in the creek; but owing to its great width and rapid fall the flood passes off in a few hours, leaving, however, a vast body of water stored in the coarse drift which covers the bed for a depth varying from 10 to 4 feet, and from 300 to 100 feet in width.

The creek ran in December last, and since then the soakages have only been replenished by an occasional shower.

Wells are sunk in this drift till they meet the clay, some few are timbered, but the greater number are nearly holes 2 feet in diameter at the bottom. The best yield is obtained from dry-goods casks sunk to the bottom with a hollow of about 2 feet in the clay. One of these casks near old Mount Gipps was yielding on the day I visited it at the rate of 150 gallons per hour.

This part of the creek was replenished about a fortnight previously by the influx from a tributary creek, on which 40 points of rain had fallen.

On the 10th of October I inspected the creek for a distance of about 10 miles, commencing at Anderson's wells about 7 miles from Broken Hill. Here the creek is very shallow, and about 240 feet wide. A rise of 3 feet would overflow the surrounding country for some distance, as the land slopes to the creek at an angle of less than 1°. There are numerous holes sunk here, as it is the nearest point to Broken Hill, and with a good track. A few of the holes are timbered: one description will apply to all of these, viz.—Anderson's well, timbered 4 feet x 2 feet; drift, 7 feet; clay, 3 feet. Yield, 200 gallons in five hours.

While here I met a man—James White—who has been fifteen years on the creek, and obtained the following useful information, viz.:—The creek ran 3 feet deep at Christmas last, and for three days in November. It ran four or five times the previous winter, which was exceptionally wet. Only one year has ever elapsed without the creek running; but on an average it runs at least once every year. On the 10th of January, seven years ago, a heavy flood occurred, which covered all the rising ground for nearly a mile each side.

Between here and old Mount Gipps the bed of the creek is pretty thickly timbered; many wells have been opened, and nearly all yield more or less water. Above old Mount Gipps I noticed an old stone dam built with mortar, portion of which had been washed away, rendering it useless; the upper side had also silted up.

At Old Mount Gipps I saw many wells yielding large supplies, and numerous drays were awaiting their turn to be filled. The following are descriptions of three of these wells—

- Size, 3 ft. x 4 ft.; timbered depth, 5 feet; drift, 4 feet deep; 1 foot of water standing, yielded 2,000 gallons on previous day; quality very good (see sample); well nearly dry previous to last fall of rain.
- Dry goods cask, 3 ft. diameter; depth, 4 feet. Yields 300 gallons in two hours, previous to last rain less than half this amount. Sold at 8s. 6d. per hundred gallons delivered in Broken Hill, over 7 miles distant.
- Size, 2½ ft. x 2½ ft., timbered; depth, 4 ft. Yielded 3,000 gallons to-day (October 10th); cannot bale dry.

The creek here is about 80 yards wide with slopes of 1°. Below this for about 2 miles hardly any wells have been sunk, although there appears to be plenty of drift. One well I noticed owned by a man named Jackson; this had been commenced on liberal principles, being 16 ft. long by 8 ft. broad; however, at the bottom (9 ft. deep) the size was reduced to 10 ft. x 5 ft., and as it had not been timbered it was half filled with sand. The water rose 18 inches from the bottom and the yield was 800 gallons, which doubtless could have been vastly increased if the well had been kept clear. This place is about 8½ miles from Broken Hill.

Where Lindsey's Creek joins from the N.E. a fine deep drift occurs, here I noticed several wells, and one with a pump.

About half-a-mile lower down the creek narrows and enters between two rocky hills, only about 800 feet apart. Here it is proposed to construct an impounding dam, 30 feet high. A description of the proposed scheme is given further on.

For the next 2½ miles the creek runs in a wide valley, bounded by hills, 200 feet high, which again suddenly narrow in, forming an obvious site for a second dam.

I noticed very few wells here, except a few brackish wells, which had been sunk in the clay near the creek.

It will have been seen from this description that very primitive methods are in use to obtain the water stored in creek bed.

I would recommend as a temporary measure that some wide trenches (say, 5 feet) should be cut across the creek in likely places. These should be timbered with rough slabs. Care should be taken not to sink these trenches more than about 1 foot into the clay bed below the drift, otherwise brackish water may be obtained.

It would also be advisable in some parts of the creek where there is a steeper fall to puddle the lower side of the trench so as to impound the water flowing through the drift. A small steam pump delivering from the trench into a temporary service tank some little distance back, where the carts could be filled without going down into the bed of the creek, would prove a great boon to the carters. Such of them as have sunk wells of their own complain that others make use of them.

It is probable that if assistance were given in the way mentioned that the price of Stephen's Creek water would be reduced to the consumer from say 8s. to 6s. per 100 gallons. The present price varies from 9s. to 7s. per 100 gallons, according to the quality and demand.

These are the present sources and methods of supplying Broken Hill with domestic water.

Rate-hole Tank up to the date of my visit had not been touched. It is 22 miles from Broken Hill by the way the water must be conveyed. On October 11th, when I visited it, the water was about 80 yards long by 50 yards broad by 3 yards deep, with slopes of 3 to 1. This would give about 1,300,000 gallons allowing for waste at bottom, equal to sixty-five days supply of 20,000 gallons, which is the largest amount that can be delivered by the present arrangements in Broken Hill. The man in charge informed me the water was falling 3 inches per week, although he only sold about 3,500 gallons in the same period. This proves a considerable loss by evaporation.

The following is a description of the arrangements which have been made by the Roads and Bridges Department to supply the town, viz. :—

A Tangye boiler with 8 in. 4 in. steam pump, forces through $\frac{3}{4}$ of a mile of 3 in. wrought iron galvanized pipe into a service tank beside the tram-line, 70 feet above the Rat-hole Tank. The pump can deliver 4,000 gallons per hour when pressed; but the tramway arrangements admit of only 20,000 gallons being carried during the day.

The water will be conveyed to Broken Hill in trucks and discharged into a low level tank there, from which it is again pumped into a tank alongside sufficiently elevated to fill the carts from.

The general arrangement seems good except for having to pump the water a second time. I think a short branch siding on staging, similar to a coal siding, would have enabled the trucks to discharge into the higher tank at once, and saved fuel and driver's expenses for second engine.

The tramway being on an embankment would have further assisted. However, some difficulty with the Tram Company may have prevented this being done.

A second engine and boiler with service tank is also at the Rat-hole Tank, it was used for watering stock. There is unfortunately no means of filling carts from this tank except by baling over top of tank. A tap should be placed in the side.

I would recommend that the trustees should use the tank at once, and when emptied that the engine, pipes, and tank beside the tram-line, be removed and utilized to bring water from the limestone quarries, between Silverton and Broken Hill, to the tram-line, in a similar manner as at the Rat-hole Tank.

These limestone quarries are scattered over an area of over a square mile about one mile to the north of the tram-line, at a point about 10 miles from Broken Hill.

I examined many of them on my way to the Rat-hole Tank, on October 10th.

They lie near the course of the Acacia Creek, and yield apparently an inexhaustible supply of good drinking water.

When the quarries are sunk 14 feet, water is reached in such quantities as to prevent further sinking, although the best limestone is found below this level. At one quarry troughs and a rough water lift had been erected, and were being used for watering stock. The owner informed me that he could not possibly dry the quarry although the drainage hole was very small.

I was informed by another quarryman that he and his family used no other water for the past two years, and that it was good for washing and tea making, and that his children were all healthy and strong.

There must be a vast quantity of water lying in this natural basin, surrounded as it is with high hills. A very small expenditure would be sufficient to deepen one of these quarries, and run a few open cuttings or drives. The limestone raised will more than repay the outlay.

The engine from the Rat-hole Tank is sufficiently powerful to deliver 40,000 gallons per day into the service tank placed on the tram-line. The cost of removing the tank would not be great. As there is plenty of good building stone all about, it would be as cheap to put it on stone piers as on timber staging. A little extra 3-in. pipe will be required.

I am sending a sample of this water with the others. The limestone is clean and very white, so it is unlikely that the water contains any hurtful components.

Silverton is well supplied with water, having a tank containing over $\frac{1}{2}$ an acre of water 13 feet deep, with steam pump and service tank with filling arrangement for carts. There is no reason why the water should not be supplied by gravity from this service tank to the town, $\frac{1}{3}$ of a mile away. The tank is now as high as the tops of the houses, and if raised would command them.

There is also a splendid supply of stock water from the stock well close by, which has a service tank also.

Should a good fall of rain occur, a large quantity of water will be conserved in the large dams which are being constructed by the Roads and Bridges Department.

One of these, $2\frac{1}{2}$ miles out on the Pinnacles Road, will hold 5,000,000 gallons. I believe it is now being improved by the Department.

This tank yielded about 30,000 gallons per day up to the 3rd of June, when it failed.

No rain having fallen worth mentioning since Christmas. The water was sold at 1s. per 100 gallons at the tank, and yielded a revenue of £750. The total cost of the work including 6 miles of drains and every thing, being £1,189.

The reservoir now nearly completed between Round Hill and Broken Hill will conserve 6,000,000 gallons, and the contract sum is £485, These

These works have been carried out cheaply and well, and, once rain falls steadily, should change the aspect of affairs very materially.

The other Government work is a stock-well, sunk to the east of the Broken Hill lode, towards South Broken Hill.

It is 150 feet deep, with an 8-foot drive, and yields 3,000 gallons per day of good stock-water, containing no minerals of any injurious nature according to its analysis. It cost £733, and yields a revenue of £14 per week. I am informed that the water is sometimes drunk.

A large supply of very good stock-water is obtained by pumping from the "Silver Crescent" mine about 2 miles out north-east of Broken Hill.

The water comes from a drive about 120 feet down the shaft. The yield is 7,000 gallons per day; the demand is not equal to the supply. Messrs. Hill & Co. water sixty horses per day at the mine.

The water is not very bad to the taste, and contains lime, magnesia, and salt.

Arrangements were being made by Messrs. Nolan and Lloyd to pump this water to the town through a 4-inch wrought and cast iron main.

The pipes were finished laying on the 11th instant, but no water had been delivered into the service tank in town before I left to examine the Darling scheme on the 12th.

I fear there will be considerable trouble from leaky joints owing to the way the pipes are laid.

It is contemplated by Messrs. Nolan and Lloyd to continue the line of pipes to Stephens Creek and pump water from a point below Mount Gipps. I believe the pipes are now being laid.

It is unfortunate that these gentlemen did not obtain proper engineering advice before carrying out this work, as it would have saved money and disappointment afterwards.

Taking the length of main as 11 miles, and the diameter as 4 inches, and height to be pumped as 300 feet,—calculating by one of Hawksley's formulæ, it would require 7 indicated horse-power to deliver 21 gallons per hour, showing how much too small the pipe which is being laid is for the work expected from it.

No one can for a moment doubt that Broken Hill should have a really good permanent water supply. The prosperity of the town depends on this being provided without delay. Such a supply should be sufficiently large to enable the water to be used for gardens, tree-growing, watering streets, and in the mines for concentrating the ore.

The present cost of water prevents the enjoyment of any comfort, and compels residents to send away their families on account of the cost of washing alone.

I would not recommend any supply being sanctioned by the Government which cannot be sold at 5s. per 1,000 gallons; as I believe, if the work was carried out by the Harbours and Rivers Department, the water could be sold for much less than this amount. This is supposing compulsory powers are granted.

There were three distinct schemes brought under my notice by their promoters:—

1. Artesian boring.
2. Damming and pumping from Stephens Creek.
3. Stockdale's scheme, pumping from Lake Speculation and River Darling.

(1.) It is proposed by the "Australian Water and Mineral-boring Company" to bore for an artesian supply on the plain near the Rathole Tank, at a distance of about 24 miles from Broken Hill.

They have, in my opinion, fair prospects of success.

The land falls steadily for over 100 miles to this point; the total fall from the summit level on the South Australian Railway is over 700 feet.

From the Rathole Tank the ground rises more suddenly towards Silverton,—

The aneroid level at the tank being	875 feet.
And on top of dividing range	1,085 "
The level of Silverton on same day was	1,000 "
And of Broken Hill township	1,200 "
The summit level in South Australia is about	1,600 "

A bore of 1,000 feet or more may reach an artesian supply which will rise a considerable height.

(2.) The scheme proposed by the "Barrier Ranges and Broken Hill Water Supply Company" comprises the erection of two large dams on Stephens Creek, and the pumping there from a distance of 10 miles to the top of a hill, in the centre of Broken Hill township, as laid out. Mr. J. D. Derry, M. Inst. C.E., is the company's engineer, and the plans have been carefully laid. The supply main is to be 18 inches in diameter.

The sites chosen for the dams are admirably suited by nature for the purpose, and present no engineering difficulties. The hills at these points approaching almost to meet.

Good clay suitable for the construction is found close by.

The catchment area is calculated at 170 square miles, but this would have to be reduced a little so as to exclude by other dams the drainage from Broken Hill and all mines.

With this enormous catchment, one heavy downpour would provide a year's supply to Broken Hill.

Taking the catchment which is really available for supplying the creek as only 100 square miles, on this area 1 inch of rain would produce 233,000,000 cubic feet of water, but half of this would be lost in soaking into the ground, leaving at any rate 100,000,000 cubic feet for storage purposes, equal to 600,000,000 gallons, which would supply 20,000 people for about three years, at the rate of 30 gallons per head per day.

Stephens Creek, as I showed earlier in this report, has been in flood every year for the last fifteen with one exception.

So that if these works were carried out, and a sudden fall of only 1 inch of rain follow, Broken Hill might be said to have a permanent supply.

Some compensation would doubtless have to be made to owners of land further down the creek: The amount would not be large, as little use is made of the water when it does run. I could hear of no dams or tanks supplied from it, and only soakage water remains after the flood passes. The creek is generally supposed to flow into Lake Speculation, but this is not the case; it crosses the road to Menindie (*via* Rockwell) about 33 miles from Broken Hill, and runs into the new lake about 20 miles south, and then is lost in a cotton-bush flat.

The bed of the creek at the site of the reservoir is about 300 feet lower than the higher parts of Broken Hill town.

Attached to this report is a plan and prospectus of the proposed works.

(3.) H. Stockdale's scheme for supplying Broken Hill by raising water 1,000 feet in height above Speculation Lake, so as to command the highest points of the town, has about it an element of boldness calculated to catch the popular sympathy. Unfortunately, Speculation Lake is over 50 miles from Broken Hill, and is itself 16 miles back from the Darling. This adds greatly to the difficulty and expense of the undertaking; but still there is nothing impossible about it, provided the whole question is carefully gone into by a competent engineer with experience in water-works, and especially pumping machinery.

The survey was made in great haste and under great disadvantages, and no doubt the pipe line could with advantage be altered in many places so as to take advantage of the nature of the ground. The proposed site for the service reservoir on Mount Taylor, 5 miles from Broken Hill, is not the best that can be chosen. I observed a more suitable natural basin about half a mile to the south and at an elevation 50 feet greater, which would give a better command of the Broken Hill Mines.

The following are the published details of the scheme, but apparently the promoters do not bind themselves closely to any particular detail.

There are to be ten pumping stations to force the water to the top of Mount Taylor, viz:—

Name of Station.	Distance to Pump.	Height to lift.
(1.) Speculation Lake	8 miles	130 feet.
(2.) Near No. 1 Tank	7 "	40 "
(3.) Kar's Station	9 "	40 "
(4.) Near Stephen's Creek	7 $\frac{1}{2}$ "	62 "
(5.) Near Mulculea Station	6 $\frac{1}{2}$ "	167 "
(6.)	5 "	30 "
(7.)	4 "	173 "
(8.)	1 $\frac{3}{4}$ "	163 "
(9.)	1 $\frac{1}{4}$ "	242 "
Totals	50 "	1,047 "

The tenth station will be on the Darling, at Menindie, to pump to Speculation Lake (16 miles) in time of drought.

From the reservoir on Mount Taylor the water will gravitate to Broken Hill, 5 $\frac{1}{2}$ miles away. The reservoir is to be formed by damming across a natural basin in the hills. A higher reservoir is also proposed to be excavated to give greater pressure. The aneroid readings on the day of my inspection were as follows:—

Broken Hill, Argent-street	1,150 feet.
Peg, 47 miles, near reservoir bottom	1,240 "
Top of hills round reservoir	1,350 "
Point 28 miles from Broken Hill	850 "
Stephen's Creek Crossing, 33 miles out	730 "
Kar's Station	610 "
Speculation Lake	450 "

These agree closely with the original levels.

It is proposed to supply daily 440,000 gallons at Broken Hill, and to lay an 8-inch pipe.

A short calculation would have shown the utter inadequacy of such a small pipe, the friction in which would be enormous, thus:—

To raise 440,000 gallons 1,000 feet in twenty-four hours requires—

To overcome pressure due head	92 $\frac{1}{2}$ h.p.
" friction in pipe	92 $\frac{1}{2}$ "
" loss and friction in pumps	20 "
" contingencies—joints and bends	60 "
Total	265 "

Fuel suitable for large engines is scarce and dear, except close to the river and lake.

If the fuel costs 12s. per ton all round, the cost of each effective horse-power will cost twice as much as at Wentworth, where fuel can be got for 6s. per ton.

At Wentworth fuel costs 3d. per h.-p. per hour, therefore near Broken Hill 6d. per h.-p. per hour.

Calculating from this it will cost 7s. to pump 1,000 gallons into the reservoir on Mt. Taylor.

If a 12-in. pipe were provided the total power required would be reduced to 142 h.-p.

It would be far better to at once lay an 18-in. pipe, and thereby have sufficient water to spare for irrigation purposes on the rich plains lying at the base of the ranges.

The water in Speculation lake is very good, and free from weeds and timber. At present it contains 26 feet of water in the centre, sufficient to last four years at least.

It is replenished by the Darling filling it after flowing through Menindie lake. The entrance to Menindie lake was dammed 18 months ago in a temporary manner in order to impound the water it then contained. The original plan for closing the entrance was made by me, but was not carried fully or according to my design. I proposed that the whole entrance, three-quarters of a mile wide, should be embanked across from sandhill to sandhill, and that as soon as the water fell in the river a second dam with sluices should be erected across the deepest creek, a few feet lower down, and the original dam in this place cut away, this would have allowed the lake to refill when the river again rose. Nothing has, however, been done except to dam the deepest creek, and to throw a few small dams across some side creeks—unless the work is carried out in its entirety the first high flood will sweep everything away.

The value of Mr. Stockdale's scheme depends largely on this being done, and powers should be sought for carrying out the work.

I do not recommend that Mr. Stockdale's scheme should be approved of till the work has been carefully gone through again, and full details supplied.

It

It cannot be hurried through as a means of immediately supplying Broken Hill—five months has been mentioned as the probable time required to complete the work—such statements only bring discredit on the scheme. To rush the work through means doubling the cost and expense of subsequent working. Nothing of a permanent nature could be carried out in this time.

So far as I can judge from my short visit, and from calculations since made, the scheme for supplying Broken Hill from Stephens' Creek is the best of the proposed plans, in that the water can be supplied at less than half the cost of the Darling water.

There is no doubt that exaggerated reports have been spread touching the scarcity of water at Broken Hill, and very conflicting reports have been sent in by the officers of the Mines and Works Department.

The dual control of the Government tanks and wells must ever prove a failure. Though each officer may try to do his best for the public good, differences are sure to arise and valuable time be lost.

The same Department that constructs the work should also have the subsequent working of it.

The broad fact, however, remains that the people in Broken Hill have to pay famine prices for water, owing to the difficulties of getting at the supplies.

I have endeavored to show how this pressure may be immediately relieved, and also that a good permanent supply can be obtained at reasonable cost.

In conclusion, I beg to make the following recommendations:—

1. Appointment of Sanitary Inspector.
2. Appointment of Stipendiary Magistrate.
3. Appointment of Mining Inspector.
4. Immediate incorporation of town.
5. Development of temporary water supply in Stephens' Creek, by trenches.
6. Development of limestone quarry water.
7. Approval by Government of a scheme for the permanent supply of water.
9. Construction of gaol.
10. Erection of better Court-house.
11. Placing of Government tanks and wells under control of Works Department.

Owing to the urgency of subjects of this report and the pressure of other business, I have not attempted to furnish my report in a more finished form, but trust that it will be taken as a true statement of facts.

I have, &c.,

EDWD. B. PRICE,
A. M. Inst. C. E.

APPENDIX.

List of Wells at Broken Hill.

Name.	Depth.	Quantity.	Quality and Remarks.
Silverthorn's Baths	ft. 118	gals. per day. 2,000	Good, slightly brackish; horse lift. 2s. per 100 at well.
Steam laundry	123	200	Good; not finished sinking; steam-pump.
McIntyre's	92	2,000	Good, slightly brackish; horse and 30-gallon cask can dry well in two hours. 2s. per 100 gallons.
Broken Hill Brewery.....	99	8,000	Good, slightly brackish; steam-pump; 20 ft. drive, 6 ft. x 6 ft. Sells now only 4,000 gallons.
Gibson's	92	6,000	Slightly salt; horse lift; drive of 6 ft. x 4 ft.; increased supply by 4,000 gallons.
O'Neil and Nicholas'.....	87	2,000	Good; horse lift; used to yield 4,000 gallons.
Stephens' Brewery.....	90	1,500	Very good, slightly salt; no drive; engine and pump; can't sell all; open 12 months. 2s. per 100.
Houghton's	80	3,000	Very good, slightly brackish; got water at 75 ft.; no drive; can't sell more than 1,400 gallons at 2s. per 100.

1888.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

BROKEN HILL WATER SUPPLY.

(PETITION FROM INHABITANTS OF—PRAYING THE HOUSE TO PASS A BILL TO CARRY OUT THE.)

Received by the Legislative Assembly, 21. December, 1888.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the 2,121 inhabitants of Broken Hill, in the Parish of Willyama, Town of Willyama, in the Colony of New South Wales,—

SHOWETH:—

That in consequence of the rapidly increasing population of Broken Hill and the surrounding district, and the absence of any water supply commensurate with the growth of the population, a great amount of sickness and mortality has been occasioned.

That numerous deaths have taken place from typhoid, attributable directly to the unwholesome water upon which the inhabitants have had to rely.

That such deaths represent only a percentage of the illness occasioned by the same cause.

That in consequence of the sickness prevailing many of the inhabitants and capitalists have left the district.

That your Petitioners desire to point out that at present their only means of water supply, in addition to the small quantity which is able to be collected in the tanks, are as follows:—

1. The Government well, 3,000 gallons per day (which is brackish and unfit for domestic use).
2. Stephen's Creek soakage (distant about fourteen miles from Broken Hill) about 15,000 gallons per day (which is selling at 10s. per 100 gallons, and is a very inferior water, and not to be compared with the water at Speculation Lake).

That the Government dams, situated about three miles out of Broken Hill, are now empty, and when full are liable to be impregnated with all local drainage, and will then be quite unfit for use, and dangerous to life.

That so far as your Petitioners are aware and believe the nearest and best supply of good water that can be obtained is from the Darling River and Lakes Menindie and Speculation.

That a Company has been formed for the purpose of supplying Broken Hill and its district with water from the above sources, which your Petitioners believe to be the best and purest water, and the best and most simple means of fulfilling a great necessary want.

That the said Company's said scheme will, if carried out, not only supply Broken Hill and all the Rockwell Paddock Mines with a permanent and pure supply of water, but will open up a valuable stock route of over fifty miles.

That if the said Company's said scheme is carried out, your Petitioners believe that it will enable them to purchase the water at a cheaper rate than any other scheme which has been hitherto propounded.

That your Petitioners are in favour of the said Company's scheme.

Your Petitioners therefore humbly pray that the Honorable the Legislative Assembly will take into their earliest consideration, and at the earliest opportunity allow a Bill to pass through Parliament, and the Council allow all the necessary powers to enable the "Broken Hill Water Supply Company" to carry out their proposed scheme.

And your Petitioners, as in duty bound, will ever pray, &c.

Dated this eighth day of November, in the year of our Lord one thousand eight hundred and eighty-eight.

[Here follow 2,085 signatures.]

1888.

NEW SOUTH WALES.

COUNTRY TOWNS WATER AND SEWERAGE ACT.

(PROCLAMATION—RETICULATION WORKS WATER SUPPLY, WEST MAITLAND.)

Presented to Parliament, pursuant to Act 51 Vic. No. 18.

NEW SOUTH WALES, } Proclamation by His Excellency The
 . to wit. } Right Honourable CHARLES ROBERT,
 BARON CARRINGTON, a Member of Her
 Majesty's Most Honourable Privy
 Council, Knight Grand Cross of the
 (L.S.) Most Distinguished Order of Saint
 CARRINGTON, Michael and Saint George, Governor and
 Governor. Commander-in-Chief of the Colony of
 New South Wales and its Dependencies.

WHEREAS by an Act intituled an Act to define and extend the operation of certain provisions of the "Country Towns Water and Sewerage Act of 1880," and to amend the said Act in other respects, it is among other things enacted that "it shall be lawful for the Minister and the Council of any Borough or Municipal District to agree by writing, under their respective hand and common seal, for the supply to such Council for distribution within such Borough or district of water conveyed by means of any-works now or hereafter constructed under directions of the Minister. Every such contract, after approval by the Governor, shall during the continuance thereof bind the contracting Council and its successors, and any sum of money payable thereunder may be enforced and recovered as a debt due to the Crown. And for the purpose of enabling any such Council to carry out the terms and conditions of such contract, to provide funds for satisfying any liabilities incurred thereunder, to control and regulate the distribution of water thereby contracted to be supplied, and generally to exercise all necessary powers in connection with such water, it shall be lawful for the Governor to declare by Proclamation in the Gazette that any specified powers and provisions contained in the "Country Towns Water and Sewerage Act of 1880" applicable to any of the aforesaid purposes, including powers incident to the levying of water rates, may be exercised and applied within such Borough or district, by and with respect to the Council and inhabitants thereof respectively. And any specified parts or enactments contained in the said Act shall, upon the publication of such Proclamation, apply to and be in force within such Borough or district, and with respect to such Council and inhabitants with the same effect for all purposes as if the said Act had specifically declared such parts or enactments so to be in force or applied." And whereas the Minister for Works and the

Council of West Maitland have agreed by writing under their respective hand and common seal for the supply to such Council for distribution within such Borough of water conveyed by means of works constructed under directions of the said Minister. And whereas it is necessary, for the purpose of enabling such Council to carry out the terms and conditions of such contract to provide funds for satisfying any liabilities incurred thereunder, to control and regulate the distribution of water thereby contracted to be supplied, and generally to exercise all necessary powers in connection with such water. And whereas, under the aforesaid section of the said recited Act, it is among other things enacted that it shall be lawful for the Governor to declare by Proclamation in the Gazette that any specified powers and provisions contained in the Country Towns Water and Sewerage Act of 1880 applicable to any of the aforesaid purposes, including powers incident to the levying of water rates, may be exercised and applied within such Borough and with respect to the Council and inhabitants thereof respectively: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, in pursuance of the power and authority vested in me by the said Act, do, by this my Proclamation in the Government Gazette, declare, that all and every the powers and provisions contained in the 13th section of the Country Towns Water and Sewerage Act of 1880 and in Part 2 of the said Act, that is to say, sections 16 to 62, both these sections being included, and in Part 5 of the said Act, sections 128 to 140 inclusive, shall be applied within the said Borough of West Maitland, by and with respect to the Council and inhabitants thereof respectively, to the intent that the said sections of the said Act and the powers and provisions in and by the said sections given, shall upon the publication of this Proclamation apply to and be in force within the said Borough of West Maitland, and with respect to the said Council and inhabitants with the same effect, for all purposes as if the said Act had specifically declared the said parts, powers, and provisions to be so applied as aforesaid.

Given under my Hand and Seal, at Government House, Sydney, this twenty-fifth day of April, in the year of our Lord one thousand eight hundred and eighty-eight, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,

JOHN SUTHERLAND.

GOD SAVE THE QUEEN!

1888.

NEW SOUTH WALES.

COUNTRY TOWNS WATER AND SEWERAGE ACT.
(NOTIFICATION IN CONNECTION WITH LOAN WATER SUPPLY WORKS, HAY.)

Presented to Parliament, pursuant to Act, 44 Vic. No. 14.

NEW SOUTH WALES, } Proclamation by His Excellency The Right Honourable CHARLES ROBERT, BARON CARRINGTON, a
to wit. } Member of Her Majesty's Most Honourable Privy Council, Knight Grand Cross of the Most
(L.S.) Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the
CARRINGTON, Colony of New South Wales and its Dependencies.
Governor.

WHEREAS by the "Country Towns Water and Sewerage Act Extension Act of 1887" it was amongst other things enacted that it should be lawful for the Governor, by notification in the Gazette, to declare that any of the special provisions contained in part 5 of the "Country Towns Water and Sewerage Act of 1880" should apply to the Council of any Borough or Municipal District in respect of any loan authorized to be made by the Colonial Treasurer to such Council, pursuant to the first-mentioned Act, and upon the publication of such notification the enactments specified in such notification, with such necessary modifications as the Governor might think fit to make, should apply to the Council and to the Waterworks therein referred to with as full effect as if the said enactment had been embodied in that Act and specifically applied to such Council and works: And whereas by an agreement dated the twentieth day of September, one thousand eight hundred and eighty-eight, made between the Council of the Municipal District of Hay, in the Colony of New South Wales, of the one part, and the Honorable John Sutherland, Minister for Public Works of the said Colony, of the other part, it was agreed that the amount of the loan to be made to the said Council, pursuant to the provisions of the said first-mentioned Act, should be the sum of seven thousand pounds, and that such loan should be made upon the terms and conditions contained in the said agreement now in recital: And whereas by a bond under the seal of the said Council, dated the twentieth day of September, one thousand eight hundred and eighty-eight, being a bond given pursuant to the provisions of section 5 of the said first-mentioned Act, the said Council bound themselves in the penal sum of fourteen thousand pounds sterling well and truly to perform and fulfil the terms and conditions and provisions contained in the said agreement: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, in pursuance of the power and authority so vested in me by the said first-mentioned Act, do by this notification hereby direct that the provisions of section 125 of the "Country Towns Water and Sewerage Act of 1880," with such modifications (if any), as are contained in the said recited agreement, shall apply to the said Council in respect of any loan authorized to be made by the Colonial Treasurer to such Council, pursuant to the "Country Towns Water and Sewerage Act Extension Act of 1887."

Given under my Hand and Seal, at Government House, Sydney, this fifteenth day of October, in the year of our Lord one thousand eight hundred and eighty-eight, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,
JOHN SUTHERLAND.

GOD SAVE THE QUEEN!

1888-9.

NEW SOUTH WALES.

COUNTRY TOWNS WATER AND SEWERAGE ACT.

(NOTIFICATION OF LOAN OF £8,000 TO MUNICIPAL COUNCIL OF FORBES.)

Presented to Parliament, pursuant to Act 44 Vic. No. 14.

NEW SOUTH WALES, } Proclamation by His Excellency The
to wit. } Right Honourable CHARLES ROBERT,
BARON CARRINGTON, a Member of Her
(L.S.) Majesty's Most Honourable Privy
CARRINGTON, } Council, Knight Grand Cross of the
Governor. } Most Distinguished Order of Saint
Michael and Saint George, Governor and
Commander-in-Chief of the Colony of
New South Wales and its Dependencies.

WHEREAS by the "Country Towns Water and Sewerage Act Extension Act of 1887" it was amongst other things enacted that it should be lawful for the Governor, by notification in Gazette, to declare that any of the special provisions contained in part 5 of the "Country Towns Water and Sewerage Act of 1880" should apply to the Council of any Borough or Municipal District in respect of any loan authorized to be made by the Colonial Treasurer to such Council, pursuant to the first mentioned Act, and upon the publication of such notification the enactments specified in such notification, with such necessary modifications as the Governor might think fit to make, should apply to the Council and to the Waterworks therein referred to with as full effect as if the said enactment had been embodied in that Act and specifically applied to such Council and Works: And whereas by an agreement dated the fifteenth day of October, one thousand eight hundred and eighty-eight made between the Council of the Municipal District of Forbes, in the Colony of New South Wales, of the one part, and the Honorable John Sutherland, Minister for Public Works of the said Colony, of the other part, it was agreed that the amount of the loan to be made to the said Council, pursuant to the provisions of the said first-mentioned

Act, should be the sum of eight thousand pounds, and that such loan should be made upon the terms and conditions contained in the said agreement now in recital: And whereas by a bond under the seal of the said Council, dated the fifteenth day of October, one thousand eight hundred and eighty-eight, being a bond given pursuant to the provisions of section 5 of the said first-mentioned Act, the said Council bound themselves in the penal sum of sixteen thousand pounds well and truly to perform and fulfil the terms and conditions and provisions contained in the said agreement: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, in pursuance of the power and authority so vested in me by the said first-mentioned Act, do by this notification hereby direct that the provisions of section 125 of the "Country Towns Water and Sewerage Act of 1880," with such modifications (if any) as are contained in the said recited agreement, shall apply to the said Council in respect of any loan authorized to be made by the Colonial Treasurer to such Council, pursuant to the "Country Towns Water and Sewerage Act Extension Act of 1887."

Given under my Hand and Seal, at Government House, Sydney, this twenty-second day of November, in the year of our Lord one thousand eight hundred and eighty-eight, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,

JOHN SUTHERLAND.

GOD SAVE THE QUEEN!

1888.

NEW SOUTH WALES.

COUNTRY TOWNS WATER AND SEWERAGE ACT OF 1880,
AND NUISANCES PREVENTION ACT, 1875.

(BOROUGH OF WAGGA WAGGA—BY-LAWS.)

Presented to Parliament pursuant to Acts 44 Vic. No. 14, sec. 13, and 39 Vic. No. 14, sec. 18.

Colonial Secretary's Office,
Sydney, 9th August, 1888.

BOROUGH OF WAGGA WAGGA.—BY-LAWS.

THE following By-laws, made by the Council of the Borough of Wagga Wagga, under the "Country Towns Water and Sewerage Act of 1880," and the "Nuisances Prevention Act 1875," respectively, having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of the above cited Acts.

HENRY PARKES.

WAGGA WAGGA WATERWORKS.

Additional By-law.

THAT onescrew-tap be allowed to each premises liable to assessment for water rate, for the purpose of watering flower gardens or lawns without extra charge beyond the amount of water-rate which is assessed on the said premises; but the Borough Council may at any time require the said tap to be removed, or a meter fixed to the service pipe laid on to said premises, and may charge for all water supplied to said premises, by measure, at the rate of two shillings per 1,000 gallons.

We certify that the foregoing By-law under the Country Towns Water and Sewerage Act of 1880, was duly passed at a regular meeting of the Wagga Wagga Borough Council, held on Thursday, the 8th day of March, 1888.

(L.S.) HY. BERKELEY FITZHARDINGE,
Mayor.

Borough Council Chambers, Wagga Wagga.
J. HAWKES, Council Clerk.

BY-LAWS UNDER THE NUISANCES PREVENTION ACT.

1. The contents of all cesspits, closets, privies, earth-closets, pans, or receptacles for nightsoil, and all ashpits, refuse pits, or house rubbish, shall be removed by contract under direction of the Borough Council. And the Council of the Borough of Wagga Wagga is hereby empowered to enter into any contract or contracts with any person or persons for all matters or things necessary for the removal and deposit of nightsoil, refuse, house rubbish, or sweepings, and may make any regulations from time to time deemed necessary for carrying out any contract or contracts as aforesaid, or for determining the price to be paid by householders or others for emptying, cleansing, and carrying away nightsoil, refuse, or house rubbish. And the said Council may recover from any ratepayers, householders, or residents within the Borough, such charges as may be fixed by any regulations of the Council, before any Justice or Justices of the Peace in Petty Sessions assembled in Wagga Wagga.

2. No closet, privy, cesspit, or earth-closet, pan, or receptacle for nightsoil, or no ashpit, dust-bin, or receptacle for house rubbish shall have its contents removed by any person or persons, except the duly appointed contractor or contractors of the Council, or his or their workmen or servants.

3. Any person or persons committing any breach of this By-law shall be liable to pay to the said Borough Council the charges payable for removal of nightsoil or refuse, or rubbish by the Council's contractor or contractors as if the work had been done by such contractor or contractors; and shall also be liable to a penalty of not exceeding the sum of twenty pounds, to be recovered as before provided.

4. Any householder or resident within the Borough of Wagga Wagga, who shall require the contents of any closet, cesspit, earth-closet, pan, or receptacle for nightsoil, ash-pit, dust-bin, or house rubbish removed, shall leave notice in writing at the Council Chambers, addressed to the Inspector of Nuisances for the time being, describing accurately the position of the premises, at least twenty-four hours before requiring the work done, and shall deposit with such notice a sum of one pound towards the cost of such cleansing, emptying, or removal, as aforesaid.

5. If any closet, earth-closet, privy, cesspit, pan, or receptacle for nightsoil, ashpit, dustheap, or rubbish heap on any untenanted or unoccupied premises shall, in the opinion of the Inspector of Nuisances, require cleansing, or emptying, or removal the owner of the said premises shall be liable to pay all charges for emptying, cleansing, or removing any such closet, cesspit, earth-closet, ashpit, pan, or receptacle for nightsoil or rubbish. And for the purposes of this by-law "owner" shall mean the person for the time being receiving or claiming the rent of such premises, or exercising any act of ownership over the said premises.

6. Any contractor or contractors with the said Council from time to time for removal of nightsoil or rubbish who shall neglect or refuse to empty any closet, earth-closet, pan, or receptacle for nightsoil, or remove any house rubbish when required so to do by the Inspector of Nuisances, or other appointed officer of the Council, or shall be guilty of any breach of these By-laws, shall be liable to a penalty not exceeding £20, nor less than £2, to be recovered as before mentioned.

Borough Council Chambers,
Wagga Wagga, 17th March, 1888.

We certify that the foregoing By-laws, under the Nuisances Prevention Act, were duly passed at a regular meeting of the Borough Council of Wagga Wagga, held on Thursday, the 8th day of March instant.

(L.S.) HY. BERKELEY FITZHARDINGE,
Mayor of Borough of Wagga Wagga.

J. HAWKES, Council Clerk.

APPENDIX.

Plan showing the Proposed Works as they were submitted to the Committee, and the modification of the Plan which the Committee recommend.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

DRAINAGE WORKS, MANLY.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the last Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, to whom was referred the duty of considering and reporting upon "the expediency of carrying out Drainage Works at Manly," have, after due inquiry, resolved that it is expedient a modification of the works should be carried out; and in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

The proposed works provide for a drainage area of 482 acres, and a prospective population of 18,316 persons, and they involve the construction of about 7 miles of sewers with an outlet into the ocean at the north-eastern part of the Quarantine Reserve. It has, however, been decided to postpone for several years the construction of the outfall tunnel, the proposed situation of which is at the point known as Blue Fish, or Blue Nose, by adopting which course the immediate expenditure will be considerably reduced; and more recently the Municipal Council of Manly have suggested an alteration in the original plan by which a still further reduction may be made in the immediate outlay. This alteration has been considered by the engineers who are responsible for the general scheme, and if after due examination it be found possible they are disposed to adopt it.

The total estimated cost of the scheme in its entirety is £34,114; the postponement of the construction of the outfall tunnel at Blue Nose will reduce the amount to £22,000; and the alteration suggested by the Municipal Council will bring down the immediate cost to £20,250.

The modified plan concurred in by the Municipal Council the Committee desire to recommend, if it should prove practicable, as it appears from the evidence not only to materially lessen the present cost, but to be sufficient to meet the requirements of the municipality for some time to come, and it has the additional merit of not involving any subsequent alteration in the original plan for the proposed complete system of sewerage beyond the circumstance that it will increase the total cost of the entire scheme by £1,000, when the entire scheme shall be carried out. If this modification should prove, after examination, to be impracticable the Committee recommend the adoption of the plan by which the construction of the outfall sewer at Blue Nose will be postponed and the immediate expenditure reduced to £22,000.

The original scheme includes a main outfall sewer in tunnel under the Quarantine Reserve, 1 mile 207 yards in length, having an outlet to the ocean in the vicinity of Blue Fish Point (referred to in the evidence as Blue Nose Point), which is at the north-east part of the Quarantine Reserve, together with 1 mile 253 yards of sub-mains, and 4 miles 703 yards of subsidiary sewers. In addition to that it is proposed to utilize 900 yards of the existing sewers. The total length comprised in the scheme is therefore 7 miles 303 yards, and the works include the construction of

121 shafts, manholes, and automatic chambers. The main sewers are shown on the plan, which accompanies this report, in red lines, the subsidiary sewers in blue lines, and the existing sewers in green. The scheme is so devised that the system may be considerably extended to the westward whenever required.

With reference to the reduction of the total estimated cost of the scheme to £22,000, by postponing the construction of the outfall tunnel at Blue Nose, it is pointed out in a report by Mr. G. H. Stayton, M.I.C.E., of the Sewerage Branch, Roads and Bridges Department, that the proposed outfall sewer possesses the distinct advantage that the portion of it nearest to Manly could, if deemed expedient, be temporarily used as a sewage outfall. Under any circumstances, the report states, a penstock chamber must be provided at the storm-water overflow near the east end of Fairy Bower; and as this overflow could be well extended into the deeper waters of the bay (Little Cabbage-tree Bay), it would be quite practicable to utilize it as an outfall, and to defer the construction of the remainder of the tunnel until, by reason of additions to the first-named drainage area, the time arrives when the daily volume of sewage will have considerably increased. Under these circumstances the new drainage system, Mr. Stayton points out, could be brought into earlier operation, and the postponement of an expenditure of £12,000 might be an advantage to the municipality, as doubtless it will hereafter be in a better position to meet the additional outlay.

The Municipal Council, however, deemed it desirable that the temporary outlet should be fixed in the vicinity of the north-east corner of Little Cabbage-tree Bay, with a view to saving the expense of the first portion of the tunnel. Upon that Mr. Stayton was called on to report, and a report was prepared on July 4th, to the effect that a modification might be made, but it would necessitate the construction of a sewer in tunnel under Fairy Bower Point, with an iron pipe outfall sewer 21 inches in diameter, discharging outside the rocks below low-water mark. But the practicability of constructing such outfall at so exposed a spot could not be absolutely determined in the absence of the necessary soundings or trial borings. If, however, on further investigation, the proposal was found to be practicable, and not too costly, it commended itself by the fact that a better seaward current would be secured at the point of discharge. Moreover, the proposal would effect an immediate saving of £1,750.

On the 9th August the Council informed the Minister for Works of their desire to have the temporary outfall carried on the rocks along the northern side of Cabbage-tree Bay, and so to dispense with the cost of the proposed tunnel under Fairy Bower Point. On this Mr. Stayton reported that the rocks in question were a favourite place of public resort, and, even if practicable, it would be undesirable to carry the outfall sewer across them as suggested; and the Council was informed accordingly. By the evidence of Mr. J. G. Griffin, the Mayor of Manly, it will be seen that he is willing to fall in with Mr. Stayton's view, and to agree to having the sewage discharged in the vicinity of the north-east corner of Little Cabbage-tree Bay.

In their consideration of this proposed work, the Committee had before them an exhaustive report by Mr. G. H. Stayton, dated 8th February, 1887, with a minute thereon by Mr. W. C. Bennett, Engineer-in-Chief for Roads and Bridges and Sewers, and lithographic plans upon which the proposed scheme and the suggested modifications of it were clearly shown. These enabled the Committee to fully understand the proposals made, and, with the evidence obtained, to come to what they believe to be a satisfactory conclusion.

In the conduct of the inquiry it appeared to the Committee to be very desirable that information should be obtained as to whether the residents of Manly were favourable to the proposed scheme, and whether they clearly understood the monetary obligations they would incur by the adoption of it. Though it was apparent, from the papers before the Committee, and without the testimony of witnesses, that a proper sewerage system for Manly was necessary, it could not, without the examination of persons immediately concerned in the matter, be understood whether the people of the municipality clearly comprehended what was proposed, or what, if the scheme were carried out, they would have to pay. The Committee, therefore, had before them as witnesses gentlemen who either represented the Manly Municipal Council, the members of which are, of course, directly responsible to the ratepayers,

or

or who being prominent residents of Manly, may be regarded as representatives of the general community there; and it will be seen that their statements go to show that the people of Manly, as a whole, are not only fully aware of the proposed scheme, and the obligations attached to it, but are anxious that it should be carried out.

Generally stated, the Committee examined the witnesses brought before them, upon the following points:—

- (1.) The nature of the proposed work.
- (2.) The nature of the present drainage system in the municipality.
- (3.) Whether the proposed work has been well conceived.
- (4.) Whether it is clearly understood and approved by the residents.
- (5.) The arrangements for the annual payment to repay the sum expended upon the work, and the interest upon that sum.

The nature of the work proposed will be found fully described in the evidence given by Mr. J. Barling, Under Secretary for Public Works; Mr. W. C. Bennett, Engineer-in-Chief for Roads and Bridges and Sewers, and Mr. G. H. Stayton, Engineer in connection with the Sewerage Branch of the Department of Roads and Bridges. It has already been briefly described in the earlier portion of this Report.

The nature of the drainage system which at present exists in Manly is described principally in the evidence of Mr. Stayton, Mr. J. G. Griffin, Mayor of Manly; Mr. J. A. Scarr, Alderman of Manly, and Mr. Alexander Dean, a resident of the municipality. Mr. Stayton says the existing sewers do not give satisfaction, that they are very defective in places, and in consequence of not being properly adjusted silt accumulates in some of them, and the whole are very foul. "I do not think," he states (*Question 225*), "I ever smelt worse sewer-gas than I experienced at one of the openings;" and, while the sewers are in this very objectionable condition, there is no proper provision for preventing foul gas from passing into the houses. Mr. Griffin informed the Committee that the earth-closet system is in operation in the municipality, and that the soil is dug into pits; but Mr. W. C. Bennett, referring to this practice, draws attention, in his evidence, to the fact that there is a limit to this as population increases, and that this limit must now be very nearly reached. Mr. Scarr says that the present system of sewerage only provides for slop and storm-water, and that only a small proportion of the former is carried away; most of it is run off into pits in the yards, a practice which he considers to be extremely unhealthy.

As to whether the proposed system of sewerage is well conceived, the evidence indicates that it is. The greater part of the present sewers will be utilized, as they will be intercepted at certain points, and where they cannot be intercepted they will be used for removing storm-water from the streets. Excreta, as well as house slops, will be removed by the proposed sewers, and the sewers will be constructed at such a depth under the ground as to catch the whole of the sewage, the fall, though slight, being so calculated as to be sufficient to ensure a self-cleansing velocity. If necessary, it is contemplated also to establish a flushing system. The sewage will be discharged, as already stated, into the ocean; and according to Mr. Bennett and Mr. Stayton, a sewerage outfall on the sea coast, wherever it can be obtained, is always considered desirable, and one of the best and cheapest methods that can be adopted. Mr. Stayton also says that the water-borne sewerage system is the cheapest and best. Asked (*Question 479*) as to whether it is customary in other countries to carry the drainage out to the ocean beaches, he stated, "Wherever it is practicable it is considered the most economical plan, and the results, if the local circumstances are favourable, as in this case, are such that certainly it is considered the best thing to be done." The proposed outlet at Cabbage-tree Bay is so arranged that it will be some distance from the shore, more than 100 feet from low-water mark, and 8 or 10 feet below the water; the outfall having a considerable inclination, so that the sewage and foul water coming through the drains will carry with them sufficient velocity to force them out. The calculations of the engineers are such, according to the evidence of Mr. Bennett, that the sewage will be taken from the lowest parts of the municipality, and he points out that where it is proposed the outfall shall be in Little Cabbage-tree Bay the tide (or current) flows to the southward, and there is an eddy there which will take the material out to sea. Even, he says (*Question 104*), if the wind blow in such a direction as to wash some of the sewage on to the beach, in what is called Fairy Cove, the quantity so washed

up "would be inappreciable, because it would be discharged well below low-water, and would be so thoroughly diluted with sea water that it would be almost inappreciable for many years." Certain portions of Manly known as the Addiscombe Estate, and the Manly Vale Estate, lie very low below the ordinary level, and in regard to this a recommendation is made by the engineers that building operations there should be limited, and if anything is done to provide for sewage there the sewage will be pumped. Mr. Bennett thinks that the proposed system is of vital importance to Manly, seeing that that suburb depends entirely upon its character as a health resort, and that if a pestilence of any kind were to break out there it would ruin the place. Then he points out that, in all sewerage systems, the great object is to keep the sewage going, and not to allow it to accumulate, as sewage is not offensive unless it is a day or so old; and, to meet this necessity, arrangements have been made for flushing the sewers, and for their examination, in order that they shall not at any time be obstructed. Mr. Stayton appears, by his evidence, to have made a careful examination of the whole of the coast at Manly, including the Quarantine Reserve, in order to ascertain whether any nuisance is likely to be caused by the discharge of the sewage at either of the points proposed on the plan, and he says (*Question 482*) that at Little Cabbage-tree Bay he has spent several hours, on several occasions, noticing the currents and watching the action of the waves, and he is perfectly satisfied that neither at that point, nor even further along, will there ever be any nuisance. The scour there, he states, is very great, and the position is very favourable. The modification of the original plan, according to his evidence, will meet all the requirements of Manly for at least ten years. At the end of that period, if the population of the district increases very rapidly, he thinks it will be necessary to consider the question of extending the outfall. One other recommendation in favour of the scheme generally is, that the amount which it is calculated it will be necessary to draw from the ratepayers as a sewerage rate will actually be less than they are now called upon to pay for the removal of night-soil.

That the proposal to establish the new system of sewerage is clearly understood and approved by the residents of Manly is apparent by the evidence of almost all the witnesses examined. Mr. Barling states that Mr. Stayton's report was made in consequence of a request from the Municipal Council. Mr. Bennett, when asked (*Question 41*) whether the residents of the district understood thoroughly the provisions of the Act and the responsibility they were incurring in becoming parties to the proposed work, said he thought they did; and (*Question 74*), when questioned whether he had any doubt as to people continuing to contribute to the cost of sewerage works such as these before the Committee, said he had no doubt, and that certainly he thought the people at Manly would continue the necessary payment. "It is very difficult," he states, "for anybody who has not seen the tremendous advance of population, and the advance in the value of property, to realize how willingly people will contribute in a few years to anything of this sort." Mr. Griffin considers that, as far as he has been able to judge from a professional point of view, the proposed scheme is a most efficient one; and he says that the Municipal Council are strongly in favour of it, that there has been no petition against it, and that he has reason to believe the bulk of the ratepayers strongly approve of it. The question of the liability of the municipality, he further states, has been discussed by the Council, and agreed to by resolution, and several letters have been sent to the Department of Works pressing them to carry out the scheme. Asked (*Question 346*) if the scheme were recommended by the Committee, and the Government were prepared to carry it out, was it at all likely that the Council would repudiate it, he said, certainly not, nor did he think that any Councillor would be elected for Manly if he opposed it. Mr. Alexander Dean says (*Question 364*) he is quite sure the people of Manly are desirous of having the system established, and that 90 per cent. of the inhabitants are agreeable to comply with the conditions of the Water and Sewerage Act. Mr. J. A. Scarr, Alderman of Manly, also speaks in his evidence of the unanimity of the Council on this subject, and says that from conversations he has had with ratepayers he has never heard anyone object to pay the rate which will be necessary when the scheme is brought into operation.

With regard to the arrangements for the payment of the principal and interest in relation to the sum expended upon the proposed works, the evidence indicates a strong desire on the part of the Council to have the period for the repayment

repayment extended beyond the twenty-eight years stated in the provisions of the Metropolitan Water and Sewerage Act. The Council, it is considered, will be strong enough to make the annual payments necessary on the scale of repayment for twenty-eight years, but they would rather have the period extended to sixty years, the time fixed for the repayment of similar expenditure under the Local Government Act in England. This will be found referred to in the evidence of most of the witnesses examined by the Committee, and it is also mentioned in Mr. Stayton's report. In that report Mr. Stayton points out that if the proposed sewerage system is carried out under the provisions of the Metropolitan Water and Sewerage Act the annual payments to repay principal and interest, at 4 per cent. per annum on the amount expended, for the period of twenty-eight years, would be 6 per cent. "In England," the report goes on to say, "similar debts are extinguished by equal annual instalments of principal and interest spread over a period of SIXTY years, it being deemed just and equitable that a succeeding generation should contribute to the cost of such permanent and beneficial works. By extending the period to sixty years, the annual payment would be reduced to 4.42 per cent.—a result obviously advantageous." The evidence generally upon this point will be found very much to the same effect as this extract from Mr. Stayton's report. It is contended that as an efficient sewerage system, such as that proposed, will benefit future generations, posterity should be called upon to contribute something towards its cost, and as far as possible the burden of cost on the present population lightened.

The resolution arrived at by the Committee was as follows: moved by Mr. Street, and seconded by Mr. Sydney Smith, and agreed to:—

"That the Committee consider it expedient that the drainage works at Manly should be carried out as proposed on the plan and explained in the evidence before the Committee," the intention of the Committee by this resolution being to recommend, as already stated, the modification of the original plan by which the construction of the outfall tunnel to Blue Fish Point will be postponed and the sewage conveyed for the present to a point in the vicinity of Little Cabbage-tree Bay.

JOHN LACKEY,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
22nd October, 1888.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

DRAINAGE WORKS, MANLY.

THURSDAY, 4 OCTOBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.

The Hon. WILLIAM HENRY SUTTON.

The Hon. FREDERICK THOMAS HUMPHERY.

ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee proceeded to consider the proposed Drainage Works at Manly.

Joseph Barling, Esq., Under Secretary for Public Works, sworn and examined:—

1. *Chairman.*] Are you aware of a proposal to carry out the drainage of Manly? Yes.
2. Have those works been long in contemplation? With the permission of the Committee I will read the following statement giving the history of the matter:—"At the request of the Municipal Council of Manly, in 1886, Mr. Secretary Lyne gave instructions for a report to be prepared on the whole question. Whereupon a thorough inspection of Manly was made, and its sewers examined, and in February, 1887, a comprehensive sewerage scheme and report thereon were submitted by Mr. G. H. Stayton, M.I.C.E., to the Engineer-in-Chief, who recommended the adoption of the scheme. The scheme provides for a drainage area of 482 acres, and a prospective population of 18,316 persons. The works included involve the construction of about 7 miles of sewers with an outlet into the ocean at the north-eastern part of the Quarantine Reserve; the total estimated cost being £34,114. It is intended, however, to postpone the construction of the outfall-tunnel (1,317 yards in length) for several years, thereby reducing the immediate outlay to £22,000. A correspondence has recently taken place with the Council respecting the position of the temporary outfall, with a view to a further slight reduction in the outlay, and it is possible that some conclusion may yet be arrived at by which the wishes of the Council may be met." I will also read the following paragraph from Mr. Stayton's report:—"If the works are carried out under the provisions of the Metropolitan Water and Sewerage Act (43 Vic. No. 32), the annual payment to repay principal and interest at 4 per cent. per annum would amount to 6 per cent. on the amount expended for a period of twenty-eight years. In England, similar debts are extinguished by equal annual instalments of principal and interest spread over a period of sixty years, it being deemed just and equitable that a succeeding generation should contribute to the cost of such permanent and beneficial works. By extending the period to sixty years, the annual payment is reduced to 4.42 per cent.—a result obviously advantageous. The annual cost of the sewerage scheme, taking 6 per cent. to cover interest and repayment on an outlay of £22,000, and including £200 for a supply of water for flushing, is estimated at £1,520. As will be seen on page 1, the ratable value of the municipality amounts to £67,452. A rate of 1d. in the £ per annum on the existing assessments within the drainage area would probably produce £250 net; but there is little doubt that by the time the works are carried out and completed the ratable value will have further increased to such an extent that a penny rate would produce £300. Under such circumstances a drainage rate of 5d. per annum would be sufficient to pay for the execution and maintenance of the necessary works. If, however, the period for repayment were extended to sixty years, the annual cost would be reduced to £1,172, in which case a 4d. drainage rate would be sufficient." We find a difficulty with regard to waterworks which we have constructed for municipal councils. They find it extremely difficult to pay the interest and sinking fund during the first few years after they are called upon to do so. They complain that they are unable to pay the large amount of 6 per cent. Of course their water rates are very small during the first few years, and therefore they complain very much about it. I think it will be the same with regard to sewerage.
3. What is the drainage rate now proposed? 5d. in the £.
4. Are there any other drainage works proposed besides these? Yes, for the North Shore and the western suburbs.
5. Are all those being carried out under the Water and Sewerage Act of 1880? Yes, proposed to be.
6. How far does the Water and Sewerage Act extend from the metropolis? It applies to the county of Cumberland.
7. Not outside of that county? No. There is another Act provided for that—The Country Towns Water and Sewerage Act—which was passed in the same year as this Act.
8. Have you many applications to come under the operation of this Act? For water we have.
9. For sewerage? We have several.

J. Barling,
Esq.
4 Oct., 1888.

J. Barling,
Esq.

4 Oct., 1888.

10. Have any of the western suburbs—Ashfield, Burwood, and those places—made application? Yes. Deputations on various occasions have waited on the Minister, urging that he should take up the work under the provisions of this Act.
11. Are they all prepared to have the sewerage undertaken under the provisions of the Act? I think that is a question yet to be decided; probably some amendment of the Act will be necessary.
12. In what respect? It involves a question of public policy, so that I cannot speak as to the intentions of the Government.
13. In what direction are the people now endeavouring to have an alteration made? I think it is this: Some, at any rate, wish the Government to take up the whole thing; not merely constructing, but also managing them, and levying the rates the same as the Water and Sewerage Board does.
14. Taking it out of the hands of the Municipality? Yes.
15. Do they express themselves as being prepared to continue contributing towards the cost, as provided by the Act? In that case they would have to pay the rates. They would not be called upon to pay the capital, but just simply to pay the rates for working expenses, and interest on capital. But that is not yet settled.
16. *Mr. Suttor.*] Would these works be committed to the Water and Sewerage Board? I do not think that would be the case at Manly, because it is a completely separate scheme. The western suburb sewerage, however, is quite different, because it works in with the scheme already carried out.
17. Is there anything in the Act to compel these Manly works to come under the Water and Sewerage Board? I have not the Act here to refer to, but the intention evidently is that the Government should carry out these works, and hand them over to the local authorities. It is not part and parcel of the general scheme, such as the western sewerage scheme would be.

W. C.
Bennett, Esq.

4 Oct., 1888.

William Christopher Bennett, Esq., Commissioner and Engineer-in-Chief for Roads and Bridges and Sewers, sworn and examined:—

18. *Chairman.*] Are you Commissioner for Roads, and Engineer-in-Chief for Roads and Bridges? Yes.
19. Have you control of the Sewerage Works? Yes, from the commencement, under the Metropolitan Act
20. Has the Sydney Sewerage System been carried out under your supervision? Yes.
21. We desire to get from you this evening some information with reference to the proposal to spend £34,000 in drainage works at Manly; have those works been designed under your supervision? Yes.
22. Have they been designed by Mr. Stayton? Yes.
23. Is he an engineer in your Department? Yes.
24. The project and design have your concurrence? Yes.
25. You are aware of the nature of it? Yes.
26. Is it done under the auspices of the Water and Sewerage Act? Yes.
27. When was that Act passed? In 1878.
28. I presume that the project is the result of the action of the residents at Manly? Yes; they petitioned to have the work done, and I was instructed to have the surveys made.
29. And you feel that this is the best project you could recommend under the circumstances? Yes.
30. Did you make any examination of the configuration of the place? I knew Manly very well before, and Mr. Stayton conferred with me from time to time, and I agreed with him as to the surveys which were to be made. When the whole thing was ready, I went down to Manly, and went through the whole project with Mr. Stayton, on the ground.
31. The project is to convey the sewage into the sea at two different places? Yes. It is an alternative project. One is for £22,000 to convey it to Cabbage-tree Bay; the other is for £34,000 to convey the sewage to a more distant point on the coast.
32. What depth would the sewer be in the ground? A considerable depth, but I cannot state it exactly.
33. Are you sure that it is at a sufficient depth to catch the whole of the sewage? Yes.
34. Is not the whole place very flat? Yes; but we have made all our calculations to take the sewage from the lowest points.
35. Who made the estimate? Mr. Stayton, under my instructions, and it is based on the prices which were paid for the work in the Sydney sewers.
36. Do you think the estimated amount will be sufficient to carry out the project? I am sure it will.
37. Have you had any other applications for suburban sewerage submitted to you besides this scheme? Yes; North Shore and the western suburbs.
38. What do the western suburbs consist of? All the railway suburbs; Balmain, Petersham, Ashfield, Camperdown, and right out to Strathfield. Then some country towns have also applied.
39. Do the country towns come under a different head? Yes.
40. Does the same Act make provision for sewerage works outside the county of Cumberland? It is not the same, but it is a parallel Act. They are very nearly the same, but they are separate Acts.
41. Have you any knowledge whether the residents of those districts understand thoroughly the provisions of the Act and the responsibility they are incurring in becoming parties to these works? I think at Manly they do. I am not quite sure that the people in the western suburbs—a much larger number of people—are fully aware of it.
42. We have it in evidence from the Under Secretary for Public Works that the principal and interest for these works at Manly, spread over a period of twenty-eight years, would be recouped by an annual payment of 6 per cent.;—is that correct? Yes.
43. As far as you can form an estimate? That would be a rate of 5d. in the £.
44. Would that be the rate upon the value of the property at the present time? No. It allows for an increase of one-fifth. The present valuation is £67,000. That would be on a valuation of about £80,000.
45. Would that allow for an increase in population or an increase in the value of property? An increase in the value of property. The increase in population is met by making the capacity of the sewers sufficiently large to carry away the sewage.
46. Provision is made for that in the design? Yes.
47. Do you recollect if you have had any other applications besides the North Shore and the western suburbs for the construction of sewerage works? Yes; there have been a number of applications collateral

W. C.
Bennett, Esq.
4 Oct., 1888.

- collateral to the large drainage scheme for which sums of money have been voted, and the works are now being carried out; but there have been no special schemes about Sydney except those three.
48. Have you given any consideration to this view of the case: In view of the large amount of convenience which the future residents of Manly will derive from such a public work as this, which will last for all time, would it not be reasonable to extend the payment of principal and interest over a longer period so that the present residents may be called upon to pay somewhat less than is contemplated by the present Act? Yes. Of course, we have only calculated on the time specified in the Act, but I think it would be prudent and equitable to extend the time to sixty years, as in England.
49. Then the project would be lighter on the present residents, while it would convey all its advantages and benefits to a future increased population? Yes.
50. Have you had a great deal to do with public works of various kinds, more especially with works of this description? Yes; for forty-eight years.
51. I mean in this Colony? For thirty-four years in this Colony.
52. Have you formed any opinion in reference to large permanent works as to whether their cost should not be so adjusted that those who come afterwards should bear a fair proportion of the cost of construction? Yes; I think that is a very equitable view.
53. Of course, those who come afterwards would derive a great advantage if we paid for everything that is done at present? Yes; and they would also have this very great advantage: that the works can be done for a much smaller sum of money now than they can be in the future. However, there is another consideration to balance that. There may be improvements in science which would render such works unnecessary, or which would modify them. At present there is not much prospect of that.
54. There are not many alternative schemes of drainage now beyond two or three? There are a great number of schemes, but very few worthy of consideration.
55. But most of the old schemes of drainage are abandoned. For instance, the draining of the western suburbs into the Parramatta River would not be permitted? It is considered to be an established rule that nothing should be allowed to drain into Port Jackson.
56. It is a rule in all parts of the world that you must not drain into a river or harbour? Yes, if possible.
57. In furtherance of that, in your sewerage scheme which you have carried out so successfully in Sydney, is it not confined to two systems,—one being the conveyance of the sewage into the sea, and the other the conveyance of the sewage to a sewage farm at Botany? Yes.
58. These are the two systems observed everywhere, except where the sewage is deodorised? Yes. There are countless systems of deodorisation, but no system has met with general favour, except the two just mentioned. It is generally agreed that if you have the ocean near you it is best to convey the sewage there. No profit to be derived from sewage will pay for putting it on the land. Then if the ocean is not near you, and it is too expensive to convey the sewage to the sea, it is expedient to filter the sewage through land.
59. Might not the filtering of sewage through land be made a source of profit in recuperating the soil for cultivation? Yes; but it is never made a source of profit *per se*. There has never been a net profit from it.
60. Not anywhere? No; not that I am aware of. It is made profitable in this respect: that it reduces the cost of getting rid of the sewage; and certainly it is the most effective way of doing it. I may say that Mr. Roberts, of this Department, who is fond of trying experiments, told me a year and a half ago that he had discovered a mode of desiccating sewage by electricity. I told him to protect his rights by patent, and he did so. By the time the patent was obtained we found that the same thing had been mooted in England, and I find now that the Metropolitan Board of Works in London are allowing an English inventor to experiment very largely. At my suggestion, Mr. Sutherland referred the case to Professor Threlfall, and we have had some analysis of the water by Mr. Hamlet. It looks very promising; and it would be a great aid in getting rid of the objectionable features of the sewerage outfalls.
61. The object would be to get rid of the offensive properties of the sewage by electrical action? Yes. Describing it roughly, the electricity decomposes the water, and the oxygen in the water combines with the offensive matter in the sewage, oxydizing and precipitating it.
62. Are you now conveying a considerable quantity of sewage from Shea's Creek and that neighbourhood down to Webb's Grant, at Botany? Yes.
63. So far have you found it successful? Yes; but of course it is only comparatively a small quantity as yet.
64. But so far as the test is concerned, have you been able to utilise the sewage? Yes, very successfully. We have been able to produce very good crops on bare sand—the ordinary blown sand of Sydney.
65. Can you give us an idea roughly of the character of the work;—do you catch the sewage in tanks? No. The sewage crosses the river by a syphon, and we have taken advantage of that syphon to strain the sewage before going into it. Then on the other side the sewage is carried in an elevated carrier, until the level of the ground is attained. Then we let it out, and let it flow. In some places we have large flood areas, made in case of a fresh. We run the water on to those areas, and there it deposits the sewage matter on the surface. That is used for raising lucerne, sorghum, and all sorts of vegetables.
66. I suppose that what you do there anybody else could do? Yes. The present scheme before the Committee does not involve anything of that sort.
67. What area have you there? Three hundred acres. I think we have only operated on 5 or 6 acres.
68. Could it be extended to the whole area? Yes. It is proposed to extend it to the whole area as the sewage increases.
69. Where does the sea-channel empty itself? At Ben Buckler.
70. Is that in operation? Yes. Not in full operation, but partial operation. The sewage from Prince Alfred Hospital, and all the intermediate sewage which we have been able to get from a great part of the city, flows through it.
71. Does that intercept a great deal of the sewage which used to come into different parts of the harbour? Yes. I am in hopes that it will so completely intercept all the offensive sewage that there will be very little sewage flowing into the harbour. As Woolloomooloo is a large residential place, and the area a great deal below the level of the sewer, we have arranged for elevators to lift the sewage into the sewer.
72. It will be intercepted and elevated? Yes; by a hydraulic or pneumatic elevator.
73. *Mr. Garrard.* Does that apply to all the low levels? Yes.
74. As far as your experience has extended in the construction of these sewerage works outside Sydney, such as this now before the Committee, do you think that the Government would be justified in constructing

W. C.
Benfett, Esq.
4 Oct., 1883.

constructing them; or have you any doubt as to the people continuing to contribute to the cost? I have not. I certainly think that at Manly they would go on. It is very difficult for anyone who has not seen the tremendous advance of population, and in the value of property, to realise how willingly people will contribute in a few years to anything of this sort. I have no doubt there will be great grumbling hereafter by people who have to pay, because they will not be able to realise what would be the state of things without such works. But if things could be changed into the pre-sewer period, and the people had a choice, they would willingly embrace it then.

75. Looking at it from a money point of view, I suppose that works such as these would improve the value of property in the neighbourhood? I think so, particularly at Manly.

76. Have you had to do with works for country water supply? Not for country water supply, but I was a member of the Sydney Water Commission which recommended the Nepean scheme.

77. Have you ever given any consideration to the system of deodorising sewage? Yes; there are countless plans.

78. Do you know anything of Sir James Farmer's plan which is carried out at Birmingham, where by means of a cylinder they dry the material? Yes; there are countless ways of doing it. Mr. Stayton, who is just recently from England, will be able to give you some information on the subject. I know the general fact that no real success has resulted from any of these systems. They find that it is absolutely necessary, dear as land is in England, to get land to filter the sewage in order to comply with the conditions of the Pollution of Rivers Act.

79. Is that what they do in most cases? Yes; in most cases where it is possible. But in some places it is not possible to get land.

80. In cases of that sort do they resort to deodorisation? Yes; they mix chemicals with the sewage.

81. Do you not apprehend some difficulty in the project of draining the western suburbs? No.

82. Where do you propose to empty your drainage? We bring it down by Webb's Grant.

83. Do you propose conveying all the sewage into one sewer? It will be one line of sewer, but there will be two, and ultimately three ducts—three different cylinders.

84. What about the levels;—will the sewage be conveyed by gravitation? Yes. We have made the levels so that the sewage will go by gravitation the whole distance.

85. Does that apply to the whole of the suburbs? No. There is a portion of it outside the limit which will not gravitate. But if it is necessary, the sewage can be elevated. The greatest part of that is very sparsely populated. There are suburban villas built on it, and it lies around the margin of the Parramatta River.

86. Would you pump the sewage up to tanks? When it becomes necessary.

87. *Mr. Humphery.*] In the first instance by this plan before the Committee you propose to discharge the sewage into Little Cabbage-tree Bay? Yes.

88. The total cost of that will be £22,000? Yes.

89. For how many years do you think that system or that portion of the system will be sufficient? It would be hard to say.

90. You have not made any calculation as to what period it will do for? No; I have not. It would be a very difficult thing to do, as it depends upon many circumstances.

91. Is it desirable at the present time to incur greater cost than £22,000 for this system of sewage for Manly, having regard to the amount which the inhabitants will have to pay per annum to cover the cost of construction and interest? It is not desirable at present.

92. Would you recommend the expenditure of £22,000 only and not of £34,000? Yes.

93. Has this plan been submitted to the Municipal Council of Manly? Yes.

94. Has the proposal been before the Council? Yes.

95. Have you had any expression of opinion from the Mayor? I think they have approved of it. They proposed some modifications, reducing the cost, and making the outlet nearer the town.

96. Can you remember what modification was proposed? It was merely that instead of having the outlet at Cabbage-tree Bay, it should be in the next bay nearer to Manly; that is Fairy Bower. But we objected to that very much, as it would spoil the very thing on which Manly exists, namely, the beach.

97. That corner is where people bathe? Yes; it would be most objectionable.

98. What is the difference in cost? Something very inconsiderable.

99. So that the pecuniary benefit of the proposed modification would be inappreciable? Yes.

100. If the expenditure be £22,000 instead of £34,000, what amount per annum will be necessary to cover the repayment and interest? £1,172 a year.

101. What rate would it be necessary to strike for that? A 4d. rate.

102. *Mr. Kethel.*] Is it in your opinion quite safe to make the outfall so near to the public reserve of Manly as Little Cabbage-tree Bay? I think it would be. The tide flows to the southward, and there is an eddy in there which would take the material out to sea.

103. Is not that only at certain times of the day? Yes.

104. In any case it is certain if it blows to the south-east to disfigure all the beach in what you call Fairy Cove? It would be inappreciable because it would be discharged well below low water, and it would be so thoroughly diluted with sea-water that it would be almost inappreciable for many years.

105. The breakers are rarely heavy where you have the outfall? Yes.

106. Would not that have the effect of throwing the solid matter back on the land while the liquid matter will be held in suspense and carried out to sea? The solid matter would be more likely to form a shoal there. It would be below the surface.

107. Have you made any provision for screening it before discharging it into the ocean? None whatever.

108. No silt pits? There are silt pits proposed to intercept silt to prevent it from getting into the pipes, but nothing more.

109. There is nothing to prevent the whole of the silt or offensive matter from being thrown back on the beach? No.

110. Is it possible to make any provision to prevent that? No.

111. Would it not be possible to construct a screen so as to sift the material? It would be hardly worth it.

112. Do you think the population is not sufficiently dense to require such a precaution? The material will be diluted by the sea, and will not appear at all events for many years.

113. I suppose that at any time steps could be taken to intercept solid matter to prevent it from flowing into

W. C.
Bennett, Esq.
4 Oct., 1888.

into the sea if it were found to be seriously offensive? I would not recommend anything of that kind. If it were found to be offensive it would be better to convey the sewage further away.

114. In the event of the sewage being carried out to the neighbourhood of North Head do you think there is no danger of its flowing in at the Heads? Not the slightest.

115 *Mr. Garrard.*] Do I understand that £22,000 will be the cost of having the works constructed with the outlet at Little Cabbage-tree Bay? Yes.

116. Since the Manly Council sent in their request to have the outlet put at Fairy Bower side—the northern side—has it been intimated to them by the Department that there are reasons against that? I think so.

117. Have they now concurred in the Little Cabbage-tree Bay outlet? I cannot say.

118. *Mr. Kethel.*] Of what material is the work to be made—pipes or brick sewers? Some of the work will be brick sewers, and some pipes.

119. The main outfall will be brick? Yes; particularly in the tunnel.

120. Is a great part of the ground sandy? Yes, a great deal of it.

121. Therefore you will require pipes? Not on account of its being sandy, but on account of not requiring so large a section.

122. *Mr. Garrard.*] What fall have you in your main line of sewer? 1 in 1,350. That is at the outfall sewer. Above that, on the flat, it is 1 in 800, 1 in 600, and 1 in 500.

123. Is not that a very small fall? We have calculated the velocity and we find we can get above the minimum velocity by low-level sewerage with the fall we have.

124. Will that be the case in summer weather when there is very little water going through? Yes; we can get the minimum velocity then.

125. Will you do away altogether with the present outlet on the harbour side? Yes.

126. Will you do away with the existing local sewerage scheme? Yes.

127. How do you propose to drain the lowest part of Manly;—is there not some portions of the Addiscombe Estate and the Manly Vale Estate much below the level? Yes; that is dealt with in the report. We recommend that they should be limited as to building there.

128. If anything is to be done to provide for sewage there will it have to be pumped? Yes.

129. After many years experience in sewerage matters I suppose you are quite firm in your opinion that this water carriage sewerage is better than any dry or pneumatic system? Yes; when the population exceeds a certain limit.

130. Have you given any consideration to Liernur's scheme? Yes. When I was in London Sir John Fowler brought me over to Mr. Rawlinson, the chief engineer of the Local Government Board in London. I told him that I was very anxious before commencing these works to see the Liernur system. I never believed in it from my own observations, but I was anxious to see it. I told Mr. Rawlinson that although I only had thirty days in London I was quite prepared to give two or three days to go to Amsterdam and look at it. He said, "Do not waste your time; if you want to see something of use to you out there go and look at the sewage farms of Croydon."

131. He was therefore asking you to see something which he had adopted? He is admitted to be the chief man and the best man in these matters at home.

132. Is not the system which I have just referred to in operation in many Continental cities? Not in many; it is not in general operation. Amsterdam is the place where it is most in operation.

133. Would you state briefly your principal objections to the system? It is very expensive. It depends on carriage by air instead of by water. It requires a great deal of manipulation which is not agreeable. The only place where there is an apology for using it is at Amsterdam where there is no fall, and because the buildings and houses are surrounded with canals, and they have to be dealt with almost separately. It has never been used in England, and the people in England are tolerably alive to all these things. It is used in perhaps half-a-dozen Continental towns, but its use is not increasing. I do not think it has been adopted by any town, or that there has been any addition to or extension of it, for the last eight or nine years.

134. Did I understand you to say that at the inlet into the main sewers there are catchpits for the sand brought down by storm-water? Yes.

135. Is there not great danger of the sewers being choked up where there is little fall? Except just at the outfall the fall is very fair. At the outfall it is only 1 in 1,350, but there is very little chance of that silting up.

136. Do I understand you to say that you would strongly recommend giving the ratepayers an extended time for payment so as to make it easy for them? That is a mere recommendation that should be taken *cum grano salis*. That is a question more in the province of a financial statesman. As far as my knowledge goes it would be a good proposition.

137. Do you think that the people of Manly thoroughly understand the responsibility they will incur under this scheme? I think they do; but they will be better able to tell you that themselves.

138. Do you also do away with the present sewer outlet on the beach by this scheme? Yes, that is the object of the whole scheme.

139. Has that sewer at present leading to the beach been found very offensive? Yes, I think so.

140. It is continually choked up? Yes.

141. Do you purpose extending your outlet in Little Cabbage-tree Bay well into the water by pipes? Yes; well below low water.

142. *Mr. Sydney Smith.*] What is the population of Manly? I think it is 3,000.

143. Do you know the number of houses? Over 500.

144. Is not that from an old date? March, last year. The sewers are made to accommodate a population of 18,000.

145. How many houses would that provide for? 3,000 houses, or something more, at the usual average, 3,600, allowing five persons to a house.

146. What system have they in force at Manly at present in dealing with sewage? They have a system of sewerage, and they use dry earth closets and cess-pits.

147. If this system of sewerage were adopted, would there be any necessity for the cost now incurred by the Council in removing the closet pans? No.

148. If the cost is 6d. per pan, as in other municipalities, and there were 3,000 pans, that would cost £75 per week to do what your sewers will do for them? Yes.

149. So that in point of fact it would be cheaper for them to adopt the system of sewerage now proposed by

W. C.
Bennett, Esq.
4 Oct., 1888

by you than it would be to remove the night-soil under the present system? Well, it would be as cheap; at all events. The cost of removing the night-soil at present would go towards defraying the expense of sewerage.

150. If there were 3,000 houses, the expense at 6d. per pan would be over £3,500 per annum. That expense would be avoided by your sewerage system, which would only cost the ratepayers something like £1,200 per annum? It would cost £1,520 per annum if the amount is paid off in twenty-eight years; and it would cost £1,172 if the repayment is extended over sixty years.

151. Are you in favour of extending the period of repayments to sixty years? Yes; but I only make that as an engineer's recommendation.

152. So that in point of fact, taking that calculation as a basis, the Manly Council will be benefited by adopting your scheme; it will be no cost whatever, but a saving;—do you think it will give them a more effective system than they have at present? Yes; I think so. I think it is of vital importance to Manly. The whole living of Manly depends upon its being a health resort; and if a pestilence of any sort broke out there it would ruin the place.

153. Are you aware what they do with the night-soil at present? Sometimes it goes into the sewers; and I think they have earth-closets, which they dispose of on the land.

154. Do they utilise it in any way? Yes; in gardens and so forth. But there is a limit to that as population increases.

155. Do they deodorise it in any way? I think not.

156. If not do you not think it must be very unhealthy? No; not if it is buried in the land and crops are growing from it. But there is a limit to that.

157. Do you not think it would be very offensive to allow them to bury it? No. The land has a wonderfully purifying effect; but there is a limit to it, which must now be very nearly reached at Manly.

158. Is there not some Act of Parliament which prevents that? There is a Nuisances Prevention Act which regulates these matters. It is prevented in any place proclaimed under the Act.

159. Does Manly come under that Act? I am not aware. It is entirely optional.

160. If Manly is under this Act people there would not be able to do such a thing without rendering themselves liable to a penalty? No.

161. I presume that with regard to all sewerage works, one great feature is to prevent the gases from going into the houses;—I presume proper provision is made for that? Proper provision should be made for ventilation.

162. I presume that is done? Inspection and ventilation are provided for, but there will have to be a little addition to the Act, empowering the sewerage authorities to take ventilating pipes up the houses before it is perfect. They have that power in England, and it is used with great success.

163. To prevent gas from going into the houses? Yes.

164. Unless the air-pipes are there, the ordinary syphon, owing to the force of the wind, might allow the gas to go into the houses? Sometimes.

165. In all schemes of this kind, should proper provision be made for the escape of gas? Yes.

166. Otherwise the real object of a sewerage scheme would be defeated, and it would be more unhealthy than ever? Yes. The pipes would convey the gas into the houses, which would be very objectionable.

167. One most important feature of the scheme would be to prevent the gas from going into the houses? Yes.

168. In the case of this work I presume provision has been made to carry that out? As far as possible; but it is impossible to provide, in a scheme of this sort, for details. You could not expect to provide for all water-closets. Ventilation would have to be carefully attended to by the people who are adopting the work.

169. Would you recommend that power should be given to allow pipes to be taken up the houses? Yes. There is an Act in draft now for that purpose.

170. A Bill will be brought in to compel householders to allow you to take your pipes up the houses? Yes; they have such a provision in Adelaide now, and it is a very great success.

171. What provision is made in our present sewerage system? There was no provision made in the old system of city sewerage, except street ventilators, the gullies, and so forth.

172. Are they not very objectionable? Yes; we intend that the openings we are making now in the new sewers shall be downcast shafts, while the sewer gas will go up the high ventilators.

173. Even with the sewers you have down now, do you not think some provision should be made at once to get rid of this nuisance? It has not become a downright nuisance yet, on account of the connections not being sufficiently completed; but when the whole thing is working, and the sewage conveyed away to the outlet, without giving it time to decompose, the formation of sewage gas is decreased and almost prevented entirely. Sewage is not offensive, unless it is a day or so old.

174. The great point is to keep it going and not allow it to accumulate? Yes; to get it away fresh.

175. Will provision be made for flushing the sewers? Yes; arrangements are made for flushing. The man-holes and lamp-holes are arranged alternately, so that when a man goes down a lamp is also placed in the lamp-hole, and he can see if there is any obstruction. All these are used for ventilation.

176. Have you gone into a calculation with regard to the size of the sewers, and have you satisfied yourself that they are of sufficient capacity? Yes; they are of ample capacity.

177. Do you think that the work will not cost more than £22,000? Yes; the quantities have been carefully taken out, and the prices graduated on the same scale as the prices paid in Sydney.

178. You have mentioned a difficulty as to the point where the sewage will empty;—the Manly Council proposed one place and you proposed another, and they have fallen in with your proposal? Yes.

179. Even where you propose to empty it, is there not a danger of its being brought back? I think not.

180. Is it an alternative proposal to take the sewage further away towards the North Head? Yes; we do not propose to go on with that at present.

181. *Mr. Campbell.*] Do you think it is not necessary to take the sewage along the longer line shown on the plan? It will be necessary in a few years, but not at present.

182. After the population increases to the capacity of those pipes? The population cannot increase beyond the capacity of those pipes.

183. When the population comes up to the capacity of those pipes, do you think it will be necessary to extend it; but in the meantime do you think the present proposal will be sufficient without being offensive to the neighbourhood? Yes.

184. *Mr. Suttor.*] Do you know whether Liernur's system was ever carried out in the Colonies? No; nor in England. I have only known of its being carried out at Amsterdam, and one or two places in Germany.
185. Was it not at one time tried in Melbourne? I do not think so.
186. *Chairman.*] I think there is evidence of its having been tried in Melbourne eight or ten years ago in the Benevolent Institution, but it was given up at once? I do not recollect that; but it might have been the case.

G. H. Stayton,
Esq.
4 Oct., 1888.

George H. Stayton, Esq., M.I.C.E., Sewerage Branch, Roads and Bridges Department, sworn and examined:—

187. *Chairman.*] Have you had to do with the Manly sewerage scheme? Yes.
188. Has it been under your supervision from the first? Yes.
189. How long ago is it since it was commenced? About August or September, 1886.
190. I presume you have had a great deal to do with sewerage works in your time? Yes.
191. Is that a special part of your profession to which you have given greater attention than to any other? Yes; I have been engaged in sewerage and water works almost daily since 1864.
192. How long have you been in this Colony? Three years.
193. Where were you engaged in these works before? In various parts of England, and for the last ten years in London.
194. In connection with town sewerage? Yes, together with water supply, and other public works.
195. Is it your conviction that this is the best plan that could be adopted at Manly for the purpose of draining the place? It is.
196. Have you formed any estimate of the probable cost yourself? Yes. The estimate is set out in the report.
197. Is that your estimate? Yes.
198. Do you think that is about the cost at which the work can be constructed? Yes.
199. Are you impressed with the fact that the project will be a satisfactory one? I have every reason to believe so.
200. A considerable quantity of sewage at Manly is emptied into the bay in Manly Cove? Yes. I produce a plan showing the existing sewers. There are two outfalls on the ocean side, and there is one outfall on the Manly Cove side.
201. They have sewers at the present time emptying into the ocean? Yes; and they do not give satisfaction.
202. They do not fall into your scheme? The greater part of those sewers will be utilised. They will be intercepted. But in other places where they cannot be intercepted, they will be used for removing storm-water from the streets. That is all shown on the plan.
203. *Mr. Garrard.*] What were the last sewerage works you were engaged upon in the old country? Sewerage works in London. I constructed a great many miles of sewers in London. I was engineer for the borough of Chelsea for ten years. I was previously engaged at Coventry, Portsmouth, the Isle of Wight, and several other places.
204. What is your reason for keeping the present system of pipes only for storm-water;—is it not usual to use storm water for flushing the ordinary sewers? It would be impossible to provide sewers of sufficient dimensions to carry off the whole of the storm-water, except at a very large outlay.
205. In your report do you recommend that in the low-lying portions—Manly Vale and Addiscombe—building should not be allowed to a greater extent than four buildings to the acre? That is in Mr. Bennett's minute accompanying the report.
206. To deal with the sewage for those low-lying places would it be necessary to pump if the place were built upon? Yes, if it were built upon; but the greater part of it is of too swampy a nature to permit of any amount of building there.
207. Do you think the fall is sufficient to allow of the transit of sewage matter;—is not the fall very slight? Yes; but it is sufficient to ensure a self-cleansing velocity.
208. Do you intend to keep the outfall on the main beach for storm-water? One for storm-water.
209. And also the inner one? Yes.
210. Do you know if the outlets on the ocean side are continually silting up? The outlets do not silt up.
211. The water going out keeps the mouth clear? Yes; the mouth is always clear.
212. Will the outlet which you propose at Cabbage-tree Bay be some distance out from the shore? Yes; it will be more than 100 feet from low-water mark.
213. How much below the surface of the water? 8 or 10 feet.
214. Owing to its being so much submerged will there not always be a lot of foul matter remaining in the mouth? None whatever. This outfall has a considerable inclination, so that the head of sewage would force it out.
215. Would that be the case in hot summer weather? Yes; there will always be sufficient water.
216. Do you purpose flushing the sewers in very dry weather? As you will see by the report, it is contemplated, if found necessary, to establish a flushing system.
217. There are no water works or water scheme at Manly at present? Yes; there is a water scheme, but it is only a scheme. It has been approved by the Council, and they are waiting for the sanction of the Government, I believe, before proceeding with it.
218. Will it be brought by gravitation? No; it will have to be pumped.
219. Where is the catchment area? Some 2 or 3 miles from Manly. They have a very large catchment area, and they propose to pump the water to the heights at the back of the town.
220. Will the height of the water, if pumped, give sufficient force for your purpose? Ample.
221. What is the height? Very nearly 200 feet.
222. That will command every point from which your sewers take in? Yes; and every house, too.
223. *Mr. Sydney Smith.*] Have you been at Manly frequently? Yes; a great many times.
224. Have you made inquiry into the present system of sewerage? Yes, I have inspected all of it. We had a large number of trial shafts excavated in order to ascertain what the present condition is. They have three systems there, all of which drain into the sea; and those sewers, as explained in the report, are very defective in places, and in consequence of their not being properly adjusted we found several inches of black silt in some of those pipes. Therefore, these sewers would have to be reconstructed, for which provision is made in the scheme; the good ones to be grafted on to the new system, and the others, which are not required, to be turned into storm-water drains.

G. H. Stayton,
Esq.
4 Oct., 1888.

G. H. Stayton
Esq.
4 Oct., 1888.

225. Have they made no provision for escapes and ventilation? There is no provision at all for ventilation at present. The existing sewers are very foul. I do not think I ever smelt worse sewer gas than I experienced at one of those openings.
226. Did they make no provision for flushing them out? The Council have made provision for flushing. They erected a couple of tanks near the pier, which are filled with salt water, and whenever they think it necessary, they allow the whole of this water to go through the sewers. It runs through in four or five minutes and carries everything before it. It was done on one occasion when I was there to enable me to see the result. It only took about two and a half minutes for the sewage to travel right down to the coast, and when it was washed out to the ocean it was very black and offensive.
227. Have they no provision at present to prevent foul gas from going into the houses? No provision whatever.
228. No traps or pipes? No proper provision, I should say.
229. I presume that under your scheme you propose to make provision for preventing gas from going into the houses, and also to have proper outlets at different parts of the sewers? Yes. In fact it is explained in the report that such regulations will have to be made, and that the interceptors will be provided with ventilation pipes.
230. To run up alongside the houses? Yes.
231. That provision of course is not compulsory now, and an Act of Parliament will be necessary to enable you to do that? I believe that is the case.
232. Have they the dry earth system at Manly? Yes; it is nearly all that system at present.
233. Does the Council pay for emptying the pans? I do not know; but the Council provides the carts.
234. Do you know the charge they make on each household? No.
235. You are not aware at the present time what is the cost of removal? No. I expect it is the same as in most of the suburbs—5d. or 6d. per pan per week.
236. Then in addition to that charge there is also another charge in connection with the cleaning of the gutters, which of course will be saved if your scheme is adopted? Yes, there will be no filth in the gutters then.
237. In addition to saving the cost of emptying the pans they will also save the expense in connection with the scavenging to a large extent? Not so much here as in other suburbs, because they have a system of sewers already. All the slop water, wherever there are sewers, goes into those sewers. But in other streets your observation would apply; that is, where there are no sewers.
238. Are there many such streets? Yes, a great many.
239. Do you think that half the streets have been provided with the necessary pipes? Half the well-populated streets have been.
240. Do you know the number of houses in Manly at present? At the time this report was made the Municipal Council stated that there were 500 houses, but those figures were given two years ago. In all probability there are 600 and upwards at the present time.
241. *Mr. Garrard.*] Do you know if any of those houses were connected with the sewers at that time? I had a complete list—103 houses were connected at that time.
242. How many of the balance of the 500 got rid of night-soil by means of the Corporation carts? The whole of the houses, I think.
243. Is it buried on their own premises? I do not know.
244. *Mr. Sydney Smith.*] Do I understand that the Council will not allow any of the householders to empty the night-soil into the pipes? No.
245. Is it all disposed of either by the dry earth system or by means of cess-pits? The dry-earth system is in operation at Manly.
246. Have you examined any of the places there and found them offensive and not properly deodorised? I do not think there was any attempt at deodorisation. I went into the back premises of many houses and I do not think anything was done.
247. Was there anything offensive at all? Nothing to call for special remark.
248. They were fairly clean? Yes; the principal objection to the sanitary arrangements at Manly is the defective sewers which I have mentioned. They are named in Schedule D of my report.
249. What is the principal cause of their becoming so offensive? Simply because the inclinations are not properly adjusted. It is not a question of workmanship, but of levels,—they were laid without due regard to the quantity of sewage they had to take. I do not say that this is absolutely correct, but by way of illustration I might state that one part of the sewer might have a discharging capacity of 200 feet per minute; the next part, owing to its being laid at a sharper fall, would, perhaps, discharge 500 feet per minute; the next part, being flat, would discharge, perhaps, 100 feet per minute. The consequence is, that when sewage is being discharged through these pipes it is checked;—it goes rapidly down one part, and then comes to a flat part, where the discharge is retarded. Precipitation takes place, and in course of time a considerable quantity of black silt accumulates.
250. No provision having been made for ventilation, is it very offensive? Yes.
251. Does the scheme you propose remedy these evils? Yes.
252. Have you calculated the cost? Yes; every item has been taken out very carefully at the existing contract rates.
253. Are you satisfied that it will not exceed the cost now estimated? Yes, but I might be allowed to add that the terms for repayment have a very important bearing on the execution of sanitary works such as that.
254. Have you had large experience of sanitary matters in other parts of the world? Yes.
255. What is the average cost in most places? It varies very considerably. I think the Portsmouth sewerage system cost nearly £3 per head for the whole population; and it has varied in England from £1 per head, in places where sewerage works could be carried out very economically up to £4 per head. At Reading the works were costly because they adopted a double system of sewers. The part where the outfall was fixed was close to the Thames, where it was very liable to floods, and they had to exclude as much rain-water as possible from the sewers.
256. What would be the cost according to the ratable value of the property in the same way as you calculate the cost here—I understand you calculate the cost at a rate of 5d. in the £, which would be sufficient to pay for the execution and maintenance of the works and interest on the outlay? The drainage rates in England vary from 6d. in the £, in some towns to as much as 3s. I think in others. At Manly a drainage

drainage rate of 5d. in the £ would be sufficient to pay for the works under the present Act. That is repay- G. H. Stayton, ment in twenty-eight years. In England it was found that that time was too short, and insufficient encouragement was given to the sanitary authorities throughout the country to improve their places, because it was considered a hardship on the present generation. Under the comprehensive Local Government Act, which has just been passed in England, constituting true local self-government, the period for repayment has been put at sixty years.

4 Oct., 1888.

257. What rate are they called upon to pay? The rate varies very considerably; I can give no additional answer that would be of any value.

258. You could not make any comparison between the rates there and here? I have a great many figures showing the drainage rates paid in various towns, but there is considerable variation. It all depends on local conditions, whether there is pumping or chemical treatment, or whether the outfall is on the sea-coast where they can have a constant gravitating fall, as in the case of Manly. In such cases it is one of the cheapest methods that can be adopted.

259. Will you append those figures to your evidence? Yes, but I cannot recall the name of any town in England where they have been able to carry out a complete system of sewerage for a rate so low as 4d. or 5d. in the £.

260. So that the Manly people will not be called upon to pay a high price as compared with what is charged at home? No.

261. *Mr. Suttor.*] Have you had any experience of the English system of desiccating sewage;—we have been told that in Birmingham there is a system of that kind? Birmingham has a water carriage sewerage system; but in a certain part of the Borough they collect night-soil and desiccate it. But they have a very extensive sewerage system and sewage outfall works at Birmingham. The night-soil in question is desiccated by the "Farmer" patent machines, but I do not know the cost of treatment.

262. Have you any knowledge of that system? No; it has been adopted within the last eighteen months or two years.

263. *Mr. Garrard.*] Have you had any experience of Liernur's system? I have had no practical experience, but I am acquainted with the principle of it.

264. Have you seen it at work? No.

265. From what you know of that and other systems, do you believe that the water-borne sewage system is the cheapest and best? Undoubtedly; I believe it is so.

266. What are your principal objections to the Liernur system? The principal objections are—firstly, that the excreta is kept too long upon the premises, because it is removed once a day only. Secondly—it involves a duplicate system of sewers, that is, one system for excreta and slop waters, and another for liquid refuse and rainfall. Thirdly—it is very expensive; at least double the expense of a water-carriage system.

267. Do you know in how many places it is in operation? I have not a list of the towns here, but I think there are six or seven in Europe. Amsterdam has the largest installation of the system.

268. Amsterdam is situated on a very low lying site? Yes; it is almost as flat as this table, and it is intersected by canals.

269. Which would make it very undesirable to have sewage going into the canals? Yes; they were obliged to adopt this system.

270. *Mr. Suttor.*] Do you know that the desiccating system carried out in Birmingham is now being carried out at the Sydney Meat Preserving Works? Yes; I saw what they are doing some six months ago.

271. Can you give us any idea whether or not it is desirable to carry out that system for sewerage? Compared with water carriage system, such as is proposed here, it would be much more expensive.

272. *Mr. Sydney Smith.*] Are you aware that they are attempting to carry out a system similar to that referred to by Mr. Suttor at Parramatta? I only know about it from what I have seen in the newspapers; that the Council are contemplating its adoption. At the same time they are going to have a sewerage system.

273. *Chairman.*] The desiccation system gives facilities for the collection of manure where it is required? Yes.

FRIDAY, 5 OCTOBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.

The Hon. WILLIAM HENRY SUTTOR.

The Hon. FREDERICK THOMAS HUMPHERY.

HENRY COPELAND, Esq.

ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

The Committee further considered the proposed Drainage Works at Manly.

James George Griffin, Esq., Mayor of Manly, sworn and examined:—

274. *Chairman.*] Are you the present Mayor of Manly? Yes. I have been Mayor during the present year.

J. G. Griffin,
Esq.

5 Oct., 1888.

275. Have you been a resident of Manly for some years? Yes.

276. And have you taken an interest in its welfare? Yes.

277. Have you been long connected with the Municipality? Yes; for the last three years.

278. Do you understand the design of the proposed Manly sewerage works? Yes.

279. I think you are an engineer yourself? Yes.

280. Have you given any attention to this work from a professional point of view? I have given it some attention, but I have not gone into the details.

281. Would you feel disposed to give an opinion professionally? So far as I have been able to judge from a professional point of view it is a most efficient scheme.

282. Are not the existing drainage works very imperfect? They would be imperfect for the drainage of the town under this method; but they are not imperfect for the purposes for which they were constructed. They were constructed simply to carry off storm-water and slops, and not for excreta. As a matter of fact they do their work very well; but we would not permit excreta to be passed through them.

- J. G. Griffin, Esq.
5 Oct., 1888.
283. It was never intended that excreta should be conveyed into them at all? No; that was never intended. They are only for storm-water and slops.
284. Under what system has the excreta been dealt with? The earth-closet system.
285. Do you find that that answers satisfactorily? Yes. I think it has answered satisfactorily up to the present.
286. For what purposes do you use the material from the earth-closets? We pay a man £48 a year for the use of 10 or 12 acres of land 3 miles out of the town, and he digs the pits into which the nightcarts empty the material obtained from the pans.
287. It is not used for reproductive purposes as manure? No; it was used for manure, but the health officer objected (I think properly) to its being used inside the town. I would have objected if I had been Mayor at the time to its being used in the town.
288. Is it because you think that if it were used in that way it would be a nuisance? I am sure it would be. In point of fact that small part of the town which is very sandy and planted with trees, and the reserves and on the edges of the roads, were used at times as places in which to deposit night-soil. Of course it had a very excellent effect on the trees.
289. Was it used on the surface or dug in? Pits were dug 10 or 12 feet deep. But inasmuch as a great deal of water is pumped up by artesian wells from a depth of 20 to 30 feet all over this flat, and used for household and other purposes, I was sure that the continual use of night-soil in that sandy flat must ultimately become dangerous to health.
290. Is Manly generally supplied by that means with water? Yes; unfortunately, that and water caught on roofs is the only supply we have.
291. Are the wells on the artesian principle? No; the water is pumped up. I do not think there are any over 24 feet deep. The water is at a greater depth. I have put down such a well for the purposes of the recreation ground, and we got water at 24 feet.
292. Your main objection to the deposit of night-soil would be owing to the possibility of the water supply being vitiated by the deposit? Exactly; and besides that I think it would be injurious to health from every other point of view. Being so close to the surface the whole of the sandy portion of the town would become contaminated, and it would probably breed fevers.
293. Do you think that would be the case if it were used for the growth of vegetation or for any kind of garden purposes? That could not be done in town, because the gardens are small. It certainly could not be done in the most thickly populated part. All the other parts are very rocky, and it would be impossible to use it in that way.
294. Would your objection exist to the use of it outside the town—for instance, by professional gardeners? No; not so long as it was used a long way off, in the same way as it is used at Brighton, near Melbourne.
295. Do you know that there are two plans proposed here, or rather two alternative designs. There is one in which the sewage is proposed to be deposited in Little Cabbage-tree Bay, and another in which it is proposed that the sewage should be deposited at Blue Nose Point? I think I may say that the proposed outlet in Cabbage-tree Bay, as shown on this plan, has been abandoned. I pointed out on seeing this plan that the scour was greater at another point, and that there would be some danger if the material was allowed to flow out at the point shown on this plan. I suggested to Mr. Stayton and to the Department that the outlet should be made at the point of the rocks north of Fairy Bower. Unfortunately we have melancholy evidence of the fact that the scour is great there, for several bathers have been washed out straight to sea from this point and drowned. Mr. Stayton and Mr. Bennett agreed that the modification we proposed would be worth considering, and, instead of making the outlet as shown on the plan, they have proposed to put in a tunnel so as to carry the sewage out at the point I have shown the Committee on this plan. This will effect a saving of £2,000 in the cost of the work. If the outlet were made as originally proposed, the work would cost £22,000. If it is made where we suggest, it will cost £20,000. I had hoped that they would carry the sewer along the rocks, and so save the expense of tunnelling, but Mr. Stayton has shown me that it would be quite as expensive; that it would interfere largely with a favourite resort; and might be liable to damage owing to heavy breezes forcing the water over the outlet. Consequently, on the whole, I think it would be as well to tunnel.
296. With reference to the gross amount proposed to be raised for the purpose of carrying out this work, I suppose you understand that, if the debt is allowed to extend over sixty years, it comes much lighter on the present community as compared with a term of twenty-eight years? Yes.
297. What is your opinion about that? Undoubtedly, I am in favour of extending the term. I have a very strong feeling about that. Everybody has.
298. It would make the cost lighter on the present community? Exactly.
299. Those coming afterwards will derive equal benefit from the work? Yes; and they might very justly be asked to pay a portion of the cost.
300. Do you think you are speaking for the inhabitants in expressing that opinion? I am sure of it. Every member of the Council and every person in the town—we have discussed the matter a great deal—to whom I have spoken are strongly of opinion that the time should be extended to sixty years. The population at present is about 4,000.
301. *Mr. Street.*] Have you studied the question of the fall with a view to arriving at a conclusion as to whether there will be sufficient to carry off the drainage? Yes; I am sure of that.
302. What is your idea about the outlet at Cabbage-tree Bay? Do you think there will be much deposit from the sewer carried up on the beach, where it will be offensive? That, I think, will be abandoned, as I have already explained.
303. Do you think there is any danger of the sewage being carried back if the outlet is placed where you suggest? No. I think the Department is with us in the opinion that the scour comes around Cabbage-tree Bay and goes out to sea, so that the deposit will be all carried out.
304. Have the Department agreed to that diversion? Yes; that was a suggestion of ours, and they have agreed to alter it in that way, and by that means save £2,000. Ultimately the outlet must be taken to Blue Nose Point; because, as population increases, a larger outlet will be required. The cost at present of the removal of night-soil is 6d. per pan per week, and as many of the houses have two, it is fair to assume that the existing number of houses, 600 or 700, at 26s. a year, pay between £700 and £800 a year. That would be saved if this sewerage system were adopted.
305. *Mr. Sydney Smith.*] Have you the dry earth system at present all over the borough? Yes.

306. The charge is 6d. per pan, and of course if this scheme were carried out the Council would be saved the expense now involved in emptying those pans? Yes; but I may tell you that the Council does not spend that money. We contract with a man at so much per pan, and the ratepayers pay that to the contractor.

307. Still the ratepayers pay it? Yes.

308. What is done with the night-soil at present? It is taken 3 miles out of town, and we pay a man for digging it in.

309. In addition to the saving effected by the removal of the night-soil, do you not think you will effect a saving in the expenditure on scavengers, as you will not require so many when all the connections are made with the various houses? There is very little refuse in the gutters at Manly. We send the ordinary day-labourers round to clean them out. It is not offensive matter which has to be dealt with, but mostly the growth of grass and weeds. There is no accumulation of offensive matter permitted.

310. How many houses have you now connected with the system of sewerage? All those within a reasonable distance of it. We do not allow anybody to empty slops into the streets. If they do we summon them. They must do away with the slops in some way themselves, unless there is a sewer in the neighbourhood, and then they generally connect with the sewer.

311. How do they get rid of the slops? Sometimes they have great holes dug in the ground; otherwise they water their gardens with them. Sometimes they send the slops away.

312. Is it not dangerous to health to allow holes to be sunk in the yards? We will not allow them to make it dangerous. They must use disinfectants and keep their premises clean, or they must pay a man to take them away. It is a very disagreeable matter to have to summons people for allowing slops to go into the roadway where there are no sewers; but we have to do it. Only the other day I stopped two or three people from doing so by threatening to summons them.

313. Do you not have regular scavengers to attend to that? No, the labourers are sent round occasionally.

314. When all the houses are connected with the sewers will not this trouble be avoided? Yes; it will be an advantage, no doubt.

315. What is your present population? There are 600 or 700 houses, and a population of over 4,000, as far as we can judge. It is a varying population.

316. *Chairman.*] It is a tourist's resort? There is a large residential population, but in summer a great many people come down.

317. The tourist element would prevent you from making an accurate estimate of the general population? Yes.

318. *Mr. Sydney Smith.*] There are about 700 houses? Yes; between 600 and 700. There were 500 about two years ago, and the number has increased.

319. How many pans will there be? I suppose some houses have two? Yes; and some will have more. There are one or two odd pits. I think there will be a total of 700 pans, paying each £1 6s. per annum.

320. So that the cost to the ratepayers of this sewerage scheme, when it is carried out, will be very little more than they are paying at present for closet pans? 700 pans at £1 6s. would give an annual cost of £910.

321. What will be the cost to the ratepayers of the sewerage scheme? £1,200 a year; so that there will be a difference of only £300 a year.

322. At present you have only 700 houses, but this system of sewerage is supposed to be capable of taking the night-soil from 3,000 houses? I think, when it is finished, it will accommodate any population.

323. Then there will be a very great saving to the ratepayers? Yes.

324. Although there may be a small loss at present, as population increases will there be a very great saving to the ratepayers in carrying out the scheme now proposed? Yes.

325. There is no objection by the Council to the scheme? No; they are strongly in favour of it.

326. Has there been any counter-petition? No.

327. *Mr. Suttor.*] Under the Act, as at present, the interest and sinking fund on the outlay would be wiped of in twenty-eight years? Yes; about twenty-eight years.

328. Will the householders be quite prepared to carry out the arrangement for repayment in twenty-eight years if an extension to sixty years is not conceded? I think we would accept the scheme if we had to pay off the money in twenty-eight years, so far as the bulk of the people are concerned.

329. Is it your opinion that the period should be extended to sixty years? No doubt that would be far better in every way. It would be very hard to repay the money in twenty-eight years.

330. But that is the law, and would you be prepared to carry it out? Yes.

331. Of course this Committee cannot guarantee that the term will be extended to sixty years? I hope that the Committee will recommend an extension of the term to sixty years. We think that those who follow us should pay for what benefits them.

332. *Mr. Copeland.*] Do you know what is the term for the repayment of the outlay on the city sewerage? No.

333. Of course it would be very much easier for the municipality if the term could be extended? Yes; very much easier.

334. With reference to your statement about taking the outlet to the northern point of Fairy Cove, do you feel quite sure that the sewage will not come back on to the beach? I feel sure of that. As I have already said we have had melancholy evidence of the force of the current there, because several bathers have been carried out and drowned. We have also had evidence from fishermen who have frequented the place for many years, and they state that the scour is from that point outwards. I have taken great care, and I think the engineers have taken great care, to ascertain that fact.

335. Is not Fairy Bower a reserve? No; it is the property of Mr. J. J. Jones.

336. What amount of land will it be necessary to resume for this work? None. I think the tunnel will go under his land.

337. Will there not be compensation for that? I do not think so. But if so it would be very slight. It is a very small tunnel.

338. Is that the only land which will have to be resumed? That is all I know of at present. I think all the remainder of the sewer goes through streets. I do not know that the land where the tunnel goes will have to be resumed, for the tunnel is so deep as not to interfere with the surface in any way.

339. Through what land does the longer line of sewer go, as shown on this plan? Through the Catholic reserve, the Quarantine ground, and also through Mr. Jones' property.

J. A. Scarr,
Esq.
5 Oct., 1888.

407. With reference to the period of time over which the repayment of the cost of the work should extend, do you think the population wish it to be sixty years or twenty-eight years? I should fancy they would prefer the longer period. I should like to see the longer period adopted, for the reason that it would come easier to the ratepayers.

408. And the work would be a permanent work from which the future residents of Manly would benefit, and therefore they should bear their proportion of the cost? Yes.

409. Do you know anything about the currents on the beach there? I have observed the water, and have come to a conclusion in my own mind with respect to it. There is a proposal to cut a tunnel into Cabbage-tree Bay. I think that would be unwise, because the water there is comparatively still, but the water at the point is always unsettled, and there is a strong current there. I think that would be far the best. The more you go into Cabbage-tree Bay, the more likelihood is there of still water, and the sewage matter would be thrown on the beach.

410. There have been several cases of drowning in the neighbourhood of that point, have there not? Yes; I think somewhere to the left of the point, and I think the circumstance indicates a very strong current.

411. The bodies have always been taken away? Yes, I think so; I know that in some cases they have not been recovered. I fancy the current comes round this point into Cabbage-tree Bay and scours it out in that direction. I see a mark in pencil on the plan; I think that would be a good outlet.

412. *Mr. Copeland.*] Do you think it would be a very desirable scheme to extend the repayment of the cost of this work over sixty years; that seems to be the general opinion of the Manly people? Yes; that the payment should be extended over a number of years.

413. You think it would be a justifiable measure of procedure to settle this responsibility on future generations? I think so, because they would derive as much advantage as the present inhabitants. I may say with reference to the repayment of the money that we are already paying a considerable sum for emptying earth pans, and that amount would go a long way towards paying the sewerage rate, and the people would have the work done in a far better way.

414. You do not think the ratepayers would object to a rate of 5d. or 6d. in the £? I think not. From conversations I have had I think they would be willing to pay anything in reason. I have never heard anyone object to the proposal. I think the work is not only desirable in the interests of the residents of Manly, but also in the interests of the whole country, because people from all parts of the country are continually coming there, and one of the annoyances they have to put up with is that arising from the present system of earth closets and the want of drainage for slop water.

415. Would it not strike you as a very convenient method of building up an extensive national debt if we were to leave over all payments of this kind to future generations? It is only what has been done in other matters. We have handed over the debt on the Railways, and I doubt whether that will be paid off in sixty years.

416. Do you think the Council will be satisfied with the proposal to pay it off in twenty-eight years? Well, I think they would. When you speak of sixty years I think the Council would prefer that time, but I think in twenty-eight years we should be able to pay it off. The place is increasing.

417. I suppose property will go up in value in consideration of this work being carried out? Not a doubt of it.

418. *Mr. Humphery.*] The cost of discharging the sewage at Cabbage-tree Bay is estimated at £22,000, and extending the pipes to the point at £34,000;—as a member of the Council do you think that the ratepayers would prefer at present to limit the expenditure to the £22,000? I think so.

419. Should you think that would be sufficient for some years to come? I think so.

420. Are you strongly of opinion that the sewage should be delivered at a point between the ocean beach and Cabbage-tree Point—at what is called the Fairy Bower Point? At the point at the south end of the ocean beach.

421. *Mr. Copeland.*] Is there ever any northerly current there? I could not say; but there is an under-current. I have heard people say that they have thrown things into the water, and have watched them go clean out.

422. *Mr. Kethel.*] Have you walked round the little bay in the corner of Cabbage-tree Bay up to the southern extremity? Yes.

423. Have you noticed that there is a greater deposit of drift-wood, odds-and-ends, left by the sea there than in any other part? I think there is.

424. And that indicates that anything flowing in there would be more likely to be deposited in the extreme southern bay than anywhere else? Yes; I should think so.

425. Have you ever noticed that in the vicinity of rocks there is always a greater scour than in the vicinity of sand? I think that is very likely, but I cannot say I have noticed it, except at this particular place.

426. But you think there is some scour at Fairy Bower Point—that the south-east scour is greater at that point than at any other in the vicinity? I think so.

427. You are not prepared to say from your own experience that there is a greater scour in the vicinity of rocks than of sand? I cannot say generally, but I have observed it at this point.

428. If such is the case is it your opinion that it would be more desirable to make the terminus of the outfall on the projections of the rocky point than in the secluded waters of the bay? Quite so.

429. *Mr. Street.*] The present system of sewerage carried out at Manly only provides for slop and storm waters? That is all.

430. In the proposed system excreta will be added? Yes.

431. And do you think there is a sufficient fall shown on this plan to keep the pipes scoured and clear? I am not able to give an opinion on matters of that sort. I know the land is flat, and that the fall cannot be very great, but I think the engineer must be satisfied on that point, and we are trying to get a water supply, with a view of flushing these sewers, as well as for domestic supply.

432. *Mr. Sydney Smith.*] You have to flush your present drains, I believe, with water from some tank? Yes; the drains are flushed with salt water from a tank.

433. In your present scheme is there any provision made to prevent gases getting into the houses? There are traps in some parts of the streets.

434. What kind of traps are they—ordinary syphons? I cannot tell you. There is some provision made of traps which are kept filled with water, but there are constant complaints about them. The breeze from the ocean seems to drive the gas up through the pipe, and it forces itself through the traps.

435. Would that be obviated in a proper system? Yes. The system we have now is a piecemeal arrangement. I should be highly delighted, as far as I am concerned, to have this proposed system, if only to get rid of our present arrangement.
436. Do you find the smell very offensive from the present drains? Gas escapes, but I cannot say that I have found it very serious; I do not reside near it. I have been down on the beach, when I have heard that deposits have been thrown back on the beach, but I have not seen them. I think if the beach remains clean, with the sewers as they are now, the outfall at the point indicated will carry everything quite away.
437. At the present it costs each ratepayer 6d. per pan, and of course that expenditure would not be incurred if this new system were adopted? I think the saving of that expense, speaking roughly, would very nearly pay the sewerage rate.
438. And in addition, the new system would connect all the houses in the borough with the sewers, and so get rid of the offence arising from slop-water? With reference to slop-water, when we speak of that being carried away by the present drainage, it is only a small proportion of it that is carried away. Most of us have to run it away into a pit in the yard.
439. Do you not think that it is very unhealthy? Extremely so. Of course that depends on the circumstances of each place. I know, for instance, a place where there is an underground water-tank within a very few feet of a silt pit, made to receive house-water, and such a thing may breed typhoid fever, and spread it over the whole locality.
440. How many houses are connected with your present system? I cannot tell you.
441. There is a very large proportion unconnected, is there not? Yes.
442. But if this system of sewerage were adopted the ratepayers would almost save sufficient of the 6d. per pan to cover the cost of the new scheme? It would go a long way.
443. And in addition to the houses being connected the slops would be emptied into the sewer, and all the objections of your present system would be obviated? Yes.
444. *Chairman.*] Do you, in the treatment of the cesspits at Manly, adopt any deodorizing method? I cannot say. I do not myself; I do not know whether other people do.
445. Chloride of lime, carbolic acid, or anything else of that kind? I daresay such things are used, but I myself have not used them. I have planted a tree or two round the pit to absorb the moisture.
446. The soil is very porous there is it not? Yes.

J. A. Scarr,
Esq.
5 Oct., 1888.

George Henry Stayton, Esq., M.I.C.E., Sewerage Branch, Roads and Bridges Department, sworn and further examined:—

447. *Chairman.*] I wish to ask you some questions in reference to the evidence you gave last night, and in regard to a point in some evidence which has been given by Mr. Griffin, Mayor of Manly. In examining him a short time ago he stated that you, as a professional man engaged in the carrying out of this work, had concurred in an alteration in the tunnel by which the sewage at Manly was to be discharged;—are you aware of any such arrangement? I am aware of that, and have a report upon it here. This report was made on 4th July, at the request of the Manly Municipal Council, and, although the question has never been definitely decided by Mr. Bennett or myself, it has, to a certain extent, been approved; but it cannot be stated definitely whether the proposal could be carried out without some expense being incurred to ascertain the nature of the bottom. It was proposed to carry out this temporary outlet as shown on the line upon the tracing here (*tracing produced*). This tracing was sent to the Municipal Council. It shows a tunnel under the Fairy Bower into the northern part of Little Cabbage-tree Bay.
448. You think that would be equally efficient with the proposal submitted on the plan? So far as the point of discharge is concerned I think it is preferable, but I am not absolutely certain that it is practicable. The nature of the foundations may be such that it may be possible to fix iron screw piles at that point, but in order to determine that borings might have to be made.
449. From your knowledge of the soil and of the substrata there, have you any doubt as to its being practicable to carry out the proposal there? I think there is *prima facie* evidence in favour of carrying out the suggestion.
450. That being so, you see no reason for not complying with the recommendation of the Manly Council? If it is found practicable there is no objection, and what is more, the financial question has an advantage, because the estimate is then reduced to £20,250.
451. That is £1,750 less than the original estimate? Yes; but it would involve an increase of £1,000 on the entire scheme when that is subsequently carried out.
452. But would it be more expensive in connecting these parts of Manly with the sewer? No; because the fall down Redall-street is towards the proposed tunnel.
453. Would the same reason apply to the whole of the premises along Redall-street and in that direction? To the whole of the premises, or nearly so. That side of Manly falls entirely to Ashburner-street.
454. Are there drains there now? Not at the present time. It is proposed to lay sewers, as shown by the blue lines on the plan. It is not only proposed to construct main sewers, but also several miles of subsidiary sewers, as shown by the blue lines on the plan.
455. How would property be connected? In this way (*indicating on the plan*).
456. Then that would indicate the necessity of a sewer independent of what is represented on the plan at present before the Committee? A small pipe sewer; but that locality is at present bush.
457. Is not that where the Roman Catholic buildings are? They are here (*indicating on the plan*), but they would not have access to the main sewer until it is carried in the direction of the ocean.
458. Is it not proposed to connect them with the sewer to Cabbage-tree Bay? Not by the proposed plan now under consideration.
459. *Mr. Copeland.*] In estimating the present amount of revenue, have you been careful to apply the scheme only to property likely to be benefited? The rateable value is taken on the whole of the houses throughout the municipality.
460. Whether they will be benefited or not? Yes; there are comparatively few houses beyond the present drainage area.
461. Is there much space for the extension of the town in such a position that it would be directly benefited by the drainage system? Some parts of Manly, which are not now built upon at all—in fact considerable areas—could be drained by this system; but the whole of Manly covers 2,000 acres.
462. I suppose it is not customary to levy drainage rates where houses are not connected with the drainage?

G. H. Stayton,
Esq.
5 Oct., 1888.

- G. H. Stayton, Esq.
5 Oct., 1888.
- I do not know what the custom is here, but in England it is customary to levy drainage rates irrespective of the fact whether the houses are immediately connected or not. A sewerage system is considered a benefit to the whole of a borough, and therefore that all ought to contribute.
463. And in cases where the municipality cannot make provision for connecting houses with the drains, those houses which are not connected have to pay their share of the expense? That is so.
464. And yet derive no direct benefit from it? I have known that in scores of cases.
465. Do you know whether it is the custom to charge for water where water is not supplied? No; water is looked upon more as an article of consumption, and I am not aware that any person in the old country is made to pay for water unless he is a consumer of it.
466. Is it not as much a necessity to get rid of the drainage water as it is to get the water that you consume? It is most necessary to get rid of the foul water.
467. Would you consider it fair to charge for taking away water where it is not taken away, any more than it would be fair to charge for bringing water to you when you do not consume it? Yes, for the following reasons: Although an inhabitant may not have his foul water removed by a proper system of drainage, he is nevertheless a resident of the municipality, and it is generally considered a benefit to the whole of the population of a municipality—especially for those parts that are thickly populated—that a scheme should be in operation, although it may not extend to the utmost limits of the municipal boundary. There might be a few houses at one particular spot in the municipality to which at the present time it would cost too much to extend a sewer, but as the municipality generally is made much healthier by the construction of sewers, the hardship is not excessive.
468. Then, in computing the value of the property, you have considered all property, whether directly connected with the sewers or not? I have, and that is a point upon which I particularly wish to give some additional evidence. In the report which was considered by the Committee last night, it states on page 1: "That the annual rateable value of the municipality, which, in 1880 was £16,338, now amounts to £67,452", and on the last page of the report (page 10) it will be noticed that the calculations were based upon those figures—£67,452. To-day I have looked carefully into the figures to see what the present rateable value is, in order to ascertain whether there was any misconception, and I should here state that this annual value of £67,452 was supplied to the Department by the then Mayor of Manly in reply to an official request dated 20th August, 1886. In the Statistical Register for 1887, on page 373, the annual value is returned as £77,769 instead of £67,452; but in the last Statistical Register, which was only issued a few weeks since, I find that in April, 1888, the annual value on which the rates are struck is estimated at £47,959. The reason of the discrepancy is that the value of the unoccupied lands is not calculated in that estimate. Therefore it is necessary, in considering the cost of the works in question, to slightly alter the figures, and taking as a basis the probability that by the time the works are completed the assessed value will have increased to £60,000, a penny rate will produce £250, and if the works are to be repaid in the course of twenty-eight years, it will mean a sixpenny rate instead of a five-penny one, or if repaid in sixty years it will mean a fourpence three farthing rate instead of a fourpenny rate. From that there is to be set off the present charge of emptying the closet-pans. For instance, taking a house rated at £80 a year, the owner would have to pay £2, less 26s., for emptying the closet-pans, which would leave 14s. only per annum extra per house.
469. That is on the twenty-eight years? Yes, and very much less, of course, on the sixty years. Then, on the other hand, if the entire scheme were carried out to Blue Fish Point to cost £34,000, and the payment were extended to sixty years, it would make a sevenpenny rate at the present time. Under these circumstances, a house rated at £80 a year would have to pay £2 6s. 8d. in rates, less the 26s., the cost of emptying the closet-pans, and leaving £1 0s. 8d. extra, which would mean a threepenny rate beyond what is at present paid. So that if a house were rated at £50, it would only mean an extra cost of 3s. per house per annum. With regard to the extended period, I omitted, in the evidence last night, in reference to what is done elsewhere, to state that the larger water and sewerage works that have been constructed in England are to be repaid in even longer periods than those mentioned here; they have increased the term to seventy and seventy-five years.
470. They are regarded as permanent works? Yes.
471. What would be the life of a well-constructed sewer or tunnel? It would certainly last from seventy-five to eighty years, without any considerable repairs. I have been in sewers in London which have been constructed fifty years, without having had any material repair. On the other hand, I have seen sewers badly constructed utterly worn out in thirty years.
472. From the result of your experience, do you come to the conclusion that the climate here has a greater effect upon sewerage works than in England? I have not considered that; there is no data to go upon.
473. But it is a fact that our climate is a much drier one than the English climate? Oh, yes.
474. And I take it that the longevity of the English tunnels is the effect more of the moist atmosphere than would be the case with our comparatively dry atmosphere? I am not prepared to give an opinion upon that, but I am certain of this, that with good workmanship these tunnels ought to last the period I have indicated.
475. From seventy to eighty years? Yes.
476. Have you examined any of the city sewers? I have not.
477. You have not been called upon to examine any of them? I have had nothing whatever to do with the city sewers.
478. Of course you could give no opinion as to the state of their preservation at the present time? No. I know absolutely nothing on that point.
479. *Mr. Copeland.*] I suppose it is customary in other countries to carry the drainage out to the ocean beaches? Wherever it is practicable it is considered the most economical plan, and the results, if the local circumstances are favourable, as in this case, are such that certainly it is the best thing to be done.
480. And as a matter of fact has been done, and is done? I have been engaged in several works where it has been done, and might name numerous places besides.
481. For some time? For some time.
482. So they have had the opportunity of getting experience of the results? Yes; in some towns they have had thirty or forty years experience. I may say I have examined the whole of the coast at Manly, including the Quarantine Reserve, and at Little Cabbage-tree Bay I have spent some hours on several occasions noticing the currents and watching the action of the waves, and I am perfectly satisfied that either

either at that point as proposed or even further along there will not be any nuisance. The scour is very great, and it is a favourable position. G.H. Stayton, Esq.

483. How far do you propose carrying it into the water? I think it is 100 ft. from low water-mark.

484. Would that be by iron piping? Iron piping in the water.

485. *Mr. Humphrey.*] Would it be necessary to carry the pipe 100 ft. beyond the rocky point if you adopted the modified plan agreed to by the municipality? Not so far as that.

486. Would you have to carry it any distance? Some little distance, but not very far beyond the rocks.

487. Then by adopting the modified plan you would save nearly 100 ft. of iron piping? Yes.

488. And also about 30 chains of tunnel? Yes; but we should have to construct another length of tunnel 600 ft. in lieu of that.

489. Would you take it by tunnel to the point or by iron pipes? By tunnel under the eastern end of the Fairy Bower.

490. Are you of opinion that the discharge of the sewage at that point would meet all the requirements of Manly for some years to come? Yes. It depends materially on the rate of increase. If the population increases very rapidly I should think in the course of eight or ten years it would be necessary to consider the question of extending the outfall, but if it only increases moderately and the system is found to work efficiently it may last a few years longer.

491. Then your opinion is that the first part of this scheme carried out to the point in question would be sufficient for ten years? I think so.

492. It would be unnecessary, therefore, at present to consider the extension of the sewer at the additional cost of £10,000 or £12,000? Yes.

493. Will you explain in what manner the extension of the main outfall sewer to Blue Nose Point will afford greater accommodation than the first part of the sewerage scheme? Well, it will afford accommodation to the Roman Catholic College and the Cardinal's palace; and, in the event of the Quarantine Station being abandoned, and a portion of the reserve being laid out as building-land, it would enable a sewer to be carried towards the site of the Quarantine Station for the drainage of a large area.

494. Then it would only be necessary to carry out this extension in the event of the population settling on the Quarantine Ground? Not only that; but in the event of the population extending towards the cemetery. The whole of the area within the green lines on the plan is termed the drainage area, and in the event of the population increasing on the higher ground of Manly, the sewerage requirements will increase. The present proposal will be sufficient for all reasonable requirements, but as the population extends, further provision will become necessary. The capacity of the main sewer will be ample.

495. And it may become a question of eight or ten years whether or not to remove the sewage from Cabbage-tree Bay Point to Blue Nose Point? Yes.

496. *Mr. Kethel.*] In laying pipes, whether from the Point or from the beach in Cabbage-tree Bay, is it not necessary to fasten them down by anchoring them to the ground, as they are subject to the action of the waves? Yes; they must be fixed to piles. At the present time the pipes on the ocean beach are fixed to wooden piles, but in this proposal screw piles would be used if practicable.

497. Is there not a danger of the waves during a storm or gale washing water up the pipes? Not the slightest. The diameter of the pipe is 21 inches, and whatever force would be exerted on so small an area would very soon expend itself in the pipe, and would be immediately checked by the flow of sewage.

498. You are aware that the heavy storm waves we have on this coast would roll in and would come into the mouth of your pipe? I am aware of that, and this line was laid down so as to meet the direction of the waves and offer the least resistance to them.

499. It is your opinion that the precautions you have taken will meet all contingencies arising from storms? Yes.

500. *Mr. Sydney Smith.*] With reference to the information given just now in regard to the actual cost of the ratepayers, I understand that there would be 14s. over and above the actual charge now made for emptying the pans? That would be 14s. on a house assessed at £80 a year.

501. How many houses do you reckon you will be called upon to make provision for at the present time in that calculation? The scheme provides for a prospective population of 18,000, and if you take five persons or six persons to a house that would make eventually 3,000 houses at least. We take the rateable value of the whole district, and have ascertained that a rate of 7d. in the £ will meet the whole expense. The 14s. is simply given as an example of what it will cost a house assessed at £80 a year.

502. But in your scheme you have made provision for 3,000 houses? Yes, the main sewer is designed to take the sewage from 3,000 houses or more.

503. The cost will be less as the houses increase? Yes.

504. At present you have made provision for 3,000 houses, and yet your present estimate is on £60,000; as the number of houses increases the amount chargeable to each ratepayer will proportionately decrease? That is so.

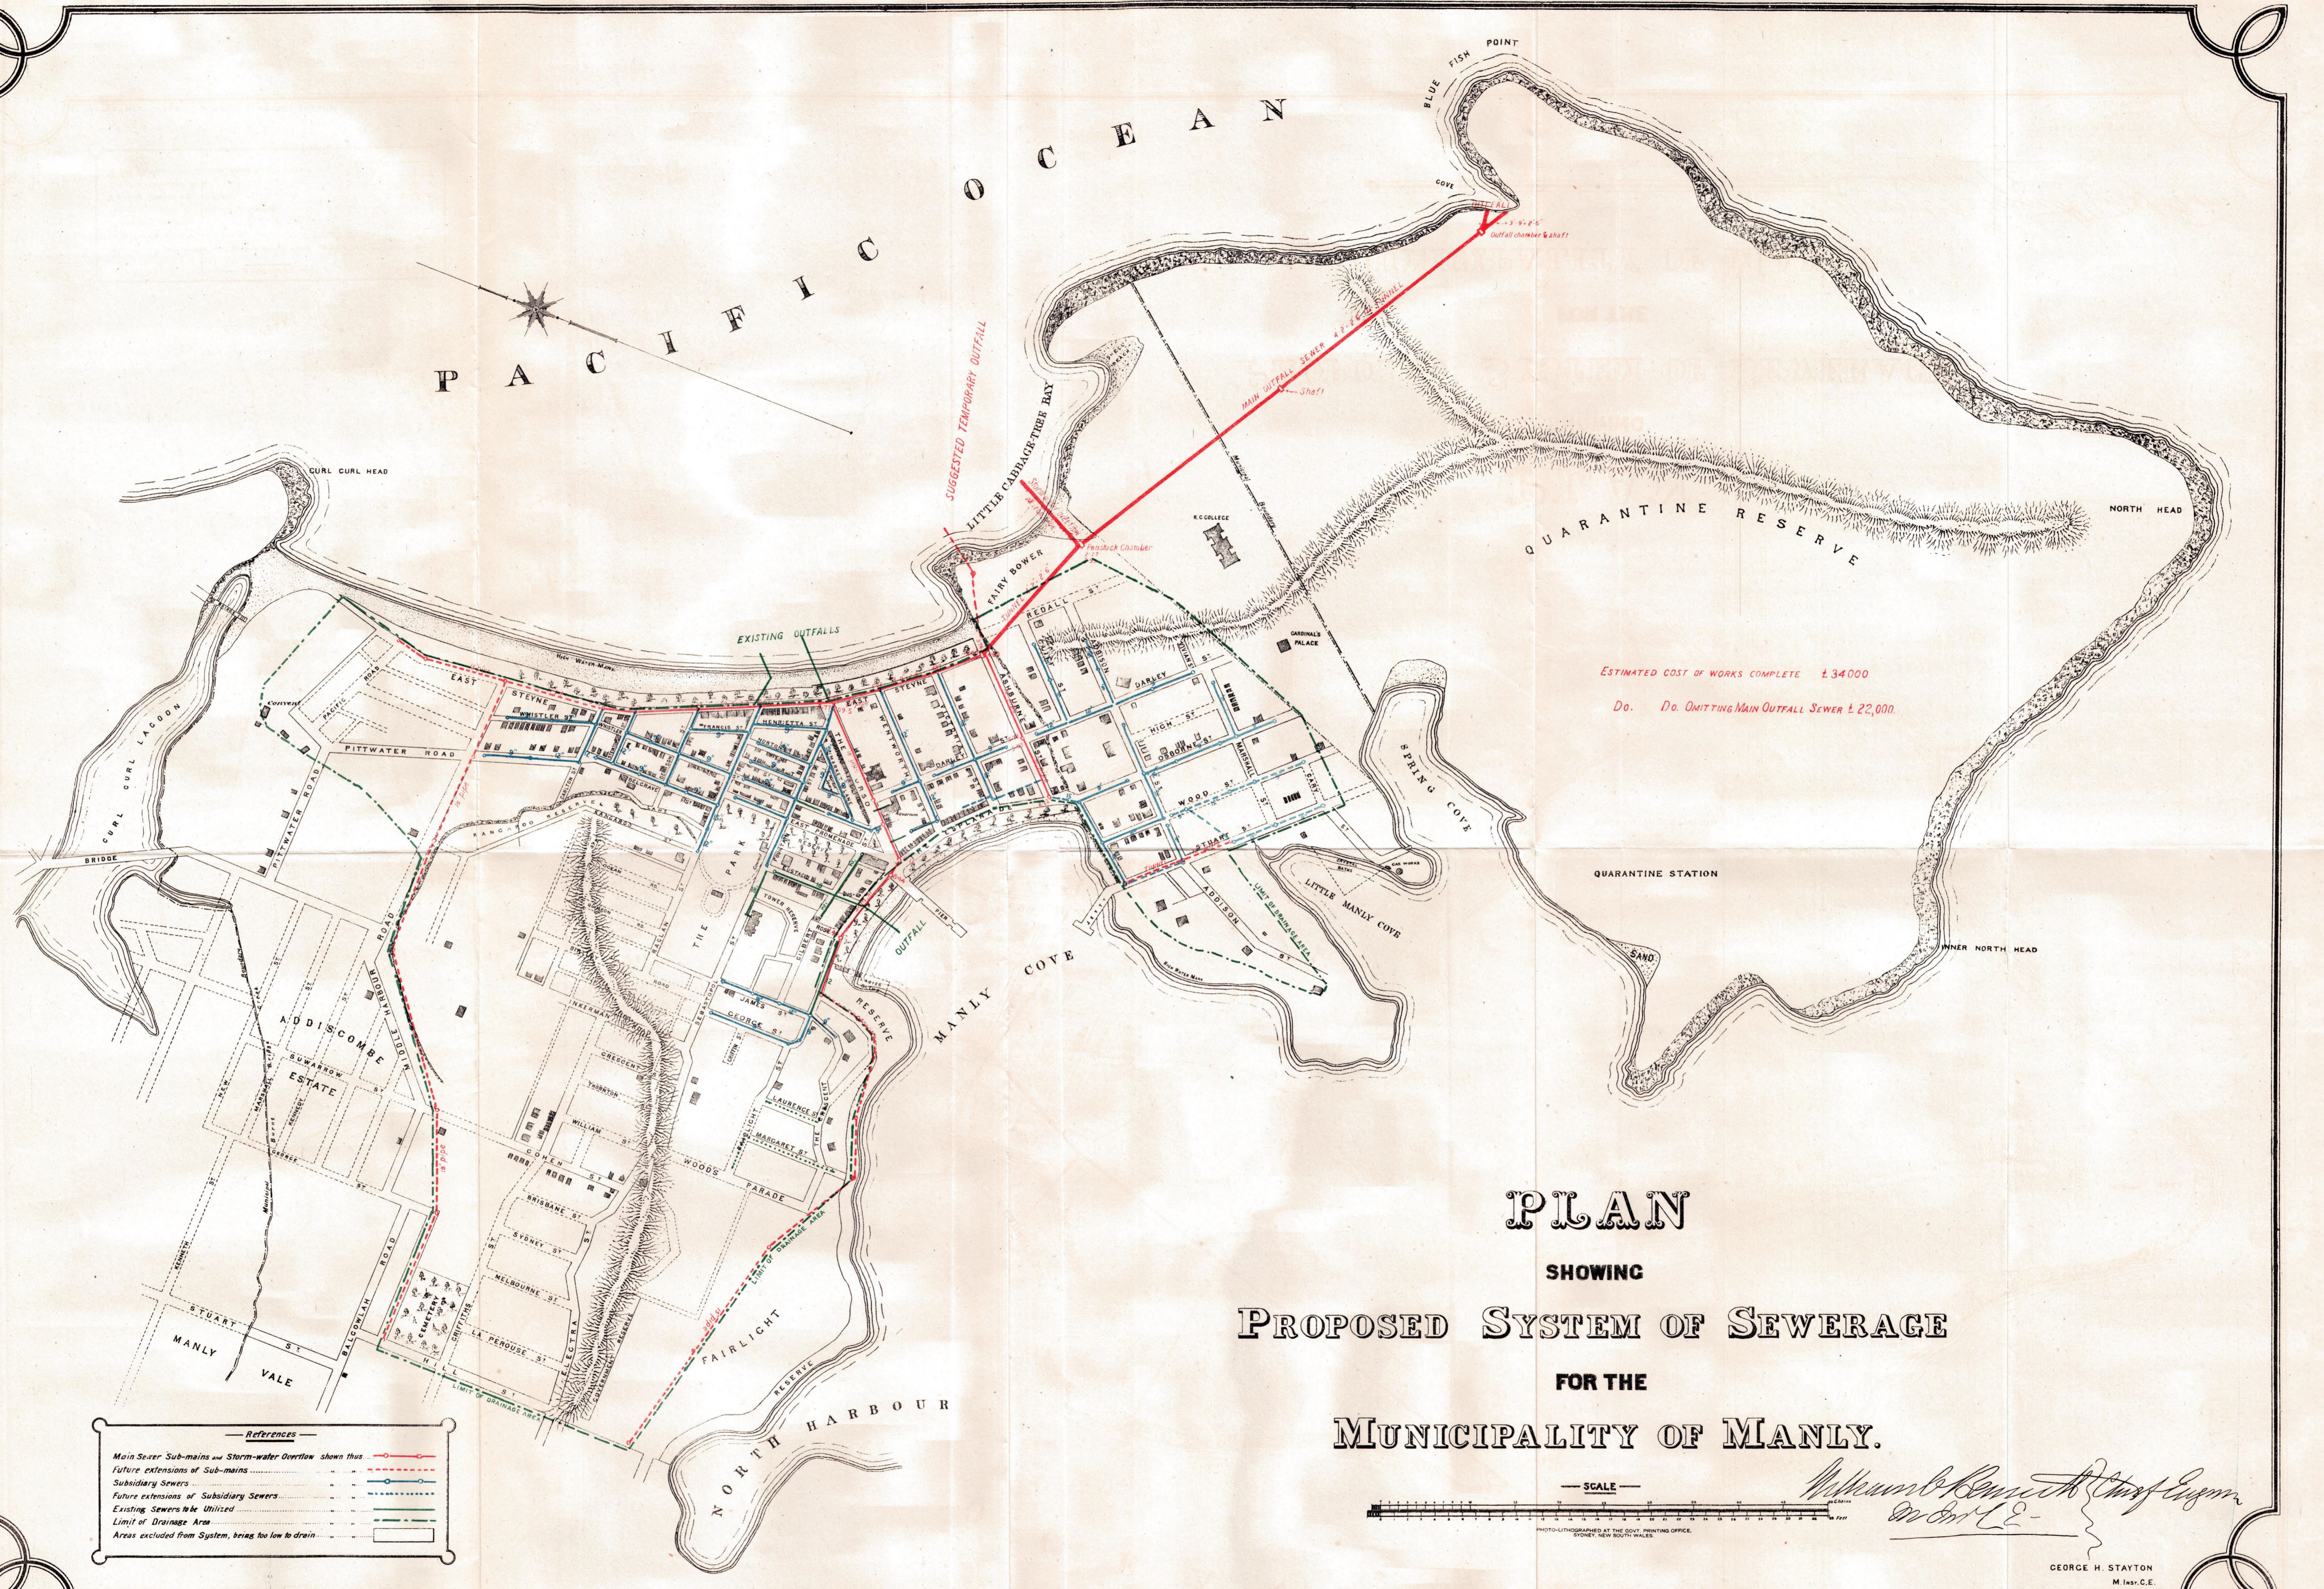

505. And the saving will eventually be a great deal more than the cost at the present time of emptying the pans? Yes.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MANLY DRAINAGE WORKS BILL.

(MESSAGE No. 5.)

Ordered by the Legislative Assembly to be printed, 6 December, 1888.

CARRINGTON,

Governor.

Message No. 5.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends, for the consideration of the Legislative Assembly, the expediency of making provision to meet the requisite expenses in connection with a Bill to sanction the carrying out of certain drainage works at Manly, in the county of Cumberland.

Government House,

Sydney, 30th November, 1888.

1888.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MANLY DRAINAGE WORKS BILL.

(PETITION FROM MUNICIPAL COUNCIL OF MANLY, PRAYING THE HOUSE TO AMEND THE.)

Received by the Legislative Assembly, 19 December, 1888.

To the Speaker and the Members of the Legislative Assembly.

The humble Petition of John George Griffin, Mayor of, and for and on behalf of the Municipal District of Manly,—

HUMBLY SHOWETH:—

1. That your Petitioner as Mayor of the abovementioned Municipality prays that your Honorable House will be good enough to amend the Manly Sewerage and Drainage Bill now before your Honorable House, so that the said Municipality shall be enabled to carry out the sewerage scheme to Bluefish, and have sixty (60) years within which to repay the loan proposed to be authorized under the said Bill.

And your Petitioners, as in duty bound, will ever pray, &c, &c.

[2 signatures.]

The seal of the Council was this day affixed, December 18, 1888.

APPENDIX.

Plan of the Proposed Drainage Works, as it was submitted to the Committee.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

DRAINAGE WORKS, NORTH SHORE.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the last Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, to whom was referred the duty of considering and reporting upon "the expediency of carrying out drainage works at North Shore," have, after due inquiry, resolved that it is expedient the works should be carried out, in accordance with the plan representing the proposal for the works in their entirety, the estimated cost of which is £107,000; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

In their consideration of this proposed work, the Committee had before them a report by Mr. G. H. Stayton, M.I.C.E., of the Sewerage Branch, Roads and Bridges Department, dated 9th October, 1886, accompanied by a Minute thereon from Mr. W. C. Bennett, Commissioner and Engineer-in-Chief for Roads and Bridges and Sewers, dated 28th October, 1886, and by lithographed plans.

The proposed works consist of a main outfall sewer in tunnel 1 mile 1,540 yards in length, commencing at New-street, Milson's Point, and passing under Willoughby-street, Lane Cove Road, Alfred-street, and Falcon-street, and terminating at the proposed outfall at the head of Long Bay, Middle Harbour. The system further includes 1 mile 986 yards of sub-mains and 20 miles 692 yards of subsidiary sewers, making a total of nearly 24 miles of sewers. The outfall works will necessitate the reclamation and embanking of 6 or 7 acres of the mud flat at Long Bay, and a process is proposed for the classification and purification of the sewage, by which it will be passed through a straining chamber containing certain proportions of lime and sulphate of iron well mixed therewith, and the whole will be allowed to flow into settling tanks where the sludge will be precipitated. The clarified effluent will be subsequently run off to some portion of the filtration area, where after passing through 6 feet of earth it will be purified in the best known manner, and be discharged by outfall pipes into the waters of Long Bay, below water level, and in a tide way.

At the time Mr. Stayton's report was prepared it was thought that only certain streets (shown on the plan by dotted lines) were in need of sewers, and that the construction of some 9 miles of sewers might be postponed to a later period, thereby reducing the present expenditure to £77,000; but it is now found that the population of the district has increased so rapidly that it is absolutely necessary to make immediate provision for the carrying out of the entire scheme, the total cost of which is £107,000.

The system proposed will serve the boroughs of St. Leonards, East St. Leonards, and Victoria, which contain a population of upwards of 15,000. The prospective population for which the proposed scheme provides is 30,225. The drainage area is 888 acres, but it is capable of considerable extension.

Generally

Generally considered, these proposed drainage works for North Shore are similar to those proposed for the Municipality of Manly, and the form of the Committee's inquiry concerning them was very much the same. It was considered very desirable while learning the nature of the works, and the advantages anticipated from them, to understand clearly whether the residents of the district were fully aware of what it was proposed to do, and of the obligations attached to the carrying out of the works, and whether any objections were raised by the residents to them; and much of the inquiry was directed towards this point. The advisableness of carrying out the scheme in its entirety, in preference to adopting the modified plan actually submitted to the Committee, was also specially inquired into.

The principal points of the inquiry may be stated as:—

- (1.) A description of the proposed works, and the necessity for them.
- (2.) The advantages of adopting the entire system in preference to the modified plan.
- (3.) The opinion of the residents with regard to the scheme.
- (4.) The question of cost and of repayment.

A brief outline of the scheme has already been given, and to that may be added the following:—Mr. Barling informed the Committee in the evidence he gave, that the proposal to carry out the works was the result of repeated requests on behalf of the North Shore boroughs that a system of sewerage should be established there; that copies of the scheme were supplied to the respective Councils; and that they, after mature consideration, had approved of the scheme, and by deputation to the Minister for Works had requested the Government to proceed with the works as speedily as possible. Mr. W. C. Bennett states that the main drain will serve the district from Milson's Point to Long Bay, with the exception of a small margin around the coast occupied chiefly by gardens and villa residences, which is below the gravitation level, and the length of the tunnel will be about $2\frac{1}{2}$ miles. The drain will be tunnelled through rock for the whole of its length, and the sewage will be conveyed by gravitation. Asked whether he considered the work essential, he answered (*Question 34*), "very essential indeed," and stated further that there was no other scheme he could suggest which would be of greater benefit to the residents and the public; and that the works would be of a permanent and durable character, so durable, in fact, that with proper care they would last twice sixty years. The main sewer will be half bricked in cement, so as to prevent the sewage from percolating through, and it will be wholly bricked where necessary. All the man-holes and lamp-holes are so arranged that they can be made flushing stations when required, and the gradients are in every case, Mr. Bennett says, self-cleansing.

As to there being any contamination of the waters of Long Bay by the discharge of sewage, Mr. Bennett is of opinion that the sewage will be so purified that it will not be a nuisance. As soon as there shall be sufficient of the sewage deposited to form what he terms "a skin of soil," steps will be taken to grow something upon it, and this will have the effect of absorbing and making the sewage quite inoffensive. No absolute provision has been made in the plan for flushing the sewers; but as they cannot be completed in less time than two years, the Nepean water supply will before that have been taken to North Shore, and there will be sufficient water at hand for flushing purposes.

Mr. Stayton, who is an engineer of considerable English experience, and the author of the proposed enlarged scheme, says he feels assured that if the work is carried out it will be effectual in every way, and undoubtedly will be effectual for the purpose of draining the North Shore suburbs generally. The scheme does not, he points out, take in the whole of East St. Leonards, because there are parts of that Municipality which are not at present populated; but it takes in all the heart of St. Leonards, and includes portions now very thinly built upon. It does not extend beyond the Military Road or Bloxsome Road, but if it should ever be required, a considerable part of the slope on the north side of the Military Road, between the Military Road and Long Bay, could be included. The area could be considerably extended, he says, if it is ever required. He is also very emphatic upon the question of filtration at Long Bay, and the certainty of its not proving a nuisance. He points out (*Question 117*) that the same system which is proposed here, although the chemicals are not exactly the same, has been adopted in many towns in England, and that no nuisance whatever exists there
from

from the operations. "The works and the process," he says, alluding to what has been done in England, "are brought up to date in all essential particulars in these instances, and they amply demonstrate the fact that no injury whatever would be done to Middle Harbour by the adoption of the contemplated sewerage scheme;" and the 6 or 7 acres which it is proposed in connection with this discharge of sewage at Long Bay to reclaim will be sufficient, he states, for all time, "because" (*Question 128*), "this drainage area would not contain more than 30,000 or 40,000 people at the outside, and that space would be sufficient for the purpose." Then it is proposed that the chemically-treated sewage shall be made use of, if necessary, as a manure which can be sold to farmers; and this manure, which is known as "pressed sewage sludge," has, according to a statement made by Mr. Stayton (*Question 471*), been proved by a series of experiments in England to be a very valuable fertilizer. As to the life of the proposed sewer, his evidence is (*Question 136*), that "he can safely say that in 80 or 100 years it ought to be thoroughly efficient, and with slight repairs it would last for a much longer time."

Mr. John Trevor Jones, Engineer to the Water and Sewerage Board, who was also examined upon the merits or otherwise of the scheme, considers it to be admirably adapted to St. Leonards, and with regard to the place at which it is proposed the sewage shall be discharged, he thinks it will be difficult to find a position equal to it, and not possible to find a better. "I think," he says (*Question 420*), "that it is admirably suited to the purpose, seeing that they are going to treat this sewage and render it fit to enter into an estuary of the harbour without detriment to the water." Further, he considers that the proposed process of filtration and subjecting the sewage to chemical treatment will eliminate all chances of nuisance. "If it is favourably done," he says, "I quite anticipate that the sewage water will be pure enough to enter into a trout stream or an inland river." Questioned as to whether the system proposed by Mr. Stayton was quite up to date and in accord with the most approved method of treating sewage, Mr. Jones stated that, with the exception of what is called the electric process, now being investigated, and the effects of which are not yet properly understood, he knows nothing superior to it. In respect to this electric process, it will be seen by the answer to *Question 472*, that even if it should be deemed desirable hereafter to apply that process to the sewage to be dealt with under the present proposal, it could be done. Dr. John Ashburton Thompson, who is Assistant Medical Adviser to the Government, and who, although by profession a medical man, has some experience as an engineer, appears from his evidence to be well acquainted with systems of drainage adopted in Europe, and he regards the proposed system of draining North Shore as a very desirable one, and does not know of any better that can be adopted. Moreover, he says, he has not known of any injurious effects resulting from the plan of deodorization or filtration such as that proposed to be resorted to at Long Bay. The proposal to precipitate and then to filter the sewage is, he thinks, recognised as the best plan in most cases of dealing with sewage.

The advantage of adopting the entire scheme in preference to the modification, which would postpone the construction of some 9 miles of sewers to a later period, is shown by the evidence of several witnesses. Mr. Stayton (*Question 157*), says that "the recent development of the district in certain parts has been such that it is most essential that the whole scheme should be considered and provided for." Mr. P. W. Glacken, Mayor of East St. Leonards, states that the Council has considered the project of draining the whole of North Shore, and concur in the construction of the work. The population of the district, he says, is largely increasing, and at a much greater rate than was apparent some years ago. "If something is not soon done in the way of drainage," he says (*Question 260*), "we shall have malaria on the North Shore. Carreening Bay and Neutral Cove are getting into a very bad state." This locality, he further states (*Question 309*), "is in a very dangerous condition; it is not safe to ride along the foreshores at present, and it will be worse in the summer months." Mr. Frederick Smith, Mayor of Victoria, another of the boroughs interested in the proposed sewerage scheme, will be found by his evidence to state that the Council of that Borough are aware of the nature of the proposed works, and are consenting parties to the proposal. So also in the case of Captain Jenkins, Mayor of St. Leonards. He states that not only are the Council consenting parties to the work being undertaken, but the general feeling among the ratepayers is

to

to have the scheme carried out. "They are almost unanimous," he says (*Question 330*); "we are unanimous in the Council, and it is also the general feeling of the public." Mr. Walter L. Vernon, an alderman of East St. Leonards, and formerly Mayor, having some experience as an engineer, is of opinion that the scheme proposed is the only possible one for North Shore, taking the physical nature of the country into consideration. He is somewhat doubtful about the filtered water from the sewage flowing in a pure condition into Long Bay, but at the same time he does not know of any alternative plan for dealing with it. As to whether the proposal is approved by the public, he thinks the proposed scheme will satisfy the present population, and also a population very much larger. His opinion with regard to the life of the sewers is that the main drain will be as good 100 years hence as it will be when constructed; and with reference to the general question of the necessity for a proper sewerage system, he says, "It is an absolute necessity that something should be done."

With reference to whether the opinion of the residents of North Shore is favourable to the proposed scheme, the testimony already quoted from the Mayors of the boroughs immediately concerned indicates very distinctly that it is, and additional proof upon this point is given by the evidence of a witness named Mr. Charles Chatfield, who came before the Committee as a ratepayer of North Shore, and requested to be heard in opposition to the scheme. He is a resident of Willoughby Falls, the locality of the proposed outfall, and he desired to protest against the scheme, because he doubted that the sewage outfall or flow into Long Bay would not be a nuisance. But even he, though perhaps personally, as deeply interested as anyone could be in the scheme, will be seen by his evidence to have objected to the proposal only in a general way. He could not give any opinion (*Question 452*), founded on professional knowledge, but he was not satisfied in his mind that the sewage could be so dealt with as to become innocuous. "First of all," he said (*Question 453*), "there must be an outlet from the sewer which must give forth some effluvia, and consequently the question is will the water that will percolate through the earth be entirely innocuous." As to the first point, Mr. Stayton afterwards informed the Committee that the tanks at the outfall works would be covered, and the sewer entirely underground, and that therefore there would be no exposure whatever at the mouth of the sewer. With regard to the second point, Mr. Chatfield was asked (*Question 470*) whether it was not his opinion that, with scientific appliances and discoveries every day, engineers would be able to treat the sewage so as to remove anything noxious or offensive, and he answered, "Yes, my reason compels me to believe that; but living in the place I have an objection on account of the possibility of failure."

The question of cost and repayment of the money expended was put before the Committee by the evidence very much in the same way as it appeared in the case of the proposed drainage works for Manly. The Borough Councils of North Shore, and the residents of the districts are very anxious for a proper sewerage system, and appear to be able and willing to pay the necessary rates to meet the expenditure and the interest upon it; but the general opinion is apparently that the term of repayment should be extended to sixty years. Twenty-eight years, it is argued, as was done in the case of Manly, is too short a period, and imposes upon the present population too great a burden. Some interesting and important information on this subject as it relates to the practice in England, will be found in the evidence of Mr. Stayton on page 17, *Question 472*. There he shows that in some instances the periods over which loans for sewerage works have been granted in England have been as long as 100 years, and in several cases it has been for periods of between sixty and eighty years.

The Committee regard the evidence in the case of these proposed drainage works for North Shore as quite sufficient to justify the carrying out of the scheme in its entirety, and on Thursday, 11th October, they agreed to the following resolution, which was moved by Mr. Sydney Smith, and seconded by Mr. Copeland:—

"That the Committee consider it expedient that the drainage works for North Shore should be carried out as proposed on the plan and explained in the evidence before the Committee, at an expense of £77,062, and recommend the adoption of the enlarged scheme at an additional cost of £29,938."

JOHN LACKEY,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 22 October, 1888.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

DRAINAGE WORKS, NORTH SHORE.

WEDNESDAY, 10 OCTOBER, 1888.

Present:

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
HENRY COPELAND, Esq.
ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.
JACOB GARRARD, Esq.
SYDNEY SMITH, Esq.

The Committee proceeded to consider the proposed Drainage Works at North Shore.

Joseph Barling, Esq., Under Secretary for Public Works, sworn and examined:—

1. *Chairman.*] Do you know something of the proposed drainage works at North Shore? Yes.
2. Are you aware of the circumstances under which the project has been submitted to this Committee? Yes. At the repeated requests of the North Shore boroughs two sewerage schemes have been prepared by the Sewerage Department, viz.—one in November, 1882, by Mr. Smyth, and the present scheme in October, 1886, by Mr. G. H. Stayton, the latter being an enlargement and modification of the former proposal. Copies of the scheme now before the Committee were supplied to the respective Councils, who, after mature consideration, approved the same, and, by deputation to Mr. Sutherland, requested the Government to proceed with the works as speedily as possible. The drainage area included in the scheme contains 888 acres, and provides for a prospective population of 30,225 persons. The works comprise the construction of nearly 24 miles of sewers, at a total cost of £107,000. The main sewer commences near Milson's Point, and continues in tunnel for 3,300 yards to a point near Willoughby Falls, at Long Bay, at which place it is proposed to reclaim a few acres of the mud-flat, and chemically clarify the sewage according to the most recent process, the effluent being filtered through earth in such a manner that it will pass into the waters of the Bay, below low-water mark, properly purified and unobjectionable. As considerable discussion has been raised outside about the clarification of this sewage, I may be allowed to read the following passage from Mr. Stayton's report:—"The process proposed to be adopted consists in passing the sewage through a straining chamber, after which the lime or other chemical is mixed therewith, and the whole allowed to flow into one of two open concrete settling tanks. The sludge is here precipitated, the clarified sewage being subsequently run off to some portion of the filtration area. The effluent therefrom would be conveyed by drains and a culvert to outfall pipes discharging into the waters of Long Bay, below low-water level, and in a tideway if practicable. In this manner it is possible to deal with the sewage effluent of from 1,000 to 5,000 persons per acre of filtration area. The richness of the sewage and the suitability of the earth are important factors, and I am of opinion that the existing conditions of the district favour a proportion of about 4,000 persons to the acre of filter. It would therefore be desirable, in the first instance, to reclaim and embank an available area of 6 or 7 acres for all purposes, the greatest care being observed to secure the most suitable materials for forming the filters." With regard to the cost of working the scheme, Mr. Stayton, in his report, says:—"A rate of 1d. in the £ per annum on the existing assessments within the drainage area would probably produce £750 net; but there is little doubt that by the time the works are carried out and completed, the ratable value will have further increased to such an extent, that a penny rate would produce £1,000. Under such circumstances a drainage rate of 6d. per annum would be sufficient to pay for the execution and maintenance of the necessary works. If, however, the period for repayment were extended to sixty years, the annual cost would be reduced to £4,230, in which case a 4½d. drainage rate would be sufficient. To complete the entire scheme at once would necessitate, under the provisions of the Act, a drainage rate of 7½d., but if the period for repayment be extended to sixty years, a 5½d. rate would suffice. Assuming that the completion of the entire scheme will not be necessary for a period of seven years, and that the population and ratable value will have increased to the same proportion as during the last six years, the drainage rates would not exceed 5d. and 4d. respectively." I may mention that the present Secretary for Public Works, Mr. Sutherland, has given very great attention to these sewerage proposals, and he has called in the aid of Mr. Coghlan, the Government Statistician, to supply him with certain statistics in connection with mortality rates, and so on; and some of the information given to him I would like to give to the Committee on this occasion. I think it will be extremely interesting. I refer especially to a diagram showing the death-rate of London from 1843 to 1888. The object is to show what a complete system of sewerage will do, and how it brings about a persistent decrease in the death-rate.

J. Barling,
Esq.
10 Oct., 1888.

- J. Barling, Esq.
10 Oct., 1888.
3. *Mr. Copeland.*] I notice that the works submitted to the Committee are nearly all works adjacent to Sydney? Yes.
4. Have the Department no other works that they could submit to the Committee, so that the labour might be dispersed throughout the country? I notice that for one electorate—North Shore—there are three works before the Committee at the present time—drainage works for Manly, drainage works for North Shore, and a bridge over the spit. Could not some other works be also submitted to the Committee? If you can suggest any others we are quite ready to take up any one on the list that you may think necessary.
5. Is this a complete list of the works that will be submitted to the Committee? Yes. The railway works could not be submitted because the Commissioners were not appointed.
6. Are there any other works besides those on this list? These are the only works submitted to this Committee. We are ready to take up any one on the list almost at a moment's notice.

William Christopher Bennett, Esq., Commissioner and Engineer for Roads, sworn, and examined:—

- W. C. Bennett, Esq.
10 Oct., 1888.
7. *The Chairman.*] Are you acquainted with the principle upon which the drainage works at North Shore are proposed to be carried out? Yes.
8. Are they to be carried out in accordance with the plan we see before us? Yes.
9. They consist of a main tunnel from near Milson's Point to Long Bay? Yes.
10. That will be the main drain? Yes.
11. It will be carried out by means of a tunnel, of course? Yes; the greater part of it.
12. Will it drain the whole area above it into Long Bay? Yes; except a small margin around by the coast. That portion is chiefly occupied with gardens and villa residences.
13. I mean from Milson's Point? Yes; it will drain from Milson's Point to Long Bay, but there is a portion shown on the plan below the gravitation level which chiefly consists of villas and gardens.
14. Will the main drain be a very considerable depth below the high lands at North Shore—the military road, for instance? Yes.
15. Will it be very much below the heights of North Shore? Yes.
16. Do you recollect the exact depth? No. About 250 feet.
17. What will be the length of the tunnel? It will be, roughly, some 2 miles.
18. Does this project provide for the complete drainage of St. Leonards so far as the red lines indicate? Yes; the green-dotted line is the margin of drainage.
19. The drainage as shown on this plan does not provide for the drainage of that area within the green line? Yes; by subsidiary drains. They are shown in blue lines.
20. Will that give a complete system of drainage to the whole locality within that green-dotted line? Yes.
21. Can this be done without any system of pumping at all? Yes.
22. In fact, the drain will be tunnelled right through? Yes; and the sewage will be conveyed by gravitation.
23. Are the outfall works a sort of percolatory works—Are they supposed to clarify the sewage? It is proposed to treat the sewage with lime first; then with sulphate of iron; and next to put over land which we propose to make there. It will be almost an artificial filter.
24. Does the green area represent the land you intend to treat? Yes; at present it is water.
25. That at present is not filled up? Yes.
26. Then you propose to allow the filtrated water to escape from there into Long Bay? Yes.
27. Will it be deprived of all sediment or deposit by the time it gets into the water? Yes; the water will pass the test established by the Commission for the purification of rivers in England.
28. Then it would not be likely to interfere with the depth of the water at Long Bay, or to silt up the Bay in any way? No; because it will first be used to fill up the reclaimed area.
29. Have you been over these works yourself? Yes.
30. Do you understand thoroughly the whole principle on which the project is proposed to be carried out? Yes.
31. Do you consider it will be effectual? Yes.
32. Have you given attention to the estimated cost? Yes; it is estimated on the actual cost of works in Sydney.
33. Do you think it is reasonable? Yes.
34. Do you think the work is an essential one? Yes; very essential, indeed.
35. Is there any other scheme which you could suggest which would be of greater benefit to the residents and the public? No; this scheme was thought out by me before Mr. Stayton came to the Colony, and the details were worked out by Mr. Smijth, who is in the Department, and who made a report. Then Mr. Stayton had large and recent experience in England, and I sent him over to make an entirely new report. They coincided to a great extent. The alterations were chiefly owing to the increase of population and buildings in the interim.
36. As far as your experience goes in the construction of these works, has it led you to the opinion that the residents are prepared to contribute towards the cost of the work in rates? I was under the impression that there was rather a feeling against the works at North Shore; but I understand from a meeting that was held in the Under Secretary's office to-day of all the mayors and some of the aldermen that they have changed their opinion, and are now prepared to advocate the work.
37. Do you think that the cost which would be entailed upon the present residents at the higher rate of payment would be oppressive, and would you rather have the period extended so as to make the present payment less? I would rather have the term extended. A question was asked on a previous occasion respecting which I have since obtained statistics: That is, the present cost of the removal of nightsoil as against the cost of these works. At present the whole of the boroughs on the North Shore pay at the rate of £3,298 for the removal of nightsoil.
38. What will be the cost to them of the proposed sewerage works? If the whole of the works were executed and paid for in twenty-eight years the cost would be £7,570 a year—that is with a 7½d. rate.
39. If the term were extended to sixty years would it not be considerably less? It would then be £5,875; with a 6d. rate.
40. These works will be of a permanent and durable character? Yes.
41. Those who live sixty years after us will benefit by them as much as the present generation will? With proper care the works would last twice sixty years.
42. Will the tunnel be bricked and cemented inside? Yes.

W. C.
Bennett, Esq.
10, Oct., 1888.

43. How long would that work last if faithfully done? It is impossible to assign any limit. Similar works done by the old Romans now exist.
44. *Mr. Kethel.*] Are they in use? No; because they are too large for present purposes, and besides the present inhabitants are too lazy to use them.
45. *Chairman.*] Do you think, as a general principle, that an extended time would be fairer? Yes. I think as a young country we have a much longer future to look forward to than they have in England, and there the time is extended.
46. Is it the case that the old rudely constructed drain, known as Busby's Bore, which supplied Sydney with water 50 years ago, is still in existence? Yes. It is now in good order. It was never lined with cement; it is merely an excavation in the rock.
47. As far as you know this proposed work generally, have you no hesitation in recommending it as one which it is desirable to carry out in the interests of the public? Yes.
48. Both for a sanitary point of view and for immediate convenience? Yes.
49. *Mr. Copeland.*] I notice in your report and Mr. Stayton's report that periods of twenty-eight and sixty years are mentioned. Why do you adopt those two periods? Twenty-eight years is the period prescribed in the New South Wales Act. Sixty years is the extended term in England.
50. What period of repayment is fixed in the case of the present City Sewerage Works? Twenty-eight years.
51. Do you think that twenty-eight years is not a sufficiently long period for this money to be repaid? The development of the place is so great, and things change so much, that I really think sixty years would be just.
52. Have you considered that a great many of these places will require a large expenditure, and that the country will be unable to continue borrowing if the repayments came in so slowly? I have not looked at it in that aspect; but as the places develop and require those improvements, each independently become able to pay for the loans.
53. Would you be in favour of other towns and municipalities having the same privileges extended to them that are here proposed? Yes. The very first minute I made when I took charge of the sewerage was that the Government ought to propose a law prohibiting any town or person draining into any river where the water is so unspeakably precious as it is here.
54. In view of the large number of growing towns which are in existence now, and which will be in the course of a few years, do you think it would be at all fair to continue borrowing money to carry out those works in the various towns unless we get the money in again within a period of something like twenty-eight years? I am not prepared to enter into that question.
55. Of course, if there were only one or two places, it would be a simple matter to give plenty of time, and be generous and liberal; but would you advocate the same privileges being given to places like Newcastle, Bathurst, Goulburn, Armidale, Wagga Wagga, Albury, and all those places? Yes; but they are hardly all ripe for it just yet. Schemes have been prepared for Goulburn, Albury, and Parramatta, and are in course of preparation for Newcastle.
56. Do you think people would be prepared to pay the drainage rates on the shorter period of twenty-eight years? I think so. However, the municipal representatives of the people are here to-night, and will be able to speak for them.
57. Will the main sewer be constructed through rock or will it consist of pipes? It is made through rock. We are limited in size in all these things by the smallest gallery that a man can work in. This is the smallest duct we can make where we have to tunnel.
58. Do you think that an expenditure of this kind would materially enhance the value of the adjacent property? Yes; I think a very casual inspection of North Shore would show that.
59. Therefore, in point of fact, the additional expenditure by way of rates would scarcely be felt, as it would be compensated for by increased value? Yes; by increased value and by increased health. There would be less illness, and those who are not absolutely ill would enjoy more robust health.
60. *Mr. Humphery.*] Will the sum of £77,000 cover the cost of constructing the whole of the works shown by the red, green, and blue lines shown on this plan? No; £77,000 would cover all but the expenditure that is shown in the Schedules B and C at the back of the report.
61. Is it shown in the plan what portions of the works are not to be included in the first part of the scheme? The works shown by the red and blue dotted lines are not included in the scheme for the smaller sum. All with the works shown in the full lines are included in the proposed expenditure of £107,000.
62. In your estimate of the rate which it will be necessary to strike to cover the cost of construction with interest, spread over a period of sixty years, have you taken into consideration the probable increase in the annual rates during the time the works are in course of construction—that is, seven years—or have you taken the present annual rates? It has been calculated as the rates increase.
63. If the cost of construction be £77,000 would not that require only about £3,000 a year for repayment of principal and interest? Yes; the calculations I have given you were on £107,000.
64. Would a rate of 5d. be ample to cover the cost and interest if spread over a period of sixty years? Sixpence for £107,000; 4½d. would be sufficient for £77,000.
65. Would these works be available during the whole period of sixty years? Yes, and for a very much longer period.
66. Would they be ample? £107,000 would cover all.
67. But the works now proposed to be constructed would be useful during the whole period of sixty years? Yes.
68. So that those who bear the burden of the debt during the latter part of the sixty years would receive some consideration for their contributions? Yes.
69. It would be a benefit to the future population as well as to the existing population? Yes.
70. *Mr. Kethel.*] I observe that the outfall works are to consist of a certain area of land, to be reclaimed from the harbour. Is the portion tinted green on the plan the outfall of the sewer? Yes.
71. With what material is it intended to fill up that space? Well, with the best material we can get—sand. It will not be filled up at once. It will be gradually filled up.
72. Will you erect a dam across the entrance and fill in with the material? No. We will fill in the material as stated gradually from the shore.
73. Do you think it possible with any material you can place there to thoroughly filter the sewage matter, or intercept all offensive matter carried down by it? It is not possible, unless you first treat it chemically. We will treat it chemically with lime and sulphate of iron.

- W. C. Bennett, Esq.
10 Oct., 1888.
74. Will you have intercepting tanks? Yes; tanks built for the receipt and precipitation of the sewage. It will be treated chemically, and then it will flow out over this land.
75. What will be the height above high-water mark of the mouth of the outfall sewer? Nineteen feet above high-water mark.
76. The mouth will be near Willoughby Falls? Yes.
77. Is it your opinion that the mode of treatment will so effectually remove any offensive matter from the sewage that it will not contaminate the waters of Long Bay, and become a nuisance to the people occupying the shores of Middle Harbour? I think it will be so purified that it will not be a nuisance. If the ordinary old chemical process does not purify it sufficiently, this new process will be still more effective.
78. With reference to the main sewer, will the greater part of it be tunnelled through solid sandstone rock? Yes.
79. Is it your intention to line the main sewer through the rock, or any portion of it? It will be half-bricked in cement so as to prevent the sewage from percolating through. It will be wholly bricked where necessary.
80. Have you made any provision in this scheme for flushing the sewers? Not any absolute provision; but all the manholes and lampholes are so arranged that they can be made flushing stations if required.
81. What fall have you given the main sewer? One in 400. The gradients in every case are self-cleansing.
82. With that grade is it your opinion that the sewage fluids will have sufficient velocity to flow along the bottom of the sewer without depositing any of the matter they hold in suspension? In every case they will have the limit of velocity. 120 or 130 feet per minute is considered the minimum velocity, and in all these cases it will have a very much greater velocity.
83. *Mr. Street.*] You have stated that you do not consider there will be any contamination of the waters of Long Bay from this discharge of sewage. Do you think that the discharge of sewage on the reclaimed land and the process of deodorization will not be offensive in the atmosphere in that locality? I do not think so.
84. Of course a large quantity of sewage will be deposited on this made land? Yes.
85. Do you not consider that that will cause an offensive state of the atmosphere? No; because as soon as we get a skin of soil on it we will begin to grow something which will have the effect of absorbing and making inoffensive the sewage.
86. *Mr. Kethel.*] Have you seen the sewage farm on which the city sewage of Adelaide is deposited? No; but I have had experience at our own sewage farm at Webb's Grant. The effluent water is perfectly pure.
87. *Mr. Street.*] Is the process at Webb's Grant similar to this proposed process? No; that is not the process except with regard to filtering through sandy soil. Here a chemical process is proposed.
88. Is there any offence in the atmosphere at Webb's Grant? No.
89. *Mr. Garrard.*] How long will the works take to complete? I do not think we can hope to complete them in less than two years.
90. By that time I presume the water supply will be taken to North Shore? Before that time.
91. So that you will have sufficient water for flushing purposes? Yes.
92. *Mr. Copeland.*] What is the usual dip or fall allowed per mile for sewerage? It depends a great deal on the construction of the sewer and the quantity of the sewage.
93. Will 1 in 400 be sufficient? At Bondi it is only $3\frac{1}{2}$ feet to 1 mile, that is about 1 in 1,500; 1 in 400 will be ample.
94. Will it be sufficient in case there is no water to flush the main sewer, and will there be no sediment? If there is no water for water-closets they cannot have sewerage proper. Scullery-water, and such like, which is equally offensive might be carried away; but if you have no water for water-closets you will have no water for flushing. But without any flushing-water this will be ample.

George Henry Stayton, Esq., M.Inst.C.E., Engineer, Sewerage Branch, Roads and Bridges Department, sworn and examined:—

- G. H. Stayton, Esq.
10 Oct., 1888.
95. *Chairman.*] Have you been engaged in designing these sewerage works for North Shore? Yes.
96. They have been brought to their present state under your supervision? Yes; the present scheme has.
97. Had anything been done before you took it in hand? A scheme was prepared in 1882 by Mr. Smyth. That was for an area of 350 acres—the portion coloured green on this plan. (*Plan submitted.*)
98. That is not identical with the present scheme? No. The present scheme is an enlargement including the portion coloured red, and dealing with an area of 888 acres.
99. Does that include the gross area of the North Shore Drainage Scheme? Yes.
100. Have you had considerable experience in the construction of sewerage works in England? Yes.
101. From the result of your experience do you feel assured that this work if carried out will be effectual in every way? I do.
102. The drainage is to be carried out by gravitation? Yes; to the outfall.
103. Will not the depth of the tunnel on the high land of North Shore be very great? The depth of the tunnel at that particular point would be over 200 feet. That circumstance will not affect the cost of the subsidiary drainage at all, because the connections will be made with a pipe-sewer at the ordinary depth from the surface, and the sewage will be carried down the shafts in a special manner.
104. Will that apply to manholes, ventilation, and so forth? There are openings for a variety of purposes—inspection, ventilation, and so on.
105. At what intervals would they be? I cannot quite remember, but the number of shafts is mentioned in the report.
106. I suppose it is about the usual number? Yes.
107. Is there some professional rule by which you are guided in that matter? There is no professional rule. Local conditions determine the question. The report shows that there are 295 shafts and manholes.
108. Is that for giving access to the main tunnel or the others? Extending over the whole system. That is, 295 openings in 24 miles of sewers.
109. Then you have sub-mains connecting with the main tunnel? Yes; four sub-mains.
110. Then you have subsidiary mains? Yes.
111. Are they all at the same depth? That depends on the configuration of the ground, and what their duty is. The small sewers are at an average depth of 5 or 6 feet.
112. Do you think that the project as submitted would be an effectual one for the purpose of draining the North Shore suburbs generally? I think so, undoubtedly.

113. How many municipalities are comprised in the scheme? Three—St. Leonards, East St. Leonards, and Victoria. G. H. Stayton, Esq.

114. Do you happen to know whether the residents of those different municipalities are agreeable or anxious to have the works carried out? I know nothing of the local opinions, except what I have heard from the Mayors to-day, who were unanimously in favour of the scheme.

10 Oct., 1888.

115. That would not come within your province? No.

116. Are you engaged only in carrying out the professional part of the work? Yes.

117. We have heard something about an improved modern system of filtering; what is the nature of that generally? The very latest system adopted in England is that now being carried out by the Metropolitan Board of Works, which body has expended about £50,000 in making experiments to determine which chemicals and what quantities should be used. They are now carrying out works at a cost of £750,000 with a view to treating the whole of the London sewage. It is proposed to use 3·7 grains of lime and 1 grain of sulphate of iron per gallon of sewage. This proposal is based upon the same quantities. The sewage would first of all be received at the outfall; it would then pass through strainers. The chemicals would then be mixed with it, and it would pass into and through the precipitating tanks. After standing at least three hours in the tanks the clarified effluent would be drawn off and passed through the earth filters, which would be 5 or 6 feet deep. When it left the filter beds and passed out into the bay it would be perfectly clear and inoffensive. The question of sewage filtration was very largely considered by Lord Bramwell's Commission, as it was termed. They sat for some months and made a very exhaustive inquiry into the whole question of the metropolitan sewage. They reported that earth filtration, combined with precipitation and prepared filters, gave the best effluent known. That system is now being acted upon wherever practicable. They took the evidence and opinions of the very highest authorities they could get from all parts of England. I would also like to mention that the same system which is proposed for North Shore—although the chemicals are not exactly the same for the reasons I have stated—has been adopted in many English towns. The process of precipitation which the Sewage and Health Board considered and reported upon in 1876 as undesirable, is entirely different to the combined system of straining, precipitation, aëration, and earth filtration now in use in England, and recommended for North Shore. The modern process is carried on without creating nuisance. The effluent is purified and clear, and the sewage sludge is reduced to one-fifth of its bulk by the use of filter-presses, and is thus rendered fit for agricultural purposes. Up to 1875 the principal towns which had adopted chemical processes (as is shown by the Local Government Board Blue Book) were Bradford, Birmingham, Bolton, Coventry, Edmonton, Hertford, Leeds, Luton, and Tottenham. In all these instances precipitation is continued, but upon the modern system, and the process has worked so satisfactorily that it has been recently extended at Coventry, Luton, Hertford, and Edmonton. The combined system of precipitation and earth filtration has also been adopted in the following towns and districts within the last seven or eight years, viz.:—Accrington, Acton, Chiswick, Codnor, Colchester, Frome, Hendon, Henly-on-Thames, Petersfield, Royton, Salford, Sheffield, Stratford-on-Avon, Swinton, the River Lea Valley Sewerage, the Thames Valley Main Sewerage (south side), the Thames Valley Main Drainage (north side), the Wandle Valley Main Drainage, Walthamstow, Wednesbury, Willesden, and Wimbledon. Some of these are very large districts, with large populations. With regard to the possibility of any nuisance being created by these works, to my own knowledge the sewage works at Wimbledon, Coventry, Chiswick, and Acton are in the vicinity of dwelling-houses, and in the first three instances the processes are now so successfully carried out that the Court of Chancery has decided that no nuisance whatever exists from the operations. The works at Chiswick are about 350 yards from Chiswick House (owned by the Duke of Devonshire), and a considerable number of large houses are quite as near. The works and the process are brought up to date in all essential particulars in these instances, and amply demonstrate the fact that no injury whatever would be done to Middle Harbour by the adoption of the contemplated sewerage scheme.

118. *Mr. Copeland.*] What chemicals do they use? Sulphate of alumina, lime, and various chemicals, according to the quality of the sewage. At Coventry a great deal of dye refuse is carried off by the sewers, and the sewage is treated differently to the sewage of other towns.

119. *Chairman.*] Do the schemes to which you have just referred include the use of land for agriculture or horticulture? Yes, they have earth filtration areas on which crops are grown.

120. And they cultivate those areas? Yes.

121. Is that absolutely essential to the system you speak of? It is most necessary that it should be done. Earth filtration is absolutely necessary for the chemical process.

122. Have you made the same provision here as they have made there? Yes.

123. Adjoining this area to be reclaimed there is a market garden shown on the plan? That is at a much higher level.

124. Has that no connection with your proposed works? No, that is 40 or 50 feet above it.

125. Therefore it could not be worked with your system? No, not at all.

126. What is the area at the head of the bay which you propose to reclaim? Between 6 and 7 acres. Of course the whole of that would not be required for some years to come, and it would be necessary to start from the outside and gradually reclaim inwards.

127. *Mr. Copeland.*] How many years do you contemplate it will take to reclaim the 6 or 7 acres? I think that 6 or 7 acres would be sufficient for the whole of this drainage area.

128. For how long? For all time continuously, because this drainage area would not contain more than 30,000 or 40,000 people at the outside, and that space would be sufficient for the purpose.

129. What is the present population? About 15,000. That is, on this particular area.

130. Do you not think the population is capable of greater expansion than you have named? I do not think this area will be more largely built upon. The figures I have given are based on an allowance varying from fifty-two persons per acre in the more populated parts to twenty-two persons per acre in the residential parts. That gives an average of thirty-four persons per acre. The suburban rate for London is thirty-one persons per acre, and the same rate was estimated for the suburbs of Sydney. Sydney itself was calculated at forty-seven persons per acre. So that, taking the average at thirty-four, and allowing for a small increase, there would probably not be more than 35,000 people on this area if it were closely built upon.

131. *Chairman.*] Are the works proposed to be constructed in concrete of brick and cement? Yes.

132. Is there much rock? Yes, there is a considerable amount of rock excavation. The main tunnel will be lined and made good with concrete in order that the flow of the sewage shall be uniform. 133.

- G. H. Stanyon, Esq.
10 Oct. 1888.
133. Then it will not be solid rock where the tunnel is? The tunnel will have to be made in solid rock.
134. And you will line that also? Yes.
135. Can you form any approximate estimate of the durability of a work of that sort? Scarcely.
136. The reason why I ask that question is because a question has arisen with the Committee as to the term over which repayment should extend: whether for twenty years or sixty years. Of course, the life of the work would have a great deal to do in governing the Committee in coming to a decision? The class of work which would be executed here is such that I can safely say that in eighty or one hundred years it ought to be thoroughly efficient, and with slight repairs it would last for a much longer time.
137. I think that in evidence you gave some time ago you said that repayment for works of this sort was extended over a longer period at home as a rule? Yes. It was originally a much shorter period.
138. The works being permanent, and lasting for so long a time, is it supposed that those who have the advantage of them at a later period should contribute as well as those who happen to use them immediately after they are constructed? Yes; that is so. Every year several millions of money are advanced by the English Local Government Board upon the longer period for that very reason.
139. In carrying out large works of this sort are they not regarded as a safe investment for money? Where municipal authorities have taken large loans their stock is invariably considered very good indeed, and is well quoted in the market.
140. Supposing that the Government required to raise money for the purpose of constructing works like these for a period of fifteen or twenty years, could not approximately the same money be raised at the end of that time, and would not the original works form a fair security when that time arrived? Yes, certainly; they would be equally valuable at the end of fifteen years.
141. Would it be a fair asset for the amount of money which had been advanced? Certainly. The English Public Health Act of 1875 gives the Local Government Board a discretionary power. They may sanction loans for such term as they think fit. It depends on the nature of the works, e.g., for wood pavements they only lend money for seven years. For gasworks, machinery, and so forth, the period varies from twenty-five to fifty years; according to the class of work. For water and sewerage works they lend money for sixty years. In the latest and very largest works the term has been extended beyond that.
142. These are understood principles? Yes; these are accepted principles. There is another reason why this question will press itself very strongly in this Colony. Population increases so rapidly, unprecedentedly so in some parts,—that works have to be provided for double or even three times the present population. It would press very hardly in some cases upon the present property owners or ratepayers to provide for such a long way ahead. They are laying the foundation of works which will equally benefit the next generation.
143. *Mr. Garrard.*] And equal to the requirements of the next generation? Yes.
144. *Mr. Sydney Smith.*] What area of land will be left unprovided for within the municipalities by this system of sewerage? It takes the whole of Victoria. It does not take the whole of East St. Leonards, because there are parts of that municipality which are not at present populated. It takes all the heart of St. Leonards and includes portions now very thinly built upon. It does not extend along Military Road beyond Blöxsomé Road. But if it is ever required, a considerable part of the slope on the north side of the Military Road, between the Military Road and Long Bay, could be included. The area can be considerably extended in various ways if it is ever required.
145. Have you provided in this system for the whole of the populated parts? Yes, for the whole of what is coloured red on the plan.
146. Is there any residential portion not provided for? There is a small portion beyond the Cemetery. It was so undefined when the survey was made that it was impossible to say what would be done with it. But these sewers can be extended for, say, two streets in length, and they would thus come up to the municipal boundary.
147. It could be all worked in with the present system? Yes.
148. What about the low-lying portions? They are simply narrow margins on the water frontage, and I do not think that any evil or nuisance whatever would accrue from allowing the residents to continue that drainage; provided the drains are properly carried below low-water mark. Should it ever occur that from some of these places the amount of sewage was so great that it would create a nuisance, the question could be dealt with either by the Shone system or some other low-level pumping system.
149. Does the estimated cost include the work in connection with the sewerage connections and everything? It includes only the sewers.
150. Not the house connections? No.
151. Will that be an additional cost to the ratepayers? Yes; that is so all the world over.
152. Have you made any calculations as to what that additional cost will be? No.
153. Will it not be something considerable? Yes. I cannot answer that question definitely, because the cost of private drains depends upon the nature of the work to be done.
154. In this particular place I understand it is mostly composed of rock? Partly rock. In some places rock will not be met with. To compensate for that the greatest portion is on a slope, so that in many instances the house drains need not be laid more than 2 ft. 6 in. or 3 ft. deep, because the natural slope would ensure ample fall. It would not, therefore, be especially expensive. I cannot say exactly how much it would be.
155. With regard to the amount, what would it cost extending over a period of sixty years; is it estimated to be £4,230 per annum? No. The amount should be £4,553. The rate for sixty years is not, as stated in the report, about 4 per cent.; it is 4.42 per cent. All the sixty years calculations are based on 4.42 per cent. That provides for interest and repayment.
156. *Mr. Copeland.*] Would 0.42 per cent. go towards payment of the principal and 4 per cent. to interest? Yes; 4.42 per cent. was taken from the official tables issued by the Local Government Board, so that they are perfectly correct. The 4 per cent. in the report is a misprint. I said about 4 per cent., and I had not those tables by me at the time. It is really 4.42 per cent.
157. That makes a difference of nearly 1½ per cent. between the shorter and longer periods? Yes; on the £77,000 outlay it reduces the annual cost from £5,570 to £4,553, and that annual cost includes the cost of labour and chemicals for treatment, and supervision; in fact, the whole working expenses. But an expenditure of £77,000 does not now include all that is desirable to be taken into consideration. The conditions have altered during the past two years, and they are such that it is most desirable to consider the whole scheme.

MINUTES OF EVIDENCE—DRAINAGE WORKS, NORTH SHORE:

scheme as foreshadowed in this report. At page 10 of the report the estimate shows that for a main sewer, sub-mains, outfall works, and subsidiary sewers, Schedule A, the cost would be £77,000. The sewers in Schedules B and C would make up the difference between £77,000 and £107,000. It was then thought that the sewers in Schedules B and C might stand over for a period of seven years; but the recent development of the district in certain parts has been such that it is most essential that the whole scheme should be considered and provided for. £107,000 at twenty-eight years would increase the annual expenditure to £7,570; at sixty years, to £5,875; or, in other words, a 7½d. or a 6d. rate respectively.

G. H. Stayton,
Esq.
10 Oct., 1888.

158. The present system in the boroughs is known as the earth-pan system? They have both earth-pans and cess-pits.

159. But principally earth-pans? Yes.

160. The present charge to the ratepayers is something like £3,100 per annum? I do not think that that is strictly correct. From the information supplied by the municipalities it appears that they make charges varying from 4d. to 6d. per pan per week. There are over 3,000 houses in the district, but there are a certain number of those houses which do not have their pans emptied by the municipal authorities. The occupiers attend to them themselves, and empty the excreta somewhere within their own premises. If the whole of the houses were attended to in the same way by the Councils, the cost of emptying the dry earth-pans would be over £3,000 a year.

161. Do you think it is desirable to allow the residents to empty their pans on their own premises? It depends upon what the premises are like. Of course, some premises are very large, and the pans might be emptied without any nuisance. On the other hand, where the back-yards are contracted, it is not at all desirable.

162. *Mr. Copeland.*] I suppose the material is dug into gardens? Yes. In which case it depends on the area of the land whether it is injurious.

163. *Chairman.*] And in some measure on the character of the soil? Yes.

164. *Mr. Sydney Smith.*] In addition to that there is the house drainage which would be provided for, and which I presume now empties itself into the gutters? Yes, and into certain drains laid by the municipalities, which discharge into the natural water-courses, and which have obviously become very foul. There is one point in connection with the annual cost which I omitted to state. Assuming that the rateable value in 1894 amounts to £300,000 (it is now £217,000), the rate for the whole scheme would then be 6d. for twenty-eight years and 4½d. for sixty years' repayment.

165. *Mr. Kethel.*] It was stated by Mr. Bennett that it was intended to screen the sewage, or to precipitate the matter held in suspense, before it was allowed to go on the filter beds? To strain it first and then precipitate it.

166. How is the solid matter disposed of after it is strained? The straining is to take out any specially large or hard substance in the sewage which might interfere with the process of precipitation. The sewage itself, after precipitation, goes to the bottom and forms a sludge. That sludge would then be collected together and drawn into a mud pit. It would there be collected in receptacles. As stated in the report, the amount of sludge for some time to come would probably not exceed 5 tons per day. That would then be dug into the earth and covered up, or be subjected to pressing and be converted into dry cake. Fifty tons of sewage sludge when thus treated will decrease to 10 tons.

167. To what purpose is it intended to apply this dry cake? It might be used by the market-gardeners or agriculturists for manuring purposes.

168. In view of the fact that it will have to be treated with certain chemical substances to get it into that condition, would not the presence of those chemical properties impair its efficiency for manuring purposes? I think not.

169. Is it not possible that the chemicals may render it injurious for plant food? The experience is very much to the contrary. Thousands and thousands of tons are made every day, and disposed of to farmers, in England.

170. Does your experience go to prove that the chemical substances required to precipitate the solid matter and prepare it to become dry cake do not impair its efficiency as manure? No; before the cake is finally turned out, it is sometimes fortified and made of greater value, and then it is of greater service for agricultural purposes.

171. *Mr. Garrard.*] What is the height above sea-level of the sewer at Blue's Point? Forty feet at Milson's Point; 55 feet at Blue's Point.

172. What is the reason for that difference in the levels? Forty feet is the termination of the main sewer; and 55 feet is the end of a branch sewer which ends at Milson's Point.

173. Is it possible to bring all those areas which are outside the coloured portions on the plan within the present scheme; for instance, Queen's Park and beyond there? Some of those streets could be.

174. That is to say, are your mains sufficiently large to bring in that extended area of drainage? Yes; the mains are sufficiently large.

175. Does that hold good with respect to the area on the further side of the Military Road to which you have referred? Yes.

176. Has there been any consideration given to the large area on the western side of Lane Cove Road; will that have to be treated separately in future? There has not, so far as I am aware. The fall there is towards the river.

177. *Chairman.*] Did you state that in England this pressed cake is sold to farmers? Yes.

178. Then it is made into that condition for sale? Yes.

179. It does not alter its efficacy as a soil stimulant? No.

180. Is it done by a process of drying? Yes; drying and pressing.

181. The same constituents remain in the manure as before? Certainly.

182. And that could be done here? Yes; either with or without being fortified by the addition of other chemicals.

183. *Mr. Kethel.*] Does not the application of lime to sewage tend to liberate the large amount of ammonia contained in it, and reduce the quantity of ammonia which is essential to plant manure? I have never heard that question raised, and I am not prepared to answer it.

Dr. John Ashburton Thompson sworn and examined :—

Dr. J. A.
Thompson.
10 Oct., 1888.

184. *Chairman.*] Are you Deputy Medical Adviser to the Government? Yes.
185. Have you been very much impressed with the necessity for a proper system of sewage in Sydney and its suburbs during your professional career? Yes.
186. It is the case, I suppose, that the public health is considerably interfered with from the want of proper drainage and sewerage? I have very little doubt that the death-rate of the city and suburbs might be reduced by 5 or 6 per 1,000 if proper drainage and scavenging were employed.
187. I have frequently seen it stated in the newspapers that certain of the suburbs of Sydney have been more exposed to typhoid, for instance, than others. Would that be in some measure attributable to imperfect drainage? I think it is attributable to imperfect drainage in part and in part impure sources of water supply. But I should, perhaps, mention that the statistics which are supposed to show the relative prevalence of disease in small areas are not very accurate for several reasons. One very important reason with respect to typhoid fever and diseases of that class, which are indications of the state of a district as to drainage and scavenging, is that a large proportion of the deaths take place in hospitals, and are credited to the districts in which the hospitals happen to stand. That is a very serious cause of error in the statistics. When the figures are taken for the whole of the suburbs and city they are perhaps tolerably correct, but when you come to compare one suburb with another or with the city then the figures fail.
188. Are not the germs of typhoid and diseases of that character more likely to be generated in imperfectly drained localities than in localities which are better drained? Yes; no doubt of that. Prevalent typhoid and diarrhoeal diseases are always owing to excremental contamination of air and water.
189. Have you had much experience of the systems of drainage adopted in the old countries of Europe? Yes. I know something about the subject, but I am not an engineer.
190. Have you had occasion to make yourself sufficiently acquainted with the subject to enable you to form an opinion of one system as being much more favoured than others? Yes; that is part of my special business, and I have made myself acquainted with it.
191. Are you aware that it is proposed to construct a system of sewerage for the suburb of North Shore, as it is called? Yes.
192. Do you think that the system proposed is a desirable one, as far as you have made yourself acquainted with it? I do. I do not know that any better system could be adopted.
193. As a medical man do you think it is desirable in the interests of the health of the community that a system of that sort should be adopted? I have no doubt of that.
194. You are not aware of any injurious effects that would be likely to be produced by the great depth of the principal drains or tunnels by which the sewage is proposed to be carried off? No, I think not; provided there is proper ventilation.
195. Without proper ventilation would it be dangerous? Yes.
196. Have you known any injurious effects to result from the system of deodorisation or filtering which is proposed to be resorted to in this case at Long Bay? No; I have not.
197. Is it the case that in many parts of the world it is regarded as a desirable means of utilizing sewage to adopt it to agricultural purposes? The proposal is to precipitate, and then to filter, and I think that that is recognized to be the best plan, in most cases, of dealing with sewage. Its use for agricultural purposes is subsidiary, and I think for my own part that much stress ought not to be laid upon that, and upon any possible profit which may arise in that way.
198. But is it not a desirable means of utilizing the solid matter? Yes; very desirable.
199. And probably might be made useful in other respects for producing green crops? Yes; it is very desirable that it should be utilized in that way.
200. Although that would be a subsidiary part of the scheme, do you not think that it would be an important one at the same time? Yes. What I mean is that the main thing is to get rid of the sewage. You might make some money by the way, but that should not be reckoned upon or seriously regarded.
201. *Mr. Sydney Smith.*] Do you think it is desirable to allow the ratepayers to empty nightsoil into gardens? Certainly not in populous places.
202. Is it dangerous to the health of the inhabitants? Yes; I think it is.
203. Would you recommend that it should be allowed in any place? Not in any populous place.
204. In any of our suburbs, such as North Shore? Certainly not, more especially where a considerable portion of the drinking water is taken from tanks or wells. Even after the town water supply has reached a neighbourhood people within a certain distance of mains are compelled to take it, but there is no law compelling them to close the old sources of water supply. Many people think that water from wells is sweeter and softer, and when it contains sewage it is a fact that it is often sweeter than perfectly pure water.
205. Irrespective of that it is unsatisfactory? Irrespective of pollution of well-water I think it is highly undesirable, and it should be strictly forbidden.
206. Under the Nuisances Prevention Act is it not prohibited in certain places? Yes.
207. Do you think that ought to be extended to all municipalities? Yes; if a district is populous enough to be erected into a municipality the Nuisances Prevention Act ought undoubtedly to be proclaimed at the same time.
208. *Mr. Copeland.*] Do you think that vegetables grown by the use of this sewage would be likely to convey disease? I do not think so. There is one rule that should be observed with regard to vegetables from a sewage farm, that is that they should be boiled. One should not grow on a sewage farm lettuce, water-cress, or anything eaten raw.
209. What means would there be of preventing vegetables of that kind from being grown on a sewage-farm and eaten raw? I do not think it could be prevented; the people can be instructed, that is all.
210. There would be a danger that while on the one hand you are preventing danger by effective drainage, on the other hand, if you use this sewage for market-gardening and agricultural purposes, you will probably produce another means of spreading disease? I think the danger is remote and depends entirely on what sort of thing you grow. If you manure wheat land you will do no harm at all. It is only dangerous when the sewage is used in market-gardens where lettuce, water-cress, and other things eaten raw are grown.
211. Cabbages would not be injurious through being manured with sewage? Nothing is injurious unless the crude sewage is sticking to it. Cabbage must be boiled, and anything adhering to it is effectually killed by the boiling. Lettuce is usually eaten raw, therefore you should not manure it with sewage.
212. Would boiling be sufficient to kill any germs of disease? Entirely sufficient.

213. Do you think that the method supposed to be adopted by the Chinese gardeners of watering cabbages with liquid manure is likely to spread disease? I have never eaten salad in Sydney—that is all I can say; but I have eaten cabbages, and I do not care how they are grown as long as they are boiled.

Dr. J. A.
Thompson.
10 Oct, 1888.

214. *Mr. Kethel.*] In some parts I believe a large amount of cattle fodder is grown on sewage farms. For instance, in Adelaide very extensive crops of green fodder and various root crops and grasses are grown, and cattle are stall-fed on these crops. What is your opinion, as a professional man, with regard to fodder of that kind, grown on land where liquid sewage is actually flowing around the plants while growing, and the cattle being fed exclusively on that fodder for many months;—would the fact of their being fed in that way be injurious to the flesh of the animal, and make it unwholesome, and would it be injurious to the milch cows? Fodder so grown is fit food for milch cows. There is no evidence at present to show that there is danger in that practice; but that answer must be taken subject to the way in which the sewage farm is managed. If the sewage is improperly applied to the land, so that the growth is very speedy, watery, and rank, it does produce an effect upon milk; for example—milk from animals so fed does not keep quite so long as milk from animals otherwise fed; but a farm which produces that sort of food is improperly managed. If the supply of sewage is moderate, carefully applied, and not beyond the needs of the plants, they produce no bad effects upon the cattle. On the contrary, this is a very proper way of utilising the sewage.

215. *Mr. Street.*] Is it not a fact that vegetables grown upon sewage land develop, in boiling, a much more offensive odour than vegetables grown in more natural soil, showing absorption to some extent of the injurious matter in their growth? I have heard that said, and what I said just now with regard to cattle-feed, of course, holds good with regard to vegetables; but practically, I think I get my vegetables often enough from Chinamen, as other people do, and I cannot say that I have noticed anything of the sort. I know nothing accurate on that point.

216. Do you consider that in this process of deodorising sewage and precipitating it, there will be no offensive contamination of the atmosphere in the neighbourhood? No; I think not. The experience of similar works in England shows that is a remote contingency.

217. It is not injurious to the health of the people? It is not injurious to health, and not even a nuisance to them, apart from actual injury.

Mr. P. W. Glacken, Mayor of East St. Leonards, sworn, and examined:—

218. *Chairman.*] Are you the Mayor of East St. Leonards? Yes.

219. Have you been long a resident in the municipality? About nine years.

220. Has it grown considerably in population? Yes; within the last six years the population has doubled itself.

Mr. P. W.
Glacken.
10 Oct, 1888.

221. What is the number of your inhabitants now? About 6,000. We have 1,138 houses in the borough, and we generally take an average of five for each house.

222. Has the municipality you represent made itself acquainted with the project for draining the whole of North Shore? Yes; our Council has given the matter consideration, but more from a business than a scientific point of view.

223. Do they know the principle generally on which it is proposed the work should be carried out? Yes.

224. Do they concur in the construction of the work? Yes.

225. Are they prepared to pay the amount which will be annually charged for its construction? Yes; I think they will do so very willingly. I have a return, showing the valuations of the borough. From 1885 up to the present time it has increased 70 per cent. in the assessment value. In 1884-5 the valuation of property in the borough was £45,000; this year it is £75,000.

226. The general receipts were increased by so much? Yes; the rates have increased proportionately during that time.

227. *Mr. Copeland.*] Were these valuations made by the same valuers? No; we advertise for valuers every year. For many years the Council Clerk made the valuations, with an assistant.

228. Is your population largely increasing? Yes. I think about six years ago it was 3,000; now I take it to be 6,000.

229. Is it going on increasing? Yes.

230. Is the rate of increase much greater than it was six years ago? Yes.

231. There is an alternative project spoken of. That is, whether the period of repayment by the municipalities should be twenty-eight years or sixty years. Sixty years, of course, would mean a much lesser annual rate than twenty-eight years. Have you given any attention to that question in your Council? That matter has not been put before our Council for consideration.

232. Have you formed any individual opinion about it yourself? I would favour the term of sixty years. Being a permanent work, twenty-eight years would bear rather heavily upon the present population.

233. You are not a professional man? No.

234. Do you think there would be no doubt about your municipality being prepared to contribute the stipulated annual payment? I think so. I may be allowed to submit to the Committee one or two facts which have been brought before me. From August last year till August this year we received, for the removal of night-soil, £965 6s. 1d. in our borough alone. That was by contract for services rendered. The regular charge is 6d. per pan per week for houses up to six rooms; above that we charge 9d. There are two services per week if required.

235. What is the gross sum? £965 6s. 1d.

236. That is more than you would pay under the proposed system of drainage? I assume that it is more, when we consider the increase of population. By the time the sewer is constructed—in two years' time—there will be increased population.

237. Has the question of incurring this expenditure been submitted to the ratepayers? Yes; it was not submitted as a question at elections, but it was submitted to a public meeting in 1885, and it was then enthusiastically received.

238. Do you not think it would be desirable, before committing the borough to this expenditure, to submit the question at a municipal election, and have a vote? I do not think so.

239. I suppose you are aware that that course is adopted sometimes? Yes; when there is any question of difference of opinion—when there is reason to suppose that the people, or any particular portion of the people, are opposed to any proposal, but not when no complaint seems to arise.

Mr. P. W.
Glacken.
10 Oct., 1888.

240. Do you think that there is unanimity of opinion on this subject? I would not like to say unanimity, but the portion objecting would be very small.
241. What percentage? I have not heard anybody speak against it, and I have talked over the matter frequently with ratepayers.
242. When the matter has been brought before the Municipal Council, has it been unanimously approved of there? Yes; in fact, all the people at North Shore are most anxious for a scheme of sewerage.
243. Has there been any general expression of opinion as to the desirability of extending the repayment over sixty years? No; that has not been put before the Council.
244. Do you think the people would be prepared to incur the responsibility of repaying the amount in twenty-eight years? I think they would prefer sixty years.
245. But I suppose you have not consulted the people of sixty years hence about it? It would be difficult to confer with them, and it would be difficult to make some of them understand it.
246. As a matter of business, do you not think it would be better to confine the term of repayment to something like a reasonable period—to the present generation, in fact? I do not think so.
247. Would you propose, in debts of any other character, that the term of repayment should be extended to the next generation? I would not come before this Committee in that case. I would do the best I could for myself.
248. You would not propose that your grandchildren should pay off a debt of yours? I would, if the terms were good, and I got the chance.
249. I suppose you have no doubt whatever that if Parliament adopts this scheme the people will be prepared to pay the amount back again in the term of twenty-eight years? I think they would prefer sixty years.
250. Do you think they will be also prepared to accept the term of twenty-eight years? I cannot answer that question. I know the people are very anxious to have a system of sewerage.
251. If Parliament voted for this scheme, you do not know whether the people would be prepared to take it up at twenty-eight years? I think they would take it up. I know that they would prefer a term of sixty years; and if a poll were taken, they would be unanimously in favour of the term of sixty years.
252. Still you are aware, perhaps, that the existing Act provides for a term of twenty-eight years? Yes.
253. So that if this scheme were submitted to Parliament under the existing Act, there is no doubt that the people would accept the proposal and take upon themselves the responsibility of repaying the money in twenty-eight years? If there was no alternative, and if you said, "take twenty-eight years or nothing," I do not think they would give up the system of sewerage.
254. Do you not think that the increased value of property, on account of this public expenditure, would more than compensate for the additional expenditure in rates? Yes. Looking at our rates for the last year, I find that there was received, under the shilling general rate, £3,765; therefore, a rate of 6d. in the £ in our borough for drainage would yield £1,880 per annum. Seeing that our ratable value has increased from £45,000 in 1884-5 to £75,000 in 1888, it is certain that the burden will become less and less upon the people, and I do not think we shall require a 6d. rate. At the same rate of progression, in six years more the assessed value in our borough would be about £135,000.
255. Therefore, there will be no financial difficulty in the way of the people repaying this money under the terms provided by the Act? No; I think the people would be very glad to adopt it, because at the present time a house worth £50 a year is charged 6d. per week for removal of nightsoil—that is, £1 6s. a year. A 6d. rate would only amount to £1 5s. a year.
256. Do you know the scheme submitted to the Committee? Yes.
257. Has your Council no objection to it in any way? None, to my knowledge.
258. Are they quite satisfied with the details of the scheme? Yes.
259. Do they wish to suggest any amended scheme? There is only one suggestion which I would submit. I believe these works are to be placed under the Sydney Water and Sewerage Board. I would suggest that a separate Local Board should be constituted to take charge of the works.
260. That is, in order that your municipality should have control of the works? Yes; the municipalities or some persons selected for that purpose. That is, because we are separated from the other boroughs by the water. The population on the city side is so great that we can never expect to get representation on the Board in Sydney. The people like to have representatives of their own localities. If something is not soon done in the way of drainage, we shall have malaria on the North Shore. Careening Bay and Neutral Cove are getting into a very bad state.
261. Do you think there is any likelihood of injurious effects being produced by this sewerage scheme at Long Bay? I would not like to give an opinion on such a scientific question.
262. *Mr. Humphery.*] Are the majority of the houses in your municipality rated at less than £50 per annum? No; I should say that the majority are rated at more than that. There is only one portion of the borough where there are such small valuations. At Kirribilli, most of the houses are rated at over £300 per annum.
263. *Mr. Sydney Smith.*] Have you borrowed any money on your rates? Yes; I think it is £21,000 or £23,000.
264. At what rate of interest? The last loan of £6,000 was borrowed at 5 per cent.
265. Is your rate 1s. in the £? 1s. in the £ general rate; 3d. in the £ for lighting.
266. Is there no sewerage rate? Last year we had, but we did not levy a sewerage rate this year.
267. Did you borrow on your general rate only, or on the lighting and general rates? We borrowed on the general rate.
268. When you borrowed you had a lighting rate in force? Yes.
269. And a sewerage rate as well? No; that rate was only imposed for one year.
270. For what reason did you discontinue it? We had made a good deal of sewerage from time to time, and the people were very liberal in subscribing money to make drains, and it was thought expedient not to impose the tax for some time. It was not entirely abandoned.
271. What was the amount of the rate? 1d.
272. What system is adopted with regard to house drainage? The drainage, as far as practicable, is drained into what we now call our main sewer. There is a very large sewer or drain through the centre of the township, and as far as practicable the sewage is taken to that, and it then finds its way into the bay.
273. Is it conveyed through pipes all the way? There is very little gutter drainage in our place. We have a great quantity of pipes, but it is principally drained into this main sewer.

Mr. P. W.
Glacken.

10 Oct., 1888.

274. What does it cost you generally for attending to the drains and scavenging? Scavenging costs £5 8s. a week; but that is a self-paying arrangement. We charge the ratepayers for removal. We also pay an Inspector of Nuisances out of the tax we charge for the removal of nightsoil.
275. Do the Council undertake the removal of nightsoil, or is it done by contract? It is a contract with the Council. The Council charges the ratepayers so much. Last year the revenue came to £965. We paid the contractor £865, so that we had a profit of £100.
276. I suppose the Inspector of Nuisances has a great deal to do in attending to the removal of nightsoil? Yes; and the removal of rubbish, as well as the administration of the By-laws.
277. Is any of the nightsoil buried in the gardens? Only in places where they have large areas of ground.
278. Is it permitted in those cases? Yes; under the By-laws we give permission, but we are very careful in seeing that they have large areas of ground.
279. Does the household drainage cause a great deal of nuisance at present? It goes to the pipes under the surface.
280. Have you any system of flushing? No; if complaints are made, we sometimes send a water-cart down to flush the drains.
281. Are the pipes connected directly with the houses? With the yards.
282. Are any of them connected with the houses? No; of course they receive the slops from the houses in the yards.
283. What provision is made to prevent foul gases getting into the houses? Only the ordinary sinks and traps.
284. There is no regular system of flushing the drains? No; the storm-water finds its way into the pipes. We have ventilating shafts wherever we can.
285. If you had the proposed system of drainage, do you think that a great deal of the present nuisance would be prevented? Yes; and the value of property would be considerably enhanced. There would be a large increase of population, as it is a favourite place for residing now, except for the want of drainage.
286. Have you any alterations to suggest in the proposed system? No; I have every confidence in the gentlemen who have charge of it.
287. Do you think it is a very complete system as far as your borough is concerned? Yes; as far as I am competent to judge.
288. *Mr. Copeland.*] You have stated that the annual income in your borough is £3,756 a-year? Yes; for a shilling rate.
289. That is the general rate? Yes; 1s. general rate, and 3d. lighting rate.
290. You have stated that you have borrowed £21,000 at 5 per cent.? Yes.
291. When you borrowed that money did you issue debentures? Yes.
292. What provision have you made for the repayment of the principal? There is no sinking fund.
293. Then at present your interest on that loan will amount to £1,050 a-year? I think it amounts to more. It is only lately that we have borrowed at 5 per cent.
294. At any rate, you have to pay over £1,050 by way of interest, without making any provision for repayment of principal? Yes.
295. You have provided no sinking fund whatever? No.
296. In the face of this present liability, do you think that it is wise for the Council to take upon itself additional responsibility in the way of this expenditure for drainage;—will the Council be strong enough to make provision for repayment of the loan of £21,000, which will have to be repaid some time or other? I have heard Mr. Stayton's evidence as to the amount which will have to be paid by these boroughs for carrying out their scheme, and I do not think we shall have any difficulty in paying our share. We assume that the rates will continue to increase each year, so that the burden will annually become less on the people, and it will be no hardship.
297. Some of this increase will have already taken place before the scheme is carried out? Yes. It is to be assumed that it will go on at the same rate of progression; in fact, I should say more rapidly.
298. *Mr. Garrard.*] Is this charge of £965 per annum for the disposal of night soil made for the dry-earth service and cesspits together, or is it the dry earth alone? For both.
299. What is the proportion of dry-earth pans to cesspits? I cannot say. We have passed a By-law, which we have given notice of, for dispensing with the cesspits altogether.
300. Where is the nightsoil deposited? I do not know.
301. Do you cast the responsibility on the contractor? Yes; so long as he has proper carts. At one time it used to be deposited in the reserve; but I think it is now taken into the country.
302. Have you had long experience as a Borough Councillor? Yes.
303. Do you know any borough which provides a sinking fund for loans? No; the question surprised me.
304. Do you think that the enhanced value of the borough property is sufficient guarantee? Yes.
305. Have you yet borrowed up to the limit under the Municipalities Act? No.
306. Do you think it is a very slight matter to take the responsibility of a drainage rate of this kind? I do not think we need to hesitate for a moment.
307. Do you think that the people would gladly pay more than they are paying now to get rid of the sewerage? I think so. From conversations I have had with the ratepayers, I believe that they would be willing to pay a little extra.
308. Does the greater part of the sewage matter now go down to Careening Cove? Yes; and Neutral Bay.
309. Are there not loud complaints about that? Yes; it is in a very dangerous state. It is not safe to ride along the foreshores at present, and it will be worse in the summer months.
310. *Mr. Humphery.*] If the term of repayment for this sewerage scheme were spread over sixty years, the present financial position of your borough would not be affected at all? No; not in the least.
311. *Mr. Sydney Smith.*] You say that you have a lighting rate of 3d. in the £—what are the expenses in connection with lighting? We do not save anything on that account. We keep on putting up additional gas-lamps.
312. The expenses would be as much as the revenue derived from the rate? Yes; there might be a little; but there are so many applications for lamps that we have seldom any funds left.

Mr.

Mr. F. Smith.

Mr. Frederick Smith, Mayor of Victoria, sworn and examined :—

- 10 Oct., 1888. *Chairman.*] Are you Mayor of the Borough of Victoria? Yes; this is the fourth year I have been Mayor. I have been ten years connected with the Borough.
314. Are you an old resident in the district? Yes, for twenty-five years.
315. Are you aware of the proposed sewerage works? Yes.
316. Is your Council also aware of them? Yes.
317. Do they understand the principle on which the works are based? Yes.
318. Are they consenting parties to the proposal? Yes.
319. Are they prepared to pay the rates for which they will become responsible? Yes; I have no doubt of that, or very little doubt. I have not been made aware of the rate likely to be imposed.
320. From your knowledge do you think they will be ready to contribute the amount required? Yes.

Captain Benjamin Jenkins, Mayor of St. Leonards, sworn and examined :—

- Captain Jenkins.
10 Oct., 1888
321. *Chairman.*] Have you been for some time a resident of North Shore? Yes.
322. Is your Municipality St. Leonards? Yes.
323. Are you Mayor of that Municipality? Yes.
324. Have you been Mayor for some time? Yes, for four years.
325. How long have you been connected with the Municipality? Ten years.
326. How long have you resided in St. Leonards altogether? Fourteen years.
327. Are you aware of the drainage works proposed to be carried out there by the Government? Yes.
328. From what you know of the Council, are they consenting parties to the work being undertaken? Yes.
329. Are they prepared to pay the necessary rates which the work will entail? Yes.
330. Do you think that feeling is entertained by the ratepayers generally? Yes; the general feeling is to have the scheme carried out. They are almost unanimous. We are unanimous in the Council, and it is also the general feeling of the public.
331. Have you heard any objection urged to the principle on which the work is proposed to be carried out? No.
332. *Mr. Kethel.*] Do not some of the residents on the Middle Harbour side object to the outfall of the sewer? I never heard of any. I think that they get plenty of the sewage as it is; the creek which runs down there is very much polluted.
333. The creek flowing over Willoughby Falls? Yes.
334. So that so far as the people in the immediate neighbourhood of Willoughby Falls are concerned, this scheme would rather remove pollution than increase it? Yes.
335. *Mr. Street.*] What is the ratable value of property in your borough? About £6,000 is the annual revenue for a rate of 1s. in the £.
336. How far does your boundary go? From the old sugar works along Middle Harbour down to Middle Head and Bradley's Head, and across to Mossman's Bay. East St. Leonards and Victoria form our southern boundary.
337. Is the earth closet system in use in your municipality? Yes; and cess-pits.
338. Do you know the annual amount received for the removal of night-soil? About £400. There is a great deal of land in which people bury night-soil.
339. In the more scattered localities and larger areas? Yes.
340. *Mr. Garrard.*] Are you discontinuing the system of burying night-soil? Yes; there is a certain acreage of land prescribed before permission will be given.
341. Are you still giving permission? No, not in the thickly populated portions.
342. Are you rather restricting than extending that privilege in the part of the borough which is most largely built upon? Yes. In the thickly populated parts none is buried.
343. Is your drainage surface drainage? Yes.
344. And from the southern slopes it has to go through some portion of the Borough of East St. Leonards? Yes. From the top of Ridge-street it goes into Neutral Bay, Shell Cove, and other places.
345. Has there been any complaint on the part of the Municipality of East St. Leonards? Yes. They had an action against us some time ago, and we have now to pay £90 a year for letting it go down there.
346. What is the indebtedness of your borough? We kept out of debt until this year, when we borrowed £5,000.
347. Is that your only debt? Yes.
348. Do you think that the proposed scheme is immeasurably better than the present surface drainage? Yes.
349. Have you a lighting rate in your borough? Yes; 3d. in the £.
350. Is the municipal rate 1s. in the £ on nine-tenths of the annual value? Yes.
351. Have you no other rates? We have laid down some drain-pipes and we charge a certain amount to those houses which drain into them.
352. Have they any system of pipes for East St. Leonards? I think in some places they have pipes. It is still carried on the surface.
353. If there is any serious objection to a scheme on the part of the inhabitants are not they always ready to hold public meetings? Yes.
354. Is it your experience that where municipal councillors do not interpret public feeling rightly the public are always ready to call meetings and bring them to book? Yes.
355. When does your term expire? Next February as Mayor, and February 12th as Alderman.
356. In view of the coming election have you any fear of facing the public on this question? No.

George Henry Stayton, Esq., M.I.C.E., Engineer, Sewerage Branch, Roads and Bridges Department, recalled, and further examined :—

- G. H. Stayton, Esq., M.I.C.E.
10 Oct., 1888.
357. *Mr. Sydney Smith.*] Following up a question which I asked with regard to what is intended to be done with the sum of £107,000, I wish to ask if that sum is only intended for the main sewers and not for connections with the houses? No. The estimate of £107,000 is for the main sewers and all other street sewers.
358. Have you any idea what cost will be entailed on property owners for connecting with the sewers? No. I cannot give any opinion that would be of service. 359.

359. What do you think it would cost per house? I cannot give an opinion of any value.
 360. Can you not give us any reliable opinion? I am afraid not.
 361. *Mr. Garrard.*] When examined before on this matter did you not state that it would depend upon the nature of the ground—whether it was composed of rock or soil? That would be an important element.
 362. Is it any part of your work to estimate the cost of connections with sewers by individual property owners? No.

G. H. Stayton,
 Esq.,
 M.I.C.E.
 10 Oct., 1888.

THURSDAY, 11 OCTOBER, 1888.

Present:—

JOSEPH PALMER ABBOTT, Esq. (VICE-CHAIRMAN).

The Hon. GEORGE CAMPBELL.
 The Hon. FREDERICK THOMAS HUMPHERY.
 HENRY COPELAND, Esq.
 ALEXANDER KETHEL, Esq.

JOHN RENDELL STREET, Esq.
 JACOB GARRARD, Esq.
 SYDNEY SMITH, Esq.

The Committee further considered the proposed Drainage Works at North Shore.

Mr. Walter L. Vernon sworn and examined:—

363. *Vice-Chairman.*] Are you a resident of North Shore? Yes.
 364. Have you been Mayor? Yes, of East St. Leonards; but I come to-day as a ratepayer, and not in an official capacity. I am an alderman, but I come here merely as a ratepayer.
 365. What are you by profession? I am an architect and surveyor, and an engineer to some extent. I am an architect principally.
 366. Have you had under consideration the proposed scheme of sewerage works for North Shore? Yes. For some considerable time.
 367. Have you studied it in its details? I have never gone into the question of grades and so on, because I would not touch a question of that kind; but the general scheme I have looked at carefully.
 368. What is your opinion as to the proposed scheme? My opinion is that it is the only possible scheme taking the physical nature of the country into consideration. At the same time I think that some part of the outfall works are to a slight extent experimental.
 369. In what respect? I do not think the question of desiccation has been fully solved yet, and therefore although it is possible that the effluent water may come out clear into Long Bay, I think at the present moment there is just a chance that it will not be absolutely fresh and pure, as it comes from the area proposed to be reclaimed for that purpose. At the same time I do not see any alternative at all.
 370. Do you think that the proposed scheme will satisfy the present population and the possible population for some years to come? Yes; it is equal to a very large population. It is an absolute necessity that something should be done.
 371. At present does all the drainage of North Shore go into different parts of the harbour? It runs down each creek and waterway, causing daily more and more danger to health. In fact the whole of the Shore almost is contaminated in a more or less degree. It is very dangerous in some places, especially Neutral Bay, Careening Cove, and Lavender Bay.
 372. Was not Lavender Bay a few years ago the cleanest spot around Sydney? I should think so.
 373. Have you considered the question of the payment by the Councils within twenty-eight years? I should say that under the circumstances twenty-eight years is far too short a term, because the expenditure for this scheme would be equal to something like half the present ratable value, or, in other words, about £120 per house, which is a very large proportion for any population to pay for drainage. Of course that is reckoning for the present population.
 374. Does that estimate take into consideration the cost of connecting with this system? No. I reckon that the owners themselves will have to spend £10,000 additional in changing from the earth closet system to water closets, and in making drainage connections. That will be a very considerable tax in the first instance, although I think it will be cheerfully borne. But that has to be taken into consideration, and I am strongly of opinion that twenty-eight years is far too short a term in which to allow a large scheme of that kind to be paid for by the people, because it is a scheme for a very long time to come.
 375. What length of time do you think it would be fair to extend it over? Sixty years has been mentioned. That is the usual time in England. Works are graduated there, and for permanent works of this description the extreme term is granted.
 376. Of sixty years? Yes; and in some cases a little more if circumstances permit of it. For works of a more perishable nature, such as road-making, fencing, or buildings, the time is shorter.
 377. Do you think that if they were compelled to pay within twenty-eight years it would be a very heavy tax upon the population of St. Leonards at the present time? I do not think they could do it.
 378. These works would serve double or treble the present population? I should think the main sewer would be as good one hundred years hence as it is now.
 379. And the population is capable of increasing within these drainage limits to double or treble its present extent? Yes. You can hardly form a calculation as to the increase.
 380. *Mr. Copeland.*] I understand you are quite satisfied with the proposed scheme as a scheme? Quite.
 381. You have no fault to find with the levels or anything of that kind? I should advocate the whole scheme being carried out and not merely a portion.
 382. That is for an expenditure of £107,000? Yes. I might also be allowed to make the remark that I think it would be a great advantage to the boroughs if the present reticulations were used as far as possible. If the existing drains could be worked in with the new scheme it would save expense, and be a consideration with the boroughs.
 383. The only difficulty in your mind is the question as to whether the desiccating work would be complete or not, and whether or not the water would run away in an impure state? That is the only question in my mind.
 384. Have you considered the scheme for purifying the drainage? I have.
 385. Have you read the report of Mr. Stayton? Yes.

Mr. W. L.
 Vernon.

11 Oct., 1888.

- Mr. W. L. Vernon.
11 Oct., 1888.
386. Have you read about the method to be adopted for precipitating it? Yes.
387. Having read that you are still of opinion that it may not have the desired effect? I think it will to a great extent, but I am not quite sanguine enough to believe that it will be absolutely perfect, because I do not know a single case anywhere where it is absolutely perfect.
388. Having this portion tinted green for filtering beds as well? Yes. My objection to the area spoken of is that it is all sand. Of course that cannot be helped. On these filtering beds, generally speaking, there is a surface water carrier and underneath a series of deep drains which take the water off until it has percolated 5 or 6 feet through soil and it is then carried away to the outlet. But in this scheme it will be taken through sand, and it seems to me that the sand will be very liable to choke the lower pipes. Therefore I do not think the filtration will be so thoroughly efficient as it would be if you had a better subsoil. Of course it is not possible to get it.
389. You think the sand would choke the lower pipes. Do you mean the main channel? There is generally a lower system of pipes.
390. I understand this is to be a tunnel? But I refer to this portion marked green on the plan in the filtering beds. This is just one of those cases where the scheme must take its chance. I do not see what help there is for it.
391. Have you had practical experience of similar drainage works? I have.
392. Have you seen this proposed scheme of Mr. Stayton's carried out anywhere? I have seen a somewhat similar one.
393. Was it not efficacious in that case? Well it was to a great extent because the subsoil was gravel and chalk—the best you can have. But we found that the results from the tanks and so on were of no commercial value.
394. The question more particularly to be considered is whether the water itself would escape in a purified state—sufficiently clean not to vitiate the shores of the harbour? It did so in the case I refer to. It went into a trout stream.
395. Then the reason you have for fearing that it will not have the same effect in this case is that here the soil is composed of sand? Of course I would qualify the statement to some extent by saying I believe it will purify the sewage to a very large extent; but I think there is always a fear that it will not be fully purified on account of the sand, and also because I think the area is rather small.
396. Can you suggest any amendment on the scheme? No. It is the best possible one under the circumstances.
397. What proportion did you say the liability incurred by this scheme would bear to the value of the houses? I think it is about one-half of the present ratable value. The present ratable value is £217,000, and the cost of the scheme would be about £107,000.
398. Are you afraid that it would impose too much responsibility on the different boroughs? It would if the term of repayment were fixed at twenty-eight years; but, with an extended term of repayment, I think there is every likelihood of the population increasing very largely if this work were carried out, and then it would become a very light matter. 6d. in the £ would more than cover it in ten years time.
399. *Mr. Kethel.*] In reference to the purification of the sewage, in making your remarks have you considered that it is subjected to two processes, namely, screening and then precipitation; then, after the removal of all the solid matter that can be removed, it is poured out and run over filtering beds? Yes.
400. Still you doubt whether it will be sufficiently effectual to remove every trace of offensive matter? I have a strong doubt about it.
401. Are you aware that there are several acres of land to be filled in to form the filtration beds—that is, a portion at present covered with water? Yes.
402. Would it not be quite possible to mix with the sand portions of lime, charcoal, or similar material, to improve the filtering qualities of the beds, so as to prevent any offensive matter being retained in solution? Everything that science can do might be done to reduce it to a minimum.
403. The main sewer will be at a great depth. Do you know what depth it will be below the surface—say at the reserve? I know it must be a great depth.
404. The question that suggests itself to some members of the Committee is whether the cost to the householder for connecting with the sewers at such a great depth will not entail an immense expenditure? The reticulating drains are only about 6 feet down. There are shafts here and there.
405. *Mr. Sydney Smith.*] What do you think will be the cost per house for connecting with these pipes? £10 per house.
406. I presume the ratepayers thoroughly understand that in this scheme the Government will only construct the main sewers, and that the ratepayers will have to pay for the connections? They understand that through their representatives, the aldermen. They all understand it, and I presume the public do.
407. There is no objection on their part? None whatever.

John Trevor Jones, Esq., Engineer of Water and Sewerage Board, sworn and examined:—

- J. T. Jones, Esq.
11 Oct., 1888.
408. *Vice-Chairman.*] Are you a civil engineer? Yes, an hydraulic engineer.
409. What is your official position? Engineer to the Water and Sewerage Board of Sydney.
410. Have you considered the proposed sewerage scheme for St. Leonards? I did so some time ago.
411. Is this the scheme as shown on the plan before the Committee? Yes. The scheme is Mr. Stayton's revised plan based upon Mr. Bennett's original scheme.
412. Have you formed any opinion about it? Yes, and I have given evidence before the local Municipal Council in favour of this scheme. That was some time ago. It was only at mid-day to-day that I knew I was to give evidence on this subject. Having refreshed my memory, I am prepared to give evidence; but I cannot profess to be quite so clear with regard to the figures as I was on that occasion.
413. What do you think of the adaptability of the scheme to St. Leonards? I think it is admirably adapted to St. Leonards.
414. The formation of St. Leonards being rather peculiar, with so many hills, is it not difficult to adapt any scheme to it? It is only difficult on account of the hardness of the strata through which you have to go. Otherwise, there being plenty of fall, there are great facilities for drainage.
415. You see what the fall is by the main tunnel from Milson's Point to Long Bay? Yes.
416. What is the fall the whole distance? The fall is 20 ft. in the whole length, but I am not sure as to the length.

J. T. Jones,
Esq.
11 Oct., 1888.

417. Do you think that will be sufficient? I think so.
418. Do you know what area of St. Leonards the scheme will serve? I believe it purports to be capable of serving 880 acres. I think it is capable of being extended.
419. Do you know where it is proposed the outfall works should be? I know that place very well.
420. Is that the best place where they could put those filtering beds or desiccating works? I do not think they could find a better, if they found one equal to it. I think that it is admirably suited to the purpose, seeing that they are going to treat this sewage and render it fit to enter into an estuary of the harbour without detriment to the water.
421. Do you know anything of the desiccating scheme proposed? Have you had any experience of it? I have not had any experience of it. I know it from theory and reading about it.
422. What opinion have you formed about it? From what I can learn, the most approved modern system is that by water-carriage. The sewage is first treated chemically, to deposit silt and clarify it; then it is put through an earth filter, which in my opinion is in the last degree the perfection of treatment. As far back as ten years ago the system was to trust to a chemical process. This proposes to superadd filtration to the chemical process, which I believe is the last degree of perfection in the treatment of sewage.
423. Do you anticipate that there will be any nuisance created in the neighbourhood of those filter beds? No; far from it. I think that the process will eliminate all chances of that, because I know that satisfactory results were obtained by the chemical process, and I know the purifying effect of passing sewage through earth. If it is faithfully done, I quite anticipate that the sewage water will be pure enough to enter into a trout stream or an inland river.
424. Have you considered this work from a financial aspect with regard to the repayment of the loan? I have considered that the period named for the extinction of the debt—twenty-eight years—is too short, and the period recommended by Mr. Bennett and also by Mr. Stayton would find more favour with me, and, I think, with the community.
425. It would make no difference to the Government so long as they got their interest? I should hardly think so. I do not think that a debt of this kind, while the interest is paid, can be any encumbrance to the Government.
426. *Mr. Copeland.*] What is the necessity for making the main tunnel at such a great depth? That is with a view to tapping both sides, to make one system of works serve both purposes. If you did not do that—if you intended to sewer both sides of the main ridge, you would require to have several main works.
427. To allow for the sewerage on both sides is it necessary to take the main tunnel at this depth? Yes.
428. It would not be possible to take it to a shallower depth, and so save a great deal of shaft sinking? No. I think it is quite as shallow as you can put it. The outfall is at 19 feet. That appears as if you could lower the outfall at the first glance, but the engineer has demonstrated to me that he requires all that; that the works for treating the water will require all that fall.
429. You spoke just now very much in favour of the most modern system of treating sewage. Is the system now proposed by Mr. Stayton in accord with the most modern method of treatment? With one exception it is. The very latest process is the electric system. Large sums of money are being contributed now to try that system, and promises are made that we shall have a still more efficient system in that.
430. Otherwise this system proposed by Mr. Stayton is quite up to date and in accord with the most approved methods of treatment? Yes; I know of nothing superior to it.
431. It was mentioned last night by one of the Mayors that they would be much more satisfied if they had some control over the management. Do you think that it would be at all possible to have the municipalities represented in any way, or is there any means by which they could have more control over the management than they have at the present time? They could have direct control, but I am of opinion that it would be a mistake to yield it for various reasons arising from my former experience.
432. What would be your opinion of a proposal somewhat to this effect: That those municipalities should borrow their own money on giving security; that they should have control over the whole works and execute the works with their own engineers, in the same way as in Victoria they carry out their water schemes? That is under Government control in Victoria, or it was when I was there. The construction was always under the control of the Government, and so far the administration was under its control; but in some of the inland towns the Government has given to the municipalities partial control over their water supply. But in this case I presume you wish an answer as to whether or not it would be desirable for them to make all these works, to have the full control of them, and to be responsible to the ratepayers for their success. I think it would be a very dangerous experiment. We know now—at least I am perfectly convinced—that the scheme as proposed would be carried out in the most economical and scientific way. I am not quite so sure whom a municipal body would employ to carry out the scheme. They might differ, and they might have various plausible reasons for differing from this scheme, and they might so far deviate from what is deemed, by me at any rate, to be scientific.
433. Is there not some danger of the Water and Sewerage Board becoming overlaid if they take control of the works of the whole of the suburban municipalities? The construction would be conducted by the Government I presume. The Board would only have to administer the works, and I do not think that would be too much for the Board to undertake.
434. To administer the whole of the water and sewerage works of all the municipalities in the metropolitan area? Yes; it would be an economy in one way, because one staff would do the whole of the work. Numerous staffs tend to increase the expenditure.
435. You have said that you think it desirable to extend the term of repayment to sixty years, and that it would be no burden to the Government? I cannot for a moment see why it should be thought objectionable on the part of the Government.
436. Do you not think there must be some limit to the borrowing powers of the Government, when you consider the number of places throughout the Colony which have an equal claim to the assistance of the Government in borrowing money for water and drainage works? There may be a limit, but so long as it can be shown to be reproductive work I hardly think that there should be a limit. I fancy that all works of a reproductive character may be safely entered into by the Government, and certainly a scheme for sewerage for a populous place like St. Leonards is certain to be reproductive.
437. Do you not think it would be safer for the Government to be getting back their money in a more limited time than a period of sixty years? There might be an element of safety in it, but I think it may be assumed that municipal works are a very safe investment for the Government or anyone else in a prosperous Colony like this.

- J. T. Jones, Esq.
11 Oct., 1888.
438. Still I suppose if the payments were coming in at a more rapid rate there would be more probability of their being allowed to go out again to benefit some other section of the community? There is that reason, certainly.
439. Otherwise you think it would be desirable, in the interests of these people, that the term should be extended to sixty years? I am of that opinion, because it will be burdensome to take it up earlier.
440. From what you know of the people in those municipalities are you of opinion that they would be prepared to take the responsibility if the Government were to vote this sum on condition that it was repaid in twenty-eight years? I think they would accept it. I am almost certain they would accept it although they would prefer the longer term of repayment. With regard to sewerage I may add this fact: that in my experience of Sydney and suburbs sewerage is as eagerly sought for when once it is within reasonable distance of the premises as water is, because the residents find that it is a cheaper way of disposing of their rubbish, besides being a far more efficient way.
441. *Mr. Kethel.*] Have you visited the Adelaide sewage farm where the sewage of the city is disposed of? I had barely a look at it. I went with the intention of spending ten days in Adelaide. I went inland first and in coming back I found that people in Sydney, especially the Mayor, were alarmed about the condition of the water supply, so that I had not a sufficient opportunity of visiting the sewage farm.
442. Do you know the nature of the system by which the sewage is there treated? It is treated by being dug into the ground of a sewage farm.
443. Is the soil of that farm specially prepared for filtration purposes. I think it is, but I am not quite certain about it.
444. *Mr. Street.*] Have you made yourself acquainted with the mode of the construction of the tunnel in this scheme? Yes.
445. Is it desirable that that tunnel should be lined? I think not, because it will be all in rock.
446. It has been stated that it is possible there might be percolation of sewage water through the sand stone rock which might become offensive in the lower levels? I do not think there is any such danger.
447. Will it be a considerable additional expense to carry out this lining of the tunnel? Yes. If there is a fissure at all in the rock the result would be not that the sewage would flow out, except underneath. The result would be that more water would filter into the sewer from the upper level. There would be constant filtration into it.

Mr. Chas. Chatfield sworn and examined :—

- Mr. C. Chatfield.
11 Oct., 1888.
448. *Chairman.*] What are you? I am a clerk. I come before the Committee as a ratepayer.
449. Have you read any of the reports on this subject? I have read the reports as printed some time ago.
450. Where do you reside? Just at Willoughby Falls.
451. That is in the locality of the outfall? Yes; at the top of the hill above the outlet.
452. I understand that you object to this scheme? I can only object to it in a general way. I cannot give any opinion founded on professional knowledge. I have been a resident in the neighbourhood for about three years past. I have made my home there, and I wish to make it there for some years to come. As I heard one witness say just now I am not at all satisfied that the sewage can be so dealt with as to become innocuous.
453. Have you had any experience? No, except what I have read. First of all there is the outlet from the sewer which must give forth some effluvia; and, secondly, the question is: will the water that will percolate through the earth be entirely innocuous? I wish to point out that Middle Harbour is one of the most beautiful places in New South Wales. It is certainly one of the most beautiful places near Sydney, and a great resort of pleasure parties. At Long Bay, where they propose to let out the sewage water, there is scarcely any tide whatever. There is no actual movement of the water as there would be in a tide-way; and if it should so happen that what is let into the water is noxious it will remain there for all time, spoiling that place, which in the course of a few years will probably have a large population, as well as other parts of St. Leonards.
454. Is there not a good rise and fall of the tide there as well as in the other bays in the neighbourhood? The water rises about 4 feet; but what I speak of is that there is no actual movement in the water as there is in a tide-way.
455. Is that because it is so shut in? For instance, if a boat were moored there, with no wind at all, it would not move, no matter which way the tide was going. The water seems to creep in and out.
456. Your only objection to it is a possible danger of its becoming a nuisance? Yes; that is my main objection. There is another thing, but it is for a more experienced person to mention, it is rather doubtful to me whether there is any necessity for that very large tunnel. It seems to be a most expensive work. There are two watersheds on the two sides of the hill. If it is necessary to drain both sides let Middle Harbour take its own drainage and let the drainage of the other side be taken by its own natural watershed.
457. Would not that necessitate two separate systems for the desiccating process and the disposal of the sewage? The question is whether that would be more expensive than a tunnel nearly 2 miles long; and then we should consider the doubt as to whether anything noxious will be carried into Long Bay. We should look to the future. In twenty or thirty years time the whole of the peninsula out to Middle Head may be thickly populated.
458. There are large military reserves in that locality? I was not aware of that.
459. What you anticipate is density of population, and that this will become a nuisance. Will not all the foreshores become equally offensive if there is a dense population and such a scheme as this is not carried out? Yes; that is the case. The question is whether something else could not be suggested.
460. Are you prepared to suggest anything else? Yes; that the tunnel, instead of being carried out in the direction proposed, should be carried out towards the mouth of Middle Harbour, where there is a proper tide. That would be a much more expensive affair; but the question is whether it would not be warranted by the future increase of population.
461. Would not the offensive matter then flow up Middle Harbour and destroy the bays? If it is only allowed to flow out at ebb tide, as I understand it is proposed, it would be carried out pretty well to the ocean.

462. *Mr. Kethel.*] What becomes of the drainage of that portion of St. Leonards proper which lies west of your residence? I believe that the whole of it, or nearly the whole, which is included in this scheme, flows into the creek.

Mr. C. Chatfield.
11 Oct., 1888.

463. And flows over Willoughby Falls? Yes.

464. So that instead of Willoughby Falls being a pleasure resort now, as it was years before, the creek is now full of filthy matter from the surface drainage? Yes; it is fast becoming so, but I do not see anything in this scheme which will stop it.

465. If scientific appliances are used to treat the sewage and filter it so that, as far as possible, every particle of offensive matter may be taken from the water, do you not think it will be less liable to pollute the waters of Middle Harbour than the present state of things? It would be so, if you are quite sure that the best scientific appliances and the greatest care will be used, and the water rendered innocuous. There is no doubt about that, but will not the overflow be open to the air, and so pollute the air. I refer to the first outflow.

466. It is first to be screened of all solid matter; flow into tanks; and then be subjected to some other process. By the application of chemicals it will be precipitated, and all solid matter taken from it. It will then be allowed to flow out over an area of 6 or 7 acres, which are to be reclaimed from Middle Harbour, and filled up with soil especially suited for filtration purposes. Whether this water is pure or not, it will appear absolutely pure before it is allowed to flow into the waters of the Harbour. Are you aware that there is a sewage farm at present receiving the sewage of South Sydney? I have heard of it.

467. If you were told that the sewage is simply allowed to flow on that farm, that it filters through the soil, leaving the fertilising substances held in suspense on the surface of the ground, and that it flows away as a pure and absolutely colourless stream of water, deprived of every noxious ingredient, would you believe that it is possible under any improved system so to purify the sewage as to take all noxious properties from it? Certainly; that is if the water is chemically pure so as not to affect the fish or the water. I might mention that the Cammeray Road, which runs close to the proposed farm, is a great resort of the pleasure seekers of all the North Shore.

468. Are you aware that in some parts of England, adjacent to the large cities, works like these are in existence adjoining the residences of very wealthy men? Yes.

469. And that the absence of bad smells is so marked that none of those people have hitherto complained of that? I am assured that that is a fact.

470. In that case is it not your opinion that, with additional scientific appliances and discoveries every day, engineers will be able to treat this sewage so as to remove anything noxious or offensive? Yes; my reason compels me to believe that, but living in this place, I have an objection, on account of the possibility of failure.

George Henry Stayton, Esq., Engineer, Sewerage Branch, Roads and Bridges Department, sworn and further examined:—

471. *Vice-Chairman.*] I understand that you are prepared to add some evidence to what you gave last night? Yes; there were several questions put to me by hon. members, one or two of which I was not able to answer with sufficient explicitness. I have since looked up the questions, and perhaps the information may be of use to the Committee. *Mr. Kethel* asked particularly with regard to the effect of sewage sludge, after it had been pressed into cake, upon crops. I have here the "Proceedings of the Institution of Civil Engineers" in England, by which it appears that at a recent meeting, there was a discussion upon this very question. I would like to read the following paragraph, which shows the value of sewage sludge as a fertiliser. On page 187 of vol. lxxviii. of the "Minutes of Proceedings of the Institution of Civil Engineers" the following particulars are given, viz.:—"The manager of the Wimbledon Sewage Farm has, during the past two years, carried out a series of experiments in order to ascertain if possible the value of pressed sludge. The plots experimented upon were contiguous to each other, the subsoil, 18 inches below the surface, being stiff clay. As is well known, the summer of 1885 was one of excessive drought. The crops experimented upon were mangolds, swedes, potatoes, cabbages, and permanent pasture, and the sludge-cake was tried in conjunction with farmyard manure and superphosphate. The farmyard manure was of excellent quality and quite rotten. The sludge-cake was spread on the land as it came from the presses, and was then ploughed in, as in the case of farmyard manure. The crops from each plot were set aside as taken up, and were carefully weighed, all of a like nature being taken up on the same day. The quantities of manure applied per acre were as follows:—Farmyard manure, 16 tons; sludge-cake, 16 tons; superphosphate, 5 cwt. The weights of the crops yielded are given below, the results being tabulated in tons per acre:—

G. H. Stayton,
Esq.
11 Oct., 1888.

Manure.	Potatoes.	Hay, as carried.	Mangolds.	Cabbages.	Swedes.	Average.
Sludge-cake	15·35	2·94	23·84	20·35	3·30	13·15
Superphosphate	12·14	2·50	25·18	20·62	2·59	12·60
Farmyard manure	12·50	2·63	26·16	17·77	2·32	12·27
Unmanured	14·46	1·74	23·06	18·48	0·87	11·72

I think that is very good proof as to the value of pressed sewage sludge as a fertiliser.

472. *Mr. Kethel.*] If it should be deemed desirable hereafter to apply the system of electricity to the sewage, would it be possible to do so with the works as designed and proposed to be constructed by you? It could. Another point which has been dwelt upon by different witnesses is with regard to the period of repayment. I have all along considered that this is a very important point, and it will certainly have to be threshed out and settled before long, because it strikes at the root of the whole question of water supply and sewerage works. In my previous evidence I stated casually that different periods have been sanctioned in England; but I have here the Local Government Blue Book, and I find that from 1871 to 1885 the Local Government Board had granted loans to different municipal authorities amounting altogether to over £34,000,000. Among the loans which were granted during one particular year were the following:—Burton-upon-Trent, £100,000, sewerage works, 60 years; Huddersfield, £150,000, waterworks, 100 years; Lancaster, £15,000, waterworks, 65 years; Liverpool, £3,250,000, waterworks, 70 years; Oldham, £100,000.

G. H. Stayton, Esq., £100,000, sewerage works, 60 years; Rochester, £8,500, sewerage works, 60 years; Rochester, £6,700, waterworks, 70 years; Wakefield, £300,000, waterworks, 80 years; Wigan, £10,000, waterworks, 80 years. The London Metropolitan Board of Works have borrowed no less than £36,000,000 since 1856, but by redeeming the debt by one-sixtieth part annually, there is now owing £27,000,000 only. The ratable annual value of London is about £32,000,000. That, I think, is sufficient proof that the period has been considerably extended.

11 Oct., 1888.

473. *Mr. Garrard.*] Will the tanks at the outfall works be covered tanks? Yes.

474. One witness seemed to fear that there would be effluvia from the outfall end of these tanks. Will they be protected by covers? The sewer will be entirely underground at the outfall.

475. *Mr Street.*] Did you state that the outfall would be at a certain height? Yes; 19 feet above high water mark.

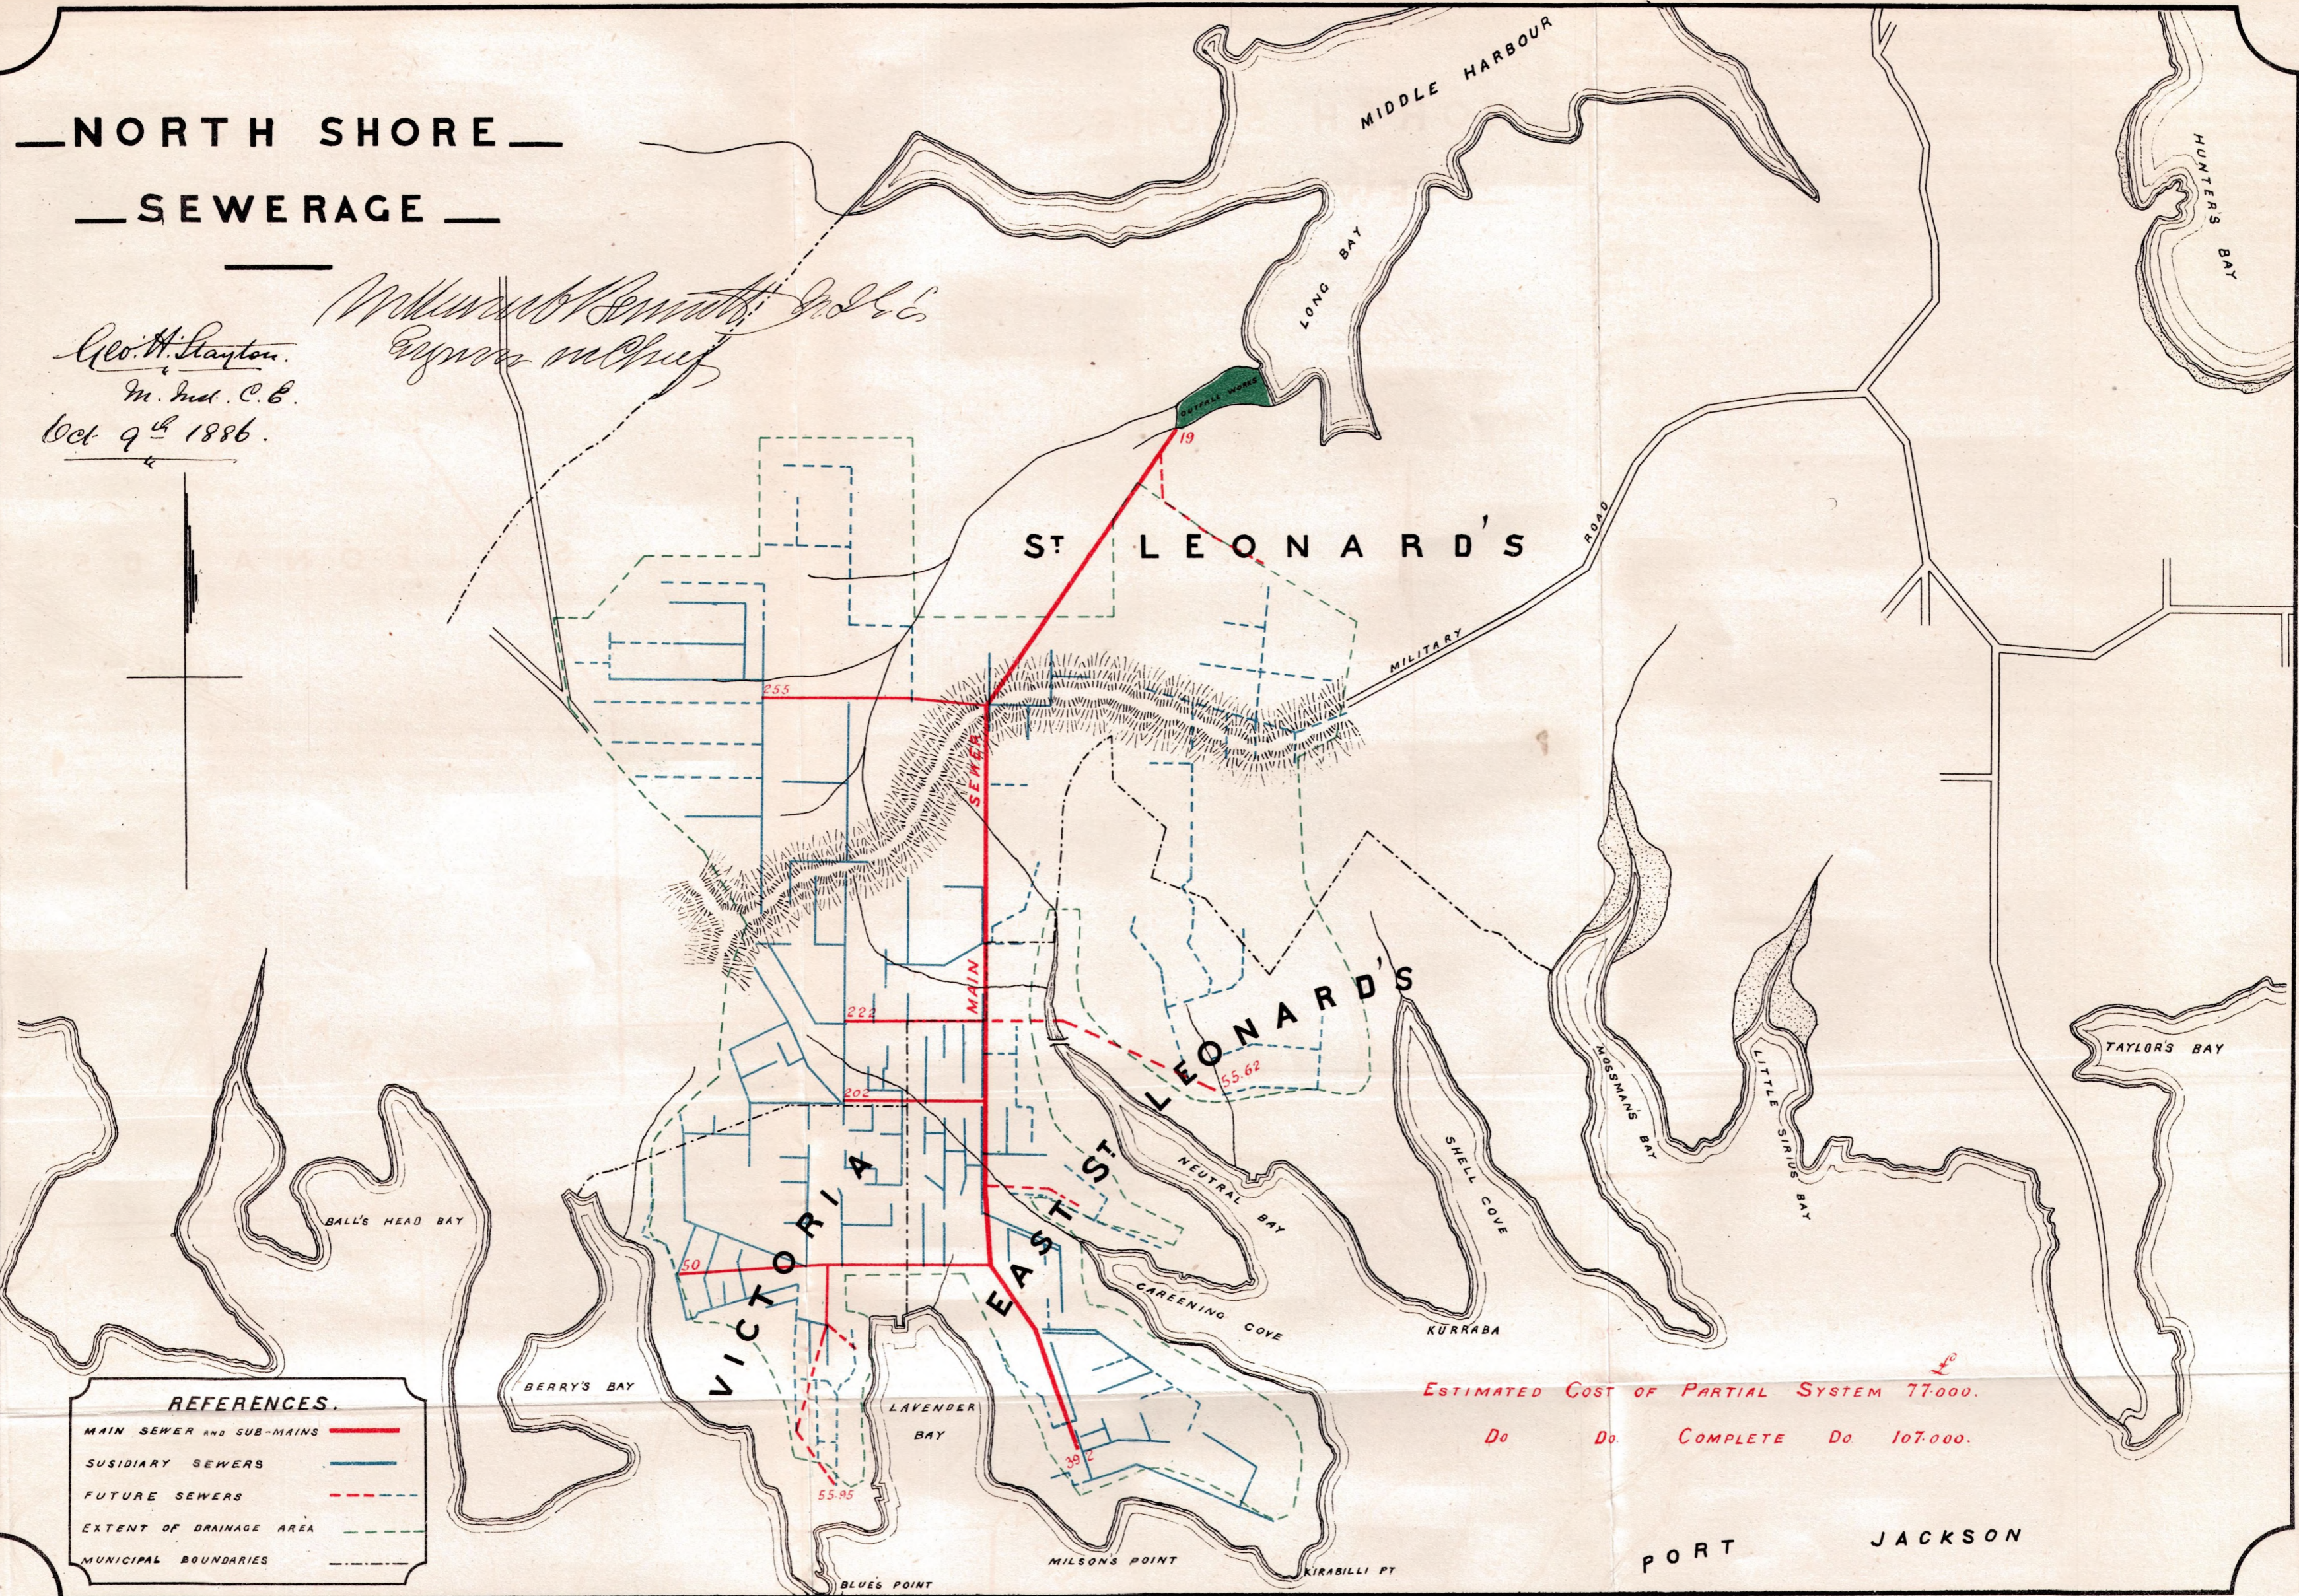

476. With a covered way into the tanks? Yes; into the covered tank.

477. So that there would be no exposure at the mouth of the sewer? None whatever.

[One plan.]

— NORTH SHORE —
— SEWERAGE —

W. H. Smith, Esq. C.E.
Engineer in Chief
Geo. H. Stanton.

NORTH SHORE DRAINAGE WORKS BILL.

(MESSAGE No. 9.)

Ordered by the Legislative Assembly to be printed, 6 December, 1888.

CARRINGTON,
Governor.

Message No. 9.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends, for the consideration of the Legislative Assembly, the expediency of making provision to meet the requisite expenses in connection with a Bill to sanction the carrying out of certain drainage works on the north shore of Port Jackson, in the county of Cumberland.

Government House, Sydney,
30th November, 1888.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that this is essential for the proper management of the organization's finances and for ensuring compliance with applicable laws and regulations.

2. The second part of the document outlines the specific procedures that must be followed when recording transactions. This includes the requirement to use standardized forms and to ensure that all entries are supported by appropriate documentation, such as receipts and invoices.

3. The third part of the document addresses the issue of internal controls. It stresses that a robust system of internal controls is necessary to prevent errors and fraud, and to ensure that the organization's assets are protected.

4. The fourth part of the document discusses the role of the accounting department in providing accurate and timely financial information to management. It highlights the importance of regular reporting and of maintaining clear communication channels between the accounting department and other parts of the organization.

5. The fifth part of the document concludes by reiterating the overall goal of the document: to ensure that the organization's financial records are accurate, complete, and reliable. It encourages all employees to take responsibility for their role in maintaining the integrity of the organization's financial information.

SEWERAGE SCHEME FOR NORTH SHORE.

(PETITION FROM RESIDENTS OF ST. LEONARDS.)

Received by the Legislative Assembly, 20 December, 1888.

To the Honorable the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned residents of St. Leonards and others interested,—

RESPECTFULLY SHOWETH :—

That the carrying out of the Sewerage Scheme for North Shore, as proposed by Mr. G. H. Stayton, and recommended by the Public Works Committee, would be detrimental to the interests of property-owners, ratepayers, and residents of North Shore, and (in an indirect manner) of the residents of Sydney also, for the following reasons :—

- (a) The outfall of the proposed sewer at the head of Willoughby Bay (near Willoughby Falls), Middle Harbour, is too close to the centre of population, and the dealing with the sewerage, even with the best appliances, and under the most careful supervision, will cause a nuisance to the residents not only of the immediate neighbourhood but of a large portion of St. Leonards, whose only access to Middle Harbour is by the Cammeray Road, which runs close by Willoughby Falls.
- (b) The population of the neighbourhood of the proposed outfall has increased at least tenfold during the last five years, and the natural beauty of the locality is such that in the course of a few years a large number of residents would be attracted thereto, unless prevented by the presence of the sewerage works.
- (c) The rise and fall of the tide at the outlet is so small that there is scarcely any motion in the water, the nearest tidal channel being about a mile and a half distant. The effluent from the sewerage works will therefore not be quickly carried away, and in the course of time will render the waters of Middle Harbour impure, and thus impair the incalculable value of one of the most beautiful pleasure and health resorts to which the residents of the metropolis have access.

Your Petitioners would also point out that Mr. Stayton's scheme deals with only a comparatively small portion of North Shore—viz., about 880 acres of the present thickly-populated localities—and that apparently no provision has been made for the eastern portion of Tunks Ward, which, though at present sparsely peopled, is eminently suited to carry, and doubtless will carry, a large population, whose wants in the near future will be a considerable factor in this matter.

In consideration of the facts that the outfall is too close to the present and prospective population, that the waters of Middle Harbour are likely to be polluted, and that Mr. Stayton's proposals are not sufficiently comprehensive, your Petitioners pray that the adoption of the scheme herein mentioned may be deferred with the view of ascertaining whether another could not be proposed, to which such serious objections could not be taken—one which would provide as an essential that the effluent should be discharged into a strong tidal channel—and if we may be allowed, we would respectfully suggest that the sewerage be carried to, and dealt with somewhere near, Middle Head, thus providing for the eastern portion of Tunks Ward.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 472 signatures.]

LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION OF LAND AT ALEXANDRIA IN CONNECTION WITH SYDNEY SEWERAGE WORKS.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16.

NOTIFICATION OF RESUMPTION OF LAND UNDER 44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honourable
to wit. } CHARLES ROBERT, BARON CARRINGTON,
a Member of Her Majesty's Most
(L.S.) Honourable Privy Council, Knight
CARRINGTON, } Grand Cross of the Most Distinguished
Governor. } Order of Saint Michael and Saint
George, Governor and Commander-in-
Chief of the Colony of New South
Wales and its Dependencies.

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the sewerage of the City of Sydney and its suburbs in the said Colony, for and towards the completion of which said works public funds are available under the provisions of the Loans Vote 50 Vic. No. 28: And whereas the lands hereinafter described are required for the construction of the said works: Now I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification published in the Gazette and in a newspaper, that is to say, in the "Sydney Morning Herald," circulated in the Police District wherein the said lands are situated, declare that the land hereinafter described has been resumed for the public purposes hereinafter mentioned, that is to say, for and in connection with the sewerage of the said City of Sydney and its suburbs, to the intent that upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee-simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent, further, that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in

the said Minister as a trustee, with the powers stated in the said last-mentioned Act: And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land containing by admeasurement ten perches and three-fourths of a perch, situate in the parish of Alexandria, county of Cumberland, and Colony of New South Wales, and being lots numbered two hundred and twenty-three and two hundred and twenty-four on a plan of Begg's subdivision of a part of the Underwood Estate, Paddington, deposited in the Lands Titles Office, Sydney, and numbered A. 1,783: Commencing at a point on the north-east boundary of Harris-street, distant four hundred and seventy-nine feet six inches, and bearing south 60° 10' east from the north-east intersection of Soudan-street with Harris-street; and bounded on or towards the north-west by the south-east boundary of lot numbered 225 in the said subdivision, being a line bearing north 29° 50' east for a distance of one hundred and three feet eight inches; on or towards the north-east by the south-west boundary of a Municipal reserve, being a line bearing south 44° 56' east for a distance of thirty-one feet one inch; on or towards the south-east by the north-west boundary of lot numbered 222 in the said subdivision, being a line bearing south 29° 50' west for a distance of ninety-five feet six inches; and on or towards the south-west by the north-east boundary of Harris-street, being a line bearing north 60° 10' west for a distance of thirty feet to the point of commencement, and said to be the property of Ebenezer Vickery and others.

In witness whereof, I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this twelfth day of July, in the year of our Lord one thousand eight hundred and eighty-eight, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,

JOHN SUTHERLAND.

GOD SAVE THE QUEEN!

LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION OF LAND UNDER, FOR SEWERAGE PURPOSES, PARISH OF BOTANY.)

Presented to Parliament pursuant to Act 44 Vic. No. 16.

NOTIFICATION OF RESUMPTION OF LAND UNDER
44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honourable
to wit. } CHARLES ROBERT, BARON CARRINGTON,
a Member of Her Majesty's Most
Honourable Privy Council, Knight
(L.S.) Grand Cross of the Most Distinguished
CARRINGTON, Order of Saint Michael and Saint
Governor. George, Governor and Commander-in-
Chief of the Colony of New South
Wales and its Dependencies.

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the sewerage of the City of Sydney and its suburbs, in the said Colony, for and towards the completion of which said works public funds are available under the provisions of the Loans Act 52 Vic. No. 17; and whereas the land hereinafter described is required for the construction of the said works: Now I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification published in the Gazette and in a newspaper, that is to say, in the "Sydney Morning Herald," circulated in the Police District wherein the said land is situated, declare that the land hereinafter described has been resumed for the public purposes hereinafter mentioned, that is to say, for and in connection with the sewerage of the said City of Sydney and its suburbs, to the intent that upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors on behalf of Her Majesty for the purpose of the said last-mentioned Act, for an estate of

inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever, and to the intent further that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a trustee with the powers stated in the said last-mentioned Act: And I declare that the following is a description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land situate in the parish of Botany, county of Cumberland, and Colony of New South Wales: Commencing at high-water mark of Cook's River; and bounded on the west by the eastern boundary of previous resumption for Main Southern Sewer, being a line bearing north 27 degrees 50 minutes east 390 links; thence by a line bearing east 27 degrees 50 minutes south 422½ links to west side of Government Road; thence by the west side of above road, being a line bearing south 7 degrees 56 minutes west 106·4 links; thence by a line bearing west 27 degrees 50 minutes north 201·35 links; thence by a line bearing south 27 degrees 50 minutes west 263 links to high-water mark; thence by the high-water mark of Cook's River, to the point of commencement,—containing 1 acre 0 roods 27 perches, and being the property of the representatives of the late Robert Lord.

In witness whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this sixth day of December, in the year of our Lord one thousand eight hundred and eighty-eight, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,

JOHN SUTHERLAND.

GOD SAVE THE QUEEN!

NEW SOUTH WALES.

METROPOLITAN WATER AND SEWERAGE ACT.

(BY-LAWS.)

Presented to Parliament, pursuant to Act 43 Vic. No. 32.

METROPOLITAN WATER BY-LAWS.

WHEREAS by the Metropolitan Water and Sewerage Act, 43 Vic. No. 32, the Board of Water Supply and Sewerage is authorized and empowered from time to time to make, alter, and repeal By-laws:

Now the Board of Water Supply and Sewerage, under and by virtue of the powers contained in the Metropolitan Water and Sewerage Act, 43 Vic. No. 32, do hereby make the By-laws following, that is to say:—

1. The following rates and charges are those which the owners and occupiers of lands and tenements shall pay in respect of water supplied by the Board, that is to say:—

(For water supplied for domestic purposes otherwise than by measure.)

- (I.) On every house or tenement of twenty pounds annual value and under, ten shillings per annum.
- (II.) On every house or tenement above the annual value of twenty pounds, a rate of sixpence for each pound sterling on the amount of the valuation up to three hundred pounds inclusive; fivepence for each pound on the amount of the valuation in excess of three hundred pounds up to seven hundred pounds; fourpence for each pound on the amount of the valuation in excess of seven hundred pounds up to one thousand pounds; threepence for each pound on the amount of the valuation in excess of one thousand pounds up to four thousand pounds; and twopence for each pound on the amount of the valuation in excess of four thousand pounds.
- (III.) Vacant lands of the annual value of sixty pounds and over shall be subject to a rate of twopence for each pound sterling on the amount of the valuation.

(For water supplied by measure.)

- (IV.) The rates to be charged for water supplied from stand-pipes shall be one shilling and sixpence per 1,000 gallons.
- (V.) The rates to be charged for water supplied from the mains by measure shall be one shilling and sixpence per 1,000 gallons.
- (VI.) Water-troughs will be charged for at the rate of twenty shillings per annum each.
- (VII.) Water for steam boilers and gas engines will be charged for by measure at the rate of one shilling and sixpence per 1,000 gallons.
- (VIII.) For water supplied to shipping, the charge will be one shilling and sixpence per 1,000 gallons. Her Majesty's Navy will be supplied free of charge.

2. Assessed rates must be paid half-yearly in advance. In the case where a meter is used, accounts will be rendered, and payments become due quarterly. Cheques and Post Office Orders will be received in payment of rates; but if the cheque tendered by any person as payment for rates due is dishonoured, the Board may cut off his service, and proceed for the recovery of the amount by Warrant for Distress. Cheques and Post Office Orders must be crossed in favour of the Board. Stamps will be received as payment of rates.

3. The minimum quantity of water to be charged for by meter where water is supplied for domestic purposes, as well as for purposes other than domestic, shall be the quantity which equals the assessed rate at one shilling and sixpence per 1,000 gallons. If the meter account be found to exceed the assessment, then the excess of the meter account over the assessment shall be charged in addition to the assessment. The Board may supply water for the making and mixing of concrete for foundations of wooden blocks, stone cubes, or other form of permanent roadway or pavement, at the rate of £1 10s. per 1,000 square yards, by superficial measurement of road surface; and for concrete generally for masonry, at the rate of threepence per cubic yard, as measured on the work.

Building charges, &c.

4. The Board may supply water for building purposes at the rate of five shillings per room for dwelling houses. All other buildings shall be supplied by meter at one shilling and sixpence per 1,000 gallons.

Before affixing service pipe, &c., license to be obtained from Board.

5. Before any person shall affix any service-pipe to any pipe of the Board, or alter, repair, or in any manner interfere with any pipe of the Board, or any service-pipe, cock, or fitting connected with any pipe of the Board, he shall obtain from the Board a license in that behalf to execute any such work; and any unlicensed person affixing, altering, repairing, or in any manner interfering with any such pipe, service-pipe, cock, or fitting as aforesaid shall be liable to a penalty not exceeding ten pounds.

Licensed plumber.

6. Before any such license shall be granted by the Board, the person applying for the same shall satisfy the Board that he is a competent plumber. His competency must be certified to by three master-plumbers.

Before pipes can be uncovered two days' notice to Board must be given.

7. Any person, whether licensed as aforesaid or not, who shall offend by opening any ground so as to uncover any pipe or pipes, the property of the Board, without giving two days' notice to the Board of his intention so to do, or who shall in any way tamper, interfere with, or alter any pipe, the property of the Board, without the permission in writing of the Board being first obtained, or who shall wilfully or negligently break, injure, or open any lock, cock, valve, pipe, work, or engine, the property of the Board, shall be liable for each such offence to a penalty not exceeding twenty pounds.

Board or licensed plumber only empowered to tap mains, &c.

8. The Board only, or a plumber duly licensed by the Board, under the superintendence and according to the directions of the officer appointed by the Board for that purpose, is empowered to tap the main in the streets or elsewhere and attach service-pipes thereto, or extend the same generally as the case may be. Any person infringing this clause shall be liable to a penalty not exceeding twenty pounds.

Penalty for communicating with pipes of the Board without notice.

9. Any person, whether licensed as aforesaid or not, who shall lay any pipe to communicate with the pipes of the Board without giving two days' notice of the day and hour when such pipe is intended to be made to communicate with the pipes of the Board, or who shall make such communication, except under the superintendence and according to the directions of some officer of the Board, or who shall lay any leaden or other pipe to communicate with a pipe of the Board of a strength and material not sanctioned by the Board, shall be liable for each such offence to a penalty not exceeding five pounds; and, in the event of continuing the offence, to a further penalty of two pounds for each day after the notice of the offence from the Board.

Fee for tapping main.

10. Every application for water must be accompanied by the payment of a fee of three shillings for the tapping of any main.

Penalty for using unauthorized fittings.

11. Any person who, being an owner or occupier of lands or premises supplied with water under this Act, for the purpose of taking, in a manner not authorized by this Act, any such water, uses in or places on, or affixes or attaches to, such land or premises, or to any prescribed fitting, or wilfully permits to be used in or placed on, or affixed or attached to, such lands or premises, or to any prescribed fitting, any fitting, instrument, or thing not authorized in that behalf by the Board, or who alters, misuses, injures, or removes any prescribed fitting, except for the purpose of necessary repair, shall, upon conviction thereof, forfeit and pay to the Board a sum not greater than ten pounds, without prejudice to the right of the Board to recover from him damages in respect to any injury by such owner or occupier done, or wilfully permitted to be done, to the Board's property, and without prejudice to the Board's right to recover from him the value of any water wasted, misused, or unduly consumed.

Owner to lay and maintain services.

12. The owner or occupier must, at his own expense, lay down and maintain all the pipes and apparatus upon his premises. All pipes must be of galvanized wrought iron, where possible, and where lead pipes are used they must be of equal thickness throughout, and of at least the respective weights following, viz.:—

Weight of lead pipes.

$\frac{3}{8}$ -in.	5 lb. per yard
$\frac{1}{2}$ -in.	6 lb. "
$\frac{5}{8}$ -in.	9 lb. "
1-in.	12 lb. "
1 $\frac{1}{4}$ -in.	16 lb. "
1 $\frac{1}{2}$ -in.	20 lb. "

Where wrought-iron pipes are used, they must be of the kind known as galvanized wrought-iron lap-welded steam tubes.

Defective fittings to be removed.

13. Any consumer's pipe, cock, cistern, or other fitting laid, fixed, or used otherwise than in accordance with these Regulations and with the provisions of the Act, or which shall in the opinion of the Board, be or become of bad or defective quality, or shall conduce to the waste, misuse, or contamination of the water, shall, upon the Board giving notice in writing, be discontinued and disused; and the Board may require the same to be removed, replaced, or repaired, and may stop the supply of water to the said consumer until such pipe, cock, cistern, or other fitting shall have been removed, replaced, or repaired to the satisfaction of the Board.

Quality of fittings for iron pipes.

14. No person shall use, in connection with the water of the Board, any iron pipe, tee, thimble, bend, reducing coupling, plug, &c., unless it be of the best manufacture, true in section, straight, and of equal thickness, properly and truly cut with Whitworth's standard gas thread, and perfectly sound and new, and free from all defects. Every such tee, bend, tube, &c., shall be capable of withstanding a hydrostatic pressure equal to a column of water 400 feet in height.

Joints.

15. Every person shall make all joints between tees, bends, thimbles, couplings, elbows, and cocks, &c., with white or red lead and flax. All joints on lead pipes, and lead pipes with brass unions, shall be of the kind known as "wiped joints."

16. No person shall lay any service-pipe on private property, below the ground surface, at a less depth than ten inches.

17. No person shall lay any pipe or other apparatus through any sewer, drain, ashpit, cistern, or manure tank, or through, in, or into any place where, in the event of the pipe becoming unsound, the water of the Board conveyed through such pipe would be liable to be fouled, or to escape without observation—unless such pipe or apparatus be laid through an exterior cast-iron pipe or box of sufficient length and strength to afford due protection to the same, and to bring any leakage or waste within easy detection.

18. No person shall use any tap, stop-cock, bib-cock, ball-cock, valve, closet cistern, service-box, waste-not regulator, bath tap or valve, or other fitting in connection with a supply of water of the Board which is not of the best quality, and approved by the Board.

19. No person shall use any stop or bib-cock which is not loose-valve, screw-down, high-pressure cocks, made of hard brass or gun-metal, and in every respect of best quality and workmanship.

20. No person shall use any cistern or tank that is not provided with an equilibrium ball-valve, and the overflow-pipe laid and fixed in a suitable manner, open to inspection, and in a position approved by the Board.

21. No person shall fix or use any service-pipe which communicates with any cistern, tank, or vessel intended or used for the reception of rain-water, or made or used below the surface of the ground, except with the express permission of the Board.

22. No person shall construct or use any water-closet fitting not approved by the Board Engineer, or supplied from the service pertaining to the tenement through a proper closet-cistern, or service-box, fitted with approved waste-preventing apparatus. No person shall fix or use any service-pipe which communicates directly or indirectly with the basin or trap, or otherwise than with the cistern of a water-closet.

23. The Board will not supply any water to any bath, the outlet of which is not distinct from and unconnected with the inlet or inlets; and the inlet or inlets shall be placed above the highest water-level of the bath. The outlet of such bath shall be provided with a perfectly water-tight plug, valve, or cock. No such bath shall have any overflow waste-pipe that is not laid and fixed in a suitable manner, open to inspection, and in a position approved by the Board. No bath shall exceed in dimensions 6 ft. 6 in. long by 2 ft. 6 in. wide by 2 ft. deep unless supplied by meter. The Board will not supply water to any bath unless the same shall be so constructed as to prevent a waste of water.

24. Except by the permission of the Board, every tenement shall have an independent service-pipe connected with the main of the Board; and no person shall connect more than one tenement with the main of the Board from one service, except by permission of the Board.

25. No person shall fix a service-pipe so as to communicate directly with any urinal, and every urinal shall be supplied only through a cistern or service-box, fitted with waste-preventing apparatus approved by the Board.

26. No person shall use water supplied by the Board for other than domestic purposes, except the supply is by meter.

27. No person, except with special consent of the Board, shall affix a meter, the dial of which is not capable of registering (1,000,000) one million gallons.

28. If any meter shall not correctly indicate the water passing through it, the Board may charge for the supply according to the average daily consumption for any month preceding the date upon which such meter shall have been examined and found to be in order; or at the request of the consumer, or by direction of the Board, the said meter shall be tested and the charge for water supplied regulated accordingly.

29. No person not duly authorized by the Board shall disconnect any meter or other apparatus from the service-pipes, or in any way interfere with the same.

30. If any person shall connect any service-pipe, or branch service-pipe, with any steam boiler for the purpose of feeding or supplying the same with water, without first affixing a self-acting valve for preventing the pressure of the steam reversing or affecting the dial of the meter, he shall be liable to a penalty not exceeding five pounds; and a further penalty of two pounds for each day after notice of the offence from the Board to each offender.

31. No person shall use a hose attached to any tap or pipe (used for the purpose of supplying the water of the Board for domestic purposes to any house or premises) for watering any garden, laying dust, or for any other purpose whatsoever, unless where a water-meter is fixed and the water supplied by measure; and any person offending against this By-law shall be liable to a penalty not exceeding five pounds.

32. No person shall place any tap in any garden or screwed tap in any yard or to or outside of any dwelling or premises supplied with the water of the Board to which a hose could be attached unless a water-meter is fixed and the water supplied by measure; and any person offending against this By-law shall be liable to a penalty not exceeding five pounds.

33. Any person using water supplied by the Board shall keep all pipes and other appliances in connection with the supply of water to such person in a proper state of repair.

Inspection of work.

34. All work at any time done or to be done on private lands or premises in connection with the water supply, whether such work consist in the laying and fixing of new services, or in the extension or alteration of existing services and fittings, shall be inspected by the proper officer of the Board, and no such work shall be commenced until after the expiration of two days' notice thereof first given to the Board. In no case shall the water be turned on to any lands or premises where any such work shall have been executed until the said work shall have been inspected by the said officer, and certified by him, on the prescribed form. No under-ground or enclosed work shall on any account be covered up or concealed from view until the same shall have been duly inspected and passed by the inspector; and any person offending against this By-law shall be liable to a penalty not exceeding five pounds.

Supply and use of water open to inspection.

35. The supply and use of water, whether for domestic purposes or under special agreement, shall be open to inspection and admeasurement whenever required; and such information must from time to time be afforded as will be sufficient to enable the Board to obtain a satisfactory account of the quantity of water actually consumed, and of the pipes, taps, cisterns, and other apparatus and conveniences for receiving and delivering such water. Any officer of the Board may at all reasonable times in the day-time enter on the premises of any person using water supplied by the Board, for the purpose of inspecting the service pipes or other appliances of such person.

Board may repair.

36. If the service pipes or other appliances of any such person shall on any inspection be found to be out of repair, the Board may forthwith, without notice, repair the same in such manner as may be deemed necessary, and the cost of any such repairs may be recovered by the Board from the owner or occupier of such premises.

Board have control of water supplied to public parks, &c.

37. The water supply to the public parks and gardens shall be exclusively under the control and direction of the officers of the Board; and any person turning on the water, or otherwise interfering with such water supply, shall be liable to a penalty not exceeding five pounds.

Notices and applications to be made upon printed forms.

38. All notices and applications required by these By-laws are to be made upon printed forms, to be obtained at the Board's office. Notices sent by post must be prepaid. Any sums paid by the Board on account of notices sent by post and not prepaid will be charged against and recovered from the sender.

Board may discontinue supply.

39. The Board shall be at liberty to discontinue the supply of water immediately on the discovery of any breach of these Regulations.

Interpretation of terms.

40. In the construction of these By-laws, the word "person" shall be deemed to extend to and include a corporation, or any body or number of persons, and the masculine shall include the feminine gender.

41. Any person committing a breach of any By-law to which no specific penalty is attached, or who shall refuse or neglect to obey any injunction in any such By-law, shall, upon conviction, be liable to pay a penalty not exceeding twenty pounds, and, in case of a continuing offence, a further penalty not exceeding five pounds for each day after notice of such offence shall have been given by the Board to such offender.

NOTE.—Attention is directed to the following Rules:—

Reward for information as to fittings.

The Board will pay a reward of not less than ten shillings to any person who will give such information as shall lead to the conviction of any person or persons who shall wrongfully attach (temporarily or otherwise) any pipe to any of the mains or services of the Board, or to any pipe, cistern, or apparatus connected therewith, or to or into which the water of the Board shall flow, or who shall wrongfully draw off, use or take the water of the Board, or who shall knowingly permit the said water to be wrongfully drawn off, used, or taken.

Reward for information as to waste.

The Board will also adequately reward any person (not being the person in fault) who shall communicate timely information to the Board of any leakages or waste of water, whether the same be accidental, negligently or wilfully occasioned or suffered, or who shall give such information as shall lead to the conviction of any person or persons who shall steal or cause to be stolen, or improperly appropriated, the water of the Board.—*Vide* section 73 of Act 43 Vic. No. 32.

Sample fittings

A set of standard fittings, such as are at present approved, is exhibited in the Board Engineer's office; but the Board will give due consideration to the claims of any other fitting which may be presented for approval, and if considered satisfactory the same will be purchased and placed among and become one of the standard approved fittings.

No gratuities allowed.

The Board do not permit their officers, workmen, or agents to solicit or receive any fee or gratuity whatever, and desires to be informed of any infraction of this Regulation, and also of any act of incivility or neglect of attention on the part of such officers, workmen, and agents, or any of them.

Attention is also directed to the following clauses of the Metropolitan Water and Sewerage Act, 43 Vic. No. 32:—

Meter to be supplied and maintained by consumer.

55. Every person who shall have agreed with the Board for a supply of water by measure, shall at his own expense, unless he hire a meter from the Board, provide a meter and keep and maintain the same in good working condition to the satisfaction of such officer as may be appointed by the Board, and in the event of any repairs being required notice in writing shall be immediately given by such person to the Board and a registration of the quantity used shall be taken before such repairs are effected.

Notice of removal, &c., of meter.

56. Every person requiring to remove or alter the position of any meter shall give six days notice in writing to that effect to the Board, and a registration of the quantity of water used shall be taken before such removal or alteration is made.

57. If any person who under the provisions hereinbefore contained ought to provide any meter, neglect or refuse, after having been required by the Board so to do, to provide such meter, he shall for every day during which such neglect or refusal continues forfeit a sum not exceeding two pounds.

Penalty for neglecting to provide meter

58. If any person who has provided any meter as aforesaid, fail to give the notice hereinbefore required of any repairs required for such meter he shall forfeit a sum not exceeding ten pounds.

Penalty for neglecting to give notice of repairs of meters

59. If any person refuse or delay to have such meter properly repaired and put in correct working order after having been required by any officer of the Board so to do, the Board may shut off the supply of water from the premises of such person either by cutting the service-pipe or otherwise, until such meter shall have been properly repaired and certified by some officer of the Board as being in proper working order.

Water may be cut off if meter not in order.

60. If any plumber or other person fix or refix any meter upon any premises supplied with water by the Board, without having first obtained a certificate from the Board that the said meter has been examined and found in correct working order, he shall forfeit a sum not exceeding ten pounds.

Penalty for fixing uncertified meter.

61. If any person remove or alter the position of or in any way interfere with any meter without giving such notice as aforesaid, he shall for each such offence forfeit a sum not exceeding twenty pounds over and above the damage which he may be found liable to pay in any action at law at the suit of the Board.

For removing or altering meter without notice.

62. The officers of the Board may enter any house, building, or lands, to, through, or into which water is supplied by the Board by measure, in order to inspect the meters, instruments, pipes, and apparatus for the measuring, conveyance, reception, or storage of water, or for the purpose of ascertaining the quantity of water supplied or consumed; and may from time to time enter any house, building, or lands, for the purpose of removing any meter, instrument, pipe, or apparatus, the property of the Board, and if any person hinders any such officer from entering or making such inspection, or effecting such removal, he shall, for each such offence, be liable to a penalty not exceeding five pounds, but, except with the consent of a Justice, this power of entry shall be exercised only between the hours of ten in the forenoon and four in the afternoon.

Power to officers of Board to inspect meters.

67. After pipes have been laid under the authority of this Act, for the supply of water to any street or part thereof, the Board shall cause a notice, in the form contained in the Third Schedule hereto, or to the like effect, to be published in four consecutive numbers of the *Gazette*, and in one or more newspapers circulating in the locality; and the owner or occupier of every tenement referred to in such notice shall, within three weeks from the date of the last publication of such notice in the *Gazette*, cause a proper pipe and stop-cocks to be laid, so as to convey a supply of water to such tenement. And after fourteen days from such last publication the owner or occupier of such tenement shall, unless the Board refuse to supply him with water, be liable to pay the rates and charges for such supply, although no such pipes and stop-cocks be laid, or no such water be used in such tenement.

Notice to lay service pipes.

68. Any owner or occupier of any dwelling-house, or part of a dwelling-house, within a Water District, who shall wish to have water from the waterworks of the Board brought into his premises, and who shall have paid or tendered to the Board the portion of water rate in respect of such premises, by this Act directed to be paid in advance, may open the ground between the pipes of the Board and his premises, having first obtained the consent of the owners and occupiers of such ground, and lay any pipes from such premises to communicate with the pipes of the Board.

Pipes laid by owners or occupiers. Power to inhabitants to lay service pipes.

69. Such pipes shall be of a strength and material approved of by some officer of the Board, and every such owner or occupier shall, before he begins to lay any such pipe, give to the Board two days notice of his intention to do so.

Notice to Board of laying pipes.

70. Before any pipe is made to communicate with the pipes of the Board, the person intending to lay such pipes shall give two days notice to the Board of the day and hour when such pipe is intended to be made to communicate with the pipes of the Board, and every such pipe shall be so made to communicate under the superintendence and according to the directions of the surveyor, or other officer appointed for that purpose by the Board. And the bore of any such pipe shall not exceed three-quarters of an inch, except with the consent of the Board.

Communication with pipes of Board to be made under superintendence of surveyor.

Bore of service pipes.

71. Any person who shall have laid down any pipe, or other works, or who shall have become the proprietor thereof, may remove the same after having first given six days notice in writing to the Board of his intention so to do, and of the time of such proposed removal, and every such person shall make compensation to the Board for any injury or damage to their pipes or works which may be caused by such removal.

Service pipes may be removed after giving notice.

72. Any such owner or occupier may open or break up so much of the pavement, if any, as shall be between the pipe of the Board and his house, building, or premises, and any sewer or drain therein for any such purpose as aforesaid (doing as little damage as may be, and making compensation for any damage done in the execution of any such work). Provided always that every such owner or occupier desiring to break up the pavement of any street, or any sewer or drain therein, shall be subject to the same necessity of giving previous notice, and shall be subject to the same control, restrictions, and obligations in, and during the time of breaking up the same, and also reinstating the same, and to the same penalties for any delay in regard thereto as the Board are subject to under the provisions of this Part.

Power to break pavements.

PROTECTION OF
THE WATER.

In case of any
breach of this
Part of this Act
water may be
cut off.

73. If any person supplied with water by the Board wrongfully does, or causes or permits to be done, anything in contravention of any of the provisions of this Part, or wrongfully fails to do anything which under any of those provisions ought to be done for the prevention of the waste, misuse, undue consumption, or contamination of the water of the Board, the Board may (without prejudice to any remedy against him in respect thereof) cut off any of the pipes by or through which water is supplied to him or for his use, and may cease to supply him with water so long as the cause of injury remains or is not remedied.

Penalty for
waste of water.

74. If any person, supplied with water by the Board, wilfully or negligently causes or suffers any pipe, valve, cock, cistern, bath, soil-pan, water-closet, or other apparatus or receptacle to be out of repair, or to be so used or contrived that the water supplied to him by the Board is or is likely to be wasted, misused, unduly consumed or contaminated, or so as to occasion or allow the return of foul air or other noisome or impure matter into any pipe belonging to or connected with the pipes of the Board, he shall, for every such offence, be liable to a penalty not exceeding five pounds.

Penalty for
misapplication
of water.

75. If any person—

- (1.) Not having from the Board a supply of water for other than domestic purposes, uses for other than domestic purposes any water supplied to him by the Board; or
- (2.) Having from the Board a supply of water for any purpose other than domestic, uses such water for any purpose other than those for which he is entitled to use the same,

he shall for every such offence be liable to a penalty not exceeding forty shillings without prejudice to the right of the Board to recover from him the value of the water misused.

No pipe to be
fixed to con-
sumer's pipe
without per-
mission of
Board.

76. It shall not be lawful for the owner or occupier of any premises supplied with water by the Board, or any consumer of the water of the Board, or any other person, to affix, or cause or permit to be affixed, any pipe or apparatus to a pipe belonging to or used by such owner, occupier, consumer, or any other person, or to make any alteration in any such communication or service-pipe, or in any apparatus connected therewith, without the consent, in every such case, of the Board. And if any person acts in any respect in contravention of the provisions of the present section, he shall, for every such offence, be liable to a penalty not exceeding five pounds, without prejudice to the right of the Board to recover damages from him in respect of any injury done to its property, and without prejudice to their right to recover from him the value of any water wasted, misused, or unduly consumed.

Penalty for
unlawfully
taking water

77. If any person, not being supplied with water by the Board, wrongfully takes or uses any water from any reservoir, watercourse, conduit, or pipe belonging to the Board, or from any pipe leading to, or from any such reservoir, watercourse, conduit, or pipe, or from any cistern or other like place containing water belonging to the Board or supplied by them for the use of any consumer of the water of the Board, he shall for every such offence be liable to a penalty not exceeding five pounds.

Inspection of
water.

78. The surveyor or other person appointed for that purpose by the Board may, between the hours of nine o'clock in the forenoon and four o'clock in the afternoon, enter into any house or premises supplied with water by the Board in order to examine if there be any waste or misuse of such water; and if any such surveyor or other person at any such time be refused admittance into such dwelling-house or premises for the purpose aforesaid, or be prevented from making such examination as aforesaid, the Board may turn off the water supplied by them from such house or other premises.

Polluting the
water.
Penalty for
bathing in water
of the Board.

79. If any person bathe in any stream, reservoir, aqueduct or other waterworks belonging to the Board, or wash, throw, or cause to enter therein any dog or other animal he shall for every such offence forfeit a sum not exceeding five pounds.

Penalty for
throwing dirt
therein.

80. If any person throw or convey or cause or permit to be thrown or conveyed any rubbish, dirt, filth, or other noisome thing into any such stream, reservoir, aqueduct, or other waterworks as aforesaid, or wash or cleanse therein any cloth, wool, leather, or skin of any animal, or any clothes or other thing he shall for each such offence forfeit a sum not exceeding five pounds.

Penalty for
letting foul
water flow
thereinto.

81. If any person cause the water of any sink, sewer, or drain, steam-engine, boiler, or other filthy water belonging to him or under his control, to run or be brought into any stream, reservoir, aqueduct, or other waterworks belonging to the Board, or shall do any other act whereby the water of the Board shall be fouled, he shall for each such offence forfeit a sum not exceeding five pounds, and a further sum of twenty shillings for each day (if more than one) that such offence continues.

Penalty for
nuisance in
watershed area.

82. Where any owner or occupier of any land within the watershed to be proclaimed as hereinbefore provided, or any reservoir or source of supply transferred to, or vested in the Board, does, or permits to be done on his land any act, or permits to remain thereon any matter or thing, which in the opinion of the Board is likely to injure the water supply, if notice to discontinue or remove the same be given to him in writing by the Board, and if he neglect or refuse to discontinue such act, or to remove such matter or thing, he shall for each such offence forfeit a sum not exceeding five pounds, and a further sum of twenty shillings for each day (if more than one) that such offence continues.

86. The following provisions shall take effect for the purpose of protecting the water in the mains or other pipes of the Board from all impurities from closets and other receptacles of faecal matter or urine—

- (i.) It shall not be lawful for any person to connect with the main any pipe delivering the water directly into the closet-pan or other receptacle for faecal matter or urine without the intervention of a cistern or cisterns into which the water from the main shall first be received, and any person so offending shall forfeit and pay a penalty not exceeding fifty pounds.
- (ii.) The Board may employ any artificers or workmen to cut off or otherwise disconnect from the main any pipe directly discharging the water into a closet without the intervention of a cistern [hereinafter termed "directly connected"]; and which in the opinion of the Board may endanger the purity of the water by the absorption of noxious gases, or suction of faecal matter or urine into such pipe, or into the main, or otherwise: For the purpose of effecting such disconnection the Board's artificers and workmen may enter into and upon the premises of any person or corporation whatsoever to do, or cause to be done, anything in his opinion requisite or necessary in relation thereto.
- (iii.) Whenever the Board shall have caused any pipe to be cut off, or disconnected, or other work to be done in relation thereto, they shall forthwith serve the owner or occupier of the premises with a notice in writing, requiring him to pay the actual cost or expense incurred. And such owner or occupier shall pay the amount to the Board, and if the amount be paid by an occupier only he may deduct the same from the rent then due or accruing. Upon such owner or occupier making default in any such payment after the delivery of such notice as aforesaid the Board may sue for and recover the same with full costs of suit.
- (iv.) The owner of every dwelling-house or premises which shall have therein or thereon any closet with a pipe or branch-pipe directly connected with the main, shall be required to fix and erect a cistern or cisterns for the reception of the water intended to be used for the closet, and every cistern shall be made of such materials and dimensions, and of such model or plan of construction, and with such ball-cocks, stop-cocks, waste-pipes, and other appliances as shall be deemed requisite and have been approved by the Board for securing the water from pollution through any noxious gases or matter evolved or derived from such closets or otherwise. Every owner neglecting to comply with the provisions of this section shall forfeit and pay a penalty not exceeding five pounds.
- (v.) Whenever any owner shall have neglected to fix and erect a cistern, with its appliances, as is in the last preceding sub-section provided for, the tenant or occupier of the premises is hereby authorized and required, after receiving a written notice thereof from the Board in that behalf, to fix and erect such cistern, with its appliances before mentioned, within fourteen days after the receipt of such notice, and the said tenant or occupier shall, upon payment by him of the charges and expense of such fixing and erection, be entitled either to deduct the amount so paid from the rent then due or accruing, or, at his option, to sue for and recover the same, with full costs of suit, from the owner as for money paid to his use.
- (vi.) Any person who shall, without the authority of the Board, re-establish any such connection which may have been cut off, removed, or severed by him, or who shall in any manner wilfully injure or tamper with any connection-pipe, cistern, ball-cock, stop-cock, or waste-pipe which may have been approved by the Board, so as to destroy, diminish, or endanger its efficiency, may be summoned for such offence before two Justices, and on conviction thereof shall be adjudged to pay the amount of the charges and expenses which the Board may have incurred (and which they are hereby authorized to incur) in repairing or restoring the same to a state of efficiency. Every such offender shall also forfeit and pay a penalty not exceeding ten pounds, and the amount of charges and expenses and penalty respectively shall, when recovered, be paid over to the Board.

87. Where several houses or parts of houses, in the separate occupation of several persons, are supplied by one common pipe, or where water is supplied to courts, alleys, and right-of-way by stand pipes, the several owners or occupiers of such houses, or parts of houses, or of the several houses, or parts of houses, in every such court, alley, or right-of-way, shall be liable to the payment of the same rates for the supply of water as they would have been liable to if each of such several houses, or parts of houses, had been supplied with water from the works of the Board by a separate pipe.

88. The rates and charges for water, and all sums due to the Board under this Part, shall be paid by and be recoverable from the owner of the premises or the occupier or person requiring, receiving, or using the supply of water; and all rates shall be paid in advance by equal payments on the first day of January and the first day of July in each year, and the first payment shall be made at the time when the owner or occupier of any tenement shall become liable to pay such rates and charges, and all such rates and charges may be enforced and recovered in respect of any premises in the said City of Sydney, or in any such Municipality as aforesaid, situate within one hundred and fifty feet from the alignment of any street or public highway along which a main water pipe belonging to the Board is laid, although such premises are not actually supplied with water from such main.

Recovery of rates
and charges.

Schedule.

89. If any such person refuse or neglect to pay on demand to the Board any rate, charge, or sum due to the Board under this Part, the Board may recover the same with costs, or may order a warrant under the hand of their President or Vice-president in the form contained in the Fourth Schedule hereto, to be from time to time issued to some constable or other person named therein to levy such rate, charge, or sum by distress and sale of goods and chattels of the person occupying the premises in respect of which such rate, charge, or sum is due at the time when the warrant of distress is executed, and in case no sufficient goods and chattels of such occupier be found on the premises to satisfy such distress, the owner of the premises, or if he be absent from the Colony, his agent shall be liable for such rate, charge, or sum, and the same may be recovered from him.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

BRIDGE AT THE SPIT, MIDDLE HARBOUR.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the present Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, to whom was referred the duty of considering and reporting upon "the expediency of erecting a Bridge at The Spit, Middle Harbour," have, after due inquiry, resolved that it is not expedient the work should be carried out; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

The bridge, as proposed, would cross Middle Harbour at The Spit, near the site of the present ferry; and according to the design it would be constructed of two central openings of 60 feet each, with two spans of 125 feet each on either side. The central spans would be formed by continuous lattice girders, revolving upon a central swing pier; the 125 feet spans would be independent lattice girders. The roadway of the bridge would be 32 feet wide; the height of the superstructure, which would rest upon wrought and cast iron cylinders, 30 feet in the clear above high-water; and the approaches, which would be 1,500 feet in length, would consist of timber spans, and an earthwork embankment. The total estimated cost of the work is £62,000.

As far back as 1881 representations were made to the Government in favour of the construction of a bridge across Middle Harbour, and since then the question has been before several Ministers for Works successively, the result, so far, being that a sum of £62,000 for the work was placed on the Loan Estimates for 1888, and passed.

The Committee, after a careful investigation, have arrived at the conclusion that the bridge should not be erected, and that the requirements at The Spit in the form of improved arrangements for crossing that part of Middle Harbour can for the present, and for many years to come, be met by means of a steam-punt.

They have come to this decision for several important reasons:—

- (1.) The expensive nature of the bridge compared with the alleged beneficial results which its construction would bring about.
- (2.) The present overland traffic to Manly and its neighbourhood, or that which is probable for some years to come, is not likely to be increased to such an extent as to warrant the erection of the proposed bridge, seeing that, even with this bridge, unbroken land communication could not be had between Manly and Sydney, unless by travelling round by way of the bridges across Lane Cove, the Parramatta River, and Iron Cove, a distance so great as to make the journey practically impossible.
- (3.) Inasmuch as persons passing between Sydney and Manly by way of The Spit must make use of the steam-ferry boats running between Sydney and North Shore, concerning which no witness examined by the Committee made any complaint, there should be no inconvenience experienced in the use of similar means of transit at The Spit, provided sufficient measures be taken for ensuring safety and expedition.

(4.)

- (4.) It is the intention of the Department of Public Works to at once place a steam-punt of the best description at The Spit, in lieu of the ordinary punt at present there, and the plan of this steam-punt shows that it will be sufficiently commodious to afford all the accommodation likely to be required for some time to come, while the width of Middle Harbour at The Spit being much less than the distance from Sydney to North Shore, the crossing in the punt at The Spit should occupy much less time, and could be carried out with as much regularity as the ferry service between North Shore and Sydney.
- (5.) It does not appear that the construction of the bridge would do much, or more than a steam-punt, to promote settlement, and the area of Crown land in the neighbourhood of Manly, the value of which would be increased by the improved means of access to it which the proposed bridge would afford, or the probable increased value, is not sufficiently large to justify the expenditure of £62,000, and the subsequent annual charge for interest upon that sum and other expenses connected with the maintenance of the bridge.
- (6.) The bridge, being a low-level one, would, to a certain extent, impede the present water traffic in Middle Harbour, and would be a more serious impediment when the shores of that estuary become, as in the course of a few years they may, extensively populated.

The bridge, as already stated, is estimated to cost £62,000; but as it is not quite certain that this would be the exact cost, the expenditure might be greater. Mr. W. C. Bennett, Commissioner and Engineer-in-Chief for Roads, says upon this point that the sum named will cover the total cost of the bridge and approaches as far as he can estimate; he has been guided by the prices paid for other works, and has reason to think that the estimate ought to be a fair one. But as no provision is made in the design of the bridge for footways, apart from the ordinary roadway, the cost would probably have to be increased to ensure the complete safety of pedestrians, especially if the bridge were to carry a tramway, though at present the possibility of a tramway crossing the bridge is not a matter for serious consideration. If these footways were provided, the estimate of £62,000, according to Mr. Bennett's evidence, would be increased by at least £3,000. By an appendix to the evidence of Mr. J. A. M'Donald, Assistant Engineer to Mr. Bennett, it also appears that if certain alterations were made in the design of the bridge the total cost would exceed to a very considerable extent the sum mentioned in the reference of the work to the Committee. But supposing the cost of construction to be £62,000, the annual charge against the bridge, representing interest and depreciation, working expenses, painting, &c., would be £3,604. All bridges in this Colony are free to the public, and therefore there could be no receipts from this bridge, unless at some future date a private company secured the right to use it for the purposes of a tramway, in which case the payment by the company would be credited against the annual charge arising from the expenditure upon the construction of the bridge. Against this large expenditure and this annual charge there must, of course, be placed the advantages which it is contended will arise from the construction of the bridge. First, there is the beneficial change from the present slow and unsafe method of crossing at The Spit by means of an ordinary punt,—an advantage, however, which can be secured without incurring the expense necessary for the erection of a bridge. Then there is the pleasure which would be afforded people by a drive from North Shore to Manly, or from Manly to North Shore; but as Sydney residents would not be likely to find much interest in such a drive while the necessity exists to use the ferry between Sydney and North Shore, the persons using the bridge in this way would be principally residents of North Shore, or Manly, and their number would be few. Further, there is the convenience which would be afforded those persons who are fearful of crossing the Heads in the Manly Beach steamers during tempestuous weather; but in their case also the number would be few, and they could cross at The Spit in a well-appointed punt with as much safety and comfort as over a bridge. Another reason advanced in favour of the bridge is an expectation in the minds of some of the residents of Manly that North Head, or a large portion of it, will eventually be dedicated by the Government as a public park, and

and it is considered that a bridge will afford suitable access to that locality. Inasmuch, however, as there is nothing to show that such a dedication is to be made, there is no ground for regarding this as a sound reason why the bridge should be erected. Lastly, there is the idea that the bridge would largely add to the value of Crown land around Manly, and by promoting settlement bring about much more profitable sales of land and a considerable addition to the population. But the evidence shows that the quantity of Crown land, the value of which would be affected by the bridge, is small, and therefore that the increased price likely to be obtained for it would, in comparison with the cost of the bridge, be of small consequence; and there is little or nothing in the statements of the witnesses examined by the Committee to induce the belief that the population of Manly and its neighbourhood would, after the erection of the bridge, increase more rapidly than now, or more than it would if some other and less costly improved means of crossing Middle Harbour at The Spit were provided in the place of the existing punt.

In relation to the second of the reasons which have influenced the Committee in their decision, it seems evident that if an extensive overland traffic between Sydney and Manly is to be brought about it must be by making the connection between the two places by land complete, and of such a nature that the journey from one place to the other shall be at least as convenient, if not more so, than the means which at present exist for communication by water. But the erection of this bridge, beyond the improved facilities it will afford for crossing at The Spit, will do nothing in the way of attaining this object. The overland journey must end at St. Leonards, and resort must be had there to the North Shore ferry boats, or it must be extended to the distance of about 20 miles, access to Sydney from the northern side of the harbour being had by crossing over the Parramatta River and other bridges. It is very improbable that with the existence of such obstacles the overland journey would be made by many persons, and it appears less likely when the facilities and attractions associated with the journey by water between Sydney and Manly are taken into consideration. The distance between the two places by water is seven miles; the journey is accomplished by the steamers of the Port Jackson Steamship Company, which run with perfect safety and uninterrupted regularity in any weather, in 35 or 40 minutes; and the maximum cost per trip by season ticket is 4d. Added to this should be the fact that the vast majority of those who travel between Sydney and Manly, either as residents of Manly or as visitors to that suburb, do so because of the benefit to health believed to be derived during the passage down and up the harbour. Even with tram communication between Manly and North Shore, it is very doubtful whether the journey from Manly to Sydney could be made as quickly and cheaply as is the case with the present water trip. To business men, therefore, and other persons to whom time is a consideration, and to the large proportion of the travelling public, who invariably give their patronage to what is safe, comfortable, expeditious, and cheap, the water journey to Manly would undoubtedly be preferred to a journey by land, the chief recommendation in connection with which would be that Middle Harbour could be crossed by means of a bridge.

Referring to the third of the reasons mentioned, it will be found from the evidence that the conveniences for crossing Middle Harbour by means of a steam-punt will be quite equal to what is experienced in relation to the steam-ferry boats running between Sydney and North Shore. No one among the witnesses examined considers that a steam-punt is equal to a bridge; but it is admitted that it may be made as convenient as what is met with in the traffic between Sydney and North Shore. That the steam-punt which it is proposed to place at The Spit will be safe and commodious, and will, moreover, perform its work expeditiously, will be shown further on; meantime it may be mentioned that the engineers responsible for both the plans of the proposed bridge and those of the steam-punt admit that the punt will get rid of the present difficulty experienced in crossing at The Spit. Mr. W. C. Bennett says (*Question 55*) that "there need be no very great difficulty if there were a steam-ferry there, except the inclines on either side." Mr. J. A. M'Donald, the engineer who prepared the designs for the bridge and the punt, states (*Question 651*) that the punt would certainly meet the requirements of the traffic for a time. Mr. Bennett does not think that the punt would, satisfactorily to the public, do all that

would

would be necessary for the next ten years; but Mr. M'Donald is of opinion (*Question 651*) that when the traffic has increased beyond what the punt will carry, the simplest plan would be to provide a duplicate punt, to run at intermediate intervals. Mr. Bennett alludes, as already mentioned, to the steep inclines on either side of The Spit; but this severe grade is shown by Mr. M'Donald's evidence to have been left with a view to putting the bridge in, and, if a steam-punt were decided upon, the grade could be eased down.

The intention of the Department of Public Works to place a steam-punt at The Spit, in lieu of the present ordinary punt, is influenced by the knowledge that, if the erection of the proposed bridge were sanctioned, it would be at least two years before the bridge would be completed, and some improved means of crossing Middle Harbour at The Spit is required at once. Therefore, plans for a punt have been prepared, and tenders for its construction invited. The punt is estimated to cost about £2,000, but it would probably be built for much less, as a tender for its construction, amounting to £1,487, has been received; and it is to be worked by steam and a wire rope, at an estimated annual cost, including depreciation, of £800, a large portion of which would be recouped by the annual receipts. Its carrying capacity will be eight ordinary-sized buggies each trip, with room for passengers on the side-walks; and it will cross and recross at intervals of 15 minutes, though the distance being short, it could do the journey much quicker. The punt, as proposed, is one of the latest design; and, according to the evidence of Mr. M'Donald, it would not be difficult to provide by means of it for the conveyance of the traffic connected with a tramway from one side of The Spit to the other. From this it will be seen that the punt is certain to meet the requirements of the ordinary traffic for some time to come. Eight ordinary-sized buggies every quarter of an hour would represent between, say, 6 o'clock in the morning and midnight, a traffic of 576 vehicles; and in the opinion of the Committee it is very improbable that there would be anything like such a traffic at this crossing, even if not only the Spit Bridge but also a bridge to connect Sydney with North Shore were built.

With regard to the question of the bridge promoting settlement and increasing the value of Crown land, it has already been shown that until land communication with Manly is complete, and there is no necessity to use the ferry boats between Sydney and North Shore, the traffic across the bridge must be very small; and therefore the bridge is not likely to promote in any appreciable degree, or more than a steam-punt would do, the settlement of population. Mr. J. W. Deering, Metropolitan and Coast District Surveyor, of the Department of Lands, who was examined by the Committee, and is well acquainted with the district about Manly and Middle Harbour, thinks the bridge would promote traffic to some extent from Manly Beach, but is of opinion that it would not be remunerative. He would regard the bridge as a highway along the coast, but admits that there is certainly no necessity for it at the present time, and that as far as concerns the question of traffic, a steam-punt would answer all purposes for many a day to come. As to the increased value of Crown land, which the erection of the bridge might be expected to bring about, Mr. Deering states that at Harbord, at Manly, near the water reserve, at Dobroyd, at Narrabeen, and at Manly Cove, there are about 4,118 acres which would be directly affected by the bridge. The approximate value of this area is about £73,980, and if the bridge were erected the increased value of the land might be estimated at 25 per cent., which would be represented by £18,500. But the fact that there is not likely to be much traffic over the bridge is evidence that its construction would not influence in any great degree the minds of persons purchasing this land to settle upon it, and though speculators may see in the bridge a step towards complete land communication with Sydney, it is improbable that they would regard it of the importance which would be indicated by an immediate increase of 25 per cent. in the value of land in the vicinity. But, taking Mr. Deering's figures, the increased value of the land which would be affected by the bridge is £18,500, and this at 4 per cent. would produce £740 a year, a very small reduction of the annual charge upon the public which would follow the erection of the bridge.

The last of the principal reasons which have led the Committee to conclude that the bridge should not be erected is that it would to a certain extent impede the water traffic in Middle Harbour. To this objection, however, the Committee do not attach very much weight. A high-level bridge would be so expensive that the erection

erection of such a structure could not be sanctioned except under the most pressing conditions as regards traffic; and a low-level bridge, however designed, must in some degree interfere with the passing to and fro of yachts and steamers. But the fact that the bridge, as proposed, would prove an interference with the water traffic deserves some consideration when placed in connection with the other objections against the structure, and to that extent the Committee regard it as one of the reasons why it is not expedient the bridge should be built.

The Committee might have examined other witnesses, for a large number of persons, principally objectors to the bridge, intimated their readiness to give evidence, but they were so satisfied from the results of the inquiry as far as they proceeded with it, of the inexpediency of carrying out the proposed work, and of the sufficiency of a steam-punt to meet requirements, that they closed the evidence, and on Thursday, 13th December, agreed to the following resolution:—

Moved by Mr. Kethel, and seconded by Mr. Campbell:—

“That the Committee do not consider it expedient to recommend the construction of the proposed bridge across Middle Harbour, at The Spit, as they are of opinion that the steam-punt proposed to be built by the Department of Public Works for a ferry Service at The Spit will be sufficient for all the traffic at that place for many years to come.”

JOHN LACKEY,

Chairman.

Office of the Parliamentary Standing Committee on Public Works,
11th January, 1889.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

BRIDGE AT THE SPIT, MIDDLE HARBOUR.

FRIDAY, 16 NOVEMBER, 1888.

Present:—

JOSEPH PALMER ABBOTT, Esq. (VICE-CHAIRMAN).

The Hon. GEORGE CAMPBELL.

The Hon. WILLIAM HENRY SUTTON.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

HENRY COPELAND, Esq.

JACOB GARRARD, Esq.

SYDNEY SMITH, Esq.

JOHN RENDELL STREET, Esq.

DANIEL O'CONNOR, Esq.

The Committee proceeded to consider the proposed bridge at The Spit, Middle Harbour.

Joseph Barling, Esq., Under Secretary for Public Works, sworn and examined.

1. *Vice-Chairman.*] Do you know anything in reference to this matter? Yes. I will give just a short statement in reference to it. For many years the question of the necessity for the construction of a bridge over the Spit has been before the Government of New South Wales. I find that as early as 1881 representations were made to the Government of the day for the construction of a bridge over Middle Harbour, and I observe, on looking through the papers, that when the Honorable the Chairman of this Committee was Secretary for Public Works he gave instructions that the matter should be considered when the Estimates for that year were being dealt with. The question has been successively before Mr. Secretary Copeland, Mr. Secretary Wright, the late Sir A. Stuart, Mr. Secretary Lyne, and the present Government, the result of which has been that a sum of £62,000 for the work was placed on the Loan Estimates for 1888, and passed. I notice also amongst the papers that in 1883, Mr. Secretary Copeland directed that certain surveys should be made with the view of a railway or tramway being ultimately carried along the road, and subsequently Mr. Secretary Lyne, when the unemployed were about to carry out improvements to the road, gave instructions that the road should be constructed to tramway grade, which has been done. I may mention that a suggestion has been made by Mr. T. E. Willis for the erection of a high-level bridge near Clontarf, as shown on the plan I submit herewith. This proposal has been fully investigated by the Department, and evidence will be given on the point if required by the Committee. The main objections to it are that the bridge would have to be built on a reef, which would prevent the deepening of the channel at any future time, if the bridge were erected. The estimated cost of the work is £264,000.* Another objection is that there is at present no road to the site, and a large expense would have to be incurred to provide approaches. The engineer will produce a plan illustrating the matter. To show the growth of the traffic which has taken place on the road between Sydney and Manly, I subjoin the following statistics in reference to the punt traffic:—Previous to 1886 a collector was in charge, being paid at the rate of £1 per week, and retaining the tolls received. In 1886 the ferry was leased for £65 per annum. In 1887 the rent received was £165. In 1888 it was let at a rent of £276. From inquiry I have made at the Government Statistician's office I find that the estimated population of St. Leonards, East St. Leonards, Victoria, North Willoughby, and Manly is 20,070. With regard to the proposed bridge, I observe in looking over the evidence taken before the Select Committee on the North Shore, Manly, and Pittwater Railway and Tramway Bill, that many witnesses gave evidence that the height of a bridge at the Spit should be 100 feet. A rough estimate has been prepared of the cost of a high-level bridge at this place, which may be put down at something like £200,000† over the estimated cost of the bridge as proposed. It will be observed that two swing openings are proposed, and the cost of working the machinery may be put down at something like £300 per annum, but the interest alone on the additional amount required for the high-level bridge would, at 4 per cent., be £8,000 per annum, thus showing how very much more economical it will be to carry out the work as proposed, even allowing for the constant attendance of two men to attend to the swing. The following is a description of the intended structure:—This bridge, which is to form the connecting link between North Shore and Manly, will cross Middle Harbour at the Spit, near the site of the present ferry. As proposed, it will be constructed of two central openings of 60 feet, with two spans of 125 feet upon either side. The central spans will be formed by continuous lattice girders, revolving upon a central swing pier. The 125 feet spans are to be independent lattice girders. The roadway will be 32 feet wide. To allow of general harbour traffic the superstructure will be 30 feet in the clear above high water, and will rest upon wrought and cast-iron cylinders. The approaches to the main bridge, which are 1,500 feet in length, will consist of timber spans, and an earthwork embankment. £62,000 has been voted for the work.

J. Barling,
Esq.

16 Nov., 1888.

* NOTE (on revision) :—With a headway of 124 feet.

† NOTE (on revision) :—With a headway of 150 feet.

William Christopher Bennett, Esq., M.I.C.E., Commissioner and Engineer-in-Chief for Roads and Bridges and Sewers, sworn and examined:—

- W.C. Bennett, Esq., M.I.C.E.
16 Nov., 1888.
2. *Vice-Chairman.*] You know Middle Harbour, and have known it for many years? Yes.
3. Do you produce a design showing the proposed bridge at the Spit? Yes.
4. Will you tell us all you desire to state about this bridge? The best and cheapest place has been selected. Some two years ago the approaches to the punt were graded. The unemployed were engaged on it, and they made suitable approaches with tramway grades, at present available for the ferry, but arranged so as to be ultimately of use for the bridge.
5. So that the construction of the approaches on each side of the bridge is to a great extent already finished? The road to it is. Then we proposed to either embank the Spit along the sand or make timber open approaches. The latter course is the one that has been decided on within the last few days. We have only had borings made within the last few days to enable us to determine whether it would be safe to put a bank of such a height on the sand.
6. Will that add to the proposed cost? No; it will be the same.
7. Do you think this opening will be sufficient for the present and future traffic of Middle Harbour? I am quite sure it will. The opening in the Parramatta bridge is somewhere in the same proportion. It answers for all the traffic there.
8. Is it on the same principle as this? There will be some slight differences. We have adopted more recent improvements. Those girders are all to be steel.
9. What time would it take to open this bridge for a vessel to pass through? We will improve on the Parramatta River bridge. That is worked by hand. This will be worked either by steam or hydraulic power; we have not determined on that yet. If the water-pipes come sufficiently near, I think we would work by pressure from them; if not, we would have a steam-engine, accumulate sufficient water at a high pressure, and have a small hydraulic engine that would turn that in a couple of minutes.
10. The traffic that way has been increasing a great deal the last few years? Very rapidly indeed. I made the first road down there some twenty-five years ago—it cost about £300 the whole thing—across the Spit. The traffic has outgrown that, and since those inclines were made the traffic has grown very rapidly indeed.
11. And the present punt appliance? Is totally inadequate; so inadequate, that the Government on my recommendation are going to put a steam-punt there at once, pending the construction of the bridge, with the view that the punt can be removed when the bridge is built and utilised elsewhere.
12. You think then that this bridge will not interfere with the traffic of Middle Harbour to any inconvenient extent? I think not. There is a sentimental objection that yachts will not be able to go under it, but the ordinary openings of the bridge are to be 10 feet higher than the Parramatta bridge, and with the exception of half a dozen yachts, every boat in the harbour will be able to go under. Those half dozen are not fond of going up Middle Harbour; they go out to sea, where they have more scope, for a sail. It would be very unwise to put a bridge at a great height simply to accommodate a few yachts. If there is ever sufficient trade in larger sea-going vessels, they can pass through the swing.
13. Has not the population on the northern side of Middle Harbour been increasing very rapidly of late years? Very rapidly indeed.
14. As well as on the southern? Yes; on both sides.
15. *Mr. Humphery.*] You are of opinion that £62,000 will cover the total cost of the bridge and approaches? Yes; as far as I can estimate. We have been guided by the prices we have paid for other work, and I have reason to think that the estimate ought to be a fair one.
16. Will this bridge carry a railway or tramway? It will carry a tramway.
17. It will be constructed so that it will carry a tramway? Yes.
18. *Mr. Street.*] 32 feet I think you said was the breadth;—will that provide for the tramway and the vehicle roadway as well? Yes; it will provide plenty of room. If necessary we can put cantilevers for a footway.
19. *Mr. Garrard.*] How much would the cost be increased by an additional 10 feet in width? You might say it would be increased one-third. It would not exceed that.
20. Would it necessitate stiffer cylinders? Yes; it would necessitate larger cylinders in order to have a greater bearing area on the base, because the load would be increased. There would be heavier girders, and very much heavier cross girders; and then to increase the width of the swing would be a very large addition to the cost. In fact, if the width of the ordinary bridge were increased, I should be disposed to keep the swing at the present width.
21. What would be the estimated cost of providing these footways outside? I do not think they would cost more than £3,000.
22. You have not included that in this estimate of cost? No.
23. It would be very dangerous to pedestrians to be walking in the roadway on a long bridge like this with a large amount of traffic? Yes; I am fully alive to that.
24. Is it not desirable at once if this bridge is to be constructed to provide these footways for the safety of pedestrians? If they are going to have a tramway I think it would be desirable.
25. What depth are you supposed to sink to get a bearing for your cylinders on rock or hard soil? We have calculated on something between 30 and 40 feet.
26. Have you had borings there? We have not had borings until lately; we have borings now.
27. Have any other sites been proposed? Yes; there were several sites surveyed. There was a site brought under our notice by Mr. Willis; we made a survey for that, but it would be a gigantic affair.
28. Does that run across to Clontarf? Yes; a high-level, nearly as large as the proposed North Shore bridge.
29. A different route altogether from this? Yes.
30. I think you said it was intended to make this approach by timber work instead of embankment? Yes.
31. Does this join the new road that comes down there? Yes.
32. The new and the old roads run to much about the same place on the Spit, I suppose? Yes; but the old road is obsolete.
33. What incline have you put on the Manly side from this low-level bridge? I think it is not worse than 1 in 16 or 17.*
34. For any great distance? That is the ruling gradient a good deal of the way.

36.

* NOTE (on revision) :—It is 1 in 20 and 25, except at foot.

W.C. Bennett,
Esq.,
M.I.C.E.

16 Nov., 1888.

35. It would be considerably easier than the present one? Yes.
36. Are these all cast iron cylinders, or are some of them wrought iron? Our usual plan is to have cast iron cylinders below high-water mark and wrought iron from that up.
37. What other bridges are built that way? Parramatta River, Iron Cove, Manilla, in fact all the bridges built by the Department.
38. Is there much corrosion on the part of the wrought iron cylinders? No; I do not find it.
39. I suppose these cylinders are filled up in the usual way with concrete? Yes.
40. What width would be required for a single line of tramway? About 9 feet.
41. And for a double line? 18 feet.
42. That would only leave 12 feet? Yes; but then the tramway part of it would be available the same as the street for traffic.
43. But in the event of two trams going in opposite directions at the same time there would be no room for vehicles? The traffic should be regulated. There would be nearly as much room as there is in many of the streets.
44. How long do you estimate this bridge to last? It is almost impossible to say. It will certainly last 150 years.
45. Do you not think then that in view of the possible enormous growth of traffic there it would be wise to have it wider? It is hardly necessary to look forward so far.
46. The opening between the cylinders is 60 feet clear? Yes; it is a little wider than the Parramatta bridge.
47. And the headway? The headway is 10 feet more, that is in the fixed girders.
48. I suppose the estimate of cost is not likely to be exceeded—it is based on your experience of bridge building in other parts of the colony? Yes.
49. *Mr. Copeland.*] Is there not some proposal at the present time for building a tramway along this road? Yes.
50. Is that a private concern? A private company are trying to get a bill through the House; I reported strongly against it.
51. On what grounds did you report against it? I reported against it, then, because it was a narrow gauge; that was one reason. Another reason is that I am doubtful of the prudence of giving a private company rights on public roads.
52. I suppose if this bridge were built, this tramway company would expect to use it? They expect to pay for it too, I think; they expect to pay something reasonable.
53. Would they be likely to construct a bridge themselves;—would they be strong enough to do that? They talked of doing it.
54. I suppose they would not be likely to build it if they could get the Government to build it for them? Very likely the bridge they would build would be only suitable for themselves; the Government bridge would be useful for general purposes.
55. What real necessity is there for this bridge;—is there any difficulty in crossing at the present time? At present there is, but there need be no very great difficulty if there were a steam ferry there, except the inclines on either side; and the traffic is getting very great.
56. I suppose the whole of the vehicles between Sydney and Manly Beach would have to go by that route? Yes, any vehicle traffic there is must go that way.
57. I suppose this road would also be required for military purposes? Yes, it was on that ground I objected to the tramway being so narrow. If any urgent occasion came to concentrate a lot of rolling stock and get material and men down to the Heads rapidly or get them away, there would be no rolling stock but the limited rolling stock of this company; but if it is made the ordinary gauge the whole of the rolling stock of the colony could be brought there if necessary.
58. I suppose this bridge as proposed will be strengthened to carry heavy field-guns? It would carry any field-guns, decidedly. I do not think it would carry those heavy 100-ton guns or 50-ton guns.
59. You think this is the best site for the bridge attainable? Yes; I think it is, at a moderate cost.
60. Do you think there is really any better site—more useful site? I do not. There is a site which would require a very large outlay, and, as another objection, it is right on the top of a rocky shoal, which may have to be blasted out and excavated at some future time to admit vessels of a large draught coming up, and the bridge being there would make the blasting rather awkward and expensive.
61. Suppose you were to get a steam-punt, would it be capable of affording accommodation for the traffic? The steam-punt we propose now is only calculated to accommodate horse traffic; it would have to be a very much larger affair to accommodate a tram, and the grades are very steep. It would be rather an awkward affair altogether.
62. Would it be large enough to carry horses and vehicles? Yes; the one we propose would carry horses and vehicles. It would be the same as the one at George's River.
63. What would be the cost of that punt? £2,000.*
64. And the annual charge? £500 a-year.
65. Then there is the interest on the £2,000? Yes, and the depreciation.
66. What is the depreciation? The depreciation would be 10 per cent., and the interest 4.
67. *Mr. Garrard.*] Do you find 10 per cent. sufficient to allow for the depreciation of a steam-punt? If you have a sum provided for repairs also. Ten per cent. is the capital depreciation. I conclude you would have to put a new punt there every ten years.
68. Does £500 for maintenance include working and repairs? Yes. We have a steam-punt at Grafton that has been twenty years at work.
69. *Vice-Chairman.*] What would be the annual income from this steam-punt? It would be very difficult to say. The traffic would not be so great on the punt as it would over the bridge, if it were there, because many people would drive their vehicles who would not go over in the punt.
70. But the steam-punt would induce traffic? Yes; I should think the income would be £400 a-year.
71. What income do you reckon there would be from the bridge? That would depend altogether upon the tolls.
72. *Mr. Copeland.*] The interest in running this steam-punt would amount to £800 a-year, against which you have a probable reimbursement of £400, leaving an annual charge of £400 a-year. On the other hand, you propose to expend £62,000 on this bridge, which, at 4 per cent., would amount to £2,480? Yes; but then the bridge would be for all time, and afford greater accommodation.
73. The £2,480 interest would also be for all time? Yes, unless they put a toll on the bridge. 74.

* NOTE (on revision):—Since let for £1,450.

- W.C. Bennett, Esq., M.I.C.E.,
16, Nov. 1888.
74. In one case a steam-punt would necessitate an annual toll of £400; in the other case the bridge would amount to £2,480 a-year? Yes. You have not calculated the maintenance of the bridge, the painting, and so on; but still I think the additional cost of the bridge would be justified by the additional accommodation afforded to the public.
75. Do you think the steam-punt would not do for all the traffic at the present time, and, say, for the life of a steam punt—for ten years? I do not think so.
76. How many vehicles would this punt you propose carry over at one time? It would carry just as many as one of those North Shore steamers.
77. How long would it take to cross the water from shore to shore? Three minutes each way. Of course there would be the unloading at the wharf, and so on. Every ten minutes you could go.
78. On each trip would you carry as many as can be carried by this North Shore punt? Yes, nearly as many.
79. How often do the punts leave for the North Shore? Every quarter of an hour.
80. If you had one leaving every quarter of an hour at the Spit do you think there would be more traffic than there is across to North Shore? Not to begin with.
81. For the next ten years is there likely to be more traffic across the Spit, or across to the North Shore. You are not looking to have anything but a punt to the North Shore for the next ten years—it would take ten years to build the North Shore bridge, I suppose. What I want to get at is this: Whether, speaking as an officer of the Department, not having any predilections at all, you think a steam-punt, at an outlay of £400 a year, could not be made to do service for the next ten years? I do not think it would do it in a way satisfactory to the public. I think it would restrict the growth of settlement on the other side.
82. Before they had the bridge across from New York to Brooklyn, do you think the want of a bridge prevented Brooklyn from growing? I know it did not.
83. It has not prevented North Shore, St. Leonards, and those places from growing? No, it has not; but if they had had a bridge they would have grown much faster.
84. Do you not think they have grown fast enough;—do you think there are any other places in the Colony that require the expenditure more urgently than this, if provided with a steam punt, the same as they have to North Shore? In the way of bridges I do not.
85. What about the bridge across the Darling? I know there will be a good deal more traffic here than on any bridge across the Darling.
86. Do you estimate that a steam punt giving as much accommodation as the North Shore one could be worked at an annual outlay of £400? Yes; taking the probable income. Of course these are only rough estimates.
87. *Mr. Sydney Smith.*] And the cost of swinging the bridge—what would you estimate that to be? That would be £250.
88. And what about wear and tear to the swing? Of course, there would be the cost of that.
89. What percentage of depreciation would you allow on the first cost of the bridge? It is very hard to say that, except on the swing.
90. Would there be 5 per cent. depreciation? That would only give twenty years for the bridge. I said the bridge was likely to last 150 years, and that would be less than 1 per cent.
91. *Mr. Copeland.*] What would you reckon the cost of repair, roughly speaking? Painting would cost about £200 a year.
92. Grease and oil, and so on? That would be very little—£10 a year would do all that was necessary.
93. Would there be any other kind of repairs necessary? I do not think there would, unless there was an accident.
94. Then the total outlay for this bridge would amount to £2,930 a year—I suppose we might safely add the other £70 and make £3,000 a year—as against £400 per annum, less the receipts, for the punt? Yes; but then you estimate the receipts of the punt, and you do not estimate the receipts from the bridge. Even if there were no toll on the bridge for vehicles, the tramway company would have to pay something. They should be bound to pay rather more than the difference between the two.
95. Do you think it is safe to estimate on an income from a company that is not in existence? No; but if a company is not formed, and a toll is put on the bridge, the vehicle traffic will be so great as to pay very well.
96. Are there any tolls on any other bridges? No; but that is a matter for legislation.
97. *Mr. Humphery.*] Have you formed any opinion of what would be a fair charge to make the tramway company for the use of this bridge? No, I have not. That could easily be arrived at by a calculation like that Mr. Copeland has been making, but more detailed.
98. Are you of opinion that the tramway company should pay 4 per cent. of the cost of the bridge? Yes, I think they should.
99. *Vice-Chairman.*] The tramway company could not work without a bridge? The tramway company should pay the difference between £2,450 and the revenue derived from passengers; because if the tramway company were charged for the bridge, there should be a toll collected on the passengers, or an allowance made to the company for the possible toll.
100. *Mr. Humphery.*] That is the difference between the 4 per cent. on the cost of the bridge and the present returns from the punt? No; and the possible returns from the passengers on the bridge.
101. Allowing a fair increase every year? Yes; there are a great many elements in the calculation, but it would be easily arrived at. Those are the principal features.
102. Could you estimate what would be a fair charge to make the tramway company for the use of that bridge? Well, I could estimate it, but I would rather not do it now. I will send it down to the Committee.
103. *Mr. Suttor.*] Do you know how far this tramway company will run their lines on public roads in that district? They are to go from the present tramway terminus, and follow the military road, I think, and the Spit road that we have made, and on to near Manly. Then, I think they deviate a little beyond Manly from the ordinary road, and make what they call a railway of it.
104. You say they ought to pay something for running over the bridge;—ought they not to pay something for running over the main roads as well? I should think so: There will have to be an arrangement to keep the road in repair.
105. *Vice-Chairman.*] Would it be possible for the tramway to carry their service across the Spit by means of a steam punt? It would be possible, but it would be awkward, dangerous, and uncertain. The inclines close to the water were advisedly left steep. They were carried down to the probable level of the bridge

- bridge at an easy grade, and from that it was necessary to carry them down steep to the water's side; so that there would be a steep grade to encounter after getting out of the punt.
106. *Mr. Garrard.*] What would be the life of the timber approaches to the bridge? Thirty or forty years.
107. What proportion would that bear to the whole cost? About £12,000.

W.C. Bennett,
Esq.,
M.I.C.E.
16 Nov., 1888.

John Alexander M'Donald, Esq., M.I.C.E., M.I.M.E., Assistant Engineer, Department of Roads and Bridges, sworn and examined:—

108. *Vice-Chairman.*] Did you prepare a design for this bridge over the Spit at Middle Harbour? Yes; under Mr. Bennett's supervision.
109. What have you to tell the Committee about it? I do not think there are any points I can bring forward that Mr. Bennett has not, except in reference to any details.
110. *Mr. Garrard.*] What would be the increased cost of making this bridge 10 feet wider? I could bring you that calculation at the next sitting. [*Vide Appendix A.*]
111. What is the planking? On the whole of the iron bridge it is proposed to put a buckle plate deck, with a tarred metal roadway.
112. Do you find that answer better than the planking? Yes. It is in a constant state of repair, whereas when the timber decking is worn out it means an interruption of several weeks at least to repair it.
113. I suppose in the event of putting footways there they would be planked? Yes.
114. *Mr. Suttor.*] Have you been asked to make any calculation of the cost of this bridge with a headway, say, 100 feet? There have been two sites proposed for a high-level bridge.
115. What would be the cost of the Spit project? About £220,000 with 100 feet headway.
116. That is the total cost? Yes.
117. What was the cost of the other site? That is on the high-level site suggested by Mr. Willis, and the Commissioner had a survey taken of it. The estimate for that would be £260,000, exclusive of the new roadway, which would be very heavy work, with very bad grades, as steep as 1 in 15.
118. That is nearer the mouth of Middle Harbour? Yes. Another great objection to this the Commissioner has already referred to; it would be built on a reef, which has only about 9 feet of water on it at low tide, and if we built a bridge on that it would practically forbid removing the reef at any future time.
119. *Mr. Garrard.*] Is that what is called the Clontarf site? Yes.
120. *Mr. Suttor.*] Have you heard it proposed that the bridge should be 150 feet high;—have you made a calculation of that? Yes; but only a rough calculation.
121. *Vice-Chairman.*] I suppose the easiest way would be to tell us how much a foot it would take to raise it? No; the spans would be altered as you raised it. The estimated cost is £264,000.
122. *Mr. Suttor.*] I suppose it is not proposed to make a lower bridge than the one on this plan? No.

J. A.
M'Donald,
Esq.,
M.I.C.E.,
M.I.M.E.
16 Nov., 1888.

FRIDAY, 30 NOVEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN.)

The Hon. GEORGE CAMPBELL,
The Hon. WILLIAM HENRY SUTTOR,
The Hon. JAMES WATSON,
The Hon. FREDERICK THOMAS HUMPHERY,
JOSEPH PALMER ABBOTT, Esq.,

HENRY COPELAND, Esq.,
JACOB GARRARD, Esq.,
ALEXANDER KETHEL, Esq.,
SYDNEY SMITH, Esq.,
THOMAS MICHAEL SLATTERY, Esq.

JOHN RENDELL STREET, Esq.

The Committee further considered the proposed bridge at The Spit, Middle Harbour.

Thomas Littlejohn, Esq., merchant, and resident of Manly, sworn and examined:—

123. *Chairman.*] You are a merchant in the city of Sydney? Yes.
124. And I believe Vice-President of the Chamber of Commerce? Not now.
125. Where do you reside? At Manly.
126. Are you a property holder? Yes; I have a small property.
127. Is your property in the neighbourhood of the proposed bridge at Middle Harbour? No.
128. You know the site of the bridge across the Spit? Yes.
129. Have you seen any design of the structure showing the height, width, and length of the bridge? I saw a sketch in Mr. Barling's office about ten days ago.
130. How long have you been a resident at Manly? For about four years permanently.
131. But you are an old colonist independently of that? Yes.
132. And you have watched the progress of Manly? Yes.
133. Has the population increased largely within your knowledge? Yes; it has more than doubled.
134. It is increasing in a greater ratio than it has ever done before? Yes. But I ought to explain that just lately there has been a lull in the accession to the population. I suppose, however, that we shall soon see them coming in again as numerously as before.
135. The greater number you have there the greater, of course, the proportionate increase? Yes.
136. Has it occurred to you during your residence at Manly that the residents have suffered inconvenience through the want of land communication with Sydney? Yes, to a considerable extent; and extra expense, besides inconvenience.
137. The crossing at the Spit is the only route by which what may be called semi-land carriage has been carried on? Yes.
138. This has caused great inconvenience, I take it? Yes.
139. Have the residents of Manly complained of it for some time? Yes; it has been a standing complaint. I ought to say, however, that some of the inhabitants do not want the improved access. For instance some of my own family say that our privacy will be invaded, and that our beautiful quiet will be destroyed.
140. I dare say there are other elements of objection to the construction of the bridge—vested interests—the steam-boat proprietors, for instance? Yes.
- 141.

T. Littlejohn,
Esq.
30 Nov., 1888.

- T. Littlejohn, Esq., 30 Nov., 1888.
141. Of your own knowledge have you been aware of any inconvenience caused from the want of improved land communication? Personally I have not been aware of any; but I know from report a good many instances in which great danger has been run, and where there has been great loss of property and nearly loss of life through the inconvenience of the crossing as it at present exists.
142. Do you think that if a bridge were constructed over the Spit it would be a favourite drive for people from Sydney? Yes.
143. It is a very pretty drive along the heights of the Military Road, and across from there to Manly? Yes. I should like in this connection to state a little of what I have seen in other places. I live on the side of Manly next to the North Head. The Roman Catholic grounds are a little off my fence, and beyond them seaward is that magnificent block of land consisting of the North Head. In travelling in Europe, Asia, and America, I have seen public parks in various places, but I have seen no place which is so exquisitely situated for laying out as a public park as is the North Head. I think that it ought to be viewed in that light by the authorities, and preserved for the purpose of making what I should call a Royal Park. The time is not far distant, perhaps, when the North Shore will become a very populous locality. In a few years there will be perhaps several hundred thousand inhabitants. Then I think that if this bridge is built visitors will come down that way from Sydney. Probably a number of visitors would be attracted by this park. I have in my mind's eye an aristocratic and leisured population in Sydney, who would be constant visitors, just the same as in the West End the inhabitants of London go to Hyde Park, Richmond Park, and other such places of resort. I think it would be a great pity to allow that splendid site to be sacrificed for any other purpose. It is capable of being laid out in the most beautiful winding roads and walks, and there are a great many beautiful hollows where tropical flowers and plants could be placed. I am advocating the erection of the bridge over the Spit in order that the formation of this park might be facilitated and accelerated.
144. What would be the distance from Sydney to Manly by way of the proposed bridge? I suppose that if people had to leave Sydney and cross the North Shore the distance would be about 10 miles.
145. Are you aware of the altitude of the proposed bridge? I am not.
146. I believe it is proposed to make it 30 feet from high-water-mark? It looks something like that from the design.
147. From your experience of the traffic there, do you think that would be sufficiently high? Not for all the traffic; if the swing bridges were not included it would admit only the small craft.
148. Do you think that the construction of the bridge would impede the traffic, and thus depreciate the value of property higher up? I do not think the interference with the traffic would affect mercantile affairs; it might affect yachtsmen to some extent.
149. But would it affect the value of the property? To its advantage. When I first went down to Manly there were no roads on my hillside; but as soon as roads were laid out, and people got access to the land, property went up. An allotment of 50 by 150 feet sold readily at £30—that is to say the seller was glad to get it; but now you would not get any of the blocks under £400 or £500, though about six or eight years ago those lots sold for £30 each. I think the property between North Shore and the Spit would benefit even still more by the bridge.
150. You have, I suppose, frequently been up Middle Harbour,—above the Spit? Yes; I have taken boats up from the Waterfalls to the Spit.
151. What distance would that be? By water probably not much more than 1 mile; it might be $1\frac{1}{2}$ mile or 2 miles, going up past the Quaker's Hat.
152. You think it would be a great advantage to have the bridge constructed across the Spit? An undoubted advantage, and I should say that the sooner it was constructed the better.
153. *Mr. Abbott.*] Have you gone into any calculation to show what the cost of the bridge would be likely to be as an annual charge against the public? No.
154. That has not entered into your consideration at all? No.
155. That is a matter of the most perfect indifference to the land owners of Manly? I do not know what area of land the Government still hold there, although if it is anything appreciable the increase to its value will be so great that the mere cost of the construction of the bridge will be a trifle.
156. If the Government want to get access to the Crown lands on the eastern side of the harbour there are places higher up, are there not, which could be bridged directly to these lands, giving direct communication; that is to say if the object of the Government is merely to give access to the land? From what I have seen of the elevations I should think it would be possible to put a bridge across in many places.
157. Do you think the Government would be justified in imposing upon the public for all time an annual charge of £3,604 for this bridge? Yes, more than justified.
158. In what way? Because of the price at which they would be able to sell the land.
159. You are assuming that this is the only place at which the Government can get approach to their Crown lands;—suppose they can get a better approach to the land which they have on that side of Middle Harbour,—do you think there would then be any justification for inflicting this charge upon the public every year? Well, I should say there would be no justification for adopting an inferior in preference to a superior approach, if a superior one could be found.
160. Is it not a fact that a great proportion of the houses at Manly Beach are vacant for a considerable portion of the year? During the last two years a great many houses have been vacant.
161. Are not a great many of them vacant in the winter? There are no more vacant in winter than in summer.
162. Do you not think the bulk of the people live there for the sake of the sea trip? Do you mean the present residents?
163. Yes? No; I do not think so. In my own case, I can say certainly not.
164. Would you come round by the road into Sydney if you had this bridge? I am half afraid that if there were an awful storm one morning I should prefer the bridge.
165. But with or without storm, would you come overland to Sydney in preference to taking the salt-water trip? Certainly not; that is, not as a rule.
166. It would be a sort of appendix to the pleasure of living at Manly? Yes; and it would perhaps enable us to get to town at times when the steamers were not running.
167. Would not a steam-punt give you all the accommodation you require for casual trips? Well, then you would deprive a great many country visitors of a pleasant trip.

168. Would not the steam-punt do for them? I do not think it would be capable of accommodating the immense volume of traffic. T. Littlejohn, Esq.
169. Do you mean to say that country visitors are so fond of travelling by land that they will go across to North Shore for the purpose of getting a land trip to Manly? Many of them would not come through Sydney. I anticipate the time when North Shore will be a large portion of this immense city, with direct communication all over the Colony. I presume that they would come down to Manly from places at which they were staying on the North Shore—perhaps to visit my projected park. 30 Nov., 1888.
170. You are assuming that the country will give up the land for the purpose of forming this park? Yes.
171. And upon that assumption you think the bridge ought to be built? Well, that is one of the features of the case.
172. Have you any idea of the value of the proposed park at Manly? I have not the slightest idea; but I am sure that it would be almost a hundred times greater than it is now in the course of a few years.
173. Is it worth half a million now? I should say more—its prospective value is incalculable.
174. *Mr. Copeland.*] Have you any idea how many of the people residing at Manly keep buggies? I can't say exactly; I think I know personally of about half-a-dozen.
175. How long does it generally take the steamers to travel from Manly to Sydney? The ordinary steamers, excluding the smallest and the oldest, do it in about half an hour and five minutes from wharf to wharf.
176. How many miles is it driving from Manly to Sydney and excluding the crossing in the punt at North Shore? I should say it would be a little over 10 miles.
177. Where would you cross the Parramatta River to make the distance 10 miles? I scarcely understand your question, as to the Parramatta River.
178. You would have to cross the Parramatta River if you did not use the North Shore ferry? That is a different thing altogether; I do not know where you would cross the Parramatta River, unless you went to Ryde, or to the bridge at Gladesville.
179. Well, can you give me the distance from Manly to Sydney by way of the Gladesville Bridge? No; I cannot.
180. Would it be 20 miles? I should not be surprised if it were 25 miles.
181. If you had to drive all the way from Manly to Sydney, then, the distance would be over 20 miles? At the present moment.
182. That is unless you made use of the North Shore ferry? Exactly so.
183. Is there any greater difficulty in using the steam ferry at Middle Harbour than exists in using the steam ferry at the North Shore; you see you would have to use one ferry, even if you had a bridge at Middle Harbour? No; I cannot see that there is any greater difficulty, but it would be a great advantage if carriages could go all the way from North Shore without having to use a ferry.
184. But you could not go all the way from Sydney without a ferry, unless you had a bridge over from North Shore? We want both bridges.
185. Could not the bridge at the Spit wait until you get the bridge from North Shore? I think it would be very advisable to accept that which is offered first, and to wait for the next.
186. You will take all you can get, and look for more? Just so.
187. What is the freight per ton of goods from Sydney or Manly? I cannot say, I have had no experience of it.
188. Do you think that if this bridge were built you would be able to get your goods from Sydney at a cheaper rate by road than you now pay by the steamers? I believe so, and with far less trouble.
189. By what means of carriage? It would have to be at present by drays.
190. You think the drays could take the goods overland better than the steamers could take them? I think so, for lately the steamboat company have imposed wharfage rates upon goods landed at their jetty in Manly.
191. And you cannot tell us what the steamer freight is? I cannot, except for small packages, and that would be no guide. I know that one or two of my neighbours have had furniture brought down by land across the Spit, as it exists at present, in preference to having it brought down by steamer.
192. The park of which you spoke is not yet planted? No; there is nothing but snakes there at present.
193. How long do you think it would take a park like that to grow in order to become attractive? I should think that after the formation of the plantations two or three years would be enough to make them show well.
194. You think we have not enough parks in the neighbourhood of Sydney without having another at North Head? None of them can equal it.
195. You seem to think that the time is at hand when Sydney will become a suburb of the North Shore, and when people will go there direct without troubling Sydney at all? I do not think I put it in that way, but of course they would each be parts of a large city.
196. *Mr. Watson.*] How far does Middle Harbour extend from the Spit inland? I have myself been up beyond the Spit 4 or 5 miles, I think.
197. Is the land all sold on each side of the harbour? I do not know.
198. Do you not think that its value would be depreciated if a bridge were built there? Certainly not, because the access would be constantly improving.
199. Do you not think the bridge would affect the traffic? I think it would in one way—it would increase it.
200. Up Middle Harbour? Everywhere, all round about.
201. I think you mean that the traffic would be increased between North Shore and Middle Harbour; but I am speaking of the traffic up towards the head of Middle Harbour;—do you think that that would be increased? I think the bridge would increase the traffic to every place in the locality nearly. You would have roads made all through the adjoining land I suppose, and wherever roads are made land increases in value.
202. Would not the traffic towards the head of Middle Harbour by water be impeded? It would to an extent; that is, in so far as vessels whose masts were higher than 30 feet would be precluded from going up except through the swing bridges.
203. Consequently the land would be depreciated because there would not be the same amount of traffic? You must have regard to the kind of craft going up; anything with masts under 30 feet would be able to go up with ease.

- T. Littlejohn, Esq.
30 Nov., 1888.
204. Well, take pleasure yachts for instance? Two or three on Saturday night or on Sunday would be all that would go that way.
205. Do you think the country would be justified in giving half a million's worth of land for a park for the people of Manly? It would not be for Manly; it would be for the people of New South Wales, in fact for the whole world.
206. You already have two parks at Manly have you not? Well, I know of one.
207. Do you think that if this bridge were erected you would often drive to Sydney—except in time of tempest? It is quite possible.
208. You would drop your buggy at North Shore and come over to your business in Sydney by the ferry? Yes, until Sir Henry Parkes' bridge is built.
209. What might the population of Manly be? I think the mayor or aldermen would be better able to tell you that; I have heard 4,000 named as the total population.
210. If the Government decided upon the recommendation of the Committee to build this bridge at the expense of £70,000, it would be for the convenience of 4,000 people? No. And, as I explained at the outset, some of us do not want the bridge, or any such interference with our quiet and comfort. Many people at Manly do not want the bridge. It is from public motives that I speak in its favour.
211. Do you know of any people of your own knowledge who do not want the bridge? Yes; some of my own family.
212. They do not want it? Well, they say that it will interfere with our quietness; but I do not think their judgment in the matter is very good.
213. *Mr. Abbott.*] Is there not just a possibility of a population springing up on the hills surrounding Middle Harbour, along the top from North Shore, and on the other side where there are Crown lands? I think there is a great possibility of it, and I think this bridge would help it.
214. Would not this bridge obstruct direct communication with those places? By water, no; because the swing bridge could be easily moved. I have crossed at Balmain frequently. Certainly a delay of 5 minutes when you are coming into business in the morning is not agreeable, but the bridge-keeper would see the craft coming along on either side at a considerable distance. They would have their signals hoisted, and there need be no delay whatever. If the bridge-keeper were ready for them they would not be more than a minute going through.
215. *Mr. Sutor.*] There is a large amount of private property in Manly? A good deal.
216. Have you any idea as to the value of it altogether? It has been of shifting value lately.
217. Upwards or downwards? Downwards.
218. Still there has been a general increase in value? Yes; I have already given you an instance of the increase in the value of the land there.
219. If this bridge is erected I suppose property will increase still more in value? I do not think very much for a considerable time; I have not been taking that feature into consideration at all.
220. But if the bridge leads to an increase of the population there will surely be an increase in value? Well, we have public accommodation for visitors, and we look for an immense influx of strangers and others to the place as time goes on.
221. Suppose this Committee recommended that the bridge be not erected, do you think the people of Manly would take the matter into their own hands and build the bridge themselves? I do not think so.
222. Do you think it would pay a company to have a bridge there? I dare say it might.

Thomas Buckland, Esq., sworn and examined:—

- T. Buckland, Esq.
30 Nov., 1888.
223. *Chairman.*] You are an old resident of Sydney? Yes.
224. You have lived here for a great number of years? I have been connected with business at the corner of Market-street for fifty-five years.
225. You have heard of the proposal to construct a bridge over Middle Harbour at the Spit? Yes.
226. You take some interest in the proposed work? I do.
227. Are you the owner of any land there? Not one acre.
228. You know the country pretty well? I do.
229. Do you think it would be desirable to construct a bridge over the Spit there? I think that unless there is sufficient headway left for any sailing vessel to pass under whose depth of draft would enable it to pass the Spit, it should not be constructed. I come to that conclusion from what has happened in connection with the Pyrmont Bridge. When that was proposed there would have been, I think, strong opposition to it—sufficient, I think, to prevent it from being built; but, unfortunately, all the water frontage in Cockle Bay was in the hands of persons who were either trustees, or executors, or absentees. When I tried to get up an opposition to the bridge, I was met with that difficulty—I had no one to back me up. The effect of the building of the bridge was that the rental went down one-third. In some cases, when the leases fell out, I think the rent went down a great deal more. I am sorry to say that last Saturday there was a fire in my office; and what with fire and water, I am very much in the position of being between the Devil and the deep sea. My premises have been saturated with water, or I would have endeavoured to produce for you some papers from which you could have obtained some valuable facts. But speaking from memory, the rent of my own wharf went down from £500 to £300, and subsequently to £2 10s. a week. The rent of the Albion Wharf went down from £900 or £960 to £700 and to £600. The next wharf (Sheldon's) was used only for slaughtering and for the sale of meat. I think that nothing was afterwards obtained for Street's Wharf for wharfage.
230. You think the bridge was a mistake then? Well, the rents went down a third or more.
231. Do you think the construction of a bridge across the Spit would lead to a parallel result? Yes. There was a large coasting trade in Darling Harbour. It is important that coasters should get in and out as quickly as possible, and the delay in opening the bridge made a difference in the length of the trips.
232. There are no wharves or any improvement for the purpose of commerce up Middle Harbour now? No.
233. You think there will be in the course of years? My view is that people who have gone up the line to live, at Burwood, Ashfield, or Homebush, will leave those suburbs as they become more thickly crowded, and will go to more healthy sites on sandhills and sandstone. I think that a lot of land at Middle Harbour is likely to be taken up as places of residence for retired people. Gradually, of course, North Shore will extend over in that direction.

234. Are you aware of the height of the proposed bridge? I understand that it is to be 30 feet. Less than 120 feet would not allow many sailing vessels to go through unless they struck their top-gallant masts. T. Buckland, Esq.
235. You are aware that it is proposed to have a swing bridge? Yes; that is the curse of the thing—waiting for the swing. 30 Nov., 1888.
236. You are aware that the population of Manly Beach is largely increasing? Yes.
237. I suppose you recollect the time when there were a very few people at the North Shore? When we put up land there in 1853 at a reserve of 15s. per acre there were no bids; the other day I was taxed at £500 per acre. Fortunately the land was not my own. The old camping place at Manly, where we used to go shooting and fishing, is now a little city. No doubt a bridge would be a great improvement and convenience, but anything interfering with the access to any part of the harbour I should most strongly oppose. It puzzles me to think how any men could agree to such a thing; they must be mad. We are proud of, and boast of our beautiful harbour, and yet we put barriers across it to prevent access. The thing passes my comprehension.
238. I suppose you know that it is a great inconvenience to the people of Manly not to have any means of coming to Sydney by land? Of course a bridge would be an excellent thing so far as that is concerned.
239. Then you think it would be a good plan? Always supposing that you would allow sailing vessels whose draft would allow them to pass the Spit to pass through without any inconvenience.
240. You think that a bridge of the height proposed would be much too low? Much too low.
241. Do you know to what distance above the Spit the water is navigable? I am not aware.
242. I mean for boats? I do not know what depth the channel would give.
243. They are commencing to build houses above the Spit, are they not? A few, not many; but the other part of North Shore is like a city.
244. Do you think that a steam-punt would answer the requirements of the traffic at this point? I cannot say; it is a makeshift at the best. We had a steam-punt at North Shore at one time, but it was a great makeshift.
245. Have you ever travelled through America? No.
246. You have not been home since you first came out here? I have never been out of New South Wales since I came here except to New Zealand and Victoria.
247. *Mr. Abbott.*] If you were told that the annual cost of a bridge with iron approaches would be £4,227, do you think there would be any excuse for setting such a burden as that upon the people for many a day? Not unless there were access for sailing vessels to the upper part of the harbour. If you cut that off you would not only cause great inconvenience, but you would depreciate the value of all the Government property beyond.
248. Do you know the bays up in that part of the harbour pretty well? I do not. I have been round them often enough, but I have never taken particular notice. I know that there must be enormous water-frontages from the sinuosity of the bays.
249. Do you not think that a steam-punt would answer the traffic requirements of Middle Harbour for many a day? It would for some time, but it is a very poor convenience.
250. *Mr. Suttor.*] You think we ought to have a high-level bridge at Middle Harbour? If we had any at all.
251. Do you know what a high-level bridge would cost? I do not.
252. We have evidence that a high-level bridge would not cost less than £220,000? I do not think it could be done for that money.
253. Would you recommend such a bridge as that? Not until we get a much larger population there.

John George Griffin, Esq., Mayor of Manly, sworn and examined:—

254. *Chairman.*] You are the Mayor of Manly? Yes.
255. And have been for some time? During this year.
256. You necessarily take an interest in all matters connected with the welfare of Manly? Certainly.
257. You are aware of the proposal to construct a bridge across the Spit on the road leading from Sydney to Manly? Yes. J. G. Griffin, Esq. 30 Nov., 1888.
258. Have you seen the design of the proposed bridge? I have.
259. You know its altitude? It is to be, I believe, 30 feet above high-water mark.
260. Would that be a desirable height? It would be quite sufficient for present requirements, and for some years to come.
261. There are swing bridges? Yes; two openings of 60 feet, I understand.
262. You think that would be sufficient for the traffic up the harbour? For many years to come.
263. Is it the case that the inhabitants on the north side of Manly Beach and the districts beyond suffer inconvenience through not having means of access to Sydney by land? Yes; they frequently suffer great inconvenience.
264. The present means of traffic is rather primitive? Across the Spit it is absurdly inadequate.
265. It is an ordinary punt? Yes; worked by a pulley and ropes.
266. Have you ever considered the practicability of having a steam-punt there? It is a temporary expedient; it would be better than the present means; but it would not be anything like the accommodation which the district demands and, I think, deserves.
267. Are you aware of the cost of the proposed bridge? From £60,000 to £70,000, I understand.
268. Have you heard of any estimate for a high-level bridge? I fancy from my own knowledge, that it would cost something like a quarter of a million.
269. Which would you consider the most desirable work, having regard to the present condition of the country's finances and the convenience afforded? I should prefer to have the low-level bridge, not only on account of the country's finances but from another point of view. If a high-level bridge were erected, it would not be at this place, but further down towards the mouth of the harbour, where the most suitable approaches could be obtained. There a very large reef exists in the harbour, and that must necessarily be blown up and removed before any vessel of size could get up. If a bridge were put up there it would have to be pulled down before this blasting could go on.
270. Are you aware of the extent of navigable water above the Spit? Not in square miles, but I know it is considerable; I know that the Harbour extends for some miles. 271.

- J. G. Griffin, Esq.
30 Nov., 1888.
271. Is it navigable for ordinary yachts? Yes, and pleasure boats.
272. Do you think it is likely to become a great place of residence? I think so, but it is used now chiefly for pleasure, and no bridge such as this would prevent that. It would be quite easy for any yacht to lower her mast if she wanted to go under. If the bridge were opened, any yacht ten times the size of our biggest yacht could get up, that is if she could get over the reef to which I referred.
273. You think that the bridge would be essentially a convenience for the people of Manly Beach and the north side of the harbour? Not only a convenience, but a mere act of justice, I think.
274. Do you think it would increase the value of the land? Very largely; the Government land would be largely increased in value.
275. I suppose that if the bridge were constructed the vehicular traffic would be increased? Very largely I should say. There would be probably 150,000 persons travelling over it in the course of the year.
276. And through the difficulty of access this means of traffic is not resorted to at all now? No, very little. Although it has largely increased, yet it is comparatively little when you consider the importance of Sydney, and the advantages of Manly.
277. Have you a park at Manly? Only small reserves in and about the town; nothing very great except the frontage to the ocean. We hope to have a park ultimately at the Quarantine Ground.
278. Has any application been made for a park? We hope to have one when the Quarantine is removed.
279. Has the municipality applied to have the land reserved for a park? Not yet.
280. Do they intend to do so? Yes, I believe so.
281. What is the extent of land they intend to apply for? We shall be glad to get 60, 80, or 100 acres.
282. You think it would make an attractive place of resort? Yes. The park land we at present have is small, but it is attractive. Of course, we have spent a great deal of money upon it.
283. *Mr. Abbott.*] What would be the annual cost of this bridge—in the shape of interest, depreciation, maintenance, and repair? The maintenance would depend upon the class of work used for the swing; I suppose two men would be wanted.
284. Assuming that we have hand-power? Yes; their wages would come to £4 a week.
285. Do you think the present requirements of Manly Beach justify the Government in incurring an annual expense of between £3,000 and £4,000 for this bridge? I did not know it would cost as much.
286. You see that the figures in Mr. Bennett's report make the annual charge £3,604? Yes; that is so according to those figures.
287. Do you think there is anything to justify that expenditure at the present time? Certainly. In the first place I think the convenience of the inhabitants of Manly Beach deserves consideration. The population approaches 5,000. Then we have a large floating population—floating in two senses; their convenience should also be considered. Thirdly, I think the whole Colony would be benefited by the expenditure, because Manly is admitted to be the only watering place. At present it cannot be nearly so much used by people in the country as it would if there were proper means of approach. The steamers are frequently very uncomfortable in rough weather, and sometimes are unable to run.
288. Do you think that many of your fixed population would use this road if the bridge were constructed? A great many would use the road, especially ladies; I suppose there would be a tram, or something of that kind.
289. You say that the road would also be used by a floating population, and that that is another reason for building it? Yes.
290. Is it not a matter of history that the floating population go to Manly Beach for the sake of the sea trip? I think that a great many would go down more frequently if they could do so without the fear of getting sea-sick.
291. How many houses are there in your municipal boundary? About 900 I think, but I cannot say exactly.
292. What is the capital value of the property rated in the municipality? I think it is £70,000, but I cannot say from memory.
293. And what do the rates amount to? They come to over £3,600.
294. Would it be any great convenience to business people coming to Sydney to have this bridge built, without a bridge from the North Shore? We hope to have that bridge some day. Perhaps I should mention one other circumstance which I think should weigh with the committee. The road may be desirable from a military point of view; a time may come when it will be necessary to take troops to Manly, and if so, I am sure that a punt of any kind would not be the proper means of getting them over this arm of the Harbour.
295. *Mr. Copland.*] I suppose this bridge would be serviceable for many years if built? Yes.
296. How many years would it last? For 100 years, perhaps; it depends upon the life of the iron.
297. You think this bridge would give sufficient accommodation for many years? For fifty years; I should say.
298. Do you think that if a low-level bridge were erected there would be any chance of that being removed and a high-level bridge being erected in its place? Yes; there would be nothing to interfere with it, because the high-level bridge would not be erected in the same place.
299. You would not object to the two bridges, I suppose? Oh, dear no.
300. Do you not think that the building of a low-level bridge would stand in the way of your getting a high-level bridge? I think we are quite prepared to run the risk.
301. You are quite prepared to take what you can get, and to wait for a high-level bridge? Yes. If you were to poll 20,000 persons who would be benefited by it, I am sure the bulk of them would be in favour of that course. I have heard it stated that the desire for this bridge is to further a tramway which is about to be made; but such is not the case, because we had a promise from the Government that the bridge should be erected before the tramway was considered. I think it is only right that I should say that.
302. Can you tell me what is the freight per ton upon goods from Sydney to Manly by steamer? I think it is 2s. 6d., but I am not sure.
303. I take it for granted that you get your stores from Sydney? Yes, everything.
304. If this bridge were constructed, do you think the goods would be carried by road? I do not think so; the goods would of course go by the cheapest route.
305. And you think that water carriage would be cheaper? It always is; I do not think there can be any question about that.
306. How many miles would it be driving from Manly to Sydney? About 7 miles.
307. That is assuming you cross by the steam ferry at North Shore? Yes.

308. Is there not an objection to crossing by ferry from North Shore to Sydney? That is the only way in which you can cross. J. G. Griffin, Esq.
309. Is it not looked upon as an objectionable method of crossing? Of course a bridge would be better than a ferry. 30 Nov., 1888.
310. Suppose you had a bridge over the Spit, would you still continue to make use of the North Shore ferry? You must do it until a bridge is made from Sydney to the North Shore.
311. Then it would not be looked upon as a great inconvenience while driving part of the way to cross by steam ferry from North Shore to Sydney? It is such a short distance.
312. How far would it be if you had to drive the whole distance? If you were to go round by Lane Cove, I suppose you would have to cover about 20 miles.
313. As a matter of fact, if you were to have this bridge, those who drive would still have to use one steam ferry? Yes; I think that very few would object to crossing by steam ferry from North Shore; the ferry is comparatively large, and the distance is short.
314. Suppose you provided a similar ferry to that at North Shore,—would there be any objection on the part of the inhabitants to using it? Well they would not like it nearly so well as the proposed bridge.
315. They would not like the steam ferry at the Spit but they do not object to it from North Shore? Well, the distance is greater.
316. Do you say that the distance at the Spit is greater than the distance at North Shore? Yes. At any rate it is more exposed. The present means of getting on to the punt and the punt itself are very inferior.
317. Do you really think that the distance is greater at the Spit than at North Shore? I should think it was; I am speaking from memory; I may be wrong.
318. Could you tell us how many people would be likely to use this land route if a bridge were built? I think that perhaps half the people would come this way. The population would increase, especially in the neighbourhood of the bridge.
319. How many people residing at Manly do you suppose are in the habit of coming to Sydney every day? 400 or 500, I suppose.
320. You mean business people? Yes.
321. Do you think that number come to Sydney by the boats every day? Yes.
322. If you had a bridge over the Spit and had to cross by the North Shore steam ferry how long would it take to make the journey by that route? I suppose it would take an hour and a half at the outside from end to end.
323. How long does it take the steamers to make the journey from wharf to wharf? The quickest is about 35 minutes, but I suppose the average would be about 45 or 50 minutes. Of course it would not take an hour and a half, but it might sometimes take an hour.
324. Do you think that a large section of the business people of Manly would spend an hour and a half in getting to Sydney by one route when they could reach it in half an hour by another route? My answer to that is that I anticipate a tramway being put down in the future; this bridge is designed to carry a tramway.
325. How long do you think the journey will take by tram? About the same time as by steamer; probably less.
326. Suppose a vessel happened to be passing through the swing bridge when a tram came along,—would not a great deal of delay necessarily take place? I suppose the Government in their wisdom would make regulations to prevent the bridge being open when a tram was likely to cross.
327. The shipping would have to give way to the trams? Yes. They could come up at certain specified hours. Of course they must not be allowed to impede the general traffic. The greater number of vessels would be pleasure boats.
328. How many trams would it be necessary to run backwards and forwards in a day? I should say about three or four morning and evening; say six or eight a day.
329. How long would it take these trams to do the journey? I cannot tell you without knowing something of the gradients, and so on. I do not suppose it would take more than the ordinary tram rate of 7 miles.
330. Would it take an hour? I do not think it would take so long as that.
331. Do you know the general rate of speed at which trams run in Sydney? I suppose from 10 to 20 miles an hour.
332. Are you not aware that the trams travel from 7 to 8 miles an hour? As a matter of fact I am not.
333. Notwithstanding that you are an engineer? I have not had occasion to find out at what rate the Government run their trams. I am sure that upon the line I am suggesting the trams could travel more quickly than in the Sydney streets. In the first place, the stopping places would not be so frequent, and there would be greater lengths of line upon which the trams could travel more quickly without doing any harm.
334. You say it would take an hour to go from Sydney to North Shore, but you would still have to cross by the ferry? Yes.
335. Adding the time for which you might have to wait for a ferry, and the time occupied in crossing, it would probably take an hour and a quarter that way;—I suppose it would take an hour to get into the city of Sydney by either route? Yes.
336. It has been given in evidence that the time made by the steamers is generally half-an-hour and 5 minutes? That is from wharf to wharf; it takes me about 50 minutes to get to my office.
337. Mr. Kethel.] It is a matter of fact I believe, that of late the traffic over the Spit Road at the punt has much increased? Yes.
338. To what extent has the population of Manly increased within the last four years? Very largely. The best way to ascertain that would be to look at the rates. The rates four years ago were under £2,000, now they approach £4,000.
339. Four or five years ago there was scarcely any traffic at all over the Spit Road, I understand? So much so that the Government had to pay someone to keep the punt; now they receive a good rent from it.
340. How do you account for the difference in the proportion of the traffic over and above the increase in the population;—the population of Manly, for instance, has doubled in four or five years, but the traffic over the Spit has quadrupled, and more than that,—it has I suppose increased tenfold? I think the increased traffic to which you refer is largely due to people coming from the North Shore to Manly—visitors and others.
- 341.

- J. G. Griffin, Esq.,
30 Nov., 1888.
341. What is the nature of the traffic over the Spit; does it consist chiefly of private vehicles or of freight-carrying? There is very little freight; it consists mostly of private vehicles.
342. Is it not a fact that when the punt capsized a few months ago there were laden drays upon it? I think not; loaded drays go down only occasionally. For instance, a person sending furniture would have to load and unload three or four times if he sent it by steamer; whereas, if he sends it over to North Shore by dray it goes over the punt straight to his house. That occasionally happens.
343. The bulk of the goods go down by steamer? Yes; and I suppose they always will.
344. Because of the cheapness of the carriage? Yes.
345. Would this work affect the people of North Shore in any way? I think that all sensible people would be in favour of it.
346. Are there any business relations between the Manly people and the North Shore people? The Manly people transact their business chiefly with Sydney.
347. *Mr. Garrard.*] Do you know Middle Harbour? Yes.
348. Is it likely that a great amount of commerce will be carried on on the shores of Middle Harbour in the future? Not for many years; no big vessel will be able to get up there until the reef has been removed.
349. The land all round is rather abrupt? Yes.
350. I suppose the land will be used chiefly for residence sites? Yes; for many years to come.
351. Do you know if the Crown has much land on the northern side of Middle Harbour? A good deal.
352. Shore frontages I mean more particularly? That I do not know.
353. The approaches to the Spit have been much improved of late. Yes.
354. The lower part is still very steep; from the water's edge about 100 yards up? Yes; but the approaches as a whole are very much improved.
355. I suppose the road is steeper there than on any other part of it? On the northern side it is; yes.
356. Do you think that if this bridge were erected, there being no bridge from North Shore to Sydney, the people of Manly would get their supplies from St. Leonards instead of from Sydney? I don't know but they might.
357. You do not know the extent of the reef at the proposed site for a high-level bridge? I know it is very extensive.
358. I believe there are about 9 feet of water on it? Yes.
359. That would preclude any large vessel from going up? Yes.
360. How long would it take to open the swing bridge? That depends upon the machinery; I suppose from 5 to 10 minutes.
361. That would be by hand-power? Yes.
362. It would not take so long by steam? No.
363. You do not think the proposed tramway company would erect a bridge if the Government did not do so? I do not.
364. *Mr. Suttor.*] Are you aware that there is a Bill before Parliament authorizing certain people to make a tram through Manly? Yes.
365. Are you aware that the Bill proposes that a steam-punt should be used and not a bridge? I do not know; but if it is so, it ought not to be countenanced.
366. You said just now that the bridge might be used for military purposes? Yes.
367. Under what circumstances? I understand that the present Quarantine Ground is to be fortified, and the bridge would be of service in taking troops to and from those fortifications; also from North Head and Manly to George's and Middle Head.
368. If a tram company can use a steam-punt, would it not be sufficient for military purposes? I do not think it would be at all a proper thing to allow a tramway company to use a punt; I never heard of a tramway company using them, except in the case of the enormous ferries in use at San Francisco.
369. Is Manly a place which an enemy could attack very easily? Yes.
370. In that case you would have to blow up the bridge? It would not be very difficult to do that.
371. *Mr. Abbott.*] Are you aware whether any of the Manly Beach people are opposed to the construction of this bridge? I have not heard of a single one.
372. Do you know Mr. Littlejohn? Yes.
373. He says that there are people who object to it? I think that some of his children oppose it. No sensible person, whether he has or has not property at Manly, to whom I have spoken, but has been in favour of it.
374. Would private property in Manly be improved in value by the construction of that bridge? Not particularly. An improved means of communication would, of course, improve the place; but I do not know that it would put property up very much, if at all, in the town itself.
375. The bridge, you think, would be useless so far as the value of property is concerned? It would improve the Government property in the neighbourhood; that is to say, it would sell very much better with a bridge there.
376. *Mr. Copeland.*] I suppose there has been a great deal of speculation in land at Manly recently? Not recently; two years ago there was; there have been some Government sales lately, that is all.
377. I take it for granted that you yourself are considerably interested in land at Manly? Yes.
378. So that, while this bridge will benefit the Crown lands, it would also benefit your own? Not to a great extent. I do not think there will be any improvement in the town save that which generally takes place with improved means of communication, but the Government land in the district would certainly be improved in value.
379. Would the bridge not create a little boom? I do not think so; I should hope not.

Charles H. Hayes, Esq., Alderman of Manly, sworn and examined:

- C. H. Hayes, Esq.,
30 Nov., 1888.
380. *Chairman.*] You reside at Manly Beach, I think? Yes.
381. You have lived there some time? Sixteen years.
382. You have been Mayor of Manly? Yes, for three years.
383. Are you a member of the Corporation now? Yes; an alderman.
384. Manly, I suppose, has made considerable strides lately? Yes; great progress.
385. Are you aware of the site of the proposed bridge over Middle Harbour? Yes.
386. Do you think it a desirable site? I think so.

C. H. Hayes,
Esq.
30 Nov., 1888.

387. You think the bridge is a necessary improvement? I do.
388. Do you know the nature of the design at all? Yes; I have seen a plan.
389. Do you think the altitude is sufficiently great? I am told the altitude is 30 feet clear of high water-mark, and I think that will take the ordinary traffic without opening the swing.
390. It is proposed to have two openings? Yes; I see there are two openings of 60 feet each.
391. You think that would be sufficient to permit of vessels going backwards and forwards without hindrance or impediment? I think so.
392. Is it the case that considerable inconvenience has been felt through not having this means of communication overland? Yes; great inconvenience.
393. Is it not the case that property has been lost from time to time in consequence of the present arrangement? Yes; accidents have happened at the Spit.
394. Do you know much of the harbour above the proposed bridge? Yes; I know Middle Harbour pretty well.
395. It is a great place of resort? Yes, for yachtsmen.
396. I take it that it is not used for residential purposes to any extent? No, nor for commercial purposes.
397. Have you formed an opinion as to the effect of the bridge, from a commercial point of view, in time to come? I do not think there will be any great increase in the traffic up the harbour, from a commercial point of view.
398. Will the construction of the bridge improve or lessen the value of property above it? I do not think that with the openings provided the bridge would interfere in any way with the value of the frontages to the harbour.
399. Will the bridge add to the value of the property at Manly? Considerably, no doubt; also to that of large areas of Government land.
400. Are you a property owner? To a very small extent.
401. Your property would be increased in value, I take it? I think it would.
402. And the property of the ratepayers generally? I think the whole municipality would be benefited.
403. The whole work is regarded by the municipality as a very proper one? Yes.
404. And a spirit of philanthropy leads the inhabitants to think that it would add largely to the value of the Government land? Yes.
405. Do you know the area of Government land? Many thousand acres; I could not give you the particulars.
406. What Government subdivision would be nearest to the proposed bridge? Dobroyd subdivision; it would be about a mile and a half away.
407. Is that on the northern side of Middle Harbour? Yes.
408. Then there is Government land still further behind it? Yes; there is the Harbord subdivision about a mile or so out of the municipal boundary. Only a very small portion of it is sold. Then there is a great quantity of land between Narrabeen and Pittwater, to which this bridge would give access.
409. Do you think a high-level bridge is feasible? Yes; I think so. You must have regard to the expenditure incurred in making approaches to the waters of Middle Harbour by the labour of the so-called unemployed. A few years ago they made a splendid road, making approaches to the site of the proposed low-level bridge. At one time I thought that a high-level bridge would be necessary. I did not think we should be able to get a gradient to take vehicles safely down to the waters of the harbour; but that difficulty having been overcome I think a low-level bridge with swings would answer all purposes.
410. *Mr. Abbott.*] During the sixteen years you have been at Manly how often have you had to travel overland to Sydney by reason of stress of weather? I do not think more than half a dozen times.
411. Is that since you have had the present steamboat service? No.
412. That is the best you have ever had? Yes.
413. As a matter of fact the residents of Manly use the overland route very seldom, do they not? Not the residents.
414. I suppose as a matter of fact the residents of Manly look upon the road as rather an attractive drive than anything else? Well, a number of people have been prevented from living down at Manly in the absence of this road communication, feeling that they were cut off from the place after 11 o'clock at night.
415. There is a larger area of Crown lands in the upper part of Middle Harbour than down at Manly Beach? The largest portion is away beyond Narrabeen.
416. Do you think the necessity for this bridge would justify an annual charge of between £3,000 and £4,000? I think so.
417. Why? I think it would be a profitable investment, looking at the large area of Crown lands yet unalienated.
418. Have the Government had any difficulty in selling the land which they have heretofore offered for sale? There has been no difficulty that I know of in selling land in any part of the country. The policy of successive Governments, as you know, has been first to sell the land and then to make railways through it.
419. Has there been no difficulty in the Government alienating the land which they have offered for sale down about Manly and Narrabeen? There was some difficulty at Dobroyd, but the sale of that subdivision would have paid the cost of this bridge if the sale had been conducted upon and regulated by sound commercial principles.
420. Do you know whether the land was offered at a time when the Government had no power to grant deferred payments? That is a question I could not answer.
421. Do you know when it took place? About two years ago.
422. When you refer to commercial principles do you refer to the principle of giving terms? What I mean is that the Government should deal with the land as a private estate would be dealt with, and that they should get the benefit of the improvements in their sale instead of selling the land and making the improvements afterwards.

THURSDAY, 6 DECEMBER, 1888.

Present:—

THE HONORABLE JOHN LACKEY (CHAIRMAN).

THE HON. GEORGE CAMPBELL,	JACOB GARRARD, Esq.,
THE HON. WILLIAM HENRY SUTOR,	ALEXANDER KETHEL, Esq.,
THE HON. JAMES WATSON,	SYDNEY SMITH, Esq.,
THE HON. FREDERICK THOMAS HUMPHERY,	THOMAS MICHAEL SLATTERY, Esq.,
JOSEPH PALMER ABBOTT, Esq.,	JOHN RENDELL STREET, Esq.,
HENRY COPELAND, Esq.,	DANIEL O'CONNOR, Esq.

The Committee further considered the proposed bridge at The Spit, Middle Harbour.

Alexander Dean, Esq., J.P., sworn and examined:—

- A. Dean, Esq., J.P.
6 Dec., 1888.
423. *Chairman.*] You are an old colonist, Mr. Dean? Yes.
424. You are now living at Manly? Yes.
425. You travel backwards and forwards pretty frequently? Daily.
426. And you have a tolerably good knowledge of the traffic between Manly and Sydney? Yes.
427. Do you know the site of the proposed bridge over the Spit at Middle Harbour? I do.
428. Do you think it is a good situation for a bridge? I do; I believe nature has provided a situation for it.
429. Do the residents of Manly suffer inconvenience from want of land communication? They do.
430. Manly is a favourite resort? It has been for many years.
431. Do you think it would increase if additional accommodation were given by the construction of a bridge? Yes, not only Manly Beach, but the whole of the western portion—the tableland near the Spit.
432. There is a large extent of vacant land behind Manly—right out to Broken Bay? Yes.
433. A great deal of that is Government land? Yes.
434. And I suppose its value would be considerably enhanced? Very much so.
435. Are you a maritime man;—do you take any interest in boating? I did when I was a boy; but of late years I do not.
436. You do not keep a yacht? No.
437. Do you think the construction of the bridge would be an impediment to the navigation of the harbour above the Spit? No; I do not. It would be very simply remedied. I have been in many countries, and have seen bridges over many rivers and lakes; and I know that if a signal were given by a yacht as she rounded the point at Middle Head, the bridge could be opened before she came up.
438. The proposed bridge is a swing bridge? Yes; and it would be very simply opened; I do not think there would be any difficulty at all to the yachting. Of course I would be very sorry to stop the yachting on the harbour, because it is one of the finest harbours in the world for the purpose.
439. It is a pretty resort above the Spit, is it not? It is.
440. It is likely to become a great resort for submarine residences? Yes; both on the south side of Middle Harbour and on the north side. It will become a great outlet for the retired merchants of Sydney. It is the healthiest part of the city. We are bounded to the south by Botany, and to the west by the railways, Parramatta, Balmain, and all those places. Here there is a great tract of country that can be utilised for the relief of the city an easy distance away.
441. Communication now is carried on in a very primitive way? Yes; a punt worked by a wheel.
442. Do they use Chinese labour? I did not notice that.
443. *Mr. Copeland.*] You say the people of Manly suffer great inconvenience through the want of this bridge? There are many females down there who are very timid, and in very severe weather we have as rough seas inside the Heads as I ever saw in my life. Of course they do not come very often in the year, but on several instances I have seen timid ladies frightened to take their children back. If there were a bridge across the Spit, they would hire a conveyance and take their children across, but they are afraid of the punt.
444. Do you think ladies and children would be very desirous of being out in bad weather like that? Sometimes they leave Sydney without knowing what sort of weather it is at Manly, and then they are frightened to go back. I myself once took an old lady, 76 years of age, with two boys, right round the Spit, and walked to the North Shore, because she was afraid to go by boat.
445. How often do you think the residents of Manly would suffer the inconvenience of being saddled with an old lady 76 years of age, with two children? I am only citing an instance that came under my own notice, and I know other instances where ladies have been timid about crossing the Heads during rough weather.
446. Do you think these inconveniences would be sufficient to warrant us in proposing a continuous tax on the country for all time to the amount of about £4,000 a year, which is the difference between the cost of maintaining the bridge and the cost of maintaining a steam-punt? Manly Beach of course would reap the benefit by a bridge, but the bridge would open up a large tract of Government land, which would pay for the outlay on the bridge in a very short time.
447. Do you think the inconvenience would not be removed if a steam-punt were put there, giving the same accommodation as at present exists between Sydney and North Shore? No punt could give the convenience a bridge would.
448. Is there any complaint about the accommodation provided between Sydney and North Shore? I am not aware of any.
449. Then, if the Government provided you with similar accommodation across the Spit, what is now provided by a private company for the North Shore, would not that remove all difficulties? No; the time would be the great thing. The punt would be either on one side or the other; whereas the steam ferries come in almost every minute.
450. *Mr. Abbott.*] Every minute at the North Shore? Well, every 10 minutes.
451. *Mr. Copeland.*] Do you know, as a matter of fact, how often the steam ferry runs to North Shore? I do not know.
452. Is it as far across Middle Harbour as from Sydney to North Shore? No.

A. Dean, Esq.,
J.P.

6 Dec., 1888.

453. Then in all probability the journey could be made in less time? Of course.
454. The people would be put to no greater inconvenience by having to use a steam-punt than the people at North Shore at present? There would be less of course, because the distance is less; but I do not think of the bridge so much for the Manly Beach people, who are well supplied now with the steamers. It would open up an immense tract of country, and benefit the Government.
455. Would not the steam-punt open up that country as well? No.
456. Why? Punts are never considered so much as a bridge. I have seen punts all over the world, and they do not think anything at all about them.
457. We are not going into the question what they think about them. Do they not give the convenience? Of course, to a certain extent, but the bridge would give more.
458. The only question would be whether you drove across the bridge, or whether the punt carried your buggy across. Once on the other side you have the same advantage of driving as if the bridge were constructed? But if the punt were on the other side you would have to wait so long.
459. Might you not have to wait for a long time if the bridge were open? The engineering appliances now for opening bridges are so very much improved that it could be done in 3 or 4 minutes.
460. Then there would be the time the vessel took going through, and 3 or 4 minutes to close it again, and, altogether, I think you would find it would take as long as it would take to cross on the steam-punt? Perhaps so.
461. *Mr. Watson.*] As the cost of this bridge is about £62,000, and the interest on the money, together with the cost of keeping the bridge in repair, would involve an expenditure of £4,000 a-year, do you think the country would be justified in going to such an expense for the emergencies you allude to? I do; because the country would benefit by opening up what is now useless ground, and making it of very great value.
462. *Mr. Street.*] We have it in evidence from the skilled engineers that the punt could run from either side every 10 minutes; do you think that is sufficient inconvenience for the people of Manly to necessitate such a large expenditure for the bridge? I do think it. The money would be well spent, because there is a feeling of uncertainty about a punt, and there is a feeling of comfort and surety about a bridge.
463. *Mr. O'Connor.*] Would the construction of the bridge be convenient to anyone besides those who reside at Manly Beach? It would be convenient to all. It would open up the great Military Road, and be a splendid drive for all the inhabitants of North Shore, and it would open up an immense tract of country to the north of Middle Harbour.
464. You have travelled a good deal over the world? Yes.
465. Have you ever seen, in a civilized country, a place with so many attractions so difficult of access as Manly Beach? I have never seen so many attractions as there are in New South Wales with less ways and means of getting at them. All through Switzerland there are steamers plying every hour of the day over the lakes.
466. There is a great tract of land belonging to the Government which would be opened up by the bridge? Yes.
467. There is a lot of unoccupied land which, if that bridge were constructed, would become the scene of busy life? Yes; the whole of that tract would be covered with gentlemen's residences. It is the finest scenery in the world, from North Shore along the Military Road across the Spit and along the tableland to Manly Beach; there is not a scene like it in the world. When I came back from home, in 1872, Professor Smith and I went down to George's Head, along the Military Road, and he said to me "You have been all over the world—did you ever see a finer sight than from the top of George's Head?" I said "Never," and I say so still.
468. *Mr. Kethel.*] What is the population of Manly and the district within a radius of 3 miles? I could not tell you; I think 3,000 or 4,000.
469. How many of that number would use the road to Sydney, provided the bridge were erected next year? It would be used more by the people of Sydney than by the people of Manly; it would be used as an afternoon drive to Manly. It would only be used by the Manly Beach people in cases of emergency, but by the residents of Sydney almost daily for drives. We have not now a drive about Sydney, except out to South Head, and this road would be used for drives by all the inhabitants of Sydney.
470. Then I understand that it is not for the convenience of the residents of Manly, but only to give visitors pleasant drives that you advocate the construction of this bridge? Yes, that is one of the causes. It would be of great convenience to the inhabitants of Manly Beach; it would be a great convenience and outlet for the people of Sydney; and it would be a great means of opening up an immense tract of country to the north of Middle Harbour.
471. A large proportion of the land you allude to has been alienated from the Crown, and the bridge would simply enhance the value of the property of private persons? I cannot tell how much of the ground is private property.
472. It has been stated that the expense of maintenance, added to the interest, would be something like £4,000 a year. If the inhabitants of Manly number 4,000, that would be a tax on the revenue of £1 per annum per head for the whole population that would be benefited. Is there any way that you can suggest, by which the Treasury would be recouped for that expenditure? Of course population would grow, and the bridge would almost pay for itself by tolls.
473. You are aware that the traffic from Sydney to North Shore is conducted entirely by steam ferry;—does it not appear to you peculiar to ask for a bridge to accommodate a small section of that traffic, while the main traffic is taken by steam ferry across Sydney Harbour? There is that feeling, but then the traffic from Sydney to North Shore is divided. Of course the main traffic is conveyed by steamers, but there are many other outlets by which people can get across to North Shore; they can get across by the bridge at Lane Cove.
474. How many miles is it from the Sydney Post Office to the St. Leonards Post Office by the bridge? It would be a long way.
475. Do you believe, as a citizen of many years standing, a contractor, and a public man of great experience, that you are justified in recommending to the Committee the construction of this bridge? I do.
476. And you deliberately say the public benefits to be derived by the inhabitants not only of Manly, but of Sydney and St. Leonards, would justify the expenditure? Yes; I am convinced I am right. It would be merely the foundation of a great advancement of that northern portion, which would be a good return for the outlay.

- A. Dean, Esq., J.P.
6 Dec., 1888.
477. *Mr. Suttor.*] You say the Military Road would form a very favourite drive? It would.
478. Are you aware that a company is being got up now to make a tramline along that road? Yes; I have heard of it.
479. Do you think people would use that as a drive if there were a tram running along? Of course that would affect it to a considerable extent.
480. Do you know that there is a very narrow and steep grade down to the bridge, very dangerous for people to drive along and meet a tramway? Yes; there is a steep grade.
481. Are you aware that the people who propose to carry out the tramway intend to use a steam-punt themselves? I am not aware of that.
482. Do you know whether the population of Manly is increasing at all? Not much, I think. There is a dullness in all suburbs now.
483. The present steamer accommodation is very much better than it was some time ago? Yes; very much better.
484. And at present, I suppose, there is not much inconvenience arising in connection with the steam accommodation? The steam accommodation, as I said before, is very good, but, at the same time the northern portion of Middle Harbour would be greatly enhanced in every way by ladies and gentlemen driving themselves.
485. What is the time occupied by the steamers coming from Manly to Sydney? Thirty-five to 40 minutes.
486. How long would it take to drive along the road by the bridge? I never drove it; I could not tell you.
487. Do you know the distance? I think about 9 miles.
488. It could not be done so quickly by the road as by the steamer? No; but it would save a great amount of timidity.
489. But I suppose these timid people like to live at Manly all the same? Yes; but I know one lady who has left Manly for a time on account of the uncertainty of the weather, as she always gets sick when crossing the Heads.
490. You have never had any fatal accidents with the steamers coming from Manly? No.

John Williams Deering, Esq., Metropolitan and Coast District Surveyor, sworn and examined:—

- J. W. Deering, Esq.
6 Dec., 1888.
491. *Chairman.*] You have held your present position for some time? Four years.
492. You have some knowledge of the land belonging to the Government in the district where it is proposed to erect a bridge? Yes.
493. You know the country well? Yes; I surveyed the first road over the Spit thirty years ago.
494. How long is it since you have been there? Six months.
495. Surveying some Government land? No; inspecting it.
496. Do you know the extent of Government land there now? Yes. At Harbord, at Manly, near the water reserve, at Dobroyd, at Narrabeen, and at Manly Cove, we have about 4,118 acres, which will be directly affected by the erection of this bridge. Of course, we have a large area, but I do not think the other land would be affected by this bridge.
497. That would be farther on? Yes, farther to the west, at the back of Gordon.
498. How many miles would that be? I daresay 8 or 10 miles.
499. Is population settling down very quickly in the neighbourhood of Manly, or at those other places to which you have alluded? No. Speculators are buying the land.
500. Do you think it would settle down quickly if there were a bridge? Yes; I think it would aid it very considerably.
501. Do you think it would be a great convenience to those at present residing in those districts and at Manly? I do. I think you wanted the value of this Crown land.
502. Yes? The approximate value of those lands directly affected by the bridge is about £73,980.
503. *Mr. Garrard.*] That is their present value? Yes. If the bridge is erected I think the increased value of those lands might be reasonably estimated at 25 per cent., which on £73,980 is £18,500. I have given the question a great deal of consideration, and have also taken the opinions of other people who knew what the lands were.
504. *Mr. O'Connor.*] Those lands are in the immediate vicinity of the bridge? They are in the area the bridge would influence.
505. *Chairman.*] You are well acquainted with the harbour above the site of the bridge;—is the punt there worked under your Department? No; under the Roads, I think. [*Produces Admiralty chart.*] There is a sand-bank below the Spit with about 9 feet of water at low tide. If a vessel draws more than 9 feet of water she could not cross at low tide. Of course if they make a tramway over the bridge it will add more than 25 per cent. to the value of the land.
506. We have nothing to do with the tramway, and the tramway has nothing to do with the bridge. Do you think that part of the harbour would be affected for yachting or navigation by the construction of that bridge? Not much, if they had two openings.
507. You think two openings would obviate all difficulties? I do, because there is no great depth of water. Before you reach the site of the bridge the water shallows; it is a broad sand-bank that at present impedes the navigation for deep-drawing vessels.
508. *Mr. Abbott.*] Is it not a reef? No, I do not think it is a reef; it is sand; there may be rock amongst it.
509. We were told that it was a reef? It may be a reef underneath.
510. *Chairman.*] Do you think, under the whole of the circumstances, the convenience provided by this bridge would be sufficient to justify the Government in expending £62,000 in the construction of it? Yes; I do.
511. *Mr. Abbott.*] Have you a map of the Crown lands that would be affected by the bridge? Yes. [*Vide Appendix.*]
512. These lands in Gordon would be more easily approached by roads through St. Leonards, would they not? Yes; I have not included them.
513. Have you sold any of this Narrabeen land? Yes, about 1,500 acres, at an average of about £15 per acre. We have 800 acres yet to dispose of in the same estate.

514. In round numbers, the increased value given to this land by the construction of the bridge would bring it up to about £91,000? Yes, and my estimate is a low one; I intended it to be low.
515. At the present we could get £74,000 for those lands without the bridge? Beyond a doubt.
516. Then you add £18,000 as the increased value? Yes.
517. We have been told that the annual charge for this bridge will be £4,000 a year; do you think the increased value it would give to those lands would be a justification to place that charge on the country for all time? Yes; but not for the Crown lands alone.
518. £18,000 at 4 per cent. would be £720 a year? Quite so.
519. So that there would be £3,000 odd still a charge against the country for which there would be no return to the country? Quite so; that is putting it on mercantile grounds only.
520. Have you ever travelled to and fro between North Shore and Manly Beach as it is now? Yes.
521. Have you seen any great traffic there at any time? No; I cannot say that I have. If there were a bridge I think there would be traffic.
522. Where from? Manly Beach.
523. How many people living at Manly Beach do you estimate would have the means of driving to and from North Shore? I could not say. If it is to be taken as a paying transaction, I should say the bridge will not pay.
524. In the interests of the public is there necessity for it at the present time? There is no necessity for it; certainly not.
525. It would be a nice outlet to people who desire to go to Manly Beach, but who object to the sea? It would be more than that; I look upon it as a highway along that east coast.
526. What is the use of a highway if there are no people to use it? You cannot have the people until you make the highway; make the highway and the people will come.
527. Do you not think that a steam-punt would answer all the purposes for many a day to come? I think it would, but I think the bridge would be better.
528. Do you know anything of the service between here and North Shore? Yes.
529. That is a very heavy traffic, especially in the morning and evening? Yes.
530. Have you ever seen any inconvenience arising there? No, none at all; but I cannot dissociate from my mind that there is to be a tramway across the bridge. It has got so ingrafted in my mind that I have a difficulty in getting rid of it.
531. *Mr. Copeland.*] You stated just now that the Government sold 800 acres odd at Narrabeen, at an average of £15 per acre;—have you any reason to suppose that this land, as coloured yellow, will bring a greater average than the land at Narrabeen? That is the land I meant—Narrabeen Estate.
532. Have you included the Manly Cove in your estimate? Yes; I put that down at £8.
533. Now suppose we were to estimate the whole of this 4,118 acres to give a net return of £15 per acre, free of any further expense for clearing, forming, or metalling roads, auctioneers' commission, &c.;—would that not be a fair estimate? Yes; that would be about a fair thing.
534. You will perceive that it will just take the whole of this 4,118 acres of suburban land to provide the money to build this bridge? Quite so.
535. You say you are under the impression that the value of this land would be increased 25 per cent. if the bridge were built? Yes.
536. Have you considered how much the value would be increased if a steam-punt were provided instead of a bridge? Nothing.
537. All the improvement would take place only if the bridge were built? Yes; I think there would be no improvement unless the bridge were built.
538. I suppose you are pretty well acquainted with North Shore? Yes.
539. Have you any idea what improvement has taken place in the value of land there during the last ten or fifteen years? An enormous increase.
540. I suppose some hundreds per cent. in some cases? Yes; land which was sold at per acre is now only sold at per foot.
541. Could we not, reasoning by analogy, expect that an increase would take place in the value of these Crown lands, if we provide a similar steam-punt for the Spit? Scarcely; I do not think the analogy is complete, because at the Spit that would be the only means of traffic, whereas here they have a passenger traffic; there would be no passenger steamers at the Spit.
542. But on the other hand is not the distance shorter across the Spit than from Sydney across to North Shore? Yes.
543. Therefore, the shortness of the distance would make up for the slightly slower speed? Yes, to a small extent.
544. I suppose the people at North Shore receive as good accommodation as other people by the use of this steam ferry? Yes; I have seen many steam ferries in other countries, and I think these are quite equal to any of them.
545. If the Government were to provide an equally good steam ferry for the people at Manly, they would have no real cause of complaint? No; I do not think they would have any cause of complaint, but it would not be equal to a bridge.
546. What particular reasons have you for placing such a great value on the bridge? I cannot but feel that a tramway will go over it.
547. If the Government do not build a bridge, the tramway people may build a bridge for themselves? I do not think so; they might pay half the cost of the bridge; I believe they would.
548. Leaving out the tramway, what other special advantages would there be? There would be no transshipment.
549. Is there any transshipment when you send goods by steamer from Sydney to Manly? I mean there is a transshipment with the horse and vehicle in driving; you have to drive on to the punt, which is awkward.
550. You would have to drive on the bridge? Yes; but it is a different thing. When I said I thought the Government were justified in building the bridge, I did not mean as a commercial undertaking only.
551. *Mr. Abbott.*] There is reform now? I have seen that. I only spoke as a public officer who has seen these wants for thirty years or more.

J. W. Deering,
Esq.
6 Dec., 1888.

- J. W. Deering, Esq.,
6 Dec., 1888.
552. *Mr. Copeland.*] Do you think the low-level bridge can be constructed without impeding the navigation? No, it is bound to impede it to a certain extent; every low-level bridge does that; but no large vessels will ever go up above the Spit.
553. Suppose they were to strike a large supply of natural gas or kerosene shale, or anything of that kind;—can you foretell what large cities may spring into existence on the upper part of Middle Harbour? There would not be vessels of large draught at any time go above the Spit.
554. Suppose they were to strike kerosene shale? That would probably come down in punts; I do not think there will ever be a large traffic up there. Steamers could have jointed funnels, and strike them.
555. *Mr. O'Connor.*] You said you thought the people at North Shore were quite satisfied with their means of transit? Yes; I think they should be.
556. I heard you say that land had increased wonderfully in value at North Shore? Yes; beyond a doubt.
557. Do you think it would further increase if there was a bridge between Sydney and North Shore? Beyond a doubt; it would be no longer North Shore; it would then be Sydney.
558. Would the people not be much more satisfied and much better served if they had a bridge? Beyond a doubt.
559. Since you have been in the public service, do you think it has been a cardinal principle in the construction of bridges to know first whether they will pay or not? No; I do not know that that is taken into consideration at all in the case of a public bridge.
560. Do you not think it would be a rather narrow policy merely to ask whether this bridge would benefit the people in the main street of Manly? Yes; I do.
561. You consider if the bridge were constructed, it would not be for the people of Manly, but for the people of the Colony? Yes; that is what I meant when I told the Chairman that I thought the Government would be justified in building it.
562. *Mr. Garrard.*] Would you be able to furnish the Committee with a tracing of that plan? Yes.
563. A large amount of Crown land has been sold recently in those districts? Yes.
564. Were the purchasers led to expect improved means of communication? Not at all; not by the Crown auctioneers.
565. You have been present at each of these sales? I was present at the chief sales, and nothing was said about the bridge; we carefully avoided it.
566. *Mr. Suttor.*] Within what distance from the bridge are most of these lands? They vary from 2 miles to 6 and 7 miles.
567. Do you think they would increase in value if the bridge were not erected? No; they have been at a standstill for some time; there would only be a very moderate increase.
568. You think a large population would settle down if these lands were opened up by the bridge? Yes.
569. What would be the inducement? To make homes. There is very good land in that locality that would make very comfortable and cheerful homes for the people.
570. Land that could be cultivated? Yes; some of the richest in the Colony—black sand soil.
571. *Mr. Copeland.*] Where is that soil? There is some on the northern part of Harbord; down in the low places there is beautiful soil.
572. *Mr. Suttor.*] Are there many people living out there now? Not very many; perhaps 200.

John Joseph Chounding, Esq., Traffic Manager, Port Jackson Steamship Co., sworn and examined:—

- J. J. Chounding, Esq.,
6 Dec., 1888.
573. *Chairman.*] You are the traffic manager of the Port Jackson Steamship Co.? Yes.
574. Where do your boats run to? To and from Manly, and other places where we can get a charter for them.
575. Have you many boats running? We have three boats constantly running to Manly—the “Brighton,” the “Fairlight,” and the “Narrabeen.”
576. Have you much goods traffic? Yes; a fair share.
577. What is your charge per ton? Four shillings per ton.
578. You do not make distinctions between one class of goods and another? No; unless it is a small lot of goods, such as parcels, when we charge 1s. or 6d. each. Anything over a ton we charge at the rate of 4s. per ton.
579. Are there great quantities of goods going backwards and forwards? We have not had so much this year; nearly all the building has stopped for the time.
580. You take building material? Yes.
581. And necessaries of life—such as groceries, &c.? Yes.
582. Most people get their supplies from Sydney? Most of them.
583. Are there any industries down there that send goods or produce to Sydney? No; except that the Chinamen have one or two gardens and bring a little fruit.
584. Have you heard any complaints of the cost of conveying goods between Sydney and Manly? I have had no complaints made to me.
585. Do you know the site of the proposed bridge across the harbour at the Spit? Yes; I have been there pretty often.
586. Are you given to yachting at all? No; but I take a great interest in it.
587. Do you think that commerce or the pleasure of the people would be interfered with materially by the construction of a low-level bridge at the Spit? It would interfere with the yachting.
588. It is proposed to have two swings? Yes; but I fancy there would be a little delay in boats getting through. I know we have a little delay in getting through the Pyrmont Bridge, and that is worked on a very large scale.
589. Do you think the delay would be greater than is caused by going across by the present means of transit? You know our boats are increasing in number every week. I have seen nine or ten yachts at a stretch going up Middle Harbour, and they could not all get through at once.
590. Do you think the erection of the bridge would be a matter of great convenience to the people living on the other side of the harbour? I think it would be.
591. You think it would be largely used for traffic purposes? Yes; I fancy it would increase our own trade; people would go down by the road and come back by steamer if there were conveyances running to carry them.
592. You think it would largely increase the population? Yes.

593. Are you aware that the Government have a large quantity of land over there? No; I did not know.
 594. Supposing there were four or five thousand acres of Government land there, do you think that would warrant the Government in erecting a bridge in connecting one side with the other? I would not like to say.

J. J.
 Chounding,
 Esq.
 6 Dec., 1888.

595. *Mr. Copeland.*] What is the time usually occupied by your steamers in making the journey from Sydney to Manly? Forty minutes we allow, but we can do it in 35 when clean.

596. If the bridge were constructed, do you think the journey could be done quicker than that by land? No; I do not think so.

597. You do not think there would be any saving of time in travelling overland instead of by steamer? No; I have ridden around very often. I have started on a pretty good horse when the boat started, and she has always beaten me. Of course there was the delay at the Spit.

598. It has been stated here that a considerable amount of furniture is carried to and fro. Supposing the bridge were constructed, do you think people would be likely to carry their furniture overland instead of by your steamers? That I cannot say. I know that some of the gentlemen living down there prefer to take it overland, because it does not get knocked about; it is put on the cart and not taken off till it arrives at the house it is going to. If it is taken from the cart into the steamer, then from the steamer to the wharf, and then put on the cart again, it is shifted four times. I believe I myself would take it right round.

599. Does it often happen that your steamers are not able to make the journey through stress of weather? No.

600. Has it happened since you got these large vessels? No; our boats could go through any weather. We have never had to take a boat off on account of the bad weather since we have had the class of steamers that are now running.

601. As a matter of fact you run as regularly as the railway? Just so.

602. And with the same amount of safety? Yes.

603. *Mr. Humphery.*] Do you issue season tickets? Yes.

604. How much do you charge for them? £8 a year.

605. What would that be for a single trip? About 4d., I think, if you go once each way every day; but then if you have a family of eight it would only be about £1 a year for the youngest in the family—the larger the family the smaller the rate.

606. The head of the family would pay £8? Yes; then the next £6, then £5, £4, and down to £1 1s. 10d.

607. Do you think it probable that a tramway would carry passengers at a less fare than that? I do not know.

608. What would be the distance by tram? I could not tell. We reckon it 7 miles by water.

609. *Mr. Watson.*] Are your present rates remunerative to the company,—do you pay a fair dividend? No.

610. How long is it since you paid a dividend? We paid a dividend last year of 6 per cent. per annum, but then we had not paid one for eighteen months before.

611. As a matter of fact, the fares do not pay the company? I would like to see it a great deal better.

612. *Mr. Garrard.*] What height would the bridge require to be for your steamers to go under? About 50 feet. Our steamers are about 42 or 43 feet, I think.

613. Your boats never go up Middle Harbour? Yes; I have been up there several times in the "Fairlight," on moonlight nights, with the Austrian band and the Liedertafel.

614. The ordinary traffic is conducted by smaller steamers than any of yours? Yes.

615. And if the bridge had a headway of 30 feet, it would accommodate the ordinary traffic without opening the swing? I do not think it would, because our passenger boats very often go there. The "Narrabeen" was up Middle Harbour the other day with a picnic, and she is 36 feet.

616. But the usual traffic is carried on with smaller boats? Yes.

617. If there were swings worked with modern appliances it would be no very great hindrance to traffic? No; I do not think so.

618. Do you think there is likely to be a large amount of activity on the shores of Middle Harbour at any time, or do you think it will be confined to residential sites? That I could not say.

619. Is it true that the shores of Middle Harbour come down rather precipitously to the water; that there is not much level land between the water and the hills? I think it is.

620. Are you aware of the depth of water in the shallowest part of Middle Harbour? No; we always keep in mid-channel.

621. Your boats have very shallow draught? No, 7 or 8 feet; but our instructions to our masters always are to keep to mid-channel.

622. You have had no difficulties in going up with your boats? No.

623. *Mr. Suttor.*] Is there much passenger traffic between Manly and Sydney? Yes.

624. What is the average number of passengers every day? On an ordinary day we carry about 700 to 800; on Sundays and holidays of course we carry more. We have carried as many as several thousand.

625. Have you much goods traffic? We have no difficulty with goods. Years ago we had a lot of trouble, but since we have had the large boats we can take it away quicker than they can bring it down.

626. *Mr. Garrard.*] You spoke of the small dividend paid; how has your increased plant been paid for—by increased capital or out of earnings? Out of earnings.

627. There was no increase of capital to buy the "Narrabeen," for instance? No.

628. Although you have not been paying a large dividend, you have been increasing your stock? Yes.

629. *Mr. Watson.*] Is it not a fact that you have issued debentures to pay for some of these steamers? That was at the commencement of the company, some three or four years ago.

John Alexander M'Donald, Esq., Assistant Engineer, Department of Roads and Bridges, sworn and further examined:—

630. *Chairman.*] Your name is? John Alexander M'Donald.

631. And you are engaged in the Department of Roads and Bridges? Yes.

632. Have you had to do with the design of the proposed bridge across Middle Harbour, at the Spit? Yes, I got out the design.

J. A.
 M'Donald,
 Esq.

633. 6 Dec., 1888.

J. A.
M'Donald,
Esq.
6 Dec., 1888.

633. Is it the case that plans have been prepared for a steam-punt? Yes, and tenders have been invited. The Commissioner for Roads has recommended a tender, and the papers are with the Works Department to deal with. The money is not yet available. An amount of £2,000 is to be put on the Estimates for 1889, and I believe the Minister has refused to sanction the expenditure until the money is available. £2,000 is the amount proposed to be voted; but the tender was below that.
634. What was the amount of the tender? It was about £1,700.
635. Then all the plans of the steam-punt are completed? Yes; the plans can be produced at any time.
636. Is it contemplated to provide by means of the steam-punt carriage of a tramway? No.
637. Only for ordinary traffic? For ordinary traffic. The punt will be similar to the one now working at Hexham, on the Hunter River.
638. Worked by steam? By steam on the punt, and a wire rope.
639. *Mr. Copeland.*] The intention of the Department is that in the event of a bridge being proposed by the Government, you will be able to take this steam ferry away to some other place? Yes. A bridge of the size that has been proposed will take at least about two years to build, and it is proposed to put a steam ferry there until the bridge is completed.
640. And then remove the ferry to some other place? Yes.
641. *Mr. Garrard.*] Can you produce the plans of the steam punt? I can produce them in two or three minutes.
642. *Chairman.*] Let us have them at our next meeting? Yes.
643. *Mr. Street.*] Can you tell us what time will be occupied in the transit across the Spit by this steam-punt? Including starting and stopping it would not exceed 5 minutes.
644. A little over 10 minutes a double trip? Yes. Of course there is the loading or bringing the waggons or carts on; that takes a little time. Generally it would be about 15 minutes from either side.
645. *Mr. Garrard.*] Would it be possible to ease down the rather severe grade which at present exists leading down to the punt on both sides—there is a severe grade about 40 feet above high-water mark? Yes; that has been left with a view to putting the bridge in. If a steam-punt were decided upon the grade could be eased down.

FRIDAY, 7 DECEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.

The Hon. WILLIAM HENRY SUTTOR.

The Hon. JAMES WATSON.

The Hon. FREDERICK THOMAS HUMPHERY.

JOSEPH PALMER ABBOTT, Esq.

HENRY COPELAND, Esq.

JACOB GARRARD, Esq.

ALEXANDER KETHEL, Esq.

SYDNEY SMITH, Esq.

THOMAS MICHAEL SLATTERY, Esq.

JOHN RENDELL STREET, Esq.

DANIEL O'CONNOR, Esq.

The Committee further considered the proposed bridge at The Spit, Middle Harbour.

John Alexander M'Donald, Esq., Assistant Engineer, Department of Roads and Bridges, sworn and further examined:—

J. A.
M'Donald,
Esq.
7 Dec., 1888.

646. *Chairman.*] Have you prepared the plans now produced with reference to the proposed steam-punt over the Spit at Middle Harbour? Yes. There is one point upon which I should like to correct the evidence that I gave yesterday with regard to the lowest tender for the work. The amount was £1,487 9s.
647. Were there many tenders? There were three. There is another point which has been raised by the Committee; that is, as to how many vehicles the punt will carry on one trip. It will carry eight ordinary sized buggies at one trip.
648. How long would the trip occupy? About 5 minutes, but the trips would be at intervals of about 15 minutes.
649. The vehicles I suppose would be simply driven on to the punt? Yes.
650. And I suppose as many people could be conveyed as the buggies would hold? Yes; there would be room for passengers, in addition, on the side walks.
651. On the whole you think that the punt would be sufficient to meet the requirements of the traffic for a time? Certainly; and when the traffic increased beyond what the punt would carry, the simplest plan would be to provide a duplicate punt to run at intermediate intervals.
652. Suppose a private company were empowered to construct a punt for tramway purposes, would that interfere with the Government punt? The company would have to run their tramways at the crossing entirely on Government reserves.
653. But I mean as far as the working of the punt is concerned? The road is rather narrow there, and it would be very difficult to get an approach independent of the Government approach.
654. Do you think it would be possible to make the Government punt available for carrying a tramway? I think it would be advisable to have an additional punt for the tramway.
655. What would be the extreme length of the punt available for vehicles? Fifty-five feet 3 inches by 11 feet is the available space for vehicles and horses.
656. *Mr. Abbott.*] And how many buggies would the punt hold? Eight in two lines.
657. *Chairman.*] Suppose a set of rails were put on the punt, would it carry an ordinary tram? Yes; but the tram would have to be carried in the centre, and there would be no room for the ordinary traffic.
658. That would be when the tram was crossing, but it would not cross very frequently—not more, perhaps, than two or three times a day. If that were the case would the tram interfere largely with the general traffic? Not largely, but it would be very difficult to get tramway grades from the ferry.
659. That is another matter; I am simply asking about the conveyance of the traffic from one side to the other? It would not be difficult to provide for that.
660. *Mr. Kethel.*] What dead-weight will the punt carry without endangering its stability? About 20 tons.
661. *Chairman.*] Not more? It would carry more in calm weather.

J. A.
M'Donald,
Esq.

7 Dec., 1888.

662. It would carry an engine, I suppose, in addition; I mean its own engine? Yes.
663. Then the 20 tons you speak of would be in addition to its own working gear? Yes.
664. *Mr. Kethel.*] What is the depth of the punt from the deck to the bottom? Four feet.
665. *Mr. Garrard.*] What width is allowed for a buggy in order to have two rows on the punt? About 5 feet 3 inches.
666. *Chairman.*] What is the width of the punt? Eleven feet between the kerbs, but the hubs of the wheels would go over the kerb.
667. *Mr. Garrard.*] There would be no fear of a run-away when there were eight buggies on the punt? No; if there were eight buggies they would be pretty tightly packed.
668. And the foot passengers would be on the wings as it were? Yes.
669. *Chairman.*] Is there any platform besides the ordinary floor? Yes; there is a separate platform for passengers.
670. *Mr. Garrard.*] Is the punt to be of the same dimensions as the one at Tom Ugly's Point, George's River? It will be larger, and the machinery will be differently arranged. It is one of the latest design.
671. How many men would it take to work the punt? Two—an engineer and fireman.
672. *Chairman.*] Are there any other figures you wish to put in as an appendix to your evidence? The total amount of the estimated annual working expenses of the steam-punt has been given in evidence; I now supply the details. [*Vide Appendix A1.*] The total amount is £800. The returns in 1889 are estimated to be £400, leaving a debit balance of £400.
673. Is the estimate based upon any calculation or record? On the working of other steam-punts.
674. How have you got at the number of passengers—from the returns of the present traffic? It is simply estimated.
675. Have you had any guide from the present traffic—the present punt is in your Department? Yes, it is leased, and the lessee pays £276 for this year. If the facilities are increased by having a steam-punt it is probable that the returns will be increased, and the lessee must make something out of the working of the present punt, so that I think it is fair to estimate £400 as the return. Other information which may be given in the appendix is with respect to the details of expenditure in connection with a bridge [*Vide Appendix A.*]; £3,604 is the amount given as the annual charge against the proposed bridge, and the details show how it is made out.
676. That is the estimate of the amount likely to be incurred in maintaining the bridge? Yes, including interest and depreciation, working expenses, painting, &c.
677. You put that statement in? Yes.
678. *Mr. Humphery.*] Is the £3,604 the debit balance after giving credit for the probable receipts from the bridge? No, that would be the gross debit charge. All the bridges are free. Of course if there were any returns from the tramway or anything else it would be credited.
679. *Mr. Suttor.*] Do you think it would be advisable to make a larger punt if it was required? The punts are made of thin plates, and they have to be docked every nine months for painting and cleaning, so that it would be better in the interests of the public to have two punts at the one ferry instead of providing a larger one.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Bridge at The Spit, Middle Harbour.

APPENDIX.

A

[To Evidence of J. A. McDonald, Esq.]

PROPOSED BRIDGE OVER MIDDLE HARBOUR. [87/16,939]

Preliminary Estimate of Cost.

	£	£
Swing Pier—Outside cylinder, 25 ft. x 83 ft. = 143 tons at £15	2,145	
Inside cylinder, 8 ft. x 88 ft. = 55 tons at £15	825	
Machinery, hydraulic and steam, 70 tons at £32	2,240	
Concrete, 25 ft. diameter x 15 ft. = 280 cubic yards at £2 10s.	700	
Do. (25 ft. diameter — 8 ft.) x 73 ft. = 1,123 cubic yards at £2 10s.	2,807	
Total cost of swing pier		8,717
North Pier—Cylinders (2), 12 ft. diameter x 88 ft. = 143 tons at £15	2,145	
Concrete (2), 12 ft. diameter x 88 ft. = 737 cubic yards at £2 10s.	1,842	
Total cost of north pier		3,987
South Pier—		3,987
Intermediate North Pier—Cylinders (2), 6 ft. diameter x 88 ft. x $\frac{1}{2}$ ton per foot = 88 tons at £15	1,320	
Concrete (2), 27 square feet area x 88 ft. = 176 cubic yards at £2 10s.	440	
Total cost of intermediate north pier		1,760
Intermediate South Pier—		1,760
Cross girders in main and swing spans, 66 at 3 tons each = 198 tons at £22	4,356	
Longitudinal girders, 9 girders, each 650 ft. x 50 lb. = 130 tons at £22	2,860	
Buckled plates (650 ft. x 32 ft. x 165 ft.) \div 16 = 100 tons at £22	2,200	
Bulb T iron, 163 ft. x 32 x 16 lb. = 40 tons at £22	880	
Road metal, 20,800 sq. ft. at 100 lb. = 600 cubic yards at £1 10s.	900	
Total cost of deck		11,196
Main girders, 4 spans, each 126 ft. x $1\frac{1}{2}$ tons per foot = 625 tons at £22	13,750	
Swing spans, 150 at $\frac{1}{2}$ ton per foot = 113 tons at £22	2,475	
Abutments (2), sandstone masonry, each £1,350	2,700	
Approaches, Embankment on Spit, 40 ft. on top, slope 1 to 1, 27 chains, 28 ft. high = 125,658 cub. yds. at 2s.	12,565	
Total cost of bridge		£62,897
(Headway, 28 ft.; roadway, 32 ft.)		

Extra Cost of Widening proposed Bridge 10 ft.

Cross girders, 327 tons at £22	£7,200
Longl. girders, 167 " at £22	3,677
Buckled plates, 128 " at £22	2,838
Bulb T irons, 51 " at £22	1,122
Road metal, 771 cubic yards at £1 10s.	1,157
Total cost of deck	£15,994
Main girders and swing girders, 976 tons at £22	£21,472
Swing pier	11,208
North and south piers	10,254
Intermediate piers	4,526
Abutment	3,471
Approach in timber	17,357
	£84,282
Less Estimate 87/16939	62,897
Additional amount for 10 ft. extra width ..	£21,385

Extra Cost for Alterations in Original Design.

Estimated cost as per paper 87/16939	£62,897
Additional cost for timber in place of earthwork approaches	935
Additional if raised 2 ft.	800
Total	£64,632
NOTE.—The above does not include footways at £1,430 each side, or a total of	2,860
	£67,492

COMPUTATION of Annual Charges on proposed Design, with interest at 4 per cent. :—
Taking estimated cost as follows :—Main bridge, £50,332 ; timber approach, £13,500.

	Annual cost.	
	£	£
Interest and depreciation on £50,332 at 4 per cent. compound interest, and life taken at 150 years, equivalent to 4.01 per cent. per annum	2,018	
Painting every three years at 25s. per foot	285	
Wear and tear on machinery, 2 per cent. on £2,240	45	
Oil, stores, &c.	25	
Wages—one engineer and one labourer	288	
Total main bridge		2,661
Interest and depreciation on £10,000 at 4 per cent. compound interest, and life taken at 30 years, equivalent to 5.78 per cent.	578	
Interest and depreciation on £3,500 at 4 per cent. compound interest, and life taken at 15 years, equivalent to 9 per cent.	315	
Painting, &c.	50	
Total approach		943
Total		£3,604

COMPUTATION of Annual Charges if Iron Approaches be adopted in place of Timber on proposed Design :—
With main bridge, £50,332 ; and iron approach, £45,000 ; interest at 4 per cent.

	Annual cost.	
	£	£
Main bridge, as before, at 4.01 per cent., &c.	2,661	
Interest and depreciation on £45,000 at 4 per cent. compound interest, and life taken at 150 years, equivalent to 4.01 per cent.	1,800	
Painting, &c.	228	
Total		4,689

Note.—The above calculations of interest and depreciation are based on the principle of annuities, and are worked out from the formula.

$$P = \frac{1 - (1+r)^{-n}}{r} A$$

which gives the amount of equal annual payments required to pay off both principal and interest in n years. This annual amount is then worked out as a percentage on the prime cost.

With the iron and steel structure, the life has been assumed to be 150 years. With the timber structure the life of the deck has been assumed to be 15 years, and the life of the rest of the timber work has been assumed to be 30 years.

SUMMARY, with loan at 4 per cent. interest ; showing difference in annual charge between iron and timber approaches.

The annual charge with iron and steel main bridge and iron approaches, headway 28 feet, and roadway through-out 32 feet, would be	£4,689
Equivalent to 4.92 per cent. on £95,332.	
The annual charge with iron and steel main bridge and timber approaches, headway 28 feet, and roadway through-out 32 feet, would be	3,604
Equivalent to 5.57 per cent. on £63,832.	
Balance in favour of timber approaches	1,085

JOHN A. McDONALD, M.I.C.E., M.I.M.E.
Assistant Engineer of Roads.

A1.

STEAM PUNT, MIDDLE HARBOUR.

Estimated annual working expenses ; taking life of punt at 21 years, and working with one shift only of men :—		£
Annual cost for repairs, stores, painting, &c. (wear and tear)		320
Depreciation (say) 7 per cent. on £2,000 (life 21 years)		140
Coal account		52
Labour		288
Total annual cost		£800
Estimated returns in 1889		400
Debit balance		£400
Taking life of punt at 10 years, and working with two shifts of men.		
Annual cost for repairs, stores, painting, &c. (wear and tear)		320
Depreciation (say) 11 per cent. on £2,000 (life 10 years)		220
Coal account		75
Labour		576
Total annual cost		£1,191
Estimated returns in 1889		400
Debit balance		£791

JOHN A. McDONALD,
Assistant Engineer.

B.

[To Evidence of J. W. Deering, Esq.]

ESTIMATED Value of Crown Lands affected by proposed construction of Bridge at the Spit, Middle Harbour.

On Plan.		Acres.	Per acre.	Total Value.
1	Harbord	270	£40	£10,800
2	Manly, near the Water Reserve	590	£50	29,500
3	Dobroyd (55 lots)	28	£80	2,240
4	Narrabeen	800	= 10/- p. ft. £15	12,000
5	Manly Cove.....	2,430	av. £3	19,440
			av.	
	Total.....	4,118		£73,980

If the Bridge is erected, I think that the increased value of the above lands may reasonably be estimated at 25 per cent., which on £73,980 is equal to £18,500.

6th Dec., 1888.—No. 3,372.

JOHN W. DEERING,
Metrop. and Coast Dist. Sur.

NEW SOUTH WALES.

RAILWAYS OF NEW SOUTH WALES.

(REPORT FOR 1887-8.)

*The Commissioner for Railways to The Honorable the
Secretary for Public Works.*

Department of Public Works,
Railway Branch,

Sydney, 20th October, 1888.

Sir,

Although it is only a few weeks since I presented you with a Report upon the Railway Transactions of this Colony for the year 1887, I consider it incumbent upon me to bring up to the latest possible date an account of the Railway Transactions under the management which is giving place to the new administration; and as the Act which brings the new administration into operation requires that the financial year of the Railways shall close on the 30th June of each year, instead of on the 31st December, as heretofore, I have now the honor to submit to the Government a Report upon the Railways for the year ending 30th June, 1888.

1.—RAILWAY CAPITAL EXPENDED.

On the 30th June, 1888, there had been expended on lines open for traffic £27,663,431,* and on lines in course of construction £1,815,483, in all £29,478,914,—of which amount the sum of £567,690 was expended during the half-year ending 30th June, 1888, as under:—

Construction	£497,016
Rolling stock, machinery, &c.	65,766
Trial surveys	4,908
	<hr/>
	£567,690

The sources from which the money expended on Railway Lines open for traffic have been obtained, are:—

From Loans	£26,826,469
„ Revenue	836,962
	<hr/>
	£27,663,431

2.—

* Excludes the cost—£4,878—of old Pitt-street Tramway, taken up in 1867, and £5,613, cost of rolling stock used on Camden and Sans Souci Lines.

2.—LINES OPEN AND IN PROGRESS.

Of the sum of £567,690 for construction the sum of £195,269 was expended on lines open for traffic, and the balance £372,421 invested in lines in course of construction.

Additions to Capital Account—Lines open for traffic.

At the close of the year 1887 the capital invested in lines open was £26,532,122.* During the first six months of 1888 a further sum of £1,131,309 was added, making the total invested £27,663,431.

The amount of £1,131,309 was made up as follows, viz. :—

Amount transferred from Construction Account	£936,040
Expenditure during six months of 1888 ...	91,083
Additions and improvements to works and stations, &c.	38,420
Additional rolling stock, machinery, and workshops, &c.	65,766

3.—RAILWAYS OPEN.

The lines in operation on the 31st December, 1887, the date up to which my last Report treated, comprised 2,036 miles, divided as follows:—

Southern System... ..	860½ miles.
Western System	614 miles.
Northern System	561½ miles.
Total	2,036 miles.

Since that time the following extensions have been opened, making a total of 2,102 miles in operation on the 30th June, 1888 :—

16 January, 1888—Mullet Creek to Gosford	10 miles.
16 January, 1888—Tenterfield to Wallangarra	11 miles.
13 February, 1888—Cowra to Blayney	45 miles.
	66 miles.

On the 30th June last there were only 66 miles of line in course of construction, viz. :—

Extension.	Section.	
Illawarra Line	Second Section (part)	10 miles.
” ”	Third Section (part)	2 miles.
North Coast Line	Hawkesbury and Mullet Creek Section	4 miles.
Goulburn to Cooma	Michelago to Cooma	39 miles.
North Shore Line	North Shore to Pearce's Corner	11 miles.
		66 miles.

On the 3rd of this month the 12 miles of line requiring to complete the railway between Sydney and Kiama, known as the Illawarra Line, were opened for traffic; leaving only, at this date, 54 miles in course of construction.

It

* Excludes the cost—£4,878—of old Pitt-street Tramway, taken up in 1867, and £5,613, cost of rolling stock used on Camden and Sans Souci Lines.

It may be mentioned that the mileage under construction is less now than it has been at any time during my administration. At the close of—

	1878	there were	208	miles under construction.
	1879	„	286	„
	1880	„	347	„
	1881	„	573	„
	1882	„	504	„
	1883	„	597	„
	1884	„	391	„
	1885	„	407	„
	1886	„	278½	„
	1887	„	132	„
	On the 30th June, 1888	„	66	„
	And at this present time there are		54	„

The extensions opened during the year ending 30th June, 1888, were numerous, making a total of 197 miles; and, as most of the mileage was open for the greater part of the year, the average amount of new capital brought into operation was much greater than has been the case in preceding years, as will be seen from the following table:—

Year.	Capital Expenditure.	Average for year.
	£	£
1883	349,494	259,421
1884	2,162,164	766,160
1885	1,011,948	436,822
1886	1,708,716	632,139
1887	1,899,182	695,108
1887-8	2,379,134	1,457,828

The gross earnings for the year were fairly good, and the net earnings showed an increase of £12,281 over those for the year ending 31 December, 1887; but, owing to the much larger average capital brought into operation, the return per cent. to capital was slightly reduced. I have in previous reports referred to the fact that we cannot, for the first few years, expect newly-opened lines to be immediately remunerative—indeed, in our comparatively young and sparsely-populated Colony, the mission of the lines has been more to open the country for settlement and development. Without railway communication, industrial settlement inland, to any large extent, would be impossible, and the State property would be, in many cases, of merely nominal value.

The rapid rate at which we have been extending our lines is shown by the fact that within the ten years that the Railways have been under my control the capital expenditure has increased from £8,883,177 to £27,673,922; and I may add that our earnings for the single year under review are greater than the total earnings for the first fifteen years the lines were open.

In

In the following table will be found a statement of the railway expenditure for each year from 1878 to 1888, the number of miles in operation at the close of each year, the number of people in the Colony to the mile of line, and the return which the net revenue has given to the capital invested:—

Year.	Number of Miles under Maintenance.	Population to the Mile of Line.	Number of Train Miles run.	Capital Invested.	Net Profit.
1878	688	977	2,655,176	£ 9,784,645	3,741
1879	734	967	2,932,463	10,406,495	3,341
1880	849	874	3,239,472	11,778,819	4,358
1881	995	783	3,923,929	13,301,597	5,307
1882	1,268	639	4,851,127	15,843,616	5,135
1883	1,320	649	5,937,261	16,905,014	4,484
1884	1,618	559	6,403,041	20,080,138	4,201
1885	1,782	553	6,638,399	21,831,276	3,370

4.—LAND TAKEN FOR RAILWAYS.

Satisfactory progress has been made with the settlement of claims for compensation for land taken for railway purposes. The incoming Commissioners will, however, be saved a large portion of the work of dealing with land-compensation cases, as this service is provided for under the Public Works Act; but I may express my satisfaction that in that Act provision has been made for determining the amount to be paid for compensation for lands actually taken by the increased value given to the remainder by the construction of the railway. So far back as 1882, in referring to this question, I said,—

For some time past consideration has been given to the question whether the community is not entitled, in a more direct way than has hitherto prevailed, to a portion of the wealth created by the construction of railways with public money. I brought this principle under the consideration of Mr. Secretary Lackey in connection with the extension of the Tram Lines, and it was so far adopted that the construction of the Tram Line to Cook's River was made conditional upon the owners of the land through which it would pass giving free the land required for the purpose. This proposal was very generally responded to, and no doubt the whole of the persons who held property would have given the portion required free had not other considerations determined the Government to abandon the construction of the line. I have called the attention of successive Ministers of Works for the last two years to the desirability of providing for the increased traffic on the Southern Line and creating and developing additional suburban traffic, by the construction of a line from about Liverpool to meet the Illawarra Line in the neighbourhood of Newtown. Such a line would open up a large area of country capable of cultivation, and would give an additional outlet for the overcrowded population of the city. In order that the community might share in the benefits derivable from the expenditure of the money in the construction of this line, it was proposed to resume a large area of land, about 1 mile in width, throughout the whole route; and after providing for roads and the creation of suitable townships, to re-sell the land not required for railway purposes, the profits made upon the re-sale to go as a set-off against the cost of the railway. You thought favourably of the proposal, and took some initiatory steps to give effect to it; but it soon appeared, from the fact that public petitions were being largely signed advocating this route, that either the intentions of the Government in this regard had become known, or the necessity for such a line had manifested itself to others. The object in view being thus in a measure frustrated, the alternative course was adopted of intimating to those interested, who waited by deputation upon you, that you would only consent to recommend the construction

of

of the line to Parliament upon the understanding that the land required for its construction was given free. The policy proposed to be pursued in this respect is not, I find, without example. The question has recently been taken up in New Zealand, and the Minister for Public Works, the Hon. Walter Woods Johnston, in a statement delivered to Parliament on the 3rd July last, in speaking of the treatment of land specially benefited, said:—

“I now come to the consideration of the manner in which lands specially benefited by the construction of railways should be dealt with. With reference to the advantages which have accrued in the past, the Government does not intend now to make any proposals, for it is not practicable to suddenly seize for the State a share of these advantages without inflicting numberless wrongs. But with regard to the future the case is different, and we are free to consider, unembarrassed by any apprehension of committing injustice, what share the community may be entitled to of the wealth created by the construction of railways with public money. In seeking the simplest and fairest course to adopt, the first suggestion which will have probably occurred to the minds of honorable members is that the State should repurchase all the land for a certain distance on either side of the proposed line at a certain increase upon the property-tax valuation. Valuations for taxation are usually low; on the other hand, compensation for expulsion should be liberal—perhaps compensation to the dispossessed landholders of 25 per cent. more than the valuation for property-tax would not be inequitable; and when railways are extended through country suitable for settlement there can be no doubt that the re-sale in moderate-sized farms of the land so taken would produce a profit sufficient to make a considerable contribution towards the cost of the railway, and, moreover, would bring into existence a traffic large enough to cause the railway to be a source of considerable revenue. Great collateral advantages would accrue to the Colony from the increase in our total production, and from the revenue contributed by an additional population.”

5.—EXISTING LINES.

Maintenance of Ways and Works.

The road and works generally have been kept in good order, the fine weather throughout the year facilitating the maintenance of existing lines. The failure of the sleepers in many places has led to extensive renewals under this head, the original supplies being replaced as far as possible by approved ironbark sleepers.

Rolling-stock.

The rolling-stock has been fairly well maintained, but the necessity for additional stock in certain classes becomes every day more apparent. The supplies now under order will meet the requirements to a large extent. I have for the last three years pointed out that more locomotives were required. So much time has been lost in obtaining satisfactory contracts that the locomotives now under manufacture by colonial makers will not be supplied in time to meet pressing wants. Tenders have consequently been invited in England and America for the supply of ten locomotives for immediate use.

My efforts for the last three years to increase the number of the live-stock waggons have been frustrated, owing to the difficulty of determining the description of waggon to be adopted, there being several rival designs to choose from. At this present moment the Department is almost at a deadlock, the demand for live-stock waggons being largely in excess of our ability to supply. I foresaw this, and repeatedly drew attention to the consequences of delay, but the decision was practically stayed by the appointment of a Parliamentary Committee to enquire into the rival merits of the trucks, notwithstanding that two Boards of experts had already reported upon the matter. The new administration, freed as it is from political intervention, will now, I presume, take measures to meet the demand.

6.—REVENUE AND EXPENDITURE.

The gross earnings for the year ending 30th June, 1888, were £2,290,010; the working expenses, £1,527,195; and the net earnings, £762,815.

Total	„	67·11	61·99	66·01	67·86	62·33	66·69	

The increased mileage opened will account for the increase in the expenditure for maintenance of way, locomotive power, and traffic charges; but the increase in the charge for repairs of carriages and waggons calls for remark,—it is £28,874 in excess of the expenditure for the year ending 31st December, 1887, and represents an increase equal to 34 per cent. This expenditure is owing to the abnormal accumulation of stock in need of repair, but the repair of which could not be economically performed previously owing to the limited accommodation afforded. This condition of affairs will last some little time longer—till all arrears are pulled up, which will soon be accomplished as the shops at Eveleigh will admit of 400 carriages, and 3,375 trucks being repaired in the year. The conveniences are so great that the same number of men can turn out 25 per cent. more work than they could accomplish in the old premises.

The total working expenditure, compared with 1887, increased—
 £61,259, for South and West lines.
 £ 8,176 ,, North line.
 £69,435 ,, all lines.

The expenditure per average mile of line open—
 Increased £ 7 for South and West lines.
 Decreased £22 for North line.
 ,, £ 1 for all lines.

The expenditure for train mile shows as follows—
 An increase of 1·94d. for South and West lines.
 A decrease of 1·90d. for North line.
 An increase of 1·22d. for all lines.

The proportion of expenditure to gross receipts from all sources shows—
 An increase of ·75 per cent. for South and West lines.
 ,, ·34 ,, North lines.
 ,, ·68 ,, all lines.

Percentage of gross earnings, working expenditure, and net earnings to capital.

The subjoined abstract furnishes the percentages which the gross earnings, the working expenditure, and the net earnings bear to the capital invested in lines in operation for 1887-8, as compared with 1887:—

	1887-8.			1887.		
	S. & W.	North.	Total.	S. & W.	North.	Total.
Net receipts from all sources ... £	580,187	182,628	762,815	570,320	180,214	750,534
Do per average mile... £	388	341	375	398	359	388
Do per train mile ... d.	26·17	33·45	27·61	26·12	35·09	27·83
Proportion of gross receipts to capital ... %			8·56	8·72
Do of expenditure to capital ...			5·71	5·76
Do of net receipts to capital ...			2·85	2·96

The net earnings from all sources for the year show as follows—

£9,867 increase South and West.
 2,414 „ North.
 12,281 „ all lines.

The net earnings per average mile of line open show—

A decrease of £10 for South and West lines.
 „ £18 for North lines.
 „ £13 for all lines.

The proportion of gross earnings to capital—

Decreased 0·16 % on all lines.

The proportion of net receipts to capital—

Decreased 0·11 % on all lines.

The following is a summary of the gross earnings, working expenditure, and net earnings of the Railways for 1887, as against 1887-8 :—

	South and West.	North.	Total.	Summary of gross earnings, working expenditure, and net earnings.
	£	£	£	
Gross earnings, 1887-8	1,805,232	484,778	2,290,010	
Do 1887	1,734,106	474,188	2,208,294	
Increase for 1887-8	71,126	10,590	81,716	
Working expenditure, 1887-8	1,225,045	302,150	1,527,195	
Do 1887	1,163,786	293,974	1,457,760	
Increase for 1887-8	61,259	8,176	69,435	
Net earnings, 1887-8... ..	580,187	182,628	762,815.	
Do 1887	570,320	180,214	750,534	
Increase for 1887-8	9,867	2,414	12,281	

7.—DIVISION OF THE RAILWAY LINES INTO SECTIONAL AREAS.

The particulars to the end of the year 1887 are given in my Report of that year. The transactions of the six months ending the 30th June last will not materially affect the result therein shown, and it is unnecessary to encumber this Report with a repetition of the tables.

WOOL

8.—WOOL TRAFFIC.

In the Report for the year 1887 there is given a statement of the wool traffic for the season of 1887-8. I said that the prospect of an extremely heavy clip of wool during the approaching season (we have now entered upon it) is very encouraging. The realization, so far, has exceeded expectations, the quantity of wool received for the months of September and October being unprecedented. The number of sheep in the Colony is 47,000,000, the largest stock ever known in our history, and double the number depastured in 1878. The improved wool and stock traffic which will result from this large increase is not the only advantage which will accrue therefrom; on the down journey there will be a corresponding increase in the tonnage of station supplies carried.

In concluding this brief report upon the Railways, for the year ending the 30th June last, preparatory to the Department being handed over to the new administration, I may be permitted to point out that the new management will enter upon its functions under circumstances of considerable advantage. Trade is reviving, the traffic on the railways at the present time is unprecedented in the history of the Colony, and for some years to come the Administration will not be burdened with newly-opened and undeveloped lines upon which, before any return can be expected, a traffic has to be created.

At the request of the Government I have had to forecast the probable revenue and expenditure of the Department for the year 1889. I shall not, of course, be instrumental in realizing the prospect, but my successors should have no difficulty in doing so. While the gross revenue will be £2,570,000, the working expenditure should not exceed £1,589,675, and the net revenue will give a return of 3½ per cent. to the capital invested in lines open on the 31st December, 1889.

I have the honor to be,

Sir,

Your most obedient servant,

Commissioner for Railways.

The Hon. John Sutherland,
Secretary for Public Works,
&c., &c., &c.

TRAMWAYS OF NEW SOUTH WALES.

Department of Public Works, Railway Branch,
Sydney, 20 October, 1888.

Sir,

In the concluding portion of my report on the Tramways for the year 1887, I said, while expressing my disappointment with the results, that it was my intention to submit, in a few weeks, a return of the operations for the year ending the 30th June, 1888, and I added that I had every reason to believe that I should be able to place before you a more encouraging statement of our tramway affairs.

In redeeming that promise, it affords me pleasure to state that an appreciable improvement has taken place—the return to the capital invested in our city and suburban tramways has increased from 1·76 per cent. to 2·27 per cent.

In the subjoined return are given the capital expenditure on the Government Tramways of New South Wales to 31st December, 1887, and the subsequent expenditure to 30th June, 1888.

Lines and Sections.	Total Expenditure to 31 December, 1887.			Amount expended during half-year ending 30 June, 1888			Total expenditure to 30 June, 1888.

Average cost, all charges	29 $\frac{1}{2}$	742,555	25,171

REVENUE AND EXPENDITURE.

The total earnings derived from the city and suburban Tramway for the year ending 30th June, 1888, were £221,060; the expenditure was £204,227; the net earnings were £16,833, giving a return to capital invested of 2·27 per cent.

I have not prepared tables showing the earnings and expenditure for each section of the city lines; the increase has been very general on all the lines. The following table gives the earnings and expenditure on the whole of the sections:—

CITY AND SUBURBAN TRAMWAYS—1887-8.

ALL SECTIONS.

Year ending 30th June, 1888.

All sections.

Expenditure.				Earnings.		
All Sections—				All Sections—

Lines in operation 12 months.						

NORTH SHORE CABLEWAY.

No alteration was made in the return to capital on this line for the year ending 30th June, 1888, as compared with the year 1887. The surplus land at Milson's Point, taken for the purposes of this tramway, which it was proposed to level, subdivide, and sell with wharf improvements, and which would have realized, it was expected, £35,000, has been practically taken for the railway from the Crow's Nest to the deep water of the North Shore. When the capital account for the tramway is relieved of the amount named, which will be properly chargeable to the vote for the railway, the return which the net earnings will give will be appreciably increased.

The following table gives the particulars of the capital expenditure and the revenue and working expenses of the line :—

NORTH SHORE CABLE TRAMWAY.

Year ending 30th June, 1888.

Expenditure.				Earnings.

Line in operation 12 months.						

KOGARAH AND SANDRINGHAM TRAMWAY.

ON the 31st December last, this line had been opened 3½ months only, and its working for that period resulted in a loss of £98. The loss for the 9½ months it has been in operation to 30th June last has been £338.

I said in my last report that while the line itself does not pay, it must not be forgotten that it is a valuable feeder to the Illawarra Railway line, and that it required the development of a larger residential traffic to make it self-supporting.

The

The following table gives the return of Revenue and Expenditure :—

			£14,152	Loss per cent. per annum on capital			2 96
Line in operation 9½ months.							

NEWCASTLE AND PLATTSBURG TRAM LINE.

For the 5½ months—this line had been opened on the 31st December, 1887—the loss on working amounted to £179. For the 11½ months to which the return for the period ending 30th June last brings the operations, it is shown that instead of a loss there has been a slight gain. The line should, in my opinion, be extended further into the city of Newcastle, and a 1d. section be established between Newcastle and Hamilton, with a largely increased tram service between those two points.

In the following table are given particulars of the Revenue and Expenditure :—

NEWCASTLE AND PLATTSBURG TRAM LINE.
Year ending 30th June, 1888.

Expenditure.				Earnings.			
Miles open	7½	Cost per train mile.	Per cent. to earnings	Miles open	7½	Earnings per train mile.

Line in operation 11½ months.							

CAMPBELLTOWN AND CAMDEN TRAMWAY.

The transactions of this Tramway continue to give satisfactory results. At the close of the year 1887 the return which the net revenue gave to the capital expended was 4·29 per cent. The transactions for the year ending 30th June last show an increase on the return from 4·29 to 4·64 per cent. The following table gives the particulars:—

CAMPBELLTOWN AND CAMDEN TRAMWAY.
Year ending 30th June, 1888.

In concluding this Report it will be unnecessary for me to comment upon the two main features which have characterised the recent history of the Department, viz., the appointment of the Royal Commission to inquire into the alleged tramway frauds and the proposal of the Government, with the approval of Parliament, to lease the trams.

All the facts connected with these matters are so fresh in the mind of the public as to require no further reference to them.

From a forecast by the Accountant for Railways, to which I have made reference elsewhere, it would appear that the transactions of the Tramway to the end of the present year will give a return of not less than 3 per cent. on the capital expended.

I have the honor to be,

Sir,

Your most obedient Servant,

Commissioner for Railways.

The Honorable John Sutherland, Esq.,
Secretary for Public Works.

1888.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(STATEMENT OF COMMISSIONER UPON RELINQUISHING OFFICE.)

Ordered by the Legislative Assembly to be printed, 21 October, 1888.

Statement of the Commissioner for Railways upon relinquishing office,
October, 1888.

IN relinquishing the office of Commissioner for Railways of the Colony and transferring the management to the new Board of Commissioners, I desire to place on record a brief memorandum setting forth the main features of my administration, the difficulties I have had to encounter, and the measure of success which, in spite of obstacles, has attended my efforts.

I entered on the office of Commissioner in January, 1878. I have therefore filled the office of Commissioner for Railways for nearly eleven years.

For some time prior to my appointment the management of the railways had fallen into a condition of considerable disorganization, it being under an administration which, while actuated doubtless by the best intentions, was not possessed of that knowledge of railway business without which successful management is impossible.

The facilities for working the traffic were notoriously deficient, and strong representations on this point were made by the Traffic Manager, but those with whom the matter rested declined to increase them. A complete dislocation of the traffic arrangements ensued, and this led to incessant complaints from the public, and to charges of maladministration against the Department.

In other respects the administration was defective and weak, and a dangerous state of disorganization had crept into the staff. This was evidenced in many ways, but especially by an occurrence which I will briefly describe. At the period in question (1877) the operations of the traffic were carried on under a code of Rules and Regulations issued in 1869. It had, however, been found that in the extension of the lines and the development of traffic the business had to some extent outgrown the provisions of the Rules and Regulations, and that it was necessary to amend and extend and more accurately define them. This was accomplished by the then Traffic Manager by the issue of what he termed "Working Orders." A station-master in a case of some difficulty acted solely on the Rules and Regulations, and disregarded the "Working Orders," with the result that a disastrous collision was narrowly averted.

By a singular error of judgment, and without any inquiry, the "Working Orders" were at once cancelled.

About this time Mr. Secretary Sutherland took office, and it devolved upon him to deal with this case.

The Minister himself investigated the case, and circumstances brought to light led him to the conclusion that the Department was in a dangerous state of confusion and disorder, that a complete re-organization was necessary in the public interests, and that it was essential that the supreme management should be placed in the hands of an officer familiar with railway working and management, and with the requisite capabilities for administering this important branch of the Public Service.

The Minister's choice fell upon me, and I relinquished the post of Secretary of Railways, which I had filled for some years, to take up the appointment of Commissioner for Railways.

My commission is dated 29/1/78, and the day following—there had of course been no time to re-organize the arrangements—the disastrous Emu Plains accident occurred—a practical comment upon the inefficiency of the administration which was in course of being superseded. That that disaster was due to

to want of experience and judgment on the part of the management, and directly to the cancelment of the Working Orders, is indisputable. The causes which led to the accident are clearly set forth in a minute by Mr. Secretary Sutherland, from which the following is an extract:—

The evidence given at the inquiry shows very clearly that the Working Orders made for the guidance of the Staff in carrying out the Rules and Regulations were absolutely essential to provide for the public safety, and that in abolishing them the door was thrown open to uncertainty, contradiction, and danger. It is to my mind marvellous, that with the evidence of the value of these Working Orders before him, the late Commissioner should have ventured to cancel them. His only reason appears to have been that one officer, who was charged with disobeying them, stated in his defence that they clashed with the Rules and Regulations. No inquiry appears to have been made whether this was so or not; but, recklessly and without thought of the consequences apparently, the Working Orders were abolished, and the Staff left entirely to form their own judgment in regard to the interpretation to be placed upon the Rules—the very action of abolishing the Working Orders implying that the practice they sanctioned was wrong, and something different to that practice was to be adopted; something different was adopted; the system which the Working Orders provided—that “written line-clear reports” were to be placed [in the hands of the guards, showing to what points they were entitled to run—was abandoned, “line clear reports” were no longer obtained, and the duty of making safe arrangements for crossing trains was left to the discretion of the guards, without, in the case of goods-trains meeting, any time being fixed, whereby one train was to be in before the other was due out.

In the matter of rates and charges the policy of the superseded administration was defective in the extreme. For some years prior to my appointment, efforts had been made to induce the Minister for Works to consent to a considerable augmentation of the rates for the conveyance of merchandise and produce. To this policy I was always opposed, being convinced that the truest wisdom was to reduce the rates to the lowest possible point consistent with securing a fair return on the capital expenditure, and throughout my administration this is the aim which I have kept in view.

The following comparison of the rates which ruled at the period when that proposal was made with present rates is both suggestive and instructive, and will serve to show that I have steadily pursued the policy above indicated of minimising the rates:—

	Rates which for 130 miles it was proposed to raise.	Present rates for 130 miles.
Hay.....	20/ per ton.	8/11 per ton.
Straw and Chaff.....	20/ ” ”	8/6 ” ”
Grain.....	19/5 ” ”	11/3 ” ”
Flour.....	24/8 ” ”	11/3 ” ”
Coal.....	17/5 ” ”	10/1 ” ”
Bricks.....	22/8 ” ”	10/1 ” ”
Bark.....	17/5 ” ”	11/3 ” ”
Cement.....	43/4 ” ”	21/8 ” ”
Sleepers.....	28/ ” ”	14/ ” ”
Fruit.....	24/8 ” ”	11/3 ” ”
Limestone.....	17/5 ” ”	10/1 ” ”
Timber.....	28/ ” ”	11/3 ” ”

That a maintenance of these high rates (which a pseudo-expert desired to increase) would have been detrimental to the industries and to the best interests of the Colony needs no argument to prove. It is remarkable, moreover, as showing the folly of the proposed policy, that in the year when it was desired to increase rates, already inordinately high, the return upon the capital was only 1·817 per cent.; while in 1882, when the rates now in force had already been established, the percentage was 5·135; and in 1887, after a period of prolonged drought and great commercial depression, and when the account was burdened with the cost of 300 miles of newly-opened and undeveloped and practically unprofitable lines, the return was still within a fraction of 3 per cent.

STATISTICS.

Appendix A.

The accompanying tabulated statement furnishes particulars of the extension of the mileage and of the development and increase of the traffic during my tenure of office. It will be seen that the mileage of working railways was gradually increased from 688 miles when I took charge in 1878 to 2,036 miles in 1887, up to which date I have carried my calculations. It will also be seen that the additions to the mileage have been out of all proportion to the increase of population, and that, while in 1878 we had an average of 977 persons to every mile of railway open, the proportion of population per mile had, by the large extensions of the mileage, diminished to 512 in 1887. That this must have had an adverse influence on the average earnings of the railways is a self-evident fact. And this is not the only circumstance which has diminished the financial success of the railways. The construction of non-paying lines, for reasons which could not be defended on a sound commercial policy, has had a disastrous influence in diminishing the average earnings of the lines. The Hay and Jerilderie line, for instance, is worked at an annual loss, and there is no prospect of its paying expenses for many years to come. These unprofitable lines will account for the reduction of the gross earnings from £1,311 per mile of open line in 1878 to £1,084 in 1887. The exceptionally good returns for the years 1880-1884 will be remarked. These favourable results are due to causes which will be referred to hereafter. The compensation paid for personal injury and loss of, or damage to, goods may, I think, be claimed as a very low average. The first-named, however, was largely augmented in 1887 by the disastrous Peat's Ferry accident. The diminution in the number of employes per mile of line from 5·706 in 1878 to 4·602 in 1887 is a favourable feature. The average return of interest, for the 10 years 1878 to 1887, on capital expended, is 3·98 per cent. I desire to call especial attention to the fact that no railway system in any of the Australian Colonies, not excepting Victoria, which comes next, can show, for the period named, so good a return to the railway capital invested; and I think I have a right to expect, in justification of my removal from the position of Chief Manager, that under the new administration the return to the capital will at least be equal to the average return which has been made, if it does not equal the maximum, which for the year 1881 was 5½ per cent. The small return shown for the years 1886 and 1887 was due to the opening of new lines, which were either more or less unprofitable, or the traffic of which was not fully developed.

IMPROVEMENTS

IMPROVEMENTS AND INCREASE OF TRAFFIC FACILITIES.

I had long been aware of defects in the arrangements which precluded us from properly developing and working the traffic, but which I had been powerless to remedy, and as soon as I took office I initiated efforts to bring about necessary improvements.

One of my first measures, with the concurrence of the Minister, was to increase our working appliances in especial our stock of goods trucks, which, under the circumstances already set forth, had not been maintained in proportion to the increase of the business of the Department.

I may take occasion to state here that for the last three years I have been endeavouring to increase the number of the live-stock waggons (it is in this direction only that the appliances for working the traffic are now deficient), but the political influence at work in regard to the character of the waggon to be used has kept this question hung up for so long a time that at this present moment the Department is at a deadlock, the demand for live-stock waggons being largely in excess of our ability to supply. I foresaw this, and repeatedly warned the Minister of the consequences of delay; but the decision was practically taken out of his hands by a Parliamentary Committee appointed to inquire into the rival merits of various designs of trucks, notwithstanding that two Boards of experts had previously reported upon the matter, and it was felt that nothing could be done till the Parliamentary Committee had reported. Nothing has been done since the Committee has reported, and I presume nothing will be done till the new administration, freed as it is from political interference, can take measures to meet the demand.

That our working appliances are fully utilised will be apparent from the following facts:—Our engines earn £2,584 per engine as against £2,337 in Great Britain, and they run more miles in the year. That our carriages are as well utilised as they are in Great Britain, and that the number is not in excess of the requirements is shown by the fact that the earnings per carriage are £496 Os. 2d. as against £356 14s. 3d. in Great Britain. We show still more favourably as regards waggons. Our earnings per waggon are £67 1s. as against £38 18s. 6d. This no doubt is due in part to the higher charges made in the Colony, but it is indisputable that our waggons are used to a greater degree than in England. Owing to the absence (nearly to the present time) of facilities, much of the rolling stock, especially the carriages, will be found to be in want of renovation. The commodious paint-shop recently completed at Eveleigh will afford the means of rapidly remedying this defect.

INADEQUATE ACCOMMODATION AT REDFERN.

Redfern Station, the central terminus of our railway system, was, and although I have been able to accomplish much, still is, utterly inadequate as the terminus of so extensive and important a system of railways. Concentrated in the one confined area, not too extensive for passenger accommodation only, are the passenger station and sidings, the goods sheds and sidings, and, until quite lately, the locomotive and carriage and waggon repairing shops and sidings. In the interests of the public convenience, an extension of the line into the city and the establishment of the passenger terminus there was much required; and I urged upon successive Ministers the expediency of carrying out this work, which, while giving much-needed accommodation to the public, would have the effect of relieving Redfern of the plethora of traffic.

Failing the adoption of that measure, I urged the desirability of resuming land at Redfern and providing additional accommodation there. But I was never able to bring the authorities to recognize the importance of these proposals. Neither of the suggested improvements has been carried out, and the great mass of the railway traffic of the country continues to be poured into the Redfern Station-yard. That a traffic so enormous should for so many years have been received into so confined a space without the occurrence of any serious accident is matter for congratulation, and reflects infinite credit on the officers and staff who have the management and manipulation of the business at Redfern.

WORKSHOPS.

The location of the Locomotive-repairing and Carriage and Waggon Shops at Redfern in the same confined area was not only a source of inconvenience and danger, but owing to the limited space available it was impossible to introduce improved appliances and economical methods of working, and the cost of our repairs and of any articles manufactured in the shops was thereby very largely increased. Owing to the limited accommodation afforded, carriage repairs, painting, and trimming had often to be done in the open air, and the work was necessarily interfered with by unfavourable weather; the men, moreover, were scattered, and proper supervision could not be exercised over them.

In view of these inconveniences, and impressed with the urgent importance of relieving the Redfern yard of the irregular traffic with which the location of the shops there encumbered it, and with the still greater importance of providing repairing shops on a scale commensurate with the magnitude of our operations, and thus enabling us, by adopting the best and cheapest methods of working, to diminish the cost of our repairs, I very early brought the subject under the notice of the Minister, who frankly adopted my views, and as early as 1879 a large area of land was resumed at Eveleigh for the erection of suitable shops.

Building operations were commenced in 1882, and although something yet remains to be done, the building of the new shops may be looked upon as practically accomplished, and we have now the finest and most complete locomotive depôt in the Southern Hemisphere—perhaps in the whole world. My management has not had the good fortune to benefit by these magnificent shops; the new administration will reap the advantage, and will find the value of them. The Locomotive Engineer anticipates that the same number of men will be able to turn out 25 per cent. more work than they could accomplish in the old premises; and if this expectation be realised, and I see no reason why it should not, the money thus saved will more than pay the interest on the cost of the building.

The following brief statement of the accommodation afforded by the shops will show the completeness of the provision made:—

1. Boiler, steam-hammer, and smiths' shops.—These shops are 300 feet x 180 feet, communicating with the other shops and the main lines by rails through the buildings and turn-tables at each end.
2. Iron and brass foundry, tin and copper smiths' shop, 300 feet x 60 feet, with annexes.

3. A block of buildings 550 feet x 300 feet, containing the following shops:—Engine and tender repairing and paint shops; wheel, machine, and fitting shops; joiners' shops; and stores. In these shops the erecting and general repairs of the engines and tenders are done, as also the turning of wheels and axles, &c., and the general machine and fitting work required for the construction and repair of engines and tenders.
4. Engine running shed No. 1.—This building, which is 303 feet x 300 feet, is capable of accommodating 126 engines of the largest type.

The plan of the latter building is a somewhat novel one. The roof is of the arched type, in three spans of 101 feet each, and, springing direct from the ground, it is complete in itself and independent of the walls of the building, and the latter having to act only as screens and to give general appearance to the building, have consequently been constructed light in proportion to the height and extent of the structure.

There is a clear height of 37 feet from rail level and 45 feet to top of lantern. The columns, supports, ties, &c., attendant upon roofs of ordinary construction, are dispensed with, leaving a large, clear, uninterrupted space, both horizontally and vertically.

The area covered by this building is 91,000 square feet, or about $2\frac{1}{2}$ acres; this area is amply lighted from about 48,000 square feet of skylights and 2,400 square feet of side light, being a total area of about $1\frac{1}{2}$ acre of glass; the skylights are on the ridge and furrow principle, forming a number of small roofs on the main roof, and glazed on "Rendle's" patent combination system. At night the building is lighted by incandescent electric lamps, besides numerous portable burners attached to flexible tubes for the purpose of enabling the workmen to apply the light to any part of the engine. Ventilation is provided for by three lantern roofs with louvres, each 250 feet long, and by 240 openings in the main roof.

Some adverse criticism has been passed upon the expensive character of the running shed, but it has been successfully replied to. In the Appendix will be found an official *précis* of the correspondence.

Besides the above-described shops and buildings, there will be on the same side of the main lines the following buildings and appliances, viz., engine and boiler house, engine-driver's quarters, sand-house and furnace, stores for Locomotive Department, two 50-ft. turn-tables, water-cranes, one ordinary coal-stage 300 ft. x 30 ft., one elevated siding over a coal-stage 720 ft. x 15 ft.

Carriage and waggon repairing shops, in a block of buildings, 600 ft. x 350 ft., containing waggon-repairing shops, wood-working machine shop, fitting and turning shop, smiths' shop, carriage-repairing shop, paint-shop, trimming-shop, and stores.

These shops will accommodate 40 carriages and 98 trucks for repair. If an average of 40 carriages are under repair throughout the year—allowing 5 weeks for each carriage—400 carriages per annum may be repaired. Again, if an average of 75 trucks are in for repair throughout the year—allowing 7 days for each truck—3,375 trucks may be repaired in the year.

In addition to these shops there is a carriage-painting shop, 400ft. x 160ft., which is at present capable of holding 6 trains, and will ultimately, when completed, have accommodation for 8 trains.

It will be apparent from this statement that ample means have been provided for keeping the rolling stock in good running order.

The whole of the shops are amply fitted and provided with all necessary machinery and appliances that are required for the descriptions of work to be performed.

On the same side of the line there will be found Locomotive Engineer's Office, a two-story building, 100 ft. x 50 ft., containing offices for the Locomotive Engineer, Locomotive Overseer, Locomotive Inspector, and the professional and clerical staff, &c., in connection with this branch of the Department. From the position of the building it commands a good view of the whole of the yard.

The general railway stores, which are now constructed, consist of 1 main building, 200 ft. x 50 ft., and 1 open shed, also 200 ft. x 50 ft.; also detached office building for the storekeeper and his staff. The stores are fitted up in the most convenient manner, and communicate with the main lines and workshops by means of sidings and turntables.

INTERLOCKING AND BLOCK SYSTEM.

The interlocking of points and signals, a system which I introduced about the year 1880, is one of the most important of the improvements which I have adopted in connection with our railways. The system has now been applied to 50 stations, 19 junctions, and 36 sidings at which there is no person in charge, at a cost of £79,500.

The application of this appliance adds an important element of safety to the working of the line, and I have had it in view to adopt it at all stations and junctions on the main trunk lines over which mail and express trains travel at a high rate of speed; the work, however, being of such magnitude must of necessity take some considerable time for its completion.

To many sidings on the main lines at which there is no person in charge, and the points of which are worked by guards of trains appointed to shunt the same, I have had the interlocking applied, but there are some few still to be done.

Sidings on single lines which cannot at all times be worked only by trains which carry the main staff have been fitted with fixed signals and interlocking complete; but for those which can always be worked by trains carrying the staff it was my intention to have the points locked by a special lock which can only be unlocked by a key fitted to the staff, which key, after having unlocked the points, cannot again be taken out of the lock until the points have been properly set and locked for the main lines. By this device the facing points are secured before the staff can be released to enable the train to proceed on its journey.

For the interlocking at small stations, where it could be worked by the existing staff of men, the machines have been placed on the platforms near the ticket office, in order that the officers in charge may work the points and signals, and thus save the cost of extra men.

Notwithstanding the important bearing which these appliances have in regard to the safety of railway travelling, £79,500 is considered by some persons a large amount to have spent on interlocking; but, as compared with the other Colonies, our expenditure on this head has been very moderate, while from the judgment which has been shown in adopting the system only at those points where it was required by the exigencies of the traffic, the cost and utility of our interlocking will bear favourable comparison with that of any of the Australian Colonies, as the following table will show:—

South Australia	has spent on interlocking an amount equal to 75 per cent. of its capital expenditure.				
Victoria	do	do	52	do	do
New South Wales	do	do	30	do	do
					As

As regards the value set upon these safety appliances in England, I will take as an instance the expenditure on the London and North Western Railway. On that railway, the mileage of which is not equal to that of New South Wales, but which earns a gross revenue four times as large, there has been expended £2,000,000 in interlocking. This sum represents 2 per cent. of the entire capital of the Company. If our expenditure had been in like proportion, we should have spent in interlocking £560,000; if taken in proportion to the relative revenue, we should have expended £500,000; or to the train mileage, which is perhaps the fairest form of comparison, £330,000. It has been, as before stated, £79,000 only, but I shall expect to see a large increase of expenditure in this direction in the immediate future.

A brief reference to the "absolute block" system, as employed on our lines, may not be out of place here. This system, which I introduced in 1879, is worked on our double lines by Preece's instruments, and has been gradually applied to the main suburban line (Sydney to Parramatta), on the Illawarra line (Sydney to Hurstville), and Great Northern Railway, from Burwood junction to Wallsend junction.

The following sections of single lines are also worked by "absolute block," but with Morse telegraph instruments, in addition to the main staff and ticket system:—Bargo and Mittagong, and Harden and Demondrille junction, on the Great Southern Railway; also between Lapstone Zig Zag and Glenbrook and Clarence station, and bottom points at Lithgow Zig Zag. The portion of line between Lapstone Zig Zag and Glenbrook is blocked by telephone.

The further extension of "absolute block" working on single lines has been delayed, pending a trial of the Tyer's electric train tablet system, by which the staff and block system is combined. I have imported several sets of instruments for the purpose of testing the system on the most dangerous sections of our mountain lines, with a view to adopting it on those portions of the railway.

I am aware of the defect in this system, but I consider the advantages it possesses outweigh its disadvantages, and as these tablets are in use on some portions of the lines of the Caledonian Railway—from whose staff Mr. Eddy comes to us—I shall expect to see them adopted here, even to a greater extent than I contemplated.

DARLING HARBOUR.

An enormous and constantly-increasing traffic in minerals, wood, timber, firewood, farm produce, &c., is carried to Darling Harbour. When I took charge the accommodation provided at that place was quite inadequate even for the business then transacted there. I at once commenced to improve the facilities and appliances, and a large expenditure has been incurred to date in putting the accommodation in a condition to cope with the augmented traffic. The principal improvements are the erection of a dead-meat market, which will be fitted up with the best apparatus for chilling, and in this climate will be highly convenient and useful. Additional siding accommodation has been provided from time to time, as the exigencies of the business required. With a view to obviate the danger to passengers from the increased traffic, a bridge was erected at William-Henry-street (to which the city contributed a proportion), at a cost to the Department of £16,000. A farm-produce sale shed has been provided, at a cost of £5,000; and a contract has been let for a produce store market, which is to cost nearly £17,000. Additional office accommodation has been erected, at a cost of upwards of £5,000. Cranes, additions to goods-sheds, cattle-yards, &c., have absorbed nearly £14,000, and many minor improvements have been effected.

It was at my instigation that the Government resumed from private owners 15 acres of land known as the Darling Harbour-resumptions. Though the propriety of that course was cavilled at and impugned by many at the time, I do not think a single voice would now be raised in contradiction of its wisdom. The inordinate claims made by the owners for compensation caused a convulsion of public feeling, and I think it must be confessed the expression of opinion on the subject was not uncalled for. Upon viewing calmly at this distance of time the compensation which was obtained in the Supreme Court actions which followed, it cannot, I think, be denied that the reaction following upon these claims resulted in verdicts being given for amounts below the actual value of the property. At all events, if the land could be resold at the present time it would realise at least twice the amount which the Government had to pay for it.

I have had plans prepared for a further extension of the accommodation at Darling Harbour, which must be largely increased, unless the project for the extension of the railway into the city and to the deep waters of the harbour be given effect to. Looking to the requirements of the next fifty years, it would not be too soon to acquire some additional land at Pyrmont with water-frontage, to meet the demand which will grow with the years for further shipping accommodation.

INCREASED TRAFFIC, SUBURBAN LINES.

Our railway system originated in a line from Sydney to Parramatta. An extension of this line, commenced in 1858, is our present Western line. The Southern line junction is at Granville. After the completion of the line to Parramatta, settlement between that point and Sydney increased very rapidly, and very soon collections of houses, which in time rose to the dignity of boroughs, were formed at intervals all along the line; and year by year the traffic with these places—we term it the suburban traffic—continued to augment, until it assumed enormous dimensions. And as the whole of the traffic from the south and west, with this suburban traffic, is carried on the single pair of lines into and out of Sydney, it is hardly necessary to say that the lines are worked, not only up to their utmost capacity, but beyond the limit of safety.

In 1882 the Illawarra line was put under construction, and by the completion thereof a further large accession of traffic would, as a matter of necessity, be brought on to the already overcrowded main line. In view of this circumstance I recommended that the Redfern tunnel should be widened to admit of laying in two additional lines of rails, and that the lines should be quadrupled thence to the Illawarra junction. This was approved by the Minister, and the work has been carried out.

Since that the Northern line has been completed (except the bridge over the Hawkesbury), and connected with the main line at Homebush.

This brings all the Northern traffic, both goods and passenger, on to the main line from Homebush to Sydney, and this traffic will be largely augmented (with the addition probably of minerals to a large amount) when the opening of the bridge over the Hawkesbury gives uninterrupted communication.

communication with Newcastle and the Northern District. In a word, an accession of traffic will be brought on to the main road which the existing pair of lines (the quadruplication extends only to Eveleigh) cannot carry with safety. In view of this circumstance I have mooted the expediency of continuing the quadruplication of the line from Eveleigh to Homebush. This will, I am sure, have to be carried out by my successors in the administration.

And here I might direct attention to the unfavourable condition under which our suburban traffic is carried on. The same lines convey the through passenger and goods traffic going in both directions, as well as the enormous suburban traffic, the number of trains passing each way per day being 130; and it is most creditable to the management that this has been accomplished with entire immunity from serious accident. In Melbourne, where there is a large suburban traffic, the conditions are very different. The principal suburbs have independent lines. There is no clashing between through and local trains, and the traffic is carried with ease, and there is no impediment to its being carried with perfect safety.

RULES AND REGULATIONS.

When I took charge, the traffic as already pointed out, had outgrown the Rules and Regulations under which the Department was administered. I therefore caused them to be revised and amplified, and have taken special care that, as the business of the Department increased, the scope of the Rules and Regulations should be extended in the same proportion. I think they may now be claimed to be complete in every way, and framed to meet all conditions of working. Every emergency has been provided for, and I believe that to the comprehensiveness of these rules our happy immunity from serious disaster is to a large extent due.

THE EMPLOYEES.

Great caution has been observed in the matter of accepting candidates for the Service, with a view to secure that only properly-qualified and otherwise suitable men are admitted. Precedent to appointment a candidate must be passed by a Board of Medical Examiners, and in the promotion of men to responsible positions only those are selected who have been proved to be competent by a proper examination by a Board constituted for the purpose. I believe that for efficiency, discipline, and devotion to duty, the Railway Staff of these railways could not be excelled by any Railway Staff in the world.

The mental and moral improvement of the men has not been lost sight of. Libraries, technical schools, and classes for mutual improvement have been established, the Department contributing in aid of these objects. They are at present in their initial stage, but many of the men take a keen interest in these matters, and much benefit may be expected to result from the movement.

It is admitted that our railways compare very favourably with railways generally in respect of accident to life or limb, and consequently in the amount paid for compensation in such cases; also in the amount paid for loss of or damage to goods or property received for conveyance. These favourable results are not the effects of chance, but are fairly attributable to the care with which our men are selected, to the training through which they have to pass, to the practical nature and completeness of our rules, and generally to the integrity and zeal of the employés.

It will probably devolve upon my successors to complete the re-organization of the staff of the Engineer for Existing Lines. Under circumstances which are set forth in the papers, the staff in question had grown by slow and almost imperceptible degrees, until it assumed undue proportions, and since 1886 I have directed my efforts to the work of placing it on a more economical basis. Something in this direction has been accomplished, but much more remains to be done. I beg to direct the attention of the Commissioners to the papers on the subject, and especially to my minutes of 15/5/88 and 26/9/88.

As regards, however, the general question of the number of hands employed, it will be seen by a reference to Appendix B that the number of men to the mile of line when I took charge of the Department was 5·967, and now I am leaving it the number is 4·602 to the mile of line. That this number is not excessive can be established by reference to the number of men employed to the work done on any railway of which I possess the statistics. That neither the London and North-Western Railway nor the Caledonian Railway is worked with such economy the new Chief Commissioner will have to admit. The average lifting in the Traffic Branch of the railways of New South Wales equals 1,511 tons per man per annum. I shall be surprised to learn that more work is done per man on any railway in the world. On the London and North-Western Railway of England, which claims to be in the van of railway administration, and has availed itself of all labour-saving appliances, 36,000,000 tons are lifted by 25,000 men employed in the Traffic Branch of that Company's staff. These figures give a return of 1,440 tons per man per annum.

AMBULANCE ARRANGEMENTS.

The possibility of accident is one which a railway manager should have in view and make provision for. I was always of opinion that much suffering might be saved and much benefit accrue if some number of the employés were made competent to afford "first aid to the wounded" in case of casualty.

In this view I compiled a pamphlet on the subject, and issued it to every employé, and engaged competent professional men at the chief centres to give instruction to those desirous of identifying themselves with so laudable a service. In due time I established an Ambulance Corps, which has had remarkable success. Professional examinations have been instituted, and medals of honor are conferred on the successful candidates. The result of this plan is that we now have scattered over the lines a large body of men competent to render prompt and skilful aid in any casualty that may occur, and thereby avert much bodily suffering, and even save life in cases where instant precautions are necessary to that end. The practical value of this institution has already been experienced when accidents—such as cannot be avoided in a large concern like this—have happened on the lines and in the workshops.

RATES AND CHARGES.

The rates charged on our railways will bear favourable comparison with those of the other Australasian Colonies. Complaints, however, have been made from time to time that they are excessive. A few years ago these complaints became so persistent and outspoken that the then Minister for Public Works (Mr. Jno. Lackey) deemed it expedient to test the question by appointing a Board of experts unconnected

unconnected with the Department and the Government to investigate the subject. This Board (comprised of the most experienced men in the Colony) were unanimously of opinion (in which they were fully supported by the evidence taken) that there was no ground for disturbing the rates and arrangements adopted by the Railway Department.

Subsequently, the special rates which we have adopted with reference to the border traffic, with a view to neutralise the action of Victoria in endeavouring to monopolise the trade by reducing their rates to the Border, were assailed by persons whose interests were affected by the special rates. But the abolition of those rates would have had the effect of throwing the whole of the Border traffic into the hands of Victoria; and, in the policy not of retaliation, but of defence, adopted by us, we are supported by such eminent authorities as Mr. Farrar, Secretary of the Board of Trade, Mr. Grierson, of the Great Western Railways of England, and Mr. Swarbrick, of the Great Eastern Railway of England. The report of a Select Committee of the House of Commons which sat a few years ago also distinctly justifies such special arrangements. The official paper which I have prepared on this subject, in answer to the demand for equal mileage rates, and a reply to the extraordinary proposals of Mr. Haynes, M.P., for Mudgée, will be found in the Appendix.

Appendix C.

I some time ago wrote a minute suggesting a means by which a competition which is equally injurious to both colonies might be put an end to, and this Border traffic be carried at fairly remunerative rates. Broadly stated, the plan I had in view was that each Colony should convey such traffic as offered to and from the competitive districts at ordinary rates. The proceeds of such traffic, after deducting a fair proportion for working expenses, to be "pooled," that is, to be paid into a common fund and divided on the basis of the mileage worked by each Colony in the conveyance of such traffic. I took an opportunity some time ago of broaching the scheme to Mr. Speight, and he seemed to be of opinion that it offers a means of escape from this long-standing difficulty. I commend this scheme or some modification of it to the consideration of my successors.

The returns on the traffic, comparing one year with another, have varied considerably. This is due in some measure to the influence of the seasons on the production of wool and other produce.

But other causes have been in operation. It will be seen by the return that the interest paid on the capital cost of the railways was unusually good in the years 1880 to 1883. This was the period during which Mr. Lackey was Secretary for Works; and that gentleman not only confessedly, but actually, left the administration of the railways in the hands of the Commissioner, who, untrammelled by the political control and influence which has been so serious an obstacle to the successful working of the railways, was enabled to carry out such reforms as he considered necessary, and to work the lines as nearly as possible on commercial principles. Tentative concessions were made with a view to encourage particular lines of traffic, and all drastic measures were avoided,—such, for instance, as those carried out by Mr. Secretary Combes, who made alterations in the rates which, while affording no appreciable advantage to the public, affected the railway returns in the aggregate to the extent of £100,000 annually. It has been too much the practice to make alterations in rates, in wages, in train running, &c., on political grounds, and not to meet legitimate railway requirements, and the railway revenue has thereby been most seriously affected.

GRADIENTS.

The railways of the Colony will always labour under peculiar disadvantages, due to the geographical features of the country. Between the seaboard with the ports of shipment and the interior precipitous mountain ranges are interposed, and those ranges, at least on the routes adopted, can only be surmounted by series of unusually heavy gradients. We have many miles of such gradients, by which the load carried is limited to about 120 tons; while in England, where these severe grades do not occur, a load of 300 or 400 tons is carried at the same cost in locomotive power, wages, &c. How severely our railways are handicapped in respect of the profit on the working of them by this condition of things will be apparent to every railway expert.

Whether easier routes could have been found is a question which I am not at present prepared to deal with. It may be that, with the amount of capital expended, lines with a better level could not have been constructed; but it is quite certain that any saving in cost of construction effected by nearly following the contour of the country, as we have done, is much more than neutralized by the enormously increased cost of working.

THE NEW MANAGEMENT.

The new management will enter upon its functions under circumstances of considerable advantage. The past two seasons have been exceptionally favourable ones, and in consequence we anticipate an enormous wool and stock traffic in the season upon which we have just entered. Many of the lines are almost entirely dependent for their business upon the pastoral interest; and in 1887 the number of sheep in the Colony was 46,900,000, the largest number ever known in our history, and double the number held in 1878. The improved wool and stock traffic which will result from this large increase in the number of sheep is not the only advantage which will accrue therefrom; on the down journey there will be a corresponding increase in the tonnage of general supplies carried.

Another favourable feature is that for some years to come the traffic will not be burdened with newly-opened and undeveloped lines upon which a traffic has to be created. At the present moment we have only 54 miles under construction—a smaller mileage than has ever been recorded since I assumed the control; and a portion of this, moreover—the Hawkesbury Bridge and Mullet Creek section—will give good returns and materially assist present non-paying sections.

The recent impetus given to gold and silver mining promises to furnish a considerable addition to the traffic, and the opening up and working of new coal-mines will have an appreciable effect on the revenue.

At the request of the Government, I have had to forecast the probable Revenue and Expenditure of the Department for the year 1889. I shall not of course be instrumental in realizing the prospect, but my successors should have no difficulty in doing so. While the gross Revenue will be £2,570,000, the working expenditure should not exceed £1,589,675; and the net Revenue will give a return of 3½ per cent. to the capital invested in lines open on the 31st December, 1889.

CH. A. GOODCHAP,

The Honorable the Secretary for Public Works.

20/10/88.

ROOF OF RUNNING SHED, EVELEIGH.

EARLY in 1882 the Engineer for Existing Lines submitted a plan and specification, and an estimate of £38,000, for the roof of the running shed, Eveleigh. In his design the engineer adopted the novel plan of an iron arched roof—novel, that is, when applied to a running shed—instead of an ordinary trussed roof.

The Commissioner was startled by the unusual character of the design, and he drew the attention of the engineer to the matter, pointing out that the style of roof proposed had heretofore been applied only to railway stations, halls of entertainment, &c.

The engineer, however, assured the Commissioner that the kind of roof recommended—the price of labour and material in the Colony being so high—was cheaper in construction and erection than an ordinary roof on walls would be.

Tenders were therefore called for in the Colony to the design suggested by the engineer, and the tender of Mr. W. H. Jennings for £38,600 was accepted.

Mr. Jennings associated with him in the contract the firm of D. & W. Robertson, and by them the ironwork for the roof was ordered from England.

In the *Engineer* for 12th January, 1884, an article appeared criticising this roof unfavourably, both in a professional and economical point of view. The writer stated that this was “the first time that a design, which is of necessity more expensive than an ordinary trussed roof, has been erected for such a building as a locomotive running shed.” Admitting, however, that this design had “the advantage of an open space, unimpeded by intermediate columns,” and “of the ridge and furrow system of lighting which is convenient not only in construction but for easy repair afterwards.” This admission was qualified by the assertion that the skilful simplicity of detail which characterized the earlier roofs and which was one of the signs of a skilful designer, was in some parts wanting in this structure. There was the writer said, unnecessary “smithing” and welding which added to the cost and risked the safety of the structure. The article proceeded to give examples of this kind of roof. The first was that of the St. Pancras Station of the Midland Railway, with a span of 240 feet. In this case the thrust of the roof, minimised by the shape of the arch, was resisted by the girders of the floor which formed the tie. The Roof of the Drill Hall at Derby, by Handysides of that town, 150 feet long, with a space of 75 feet. In this case no tie-rod was required, the slope of the roof and its connection with the cast-iron stanchions giving it the requisite stability. A roof, almost identical with this, was also fixed over the Gymnasium at the Royal Naval Hospital, Greenwich; in the roof over the St. Enoch’s Station of the Glasgow and South-western Railway, at Glasgow, 518 feet long with a span of 198 feet, by Handysides, the form of the arch and the anchorage to the large base plates which project inwards render a tie unnecessary; the joint Station at Manchester of the Great Northern, Manchester, Sheffield, and Lincolnshire, and Midland Railways, 550 feet long with a span of 210 feet.

The Eveleigh roof, the article continued (300 feet long with a span of 101 feet), was rather heavy in details, having double triangulation and vertical or normal struts at every fifth apex.

Until, the writer remarked, the maximum strains on roofs of this kind was ascertained with sufficient accuracy to enable designers to place confidence in their figures they would continue to employ large sectional areas to make sure of sufficiency; and so long as this was the practice we should never arrive at the elegant lightness of such roofs as that of the new station at Berlin. Returning to the Eveleigh roof, the writer stated that the specification required all the wrought iron used to be of the best quality, tough, ductile, and uniform, capable of sustaining 50,000 lb. per square inch of area in tension without fracture, and 24,000 lb. per square inch of area without taking a permanent set, and the compression breaking strain to be not less than 37,000 lb. per square inch of area, and 24,000 lb. per square inch of area without taking a permanent set.

The same question was taken up in the *Sydney Morning Herald* of 20/6/83. A correspondent of that paper, under the *nom de plume* of “Observer,” after quoting the criticisms in the *Engineer* upon the roof of the Eveleigh running shed, pointed out that the statements made in that paper were “full of valuable observations” and that they were “palpably impartial and well intentioned criticisms,” and maintained that if we did not want to part with our money unwisely and to be laughed at into the bargain by those who would benefit by our blunders, our future indents for large structures would require to be closely watched by those whose duty it was to protect the interests of the Colony.

Hereon the Commissioner remarked that perhaps “Observer” was not so innocent as he appeared to be, that he professed to think the criticisms referred to were impartial, but if he would look round the question and see the interests (home interests, not colonial) which were involved, he would come to know how these articles were inspired and why.

When the Commissioner came to know of the criticisms in the *Engineer*, he minuted that when the plans were submitted to him he himself had objected that the proposed design was a very unusual one for a running shed, and suggested that an ordinary truss roof would be cheaper; but he was assured by Mr. Cowdery that owing to the price of labour in the Colony and also of material this style of roof affording its own support, was cheaper in construction and erection than an ordinary roof on walls would have been. With reference to the charge implied (not directly stated) by the writer in the *Engineer*, that the roof of our running shed compared unfavourably in point of weight with the roofs of some structures in England and on the Continent, he (the Commissioner) was particular in his inquiries on this head, and, at his suggestion, some figures were obtained from which it appeared that the Eveleigh roof compared most favourably in point of weight with similar roofs elsewhere. The writer in the *Engineer*, referred especially to the Manchester roof, leaving his readers to infer—which was most unfair—that the Eveleigh roof was of the same weight, but as a matter of fact the comparison was absurd—the Manchester roof being 45 lb., and the Eveleigh roof 25 $\frac{1}{4}$ lb. to the foot. The Commissioner added that he would like to have a report from Mr. Cowdery, as statements were being industriously circulated that our roof was excessively heavy.

A report accordingly was prepared by the Assistant Engineer who was directly responsible for the design. In this report, which dealt exhaustively with the subject, the designer pointed out that it was no unusual thing for a new work to be subjected to criticism, that designs by some of the most eminent engineers in the world have been criticised and depreciated; and that as opinions among men will always vary, it was not to be expected that any work, however good, would be universally praised or pronounced perfect. He thought, however, that he would be able to show that the cost of the Eveleigh shed compared favourably with cost of running sheds elsewhere.

He believed the *Engineer* was right in saying that this was the first time an arched roof had been applied to a running shed, but that was no reason why it should be the last; and it certainly was the first time that a running shed had been put up to include within four walls an area of 91,000 square feet (nearly 2 acres) and 6,300 feet of track. An arched roof moreover was not of necessity more expensive than an ordinary trussed roof; that would depend upon the nature of the ground, cost of labour, &c. In our case the foundations had to be carried to a depth of 14 feet, and for that reason large spans were adopted for the roof, it being universally admitted that where foundations had to be carried to a great depth it was more economical to have a few strong supports than a number of small ones. The present building had in fact cost no more than one with an ordinary trussed roof would have done. It might be admitted that the roof, taken as a roof only, cost more than a trussed roof; but the cost of the extra foundations, columns and stronger walls required for the latter must be taken into consideration. It would be seen by the illustrative estimate submitted that the very lowest price at which a plain brick and iron structure, with an ordinary trussed roof, and affording the same extent of space and accommodation, would amount to just as much as the present building had cost. If the plan of round houses, now so much in vogue, had been adopted, three times the area would have been required, and the cost would have been four times as great. Again, if the plan of traversers (at one time proposed) had been adopted, an area 50 per cent. larger would have been necessary. Buildings of galvanized iron and wood, such as were proposed in Victoria, or with wooden roofs, as adopted by the London and North-western Railway, England, would be much cheaper in first cost, but they would soon require renewal, and would be costly in respect of repairs. The following comparative table of particulars of several running sheds would show much to the advantage of our shed:—

Where situate.	Style.	Area in square feet.	No. of Engines.	Area in square feet for each Engine.
Philadelphia.....	Circ., 300 feet dia.	70,686	40	1,767
Altoona.....	„ 283 „	136,511	120	1,138
„	„ 195 „			
„	„ 236 „			
Pittsburgh (2).....	„ 274 „	117,927	78	1,512
Harrisburg	„ 294 „	129,023	81	1,593
„	„ 279 „			
Meadows	„ 350 „	92,212	42	2,290
Melbourne (3).....	„ 284 „	190,041	91	2,088½
Derby	Rect., 360 x 184	132,480	88	1,505½
„	„ „ „			
„	Circ., 185 feet dia.	59,108	50	1,182
„	„ 146 „			
„	„ 136 „			
Eveleigh	Rect., 303 ft. x 300 ft.....	90,900	126	721½

It would be seen that the area per engine in our shed was only 721 feet per engine, while in the seventeen engine-sheds quoted it varied from 1,138 feet to 2,290 square feet per engine, and he did not believe any of these, except the Victorian one, which was of wood and galvanized iron, cost less for the accommodation provided.

The cost of our shed which was £68,455, equal to £543 per engine, included £14,000 for foundations and pits, and gave the cost per cubic foot of space at 5½d., a price no higher than that of an ordinary galvanized iron shed. With reference to the statement in the *Engineer*, that the “skilful simplicity of detail which was so characteristic of the earlier structures and one of the best signs of a skilful designer is, in the present case, wanting in some parts; that there appears to be unnecessary smithing and welding, which add to the cost and involve risk to the structure,” the writer of the report asked where the unnecessary “smithing and welding” occurred, pointing out that the critic vaguely alleged the existence of the defect, but did not say in what part it was to be found, and adduced no proofs. It was evident that the critic had not examined the drawings. This was distinctly proved by his assertion that the ribs, besides double triangulation, had normal struts at every fifth apex,—an assertion distinctly opposed to the fact. What the critic took to be normal struts were simply the section of the main purlins shown in connection with the elevation of the ribs. He (the writer) had seen letters from the English manufacturers praising the simplicity and skilfulness of the design, and stating (what they were the best judges of)

of) that it was very easy of manufacture. In one case only had the manufacturers asked for any departure from the original design, and that was not on account of any difficult smithings or weldings, but with a view to facilitate the carriage of certain parts, and to lessen the cost of erection. There might fairly be a difference of opinion as to whether smithing or welding should be employed instead of riveted or bolted connections; but the *Engineer* must not forget that on a roof construction there must of necessity be more smithing and welding than in a simple girder, and he maintained that there was no unnecessary smithing and welding in the Eveleigh roof. He (the writer of the report) was surprised that the *Engineer* had not criticised a very remarkable roof construction designed in this Colony for an important building and now being manufactured in England—a roof hardly able to support itself, and of which the manufacturers said that it was the most extraordinary structure they had yet seen—a conglomeration of forgings and welds, and fancifully cut and curved plates and angle irons. The *Engineer* would lead his readers to believe that our roof was as heavy as the Manchester roof; but how erroneous and unfair this was, and how favourably the Eveleigh roof compared in point of weight with that and other roofs, would be seen by the following comparative statement:—

Weight of ironwork of various roofs per square foot of area covered.

	lb.
Midland Railway Station, Bath	25
Railway Station, Middlesboro'	29.5
Agricultural Hall, London... ..	23.5
St. Enoch Station, Glasgow	32
Railway Station, Manchester	46.5
Eveleigh shed	25.5

It would be seen that the weight per square foot of area of the Eveleigh shed was not much more than half that of the Manchester Station.

The writer of the report continued that the strains of the Eveleigh roof were got out with the utmost care, and were determined according to English practice, with due regard to a proper factor of safety and to facility of construction and erection. He might have carried out the principle of economy of material according to Continental practice, and thereby have saved 50 or 100 tons of material, but there would have been an increase in cost of construction and erection, and probably no saving in total cost, while the very persons who now, from ignorance or a worse motive, condemned the structure as excessively heavy, would, in that case, have alleged that a weak and unsafe building had been put up.

The report proceeded to expose inaccuracies and misstatements in the *Engineer* article relative to certain other roofs of this character; but as these remarks have no special bearing on the matter under discussion, except as showing how little knowledge of the subject the writer of the article really possessed, they need not be further referred to here.

The report pointed out that if the alleged defects really did exist in this roof, they would have been found out and exposed by competent authorities, and that, as there had been no such adverse criticism, it might fairly be assumed that the profession at large did not share the opinions of the *Engineer*. It further suggested, in conclusion, that this criticism had been written or inspired by the person who wrote the articles in the *Engineer* on "Colonial Contracts," which articles betrayed a sign of prejudice against work designed out of England, and led one to suspect that the writer was employed to serve some party adverse to colonial industry and development.

Subsequently the writer of the above report supplemented his remarks by stating that he had ascertained that the sum of £75,000 had been placed on the Victorian Estimates for the wood and galvanized iron structure referred to by him in his report, while the cost of the Eveleigh shed completed would be £68,455.

In April, 1884, it having been alleged that some of the ironwork imported from England for this work was not to specification, the Minister gave permission for a deputation from the Iron Trades Employees Association to visit and inspect the works, accompanied by an officer of the Department.

The officer who designed the roof, and who wrote the report before-noticed, was deputed to undertake this duty.

The deputation carefully examined the works, and pointed out the portion to which the complaint referred; but it turned out that they had not discovered anything which was not already known to the Department; that the defects referred to had been officially reported, and that steps had been taken to remedy them.

Under date of 23rd April, 1884, the officer who accompanied the deputation reported that the defects complained of referred to some defective work supplied by the contractors ten months before, upon which he (the writer) reported on the 26th July, 1883, and that the defective work was then at once condemned and taken out and reconstructed, in accordance with the spirit and intention of the specification. The part replaced was somewhat different in appearance from the rest of the work, but it was all sound and good. He explained to the deputation that the most rigorous and careful inspection was exercised both by himself and by the Inspector on the works, and that no work was passed which was not of good quality and according to specification. The deputation, at the conclusion, expressed an opinion that the work was of a first-class character.

The question was again brought forward in an article in the *Globe* of 22nd July, 1886, in which the manager of the Atlas Ironworks is stated to have said, of the railway sheds at Eveleigh, that the contract was given out of the country though a Sydney firm put in an extremely low tender, and that he knew of no railway station in England, not even the magnificent ones owned by the Midland and North-western Railways, which had such an expensive and elaborate roof as was demanded by the specification for this structure, which at the best was only an engine-shed in an out-of-the-way place, and could have been erected and made just as serviceable for half the money.

This

This gentleman's allegation as to the expensive and elaborate character of the Eveleigh roof has been fully answered by anticipation in the report of the designer of this roof. It is there shown that the roof in question, taking into consideration the cost of foundations, walls, &c., was not more expensive than an ordinary roof would have been, while it was admitted in the unfriendly critique in the *Engineer* already noticed, that the style of roof adopted presents advantages in the way of ventilation, light, &c., which a roof of the truss construction does not possess. The assertion that the contract was given out of the country is, to say the least, a misapprehension. The contract, as before shown, was given to a Sydney firm. The contractor, it is true, did have the ironwork manufactured in England, but this is a circumstance for which the Government is not responsible. There can be no doubt that if a firm, capable of doing the work, and possessed of sufficient enterprise to undertake it, could have been found in the Colony, the contractor, in view of the risk attendant upon operations carried on at so great a distance, would have much preferred to place the order here. This, however, is a matter which the gentleman, whose remarks are now particularly under notice, should, from his connection with an iron manufacturing establishment in the Colony, be well qualified to give an opinion.

RAILWAY RATES.

MEMORANDA on the existing merchandise rates of our railways, with proposals for an alteration of the same.

THE following has been addressed by Mr. J. Haynes, M.P. for Mudgee, to the Premier:—

“To the Hon. Sir Henry Parkes, K.C.M.G., Colonial Secretary,—

“Dear Sir,—I beg to submit to the Government, through you the following memoranda on the present system of merchandise charges on our railways. I am aware that, in some respects, the matter concerns the Works Department, and that my proposals might have been submitted to either the Commissioner for Railways or his chief, the Minister for Works; but as, according to my view, the whole thing is a question of public policy, affecting the government of the interior districts of this country, I have thought it the better course to submit the proposals to the Cabinet. In this work I stand representing the entire inland community, who are affected one way or another—for good or for harm—by the management of our great national highways. The question as to this management or control is one far beyond official or departmental concern, and is, in reality, a question of public policy. The representations in regard to the management of our railways which I now make, are from the country. It is fitting that these representations should be made to the Minister who represents the Government. Therefore I address you; and have only to hope that as the reforms proposed are really of an urgent character, no time will be lost by the Government in ascertaining whether they are sound or unsound. With these few introductory words I beg to proceed.

1. For a considerable period of time, principally during my last five or six years connection with the Press, I have watched the relative advance in trade development of our metropolitan and inland districts, and I have been struck with the comparatively small headway of the latter, notwithstanding their varied and great resources. Of late many bitter complaints have come up to us from the country of the continued unproductiveness of labour and enterprise of every kind. The tillers of the soil, spread over the railway-traversed centres of the country, have complained that they are almost wholly shut out from the great coast markets; while, on the other hand, those markets inland at all available are reached by cheaply-borne produce from outside Colonies. Very many of our farmers took up their lands years ahead of railway communication, and they have in the interval plodded on, expecting a complete change with the appearance of the locomotive. But to these the railways have come, and the farmers find their position changed if anything but little; in many cases they are the worse off. This disappointment has been felt inland, not by the farming interest alone. Almost every branch of trade, manufacturing as well as mercantile, has long been suffering from drawbacks which all could feel, but few describe. The recent three or four years of depression, felt here as in other parts of the world, has intensified the effect of this condition of things; and after all it is not perhaps surprising, in the uncertainty of the hour, many of our inland people, hitherto conspicuous as a body in their attachment to free trade, should lend for a time, at any rate, a partially willing ear to the delusive cry of protection.

2. I always felt that there must be something radically wrong with our governmental or administrative system (and as far as our inland communities are concerned they are one and the same under our centralising system), which would induce men to entertain even for a moment a proposition that to relieve trade of depression we must burden it with fresh handicaps rather than free it from those which it already bears. I was convinced that free trade meant deep and lasting prosperity, and I perceived that the existing handicaps to inland development could not come from our fiscal policy. I could see that our farming community were a laborious and steady people, and that our country business men were as energetic as any that could elsewhere be found. I turned my attention to our facilities for transport, and I must say I was not long examining our railway tariff system before I discovered what I believe to be the great—the one only—hindrance to inland development, and the ever-present cause of agricultural depression in this country.

3. I now propose to set forth in this paper the results of my investigation on this head, giving in detail particulars of existing handicaps, and appended hereto will be found my proposals for a complete remedy. Before proceeding further, I must here state my belief that the Commissioner for Railways (Mr. Goodchap) has at all times striven to shape our railway system to the wants of the general community; and I believe, further, that his occupancy of office has been an executive success. He has organised for the country a staff of officers second to none in any other part of the world—steady, reliable, and competent. We can realise this when we note that (with almost an entire absence of sacrifice of life or loss of property) we carry between 53 and 54 million passengers and about 1½ million tons of merchandise on our railways and tramways in a single year. In this way, as an executive officer I believe Mr. Goodchap to have succeeded. But I must say that it is in this executive work his success begins and ends. I regret that I will in this paper have to show that not only has he failed to grasp the wants of the interior as regards our goods traffic, but that he has exercised ministerial rather than official powers, and has inaugurated a system of rates which is illegal as well as being diametrically opposed to the declared free trade policy of the country.

4. The profound blunder of our railway goods system is that it is shaped to meet a wholesale rather than a retail trade. It is impossible, on examination of the system, not to observe that it is to the few any favourable consideration is shown, and that the one object—benefit to the metropolis—is kept always in view. I will have to show that the wholesale principle is the body and soul of the system, as far as the metropolis and (in some respects with the view to benefiting Sydney) Newcastle are concerned, and that where the principle is extended inland at all it is to coal-mine owners and wool-growers.

5. Now it has been proposed to abolish the differential rate system, namely, that under which a specially low rate of carriage was devised to secure our trade in the terminal districts of the south and south-western trunk lines. Now, I propose—it is a paradox—to abolish the system by making it general. I believe it can be shown that the Commissioner is acting directly contrary to law in charging any such thing as a differential rate; and I believe a Maitland, Mudgee, Goulburn, or Bathurst trader could successfully resist in a court of law any further payment for carriage than the average for distance under the differential rate. (Mr. Teece, M.P., for Goulburn, informs me that the English Courts have decided the differential rates are illegal.)

6. As above stated, it is a paradox for me to say I propose obliterating these differential rates by maintaining them in general application over the entire stretch of our railways. My point is that the differential system, low as it is, pays the Department; and, extended all over the country, might be calculated to lead to a vastly increased traffic.

7. First of all, for general information, it may be as well that I describe what the differential rate system is and what it really means in pounds, shillings, and per cent. It was inaugurated, as is well known, to enable Sydney to compete for the trade of our southern border with Victoria, who had devised a specially low railway rate to retain her hold of it. Our concession to the Sydney business people was this:— (1.) The maximum rate for any class of traffic (except explosives) from Sydney to stations distant over 305 miles on the Southern and 340 miles on the South-western lines will be £5 10s. per ton; or if in truck loads not exceeding 6 tons, the maximum charge will be,—corrugated iron and fencing wire, £18 per truck; other 1st, 2nd, 3rd, and 4th class goods, £20 per truck. (2.) A reduction of 20 per cent. will be allowed on 1st and 2nd class traffic from Sydney to stations on Southern and South-western lines, distant over 340 miles. With regard to the Western line, a differential rate of £35 per truck of 6 tons is made for a distance of 503 miles.

8. The working out of the system may here be briefly illustrated. A Sydney trader may send 6 tons of corrugated iron 454 miles for £18; but a Maitland trader sending his 6 tons to Tenterfield (120 miles less haulage) would pay £26 17s. Under the same system a Sydney firm dealing, say in Victorian-made agricultural machinery, could send 6 tons of it 450 miles for £20; but the Maitland man, sending exactly the same goods only 334 miles would pay £46 10s. 6d. Under the same arrangement, a Sydney merchant sending goods, known as fourth-class, would get his 6 tons for £20 for 450 miles, while the Maitland man, sending 120 miles less, would have to, and does, pay on 6 tons his £59 19s. Sending to Bourke, 503 miles, goods of this sort, the Sydney merchant would be charged £35, but if he had to pay the same rate per mile as the Maitland business man he would contribute not £35 but £82 15s. to the railway returns.

The rate sheet has not been the work of any one person, nor the outcome of the policy of any one Government; it has been shaped by the policy of the times, and the ever varying conditions of trade.—CH. A. G., 17/10/87.

Mr. Haynes is going to level down his proposal to give the short-journey traffic the benefit of the long-journey rates—he is going, in effect, to demolish the railway revenue.—CH. A. G., 17/10/87.

This has been replied to in anticipation by an official paper written on Mr. Teece's proposed motion for the abolition of the differential rates, supplied by an article in the *Herald* on 27th September, 1887.—CH. A. G.

But in practice we know that 6 tons of fourth-class goods never forms a consignment.—CH. A. G.

9. It might be contended that this instance of Maitland on the Northern line, where the differential system does not apply, is hardly a fair illustration of the workings; but it may be illustrated with equal effect as regards intervening districts on the very lines where the differential system is in operation. For instance, Orange. This town is 192 miles from Sydney. A trader there getting up 6 tons of ironmongery, agricultural machinery, &c., would pay for the distance £31 6s. 6d., while a Sydney merchant could send his 6 tons 454 miles for £20, or 262 miles further for £11 6s. 6d. less. If the trader at Orange were receiving 6 tons of fourth-class goods he would pay £40 8s. 6d., but the man at Sydney could send his 6 tons 311 miles further on the same line for £5 8s. 6d. less; and on the Southern Line 262 miles further for £20 8s. 6d. less.

10. How it has worked out may be judged from this fact: A storekeeper at Cootamundra, being 253 miles distant from Sydney, and consequently too near for the differential system, would pay for 6 tons of ironmongery, machinery, &c., £38 0s. 6d. But he knows the differential ropes. He books his goods to Wagga (56 miles further on) so as to get within the differential reach; gets the 6 tons up to Wagga for £20, retrucks them back from Wagga to Cootamundra for £9 17s. 6d., and saves £8 3s. on the consignment by giving the Department 112 miles of extra haulage.

11. This is the differential system briefly illustrated. It is not for me just here to bring the whole thing right out. That will be done further on. My object now is to justify by illustration my contention that our railway system is the embodiment of the wholesale rather than the retail principle; that consequently it is dead in favour of the metropolitan man, whether he be a big or a little trader, and that where it does extend any advantage to the country, it does it mostly to the big man, represented in the wool or the coal ring. And here I may just keep this idea clear and distinct on the surface, that I do not propose to deprive these men of the advantages they possess under the tariff, but claim rather for an extension of the advantages to every man of the inland community. I have said that the wholesale idea is the principle of our railway system, and then make the apparently illogical assertion (as above stated) that the little man (or the retail trader) of the metropolis is favoured. The point is very simply shown. First of all, it is seen that the wholesale Sydney merchant can send his 6 tons at the reduced rate of £20, and the 6 tons may be made up of any class of merchandise. The Sydney merchant usually deals in large consignments, and they are as often over as under 6 tons. But even if under the 6 tons the same advantage is gained; and herein is the way the retail or small man in Sydney gets the benefit of the wholesale principle. In Sydney, as we know, there are carrying or forwarding agencies—Wright, Heaton, & Co.; Lee, Macalister, & Co.; &c. Now, when a Sydney trader, large or small, has 4 cwt. of a consignment to send, he forwards it to the agents; twenty others do the same thing, and a £20 truck load of 6 tons is made up, the agents charging only commission; and so the £20 principle is extended to and enjoyed by the little and big man alike in Sydney. But the inland man, the farmer or the storekeeper, battling his way on any part of the vast stretch of our railways, knows nothing of such a grand arrangement. The farmer is a retail man, and as a retail man the system kills him. Illustration and proof of this will be amply given further on.

12. Now, with regard to the application of the wholesale principle inland. That it applies to the wealthy coal-mine owner and the wool king is indisputable. For instance, 6 tons of coal are carried (say) 96 miles for 46s., and at Newcastle or at Darling Harbour the use of the cranes or staiths, which have cost the country huge sums of money, is given in free. Now the colliery man is a wholesale customer. The farmer is not. But if he has to send his 6 tons of dairy produce the way in ninety-nine cases out of 100 it is sent, it will cost him the 96 miles, not £2 6s., but £12 4s. 6d.; while his ploughs, harrows, &c., would cost him £16 19s. 6d. As to the woolgrower, he is essentially a wholesale man, and gets his wool down 454 miles for £2 19s. per ton. Now the farmer has the wholesale principle offering to him with respect to grain that he seldom uses. If he sends 6 tons of wheat he can travel at a low rate (and I will show that it may be one at 100 per cent. cheaper); but he is oftenest a small dealer, and at that rate his grain costs him for the 6 tons £34 1s. 6d.

13. In hay, straw, and chaff, the farmer has got a consideration, but these are by no means the staple products of the interior, and the farmer prefers dealing in 1 ton to 4 or 5 ton consignments of hay, chaff, &c., especially if he has any transactions with inland markets.

The

No; the truck load does not average 6 tons; it may be made up of any class of merchandise, and this admission invalidates Mr. Haynes's calculations, which are always based on the supposition that the merchants send in some cases fourth-class goods, but never less than third-class goods.—*CH. A. G.*

To be accurate, Mr. Haynes must leave Newcastle out of the calculation; the northern coal is carried on very different terms to those he states.

Mr. Haynes's figures are wrong—but it appears that the principle he advocates here is that dairy produce should be carried as cheaply as coal; now, coal is worth 5s. a ton, while dairy produce is worth 6d. a lb., or £56 a ton.

The concession applies to consignments of 5 tons or so; but if a less amount is sent he is charged for the truck load; or his consignment of 1, 2, or 3 tons is charged first-class rates, actual weight. For instance, a wool-king can send his wool down by the ton at £2 19s. for 454 miles; but a farmer sending 1 ton of hay or chaff that distance would pay £5 13s. 6d.; or from my district, Mudgee, 192 miles, £3 0s. 7d.—a rather high percentage on its value. These are illustrations that our railways are conducted on the wholesale principle to the advantage of a few. The farmer gets concessions that he seldom uses, while on the other hand, the very wholesale principle of the tariff is used as a means to swamp him in his own adjacent inland markets. Proof of this latter statement is found in the following fact:—Millers and storekeepers (say) at Tamworth and Armidale, &c., on the approach of harvest time, get up cheaply by rail on the wholesale principle large lines of imported flour from Newcastle. Then, when the farmer comes to town to sell his wheat, the large cheaply-carried stocks of flour are pointed out to him, and he is forced to accept any price, &c., &c.

This is not correct.

Figures are wrong.

14. I proceed now to show the whole merchandise system in operation; but before doing so I must lay down this idea: We have no right to consider this or that trunk line separated from any other. All the lines form a system, and the line from Sydney to Albury is as much the property and concern of the Maitland trader and the Glen Innes farmer as is the line from Newcastle to the Queensland border. As portions of the general community, the Glen Innes and Maitland people have to bear the cost and the loss, if there be any, of the Southern and Western lines, and concessions granted to one portion of the people cannot be refused to another.

15. Now, let us take the case of a Maitland business man who does a trade extending along our Queensland border. I will illustrate my point with eight lines of ordinary merchandise, which may be taken as a sample of the articles in which business is every day done. The Maitland merchant sends his goods 330 miles to Tenterfield, and pays as follows:—

	£	s.	d.
Half ton of flour	2	4	4
„ bacon, cheese, &c....	2	15	2
„ salt	2	4	4
„ sugar	2	15	2
Two tons furniture	19	16	0
Half ton galvanized iron ...	2	4	4
„ fencing wire	2	4	4
One ton machinery	7	13	8
	<hr/>		
	£41	17	0

A Sydney merchant, however, could send his 6-ton consignment 454 miles—exactly 120 miles further—for only £20. Or a coal-shipper at Newcastle, who brings flour from Melbourne almost as ballast, could send from Newcastle, 354 miles, his 6 tons of flour for £6 4s., as against the Maitland man's £41 17s. 4d.

But a Sydney merchant would pay as much if he sent the stuff 330 miles on the Western Line. It simply means that if he sends the stuff to a certain station which is the *entrepôt* of the competitive district he can do so at a cheap rate.—CH. A. G.

16. If the Maitland man wish to send 6 tons of galvanized iron and fencing wire, 6 tons of iron irrigation pipes, 6 tons of pastoral or agricultural machinery, and 6 tons of general merchandise, he pays for the 24 tons in their respective classes a total of £164 4s. 4d. for 330 miles; but the Newcastle flour-ballast importer can send his 24 tons of Victorian produce 354 miles for £24 16s. If we take the same goods and see what the Sydney man can do, I find that, while the Maitland man pays £164 4s. 4d. for 320 miles, the favoured man of the metropolis will send his goods 454 miles for only £78 18s. Those are instances of a monstrous 100 per cent tax fixed on the shoulders of the inland trade.

17. Let me illustrate it further. If we take a hundred business men in Maitland doing the above trade—and we know it merely represents their everyday transactions—and put them side by side with a hundred Melbourne business men doing business through their agent at Newcastle, we find the result as follows:—The men of Victoria would pay £2,480, while the Maitland men would contribute £16,421 13s. 4d.; and let it be understood the Maitland men would have 2,000 miles less haulage than the Victorians. Is it to be supposed that the Maitland merchant stands all this heavy tax? No; he passes on to his customer as much as he legitimately can; and so we find the farmer

The comparison between flour and the miscellaneous articles enumerated is, as regards freight rate, absurd.—CH. A. G.

farmer bearing a ruinously heavy tax for all he requires, while, on the other hand, his very local market is flooded with produce carried for next to nothing, the trucks unproductively returning empty.

18. At Mudgee, the constituency I represent, there are extensive lime-burning works. At a large outlay of money two or three local men have put the industry in full swing, and 100 hands, with a prospect of many more, are employed. A few months ago the work had no existence. Let us see how our railway policy helps this inland industry. The Department will carry 6 tons of limestone 190 miles for £3 16s. 1d.; but for turning the limestone into lime on the spot the company have to pay for 3 tons, 190 miles, £9. Or the limestone, 6 tons of it, may be carried 500 miles for £6 18s. 8d., while 3 tons of lime would cost just £18 18s.—a tax on the Mudgee industry of only a few hundred per cent. The lime is mostly ordered by the ton or half-ton, and when any less quantity than 4 tons is carried (the wholesale principle in operation) the amount is charged as 4 tons, or raised to first-class rates and charged actual weight.

19. Again, Mudgee. There is a tannery in the town, not so large now as it used to be, which is not surprising when we know the why and wherefore. If the tanner wishes to send his leather to Sydney (for the benefit mainly of the Sydney manufacturer, or the produce auction mart people or exporters) he can forward 6 tons under class 1 for £18; but if he wished to reach another and better market inland he would find his goods raised to another class, and 190 miles, not to Sydney, would cost him £22 7s. If the Mudgee man sought to travel to Bourke direct with his 6 tons of leather he would pay £45 17s., while the Sydney man could send it the same distance to the same place for £10 less; and on the Southern Line could send it very nearly the same distance for the monstrous amount of £25 17s. less.

20. At Dubbo there is a soap-making industry, and, as we know, soap is not ordered by the 6-ton lot. Well, the Dubbo maker, sending his goods $\frac{1}{2}$ -ton at a time, would pay on a total of 6 tons for 250 miles, say to Bourke, the sum of £27 2s.; while at the other end of the line the favoured man of Sydney could send his 6 tons nearly double the distance for only £20.

21. At Lithgow there are pottery works, which have had a severe struggle to get to their present success. If the company attempt to do business westward, direct from the works, they are punished for ignoring Sydney. To send 6 tons of their goods 408 miles they would have to pay £31 5s. 6d., while the imported article could be sent from Sydney, 50 miles further, for £11 5s. 6d. less. Now, we know that the Lithgow Pottery does not execute 6-ton consignments— $\frac{1}{2}$ -ton orders are oftener the rule. Then up go the goods to class 2, and when 6 tons have been sent the cost for 408 miles is £38 19s., while the Sydney importer, sending his goods $\frac{1}{2}$ -ton at a time, can, through the carriers' agency arrangement previously mentioned, send his 6 tons for £20 for 454 miles. When I was at Lithgow recently the foreman said to me—"We must have 15 or 20 per cent. protection against the imported article." But here I have shown that this very industry is taxed, as compared with the imported article, by over 100 per cent. If I can get this 100 per cent. knocked off, I wonder whether the Lithgow pottery man will have need to cry out for 15 or 20 per cent. protection.

22. At Bowenfels, 97 miles from Sydney, there are tweed mills. Say the proprietors have transactions amounting in all to 60 tons, sending 6 tons at a time. They would pay £170 10s. for 970 miles of haulage. But a similar amount of Geelong or other imported tweeds could be sent on a haulage of nearly 5,000 miles from Sydney for only £30 more. If the Bowenfels firm wished to trade with Bourke they would pay £541, while the Victorian or other imported tweeds could go along the same line for £191 less, while using 970 miles more haulage. From Bowenfels to Bourke, 406 miles, the company would pay £503; while on another trunk line the Victorian manufacturer or importer at Sydney could use 454 miles for £303 less. But if the Bowenfels man was sharp and looked closely after the shillings, he would not send to Bourke direct. He would first send his goods to Sydney, and thence to Bourke, thus saving £23 by giving the Department 1,116 miles of useless extra haulage. In reality, with regard to our railways we give the outside or foreign manufacturer an advantage of from 150 to 200 per cent. against our local manufacturer. This, simply, is freetrade in a straight-jacket.

Whoever heard of limestone being carried 500 miles. Mr. Haynes should be practical; his *reductio ad absurdum* argument is misleading. If limestone or lime were carried such distances the rates would be very different.—CH.A.G.

See reasons given in rates, Board inquiry, for this apparent anomaly. It is a scientific rate, and can be well defended; it is called for by the circumstances of the case.

This is the only piece of argument approaching common-sense which Mr. Haynes has yet used. Bourke market should be as much open to Mudgee tanners as it is to Sydney tanners, and I have urged this.—CH.A.G.

The low rate to Sydney is to allow the manufacturer to get to his central market; this is right and defensible.—CH.A.G.

This is the competitive export argument again dressed in another shape.

23. At Armilale, on the New England Plains, is a first-class man of business—currier, tanner, and boot manufacturer. If he wishes to reach Newcastle (the nearest practicable terminus to Sydney at the present time—the Hawkesbury connection being incomplete), he could send his leather down under class 1, and for 260 miles he would pay on 6 tons £22 4s. But if he attempted to reach Maitland, where a fine new market is developing, he would find his goods raised to class 2, and for travelling 20 miles less he would pay £4 3s. more. Now, does the Armidale man send his goods to Maitland direct? No. For the last ten years he has sent his leather to Newcastle, and retrucked it back to Maitland. Suppose he has done 100 tons transactions with one Maitland man in that time, then he has saved himself £130 by giving the railway 4,000 miles of needless extra haulage.

24. At Newcastle, as is well known, there is one of the largest and most successful biscuit factories in Australia. The proprietor, after a big battle for success, does a great trade in biscuits all over our northern country. Let us see how the Railway Department assists him. For his 6 tons of goods, 350 miles, he pays £48 4s., while the imported or other biscuits may be sent from Sydney 100 miles further in one direction for £28 4s. less, and in another direction 150 miles further for £13 4s. less. While, more astonishing still, if the Newcastle importer of ballast-borne Victorian flour wishes to send his 6 tons over the same stretch of our northern line as the Newcastle biscuit-maker does, he pays not £48 4s. but only £6 4s. In other words, we give the outside man an advantage over our own of about 800 per cent. Evidently the country does want protection—but it is protection from the administration of our railway system.

25. At Tamworth there is a musical warehouse, and when the proprietor comes to sum up his transactions he finds his 6 tons cost him £35 18s. 6d. for 167 miles. But our Victorian squatting friends resident down about Hay, and who do their business in Melbourne, can have their goods sent round to Sydney, and thence by rail to Hay, 454 miles, the 6 tons costing only £20. If the Melbourne transactions (or for the matter of that they may be Sydney transactions) were taxed the same as the Tamworth man's they would pay not £20 for 6 tons, but £76 3s. But the real position of the Tamworth business man is this (and I am giving the case as illustrative of the dreadful handicaps placed on inland development)—First, from Newcastle to Tamworth, his 6 tons to supply his warehouse would cost him £38 16s. for 183 miles, and his transactions in the same goods with the people of Tenterfield, 171 miles distant, would cost in carriage £36 12s. 6d.—a total of £75 8s. 6d. for a use of the railway on a haulage about half that given to the Sydney man for only £20. This is simply a tax of nearly 700 per cent. on the Tamworth business man. At Tamworth, a lot of people, ignorant of these imposts on their trade, are crying out for a miserable 15 or 20 per cent. duty at the Custom House. I propose to relieve them of a huge taxation, of which they appear to know nothing. But with these facts before us, will anyone deny that the time for decentralization has arrived, and that the first step towards its realization is a sweeping change in our wretched railway system.

26. At Newcastle there are several foundries, which, besides turning out first-class marine engines, are capable of the best foundry and engineering work. Now, at the present time there is a movement on the Namoi to store the water and irrigate the land. Well, while the farmer finds that the foreigner—(we may call the Victorian a foreigner from his very hostility to us with regard to his tariff)—can send his 6 tons of flour or fodder to Gunnedah (196 miles) for £4 5s. 11d., both he (the Gunnedah farmer) and the Newcastle foundry man find that 6 tons of their necessary iron material costs them £22 19s., while 6 tons of their machinery costs £31 18s.

27. At West Maitland is to be found one of the most extensive agricultural implement and machinery depôts in the interior of the country; and when I was recently in that town I found some of the members of the firm inclining to protection. Let us compare this firm with (say) a Melbourne branch house in Sydney, now pushing its Melbourne-made manufactures in our southern and western districts. Take for any period transactions in ironmongery up to 500 tons, and in agricultural machinery up to 500 tons. On the two kinds of merchandise, the Melbourne firm at Sydney, using a haulage of 149,850 miles, would pay, in 3-ton lots, £3,340. Now, supposing the Maitland firm used neither the Newcastle nor the Morpeth line to Maitland, but, loading them at Morpeth by steamer, brought their

This is a rate to a shipping port—"leather for exportation"—quite defensible, only Mr. Haynes is ignorant of the why and wherefore.

But not in the same direction. If the Newcastle biscuit-baker wishes to send to Bourke he can do so precisely on the same terms as the Sydney biscuit-baker or the importer. I have not space here to answer all the statements.—CH. A. G., 18/10/87.

goods on by dray to their depôt, then their transactions would commence with up-country. Their business, carried on in exactly the same way as the Melbourne firms, would result in their paying £7,600 for a haulage of only 109,890 miles. In other words, the Maitland firm, for using nearly 50 per cent. less haulage, would have to pay over 100 per cent. more money. If the Melbourne or Sydney man were served like the Maitland firm, he would pay for his 1,000 tons, not £3,340, but £9,814; while, if the Maitland man were treated as leniently as the other, he would pay, not £7,600, but under £2,650.

28. Let us take the case of a farmer at Cootamundra, 253 miles, who turns his attention to bacon-curing. He pays on 6 tons of salt, $\frac{1}{2}$ ton at a time, £22 11s.; and sending his bacon to market in the same way he pays £27 6s. 6d. On the other hand, New Zealand and Victoria bacon imported to Sydney can be sent 221 miles further for £7 6s. 6d. less.

29. When at Morpeth recently I found two leading residents—one an engineer, and another a cabinet-maker, both in a large way of business—very active in the cause of protection. They wanted a 15 to 25 per cent. duty at the Custom House. Here is how they stood with regard to the railways: If the cabinet-maker attempted business with the new centres about Tenterfield, 330 miles distant, he would pay on his 6 tons £46 2s.; while on another stretch of our railways an importer could send his 6 tons 454 miles in one direction for £20, and 500 miles in another for £35. In point of fact the Morpeth cabinet-maker who cries out for 25 per cent. lives under an impost of something like 130 or 150 per cent. that he knows nothing of. With regard to the Morpeth engineer and agricultural implement maker, I found that if he attempted to reach the grand new wheat areas of the New England tableland he would pay on 6 tons, 334 miles, £46 10s. 6d.; while a similar consignment of Melbourne-made (imported) machinery would be taken on another stretch of our lines 450 miles for £20. However, the New England farmer is not likely to do much business in furniture for his home or with improved agricultural machinery for his farm. He is robbed by railway freight on the one hand, and on the other ruined, even in his own local markets, by cheaply-borne Victorian produce. The farmer's machinery costs him £46 10s. 6d., but a similar load of Victorian flour can be run up on the same line the same distance for £6 4s. Is there any wonder in the Morpeth engineer and the cabinet-maker crying out for relief? In this gloom they cried out for a delusion.

30. We know that half-ton orders of galvanized iron are the rule. Well, if a Maitland firm, who does a large business in the line, sends 6 tons in that way to their constituents, the freight is £32 2s. for 330 miles, but a Victorian squatting firm down by Jerilderie or at Hay can get his 6 tons for £20 on a run of 454 miles.

31. At West Maitland there is just forming a great inland produce depôt or bazaar. That the development of this new centre of trade should be assisted is a matter that cannot be questioned. Buyers flock in increasing numbers from Sydney, Newcastle, the mining districts, and from all the towns above and about Maitland; and a business is doing which augurs an annual cash overturn of £500,000 in a few years hence. Let us see how the railway system helps the thing. A Guyra or Ben Lomond farmer, midway between Glen Innes and Armidale, whose pits and barns are filled with produce which is rotting, never to reach a market, would find, if he attempted to reach Maitland in lots to suit trade, that on his 6 tons of potatoes he would pay £21 13s. for 281 miles, while on his bacon sent in the same way he would pay £29 8s. 6d. On the other hand, he would find the wholesale flour importer at Newcastle sending 6 tons the same distance for £5 3s. 9d., while a $5\frac{1}{2}$ truck load of chaff would go for £2 17s. 1d. Is it to be wondered at that the New England and Liverpool Plains farmers should say they have no markets?

32. At East Maitland are the Shamrock Meat-works; and if their goods are sent to Newcastle (centralising system again) they are carried under special class A. If, however, they are sent in any other direction they are raised to first-class goods (and I am not sure that they are not raised to third-class). Well, taking it at first-class. Now, for 330 miles the Maitland merchant sending these goods northward to his customers would pay £26 12s.; whereas, if the same rate prevailed upward as downward, he would pay, not £26 12s., but only £7.

33. The hay, straw, and chaff rates look very liberal for the farmer, but they are not framed to facilitate the small man or the inland trade. If a farmer executes an order for 2 tons of chaff he finds a
tremendous

tremendous jump in prices, and he pays from Mudgee to Sydney, 192 miles, £6 1s. 2d., and when a total of 6 tons is reached he has paid £18 3s. 6d. At Newcastle, however, where the coal exporter deals in return with wholesale lines of Victorian produce, the 5½ tons can be sent 350 miles for £3 10s. If the Mudgee farmer wants to execute a 2 ton order of chaff for Bourke, 500 miles, he would pay £12 6s. 6d., and his 6 tons would cost him £36 19s. 6d.; while the wholesale importer at Sydney could, as he sends it, send it the same distance for £4 11s. 7d.

34. Ale and porter, as well as spirits, are lines in which a great business is done. Here is how the question of freights affect them: The Maitland brewer sending his 6 tons of ale to Glen Innes, 300 miles, would pay £30 17s.; but imported ale on another stretch of our lines could go the 6 tons, 450 miles, for £20. The man at Tenterfield pays for his whisky or brandies £48 4s. for 350 miles; but on another branch of our lines only £20 is the cost for 450 miles. Why even the hotel-keeper at Mudgee, 192 miles, pays £31 6s. 6d. for goods which another man, distant 450 miles, gets for £20. Is this not monstrous?

35. I will now instance how a Glen Innes farmer is swamped in competition by reason of these one-sided railway rates (and I am putting it in the absurd way the Department expects a farmer will send his dairy produce—a ton at a time). He consigns to Newcastle 6 tons of bacon, 1 ton at a time, and in return for his sale gets up 3 tons of agricultural machinery and 3 tons of furniture. Now the freight would stand thus:—

6 tons dairy produce	£26	5	0
3 „ agricultural machinery	22	14	9
3 „ furniture	22	14	9
	£71	14	6

Against him the Newcastle importer of Victorian flour or fodder could send the following goods on the very same stretch of railway:—

12 tons Victorian flour	£10	3	0
10 trucks Victorian chaff	27	15	0
24 tons Warrnambool potatoes	20	6	0
12 „ American timber	10	3	0
	£68	7	0

But so can the New South Wales grower send his own produce by specifying Victorian flour, chaff, and potatoes.

Balance still against the Glen Innes farmer, £1 18s. The above case, bad even as it is, puts the farmer in a much better position than he usually occupies. He does not send down his bacon in tons, but quarters, and so his cost in the above transaction would be increased from £26 5s. to £32 9s.

36. A Goulburn boot manufacturer sends 6 tons of his boots to Wagga, 175 miles, and pays £28 19s.; but a Sydney importer or manufacturer can send his 6 tons 454 miles, to Hay, for £20. In other words, the Goulburn man pays £8 19s. more for travelling 269 miles less. Let me take a large transaction in which we may illustrate how the trade of an entire town is affected. The Goulburn tradespeople get up 500 tons of ironmongery, furniture, spirits, &c., and would pay on the amount, for 134 miles, the sum of £1,769 15s. 10d., the total, in 6-ton lots, representing a haulage of about 10,988 miles. Now, the Sydney merchant, for sending the same goods on the same line, would pay only £1,680 for a haulage, not of 10,988, but of 37,228 miles, or about £120 less for 26,240 miles more haulage.

37. It would be useless to proceed further with these illustrations. Every branch of industry or occupation inland is affected, and an incalculable amount of mischief is done. I believe I would be correct in saying that a general feeling of disappointment has followed on the opening of many of our railway extensions. The farming community, after waiting for years in expectancy of reaching near and distant markets, find themselves shut out from both, while those very immediate centres hitherto held by themselves are flooded with cheaply-borne produce from outside sources. It might, in fact, be urged that positive disadvantages have, in many cases, come to inland traders from the opening of our railway extensions. The ordinary road-carrying business has disappeared as the locomotive has advanced, and the people have now no alternative but to use the present costly system of the railways.

38. It appears to me that a radical alteration of the whole system is required, and I beg to submit proposals in that direction, and I do so with full confidence that my proposals will lend long-promised but long-denied aid to inland trade development; that they will assist our farmers to regain not only the intervening but also the coast markets of this country, and that they will bring increased returns to our railway revenue.

This is all nonsense.

Eureka.

39. From time to time quite a number of proposals have been put forth by way of a remedy; but they more or less have been of a patchwork character—special rather than common. Some reformers have proposed a variety of systems which really have no uniform applicable basis. In the present tariff we have this style of grasping the difficulty, and it is consequently not perhaps surprising to find the noxious principle of protection mischievously adopted to accomplish that which a sound, fair, and common-sense system alone would have won.

40. My proposal is to come to a common basis, allowing discounts or decrease in charges where the run of the train is lengthy—not as is done now, simply to bridge the distance out of sympathy for our people and enmity to our neighbours, but on account of the less handling or terminal work, and the consequent less cost in carriage. The differential system pays or it does not pay. If it pays, then it should be general; while if it be a loss, then a few should not benefit at the cost of the many. But we can safely go on the basis that differential system does pay, and that it may be expected to greatly increase the returns when general.

41. There must still be a classification of goods. Classification is affected by either the bulk of the goods, their perishable or other character, or the amount of handling required in the loading and unloading. Now, the classification at present adopted is notoriously defective and nonsensical. For instance, 6 tons of ironmongery is in most cases neither bulky nor fragile, and certainly does not require as much care, say, as flour. Yet we find that 6 tons of flour are carried 500 miles for £7 14s., while the carriage of the ironmongery for only half the distance would be £37 14s.

42. I have already pointed out that for every class of goods, 1st, 2nd, 3rd, or 4th, or for large or small consignments of anything, the differential system exists in Sydney from the fact that forwarding agents, acting for a number of people, can always secure a 6-ton truck load for conveyance, the maximum distance for the minimum cost.

43. Now, I propose that the present classification be altered to accommodate inland trade in the same way; but as there are no carrying agencies except here and there, I propose that the goods sheds or receiving stations act as such, that the goods be received in large or small parcels, and the loading or unloading be done under the direction and with the assistance of the porters in charge.

44. I propose that for general merchandise there be but one class—on the 6-ton per truck principle, applied retail as well as wholesale at every platform and station in the country, just as it has been so long and successfully applied solely in Sydney.

45. The differential rate appears to be about 1½d. per ton per mile, and so while we would get for a 13-truck goods train the sum of £260 (at £20 per truck of 6 tons) the cost would only be about £85 9s. for 350 miles.

46. Now, I suggest that all goods be received on any stretch of inland railway for 25 miles and over at 2d. or 2½d. per ton per mile—wool, mill and farm produce, coal, wood, hay, &c., being dealt with specially; the basis of this one general merchandise rate to be actual weight, with a reasonable addition in the case of unusual bulk. This would mean that as the Sydney man can take his 1 or 2 cwt. of goods of any description to the carriers' agent and have his consignment forwarded under the differential rate, as if he were sending a truck-load, so the inland man may take his goods to the station, and forward them in amounts as low as 2 cwt., or lower, on the differential estimate, a booking or entry commission being charged for receiving and handling, &c.

47. Let me illustrate this just and simple arrangement. If a farmer now sends 1 ton of bacon 350 miles, the cost is £4 12s. 8d., and 6 tons costs £27 16s.; while if he sends at half a ton at a time the 6 tons costs him about £34 12s. If he were in Sydney his 6 tons, whether sent in the one lot or by ½ cwt., would only cost him £20. Well, applying the differential system to the farmer, he would pay only actual weight at 2d. or 2½d. per mile, and instead of paying £5 15s. 4d. per ton in small lots, he would pay only £3 12s. 11d., and his 6 tons would stand him in £21 17s. 6d. (I have here reckoned at 2½d. per mile). With regard to ironmongery or machinery ordered by him, he would on 6 tons, in small or large lots, pay, not £48 4s., but only £21 17s. 6d. (it will be seen that I am working out these figures above the differential rate, for a purpose subsequently to be seen.) The arrangement would be actual weight down to 56 lb., with a small commission or handling charge added. As to bulk goods, there would

This is done; see our paper where it is defended—Teece's motion.

And by their value, and the freight they will stand—the most important factors of all: apply them in this case.

If general merchandise is carried at 1½d. per ton per mile for any distance, there will be no net revenue to speak of.—
C.P.A.G.

This is some advance on the 1½d. per any distance.

I do not think this is correct.

be but little extra charge in regard thereto, as a truck will accommodate 6 tons of almost any goods. A truck which carries 6 tons of flour—concentrated produce—will also carry nearly 6 tons of wool, the bulkiest of all merchandise except hay or straw.

47½. Now, the question of grain seems to be one which might, on plain commercial principles, be considered with a view to increased return traffic. It might fairly be expected that if we assisted the farmer by concessions to reach our coast and export markets, a large up-country return trade would result. And, as I have shown that there is a substantial profit on the differential rate, the reduction on the downward or coastward rate would be largely or more than compensated for on the increased inland trade. This is the difference between the protectionist differential rate and that which I propose—a free-trade or soundly economic rate.

48. I find that wheat can be landed from Melbourne to the Sydney wharf-side miller at about 3d. per ton; but as now the railway freight to our farmers is about 6½d. per bushel. The water-freight from Newcastle to Sydney is 2½d. to 3d. per bushel extra, while at the Darling Harbour terminus cartage is to be added. Now, what we want is not protection against the Victorian 3d. per bushel carried wheat, but extra facilities to our own farmers, and the conflict may be left to the future. Of course, in my estimate above of 6½d. per bushel, I am conceding to the Department for the moment, that the farmer is a wholesale man, and always sends in 6-ton lots. If the farmer sends anything less up go the freights, and a 4-ton consignment would cost him 10d. per bushel, and a 2-ton lot would cost him 1s. 8d. per bushel. Now, a downward or coastward run of thirteen trucks (our lines unfortunately are under the 50-foot grade), containing 78 tons of wheat, would cost the Department, roughly, £85. * At the present rate the return would be £80 12s. In point of fact, they about balance. But on the return journey the profit to the Department would be, at 2½d., about £179. Now, against this profit might be charged a 100 per cent. special reduction in the coast-bound wheat rates. This would bring the carriage rate down to about 3d. per bushel, and I propose that the rate should apply to actual weight down to ½-ton lots. All kinds of grain to be similarly treated. Potatoes, included as well, would come down from £6 for 6 tons for 350 miles to £2 18s. or £3. It is rare that a farmer sends more than half a ton of potatoes to intervening markets, in which case he would now, on ½-ton consignments, pay £27 10s. for 6 tons. Under the new arrangement he would be charged actual weight, like the man is charged who lives in Sydney. (Inward rates on mill produce, &c., I propose to charge actual cost and profit.)

49. The other propositions are that (1) with regard to hay, straw, chaff, &c., the present rate be made to apply to lots of not less than ½ ton; (2) goods under class A and B to be brought under above rates with charges on actual weight; (3) miscellaneous to remain with but slight alteration; (4) Class 1, 2, 3, and 4 of the present classification to come under a general merchandise rate, actual weight down to 56 lb.; (5) the minimum to be fixed at a low parcels rate.

50. Thus have I concluded my work. It will be seen that the whole of the proposals are to extend to the country that which the city at present enjoys, and to accommodate the system to catch in a retail way an enormous wholesale traffic which the railways up to the present have (much to inland loss and distress) never been able to secure. I suggest that special attention be at once given to our Newcastle terminus, as the outlet of a new, enormous trade certain to come from the north under the change I propose.

51. I finally urge on the Government to immediately obliterate from the system the principle of protection, with which it has through shortsighted official notions been impregnated; and I ask on behalf of the great army of toilers inland, those in our towns as well as those on the lands, to so have our railways controlled that they will assist inland development in every way, and bring to us at a near day a realisation of the grand and saving policy of decentralization.

Yours obediently,
JOHN HAYNES."

I do not see how this is shown. Mr. Haynes would lose half the revenue derived from down traffic, and make up for it by losing half the revenue derived from up traffic; but while two negatives are said to make an affirmative under some conditions, under no conditions can two losses result in a gain.

Mr. Haynes may think so, but if he means to persist in this matter he will find that he has not commenced his work yet.

No. 2.

Minute by The Commissioner for Railways.

But also with this the departmental paper *re* the abolition of differential rates and the competitive rates, and also the article in the *Herald* of 27th September, which was based on the official paper. The two documents answered in anticipation of Mr. Haynes's contentions. As I have said on other papers, Mr. Haynes's contribution to the controversy "bristling" with errors. He has one example which he continually repeats, iterates, and reiterates; nine-tenths of his paper might have been omitted had he been content with one illustration. He tries to give it a new dress with every fresh instance of treatment, but it is the same argument, and the anomaly, in charges which he seeks to establish thereby, is accounted for by the policy of granting competitive rates on the South-Western Railway and at Bourke. He further (while admitting the necessity for classification) exposes what he considers to be a gross injustice, viz., that flour (especially Victorian-grown flour) is carried on the down journey at a cheaper rate than general merchandise. He wishes to cheapen the carriage of flour on the up journey, which at present is carried at the same rate as it is on the down journey. And this freetrader, with a perfect horror of the protectionist leaning which he thinks he has discovered in the present tariff, is unaware, apparently, of any inconsistency in the proposals he makes.

As regards the principles upon which the rate-sheet is compiled, Mr. Haynes is not probably aware that in attacking them he is "couching a lance" at the universal railway practice in this respect, and that in his remedial measure he has proposed to put something in place of the tariff which, if adopted, would have the effect of paralysing the railway revenue.

The Traffic Manager may be directed to answer in detail Mr. Haynes's paper, and I shall be pleased if he will see the Traffic Auditor, and let me know what the railway revenue would be for goods traffic, based upon the tariff which he proposes should be adopted in lieu of that in operation; it will not be possible, as the statistics have not in recent years been kept, to give the present quantities under each line and the loss that would accrue on each article; but this can be approximated to by taking the quantities returned when the statistics were kept, and adding a percentage increase for existing traffic.

As Mr. Haynes will no doubt follow up his paper by some Parliamentary action, it is desirable that the information I have asked for should be got out as early as possible.

In the penultimate paragraph of his paper, Mr. Haynes says triumphantly, "Thus have I concluded my work."

I can promise the honorable Member that so far from this being the case, he will find, if he persists, that he has not yet even commenced his work. It will be my duty to resist the establishment or adoption of his crudities, and to expose his fallacies; but I shall do so with the conviction that only in the interests of the country will any sharp criticisms be defensible, for I am prepared to acknowledge that Mr. Haynes is animated by a belief (often held by others, and as frequently demolished), that the method he advocates is a true one, and ought to be established.

CH.A.G., 18/10/87.

No. 3.

Minute by Mr. Traffic-Manager Read.

A GREAT deal of the subject upon which Mr. Haynes has written at such enormous length was so fully dealt with some months ago in minutes written in answer to motions which were then on the Parliamentary business paper in the names of Mr. Teece, on the differential rate question, and of Mr. O'Sullivan, as regards live stock and agricultural produce rates that, generally, there does not, at the first glance, appear to be much more to be said. I attach copies of the minutes.

The reasons for the existence of the low rates between Sydney and the competitive districts in the southern and south-western parts of the Colony are so well known, and were so exhaustively dealt with in the reply to Mr. Teece's motion, that, as far as that part of the subject is concerned, at all events, it will not be necessary to go over the ground again, particularly as Mr. Haynes will be found to have stated those reasons in the 7th paragraph of his letter.

In the fourth paragraph of his letter, Mr. Haynes states that "the profound blunder of our railway goods system is that it is shaped to meet a wholesale rather than a retail trade"; but if I am able to judge, I should say that it is framed to meet both—the retail even more, much more, than the wholesale.

In paragraph No. 5 it is stated that it has been proposed to abolish the differential (of course Mr. Haynes means *competitive*, for we have no *differential*) rate system. Except the motion of Mr. Teece's to which I have alluded, and which was never brought before the House, I am not aware of such a proposal ever having been made. Certainly it has never come from any of the railway officers, who are but too well aware that so long as the Victorian railway authorities, who initiated the competitive rates, adhere to them, we must in self-defence adhere to ours, or make up our minds to sacrifice the traffic to and from the competitive districts altogether, in which case it would, as a matter of course, be necessary to charge higher rates upon the traffic in the non-competitive districts to compensate for the revenue so sacrificed. And here let me say, in answer to the numerous examples quoted by Mr. Haynes of exceptionally low rates from Sydney to Hay—they are the same to Wagga Wagga, 309 miles—as compared with the higher rates from Maitland to Tenterfield—which, by the way, is 361, not 334 miles as stated—that for the traffic of the Hay district we have to compete with very low water-carriage as well as greatly reduced rates on the Victorian railways, while for the Tenterfield traffic, any more than that of all stations north of Wagga Wagga or east of Narrandera or Bourke, there is no such competition.

But let Mr. Haynes take any 361 miles, or any other distance, on the Southern and Western lines *outside of the competitive districts*, and he will find that they are *precisely the same as on the Northern line*.

If that gentleman would, as he says in paragraph 6, make the low rates of the competitive districts general all over the lines—that is, take the existing rate for the longest distance, and reduce it proportionately for shorter distances, which appears to be the only way he sees out of the difficulty—I have no hesitation in telling him that he would diminish the revenue by something like £150,000 to £200,000, and, *rather than do that, I am satisfied it would be in the interests of the Department to abandon the competitive rates altogether and make Victoria a present of the traffic*. It would take much time and labour to work out the sum with accuracy, and the Traffic Auditor tells me his hands are already full of returns which have been asked for, but Mr. Haynes's proposal is so inadmissible that perhaps the estimate I have named will suffice for the present purpose.

The

The idea that the competitive rates extended all over the country might be calculated to lead to a vastly increased traffic is purely imaginary. Low rates are advisable when they are likely to foster a production which would otherwise languish; but it is useless to say that reduced rates would add vastly to the conveyance of general goods, and it is only upon such goods that competitive rates exist. *All our other rates are very low for the express purpose of fostering production.*

Paragraph 7 contains a fair statement of the reason for initiating the competitive rates; but as Mr. Haynes seems to make a point of their having been introduced to enable Sydney to compete for the trade of our southern border with Victoria, it may be as well to mention that in the latter colony they only apply from Melbourne upon general goods, and even from there, *only when the traffic comes into New South Wales.*

Mr. Haynes's reference to the rate for corrugated iron in paragraph 8 is quite correct; but he is evidently not aware that it has been decided to carry lots of 5 tons or upwards of any kind of machinery in a truck at *first-class rates*, according to which *three* tons conveyed a distance of 200 miles would be charged as 5 tons at first instead of actual weight at third-class rate, the former being the lesser charge to a small extent; so that if 6 tons (the quantity named by Mr. Haynes) were put in a truck and sent from Maitland to Tenterfield, the charge would not be £46 10s. 6d. for 334 miles, but £28 9s. for 361 miles. The amended rate was approved of since the present rate-book was issued; but it is inserted in the proof now in the hands of the Government Printer.

I cannot make out what deduction Mr. Haynes means to be drawn from paragraph No. 9, in which he implies that, as regards trainage, the trader at Orange is in a less enviable position in connection with the conveyance of his goods from Sydney than the sender in Sydney is in sending the same class and weight of goods 311 miles further (Bourke). Mr. Haynes must know that, as the sender in Sydney does not pay carriage, it is immaterial to him whether it amounts to 20s. or £20 per ton, so why he should think that the competitive rates play particularly into the hands of the Sydney merchant is somewhat of a mystery, since the goods all go from Sydney in the first instance, whether to Orange, Bourke, or Hay.

In paragraph No. 10 Mr. Haynes shows how a storekeeper at Cootamundra can save money by consigning his goods from Sydney to Wagga Wagga at the £20 truck rate, and having them re-consigned from there to Cootamundra. That has been known to us for a very long time, but we have also known that it has only been done to a small extent, and experience tells us that it is to our advantage to adhere to the present practice rather than to carry the goods direct to Cootamundra *at Wagga Wagga rates, plus the additional charge from Wagga Wagga to Cootamundra.*

And in paragraph No. 11 it is contended that the truck rate is the embodiment of the wholesale rather than the retail principle, and that, consequently, it is dead in favour of the metropolitan man, whereas it is well enough known, and a moment's reflection would have convinced him, that it was introduced purely upon economic grounds; moreover, in the very same paragraph, Mr. Haynes admits that it is not the metropolitan man at all but the country constituent who reaps the benefit, since he who does not get a truck load on his own account can get them sent through forwarding agents at a proportion of the truck rate, plus a small commission for the cost of collection and forwarding, &c. It would not pay the Department to run a truck from Sydney to Hay with 2 tons of goods for £6 13s. 4d., but it does pay when that truck, by carrying 6 tons, earns £20—although, of course, it would be very acceptable if we could get more. Mr. Haynes goes on to say that the wholesale Sydney merchant can send his 6 tons, made up of any class of merchandise, at the reduced rate of £20, and that such merchant, usually deals in large consignments which are as often over as under 6 tons. In this assertion Mr. Haynes is very greatly mistaken, but even if it were correct it does not seem to have occurred to him that *the consignments of the Sydney merchants are entirely dependent upon the orders they get from their country constituents*, who alone reap the benefit of the truck rates, while the Sydney merchants only reap the advantage of the orders for the goods which would otherwise go to Victoria, where every inducement is offered by the railway authorities to attract them.

The fact, already alluded to, that small consignments are collected by forwarding agents until a truck load is made up, and that those agents only charge a commission for their trouble, shows that the small storekeeper and farmer have their interests as well looked after as others doing a large business.

In the following paragraph, No. 12, Mr. Haynes mixes up coal, dairy produce, agricultural machinery, wool, and wheat, and seems to be astonished that we should carry coal so much cheaper than the other articles named, or why we should insist upon its being carried in wholesale quantities, *i.e.*, truck loads. As regards the coal, he has made a slight mistake in stating that we carry 6 tons of coal a distance of 96 miles for 46s.; the correct amount is 48s., and that is about 150 per cent. of its value. As we cannot put dairy produce or any other goods in a truck beside coal, it is not difficult to understand why we specify that it will only be carried at such a low rate when it is in truck loads, or that, when consigned in smaller quantities, a higher rate is charged.

Dairy produce, in lots of *one* ton and upwards, is charged 33s. per ton for the same distance, so that the trainage of 6 tons would only be £9 18s., not £12 4s. 6d., as stated by Mr. Haynes, and £9 18s. is only about 20 per cent. of its value, assuming that value to be £50 per ton, which, I think, is rather under than over the mark. For £12 4s. 6d.—the amount named by Mr. Haynes—the 6 tons can be forwarded in consignments of 1½ cwt. at a time, and it surely cannot be held to be unreasonable that we should charge more for 100 consignments distributed over a number of days and, consequently, a number of trucks, than for one consignment.

Ploughs, harrows, &c., would only cost £9 18s. if loaded in one truck, not £16 19s. 6d. as stated.

The assertion that the farmer has the wholesale principle offered to him, which he seldom uses, and that consequent upon his being oftenest a small dealer, his grain costs him for the 6 tons £34 1s. 6d. for 454 miles, is not in accordance with fact. The great bulk of agricultural produce is carried in truck loads, and the farmer gets it carried in that way a distance of 454 miles for £7 4s. 10d. for the 6 tons, while, even if he sends it in lots of 1 ton, he gets the 6 tons conveyed for £8 17s., and twelve consignments as low as 10 cwt. each would only cost him £17 14s.

It is not very long since a gentleman largely interested in the trade stated that we ought to carry live stock 100 per cent. cheaper than we do, and now we are told that the same thing might be done in respect of agricultural produce. It would be preposterous to suppose that these gentlemen are not aware that their proposals literally mean carrying the traffic *for nothing*; but so it is, and it would be interesting to know from what other source the revenue so sacrificed is to come, or why the general public should be taxed for the special benefit of the farmer or the grazier.

Mr.

Mr. Haynes admits in paragraph No. 13 that as regards hay, straw, and chaff, the farmer has got a consideration. That is, to say the least, a mild way of putting the case; for I can assure that gentleman that, owing to the weight of such traffic, which can be, and is, put upon trucks—weights which, a few years ago, were considered by farmers and others to be impossible—it is actually conveyed at considerably less than coal rates.

It is true that £2 19s. is the rate for a ton of greasy wool from Hay to Sydney, while the same weight of chaff or straw would be £4 5s., not £5 13s. 6d. as stated; but it is perfectly well known that no hay, straw, or chaff comes from Hay, or even from the district; and, even if it did, it is in the very highest degree improbable that it would come in small consignments when the truck could be loaded up to 6 tons for the same money. On the other hand, wool is the staple product of the district; and, so great are the inducements offered by low water-carriage, coupled with exceptionally low rates on the Victorian railways, that we have great difficulty in getting £2 19s. per ton for it. Still a full truck of wool would earn £17 14s., as against for a full truck load of straw or chaff. Indeed, as I have already pointed out on other papers, the inducements thus offered have attracted an unusually large quantity of Riverina wool to Melbourne this season. Mr. Haynes is mistaken again in stating that the rate for a ton of hay or chaff from Mudgee to Sydney is £3 0s. 7d., for it is only £2 12s. 9d. for hay, and £2 6s. 8d. for chaff, and in each case the farmer can put 6 tons of the same kinds of traffic on the truck for the same money.

The assertion that millers and storekeepers at Tamworth and Armidale get large lines of imported flour from Newcastle does not say much for New England farming if it be true, considering that it has to bear the cost of transit and insurance to Newcastle, whilst the lowest charge from thence to Tamworth is 13s. 9d. and to Armidale 17s. 3d. per ton.

In the 14th paragraph of his letter, Mr. Haynes says:—"We have no right to consider this or that trunk line separated from any other. . . . As portions of the general community, the Glen Innes and Maitland people have to bear the cost and the loss, if there be any, of the Southern and Western lines; and concessions granted to one portion of the public cannot be refused to another." At the first glance this seems a reasonable contention, but suppose, as I have already said, it were preferable to abandon the competitive rates altogether the certain effect would be to drive the competitive traffic to Victoria, and to compensate for the traffic so sacrificed we would have to charge increased rates in the non-competitive districts. Mr. Haynes could not call that good policy.

And he has made a slight mistake in the 15th paragraph as regards the conveyance of certain specified kinds of traffic from Maitland to Tenterfield; the half ton of flour and half ton of salt should be added together and charged as 1 ton at B rate, which would reduce the charge upon these two articles by £2 4s. 4d. It is quite true that a 6-ton consignment, such as that specified by Mr. Haynes, would be conveyed to Hay for £20 if it could be got into a truck, which I have no hesitation in saying it could not, but it would not be carried in any other direction the same distance for less than the charge from Maitland to Tenterfield. The distance on which Mr. Haynes has calculated is 330 miles. The correct distance from Newcastle to Tenterfield is 361 miles. Such a mixed consignment as Mr. Haynes mentions could not be got into one truck.

But this rather extraordinary paragraph goes on to say, "Or a coal-shipper at Newcastle, who brings flour from Melbourne almost as ballast, could send from Newcastle, 354 miles, his 6 tons of flour for £6 4s., as against the Maitland man's £41 17s. 4d." What analogy there is between a consignment of 6 tons of mixed goods from Maitland and a consignment of 6 tons of flour from Newcastle it is difficult to see, since, as regards the flour, there is no competitive rate—the charge being exactly the same on all parts of our lines.

And precisely the same argument applies to the 16th and 17th paragraphs of the letter. It is only necessary to mention that the 24 tons of goods specified in the 16th paragraph would only be charged £125 18s. from Maitland to a distance of 330 miles, not £164 4s. 4d. as stated. But the idea Mr. Haynes seems to have that we should charge as high a rate for flour as for furniture is little less than ridiculous.

In the following paragraph—the 18th—Mr. Haynes draws attention to an imaginary anomaly in the rates for limestone and lime. "The Department," he says, "will carry 6 tons of limestone 190 miles for £3 16s. 1d., but for turning the limestone into lime on the spot the company (a Mudgee company) have to pay for 3 tons, 190 miles, £9; or the limestone, 6 tons of it, may be carried 500 miles for £6 18s. 8d., while 3 tons of lime would cost just £18 18s.—a tax on the Mudgee industry of just a few hundred per cent.," and then he deprecates the fact that the minimum charge for lime is as for 4 tons at A, or actual weight at first-class rate. Now, in this, as in other instances, that gentleman has shown a want of knowledge of our rates, which I should not have expected from anyone who has undertaken to criticise them so exhaustively. The charges for 6 tons of limestone are, it is true, £3 16s. 1d. for 190 miles, and £6 18s. 8d. for 500 miles; but the charges for the lime (6 tons of it, if the company likes to put that quantity into the truck) are not £9 and £18 18s. as stated, but £4 4s. 6d. and £7 14s. respectively.

And the grievance pointed out in paragraph No. 19 is really purely imaginary. It is difficult to know why it should be regarded "as for the benefit mainly of the Sydney manufacturer, or the produce auction-mart people, or exporters," that the Mudgee tanner should be able to send his leather to Sydney for 2d. per ton per mile less than the same material can be sent from Sydney to Mudgee. One would have thought that the advantage was rather in favour of the Mudgee tanner, who is enabled to get his leather conveyed to what must undoubtedly be his best market, at a low rate of trainage. To the Department it is beneficial in every way to encourage inland manufactures, for in addition to getting the products to carry, we get the general supplies, and it is from the latter we derive our principal source of revenue.

It is simply a waste of time to talk about 6 tons of leather being sent into the competitive districts, for such a consignment never has been, nor is ever likely to be sent.

Mr. Haynes is again wrong when he states in paragraph No. 20 that the trainage of 6 tons of soap from Dubbo to Bourke, in half-ton lots, would amount to £27 2s. The correct amount is £25 5s., and if he sent it in lots of 1 ton it would only cost £20 6s. As many as 120 consignments of 1 cwt. each would not cost so much as £27 2s.

And in paragraph 21 Mr. Haynes is very much astray in his figures, although in this case the mistake is quite pardonable, as the new rates have been adopted since the existing rate-book was issued.

In

in 1885; still, as Mr. Haynes admits having visited the Lithgow Pottery Works, and conversed with the foreman (who appears to be a protectionist as far as his own business is concerned, at all events), a simple inquiry would have put him right on the rates question as well as upon others, and he would not have hazarded the assertion that the Company are punished for ignoring Sydney if they do business westwards. 6 tons of their pottery, carried a distance of 408 miles, would not be charged £31 5s. 6d., but £15 13s. It is admitted that if forwarded in half-ton lots the charges for the same distance are £31 5s. 6d. (not £38 19s., as stated); but it is useless to say that the Sydney importer can send his half-ton lots through a carrier's agency for £20 for a distance of 454 miles, because in the one case we know that the truck does earn the £20, while in the other, as there is really no loading at Eskbank beyond the half-ton of pottery for the same place, the truck would only earn £2 12s. 2d. for 408 miles.

Nearly the whole of the remainder of Mr. Haynes' letter might have been left unwritten if he had left the competitive rates alone instead of comparing them with the non-competitive rates, between which, as the terms imply, there cannot possibly be any analogy.

His reference in paragraph 23 to the Armidale tanner paying more for the conveyance of his leather to Maitland is, as I notice the Commissioner has observed, due to the fact that Newcastle is a place of export; besides, the lower rate to Newcastle only applies when the leather is forwarded in consignments of 1 ton and upwards—smaller consignments are charged the very same rate per ton per mile to both places. Still, instead of making the reduced rates apply to Sydney and Newcastle only, I think they might be made to apply to all leather carried on the up-journey.

What does it matter whether for auction sale or for export. The probability is that lots of leather submitted to auction at Maitland would ultimately find their way to Newcastle for export.

The comparison between the rates for flour and biscuits is equally uncommercial (*vide* paragraph 24). Admitted that a 6-ton consignment of flour is carried 350 miles for £6 4s., what has that to do with the fact that 6 tons of biscuits would cost £48 4s. for the same distance?

To begin with, there is admittedly a great difference in their respective values, and while it is more the rule than the exception to carry 6-ton consignments of flour, where can Mr. Haynes or any one else point to a 6-ton consignment of biscuits? To get the advantage of the £6 4s. rate for the flour it must be sent in one consignment—for £48 4s. the biscuits may be sent in nearly 250 different consignments.

Flour, about £10 per ton; biscuits, about £50 per ton.

The statement that we give the outside man an advantage over our own of about 800 per cent. is utterly at variance with facts—in each case the "outside man" pays precisely the same as our own.

In paragraph No. 26 an extraordinary comparison is made between the rates for flour, iron, and machinery, the rate for which latter is £18 9s. 6d. for 196 miles, and not £31 18s., as stated. But suppose we went so far as to reduce the rate for machinery to the same as that for flour, would it help the engineers at Newcastle in any way, or would it not mean a sacrifice of revenue which would result in putting probably a good deal more money into the pockets of the Victorian implement maker than into those of our own. It is an undoubted fact, whether Mr. Haynes knows it or not, that the bulk of the machinery used in the Colony comes from Victoria.

It is unnecessary to follow Mr. Haynes in the examples cited in the 27th, 28th, and 29th paragraphs, since the circumstances in each case are so different, and seeing that these circumstances have already been fully dealt with. If he will take the same conditions and distances outside the competitive districts all the anomalies which he has made so much of will disappear. In the 30th paragraph we find Mr. Haynes stating that half-ton orders of galvanized iron are the rule, and that if a Maitland merchant sends 6 tons in that way to Tenterfield, 361 miles, the trainage is £32 2s., while "a Victorian squatting firm down by Jerilderie or Hay can get his 6 tons for £20 on a run of 454 miles" (Hay). Now, if we take the same conditions in each case it will be found that twelve half-ton consignments from Sydney would be charged £33, while if the whole 6 tons are sent in one consignment the trainage is only £18, not £20, as stated; and if the squatter could not get the iron from Sydney for that money he would get it from Melbourne. Equally misleading is the example quoted in paragraph No. 31. It is a most extraordinary circumstance that Mr. Haynes should conceive the idea of a farmer near Armidale or Glen Innes sending his 6 tons of potatoes to Maitland in lots of 5 or 6 cwt. at a time, as he must do to cause the trainage to amount to £21 13s., and in the same breath bewail the possibility of the wholesale flour importer at Newcastle being able to send (in one consignment) 6 tons "the same distance" for £5 3s. 9d., and that, too, into a farming and comparatively thinly populated country. Put the 6 tons in one consignment in each case and the trainage is exactly the same.

From flour and potatoes we come, in the 32nd paragraph, to meat, and here we are challenged with carrying preserved meat from the country districts to the ports of shipment at Sydney and Newcastle at lower rates than to the country districts further northward, southward, and westward.

If Mr. Haynes cannot see a good reason for the concession to Sydney and Newcastle as outlets for country-killed and preserved meat, I am afraid it will be useless to point it out to him. I question whether any is sent from the country stations to places other than Sydney and Newcastle, and if there is it must be in very small quantities.

Fresh meat is charged the same rates everywhere throughout the lines.

In paragraph 33 we are told the hay, straw, and chaff rates look very liberal for the farmer, but that they are not framed to facilitate the small man or the inland trade, and then it is asserted that 2 tons of chaff from Mudgee to Sydney cost £6 1s. 2d., and that consequently three such consignments (or 6 tons in all) costs £18 3s. 6d. Mr. Haynes is very imperfectly conversant with the rate-book, otherwise he would not make such glaring mistakes. *As a matter of fact, 2 tons would only cost £2 6s. 8d., and if the chaff is well pressed and 6 tons put upon the truck it would not cost more.*

It is almost unnecessary to say that the assertions about the rates for 500 miles being £12 6s. 6d. for 2, and £36 19s. 6d. for 6 tons, are equally wrong. In each case they are really only £4 11s. 7d., and the rates are the same on all lines.

Paragraph 35 gives a very peculiar mixture. Here Mr. Haynes states that the Glen Innes farmer sending 6 tons of dairy produce, 3 tons of agricultural machinery, and 3 tons of furniture to Newcastle would have to pay £71 14s. 6d., which is quite correct; although why a farmer should send agricultural machinery and furniture to Newcastle (these can hardly be called the products of his farm), instead of flour, chaff, and potatoes, which he grows in the district, but is supposed by Mr. Haynes to get from Newcastle, it is difficult to know.

But many Northern people have been led by Mr. Haynes's mode of exposition to suppose (not having looked into the subject themselves) that as a general thing the rates on these lines are higher than on the Southern and Western, even where there is no competition, and they consequently feel aggrieved that their lines have to make up for losses on the other lines. Mr. Haynes has not told them that all within the 305 and 340 distances respectively on the other lines have also to make up for loss on differential rates—supposing there is any.

The way in which unlike cases have been paired, and in which he has compared conditions that do not exist, and never will, with natural conditions, is amazing, completely nullifying all the intended effect of his arguments.

If such irregular reasoning and arbitrary comparisons are allowable, it is competent for any person to bring euclid or the science of astronomy into ridicule.

In paragraph 40 an approach to reason is made in the admission that goods should be classified according to risk, bulk, amount of handling, fragile character (though he says nothing about values, which all over the world are an unavoidable factor in freights), but throughout the whole of his article Mr. Haynes ignores the principle. For instance, in No. 12 he speaks of the injustice of carrying Newcastle coal, run over a portion of the Coal Companies own lines, in their own waggons, millions of tons annually, at a less rate than dairy produce, carried in small quantities at a time, and in Government waggons, wholly on Government lines.

It is further stated that the use of the cranes is given free. I am afraid this imperfect knowledge pervades the whole of Mr. Haynes's article.

1. It is stated roundly that in many cases the extension of railways has affected inland farmers injuriously, "because they are almost wholly shut out from the coast markets, while on the other hand, the inland markets are reached by the cheaply-borne produce from the other Colonies." A farmer reading this would be indignant to learn that the produce from other Colonies is carried cheaper than his own. The farmer, however, is misinformed, because the implied difference in rate against him is not a fact. Paragraphs 1 and 2 are founded on this assumption, and are therefore baseless.

4. While it is accordant with "commercial principles" everywhere to charge higher, *pro rata*, for small quantities than for large ones, Mr. Haynes says it is a "profound blunder" for the New South Wales Railway Department to carry out this principle. He has admitted that cost of handling, &c., should have a part in classifying, but, although small quantities cost more, *pro rata*, than large ones for handling, and do not admit of economical loads as a rule, we must still charge the same rate as a large lot, fulfilling all conditions of economy for the Department.

8. Here Mr. Haynes gives an impossible case—one that never occurs—in speaking of 6-ton lots of fourth-class goods. Any reasoning founded on 6-ton lots of fourth-class goods is invalid, because unreal.

13. "Millers and storekeepers, say at Tamworth or Armidale, * * * get up cheaply by rail large quantities on the wholesale principle of imported flour; then when the farmer comes into the town to sell his wheat the large cheaply-carried stocks of flour are pointed out to him, and he is forced to accept any price." Tamworth is a great wheat-growing district. The farmers do not grow wheat retail. The millers, as everywhere else, sell flour wholesale as well as retail. Though it is implied that it is dearer to send a given quantity of Tamworth flour to Newcastle than to send the same quantity of Adelaide flour the other way, it is not a fact. There is here a distinct, though unintentional, impeachment of the business capacity about Tamworth. With the same chances, the Victorian or Adelaide flour is nevertheless, run in upon him, although it has to pay two railway freights and the sea-freight—at least Mr. Haynes says it is. If it be true, it is a state of affairs for which the railway tariff is not answerable.

15. Victorian flour is again compared with (among other things) furniture, although, as the articles differ so widely, there is no common ground for comparison. The admission that there should be classification is forgotten.

16. Victorian flour, irrigation pipes, and agricultural machinery compared as regards freight needs no comment.

17. Speaking of the country farmer, Mr. Haynes repeats an inaccuracy, to which I have before alluded. He says "his local market is flooded with produce carried for next to nothing." If the inward produce is carried for next to nothing, so is the country farmer's. While the inequality of differential rates is loudly complained of, so are the rates that act equally everywhere. It is hard to say whether Mr. Haynes has most objection against equal rates or against the competitive. If neither is right, what system is? A higher rate on Victorian flour, I take it.

23. Leather to Sydney or Newcastle 1st class, to other stations 2nd class. Mr. Haynes does not appear to comprehend the reason for the lower rate to the ports. It is, of course, to allow easier access to the great markets, and consequently admits of tanneries being established in the country. If the rate were higher, access to market would be retarded, and the tanneries would have to be established on the coast. Mr. Haynes favours decentralization; this rate, in the way indicated, has that tendency. The Armidale tannery (Messrs. B. A. Moses & Co.) has shipped a considerable quantity of leather from Newcastle direct to London. To give a cheap rate the other way would allow the Sydney tanner a better opportunity of competing in Armidale with the local establishment. This rate is not in favour of the Sydney merchant, as it is implied that the rates in general are.

24. A complaint that Victorian flour is carried cheaper than the Newcastle biscuits. There is no need to defend it. Gives the rate at which Newcastle biscuits are sent a given distance on the north, and imported biscuits on the south and west—like is seldom compared with like. Newcastle biscuits can be sent at same rates on all lines as other biscuits. Arnott's biscuits, as a matter of fact, are sent to the competitive districts on south and west, and get the benefit of the rates.

25. A Tamworth musical warehouse gets 6 tons musical instruments for £35.18s. 6d., and this is compared with the competitive district's rate.

26. Complains that the "Victorian foreigner" can send his fodder more cheaply than the Newcastle foundries can send irrigation pipes and machinery to the country. This is a curious kind of attack on rates.

31. Speaks of produce rotting at Guyra and Ben Lomond that can never reach a market. If a Ben Lomond farmer sends 6 tons potatoes in lots to suit purchasers "it will cost £21 13s. for 281 miles." This is a misstatement, unless the farmer sent 120 lots of 1 cwt. each to different persons at different times;

times; he would then pay £24. If he sent a truck load of 6 tons he would pay £5 8s. 6d. for the load. The unfairness of Mr. Haynes' statement lies in the fact that it is stated it will cost the Ben Lomond man £21 13s. for the same tonnage that the Newcastle importer pays £5 8s. 9d. (should be £5 8s. 6d.) for.

32. The "centralising system" of charging A rates for preserved meats to ports—the only outlet to a suitable market that these meats have—is alluded to. Mr. Haynes quite misses the point, and complains of the high rates on preserved meats to the country, where they never go, and would not go if they were carried for nothing. He does not perceive that cheap rate from the meat preserving establishments to their natural markets through the ports aids decentralization by permitting such establishments to be set up in the country. If there was not this special rate either the factories could not start or they would have to be located on the coast.

It is not worth while pursuing the investigation of this report any further. I have dealt with Mr. Haynes' illustrations and facts, which are typical of the whole. Though all varied, and the changes rung with some skill, they all apply to the one thing.

The remedy Mr. Haynes proposes is extremely crude, and would deprive the railways of the greater part of their revenue. He fails to know that rates must be made to suit particular circumstances, and that his hard and fast recommendations would not work.

Railways are about to be established in China. If that nation's producing powers be developed in anything like the ratio that railways have developed those in England, America, and other countries, China's production will, before many years, become a menace to the industries of all nations on the globe.

If, however, the Chinese could be persuaded to adopt Mr. Haynes' system the railways would before long become extinct, and the danger to other nations from China's competition be averted.

J. HIGGS,
9/11/87.

No. 5.

Minute by The Commissioner for Railways.

On the proposal for equal Mileage Rates.

NOTICE of Motion by Mr. William Teece,—That, in the opinion of this House, the differential rates charged for the carriage of goods and merchandise on the Railway Lines of New South Wales should be abolished.

THE term "differential" used in connection with our rates will probably convey an incorrect impression; it will to many persons imply the existence of a practice of charging different rates to different persons for the carriage of the same class of goods conveyed under similar conditions, whereas on our lines all persons are charged alike where the conditions are similar. The meaning of the term "differential."

I assume that Mr. Teece's motion refers to the *competitive* rates which exist in respect of the carriage of general merchandise from Sydney to the southern and south-western districts of the Colony—rates that were forced upon the Department in this Colony by the aggressive policy of the Victorian Railway Department, which, while charging full mileage rates upon all traffic in Victorian territory, has granted, for many years past, exceedingly low rates for the conveyance of traffic going from or coming to this Colony. Scope of Mr. Teece's motion.

Long before our railways had penetrated to any great extent southwards, Victoria had completed her Railways to the border, and so secured, with but little effort, a hold upon the trade of the more southern and the whole of the south-western districts of New South Wales. Measures taken to secure Riverina trade.

But about seven or eight years ago, when our railways were being rapidly extended southwards, the Sydney market was made as readily accessible, at our ordinary mileage rates, as the Melbourne market had been; the Victorian Railway Department began to foresee that if that Colony were to retain the trade which it had become accustomed to regard as its own, special inducements would have to be offered, and that was done in the shape of a considerable reduction of railway rates.

A competitive policy followed—our Railway authorities felt it to be their duty to secure as far as they possibly could, the traffic of the districts through which our lines passed, and as the reduced rates on the Victorian lines were turning the stream of traffic towards Melbourne, while its natural channel was towards Sydney, the only course available was to reduce the rates on our lines between the metropolis and those districts of the Colony affected by the concessions given on the Victorian lines, and to raise the carriage-rates on goods between Albury and Wagga.

The success of this arrangement became so apparent, that after a time (in 1882) the Victorian Railway Department, in order to regain the trade, which it had to a large extent lost, offered to convey it over their lines at even lower rates still, and these rates have been in existence ever since.

For a brief, but only a very brief, time, this concession had the effect desired; it was met, however by our Railway authorities introducing a truck-rate, which, while it offered a lower average rate per ton than formerly, had also the effect of securing full loads for the waggons, and so yielded about as much revenue per waggon as had been realized previously, thereby securing the traffic without loss.

Since the time in question, with the exception of a little modification, in regard to the rate for the carriage of wool, no further effort has been made by Victoria to regain the trade; indeed, it is difficult to imagine what further concession they could give, unless they carried the traffic for nothing.

To show, however, the extent of the endeavour made by the Victorian Railway Department to obtain the trade of this Colony, two illustrations are given (one as regards general goods from Melbourne, and the other as regards wool to Melbourne).

First illustration.—Fourth class traffic (comprising furniture, liquors, glassware, and numerous other articles), conveyed from Melbourne to Wodonga (187 miles) for use in Victoria is charged at the rate of 106s. per ton; if the same traffic crosses the border to Albury (190 miles) the charge is reduced to 63s. 6d., and if it is consigned to any part of this Colony north of Gerojery (20 miles from the border) the rate as far as Albury is only 32s. 6d. per ton.

It will be at once apparent that if, as Mr. Teece's resolution proposes, our competitive rates are abandoned, whilst those of Victoria are retained, that Colony will be enabled to regain not only all she has lost but the whole of the trade of this Colony for a distance of 50 to 60 miles further north—as far indeed as *Cootamundra*, which is 253 miles from Sydney, and 323 from Melbourne—as the respective rates for general traffic would then be 126s. per ton from Sydney, and 108s. from Melbourne. The whole of the Riverina traffic as well as that of the Tumut district would be lost to us. Effect of Mr. Teece's proposal.

Second

Second illustration.—The Victorian rate for wool grown in its own territory, is 7s. 6d. per bale, not exceeding 4 cwt., from Wodonga to Melbourne, but if grown in any part of New South Wales, bounded by the Murrumbidgee on the south, and longitude 144° west, the charges are only 3s. per bale, not exceeding 300 lb., and 3s. 6d. per bale exceeding 300 lb.

It is therefore very certain that the abandonment of our competitive rates, even if it does not prejudicially affect the traffic as far north as Cootamundra, which I have shown to be not only a possible but a probable result, will have the effect of depriving Sydney of the whole of the trade from June southwards and from the south-western district.

The policy we have adopted to secure this trade has had the effect of causing not only an enormous increase of business to the old-established mercantile firms and others of Sydney, but has also resulted in bringing over a number of the largest Melbourne firms to retain the connection which no other course would accomplish. Amongst the firms referred to may be named Goldsbrough & Co. (Limited), Bright Bros. & Co., Cunningham & Co. (Limited), &c., &c.

Although this has been the result, and that the public in the districts referred to have obtained the benefit of very low rates of carriage, it is, nevertheless, to be regretted that such keen competition as I have described should ever have existed. The position, however, was forced upon, not initiated by, the railway authorities of this Colony. And to abandon what we have secured would be uncommercial and suicidal. It may be, however, that Mr. Teece's motion is not intended to affect this competitive traffic, but is confined to asking Parliament to resolve that the rates throughout the lines shall be fixed upon uniform rates per ton per mile according to distance.

To anyone conversant with the principles which govern the conveyance of traffic, either by land or water, it must be apparent that there would be as little reason in such a system as there would be in charging the same rate for the carriage of coal as for silks.

Charges for carriage should, with other consideration, be proportioned to the cost of the service; it costs the Department more per mile for the carriage of goods 100 miles than it does for carrying them 200 miles, and the public who require the goods carried the longer distance should reap the benefit of this decreased cost by being charged a proportionately decreased price. Not only is such a system of charging fair in its incidence, but a contrary practice would most probably drive from Sydney the whole of the trade of the Colony from *Murrumburrah* southwards, because the conveyance of a ton of general merchandise between Sydney and Murrumburrah would cost £6 13s., while from Melbourne, *via* Wodonga, the charge would be £6 0s. 6d., notwithstanding the distance is 120 miles greater. Most certainly such a system would divert from Sydney all traffic from *Cootamundra* southwards since a ton of goods from Sydney to that station would cost £7 7s. 7d., while from Melbourne, a greater distance by 70 miles, the cost would be only £5 10s. 1d.

The introduction of uniform mileage-rates would, as regards the carriage of agricultural produce, have the contrary effect to that which the producers have been contending for, *viz.*, a *pro rata* reduction for distance. This has been granted to them, but they want it to a larger degree. The adoption of Mr. Teece's proposal would increase the rates as follows:—

For a distance of 100 miles, from 9s. 9d. to 10s. 5d. per ton.
" " 200 " 16s. 10d. to 20s. 10d. "
" " 300 " 21s. 10d. to 31s. 3d. "
" " 400 " 26s. 10d. to 41s. 8d. "

and so on. Uniform mileage-rates would be the means of closing all the agricultural country beyond 200 miles from its market, whereas by the adoption of the sliding scale of rates proportioned to distance, agricultural country within 500 miles of its market can be made available for the profitable cultivation of produce.

An exhaustive inquiry, which extended over several months towards the end of 1881, was made into the question of rates on our railway lines by a Board of three gentlemen, entirely unconnected not only with the Railway Department but with the Civil Service; and these gentlemen, in submitting their report to the Minister of the day (and here it may be stated that at that time the competitive rates were in existence), the Board stated that they had commenced the inquiry "fully impressed with the importance of the subject, and the influence the policy of the Railway Department, in regard to the rates charged for the conveyance of goods, has upon the progress and development of the Colony."

The Board examined seventy-seven (77) witnesses, "who were fairly representative of the various interests in the Colony," and obtained the written evidence of four gentlemen, who were unable to attend personally; and perhaps I cannot do better than quote from the report of the Board the conclusions they arrived at. They said—

"The rates relating to the pastoral interests have not drawn forth much criticism, the principal matters complained of being the difference between the mileage rates for the carriage of stock and wool for long distances in comparison with the rates for short distances. The charges are, however, defended on commercial grounds and on the score of exigency. We do not see that any alteration can judiciously be made so as to equalize the rates, and we believe the effect of such an alteration would be, in the first place, to divert to other Colonies a considerable portion of the traffic that now comes to our metropolis; and, secondly, to cause much of the cattle now sent by railway to be travelled by road.

"The principal complaints tendered on behalf of the commercial interests are made by the country storekeepers, who state that their trade is practically limited to their own particular district by the differential rates, to remedy which an equal and uniform mileage rate is proposed. We have considered the feasibility of the adoption of a uniform rate, but cannot recommend it. It is against the practice, we believe of any railway company in the world; it is against the common practice of carriers, who will convey goods for a long distance at a cheaper proportionate rate than they will for a short distance; and in this Colony the concession would simply benefit the storekeepers, who must obtain their goods from the terminal station; and the uniform rate, while an advantage to them, would be a disadvantage to the people in the interior, who require the greatest consideration.

"Taken as a whole, the opinions of the various witnesses we have examined are very diverse, and evidently based upon mere local experience derived from the business in which each is most interested—in many cases diametrically opposed to each other—and in no instance offering any comprehensive or practical suggestions for the revision on the rate-sheet, but admitting generally that the present rates are fair and equitable.

"Taking

Result of measure to secure trade.

Wider scope of Mr. Teece's motion.

Considerations which govern the fixing of rates.

Effect of uniform mileage-rates on agricultural produce.

Inquiry made by Rates Board in 1881.

Conclusions arrived at by Board.

"Taking the evidence tendered to the Board, together with the Commissioner's able and exhaustive comments and explanations thereon, we are constrained to accept his assurance that the officers of the Railway Department have studied the question of the freight of charges from every point of view, with the object of affording to all interests concerned fair and equitable rates, and to agree with him that it is not desirable that any hard and fast rule from which departure is inadmissible should be laid down, because changes must be made from time to time to meet the variable conditions of trade, as well as the traffic, and the effect upon the traffic, brought about by the rates charged."

While these conclusions have been arrived at by our own authorities after careful investigation, it may be as well to know what authorities in other parts of the world have to say on the subject.

Opinions of other authorities.

Mr. Farrar, Secretary to the Board of Trade in England, says, with reference to the rates question:—

"As to equal mileage rates, they would put an end to competition. The result would probably be 'levelling up' and not 'levelling down.' Parliament would never consent to take the lowest profit which a company now makes by its cheapest traffic as a standard, and fix maximum rates accordingly for all their traffic. The endeavour would be to fix a medium or average rate, and in the struggle over this, the companies must inevitably have the advantage of the public. But, supposing such a standard fixed, what would be the result? The traffic, which was now carried at a low rate, in competition with a sea route, would be driven from the railway to the competing route; while the railway, if it was to make as much aggregate profit as before, must charge a higher rate than is now charged on the traffic which remained to it. If, for instance, Parliament were to take from the South-Eastern Railway Company the power of charging on fruit and hops from Boulogne the low rate they now charged, the result would be that French fruit and hops would reach London by water, and that the Railway Company, to recoup themselves for the loss of the French traffic, would probably charge more on Kent fruit and hops. This charge the Kent fruit and hops would be able to bear, because the price would be raised in the London market. It was probable, therefore, that *most of the inequalities of charges complained of were to the advantage rather than the disadvantage of the public.*"

Applying to our circumstances the principle underlying these remarks, we should find as I have endeavoured to show, that the adoption of an uniform mileage rate for all distances would offer no advantage to the distant producer to send his produce to market; and that for those goods which must under any circumstances go into the interior for the requirements of the people there, water-carriage by rivers, wherever available, and the competing rates of the neighbouring colonies, would reduce our traffic to a minimum. To compensate for this it would be necessary to charge very much higher rates than are at the present time charged for the carriage of goods for short distances, or to places from whence the traffic could not be diverted by competitive routes.

Effect of loss of traffic on distant parts of line.

Writing on the same subject, in reply to a communication which I addressed to him, Mr. Swarbrick, the General Manager of the Great Eastern Railway in England, says:—

Mr. Swarbrick's opinion.

"You cannot, in my opinion, lay down any very hard and fast line for fixing rates. As a general rule, our home experience is that it is better to foster large quantities and longer distances by means of relatively lower rates, than to try by means of smaller quantities and shorter runs to secure a higher percentage of profit over a smaller area. We also, where there is an exceptionally large industry, or where necessary to foster any export or import trade, make special rates to meet the case, and thus our rate-books are full of anomalies and apparent contradictions to the benefit, as we think, both of ourselves and customers."

And as the result of an inquiry held in England some years ago, by a Select Committee appointed by the House of Commons, on the question, the Committee reported that:—

Conclusions arrived at by Committee of House of Commons

"There is no question as to the existence of these 'preferential' or 'exceptional' special rates, the latter epithet being the term used by representatives of the railway. The evidence given under this head comes almost entirely either from persons engaged in production, who are being charged proportionately higher rates than producers resident in other parts of the country, or from towns or places through which traffic passes, who, as engaged in the business of carrying or distribution, complain that it is diverted from them by the lower rates charged on other routes. But for the competition introduced by the low rates given by railway companies, trade would be much more local, and the trader who was nearest the market would probably make a large profit; but, on the other hand, this competition cannot but be advantageous to the public; that Greenock sugar refiners should be in the same market as the sugar refiners of London, while it may be a grievance to London refiners, must be an advantage to Greenock refiners, and cannot be a disadvantage to buyers of sugar. It may be worth while to follow this as a typical case:—Thirty-nine towns in England to which sugar is sent are at an average distance of 292 miles from Greenock, and the same towns are at an average distance from London of only 150 miles. The rates for these distances, from London and Greenock respectively, are about the same * * *. In other words, sugar from Greenock is for the same sum carried double the distance as sugar from London. This enables Greenock to compete at these thirty-nine towns, and this is what the refiners of London object to. The demand from London, therefore, is that either the rates for the longer distance should be raised, or those for the shorter distance reduced. The effect of compliance with this demand would be to close some of these markets against Greenock sugar, to deprive the northern lines of a considerable portion of their trade, handing it over to the southern lines, and to give a practical monopoly to the London refiners of sugar, who would be real gainers by the transaction. It does not appear to your Committee that such a result would be either just or reasonable.

"Although 'equal mileage' rates, that is to say, rates proportioned exactly to the number of miles run, have not been advocated on this occasion as before former Committees; still, ideas have been put forward so closely resembling such as would naturally support the mileage system, that it may be worth while to recall the words of the Committee of 1872:—

"(a) It would prevent railway companies from lowering their fares and rates so as to compete with traffic by sea, by canal, or by a shorter or otherwise cheaper railway, and would thus deprive the public of the benefit of competition, and the company of a legitimate source of profit.

"(b) It would prevent railway companies from making perfectly fair arrangements for carrying at a lower rate than usual, goods bought in large and constant quantities, or for carrying for long distances at a lower rate than for short distances.

"In

In short, to impose equal mileage on the companies would be to deprive the public of much of the competition which now exists, or has existed, to raise the charges on the public in many cases where the companies now find it to their interest to lower them, and to perpetuate monopolies in carriage, trade, and manufacture, in favour of those rates or places which are nearest or least expensive, where the varying charges of the companies now create competition. And it will be found that the supporters of equal mileage when pressed often really mean, not that the rates they pay themselves are too high, but that the rates that others pay are too low.

"Pressed by the difficulties, the proposers of equal mileage have admitted that there must be numerous exceptions, *e.g.*, where there is sea competition (*i.e.*, at about three-fifths of the Railway Stations of the United Kingdom), *where low rates for long distances will bring a profit*; or where the article now carried at low rates is a necessary, such as coal. It is scarcely necessary to observe that such exceptions as these, whilst inadequate to meet all the various cases, destroy the value of equal mileage as a principle, or the possibility of applying it as a general rule.

"Any fixed standard of rates would materially interfere with competition; supposing such a standard fixed, the result would be that the traffic which is now carried at a low rate in competition with a sea route would be driven from the Railway to the competing sea route, whilst the Railway, if it is to make, as much aggregate profit as before, must charge a higher rate than it now charges on the traffic which remains to it.

"It may therefore be assumed that some of the inequalities of charges complained of are to the advantage, rather than to the disadvantage of the public. A preference to be illegal, and to furnish a reasonable cause for complaint, must be unjust. It is not unjust so long as it is the result of fair competition, and so long as equal rates are given for like services under like circumstances, and for like quantities of merchandise."

It is gratifying to find that the principle upon which the railway rate-sheets of this Colony have been compiled are supported by such unimpeachable authorities as I have quoted; but as railway management is a progressive science, it may be as well to know what the authorities say to the latest date.

The following extracts are taken from a book written in the end of last year (it is in fact, dated December, 1886), by Mr. Grierson, the eminent General Manager of the Great Western Railway in England, on "Railway Rates, English and Foreign." He says:—

Page 21. While shrinking from advocating equal mileage rates, many persons take up an intermediate position. They object to rates being much out of proportion to distance; they do so, although the traffic may not be carried over the same parts or sections of a railway. The rates to which objection is taken are of several kinds—transit or through rates, special rates generally, special rates for long distances as distinguished from short distances or intermediate traffic.

Such differential rates exist in all countries in which railways have been developed; and it will be found that here as elsewhere they have been adopted not solely or even chiefly with a view to benefit railway companies, but mainly to meet the not unreasonable demands of traders and consumers.

23. Special lower rates enable the manufacturers of exported goods, such as manufactured cottons from Manchester, and hardware from Birmingham, to send them to London, and to avail themselves of lines of steamers sailing from several ports. But for such facilities exporters would be confined to one, and that the nearest port, and they would lose the benefit of the competition in facilities and sea freights.

The railway company which happened to own the route to the nearest port would possess a monopoly of the traffic, and might charge their full rates instead of the present reduced rates.

31. Many apparent anomalies arise from competition of the railways with the sea; others are the results of comparison of the rates charged by railway companies, which must carry, if they are to carry the traffic at all, at the same rates as a company having a shorter route. Inasmuch as competition between railway companies is carried on extensively, many such disparities exist.

Tin plates are carried from South Wales *via* Stockport for Liverpool at lower rates than to Manchester, because the Midland Railway Company has to compete with two shorter routes between these places. This (apparent) anomaly would be entirely removed by the Midland Company ceasing to compete for the Liverpool traffic; but the consumers of tin plates in Manchester would not in any respect be benefited by the change.

32. One more illustration: Steamboats ply between Liverpool and Bristol. Goods carried by railway between these two places by one or other of the three available routes must pass through some one of the following places—Birmingham, Worcester, Hereford, Shrewsbury, Chester, or Warrington.

The local rates to all these intermediate towns may appear disproportionate to those charged between the extreme points, but is there any real injustice done?

What injustice is done to those whose goods are carried to and from intermediate inland places by the fact that their rates are higher, or higher in proportion, than the competitive rates, provided the rates to intermediate places are in themselves fair and within the Company's legal maximum?

33. A third source of complaint of disproportionate rates arises from the competition between ports. Assume, for instance, port A to be 51 miles, port B 72 miles, and port C a greater distance from D, one of the great seats of manufacture and commerce.

The merchants and shipowners at C and B desire to compete with A, and they induce the Railway Company to carry from all three at the same rates.

The result is that the rates are lower for the throughout distance than to and from some of the intermediate places. The grounds of grievance would be removed by the Railway Company ceasing to carry from C and B at the same rates as from A.

34. The chief explanations of differential rates have been mentioned; another cause less important is in operation.

Of the various kinds of outlay on the part of a Railway Company, a large portion remains fixed, whether the distance run by a train is 10 miles or 100. Such, for example, are the cost of terminal accommodation, loading and unloading, clerical work, and, broadly speaking, such are the interest on construction cost, maintenance, &c. Another kind of expenditure increases directly with the mileage run; for example, the provision and wear and tear of locomotives, rolling-stock, and permanent way, and liability for loss of or damage to goods in transit.

Certain kinds of expenditure increase with the distance run, but not in the same ratio.

34, 35. Obviously, wages, cost of locomotive power, and cost of haulage generally, are not four times as much in the case of a train which has run a hundred miles as in one which has run twenty-five. With the progress of railways, with improved economy in the use of machinery, and in other ways, this tendency—recognized to some extent by the Legislature in the rates for short-distance traffic—in expenditure not to increase in the same ratio as mileage distance, becomes an important element. The result of all this is to make mileage less a criterion of cost, and tends to place large towns at a greater distance at an advantage as compared with intermediate towns, and to give rise to differential rates. It is also obvious that from many intermediate towns the quantities forwarded are not so large and regular as from terminal towns, and that from the former there is not a constant traffic to and fro.

Differential rates have arisen in no small degree out of the same causes as have necessitated a classification of goods. Goods of small intrinsic value will not be conveyed at all unless at low rates; only on special terms can such goods produced at a great distance be brought to market.

36. Sometimes it is urged as an objection to differential rates that by reason of them companies sustain, on long-distance traffic, a loss which is made up by charges on short-distance traffic; but though producing, no doubt, a lower percentage of profits than the latter, the former *yields some* profit, unless where undue competition exists. If a company be deprived of this long-distance traffic will it not be forced to raise rates on other traffic to maintain its revenue?

But,

Rates charges made in New South Wales upheld by authorities.

Mr. Grierson's opinions, latest published authority on subject of equal mileage rates.

But, it is also objected, differential rates deprive the inhabitants of certain towns of the natural advantages of their geographical position.

This argument would be more persuasive than it is if it were not generally expressed in the very language of protectionists—if it were not so often a claim of an exclusive right to supply certain markets, and a scarcely concealed dislike to the intrusion of competition.

Preserving the natural advantages of one town means preventing the removal of the natural disadvantages of others.

I could quote from other railway authorities to the same effect, but while it would lengthen it would not materially strengthen the case.

Summary showing effect of proposal.

To put the matter very briefly, the points to be considered are :—

- “1st. That the abolition of competitive rates would mean the diversion from Sydney to Melbourne of the trade of that part of the Colony from Junee southwards, and the whole of the trade of Riverina, which is now conveyed on the South-western line ; and
- “2nd. That the adoption of uniform rates per ton per mile will either involve the loss of an enormous amount of revenue on the short-journey traffic if the ‘levelling down’ process is adopted—that is to say, taking the longest-journey rates as a basis, and fixing all those for shorter distances in proportion, or otherwise divert to Melbourne the whole of the trade of the Colony from Cootamundra southwards.”

I may perhaps be pardoned for saying that, after the success that has attended the efforts of the Department to secure, against keen competition, the trade of our Colony, any action that may be taken to alienate it will be greatly to be deplored, not only in the interests of the Railway Department and its revenue, but of the Colony generally, the commerce of which will be, in a material degree, prejudicially affected.

Alternative Proposal by the Commissioner.

From inquiries I have made on the subject I am led to believe that the agitation for equal mileage rates derives its existence from the representations of country storekeepers that their trade under present system of charging is practically limited to their own particular districts.

Agitation for equal mileage rates promoted by country storekeepers.

They contend that they should be allowed to break journey with their goods, and be charged no more than the through rate, beyond a small terminal charge for unloading and loading at the intermediate stations. A trader at Goulburn, for instance, pays £3 16s. 5d. per ton for goods from Sydney for that place, but he wishes, subsequently, to send a portion of them to Cootamundra, and the charge from Goulburn to Cootamundra is £3 8s. 7d., in all £7 5s.

The storekeeper, however, at Cootamundra can obtain goods from Sydney direct, on the reduced sliding scale for distance, for £6 6s. 9d., and practically the Goulburn storekeeper is shut out from trading with Cootamundra and the district surrounding it.

The Traffic Manager, in a report on the proposal to grant this concession, has given some excellent reasons against it—a copy of his report is appended ; but on the whole I fail to see that the objections are insuperable. The Traffic Manager is in error as regards the statement that the Rates Board dealt with this aspect of the case. I think I am right in saying that this particular phase of it was not before them, the Board deprecated the introduction of equal mileage rates in the interests of local storekeepers to the disadvantage of settlers in the more distant part of the Colony, but the proposal to overcome the admitted disability of country storekeepers trading beyond their immediate district with goods brought from Sydney by the introduction of a “break-journey” rate was not discussed by the Board beyond its application to wheat stopped *in transitu* to be ground into flour, and this principle of charging they found to be in active operation, and approved of it.

Traffic Manager's report reviewed.

There are, it is admitted, difficulties and perils in the way of the application to goods generally of this principle of charging, especially in cases where there are manufactories at the intermediate towns ; but if there be no abuse of the concession I do not see how the Railway revenue can suffer. Country storekeepers are not now supplying such goods to districts beyond their immediate neighbourhood ; they are supplied direct by metropolitan tradesmen and merchandisers ; the adoption of the proposal will have the effect of disseminating trade, and as regards the more distant storekeepers, decentralizing it. The revenue (if there be no malpractices) would obtain a benefit, inasmuch as the terminal charges for break of journey can be made sufficiently high to show, not only a return for the service rendered, but a profit upon it.

Break-of-journey rate.

It is only the comparative absence of local manufactories which makes the introduction of this system of charging possible ; it has no parallel in any other country, and I would not willingly introduce it here, I only submit it for consideration because I fear that, unless this concession be made to country storekeepers, they will have sufficient influence to induce Parliament to sanction the scheme of equal mileage rates, which will result disastrously, not alone to the Railway revenue, but to the general commerce of the Colony.

Alternative proposal recommended and why.

12 May, 1887.

CHAS. A. GOODCHAP,

Commissioner for Railways.

Report of Traffic Manager to Commissioner for Railways on proposal to introduce a rate for goods which break journey at intermediate towns.

I HAVE carefully considered the proposal to give traders, at intermediate towns, the benefit of the reduced rates to the competitive districts proportionate to the distance they are situated from those districts, and would respectfully point out that a powerful argument against the introduction of the principle is that, if adopted in the case of traffic forwarded from Goulburn or other station on the Southern line to the competitive districts, it is all but a certainty that a similar demand will be made throughout the lines even where no competition exists ; indeed the Commissioner will remember that this very matter was pressed upon the Board, which inquired into the rates some years ago, by some storekeepers in Orange who thought they should be able to reconsign goods (which had originally come from Sydney) to Dubbo at a through rate, plus a small charge for the break of the journey at Orange.

The effect of the adoption of such a principle would mean that the nearer a storekeeper lives to Sydney the better his position to compete for the trade of the districts lying near to a town many miles further into the interior.

For example, let it be assumed for the moment that competitive rates do not exist, but that ordinary mileage rates are charged throughout the lines. A storekeeper in a large business in Goulburn pays trainage from Sydney at the rate of £3 16s. 5d. per ton upon third-class goods, while the through rate to Bomen is £7 4s. 7d. His contention is that we should allow him to reconsign goods (originally received from Sydney) to a small store at Bomen at the latter rate, plus (we shall say) 7s. 6d. per ton, = £7 12s. 1d. altogether. But if the Wagga Wagga storekeeper, under precisely the same conditions, desires to supply the same small store at Bomen, he must pay:—

From Sydney to Wagga Wagga	£7 6 4 per ton, and
„ Wagga Wagga to Bomen	0 9 0 „
Total	£7 15 4 per ton.

So that, in the matter of railway carriage, he is beaten at his own door by a competitor living 170 miles away.

I would respectfully submit that the competitive rates do not affect the principle; moreover, these rates were forced upon us. We did not adopt them from choice, and it would seem judicious that they should not extend beyond the limits suggested by the Commissioner.*

There is another aspect of the case which has, perhaps, been overlooked, and that is that the adoption of the suggestion will necessitate a very largely increased staff at country stations, if adopted generally; and there is a further fear that it would open the door to frauds, the opportunity of which, in the light of past experience, should be avoided.

Take the case of a storekeeper at Orange, who, for every ton of leather he gets from Sydney, gets ten in the district. He sends a ton to Dubbo, and asserts that it came from Sydney and should be charged the through rate, plus the small charge alluded to. Who is to say that this particular ton of leather did not originally go from Sydney, and yet there may be strong presumptive evidence that it did not? The door would certainly be open to a dishonest clerk to defraud the Department by acting in collusion with the sender without much, if any, chance of ever being found out.

It is solicitude for the welfare of the Department which induces me to make these observations. I believe the introduction of this system of charging, while it might please storekeepers who live nearest to Sydney, it would give dissatisfaction to those living far in the interior, and, in my opinion, the latter deserve the most consideration.

W.V.R.,
4/5/87.

No. 5.

Extract.

From *S. M. Herald*, September 27, 1887.

DIFFERENTIAL RAILWAY RATES.

THE four eastern colonies of Australia have long been looking forward to the time when railway extension, in spite of all breaks of gauge, should draw them together in common interests and friendly neighbourhood. But now that the last link is almost completed, at the Queensland border, instead of the first notes of harmonious jubilation, we hear ominous threatenings of railway war, of fresh barriers to be built over the metals, of sharp practices in the matter of traffic rates, and of determined reprisals. Instead of the universal handshaking expected amongst the railway authorities, we find Mr. Speight, the Victorian Chief Commissioner, rushing over to Adelaide, not to congratulate Mr. Pendleton on the opening of a highway of intercolonial friendship, but to warn him, at the peril of his Colony's railway capital, not to attempt any poaching on Victorian trade; whilst the Queensland Minister for Works takes up the strain in the North against New South Wales, and threatens to lay such an impost on everything, whether living or dead, that dares to cross the border, that there shall be no dealings between the Southern Jews and the Northern Samaritans—threatens, in fact, to cut off Queensland's nose to spite the older Colony's face. Handshaking, indeed there is plenty, but the railway authorities, who are, of course, to the front in this matter, are shaking their own hands in their neighbours' faces.

If the spirit of provincialism underlying this steadily thickening railway war were not so pitiable, and the tricks resorted to so paltry, there would be a good deal of amusement in it to the lookers on. Of course it goes without saying that the lion's share of the blame for this state of things is rightly charged to the colony who struck the first blow; and it is equally superfluous to say that the arch-enemy is none other than our clever—too clever—neighbour to the south. The boundary between this Colony and Victoria was amicably, though perhaps not over scientifically, fixed in 1851, when the younger colony began to do for herself. It was not long, however, before Victoria began, whether out of benevolence or covetousness, to desire to do for a part of New South Wales as well. Probably both motives were discriminatingly mingled, and so she coquetted with Riverina partly because she thought it would do Riverina good, but chiefly because she was sure it would benefit herself. With these benevolent and politic objects in view, Victoria pushed on her railway system to tap the rich border land at no fewer than six points—Echuca, Wodonga, Wahgunyah, Rutherglen, Chiltern, and Kerang. Nor did she fail in her reward. Riverina, finding the Sydney market not only twice as far off, but immeasurably more difficult to reach than the port of Melbourne, fell in largely with the Victorian wishes, despite the counter-hampering of protectionist duties. But, meanwhile, New South Wales was not unmindful of her own. In her slower, but surer, methods she pushed her railways on till at length, some seven or eight years ago, she began to draw the trade of Riverina to Sydney. Then Melbourne became alarmed. This turning of the tables would never do. If Riverina trade, which she had spent so much to secure, slipped away, a great deal more would go with it—prestige for the colony and her opportunist policy, and, possibly, some of the Melbourne firms that had fattened on trade from New South Wales. It was then that Victoria resorted to what has become so notorious as the differential rate system, but which ought more correctly to be called a “competitive” system. Victoria, in

*The suggestion first made by the Commissioner was that traders at intermediate towns should be allowed to have the benefit of the competitive rates that Sydney traders were allowed.

in effect, determined to extend special favours to Riverina in the shape of heavy rebates on over-border traffic; and thus was exhibited the altogether novel spectacle of a colony loving its neighbour, or rather, a part of its neighbour, better than itself. The weak point about it was that one colony should so openly throw down the gage for a contest which could only end in humiliation, to prevent a neighbouring colony trading with its own territory. Competition was thus forced upon the Railway Department of New South Wales, and, as a measure of purest self-defence, special rates on our lines were conceded within the Riverina districts. The counter-move was so successful that in 1882 Victoria made still further concessions, which she has maintained ever since. For a time the trade again inclined to the Southern port, but our Railway Department, by a very simple arrangement of truck-rates, offered a lower rate per ton, without losing revenue, since the fuller loads secured compensated for the reduction. Victoria had already gone as far as she could without loss, and the outcome of the contest is that the Riverina trade has largely come to Sydney; and not only so, but a number of Victorian firms have followed it, and established branches of their business in this city.

But the extension of our railway system through our south and south-western districts brought us into contact with much of our own trade, and a fair share of Queensland trade, that had previously gone down the Darling and Murray; and we thus came somewhat innocently into collision with some of the interests of some of our other neighbours. Queensland has discovered that not only do her south-western squatters send us a good deal of wool, but that contrary to all the ethics of protectionism, they take back with them flour and other supplies, thus conferring a double benefit on our colony, partly to the loss of Charleville and Brisbane, and partly to that of South Australia; and the Brisbane merchants are very angry. But it must be admitted that Adelaide has taken the matter more philosophically; and the secret of it is that nature is largely on the side of the south-western colony. Taking a leaf out of Victoria's book, she, too has her special rates for border and over-border traffic. Not only has she a line skirting the Victorian border for a considerable distance, on which she is inclined to manifest her neighbourliness by a system of liberal rebates; but she hold out similar inducements to our Darling River trade. It is difficult to believe, indeed, that Adelaide has not indulged in many a laugh in her sleeve at the unexampled liberality of our Government over our costly railway to Bourke. Before we carried out that bountiful piece of kindness to the Darling squatters, most of the wool went down the river to South Australian ports whenever the seasons permitted, whilst in the dry seasons it had to be carried at double or treble cost overland to meet our railways, or to the Victorian border. In response to the urgent appeals of these squatters, we constructed the railway at immense cost. But, instead of getting all the trade, and a great deal of gratitude, we only get the dry season trade; for, when the river is high enough, water carriage is cheaper than even our very low rates, and the Darling squatters take a two-fold benefit at the country's cost. They are able to get their land carriage for a mere fraction of what it used to cost, and to beat the old water-carriage rates lower still by pointing to our railway competition. Surely, the most pronounced opponent of differential rates would hold it fair for the Railway Department to say to these grateful squatters: Since we have provided you with a railway at your urgent request, you must either use it regularly, or pay higher for the privilege of intermittent use.

The tide seems, however, to be turning against differential rates, and the most striking feature of the reaction is that Mr. Speight should to a certain extent champion the counter-movement. It would be a mistake to count much on this hopeful sign. It is not so much against the principle of intercolonial competition that Mr. Speight has begun to protest, as against the particular application of it as between South Australia and Victoria. He is firm and emphatic enough in his warnings to Mr. Pendleton against any poaching on Victorian trade, but there is nothing on record to show any objection on his part to the expedients of his own Railway Department to secure advantages over New South Wales. This is how the Melbourne *Argus* thinks it necessary to help him over the stile:—"We are glad to see Mr. Speight does not favour a railway war. His appeal or remonstrance is a request to the Adelaide Government to charge the ordinary prices, coupled with a promise, as we understand, that Victoria will in that case charge ordinary rates also. If the trade then shows a tendency to flow to Adelaide or Kingston it should be left to flow there. . . . Mr. Speight is not answerable for the ridiculous state of things in connection with Riverina, by virtue of which the further the goods are carried the less the Department gets, so that where a Victorian customer pay £1 the more remote customer in New South Wales pays only 10s. The Commissioner inherited this system, and he has no choice but continue it." This apology for Mr. Speight reads well up to the last clause. Wherein lies any necessity for continuing the war with New South Wales, any more than for commencing it with South Australia does not exactly appear. At all events, if necessity there be, it rests with the Victorian Government. This Colony has only acted reluctantly in self-defence, and would no doubt gladly meet any penitent overtures from the colony which opened the contest.

It is time now to look a little more closely into the real bearing of this railway competition by which both the friendly relationships and commercial interests of the four colonies are so directly affected. In one aspect of it this is essentially an intercolonial question; but, as we shall see, this is by no means the whole of the matter. If an amicable settlement were arrived at by all the colonies concerned, differences would still remain as between places within colonial boundaries and classes and quantities of goods. As a matter of fact, it is against these subtler forms of differentiation that agitation has already commenced in this Colony, and may be expected to cause more or less discussion in Parliament.

Early in March last, an influential meeting at Goulburn resolved that the system of differential rates was "unequal, unjust, and detrimental to the interests of Goulburn and surrounding districts." This led to the tabling of the following notice of motion by Mr. Teece, the member for Goulburn:—"That in the opinion of this House the differential rates charged for the carriage of goods and merchandise on the railway lines of this Colony should be abolished." Still more recently the business men of Maitland were startled by revelations as to injuries said to be inflicted upon them by this system, and they resolved to follow the Goulburn example. Considering how sensational were the figures submitted at these two meetings, it is easy to understand a momentary shock to the people of those terribly victimised districts. But second thoughts should at least have brought some relief. The very outrageousness of their alleged sufferings ought to have suggested a doubt as to whether the officers of the Railway Department, with their special knowledge of their duties, and the absolute impartiality of their position, would have been likely either knowingly to tolerate such injustice, or unwittingly to blunder and have to wait for some new light to come forward with a revelation.

The

The position taken by the Railway Department is that as far as the intercolonial competitions, and the measure of differentiation within this Colony resulting from these competitions, are concerned, this Colony has only acted in self-defence. And that as regards the deeper question of a certain degree of differentiation within the Colony, apart altogether from such competitions, the thing is inevitable, and must exist wherever carrying has to be done.

As to the defensive attitude of this Colony, the goods rate-sheet of the Victorian Railway Department is a sufficient witness. As already mentioned, the manipulation of traffic charges began some seven or eight years ago, when our railways first reached the Riverina District, and after a number of modifications, the rate-sheet assumed its present form. A glance suffices to show the deliberate and determined stand made to hold the trade of Riverina. After all ordinary Victoria traffic has been scheduled, there appear two special headings—"Rebate on Goods for Riverina," and "Albury Rates." Under the first there is a list of rebates, ranging up to £3 16s. per ton on goods carried to any of the Victorian border stations for further conveyance to New South Wales territory. Under the second there is a still further refinement of benevolence. The rebates before mentioned are to reward the sending of Victorian goods even a foot across the border line; but under these special Albury rates, the further the goods are sent into New South Wales the more cheaply will they be carried to the border. This is a specimen of how the system works: Fourth-class traffic (consisting of furniture, liquors, glassware, and numerous other articles) conveyed from Melbourne to Wodonga (187 miles) for use in Victoria, is charged at the rate of £5 6s. per ton. If the same goods are carried across the border to Albury (190 miles), the charge is reduced to £3 3s. 6d. per ton; and if they are consigned to any part of this Colony north of Gerogery (20 miles from the border), the rate from Melbourne to Albury is only £1 12s. 6. per ton. It is clear from this illustration, that if Mr. Teece's resolution had been carried out, and acted upon by our Railway Department, in the absence of any similar action in Victoria, the southern colony would be able to carry her competition for our trade at least one-third of the way from the border to Sydney. Riverina wool is, of course, the most important item in this unneighbourly competition, and the absolute necessity of defensive measures by our Railway Department may be seen from the following figures:—The Victorian rate for wool grown in its own territory is 7s. 6. per bale not exceeding 4 cwt., from Wodonga to Melbourne; but for wool grown in any part of New South Wales, bounded by the Murrumbidgee on the south, and long. 144° on the west, the charges are only 3s. per bale not exceeding 300 lb., and 3s. 6d. per bale over that weight. These rates, in the absence of the counter-acting measures taken by our own Railway Department, would simply deprive us of the whole trade of our wool from Junee southwards, and from the south-western districts. It is little wonder, therefore, we find our railway authorities contending that, in the absence of simultaneous action on the part of Victoria, for us to abolish competitive rates, and thus give up this important part of our own legitimate trade, would be "uncommercial and suicidal." Now that Victoria is confronted with a further development of her own policy by South Australia, possibly she may be disposed to face the logical issues, and make a virtue of swiftly-coming necessity. Her very limits of area would ensure her the advantage still. Her port would be the nearest one for a large share of this Colony's trade, and she has therefore the least reason of all the colonies to fight against natural channels of commerce. When she comes to see this she will no doubt repudiate her provincial and opportunist policy, for it is doubly pleasant to pose as peacemaker, and retain an advantage. It will certainly be the duty of the other three colonies to bury past strifes when that time comes, and agree to fix the rates for competitive districts on the same scale as for other districts equally distant from their terminal ports.

When the intercolonial and purely competitive aspects of the question of differential rates are thus dealt with, the greatest anomalies will, of course, be removed. But our Railway Department takes somewhat strong ground, and argues that so long as the most distant traffic is not carried on at a loss it is to the interest of the carrier to make the basis of his trade as large as possible, and that whilst the addition of the distant and barely paying trade is in no sense an injury to the nearer and better paying districts, its loss would tend to raise the rates over the narrower range of traffic. Furthermore, they argue that, apart altogether from intercolonial competitions, the principle of differentiation must be maintained. However much it may scandalize Mr. Teece, Mr. Haynes, and the heavily-wronged people of Goulburn and Maitland, who categorically demand the abolition of differential rates, there is no doubt but that the position thus taken is amply borne out by railway experiences in all other countries, and in fact by carriers of all sorts all over the world. A great number of considerations have to be weighed by the carrier, and all tend to differentiate the charges. In connection with our railways, a large part of the various items of cost remains fixed, whether the distance is 20 miles or 200. Terminal accommodation, loading and unloading, clerical work, and in fact nearly all the expenses of management came under this head; and therefore, as a necessity of justice, the principle of uniform mileage breaks down at the very first test. In the next place, a carrier has to choose between stopping his traffic at a circumscribed distance, or lowering his mileage the further he goes. Above a certain rate it simply would not pay the producer to have his goods carried at all; and since it is better to carry at diminished profits than not at all, every carrier charges less mileage as the miles increase. Further differentiation comes in on grounds of quantities and of values. The carrier would be thought to be going mad who would charge as high a rate for bringing the output of a Lithgow coal-mine to Sydney as for sending a few bags of coal from Sydney to sundry consumers even as near as Parramatta; he would be considered hopelessly mad if he charged no more for a parcel of silks than for a bag of potatoes to a Goulburn or Maitland business man. Differences, discrepancies, and apparent absurdities even, may therefore be looked for in our railway rate-sheets; and to deny the Department the power to put and keep them there would be to deny it the indispensable discretion of the most ordinary carrier.

But our Railway Department is more than a mere commercial carrier. It is charged, as an impartial steward, with the administration of a great public service in the interests of the whole Colony. The differentiation introduced by an ordinary carrier may with all propriety be extended still further in such a service. As a matter of fact, it is the deliberate and frequently endorsed purpose of the people as a whole that this should be done. The authorization of every section of railway extension in new country means that, for the sake of the general expansion of the country's settlement and business, capital will be sunk without expectation of immediate returns. The very idea of uniform mileage, or in fact any rigid system of rating, would simply stultify the fundamental principles of the service. On the other hand there would be just cause for complaint if different rates were charged to different persons for the carriage of the same class of goods conveyed under similar conditions. But it is a fixed rule of our Railway Department to charge all persons alike where the conditions are similar. The

The principle of differential rates is not, however, so new or so easy to deal with as a resolution like that tabled by the Member for Goulburn might lead many people to suppose. It has been the subject of investigation by two Select Committees of the House of Commons within the last fifteen years. The Committee of 1872 reported that uniform mileage would "deprive the public of the benefit of competition," would "raise prices," and "prevent concession to large customers." The latter investigation, some years ago, resulted in an expression of opinion that differential rates tended to "delocalize trade, and benefit the public by the consequent competition"; and that the equalizing of rates would not be either just or reasonable. The position taken by our Railway Department is further strengthened by the greatest traffic experts in England. Mr. Farrar, Secretary of the Board of Trade, holds that "equal mileage rates would level up and not down. A medium rate would have to be selected for fixing, and the companies would get the better of the public. . . . Uniform rates would mean the loss of much traffic, and raising the prices on all the remainder to make the railways pay." Mr. Swarbrick, general manager of the Great Eastern Railway, says: "Our home experience is that it is better to foster larger quantities, and longer distances, large industries, &c. . . . Our rate-books are full of anomalies and apparent contradictions, to the benefit, as we think, of ourselves and our customers." Equally strong is the evidence of Mr. Grierson, general manager of the Great Western Railway, in a book he published last December on "Railway Rates, English and Foreign." He says:—"While shrinking from advocating equal mileage rates, many persons take up an intermediate position. They object to rates being much out of proportion to distance; and they do so although the traffic may not be carried over the same parts or sections of a railway. The rates to which objections are taken are of several kinds—transit or through rates, special rates generally, and special rates for long distances or intermediate traffic. Such differential rates exist in all countries in which railways have been developed, and it will be found that here as elsewhere they have been adopted not solely or even chiefly with a view to benefit railway companies, but mainly to meet the not unreasonable demands of traders and consumers. Differential rates have arisen in no small degree out of the same causes as have necessitated a classification of goods—goods of small value would not be carried at all unless at low rates. Only on special terms can such goods, produced at a great distance, be brought to market." In answer to the argument that this benevolent assistance by the railway to backward towns overrides the natural advantages of other towns, Mr. Grierson remarks that under certain conditions "preserving the natural advantages of one town means preventing the removal of the natural disadvantages of the others."

It may not be generally remembered that in 1881, after the commencement of the competitive struggle with Victoria, an investigation was made, under the auspices of our Railway Department, into the whole question of differential rates by three gentlemen unconnected with the Department, or with the Civil Service in any way. The evidence of eighty witnesses, representing all the interests concerned, was taken. It was found, as might naturally have been expected, that the chief objections came from country storekeepers in the intermediate districts along the railway lines. The conclusions of the board were that the Department had fairly studied the question from every point of view; and that no hard-and-fast rule must prevent changes to meet the variable conditions of trade. It is understood that the case of the business men in the intermediate districts, such as Maitland, Goulburn, &c., has been since considered, to see whether a break-journey rate could not be arranged, with a slight addition on the through rate for stoppage charge. As the rates now stand, a Goulburn storekeeper pays £3 16s. 5d. for a ton of goods from Sydney, and if he wants to send the goods on to Cootamundra he has to pay £3 8s. 7d. additional, or a total sum of £7 5s.; whereas the charge direct from Sydney to Cootamundra would have been only £6 6s. 9d. The only serious difficulty in the way of such a concession is that it would open the door to fraud in manufacturing towns, since there would be strong temptations to send on local manufactures at break-journey rates. The propriety of giving business people in intermediate districts a share in the advantages now limited to Sydney merchants, of trading with those districts over which competitive rates prevail, has also been under the consideration of the Department; and whilst such a concession would be regarded as a substantial benefit by certain of the business men of inland towns, it seems free from any great objection either on the ground of complication of rate-sheets or of liability to abuse.

A careful review of the whole subject shows that the discoveries and surprises with which certain Members of Parliament and country storekeepers have been working up the enthusiasm of reformers are mere items of the complicated subject of the railway goods traffic. That they have each been carefully weighed in relation to the whole subject by the railway officials, and that, whilst certain modifications are likely to be made, the competitive rates can only be abolished as the outcome of an intercolonial compact; and the introduction of uniform rates per ton per mile, which seems a simple and desirable piece of reform to many people, would mean either immense loss on the shorter distance traffic, or the diversion to Melbourne of the whole of our southern and south-western trade.

Resubmit with other letters on the subject. Do not specially report.—A.R., 27/9. Seen.—D.V., 1/10/87. The Commissioner asked to see these papers.—D.C.M.L., 17/10/87.

This article is an adaptation of the official paper (printed) which will be found with these papers.

The paper written by Mr. Haynes to the Hon. the Colonial Secretary, which appears in the *Evening News* of the 15th instant, should be put with these papers. This article on "Differential Railway Rates" answers Mr. Haynes' crudities, and it has the advantage of having preceded Mr. Haynes' paper.

Mr. Haynes' paper is bristling with errors; he has one example which he repeats *da capo da capo*. He tries to give it a new dress with every fresh instance of treatment, but it is the same old argument, viz., that there is an anomaly between the charges to the competitive districts and the charges to the non-competitive districts. In attacking the New South Wales Railways for its practices in this respect, Mr. Haynes is couching a lance—although he does not know it—at the universal railway practice, and he has proposed to put something in lieu of it which would have the effect of paralysing the railway revenue.

I will deal with his proposals, expose his errors and fallacies in another paper, and convince, I trust, all those who are interested that it is better to follow the advice, in this respect, of the railway officials, who have been trained to their duties, rather than that of this new expert (!) who is without railway experience, and has only blundering enthusiasm to guide him. C.H.A.G., 17/10/87.

1888-9.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MR. W. M. FEHON, RAILWAY COMMISSIONER.

(CORRESPONDENCE REGARDING CHARGES MADE IN THE LEGISLATIVE ASSEMBLY AGAINST.)

Ordered by the Legislative Assembly to be printed, 8 January, 1889.

Telegram from W. M'Culloch, Esq., to W. M. Fehon, Esq.

Market-street, Melbourne, 8 December, 1888.

CONGRATULATE you on splendid opportunity given of clearing your character from foul lies uttered Parliament yesterday, and justifying Government appointing you. Insist Board making most searching inquiry previous joining me, for my sake as well as yours. The fuller and more searching inquiry the better for you.

W. M'CULLOCH.

For Sir Henry Parkes' information.—W. M. FEHON.

The Principal Under Secretary to W. M. Fehon, Esq.

Sir,

Colonial Secretary's Office, Sydney, 10 December, 1888.

I am directed by the Colonial Secretary to call your attention to the accompanying copy of the official report of the proceedings of the Legislative Assembly on the 7th instant.

You will observe that Mr. Want, the Attorney-General in the late administration, made a statement that he, as law adviser of the Crown at the time, had it in contemplation to prosecute you for being concerned in the railway frauds for which others were prosecuted in 1886, and that he further alleged that you were guilty of gross misconduct as an officer of the Victorian Railway Service in favouring some private carrying firm, presumably for your own advantage. These imputations against you by a person in Mr. Want's public position assume so serious a complexion that only one course is open to the Government, and you are now called upon to offer any explanation and evidence which you may deem necessary in vindication of your character. It is not doubted that you will be able to clear yourself of the aspersions cast upon you, and render any further proceedings unnecessary.

I have, &c.,

CRITCHETT WALKER,

Principal Under Secretary.

W. M. Fehon, Esq., to The Principal Under Secretary.

Sir,

Department of Railways, Sydney, 11 December, 1888.

I have the honor to acknowledge receipt of your letter of yesterday's date, directing my attention to the official report of last Friday's proceedings in the Legislative Assembly, and particularly to the remarks made by Mr. Want, the late Attorney-General, wherein he stated "that when he was Law Adviser of the Crown he had it in contemplation to prosecute me for being concerned in the railway frauds, for which others were prosecuted in 1886, and further, that I had been guilty of gross misconduct as an officer of the Victorian Railway Service in favouring some private carrying firm, presumably for my own advantage."

In reply, I will place before you, for the information of the Colonial Secretary, such facts as will, I trust, prove clearly to the Government, the Assembly, and the country, that the statements made were utterly groundless, and should never have been uttered, except the person making them was in possession of some reliable information, which in this case was impossible, as there does not exist one atom of truth on which to hang the ingeniously arranged statement of the Member for Gundagai.

I will first reply to the charge affecting my position as Traffic Manager of the Victorian Railways.

A statement of a somewhat similar nature was circulated some sixteen years ago, by a man long since dead, and who occupied a position in the Victorian Legislature.

By good fortune I have preserved a letter written by me to the editor of the Melbourne *Argus* in 1872, which I attach hereto, and which is the best evidence I can offer as to the untruthfulness of the charge. It effectually silenced the man who invented the falsehood, and I have never heard a word on the subject since, until my appointment as one of the Railway Commissioners of New South Wales.

As a fact the Government of the day very unwillingly accepted my resignation. I was presented with a handsome service of plate and an address by the citizens of Melbourne. The presentation was made in the Town Hall by the Mayor, and the address is signed by the Mayor and the three Mayors preceding him. I was also the recipient of a handsome testimonial from the staff of the Victorian Railways, and in my thirty years' experience in Melbourne I cannot call to mind a single public officer who left the Service with such flattering marks of official and public esteem.

Mr. Longmore was the political head of the Railways when I resigned. I have not seen him for some years, but I believe his address is Upper Tarwin, Gippsland. Should you communicate with him I am sure he will give Mr. Want's statement a most emphatic denial, as would also the Hon. Wm. Wilson, who resides in Melbourne, and was, I think, twice Minister for Railways during the time I held the office of Traffic Manager.

Any inquiry the Government chose to make can only confirm my statement.

The other charge is one Mr. Want should know something about, but here also he is equally at fault. The history of my connection with Wright, Heaton, & Co. is as follows:—

Shortly after I joined the firm of Wm. McCulloch & Co. we thought it desirable to establish a branch of our business in Sydney, and for which purpose we took a fresh partner, who was to reside in Sydney and conduct the business. It was up-hill work, and resulted in overtures being made which ended in an amalgamation of our Sydney business with that of Wright, Heaton, & Co.; the partners in that firm managing the business without any control from the Melbourne partners.

Wm. McCulloch & Co. was then a limited company, and we did not like holding a share in Wright, Heaton, & Co.'s business, where our liability was unlimited. Consequently they were induced to put their business also into a limited liability company. Twelve thousand shares were issued, of which Wm. McCulloch & Co. (limited) had 4,000. For the purpose of securing a full voting power at half-yearly meetings the 4,000 shares were divided amongst eight shareholders in Wm. McCulloch & Co. (limited), each having 500 placed in his name in trust for the company. I was one of the eight. Messrs. Wright and Heaton were the managing directors, and Wm. McCulloch & Co. took no part directly or indirectly in the management of the business.

I paid occasional visits to Sydney to attend the meetings of the company, to ascertain in general its position, but beyond that I knew nothing of its internal working.

The business was extended to Queensland and the capital was increased, resulting in some more shares being placed in the names of the Melbourne trustees.

In 1882 I gradually sold out my interest in Wm. McCulloch & Co.'s, and in March, 1883, I started on a trip to Europe. Just prior to leaving I sold the last of my shares, and since that date I have not had one penny interest in any carrying business. Whilst in Wright, Heaton, & Co. (limited) I never at any time, held a share in my own right. When dividends were paid it was to Wm. McCulloch & Co. (limited) and calls were also paid by the cheque of that company, although the shares were placed, as a matter of convenience, in individual names.

It was some two years after my return from Europe that Wright, Heaton, & Co. were charged with irregularities in connection with their wool consignments, and to no person was it a greater surprise than to myself, so that by no process of reasoning can I in the slightest degree connect myself with what Mr. Want so intimately associates me.

My statement is capable of proof, and I defy Mr. Want or any other person to prove that I had the slightest knowledge of or that I was directly or indirectly associated with any irregularity.

I can do no more than give a most complete denial to every statement made to my discredit, and should the Government or the Opposition Members of the Assembly be able to prove to the contrary, I will at once return to the Government the Commission with which I have been honored.

I have made considerable sacrifice to accept the office conferred on me, but I should most certainly have declined it had I known that its possession would have entailed my name being dragged before the public, in connection with dishonorable transactions in which I had no part.

I have, &c.,

W. M. FEHON,
Railway Commissioner.

[Enclosure.]

MR. ORR, M.L.A., AND MR. FEHON:
To the Editor of the Argus.

Sir,—I seek the favour of your columns to reply to an attack made on my public and private character in the House of Assembly on Thursday last by Mr. Orr, M.L.A. for the Murray district. The purport of his statement is, that I was connected with the firm of Wm. McCulloch & Co. before I left the Railway department, and that I was in the habit of showing that firm special partiality.

I first heard of such a rumour being circulated after I left the railway, and at once saw the Commissioner on the subject, and asked him to make an appointment with Mr. Orr, allowing me to be present, so that I might ascertain how far he had authorised such a report, and that Mr. Longmore might ascertain its truth or otherwise.

Whilst we were talking, Mr. Orr happened to call about other business, and after transacting same was leaving the office, when I told him I wished to have a few words with him, in Mr. Longmore's presence relative to a false rumour which had been circulated about myself, and of which I believed he was the author. I repeated the substance of the statement, when he replied that he had not spread the report as a fact, but had remarked that he thought such might be the case. Feeling indignant at his reply, I told him that he had concocted and spread the report knowing it to be untrue. Finding that he was cornered up, he said if he had made any statement which was not true he was sorry for it. I then accepted his apology; we shook hands, and I considered the matter ended.

After he left the office Mr. Longmore remarked to Mr. Fyfe, of the Railway department, who was present through the interview, that Mr. Orr had lowered himself very much in his estimation.

I thought that Mr. Orr, seeing he had done me a gross injustice, would at least have refrained from making any further remarks on the subject; but, on the contrary, I was informed a short time afterwards, when on his election tour, he remarked in conversation with a friend of mine, "That he had a great dislike to me, and that if he got in the House he did not care so much for the £300 per annum as for the opportunity it would give him of slating me." This threat he has taken the first opportunity of carrying into effect.

The fact is, Mr. Orr was and is a carrier, and seems to be so blinded by jealousy at my joining a firm in the same line of business that he allows no opportunity to pass of attempting to injure me.

In conclusion I may say that whilst traffic manager my conduct towards McCulloch and Co. and all other firms doing business with the department is open to the strictest investigation, and I have now reason to know that to my efficient and straightforward conduct alone I am indebted for the offer of an interest in McCulloch and Co.'s business, which my meagre salary and great responsibility as traffic manager alone induced me to accept.

I much regret having to trouble you with so long and unpleasant a communication; but as Mr. Orr in making his statement is protected by the privileges of the House, I have no other means of laying the facts of the case before the public.

Melbourne, 30th November, 1872.

I am, &c.,

W. M. FEHON.

W.

W. M. Fehon, Esq., to The Colonial Secretary.

Dear Sir Henry,

Moss Vale, 12 December, 1888.

I meant yesterday to have written you a note respecting an interjection made by Mr. Lyne on last Friday night, when the Railway Commissioners were being discussed in the Assembly, but I was busy in the office up till the time we left by the mail train. The remark I allude to was to the effect that I applied to Mr. Lyne when he was Minister for Works for one of the Commissionerships of Railways. The interview he refers to was the first and only time I ever met him officially, and it occurred as follows:

About two years since I noticed in the papers that the Jennings Government were thinking of putting the Railways of New South Wales under a Board of Commissioners, a short while after I was in Sydney, and it occurred to me that, as I had recently returned from England, where I was asked by Mr. Murray Smith, the Agent-General, to assist him in the selection of a chairman for the Victorian Board, that I might give Sir Patrick Jennings, whom I had known for some years, the benefit of my experience in London, where I interviewed a large number of gentlemen in connection with that appointment.

I called on him at his office, and he was much pleased with the information I gave him, and he asked me if I would call on Mr. Lyne and have a talk with him on the subject, and as I did not know that gentleman he gave me a note of introduction. I went to his office and saw him, and we had a general talk over the subject, but as he was busy the interview was short. My only object in seeing Sir Patrick Jennings and Mr. Lyne was the idea that I might be able to give them some useful information. At that time I had not the slightest idea that I would have accepted such a position had it been offered. If Mr. Lyne will tax his memory I feel sure he will do me the justice to say the above is exactly what took place.

I am, &c.,

W. M. FEHON.

The Principal Under Secretary to W. M. Fehon, Esq.

Sir,

Colonial Secretary's Office, Sydney, 12 December, 1888.

With reference to my letter of the 10th instant, I am now directed by the Colonial Secretary to transmit to you a further report of the proceedings of the Legislative Assembly, by which you will see that Mr. J. H. Want, M.P., makes charges against you in a clear and definite form. [11 Dec., 1888.]

I am to request that you will kindly furnish me with such further explanation as you may desire to make.

I have, &c.,

CRITCHETT WALKER,

Principal Under Secretary.

W. M. Fehon, Esq., to The Principal Under Secretary.

Sir,

Department of Railways, Sydney, 13 December, 1888.

I have the honor to acknowledge receipt of your letter of yesterday's date, forwarding for my information a further report of the proceedings of the Legislative Assembly, wherein Mr. Want repeated his charges against me but in a clearer and more definite form.

This is the first instance in my long official and commercial experience, extending over thirty years in Australia, that my honor and honesty has been impugned; and it is very humiliating to me to be, as it were, put on my trial to answer charges for which, as I stated in my previous communication, there is no foundation; but in deference to the wish expressed in your letter I will, for the information of the Colonial Secretary, give replies as concise as possible to what I gather from *Hansard* report to be Mr. Want's points.

It appears to me that he based his statement (first) on the information supplied by two persons whom he terms informers, and (secondly) from returns he has perused in the Registrar-General's Office, and upon this information he builds up his case, wherein he charges me with being the arch-rogue who invented what he terms the wool frauds, and he does not hesitate to call me a thief and everything else that is dishonest and dishonorable, and not only myself, but the firm, and afterwards company, of Wm. M'Culloch & Co. (limited).

It is not my intention now, nor am I required to defend others who are equally able to defend themselves from such baseless insinuations, but I may state that all the gentlemen whose names appear as shareholders in Wm. M'Culloch & Co. (limited) on Wright, Heaton, & Co.'s prospectus are highly honorable men, and are esteemed as such by all who know them.

I can understand the stories of the informers proving true in regard to what may have come under their individual notice, but as I never did one act, or gave the slightest advice in respect to the manner in which Wright, Heaton, & Co.'s business should be carried on, I fail to see how the informers could give Mr. Want any information regarding myself.

In my previous communication I gave as nearly as possible the date of my severance from Wm. M'Culloch & Co., and the history of my connection with Wright, Heaton, & Co., but I may repeat that I sold my last shares in Wm. M'Culloch & Co. (limited), in February, 1883, and as Wright, Heaton, & Co. shares were an asset in Wm. M'Culloch & Co.'s business, I consequently ceased to have the slightest interest in that company also.

I find that I only attended six meetings of Wright, Heaton, & Co. (limited), during the whole time I had any association with the company, and the last one was in August, 1882. The minute book of the company can prove this.

Although I ceased to have any interest in Wm. M'Culloch & Co. (limited), in February, 1883, I find the Wright, Heaton, & Co. shares were not taken out of my name till September, 1884, and 650 shares, which Mr. Wright had placed in my name, I find to my surprise they were not transferred from my name till June last, although I had signed a blank transfer at the time they were so placed in my name; however the 650 shares never belonged to me in any shape or form, which is easy of proof, so that Mr. Want's two charges, first, that "I am even now a shareholder in Wm. M'Culloch & Co. (limited)," and second, by that "on the day I was appointed I held a large number of shares in a company, some members of which having been prosecuted on two different occasions" fall to the ground.

I believe I am justified in saying that the books of Wm. M'Culloch & Co. (limited) and Wright Heaton, & Co. (limited) are open to the inspection of any person the Government may appoint to prove the truth or otherwise of my statement. My

My removal from the Railway Department of Victoria to a partnership in the firm of Wm. M'Culloch & Co. I need not again touch. I have made my statement, which the Government can verify by reference to Crown Ministers in Victoria, who know all about the circumstances, and who can vouch for my probity and honorable conduct during a long series of years.

In conclusion, as I feel deeply aggrieved, I may be excused for saying that nothing can justify a man being attacked as I have been, and that no privilege should shield one whose words might blast the future of an innocent man. It is very well for Mr. Want to say he bears me no ill-feeling, but his language nevertheless has the same effect as if he did, and if he only knew me better I believe he would have been the last to become the mouthpiece of such a gross injustice.

I have, &c.,
W. M. FEHON,
Commissioner for Railways.

The Colonial Secretary, New South Wales, to The Honorable Duncan Gillies, M.P.,
Victoria.

Sir, Colonial Secretary's Office, Sydney, 13 December, 1888.

I have the honor to enclose copies of the Official Reports of the Debates in the Legislative Assembly of this Colony, on Friday and Tuesday last, in which it will be seen that Mr. J. H. Want, late Attorney-General in the Jennings administration, made a strong attack upon the character of Mr. W. M. Fehon, who was lately appointed by this Government to the office of Railway Commissioner.

I shall feel much obliged if you will cause such strict inquiries to be made as will place beyond doubt the question of Mr. Fehon's character and conduct as an officer in the Railway Service of Victoria.

If any other information can be afforded respecting Mr. Fehon's character as a citizen of your Colony, I shall feel much indebted to you for any such information being supplied to this Government.

I have, &c.,
HENRY PARKES.

The Colonial Secretary, New South Wales, to The Honorable William Wilson,
Melbourne.

Sir, Colonial Secretary's Office, Sydney, 13 December, 1888.

I have the honor to transmit herewith copies of the official reports of Debates in the Legislative Assembly of this Colony in which attacks were made upon the character of Mr. W. M. Fehon, lately appointed by this Government to the office of Railway Commissioner. I shall feel much obliged if you will inform me of any knowledge you may possess bearing upon the misconduct imputed to or insinuated against Mr. Fehon, either in his capacity as an officer of the Railway Service of Victoria, or in any other capacity.

I have, &c.,
HENRY PARKES.

[Similar letters were addressed to the Honorable Francis Longmore, Melbourne; the Honorable James Service, Melbourne.]

W. M. Fehon, Esq., to The Colonial Secretary.

Dear Sir Henry, Department of Railways, Sydney, 17 December, 1888.

In compliance with your request, I forward herewith a short memorandum as to dates, &c., bearing on the charges made against me by Mr. Want, and in addition I forward two letters received by me, which also bear on the same subject—one from Mr. Harold Selwyn Smith, respecting my standing in the Victorian Railway Service, and the other from Mr. F. A. Wright, regarding my association with the Company of Wright, Heaton, & Co.

I also enclose a copy of Wright, Heaton, & Co.'s prospectus, wherein you will see the dealing was between Wm. M'Culloch & Co. (limited) and Wright, Heaton, & Co., and not between individuals and that company.

As these three documents are all in corroboration of my previous communication, I trust you will have them so dealt with that they may have the same publicity as the charges it has pleased Mr. Want to make against me.

I am, &c.,
W. M. FEHON.

[Enclosures.]

MR. FEHON'S CASE.

JOINED Wm. M'Culloch & Co. in March, 1872.

Ceased his connection with them in February, 1883.

Has held no interest in any carrying company since February, 1883.

Wright, Heaton, & Co.'s business was put into a company in March, 1880, when Wm. M'Culloch & Co. (Limited) had 4,000 shares, which, for convenience of voting, were divided amongst eight of Wm. M'Culloch & Co.'s shareholders, Fehon having 500 placed in his name.

In August, 1882, the capital of W. H. & Co. was increased, and 800 more shares were placed in Fehon's name until March, 1883, when Fehon sold out of Wm. M'Culloch, and consequently ceased to be a shareholder, when the interest which stood in his name, in Wright, Heaton, & Co., was transferred to John Jackson, who was also a shareholder in Wm. M'Culloch & Co.

In 1885 F. A. Wright, without Fehon's knowledge, placed 650 of his shares into Fehon's name, and 1,835 into the names of other persons. After doing so he wrote Fehon, and asked him to sign a blank transfer. These shares Wright allowed to remain in Fehon's name till June last, but these shares Fehon never had the slightest interest in.

Fehon never saw one of Wright, Heaton's business books, and never gave the slightest order or advice in connection with working Wright, Heaton's business; neither did he ever have any conversation with any member of the staff as to the way they should conduct their business.

Wright, Heaton's prospectus does not even mention Fehon's name as a trustee for Wm. M'Culloch & Co.'s interest—the names being Hon. C. J. Jenner (late Chairman of Committees in the Legislative Council of Victoria) and Mr. Jenkin Collier, the well known contractor.

As a fact, Fehon never had a single shilling in Wright, Heaton's business, except that as a shareholder in Wm. M'Culloch & Co.; he was interested in all the assets of that company, and of which the shares (M'Culloch's) held in Wright, Heaton, & Co. formed a portion.

Mr. Want stated he could find nothing against Fehon when getting up the case against Wright and Heaton.

All his statements are based on the word of two informers who could know nothing of Fehon.

W. M. Fehon, Esq., Commissioner for Railways, Moss Vale,—

Ellenboro Chambers, 97, Castlereagh-street, 13 December, 1888.

Dear Sir,

I deem it only courteous to you to annex copy of a note I addressed to Mr. J. H. Want yesterday, and which is self explanatory.

Yours, &c.,
H. SELWYN SMITH.

Sydney, 12 December, 1888.

My dear Mr. Want,

If the *Herald* correctly reports your reference in the House last night to Mr. Fehon in connection with the inquiry I conducted relating to the Victorian Railway Department in 1862, you must have misapprehended my reply to your request that I would tell you whether I had held an inquiry into Mr. Fehon's conduct while he was in the service of the Government.

I told you distinctly that I had not, and I explained further to you. In the year 1862 the Governor in Council appointed me under commission to investigate and report upon every Department of the Victorian Railways, excepting only that of the Engineer-in-Chief.

In the course of my duties I became acquainted with Mr. Fehon, who was then in charge or sub-charge of the goods-sheds. I formed a high opinion of his special abilities for the discharge of the duties assigned to him, and to this effect commended him to the Commissioner of Railways—the late Sir W. H. F. Mitchell, and to the Traffic Superintendent, the late Mr. John Carruthers. He was, I think, immediately thereafter appointed to the full charge, a position he held up to the time he resigned the service.

My report to the Government is a Parliamentary document in Victoria, and a reference to it will show that Mr. Fehon's Department was commended, and he certainly was not the subject of any special inquiry by me. It seems to me to be due to Mr. Fehon to write what I have done.

Yours, &c.,
H. SELWYN SMITH.

J. H. Want, Esq., M.P., &c., &c.

Wright, Heaton, & Co. (limited), 241, Pitt-street, Sydney, 13 December, 1888.

My dear Mr. Fehon,—

It was with great pain that I read the very unfair and in some respects untruthful statements made on Tuesday night in the Assembly by Mr. J. H. Want reflecting on you.

It is the worst possible form of attack, because to those unacquainted with the facts of the case it bears the semblance of truth; and I have no doubt that Mr. Want has the fullest belief in his statement and was actuated by a sense of duty in making the charges.

I shall be very pleased, if called upon, to give evidence upon oath, which can be confirmed by others if necessary, that will convince every fair-minded man in the community that you are entirely guiltless of the charges brought against you, so far as your connection with Wright, Heaton, & Co. is concerned.

The facts I can prove are as follows:—

- 1st. That you never held a share in Wright, Heaton, & Co., other than as a trustee.
- 2nd. That you ceased to have any business transactions (as a director) with the firm since August, 1882, that being the date of your last attendance at any meeting of the directors of which up to that time you had been one from 1880. Your total attendance at meetings were seven, four of which were formal for the initiation of the company; and in September, 1884, the interest in our firm which stood in your name, viz., 1,300 shares, were transferred to Mr. John Jackson, who had succeeded you as a director to represent the Melbourne interest,
- 3rd. That you never looked into or examined in any way any business books of the firm, and that no person other than the employees and the Managing Directors, Mr. Heaton and myself, have ever done so; in fact no details of the business or any books, other than the minute, bank, or transfer books, have been before a board meeting, or been looked at by any director other than those entrusted with the management.
- 4th. Dealing with that part of Mr. Want's speech in which he says you were recently, and he believes still, a shareholder of my company, it has arisen from the fact that in October, 1885, just about the time I went out of office and Parliament, I transferred, as a matter of convenience to myself, 650 of my shares to your name, and, at the same time, 750 to C. B. Lowe, of Sydney; 508 to Tunmouth F. Dye, of Brisbane; and 577 to John Jackson, of Melbourne. This transfer took place at my request, and without the knowledge of yourself or the other gentlemen named, neither of whom were considered as shareholders, or acted as such, the shares being retransferred to me in blank within a week from the date of issue. The transfer in our books took place in June last.

This is the only portion of Mr. Want's charge *re* W., H., & Co. that can be considered serious against you; and the facts I have stated can be proved by numbers of reliable witnesses. I have shown this to Mr. Heaton, who entirely approves of it, and, like myself, is perfectly willing to submit himself to any examination in relation to this matter.

I remain, &c.,
F. A. WRIGHT.

W. M. Fehon, Esq.

MEMORANDUM OF ASSOCIATION OF WRIGHT, HEATON, & CO. (LIMITED).

3.—The objects for which the Company is established are the carrying on and in such place or places as the company may from time to time determine, and for the purchase of (in all its branches) the business heretofore carried on by Francis Augustus Wright, Edward Heaton, Edward Bell Barber, and Jenkin Collier, with Caleb Joshua Jenner, as Trustees for William M'Culloch & Co. (limited), under the style or firm of "Wright, Heaton, Barber, & Co.," as agents to the Railways of New South Wales, contracting and general carriers, express agents, Customs, shipping, insurance, general and forwarding agents, merchants and traders, and the goodwill thereof; and all the property (real and personal) of and belonging to or used in or about or in connection with the said business, whether in the name of the firm or in that of individual partners, and to undertake all or any part of the liabilities of the said Wright, Heaton, Barber, & Co. in relation thereto, as and from the first day of February, one thousand eight hundred and eighty.

We, the several persons whose names and addresses are hereunto subscribed, are desirous of being formed into a company in pursuance of this memorandum of association, and we respectively agree to take the number of shares in the capital of the company set opposite our respective names.

Names.	Addresses and description of Shareholders.	Number of Shares held by each Shareholder.
W. M'Culloch	Gentleman, 123 Collins-street, Melbourne	Five hundred shares.
James M'Culloch	Gentleman, 123 Collins-street, Melbourne	Five hundred shares.
C. J. Jenner	Importer, 18 Market-street, Melbourne.....	Five hundred shares.
Jenkin Collier.....	Contractor, George-street, East Melbourne ...	Five hundred shares.
W. M. Fehon	Carrier, 123 Collins-street, Melbourne	Five hundred shares.
W. G. Sprigg	Accountant, 18 Market-street, Melbourne ...	Five hundred shares.
William Cain	Contractor, South Yarra, Melbourne.....	Five hundred shares.
L. Munro.....	Gentleman, Sydney	Five hundred shares.
F. A. Wright	Carrier, 485 George-street, Sydney.....	Two thousand six hundred and seventy-seven shares.
David M'Neil.....	Carrier, Tamworth, New South Wales	Two thousand shares.
Edward Heaton	Carrier, Orange, New South Wales	Two thousand six hundred and seventy-seven shares.
John Woods	Contractor, Manly Beach, New South Wales..	Six hundred and forty-six shares.

INCREASE OF CAPITAL.

Memorandum of Resolution carried at an adjourned Extraordinary General Meeting of Shareholders, held at the Company's Offices on Friday, 4th August, 1882.

That the capital of the Company be increased to £80,000, by the issue of 4,000 new shares at £5 each; and that the new shares be offered to William McCulloch & Co. (limited), on the following terms, viz.:—That they purchase them at six pounds five shillings (£6 5s.) per share, viz., £3 5s. paid up, and that the bonus of £12,000 be added to the present value of existing shares, and further, that the six thousand pounds (£6,000), at present written off goodwill account, and the six thousand pounds (£6,000) brought forward on the last year's balance-sheet be used to further write up the value of the 12,000 existing shares, another £1 per share making them paid up, £4 5s. per share, but all shares participate equally in dividends irrespective of amount paid up.

* * * * *

The Honorable Duncan Gillies, M.P., Victoria, to The Colonial Secretary, New South Wales.

Sir,

Premier's Office, Melbourne, 20 December, 1888.

I have the honor to acknowledge the receipt of your letter of the 13th instant, requesting to be furnished with some information respecting the character of Mr. W. M. Fehon, recently appointed to be a Railway Commissioner in New South Wales.

As I mentioned in my previous note to you on this subject, Mr. Fehon resigned his position as Traffic Manager in the Victorian Railway Department previous to my becoming the Minister at the head of that Department in 1872.

The date of his retirement was the 31st March, 1872. It was entirely voluntary on his part, and, as was well known at the time, it was with the intention of joining the carrying firm of McCulloch and Co.

I may state that some months after Mr. Fehon's retirement he made an application to me for a retiring allowance, on the special ground, that while he was in the Railway Department, he had rendered exceptional service to the Government. No retiring allowance was, however, granted to him, because he left the Service voluntarily, in order to benefit himself.

I know nothing, and have not heard of anything, detrimental to Mr. Fehon's character and conduct as an officer in the Railway Service of Victoria. As regards his reputation as a citizen, I take the liberty of forwarding to you a printed report of a farewell luncheon given to Mr. Fehon previous to his departure from Melbourne to assume the responsibility of his office as one of your Railway Commissioners. It will be noticed that a number of well-known public men were present and took part in the proceedings. This circumstance may well be allowed to speak for itself.

I have, &c.,
D. GILLIES,
Premier.

[Enclosure.]

"The Argus," 3 November, 1888.

FAREWELL LUNCHEON.

MR. W. M. FEHON, who was recently appointed a Commissioner of Railways in New South Wales, was entertained at luncheon yesterday, in the supper-room at the Town Hall, by a large number of Melbourne citizens. The chair was occupied by Mr. James Service, M.L.C., and amongst those present were Mr. Deakin (the Chief Secretary), Mr. Simon Fraser, M.L.C., Mr. R. Ford (Railway-Commissioner), Mr. R. Speight, Mr. D. M. Davies, M.L.A., Mr. C. W. Langtree, and Mr. C. H. James, M.L.C.

The CHAIRMAN, after the usual loyal toasts had been honoured, and also that of His Excellency the Governor, stated that he had been requested to apologise for the absence of Mr. Gillies. However, there were two or three members of the Ministry present, and he proposed the health of the Government, in order that Mr. Deakin might be able to add his testimony to the value of their guest.

The toast was drunk with enthusiasm.

Mr. Deakin, replying, said he proposed to say nothing about the Government, except that it and past Governments had been under great obligations to Mr. Fehon, both in connection with the Central Board of Health, and also with the railway service of the Colony. Mr. Fehon, in the high and honourable position he was going to occupy, could do much to cement the relations of the two Colonies. Although he was partially parting from friends in Melbourne, he was passing to other friends of theirs, and would assist them in making this one of the freest, most progressive, populous, and most powerful continents in the world. (Cheers.)

The Chairman rose to propose the health of the guest. He said that Mr. Fehon had been amongst them for many years in a variety of capacities, but whether as a public servant or as a private citizen his ideas and time were always at the disposal of the public. Mr. Fehon deserved that respect which the meeting manifested towards him in so high a degree. Mr. Deakin had referred to his connection with the Central Board of Health. In that capacity, if in no other, he had rendered valuable aid, but he had done much in the movement to have the city extended westward. (Hear, hear.) If he did not get all his own way, he submitted a scheme which was practicable, and which it would have been wise to adopt. (Hear, hear.) They all regretted losing him, but whilst he was being lost from Melbourne he was being gained in Sydney, and both were equally Australian cities. It was a satisfaction to them all to know that the railways in New South Wales would be under the direction of a gentleman, who, if he had not served his apprenticeship on our railways, was for a long time connected with them. He was very gratified to think that New South Wales had seen fit to select a gentleman from Victoria. The feeling in Sydney towards Melbourne was one of kindness in the highest degree, although there were a good many persons who believed that no good thing could come out of Nazareth, but they came to Nazareth to get a good thing for their railways. Mr. Fehon would prove in a very short period that he was the right man in the right place. Whilst he was a man of personal ability, and capable of working a huge machine, he was a man of kindly feeling, generous disposition, and had a knowledge of how to work a system in which a large number of persons were engaged. They could look forward to seeing the new system of railway management in New South Wales, which was adapted from Victoria, working as smoothly with Mr. Fehon as one of the Commissioners, as it did here under the presidency of Mr. Speight and his worthy coadjutors.

The toast was drunk amid cheers.

Mr. Fehon said that he was overcome by the flattering manner in which he had been entertained, and by the words of Mr. Service and Mr. Deakin. He looked back upon his career and could not think that he deserved it. There were some gentlemen present whom he had known for over 30 years, and when men could be friends for that length of time there could not be much the matter with any of them. Twelve months ago he would not have accepted the appointment, because he was not dissatisfied with this Colony, in which he had carried on his business, but he felt that Mrs. Fehon required a change, and the position offered to him was a high and honourable one. The work to which he was going was congenial, for besides being a railway man, he was well acquainted with the other Colonies. He was, in his opinion, a man after Mr. Service's heart—a federalist. One fact which gave him great satisfaction was that the New South Wales Government had appointed as his colleagues

colleagues two gentlemen with whom he could work for the good of the Colony. A person could take a train at Adelaide to-day and go through to Brisbane in a few hours, a trip which five years ago was regarded as impossible. He would try to justify the confidence which the New South Wales Government had reposed in him, and to give satisfaction to the large number of friends who would watch his career with interest.

Mr. G. Coppin, M.L.A., proposed the health of the Chairman, who, he said, was the father of our foreign policy. Since that policy was created the Colony had progressed more than it had ever done previously in the same space of time, for we had attracted attention from all parts of the world through our own and other exhibits. It was to be regretted that Mr. Service had taken his departure in peace from the scene of the storms and broils in the Legislative Assembly. He (Mr. Coppin) would far sooner see him back there again. (Hear, hear.)

The Chairman said that he was pleased, in his old age, to think that during the thirty-five years he had lived here he had secured, to a certain extent, the kindly feeling of his neighbours and fellow men. That was a goal worth aiming at, although he confessed that it was not the goal he aimed at at first. After all the old political disturbances, and fights, and other troubles they had been engaged in, the successes they had accomplished, the difficulties they had overcome, and were to overcome, welded them together and gave them a kindly feeling towards one another which would last while life did. Mr. Coppin had been good enough to refer to the future. No one could tell what would happen. He could repose at his ease in the other chamber; and had no desire to go down to the Assembly so long as nights were passed in doing worse than nothing. (Hear, hear.) Nothing was more pleasing to him than a good stand-up fight, when it was conducted in a friendly and amiable spirit, but it was a monstrous state of things when public affairs could not be conducted without personal bitterness. (Hear, hear.) The public business could only be conducted when the constitutional practice was adhered to. Some people said that it was the province of the Opposition to oppose. He denied that utterly. It was the duty of the Opposition to criticise thoroughly and heartily, but without personal abuse, such as we have had too much of in the Australian Colonies. He could say, as one who had visited the old country, that nothing made the blood fly to his face more than to read telegrams in the papers there about scenes in the Australian Parliaments. The blood was brought to the face of every Australian in England on reading such telegrams. It depended upon the constituencies whether the country should have those scenes or not. The duty of every constituency was to see at the ensuing general election that the men who disgraced Parliament should no longer be sent there. (Cheers.)

Mr. W. Wilson proposed the health of Mr. Speight and the other Railway Commissioners.

Mr. Speight, responding, said that he was glad that the selection of the Victorian Railway Commissioners met with the approbation of the Colony. (Cheers.) If it were not that they felt they were strongly backed up in whatever course they took by public opinion, their duties would be too much for them to carry out. Mr. Fehon would do well to be careful of public opinion, and see that no friction existed in his department. He would ensure success if he preserved unanimity amongst the Commissioners. Discord was bad enough outside, but it was ten times worse inside. He was glad to have had the opportunity of wishing Mr. Fehon God-speed.

The gathering then broke-up.

The Honorable William Wilson, Melbourne, to The Colonial Secretary,
New South Wales.

Sir,

Australian Club, Melbourne, 17 December, 1888.

I have the honor to acknowledge receipt of your favour of 13th instant, and in reply thereto beg to state that Mr. Wm. M. Fehon was Traffic Manager of the Victorian Railways during 1869 and portion of 1870, when I received my appointment as Commissioner of said Railways.

The late Mr. Thos. Higinbotham was then Engineer-in-Chief, and head of all the Departments. I found this arrangement very awkward, and therefore deemed it advisable that a change should be made in the responsibilities of the several offices, and in carrying out the new arrangements I obtained most valuable assistance from Mr. Fehon.

I appointed him Traffic Manager as head of the Department, and during all the time I held office as Commissioner of Railways, I had every reason to be more than satisfied with his general knowledge of the duties to be performed, and his tact in managing that branch of the Service, and looked upon him as a most valuable, capable, and efficient officer, and in recognition of the ability displayed by him I was instrumental in securing an increase in salary.

I may further state that privately I have known him ever since, and can confidently say that in my opinion a more honourable or upright gentleman does not exist, and one incapable of doing a mean or dishonourable action.

I have, &c.,

WILLIAM WILSON.

The Honorable James Service, Melbourne, to The Colonial Secretary,
New South Wales.

Sir,

119 Collins-street, West Melbourne, 17 December, 1888.

I have the honor to acknowledge receipt of yours of 13th instant, and have read your enclosed Hansard in the matter of Mr. Fehon.

In reply, I beg to say first, that I have no knowledge whatever of the things charged against that gentleman, and second, that I do not know of anything in Mr. Fehon's career which renders him unfit to hold any office or post in which the strictest honour and probity are essential qualifications.

I am, &c.,

JAMES SERVICE.

The Honorable Francis Longmore to The Colonial Secretary.

Sir,

"Tullaree," Tarwin Lower, 21 December, 1888:

I have the honor to acknowledge receipt of your letter of the 13th instant, also official reports of debates in the Legislative Assembly of your Colony, in which attacks were made upon the character of Mr. W. M. Fehon, lately appointed by your Colony to the office of Railway Commissioner.

In your letter you ask me to inform you of any knowledge I may possess "bearing upon the misconduct imputed to or insinuated against Mr. Fehon, either in his capacity as an officer of the Railway Service of Victoria or in any other capacity."

In reply, I beg to say that Mr. Fehon was Traffic Manager of the Victorian railways when I had charge of them in the years '69 and '71, and I never heard any "misconduct imputed or insinuated against him." I looked upon him as a very able officer.

He resigned his position voluntarily for reasons that I sympathised with at the time.

I know nothing whatever of his dealings since he became connected with M'Culloch & Co.

I have, &c.,

FRANCIS LONGMORE.

The

W. M. Fehon, Esq., to The Colonial Secretary.

Dear Sir Henry,

Railway Commissioners' Office, 28 December, 1888.

I have much pleasure in handing herewith for your perusal and information an address signed by the Mayor and Councillors of the City of Melbourne, as well as by the principal merchants and others of that City, wherein they express their sympathy with me in the charges recently brought against me by Mr. J. H. Want, and their confidence in my integrity and honor.

I am, &c.,
W. M. FEHON.

[Enclosure.]

To William M. Fehon, Esq.

HAVING noticed that an unwarranted attack has been made upon your character by some persons who have either allowed their feelings to blind their sense of honor and of justice, or who have some ulterior object in view, we, who have personally known you for many years, desire to assure you of our unshaken faith in your probity and honor, and of our thorough belief that you could never have given cause for the aspersions so wantonly cast upon you.

The Colonial Secretary to W. M. Fehon, Esq.

Sir,

Colonial Secretary's Office, Sydney, 22 December, 1888.

In reference to the statements made in the Legislative Assembly by Mr. J. H. Want, impugning your character in connection with the important office you hold in the Civil Service of this Colony, I have read your several letters of explanation, and have received and carefully considered the replies to inquiries made in Victoria, copies of which I forward herewith for your information.

On behalf of the Government I have pleasure in informing you that it is considered that the aspersions cast upon your character have been fully and satisfactorily met.

I have, &c.,
HENRY PARKES.

1888.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(CORRESPONDENCE, &c., RESPECTING APPOINTMENT OF RAILWAY INSPECTORS.)

*Ordered by the Legislative Assembly to be printed, 12 December, 1888.***Mr. James Angus—Salary, £600.****Minute Paper by The Chief Commissioner for Railways.***Subject:—Mr. James Angus—Salary, £600.*

MR. JAMES ANGUS, the civil engineer, whose services have been obtained through Mr. G. Findlay, the general manager of the London and North-Western Railway of England, is an engineer of great experience and ability, and has had a long training as engineer for a contractor in making new lines, and for the last ten or twelve years has had charge of the maintenance of the permanent-way works of two of the heaviest sections of the London and North-Western Railway; the first part of the time having controlled the Birmingham and South Staffordshire section, and for the last seven or eight years having been in charge of the southern section, including the London District.

E. M. G. EDDY.

Mr. D. H. Neale—Salary, £550.**D. H. Neale, Esq., to E. M. G. Eddy, Esq.**

Dear Sir,

73, Broadway, New York, 24 August, 1888.

I hear from Mr. Barattoni that you are leaving the Caledonian for Australia. I am sorry that I shall miss seeing you in Glasgow, which I hope to visit shortly; but I can, at any rate congratulate you on the wonderful run of the Scotch express from Carlisle to Edinburgh, which has caused quite a sensation here.

I hope if you are in want of an intelligent and experienced officer in the locomotive, carriage, and wagon department that you will bear me in mind. I have had twenty-one years' railway experience in Great Britain, the Cape of Good Hope; and the United States; and have held a great variety of positions, and met railroad men from, I think, every country in the globe, from Russia to Venezuela.

I have sent you copies of testimonials, &c., addressed to New South Wales; but Mr. Drummond, Mr. W. Adams, and Mr. George Macellan, works manager at Stratford (Great Eastern Railway), can speak as to my abilities. Mr. Massey Bromley, under whom I served for nearly four years, is dead; but Mr. Adams can tell you what Mr. Bromley thought of my services.

Wishing you a pleasant voyage, and hoping that you will find your new position satisfactory and pleasant,—

I remain, &c.,

D. H. NEALE.

THIS letter overtook the Chief Commissioner at Naples; and from Port Said he wrote a letter to Mr. Neale, stating that he did not know what the requirements of the New South Wales railways were, but that it would be better if he wrote a further letter, giving more particulars of his experience in controlling locomotive, &c., works; and the following is an extract from the reply received under date of 13th October, 1888:—

"In regard to your inquiry concerning my experience in actual charge, I had charge of the shops of the Cape Railways, near Cape Town, for some time, nearly a year, and enlarged them, and infused more life into the workmen. When I went the repairs were greatly in arrears. We had only five broad gauge engines, two were running with known defects and the other three were in the shops, and had been there for months. I got all five in working order, and the old Locomotive Superintendent told me that he never recollected all being fit to run at any one time before. I sent you a copy of my testimonial from the General Manager, addressed to you at Sydney.

"As regards salary, I have been getting \$3,000, say £600 here, and they have offered me \$3,600, say £720, to stop. I understand, however, that rent, &c., is far cheaper in Sydney, and therefore I would be willing to take less. Prices are enormous here, and as I should much like a change I should be willing to take £550. I got £400 when I first joined the Cape Railways, and it was raised to £450 after I had been with them six months.

"I should mention that the shops were the largest in the Colony. I had nearly 100 locomotives when I left, and over twenty in steam daily at my works. I had for a short time charge of the entire Locomotive Department."

Mr.

D. H. Neale, Esq., to E. M. G. Eddy, Esq.

[Private.]

Dear Sir,

Railroad Gazette, 73 Broadway, New York, U.S.A., 23 August, 1888.

I am sorry that your departure for Australia will prevent my seeing you on my approaching visit to England, but I trust that your new appointment will prove satisfactory to you in every respect.

I hope that if you want a man in the Locomotive Department you will bear me in mind. I have had a good deal of experience under Mr. Adams on the North London, then under Mr. Drummond on the North British, and afterwards as Chief Draughtsman on the Great Eastern. I was also on the Cape Railways as Assistant Locomotive Superintendent, and had charge of the shops, and effected a good many reforms, putting the men on piece-work and materially increasing the amount of work turned out.

I inspected locomotives, water-cranes, &c., for the South Indian Railway, of which Sir Charles Douglas Fox is engineer. The engines (83 in all) were built at Sharp Stewart's, and at Neilson's, so that I had a good opportunity of seeing the best locomotive builders practise.

I had a good deal of experience with different forms of brakes while in England and the Cape, and was appointed one of the Committee to conduct trials and choose the best freight brake for this country. I enclose a copy of our final report which I drafted, and copies of some testimonials.

I am nearly forty-one, and have had twenty-one years railway experience. My salary in the Cape at starting was £400, and it was increased to £450 after I had been there six months.

I have held my present post nearly five years, but my salary \$3,000 (say) £600 is not sufficient, in my opinion, in such an expensive place as New York; and I feel sure this trying climate would not suit the English lady to whom I hope to be shortly married. I therefore should be glad to get a post in the Colony, for which I believe I am well fitted, both by age, disposition, and experience.

Any letter or cable addressed either 73 Broadway, New York, or Neale, Dartmouth, England, will reach me.

I remain, &c.,

D. H. NEALE.

[Enclosures.]

Dear Sir,

South Indian Railway, Engineer's Office, 5 Delahay-street, Westminster, S.W., London, 9 May, 1876.

I am in receipt of your letter of the 5th instant, and can only say that I have been perfectly satisfied with the manner in which you have discharged your duties as Locomotive Inspector, and shall be always glad to give you a recommendation.

D. H. Neale, Esq., 1 Holywood Crescent, Great Western Road, Glasgow.

I am, &c.,

CHARLES DOUGLAS FOX.

London and South-Western Railway, Locomotive Engineers' Office, Nine Elms Works,

London, S.W., 2 September, 1881.

My dear Sir,

This will be handed to you by Mr. Neale, an old pupil of mine, now Chief Draughtsman at the Stratford Works of Great Eastern Railway.

Mr. Neale is desirous of obtaining employment on the Cape Railways, and, as I consider him a thoroughly practical man, and qualified for any leading position in the Locomotive or Carriage Departments of a Railway, I have much pleasure in recommending him to you.

C. H. Gregory, Esq.

I am, &c.,

W. ADAMS.

My dear Sir,

I am informed by the bearer, Mr. D. H. O'Neale Neale, that there is some little difficulty in his obtaining a certificate from you as to his service under the Great Eastern Railway Company owing to a change of Locomotive Superintendents.

I have much pleasure in stating that Mr. Neale was employed by your Company, under me, from February, 1878, until August, 1881, as Chief Draughtsman in the Locomotive, Carriage, and Waggon Departments, and during that time his brains, capabilities, and attention to business always gave me complete satisfaction.

Hoping that the above may be of use to Mr. Neale in his application for another position; and, with kind regards,

W. Birt, Esq., General Manager.

I remain, &c.,

MASSEY BROMLEY.

Office of the General Manager of Railways, Capetown, 26 December, 1882.

MR. D. H. O'N. NEALE has been in the Cape Government Railway Service as Assistant Locomotive Superintendent, Great Western System, for about fourteen months, during which he has acted as Locomotive Superintendent of the Western System for about six weeks.

Mr. Neale is an engineer of considerable ability, has proved his efficiency, and I am informed that he has given the Locomotive Superintendent of the Western System general satisfaction in the performance of his duties.

He leaves the Service at his own instance on personal grounds.

C. B. JELLIOT,

General Manager.

The Manchester Ship Canal, 68B Market-street, Manchester, 30 January, 1883.
I HAVE much pleasure in stating that during the time I was in command at the Cape I had the very highest opinion of your capabilities in the Locomotive, Carriage, and Waggon Department; and I consider that, in spite of the difficulties you met with, you accomplished wonders in the reduction of expenses and the increase of efficiency. If the Government had adopted my recommendation, and pensioned off the Locomotive Superintendent, you would have been put in this place.

I never can speak in terms sufficiently warm of the painstaking way in which you evolved order from chaos, and reduced inefficiency and extravagance within proper bounds.

To D. H. O'Neale Neale, Esq.

J. LAWRENCE,

General Manager.

[3d.]

1888.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

CITY RAILWAY EXTENSION.

(PETITION FROM CERTAIN RESIDENTS OF CITY AND SUBURBS IN FAVOUR OF.)

Received by the Legislative Assembly, 28 November, 1888.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned residents of the City of Sydney and Suburban Towns and Boroughs, as well as of the Country Districts of New South Wales,—

RESPECTFULLY SHOWETH:—

(1.) That urgent need exists for the extension of the main line of Railway to the deep waters of Port Jackson, at Circular Quay, and that such extension has been repeatedly promised by successive Governments.

(2.) That nearly four years ago your Honorable House passed the vote for such extension, and two years later plans and book of reference were approved, but nevertheless, and notwithstanding the promises above referred to, the work has never yet been carried out, a work required not only for the benefit of the metropolis but to meet the travelling and commercial requirements of the inhabitants of the whole Colony.

(3.) That, according to the railway returns for last year the suburban railways were the only lines paying more than interest on cost of construction. The returns for these lines would be considerably increased if the traffic were carried to the heart of the city, instead of stopping short at its southern extremity.

(4.) That a large sum of money is annually expended by the Railway Department for the delivery of wool by drays and lorries, within the city, causing a loss to the Department of nearly £10,000 a year, and an incalculable amount is also lost to the public by reason of the distance that goods, intended for transmission by rail to the country, have to be carried from the wharves and other parts of the city.

(5.) That the estimated cost of the work will be materially increased, by being longer delayed, owing to the rapid advance in the value of city lands.

Your Petitioners therefore pray that precedence over all other new lines be given to this most necessary work, and that it be commenced and completed forthwith.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 64,029 signatures.]

1888-9.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY LOCOMOTIVES.

(FURTHER PAPERS RESPECTING FIFTY COLONIAL MADE.)

Ordered by the Legislative Assembly to be printed, 11 January, 1889.

[Laid upon the Table of the Legislative Assembly by the Secretary for Public Works on 11th January, 1889, Minutes and Reports in connection with the Manufacture in the Colony of Locomotives for the Railway Department.]

Minute by The Secretary for Railways to The Under Secretary for Public Works.

I AM instructed by the Railway Commissioners to forward the report of Mr. Midelton, regarding the manufacture of locomotives, asked for by the Minister for Public Works; but they desire me to state that, in forwarding the report asked for, it will not be considered that they are expressing any opinion upon the subject under review.

B.C., 9/1/89.

D. VERNON.

Submitted.—J.B., 10/1/89.

With reference to the latter portion of the minute of the Secretary for Railways, I desire to state that, in sending the papers to the Railway Commissioners, I advisedly omitted asking for their opinion on the subject, as I am well aware that in this matter I was the Minister responsible for the action taken. My only desire in obtaining the report of Mr. Midelton on the subject, was to show upon what grounds I based my action, Mr. Midelton being the officer responsible to me in the matter.—JOHN SUTHERLAND.

Minute by Mr. Superintendent Midelton.

Report upon Mr. Dalton's speech in Parliament on the 28th November, 1888. [See *Hansard*, 28/11/88.]
In accordance with the instructions contained in Commissioners' 88-22,434 herewith, I have the honor to report as follows:—

Mr. Dalton does not appear to have read the Parliamentary papers on the locomotive question, which were printed on the 13th October, 1887, so assiduously as he has the *Indian, Colonial, and Foreign Engineer and Builder*. On page 2 of the former he could have seen that "twelve copies of each specification for colonial-built engines, and ten copies of each specification for engines to be manufactured in England or elsewhere," were forwarded to the Commissioner by the late Locomotive Engineer, Mr. Scott, on the 31/8/86, so that is quite true "there was one specification for the foreign, and another for the local manufacturer" for his engines only. Steel fire-boxes, shells, and tubes were introduced, because they are best, and lessen the first cost of the engines, and it is "all nonsense to say that this has been done in the interest of freetrade."

Speaking generally, those persons who have had no actual experience of a thing are the most emphatic in their opinions, and Mr. Dalton tells us the author of the article "is a scientific gentleman, who understands what he is writing about"; but I question whether he ever had a day's experience of steel fire-boxes. He, like others, seems to think that copper boxes give no trouble, never *crack*, or want *repairing*, and are perfect. He makes use of the orthodox statement about the value of the old metal, the conductivity, &c., &c., but he says nothing about the *thickness* of *plate* (copper being $\frac{1}{2}$ " and steel $\frac{1}{8}$ " and $\frac{3}{8}$ "). Now, as the conductivity of silver is 100, copper 74, and steel 60, one would think that silver fire-boxes would be best, but they are not yet spoken of, although the old metal would sell well, no doubt, when worn out. Neither do we hear of marine, portable, or stationary engine builders proposing to use copper fire-boxes. It is left almost exclusively to the English locomotive engineers to use that metal, and they do not forget to ride their hobby well. They have lately ventured to use steel plates for shells of locomotive boilers, and perhaps, in the course of a century, they may adopt steel for inside boxes too. Their American brethren, with their 150,000 miles of railway, use steel, I may say, exclusively, as Mr. Dalton could see, if he would peruse the American engineering papers, a book entitled "Recent Locomotives," "The Proceedings of the Institute of Civil Engineers," and other papers. The

The Government Analytical Chemist, Mr. Hamlet, would perhaps kindly tell us which is the most scientific and perfect boiler, *one made of steel or iron throughout*, or one made of *copper, brass, and wrought iron*, metals having different ratios of expansion and considerable galvanic action, when made up into a locomotive boiler.

Mr. J. N. Paxman says his firm began to manufacture steel fire-boxes in 1879, and up to 1883 had made 230 with very fair results. Sir Fred. Branwell, Bart., said in 1883, the steel fire-boxes, under a lengthened inspection which he made on the Grand Trunk Railway of Canada, "appeared to be perfectly satisfactory." That company continues to make steel fire-boxes.

Mr. B. Connor, late Locomotive Superintendent of the Caledonian Railway, stated that the steel fire-boxes which were put in between 1860 and 1863 were still working in 1871, and only two out of ten had been slightly repaired.

Mr. Worsdell, now Locomotive Superintendent of the North-eastern Railway (England), formerly of the G. E. R., L. & N. W. R., and the Pennsylvania Railway, stated in 1883, "he was so satisfied with the quality of the material (steel) that before he left Altoona, he had put in 250 to 300 steel fire-boxes, and he did not remember a single failure due to steel.

Sir John Hawkshaw, C.E., said in 1883, "he had been twice to America during the last four or five years, and finding that such a thing as a copper fire-box was unknown there, he naturally inquired *into the reasons for the use of steel.*" He said also "the Americans did several things better than Englishmen"—an opinion I cordially endorse.

In 1877, Mr. Stirling, Locomotive Engineer, of the G. N. R., said a copper fire-box lasted for three to five years, and Mr. Kirtley, Locomotive Superintendent of the L. C. & D. Railway, also spoke about copper boxes. These two authorities gave 100,000 miles as the average life of a copper box; and if so, American steel boxes were doing twice the duty of English at one-sixth the cost.

Mr. D. Adamson, the most eminent boilermaker in England, said last year, "in 3,000 steel boilers of his construction, there had not been *one* accident in the subsequent working, at pressures from 50 to 250 lb. per square inch. This was about the best testimony he could furnish in favour of steel, namely, its enormous endurance and its increased trustworthiness, as the heat was raised to about 400° F.

Mr. Tomlinson speaks of a copper fire-box lasting twenty-three years on the Metropolitan Railway, and would lead some people to think that it had never been repaired, and he does not tell us that *hot feed* water is used on that line, and that when those engines were made in 1864, copper was copper. If he would turn to the "N. C. and Locomotive Builder," of November, 1888, page 164, he will see that an engine has run continually on the Old Colony Railroad with a steel fire-box for twenty-five years. She was built in 1863, cost 27,500 dollars, and is now in the shops for the *first time* to receive a new box. We have engines on our own lines, which have steel fire-boxes, and have now run the following mileage:—

					miles.
Engine 105	began to run	October, 1877	150 179
" 130	"	April, 1879	171 221
" 131	"	"	228 294
" 132	"	"	148 794
" 133	"	September, 1879	151 287
" 134	"	"	234 444
" 135	"	August, 1879	178 245
" 136	"	September, 1879	141 493
" 137	"	"	242 383
" 138	"	"	231 132
" 139	"	August, 1879	198 037
" 140	"	September, 1879	154 592
" 141	"	"	173 807

I think I cannot do better than quote the following from a letter by an eminent locomotive engineer in America to me, dated New York, 3rd November, 1888:—

"I have been watching the progress of your struggle as closely as possible, and from the fury of . . . I concluded that you were getting the best of the battle, and it pleases me very much to learn that the inference was correct. It appeared to me from the first, that you were working to put on your lines the machinery *best adapted for the work to be done*, while your opponents were striving to make machinery designed for entirely different conditions, and to perform the service through *force of traditions*. Your railways must be similar in many respects to those in this country, and that being the case, the rolling-stock best adapted for our roads is certain to be better for you than that of British design. In that tiresome controversy about the relative merits of English and American locomotives, the English writers generally assumed that American engineers had made an arbitrary design of a locomotive, and improved it to suit the conditions of operating; and I do not think any people are less wedded to their own traditional habit than Americans. They have had good opportunities of judging how English locomotives compare with those of American design, from the experience of Canadian Railways. If there was any reason at all to believe that English engines would do the work as well, and at less expense than those of their own type, I feel sure that American railroad men would soon put the matter to a practical test." With this I concur.

"In districts where the water is not badly charged with lime salts, the life of a steel fire-box is about 500,000 miles. I was for some years in charge of the running locomotives of a Western Railway, where the water was rather bad, and the average service of a fire-box was about 180,000 miles. As a measure of economy, copper fire-boxes were recommended (through the prejudice of a Scotch . . .) I favoured the experiment, and we got four engines with fire-boxes of that material. They did not prove any more durable than the steel fire-boxes. My experience then led me to prefer good soft steel for fire-boxes, and charcoal iron for tubes.

"You appear to be leading the railway officials in New South Wales in the same line of progress as other engineers at an earlier day led Canadian railway men, after the latter had made prolonged efforts to run their business to accord with English interests and ideas, and their zeal and labour had proved futile. You are not only going to give your lines better machinery, but you are going to aid materially in the development of the natural resources of the Colony by helping the people into a way of manufacturing their own machinery. You need, however, expect to have nothing but hard words from our British contemporaries."

I am sorry that Mr. Dalton and others do not seem to think it worth while to see facts within a few yards of their own doors, instead of preferring to pay so much attention to what is said by irresponsible writers 16,000 miles away. If he would come to Eveleigh works, I should be glad to show him steel fire-boxes which have been in use ten years, and new copper plates which have cost the Government £99 15s. per ton, which will not stand flangeing. It breaks like cardboard when it is worked in the heated state. He could also see the trouble we have with copper fire-boxes and copper stays.

THOS. MIDELTON.

Minute by the Under Secretary for Public Works.

Subject :—Manufacture of Locomotives.

THE Secretary for Public Works would be glad if the Board of Railway Commissioners would kindly instruct the Locomotive Engineer, Mr. Midelton, to report upon the statements made in the enclosed speech, delivered by Mr. Dalton in Parliament on the 28th ultimo.

J.B

Urgent. B.C., 31/12/88. Secretary Railways. The Commissioners approve.—A. R. Loco. Engineer, B.C., 2/1/89. Report herewith.—T.M., 7/1/89.

[EXTRACT from *Hansard* of 28th November, 1888.]

MR. DALTON: A great deal has been said with reference to the unfortunate fifty locomotives, for the construction of which the Government have let contracts in the Colony. I hold in my hand a paper published in London called the *Indian, Colonial, and Foreign Engineer and Builder*, an acknowledged authority upon engineering matters, from a recent issue of which—15th October last—I will read a few extracts on the subject :—

The course pursued by the authorities in New South Wales in respect to the new locomotives ordered from local firms, raises several questions of very general interest, apart from that of localizing the contract by altering the specification of the machines.

There can be no doubt that the specifications were altered. There was one specification for the foreigner and another for the local manufacturer.

The engines to be made in the Colony are fitted with steel fire-boxes and tubes instead of copper fire-boxes and brass tubes. By thus varying the material it is estimated that £300 per engine will be saved in raw material, and there will be a further saving of £68 in items as between best Yorkshire iron and steel. Setting aside the question of favouritism, the point of practical interest is whether the substitution of steel for the materials hitherto used does affect a genuine economy.

The first cost cannot be considered in this connection without reference to the durability and efficiency of the different materials, and also their possible value when worn out. The answers to questions put in the Legislative Assembly on these subjects have been vague. It is "assumed" that the life of copper fire-boxes, "with repairs and partial renewals more or less costly," may be taken as averaging seven years, and that of steel fire-boxes five and a half years. Let us, however, turn to the teachings of actual practice. In the discussion of a paper "On the Construction of Canadian Locomotives," read last year before the Institution of Mechanical Engineers, Mr. Tomlinson, late Locomotive Engineer of the Metropolitan Railway, London, said: "There are engines now running on the Metropolitan Railway, with copper fire-boxes and brass tubes and wrought-iron boilers, which have run over 650,000 miles, and are still in good working order, and carrying the original steam pressure of 130 lb. per square inch, that they had when they started new in 1864," that is, twenty-three years previously. "They have run on an average 30,000 miles a year, from 1864 to the present time." This shows a very different term of life from that assumed by the New South Wales authorities, and exhibits a very great advantage in favour of copper-boxes. In regard to the tubes, it is admitted that the life of the brass tube is three times as long as that of the steel.

A matter that is entirely ignored in the official reply is the fact, at the end of their time, both old copper fire-box plates and brass tubes are of considerable value—one-third to one-half of their original cost—while old steel plates and tubes are scarcely worth the labour of cutting up; and furthermore, the repairs and renewals required with steel as the material, are more frequently necessary, so that there is a greater loss of service; and in addition to all this, steel being inferior as a conductor of heat to both copper and brass, the steaming qualities of the engines are reduced.

Some attempt has been made to support the adoption of steel on account of its superior strength as compared with copper and brass; but it should be borne in mind that fire-boxes and tubes do not fail by yielding to direct pressure, as a rule, but by corrosion and cracking, induced by unequal internal strain from heating and expansion, and these causes of injury have a far greater effect on steel than on copper.

From all these considerations it is obvious that the advantages are entirely on the side of copper fire-boxes and brass tubes, both as to ultimate cost and convenience in running, and the sophistries raised to indicate the contrary are worthless; but, even if this were otherwise, it would not alter the injustice of comparing the prices of different manufacturers when they do not tender to the same specification.

The concluding words of the article are as follows :—

If it was intended by the Government that the local manufacturers should have the work, it would have been better not to invite tenders from foreign makers, and then there would have been no occasion to adopt an inferior article, and so risk impairing the efficiency of the Railway Service.

That is an article which bears the stamp of truth on the face of it. It is written by a scientific gentleman who understands what he is writing about. It has been stated here this evening that the contractors for the locomotives are providing copper fire-boxes and steel tubes instead. If that be so, and the cost in the old country would be equal to £368 per engine, it would be interesting to know what the cost will be here. It is all nonsense to say that this has been done in the interests of free-trade; it is protection of the most pronounced kind.

EXTRACT from *Engineering*, Friday, 6th July, 1888.

LOCOMOTIVES FOR NEW SOUTH WALES.

AT length a settlement of this question, so far as the manufacturing of locomotives in the Colony is concerned, has, after a fashion, been arrived at by the New South Wales Government, by the letting of twenty-five passenger and twenty-five goods engines to manufacturers in Sydney, at £2,987 and £3,000 per engine respectively, although the means of meeting the immediate demand of the Railway Department for additional engines had not been disposed of at the date of the latest newspapers to hand from the Colony.

As the lowest tenders received from this country for the passenger and goods engines specified by the Locomotive Engineer, delivered in steam in the Colony (even under the unfavourable conditions imposed) were £2,375 and £2,245 respectively, or an average of £2,310 per engine, it will be seen that

Government

Government which climbed to office on the ladder of free-trade, in avowed contrast to the policy of its predecessors, has not scrupled to "protect" the local manufacturing interests by granting them a bonus, which on the very face of the transaction stands at 30 per cent. advance on import prices. This fact in itself would call for some remarks; but, in addition thereto, the course which the New South Wales Government has thought fit to pursue in arriving at their decision is so entirely opposed to that fair and honorable treatment which those manufacturers outside the Colony who submitted tenders on the invitation of the previous Government had a right to expect at their hands, that we cannot refrain from commenting at some length on the matter.

The earlier steps taken in this business by the Minister for Public Works, in his individual capacity, are already known to our readers, and need only therefore be briefly referred to. Suffice it to say that it having been found that the tenders of the colonial firms to the original specifications were 60 per cent. in excess of the English tenders—an amount obviously too high for any Government, whether free-trade or protectionist, to pay, by way of premium, for "fostering local industries"—the difficulty, as it will be remembered, was attempted to be met by the Minister inviting fresh tenders from the local firms to pattern engines of entirely different design, and constructed of cheaper materials. This was done under the far-fetched excuse that the specifications of the Locomotive Engineer (to which the original tenders had been invited) "provided for a different type of engines to any the Department had then running." This attempt on the Minister's part to balance colonial and foreign prices in favour of local firms proved, however, an entire failure—the new tenders being found to be over 50 per cent. in excess of the English quotations. The Minister having thus far failed in his endeavour, and public discontent having been expressed at the protracted delay that had been allowed to take place in deciding the question, the Cabinet was forced to take the matter in hand, with the result that the Minister was authorized to make the local firms an offer of £3,000 per engine. This offer, amounting to 30 per cent. in advance of the English tenders for engines of a superior class, was, however, declined by the local firms. In these circumstances it would have been supposed that the question would have been brought to a close, as far as the local manufacturers were concerned, by the Government recognizing that they had gone quite far enough in their attempt to reconcile free-trade theory with protectionist practice, and forthwith leaving the local manufacturing interests to their fate. The political morality of the members of the present New South Wales Government seems, however, to partake somewhat of the free-and-easy character of the financial morality of the father who, in sending his son out into the world said: "My son, make money—honestly if you can; but make money." In this instance they have apparently acted on the precept: "Make political capital—by the exercise of free trade if you can; but make political capital." Having failed to adjust the political situation in unison with their free-trade professions, the Government forthwith threw free-trade and its principles to the winds, and authorized the Minister for Works to introduce such changes in the *structural details* of the locomotives as would enable the local manufacturers to submit new tenders at, or within, the limit they had fixed of £3,000 per engine, with the result, as before stated, that twenty-five locomotives of each class have been let in the Colony at £2,987 and £3,000 per engine, respectively.

It has not yet been made clear what the full extent of these alterations are, although sufficient may be gathered as to their nature from an answer given on behalf of the Minister for Works in the Legislative Assembly, as reported in the local press. We quote from the *Sydney Morning Herald* of May 16th, as follows: "Mr. Roberts (for the Minister) said that alterations had been made in the plans and specifications of the locomotives proposed to be manufactured in the Colony. The main frames in the pattern engines" (of American make, it may be noted in passing) "were very heavy and costly forgings, necessitating much smith's and steam hammer work; but the altered frames were made of bar iron in pieces, which will be much simpler and less costly to make, and yet be interchangeable with the present frames. Steel would be used instead of copper for fire-boxes, and steel tubes instead of brass. Steel was considered to be equally adapted for the work, and it was cheaper. The boilers would be of steel throughout, and built with fewer parts, joints, and plates than the pattern engines, and yet would be interchangeable. Cast-iron would be used instead of brass for slide valves, because they were cheaper and lasted very much longer. Copper chimney tops and brass dome covers would be abolished, and cast-iron used instead. Brass or Dalziel's metal would be used for bearings where required, but in much less quantities than in other engines, and a cheap and effective engine would be obtained. These alterations should cheapen the cost of construction, but the actual figures could not be obtained until the tenders were received. Some of the locomotives imported by the Government had been constructed (*sic*) and similar material had been used as was now proposed under the new specifications. They had been as lasting and had done as much work, with as little cost for repairs, as the type of engine imported from the best makers in England and America."

It is needless to say that nothing is easier than to "cheapen" the manufacture of any article or machine, provided one is only sufficiently indifferent as to the quality of the material used, or the substantiality of the machine when constructed; and so far as the above quoted paragraph throws light on the subject, it is evident that the cheapening of the locomotives in question has, in the main, and with the exception of a few minor details, been effected at the expense of their substantiality and durability, notwithstanding all that was said in the Legislative Assembly to the contrary.

But assuming, for the sake of argument, that the make of engines substituted for those specified by the Locomotive Engineer are all that their advocates have said in their favour as regards quality combined with cheapness in first cost, and that the subsequent modifications in designs and materials in nowise detract from their efficiency, while further reducing the cost of construction, by what process of reasoning, we should like to know, have the New South Wales Government persuaded themselves, or hope to persuade the public at large, that they have acted in accordance with free-trade principles in limiting the competition for these modified and "cheapened" locomotives to the colonial firms? For it cannot be questioned for one moment that, if tenders had been invited for them in this country, it would have been found—in view of the difference in the rates of wages alone—that the price at which the engines have been let to the colonial firms are, at the lowest estimate, from 50 to 60 per cent. in excess of the prices at which they could be imported.

No reasons consistent with free-trade that would stand a moment's consideration can be advanced by the New South Wales Government—as is obvious to any one—to justify their decision in this matter, while they have made it clear that it is hopeless for manufacturers outside the Colony to expect either fair treatment or ordinary courtesy at their hands.

EXTRACT from *Engineering*, Friday, 30th March, 1888.

LOCOMOTIVES FOR NEW SOUTH WALES.

IN a recent article (*vide Engineering*, page 193 *ante*) we incidentally alluded to a matter in connection with this subject as affording further evidence of the partisan spirit that seems to have guided the action of the New South Wales railway authorities in this affair since the accession to office of the present Government. We allude to the so-called "trial" of the engines advocated, respectively, by the Locomotive Engineer and the Tramway Superintendent, the latter of whom, it will be remembered, was called in by the Minister for Public Works to advise in the matter over the head of the Locomotive Engineer, notwithstanding the latter being retained in his position as responsible head of the Locomotive Department.

In proceeding to give particulars, we would preface our remarks by saying that, as far as the main point of the case we are about to deal with is concerned, the relative merits of the locomotives advocated by each is of no more importance than was the personal matter between the Locomotive Engineer and his late subordinate, touched upon in our previous article. The point in the case has reference to the unfairness that marked the conditions under which, by the authority of the Minister, the trial was made, and which, in our judgment, indicated a preconceived desire to make out a case in favour of the engines advocated by the Tramway Superintendent, to the prejudice of those specified by the Locomotive Engineer, whereby an excuse might be afforded for ignoring the tenders received from this country, and diverting the orders for locomotives into other channels.

It will, perhaps, serve to elucidate the case if we give, in the first instance, a brief description of the engines recommended by the Locomotive Engineer, on the one hand, and by the Tramway Superintendent on the other. Those specified by the Locomotive Engineer for goods traffic were outside-cylinder six-coupled engines, with a two-wheeled bogie in front, having a fixed wheel base 11 feet long, the driving wheels being 4 feet in diameter, and the cylinders 19 inches, with a stroke of 24 inches, the grate area 20.8 square feet, the total heating surface 1,143 square feet, the weight on the coupled wheels 35½ tons, and the tractive power of the engine 180 lb. per pound of effective pressure in the cylinders. The engines specified by the Locomotive Engineer for passenger traffic were also outside-cylinder engines, but with four coupled wheels and a four-wheeled bogie in front, the fixed base being 8 feet 3 inches long, the driving wheels 5 feet 6 inches in diameter, and the cylinders 19 inches, with a stroke of 26 inches, the grate area 20 square feet, the heating surface 1,214 square feet, the weight on the coupled wheels 30 tons, and the tractive power 142. It is with the latter engines we have at present more especially to deal, as having been the subject of trial with those advocated by the Tramway Superintendent.

The engines recommended by the last-named for passenger traffic were of the make illustrated on page 194 of the *New York Railroad Gazette* of 27th March, 1885, to which we alluded in our former article, these having outside cylinders, six coupled driving wheels, with a two-wheeled bogie in front, and a fixed wheel base 15 feet long, the driving wheels being 5 feet in diameter, the cylinders 18 inches, with a stroke of 26 inches, the grate area 17 square feet, the heating surface 1,306 square feet, the weight on the coupled wheels 35 tons 5 cwt., and the tractive power 140. The engines recommended for goods traffic were of the American "consolidation" type, with eight coupled wheels, 4 feet in diameter, and a two-wheeled bogie, the cylinders being 20 inches in diameter, with a stroke of 24 inches, the fire-box 9 feet 10 inches long inside and 2 feet 9½ inches wide, and the total weight of the engine and tender in working order 72 tons.

It will be observed, on comparing the passenger engines, that the essential difference (apart from any differences in detail) is in the size of the driving wheels, and in the distribution and amount of the adhesion weight, the engines specified by the Locomotive Engineer having four coupled wheels, loaded to 30 tons, while those recommended by the Tramway Superintendent have six coupled wheels loaded to 35 tons 5 cwt. It is clear, therefore, that to the latter the advantage would fall on the steeper gradients, while the advantage would be with the former on the more level portions of the line. The papers laid on the Table of the Legislative Assembly show that the purpose for which the Locomotive Engineer intended the engines in question was that of running passenger trains from Sydney to Bathurst, on the Western main line, a distance of 144 miles, on which the gradients for the greater length do not exceed what are regarded in New South Wales as normal and moderate, namely, short though frequently recurring lengths, varying from the level up to 1 in 60, and occasionally 1 in 50; but on a portion of the length, commencing 36 miles from Sydney, the line, in crossing the dividing range of mountains, ascends on gradients of 1 in 30 for 2½ miles, succeeded by long and frequently recurring gradients of 1 in 33 on a length of about 27 miles to the summit of the line. Thence, after a run of some 22 miles over gradients varying up to 1 in 55, the line descends rapidly by gradients of 1 in 40 for about 5 miles, until it reaches a way-side station at Eskbank, 94½ miles from (and 2,990 feet above the level of) Sydney, whence the distance to Bathurst is 50 miles, over the more easy gradients we before referred to, the total fall in that distance being 890 feet. It is no part of our business to express an opinion as to which of the two types of engines in question was the more suitable on the whole for the purpose intended. Our object, as we have already said, is to criticise the spirit in which at times locomotive questions are determined by the authorities in New South Wales, and which has formed so marked a feature throughout the whole of this transaction.

The proposal to go through the form of a trial to determine the question between the Locomotive Engineer and the Tramway Superintendent, appears to have followed a reply by the former to the report of the latter, which, it will be remembered, was withheld from the knowledge of the Locomotive Engineer until after its publication in the press. On this point, in addressing his reply to the Minister, the Locomotive Engineer wrote: "It would only have been an act of justice if, before such documents had been made public, the Honorable Minister had submitted such to me, and requested that I would reply to them. Such reply could then have been considered in conjunction with the strictures on my recommendations made by the Superintendent of Tramway Rolling Stock and such a course would, if the Minister had seen fit still to maintain the action he has taken, at least have given him an opportunity of judging of the correctness or otherwise of my opinions and actions. The first intimation I had concerning this matter was from the columns of the public press; and a consideration of the Minister's action, without reference in any form to me, forces the conclusion that any explanation I may have to offer will not in any way have the effect of altering his decision." In the concluding opinion the Locomotive Engineer was entirely correct, as subsequent events proved.

At-

At this stage the Commissioner for Railways seems to have come on the scenes as a supporter of the Ministerial action against the Locomotive Engineer, and in a minute dated 20th May, 1887, he requested the latter to furnish him with the "proposed conditions of test" under which the engines advocated by him should be tried against those recommended by the Tramway Superintendent. The reply of the Locomotive Engineer was a fair and reasonable one. He suggested "that each class of engine should be put to run the day passenger trains between Sydney and Bathurst, and an accurate account kept of load hauled and stores consumed." In the mean time the Commissioner appears to have requested the Tramway Superintendent also to name conditions, who, in reply, laid down a number, which, as was perhaps natural in the circumstances, were entirely in favour of the engine recommended by himself. The more notable of these were: "That the trial trips should be from Sydney to Eskbank and back"; that the train should consist of a definite number of carriages, viz., "eight of the double bogie type"; that water should be taken only at stations specially selected by him; and last, but not least, that "neither engine should have any sand in the sand-boxes," and that the "brake-blocks, hangers, and rods should be taken off each engine." One condition he proposed to which we may refer, not as being unreasonable, but as one which, in contrast with the others, seems to us reasonable and practical and for which we are only too pleased to give the author full credit. The proposal was that the trial trains should be "run to a time-table made out by the Traffic Manager, time the same as the Western mail on the up and down journey." At the foot of these extraordinary conditions the Commissioner wrote a minute, which, coming from a non-professional man on a matter of locomotive practice, is probably only equalled in its absurdity by the various Ministerial minutes on the subject. It was as follows: "The tests proposed by the Superintendent of Tramway Rolling Stock are preferable. Will the Locomotive Engineer say if he has any observation to make or any suggestion in connection with them?" The Locomotive Engineer had, reasonably enough, several important observations to make on them, as being, he said, "at variance with the work" for which his engines "were designed, and intended to perform." He pointed out that "about two-thirds of the journey proposed was over the mountains, where fast running was not possible with any engine," and that, in order to give a fair result, the trials "should be made to extend to Bathurst, where the engines had to run with the trains, or from Sydney to Goulburn" (a similar length of railway on the Southern main line), "and, if possible, a clear run of about 30 miles between stopping places arranged for, so that the speed might be ascertained." With regard to the load proposed by the Tramway Superintendent, he pointed out that it was equal to sixteen ordinary carriages, whereas the train load in regular service was twelve carriages, adding: "I therefore consider that what is proposed is simply a test of power, where a goods engine will, of course, give better results than a passenger engine, particularly over the portion of the line proposed by the Tramway Superintendent, chiefly mountain grades, where the running is slow. I consider the "service load" should be adhered to in the trials." As regarded the watering of the engines he considered that "water should be taken when each considered it necessary, but that time lost in taking it should be calculated." He objected to "dispensing with anything provided for the more efficient working of the engines." On that account he "protested against the sanding arrangements not being availed of, if necessary," as well as to the removal of the brake arrangement. He further stated that, "if it were decided to have the engines tested as to their relative merits under all circumstances," he thought "such tests should be conducted under the direction and supervision of properly qualified locomotive experts outside the Department, who could have no interest in the result," and he concluded with the very apt remark that the Tramway Superintendent "appeared to be stipulating for conditions to suit as nearly as possible the type of engine he recommended," while "the conditions laid down should approximate as closely as possible to those under which the traffic had to be worked, and which a locomotive engineer would be guided by in ordering his type of engine."

Regardless, however, of the opinion of the Government Locomotive Engineer, the conditions laid down by the Tramway Superintendent were, on the recommendation of the Commissioner, approved by the Minister for Works, and ordered to be adhered to, the only concession granted therefrom being that "if, in the judgment of the experts, the rails were greasy, sand might be used," although "if the day was fine and dry no sand was to be placed in the boxes." It was also conceded that water should be taken as required. Further it was agreed that the "testing" of the engines should be made "under the supervision of two locomotive experts." The Minister, however, reserved to himself the nomination of the experts, while, at the same time, the testing was directed to be confined to a single trip by each engine in each direction on separate days, and to the limited portion of the line between Sydney and Eskbank. That there might be no departure therefrom, the experts were supplied by the Commissioner for Railways with copies of the conditions laid down. The minute by the Commissioner giving the reason for the above limitations is, we have no hesitation in saying, entitled to prominence amongst the many minutes written in connection with this matter. It is as follows:—"If the trials be made beyond Lithgow" (*i.e.*, Eskbank Station) "it will mean four days instead of two will be consumed in the trials. The trials will not commence till Wednesday morning. On Friday we shall require all our rolling stock to meet the requirements of the excursion traffic of Jubilee. I must, therefore, decide that the test be made between Sydney and Lithgow, and be concluded on Thursday night." It is thus, after months of needless delay, that locomotive questions, involving the expenditure of hundreds of thousands of pounds, and in dealing with which both the Minister and the Commissioner must needs leave their proper duties to assume the rôle of amateur engineers and meddle in technical details, are summarily disposed of in New South Wales.

Where are the papers? If they have been printed, please attach copy.—CH.A.G., 4/6/88.

It has now (7/1/89) been proved, over and over again in actual practice, that the engines recommended by Mr. Scott cannot do the mail service to time between Sydney and Bathurst, neither can they haul the loads he stipulated without the use of sand. Both types of engine have now been tested on the Goulburn and Western lines, and it is admitted that my engines are the best in every respect; indeed, the proof of the correctness of my words in my report of the 19th April, 1887, that "I have gone very carefully into the merits of the design of these engines, and must express my conviction that their unsuitability will be established on trial; they cannot be successful unless they are ruinously overloaded on the coupled wheels"; indeed, it is well known that on the trial day that if the engine had no sand she would never have mounted the 1 in 30 grade at 36 miles west, and I do not think any engineer could justify the use of sand on a bright clear fine day such as that was.—T.M., 7/1/89.

The

Yes; but this was the absurdity: the service load was too small; we wanted greater power.—CH.A.G.

The English critic does not understand the case. His strictures, therefore, may be taken for what they are worth. They have little but their impudence to recommend them; and the author, who is well known, had nothing else to recommend him when he was engaged in and discharged from our Service. Mr. Scott's conditions were as absurd and extraordinary as Mr. Midelton's conditions were said to have been. In view, however, of what was required—an engine to take an adequate passenger load over the mountains (instead of employing an assistant engine)—Mr. Midelton's conditions, while they were those to which his engines could respond, were exactly what was wanted. If the service load only were taken, both engines would be found efficient; but the service load was altogether inadequate, and the proposal that the load should be confined to that load was simply a piece of childishness, which, since our critic approves of the conditions proposed, he is to be credited with. The day is gone by when so-called "engineers" can claim exclusive knowledge. The locomotive is a machine easily understood, and we do not need to speak of it with "bated breath," as if it were some occult thing which high priests only should be allowed to talk about. These "high priests," or, as they are pleased to call themselves, locomotive engineers, are (the best of them) good mechanics, for the most part uneducated, and knowing little or nothing beyond their trade. They choose to call it "engineering," and claim it as a profession; but they have no diplomas, they can produce no certificates, and they become professional men merely by calling themselves so. It is not so with any other profession, except that in which the experts practise sleight of hand. Professor Jacob and other conjurers have this advantage, that while we do not know their tricks, we know and can expose the tricks practised by our would-be critic and his confrères.—CH. A. G.

EXTRACT from *S. M. Herald*, 13th April, 1888.

WITH regard to the locomotive tenders, a great deal has been heard from our own point of view. But there is another point of view, that of the English tenderer, or foreign manufacturer, as he is called by our protectionist friends, and the case as it appears to him is ably stated in articles which have recently appeared in *Engineering* and the *Glasgow Herald*. Our contemporaries seem to be well informed as to the facts of the case, with which we in Sydney are of course familiar. Early in 1887 tenders for forty-four engines were invited simultaneously from locomotive makers in Europe, America, and this Colony. A number were sent in, but none were accepted. The Sydney tenders were about 60 per cent. above the offers from Home, and were therefore out of the question; but the English tenders were laid on one side because, in the first place, it was desired to give the local manufacturer another chance, and in the second place, because the Minister for Works disapproved of the type of engine which had been tendered for under the specifications sanctioned by his predecessor.

Engineering represents that the English manufacturers have been unfairly treated from first to last. It refers first of all to the unusual conditions which were imposed in the case of manufacturers outside the Colony. They were required to provide themselves with workshop accommodation for the erection of the engines on landing, and payment was deferred until a certificate that the engines had been delivered and had run a stipulated number of miles had been granted. These conditions, our contemporary says, "were justly regarded as operating prejudicially to the manufacturers outside the Colony, and had the effect of limiting the number of tenders, as well as of considerably enhancing the amounts quoted in those sent in." According to this, we have not yet had the true measure of the difference between the cost of constructing locomotives in the Colony and the cost of constructing them in England. *Engineering* deals severely with the Minister for Works for setting aside the specifications of the Locomotive Engineer in favour of those proposed by the Superintendent of Tramway Rolling Stock, who had nothing whatever to do with the Railway Department. With regard to these specifications, Mr. Sutherland, it will be remembered, wrote a minute to the effect that "they provide for a different type of engines to any we have now running, and their adoption would, in my opinion, be a serious mistake." The minute went on to say that a report on the subject was desired from the Tramway Superintendent, with regard to whom the Minister said:—"He has already designed ten locomotives, which, after two years' service, have proved to be the most economical in working that we have." To call in some one outside of the Department to reverse the recommendations of the responsible officer is regarded by *Engineering* as extraordinary conduct on the part of the Minister. Our contemporary fails to see how the Tramway Superintendent can be regarded as an authority on the question, and it disputes the originality of the design for which he is praised by the Minister. "As regards the ten locomotives, with the design of which the Tramway Superintendent is credited by the Minister, we may mention," says the paper from which we quote, "that an illustration of them is to be found at page 194 of the *New York Railroad Gazette* of March 27, 1885." It is asserted that the engines illustrated are "practically identical in general features with the ordinary American 'Mogul' engine, as made by the Baldwin Company, who supplied them, 5-foot coupled wheels having simply been substituted for the usual 4-foot wheels, the steam dome being dispensed with, single slide bars substituted for double bars, and the connecting rods, in common with the coupling rods, fitted with solid bushes at both ends, in place of being provided with straps and cotters, as is usual in ordinary practice." Having shown that the engines said to have been designed by the Tramway Superintendent were only modifications of the Mogul type, *Engineering* offers some pertinent comments upon the remarkable conduct of the Minister in setting aside the specifications of Mr. Scott and calling upon Mr. Midelton to draw up new ones as the basis of fresh tenders. We quote a couple of sentences. "The action of the Minister in this matter was, as will have been seen, of the most arbitrary kind. Although, no doubt, entirely within his powers as Ministerial head of the Department, we venture to say, in view of the fact that the Locomotive Engineer was retained in his position as responsible head of the Locomotive Department, that the action of the Minister was not only unjust to that officer, but subversive of all discipline and responsibility." This is exactly the view that was taken here at the time; it is scarcely possible, in fact, to arrive at any other conclusion. The so-called trial of locomotives of the types recommended by the Locomotive Engineer and Tramway Superintendent respectively, is condemned as unfair both to Mr. Scott and the engines which he recommended. Here, again, we find an impartial observer in London taking much the same view as that which found expression at the time on the spot.

But what the Home papers chiefly complain of is the cavalier manner in which the New South Wales Government has treated the British manufacturers, who have been made a convenience of, and have been denied even ordinary courtesy. The whole proceeding, which is regarded as a breach of faith, has

excited

The impartial observer, in all probability, is Mr. Bennett, the late Locomotive Engineer, whose services were dispensed with. Get the article from *Engineering* and put with this.—CH. A. G., 14/4/88.

excited, the *Glasgow Herald* says, great indignation amongst the engineers of England and Scotland, who have determined, we are told, to send a remonstrance to the New South Wales Government. It is pointed out that engineers at Home would never have gone to the expense of tendering for these contracts if they had known that the work was to be reserved for the Colony. "If," says the Glasgow paper, "the sole object in inviting tenders from this country is to check the prices of Home competitors, then firms here will cease to enter the lists." But this is not all. *Engineering*, in concluding a lengthy article on the subject, remarks, that to the unwarrantable treatment which tenderers outside the Colony have experienced at the hands of the New South Wales Government has been added the discourtesy of withholding from them official notification either of the rejection or acceptance of their tenders. It must be admitted that the Home manufacturers have grounds for complaint. They have been made conveniences of, and they have not been treated with common civility. It is right, of course, for Ministers to do the best they can for the Colony, but in protecting the interests of the Colony it is not necessary to bring us into disrepute at Home. Tenders should not have been called for in Great Britain unless we were prepared to deal with them on their merits; but when it was determined to set them on one side, and not to deal with them at all, those who were concerned should not have been left in the dark.

EXTRACT from *Engineering*, Friday, 24th February, 1888.

LOCOMOTIVES FOR NEW SOUTH WALES.

THE locomotive question in New South Wales, to which we referred at some length in our issue of March 18 last, and which has been dragging its weary length along ever since, has now arrived at a stage which gives occasion for some additional remarks.

It may be well, in the first instance, to recall to mind the main points bearing on this vexed question. It will be remembered that early in 1887 tenders were invited from locomotive makers in Europe and America, simultaneously with like invitations to manufacturers in the Colony, for sixteen passenger and twenty-eight goods engines. Scarcely, however, had the invitations been issued by the Agent-General than a change of Government took place, when instructions were received from the Colony, to alter the conditions of tender for manufacturers outside the Colony. These alterations consisted in requiring them to provide themselves with workshop accommodation for the erection of the engines on landing, and in postponing inspection and payment until delivery of the engines in the Colony, payment being made contingent on the granting of a certificate from an inspector in the Colony that the engines had been delivered and had run the stipulated number of miles. These new conditions were justly regarded as operating prejudicially to the manufacturers outside the Colony, and had the effect of limiting the number of tenders, as well as considerably enhancing the amounts quoted in those sent in.

Yet, notwithstanding the disadvantage at which the "foreign" manufacturer was thus placed, a comparison of the prices quoted by the local and foreign manufacturers showed that the lowest prices tendered by the former were no less than 60 per cent. in excess of the lowest prices quoted by makers in this country, who beat all other competitors, both Continental and American, in lowness of price. Under these circumstances it was at once seen by the railway authorities that it would be impossible for the New South Wales Government, with any regard to the free-trade principles on which the majority of the Legislative Assembly had been returned at the general elections, to place the orders with the local firms. In view of this, and pending a decision of the matter by the Cabinet, currency was given to a proposal by the Minister for Public Works that the locomotives should be made in the Government workshops, the proposal being based on an estimate furnished to him by a former subordinate officer in the Locomotive Department, whom the Minister appears to have called in to advise in opposition to the Locomotive Engineer in charge of the Department, that locomotives could be built in the Government workshops at an advance in price of only 10 per cent. on the English tenders.

The inherent absurdity of this estimate, seeing that the rate of wages in the Colony is double that paid in this country, is obvious. But apart from this, the proposal was condemned by the Cabinet as vicious in principle, the Prime Minister stating in Parliament that he would rather resign his position than give his consent to a proposal that would inevitably lead to "corruption and jobbery." In the awkward position in which the Minister for Works had placed himself, and with the latent desire, doubtless, on the part of the Ministry not too ruthlessly to disappoint the hopes that had been raised in the breasts of manufacturers and workmen possessed of votes, the Government acceded to the Minister's desire to make a final struggle to retain the manufacture of the engines in the Colony, and authorized his inviting fresh tenders from the local manufacturers, to enable them to come, if possible, within such a distance of the English prices as should warrant the Government in placing the work in their hands. The fresh tenders were opened by the Tender Board on December 20. But, notwithstanding some reduction on the prices previously quoted, the tenders are, as we learn by the Sydney Press, still so high as to be regarded even by the Protectionist Minister for Works as rendering it impossible for the Government to place the order with the colonial firms. Up to the date, however, of the latest advices from the Colony, nothing had apparently been done by the Government in settlement of the matter.

Already there has been an amount of unnecessary delay attending this question, which is strangely inconsistent with the pressing need under which the Railway Department stands, and has stood for a long time past, for additional locomotive power, and which gives support to the general belief that influences are at work to divert the orders for locomotives—which, it is clear, must go outside the Colony—into channels to which they could not possibly go if matters were allowed to run a free and unfettered course. The urgency of the question may be seen by the following paragraph which appears in the report of the Commissioners for Railways for 1886, under date of July 20 last:—"The Locomotive Engineer renews his statement that more engines are required for the economical working of the traffic." The Locomotive Engineer's reference to the matter is even stronger. He says—"The drought having broken up, there is every probability of increased traffic on our lines during the present year (1887), and as in the past great difficulty was experienced in supplying the motive power for the traffic, I would again urge upon the Commissioner the necessity for increasing the number of passenger and goods engines with as little delay as possible." Yet, notwithstanding the difficulty in which the Department stands, the official papers recently laid on the Table of the Legislative Assembly disclose an apparent disregard of everything but the promotion of Ministerial hobbies or of political and party interests.

The date fixed for the delivery of the tenders advertised for in the early part of last year, to which we made reference in our opening remarks, was April 12 (1887). On April 14 the result of the tenders received in this country was communicated to the Government by the Agent-General, showing, as we have already stated, a difference in favour of the manufacturers in this country of 60 per cent. Significantly enough, this result was followed in the course of a few days by a remarkable minute by the Minister for Works. On April 18 the Minister wrote as follows:—"With reference to the specification for twenty-eight goods and sixteen passenger engines, it seems to me, from a perusal of them, that they provide for a different type of engines to any we have now running, and their adoption would, in my opinion, be a serious mistake." Coming from the political head of the Department, who is, we believe, without any technical training or experience whatever, this expression of opinion on the specifications of the Government Locomotive Engineer is not a little suggestive. Further on in the minute, the Minister entered on a review of the character of the lines, the nature and tendency of the traffic, and the speed at which, in his opinion, the trains should be run, and concluded with the following extraordinary proposal:—"For the purpose of obtaining opinions as to the best class of engines for this purpose, I wish an early report from the Superintendent of Tramway Rolling Stock, he having had a large engineering experience both in England and the colonies, and has already shown evidence of his ability with regard to his plans for the Goulburn running-sheds, and in regard to his advice in connection with the Eveleigh workshops. He has already designed ten locomotives which, after two years' service, have proved to be the most economical in working that we have; and for these, and other reasons, although he is not now in the Railway Locomotive Branch, I should like his opinions on this question."

Here we may remark that we are not concerned about the personal aspect of this matter as between the Locomotive Engineer and his late subordinate, and under ordinary circumstances we should not have thought it necessary even to refer to it. But when the Government of an important Colony like New South Wales treats with something more than discourtesy manufacturers in this country, from whom their predecessors in office had thought fit to invite tenders, and when the Minister for Public Works thinks proper to base on the report of an irresponsible officer, whom he has called to his aid over the head of the responsible officer of the Department, a justification or excuse for setting aside the tenders, it becomes necessary to examine a little closely the grounds on which the Minister seeks to justify his selection of the individual chosen. As will have been observed, the Minister had "other reasons" than those he enumerates for his selection of the Tramway Superintendent, feeling conscious, doubtless, that those named by him were far from adequate. What the reasons were which he thought fit to suppress may well be left to the imagination of the reader to determine. As regards those he vouchsafes to give, we can only say they seem to us to be, on the one hand, far-fetched and irrelevant, and, on the other hand, where relevant, to be of little weight. What bearing the giving of advice, or even the submission of plans, in connection with workshops and running-sheds, has on the question of locomotive practice we are at a loss to perceive; while, as regards the ten locomotives with the design of which the Tramway Superintendent is credited by the Minister, we may mention that an illustration of them is to be found at page 194 of the New York *Railroad Gazette* of March 27, 1885.

Those of our readers who are interested in the matter have thus the means of satisfying themselves how far the engines in question indicate any special ability or fitness on the part of the Tramway Superintendent for the position for which the Minister selected him. As far as we can judge, the engines illustrated are practically identical in general features with the ordinary American "Mogul" engine as made by the Baldwin Company, who supplied them, 5-ft. coupled wheels having simply been substituted for the usual 4-ft. wheels, the steam dome dispensed with, single slide bars substituted for double bars, and the connecting-rods, in common with the coupling-rods, fitted with solid bushes at both ends, in place of being provided with straps and cotters, as is usual in ordinary practice. The circumstances which led to the placing of this lot of engines with an American firm have already been commented on by us in *Engineering* of March 5, 1886. As was explained by the Minister at the time, the order was given to meet an emergent case. Makers in this country being unable by pressure of other orders to supply the engines in the short time available, a telegram was sent to the Baldwin Company, who, the Minister said, "offered to supply the whole of the engines within eight months, and six of them within two months." On that account the offer was accepted, although the cost to the Department of the ten engines in question was, as given by the Minister, no less than £3,000 each. So much as regards the engines with which the Tramway Superintendent is credited by the Minister for Works.

Encouraged by the minute of the Minister, the late subordinate of the Locomotive Engineer was not long in sending in a lengthy report. It was perhaps more than could have been expected of human nature as developed in the atmosphere of political intrigue that prevails in some of the Australian Government Departments, for the Tramway Superintendent to have declined the invitation of the Minister for Works. Its acceptance, however, placed him in a somewhat invidious position, requiring no little self-restraint to discharge it faithfully. As was perhaps to be looked for in the circumstances, the report did not spare either the Locomotive Engineer or his specification, but proved to the satisfaction, we doubt not, of the author, and not less so, we presume, to the gratification of the Minister, the utter incapacity both of the Locomotive Engineer and his engines for their respective duties. The report, however, to our thinking, shows a shallowness and superficiality in its treatment of an important subject that is only equalled by its needless personalities, and it will, we feel sure, have little weight with any one competent to form an opinion on it beyond the circle of those for whose benefit it was intended. With the opinions expressed in it as to the relative merits of six-coupled and four-coupled engines for passenger traffic, the advantages or otherwise of steam domes and single slide-bars, and other like matters on which opinions differ, it is not necessary that we should here concern ourselves. Suffice it to say, that the Minister, without affording the Locomotive Engineer the opportunity of even seeing the report of the Tramway Superintendent, forthwith adopted its recommendations, and on the 26th of April wrote as follows:—"I consider it would be detrimental to the best interests of the Railway Department to accept any tenders which have been received for the engines in question owing to their indaptability to our traffic requirements, and I have directed tenders to be invited in terms of the recent resolution of Parliament for fifty engines, twenty-five each of the types I have referred to." (Those recommended by the Tramway Superintendent). "I have directed the Superintendent of Tramway Rolling Stock to draw up such specifications as may be necessary, and he will dismantle two engines and have them placed in the shed so that manufacturers can see the design, and I shall have the locomotives constructed under the Tramway Superintendent's supervision." The

The action of the Minister in this matter was, as will have been seen, of the most arbitrary kind. Although, no doubt, entirely within his powers as Ministerial Head of the Department, we venture to say, in view of the fact that the Locomotive Engineer was retained in his position as responsible head of the Locomotive Department, that the action of the Minister was not only unjust to that officer but subversive of all discipline and responsibility, and therefore hardly consistent, one would think, with the "best interests of the Railway Department," which the Minister professed to have so much at heart. The "recent resolution of Parliament" to which the Minister referred, as affording an excuse for ignoring the tenders already received, was one passed by the Legislative Assembly on April 24 (1887), to the effect—"That, in view of the wide-spread distress amongst the iron trades, this House is of opinion that the Government should take immediate steps to call for tenders in the Colony for the manufacture of 100 locomotive engines, and that the following be the conditions of such tenders:—That the construction of the said engines be carried out by labour already in the Colony, and that only such material be imported as cannot be produced here"; a rather curious "free-trade" resolution, indeed, by a free-trade majority in a free-trade colony. No one, we fancy, would question the right and title of the Legislative Assembly to pass whatever resolutions it deemed fit, without reference to interests outside the Colony, but seeing that tenders had been received only ten or twelve days previously from these same firms for forty-four locomotives, at prices 60 per cent. in excess of those at which manufacturers in this country were prepared to supply them in steam on the railway, the resolution passed by the Assembly was not a little absurd, unless, indeed, the object of its promoters was, as is believed, to delay the settlement of the question.

It might, no doubt, be urged that by increasing the number of engines to be tendered for from forty-four to 100, the local firms would be enabled to tender at a lower price per engine; but as the Minister himself limited the number for which fresh tenders were invited to fifty, the aim of the Legislative Assembly in this respect was defeated by the action of the Minister, and the whole affair rendered more absurd than ever. Its inherent absurdity was shown by the result. The fresh tenders received from the local firms, taking the lowest in each case, were only some £120 less than the previous ones, giving a reduction of little over 3 per cent., and leaving their prices fully 56 per cent. in excess of the offers made by makers in this country under the altered conditions, deferring acceptance and payment until the arrival of the engines in the Colony; and this, too, notwithstanding that the make of locomotives to which the Minister directed the new tenders to be invited were—if the opinion of the Tramway Superintendent be accepted—considerably less costly than those for which the English tenders were invited.

Another feature of this case, to which we may refer in passing, is that a (so called) "trial" of locomotives of the types recommended by the Locomotive Engineer and the Tramway Superintendent respectively, was gone through at the instance of the Minister, with the object, apparently, of giving a semblance of substantiality and weight to the opinions enunciated by the Tramway Superintendent. The papers on the subject laid on the Table of the Legislative Assembly, show an amount of unfairness to the Locomotive Engineer and the engines he recommended, in the conditions under which the trial was directed by the Minister to be made, which we would hardly have been prepared for, had it not been for the prior action of the Minister in the matter. With this part of the case we purpose dealing on a subsequent occasion.

In concluding this article, we may remark that to the unwarrantable treatment which tenderers outside the Colony have experienced at the hands of the New South Wales Government has been added the discourtesy of withholding from them official notification either of the rejection or acceptance of their tenders, the only information on the subject being such as may be gathered from the papers laid recently before the Legislative Assembly. They have consequently suffered the inconvenience of being held in suspense as to the result of their offers. No sufficient reason has been disclosed to warrant this treatment. It would have been but reasonable for the Government—pending the settlement of the question as to the fostering of local manufacturers—to have taken action on the tenders submitted in response to the invitation of their predecessors. The remote period named by the local firms for commencing delivery of the engines and the slow rate of supply promised by them renders it impossible for them—apart from other considerations—to meet the existing demands of the Department for Locomotives.

We shall not be surprised to find that the delay which has occurred in dealing with the matter will be followed by the discovery at the last moment that the pressing need of the Railway Department for additional engines can only be met, as on previous occasions, by ordering from America, and without competition, locomotives at prices much in excess of the English tenders.

This is altogether wrong, the engine being of a different type no comparison can be made. It is idle to say that they are 56 per cent. above the English prices unless we know what the English prices are. The writer's argument leads him constructively into the assertion that engines in England, whatever their character, dimensions, &c., are built at the same price.—CH.A.G., 16/4/88.

Railways.—Further papers respecting Tests for suitable type of Engine.

Ordered by the Legislative Assembly to be printed, 25 October, 1887.

Mr. Acting Locomotive Engineer Midelton to The Traffic Manager.

New Engines for working Mail and Mixed Trains.

Now I have this matter in hand, I should be glad to know your views as regards the maximum number of vehicles (or total weight of train exclusive of engine and tender) you desire to work on your mail trains regularly.

As you of course know, we have been using *two* powerful engines on our mail trains for some time, I hardly think it necessary to point out how prejudicial this is in many ways, as you, of course know that also.

If

If you will kindly let me know the weight of the heaviest train you desire to work, at an average speed of (say) 35 miles per hour, I should be glad, as the practice of employing two engines on ONE train should be discontinued as soon as possible. I am preparing designs for an engine which shall take the train I think you will propose, that is, of course, keeping within bounds as to safety on our steep grades.

I have my opinions of course, and when I have yours probably I shall find I have under-estimated your requirements. Please, therefore, let me have this as soon as you can.

THOS. MIDELTON, 20/3/83.

Memorandum to The Traffic Manager.

Locomotive Engines Branch, Redfern, 13 April, 1883.

WILL the Traffic Manager kindly return my m.p., 83-2,179 *re* new engines for working mail and mixed trains. The paper was sent to Traffic Manager on 21/3/83.

R.J.S.

The information we require from Inspectors not yet furnished. Will return the paper in the course of two or three days.—W. V. READ (*pro* J.P.), 16/4/83. I shall be glad to have your reply as early as possible; I have several important questions standing for this paper.—T.M., 17/4/83. Traffic Manager.

I return the paper herewith, and from inquiries I have made, I find that an engine capable of maintaining a speed of 35 miles per hour on an ordinary road, and of drawing thirteen loaded vehicles up an incline of 1 in 30 or 33, would meet the requirements of the Department. I do not mean, of course, that a speed of that kind should be maintained upon such an incline, because that would be impossible. It will be a great desideratum if such an engine can be procured for our passenger trains, because I quite concur with Mr. Midelton, that it is undesirable to have two engines doing the work of one, as they have very frequently to do at present.—W.V.R., 25/4/83. Mr. Midelton.

Please see L.E., 84-2,946, Comrs. 84-10,352 and 84-9,134.

I am sorry it has taken two years to accomplish that which is so generally admitted to be so desirable. We now possess ten passenger engines which will do what is required, *viz.*, take thirteen vehicles over any portion of the N.S.W. lines at any time-table speed the Traffic Manager likes to decide upon. I have to-day (15/4/85) hauled a train of 101 tons (exclusive of engine and tender) from Penrith to Glenbrook under conditions which cannot be said to be favourable, the boiler of No. 311 engine (the one in question) being very dirty indeed, and also the water. The engine steamed freely, did not prime, hauled the load with ease, and ran perfectly cool all round. On the return journey No. 311 was attached to the up passenger train, and ran often at a speed of over 40 miles an hour for a long distance. I consider this most satisfactory, and these engines are capable of successfully working any passenger train we have, even the express, where, if one of them were used, a train of double the weight of the present one could be worked, but of course I should not advocate the use of a six-coupled 5-ft. wheel engine where a four-coupled 6-ft. wheel will do.—T.M., 15/4/85.

Traffic Manager will please note and return, so that I may forward paper to L.E.—Seen.—W. V. READ (*pro* D.K.), 16/4/85.

Locomotive Engineer.—T.M., 16/4/85.

Minute by Mr. Midelton, Locomotive Overseer.

On letter received by Commissioner for Railways from Mr. W. Rhodes (of the Baldwin Company), offering six locomotives of the "Mogul" type, dated 1st December, 1883.

This represents the class of engine and tender I am now designing in accordance with a minute by you on a previous paper. I have ever since I came to the Colony—in 1880—argued that an engine such as here illustrated, having 18 x 26 cyls, and a set of 6-coupled wheels, 5'0 diameter, would with a suitable engine we could have, such as would be capable of working any passenger trains, or goods trains, or fast eight-wheeled tender to carry 3,000 gallons of water and 5 or 5½ tons of coal, be the best "all round" class of cattle traffic, in short it could be attached to any train and work it satisfactorily. I have already made my views known in the report and specification *re* the twenty new Mogul engines recently cabled for from England, but I regret to hear that my suggestions were *not regarded*. If the Loco. Engineer will give me his *full support* I shall have very great pleasure in preparing "Special specifications" as alluded to in the attached printed circular (extract from the *Chicago Railway Age*, May 29th and June 5th, 1879), and guarantee to have an engine which shall give equal performance, and under similar circumstances, to those named by Mr. Finney, and I recommend that such specification be prepared and submitted to the Baldwin Company for prices for six engines and tenders as suggested by Mr. Rhodes, as I am quite sure they will give us greater satisfaction than any engine we now have. It grieves me to see two engines on our mail trains when one (such as I propose) would do the work comfortably in all weathers.

The reason for this is shown in the papers.—W.S.

Mr. Midelton has my support when I consider he is right.—W.S.

T.M., 22/12/83.

The class of engine submitted by Mr. Rhodes, on behalf of the Baldwin Company, would be a great improvement on the Consolidation class supplied to us by this firm, and provided they undertake to build such a type of engine on our specification I recommend an order be given for six of them if the price be reasonable. The class of engine which I consider best adapted to our requirements is a 19 x 26 cylinder and a 54-inch driving wheel. This type of engine would have a tractive power of about 174, and can be run at a speed of 35 miles per hour, allowing a good margin of safety, which I consider would be ample for any mixed passenger or live stock trains. Believing that the speed of our mail trains must be increased rather than reduced, I could not think of recommending the use of such an engine as Mr. Midelton advocates for running mail trains.—W. Scott, 2/1/84. The Commissioner.

Will

Will the Loco. Engineer be good enough to direct Mr. Midelton to draw up a specification to his design, and I shall be glad to receive a specification from Mr. Scott to his own design, as explained in his minute of 2/1/84. Then I think it would be well to obtain prices from Baldwin Company on a competitive basis for one or both of these engine. Let Mr. Midelton state the speed to which the engine he proposes can be run to with perfect safety.—CH.A.G., 22/1/84.

Stated 35 to 40 miles per hour on specification.

I must agree with Mr. Midelton that it is a grievous thing to see, when a train is slightly added to—(say) 40 tons added, and not weighing on the whole 120 tons (without motive power)—that two engines should be required to move it. If one engine can do such work by all means let us have a design of it.—CH.A.G., 22/1/84.

Memo. to Mr. Midelton, 25 January, 1884.—Referring to your minute of 22/12/83 on Mr. Rhodes' letter of 1st December, the Commissioner desires that you will draw up a specification of the engine you propose, and state the speed to which the engine can be run with safety.—W. SCOTT.

Specification herewith. I very much regret there is not time for preparing complete drawings also.—T.M., 26/2/84. Loco. Engineer.

Extract from Commissioner's Minute Paper, 84-10,352.

* * * * * Mr. Midelton has designed a powerful passenger engine which, when required, can be used as a goods engine. The two specifications are herewith. The latter engine is to enable us to increase the weight of our passenger trains without using two engines. * * * * *

CH.A.G., 27/3/84.

Approved.—F.A.W., 3/4/84.

Railways.—Tenders for Engines and Tests for suitable Type of Engine.

Ordered by the Legislative Assembly to be printed, 13 October, 1887.

The Locomotive Engineer to The Commissioner for Railways.

Additional Engines required for new extensions, &c.

In view of the number of additional miles that will be opened for traffic within the next two years, I beg to recommend tenders be invited at once for the number of engines required to work them.

On the Northern Line there are not sufficient goods engines now in stock to meet the traffic in the busy season, and when the line is opened to Tenterfield we shall have very great difficulty in meeting the increased requirements, so that it is absolutely necessary that more locomotives be supplied at the earliest possible moment for that line.

While we have sufficient engine power to meet the traffic on the Southern and Western Lines at the present time, yet when the new extensions are opened (over 300 miles) an increase to our locomotive stock will be indispensable.

In view of the many advantages accruing from as few types of engines as possible being used, I strongly recommend that the terms of the specification for the two classes now required be strictly adhered to.

The class most suitable for our passenger traffic is that provided for in the specification upon which tenders were last invited, and for which the Vulcan Foundry Company, of England, obtained the contract. The advantages gained by having even the same class made by the same makers are so considerable, and in view of the very low price at which the Vulcan Foundry Company are supplying, induces me to strongly recommend that an order for those now required be given to the same firm.

For the goods traffic I do not think that a more suitable engine than the Mogul class, specification No. 191, can be obtained. We have now had some years' experience of them, and, as regards loads hauled, economy in "Running Stores," and small cost of repairs and renewals, they have given general satisfaction. I therefore strongly urge that this type of engine be adhered to.

The following are the number of engines required, and the estimated cost:—

Great Northern Railway—

4 Passenger Engines, @ £2,450 each	—	£ 9,800
8 Goods " @ £2,780 each	—	22,240

Great Southern and Western Lines—

12 Passenger Engines, @ £2,450 each	—	£ 29,400
20 Goods " @ £2,780 each	—	55,600

Total £117,040

I intend to submit a separate paper upon the quantity and description of tank engines which will be required to meet the increased requirements on our suburban lines.

W. SCOTT, 25/5/86.

I cannot concur in Mr. Scott's recommendation that for the reasons given the order for the sixteen passenger engines required be given to the Vulcan Company without competition.

We have not, I think, received the engines which the Vulcan Company obtained recently the contract for, and therefore cannot know much of the quality of the work; but even if it be all that can be desired, I do not think it right that we should depart from the approved system of inviting tenders.—CH.A.G., 28/5/86.

The system of inviting tenders should not be departed from. It is represented that it is absolutely necessary these engines should be obtained. I therefore approve of tenders being called.—W.J.L., 29/5/86.

Memo

Memo. by The Locomotive Engineer to The Commissioner for Railways.

Tenders for Locomotive Engines.

I FORWARD herewith a draft advertisement, calling for tenders for the supply of locomotive engines, approved on your 86-8,560 herewith, which will, I trust, be inserted as early as practicable.

I also forward herewith twelve copies of each specification for Colonial-built engines and ten copies of each specification for engines to be manufactured in England or elsewhere.

W. SCOTT, 31/8/86.

Send copy of draft specification and conditions for locomotives to D. & W. Robertson, Mort's Dock, Atlas Company, Vale, Wearne, Hudson Bros., and Chapman and Company, and ask them to peruse them and let me know whether there are any alterations which, in their opinion, should be made therein to meet the reasonable requirements of Colonial manufacturers. Suggest that they have a meeting and act in concert in any suggestions which they may have to make.—CH.A.G., 2/9/86.

The Commissioner for Railways to Messrs. D. & W. Robertson and others.

Gentlemen,

Department of Public Works, Railway Branch, 2 September, 1886.

I have the honor to enclose herein for your perusal copy of our specifications for the supply of engines, for which tenders are to be shortly invited. I shall be glad if you will let me know whether there are any alterations in the conditions which you consider should be made to meet the reasonable requirements of local manufactures. I may add that a similar communication has been addressed to the firms mentioned in the margin. It would perhaps be desirable for a meeting of representatives of these firms to be held in order that any suggestions may meet with their entire concurrence.

I have, &c.,

CHAS. A. GOODCHAP

(Per D.C.M'L.),

Commissioner for Railways.

Mort's Dock Co.,
Mr. Wearne, Mr.
Vale, Champan
& Co., Hudson
Bros., Atlas Co.

Please reply on or before the 15th instant.

The Secretary, Iron Trades Employés Association, to The Commissioner for Railways.

Iron Trades Employés Association, Box 256, General Post Office,

Sydney, 14 September, 1886.

Sir

Your favour of 2nd instant, together with copies of specifications for supply of locomotives, were duly received, and the several firms having had a conference on the subject, acted under their instructions, I have the honor to request that the following alterations be made in the conditions, viz. :—

GOODS ENGINES.

1.—General Arrangements, page 2.

In lieu of the contractor preparing the working drawings, the employés consider it to be the duty of the Government to supply plans and specifications from which the contractor should work.

See Minister's
decision ; con-
tractors to pre-
pare their own
drawings.—
CH. A. G.,
25/10/86.

2.—Wheels and tires, page 4.

The Colonial manufacturers consider that, as there are several English firms with quite as good a reputation for this class of work as that of Vickers, Sons, & Co. (such as John Brown & Co., Cammell & Co., Brown, Baley, & Dixon), it is not fair or to the interest of the Government they should be limited to one particular firm, especially as the principal railway companies in England and elsewhere obtain their material from those and other equally good firms.

See Minister's
decision.—
CH. A. G.,
25/10/86.

3.—Boiler, page 4.

The "Farnley" brand of iron to be included with Lowmoor, Bowling, or Taylor Brothers, as the makers of that iron stand on equal terms in England.

See Mr. Scott's
minute con-
ceding this.—
CH. A. G.,
25/10/86.

4.—General conditions, page 11.

Alterations.—The minor alteration to be executed by contractor should be limited to £5 ; anything beyond that value should be paid for.

See Mr. Scott's
minute con-
ceding this.—
CH. A. G.,
25/10/86.

Cost of Arbitration.—The employers consider it would be more equitable for the contractor to bear expense of arbitration if he be not awarded an amount equal to one-half his claim, instead of three-fourths, as now specified.

See Minister's
decision.—
CH. A. G.,
25/10/86.

Hoping this will meet with your approval,

I have, &c.,

JAS. CHAS. PRATT,

Secretary.

Mr. Scott for report. I do not see how the Colonial manufacturers can be prejudicially affected by our mentioning Vickers' steel for tires. The same condition will apply as regards the description of steel if English manufacturers compete. I strongly doubt whether the firms named by the Contractors' Association do make as good tires and axles as Vickers ; our experience is the other way.—CH.A.G., 23/9/86.

The

The Locomotive Engineer to The Commissioner for Railways.

CONTRACTORS' suggestions *re* alterations in specifications for engines proposed to be built in the Colony:—

(1.) The object of stipulating that contractors should provide their own working drawings is to obviate the necessity of employing a staff of locomotive draftsmen for which there is at present no accommodation, in addition to which we could not find permanent employment for them.

(2.) I cannot admit the contention that the other firms mentioned have as good a reputation as Messrs. Vickers have as makers of axles and tires, and in view of the importance of having the very best quality of material, I do not think the alteration suggested should be granted. I assume that, provided tenderers are supplied at the prices now charged to the Government by Messrs. Vickers, they are not prejudicially affected.

(3.) I have no objection to the Farnley brand of iron being included. In fact the proviso that tenderers were to name the brand of iron they intended to use was specially inserted to meet such views.

(4.) I have no objections to the value of the minor alterations in detail being limited to £5.

W. SCOTT, 28/9/86.

In what way can it be stipulated that the contractors shall have the axles and tires at the price paid by the Government? The only way that I can see to accomplish this is to provide in the specification that the axles and tires shall be provided by the Government.—CH. A. G., B. C., 30/9/86.

Mr. Scott.—Urgent.

I had a conversation with Mr. J. N. Vickers, of Bond-street, who represents the firm in the colonies, on this subject, and he gave me to understand that they could supply contractors building engines for the Government at the same price as they are supplied to the Government, and he informed me that he intended to see you on the subject. I would suggest that he be written to so as to obtain a written offer to that effect.—W. SCOTT, 2/10/86. Commissioner.

I have no doubt if the undertaking were made that the firm would carry it out, but I do not think it desirable that the Department should contract for third parties, as complications might arise. Before, however, the question is finally decided, the contention of the manufacturers that we should take other tires and axles must be submitted to the Minister. Manufacturers will push their wares, and no doubt the Department lays itself open to ungenerous suspicion in advocating a special article made only by *one* manufacturer, but if an accident were to occur through defective axles and tires—and on our mountain lines the consequences would be perhaps exceptionally severe—those who advocate cheap axles and tires would not be held responsible, but the officers of the Department would be for weakness in not resisting the use of inferior material in such vital parts of our rolling stock. Of course the manufacturers named would urge that their tires and axles are as good as Vickers', but the report of Sir John Fowler and our own experience are to the contrary.—CH. A. G., 7/10/86.

I see no objection to the contractors providing their own working drawings; on the contrary I believe if it were done it would be a considerable saving to the Department. With regard to the use of tires and axles, I deprecate any proposal to obtain these unless they are of the best quality, and obtained of makers of the highest standing. There can be no objection to the contractors arranging with Messrs. Vickers & Co. for the supply of the same class of tires, &c., as we are now using. It is undesirable that the Government should make the arrangements, as they would thereby become third parties to the transaction, which might cause complications, but contractors should have direct communication with the makers, the Government reserving to itself the right to accept or reject any supplies. With reference to the use of axles and tires other than Vickers', unless experts in whom the Department and the public have confidence are prepared to recommend other makers I certainly cannot take the responsibility of authorizing any alteration.—W. J. L., 11/10/86.

Will the Minister decide question as to cost of arbitration, as provided in specification? It reads that, unless the contractor is awarded three-fourths of his claim, he must pay costs; this is, of course, to prevent excessive claims being made. The contractors say "one-half," but that seems to me absurd. A contractor claims £100, and is awarded £50, which sum we may have been willing to pay, without going to arbitration, and yet we should have to pay costs. It would be better to say that the cost of all references to arbitration shall be borne equally by both sides, or make it in proportion—that is, the same proportion as the award bears to claim and offer.—CH. A. G., 14/10/86.

If the contractor does not get an award of more than offered by the Department, he should pay *all* costs, and if he obtains one-half his claim (being *more* than we would pay), the Department should pay half costs.—W. J. L., 21/10/86.

Communicate to Colonial manufacturers the decision of the Minister on the points raised, and the other points which the Locomotive Engineer has conceded. Then to Mr. Scott to have specification and conditions amended in accordance therewith. The payment of arbitration costs should be arranged as provided in the accompanying printed copy of conditions as to arbitration, clause 13.—CH. A. G., 25/10/86.

The Commissioner for Railways to The Secretary, Iron Trades Employés Association.

Sir,

Department of Railways, Sydney, 3 November, 1886.

With reference to your letter of the 14th September last, suggesting certain alterations in the specifications for the manufacture of locomotives in the Colony, I have the honor to inform you that the matter has had very careful consideration, and I have to intimate that Mr. Secretary Lyne has decided as follows on the various points raised:—

First.—As to drawings, that it is advisable the contractors should provide the working drawings.

Second.—Wheels and Tires: That, in the interest of public safety, it is essential they should be of the very best quality, and obtained from makers of the highest standing.

Relative to the use of axles and tires, other than Vickers', Mr. Secretary Lyne cannot accept any responsibility in authorizing the receipt of tires and axles, the manufacture of any other firm, but would be prepared to consider the matter if experts, in whom the Department and the public had confidence, were prepared to recommend other makers.

Third.

Third.—Inclusion of the "Farnley" brand of iron; and

Fourth.—Cost of alterations above £5 to be paid for. These points will be conceded.

Fifth.—Cost of arbitration: The cause relating to the costs of arbitration to be amended as follows:—

"If, upon an arbitration in respect of claims made by the contractor the sum awarded to the contractor shall be less than one-half of the amount of his said claim, all the costs, charges, and expenses of, and incident to, the said arbitration and award shall be borne and paid by the contractor, but if the amount awarded shall exceed one-half of the amount of the said claim, then each party shall pay his own costs and one-half of the arbitrators and umpire's fees."

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Memo. from The Locomotive Engineer to The Commissioner for Railways.

I SHALL be obliged if you will kindly inform me when tenders will be invited for the engines to specifications, Nos. 188A and 191, which were forwarded to you on 31/8/86.

As the engines cannot be delivered for a considerable time after tenders are invited, I would point out that unless tenders are soon called for serious inconvenience may be caused in working the traffic.

W. SCOTT, 29/10/86.

The Secretary, Iron Trades Employés Association, to The Commissioner for Railways.

Iron Trades Employés Association, Box 256, General Post Office,

Sydney, 12 November, 1886.

Sir,

I have the honor to acknowledge the receipt of your favour of 3rd instant in reference to the locomotive specifications, and am instructed to say the employers acquiesce in the specification being amended in accordance with your letter now under acknowledgment.

I am further instructed to ask if you would favour the employers with the prices paid by the Government for the Vickers' wheels and axles and tires.

I have, &c.,

JAS. CHAS. PRATT,

Secretary.

Locomotive Engineer.—D.C.M'L., 15/11/86. The information can be supplied by the Store Branch if the Commissioner approves.—W.S., 17/11/86. The Commissioner.

This paper was sent to Loco. Branch to amend the specification. The matter mentioned in the second paragraph of Mr. Pratt's letter is being dealt with separately.—D.C.M'L., 18/11/86. Locomotive Engineer—A.R., B.C., 18/11/86. The specifications with the alterations approved by the Commissioner are in the Printer's hands.—W.S., 19/11/86. The Commissioner. In a week to see if specifications are ready, 23/11/86.

Give the fullest information of the price we pay for locomotive wheel-tires and axles. I do not think we get the wheels from Vickers. Please inquire? Be careful there is no mistake, as the tenders will probably be based on the price we name.—CH.A.G., 16/11/86.

RETURN of prices paid for tires and axles during 1885-1886.

Memo. by The Locomotive Engineer to The Commissioner for Railways.

Tenders for Locomotive Engines.

I HEREWITH forward twelve copies of specification No. 188A, and twelve copies of specification No. 191, which are complete, in accordance with your directions on 86-4,423, re provision for Colonial manufactures. Draft advertisement also herewith.

W. SCOTT, 23/11/86.

The specification must embody in itself, and not in the form of addenda, the alterations made to Monk bridge boiler-plate, to be included with other brands. Is it not proposed to invite tenders in Europe and America at the same time?—CH.A.G., 25/11/86. Locomotive Engineer.

I will have the specifications altered, to include the amendments referred to in their proper places; but as this will involve the reprinting of them, some delay will necessarily occur. In regard to the Monk bridge-plates I regret to say that I have not sufficient confidence in their quality to justify my including them in the specification, more particularly as regards the boilers; but I see no objection to their being used in the frame-plates, and will provide accordingly. I would, however, suggest, for your consideration,

consideration; the desirability of sending a cable to the Inspecting Engineer in England, to the following effect:—"Are Monk bridge-plates considered suitable for locomotive boilers?" I assumed it was your intention to invite tenders in Europe and America, and provided for it in a separate specification.—W. Scott, 30/11/86.

Prepare cablegram for Agent-General.—CH.A.G., 2/12/86. Cablegram forwarded to Public Works for transmission to Agent-General, 2/12/86.—D.C.M'L., 2/12/86. Locomotive Engineer.

Eight specifications for passenger engines herewith. The specifications for goods have not been received from the Printer yet.—W. Scott, 29/12/86. The Commissioner.

Memo. by The Commissioner for Railways.

Specifications for Locomotives.

It is time the advertisement was out for locomotives.

Tenders are to be invited in the Colony, and simultaneously in England and America.

Let me have completed specifications and notices.—CH.A.G., 30/12/86.

Specifications for the passenger engines herewith; those for the goods engines have not yet been turned out by the Printer. Advertisements might however be put in the newspapers saying that specifications for the latter can be obtained after (say) the 7th proximo. Please say how much notice should be given of the date for reception of tenders.—D.C.M'L., 30/12/86.

The Commissioner wishes you to submit at once the draft advertisement. I would point out that the specifications sent only provide for the engines to be made in the Colony. Where are the specifications to be tendered from in England and America? The matter is urgent, and the Commissioner wishes it attended to with the utmost expedition.—D.C.M'L., 30/12/86. Locomotive Engineer.

Draft advertisement herewith. The specifications were only received from the Printer's this morning. There are ten of each description for Colonial tenderers, and twenty of each for foreign tenderers. More can be forwarded if required.—W. Scott, 4/1/87. The Commissioner.

The specifications have been forwarded to your office.—W.S., 5/1/87. The Commissioner.

* Specifications included in papers laid on the Table of the House, and ordered to be printed, 27 April, 1887.

ENCLOSED are papers and specifications* containing all necessary information for the invitation of tenders for the following locomotive engines:—

16 of passenger type	12 at Sydney, 4 at Newcastle.
28 of goods type	20 at Sydney, 8 at Newcastle.

The mail leaves *via* Melbourne on Wednesday next, and it is proposed to call for tenders in America, England, and the Colony, returnable in each place on the same date (12th April). The tenders received in Sydney will not be open until the Agent-General reports (which he will be able to do by cablegram) the result of the tendering in England, America, and on the Continent.

CH.A.G., 10/1/87.

Approved.—W.J.L., 10/1/87. Write to Agent-General at once.—A.R., 10/1/87. Draft letter to Agent-General.—C.A.B., 11/1/87.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 11 January, 1887.

I have the honor to inform you that, in view of the expected opening of new lines, it has become necessary to obtain a further supply of locomotives, both for passenger and goods work, and the Government have determined that tenders shall be invited for them in England, America, the Continent of Europe and the Colonies.

The locomotives required are:—

Sixteen four-coupled outside cylinder passenger bogie engines with tenders to specification, 188A (twelve to be delivered in steam in Sydney, and four in steam in Newcastle).

Twenty-eight six-coupled outside cylinder bogie goods engines with tenders to specification, 191, of which twenty are to be delivered in steam in Sydney, and eight in steam in Newcastle.

For these engines you will please invite tenders in England, America, and on the Continent; tenders to be lodged by the 12th day of April next.

As time is now an important consideration, I will ask you to be good enough to communicate to me by cable the result of the tendering, and the recommendation of the Consulting Engineer, in order that it may be considered with the Colonial tenders. By this mail I send you forty copies of specification No. 188A, and a similar number of specification No. 191.

I have, &c.,

W. J. LYNE,

Secretary for Public Works.

The Manager, Phoenix Foundry Co., to The Locomotive Engineer.

Phoenix Foundry Company (Limited),

Dear Sir,

Ballarat, 11 January, 1887.

I notice by the papers that you will be calling for tenders shortly for the locomotive engines you mentioned some time since. When the specifications, conditions, &c., are ready, I would be obliged if you would kindly forward me a copy of same. I will remit the charge for same per return. With best wishes to yourself and Mrs. Scott for the new year,—

I am, &c.,

W. H. SHAW,

Manager.

Copies forwarded.

The

The Manager, Phoenix Foundry Co., to The Locomotive Superintendent.

The Phoenix Foundry Company (Limited),

Ballarat, 19 January, 1887.

Dear Sir,

Referring to the specifications for forty-four locomotive engines which you have kindly sent us, we notice that the specifications state the engines are "To be manufactured in the Colony of New South Wales," and in the conditions also, "the remainder must be manufactured in the Colony of New South Wales."

Will you kindly inform me if these conditions are imperative on all tenderers, or if they are intended to apply to New South Wales tenderers only. If they are imperative on all tenderers, they, of course, shut us out entirely, because, although we do all the work ourselves, and only import the raw materials, yet none of our work could be done in New South Wales, and, consequently, we could not comply with this condition.

We trust you will see your way to make these conditions apply to all the Colonies. Awaiting your reply,—

I am, &c.,

W. H. SHAW,
Manager.

Minute by The Locomotive Engineer to The Commissioner.

COPIES of the specifications for Colonial tenderers were forwarded to the manager upon his application. I now submit his subsequent letter, which opens up the question as to whether they must be built in this Colony. I submit that the Phoenix Foundry be treated as a foreign firm, and be supplied with the specification relating to foreign builders.

W. SCOTT, 25/1/87.

For Minister's consideration.—I think Victoria, or indeed any of the Australian Colonies, should be admitted on the same terms as the manufacturers of New South Wales.—Ch.A.G., 29/1/87. The present tender is for engines to be made in the Colony, in accordance with the resolution of Parliament.—J.S., 20/5/87."

Tenders for Forty-four Locomotives.

The Agent-General for New South Wales to The Secretary for Public Works.

Sir,

5, Westminster Chambers, 22 April, 1887.

In accordance with your instructions, as conveyed to me in your letter 86-140, of the 11th January last, and the Honorable the Colonial Secretary's telegrams of the 5th March last and the 4th instant respectively, I have invited tenders from the Continent, America, and the United Kingdom for the forty-four locomotives required by the Government. Tenders were received at this office on the 12th instant, and on the 14th idem I informed the Honorable the Colonial Secretary, by telegram, as follows:—

"*Re Locomotives.*—Four tenders received from United States of America; three from Continent; twenty-two from England. Eleven according to original, and twelve to new conditions. Six informal. English tenders lowest, and very close. Neilson's lowest according to new conditions, but without design—passenger, £2,375; goods, £2,245. After further examination of tenders I will telegraph again."

On the 19th instant I further telegraphed as follows:—

"Tenders locomotives. Large difference between old and new conditions to cover possible rejection risks and deferred payments. Six firms not tendered under new conditions. Consider Government best served (Dübs) £2,165, passenger (Beyer) £2,495—payment in England as hitherto. Believe Beyer would take £100 less."

I have now the honor to forward, for your information, the Inspecting Engineer's letter of the 21st instant, having reference to the analysis of the tenders received, together with schedules of the tenders for each kind of engine.

I have, &c.,

SAUL SAMUEL.

[Enclosure.]

Sir,

2, Queen's Square Place, Westminster, S.W., 19 April, 1887.

I have gone very carefully through the details of the tenders, plans, and specifications of the locomotives. Of the various plans which have been sent in, six firms do not tender on the altered or new conditions, and the difference between the original and new conditions is in some cases large—namely, as much as £460 per engine. This is excessive; about £150 would perhaps represent the money value of the different modes of payment and cost of shed-room. There is the interest on the deferred payment, the commission to the Financial Agent in the Colony, and the exchange in sending home the money, &c. In the instance where the large increase is made, I think the manufacturers have put down the difference to compensate for risk of rejection in the Colony.

The lowest tender under the new conditions is, as previously stated, that of Messrs. Neilson & Co.; but no plan has been sent with the tender, and before any acceptance of this tender it would be absolutely necessary to have plans and details to be approved, so that we may know what they propose, as Messrs. Neilson have not hitherto made engines for the New South Wales Government.

If it be a question of excellence of manufacture, I should recommend that the goods engines be given to Messrs. Dübs and the passenger engines to Beyer and Peacock, who have made similar locomotives for the Colony, and have always given satisfaction in their work.

Also, that payment be made in England in the usual manner, the price being respectively* £2,265 for the goods engines at Sydney, and £2,495 for the passenger engines at Sydney. The Newcastle delivery is £25 each more.

I am, &c.,

JOHN FOWLER.

The Agent-General, New South Wales Government.

*Price since been reduced by £100¹

SCHEDULE OF TENDER.

(F 1475.)

28 outside Cylinder Bogie Goods Engine, with Tenders.

Firm	Original conditions— Pay in England.		Altered conditions— Pay in Colony.		Informal conditions.	Place of delivery.	Designs accompanying tender.

Telegram from London Station to The Colonial Secretary.

LOCOMOTIVES tenderers pressing for answer; please reply.

Refer to Works.—C.W., 10/5/87. Railways.—J.R., B.C., 12/5/87. Submitted for Minister's direction.—D.V., 13/5/87. I think we should cablegram to say: "Cannot finally decide till all the tenders are in hands of the Government."—CH.A.G., 25/5/87. Approved.—J.S., 26/5/87.

Minute by The Commissioner to The Locomotive Engineer.

I AM informed that the engines for which tenders have recently been invited are of a different type to any that we have now in use. Our object should be to reduce and not to increase the types of engines. We have now some thirty different types. My wish is to reduce the number of types to five: An express engine, an ordinary passenger, an engine for mixed trains, a heavy goods, a tank engine, and perhaps, though this is not certain, a light mixed engine for the level lines in the interior.

Loco. Engineer.

CH.A.G., B.C., 12/2/87.

Will Mr. Scott be good enough to explain why he has increased the types of engines.—CH.A.G.

It has always been my object to lessen rather than increase the number of types of our engines. I entirely agree that five types should be sufficient, and it will be found that my recommendations have been in accord with this.

The goods engines, for which tenders are now invited, are of our ordinary heavy goods class, "Mogul type," with very slight alterations to cylinders, which are increased 1 inch in diameter; the tender enlarged to hold 500 gallons more water, and an extended smoke-box provided with the view of assisting to prevent emission of sparks from the chimney.

The passenger engines are exactly the same as those now under order from the Vulcan Foundry, and will be of our ordinary heavy passenger type. The necessity for taking heavier loads required by traffic rendered it necessary to enlarge the cylinders and tender-tank. The extended smoke-boxes are also provided for in these engines.

W. SCOTT, 14/2/87.

The Commissioner.

Let me know the number of types of engines which have been introduced since Mr. Scott has been Locomotive Engineer.—CH.A.G., 18/2/87.

Memo. to The Locomotive Engineer.

I HAVE to inform you that the Commissioner wishes to be furnished with a statement, showing the number and description of types of engines which have been introduced by Mr. Scott since he succeeded to his present position.

Please forward this information early.

D.C.M'L., B.C., 22/2/87.

41 express engines, of the Standard type.

60 goods engines, of the Mogul Standard type.

18 tank engines, for suburban traffic.

2 do for Camden Line.

12 passenger engines, of the 79 class, but with increased cylinder power and tender capacity.

The Commissioner.

W. SCOTT, 25/2/87.

Not new.

Not new.

New.

Did the enclosed paper go to Mr. Scott with this covering paper? I do not think his answer quite corresponds with the question I put.—CH.A.G., 28/2/87. No.—D.C.M'L., 1/3/87.

The Mogul goods have been altered, and also the passenger, in the recent indent for forty-four locomotives. Did not Mr. Scott propose a heavier engine for the suburban traffic?—CH.A.G., 1/3/87.

The question of providing a more powerful tank engine for suburban traffic has been under discussion, but so far the Locomotive Engineer has not submitted any design. The matter was awaiting the settlement of the question as to the maximum load a suburban engine is to haul. The decision arrived at was that the present engines have sufficient power, and that a new type of engine is not required.—D.C.M'L., 1/3/87.

Memo. by The Secretary for Public Works.

Locomotives.

TENDERS invited in England, America, and Europe for,—

Passenger engines	16	
Goods engines	28

44

Tenders are to be received up to the 12th April next. Agent-General written to, 20th January, 1887.

The conditions provide that:—

"Payment will be made for each engine as follows:—90 per cent. in cash in London on receipt by the Agent-General for New South Wales of the bills of lading, together with a certificate from the Inspecting Engineer, that the terms of this specification, as to completion, and packing, &c., &c., of the engines have been fulfilled."

I consider it desirable that this condition should be amended, both as regards inspection and payment.

The area of competition has been widened, and European and American firms, as well as English and Colonial firms, have been invited to compete. The engines if made in the Colony will be subject to the inspection of an Inspecting Officer here. If made in England the Inspecting Engineer there will be able to perform the duty, but if a Continental or an American firm should obtain the contract we shall have no Inspector in those Countries.

Under these circumstances it seems to me that the inspection should be in the Colony only, and that payment should be made in the Colony on the certificate of the local Inspector, in the following proportions:—

75 per cent. upon Inspector's certificate on the arrival of the engines, and the balance, 25 per cent., after they have run to his satisfaction, 1,000 miles. A

A cablegram must be sent to the Agent-General to alter the conditions accordingly, before tenders are invited.

It is not likely that any action in this respect has been taken, as the indents have been in the hands of the Agent-General only a few days, if indeed they have yet reached him.

JOHN SUTHERLAND,

28/2/87.

Send telegram to Agent-General:—"The specifications for forty-four engines alter conditions as to payment; no inspection on your side necessary; 75 per cent. will be paid on certificate of Inspecting Engineer in Colony; balance on his certificate when they have run 1,000 miles; manufacturers must find their own workshops here for erecting engines."—CH.A.G., 28/2/87.

Locomotive Engineer to note and please return quickly.—D.C.M'L., 4/3/87. Noted.—W. Scott, 5/3/87. Commissioner. Does Commissioner wish any further action taken on this paper?—D.C.M'L., 9/3/87. Any persons representing foreign houses, either American or Continental, who have received in the Colony copies of the specification should be apprised of the change, and also firms in the neighbouring Colonies who may wish to compete.—CH.A.G., 10/3/87. Write letter to Agent-General confirming cablegram, and explaining the reason for the change more fully.—CH.A.G. The Agent-General, 15/3/87. The Locomotive Engineer.—A.R., B.C., 19/3/87. Letters written to Augustus Morris, Esq., Messrs Carson Wood, & Co., Messrs Mason Bros., Messrs Parke & Lacey, Mr. Shaw, Phoenix Foundry, Messrs Gauz & Co., Messrs Ostermeyer, Dewez, & Co.—W.S., 24/3/87. The Commissioner.

The Secretary for Public Works to The Agent-General.

Sir, Department of Public Works, Railway Branch, Sydney, 18 March, 1887.

I have the honor to confirm my cablegram of the 1st instant, relative to the conditions of payment for the supply of forty-four locomotives.

I may say that the area of competition has been widened for this supply, European and American, as well as English and Colonial firms, having been invited to tender. Should an American or Continental firm obtain the contract there would of course be no provision for inspection before arrival in the Colony, and to place all on an equality it has been determined that the engines shall be inspected locally, payments to be made as follows:—75 per cent. upon the inspector's certificate that the engines have arrived, and 25 per cent. after they have run 1,000 miles to the satisfaction of the responsible officers.

I have, &c.,

JOHN SUTHERLAND,

Secretary for Public Works.

I wish the tank engine papers separated from these, as they have not received final action. I shall exhaust every effort to make our present engines (suburban) answer before I consent to the introduction of another type. As I have before said, five types of engines should be sufficient, but owing to the total disregard of this necessity for economic locomotive working in the early years of our railway management, we have nearly thirty-three different types of engines. I feel certain I shall have the sympathy of Mr. Secretary Sutherland in this effort to reduce the number of types of engines, as he has long been aware of the mischievous effect on our working expenses this multiplication of types of engines has had.—CH.A.G., 4/3/87.

I entirely concur with the Commissioner in this matter.—J.S., 9/3/87. Locomotive Engineer to see.—A.R. 9/3/87. Seen.—W.S., 14/3/87.

Mr. C. Wood to The Locomotive Engineer.

Sir, Sydney, N.S.W., 24 March, 1887.

I beg leave to point out to you that my sole reason for troubling you about the specifications for forty-four locomotives was on behalf of the Charleroi Engineering Société. Your to-day's letter, which I have now the pleasure of acknowledging, modifies, you say, the terms of this contract. You will please see at this late date I have no means of notifying my principal that the terms of contract are changed. I must protest on behalf of European clients who are put to immense cost and great trouble, and at the eleventh hour I am here notified, 16,000 miles from my principals, that the conditions of tender are changed.

I will enclose your letter or a copy to my principals to-day.

CARSON WOOD.

For your information.—W. Scott, 28/3/87. The Commissioner.

Telegram from The Agent-General, London, to The Colonial Secretary, Sydney.

DEPUTATION from the locomotive builders urge specification should provide for inspection in this country as hitherto, and that Government find accommodation erection engines; charging contractors' fixed price per engine. I advise reconsideration. Last condition causing much feeling here.

Telegram from the Agent-General, London, to The Colonial Secretary, Sydney.

25 March, 1887.

LOCOMOTIVES.—Answer urgently required to my cablegram of 18th March. Contractors inquire what import duties or other Government dues will be charged locomotives on arrival and landing. Require immediate reply.

The Under Secretary, Public Works.—C.W., B.C., 28/3/87. Railways.—J.R., B.C., 29/3/87.

Reply:—

"BETTER tender at certain price, wharf and Customs duties to be added."—CH.A.G., 5/4/87.

Cablegram sent to Public Works for transmission to Agent-General, 6/4/87.

The

The chief objection seems to be that we should require English and foreign manufacturers to find their own erecting shops in the Colony instead of giving them the free use of our erecting shops as heretofore. Colonial manufacturers will not be allowed any facility of the kind, and if tenders are to be obtained on a fair competitive basis I do not see why foreign and home manufacturers should have the advantage they ask for. The condition is not prohibitory, for there will be little difficulty in obtaining conveniences for erecting engines should a home or foreign manufacturer secure the order. There is, moreover, a precedent for this course; the contractors for the supply of dump-cars were required to find premises for their erection on arrival in the Colony.—CH.A.G., 28/3/87.

I should advise the following message being sent to Agent-General,—“ Amended conditions as to payment and inspection and contractors finding their own premises for erection will be strictly adhered to.”—CH.A.G., 28/3/87.

Approved.—J.S., 30/3/87. Cablegram sent to Public Works for transmission to Agent-General.—D.C.M'L, 31/3/87.

*Only tenders to supply eight engines.

Those underlined thus are the lowest offers.

Memo. by The Secretary for Public Works.

Department of Public Works, Railway Branch, Sydney, 18 April, 1887.
 THE Commissioner will please send the papers and specifications to Mr. Midelton for full report. I have many reasons for desiring that gentleman's report, although he is not in the Engineering Branch of the Railways. I shall be glad to have the papers and report on Wednesday, the 20th instant.

JOHN SUTHERLAND.

Mr. Midelton accordingly.—CH.A.G., 18/4/87. Report on Commissioner's 86-8,560 and specification No. 188A and 191 herewith.—T. MIDELTON, 19/4/87. Commissioner.

Minute by The Secretary for Public Works.

Re Railway Rolling Stock, &c.

WITH reference to the specification for twenty-eight goods and sixteen passenger engines, it seems to me, from a perusal of them, that they provide for a different type of engines to any we have now running, and their adoption would, in my opinion, be a serious mistake. There are many provisions that would make the engines unnecessarily complicated and costly, and debar Colonial makers from having any success in tendering. I think we might, for instance, substitute best steel for iron; it would be cheaper, and would give the locomotive a longer life.

Three-fourths of the trade we have over the mountains, on the steep gradients, could be best and cheapest carried by one class of engines, simple in construction and powerful in action; but we have a number of engines of various designs that it would pay the Department better in the long run to put on the scrap heap, if we could be sure of replacing them by a class of engines more suitable to our requirements.

I am not in favour of any increase in the rates for passengers and produce to augment our revenue, as, I believe, by improving our rolling stock, we shall be able, with economical working, to improve our returns, so as not to require any increase. We have at present a large traffic in live stock, which has proved unprofitable, both to the Railway Department and the owner, the latter asserting that the loss to him through delay in transit by rail, &c., is sometimes equal to 10% on the value of the consignment; and this must be taken in a degree as adding to the railway rates. We will always have a large traffic, either in live stock or dead meat, and I do not think a permanent improvement will come until we have improved rolling stock for this traffic, both in engines and trucks. Stock trains should be run at almost the same speed as our mail and passenger trains, and should give precedence to nothing but them.

For the purpose of obtaining opinions as to the best class of engines for this purpose, I wish an early report from Mr. Midelton, now Superintendent of Tramway Rolling Stock, Mr. Midelton having had a large engineering experience both in England and the Colonies, and has already shown evidence of his ability with regard to his plans for the Goulburn running sheds, and in regard to his advice in connection with the Eveleigh workshops. He has already designed ten locomotives, which, after two years' service, have proved to be the most economical in working that we have; and for these and other reasons, although he is not now in the Railway Locomotive Branch, I should like his opinions on this question.

JOHN SUTHERLAND, 18/4/87.

Mr. Midelton.—A.R., B.C., 19/4/87/. Seen. My report was forwarded on the morning of the 20th to the Commissioner.—THOS. MIDELTON, 22/4/87. Commissioner.

The Superintendent, Tramway Rolling Stock, to The Secretary for Public Works.

Report on Additional Locomotives.

Sir,

After a careful perusal of the papers which provide for the addition of forty-eight locomotives to our present stock, I have the honor, in obedience to your command, to report as follows:—

In the original recommendations of the Locomotive Engineer, dated 25/5/86, I notice he writes there are "many advantages accruing from as few types of engines as possible being used. I strongly recommend that the terms of the specification for the two classes now required be strictly adhered to. The class *most suitable* for our passenger traffic is that provided for in the specification upon which tenders were last invited, and for which the Vulcan Foundry Company of England obtained the contract. The advantages gained by having even the same class, made by the same makers are so considerable, and in view of the very low price at which the Vulcan Foundry Company are supplying, induces me to strongly recommend that an order for those now required be given to the same firm." Although Mr. Scott has had a very long experience here, I venture to assert that he is in error upon this question. We have had no experience of the engine which the Vulcan Foundry are now supplying, and I am at a loss to understand how Mr. Scott arrives at the conclusion that they are the most suitable for our passenger traffic. I have gone very carefully into the merits of the designs of these engines, and must express my conviction that their unsuitability will be established on trial; they cannot be successful unless they are ruinously *overloaded* on their (four) coupled wheels.

Referring to the goods engines, Mr. Scott states: "I do not think that a more suitable engine than the 'Mogul Class'—Specification No. 191—can be obtained. We have now had some years' experience of them, and, as regards loads *hauled*, economy in running stores, and small cost of repair and renewals, they have given general satisfaction. I therefore strongly urge that this type of engine be **ADHERED** to." I will at once say that my views, based on a large experience of the running of these engines, are quite to the contrary, and the records will show that I tried to improve them when the second lot was being ordered in December, 1883, (*vide* Comr's. M.P., 83/19,720), but Mr. Scott opposed it; indeed it is evident Mr. Scott now practically admits that the principal feature—the hauling power—is deficient, for he stipulates that the power of the new engines is to be *increased* 5lb. by making the cylinders 1 *inch larger in diameter*, and by *shortening the stroke 2 inches*. I would point out in this connection that, while the improvement as regards increased power is immaterial, Mr. Scott contradicts, by introducing it, his professed anxiety to limit the types of engines—for undoubtedly he thus introduces another class.

In reporting on Specification No. 188A, for twenty passenger engines, it will be well to consider what has already been done in the matter of equipping our railways with locomotive engines. We, unfortunately, have no less than forty-two different "classes" at the present time of nearly every possible shape and dimensions, twenty-two of which are for passenger traffic, and the rest for goods traffic. This is objectionable and costly, for almost any railway could be properly worked with, at the most, six different "classes" of engine, and many lines could be worked with three.

We began in 1855 with a "class" which exerted a power of 93·10 lb.

In 1856 we had	"	"	97·85 "
" 1865	"	"	71·10 "
" 1867	"	"	112·70 "
" 1870	"	"	105·00 "
" 1875	"	"	168·00 "
" 1877	"	"	117·80 "
" 1877	"	"	123·40 "
" 1880	"	"	102·40 "
" 1883	"	"	104·00 "
" 1884	"	"	117·00 "
" 1884	"	"	140·40 "

I have here referred to twelve "classes," but do not think it necessary to name the other passenger engines which were introduced between 1855 and 1886, as they are all *less* powerful than the above.

As we have a large stock of the class which give off a power of 117·80 lb., this would lead some people to the conclusion that they were the best engines for our lines. But such is not the case, as it often—daily, I might say—happens to be necessary to put two of these engines on many of the passenger trains to work them to Schedule time. The class of passenger engine introduced by me in 1884 (*vide* Com. M.P., 83/2,350, &c.), which exerts a power of 140·40 lb., has answered our requirements satisfactorily in every respect during the past two years on all lines, and the proof of it seems to reside in the fact that the author of the Specification 188A actually describes an engine *which will exert exactly the same power, but will be of totally different design and dimension*; and not only that, it will not be such a suitable engine for the New South Wales lines generally. It will have cylinders and wheels each larger in diameter than is necessary for the power required, and the insistent weight on the wheels will be *much* more—7½ tons per wheel—as against 6 tons. This, I need not remark, will be destructive to the permanent way and to the engine itself.

The comparison between the two engines stands thus:—

Present Passenger Engine and Tender.

Cylinders—18" diameter, 26" stroke, 60" driving wheels, 6 wheels coupled, and 2-wheeled bogie
Power = 140·40 lb., as aforesaid.
Tender on 8 wheels carries 3,600 gallons of water, and 6½ tons of coal.

Proposed Passenger Engine and Tender.

Cylinders—19" diameter, 26" stroke, 66½" driving wheels, 4 wheels coupled, and 4-wheeled bogie.
Power = 141·14 or 742 lb. more.
Tender on 6 wheels carries 2,500 gallons of water and 3 tons of coal.

We here propose to introduce another "type of engine" of practically the same power, but which will in *practice* be certainly not so serviceable an engine as the present one, but *why* it is done it is difficult to

to see. I contend it would be best in every way to go on reproducing the type which has proved to be the best, instead of further complicating matters and increasing our difficulties and expenses for no good purpose. It is more than probable that the weight on the coupled-wheels of the proposed engines will largely exceed the weight specified, viz, 30 tons; if it does not, the engines will slip, and will require the use of a lot of sand, which will increase wear and tear of rails and tires, and cause other trouble. It is best to so proportion an engine that the use of the sand shall be avoided, and this has been done in the engines we have; and as it is specified that each box shall hold 4 cubic feet of sand, it is evident that much is to be expected from the free use of it, if the load on the coupled-wheels does not exceed 30 tons. To be a good reliable engine in all weathers there should not be less than 9 tons on each of the (four) coupled-wheels, but as that weight is *too much for our rails* it is proposed to put $7\frac{1}{2}$ tons on each wheel, and that is excessive. In short, the engine *should have six* coupled-wheels instead of *four* coupled wheels, and I cannot see a valid reason for proposing to have such engines. Quite the contrary, we should now reproduce in our own shops the engines and tenders we have found to answer our requirements best; and as locomotive builders only *manufacture* very little of our engines and tenders, I consider the Government should import the necessary raw material—consisting of steel plates for boilers, copper plates, boiler tubes, Staffordshire iron plates, steel tires, axles, &c., &c. (articles which cannot for some time be made in the Colony), direct from the various manufacturers of such articles, in the same way exactly that the locomotive builders do at Home, and I dare say the Government could obtain such material at the same—perhaps lower—prices than they do. Then we could, with the splendid special machine tools and new workshops at Eveleigh, fully and profitably employ our skilled mechanics and others constantly in constructing new engines and repairing old ones, under the supervision of specially trained, expert officers, on the spot, and I feel confident that the total cost of engines built in this manner, under proper discipline and control, would not exceed the highest—perhaps the average—tender which will be received for supplying the engines now under consideration, as the profit now paid the manufacturers, cost of freight, inspection, trial, dismantling, and other items would about balance the extra price of labour here. Indeed, unless this is done, I do not see how the new Eveleigh Works, which have cost about £600,000, can be fully utilized. We have only recently been able to haul, with *one* engine, mail trains, consisting of thirteen carriages, or 104 tons, exclusive of weight of engine tender and passengers, up a grade of 1 in 30, and over the 8-chain curves of the Western road; we cannot do *more* with the proposed new engine; they will not do as much, if constructed to the specification, which specification I might say is certainly a curious one. The first few lines run thus:—“Specification for a four-coupled, outside cylinder, passenger (bogie), *with* engine and tender.” Sixteen are to be delivered in Sydney, and four in Newcastle. Now, as it is almost certain that railway connection with the Southern and Northern lines will be established long before the delivery of the engines takes place, it would have been more convenient and economical for all of them to be delivered in Sydney.

The general arrangement of the engine, it is stipulated, is to be in accordance *with a plan to be prepared by the Contractors, in which certain leading particulars are to be faithfully embodied and adhered to.* For instance, the cylinders are to be 6 feet 3 inches apart, centre to centre, and the slide bars are to be 5 inches wide, the slide blocks $\frac{1}{2}$ inch thick, the tires are all to be $5\frac{1}{2}$ inches wide. Now, if these dimensions are faithfully adhered to, I think the bogie wheels will, in radiating, rub hard against the main frames, or the slide blocks or bars, or the sharp curves of the Western road, and serious results might occur, as the “clearance” is certainly not sufficient. The said specification is not only curious, but it is incongruous and amusing, as can be seen by comparing the above with the last clause on page 13, which states that “Tenderers in England or America *may either tender to the within Specification, or if they wish to depart from it*—in almost every particular—they will be *allowed* to submit *alternate ‘Tenders,’* provided they adhere to the general dimensions of the engine.” This practically means that the author of the specification describes an engine such as he thinks he wants, but he is so undecided in the matter that if any contractor will design and specify a better engine, he will accept it and his tender. A specification embodying such conditions could have been printed on half a sheet of foolscap, and the trouble and expense of preparing the present one entirely avoided.

I consider the engine and tender unnecessarily complicated, and consequently expensive to manufacture. To give an instance, it is specified that one of three makes of Yorkshire iron is to be used in the boilers, whereas *steel*, of far greater strength, and about half the cost, should have been used instead. The connecting rods are composed of no less than sixteen separate parts, whereas only three are necessary. The same argument also applies with equal force to the side rods, and nearly all the other details. There are to be four slide bars where two only are required. The driving and trailing axle-boxes are to be of wrought iron, well case-hardened. This is wholly unnecessary, and very expensive. Brass boxes and keeps are to be used on the bogies. Cast iron is all that is necessary, and it is of course cheaper and better.

The steam “dome” in the boiler is very expensive to make; it is ugly; not only that, but it weakens the boiler, and it is utterly useless.

The regulator is of a class which is anything but good. The spark arresters are to be of the “best design” known. That is very vague; surely something definite could have been specified.

The Roscoe Lubricator is a very old device; there are many others less expensive and far more efficient lubricators to be had. A water-jet is to be applied to each tire of each wheel of the engine and tender for the purpose of “cooling,” and it might have been added, for the purpose of causing the engine to “slip” on the rails unnecessarily, which they will do oftener than is convenient, even with a dry rail, as they have not sufficient weight on them to use up the cylinder power.

It is also difficult to see why the tender and train brakes only are to be worked by the Westinghouse gear. The engine brake is to be worked by *hand*, I notice, whereas the whole lot should be worked by one handle operating the Westinghouse gear to be thoroughly efficient and up to modern requirements.

The tender, which is to have a “well,” is a costly and inefficient design; the water and coal capacity is small, and the coal will have to be piled up very high to enable the proper quantity to be carried. This is dangerous, as it often happens that large lumps drop off and sometimes strike the men engaged in repairing the road. There are only six wheels to the tender; this is a grave error, as each wheel will be excessively loaded. There should be eight wheels (two bogies), but it would seem that six wheels are preferred.

The side-lamp brackets should be put at the front end of tender, and *not* at the back, for many good reasons.

To

To sum this matter up, I consider that the author of the specification has ignored the main questions, of first cost, utility, simplicity, and efficiency; and I have no hesitation in saying that a simpler, a far more efficient, and less costly engine and tender could be made in our own workshops at Eveleigh than the one proposed. I should strongly recommend the construction in our own shops of twenty-five more of the 304 class of engine, which were designed for and intended to work five different kinds of traffic, viz., mail trains, fast cattle and goods, suburban passenger, and goods traffic, and shunting generally.

Specification No. 191 for Twenty-eight Goods Engines.

THIS specification describes what is known here as the 205 class of engine; indeed if it were not stipulated that the cylinders were to be 19" in diam. and 24" stroke, instead of 18" diam. and 26" stroke, it would exactly describe the 205 class of engine, a great many of which we have been supplied with by Messrs. Beyer, Peacock, & Co.; but the author of the specification is not content with introducing another class of passenger engine, but he wishes to have another class of goods engine also, without securing any benefit. The 205 class are well known to be the most sluggish engines we have, and there are grave defects in them, as at times enormous weights are thrown on the bogie and trailing wheels, on account of the absence of proper compensating levers in the required positions, and I notice that it is not intended to remedy this defect, therefore we are not only destroying the permanent way with the engines we have, but we propose to build a still *heavier* type to expedite the destruction. The 205 class are evidently poor copies of the American Consolidated engines introduced in 1877, and intended to compete with them, but they have ignominiously failed, and if the proposed engines are built further failure will take place. I consider the Consolidated type have proved themselves to be the best goods engines we have; they are lightly loaded per wheel, and are therefore easy on the road. They give of 200.00 lb. of power, and the proposed engine will give off 180.5 lb., only *more* weight per wheel. I should strongly recommend that the new design be abandoned, and that twenty-five more of the consolidated engines be built in our Eveleigh Works. Nearly all the arguments I have advanced against the passenger engines can be made to apply to the proposed goods engines.

We now have eleven engines (of the 48 class) which are lighter, and give off 195.00 lb. of power—far more than is proposed; therefore we are taking a backward step by ordering LESS powerful goods engines than we now have.

As the recommendation indicates, the passenger engines are to be made by the Vulcan Foundry Co.; and it is evident that the goods engines are intended to be made by Messrs. Beyer, Peacock, & Co.

In my opinion it would be a serious mistake to have such engines constructed. I should advocate not only what I have hereinbefore stated, but I would construct a great many new engines of a more suitable type, in place of a lot of obsolete engines we seem to be unable to utilize. We have the best appliances for the purpose, and unless this is done it is difficult to see what use the appliances can be put to; indeed, it is a huge co-operative concern, in my view, in which every railway man is personally interested, and as the railways are State properties the whole question is a national one.

I have, &c.,

THOS. MIDELTON,

Superintendent of Tramway Rolling Stock.

19 April, 1887.

The Minister wishes to know if there are specifications for the two classes of engines which Mr. Midelton recommends; if not, could engines be built to the types of engines, one of each of which could be exhibited as a model, with perhaps some modifications in regard to material to be substituted for the material used in the engines exhibited?—CH. A. G., 25/4/87.

There is a specification and there should be drawings also for the passenger engines only. Engines could be built to a model engine as proposed, and I think it would be necessary to specify (say) "British steel" instead of "steel" only, and a few other matters of a like nature.—T.M., 25/4/87. Commissioner.

Resolution of Legislative Assembly.

Relative to Manufacture of Locomotive Engines.

(1.) That, in view of the widespread distress amongst the iron trades, this House is of opinion that the Government should take immediate steps to call for tenders in the Colony only for the manufacture of one hundred locomotive engines, and that the following be the conditions of such tenders:—That the construction of the said engines be carried out by labour already in the Colony, and that only such material be imported as cannot be produced here.

(2.) That the above Resolution be communicated by Address to His Excellency the Governor,—put and passed.

Invite tenders for twenty-five engines of each of the above types, in accordance with recent resolution of the Assembly.—J.S., 25/4/87.

Minute by The Secretary for Public Works.

Department of Public Works, 26 April, 1887.

Tenders for Locomotives.

WITH reference to the loco. engines, tenders for which were invited in the Colony and in England before I took office, I must express my disappointment that the Loco. Engineer, while professing to do so, did not display that regard for minimising the number of types of engines which is so essential for the economical working of his branch of the Department. He had already in his charge and in active use on our lines two types of locomotives, which answer more satisfactorily than any other the requirements of our traffic. I allude to the Consolidation goods engines which were introduced through my instrumentality when I was in office previously, and the locomotives designed by Mr. Midelton for the express service over the mountains. Instead of ordering engines to correspond with these designs, Mr. Scott proposed to introduce two other types, thus multiplying the undue number we have already on hand, and necessarily increasing thereby the working expenses of the Loco. Department.

I consider that it would be detrimental to the best interests of the Railway Department to accept any tenders which have been received for the engines in question owing to their inadaptability to our traffic requirements, and I have directed tenders to be invited in terms of the recent resolution of Parliament for fifty engines, twenty-five each of the types I have referred to. As there is no time to obtain plans and detailed specifications for these types of engines, I propose to have patterns of each exhibited in the running sheds at Eveleigh. Other material might perhaps be substituted for some of that used in regard to tires, wheels, and boiler plate, but this can be specified.

I have directed Mr. Midelton to draw up such specifications as may be necessary, and he will dismantle two engines and have them placed in the shed so that manufacturers can see the design, and I shall have the locomotives constructed under Mr. Midelton's supervision.

JOHN SUTHERLAND.

Mr. Scott to see.—CH. A. G., B. C., 26/4/87. Inform Mr. Midelton by separate memo.—CH. A. G.
Done.—D. C. M' L., 27/4/87. Received, 28/4/87. Please see my minute of to-day's date herewith.—
W. SCOTT, 12/5/87. Commissioner.

Minute by The Locomotive Engineer to The Commissioner for Railways.

IN referring to the Honorable the Minister for Works' minute, and decision respecting additional locomotives required by the Department, and the strictures on my recommendations made by the Superintendent of Tramway Rolling Stock, which have been accepted and endorsed by the Honorable the Minister for Works, I would respectfully point out that the perusal of such has given me no small degree of pain, as the action taken practically implies a want of confidence in my ability to fulfil the important duties devolving upon me as Locomotive Engineer of the New South Wales Railways.

Without any desire to enter into a controversy with the gentleman's opinions, which appears to have guided the Honorable the Minister in his action on this occasion, or even to refer to any of the circumstances of the past which led to that gentleman's services being severed from the Railway Department of this Colony, I respectfully submit that in justice to myself, considering my past career in the Department for over thirty-one years, coupled with the fact that the honorable position I now hold has been attained by untiring energy and ability displayed while filling subordinate positions to my present one, it would only have been an act of justice if, before such documents had been made public, the Honorable the Minister had submitted such to me and requested that I would reply to them. Such reply could then have been considered in conjunction with the strictures on my recommendations, and such a course would, if the Honorable the Minister had seen fit to still maintain the action he has taken, at least have given him an opportunity of judging of the correctness or otherwise of my opinions and actions.

The first intimation I had concerning this matter was from the columns of the public press; and considering the Honorable the Minister's action, without reference in any form to me, forces the conclusion that any explanation I may have to offer will not in any way (with his present views of my capabilities) have the effect of altering his decision. Still, I trust I shall not be considered as exceeding my duty in explaining such action, even now that the question has been decided.

A great deal is attempted to be made of the numerous types of engines on our lines as if such a thing was unknown anywhere else, which is not the case. Several of the "types" were introduced fully ten years before we had mountain lines with heavy grades and sharp curves, and some of them even before such lines were thought practicable. It is ridiculous for any one who is unacquainted with the history of our railways to criticise the action of those who had to provide for the lines opened and proposed over twenty-five years ago. It is a matter for congratulation that all the engines ordered within the last twenty years are still performing good and profitable work, and I question very much, considering the extensions opened, the varying grades and traffic to be provided for, whether such a satisfactory result has been obtained anywhere else under similar conditions. I have always been opposed to increasing the types of engine unnecessarily, and I can confidently refer to the records of the Department in support of this. The engines recommended by me are practically the same as the Standard design of passenger and goods engines, of which we have eighty-one and eighty respectively. It is absurd to say that minor alterations in the details constitute a new type, and I venture to predict that there will be many such alterations from the pattern engines if built in the Colony as proposed. I have really only introduced one "new type" of engine on our lines during the six years I have had the control of the Locomotive Branch, and these are the tank engines for suburban traffic, in which service they are giving entire satisfaction.

If this gentleman was sincere in his contention that even the difference of an inch in the cylinders constitutes a "new type," it is singular that he overlooked it when he classified the engines in stock during my absence in England. If reference is made to the table framed in the Commissioner's room, signed "THOS. MIDEルトON, Acting Loco. Engineer," it will be seen that he places engines Nos. 36, 37, 38, 39, 75, 76, 77, and 78 in one class, whereas six of them have 16-inch and two of them 17-inch cylinders with a difference of power, viz., 93.1 lb. as against 105.1 lb. Again, in the same table of classification of engines, Nos. 23, 24, 25, 26, 27, and 28 in the same class with Nos. 32, 33, 34, and 35, although the former have four coupled wheels 5' 9" in diameter, whereas the latter are four coupled wheels 5' 6" in diameter, the relative power being 112.7 lb. and 132.97 lb.

The Superintendent of Tramway Rolling Stock states I have no experience of the class of engine I recommended, and therefore he is at a loss to understand how I arrived at the conclusion that they are the most suitable.

From this he would have it inferred that I have taken a leap in the dark instead of being guided by my experience. He forgets that he might have been asked the same question when he recommended the "304 class," of which we had no experience at that time. I have not the slightest doubt that the engines of the same type I recommended, now being supplied by the Vulcan Foundry Company, will draw an equal load to the "304 class," and at a much higher rate of speed, and the price of them after running our trains 2,000 miles satisfactorily, is only £2,315 each, which is considerably cheaper than any passenger or goods engines ever tendered for before; hence my reason for recommending that the order be given to the same firm, in addition to which we would secure that the several parts be interchangeable, which, I may remark, is never the case when engines are built by different makers even to the same drawings and specifications.

The question of which is the most suitable engine should be considered from the standpoint of how far it is desirable to sacrifice "speed" for "power," and we cannot shut our eyes to the fact that, when our lines are opened to Newcastle on the North, and Kiama on the South, we shall have to compete, particularly in the former case, with water carriage served with very fast steamers. Again, the public, are constantly complaining through the press about the slow speed of our trains, and unfavourable comparisons are drawn with the trains of other countries. I therefore submit that if we want fast trains we must have a different class of engine to the "304 class," which has only 5 feet driving wheel. The recent trial of one of this class with the "Fireman's special" will fully prove this. (See Commissioner's 87-3,216, with the report from the traffic and locomotive officers on the subject.)

I also understand that there is a desire for increased speed with the morning train from Penrith, which can only be attained by the use of engines adapted for fast running.

The specification for the "304 class" stated that they were intended to run at a speed of from 38 to 40 miles an hour. This is altogether beyond the working speed of such a class of engine, which is more of a "mixed train engine" than a passenger engine.

My critic expresses his conviction that the unsuitability of the engines I recommended will be established on trial. I am quite content to abide by that test, and, as four of them are now being delivered, we shall very soon be in a position to decide the point. I have no fear of the result.

Reference is next made to my recommending the Mogul class of goods engines, in which I state that after some thirty years' experience of them they have given general satisfaction, and this type should be adhered to.

My critic asserts that his experience of them is quite the contrary; so that it comes to a question of who has most experience, and who is best able to decide. As regards experience, this class of engine first commenced to run in 1882, and I have had control of this Branch all the time, so that I ought to know what work they can do, and have done, and also whether they are expensive to keep in proper running order. He forgets that we have ten engines of the "Mogul class" with precisely similar cylinders as those recommended running on our lines for the past two years; so that I have experience to guide me, and his assertion about my introducing another class is not correct.

In reference to his comments upon what has been done in the matter of equipping our lines with locomotive engines, he asserts that there are forty-two (42) different classes at the present time of nearly every possible shape and dimension on our lines. As a matter of fact there are only twenty (20) altogether, and of these seven are odd ones, which have been purchased at different times from contractors and others at very low prices, and four engines, which constitute a class, were built as an experiment upon the recommendation of Mr. James Henry Thomas, who was appointed in 1869 to supervise the construction of new engines and rolling stock in the Colony, and these had afterwards to be altered from "Tank" to "Tender" engines. When the Superintendent of Tramway Rolling Stock classified our engines in 1882, he made only twenty-nine classes, and this number has since been reduced, so that at present time there are only twenty classes, exclusive of the old ones before referred to, and of these 75 per cent. are included in four classes, and, as a matter of fact, our orders for new engines during the past ten years for our main lines have been confined to seven types, including the two classes he takes credit for; so that there is no reliance to be placed on his statement on this subject. It is perfectly absurd to assert that such lines as ours, with different descriptions of traffic to be provided for, could be advantageously, or profitably worked with only three types of engines. Perhaps he can show where such a thing exists. The following classes will be found on all well managed lines, where such traffic as we have has to be provided for, viz. :—

1. Express engines.
2. Fast mail and passenger.
3. Ordinary passenger.
4. Mixed train.
5. Goods engines for minerals, &c.
6. Goods engines for ordinary traffic.
7. Suburban tank for heavy trains.
8. Suburban tank for ordinary trains.
9. Shunting engines.

With reference to the greater power of the "304 class" over our ordinary passenger engines, saving the use of an assisting engine, on many occasions the "304 class" has to be assisted, as the load for it is twelve vehicles, and not thirteen as asserted, and as the loads are always increasing the number of times the "304 class" will require the aid of an assisting engine will increase; so that what is a slight advantage now will then become a disadvantage, as the "304 class" uses more fuel per mile. My critic says why not go on reproducing the type that has proved to be the best, while he acted entirely different when he recommended the "304 class," so that he reflects upon me for the very thing he did himself during the short time he was in this Branch, but he evidently considers that he alone is capable of judging what is best; but it would be more to the point if he would state on what railways fast passenger trains are run with six coupled wheels 5 feet in diameter, which in this respect are similar to the goods engines on the London and Brighton Line. (See Mr. Stroudly's remarks, page 76, vol. 81, of the Proceedings of the Institution of Civil Engineers.)

The proposal to build the fifty engines in our new workshops at Eveleigh upon the grounds that with the appliances there they could be built at "perhaps the average" of the tenders received, shows how little he knows of the subject he is dealing with.

I am positive he could not build engines of the "304 class" for 50 per cent. over the price paid to the Vulcan Foundry Co., and bearing on this I would ask where a sufficient number of specially trained experts are to be found in the Colony who are to secure such results? No fear need be entertained about the new workshops and appliances being fully and profitably utilized without our undertaking the building of new engines and rolling stock, and I have no doubt but that the saving to be effected in our repairs and renewals will, when we get them into full operation, more than cover the interest on the capital invested in them, and as our wants increase the advantage in respect to economy and efficiency will be still more marked. When recommending that the Eveleigh shops should be built I looked beyond our present requirements, and although they are much less extensive than many of the railway shops in other countries, I am pleased to say, compare very favourably with any that I have seen in my tour through England and America, both in design and equipment.

I will now refer to the criticism upon my specifications, and I have no doubt I shall be able to do so satisfactorily to every one acquainted with the stipulations and conditions usually embodied in such documents.

First.—As to the provision for having a number of the engines delivered at Newcastle, my critic asserts that we shall be connected with the Northern Line long before the engines will be delivered, therefore it would be more convenient and economical to have them delivered in Sydney. I know that some of the engines are required on the Northern Line now, whereas I am informed the Hawkesbury Bridge is not likely to be finished before two years at least.

Second.—Exception is taken to my stipulating that the general arrangement of the engine is to be in accordance with a plan to be prepared by the contractors, in which certain leading particulars are to be faithfully embodied and adhered to.

The reason for such a proviso is so obvious that it is difficult to imagine how any one having any knowledge of the subject should cavil at it. When contractors make their own drawings it places the responsibility of their correctness upon them, in addition to which all locomotive builders of repute have a properly trained staff of draftsmen for the special purpose. As to the prediction that if the dimensions and distances of the several parts mentioned are adhered to the bogie-wheels will in radiating rub hard against the main frame when running round the sharp curves on the Western Line, I am sure he will be surprised, if not gratified, to find that I have provided for all this, and that nothing of the sort can occur. The provision in my specification which he terms incongruous and amusing, viz., that tenderers could send in "alternate tenders," was inserted, not as he would have it supposed, that I was undecided as to what was best, but was the result of a discussion on this subject with the Commissioner, and it was deemed advisable in order that foreign builders should not be debarred from tendering to insert the proviso. It is scarcely necessary to say that we have no experience in the suitability of the material used by Belgian and other foreign locomotive builders, some of whom were desirous of competing, so that by admitting alternate tenders to be sent in they could, of course, receive consideration if the prices were appreciably lower than those sent in strict terms of my specification. If I were undecided about what was best, I would not have specially stipulated that certain material was to be used, and his reference to my specifying for three makers of Yorkshire iron in the boilers which he takes exception to, upon the grounds that steel of "half the cost" and of "greater strength" could be used instead. It would be more to the purpose if he were to follow my example and mention the particular brands of steel that will fulfil these conditions. This point is evidently introduced for effect, but the fact remains that up to the present time the extended experience of English and foreign builders, has not yet given them sufficient data to universally substitute steel for iron in locomotive boilers, and, in reality, can only yet be considered in an experimental stage. Steel has been used, but then those who did use it made their own steel, like Mr. Webb, the Locomotive Superintendent of the London and North-Western Railway, did at the "Crewe Works." When in England in 1883, I made special inquiries on the subject, which was then being discussed by the Institute of Engineers, and the opinions I obtained from the Chief Locomotive Superintendents were adverse to the use of steel in locomotive engine boilers. As the responsible head of this important Branch of the Railways, I conceive it to be my duty to specify for material that is almost universally used, and which my own experience proves to be suitable, rather than to stipulate for steel which, as before said, may yet be considered in its experimental stage, and of which there are no generally recognized "brands" specially adapted for boiler work, that I know of, and further, considering its being in such a stage, I did not, neither do I think any experienced Locomotive Engineer would at present recommend so large an order of this material, in view of the fact that what I stipulated for is the recognized practice of all English and Colonial Engineers,—I am content to differ with him.

The driving and trailing axle-boxes which I stipulate to be of wrought-iron, well case-hardened, he designates to be unnecessary and very expensive, &c., as cast-iron is all that is necessary, and it is cheaper. This is again a matter of opinion, in which I am pleased to disagree with him. If I only considered the first cost, I should be in favour of cast iron, but my experience tells me that "first cost" in this case is more than counter balanced by the cost of renewals. However, as my critic has nothing to do with this responsibility, he naturally disregards it as unworthy of notice.

The comments upon my specifying for a "steam dome" to the engines, clearly shows to what an extent my critic's vanity leads him in engineering matters. He states that it "is very expensive to make, it is ugly," in addition to which, it is utterly useless. From these objections it would be supposed that such an expensive and dangerous contrivance would, if used at all, be only in some isolated part of the globe where the advance of science was unknown; but what, I may ask, is the universal practice? They are used all over the world, with scarcely an exception, and the very substitute he suggests was tried over thirty years ago. The fact of its being practically abandoned, and also that no locomotive engineer of experience has deemed it worthy of consideration since, shows that it cannot contain the advantages claimed for it unless, indeed, locomotive engineers in all parts of the globe are, like myself, unable to comprehend its value. I scarcely think any person would like to take up the position that locomotive engineers in other parts, who have retained the "dome," are unqualified for their positions; and one of the very classes (the Consolidation) which my critic now recommends has a "dome," so that he proposes the very thing he so strongly condemns in my specification—perhaps from the fear that to dispense with it would involve another *type* of which he expresses his condemnation so strongly. So much for consistency.

The comment on the terms used in my specification about the "spark arrestors," viz., that they are to be of the "best design known," is very ingenious, as it leaves it to be inferred that I did not know what is "best;" but when I explain the object sought by the introduction of these so-called "vague" terms it will be seen what grounds there are for the insinuation that they were inserted because I had not the ability to deal with the subject. It is admitted by everyone who has seen the spark arrestors in our engines, which I take credit for, that they are the best they have seen; so that I can well afford to treat it with contempt.

The sole object for stipulating for the "best known design" was to protect the Commissioner from being mulcted in heavy damages for fires alleged to have been caused by sparks from our engines, as the law as laid down in our Courts is that, provided the Commissioner for Railways has in use what is "best known to science" to prevent the emission of burning matter from the engine, he is not liable; and the production of the specification in Court that the engines have been built under such a proviso has on several occasions been accepted as satisfactory evidence upon this important matter. The

The "Roscoe" lubricator is an old device, but it is nevertheless a very good one, and many of those so-called improvements upon it will, I have no doubt, be found much less effective.

The reference to the "water-jet" causing the engine to slip is absurd, as it is not, of course, intended to apply it to the wheels when the engine is pulling; therefore the slipping cannot occur from that cause.

The reason why I made no provision for working the engine by the Westinghouse brakes, and confine its operations to the tender and train, is because I consider it entails unnecessary expense in the wear of the tires without effecting a corresponding advantage.

The objections raised to the tender I recommend are—"it is to have a well," is "costly and inefficient in design," "the water and coal capacity is small," and "the coal will as a consequence have to be piled up high to enable the proper quantity to be carried." This is alleged to be dangerous, as it often happens that large lumps drop off, and sometimes strike men engaged in repairing the road, also that I provide for six wheels instead of two four-wheeled bogies, which is considered a grave error. Well, as regards the cost, I have only to say that it is all included in the £2,315, which is for the engine and tender complete, and I think it will be found in this respect to compare very favourably with those to be built under his specification. As regards the "design," it is of the usual horse-shoe form, which for convenience in coaling and general efficiency has given entire satisfaction, and will in these respects compare very favourably with the American pattern which he advocates. The quantity of coal and water to be carried was fully considered, and I have no fear about the capacity being equal to the requirements in these respects without it being necessary to pack the coal up as alleged. As regards the assertion about the danger to the permanent-way men through being struck with lumps of coal falling, I have no recollection of such a thing occurring on our lines, and I am confident there is no foundation for it. I prefer the six wheels to the two four-wheeled bogies, for the reason that they admit of greater controlling power being exercised by the brake upon the wheels, and our experience undoubtedly proves this. The objection raised to the position of the lamp brackets on the tender affords ample testimony of the "straits" my critic was put to in finding something on which to ground a difference of opinion.

My critic sums up his objections to the class of passenger engines I recommended as follows:—

"I consider that the author of the specification has ignored the main question of first cost, utility, simplicity, and efficiency, and I have no hesitation in saying that a far more efficient and less costly engine and tender could be made in our workshops at Eveleigh than the one proposed.

"I strongly recommend the construction in our own shops of twenty-five more of the '304 class' of engines, which were designed for and intended to work five different kinds of traffic, viz. :—

"Mail trains, fast cattle and goods, suburban passenger and goods traffic, and shunting generally."

As I have already disposed of his absurd assertions as to the cost, if built at Eveleigh, as he recommends, I will not again refer to it beyond mentioning that the engines he recommends cost £2,600 each free on board of ship at New York, and that when cost of freight, insurance, shipping, wharfage, cartage, erection, &c., is added, it would bring the price up to about £2,970 each in steam, as against £2,315 for those delivered in steam under my specification. No one who has the slightest knowledge of the question would make such wild assertions unless with the view of misleading. If, as I understand, the lowest Colonial tender received for engines under my specification was over 60 per cent. higher than the lowest English tender, it is certainly a subject for grave consideration how far work done by Government labour, even allowing for our superior appliances at Eveleigh, would be economical.

As for the assertion of my ignoring the main question of *utility, simplicity, and efficiency*, I am satisfied the engines I recommend will prove satisfactory in these and every other respects. I never heard of an engine being specially designed for so many different kinds of work (from mail trains to shunting) before, and I think such a statement will be a surprise to Locomotive Superintendents who have hitherto acted in the belief that it is desirable, in the interest of efficiency and true economy, to have each class of traffic served as far as practicable by engines best adapted for it.

Specification No. 191, for twenty-eight Goods Engines.

My critic starts his comments on this specification by saying that if it were not stated that the cylinders were to be 19 inches diameter and 24 inches stroke instead of 18 inches diameter and 26 inches stroke, it would exactly describe the "205 class," so that he here practically admits that they are not a new class, as he previously said they were. As a matter of fact, ten of the "205 class" have cylinders of exactly the same size as those specified for, as I have before mentioned. He designates the "205 class" as being the most sluggish engines we have, that they are but poor copies of the Consolidation engines, introduced in 1877, with which they were intended to compete, but have ignominiously failed to do so, and that if the proposed engines are built further failure will take place. From these condemnatory terms it would be assumed that they have nothing to recommend them in his opinion, but it will be seen on reference to the Commissioner's 83-19,720 that in my absence he himself suggested some improvements—that such is not the case, as in the report referred to he says:

"Generally speaking these are a good class of engines, and I consider them a marked improvement upon the 93 class, but there is still room for many improvements in them, &c., &c."

He then goes on to mention the details in which the improvements could be made, which are almost identical with those which he now says the want of renders them what he designates "failure." It is notorious of my critic that he never sees anything that he could not improve on if he had a chance. It is singular that he should suggest improvements in the "Mogul class," which he now condemns, when he could have recommended the Consolidation engine instead, if he then considered they were best; it was clearly his duty to do so.

I am at a loss to know what he means by designating the "Mogul" as copies of the Consolidation engine, the more particularly when he repeatedly asserts that a difference in detail constitutes a "new type," for, as a matter of fact, they are of an entirely different design, as the following will show:—The Mogul is a six-coupled 4-foot wheel with a bogie; the cylinders are 19 inches diameter, by 24 inches stroke, with the usual English tender on six wheels, whereas the Consolidation is an eight-coupled 4-foot wheel with a bogie; the cylinders are 20 inches diameter, by 24 inches stroke, and the tender is of the American pattern, carried on two four-wheeled bogies.

The difference in power amounts to one truck on the ascending grades over the mountains in favour of the Consolidation, but the load on the descending grades is the same for both classes; but the Consolidation require an extra fireman, the expense of which in itself is sufficient to justify my not recommending them; but there is a still more important objection to the Consolidation, which is the much greater wheel base, that causes the leading bogie wheels to lift off the rails when running round the 8-chain curves on the Western Line. When this was pointed out to the Baldwin Company, who built and introduced them into the Colony, they admitted it was a defect, and upon their suggestion several schemes have been devised to effect a cure, all of which have failed to effect the desired result.

The statement that I intended the goods engines to be made by Beyer, Peacock, & Co. is evidently made with the view of having it inferred that I unduly favoured that firm. The fact that I recommended that public tenders be invited for them affords sufficient testimony, if any were needed, that such was not contemplated. It will, I flatter myself, take more than *his* insinuations to prejudicially affect my character for integrity, so I shall treat it as unworthy of further notice.

In conclusion, my critic states he would advocate, not only the building of the fifty engines before mentioned, but would advocate the construction of a great many new engines of a more suitable class in place of a lot of obsolete engines we seem to be unable to utilize. He will be surprised, no doubt, to hear that most if not all of the obsolete engines he refers to have already been replaced by others more suited to our wants, and as other engines become useless or worn out they will be replaced in like manner. I will, for obvious reasons, refrain from alluding to his remarks about "the best appliances, &c.," being "a huge co-operative concern in which every railway man is personally interested," and the railways being "State properties, the whole question is a national one;" but I would call attention to the fact that the "best appliances" referred to were specially selected by me, and afford convincing evidence that I know what was "best" in such a very important professional matter, and that even he has to admit it. As the question of the experience of my critic has been introduced into this matter, I assume it will not be considered out of place if I state what mine has been.

After serving my apprenticeship in an engineering works in Scotland, I joined the Edinburgh and Glasgow Railway in 1845, and remained three years in the shops as a leading fitter, when I went to the Locomotive Works of the London and North-Western Railway at Wolverton, where I was employed as a leading fitter for three years. I was then promoted to the position of Locomotive Foreman of the Camden Town Depôt, which I held for three years. I was appointed by Mr. McConnell, the Locomotive Superintendent of the London and North-Western Railway, to supervise the construction of the engines and rolling stock for this Colony—he being the Consulting Engineer of the agent of the "Sydney and Goulburn Railway Co." When the engines and rolling stock were completed, I came to this Colony in charge of them, under agreement, and arrived here in January, 1855, and remained in the employ of the Company until the railways were taken over by the Government, shortly after which I received the appointment of Locomotive Overseer, which position I held until April, 1882, when I was promoted to the office I now hold of Locomotive Engineer of the New South Wales Railways.

W. SCOTT, 12/5/87.

Minute to The Commissioner for Railways.

MR. SCOTT'S remarks of 12/5/87 (Comr's. M.P., 87/9,852), upon Mr. Midelton's report (requested by the Honorable the Minister for Public Works) on specifications and recommendations submitted by Mr. Scott for obtaining additional locomotive engines.

To dispose of the plausible assertions and peculiar reasoning advanced by Mr. Scott, I am compelled to go into the matter at greater length than I could have desired.

Mr. Scott in the first place says, "Without any desire to enter into a controversy with the gentleman's opinion, which appear to have guided the Honorable the Minister in his action," and then he immediately writes twenty-five pages of foolscap to upset my opinions, occasionally descending to personal references of invidious nature; at one time alluding to what he terms my "vanity," then of being "notorious" for qualities which he wishes understood as baneful, and again that I make "wild" and "absurd" assertions, his great effort being directed to depreciate and cast doubt upon everything I have said in furnishing the Honorable the Minister with my conscientious opinion upon the matter which he referred to me for report.

I will, however, at once analyse the mass of mediocre matter, which, with a certain amount of ingenuity displayed in cloaking true facts and raising false issues, is all that Mr. Scott's remarks really represent.

It seems to me that Mr. Scott's attempt to depreciate my remarks, against adding to the already excessive number of types of engines in use on our railways, recoils upon himself. Every railway man of locomotive experience is fully aware that the great advantage in having as many engines of one type in use as possible lies in their dimensions admitting of interchangeability of the parts. This is what was in my mind when I referred to the forty-two classes of engines now on our railways, and to Mr. Scott, as a locomotive man, the justice and force of my reference must have been quite apparent. Yet, with considerable subtlety, he attempts to show that I cannot be "sincere" in my representation, because, as he says, the classification sheet of the engines bearing my signature does not show as many classes as stated in my report to the Honorable the Minister. The classification referred to is based upon the general *outline* of the engines and in regard to the description of work they are equal to, the object being to group together, as much as possible, the different engines of similar power, and within one class are included many engines of different "types"; but to prevent the possibility of misconception in the matter, there is a special column in the classification sheet distinctly describing the difference in dimensions of the engines included within each class. Of this, Mr. Scott is perfectly informed, and it is from the very details entered by me on the classification sheet that he gathers the particulars with which he seeks to belittle my remarks against unnecessarily increasing the types of engine. But he shoots very wide of the mark intended, as I will now show. Mr. Scott knows that the engines he instances as included within one class will not admit of interchangeability of parts, and indeed, Mr. Scott himself, goes on to actually prove the gravamen in my reference by quoting the dimensions of several types included in one class in my classification. Had I used the word "types" instead of classes in my report, Mr. Scott would not have had available the peg upon which he hangs his peculiar argument; but this is only a fair specimen

of

of the disingenuous reasoning apparent throughout Mr. Scott's remarks. If the fact that other railways have too numerous types of engines in use, is consoling to Mr. Scott, to me it seems only reason why we should avoid the same error. He states that he "has really only introduced one new type of engine on our lines during the six years he has had the control of the Locomotive Branch." This is incorrect, for Mr. Scott caused the introduction of the "255 class," and there are four types within that class. The American Mogul engines—the suburban tank engines in opposition to my direct proof against the suitability of those engines as shown by the papers on the subject at the time; and now he adds the Vulcan engines. At one time he preferred inside cylinders, and at another outside cylinders—thus showing his indecision. And notwithstanding his assertion that it is "absurd" to say that minor alterations in the details constitute a "new type," I affirm that it is the alterations in the details that constitute a new type of engine. I might add that the prediction upon which he ventures "that there will be many alterations from the pattern engines, if engines are built in the Colony," will not be verified should the engines be built in the Colony, as there is a special clause in the specification directed against it (*vide* specification). Indeed, I have arranged that as many parts of the passenger engine as can be made to suit the goods engine shall be so made.

In his reply to my remarks upon his want of actual experience of the "Vulcan" engines, Mr. Scott says I wish to infer "that he has taken a leap in the dark," and that I forget that I "might have been asked the same question when I recommended the 304 class."

Now, as a specimen of disingenuousness, the whole of the paragraph referring to this question stands out with perhaps greater prominence than any other portion of Mr. Scott's lengthy statements. There is no analogy between the position and circumstances in which Mr. Scott and myself were severally placed. When I designed the engine (304 class) I had the knowledge that there was not an engine on the New South Wales Railways equal to the task of taking thirteen loaded carriages over the mountain line. I also had experience of the "60 class" engine, built expressly for this work in 1875, which engine gives off a power of 168 lb., and yet could not do the work. So I designed an engine giving off only 140 lb. of power with the same sized wheels as the "60 class" engine, which has proved itself fully equal to the work I have stated. And now Mr. Scott, although possessed of the same experience as to our wants years before I arrived in the Colony, made no attempt to produce an engine equal to the service required, but when the success of my engine becomes a fact accomplished, with the latter experience, he steps in and recommends another type of engine of *exactly the same power*. (In literature this kind of action is called plagiarism.) Therefore if they will do the same work (which I very much question), he has made a serious mistake in endeavouring to increase the types of engines unnecessarily. I might add that (as I have already pointed out in my report to the Hon. the Minister) this engine must have a most injurious effect upon the permanent way of the railways.

With due deference to Mr. Scott's remarks relative to the increased speed required in running the trains, I would point out that an engine of the 304 class runs the passenger train from Penrith, which train is heavier now than it ever has been. According to time-table and reference to Commissioner's M.P. 83/23,540, will show that I anticipated all that Mr. Scott now raises, and that the "304 class" engines possess all necessary to meet the requirements of the Penrith trains, being equal to a maximum speed of 35 to 40 miles an hour, in accordance with my specification.

With reference to the "Mogul" type of engine, No. 205 class, I must again point out that Mr. Scott's representations are incorrect. I had considerable experience of these engines before Mr. Scott had. They were put together and run for some time during the period I was Acting Locomotive Engineer when Mr. Scott was in England, and at the Commissioner's request, after Mr. Scott's return, because of this very experience, to which the Commissioner makes special reference (see his M.P. 83/19,194), I reported upon these engines on the 27/11/83, intimating clearly the different direction in which improvements should be effected, and Mr. Scott agreed with my suggestion. (Reference should be made to the paper.) Again, after further experience of the Mogul engines I wrote on 23/4/84, on the Commissioner's M.P. 84/5,900, in favour of the "Consolidation" engines, and from the thirty-eight reports from different inspectors and engine-drivers *re* failures of the Mogul engines, such as slide-valves, crank-pins, and draw-bar springs, &c., breaking No. 219 engine with fifty brass tubes put in, and tube-plate bulged after eleven months' service, I had come to regard the Mogul as a costly engine to keep in repair, as well as being very destructive to the road.

Mr. Scott says, referring to myself, "He forgets that we have ten engines of the 'Mogul' class, with precisely similar cylinders as those recommended."

I do not forget, on the contrary I pointed it out at the time the type of engine of No. 295 class was introduced by Mr. Scott. (The engines of this class were made in America at the same time as my engine, No. 304 class.) The following minute on the Commissioner's M.P. 83/23,540, shows that Mr. Scott objected to my engine (304 class), and introduced the one in question with a foot smaller wheel, and which engine he stated would run 35 miles an hour and "allow a good margin," which would be ample for any mixed passenger or live stock train.

"Believing that the speeds of our mail trains must be increased, I could not think of recommending the use of such an engine as Mr. Midelton advocates for running mail trains."

Now what are the facts *re* the service rendered by the two classes of engines just referred to? Why, my engines have worked the mail trains over the mountains successfully for the last two years, whereas Mr. Scott's engine have never been tested at all to ascertain if they will fulfil the condition laid down by himself.

With further reference to the too numerous types of engines, Mr. Scott says:—"It is perfectly absurd to assert that such lines as ours, with different descriptions of traffic to be provided for, could be worked advantageously or profitably with only three types of engines."

Perhaps he can show where such a thing exists. First let me point out what my words referring to the necessity for avoiding too many types of engines were. "This is costly and objectionable, for almost any railway could be properly worked with, at the most, six different classes of engine, and many lines could be worked with three." I think the object sought in endeavouring to fix me to saying, "Three types of engines could properly work our railways," is not difficult to see. And now to comply with Mr. Scott's request as per the last line of the foregoing extracts. If he will refer to the *National Car Builder* of May, 1885, he will see illustrations of four types of engines used in working the traffic of the New York West Shore and Buffalo Railroad—a line of 850 miles, the equipment of which being 177 engines and 7,291 vehicles. The types of engines being A and B, passenger; C, Consolidation; and D, six wheels coupled

coupled tank engines. This line is acknowledged by all railway men to be the finest and best equipped in America, even not excepting the Pennsylvania railroad—and all this equipment was being prepared during the very time that Mr. Scott was in America and had he been so inclined he could have obtained valuable information in respect thereof.

With reference to the "304 class" engines not now being allowed to take thirteen vehicles over the mountain line, all I can say is that such a fact reflects upon Mr. Scott's management of the Locomotive Branch, for when I had charge of the engines under Mr. Scott, thirteen vehicles were taken without the service of an assisting engine and the same thing can be done now.

I will meet Mr. Scott's remark "That it would be more to the point for me to state on what lines engines with 5-foot wheels run express trains," by simply pointing out that as far back as 1872 Mr. Webb, of the London and North-western Railway, ran a train from London to Liverpool, a distance of over 200 miles, in five hours, with an engine with four coupled wheels of 5 feet diameter, and that the same rate of speed has been run on our lines by my engine. If reference be made to the Commissioner's M.P.'s. 87/3,216, 87/4,076, 87/4,334, and 87/5,898, the facts revealed, if estimated correctly in regard to the special trip made by one of my engines with the firemen's train on the 22nd February last, show a performance so good that I very much doubt if anything superior is on record.

Mr. Scott's assertions on pages 11, 21, and 22 of his remarks, to the effect that he is positive that I could not build engines at the Eveleigh workshops for 50 or 60 per cent. more than the cost of the engines now being delivered by the Vulcan Co., are mere assertions, and the matter he advances to support them simply specious pretences put forward to hide his own inability to grasp this important question in all its bearings, and I am not surprised that he cannot properly appreciate the advantages to accrue to the Department in dealing with it in the manner I have recommended. In his efforts to show that the position I have taken up in the matter is an untenable one, I am charged with making absurd and wild assertions; need I remind Mr. Scott that abuse is not argument. I repeat here all I have already said in regard to building new engines at the Eveleigh shops, but I do not think I am at present called upon to submit particulars of the line of detail actions I should take and consider necessary for the success of such an undertaking. I am content to simply direct attention to the fact that as yet Mr. Scott has shown no reason for his self-satisfying declaration that he has disposed of my absurd assertions as to the cost of engines if built at Eveleigh.

In reply to the remarks bearing upon the subject, I may say that I am perfectly aware that when contractors make their own drawings for engines they have to build, that it places extra responsibility upon them, and I am also aware, if Mr. Scott is not, that such course relieves the locomotive engineer of the responsibility which properly and exclusively belongs to such an officer, and forms a very important part of the special duties for the performance of which he is paid a salary.

Passing over the intervening matter, as possessing no special significance, till I come to Mr. Scott's remarks *re* steel *versus* Yorkshire iron for boilers of engines, I would say this: The proof of Mr. Scott's undecided tendency lies in the fact that he had two brands of Yorkshire iron for boilers printed, in his specification, and he afterwards added in manuscript a third. I can import the best boiler steel made for £8 2s. 6d. per ton f.o.b. Glasgow, whereas the Yorkshire iron preferred by Mr. Scott would cost from £30 to £39 per ton.

The following extract from the Presidential address at the N.E.C. Institute of Engineers and Shipbuilders, 1885-6, will perhaps enlighten Mr. Scott:—"The success which has attended the introduction of mild steel in the construction of marine boilers is so marked that but one opinion exists as to the suitability of this material for such purposes; and as Mr. Head says, 'One contributing cause for this development is doubtless the employment of the higher pressures now in daily use; or, perhaps to speak more correctly, the capabilities of this material have assisted to render possible such advances in pressures as would otherwise have been out of the question. But be this as it may, call it what you like, cause or effect, there can be no question as to the success of steel boilers built by the Company with which I was connected in the spring of 1878, which are now running without having cost a penny for repairs, and practically in as good a condition as ever, and doubtless other manufacturers could bear similar testimony.'" Mr. Scott could have seen lately at the Circular Quay, in some of the new Orient steamers, steel boilers 15 feet in diameter carrying a working pressure of 160 lb. to the square inch. Now surely in the face of this there cannot be much that can be considered an extraordinary departure in proposing to make of steel locomotive boilers of 4 feet 6 inches diameter, carrying 140 lb. to the square inch, more especially when one considers that Mr. Scott quotes Mr. Webb as having used steel of *his own make* on the London and North-western Railway. And here let me say that had Mr. Scott been as alive to his opportunities as he might, and ought to have been, when in America, he would have found hundreds of steel boilers in use in locomotive engines. Yet with imperturbable self confidence Mr. Scott asserts that this matter can only yet be considered as in the experimental stage. I fear that steel for boilers, as well as many other advancements in engineering science, would have remained in the "experimental stage" were the majority of engineers as conservative as Mr. Scott. Perhaps it may not be out of place to also point out that of ninety-seven motors in the Tramway Department of the Colony ninety-two are fitted with steel boilers, and that even the two motors built by Mr. Wearne in Sydney are fitted with steel boilers, so that if Mr. Scott had taken the trouble to watch what was passing under his eyes so to speak, he could have acquired valuable information relative to the use of steel in locomotive boilers. As he asks for it I have not the slightest objection to putting Mr. Scott on the way of obtaining a few of the best brands of steel which will fulfil the conditions I have named; they are,—

The Steel Company of Scotland (Limited), Glasgow.

The Landore Siemens Steel Company, Swansea.

The Leeds Forge Company, Leeds.

Park Bros. & Company, Pittsburgh, U.S.A.

Ohio Steel Company, Cleveland, O.

Perhaps this will suffice.

In reply to Mr. Scott's peculiar remarks *re* steam domes, I did not think it necessary to take the dome off the boiler of the pattern engine No. 133 for the mere sake of allowing the contractors to see the engine without a dome. When I mention that the engines of 304 class have run for over two years without a dome, the success of the change is established.

Mr.

Mr. Scott should keep pace with the times. Evidently he did not notice the domeless engines on the Great Northern, Great Western, and South-eastern Railways in England. Yet the fact remains that such engines are largely in use, in fact exclusively so on the Great North Railway, which had over 500 engines in the year 1876.

In regard to Mr. Scott's perforated plate, which he takes credit for as a spark arrester, I see, according to the light he now throws upon the subject, that it was Mr. Scott's retiring nature which prevented him from stipulating for his own spark arrester in his specification, but as he stipulated for "the best," and as he now tells us his spark arrester is admitted by everyone who has seen it to be "the best," the inference is obvious.

My reference to the water-jet acting on the wheels causing the engine to slip is not "absurd," and the attempt made to place me in a false position by explaining that it is not intended to be used when the engine is pulling is puerile.

I say that if the jet is often used on down gradients the wheels would be wet, and in ascending gradients with wet wheels, and it would happen at times the handicap on the engine would be great. I certainly think, after reflection, that this is a case where the disadvantages outweigh the advantages. I am therefore opposed to the water-jet arrangement on engine wheels.

With reference to the remarks dealing with the Westinghouse brake, I think a little reflection will make it quite clear that the reason advanced by Mr. Scott for not working the Westinghouse brake on the engine is really a reason in favour of its being so worked.

I can afford to ignore Mr. Scott's remarks about "horseshoe" *versus* "wedge" shaped tenders. I will, however, again refer to the seemingly small matter of the position of the side-lamps on the tender, as it is just one of those small matters sufficient to be important in averting or occasioning serious accident. The reason the side-lamps should be placed on the front end of the tender rather than on the back end is that the men on the engine may be enabled to see ahead or behind without having a dazzling light thrown in their eyes; indeed, the proper place for these lamps is on the side of the engine-cab, above the men's head, in which position it would help instead of hinder their range of vision.

In the year 1884.

It is quite true that my engines (304 class) cost £2,600 each, f.o.b. New York, but it must not be forgotten that there was no competition for supplying them—that they were built to a *special specification* stipulating wide departures from the beaten track, all of which tends to increase the cost of the first engines of a new type,—and I have no doubt whatever that if engines were tendered for now in England and America under the same specification, with the detail drawings now available, that we should obtain them for a less price than actually paid for the Vulcan engines now being delivered. I might mention, because Mr. Scott does not refer to the fact, that the ten engines (296 class) built to his specification by the same makers, and at the same time as my engines, cost exactly the same price.

And now to refer to the cost of the Vulcan engines, which Mr. Scott quotes over and over again in the course of his remarks at those points where he apparently thinks it is likely to create effect, as £2,315, and as the cheapest engine ever offered to the Government.

It will no doubt be a rude shock to the reliableness of Mr. Scott's statements when I say that reference to the invoices of the Vulcan Company will show that the amount paid, or to be paid, for their engines is very much nearer £2,500 each than the figures stated by Mr. Scott, and as to being the cheapest engine ever offered to the Government, reference to the Commissioner's minute paper 80/5,712 will show that offers were made to the department by Messrs. Beyer, Peacock, & Co. to supply goods engines of the 205 class at £2,300 each. I need not say that Beyer, Peacock, & Co. are second to none as locomotive manufacturers.

I now come to the question of goods engines, but I will not combat Mr. Scott's incorrect assertions. It is sufficient to say that I have always recommended "Consolidation" engines for goods traffic ever since 1880, when I first had experience of them and of their merits, evidence of which is afforded on the Commissioner's minute paper 84/5,900 by my minute of 23/3/84, as follows:—

"* * * If it is decided to import goods engines I recommend that we have the Consolidation type, and to be exactly like those last imported, except as far as this specification (Spec. for 304 class engines) can be made to hold good."

This is good evidence I think that I have been consistent in endeavouring to limit types as much as possible, and make the parts of goods engines interchangeable with passenger engines. Again, Mr. Scott has purposely suppressed a very valuable report on the utility of the Consolidation engines by Driver John Jones, dated 15/11/79 (copy attached). I may mention that Driver Jones was a superior engineman, and was always selected by Mr. Scott himself to run special trial trips of engines for test purposes, therefore his remarks are entitled to great weight.

Mr. Scott makes a point of the second fireman being required on the Consolidation engine, and states "that in itself was sufficient to justify his not recommending the Consolidation engine." To this I would reply that when I had the opportunity I tried by certain alterations to the arrangement of the brake gear to dispense with the second fireman, and should have succeeded had I met with proper support from Mr. Scott.

In the engines I proposed to build to the pattern Consolidation engine No. 133, I have, by simply removing the cab 15 inches further back, and rearranging a few details, taken all the action necessary to dispense with the second fireman.

The best answer I can give to the sensational paragraph about the bogie-wheels lifting on the curves is that the engines have been running successfully over the Mountain line for close upon ten years.

In regard to Mr. Scott's remarks in attempted refutation of my statement that "it was evidently intended that the goods engines should be supplied by Messrs. Beyer, Peacock, & Co.," I repeat what I said, and to anyone acquainted with the favourable circumstances in which that firm stands to supply the engines in question, the reason is obvious.

In conclusion I beg to point out that it is most unsatisfactory to continue to debate the question as to the most suitable engines for our requirements, which can only be satisfactory and finally settled by actual experience of the working of the different types of engine under precisely similar conditions. And I submit that at least my engines have by their *work* during the past *two years* demonstrated beyond all question their great efficiency in all important respects, and I trust that this, with the facts I have stated in this paper, will assist the Commissioner in arriving at a sound decision upon this important, though unnecessarily rendered somewhat intricate, question.

Randwick Works.

THOS. MIDELTON, M.I.M.E.

[Enclosure.]

[Enclosure.]

Mr. Tipping,—
Sir,

Penrith, 15 November, 1879.

I have travelled with all the Consolidation engines on the Western line, as requested, &c. I beg to make the following statement to the several questions:—

1. Do these engines keep up sufficient steam with an ordinary load? They do since I have been with them. There has been no case of sticking up, but one or two struggles to reach the destination, where the pulling has been long and severe. This, in my opinion, was caused by unskilful firing. They require more judgment in firing than the old engines, having such a large area to fire over, and sometimes inferior coal will creep in. There are instances of the old engines sticking up, sometimes for want of steam from various causes, but as a rule the Consolidation engines steam as well as the old engines, and better than some of them.
2. Do they require any more attention than any other class of goods engines? They do not, excepting in watching that bolts and nuts do not stack back through not having a split-pin in to secure them.
3. Is the present mode of firing the best; if not, can you suggest any alteration? Different men have different ways of firing; but I consider the best to be a low flat fire, so as not to choke up the arch; and fire about six shovelfuls at a time.
4. Is the quality of the coal suitable? It is, as the mountain coal makes no clinker; it is readily acted upon by the rocking fire-bars.
5. Is it absolutely necessary to have a second fireman beyond Lithgow, or between Bathurst and Orange? It is at present, not altogether on account of the hard work, but the inability of the drivers to assist in braking. If the driver was supplied with a steam-brake in his corner, or things could be brought closer together, so that the driver could assist his mate in shunting, &c., then I think the second fireman could be dispensed with on the easier lines.
6. Report on the brake power of both engine and tender? The tender brake is a good one, but takes sometime to get it on, owing to its peculiar construction. The great loss of power is in the engine brake, which should have eight blocks instead of four, and six inches longer, if it is possible to get them on; owing to the great weight of the engine. The brake-rod and screws of both engine and tender should be lengthened 2 or 3 inches, so that they could be taken up a hole before starting, instead of having to wait until they are worn right up, and having to start the journey with about two or three threads on the screws.
7. Do the drivers take sufficient interest in these engines, and give them a fair trial as to their taking the maximum load with due regard to economy in fuel and stores, keeping time, &c.? The drivers take a very fair amount of interest in them, as they must do to get along the roads; but there is not that pride and care exercised as there would be if every man had his own engine. His care and attention extends of course to the end of the trip only; as he will have another engine the next day, and so on; but, generally speaking, I do not think the men appreciate them at present as they will by-and-by when they get more accustomed to them. The engines have power to take one or two waggons more, but I do not think the water in tender would hold out between some of the water cranes, and they are very difficult to get along with their present sand gear in greasy weather.

General Remarks.

In the Consolidation engine we have, I think, the *grandest goods-engine ever placed on the Western road*. They are very heavy certainly, but they pull and run well with very little signs of heating if properly lubricated; peculiarly adapted for the Western line; runs round the curves *better*; and is, in my opinion, much *safer* on the curves than the *old* goods engines. The bogie in front of them is in fact a splendid idea for the goods engines for the Western road, but their brake-power is not sufficient, and their sand boxes and gear should be altered to suit our requirements. As we have sand boxes and gear on some of the old engines, which, I think, cannot be excelled, it would be a good idea to put them on these. Their sand-box being placed on the top of the boiler occasions great loss of time and much labour in filling it. Two large sand-boxes could be placed on the truck in front, or bracketed on the side as on the old engines. They should have the short lever and quadrant, instead of their straight-pulling handle, as a much better means for gauging it. They should be worked separately, as it is impossible to catch the right and left curves, &c.

Straight Road.

I know there is an objection to sanding one rail at a time, owing to all the strain coming one side; but these engines are doing the same thing now, as one sand-pipe is running the sand on the ballast instead of the rail on the sharp curves and wasting it, owing to the cause above-mentioned. The practice also of running these engines down the mountains, tender first, cannot be too soon put a stop to, as it is unsafe in greasy weather through not being able to get any sand under tender-brake, and the small brake power of the engine, they are unable to hold the train properly. I believe the two first goods engines that arrived here are the best with the short blast-pipes. They are more lively, pull better, and burn less fuel, and do not heat their smoke-box like the others; but their injectors should be horizontal, as they work much better in that position. In conclusion, I beg to say that I think all the present difficulties will disappear in the future, as the men get more accustomed to them, and the alterations which I have suggested are carried out.

It was not stopped until did it in 1882.—T.M.

I remain, &c.,
JOHN JONES.

Loco. Overseer (Mr. Scott).—JOHN TIPPING, 17/11/79.

Sent the original papers to the Commissioner on the 1/7/82, with these comments: "The attached reports by driver J. Jones is, in my opinion, a very valuable document. He is a very steady, thoughtful man; and I agree with what he has written in almost every particular. My experience of these engines here leads me to almost the same conclusions. I forward these papers for your information." The Commissioner replies thus on 10/7/82.

"I shall be glad if Mr. Midelton will make these engines as effective as possible by the additions of the improvements suggested by driver Jones, in which Mr. Midelton concurs, and will report to me the result (say) at the end of this year."
CH. A. G.

I think the original papers should be put with these, as I fancy I wrote more than is stated in my memo. above, which I have copied from my own copy of Jones' report.—THOS. MIDELTON, 20/5/87.

Minute by The Chief Clerk to the Commissioner for Railways.

TENDERS for the manufacture of fifty Engines in the Colony.

In the advertisement for the above it is stated that particulars can be obtained at this office. One gentleman called to-day, but I was not in a position to furnish him with any particulars further than to inform him that the pattern engines would be dismantled and on view at Eveleigh running shed. To whom am I to refer intending tenderers as to the details of the engines required?

D.C.M.L., 27/4/87.

Instruct them to go to the running shed, Eveleigh, inspect No. 308 engine and tender and No. 133 engine. Any engine and tender between 804 and 313 inclusive can be inspected.—T.M., 28/4/87.

Draft specification left with Assistant Secretary for printer at 11:30 a.m. to-day.—T.M., 28/4/87.

Yes, when we receive the drawings from America, and make drawings of goods engines here.—T.M.

Mr. Midelton will please say if he wishes any one in attendance at Eveleigh. If instructions were given to the employé in charge of shed to point out the engines which are to be placed there as pattern engines, I presume that should suffice for that portion of the public requirement. In the specification to be drawn up the general dimensions of the engines will be given, and also a statement of the material which is to be used. No doubt, ultimately, detailed drawings will be required, but these could perhaps be better supplied when a contract has been accepted. It will not be convenient to persons intending to compete to visit Randwick for the purpose of seeing Mr. Midelton. The skeleton specification should be at this office, and perhaps Mr. Midelton could arrange to meet those interested in Sydney at this office at stated times.—CH. A. G., 27/4/87.

They represented that they understood from the public prints that the Government intended to allow contractors for the manufacture of locomotives the use of the machinery at Eveleigh workshops, and they contended that this would be an injustice to the firms who had spent large sums of money in building up private workshops.

They further considered that it should be the aim of the Government to encourage private firms: If, as suggested, the Government allowed the use of the shops, or undertook to build the engines, they would be entering into competition with private firms who had invested fully £1,000,000 in buildings and machinery, and in a sense they would be causing the manufacturers to be entering into competition with themselves, for in a degree they were part owners of the Government works at Eveleigh, as they were taxpayers. When the Government proposed to erect these works, and asked Parliament to vote the funds, it was never intended that these shops should be used for manufacturing work, as it was stated they would be devoted to the repairing of machinery and stock. They contended that it would not only be an injustice to them for the Government to enter into competition, but it would be unwise, as the Government never got work done so economically as it was done in private workshops. The system had been tried in other parts, and experience showed this. In America they had no Government works, and in England they had recently decided not to extend their Woolwich works, but to allow the State requirements to be met by private firms. They thought it was an unwise policy for the Government to be adopting a large plant. A foundry had been set up at Eveleigh, but the private foundries in existence already met all requirements, and if private persons found that the Government were providing these appliances they would decline to invest capital in manufacturing industries, and this would act most injuriously upon the best interests of the Colony, as in times of danger we would have to rely largely upon our local manufactories.

It was stated that through the inducement offered by the Government some of the best mechanics in the private firms left to join the Government works, and throughout the country there was a desire on the part of young men to look for Government employment rather than take up private service or to take up land for production. They thought the Government should, as far as possible, break down this system rather than increase it, by undertaking new works, and consequently employing more labour. When the motion was carried in the House to have 100 locomotives made in the Colony, it was never anticipated that they would probably be made in the Government shops.

I informed them that the Government had no intention whatever of adding anything to their present heavy responsibilities with regard to the employment of labour. They were aware they had engaged twice or three times as many men as they should, and that this was prejudicial to the interests of the Colony. The farming interest was crippled because the young men of the farming class looked to the Government for employment rather than to obtain a living from the soil. The Government were aware of all this and would give the matter their best consideration. I was the medium for bringing the matter under attention, but the conditions would be altered, as it had been decided that all deputations to all Ministers would be received in the Cabinet room, when reliable press men could be present. At the present time, with divided deputations, the press writers were scattered, and to meet the exigencies some days young reporters were sent out who did not fully understand the position, and were unwittingly the medium of misrepresentation.

It had been taken for granted that we were to make the locomotives in our works; but I might say at once that no such thing was intended, and no such proposal had engaged the attention of the Government. I was fully aware of the merits of this matter, and would be very careful in any representation I would make, knowing as I did what the effect would be if the Government were to increase the number of men they now have employed. I fully agreed with them that we should so seek to establish our private manufactories as to be able to rely upon them in case of emergency, and I had expressed that years ago in connection with the manufacture of torpedoes. I believed our local works should keep pace with the times, and by obtaining the best improvements be able to do any nature of work.

With regard to the offer to allow contractors the use of tools, I pointed out that we had at Eveleigh certain special tools that were perhaps not possessed by any private firms, and to facilitate the contract I had approved of tenderers being allowed the temporary use of these specialities under our supervision; but in their tenders they would have to state what tools they would require and certain terms would then be fixed; but the Government would entertain no speculative offers in this direction, and the whole arrangement had been made in the interests of the contractors. I was giving them every opportunity to secure this work by giving them reasonable terms and simplifying the design of the engines. I was glad to hear that masters and men had determined to do their best to secure this contract for the Colony, and if they did not take advantage of it, it would be a bad thing for the Colony. The employer and employé must agree to let the Government obtain as low a price as possible, because they might not get so good a chance again. The Government had the English prices, and they were not likely to give the colonial tender an advantage that could not be justified in giving an undue benefit to a certain class.

It had been rightly said that the Eveleigh workshop belonged to the people, and they as taxpayers should not be compelled to compete against themselves. The Government, I believed, would not attempt to do that, and so injure interests in which, as they pointed out, a million of money had been invested. I admitted that in many ways the contractors of the Colony had not had fair play, but I was trying now to give them the greatest fair play, and if they did not take advantage of it, it would be no fault of mine.

The matter would not be finally decided by me—it would be settled by the Government after full consideration, and I would submit the various points that they brought under my attention; but my sympathies were in favour of having all work, whether woodwork or iron, made in the Colony so far as it could fairly be done.

JOHN SUTHERLAND.

Locomotive Engines.

Minute by The Superintendent of Tramway Rolling Stock to The Commissioner for Railways.

IN compliance with the foregoing minute I have the honor to report as follows:—The very important question of designing and manufacturing, as well as repairing, locomotive engines, tenders, and rolling stock generally, in the workshops owned by a State or by a railway company, as the case may be, has occupied my mind for over twenty years; and I may say that I have studied the matter as much perhaps, as any man in the Colony, in consequence of my professional training, which commenced in very large works in England owned by a railway company, where all the rolling stock they required was designed and manufactured by their own officers and men, the work being done better and at considerably less cost than it could have been done by private firms.

The company alluded to (the Great Western Railway Company), like other similar companies in England, not only did as I have said, but they rolled in their own rail mill nearly all the rails they required for the maintenance of lines opened for traffic and the construction of new lines. The London and North-western Railway Company do more, for they make their own boiler plates, tires, axles, &c.

When I first came to this Colony, in 1880, I was engaged by the late Locomotive Engineer (Mr. R. H. Burnett) to design the proposed new workshops at Eveleigh, but nothing was done, practically, until I became Acting-Locomotive Engineer, when you, on the 19th of January, 1883, approved and endorsed my design of the Eveleigh shops in the following terms: "May be carried out, both Engineer for Existing Lines and Locomotive Engineer concurring;" and the shops now erected and to be erected are substantially my design, and they have been expressly laid out for the purpose of *manufacturing*, as well as *repairing*, railway rolling stock, and will be equipped with the best machinery and appliances accordingly; and it is satisfactory to note that Mr. Scott, the present Locomotive Engineer, who was sent on a tour by the Government through America and England, and who had copies of the designs of these works sent to him in London to work to, reported in July, 1883, when he returned to this Colony, that he was "exceedingly pleased to be able to say that our new shops will compare very favourably both in design and general arrangements with the *best* I have seen in my travels."

This I could cordially endorse if Mr. Scott had done as he promised he would do—that is, "*work strictly to the drawings I sent home* for his guidance." But he has, unfortunately, altered the overhead travelling cranes, and also the main shafting arrangements, which alterations, I still contend, are a serious mistake.

I also think that other mistakes are taking place at Eveleigh now, in placing the machinery, benches, &c., &c., the way it is being placed. In a new works like that, the machinery, &c., should be properly placed, so as to avoid unnecessary handling of raw material, &c., and for turning out work quickly and economically.

In round figures, there will be spent on the Eveleigh works about £600,000; and I estimate that there is £120,000 worth of machine tools, exclusive of buildings, small hand tools, &c., employed in the Locomotive Department of the New South Wales Railways, at the following stations:—Redfern, Eveleigh, Newcastle, Randwick, Penrith, Bathurst, Goulburn, and Junee shops. This, if properly placed and fully employed, would be far more than sufficient for keeping our present rolling stock in efficient repair, and we could in addition manufacture all the locomotives likely to be required in the whole of Australasia for the next fifty years. Consequently, if we do not manufacture locomotives, &c., at least for ourselves, it is evident that the vast amount of capital invested in buildings, machinery, &c., will only be partially worked and utilized. We have, unfortunately, made the same costly mistake that many English and other railway companies have made—that is, gone in for decentralizing our repairing establishments, and large workshops have, in consequence, grown up at the stations I have named; whereas we should have built and equipped our central works at Eveleigh long ago, and do nothing but the *daily running repairs* at the out-stations referred to. All manufacturing and *heavy* repairing should be done at head-quarters under the constant supervision of the chief and subordinate officers of the Locomotive Department, in whom *personal responsibility* should be centred, instead of its being divided, as at present, among a great many subordinate officers hundreds of miles apart. Centralization is now the recognized practice in the Locomotive Departments of all well-managed railways, and, if it is justifiable for so many of the said companies all over the world to manufacture their own rolling stock, rails, plates, &c., &c., and many other things they use on their lines, it certainly is equally justifiable, equitable, and philanthropic for a State to do the same thing, because, in the first case, a few shareholders only are benefited, whereas, in the latter case, the whole population is benefited and interested, and it really is a benefit to every individual in the State.

It is, perhaps, not generally known that some of the Railway Companies actually *manufacture more* of the details of a locomotive than the private firms do. For instance, they manufacture steel (boiler) plates, iron and steel cranked and straight axles, steel tires, frame plates, &c., &c., whereas none of the locomotive engine builders do that. They call for prices, and they purchase that class of material from the various manufacturers of such articles; then it is forwarded to their works to be manipulated and made into a locomotive. I propose that the Government should do the same thing. They should call for prices, and then import such articles as I have named, and which cannot, for some time to come, be made in the Colony, the freight and first cost of which, delivered in Sydney, would not, I think, exceed the cost of the same material delivered in the works of a Glasgow or Manchester engine-builder; therefore up to this point the Government stand in the same position as the manufacturers, the only question now remaining for consideration being that of *control or management of the workshops, and the price of labour*. Regarding the first, I do not see any insuperable difficulty or reason why the Eveleigh Works could not be managed by one head upon exactly the same system, principle, or basis as private establishments in the Colony of a similar character are controlled, books kept, and a proper half-yearly report produced. Indeed I believe the artizans would much prefer such a system of management to the present, because they would all know who was *head*, and *merit* then would predominate and rise to its proper level and be utilized, whereas now it is of no use whatever; it rather tends to hinder than advance its possessors, and unless proper discipline and control is established, I should strongly recommend that the work I suggest be never started.

The

The next question is the price of labour. This Colony has consented to pay a workman here on the spot about as much again for what he does, as it—through contractors—pays a similar workman for what he does in England; but the artizans here argue that they can do as much if not more work in eight hours than can be done by their brothers in England in ten hours, and I believe this to be true where proper discipline and control is practised; but of course the same quantity of work cannot be got out of *machinery* in eight hours as in ten. Therefore it is evident that a locomotive made here will cost more than it would if made, *from the same drawing*, where labour is cheaper; but this is not, under the circumstances, sufficient justification for having our engines built outside the Government workshops.

I will now proceed to show the advantages to be gained, and the reasons why we should do as I propose.

We have the workshops, the tools—such as no other establishment in the Colony has—the skilled officers and men, all specially suited for manufacturing as well as repairing, and if it is justifiable to do *repairing* it is equally justifiable to *manufacture*; indeed, much of the so-called repairing is *manufacturing*.

Unless manufacturing is done the shops and plant will not be fully utilized.

We should now, after the “tests” of the locomotives which were made on the 15th and 16th of June, adopt the simple and efficient class of locomotive and tender, which *we can manufacture*, and the more we simplify the details the less the cost of production will become and the nearer we shall approach the cost of the imported engine, which is usually paid for by weight, and which, however much it is simplified, only puts more profit into the manufacturer’s pocket; whereas, if *we supply our own engines* we profit most by it ourselves. It is clear, of course, that the simpler an engine is the less it will cost to make and keep in repair, and the more that is done in that direction the sooner we shall balance the higher price of labour here to what it is at home.

Work done by ourselves would be better done, because good work should and would be the *sole* aim of everyone engaged upon it. No *profits* having to be made, all exertions would be thrown into the *quality* and *quantity* of work to be turned out, and all difficulties of “contracts,” inspection, and litigation would be avoided. Manufacturers aim chiefly at making large profits, “extras,” &c., and as everyone engaged upon this work would see, or soon be caused to see, that the more he worked, and the better he worked in this cause the more he would gain. I think the success of the scheme would be near and certain, especially as there is no novelty about the matter; we should be simply following established precedents.

What is generally known as the American type of locomotive *can* be made here, and we have now lying idle hundreds of tons of good material which could be worked up at once in these proposed new engines, in the bar frames, motions, wheels, cylinders, &c., &c., whereas the English type of engine cannot be so easily made here; for instance, we should either have to import “frame plates” or erect special rolling mills for rolling them.

I have already reported that a simple, a far more efficient, and less costly engine and tender can be made here in our own shops than those proposed and recommended so strongly by the Locomotive Engineer. The correctness of this view is proved by the fact that the Colonial tenders for my passenger engines are £220 less per engine, and £290 less per engine for the goods engine I recommended than the Colonial tenders received for the English type of engine referred to, and as the *average tender* from six English houses for the passenger engines is £2,650, and £2,743 for the goods engines, I am convinced that we can produce in our own shops as good an engine as the imported one for the same price.

One of the most magnificent class of passenger engines and tenders in Great Britain is made by the Great Northern Railway Company at their Doncaster Works, for £2,025 each, and I could name no less than twenty-seven different Railway Companies, in England and America, who make their own engines in their own shops. The Great Western Railway Company made no less than twenty-four new engines during the *half year* ending 31 December, 1886, *at the cost of revenue*, at their own works. In doing this they not only *saved* the *profit* which would go to manufacturers, and cost of inspection, but *secured the exact type of engine which they knew best suited their requirements*.

The London, Brighton, and South Coast Railway Company have practically rebuilt the whole of their locomotive stock during the past twenty years at their works at Brighton, where they employ 1,200 hands constantly; and I notice in a recent American newspaper that the Pennsylvania Railway Company have given orders for forty new engines to be at once put in hand at their own works at Altoona.

It will be seen from the foregoing that in the building of the locomotives in the Government workshops of the Colony the only serious drawback would be the extra cost of labour, for which we should have to pay about double the English price; but on the other hand, in favour of that course, we should save litigation, contractor’s *profit*, the cost of inspection, &c., and at the same time secure better workmanship in every respect, and an engine made in every way suited to the special requirements of our railways.

As the latter appears to me to more than counterbalance the former, I have only to repeat my former recommendation in favour of the engines being built in the splendid new shops at Eveleigh.

THOS. MIDELTON, M.I.M.E.

Randwick Works, Sydney, July 11th, 1887.

Minute by The Secretary for Public Works to The Commissioner for Railways.

Department of Public Works, Sydney, 28 May, 1887.

PLEASE write to Mr. A Morris, Agent Baldwin Company, asking him upon what terms his Company will supply twenty-five engines to Mr. Midelton’s specification, and twenty-five Consolidation goods engines, for delivery, f.o.b., New York, and in steam in Sydney; and also to state time of delivery.

JOHN SUTHERLAND.

The Commissioner for Railways to The Agent for the Baldwin Locomotive Works.

Sir,

Department of Railways, Sydney, 28 May, 1887.

I have the honor, by direction of the Honorable the Minister for Public Works, to inquire upon what terms your Company (Messrs. Burnham, Parry, Williams, & Co.) will supply twenty-five engines to Mr. Midelton's specification and twenty-five Consolidation goods engines similar to those supplied to the Department in 1879.

I shall be glad if you will state price of delivery f.o.b. in New York, and in steam in Sydney, and also mention time of delivery.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

The Agent for the Baldwin Locomotive Works to The Commissioner for Railways.

Sir,

Norwich Chambers, Hunter-street, 30 May, 1887.

I have the honor, in reply to your letter of the 28th instant (No. 3,120), to say that a cable has this day been forwarded to the Baldwin Locomotive Works, asking them to name prices and times of delivery of the two classes of locomotives referred to by you. Whatever prices may be named will include any modifications or improvements which experience may have suggested to your engineers.

I have, &c.,

AUGUSTUS MORRIS,
Agent.

The Agent for the Baldwin Locomotive Works to The Commissioner for Railways.

Sir,

Norwich Chambers, Hunter-street, Sydney, 2 June, 1887.

I have the honor to communicate the following offers from the Baldwin Locomotive Works for the supply of 100 locomotives.

The Baldwin Company are prepared to deliver f.o.b. in New York or Philadelphia 100 locomotive engines during six months, commencing with December of this year, or with January of next, or as may be preferred.

The price required for the Midelton engines, 8-30 D, is £2,600 for each, f.o.b.

The price required for the Consolidation engines, 10-34 E, similar to those shipped to the Government in 1879, or according to the Baldwin's Co.'s letter to the Commissioner, dated 31st May, 1884, in reference to an improved type of consolidated engine, is £2,900 f.o.b. The materials throughout to be identical with those on the Midelton engines.

If required to deliver and erect at the Eveleigh Station or Railway works under steam, £300 must be added to the price of each engine.

The terms of payment to be the same as those agreed upon when the twenty Midelton and Mogul engines were supplied in 1884.

In submitting these terms the Baldwin Locomotive Works are prepared to accept any modifications of details which experience may have suggested, but which will not conflict with the general design of the locomotives proposed, or be inconsistent with American practice.

The fullest guarantees of the goodness of the materials and the efficiency of the engines that may be desired will be given.

I have, &c.,

AUGUSTUS MORRIS,
Agent for the Baldwin Locomotive Works, Philadelphia.

Minute of The Commissioner for Railways.

REFERRING to answer to question given in House last night, as to conditions under which the engines advocated by Mr. Scott are to be tested against those recommended by Mr. Midelton, I request that Mr. Scott will furnish me by Monday morning next with proposed conditions of test. CH.A.G., 20/5/87.

I would recommend that one of each class be put to run the day passenger-trains between Sydney and Bathurst, and an accurate account be kept of the load hauled and the stores consumed.—W. SCOTT, 21/5/87. Commissioner.

The Superintendent of Tramway Rolling Stock to The Commissioner for Railways.

In response to your letter of the 19th instant, I beg to submit the following conditions to be observed in case the 304 class of engines are tested in competition with the new engines from the Vulcan Foundry Co. :—

1. That each officer (Mr. Scott and myself) shall select his own engine, tender, and enginemen.
2. That each engine and tender shall be fairly equipped with coal and water ready for the road, and that the weight on each wheel of engine and tender shall be accurately ascertained before going out; neither engine to have any sand in sand-boxes or water conveyed to any of the wheels.
3. As much coal as may be considered safe by each officer in each case is to be put on each tender, and the said coal to be either Zig Zag or Vale of Clwydd, and to be taken from the same waggon and properly weighed in baskets and put on the tenders, the total weight to be recorded in lb., and the coal which remains on the tender after the trial in each case shall be taken off and weighed in our presence.
4. The trial trips shall be from Sydney to Eskbank and back, and shall be run to a time-table to be made out by the Traffic Manager, each train to start and return in daylight, and to be timed the same as the Western Mail on the down and up journey.
5. The train to consist of eight of the Redfern carriages (double-bogie type), all to be coupled up as may be directed and properly lubricated and examined.
6. The general condition of each engine, the time each has been running, &c., shall be recorded.
7. The weight of train shall be accurately ascertained.

8.

8. Water to be taken at Sydney, Linden, and Eskbank only.
9. Each driver to record the trips in the usual manner, and no person to be allowed to ride on the engine or tender except the driver and firemen in each case.
10. Two guards to be supplied by Traffic Department—one to ride in front of train, and the other at the rear, and they shall record the trips in the usual manner.
11. A printed time-table to be supplied to those conducting the tests.
12. As these trials are of great public interest, persons concerned in the matter, to the number of about 100, could be allowed to ride in the carriages as passengers, but they must take no part in the trials or assist in any way. The number of passengers so attending to be ascertained by counting, and this duty to fall to the two guards named.
13. No brake-van to be used. The Westinghouse brake to be worked from the engine on the tender and carriages only.
14. The carriages are not to be uncoupled for any purpose whatever, and the same carriages to be used by each engine in each trial.
15. Each engine and tender shall be oiled and trimmed by each driver the night before the trials, and on the running of the trial the enginemen shall procure from the store the stores they may require on the trip, and the same to be properly weighed and issued to them, and to be duly recorded by storeman and driver on his sheet.
16. Nothing shall be done except Mr. Scott and myself are present to see what is done, and that it is done properly and be properly recorded.
17. Brake blocks, hangers, and rods to be taken off each engine.
18. Each engine to be tested to blow off steam at 140 lb., and the same gauge to be used in each case.
19. Mr. Scott to have sole control of everything the day his engine is tested.
20. Mr. Midelton to have sole control of everything the day his engine is tested.

THOS. MIDELTON, 23/5/87.

The tests proposed by Mr. Midelton are preferable. Will Mr. Scott say if he has any observation to make or any suggestion in connection with them.—CH. A. G., 25/5/87.

Minute by Mr. Locomotive-Engineer Scott.

Mr. Scott's own proposition was to test the engines between Sydney and Bathurst. Mr. Midelton suggested Sydney to Eskbank and return; but I presume there would be no objection to extend the journey from Eskbank to Bathurst.—CH. A. G., 31/5/87.

I most decidedly and emphatically protest against many of the conditions stipulated by Mr. Midelton, as they are at variance with the work for which the "Vulcan" engines were designed and intended to perform. About two-thirds of the journey proposed is over the Mountains, where fast running is not possible with any engine—in fact, such a test would be more applicable to a "Bank" engine than a fast "Passenger" engine, such as mine is. As mentioned in my report of 12th instant, the engines built to my specification by the Vulcan Foundry Co. were intended to compete with fast water-carriage, and reduce the time of running of our principal mail and passenger trains; therefore to confine the trials to a portion of the lines where such advantages would be reduced to the minimum would be manifestly unfair. If it be decided to have the engines tested as to their relative merits under all circumstances, I decidedly think such tests should be conducted under the direction and supervision of properly qualified locomotive experts outside the Department, who would have no interest whatever in the result. I will now particularize some of the objections that occur to me in Mr. Midelton's conditions.

- 1, 2, and 3. I decidedly object to dispensing with anything provided for the more efficient working of the engines, and therefore protest against the sanding arrangements not being availed of, if necessary. To the other conditions I have no objections.
4. I most decidedly object to the trials being confined to this portion of the line. To be fair, they should be made to extend to Bathurst, where the engines have to run with the trains, or from Sydney to Goulburn; and, if possible, a clear run of about 30 miles between stopping-places should be arranged for, so that the speed may be ascertained.
5. The load proposed is equal to sixteen, whereas the train load in regular service for the "304 class" is twelve vehicles. I therefore consider that what is proposed is simply a test of power, where a goods engine will, of course, give better results than a passenger engine, particularly over the portion of the line proposed by Mr. Midelton, chiefly mountain grades, where the running is slow. I consider the "service load" should be adhered to in the trials.

This is not reasonable. Mr. Midelton has said that his first stipulation was, when recommending his design of engine, that his engine would take thirteen vehicles over the mountains; that they did so while he had charge of the Loco. Branch, but that since the load, without reason, had been limited to twelve vehicles. Mr. Scott, in his report of 12/5/87, says that Mr. Midelton's engine will soon fail in its usefulness, as the tendency is to increase the load of trains, but if it can take sixteen vehicles its usefulness will increase.—CH. A. G., 31/5/87.

- 6, 7, and 8. As I object to the trials being made over the portion of the line proposed, the places named for watering may not answer. I therefore consider that water should be taken when each considers it necessary, but the time lost in taking it should be calculated.
- 9, 10, 11, and 12. As the engines were not designed for similar services, I think it more than probable that the opinions formed by the public would be fallacious, and therefore consider that any trials decided upon should be purely Departmental. Of course this would not apply to any locomotive experts whose opinions the Commissioner might desire to obtain. The result of the trials could be published for public information afterwards, if deemed necessary.
13. Although I do not apprehend anything occurring that would necessitate the use of a brake-van, there is the possibility of it being required, and therefore it should form part of the train.
14. I, of course, see no objection to the same class of carriages being used; however, that implies that the trials shall be made on different days, when the conditions under which they have to run may be totally different. I therefore consider that the trials should be made on the same day, so that the conditions of running should be as nearly equal as possible, or else have a number of days for each engine.
15. I see no objection to the conditions proposed, excepting as regards the time for oiling. Mr. Midelton can of course have it done when he thinks proper, and I claim an equal privilege.

16. I see no objections to Mr. Midelton, or any one whom he may select, being present to see that the proper thing is done, and I will do what I consider necessary to secure it being done.
17. I most decidedly object to the removal of the brake arrangements. They are part of the engine, and should be retained, and used if found necessary.
18. I have no objections to the pressure of 140 lb., but if the trials are to be carried out on the same day description of gauges would have to be used which would be tested previous to the trials.
- 19, 20. I scarcely see the necessity for specifying these conditions. I assume Mr. Midelton has no desire to interfere in any way with any arrangements I may make in conducting the trials. I certainly shall not in any way attempt to interfere with his.

In conclusion, I would say that Mr. Midelton appears to be stipulating for conditions to suit as nearly as possible the type of engine he recommends. The conditions laid down should, in my opinion, approximate as closely as possible to those under which our traffic has to be worked, and which a locomotive engineer would be necessarily guided by in ordering his type of engine.

W. SCOTT, 30/5/87.

Minute by The Commissioner for Railways.

WHAT was required was an engine which would take with reasonable speed a heavy passenger train over the Mountains. It was a matter of complaint on my part that the trains could not be controlled except by the use of an assisting engine, and I asked that an engine might be designed to obviate the necessity of two engines being used. Mr. Midelton designed engine Class 304 accordingly, and up to the time of his leaving the Locomotive Branch he says the engine performed the service required—viz., the haulage of a train load equal to thirteen vehicles.

Mr. Scott says that the train load is being increased beyond that, and yet the engine he has designed is not equal to the requirements—at all events he objects to its capacity to take sixteen vehicles being tested, although Mr. Midelton is willing that his engine should be tested to that extent—a condition which Mr. Scott should not be slow to accept if he adheres to his statement that the engine will not take more than twelve vehicles.

CH.A.G., 31/5/87.

Minute by The Commissioner for Railways to The Superintendent of Tramway Rolling Stock.

I HAVE made some remarks upon Mr. Scott's paper, but, notwithstanding, I should be glad if conditions mutually agreed to could be adopted. Mr. Midelton should see Mr. Scott's observations, and, as far as possible, try and meet the objections he has raised. The conditions are numbered 1 to 20. Mr. Scott agrees apparently to 1, 2, 6, 7, 9, 10, 11, 16, 18, 19, 20; of the eleven terms objected to, four—viz., 8, 12, 14, 15—may be considered unimportant.

The remaining five terms can be perhaps modified and agreed to:—

3. Engines carrying and making use of sand.
4. Line upon which test is to be made—Sydney to Eskbank, or Sydney to Bathurst.
5. The weight of train—sixteen or thirteen vehicles.
13. Brake-van attached to train. [I assume that if brake-van is attached the number of carriages will be reduced by one.]
17. Removal of brake arrangements from engines.

CH.A.G., 31/5/87.

The Superintendent of Tramway Rolling Stock to The Commissioner for Railways.

Remarks on Commissioner's M.P., 87-10,284, herewith.

If I understand the matter correctly, the tests are to be carried out to prove whether Mr. Scott or I have given the best advice, and provided the best class of locomotives for the requirements of the Railway Department.

Mr. Scott was asked to furnish "Conditions of test," and his reply was brief and unsatisfactory, viz., that each class of engine be put to run the day passenger-train between Sydney and Bathurst, and an accurate account be kept of the loads hauled, and the stores, &c., consumed."

I was also asked to submit "Conditions of test," which I supplied (see Commissioner's M.P. 87-10,450). These having been sent to Mr. Scott for consideration, he, of course, "most decidedly and emphatically protests against many of the conditions stipulated by Mr. Midelton, as they are at variance with the work for which the Vulcan engines were designed and intended to perform." Now, if these engines are not designed to eclipse the performance of all other engines in the Service, what are they designed for? Why was another class introduced? Again, he objects to my conditions, but he does not propose better ones, nor give a single reason why he objects to mine.

Seeing that six of my engines have been working the day passenger-train from Sydney and Bathurst, and also the night mail-trains over the same road for about two years, they have answered that test, therefore I see no use in doing it again; and to put the Vulcan engine on the work, as proposed by Mr. Scott, would mean delay, as many months would be swallowed up before any ~~thing~~ like accurate data could be obtained, or correct conclusions arrived at; therefore it is best to decide the question in a couple of days, as I propose, especially as we are about to obtain fifty more engines, and time is of great importance.

There are two questions to decide—one has reference to the type of passenger engine, the other to the type of goods engine required. I should like to prove, too, that my Suburban Tank engines are the best we have, because Mr. Scott stubbornly opposed me on that important question also.

The conditions of test I have laid down are fair and reasonable, and I desire nothing but what is strictly right and proper, and if I have "stipulated for conditions to suit as nearly as possible the type of engine I recommend," and can fulfil them, and Mr. Scott cannot, then I hold that to be proof that I provided

provided a better engine than Mr. Scott has, and if the weather is the same on each trial day, I see nothing to reasonably object to. Of course I should select a fine day for each test, and exactly the same conditions as near as can be obtained; but if sand is to be carried and used, I must stipulate that the test shall be made on a wet day in each case. Mr. Scott's objections to my "Conditions of test" is admission that my engine is the best by a long way, otherwise he would gladly work his engine under those conditions. Again, if I alter my conditions to meet *his* views, I should virtually admit that my engine can only do the same work as his; whereas I claim that it can do more, although of the same power, and that it is the best "all round" engine and tender ever put on the New South Wales railways. He states the Vulcan engines were intended to compete with fast water-carriage, and reduce the time of running of our principal mail and passenger trains; so are mine, and not only that, but to haul the "service load" of thirteen loaded carriages up to 1 in 30 at any time. This is a matter Mr. Scott overlooks altogether.

He says:—"If it be decided to have the engines tested as to their relative merits under all circumstances, such tests should be conducted under the direction and supervision of properly qualified locomotive experts outside the Department." Of course it is decided to make such tests, and I have drawn up conditions accordingly. (See Com. M.P., 87-10,480.) I state the worst possible circumstances. Nothing more can be done? I do not see the necessity for employing any experts. If Mr. Scott and I obey the same conditions, and test each engine under the same circumstances exactly, I should prefer being judged by the logical-minded men who would attend the trials rather than by "experts," who certainly cannot know more, if as much, of the details of these engines, and the conditions under which they will work on our line, than Mr. Scott or myself. In addition to the tests provided for, I am prepared to attach my engine to a train of thirteen carriages and run it over any portion of the New South Wales lines to any time-table which the Traffic Branch may think proper to (ever) work to. If Mr. Scott wants to test "speed" in preference to "utility," we can have a 34-mile run to Penrith and back for the purpose with the load I name. My reason for stating Eskbank and back was that I considered it the most severe test, and because the journey can be done in one day. I have no objection to extend it to Bathurst or to Bourke, but it will be an unnecessary expense and waste of time. It is astonishing that Mr. Scott has reduced his wheel from 72 inches to 66 to attain "speed." He seems to revel in calling my engine a "goods engine," whereas it is anything he likes to call it, because it will work *any train* which the Traffic Department choose to attach it to; and as it can be safely run at high speeds over the 8-chain mountain curves better than any other, will do 40 miles an hour on straight roads, and take good loads up 1 in 30. I think my conditions approximate as closely as possible to those under which our traffic has to be worked, and which a locomotive engineer would be necessarily guided by in ordering his type of engine. I also think that I have properly provided to have the engines tested as to their relative merits under all circumstances.

The "service load" has always been thirteen carriages up 1 in 30, even with two engines (or say 118 tons exclusive of engines and tender.) I should much prefer taking sixteen, as per conditions 5 and 12. If I alter my conditions the relative merits of the two engines will not be tested by a long way, therefore it would be useless to attempt the test at all.

As I claim to have put the best class of engine on the New South Wales lines, as they have done better work than any others, and fulfil conditions which are highly beneficial to the Department, Mr. Scott should now prove with the Vulcan engine that he can do more, and do it better—in short, surpass me in every respect. Otherwise, he has made a serious mistake, and introduced another type of engine and tender without any good reason for so doing. Even if he can do all I claim to do with mine, he will still be wrong, because there was no necessity for altering the type, seeing that we had introduced and adopted a "good (s) engine."

- 1, 2, and 3. Mr. Scott objects to running without sand, because he knows now that the "adhesion" is insufficient, although it is a heavier engine than mine by about 2 tons. Does anyone consider it fair to use sand on a dry rail in starting if an engine is properly proportioned? The utility of Mr. Scott's engine entirely depends upon the use of sand; and if he runs out of sand between two stations where sand can be obtained he will delay traffic, and fail to make much "speed" even with a 66 wheel. My engines carry sand, but it is rarely used—indeed I may say never used. I need not point out the economy of this.
4. I am not at all particular where the trials take place—any part of the N. S. Wales lines will suit me—but I thought I would stipulate the worst case I could think of, and do the work expeditiously and cheaply. I willingly consent to run to Bathurst, but four days will be occupied instead of two. If Mr. Scott wants to test "speed," I will undertake to haul a greater load than his engine can, and at a higher speed.
5. As the Vulcan engine gives off 141.14 lb., and my engine 140.40 lb. of power, why does Mr. Scott object to the load I propose, for, as regards power, his is a "goods engine" as well as mine. I too "consider the service load—that is, thirteen loaded vehicles—should be adhered to" in these trials, or 8 double bogie Redfern cars, with 100 passengers.
- 6, 7, and 8. I do not object to Mr. Scott's proposal *re* taking water and coal; but as my engine can run from Sydney to Linden (and probably to the bottom points at Lithgow) without taking water, and from Sydney to Bathurst and back without taking coal, I need not point out to the Commissioner the great economy of being able to do that.
- 9, 10, 11, and 12. If the engines are "not designed for similar services" they will be *used* in similar service, that is certain; and whether the trials are departmental and private, or entirely public, I do not mind in the least, but I prefer being judged openly by those who may see fit to attend, as well as by one or two whose duty it may be to decide the question. In my opinion it is more of a public question—than it is one for experts; and I have no fear of the public being able to correctly judge which is the best engine for our railways if they see the facts as they take place.
13. The reason I stipulated carriages only was that the continuous brake shall be worked by the driver exclusively; and, as Mr. Scott does not apprehend anything occurring that would necessitate the use of brake-van, I think the matter should stand as it is.
14. I propose to make a trial on two different occasions with the same carriages under exactly the same conditions in each case for each engine as far as it is possible, the same persons to attend each trial, &c., and nothing could be fairer.

15. Of course each driver may oil, &c., as he likes before starting; but I must see Mr. Scott's engine oiled; and he may see mine oiled, but it should be done as I say to be fair to both, and to ascertain the consumption of stores on the trial trip.
 16. If Mr. Scott chooses to allow some person to act on his behalf I have no objection, but whatever he does I must see it, and it shall be binding on him, but I consider he should act himself; and not delegate his powers to any one, and that condition 16 stands.
 17. I have no objection to the engine brake-gear remaining on, but it should, in my opinion, be taken off in such trials as these.
 18. The steam-gauge will be the same for each engine; it will be tested before being used on each engine, and also afterwards.
 - 19 and 20. The conditions were made to prevent others from interfering. I certainly will not interfere with Mr. Scott's trial; but, as he is Loco. Engineer, some one may understand that he would be in charge the day of my trial, whereas this should not be the case.
- I consider the conditions as originally submitted should be printed and adhered to—they are fair and reasonable—and if properly and courteously regarded there should be no difficulty or dispute whatever. Mr. Scott appears to consider "speed" everything. I, on the other hand, think general utility the main question, and I have provided conditions of test and an engine accordingly. If he cannot comply with my conditions he must be held answerable for that. I know my engine will do all he wants. Will his engine do all I want? if, so, the way I suggest will test and settle the question.
- Randwick Works, June 3/87. THOS. MIDELTON.

Minute by Mr. Locomotive-Engineer Scott to the Commissioner for Railways.

HAVING read the conditions for the trials of the two types of engine, I again most strongly protest against any portion of the engine being interfered with in any way whatever. Each engine should be fully equipped and in efficient working order, including sand in sand-boxes and all brake-gear and appliances as in ordinary train-working, so as to be available if required.

I would also again point out that equal to twelve carriages is the maximum load for the Vulcan engines on the 1 in 30 grades. If thirteen are put on I take no responsibility.

These engines are designed to work through passenger traffic, not merely for use as bank engines.

From ten to eleven carriages is the usual load from Penrith, and the Vulcan engines are quite equal to all that is required of them for general passenger trains on all lines.

W. SCOTT, 13/6/87.

It seems to me that Mr. Scott gives up the whole contention by this representation. Mr. Midelton claims that his engine will do all and more than the Vulcan engine will do. It will take as great a load and will run as fast. It was designed to take thirteen carriages over the Zigzag, and Mr. Scott's engine should do the same. If it will not, and Mr. Midelton's engine will run as fast, then it seems to be clear there was no justification for ordering another type of engine, and Mr. Scott has not consulted the best interests of the Department in doing so. Submitted for Minister's consideration. I still think the testing should be proceeded with upon the conditions named, and if Mr. Midelton's engine does the work (and it must be remembered that Mr. Scott has practically said it will not do it, for in working, he has refused to allow it to take thirteen carriages up the Zigzag without an assistant engine—an expense the engine was designed to save, then I think it will be established, even if Mr. Scott's engine also does the work, which, however, he says it was not designed to do) that Mr. Midelton's design should not have been departed from in ordering new engines.—CH.A.G., 14/6/87.

Approved.—J.S., 14/6/87.

Write separate memos. to Mr. Scott, and say that testing must take place under the conditions issued. That his engine, the Vulcan, will be tested on Wednesday, and Mr. Midelton's on Thursday. Ask Traffic Manager to arrange for the running in accordance with time-table for the tourists' run on holidays, that is as regards time of departure, &c., &c.—CH.A.G., 14/6/87.

Memo. sent
14/6/87.

Telephoned and
memo. sent
14/6/87.

Minute by the Chief Clerk to Mr. Locomotive-Engineer Scott.

WITH reference to your minute of yesterday's date on the subject of the tests to be made of the engines designed by Mr. Midelton and yourself, I am desired by the Commissioner to inform you that the testing must take place under the conditions issued.

The engine built by the Vulcan Company is to be tested to-morrow, and Mr. Midelton's on Thursday.
D.C.M'L.
B.C., 14/6/87.

Minute by the Chief Clerk to Mr. Locomotive-Engineer Scott.

THE Commissioner has written the following minute:—

"If the trials be made beyond Lithgow it will mean that four days instead of two will be consumed in the trials. The trials will not commence till Wednesday morning. On Friday we shall require all our rolling stock to meet the requirements of the excursion traffic for Jubilee.

"I must therefore decide that the tests be made between Sydney and Lithgow, and be concluded on Thursday night."

Please note the above decision.

D.C.M'L.

B.C., 13/6/87.

Telegram.

Testing relative capacity of Engines.

TELEGRAPH to Mr. Speight as under:—

"Can you allow your Acting Locomotive Engineer, Mr. Alison Smith, to come to Sydney for three days next week, or the following week, to test the relative merits of two classes of engines? The Minister for Works will be greatly obliged if you can do this."

CH.A.G. 19/5/87.

Telegram sent accordingly.—J.E.P., 19/5/87, 12:30 p.m.

The

The Commissioner for Railways to T. Roberts, Esq.

Sir,

11 June, 1887.

With reference to the trial which is to be made of the two classes of locomotive engines recommended by the Locomotive Engineer and Mr. Midelton respectively, I have the honor to inform you that Mr. Secretary Sutherland has approved of your appointment in conjunction with Mr. Smith, of the Victorian Railways, to conduct the said test, and I enclose herein a copy of the conditions under which the relative merits of the engines shall be ascertained.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways
(Per A.R.)

The Commissioner for Railways to The Assistant Locomotive Engineer, Victorian Railways, Sydney.

Sir,

15 June, 1887.

With reference to the trial which is to be made of the two classes of locomotive engines recommended by the Locomotive Engineer and Mr. Midelton respectively, I have the honor to inform you that Mr. Secretary Sutherland has approved of your appointment, in conjunction with Mr. T. Roberts, of the South Australian Railways, to conduct the said test, and I enclose herein a copy of the conditions under which the relative merits of the engines shall be ascertained.

I have, &c.,

CHAS. A. GOODCHAP,
Commissioner for Railways.

The Relative Merits of Locomotive Engines belonging to Classes of Nos. 305 and 373.

Messrs. Allison D. Smith, M.E., and T. Roberts, C.E., to The Commissioner for Railways.

Sir,

Melbourne, 22 June, 1887.

In compliance with the request contained in your letter, No. 87/11,622, dated the 11th inst., and your memo. of conditions of tests, a copy of which we attach (Appendix A), asking us, by the direction of the Honorable the Minister for Works, to conduct practical experimental tests with the classes of locomotive engines recommended respectively by the Locomotive Engineer and Mr. Midelton, we have the honor to report as follows:—

The engine, No. 373, selected by the Locomotive Engineer is a new one, of a type very favourably recognized and much used in England, but following the American practice in having outside cylinders, horizontal steam-chests, and the swinging link four-wheel leading bogie.

The specification was framed by the Locomotive Engineer, but the engine was designed in England, and built by the Vulcan Foundry Company, of Newton-le-Willows, Lancashire, and had run up to the date when the tests were made 2,323 miles. It was in first-class order, although, like all new engines, doubtless a little stiff.

The engine, No. 305, selected by Mr. Midelton, is one of the well-known American "Mogul" type, fitted with De Lacy's patent balanced slide valves, and built by the Baldwin Locomotive Company, of Philadelphia, United States; it had run 41,970 miles, up to 31st May last, since it was put upon the rails, and nothing had been done to it except ordinary, running-shed repairs; the tires were considerably worn, and the bearings generally very free, otherwise it was in first-class working order.

General outlines of both engines, marked B and C respectively, are attached to this Report as appendices.

Before proceeding to make the practical tests over the mountains, we accurately weighed each engine in steam, and tender fully equipped with coal and water, carefully recording the weight upon each wheel; these are detailed in Appendix D.

A comparative table below shows that, while the engines are of almost equal tractive power per lb. of effective pressure on the pistons, the "Mogul" engine, owing to the greater weight on the coupled wheels (there being six in this class as against four on the "Vulcan" engine) has a larger percentage of weight available for adhesion at the expense of a longer rigid wheel base and the disadvantage of coupling in a third pair.

The number of lb. of tractive power per ton of load on the coupled wheels in the "Mogul" is an average one, while that in the "Vulcan" engine is excessive.

No. of Engine.	Type.	Cylinders.		Wheels.		Tractive Power per lb. of effective steam-pressure.	Weight on coupled wheels.	Initial lb. Tractive Power per ton of load on coupled wheels.	Rigid wheel base.
		Diameter.	Stroke.	No. coupled.	Diameter.				
373	"Vulcan"	in. 19	in. 26	4	ft. in. 5 6	142.2	tons. cwt. 28 3	5.05	ft. in. 8 3
305	"Mogul"	18	26	6	5 0	140.4	34 0	4.12	15 0

As will be seen by the diagram of general outlines (Appendix B), the tender of the "Vulcan" engine is carried on six (6) wheels, having a rigid base of 11 feet 6 inches, with a water capacity of 2,500 gallons, and space for 4½ tons of fuel; total weight loaded 29 tons 17 cwt.

The "Mogul" tender is carried on two (2) 4-wheeled bogies, the greatest rigid base being 4 feet 6 inches, with a water capacity of 2,925 Imperial gallons, and space for 5 tons of fuel; total weight loaded 32 tons 6 cwt.

On

On the 15th instant we made the experimental trip with the "Vulcan" engine, starting at 7 a.m., and working to a time-table specially prepared by the traffic officers to the speeds of the "Western mail." (Appendix E.) The load consisted of six (6) bogie cars, and weighed in our presence totalled, including passengers, 102 tons. The length of the cars over buffers was 273 feet. The steam-pressure gauge was carefully tested, and the safety-valves loaded to stand a pressure of 140 lb. per \square inch. Deducting allowances for stoppages and detentions on the road, the engine lost six (6) minutes between Sydney and Penrith, and eight (8) minutes from Penrith to Katoomba; but gained $18\frac{1}{2}$ minutes between Katoomba and Mount Victoria, and $7\frac{1}{2}$ minutes between Mount Victoria and Eskbank, which station was made the termination of our trials. The whole journey was run in 12 minutes less time than that allowed by the time-table.

It was a fine bright morning, but until the sun attained a considerable altitude the rails were slippery with hoar frost in the cuttings; we found it absolutely necessary to allow the free use of sand to keep the engine from stopping altogether, when slipping commenced, and water was sparingly used two or three times on the flanges of the tender wheels.

We travelled on the engine together during the whole distance over the mountain, and observed that on no part of the ascent could proper advantage be taken of the large cylinder power, steam having to be cut off at $52\frac{1}{2}$ per cent. of the stroke, or thereabouts, to avoid slipping. When urged beyond this, even on a dry rail, it required all the driver's attention to prevent slipping.

The principal time lost was between Wentworth Falls and Katoomba, steam gradually falling to 105 lb. pressure per square inch till at about the $65\frac{1}{4}$ mile-post, on a rising gradient of 1 in 33, and in an 8 and 10 chain reverse curve it finally came to a dead stop, where we remained for two minutes, until steam rose to full boiler pressure, when a start was effected without difficulty. The curves were taken quite easily, and the engine was very steady on the foot-plate at all speeds, the highest rate of which we noted on any portion of the journey being 40 miles per hour, and we do not think this was exceeded.

On the day following we made the second experimental trip with the "Mogul" engine, leaving Sydney at 8.45 a.m., or 1 hour and 45 minutes late, owing to an accident in the running-shed yard. The same pressure gauge was used as on the previous day, and the safety-valves weighed to blow off at the same pressure as the "Vulcan" engine, viz., 140 lb.; the same train was also taken.

Deducting allowances for stoppages and detention on the road the time occupied in running between Sydney and Penrith was $19\frac{1}{2}$ minutes faster than allowed by time-table; between Penrith and Katoomba $18\frac{1}{2}$ minutes were gained; between Katoomba and Mount Victoria, $18\frac{1}{2}$ minutes were gained; and between Mount Victoria and Eskbank, $11\frac{1}{2}$ minutes—equal to a total gain of 68 minutes over time-table time for the whole journey. It was a fine bright morning, and as we reached the mountains later than on the previous day, there was less frost on the rails, which was decidedly in favour of the engine. No sand or water on the wheels was used, and on this trip the engine only slipped occasionally. When working up the steepest gradients steam was cut off at $70\frac{1}{2}$ per cent. of the stroke, and the engine appeared to be thoroughly master of the work, indeed the great gain in time during the ascent shows that the load might have been increased with safety. It should, however, be observed that, in approaching the same portion of the road where the "Vulcan" engine stopped, the steam-pressure in this case likewise fell, and the driver had allowed the water to get so low that it disappeared from the gauge-glass and gauge-taps, and did not again show until we had been standing at Katoomba for $1\frac{1}{2}$ minutes with both injectors full on. This engine also took the curves very easily, and was quite steady at the highest speed we noted, viz., 45 miles per hour. Analysis of running given below:—

ANALYSIS OF RUNNING.

Stations.	Miles.	Minutes by Time-table for Running.	Actual Running Time.		Time compared with Time-table.			
			Engine No. 373.	Engine No. 305.	Faster.		Slower.	
					Engine No. 373.	Engine No. 305.	Engine No. 373.	Engine No. 305.
		h. m.	h. m.	h. m.	Minutes.	Minutes.	Minutes.	Minutes.
Sydney								
Penrith	34	1 10	1 16	0 50 $\frac{1}{2}$		19 $\frac{1}{2}$	6	
Katoomba	32	1 55	2 3	1 36 $\frac{1}{2}$		18 $\frac{1}{2}$	8	
Mount Victoria.....	11	0 40	0 21 $\frac{1}{2}$	0 21 $\frac{1}{2}$	18 $\frac{1}{2}$	18 $\frac{1}{2}$		
Eskbank.....	17 $\frac{1}{2}$	0 47 $\frac{1}{2}$	0 40	0 36	7 $\frac{1}{2}$	11 $\frac{1}{2}$		
Total	94 $\frac{1}{2}$	4 32 $\frac{1}{2}$	4 20 $\frac{1}{2}$	3 24 $\frac{1}{2}$	26	68	14	

We regret that the time at our disposal was entirely too short to enable us to take indicator diagrams, because had we been able to do so we could have stated exactly the horse-power that each engine developed at various portions of the journey.

The following table analysis shows the consumption of fuel, water, and stores, with the work executed in train miles run:—

Engine.		Train Miles.	Fuel.		Water.		Lubrication—Oil and Tallow.	
Description.	No.		Total lb.	Lb. per mile.	Total gallons.	Lb. evaporated per lb. of coal.	Total lb. used.	Lb. per 100 miles.
"Vulcan"	373	189	9,355	49.5	7.025	7.5	12.25	6.48
"Mogul"	305	189	11,751	62.17	6.141	5.22	11.25	5.95

The excessive consumption of fuel by the "Mogul" engine is probably due to the high average speed of 20 miles per hour at which the ascent was made, the difference in levels between Penrith and Katoomba being 3,247 feet, equal to a constant gradient of 1 in 52 for 32 miles, with numerous curves of very

very short radius; the ruling gradient was 1 in 30 for $2\frac{1}{4}$ miles, and the sharpest curve 8 chains radius reverse. In descending, and throughout the trials, the Westinghouse automatic air brake, with which the cars and tenders were fitted, was used exclusively to control the speed and in station stops.

In conclusion, we are of opinion that the six-coupled engine recommended by Mr. Midelton is more suitable than the four-coupled engine, recommended by the Locomotive Engineer, for the particular class of traffic and road on which the experiments were made. The trials showed conclusively that the "Vulcan" engine had not sufficient adhesion on the coupled wheels to utilize its great tractive power. The specification shows that the makers were authorized to load the coupled wheels up to 30 tons in the first place, and in a letter to the consulting engineer in London, a press copy of which was shown to us, and an extract from which we attach (see Appendix F), the Locomotive Engineer subsequently authorized 32 tons as a maximum. We consider that those who were responsible for designing the engines in England should have worked to the authorized maximum of weight, or in departing from that, have made a corresponding reduction in the tractive power of the engine. Had this been attended to the engine would have been well proportioned, although the weights on the coupled wheels would have been severe on the road. The advantage of the six coupled engine recommended by Mr. Midelton is, that it has 34 tons of distributed weight availed of for adhesion, the greatest load on any pair of wheels being 12 tons—thus making it lighter on the permanent way, and able to utilize the full amount of tractive power developed in the cylinders; it has also the advantage of greater heating surface than the "Vulcan" engine.

We desire to express our high appreciation of the great courtesy extended to us by the Locomotive Engineer and his staff, who afforded us every assistance, and cheerfully supplied us with all the information and data that we required.

We have, &c,

APPENDIX A.

Government Railways—Minute Paper.

Subject:—Condition of testing Engines designed by Mr. Scott and Mr. Midelton.

I HAVE considered the proposals and the objections raised to some of them and believe that justice will be done, and the relative merits of the engines ascertained by the observance of the following conditions:

1. That Mr. Scott and Mr. Midelton shall each select his own engine and tender and enginemen.
2. The engines and tenders to be fully equipped, having a full complement of coal and water; if the day be fine and dry no sand to be placed in the boxes, and no water be conveyed to any of the wheels. If, in the judgment of the experts, the rails are greasy, sand may be used. The weight upon each wheel of engine and tender to be carefully ascertained before going out.
3. As much coal as may be considered safe by each officer in each case is to be put in each tender, and the said coal to be either Zig Zag or Vale of Clwydd, and to be taken from the same waggon and properly weighed in baskets and put in the tenders, the total weight to be recorded in lb., and the coal which remains on the tenders after the trial in each case shall be taken off and weighed in the presence of Mr. Scott and Mr. Midelton.
4. The trial trips shall be from Sydney to Bathurst and back, and shall be run to a time-table to be made out by the Traffic Manager, each train to start and return in daylight, and to be timed the same as the Western Mail on the "down" and "up" journeys.
5. The train to consist of rolling stock equal to thirteen carriages, and amount of dead weight to be added equivalent to the weight of passengers if the carriages were filled, the carriages, &c., to be coupled up as each competitor may direct, and properly lubricated, &c.
6. The general condition of each engine, the time each has been running, &c., shall be recorded.
7. The weight of train shall be accurately ascertained.
8. Water to be taken as required, the watering stations to be previously arranged.
9. Each driver to record the trips in the usual manner, and no person to be allowed to ride on engine or tenders except the drivers and firemen in each case and the experts.
10. Two guards to be supplied by the Traffic Department, one to ride in front of van and the other at the rear, and they shall record the trips in the usual manner.
11. A printed time-table to be supplied to those conducting the tests.
12. Press reporters and others, numbering not more than twenty-five (carefully checked by the guards of the trains), to be allowed to travel in the carriages only of the train; they are to be spectators only, and not to interfere in any way with the trial.
13. The train to be worked exclusively by the Westinghouse brake and by the enginemen only; the use of the brakes on the engines to be prohibited; if a brake-van form a portion of the train all parts admitting of manipulation of the brake to be removed from the brake-van.
14. The carriages are not to be uncoupled for any purposes whatever, and the same carriages to be used by each engine on each trial.
15. Each engine and tender shall be oiled and trimmed by each driver the night before the trial, and on the running of the trial the enginemen shall procure from the stores the stores they may require on the trip, and the same to be properly weighed and issued to them, and duly recorded by storeman and driver on his sheet.
16. Brake blocks, hangers, and rods to be taken off each engine.
17. Each engine to be tested to blow off steam at 140 lb., and the same gauge to be used in each case.
18. Mr. Scott to have sole control of everything the day his engine is tested.
19. Mr. Midelton to have sole control of everything the day his engine is tested.

The testing of these engines will be accomplished under the supervision of two (2) locomotive experts, who may make joint or separate reports.

They will be appointed by the Minister of Public Works.

The testing to take place between Tuesday, the 14th, and Friday, the 18th instant.

8/6/87.

This train will also stop at Emu Plains, Lucasville, Blaxland, Karaba, The Valley, Faulconbridge, Numantia, Woodford, Hazelbrook, Medlow, and Hartley Vale—allowing 30 seconds at each place.

Line must be kept clear for this train.

Acknowledge receipt by wire at once.

Traffic Manager's Office,
Sydney, 14th June, 1887.

W. V. READ,
Traffic Manager.

APPENDIX F.

APPENDIX F.

Extract from letter from Mr. Scott to Mr. J. D. Baldry, dated 16th March, 1886.

With reference to the cable *re* the greatest weight that can be carried on the driving wheels of the twelve engines which are being built by the Vulcan Company, there is nothing in the way of (say) 16 or 32 tons on the four coupled wheels. I hope by this time the matter has been satisfactorily arranged.

Minute of The Commissioner for Railways.

Report of Messrs. A. Smith and T. Roberts, Locomotive Officers, Victoria and South Australia, on certain engines tested by them.

FORWARD copy of report to Mr. Midelton for any observations he may wish to make thereon.

I wish the report made not later than the 6th July.

CH. A. G., 2/7/87.

Minute by The Superintendent of Tramway Rolling Stock.

THE report of these gentlemen fully confirms my report of the 19th April last to the Hon. the Secretary for Public Works, and leaves no doubt whatever as to which class of locomotive is best for the New South Wales lines.

I will now only make remarks where I think it necessary to do so:

1. I do not quite understand what these gentlemen were requested to do.
2. The 373 type of engine is much more "favourably recognized and used" in America and Australia than it is in England, Messrs. Smith and Roberts to the contrary notwithstanding; the horizontal steam-chests on the tops of the cylinders are bad imitations of American practice, being so very unhandy.

3 and 4. I would point out that "up to the date when the tests were made" my engine having made 40,000 more miles than the other, has, of course, more frictional resistance than a brand new engine with tires turned perfectly true.

7. It is admitted that a six-coupled engine is absolutely necessary, and that a four-coupled engine will not do for these lines (at least for the first 200 miles from Sydney in any direction), and although the rigid wheel base is long, my engine will traverse curves with less friction than No. 373 will; and the condition of the flanges of her tires proves this. I doubt if the tires of 373 nine months hence will bear favourable comparison.

I should be glad if it were shown how the same results can be better obtained without "the disadvantage of coupling in a third pair" of wheels. Mr. Roberts himself has been compelled to put a 10-wheeled *six*-coupled engine on the Adelaide and Melbourne line for working passenger trains, the said coupled wheels being 6 inches *smaller* in diameter than my engine, and it has singularly enough the same grave defect as Mr. Scott's engine, viz., not enough weight for adhesion.

8. It has but 28 tons 8 cwt. 3 qrs., although the tractive force is more than either Mr. Scott's engine or mine, and the grades are 1 in 45 there against 1 in 30 here. Mr. Scott unwisely carries 16 tons 10 cwt. on his (four) bogie wheels; Mr. Roberts carries 10 tons 14 cwt. on his (four); and I carry 7 tons only on two wheels when the engine springs are properly adjusted. No. 305 now I notice carries 8 tons 15 cwt., which indicates that the springs required adjusting, and although "the larger percentage of weight available for adhesion" is obtained "at the expense of a longer rigid wheel base," it is admitted that No. 305 "took the curves very easily, and was quite steady" at a speed of 45 miles an hour; and had the judges made templates of the "treads" of all her tires as they are now worn after running 42,000 miles over 8-chain curves, and published diagrams from them, with the diagrams of "general outlines," the information would have been valuable and interesting.

9. Nothing is said about the dangerous height the coal was stacked on 373; it was quite 18 inches higher than the top of the tender, and large lumps had to be specially packed round the sides and end to enable 4½ tons to be carried at all. The weight, too, per wheel, was 5 tons, and often, no doubt, exceeds 8 tons, as the springs are not compensated. My tender wheels have a constant load which never exceeds 4½ tons on any condition of road. Other advantages have been overlooked. The fact of being able to carry coal enough for a trip from Sydney to Bathurst, or Goulburn, and back is very important; this of course saves the haulage of coal to those places in waggons, and also the various loadings and unloadings. On the trial trip my tender ran from Lawson to Eskbank and back (74 miles) without taking water. In these items alone I consider the saving will equal the first cost of the ten engines in a few years.

12. The judges should have said "we were—in opposition to the conditions of test—compelled to allow sand to be used on a dry rail a great many times with No. 373 to enable us to get the engine along." I saw sand used on a dry rail and water used at the same time on the tender tires, which lubricated them and washed the sand off for the train to run easier; I did not use sand or water on the rails, nor was it necessary with 305 engine.

13. In this paragraph it is admitted that the large cylinder power cannot be utilized, proving my words that "their unsuitability will be established on trial." The start at 65½ miles from Sydney would not have been made at all if sand had not been used freely, and at that time the sun had nearly attained its greatest altitude, and the rails were quite dry and clean.

15. I am sorry the judges do not inform you that I pointed out to them that the train was not the weight I expected it would have been, and on the morning of my trial I had another carriage put ready for attaching to the train, but this was not allowed. I then directed my driver to *make good time* at all stations, and to show that my engine could handle such a train with ease and better than it was handled on the previous day by No. 373. This was done, and *sixty-eight minutes* made in a journey which should have taken 272.5 minutes (one-quarter less time than that allowed).

16. Due allowance is not made for the serious nature of the accident in the Eveleigh yard with my engine before it started. I am not surprised that the coal consumption was greater than with 373 under such

such conditions. At 6:20 a.m. my engine was backing out; it ran through a pair of facing-points which had been wrongly left open; the tender was nearly upset, and the driver of course "banked his fire," and never expected to go out at all that day; there was, however, a delay of one and three-quarter hours, and in great confusion another tender was obtained, and a start made at 8:45 from Redfern with a spoiled fire, coal consumed while standing, signals against us, and stops made several times during the first 13 miles; the driver and fireman both disheartened with what had occurred—and yet, with all this and a dirty boiler (which had been in use two and a quarter years), an *odd* tender and a whole set of tires which required turning up, better speed was made than with the new engine, and considering that more work was done in the greater speed run, it is not difficult to see why more coal was consumed. I think that the coal, oil, and tallow consumption for the work done during the past two and a quarter years with my engines will compare favourably with any other engine on the New South Wales lines.

My engine "only slipped occasionally," and that was when starting from one or two wayside platforms, where the driver seemed impatient and to think it unnecessary to stop at all. The load could not only have been increased with "safety," but with advantage, and it is satisfactory to know that time was gained on the *heaviest parts of the road*.

19. The judges must, I am sure, admit upon reflection that the account of coal consumed and water evaporated per lb. of coal burned is most erroneous. A lot of coal was wasted in being shovelled hurriedly (some 8 feet) from the damaged tender to another tender. Indeed, no such accurate account of my coal was kept as was kept with Mr. Scott's engine. I do not see how the water evaporated per lb. of coal is to be accurately accounted for. In my case very little water was wasted by the injectors, whereas the Vulcan engine wasted immense quantities every time the injectors were used. I am not aware that the water which entered the boiler of either engine was accurately gauged, and unless this be done any data concerning evaporation is wrong and misleading.

The quantity of water drawn from each tender was roughly gauged, but all of it did not go into the boilers, and of course, as the Vulcan engine wasted most, the evaporation is said to be the highest. I am inclined to think that, as my boiler did the most work, the evaporation in it was highest.

The oil and tallow consumption is not accounted for in accordance with conditions of test.

21. I cannot conclude without remarking that there is to my mind evidence in the report of partiality, and a desire to tone down the defects in the Vulcan engine, so as not to reflect on the Locomotive Engineer, and this is hardly to be wondered at, seeing that Mr. Scott, some three years ago, thought fit to recommend Mr. Smith for the position of assistant to himself, and subsequently recommended Mr. Roberts for the same position, although I was his assistant at the time.

I beg most urgently to direct your attention to all I have said in my former report (dated 19th April, 1887), and compare the salient points in the report now submitted by Messrs. Smith and Roberts.

THOS. MIDLTON, M.I.M.E., 5/7/78.

REFERENCE to "Engineering" of April 15th and 29th last will show further proof of the correctness of my views. On page 407 there is an illustration of a six-coupled engine, which has 5' 2" wheels and 20" x 24" cylinders, giving off but 14 lb. of power more than my engine. This engine is used for "hauling passenger trains over the mountains, which formerly required two of the (Lehigh Valley Railroad) Company's engines of the ordinary construction." It is also said "there has been of late years a growing demand that heavy trains should be hauled at express speed, and while anxious to comply with this demand, railway managers are unwilling to reconstruct their roads entirely with heavier rails, and to rebuild all their bridges, owing to the enormous outlay of capital that such a course would involve. The object of the design shown is to produce an engine able to cope successfully with very heavy express trains, while keeping the weight per axle much the same as it is on existing engines of the ordinary type." I need hardly say that this has been the object I have had in view for many years.

T.M.

Minute by The Commissioner for Railways.

Subject :—Report of Messrs. A. Smith and T. Roberts, Locomotive Officers, Victoria and South Australia, on certain engines tested by them.

FORWARD copy of report to Mr. Scott for any observation he may wish to make thereon.

I wish the report made not later than the 6th July.

CH.A.G., 2/7/87.

Minute by Mr. Locomotive-Engineer Scott to The Commissioner for Railways.

As desired by the Commissioner, I have looked through the printed report forwarded by Messrs. Alison D. Smith and T. Roberts, the two experts appointed to test the relative merits of locomotive engines belonging to the classes Nos. 305 and 373.

I find page 3 of the printed report is confined principally to a description of the engines. This was so well known by yourself previously that comment is uncalled for.

In the first paragraph on page 4 (after describing the load taken by the Vulcan engine) deductions are drawn which are not quite correct, as will be seen by comparing the time-table prepared by the traffic branch with the "running time" shown on the "report sheets" of the driver and guard. The experts state that the engine lost 6 minutes between Sydney and Penrith. By the time-table, 1 hour 26 minutes was allowed for the run. The actual time taken (according to the statement of the experts themselves) was 1 hour 16 minutes, so that instead of losing 6 minutes the run was accomplished in 10 minutes less than the time allowed. Then the experts state that 8 minutes were lost between Penrith and Katoomba.

The time-table allowed 2 hours 19 minutes for the journey, but the actual running time was 2 hours 18 minutes; therefore, instead of 8 minutes being lost, 1 minute was gained. Again, the experts state that the run from Katoomba to Mount Victoria was accomplished in 18½ minutes less than the allotted time, but seeing that the allotted time was 27 minutes, and the actual time taken was 23 minutes,

i t

it follows that the time gained was only 4 minutes, and not $18\frac{1}{2}$, as stated. The actual running time from Mount Victoria to Esk Bank was 43 minutes, and the allotted time 48 minutes, so that the journey was done in 5 minutes less than the allotted time, and not $7\frac{1}{2}$ minutes, as stated.

It will thus be seen that the Vulcan engine did the whole journey from Sydney to Esk Bank in 17 minutes less than the time allowed, and not 12 minutes, as stated by the experts.

The second paragraph describes a condition of the road which, at this season of the year, may naturally be expected as of almost daily occurrence; and I stipulated, in accordance with the universal practice, that sand-boxes should be fitted to the engines in order that the difficulty and danger of slipping under such circumstances might be reduced to a minimum. With reference to the free use of sand, which the experts state was absolutely necessary to keep the engine from slipping, I may state only $1\frac{1}{2}$ cubic feet of sand were used.

Water was only applied once (and that was on the *up journey*), and then only for the purpose of cooling the brake-blocks after arrival at Springwood. The condition of the brake-blocks even then did not absolutely demand it.

Paragraph 3 calls for little comment beyond the fact that the engine took a load in excess of that for which it was designed at an expenditure of 7,740 cubic inches of steam in each cylinder for each revolution of the wheel.

Paragraph 4 records an important fact as to the hauling power of the engine. It is clearly demonstrated that on a rising gradient of 1 in 33, and in an 8 and 10 chain reverse curve, the engine (with a normal boiler pressure) started its load without difficulty. Want of proper care and attention on the part of the driver and fireman may have been the cause of the stoppage on the bank. This neglect, however, afforded an opportunity of testing the capability of the engine starting on a grade of 1 in 33, and it is gratifying to know that the result was so satisfactory, for it has established beyond question the correctness of my calculations as to what the engine would do.

With reference to the performance of engine No. 305 on the following day, I note that the experts state the conditions of the road were decidedly in favour of the engine, yet we are told that she slipped occasionally, and that sand was not used. I submit that if the engine slipped under such favourable conditions as regards the state of the road it may fairly be inferred that had the road been in the same state as it was on the previous day the use of sand would have been absolutely necessary. The use of sand for the prevention of slipping cannot be said to militate against the usefulness of either engine.

The steam is said to have been cut off at $70\frac{1}{2}$ per cent. of the stroke. This means that the engine took its load at an expenditure of 9,328 cubic inches of steam in each cylinder for each revolution of the wheel, or 1,588 cubic inches per revolution more than the Vulcan.

In other words, engine 305 used more steam by 440 cubic feet per mile than the Vulcan engine.

The running time of the engine, as stated by the experts, will also be found to be incorrect.

For instance, the time allowed for the run from Sydney to Penrith was 1 hour 26 minutes. The actual time occupied was 1 hour 9 minutes, but the experts in their analysis of running state $50\frac{1}{2}$ minutes, clearly showing that the deduction as to running is incorrect in both cases.

Each engine is stated to have taken the curves easily, and to be steady at all speeds, but the Vulcan is assumed to have run at 40 miles an hour, and the Mogul at 45 miles per hour. I may state no instructions were given by me to run otherwise than in accordance with the time-table, so that nothing can be deduced from the results of these trials to show that the Mogul is superior to the Vulcan as to speed capability.

On page 5 it is clearly shown that in the consumption of fuel the Vulcan engine is decidedly the more economical, viz., 49.5 lb. per mile for the Vulcan, as against 62.17 lb. per mile for the Mogul. I note the experts state that the probable cause of the excessive use of fuel by the Mogul engine was on account of the high average speed at which the ascent of 1 in 52 for 32 miles was made.

I scarcely think that such a deduction would be accepted as conclusive, and in justice to the experts I must say that they do not assert it definitely.

The conclusion drawn that 305 is more suitable for the class of traffic and road on which the experiment was made will, I feel sure, be disappointing, inasmuch as it does not give a decision such as was aimed at in making the trial. The length and grades selected for the test not being anything approaching the average condition of the lines of our system may, however, account for the result.

I might, in conclusion, here repeat that, in recommending the Vulcan engine, I did not look upon the haulage power over 1 in 30 grades for about 32 miles as forming a base on which to recommend an engine adapted to the general traffic and conditions of running on all sections. I aimed at securing an engine capable of hauling equal to twelve vehicles over the steep mountain grades, and taking heavier loads and running at higher speeds on other sections, because I saw at no distant date that much would be aimed at, not only to facilitate trade, but also, if possible, to compete with water-carriage.

I am pleased to add, for the Commissioner's information, that three of the Vulcan engines, which are now running passenger trains between Sydney and Bathurst, are giving proof of their efficiency to haul the stipulated load, equal to twelve vehicles. I feel sure, also, that in the matter of economy the results obtained by the experts will be maintained.

W. SCOTT, 7/7/87.

Minute of The Commissioner for Railways.

THE Minister wishes an experiment made with Redfern type of carriages (2nd class) on the occasion of the Volunteer Firemen special train to Albury on Monday next.

One of Mr. Midelton's engines to be used. Please see that it is in perfect order.

When change of engine is made, another of Mr. Midelton's engines should be used to complete journey.

Let a special account be kept of the consumption of fuel, water, &c.

CH. A. G., 10/2/87.

Loco. Engineer to arrange and consult with Traffic Branch.—D.C.M'L., 10/2/87.

3 20011 S. 131.

Re

Re Express Engines.

CONSUMPTION of fuel, water, and other running stores by express engines with train Sydney to Albury:—

5 tons 2 cwt. 3 qrs. 24 lb. coal = 29·88 lb. per mile.
 8,755 gallons of water.
 31½ lb. castor, 8·8½
 7¼ tallow ... 1·7

10·3¼ = 33d. per mile.

Comparative consumption in lb. per mile if trains were of equal weight:—

American.	Express.
55·13 lb.	45·91 lb.

Comparative consumption in lb. per ton weight of train for the whole journey:—

American.	Express.
180 lb.	154 lb.

GEO. DOWNE, 16/3/87.

Report from Driver S. Campling to The Locomotive Foreman.

I HAVE to report for your information, *re* special passenger train run from Sydney to Albury on the 22nd instant as follows:—This train consisted of equal to 12½ carriages, drawn by engine No. 311. The first stop made after leaving Sydney was Picton Lakes, 59 miles, at 7·46 a.m., departed 7·52½; 6½ minutes taking water; crossed up express at Bundanoon, instead of Wingello, as per time-table. Barber's Creek, 109 miles, arrived 9·37, and departed 9·42; 5 minutes taking water; arriving at Goulburn at 10·16 a.m.—31 minutes late—leaving Goulburn at 10·41—36 minutes late; 20 minutes being allowed for refreshments, 5 minutes more being taken to prepare the engine to go on. A stop of 5 minutes was made at the 141-mile post, in consequence of the road being lifted. Fish River tank, 160 miles; arrived 11·30, departed 11·34, taking water, and found one of the tender axle boxes broke and got very hot. Stopped at the 201-mile post attending hot box, 12·51 p.m., departed 12·54—3 minutes. Binalong, 1·9—1·12; 3 minutes hot box. 202½ miles post, arrived 1·38, departed 1·44; 6 minutes hot box, after which it began to get cool. Harden; 227 miles, 1·58, depart 2·4, taking water. Bethungra, arrived 3·24, departed 3·28½, 4½ minutes taking water. Junee, 286 miles, 4·0 arrived, 4·20 departed. Dinner—Wagga Wagga, arrived 5·0, departed 5·9, taking water, and waiting to cross up mail, instead of Culcairn, as per time-table. Yerong Creek, arrived 5·54, departed 5·56, 2 minutes oiling, arriving in Albury at 7·11 p.m., 2 hours and 11 minutes late. Delays as follows:—1 minute late leaving Sydney, 5 minutes at 141 mile post, 12 minutes through hot tender axle box; had it not been for these delays, the train would have arrived about 6·40 p.m. - About 1 hour 40 minutes was lost by locomotive, the wheel being too small to maintain a greater speed than which was run.

S. CAMPLING,
 Engine Driver.

Referring to the special train which ran yesterday from Sydney to Albury with the fireman, the Commissioner wishes to be furnished as quickly as possible with details of its running. Time of arrival at the different depôts according to time-tables, and actual time of arrival, causes of delay, the time taken at each place for refreshment, or other stoppages, and the actual running time, deducting all detentions. Please give also the approximate weight of the train, including weight of the passengers.—D.C.M'L., 23/2/87. Traffic Manager.

The following table shows the time the train was given to run the journey, in accordance with the Minister's wishes, and the time at which the special passed certain of the principal stations.

As per Time-table.	Actual Running.
Sydney, dep. 6·0 a.m.	6·0 a.m.
Picton	7·28
Mittagong	8·39
Wingello, 8·55	9·28
Goulburn, arr. 9·45	10·16
" dep. 10·5	10·41
Gunning	11·42
Jerrawa	12·3 p.m.
Yass	12·23
Harden, arr.	2·0
" dep.	2·5
Wallenbeen	2·33
Cootamundra	2·53
Bethungra	3·35
Junee, arr. 2·10 p.m.	4·0
" dep. 2·30 p.m.	4·20
Wagga Wagga	5·8
The Rock	5·40
Culcairn, 4·15	6·25
Gerogery	6·45
Albury, arr. 5·0	7·11
Which necessitated a speed of 35 miles per hour throughout, including stoppages.	Giving an actual speed throughout, including stoppages of 29½ miles per hour.

Of course I have not shown any stoppages for water which occurred at places other than those shown above. Indeed, in that respect I have given the actual running the advantage of 5 minutes at Harden, which I did not provide for in the special train notice, leaving it to the driver to make up the time so lost.

The

The only loss of time on the journey which could have been avoided was about 5 minutes, by permanent-way signal, near the 141-mile post. In every other respect it would be simply impossible to give a train a clearer road, and this, I understand, the driver himself admits. Not only was there beautiful weather, and therefore a perfect rail to run upon, but every train, even the express, which was kept back 15 minutes, was made to give way to the special; and so completely was this done that not once throughout the journey had a stoppage to be made to enable the driver to sign for a "train ahead notice;" all he had to do was to pick up one staff or ticket, and deliver the other as he passed.

It will be understood that when I drew out the first time-table, giving the train 15 hours to do the journey, I had no idea that such special efforts were to be made to run it through quickly, consequently I allowed—

30	minutes at Mittagong, for breakfast and for an estimated 350 men.
10	" Goulburn, to change engines, and enable men to get out.
30	" Yass, for dinner.
10	" Harden, to change engines, and enable men to get out.
20	" Junee, for tea.

100 = 1 hour 40 minutes, thus reducing the actual running time, and any other stoppages that might be necessary for water, to 13 hours 20 minutes.

Exclusive of the time actually taken at Goulburn and Junee for refreshments, and at Harden for water, and the time lost near the 141-mile post (55 minutes altogether), we find the actual running time to be 12 hours 16 minutes, but that, as I have said, was attained under the most favourable circumstances. The train kept very fair time as far as Picton, but after that it lost time all the way through.

The following is the load of the train, exclusive of the engine and tender :—

		tons.	cwt.	qrs.
Redfern type	Second-class, No. 203	16	4	3
	" " 194	16	3	2
	" " 202	16	3	1
	" " 196	16	3	2
	" " 189	15	0	0
American car, first-class	" 53	16	10	3
		<hr/>		
		96	5	3
Estimated weight of 300 passengers, at 15 to the ton		20	0	0
Luggage about		0	14	1
		<hr/>		
		117	0	0

W. V. READ, 24/2/87.

The actual stoppages for water, not embodied in the foregoing report, were :—

Picton Lakes	7	minutes	
Barber's Creek	5	"	
Fish River	4	"	
Bethungra	5	"	
Wagga Wagga	5	"	
							<hr/>	
							26 minutes	

I should also mention that, between the 201-mile post and Harden, from 10 to 15 minutes were lost by the tender running hot.—D.K.

I have asked on other papers what engine was used. I see that Mr. Midelton's engine ran quicker to Goulburn than the express does.

Mr. Midelton's engine	4	hours	16	minutes
Express	4	"	50	"

Resubmit when Mr. Scott's report is received.—CH. A. G., 26/2/87.

EXTRACT from Traffic Manager's minute of 10/3/87, relative to the subject of accelerating the speed of the morning train from Penrith.

"I HAVE arranged with the Locomotive Engineer to try one of Mr. Midelton's engines on the train.—W. V. READ, 10/3/87."

Hereon Commissioner minuted, 28/3/87, that he "wished the papers to be resubmitted at the end of April, to ascertain whether better time had been made by Mr. Midelton's engine."

Report of Traffic Manager.

Better time has been kept with the Midelton engine. This engine is able to make much better time up the inclines, and starts from the stations much quicker. In new table, now in hands of printer, I am taking 8 minutes off "up" journey, and 3 minutes off the "down."—W. V. READ, 20/5/87.

Minute

Minute by The Commissioner for Railways to The Locomotive Engineer.

New Engine by the Vulcan Foundry Company. * * *

LET me know as early as possible the total weight of the engine, and separately of the tender of the Engine and above class of engines, and also the weight which is upon each wheel, empty, and fully equipped for the tender separately. road.

CH.A.G., 23/5/87.

Please arrange for the new engine now running to be weighed as soon as possible.—W. SCOTT, 25/5/27. Assistant Engineer. Mr. R. Scott;—To have this done, and attach result on separate paper.—GEO. DOWNE, 25/5/87. Details herewith.—W. SCOTT, 30/5/87. Commissioner.

W. SCOTT, 30/5/87.

Minute by The Chief Clerk to Mr. Locomotive-Engineer Scott.

Trial of Locomotives.

WITH reference to motion passed in the House on the 11th July, 1887, I should be glad to have a report, showing respectively the total cost to the Government of each of the two engines lately submitted to a trial test of efficiency between Sydney and Eskbank.

D.C.M.L., 21/9/87.

Engine No. 373, Vulcan Foundry Company, £2,479 6s. 9d.; engine No. 311, Baldwin Company, £2,959 19s. 10d. According to information supplied by Superintendent, Stores.—W. SCOTT, 21/9/87.

Minute by The Secretary for Public Works.

Manufacture of Locomotives.

Department of Public Works, Sydney, 30 September, 1887.

A DEPUTATION, comprising Messrs. Garrard, Hawthorne, F. Smith, Jeanneret, M's.P., Hudson, Bloomfield, Franki, Henry Mort, John Morris, Henry Vale, and Edginton, waited upon me to day with reference to the manufacture of locomotives in the Colony. They pointed out that tenders had been received five months ago for this work, but as yet no decision had been come to, and they asked that an early decision might be given. It was rumoured that, owing to the price of the Colonial tender, it was probable the work would be done in the Eveleigh workshops, as it was alleged the work could be done there cheaper than outside. They protested against this proposal as it would be an undue interference with private vested interests, as it would be an impolitic act to increase the number of Government employes unduly, and as it was the general experience that Government work was never carried out so economically as work done by private enterprise stimulated by competition.

They mentioned that at the present time many of their machines were lying idle, and large numbers of workmen were unemployed. Rather than see the work go out of the Colony, or be taken up in the Government shops, they were prepared to allow the work to be divided between them, the manufacture of the engines to be supervised by a Government employe, and the Service paid for at the rate of 5 per cent. on the actual cost price of the materials. They thought the Government should encourage the local makers; the cost of the first service might be high, but as they became familiar with the work, prices

prices would go down to a reasonable limit. This has been the experience in Victoria in private workshops. They pointed out also that in Adelaide, where the cost of Government work had been examined, that the result, when compared with the cost of private working, was unsatisfactory.

I informed them that I could say little that was new. I had stated previously when they and the men waited upon me that the matter largely rested with them, and if they compelled the Government to import the locomotives on this occasion it might be a long time before they would have such an opportunity again of tendering for the supply. The Government had now to face a difficulty in this matter, and it was this difficulty that kept the question so long unsettled. So far as I was concerned, I was favourable to having this work, and in fact all the work, done in the Colony, if it could be carried out at anything like the price we could import, with the addition of incidental charges. I had, when in office previously, arranged for locomotives to be made here, and only on one occasion, and then under exceptional circumstances, had I sent for engines out of the Colony; the local manufacture had benefited the Colony, and I believe if the manufacturers had been as anxious as I had been to have the locomotives made here they would not have had any need to come before me that day. Certainly the engines could be made here as efficiently as in any part of the world, and my desire was to simplify the article we wanted as much as possible. I believed it could then be made as cheaply in the Colony as anywhere else.

It had been said that the Government were about to make the locomotives in our own workshops, but the Government had arrived at no decision whatever in this matter. We certainly would like to be in a different position, as the tenders we received were much higher than we expected and above what would justify us in having them done here if we were going to have them done by contract; if we decided on having them done by contract they must come from the other side of the water. They had referred to work in Government shops, and a demand had been made for an inspection appointed from outside the Service to check the time and expenses. I stated I would be happy to allow such an officer to go into our shops to-morrow as I, with them, courted the fullest publicity. Some misapprehension had arisen with regard to my desire to have everything possible made locally; some said it was protection, but in every instance since I had been in office this time the articles I had made here had been obtained cheaper than if they had been imported, and I was therefore much surprised to find the prices for these engines so much over the English price.

It was not unusual for Railway Companies all over the world to make their own rolling stock, locomotives and carriages, and also materials, and they prove they can supply their own wants cheaper than if the work was done outside. Mr. H. Hudson here stated that I was incorrect in this statement; he knew from personal experience that in England and America the Railway Companies obtained their supplies from outside makers, and instanced the large private workshops, such as the Baldwin Company, Beyer, Peacock, & Co., Dübs, Neillson, and others, from which the Railway Companies obtained their supplies. The most the Railway Companies did was repairs; he knew of only one Company in England, the London and North-western, that made its own stock.

I stated I did not speak from personal experience but from reading the leading English scientific and mechanical journals, and it was stated there that the Railway Companies of the world largely made their own supplies, and even their own rails. I did not want to have the engines made in our shops, but rather than have them go out of the Colony, I would have them manufactured there so as to afford work to our own men. They had every opportunity of tendering, and were aware their prices were much in excess of the English offers, and the question simply was whether the Government would give them a large bonus over the manufacturers abroad. The matter would be for the Cabinet to settle. I would not advise the work going out of the Colony. Their offer to do the work at an increase of 5 per cent. on cost price was a new feature in the matter. They had, however, simply stated it verbally, but if they would put it in writing I would represent the matter fairly to the Government.

JOHN SUTHERLAND.

Messrs. D. & W. Robertson to The Secretary for Public Works.

Sir,

335, Pitt-street, Sydney, 3 October, 1887.

With reference to the manufacture of fifty locomotives in this Colony, as it is reported the local tenders are somewhat above the imported ones, and as there are only a few firms in Sydney who can make a complete locomotive, we would respectfully suggest that fresh tenders be called on something like the following basis:—

1. Locomotive boilers.
2. Wall iron under-frames.
3. Locomotive tenders, complete.
4. Set of boiler mountings, complete.
5. Cast iron-work, including cylinders, axle-boxes, &c.
6. Pistons, piston-rods, connecting-rods, &c., complete in sets.
7. Erecting the different parts at Eveleigh.

The whole work to be made to ten plates to be passed and approved by the Government Engineers during construction.

In getting tenders in this way it would permit of a large number of firms tendering that otherwise would not tender. We ourselves, for instance, could make the boilers and tenders at less than imported firms when it would not suit us to tender for a complete locomotive. In the same way several firms could make the brass work, loco. gear, &c., &c., and if proper supervision was employed it would give full employment for a large number of manufacturers in Sydney and District who otherwise could not share in this important work.

We are of opinion that if our suggestion is tried it will be found the work can be done in the Colony as cheap as the imported article, and thus give employment to the numerous first-class workmen now vainly seeking employment.

We have, &c.,

D. & W. ROBERTSON.

Messrs.

Messrs. Hudson and others to The Secretary for Public Works.

Sir,

33, Pitt-street, Sydney, 3 October, 1887.

We have the honor, in accordance with your request, to put in writing the verbal offer made to you by the deputation of engineering firms on Friday last, the 30th ultimo.

We have now the honor to state that we are prepared to carry out the construction of fifty or more locomotives required by the Government, at the rate of £5 per centum on the cost of same.

We have, &c.,

HENRY HUDSON (for HUDSON BROS., Limited.)

MORRIS BROS.

J. P. FRANKI (for Mort's Dock and Engineering Co.)

HENRY VALE.

JOHN EDGINGTON, Atlas Engineering Co.

I should like report from Mr. Midelton.—J.S., 5/10/87.

This proposal is very different from the original one made by Capt. Broomfield, as reported in the newspapers. On behalf of Mort's Dock Co. he said he was prepared to make these locomotives under the eye of an officer of the Government, and only claim 5 per cent. profit on the cost of material and supervision. This means that he would supply machinery and labour gratis. Now we find five firms who are all prepared to execute the work "at the rate of £5 per centum on the cost." This means the more the engines cost to make the more the firms will profit by it. No Government or railway company would entertain such extravagant proposals, and I am surprised that any firm should have the temerity to make them. It goes to prove that the only object these manufacturers have in view is profit, whereas if the Department does its own work it will have no object in view but that of providing sound, good work at the cheapest rate, and work which will cost but little in maintenance. The proposal of the firms signing the paper is certainly a safe one for themselves, but most unsafe and unsatisfactory for the Government. Messrs. D. & W. Robertson seem to think that the Department require fifty locomotives made simply to give employment to seven different firms, and to all the "unemployed" hands in the Colony. This could be most completely carried out if these firms obtain the work in the way they suggest. The proposals of the combined firms, and Messrs. D. & W. Robertson's are untenable.—THOS. MIDELETON, 10/10/87. Commissioner.

[Two plans.]

1888.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REPORT OF BOARD ON COLLISION AT FISH RIVER TANKS.)

Ordered by the Legislative Assembly to be printed, 21 November, 1888.

Minute by The Secretary for Railways.

I AM directed by the Railway Commissioners to enclose printed copy of the above for the information of the Honorable the Minister for Railways.

The Under Secretary for Finance and Trade.

D. VERNON,
Secretary for Railways.

B.C., 17-19/11/88.

Report on Collision at Fish River Tanks, Great Southern Railway.

Secretary's Office, Phillip-street, Sydney, 2 November, 1888.

WE have the honor to report, for the information of the Commissioners, and in compliance with their order of the 29th ultimo, the result of our inquiry into the cause of the collision which occurred on the 27th ultimo at the Fish River tanks on the Great Southern Railway.

On this occasion what is termed on the service time-table as No. 22 up goods train was running in two divisions. The first division, or train, consisted of engine and tender, fourteen loaded sheep-vans, and composite brake-van; the second was composed of engine and tender, sixteen trucks of wool, and brake-van.

The first of these two trains had just completed taking water at the Fish River tanks when it was run into at the rear by the second train.

Eight passengers in the first train were more or less injured, one, we regret to say, fatally, and the van and six sheep trucks of the same train were practically destroyed. In the case of the second train the engine only was slightly damaged. The total damage resulting from the collision to rolling stock may be estimated at £1,530.

Description.

The Fish River tanks are situated on the Southern line of railway, at a distance of 161 miles from Sydney, and 3½ from Gunning Station, which is a little over 164 miles distant from Sydney. Starting from Gunning for Fish River we have a descending gradient of about half a mile; the line then rises with an almost continuous gradient of 1 in 40 for about 1¼ mile, and then descends with a continuous gradient of from 1 in 46 to 1 in 42 to the Fish River Bridge, 1½ mile. For a sketch of the gradients see Appendix C.

"Up" and "down" distant signals are erected, the former being placed at a distance of 743 yards from the tanks, and the latter at a distance of 946 yards from the same point. These signals were erected and brought into use on the 15th ult., up to which date trains had been accustomed to take water without the protection of fixed signals.

A pumper is stationed at the tanks, but it is not his duty to attend to the signals beyond lighting them at night. They are supposed to be worked by the guards of trains which stop there for water.

The lever of the "up" signal is fixed about 132 yards from the tanks, or as nearly as possible, without being on the viaduct, to where the brake-van of a train taking in water would be likely to stand, and the same with regard to the down signal, the lever of which is 100 yards from the tanks.

Evidence.

The evidence in full will be found attached, but the following is a digest, so far as it bears upon the subject of our inquiry:—

William Patrick Morphy, night officer at Gunning:—The first division of the No. 22 up-goods (referring to train-book) arrived at Gunning at 3:40 a.m. on Saturday, and left at 4:30, as booked by myself; the second division arrived at 4:5, and left at 4:45; the actual departure was a minute or so later, as 4:45 was when the driver got the signal to go; the first division received a staff ticket from me, and the second division also a ticket and a "Train ahead" notice. *Alfred*

Alfred Chandler, engine-driver, states :—I was driver of the first division of the goods train which left Gunning on Saturday morning last at 4:30; the morning was very foggy, and the rails were very greasy; I had to sand a good deal coming out of Gunning; we are not booked at the tanks, and I did not notice the actual time that I came to a stop there, but I noticed the time at which I was about to leave; I had taken my brakes off, and was just about to give the engine steam; this was 4:55; the first thing I heard was two short whistles, and they had hardly been given before I was struck; I had not actually started when the blow took place; I had whistled to start; I believe that I was occupied at the tanks for about five minutes, as I did nothing but take water; there are signals at the tanks; I noticed the one that I passed coming down to the tanks burning a white light brightly, although I could not see it until I got close to it owing to the fog, which was very dense that morning; as far as the actual running is concerned I got on satisfactorily; I had occasion to use sand coming down the bank to the tank; I could have stopped at the signal had it been against me; I did a good bit of slipping coming up the bank from Gunning; I have never passed Fish River on the up journey without taking water; I opened the valve of the Fish River tank, and my mate held the crane over the filling hole.

Robert Walton, fireman to Chandler :—I was firing with driver Chandler on Saturday morning last; I remember noting the time when we were leaving Gunning, and it was about 4:30 a.m.; of course I did not notice particularly; we stopped at the tanks and took water; I filled the tank while Chandler turned it on; he then got up on his engine, told me to release the brakes which I did, and we were then in the act of starting when the collision took place; I heard two whistles immediately before we were struck; it was very foggy, as I could just see the end of the vans which remained attached to the engine; after I went back I remember Evans speaking to me about seeing the second division coming down the hill as he was going back to work the signals; I understood from what he said that he would not have had time to get to the lever before the train had passed the signal, and that he would have been endangering his life if he had stayed on the bridge; we had a little difficulty in some places in coming down the bank holding the train; I think my mate used sand; we could have stopped at the signal if it had been against us.

David Evans, assistant goods guard :—I had charge of the first division of No. 22 up-goods on Saturday morning last; we left Gunning at 4:30, which time I booked immediately before leaving there; the night was very foggy and the rails slippery, as we lost a good bit of time coming up the bank out of Gunning; I did not notice the time we stopped at the tanks; I remember after coming to a stand I jumped out of my brake and went partly back towards the signal lever; before I had time to get to the lever I heard two whistles; I turned and went partly back, and sang out to the passengers to clear out, as "she was into us;" I also called out and whistled to my driver to clear out, but I do not suppose he heard me; I do not think my train had started before the collision took place; as I was not in the brake I could not say positively whether she was moving or not; I did not hear my driver whistle to start; before I had finished shouting to my driver the collision took place, and I was engaged in releasing the passengers, being assisted by those who had got clear as well as by both drivers and firemen and guards of the second division; after we had got all cleared away, Driver Hill, of the second division, spoke to me; he said, "Dave, those signals were off," and I said, "Yes, I hadn't time to go back and put them up;" I said, "If all the signals in Goulburn yard had been against you, Charlie, I do not think you would have been able to pull up;" he said, "No, I don't think they would have been of any use;" I remember about a fortnight ago signing a general order informing of the signals being erected for use; I understood that guards were to work these signals, as they were so placed as to be nearest the vans; I looked at my watch immediately before my van was struck and it showed 5 o'clock; I remember comparing my watch with the driver's while waiting at Binalong, and I believe he was a little faster than mine; it was daylight from the time we left Gunning only that there was such a thick fog; the levers were, I should say, about 50 yards behind my van when it stopped; I did nothing but take the brake off after coming to a stand at the tanks before jumping out to go back; the average running time from Gunning to Fish River tanks, is 15 minutes; I could not say how long we were on this occasion, but longer than usual owing to slipping coming up the bank.

Charles Hill, engine-driver :—I was driver of the second division of No. 22 up-goods on Saturday morning; I arrived at Gunning at 4 o'clock on Saturday morning; I got the staff-ticket from the officer-in-charge at 4:45 a.m. and the "train ahead" notice, but I did not actually start for five minutes afterwards, as I did not get the signal from the guard; it was a very foggy, greasy morning; after leaving Gunning I got on very well, being benefited from the sand of the previous train; I had sixteen of wool on, beside the brake; after turning the top of the hill I told my fireman, who is a young hand and wanted tuition, to put on the brake, and remarked to him that the preceding train might be at the tanks, and to be careful; I also whistled for the guard's brakes; when I came to the signal I said to my fireman, "It is all right;" I said this to give him confidence, and he eased off his brakes slightly; I don't think I was more than 2 or 3 chains from the signal when I first saw it that morning; I saw the light clearly but not the post, owing to the fog; after the fireman easing the brakes, and the speed slightly increasing, I cautioned him to put them on again, which he did, and it was not until I was on the point of getting on the bridge that I first saw the tail lamps of the train ahead; I could have stopped at the signal if it had been against me; I immediately whistled and reversed, and as soon as I had reversed I struck the train; I think the guard assisted me with his brake all he could down the bank; I gave my engine, which was then reversed steam, and within a distance of about 161 feet, came to a dead stand; I asked the other driver how he came to be there, and he said he had been slipping coming up the bank; that was all that passed between us; I was aware that it was incumbent upon the guards to work these signals, and that there was no man stationed there for the purpose; the time I was struck the brake-van was 5.5 by my watch; my watch is a splendid one, and I have had no reason to regulate it since it was last cleaned, over 12 months since; I had compared it with that of my guard before leaving Harden, and also with Guard Evans after the accident, but I think I was 5 minutes in advance of him; the average running time between Gunning and Fish River I estimate to be about 15 minutes; that is, I reckon to have taken water and ready to start in 20 minutes from leaving Gunning; I challenged the distant signal and then whistled again when I saw the collision inevitable.

George Hutchinson, fireman :—I was firing with Hill on Saturday last, the morning of the accident; I do not carry a watch, and am not sure what time we left Gunning on Saturday morning with No. 22 up goods; it was a very foggy morning, and we could not see anything more than 50 yards ahead of us; we had a little slipping when starting from Gunning and had to use the sand pretty freely, but had no particular difficulty in travelling up the bank; it was pretty greasy coming down the bank, and we had to

use

use the sand; I know the bank coming down to the tanks and the driver said to me "Now, we'll have to go down here very cautiously, those chaps have had plenty of time to get away, but in case they haven't gone we will have to go steady;" upon this caution I put on my tender brake, and he said "Let the sand run," and he put on his steam brake; this seemed to hold the train very well while the sand was running; when we got down to where we could see the signal, he said, "They must be gone as the signal was off;" I was looking out for the signal, and so far as I could say we were about 40 or 50 yards away from it when we saw it; I eased off the tender brake until we were near enough to ease up to take water, and we were just about on the end of the bridge when we saw the tail lights of the train ahead; I sang out to my mate, screwed on the tender brake, he put on the steam brake, reversed his engine, and before we had time to give her steam we struck the brake; after we struck we went, as near as I could say, about 45 yards; my driver challenged the signal with a long whistle, and he whistled for brakes down when he got on to the end of the bridge, where we could see the tail signals of the train ahead; I don't remember any other whistling; I think we had our train under control coming down the bank; I am not sure that we could have stopped at the signal if it had been at danger, but we might have been able to do it, or we might have been obliged to run a little past it.

Richard William Davies, guard:—I was in charge of the second division of No. 22 up-goods on Saturday morning; the watch I am supplied with is a very good one; we reached Gunning at 4.15 and left at 4.45; I gave the signal to the driver to start; I gave it him three times, once out of the van which he did not see, finally I had to get out of the brake to give him the signal as the wool prevented his seeing it; the Station-master drew my attention to the fact that he could not see my signal; I booked the time directly after I gave him the first green light; we had very good steady travelling between Gunning and the tanks; at the top of the bank I had my brake, as is usual, hard on; when about 300 yards from the signal the driver whistled for brakes; I knew I could not put it harder on than I had it so I called to a man named Kundson who was in the brake to come and give me a hand with it; my wheels were not skidding; he gave me a hand and we got a few more turns out of the wheel; we were just inside the signal, which I did not see, when he whistled again, (two pops), and then before he got to the bridge he whistled again; meantime Kundson and I were hanging on to the brake; I said, "Hang on we are in for a smash;" just afterwards the collision happened, I jumped out of my brake, and looked at the signal lever and it was down or showing clear; the signal lever was between my brake and the first truck; it was 5.5 when we struck as I looked at my watch when I was running towards the engine; the collision first took place at a spot a little on the Goulburn side of the middle of the bridge.

George Benfield, pumper, at the Fish River:—As I was in bed on Saturday morning, I heard driver Hill's whistles for the guard's brakes; I heard it I think twice, at any rate, which made me jump-up and go to the window just in time to see the collision take place; no damage was sustained to the pumping gear in any way; I heard the second division coming down the hill, and from the driver's repeated whistles I knew he was in trouble; I did not see Chandler arrive at the tanks, but I was awake, and the impression upon my mind is that he must have been there from 5 to 7 minutes before I heard driver Hill's whistling; I remember thinking to myself that Chandler was there longer than usual.

Charles Stanger, locomotive inspector:—I was on the site of the accident about 2½ hours after it occurred, and the rough sketch prepared by Mr. Laughrey is, I think, fairly correct (*see Appendix D*); with regard to the two trains concerned in the accident, the first train was provided with engine steam-brake, tender hand-brake, and brake-van hand-brake, all in good order; the weight of engine and tender was 52 tons, and the weight of the brake-van 12 tons; I consider the brake-power was ample to secure safety in working; the second train had the same amount of brake-power, and engine, tender, and brake-van were of corresponding weights.

Conclusion.

It will be seen that there is no disagreement between the officer-in-charge at Gunning, and the driver and guards of the two trains as to the time of their departure from that station. The driver and guard of the first train agree with the Gunning officer, that they left his station at 4.30 a.m.; the driver evidently derived the same result as to time from his watch, as the Gunning officer did from his time-piece. The same may be said of the driver and guard of the second train. They both agree with the officer-in-charge, that the signal was received to start from Gunning at 4.45 a.m., although, from the delay which the driver experienced in getting this signal from the guard, owing to the intervening loading, the train did not actually start until a little later than 4.45 a.m.

Now, it may be fairly assumed that the watches of the drivers of these two trains, seeing each agreed with Gunning time, practically agreed with each other. When we come however, to inquire for the time at which the collision occurred, we find a discrepancy of 10 minutes between the drivers' statements; the driver of the first train giving it as 4.55 a.m., and the driver of the second train giving it as 5.5 a.m. It is important to ascertain if possible, the actual time at which the collision did take place. There can be no doubt, we think, as to the time of the departure of the trains from Gunning. The second train did not get away, the driver says, until 4.50 a.m. The officer-in-charge says, he did not leave until a minute or so after he gave him permission at 4.45 a.m., and the guard also testifies that he could not get his signal taken by his driver at first and until *after* he had booked the time as 4.45. We may safely conclude therefore that the second train did not leave Gunning until 4.46 or 4.47. Under any circumstances therefore it is not reasonable to suppose that it reached Fish River at 4.55 a.m. The testimony of the driver and guard of the first train, who give this as the time of the collision, cannot be accepted as correct. If, as we have seen, the second train did not leave Gunning until 4.46 or 4.47, 5 o'clock would be the earliest time it could reasonably be supposed to reach Fish River. A goods train usually occupies about 20 minutes from the time it leaves Gunning until it finishes taking water at the tanks. When, therefore, the driver of the second train reached Fish River he reasonably might, and no doubt did, expect the other train would have left the tanks. When labouring under this impression he found the signal "all clear;" he no doubt concluded that such was the case, and brought his train down the bank unprepared to stop short of the tanks.

Owing

Owing to the dense fog, which all testify to, he did not obtain a sight of the standing train or of its tail and side lights until too close upon it to avoid a severe collision. Considering all the circumstances of the case, we do not think that the responsibility of the accident can fairly be charged against the men with the second train. At the same time the evidence of guard Davies and pumper Benfield as to the early repeated whistling of the driver afford strong indication that the train was not under that perfect control, which, seeing he was carrying a "train ahead" notice, and the dense fog obscuring his view, the circumstances called for.

The severity of the blow with which the other train must have been struck also points to the same conclusion.

Seeing, as we have been obliged to conclude, that the collision did not take place until say about 5 a.m., it follows that the driver of the first train must have taken more than the ordinary time in making the run, or occupied more time than usual at the tanks. The evidence does not disclose whether this arose from dilatoriness at the tanks or was legitimately required on the road.

It is also clear from the evidence that the train had completed taking water, and was just in the act of starting when the collision occurred. Under any circumstances, therefore, and notwithstanding his statement to the contrary, the guard had ample time to perform his duty of working the signal. This duty he is clearly responsible for neglecting.

But for the failure of duty on the guard's part, the accident might have been modified, or perhaps altogether averted. Had he put the signal up on his arrival he would not have been required to pull it off until his train was *ready to start*, or until nearly the moment of collision, when we find the second train more than 600 yards *inside* the signal. The presumption is, therefore, that had it been put up it would have been showing danger when the driver of the second train sighted it and checked his progress. At the same time there is a possibility under this system of working signals by guards that the signal might have been showing "clear," even had the guard not failed in his duty, as under this system the signal has to be pulled off just when it is most required.

The collision we conclude therefore must be regarded in this instance as principally attributable to the guard's neglect to use the means which were at his disposal for the protection of his train. It becomes a question however whether the Commissioners will be inclined to incur the expense of providing day and night men at all watering tanks and sidings where the signals are now worked by guards, or dispense with the signals altogether and rely upon a standing order to be issued that all drivers carrying a staff ticket or a "train ahead" notice must approach such places at all times as if a train were standing in front of them.

With respect to the Fish River tanks, at which trains regularly take water and which are approached by steep and difficult gradients, we consider that it would be desirable to appoint men there for the purpose of attending to them. In fact, we think that home as well as distant signals should be provided, and thus secure more effectually the safety of the traffic.

APPENDIX.

(A.)

FISH RIVER ACCIDENT, 27/10/88.

ENGINE No. 202: Tyre of R. D. wheel shifted, left main frame bent, smoke-box front smashed, brake-gear damaged, steam-pipe damaged, cylinder cocks, lubricators, and sand-pipes broken, three springs broken, one sand-box.

Approximate cost of repair	£100
Brake-van No. 91 destroyed	850
Sheep van „ 56 „	100
„ „ 57 „	100
„ „ 188 „	100
„ „ 273 „	100
„ „ 153 „	90
„ „ 110 „	90

£1,530

C. H. STANGER,
31/10/88.

Evidence in full.

*To Mr. Vernon: William Patrick Morphy, night officer at Gunning:—*I have been five and a half years at Gunning, for nearly the last four as night officer in charge; I was on duty last Friday night; the first division of No. 22 up goods (referring to train book) arrived at Gunning at 3:40 a.m. on Saturday, and left at 4:30, as booked by myself; the second division arrived at 4:5, and left at 4:45; the actual departure was a minute or so later, as 4:45 was when the driver got the signal to go; these trains were detained at my station to allow of the crossing of the down mail, which was running about half an hour late that morning; the first division, which left at 4:30, received a staff-ticket from me, and the second division also a ticket and a "train ahead" notice, made out in the usual form and the driver's signature taken.

W. P. MORPHY.

*To Mr. Vernon: Alfred Chandler, engine-driver, states:—*I have been driving for four years next January; I was driver of the first division of the goods-train which left Gunning on Saturday morning last at 4:30; I booked my time immediately on leaving; the morning was very foggy, and the rails were very greasy; I had to sand a good deal coming out of Gunning; we are not booked at the tanks, and I did not notice the actual time that I came to a stop there, but I noticed the time at which I was about to leave; I had taken my brakes off, and was just about to give the engine steam; this was 4:55; the first thing I heard was two short whistles, and they had hardly been given before I was struck; the blow was very sharp,
and

and knocked me into the coal-bunker; at a rough calculation I think it must have driven my engine 10 or 12 yards: the first thing I did after being struck was to put my engine and tender brakes on, which brought me to a stand; I was very nearly stopped when I did this; my fireman then got off between me and the hand-rail, and went to see what had happened; as soon as I got my engine to a stand I went back myself, and assisted to lift the passengers out; I saw the guard of my train and the guard of the train that had run into me, and Charles Hill, its driver; the only remark that was passed concerning the accident was that of my own guard—Evans—that I had been 25 minutes coming from Gunning to clearing the tank, although I do not know how he knew that I had finished at the tank, as I had not actually started when the blow took place; I had whistled to start, and he may have guessed it from that; I believe that I was occupied at the tanks for about 5 minutes, as I did nothing but take water; there are signals at the tanks; I noticed the one that I passed coming down to the tanks burning a white light brightly, although I could not see it until I got close to it, owing to the fog, which was very dense that morning; I am not certain how long the signals have been there; I remember seeing a circular in the general order book in the Goulburn shed with respect to these signals; the usual way in which we receive information as to new signals being brought into operation is by notification in the general order book, which we are expected to sign.

To Mr. Read: I believe my watch was showing correct time, as I compared it with the clock at Binalong, where we were standing on the same trip for 1 hour and 35 minutes; I have compared my time on several occasions since the accident with others, and I have not meddled with it since the accident.

To Mr. Middleton: I was due to leave Gunning at 1:10 a.m. with No. 22 up goods; I left at 4:30 on this occasion; I take charge of the train at Harden, where I had to wait 1 hour and 45 minutes for the train as it did not arrive; I lost 10 minutes at Galong waiting for No. 1 down goods and 1 hour 25 minutes at Binalong waiting for down express; I lost 55 minutes at Gunning waiting arrival of down mail; as far as the actual running is concerned I got on satisfactorily.

To Mr. Middleton: Driver Chandler re-called:—I had occasion to use sand coming down the bank to the tank; I could have stopped at the signal had it been against me; I did a good bit of slipping coming up the bank from Gunning; I have never passed Fish River on the up journey without taking water; there was about a foot of water in the sieve at Fish River; don't think I could have come to Goulburn light without replenishing at Fish River, which I did; I opened the valve of the Fish River tank, and my mate held the crane over the filling hole.

To Mr. Vernon: After being struck I went back to give assistance, and I should say there was a gap of some 3 or 4 yards between the end vehicle which remained attached to my engine and the first of the vehicles which had been damaged by driver Hill's engine; there were about seven or eight damaged vehicles, and they lay about in all directions, and driver Hill's engine was in the brake-van; my engine was not moved after being brought to a stand following the collision until she was cut off by the guard and left for Bredalbane.

ALFRED CHANDLER.

To Mr. Vernon: Robert Walton, fireman:—I have been firing about six weeks, and was firing with driver Chandler on Saturday morning last; I carry a watch; I had not compared mine with the driver's; I merely looked at it at Binalong to see how long we should have to wait for the express, which we were instructed to wait there for; I remember noting the time again when we were leaving Gunning, and it was about 4:30 a.m.; of course I did not notice particularly; I used my watch again at the tanks, but not until the accident was over; we stopped at the tanks and took water, I filled the tank while Chandler turned it on; he then got upon his engine; told me to release the brakes, which I did; and we were then in the act of starting when the collision took place; I heard two whistles immediately before we were struck; I may say that after I had filled the tank I had put a fire on, and had just finished this when we heard the whistles; I think my driver had given the engine steam, but could not positively say whether he had done so or whistled to start; the blow knocked my mate down in the bunker, and me also; I think that immediately after we were struck my mate gave the engine steam, or it may have been given before, as I noticed the regulator open, and we went about 50 yards ahead; as soon as we picked ourselves up my mate put the brakes on, and I went back; it was very foggy, as I could just see the end of the vans which remained attached to the engine; after I went back I remember Evans speaking to me about seeing the second division coming down the hill as he was going back to work the signals; I understood from what he said that he would not have had time to get to the lever before the train had passed the signal, and that he would have been endangering his life if he had stayed on the bridge.

To Mr. Middleton: We had a little difficulty in some places in coming down the bank holding the train; I think my mate used sand; we could have stopped at the signal if it had been against us.

R. WALTON.

To Mr. Vernon: David Evans, assistant goods guard:—I have been out as assistant guard twelve months last August; I had charge of the first division of No. 22 up goods on Saturday morning last; I took charge at Harden; I left Harden 1 hour 45 minutes late; we were detained at Binalong about 1 hour and 20 minutes waiting for the express; we were also detained at Gunning about 45 minutes waiting for down mail; we left Gunning at 4:30, which time I booked immediately before leaving there; the night was very foggy, and the rails slippery, as we lost a good bit of time coming up the bank out of Gunning; I did not notice the time we stopped at the tanks; I remember, after coming to a stand, I jumped out of my brake and went partly back towards the signal lever; before I had time to get to the levers I heard two whistles; I turned and went partly back and sang out to the passengers to clear out as "she was into us;" I also called out and whistled to my driver to clear out, but I don't suppose he heard me; I don't think my train had started before the collision took place as I was not in the brake, I could not say positively whether she was moving or not; I did not hear my driver whistle to start; before I had finished shouting to my driver the collision took place, and I was engaged in releasing the passengers, being assisted by those who had got clear as well as by both drivers and firemen, and guards of the second division; after we had got all cleared away driver Hill of the second division spoke to me; he said, "Dave, those signals were off;" and I said, "Yes, I had'n't time to go back and put them up;" I said, "If all the signals in Goulburn yard had been against you, Charlie, I don't think you would have been able to pull up;" he said, "No, I don't think they would have been of any use;" I don't remember making any remark to my own driver beyond asking him why he had not cleared out; he replied he could not hear me; I was a good deal confused; I don't remember anything else being said; I remember, about a fortnight ago, signing a general order informing of the signals being erected for use—I understood that guards were to work these signals, as they were so placed as to be nearest the vans; I am pretty well acquainted with the rule-book, but I don't remember any rule which requires guards to work such signals; I always understood it to be the duty of the guards to work these signals, and have worked them myself on several occasions since they were erected; I was employed eleven months as signalman in the Goulburn yard before going out as assistant guard; I looked at my watch immediately before my van was struck and it showed 5 o'clock; I remember comparing my watch with the driver's while waiting at Binalong, and I believe he was a little bit faster than mine.

To Mr. Middleton: I had fourteen trucks of sheep and a composite brake-van on my train; we lost time coming up the Gunning bank; I had my brake hard on from the top of the bank coming down to the tanks, and the train worked down satisfactorily; I had no occasion to use any sand, and the driver stopped at the tank; it was daylight from the time we left Gunning, only that there was such a thick fog; the levers were, I should say, about 50 yards behind my van when it stopped.

To Mr. Vernon: I did nothing but take the brake off after coming to a stand at the tanks before jumping out to go back.

To Mr. Middleton: I had five or six passengers in the van with me, and the two second-class compartments were full; with regard to the passengers in my van, they were travelling "O.S.," with the exception of a drover; the others in the van were coming to a pic-nic.

To Mr. Read: The average running time from Gunning to Fish River tanks was 15 minutes; I could not say how long we were on this occasion, but longer than usual, owing to slipping coming up the bank.

DAVID EVANS.

To Mr. Vernon: Charles Hill, engine-driver:—I was driver of the second division of No. 22 up goods on Saturday morning; I took charge at Harden; it is ten years since I first went out driving; the most of my running has been between Goulburn and Harden; I arrived at Gunning at 4 o'clock on Saturday morning; I got the staff ticket from the officer in charge at 4:45 a.m., and the train ahead notice, but I did not actually start for 5 minutes afterwards, as I did not get the signal.

signal from the guard; it was a very foggy, greasy morning; after leaving Gunning I got on very well, being benefited from the sand of the preceding train; I had sixteen of wool on, beside the brake; after turning the top of the hill I told my fireman, who is a young hand and wanted tuition, to put on the brake, and remarked to him that the preceding train might be at the tanks, and to be careful; I also whistled for the guard's brakes; when I came to the signal I said to my fireman, "It is all right"; I said this to give him confidence, and he eased off his brakes slightly; I don't think I was more than 2 or 3 chains from the signal when I first saw it that morning; I saw the light clearly, but not the post, owing to the fog; after the fireman easing the brakes, and the speed slightly increasing, I cautioned him to put them on again, which he did, and it was not until I was on the point of getting on the bridge that I first saw the tail lamps of the train ahead; (I could have stopped at the signal if it had been against me); I immediately whistled and reversed, and as soon as I had reversed I struck the train; I think the guard assisted me with his brake all he could down the bank; I gave my engine, which was then reversed, steam, and within a distance of about 161 feet came to a dead stand; I at once sent my fireman back to protect my train, and myself went to the fettle's house close by to get some one to send back to Gunning to stop the express, and get a doctor; this I carried out, and then returned to the scene of the accident, and gave what assistance I could; I asked the other driver how he came to be there, and he said he had been slipping coming up the bank; that was all that passed between us; the signals have only recently been erected; I was informed of this by usual means of a circular in the general order book which I saw and signed for; I was aware that it was incumbent upon the guards to work these signals, and that there was no man stationed there for the purpose; I have not been stopped hitherto by this signal, but I have had occasion to use a similar signal at Rocky Ponds; I used it instead of the guard being nearer to the lever than he was; I also pulled it off when ready to start; I have only been informed in writing of the signals being there, but not of the precise means by which they were to be worked; this was a matter of inference, as we have other similar signals; the time I struck the brake van was 5.5 by my watch; I did not see the guard of the first division until after I struck his train.

By Mr. Read: My watch is a splendid one, and I have had no reason to regulate it since it was last cleaned over twelve months since; I had compared it with that of my guard before leaving Harden, and also with guard Evans's after the accident, but I think I was 5 minutes in advance of him; the average running time between Gunning and Fish River I estimate to be about 15 minutes, that is I reckon to have taken water and ready to start in 20 minutes from leaving Gunning; I challenged the distant signal, and then whistled again when I saw the collision inevitable.

CHAS. HILL.

*To Mr. Vernon: George Hutchison, fireman:—*I am 26 years of age; I have been firing a month last Tuesday with driver Charles Hill; I was firing with him on Saturday last, the morning of the accident; I do not carry a watch, and am not sure what time we left Gunning on Saturday morning with No. 22 up goods; it was a very foggy morning, and we could not see anything more than 50 yards ahead of us; we had a little slipping when starting from Gunning, and had to use the sand pretty freely, but had no particular difficulty in travelling up the bank; it was pretty greasy coming down the bank, and we had to use the sand; I know the bank coming down to the tanks, and the driver said to me, "Now, we'll have to go down here very cautiously. Those chaps have had plenty of time to get away, but in case they haven't gone, we will have to go steady." Upon this caution, I put on my tender brake, and he said let the sand run, and he put on his steam-brake; this seemed to hold the train very well while the sand was running; when we got down to where we could see the signal he said they must be gone as the signal was off. I was looking out for the signal, and, as far as I could say, we were about 40 or 50 yards away from it when we saw it; I eased off the tender brake until we were near enough to ease up to take water, and we were just about on the end of the bridge when we saw the tail lights of the train ahead; I sang out to my mate, screwed on the tender-brake, he put on the steam-brake, reversed his engine, and before he had time to give her steam we struck the brake; after we struck we went as near as I could say about 45 yards; after coming to a stand my mate sent me back with a red flag signal to protect us from any following train; I went back about 400 yards past the signal, where I remained for about half-an-hour until one of the fettle's came back from Gunning; the rule book is the only source of information respecting signals that I have been supplied with; beyond this, information has been supplied by my driver, which I have had the benefit of.

To Mr. Read: My driver challenged the signal with a long whistle, and he whistled for brakes down when he got on to the end of the bridge, where we could see the tail signals of the train ahead; I don't remember any other whistling; I think we had our train under control coming down the bank.

By Mr. Vernon: I am not sure that we could have stopped at the signal if it had been at danger, but we might have been able to do it; or we might have been obliged to run a little past it.

GEORGE HUTCHISON.

*To Mr. Vernon: Richard William Davies, guard:—*I have been running as goods guard between Picton and Harden for about five years; I was in charge of the second division of No. 22 up goods on Saturday morning; I took charge at Harden; the watch I am supplied with is a very good one; we left Harden at 10.45; I compared with the driver and Harden clock before leaving; I agreed with the driver, but there was a difference of a minute or a minute and a half—I forget which way—between my watch and the clock; we reached Gunning at 4.15, and left at 4.45; I did not see the staff or staff ticket given to the driver; I gave the signal to the driver to start; I gave it him three times, once out of the van, which he did not see; finally I had to get out of the brake to give him the signal, as the wool prevented his seeing it; the station-master drew my attention to the fact that he could not see my signal; I booked the time directly after I gave him the first green light; we had very good steady travelling between Gunning and the tanks; at the top of the bank I had my brake, as is usual, hard on; when about 300 yards from the signal the driver whistled for brakes; I knew I could not put it harder on than I had it, so I called to a man named Kundson, who was in the brake, to come and give me a hand with it; my wheels were not skidding; he gave me a hand, and we got a few more turns out of the wheel; we were just inside the signal, which I did not see, when he whistled again (two pops) and then before he got to the bridge he whistled again; meantime Kundson and I were hanging on to the brake; I said, "Hang on, we are in for a smash;" just afterwards the collision happened; I jumped out of my brake and looked at the signal-lever, and it was down, or showing clear; the signal-lever was between my brake-van and the first truck; this was after we came to a stand; I ran forward and saw two men under the bridge on the ground, and two others in the brake-van of the train in front in a corner, under the iron plates; Kundson, Walton, and I released them; I got a couple of buckets of water for them and then I ran away to protect my train from the express which was to follow; it was 5.5 when we struck, as I looked at my watch when I was running towards the engine; Hutchison the fireman went back with me; I planted some fog signals at the usual distances; I left the fireman with a red flag, about 200 yards outside the signal, the other man—fettle Hodges—went on to Gunning with a red flag which I gave him out of my pocket; after that I returned and got some lotion from Benfield the pumper, with which I rubbed the limbs of some of the injured men; Benfield had the lotion ready; I am not a member of the Ambulance Corps, but I have had some lessons; the application seemed to be very acceptable to all who had the benefit of it; I saw driver Hill, and he helped me to get the buckets of water; he told me he had sent the fireman back, but I told him I knew all about that, as I had been with him and left him with a red flag; the collision first took place at a spot a little on the Goulburn side of the middle of the bridge; after the collision, when my engine had come to a stand it and the brake-van into which it had run stood just at the Goulburn end of the viaduct; to the brake-van was attached a sheep-truck or two; then I remember another lying between this and the tanks; there were ten ahead of the platform,—seven in pretty good order, and the three others were more or less injured.

R. W. DAVIES.

*To Mr. Vernon: George Benfield, pumper at the Fish River:—*As I was in bed on Saturday morning I heard Driver Hill's whistle for the guard's brakes; I heard it, I think, twice at any rate, which made me jump up and go to the window just in time to see the collision take place; I saw the sheep-vans moving forward from the effect of the blow, and tumbling over, and the sheep escaping; I slipped my clothes on and went out; the position where the blow was first given was about the middle of the bridge; I rendered what assistance I could taking the ladies and children up to the house and supplied some lotion which I had in order to relieve pain; no damage was sustained to the pumping gear in any way; just as I got up to the window Chandler put on steam, making the engine slip violently; after the concussion I saw Chandler's engine and train moving away, and when I got outside ten vehicles were standing about 20 yards clear of the Goulburn end of the platform; the brakes had been put down and the engine had gone away to Bredalbane; I noticed there were two waggons attached to the van, and the other two were opposite the platform somewhere near the waiting room.

To

To Mr. Midelton: I heard the second division coming down the hill, and from the driver's repeated whistles I knew he was in trouble, which made me jump up immediately, which made me just in time to see the blow and the trains spread; I did not see Chandler arrive at the tanks, but I was awake and the impression upon my mind is that he must have been there from five to seven minutes; before I heard Driver Hill's whistling I remember thinking to myself that Chandler was there longer than usual; before taking charge of the pumps I had twenty-eight years' experience on the foot-plate on the Midland, twenty-one of which was as driver, two years as deputy foreman, locomotive sheds, Derby; I had to surrender this position of driver on account of suffering from bronchitis.

GEORGE BENFIELD.

To Mr. Vernon: *Isaac Davies*, ganger:—I reside about 100 yards from the Goulburn end of the Fish River platform; I was at home, and up, on Saturday morning last, when the collision took place; I saw nothing before I heard the crash, on hearing this I ran out; saw the sheep tumbling about, and the driver of the first division of the train steaming in the direction of my house, which he passed with vehicles (sheep vans) attached, and he came to a stand about 50 yards this, Goulburn, side of my house; I subsequently met driver Hill, who wanted me to go for a doctor at once; I went then to where some of my gang were living, and sent off a man to Gunning accordingly; I then returned and rendered what assistance I could at the scene of the accident.

ISAAC DAVIES.

To Mr. Vernon: *Charles Stanger*, locomotive inspector:—I am aware of the signals at Fish River, provided for the protection of the tanks; they have been in operation about a fortnight; I was instructed by circular from running foreman, Sydney, respecting these signals being brought into use; we have what we call a signal notice book, in which all such notices are pasted, the book being kept in the shed-inspector's office, with the appearance book, for the information of drivers, who sign the book in the case of every circular received; I was on the site of the accident about two and a half hours after it occurred, and the rough sketch prepared by Mr. Loughrey is, I think, fairly correct.

C. H. STANGER.

With regard to the two trains concerned in the accident, the first train was provided with engine steam-brake, tender hand-brake, and brake-van hand-brake, all in good order; the weight of engine and tender was 52 tons, and the weight of the brake-van was 12 tons; I consider brake-power was ample to secure safety in working; the second train had the same amount of brake power, and engine, tender, and brake-van were of corresponding weights.

C. H. STANGER.

To Mr. Vernon: *Alexander Crawford*, traffic inspector:—I received notice from the Traffic Manager on the 13th instant of the erection of the signals at Fish River; it is our custom to paste all such notices in the Guards' Order Book, and get the guards to sign them; this was done in the present instance, and I held the signatures of both guards for the circular in question; the circular does not prescribe the exact manner in which the signals are to be worked, but in previous cases such as, for instance, those at Picton Lakes and Wingecarribee, entered in the Guards' Order Book on 11th October, such instructions do appear and are signed for by the same guards; it was perfectly understood by the guards that it was their duty to work them.

ALEX. CRAWFORD.

(B.)

FISH RIVER ACCIDENT.

SIGNALS erected at Fish River Tank—160 m. 77 c. south—to be brought into use on Monday, 15th instant.

THE following is a description of the new signals erected for the protection of trains taking water at Fish River Tank, which will be brought into use at noon on Monday, the 15th instant:—

Down distant is a signal 28 feet in height erected on down side of line 846 yards from lever and 946 yards from tank.

Lever working this signal is fixed on up side of line 100 yards from tank.

Up distant is a signal 22 feet in height erected on up side of line 611 yards from lever and 743 yards from tank.

Lever working this signal is fixed on up side of line (at the down end of bridge) 132 yards from tank.

These signals work to "Danger" and "All Clear" only.

Acknowledge receipt at once.

W. V. READ,
Traffic Manager.

Board's decision.

THE Board of Commissioners, having had the Report of the officers appointed to inquire into the cause of the collision which took place at Fish River on the 27th ultimo under consideration, direct as follows:—

1. That Guard Evans be disrated from the position of guard for his manifest neglect of duty.
2. That home as well as distant signals are to be erected, and the latter placed at least 1,000 yards back from the tanks.
3. That signalmen be appointed to attend to these signals. The question of signalmen attending to the pump to be taken into consideration by Traffic Manager and Locomotive Engineer.

D. VERNON, 10/11/88.

Traffic Manager, Engineer Existing Lines, and Locomotive Engineer will please note and return.

[Two plans.]

19.	Amount paid for claims for goods damaged and destroyed	19

RAILWAY ACCIDENT AT PETERSHAM BRIDGE.

No. 1.

Telegram from The Station-master, Sydney, to The Commissioner for Railways.

Down express goods, which left here at 4.40 a.m. to-day, has been wrecked at Petersham viaduct. A steel axle of one of the trucks broke just before reaching the place named and caused about eleven trucks and a carriage of the latter portion of the train to be thrown off the road and over the viaduct. The engine and three or four trucks of the fore part of the train, as well as the two brake-vans at the rear, remained on the road, but the latter and most of the trucks and contents together with the carriage have been burnt by a fire that broke out amongst them shortly afterwards. The timber work of the bridge, too, has been damaged by fire, but not seriously. No one injured. Traffic at present is being conducted over the up road between Ashfield and Petersham, but both roads were blocked for some time.

F.J., 9/8/87.

No. 2.

Report by Driver Matthews.

At 4.40 a.m. I left Sydney with this train, which consisted of seventeen loaded waggons, one composite carriage, and two brake-vans. Nothing unusual occurred until passing over Petersham viaduct at 4.50 a.m., when suddenly I felt a jerk from the train, and upon looking back I noticed fire coming from underneath it.

I was travelling at a speed of about 25 miles an hour at the time. I immediately whistled for the guard to apply his brakes, and also applied the engine-brakes and pulled up. I looked back and saw the train was in flames.

I sent the fireman on to Ashfield as quickly as possible to inform the authorities of the accident that they might block the road.

When I ascertained that the road was safe I went back, when I discovered that the train had parted at the sixth waggon from the engine.

I examined the sixth, which was a "C" van, No. 128, and found that the trailing wheels were missing; also that part of the train had been precipitated over the viaduct and was completely wrecked.

The only way that I can account for this disaster is that an axle of one of the waggons must have broken, and that some combustibles in the train had ignited by the concussion. Fortunately no persons were injured by this accident.

The up and down main lines were blocked two hours and four hours and thirty minutes respectively.

HENRY MATTHEWS.

Assistant Locomotive Engineer.—J.C., 9/9/87. Locomotive Engineer.—G.D., 9/9/87.

No. 3.

The Traffic Manager's Report.

I REGRET to report that an accident of a serious nature occurred to the fast goods train this morning between Lewisham and Summer Hill.

The train, which consisted of six C vans, ten D and one B waggon, one carriage, and two goods brake-vans, left Redfern at time-table time, 4.40 a.m. When passing Lewisham platform the axle under C van, No. 128, appears to have broken close in to the wheel, which was found a few yards away. The couplings, however, appear to have held the train together until it got within a few yards of the viaduct, where there is every indication that the couplings gave way in several portions of the train, for the engine, with the first six vehicles (including the one with the broken axle), passed safely over the bridge, while three vehicles in the middle of the train toppled over the embankment at the Sydney end of the viaduct, and all the remainder of the train fell over the bridge near the southern end.

To add to the severity of the accident the train caught fire, and seven D waggons, one B waggon, and two brake-vans, with their contents, were demolished and consumed. The carriage was also completely destroyed, but strangely enough its only occupant, a man, escaped unhurt, and was seen two or three minutes afterwards clambering up the embankment with his portmanteau in his hand. He went on to Mittagong by the 9.6 a.m. passenger train.

The two D waggons and C van which toppled over the embankment at the Sydney end of the bridge were also pretty well ruined, and their contents to a larger extent destroyed.

The driver and guard and assistant guard heard one or two reports, and it is therefore believed that the fire was caused by the gas in the carriage reservoir exploding; but the whole thing occurred in such a short space of time that it is not possible to say with absolute certainty that that was really the cause of the fire. The explosion may have come from gasoline tins which were in a truck. The guard says that the first sensation he experienced was a severe bumping of the train, which threw him amongst the newspapers; and he had no sooner recovered his feet than another jolt pitched him out of the brake-van upon the bridge.

The assistant guard says that the moment he felt something was wrong he rushed to his hand-brake and put it on.

Fortunately no one sustained any injury.

The trucks which were smashed contained about 52 tons of general goods. Senders have been advised of the loss.

In

In addition to the damage to the rolling stock the woodwork of part of the bridge was a good deal charred and knocked about.

The van with the broken axle contained 6 tons 1 cwt. 2 qr. of sugar; and as all trucks conveyed by the fast goods are subjected to more than ordinarily careful inspection before leaving I cannot see that anyone is to blame, because no one could have seen any indication of the possibility of such a disaster.

W.V.R., 9/9/87.

Memo. to the Assistant Locomotive Engineer *re* accident to the express goods.

DRIVER Henry Matthews states that he left Sydney with the express goods train at 4:40 a.m. to-day (consisting of engine No. 312, 17 loaded trucks, 1 composite carriage, and 2 brake-vans). Nothing unusual occurred until the train arrived at Petersham viaduct at 4:50 a.m. When the engine reached the south end of the viaduct we felt a jerk, and on looking back saw fire flying out from underneath the train. We whistled for the guard and applied the brakes, and on looking back a second time saw that the train had parted, and that the back part was in flames. After stopping, found that six trucks were attached to the engine, and that the last one (C. 128) had only one pair of wheels, the end of the van resting on the rails. The remainder of the train was very much smashed up, some portion having fallen over the viaduct, and all were more or less in flames. The timber top of the viaduct was somewhat damaged by fire. The up line however was cleared for traffic by 7:15, and the down train by 6 a.m. It appears that the axle of a truck broke, possibly that under C. 128, near the Lewisham platform, as there were evident traces on the road at this spot, and the broken wheel was found lying close by; the axle had broken off close to the top of the wheel. The axle is a steel one, "Brunswick brand." From the place where the driver first felt the jerk to the spot where the engine stopped is 230 yards. The distance from where the wheel alluded to was lying to where the other part of the axle was found is 288 yards. The total distance from where the axle is supposed to have broken, to the place where the engine stopped, is 615 yards.

J.C.

Locomotive Engineer.—G.D., 9/9/87. Forwarded for the information of the Commissioner. Mr. Braid's report shewing estimated cost of repairing damaged stock attached.—W. SCOTT, 9/9/87.

Locomotive Engineer's Office, Sydney, 10 September, 1887.

Memo. to the Locomotive Engineer.

HEREWITH please find estimated cost of vehicles damaged at Petersham viaduct on the 9th inst. :—

Estimated cost, £1,600.
 1 Composite carriage, totally destroyed;
 2 Do brake-vans, do.
 1 B truck, do.
 1 C van, do.
 9 D trucks, do.
 1 C van, damaged.

T. BRAID.

Seen.—W. SCOTT, 10/9/87. Commissioner.

Memorandum from The District Engineer to The Engineer for Existing Lines.

Accident to express goods at Petersham, on Friday, the 9th inst.

I HAVE to report for your information that an accident occurred at Petersham viaduct on the 9th instant, at about 5 a.m. It appears that an axle broke between the platforms at Lewisham Station. The train, after running about 200 yards, separated, and the rear portions left the rails, three trucks going down the embankment, and the balance of the disconnected trucks proceeded to the viaduct, when all but three went over the side, and at once took fire, the three trucks on the viaduct also taking fire.

The damage done to the road and viaduct is as follows:—About forty or fifty chains broken, four rails badly bent, and some thirty of the main deck timbers badly charred, and the deck planting for about a quarter of the length of the viaduct destroyed, also the iron hand-rail carried away for about half of the length of the bridge. One of the main piers of the bridge was badly scorched by the fire, and the face of the brickwork burnt off. Although this does not improve the appearance of the pier it does not in any way affect its stability.

I have carefully examined the ironwork of the bridge, but beyond the paint being slightly blistered in places no damage has been done.

W.S., 12/9/87.

No. 4.

Minute by The Commissioner for Railways to The Secretary for Railways.

Inquiry into accident to the express goods train at Petersham viaduct, on the morning of the 9th September, 1887.

THE cause of the accident cannot be questioned; the evidence of the broken axle is clear and decisive on that point, but inquiry is desirable in the public interests in regard to the supervision exercised, the frequent examination of axles to ascertain their soundness, the oiling of boxes, &c.

Inquiry should also be directed into the measures taken by the Department to secure the best axles for our rolling stock.

The report of the Board to be appointed to inquire into this matter should be accompanied by a return showing the number of axles which have broken on our Railways during the last five years, the cause of breakage, the material used, the name of the maker, the number of axles of that particular make in use, and the measures taken by the Department to reduce accidents arising from defective axles to a minimum.

The

The Board should also inquire into the origin of the fire which broke out at the time of the accident and destroyed the goods carried by the train, and a portion of the wood work of the viaduct.

I would suggest, for the consideration of the Minister, that the Board of Inquiry should consist of gentlemen unconnected with the Railway Department, to give assurance to the public that the investigation will be freed from the suspicion of being influenced by *esprit de corps*.

In this respect the inquiry will be on a parallel with those conducted by the Engineer Officers of the Board of Trade, into accidents which occur on English railway lines.
The Minister. CH. A. G.,
10/9/87.

Minute of The Secretary for Public Works.

Ask the Treasurer if Mr. Cruickshank would be permitted to perform this duty.

I should be glad if this were done as soon as possible, and a diagram made of axle showing fracture. J.S., 12/9/87.

Write to U.S. Treasury.—CH. A. G., 12/9/87. Ask Mr. Scott for diagram. Make personal inquiry at Treasury.—CH. A. G., 20/9/87. The Colonial Treasurer has no objection to offer to the appointment of Mr. Cruickshank, but it is necessary to obtain the assent of the Marine Board. This has been asked for, and a reply will be sent to our letter to-day.—D.C. McL., 21/9/87.

No. 5.

The Commissioner for Railways to The Under Secretary for Finance and Trade.

Sir,

Department of Railways, Sydney, 13 September, 1887.

In connection with the recent accident to the express goods train at Petersham viaduct, it is deemed desirable that an independent inquiry should be made; and I am desired by Mr. Secretary Sutherland to ask if the Honorable the Colonial Treasurer has any objection to the appointment of Mr. Cruickshank, of your Department, to undertake this duty.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Sir,

The Treasury, New South Wales, Sydney, 21 September, 1887.

I have the honor to acknowledge your letter of the 13th instant, 87-3,841, and to inform you, in reply, that the Colonial Treasurer has no objection to the appointment of Mr. William Cruickshank as a member of the proposed Board to inquire into the recent accident to the express goods train at Petersham viaduct.

I am to add that as Mr. Cruickshank is very much engaged with his duties under the Marine Board Department, the President (Captain Hixson) requests that the time during which he may be employed in the duty above referred to may be limited as much as possible.

The Commissioner for Railways.

I have, &c.,

G. BAGAR.

Please prepare letter to Mr. Cruickshank (for the signature of the Minister), appointing him to inquire into the cause of the accident, to call for witnesses and papers, and to report the result of his investigation. Instruct all officers concerned.—CH. A. G., 24/9/87. Attended to, 26/9/87.

No. 6.

The Secretary for Public Works to W. Cruickshank, Esq.

Sir,

Department of Railways, 26 September, 1887.

With reference to the accident which happened to the express goods train at Petersham viaduct on the morning of the 9th instant, I have the honor to inform you that it is considered desirable that the cause of this mishap should be inquired into by some one unconnected with the Department; and with the concurrence of the Honorable the Colonial Treasurer, I hereby appoint you to conduct the inquiry and report to me the result of your investigation. You are empowered to call for witnesses and any papers which you may deem necessary; and the officers of the Department have been directed to afford you every assistance.

I have, &c.,

JOHN SUTHERLAND,

Secretary for Public Works.

No. 7.

Report by The Chief Engineer Surveyor, Marine Board, to The Secretary for Public Works.

Sir,

Marine Board Office, Engineer Surveyor's Department,

Sydney, 24 October, 1887.

In accordance with your instructions, I have the honor to submit the following, relating to the accident which happened to the express goods train on the 9th of September, 1887:—

Have carefully and personally examined both officers and men who were likely to give such information as would assist me in coming to some definite conclusion. (Evidence attached.)

All the evidence taken goes to prove—and prove very conclusively—that the primary cause of the accident was the breaking of the axle under No. 128 C van.

This axle (made of Brunswick steel) shows a true flaw, equal in extent to about 25 per cent. of the entire sectional area.

The grain of the steel where the break took place (both ends) is very coarse, and, judging from its appearance, looked more like bad cast-iron than anything else.

It has been running seven years, being branded August, 1880.

Acting

Acting up to the letter of my instructions—that the inquiry was to be conducted entirely outside the Department—and to thoroughly satisfy myself as to the true nature of the material, I took the axle away, and gave Mort's Dock the necessary directions to prepare suitable "test pieces," cut from various parts, and which were all carefully tested by Professor Warren in my presence at the Sydney University. (See tables and particulars of tests attached.)

The results of the tests clearly prove the material to be neither harmonious nor homogeneous—some parts hard, others soft; some extending 5, others 15 per cent., others nil; in fact, everything connected with the experiments clearly shows the material to be unreliable, unworthy of confidence, and certainly unfit for the work intended.

This is prominently seen in comparing the breaking strain of two pieces cut from the same axle, where one broke at 36.5 tons, while the other (they were only separated by 1/8") stood 45.3 tons, representing a difference of over 9 tons in the same bar.

Again, in noting the stretching or extension of the specimens, their behaviour is anything but satisfactory. Two strips were prepared from the "flawed" end of the axle (the piece that was in the wheel boss); one was tested just as it was, the other, annealed and cooled in ashes.

The breaking strain of the first, marked A, was 82,000 lbs., equal to 36.6 tons; the contraction of area, 3.7 per cent.; and the extension in 10 inches, 5.6 per cent. The other, marked A¹, stood 89,000 lbs., equal to 39.7 tons; contraction of area, 19.4 per cent.; extension, 14.5 per cent.

Two similar specimens were taken from opposite end of axle (the piece in wheel boss), one tested as it was, the other annealed in ashes.

The first, marked B, stood a strain of 101,500 lbs., equal to 45.3 tons, the contraction and extension being 8.8 and 9.6 per cent. respectively. The other, marked B¹, went at 100,000 lbs., equal to 44.6 tons; contracted, 11.7 per cent., and extended, 11 per cent.

Four other strips were cut from the body of the axle; two were annealed in ashes and two in water, but all the results obtained are bad, being most irregular and uncertain.

I also tested two strips prepared from a Vickers' steel axle which broke under a D waggon, No. 2,454, at Lapstone, on 10/8/87.

The results obtained in this case show a most decided superiority over the Brunswick steel. The breaking strain was 30.8 and 31.2 tons respectively; the contraction of area in both cases, 49.6 per cent., and the extension, 25.5 and 21.2 per cent.

As regards suitability, this test is almost perfect, the behaviour of the material being precisely the same as what is expected and insisted upon by the Board of Trade, Lloyds, and the Marine Board, in all steel plates intended for the manufacture of high-pressure boilers.

It appears that Sir John Fowler's limit of tensional strength for steel axles is from 27 to 30 tons per square inch; anything over that would, or at all events, should, be rejected, being far too hard and brittle for the work. How it comes that the Brunswick axle went up to 45 tons is not easily explained. Of course this may be an exceptional case, but it may not, and I think the chances are they will be found far too hard to be trusted.

Again the design of this axle is very faulty, so is "Taylor's," both having a square cut shoulder close to the wheel boss. Why this is so nobody seems to be able to explain, but everybody agrees it is a bad thing, and the principal cause of all the trouble.

There is no necessity or advantage in making an axle this way—on the contrary it simply amounts, in my opinion, to a premium to make it break, as it is in very much the same condition as a bar of iron which a blacksmith nicks on his anvil before he attempts to break it.

On the Home and Continental lines axles made in this fashion receive due consideration; they are not allowed to carry the same weight as others of superior design, although of the same material and dimensions; and on the German and other lines a very considerable reduction in the weight carried is made, viz., 25 per cent. for iron, and 33 per cent. for steel. This shows that steel, when shouldered, is more treacherous than iron—a lesson they have no doubt learnt from experience.

According to evidence the number of axles of the Brunswick brand now in use is 395, and I certainly think it highly desirable that although it is just possible this particular axle may be the only bad one amongst the lot, still there is every reason for testing some of the others—the results of which may or may not justify condemnation.

The measures taken by the Locomotive Engineer to remedy and rectify the faults in constructive design are at once sensible and commendable; they have been materially increased in size, have no shoulders at all, no keys or key-ways, and from a personal practical examination of the axles recently fitted they are entitled to all confidence, provided they are made of the best and most reliable material.

There are 16,000 axles in the service, and twenty-three have broken (when running) during the last five years. The cause of breakage is as follows:—17 by flaws, 4 by collisions, and 2 through the breaking of other axles.

As to the material, 19 were made by Taylor (of iron), 2 of Vickers' steel, 1 of Brunswick steel, and 1 by Cooper & Co., of Leeds.

From the above it appears the average breakage in five years is about 1 in 700; and as 19 out of the 23 were "flawed," it is very clear that if soundness of material were possible, a broken axle would be a novelty, or at all events the danger of such would be reduced to the lowest possible minimum.

Respecting the most suitable material, the evidence is exceptionally strong and quite unanimous as to the superiority of Vickers' steel. This is specially so from the men who work it, both at the forge and lathe. They describe it as being by far the best and most reliable steel—a material in which they have the most perfect confidence, and which they all recommend should be used, even if the Department have to pay a higher price for it. This opinion is the outcome of a large experience, and is certainly entitled to due consideration, besides being fully borne out by the tests.

In answer to inquiries as to what means were adopted to ascertain the work done or the mileage run by any axle, I find there is none; and the opinion is general that it is scarcely possible to do it. This may be so, and no doubt would entail some difficulty and trouble; but it is very necessary, and if attention were specially directed to it some feasible plan might be proposed by those who are thoroughly conversant with this particular branch, as I understand the mileage run by the "goods" is checked on the European lines.

The system of "numbering," which has only been introduced since April, 1886, gives the officers a good idea of the what, when, and where of the repairs done, but it does not go far enough, and can give no definite idea of the actual work done by any axle or wheel.

Respecting

Respecting the instructions given to the various officers as to the examination of axles, &c., the evidence is very satisfactory; every possible care seems to be taken to prevent any defective material being used, and none of those examined had any suggestions to offer which in their opinion would have any tendency to improve the method of inspection.

I note, however, that as regards annealing, the instructions given are confined to iron axles only (Taylor's); this, in my opinion, is a mistake—it is quite as necessary—in fact, more so—to anneal the steel axles, and it is very desirable that some practical experiments should be made to determine two things:—1. The best method of annealing. 2. The effect of annealing on the steel.

I would mention that in working steel plates for general purposes, and especially boiler work, annealing is one of the principal items, about which we are very particular, and which in all cases (when carefully and properly done) has a most beneficial effect in restoring the original ductility of the material, which is always disturbed and injured by punching, flanging, or continuous working.

Returning now to the express goods train, I find it commenced to run in May of the present year. Its speed is practically the same as the mail, and its average weight about double; the approximate weights are 100 tons and 200 tons respectively. At first it consisted of twenty-five vehicles, but it could not keep time, and the number was reduced to twenty. The brake-power, at first, consisted of engine and tender fitted with air-brake, also one brake-van with hand-brake, just the same as the ordinary goods, running about half the speed, and it was left to the engine-driver and guard to find out that the brake power was insufficient, as in their evidence they distinctly state “that when the signals were against them they were unable to control the train.”

In answer to my inquiry “if there was any rule or regulation in the Department for getting out the brake-power in proportion to the speed and weight of any train?” I received the following:—“The brake-power of any vehicle must not exceed the weight of itself when empty.” This is not a satisfactory reply, as there is no mention made of the weight or speed, nor the slightest reference to the road being level or having steep grades, &c.

Again, to the question, “Who is the officer that determines the amount of brake-power that has to be put on any particular train?” The answer was, “*It is the duty of the station-master, and, of course, of engine-drivers and guards, to point out if they should consider the brake-power insufficient.*” (The Italics are mine.)

It is scarcely credible that the determining of the brake-power in any train, and especially in this, should be left to the consideration of the engine-driver and guard, and yet the evidence is very conclusive on that point.

On the morning of the accident, the weight of the train was 192 tons, exclusive of engine and tender. The weight of the mail train on the same date was 100 tons, so that here is a train nearly double the weight of the mail, running at the same speed, and its insufficiency of brake-power is only found out after the engine-driver and guard report “they can't control the train.”

I must respectively submit that this system (if it can be called so) is simply dangerous, and certainly not conducive to public confidence, for it is not only possible but very probable that in exceptional cases like this, the insufficiency of brake-power would only be discovered after a serious accident.

It is therefore highly desirable that some engineer possessing the necessary theoretical and practical knowledge—one who is thoroughly acquainted with the New South Wales lines—should be instructed to prepare suitable tables for the standard regulation of the brake-power, in which the weight, speed, and road would be duly considered. This would be a guide for all station-masters and guards, and would certainly commend itself as being immeasurably superior to the present method.

Regarding the amount of damage done to the train on the 9th September, the evidence is most conclusive that if it had been fitted with an automatic brake, the injury sustained would, in all probability, have been confined to the broken axle, and also that when the train parted the brakes would have gone on and prevented the trucks from going over the embankment and bridge.

In this I concur—also in the opinion expressed by all capable of judging—that this train should be fitted with a continuous automatic brake at once.

In connection with the accident, I made a careful examination of the Petersham Bridge. The main structure has sustained no injury whatever, all the damage being confined to the charring of sleepers, decking, hand-rails, &c., which have been efficiently repaired.

Respecting the fire, all the evidence taken is mere assumption and conjecture, its true origin will, so far as I can judge, always remain unexplained.

In conclusion I beg to acknowledge with thanks the kindness and courtesy of the officers who assisted me in every possible way to obtain the necessary information.

I have, &c.,

WM. CRUICKSHANK, M.I.M.E.,

Chief Engineer Surveyor to Marine Board.

EXPLANATION of Test Tables.

Nos. 1 and 2.—Cut from a Vickers' steel axle, which broke under a D waggon, No. 2,454, at Lapstone, 10/8/87. Branded July, 1880.

A.—Cut from “flawed” end of axle which broke at Petersham, 9/9/87; tested as it was. Brunswick steel. Branded, August, 1880.

A¹.—Cut from “flawed” end of same axle, but annealed in ashes.

B.—Cut from opposite end of same axle, but tested as it was.

B¹.—Cut from opposite end of same axle, but annealed in ashes.

C.—Cut from body of same axle (flawed end), and annealed in ashes.

C¹.—Cut from body of same axle (flawed end), but annealed in water of 80° Fahr.

D.—Cut from body of same axle (opposite end), and annealed in ashes.

D¹.—Cut from body of axle (opposite end), but annealed in water of 80° Fahr.

Vickers' specimens, 8-inch centres; all the others were 10-inch centres.

University

UNIVERSITY OF SYDNEY.
SPECIMEN of Steel tested for Mr. Cruickshank.
Tested October 12th, 1887.

Test number.	Description.	Original dimensions.			Strain in pounds.		Strain in tons.	Contracted dimensions.			Contraction of area per cent.	Elongation per cent.	Remarks
		Breadth	Thick-ness.	Area.	Total.	Per sq. in.		Breadth	Thick-ness.	Area.			
2	Cut from broken axle ..	1.00	1.00	1.00	69000	69000	30.8	.71	.71	.504	49.6	25.5	Limit of elasticity = 36,000 total.
		1.00	1.00	1.00	70000	70000	31.2	.71	.71	.504	49.6	21.2	, = 36,000 ,
A	Cut from the axle which broke on the Petersham viaduct.	2.00	.50	1.00	82000	82000	36.6	1.99	.484	.963	3.7	5.6	, = 43,000 ,
A ¹		2.00	.50	1.00	89000	89000	39.7	1.80	.448	.806	19.4	14.5	, = 37,000 ,
B		2.00	.50	1.00	101500	101500	45.3	1.90	.480	.912	8.8	9.6	, = 36,000 ,
B ¹		2.00	.50	1.00	100000	100000	44.6	1.88	.470	.883	11.7	11.0	, = 34,000 ,

NOTE.—Specimens A¹ and B¹ were annealed in ashes.

Tested October 18th, 1887.

C ¹	Cut from the axle which broke on the Petersham viaduct.	1.50	.50	.752	64000	85108	37.9	1.34	.446	.597	20.6	15	Limit of elasticity = 35,000 total.
		1.505	.50	.752	30000	40000	17.8	Immeasurable.					
D ¹	Cut from the axle which broke on the Petersham viaduct.	1.510	.50	.755	67000	88741	39.6						, = 34,000 ,
D		1.505	.50	.752	66500	88430	39.4	1.335	.442	.590	21.5	15	, = 34,000 ,

NOTE.—1. C and D were annealed in ashes; specimens C¹ and D¹ were annealed in hot water.

2. The total elongation measured on 10 inches in specimen D¹ was not more than $\frac{1}{8}$ inch.

3. The loads recorded for specimen C¹ are in excess, as the steel-yard was not quite raised when the specimen fractured.

W. H. WARREN, Wh. Sc., M.I.C.E.,
Professor of Engineering,
University of Sydney.

Evidence of Mr. W. V. Read, Traffic Manager:—

The average weight of the express goods train? The average weight of the express goods train between Sydney and Picton, exclusive of engine and tender, is about 180 tons. The actual weight on the day of the accident was 192 tons.

The average weight of the passenger mail train running over the same ground? The weight of the mail train in the same section is about 100 tons.

The average speed of both? The speed of the goods is about 26 $\frac{1}{2}$, and the mail 27 $\frac{3}{4}$ miles an hour.

The brake-power fitted to both? Apart from the engine and tender, in each case, there are two brake-vans (one of them loaded) on the goods, while on the mail every vehicle is braked.

A list of the combustibles which were likely to explode, or by concussion cause a fire? There was a large quantity of spirits, and some gasoline, kerosene, and six tin-lined cases of vestas, and some dynamite, but there is every reason to believe that the fire was not caused either by the matches, gasoline, or dynamite. Your opinion as to whether it is desirable or necessary to have such a train fitted with an automatic and continuous brake? I am decidedly of opinion that such a train as the express goods should be fitted with a continuous and automatic brake.

Your opinion if this particular train had been so fitted would the damage done be confined to the breaking of the axle, or do you think it would have prevented the trucks from going over the bridge? I can hardly say that the damage would have been solely confined to the breakage of the axle if there had been a continuous and automatic brake throughout the train, but I quite believe it would have prevented a number, at all events, of the trucks from falling over the bridge.

Any information you may have that would tend to assist me in forming an opinion as to the origin of the fire? It is impossible to say whether the fire was caused by the combustible material which was in the trucks, or whether it was due to an explosion of gas in the carriage which was on the train.

Who is the officer that determines the amount of brake-power that has to be put on any particular train. Has it been found necessary to increase the brake-power in this express goods train since it commenced to run? It is the duty of the station-master, and of course of engine-drivers and guards, to point out if they should consider the brake-power insufficient. The train ran for some time with one brake-van only, the same as other trains, but it was pointed out to me that the brake-power was insufficient, and I therefore gave directions for another brake-van to be attached.

Evidence of Mr. Scott, Loco. Engineer:—

The number of axles which have broken on our railways during the last five years? During the last five years twenty-three axles have broken whilst in service.

The cause of breakage? Seventeen by flaws, four by collision, two by the breaking of other axles.

The material of which they were constructed? Two steel (Vickers & Sons), nineteen Taylor Bros., one Patent Shaft and Axletree Company, and one Cooper & Co., Leeds.

The age and number of axles now in use by same maker as the one that broke? We have in use 395 axles by the same makers (Patent Shaft and Axletree Company) as the one that broke. Until about three years ago no record was kept of the service of axles.

The measures taken by the Department to reduce accidents arising from defective axles to a minimum?

With regard to the measures taken by the Department to reduce to a minimum accidents arising from defective axles, I have to state that instructions have been issued to all carriage and waggon examiners and lifters that they are held responsible for the "tapping" and proper examination of all wheels, tires, axles,

axles, axle-boxes, springs, couplings, &c., and that no vehicle is to be allowed to run unless it be in a perfectly safe condition. Instructions have also been issued to the foreman blacksmith and foreman turner, that when wheels with iron axles are taken in for the purpose of having their tires or journals turned up, they must be thoroughly examined, and if the journals are found to be worn $\frac{1}{8}$ " below the original size, or any flaw detected in the axle, it must be replaced by a new one. Iron axles when taken out must be annealed before being put in the wheels again. All axles dated 1870, and prior to that year, to be stopped, the wheels pressed off, and the axles thoroughly examined and annealed before being pressed on the wheels again; any that may be found to have the slightest defect to be replaced by new ones. In April, 1886, instructions were issued that all axles were to be marked with a distinguishing number, since which time about 3,000 have been so numbered, and a careful record kept of their service. All keys were dispensed with in wheels and axles ordered during and since 1880, and the wheels have been pressed on by hydraulic power, no shoulder being allowed on the axles at the boss. Two of these have broken—one in consequence of a flaw in the centre, and the other in the journal. In ordering wheels and axles during and since 1883 provision has been made for increasing by $\frac{1}{4}$ in. the diameter in the wheel-seat and journal respectively, and by $\frac{1}{4}$ in. in the centre of the axle. Up to date none of these have broken.

The total number of axles in the service, and the means adopted (if any) of ascertaining the amount of work they do, and the mileage run—how often you lift and examine them? We have about 16,000 axles in service, and a record is now kept of when they were placed under vehicles, &c. The axles are not allowed to run for a longer period than two years before they are lifted and thoroughly examined.

The speed of this particular train as compared with the mail, its average weight and its brake-power? The average speed of the express goods train is 24.6 miles per hour, and that of the mail train 25.6. Average weight of express goods is, including engine and tender (say) 250 tons; its brake power amounts to 80 tons, in addition to which hand-brakes are fitted to each truck, which can be utilized if necessary.

Do you consider it is a desirable thing, or is it safe, to run this express heavy goods train (say) at 40 miles per hour without being fitted with an automatic brake? I do not consider it desirable to run heavy goods trains at excessive speed without the assistance of an automatic brake.

From your knowledge of all the circumstances in connection with this mishap, do you think it would have been prevented if it had been fitted with the vacuum or Westinghouse brakes? I am not of opinion that the accident would have been prevented had the train been fitted with the vacuum or Westinghouse brakes, but think that the subsequent results might have been minimised had either been available.

As it is considered desirable to have the broken axle tested in various ways, will you kindly forward same to Mort's dock (the middle part and the two ends), as I prefer conducting the tests myself? I have forwarded the broken axles to Mort's Dock and Engineering Company, as requested.

Are you quite satisfied it was the breaking of the axle that was the primary cause of the accident, or do you think it possible or probable of its being due to an explosion first, the breaking of the axle following as a natural consequence? In my opinion the primary cause of the accident was due to the breakage of the axle.

Any other information you may have which would tend to assist me in this inquiry? I am not in possession of any fresh information.

What is the age of the axle that broke? The age of the broken axle is seven years, being brandèd August, 1880. [Photograph herewith].

Who is the officer that determines the necessary amount of brake power in any train? The requisite brake-power in any train is decided by the Traffic branch.

Is there any rule or regulation in the Department for getting out the brake-power, in proportion to the speed and weight of the train? Rule for brake-power is, that the brake-power of every vehicle must not exceed the weight of itself empty.

What is, in your opinion, the safe load that could be put on each wheel of any goods truck? The safe load that could be put on each wheel of any goods truck is as follows:—Iron axles, with $3\frac{1}{2}$ " journals and $4\frac{1}{2}$ " diameter in nave, can have $2\frac{1}{2}$ tons gross weight per wheel; steel axles, with 4" journals and 5" diameter in nave, can have 4 tons gross weight per wheel. [See also lists attached.]

Have you any regulation limiting the weight on each wheel? Regulations limiting weight on each wheel, weight of a waggon, and carrying capacity, are printed on its side.

What is the standard practice in the old country, and in other Colonies, respecting the weight allowed on each wheel of a goods truck? The accompanying list shows the standard Continental practice on both State and private railways, and is made obligatory for all new rolling stock. The weights and dimensions are similar in English practice.

AXLES with journal centres not exceeding 6 ft. 6 in. must have the following dimensions at journal, and in the nave carry the undermentioned maximum gross loads per axle.

Minimum diameter of journal.		Minimum diameter in the nave.		Maximum.		Gross Loads.		Remark
				For Goods Stock and Tenders.		For Passenger Stock.		
mm.	inches.	mm.	inches.	Steel axles.	Iron axles.	Steel axles.	Iron axles.	
62	$2\frac{1}{2}$	100	4	4.3	3.6	3.44	2.88	Standard Continental practice on both State railways and private railways. The axles to be of best material of their respective kinds, and of proper design, otherwise the loads must be decreased.
66	$2\frac{3}{8}$	105	$4\frac{1}{8}$	5.0	4.2	4.00	3.36	
70	$2\frac{7}{16}$	110	$4\frac{7}{16}$	5.8	4.84	4.64	3.87	
74	3	115	$4\frac{3}{4}$	6.6	5.5	5.28	4.4	
78	$3\frac{1}{8}$	120	$4\frac{3}{4}$	7.5	6.25	6.00	5.00	
82	$3\frac{1}{4}$	125	5	8.5	7.1	6.8	5.68	
86	$3\frac{3}{8}$	130	$5\frac{1}{8}\frac{1}{16}$	9.6	8.0	7.68	6.4	
90	$3\frac{1}{2}$	135	$5\frac{3}{8}$	10.7	8.9	8.56	7.12	
94	$3\frac{5}{8}$	140	$5\frac{1}{2}$	12.0	10.0	9.6	8.00	
98	$3\frac{3}{4}$	145	$5\frac{3}{4}$	13.2	11.0	10.56	8.8	

Evidence of Mr. Shellshear, District Engineer:—

Your opinion on the primary cause of the accident? I am of opinion that the primary cause of the accident was the breaking of an axle, which threw the rear trucks off the rails.

Any information you may have relating to the origin of the fire? I can give no information on this point beyond the fact that there was a large amount of combustible matter in the train, which was probably ignited either by the concussion or perhaps from direct contact with the train lamps.

The difference in speed between this particular train, the mail, and an ordinary goods train? This train is timed to run at practically the same speed as the mail train, and about twice the speed of an ordinary goods train?

What, in your opinion, is a safe load on the wheel of a goods truck running (say) at 30 miles per hour? This depends very much on the design of wheel and axle, and would vary from 5 to 10 tons per axle, according to design.

In standard practice what is the maximum load allowed on each wheel? I am not aware of any standard practice limiting the maximum load, except in the case of locomotive axles, the greatest weight on which should not exceed 15 tons, with our weight of permanent way. For other stock this limit is only approached in special cases, but for ordinary waggon axles the limit ranges between 5 and 8 tons, as a general rule.

What is the standard weight in other Colonies and Countries? The average weight in England on waggon stock is about 7 tons on an axle, but it varies from about 5 tons a minimum to 8 tons for a maximum in the case of loaded trucks.

Do you think it safe to run this express goods train without a continuous automatic brake? I do not consider it safe to run any train at the speed the express mixed train is timed to run, unless it is fitted with a continuous automatic brake, the same as our other passenger trains.

Had the train been so fitted would the damage have been confined to the broken axle, and would the brake have prevented the trucks from going over the embankment? I am of opinion that if the train had been fitted with the automatic brake, the same as other passenger trains, the damage done by the broken axle would have been greatly reduced, and that the train would have been pulled up before the trucks reached the bridge, and that they would probably not have gone over the embankment.

Who is the officer who determines the amount of brake-power required for any train? I presume this matter rests with the Traffic Manager and Locomotive Engineer.

Is there any recognized rule or regulation by which the brake-power is in proportion to the weight and speed of train? I am not aware of any such rule in the Department.

Can you suggest anything having a tendency to increase the safety of this train? The safety of this train would be greatly increased if it were fitted with the continuous automatic brake, the same as the other passenger trains.

Evidence of Mr. Pratt, Foreman of Turning Shop:—

Had many years experience in the examination and repairing of axles and wheels.

Has strict instructions from Mr. Scott to exercise the greatest care and caution when inspecting them, and if the slightest doubt exists as to their suitability or safety, to reject them.

Has no reliable means of knowing what amount of work or mileage any axle has done.

Since the 1st of April, 1886, a system of numbering has been established by means of which they could tell how, when, and where any axle or wheel was repaired. The number of axles and wheels numbered up to date is not more than 3,000 to 4,000—about 25 per cent. of the entire stock. This was done at Mr. Scott's suggestion, and thinks it a very sensible and necessary thing to do.

The original finished size of the axle journals is $3\frac{1}{4}$ inches. Have instructions when they are worn down to $3\frac{1}{8}$ inches to discard them.

The wear which takes place in the axles is almost always due to the "heating" of the journals, and but for that the axles run for years and give no trouble.

Cause of heating due principally to want of lubrication, dirt, &c.

Axles made and supplied by different makers used in the Department are—

Vickers'—Of steel.	Cooper's—Steel.
Taylor's—Double fagoted, all iron.	Brunswick steel—(the one that broke).
Brown, Bailey, & Dixson—Steel.	

Have no hesitation in stating that Vickers' steel axles are the best suited for the work. Have more confidence in them than any other.

Many of the axles—Taylor's and the Brunswick—have a square shoulder cut in close to wheel boss; thinks it a bad plan, and has had instructions during the last four or five years to turn and round the shoulders off. They stand much better since. These instructions apply to iron axles only (Taylor's).

No orders to turn the shoulders off steel axles, but thinks it would be a decided improvement if all the axles were served in the same way.

Does not think cutting key-ways in axles hurts them much; never saw any break through the key-way; but the most recent axles are forced on by hydraulic pressure, and have no keys or shoulders; they seldom or never come loose.

Considers the present method of examination the best possible, and can suggest no improvement.

Note.—Asked Mr. Pratt to make out a written statement, giving a practical description of his examination.

Memorandum to W. Cruickshank, Esq., Engineer.

Sir,

Eveleigh Station, 6 October, 1887.

I beg to report to you as per request *re* instructions given me by the Loco. Engineer as regards wheels and axles under my immediate supervision; the instructions are as follows:—

To examine every wheel and axle now running on our lines as they come through the turning-shop for repairs, &c. If found to be worn small, or cut below the size stated to run, to have them taken out and replaced with new axles, and not to allow any doubt to exist whatever.

The stated size to run waggon wheels, $7\frac{1}{2}$ journals, is $3\frac{3}{8}$ " and no less.

Carriage axles, 8 in. journals, $2\frac{7}{8}$ " and no less.

Further

Further examinations are as follows :—

When bent axles come in (iron do) we take them out, and if not bent badly we anneal them, put them through the furnace until dark hot, afterwards place them in ashes and let them remain until cool ; after they are cold they go to the lathe, and are strung up and sounded ; if the sound is good we turn back the shoulders and leave a good fillet, so that in the future we can more easily detect any flaw there may be in the shoulders or elsewhere.

The axles are thoroughly examined as regards the fillet of the same after they come out of the furnace.

I might state there are no new axles put in with square shoulders ; all axles are left with long round fillets.

I may further state that all axles and wheels from April 1st, 1886, up to the present, have been numbered, and will continue to be so until the whole are numbered—some 15,000 pairs up to date running.

I may also remark that I am very particular in examining all wheels and axles, as I consider the wheels and axles are one of the most important items on a railway.

WM. PRATT.

Evidence of Mr. Braid, Carriage Superintendent.

Had considerable experience in the examination of rolling stock ; pays particular attention to axles and wheels, and in all cases, if there is the slightest sign or indication of a flaw or defect, they are invariably condemned.

Does not know who the officer is who determines the amount of brake-power for this or any other train. Is decidedly of opinion this train should be fitted with a continuous brake ; thinks it is scarcely safe to run at the speed without it.

Of opinion that the damage done would in all probability have been confined to the broken axle, and is almost sure the trucks would not have gone over the bridge, if an automatic brake had been fitted.

Believes the desirability of having this train fitted with a continuous brake has been represented to the Minister.

Can suggest no improvement in the *method* of inspection ; only as the work is increasing two more men are required, as the present staff have rather too much to do.

In two and a quarter years four (4) axles have broken ; one of Vickers' broke in the journal, the other three close to wheel boss—don't remember the brands.

Thinks the square shoulder is very bad ; it practically nicks the axle ; present, that is recent, axles, are made much stronger, and are put on by hydraulic pressure, without keys or shoulders.

Considers this a great improvement ; have had no broken axles since this system was adopted.

Has no doubt it was the axle which broke first ; nothing to lead anyone to assume or believe an explosion took place first.

There was a considerable amount of combustible goods in the train.

Evidence of Mr. Lennox, Foreman Blacksmith :—

Had a large and varied experience in the handling, repairing, and annealing of axles (14 years).

The annealing is done by heating them in a slow furnace to a dark red, covering them with ashes, and allowing them to cool.

Has no other guide but the eye in heating them ; believes this annealing restores the original structure of the material.

With continuous hard running and vibrations the axles become crystallized in places only—some parts are hard and brittle, other parts remain soft and ductile ; but when properly annealed, the harmony of the particles is brought back to its original form.

Thinks the plan of annealing the best known. Did not know the method adopted by the Board of Trade and Lloyd's was to heat the steel cherry-red and cool it out in water, whose temperature was 80° Fah.

Vickers' steel is by far the best supplied to the Department, and is best suited for our work. The most reliable material he has ever worked ; you can depend on it.

Would always have Vickers' steel, even if he paid more money ; it would be the cheapest in the end.

Large percentage of broken axles always go close to wheel-boss ; the square sharp shoulder nicks the axle in a somewhat similar fashion to what a smith does when he nicks an iron bar to break it.

Thinks that all axles after doing a certain amount of work should be taken out and annealed, but can suggest no plan by which the mileage run could be ascertained.

Could never rely on Cammell's steel ; has little confidence in the material—not only axles, the spring steel is bad ; has often found it so.

Of opinion the system carried out by the Department is the best possible for ensuring the soundness and safety of the rolling-stock, especially as regards axles and wheels.

Could think of nothing that would be likely to improve it.

Considers the material (Brunswick steel) of which the broken axle is made, is very much inferior to Vickers'.

Has strict instructions to reject all doubtful axles ; if they show the slightest defect they are condemned.

Evidence of Henry Matthews, driver of train :—

Been ten years in the service ; four years driving ; and has driven this train ever since it started, which was in May, 1887.

At first took twenty-five trucks, but found it too much ; reduced to twenty, because they could not keep time ; engine couldn't do it.

Average speed about 30 miles per hour—sometimes goes quicker than that when we require to make up time.

This train runs at the same speed as the mail ; it is much heavier.

The brake-power was insufficient at first ; had air-brake on engine and tender (Westinghouse) ; American engines only have air-brakes on engines ; found this with one brake-van ; could not control the train ; but, on reporting same, another brake-van was put on at once—in fact anything for this particular train is attended to at once.

When driving other goods train the speed ranges from 18 to 20 miles per hour ; this express goods goes 50 per cent. faster.

Difference between the brake-power of this and the mail train : Mail would have air-brake connected to every carriage, also tender and engine, whereas this train has only air-brake on engine and tender, and the hand-brakes on the two brake-vans.

When the train first ran, found, when the signals were against me, the power was insufficient to stop the train : hence my application for additional brake-power.

Was

Was pretty certain it was the axle that broke first; there is no evidence which would justify anyone assuming that an explosion took place first, the axle breaking afterwards. Think the fire was caused by concussion, but there can be no certainty about its origin. Was of opinion that if this train had been fitted with an automatic brake the damage done would have been comparatively small, and in all probability the cars would not have gone over the bridge.

Evidence of Charles Dunn, guard of the train:—

Has had considerable experience as guard; often watches the men examining the train before it starts; they do their work carefully and well.
 Examiner Selby is very attentive and painstaking in his inspection.
 Tools used in examination; trusts to his eye principally; makes good use of his hammer, lamp, &c.
 Was in the brake-van when the accident happened—it was lighted up with gas; the brake-vans are generally charged afresh before starting; don't know the pressure in gasholders when charged.
 This train runs as fast as the mail; fastest speed from 35 to 40 miles per hour; average about 30 miles per hour.
 Quite satisfied the accident was caused by the axle breaking, and that the fire took place afterwards; quite sure the explosion took place afterwards.
 Only one axle broke in the train; never heard of any more than one breaking.
 Of opinion that nobody can say with any certainty what caused the fire.
 Had no difficulty in breaking the train in ordinary running, but when signals were against us the brake-power was not sufficient to control the train.
 When application was made for extra brake-power it was granted at once.
 Of opinion that this train should be fitted with a continuous air-brake (automatic).
 If this train had been so fitted the damage done would not have been so great, and think it would have prevented the cars and trucks from going over the bridge.
 Twenty cars are as much as the engines can pull to keep time; took twenty-five at first, but had to discard five.
 This train takes twenty trucks to Picton, then sixteen to Mittagong (with two engines), then sixteen through to Albury with one engine.
 Difference between the speed of this and other goods trains? This travels about 30 miles, the ordinary goods about 20 miles per hour.
 This is the only axle that has broken in any train that he had been on.
 The officers take every care and precaution in making up this train.
 Who determines the amount of brake-power in any train? Does not know.

Evidence of Mr. Harper, Goods Superintendent:—

Has had 17 years experience at this work; has the entire supervision of all the loading.
 The weight of each truck is distinctly marked on it, also the maximum load it is allowed to carry.
 About 90 per cent. are marked, the other 10 per cent. are not; but any truck is quite safe with a load of 6 tons, whether marked or not.
 Knows nothing of what axles may be under any particular truck.
 The Loco. Engineer determines the weight to be carried.
 No truck is marked to carry less than 6 tons or more than 8 tons (with four wheels).
 Double trucks, with six and eight wheels, carry from 10 to 18 tons.
 The system of weighing goods, is by making every thing pass over the weigh-bridge, when the correct weight is taken; the weight of the cart or trolley being always deducted afterwards.
 Have special instructions to always distribute the weight as equally as possible; every allowance is made for overhanging weight, the object being that no matter how any truck may be loaded, the maximum shall not exceed the direct load marked on the truck.
 The C van, No. 128 (under which the axle broke) was loaded with sugar (all 70 lb. bags) and weighed about 6 tons; the sugar was uniformly distributed, and there was practically the same weight on each wheel.
 Of opinion the trucks would carry more weight with safety; the tendency of the Department is to under-load, but when loaded by the owners of the goods, the tendency is sometimes the other way, but strict orders are always given to prevent that.
 Can give no information as to the origin of the fire.

Evidence of Mr. Baker, Examiner in Waggon and Goods Department:—

Been 16 years at this work. Has had considerable experience in examining goods rolling stock, and pays considerable attention to the axles and wheels.
 Has all to do with the making up of the goods trains; made up the one in question.
 Has particular and special instructions regarding this train; all the trucks, cars, brake-vans, &c., are always of the best, and no car or truck is put in that train but what has been examined and lifted within a period of two years.
 This is done because of the great speed, weight, sharpness of curves, and length of journey, which this express goods train has to contend with.
 Axles with square shoulders are bad; they almost always break short off by them, close to wheel boss; they are the cause of all the trouble.
 Axles seldom or never break in the journals; they sometimes get hot and cut, when they are condemned; cause of heating is the want of oil principally; takes place more in the country than about Sydney.
 A special examination consists in selecting the very best and most reliable of the rolling stock for this train; anything that is in doubtful order is never put in it.
 The system of lifting has been in force since 1884; before that no record was kept of when or where the examination and repairs were carried out; had nothing to guide us previous to that date, only experience.
 Do not think the method of examination could be improved; could not suggest anything. Have to trust to the eye to detect any flaw, also the sound of the hammer to detect loose wheels, &c.
 No man could have seen the flaw in the axle that broke; it was not possible to tell by sounding whether any axle was sound or not.
 Vickers' steel axles are by far the best; they never break; they are the most reliable.

Evidence

Evidence of Mr. Staunton, Carriage-lifter:—

Been many years at it (27 years).

In lifting, examines axles, wheels, &c.; has instructions to be very particular; any defects or flaws are always duly marked and sent into turning shop.

All axles that have been examined and found all right, are painted in journals. This indicates they have been inspected, are sound, and fit to go to work; they are also numbered and a record kept for reference. Heated journals often caused by mischief—boys and evil-disposed persons; also by neglecting to oil the boxes; dirt, &c. If the axle-boxes are properly attended to they will give no trouble.

Has recently received instructions that all axles made previous to 1870 are not to be used.

Some of the axles now in use have been running over twenty years; believes there are some dating back to 1860. The first axles sent out was in 1855—they were of iron, and made hollow, having a $1\frac{1}{2}$ in. hole through them, made by Wright, of Birmingham.

Is of opinion that, considering the total number of axles now in use, the number that break is very small. Vickers' steel axles never break; have no doubt they are by far the best.

Brunswick steel axles are not reliable; some parts are hard, some soft. Think the square shoulder has a good deal to do with the breaking.

Don't think the mode of examination could be improved.

Consider that every possible care and precaution is taken.

Whenever the slightest defect shows in either axles or wheels they are rejected; the order to do so came from Mr. Braid.

Evidence of Charles Selby, Examiner of Night Trains:—

Examined the train in question; always inspect this train; his principal duty.

His examination takes place after the train is made up.

Has instructions to pay particular attention to all the gear about this train.

All the best rolling-stock is always picked out to make it up.

Being subjected to special inspection is owing to its weight and the great speed it runs at.

When examining the train on the 9th September, went all round and under it; could see nothing wrong.

No man could detect the flaw in the axle—it could not be seen.

Considers the method of examination as good and as complete as can be made; does not think it could be improved.

No. 8.

Minute by The Commissioner for Railways.

RESPECTING Mr. Cruickshank's report on the causes which led to the Petersham accident on 9/9/87, and his condemnation of the Brunswick steel axles, these axles must be removed.

Instead of removing them at once, would it not do to lighten the loads of trucks so axled by 25% till the traffic slackens sufficiently to admit of the axles being removed altogether?

CH.A.G., 2/11/87.

Instructions have been given for ten axles to be tested, and unless the test demonstrates exceptional and imminent danger, the loading of the trucks with these axles must be reduced by 25% (from 6 tons to $4\frac{1}{2}$ tons).—J.S.

No. 9.

Issue of Writ, &c.

6/12/87.

MESSRS. CHRISTOPHER NEWTON & Co. issued a Supreme Court Writ to recover £250 for goods damaged in the accident at Petersham viaduct.

No. 10.

The Secretary of Railways to Messrs R. Chalmers and Others.

Gentlemen,—

Department of Railways, Sydney, 7 December, 1887.

With reference to your claim for goods consigned to J. Kennedy, Jerilderie, and destroyed by accident to the express goods train at Petersham, on 9th September last, I am desired by the Commissioner for Railways to explain that the refusal to recognise liability is based on the ground that the Government are not insurers of goods entrusted to them for transit, but where negligence can be established they are liable for loss or damage. In this case liability is denied, as the accident was due to a cause exhibiting no carelessness or neglect on the part of the Railway Department.

I have, &c.,

A. RICHARDSON,

(*pro* Secretary of Railways).

Sir,

Department of Railways, Sydney, 6 January, 1888.

Referring to your letter of the 18th ultimo, in which you intimate that a consignment to you by Campbell Bros., Sydney, was destroyed in the railway accident at the Petersham viaduct, and that you have been called upon to pay for the goods, on account of this Department having asked the consignors to repeat the order, I have the honor, by direction of the Commissioner for Railways, to inform you that, after a consideration of the question involved, he is not prepared to accept any liability in respect of claims through the accident in question, and I am to add that no instructions were given by the Department to Campbell Bros. to duplicate your order.

I have, &c.,

A. RICHARDSON,

(*pro* Secretary of Railways).

Gentlemen,

H. N. Scott, Esq., Surveyor, Junee.

Gentlemen,—

Department of Railways, Sydney, 7 January, 1888.

I have the honor to acknowledge your letter of the 28th ultimo, with further reference to your claim for goods lost in the railway accident at Petersham, in which you ask, before taking further steps, whether the Department is willing to make any compromise with a view to avoiding legal expenses.

In reply, I am desired by the Commissioner for Railways to say, that he is unable to compromise the case, as he is quite certain that negligence cannot be established against the Department. The Commissioner would be sorry to learn that your firm have been advised to take legal action, as success is improbable, and the result can only be greater loss. Altogether, apart, however, from any consideration of this kind, it will be his duty to defend the action on principle.

I have, &c.,

D. VERNON,

Secretary of Railways.

Messrs. Atcherley & Dawson, Sydney.

Gentlemen,—

Department of Railways, Sydney, 10 January, 1888.

With reference to your claim for compensation in respect of goods damaged in the recent railway accident at the Petersham viaduct, I have the honor, by direction of the Commissioner for Railways to inform you that, after careful consideration of the question involved, he is not prepared to accept any liability.

I have, &c.,

A. RICHARDSON,

(*pro* Secretary of Railways).

Messrs. Wickham & Martin, Clarence-st., City.

No. 11.

Minute by The Commissioner for Railways.

Action at law.—Recovery of value of goods destroyed at Petersham viaduct accident.

It is reported that we are in jeopardy of losing this test action from several causes. I shall be glad to see the Traffic Manager about it. Who was it went to the consignors of the goods immediately after the accident? Were any letters written? I wish to see with Traffic Manager the officer who gave intimation to the consignors, and also copies of any written communications which were made.

CH.A.G., 10/1/88.

No. 12.

Minute by The Commissioner for Railways.

Axles, &c.

STEEL axles were first brought under the notice of the Department by Mr. G. N. Vickers in the end of March, 1880.

An order had previously gone to England for 800, made of Yorkshire iron, but it was altered to "half Vickers and half Patent Shaft" steel, so that the relative merits of both might be tried. These arrived in the Colony several months afterwards, and were immediately put in use as required.

In January, 1881, another order was sent for 750 of each, so that we have or had 1,150 Brunswick steel axles altogether.

In December, 1881, one of them broke under a van containing 5 tons 17 cwt. 3 qr. of meat while running over the Mountains. It had been running thirteen months, and where it broke there was no sign of flaw. It was afterwards tested, and Mr. Scott reported that it was of "an inferior and coarse-grained metal, and did not prove so satisfactory as the iron axles."

Immediately afterwards another test was made of a Vickers and another Brunswick steel axle, and the latter gave very satisfactory results; indeed, it was found to be better than that made of Vickers' steel. Still it has been generally admitted that the Vickers' steel is the most reliable, and although no danger was apprehended from the continued use of the Brunswick steel axles the preference was given to Vickers' in all orders since January, 1881.

In November, 1882, a second Brunswick steel axle broke at Granville under a waggon loaded with timber, which weighed 4 tons. The axle had been running twenty-five months, and bore evidence of an old flaw.

The only other Brunswick steel that has broken was in the Petersham accident in September, 1887, four years and ten months after the previous one. The grain was very coarse, and a flaw (which however was not noticeable) existed equal in extent to about 25 per cent. of the entire sectional area. The van under which the axle broke in the Petersham accident contained 6 tons 0 cwt. 2 qr. of sugar. It had been running 7 years and one month.

The first Vickers' steel axle broke in May, 1885, under an empty goods brake-van on the Mountains, after having been in use twenty-three months. It exhibited a bad flaw right across.

In August, 1886, a flaw was detected in another axle, which was under a waggon loaded with wool; and to prevent accident the waggon was unloaded and the axle removed. On being tested it exhibited clear evidence that the flaw had existed from the time of its manufacture. It had been running three years and three months.

In August, 1887, another Vickers' steel axle broke under D 2,454, while running over the Mountains. The waggon contained 6 tons 10 cwt. 1 qr. of maize. The axle had been running six years and seven months. The locomotive officers reported that although no defect could be discovered they thought one must have existed.

In November, 1887, a flaw was detected in a Vickers' steel axle under a cattle waggon, and to prevent accident was removed. It had been in use five years and three months.

Mr. Scott is satisfied that although since he has known their relative merits, he has always preferred the Vickers' steel to that of any other make, and has repeatedly written to that effect, he has never condemned those made of Brunswick steel, nor has he ever apprehended any risk beyond the ordinary risk from their continued use. The strongest minute he has written about them was in May, 1884, when he said, "Our experience of this Company's axles shows that they are not reliable, three having broken under our waggons whilst running." Every search has been made in the Locomotive Office, but the records only show two to have broken up to the time of Mr. Scott's report.

As

As regards the inspection of axles Mr. Cruickshank admits that the evidence shows that "the instructions given to the various officers as to the examination of axles, &c., is very satisfactory; every possible care seems to be taken to prevent any defective material being used, and none of those examined had any suggestions to offer which in their opinion would have any tendency to improve the method of inspection."

Speed of Train.

As regards the speed of the train and the brake-power I cannot see how a case tried before the Court could be against the Department. No doubt the mail train is controlled by a continuous brake, although its weight is only half that of the goods train, but there is no analogy between the two.

It will not be disputed that it is very desirable to have the express goods fitted with a continuous automatic brake, but it is not between Sydney and Picton (where the average speed is only 26½ miles an hour) where such a brake is required, but on descending gradients or the level country in the interior where the speed is very high (as much as 45 to 50 miles an hour) in order to make up for the time lost on the ascending grades.

In England goods trains without any continuous brake and with only one brake-van (we have two) are run at upwards of 30 miles an hour including stoppages, and on our own lines, the South-Western and Western, between Nyngan and Bourke, our mixed trains, which have no continuous brakes, run at a greater speed than the express goods between Sydney and Picton, and they have only one brake-van.

Question of Liability as Insurer.

Since it is evident that the axle which broke on the express goods was duly examined, and no sign of a flaw detected, and as moreover there has never been any reason to apprehend danger from the use of the Brunswick steel axles the next question to consider is whether the Commissioner for Railways as a common carrier is an insurer of goods entrusted to his care.

In "Ivatt's Carriers' Law," pages 878, 879, and 880, will be found particulars of cases *Stokes v. Eastern Counties Railway Company* and *Lee v. Cork and Bandon Railway Company*, both of which were decided in favour of the Companies, and they are very similar to ours. Again, on page 881, *Readhead v. North Midland Railway Company*, and page 884, *Phelps v. Great Eastern Railway Company*, judgment in both cases was in favour of the Companies.

But all these were cases of personal injury. In the case of *Readhead v. North Midland Railway Company* the Judges spoke as follows:—

Mr. Justice Lush:—The Courts have drawn a clear distinction between the liability of a carrier of goods as an insurer and the liability of a carrier of passengers for negligence.

Mr. Justice Mellor:—Why carriers are held to be insurers is founded on the danger of carriers (in old times) colluding with thieves if they were allowed to set up robbery or loss by accident as an excuse for failure to deliver goods, and—

Mr. Justice Blackburn:—I quite agree with my two brothers that the carrier of passengers is not like the carrier of goods, an insurer who undertakes to carry safely at all events unless prevented by exceptional perils.

Then again on page 880, in the cause *Dawson v. Manchester, Sheffield, and Lincolnshire Railway Company*, where the passenger was injured through the breaking of an axle which had exhibited no visible sign of flaw, justice was given against the Company. The Company appealed, and the appeal was heard before Chief Baron Pollock, who said—"We have held where an accident happens as in this case to a passenger in a carriage on a line of railway, either by the carriage breaking down or running off the rails, that it is *prima facie* evidence for the jury of negligence on the part of the Company.* There was such *prima facie* evidence of negligence here, and it was not rebutted by any evidence on the part of the Company."

Judgment against Company.

There are no cases of goods lost or damaged in transit where such loss or damage arose through the breaking of an axle or tyre, or similar cause.

Mr. Harper, the Goods Superintendent, and Mr. Price, of this office, went round and saw the consignors of the goods on the day of the accident and informed them what occurred, but nothing was said about duplicating the orders—that was left to the option of the senders.

The position of the Department was fully discussed in the Traffic Manager's Office before Mr. Harper and Mr. Price started on their mission, and it was held then that the Department would not entertain responsibility.

They were told, however, to get a look of the senders invoices so as to see the value of the goods in case of the Department being held responsible.

*The Company it would seem omitted to give evidence that they had used care throughout. They pleaded they were not the makers of the axles; it was held, however, that their obligation went beyond this—they were bound to use every precaution to secure good axles, and they had submitted no evidence that they had taken these precautions. In our case we shall be able to show that the axles (one of which breaking was the cause of the accident) were selected with due care—not only were they purchased from a well established firm of great repute, but their manufacture was supervised by our inspecting engineer in England, in accordance with a specification which provides for such inspection and also for tests. We should not fail on any grounds of want of proper care.—CH.A.G.

Will Mr. Badham draw up from this paper a minute, for my signature, submitting the case for the consideration and advice of the Crown Law Officers? The cases quoted may be given pretty fully. The question of liability will depend upon the legal position of common carriers in regard to the delivery of goods. If they are insurers of goods in regard to safe delivery (the act of God and the Queen's enemies excepted), we shall be clearly liable in the case of the Petersham viaduct. That there is force in this view seems to me evidenced by the fact that there is no case in the books showing that any claim for the recovery of the value of goods lost under similar circumstances has been resisted, although there are several instances in which claims for *personal* injury have been successfully resisted. It seems to me that common carriers are insurers of goods, and the only relief afforded them is that given by Lord Campbell's Act (adopted in this Colony by Judge Windeyer's Act), requiring that, as regards certain classes of goods, an insurance fee over and above the ordinary or regulated charge for carriage shall be paid. Any goods lost (coming within the category) which were not insured as provided we shall not be liable for.—CH.A.G., 24/1/88.

No. 13.

The Commissioner for Railways to The Crown Solicitor.

Question of Commissioner's liability for goods damaged in Petersham accident.

In the accident which happened to the express goods at Petersham viaduct on the 9th September last, goods of various kinds, to a considerable value, delivered to the Department for conveyance, in its capacity of common carrier, were destroyed, and actions are now pending against the Commissioner for the recovery of the value of such goods.

I wish, therefore, to submit, for the consideration and opinion of the Crown Solicitor, the question, whether we can resist, with any prospect of success, the claims thus made against the Department?

I am satisfied that no imputation of negligence can be fairly sustained against the Department.

The primary cause of the accident was the breakage of an axle under one of the waggons, and it cannot be disputed that the fracture was due to a flaw in the axle, which Mr. Cruickshank, in his report on the subject, describes as equal in extent to 25 per cent. of the sectional area of the axle.

Now there are none of our appliances to which more attention is given than the axles. Only the most approved makes are purchased, and the axles, before being put into use, are subjected to the most rigid examination and test. Every effort, in a word, is made to secure the best quality of material and superior workmanship.

Upon this point Mr. Cruickshank, in his report above referred to, states that "respecting the instructions given to the various officers as to the examination of axles, &c., the evidence is very satisfactory; every possible care seems to be taken to prevent any defective material being used."

As regards the speed of the train to which the accident happened it may be stated that it did not exceed $26\frac{1}{2}$ miles an hour.

The train was controlled by *two* brake-vans, while in England goods trains are run at upwards of 30 miles an hour with *one* brake-van only.

It being thus clear that there was no negligence on the part of the Department; that the axle which broke was thoroughly examined without any flaw being detected; that the speed of the train was moderate, and that the brake-power was ample, the question presents itself whether the Commissioner for Railways as a common carrier is an insurer of goods entrusted to his care.

In Ivatt's Carriers' Law, pages 878, 880, particulars will be found of the cases—*Stokes v. the Eastern Counties Railway Company*, and *Lee v. the Cork and Bandon Railway Company*, both of which were decided in favour of the Companies, and they are very similar to our case. Again (page 881) *Readhead v. the North Midland Railway Company*; and (page 884) *Phelps v. the Great Eastern Railway*, in which also judgment was given for the Companies.

But all these were cases of personal injury. In *Readhead's* case the Judges spoke as follows:—Mr. Justice Lush—"The Courts have drawn a clear distinction between the liability of a carrier of goods as an insurer, and the liability of a carrier of passengers for negligence." Mr. Justice Mellor—"Why carriers are held to be insurers is founded on the danger of carriers (in old times) colluding with thieves if they were allowed to set up robbery or loss by accident as an excuse for failure to deliver goods." And Mr. Justice Blackburn—"I quite agree with my two brothers that the carrier of passengers is not like the carrier of goods, an insurer who undertakes to carry safely at all events unless prevented by exceptional perils."

In the case of *Dawson v. the Manchester, Sheffield, and Lincolnshire Railway Company* (page 880), where a passenger had been injured by the breaking of an axle which exhibited no outward sign of flaw, judgment was against the Company. The Company appealed, but the appeal was dismissed on the ground that the Company had produced no evidence to rebut the *prima facie* evidence of negligence. The Company, it would seem, omitted to give evidence that they had used care throughout. They pleaded that they were not the makers of the axle, but it was held that their obligation went beyond this, that they were bound to take every precaution to secure good axles. The Company, however, submitted no evidence that they had taken such precautions.

But in our case we shall be able to show that the axles were selected with due care. Not only were they purchased from an established firm of great repute, but their manufacture was supervised by our Inspecting Engineer, under a specification which provides for such inspection, and also for tests. We should not fail on any ground of want of proper care.

It seems to me from the cases quoted that the Commissioner, as a common carrier, is an insurer of goods entrusted to his care, except those mentioned in *Windeyer's Act*, for which he would not be liable unless a premium in excess of the ordinary carriage rate was paid.

CH. A. GOODCHAP,
1/2/88.

No. 14.

The Crown Solicitor to The Commissioner for Railways.

Newton v. You.

Sir,

Crown Solicitor's Office, Sydney, 13 February, 1888.

I have the honor to forward herewith declaration herein, received by me to-day, and to request that you will cause me to be instructed as to the nature of the defence you wish me to set up, not later than Thursday, 16th instant.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

I think this letter has been written under some misapprehension of the facts of the case. I am asked to say what defence is to be set up. On the 2nd instant I forwarded for advice a very exhaustive *résumé* of the facts of the case, quoting decisions in English Courts, and asking that it might be determined upon the facts therein set forth whether I had any defence to these actions, expressing my own belief that there was no defence, and that the Commissioner under the law was an insurer of goods entrusted to his care, except in certain specified and specially legalised cases. An officer from this Department

Department has called almost daily since the 8th instant at the Crown Law Department to ascertain whether a reply could be given, without any satisfactory result. This letter from the Crown Solicitor asking me to say what defence I wish set up takes me therefore by surprise, and induces me to conclude that it has been written in forgetfulness of the action already taken by me.—CH.A.G., 14/2/88.

Write to Crown Solicitor, and say that I cannot reply to his letter of the 13th until he replies to the case for advice on this very subject which I sent to him on the 2nd instant.—CH.A.G., 14/2/88.

Newton v. The Commissioner.

Sir,

Department of Railways, Sydney, 14 February, 1888.

With reference to your letter of the 13th instant, forwarding declaration in the above matter, and asking the nature of the defence to be set up therein, I have the honor to inform you that I cannot reply to your communication of yesterday's date until you answer the case for advice on this very subject which I sent to you on the 2nd instant.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

The Crown Solicitor, Sydney.

No. 15.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 16 February, 1888.

I have the honor in reply to your letter of yesterday, respecting the case of Newton v. The Commissioner, to state that I submitted the case mentioned in it to Mr. Attorney-General for his advice thereon, and that I have this morning received his opinion, a copy of which I send herewith.

The Act referred to in Mr. Attorney-General's opinion as 41 Vic. No. 21 is the Common Carriers' Act of 1878, and will be found at page 134 of Oliver's Edition of the Statutes. The Section 1 referred to limits the liability of a common carrier for loss of the goods of the description therein named above the value of £10 unless declared, and an extra charge paid for same.

The concluding paragraph by you at the foot of the minute submitted, correctly states the difference between a contract for the carriage of goods and for the carriage of passengers. In respect of the carriage of goods you are an insurer with full liability, excepting so far as it is limited by the Common Carriers' Act, but with respect to passengers you are only liable for damage occasioned by negligence either direct or implied.

From the opinion now sent, you will be able to instruct me as to the defence in the action Newton v. You; it is necessary that the papers sent and instructions for the defence should be forwarded with as little delay as possible.

I have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

[Enclosure.]

COPY OPINION.

I AM of opinion that in the absence of any special contract limiting the liability of the Commissioner as a common carrier, he is responsible for injury to the goods during transit, although such injury was not caused by any negligence of the Railway Department. The Commissioner is an insurer of all goods not coming within Sec. 1 of 41 Vic. No. 21. If the goods are injured which do come within that Section, the Common Law liability is taken away unless the requirements of that Act are complied with. I am not aware whether there is any special contract in the case.

G. B. SIMPSON.

15 February, 1888.

No. 16.

Minutes by Mr. J. Harper.

Petersham Accident Claims.

I HAVE a list showing the invoice value of most of the packages damaged or destroyed in this accident, but in order to determine the extent of our liability it will be necessary to know the description and value of the articles. There are some seventy consignees concerned, and it will occupy some little time in obtaining this information, but every effort will be made to procure it at once, a trustworthy officer having been specially detailed to do it.

JNO. HARPER, 18/2/88.

Traffic Manager.

I HAVE been able to get the necessary information from all concerned except Messrs. Wright, Heaton & Co., who have referred us to their solicitor, Mr. M'Laughlin. I called on the latter gentleman with a view of obtaining the necessary particulars, and have been promised a detailed list in a few days.

I may state that on the morning of the accident I was able to get a sight of the invoices of goods sent through them by Sydney houses, but several of the consignments came from other Colonies, and I was unable at that time to ascertain their value.

I gathered from Mr. M'Laughlin that steps were taken by him to institute proceedings against the Department, and it was suggested that if we intended to adjust the claims it would be as well if he was formally apprised of the fact by the Crown Solicitor, so that further legal expenses might be avoided.

Traffic Manager.

JNO. HARPER, 24/2/88.

But where is the list asked for by the Commissioner?—D.K., 25/2/88. Goods Superintendent, Now herewith, 3/3/88.

Accident

Accident at Lewisham Viaduct.

I now forward the list required by the Commissioner, which is as complete as I can make it.

In a number of instances the senders refer us to Messrs. Wright, Heaton, and Co., and the latter decline to give us any particulars, but refer us to Mr. M'Laughlin, solicitor.

Mr. M'Laughlin has been seen, with the result stated in my minute of 24th ultimo.

I attach the accounts which I have been successful in obtaining; and where I have given a reference to Commissioner's papers on the list, accounts will be found attached to the papers quoted.

The figures shown in the columns "value of goods" were obtained by me from senders at the time of the accident, and in those cases where erasures have been made the accounts now obtained differ slightly in amount.

So far, the only items for which the Département is not responsible are:—

£15 10s. Goodlet and Smith, for one case glass.

£11 18s. M'Arthur and Co., for silk handkerchiefs, &c.

Regarding Chris. Newton and Co.'s account for £79 9s. 7d., there were twelve out of the fifteen cases of samples returned to them. Particulars of the goods which they received back we are unable to get from them.

JNO, HARPER, 5/3/88.

Traffic Manager.

No. 18.

Minute by The Traffic Manager.

Newton v. Commissioner for Railways.

THE action is for recovery of the value of fifteen cases of samples which were in the accident at Lewisham viaduct on the 9th September, 1887.

Twelve of the cases apparently were not damaged, and were taken possession of by Newton. The remaining three cases were partially destroyed.

Several attempts have been made to obtain an inventory of the contents of the cases, but Newton is not inclined to supply it.

As the case is understood by me, there is no plea to set up. The decision of the Attorney-General is that the Commissioner is responsible except for such articles as are exempted under the Common Carriers' Law; therefore it seems that the only thing to be done is to arrange a compromise of the matter.

The Commissioner.

No. 1.

Memo. from Mr. District Engineer Shellshear to The Engineer for Existing
Lines.

Bridges between Parramatta and Blacktown.

I HAVE to report, for your information, that on inspecting the bridges yesterday I find that since you visited the bridges between Parramatta and Blacktown with me, on the 6th October last, that the abutment of the bridge at Wentworthville has gone over a little more, and that the upper part of the brickwork is badly shaken, and there is a horizontal crack at the level of the washer-plates of holding-down bolts, and the lower part of the wall has been thrust forward nearly $\frac{1}{4}$ " in advance of the upper part from this level on the up-line side, next Parramatta. I am of opinion that it is necessary to reset the stone and strengthen the abutment, as at present there must be a heavy compression strain on the girders, which, with the vibration of passing trains, puts an undue strain on the structure. The abutment has come over fully $1\frac{1}{4}$ " at this point.

To make this bridge secure, I consider it necessary to build counterparts along the face of each abutment, and reset the girders and bed stones. This will cost about £1,000. The

135—A

[930 copies—Approximate cost of printing (labour and material), £25 17s. 9d.]

The bridge at Parramatta Park, the ends of the girders of which were cut, as per your verbal instructions have nearly closed again, and I am also of opinion that it is necessary to strengthen the abutments, the same as proposed for the bridge at Wentworthville, at a cost of £1,000.

The bridges at 16 miles 48 chains, and 20 miles 72 chains, are also shaken, and the bed stones working. To repair and strengthen these would cost about £900 each, making a total cost for the four bridges of £3,800.

WALTER SHELLSHEAR, 25/11/87.

I will see you about this matter.—M.T., 19/12/87. Mr. Shellshear. Mr. Thomson seen. I examined these bridges yesterday, and find that bridge at Wentworthville and Parramatta Park are more shaken than they were at the date of my last report. The abutments of the bridge at Parramatta Park are $1\frac{3}{4}$ " out of plumb, and the girders over the pier are again close, having come together more than $\frac{1}{2}$ " since they were cut. I consider it most advisable that the work should be taken in hand at once.—WALTER SHELLSHEAR, 20/12/87. The Deputy Engineer.

Under these circumstances I would recommend that the abutments of the bridges at Parramatta Park and Wentworthville be at once strengthened at a cost of about £2,000. Those at 16 miles 48 chains and 20 miles 72 chains are not so bad, and the pressure behind the abutments could be lessened by taking out some of the present embankment, and refilling with rubble and ashes behind the abutments.—M.T., 22/12/87. Engineer for Existing Lines.

I will inspect these bridges with you in the course of a few days.—G.C., 4/1/88. Deputy Engineer.

Let me have an estimate of cost of putting ashes at the back of these abutments, a plate on each of the walls, and square timber (for the three highest bridges), say 12 feet long, under the rails, with one end resting on abutment; also repairs to abutments.—G.C., 10/1/88. Deputy Engineer.

Estimated cost about £550 for each bridge. I attach sketches showing the amount each abutment has been forced out of plumb.—WALTER SHELLSHEAR, 25/1/88. Engineer for Existing Lines. Will Commissioner please approve of this expenditure? The abutments have been forced out with the swelling of the clay in the late wet weather, it having been poured in in the dry weather probably too hard.—G.C., 30/1/88. Commissioner. Bridges must be made safe.—CH.A.G., 2/2/88. Engineer for Existing Lines, B.C., 2/2/88. Mr. Shellshear to note and carry out.—G.C., 3/2/88. Mr. Purton to carry out.—W.S., 4/2/88.

No. 2.

G. W. Townsend, Esq., to The Commissioner for Railways.

Sir,

Railway Survey Office, 10 February, 1888.

I have the honor to request that you will make inquiry into the present state of the abutments of one or more of the bridges recently erected on the duplication of line, Parramatta to Penrith, as I am informed that they are showing signs of failure; also that you will satisfy yourself whether my designs for those abutments were adhered to, and whether, in case the designs were departed from, such departure is or is not the probable cause of alleged failure.

The facts are as follows:—Previous to making the above designs, I had found that a 12-foot culvert at 16 $\frac{1}{2}$ miles on Western Line had completely failed, the brickwork, though of excellent quality, having burst and cracked in all directions; this culvert was removed and replaced by a 40-foot girder bridge; the failure of the culvert I attributed to the swelling of the earth of which the bank was formed in which the culvert was placed; this earth was taken from an adjacent cutting through Wianamatta shale, which has a most dangerous property of swelling after being placed in embankment; to guard against this danger, as the same shale runs throughout the line, I made the designs for the bridge abutments with a large quantity of dry hand-packed sandstone rubble placed between the abutments and adjoining bank. I am informed that the whole of this rubble packing was left out in carrying out the work; if this is really the case there is no doubt but that it is the cause of failure. I wrote you a previous letter on this subject some months since, but as I had heard of the matter from a source that I could not mention without injury to the man who told me, I deemed it better to wait for further development of the case, so did not send the letter.

I have, &c.,

GEO. WM. TOWNSEND.

P.S.—I am further informed that at one of the abutments in question the earth has been excavated from behind the abutment and the space filled in with dry ashes, which has prevented any further movement of the brickwork.—G.W.T.

Please return with report.—A.R., B.C., 13/2/88. Engineer for Existing Lines. Returned with report herewith.—G.C., 9/3/88. Commissioner.

REPORT ON Abutments of Bridges, Parramatta to Penrith, by Engineer for Existing Lines.

WITH reference to Mr. Townsend's letter of 10th February last, it may be stated that some of the high abutments on the line between Parramatta and Penrith have been found out of plumb, caused no doubt through the earth filling behind them—which was put in during very dry weather—being soaked through during the heavy wet weather last year, thereby expanding to an unusual extent. This has not been caused through the departure from Mr. Townsend's design, because if this had been followed these abutments would probably have been down long ago. The designs were altered for the sake of safety. Mr. Townsend's designs provided for work built in lime mortar, with only a thickness of about one-sixth of the height—out of proportion altogether—and the hand-packed rubble referred to would, if anything, have a tendency to decrease rather than increase the stability of the work in the way Mr. Townsend proposed to dispose it, and being some £4,600 more expensive than the designs to which the work has been carried out. The designs were consequently altered to properly proportioned work, built in cement, and of a thickness of about one-fourth of the height, but such alterations have nothing to do with the matter of the abutments being forced out of plumb, as they are much stronger than those designed by Mr. Townsend.

To Engineer for Existing Lines.

MAX THOMSON, 8/3/88.

Forward copy of this report to Mr. Townsend.—CH.A.G., 13/3/88.

Sir,

Sir,

Department of Railways, Sydney, 19 March, 1888.

With reference to your letter of the 10th ultimo, asking that inquiry might be made into the present state of the abutments of one or more of the bridges recently erected on the duplication of line between Parramatta and Penrith, I have the honor, by direction of the Commissioner for Railways, to inform you that the matter has been referred to the Engineer for Existing Lines, and to enclose for your perusal a copy of the report received in reference thereto.

I have, &c.,

D. VERNON,

Secretary of Railways.

Geo. Wm. Townsend, Esq., Railway Survey Office, Pitt-street.

No. 3.

Minute by The Commissioner for Railways.

Has anything unusual or exceptional taken place recently in connection with the maintenance of the line?

It is the duty of the Engineer for Existing Lines to report to me any unusual occurrence.

A bridge, for instance, showing signs of weakness in any part; any structural repairs required to any particular work; in short "anything out of the common."

CH.A.G., 8/3/88.

Engineer for Existing Lines, B.C., 9/3/88. Nothing unusual has taken place, except the repairs to bridges between Parramatta and Blacktown, and which were approved by you on attached papers.—G.C., 10/3/88. Commissioner.

The reason given for the failure of these bridges is that the abutments have been "forced out with the swelling of the clay in the late wet weather, it having been primed in the dry weather and perhaps too hard." Who designed these bridges—was the original design departed from, and for what reason? I am informed that when first designed the treacherous nature of the clay or shale was known, and the designer proposed to overcome this difficulty by hand-packing with rubble between the abutment and the formation, the shale being taken out for this purpose. When the work was carried out this precaution was not taken, but the abutment was strengthened to resist the pressure of the shale. Again, it was found that the foundations for the abutments were not put in deep enough, but the engineer, instead of continuing the mode of construction by counterfort, carried the extra foundation down plumb. I must have a full report on the subject. An expenditure of over £3,000 has to be incurred, which, it seems to me, might have been avoided if the work had been carried out properly in the first instance.—CH.A.G., 12/3/88.

Engineer for Existing Lines.—A.R., B.C., 13/3/88. Please see report attached.—G.C., 23/3/88. Commissioner.

REPORT by Engineer for Existing Lines to The Commissioner.

REFERRING to my previous report on this matter on 8/3/88, I can only say that it would have been impracticable to carry out Mr. Townsend's design, and the rubble behind the abutment, as shown by him, instead of doing any good would increase the danger of the abutments overturning,—That the work as carried out is much stronger and better designed than what was proposed by Mr. Townsend, will be seen at a glance from attached tracing, as well as the impracticability of carrying out Mr. Townsend's design. Again, he made no provision for retaining the ballast on top of embankment.

The work was properly designed and carried out, and I can assign no other reason for the failure of these abutments than that previously expressed, viz, that the work was constructed during a very dry season, followed by an extremely wet one before the earthwork had had time to settle, and thereby quickly expanding it to an unusual extent and putting a sudden strain on the abutments while they were almost green. The fact also that the girders are absolutely rigid, without any elasticity or deflection, would contribute towards decreasing the stability of the abutments, as the girders are light and have but a small bearing surface, and every time a train passes over them they jump and create a regular hammering action or succession of blows on the abutments and piers, which I know to be the case from actual observation.

It is a fact which should not be forgotten that it is only between Parramatta and Blacktown that the abutments show signs of weakness. Between Blacktown and Penrith, where they are carried out just the same, they stand alright, so the failure cannot be attributed to any want of strength of the work but to other causes which could not be foreseen and therefore beyond control; one of these unfortunate circumstances which will happen occasionally and cannot be averted.

G.C., 22/3/88.

Ask Mr. Townsend if he wishes to offer any observations on these reports. Please write note to him to see papers in this office.—CH.A.G., 26/3/88.

D ear Sir,

Department of Railways, Sydney, 28 March, 1888.

I shall be glad if you will be good enough to call at this office on an early day and see me with reference to the matter of the maintenance of bridges between Parramatta and Blacktown and late reports thereon.

Yours, &c.,

A. RICHARDSON,

Assistant Secretary.

G. W. Townsend, Esq.

Reply by Mr. Townsend.

Correspondence *re* "Bridges, Parramatta to Penrith."

22ND December, 1887.—Mr. Thompson states: "Those at 16 miles 48 chains and 20 miles 72 chains are not so bad, and the pressure behind the abutments could be lessened by taking out some of the present embankment and refilling with rubble and ashes behind the abutments."

Sections of such
refilling should
be shown.—
G.W.T.

3rd March, 1888.—Mr. Thompson states: "The hand-packed rubble referred to would, if anything, have a tendency to decrease rather than increase the stability of the work in the way Mr. Townsend proposed to dispose it, and being some £4,600 more expensive than the design to which the work has been carried out, the designs were consequently altered to properly-proportioned work."

23rd March, 1888.—Mr. Cowdery says: "I can only say that it would have been impracticable to carry out Mr. Townsend's design; and the rubble behind the abutment, as shown by him, instead of doing any good, would increase the danger of the abutments overturning."

Mr. Cowdery signed these very designs, thereby adopting them as his own; subsequently he alters them, ostensibly, to make them safe; then, when he finds the safe work failing, he falls back, when too late, upon the means I proposed to overcome the difficulty that I anticipated, and that has now arisen, viz., the peculiar swelling of this earth. The wall that Mr. Cowdery mentions as left out in my design for the purpose of keeping back loose ballast was, owing to my different disposition of the sleepers, not needed, but could have been replaced by a row of border stones, and it could in no way affect the stability of the work.

In making my work £4,600 more expensive than that adopted, Mr. Thompson has evidently debited me with cost of rubble, and has not credited me cost of his increased amount of brickwork—in fact my design was the cheapest.

But, as my design was not followed, I am relieved of all responsibility in the matter of the failure of these abutments.

3rd March, 1888.—Mr. Thompson says: "Mr. Townsend's design provided for work built in lime mortar, with only a thickness of about one-sixth of the weight—out of proportion altogether."

I have had excellent work done in other parts of Australia with lime mortar. We have excellent limestone here that I have proved will make first-class mortar for dry situations if properly used. Brickwork in cement costs one-fourth more than that in lime, the average prices being 50s. and 40s. per cubic yard. I was therefore anxious to make this saving in such portions of the work as could be suitably set in lime mortar. Prices for both lime and cement were shown in my schedule, and had I not been satisfied with the sample of lime shown by the contractor I should have had the work set in lime; but I am certain that with proper care a very large saving could be effected in all our works, and I strongly deprecate the wasteful and indiscriminate use of so expensive a material as Portland cement that is at present practised on nearly all our railway works. In many instances the slow setting of lime mortar is an absolute advantage over the brisk setting cement mortar. Of course in such portions of brickwork or masonry as are exposed to the action of water, as we have no hydraulic lime, the use of cement is necessary; but in such portions as can never be so exposed it is wasteful and unnecessary. As for the bad proportion of one-sixth the weight shown in my design, I can point to two heavy retaining walls that have been standing about five years carrying a heavy timber bridge over the Coogee tramway, that were designed by me, of exactly the same proportions as those now in question, only without rubble backing. The Coogee walls have to support about 25 feet depth of loose sand. The hand-packed rubble, as designed by me for the Parramatta to Penrith walls, would have relieved the walls of nearly all normal pressure from the earth behind, and by the slight giving of the rubble the abnormal pressure caused by the swelling of the earth would not have been communicated to the walls.

The failure of these safe (?) walls as designed by Mr. Cowdery, though costly to the Department, is valuable as an instance of the inutility of heavy masses of brickwork unscientifically applied.

Further, in his minute of 22/3/88, Mr. Cowdery says:—"The fact also that the girders are absolutely rigid, without any elasticity or deflection, would contribute towards decreasing the stability of the abutments, as the girders are light, and have but a small bearing surface, and every time a train passes over them they jump and create a regular hammering action or succession of blows—which I know to be the case from actual observation." Mr. Cowdery admits that my girders are light and exceptionally strong, but if they are "absolutely rigid, without any elasticity or deflection," they cannot cause the hammering action complained of; but how is it that these girders, from their alleged hammering action, produce disintegrations in some abutments and not in the contiguous pieces, and not in other abutments, for further on Mr. Cowdery says:—"It is a fact that should not be forgotten that it is only between Parramatta and Blacktown that the abutments show signs of weakness;" and in no case does he say that the pieces show signs of failure. Besides any amount of hammering action, though it doubtless would cause disintegration, could not possibly cause a tendency to overturning in the abutments, and this is what is complained of. The hammering action complained of is due to the injudicious placing of the coping-stone in the adopted designs as compared with the placing of the same stones in my design. The bearing surface is ample, only giving a pressure of less than $1\frac{1}{2}$ cwt. per square inch of surface.

GEO. WM. TOWNSEND,
3/4/88.

It is fortunate that these girders are exceptionally strong, or, on the failure of the abutments, they would have been completely destroyed by the united action of the load they have to bear in the course of traffic, added to the heavy compression strain they have been subjected to by the thrusting out of the abutments.—G.W.T., 3/4/88.

I think it desirable that an independent report should be made, and would suggest that Professor Warren, of the University, be asked to report upon the girders and abutments.—CH.A.G., 5/4/88. Approved.—J.S., 5/4/88.

No. 5.

The Secretary for Railways to Professor Warren.

Sir, Department of Railways, Sydney, 5 April, 1888.
In view of a difference of opinion which exists with regard to the design and construction of certain bridges on the duplicated line between Parramatta and Penrith, the Commissioner for Railways considers it desirable that an independent report in the matter should be obtained.

To that end I am desired to ask that you will be good enough to inspect such bridges as are reported to be defective, viz., those between Parramatta and Blacktown, and report upon the girders and abutments of such structures.

I have, &c.,
D. VERNON,
Secretary for Railways.

No. 6.

G. W. Townsend, Esq., to The Secretary for Railways.

Dear Sir, University of Sydney, 17 April, 1888.

I have been through the tracings supplied to Professor Warren of the bridges, Parramatta to Penrith, and I find the sheet of diagrams showing rail bridge in detail has been omitted. May I suggest that Professor Warren be permitted to see the original of that and all drawings of these bridges.

I am, &c.,
G. W. TOWNSEND.

Inform Mr. Townsend that any and all information we have is at Professor Warren's disposal should he desire it.—D.V., 18/4/88.

Sir, Department of Railways, Sydney, 20 April, 1888.

I have the honor to acknowledge the receipt of your letter of the 17th instant, and in reply to say that any and all information we have relative to the railway bridges referred to in your letter is at Professor Warren's disposal should he desire it.

I have, &c.,
A. RICHARDSON,

Geo. Townsend, Esq., Athenæum Club, Sydney. (For the Secretary of Railways).

No. 7.

Memo. from Professor Warren to The Secretary for Railways.

Sir, I have the honor to acknowledge the receipt of your letter of the 5th instant.

I shall be glad to report on the bridges as requested, and should like to have the drawings both of the girders and the abutments as designed and as carried out as soon as possible. As I may have to make more than one inspection, will you kindly send me a pass. I will send back my pass for last month to-morrow.

I have, &c.,
W. H. WARREN.

Issue pass, then refer to Mr. Cowdery.—H.M.L., 7/4/88. Pass issued, 9/4/88. Mr. Cowdery. Re plans.—D.V., 9/4/88. Please furnish tracings of plans required.—M.T., 10/4/88. Mr. Fischer. Tracings (4) herewith.—G.F., 13/4/88. Deputy Engineer.

Memorandum from Professor Warren to The Secretary for Railways.

Sir, Thursday, 12 April.

With reference to my report on the bridges between Parramatta and Blacktown, I have the honor to state that I have not yet received the drawings and specifications of the bridges as originally designed and as carried out in accordance with the request contained in your letter of April 6th. I understand that the matter is urgent, and should therefore be glad to receive the particulars asked for as soon as possible.

Yours, &c.,
W. H. WARREN.

Engineer for Existing Lines.—A.R., B.C., 13/4/88: Most urgent. Specifications and tracings herewith.—G.C., 13/4/88.

Sir, Department of Railways, Sydney, 13 April, 1888.

In compliance with your request of the 6th instant, I have the honor to forward to you, under separate cover, the drawings and specifications of the bridges between Parramatta and Blacktown.

I have, &c.,
H. M'LACHLAN,
(*Pro* Secretary for Railways).

W. H. Warren, Esq., Professor of Engineering, University of Sydney.

Sir, University of Sydney, 23 April, 1888.

I have the honor to state that I have inspected the bridges between Parramatta and Blacktown, and have also tested the deflections and side oscillation of the superstructure. I have had trial shafts sunk in order to ascertain the nature of the foundations with a view to explain the cause of the numerous cracks which exist in the wing-walls and abutments. I have also completed the necessary calculations with regard to the strength and the stability of the bridges. I understood when I received your instructions to report on these bridges that the matter was very urgent, and I have been engaged every day in collecting data for my report, which I propose sending to you not later than Friday next.

I have, &c.,
W. H. WARREN.

The Commissioner for Railways. Seen.—D.V. (*pro* Commissioner), 27/4/88.

No. 8.

Professor Warren to The Commissioner for Railways.

Sir,

University, 27 April, 1888.

I have the honor to enclose my report on the bridges between Parramatta and Blacktown.

I have, &c.,

W. H. WARREN.

[Enclosure.]

REPORT from Professor Warren to The Commissioner for Railways.

Sir,

University of Sydney, 27 April, 1888.

In accordance with your instructions I have the honor to state that I have thoroughly investigated the strength and the stability of the bridges between Parramatta and Blacktown, and also the original designs for these bridges, as prepared by Mr. Townsend, and herewith report as follows:—

The bridges referred to are eight in number, which for convenience of reference will be denoted by numbers, commencing with the bridge in Parramatta Park, thus—

No. 1 bridge consists of two spans of 44 feet each.

2	one span of 44 feet.
3	two spans of 44 feet each.
4	one span of 44 feet.
5	two spans of 44 feet each.
6	one span of 44 feet.
7	" "
8	" "

They each consist of Warren girders resting upon brick piers and abutments. The main girders, as originally designed by Mr. Townsend, are arranged one under each rail. They are 44 feet long overall and 5 feet 3 inches deep.

The top flange is formed with double angle-irons, each 5" x 5" x $\frac{5}{8}$ ", riveted to a stringer plate 14 $\frac{1}{2}$ " in. deep by $\frac{5}{8}$ " in. thick, forming a T section. The bottom flange is formed with double angle-irons, each 5" x 5" x $\frac{5}{8}$ ". The web consists of channel and flat bars riveted to the stringer plate of the top flange, and to rectangular plates in the bottom flange, each 22" long x 14 $\frac{1}{2}$ " deep x $\frac{5}{8}$ " thick; the bars intersect at angles of 60° and form a single system of triangulations. The end members of the web consists of two flat bars, each 5" wide x $\frac{5}{8}$ " thick; the other members consist of double channel-irons varying in section from 5" x 2 $\frac{1}{2}$ " x $\frac{1}{2}$ " to 5" x 2 $\frac{1}{2}$ " x $\frac{3}{8}$ ".

The girders are prepared at each end for fixing to or sliding upon cast-iron bed-plates, which latter are bolted to the bed stones on the piers and on the abutments. There are six rivets in the attachments of each of the two end bars to flanges, and also in the second bars from each end; there are five rivets in the third and fourth bars from each end, and four in the remaining bars. All these rivets are shown 1" in diameter.

The top flanges of the girders are braced together in a horizontal plane with angle-iron lattice bracing 3" x 3" x $\frac{3}{8}$ " riveted to the top flanges of the main girders with one rivet at each attachment, the diameter of which is omitted from the drawings. There is also a footway on each side which is supported off the outside main girders by triangular cantilevers formed with \angle irons 3" x 3" x $\frac{3}{8}$ "; apparently intended to be fixed at each apex of bracing to main girders not shown on the drawings, excepting at the ends of main girders there is an angle-iron 3" x 3" x $\frac{3}{8}$ " attached to the top flange of the inner main girder, and to the bottom flange of the outer main girder which is only shown at the ends.

The rails are shown fixed to longitudinal sleepers 12" x 6" which are bolted to the flanges of the main girder.

The abutments, wing-walls, and piers are shown of brick, with stone copings and girder beds. The abutment-walls have been designed for a height of 24 feet from coping to foundation level; they are shown 21 ft. wide at level of bed stones, and the face is battered 1 in 12; the thickness of the wall at the level of bed stones is 2 ft. 3 in., which is increased by stepping to 3 ft. 9 in. at foundation level. There are four counterforts at the back of the wall, each 2 ft. 6 in. wide, with a back batter of 1 in 12; the total thickness of brickwork through the counterforts is 5 ft. 3 in. There is a backing of rubble stone work which extends backwards for a distance of 3 ft. 8 in. from back of counterforts.

The wing-walls are 3 ft. 9 in. at the base at the top of the bank where they join the abutment-wall, and 2 ft. 3 in. at the base at the foot of the bank; the rubble stone work is diminished from 3 ft. 8 in. at the top of the bank to 1 foot at the foot of the bank. The piers are designed for a height of 25 ft. from top of coping to foundation level; they are 3 ft. thick at the level of the bed stones, and 5 ft. thick at the base, with a batter of 1 in 24; the piers are 21 ft. wide at the level of the bed stones, and they are formed into curved cut waters on each side. The specification states on page 4, clause 27, that the brickwork is to be laid in courses of headers and stretchers alternately (English bond) in mortar or cement as may be hereafter directed. Clause 27 states, "The bricks to be well bedded, and joints flushed with mortar or cement at every course and well jointed, and finished with a neatly-struck outside joint." In the schedule of quantities, item No. 7, is brickwork in cement, &c., &c., 200 cubic yards, item No. 8, brickwork in mortar, &c., 10,331 cubic yards.

The following alterations and modifications of Mr. Townsend's design have been made in the revised design in accordance with which the works have been executed:—

1. In the main girders the end bars of the web have been altered to channel bars, 5" x 2 $\frac{1}{2}$ " x $\frac{1}{2}$ "; the rivets have been altered from 1" diameter to $\frac{7}{8}$ " diameter, and the main girders have been spaced 5-6 in. apart (centres).
2. The angle-iron horizontal bracing has been altered to flat bars, 4" x $\frac{3}{4}$ ", with two rivets in each bar $\frac{3}{4}$ " diameter.
3. The outside footways, with their cantilever supports, have been dispensed with, also the angle-iron bracing to bottom flanges of outside girders.
4. The top and the bottom flanges of each pair of main girders are braced together in a vertical plane at the ends and at two intermediate points by means of double \angle irons 3" x 3" x $\frac{3}{8}$ " riveted to the top and to the bottom of the flanges, with flat bars 4" x $\frac{3}{8}$ " connecting the top flange of one girder with the bottom flanges of adjacent girders. There are also three transverse T irons 6" x 3" x $\frac{3}{8}$ " riveted to the top flanges forming with the flat bars (referred to in clause 3), a complete top bracing in the horizontal plane.

5.

General description of the bridges.

Mr. Townsend's design.

Main girders, Mr. Townsend's design.

Transverse bracing to main girders.

Abutments, wing-walls and piers.

Revised design.

5. The longitudinal sleepers 12" x 6" have been altered for cross sleepers 9" x 9", spaced 2 ft. apart, centre to centre, with angle-iron guard rails 5" x 4" x $\frac{1}{2}$ ".
6. A footway is formed in the 6-foot by means of two planks, each 12" x 3", supported on joists 8" x 4", laid on top flanges of main girders.
7. The piers and abutments, also the wing-walls, have been built in cement mortar.
8. The width of the abutments at the level of the bed stones have been increased in width from 21 ft. to 25 ft., and dwarf-walls and pillasters built to house the ballast.
9. The rubble backing has been dispensed with.
10. The abutment-walls are designed with a vertical face instead of battering, 1 in 12., as in Mr. Townsend's design. The thickness of the abutment-wall at the top is 3 ft., and at the foundation level 5 ft. 3 in.; there are only two counterforts at the back of the wall, each 2 ft. 3 in. square, stepped back in the same manner as in the main walls.

The inspection of these bridges consisted chiefly in examining the condition of the brickwork and masonry in the abutments, wing-walls, and piers, and, by means of trial-shafts, the nature of the foundations; measuring the heights of the piers and abutments, to see whether any modifications of the type drawing were necessary; examining the superstructure to see how it had been affected by the condition of the brickwork in piers and abutments. Inspection of the bridges.

No. 1 Bridge.—The abutment-wall, Parramatta end, leans over at the top $2\frac{1}{8}$ in. on the up side and $1\frac{3}{8}$ in. on the down side. The wing-walls are badly cracked in three places on the down side and in two places on the up side; the coping stones are bulged forward, and the joints unset. There are several small cracks in the brickwork in addition to the large ones referred to. The abutment-wall, Blacktown end, leans over at the top $1\frac{1}{2}$ in. on the up side and 2 in. on the down side; the wing-walls are cracked on each side from top to bottom in two places. All these cracks, and those that will be subsequently referred to in the other bridges, slope diagonally from the coping-level downwards towards the centre of the railway; they are open from $\frac{1}{8}$ of an inch to $\frac{3}{4}$ of an inch at the top, and die out to a line at or before reaching the ground-level. The dwarf-walls which retain the ballast are shattered, and the brickwork in abutment-wall, down to the seventh course from the top, is cracked and unset at the joints. The brickwork in the central pier is cracked in several places and unset at the joints. Four trial-shafts were sunk down to the shale at the corners of the abutments where they join the wing-walls.

Trial-shaft No. 1 down side Parramatta end disclosed the fact that the abutment-wall rests upon a bed of concrete 2 ft. thick, the top of the concrete is 4 ft. below the ground-level, so that the wall is 27 ft. below the level of the rails, which is therefore 3 ft. higher than in the section shown on the type drawings. The foundations consist of clay with bands and patches of ironstone. There is a bed of solid shale 2 ft. 2 in. below the foundation of the wall at this point.

Trial-shaft No. 2 on the up side, Parramatta end, showed that the concrete here also was 2 ft. thick, and that the height from rail-level to footings of brickwork was 27 ft. 4 in. The foundations are similar to those disclosed in trial-shaft No. 1.

Trial-shaft No. 3 on the up side, Blacktown end, showed that the abutment-wall rests upon a bed of concrete 2 ft. 10 in. thick, and that the height from rail-level to bottom of footings of brickwork was 29 ft. 7 in. The foundations consist of soft blue and yellow clay, with occasional patches of ironstone mixed with clay, varying in extent and thickness. One band of ironstone is about 3 ft. thick at about the level of the old foundations, but it runs out to nothing in a few feet. The shale is 6 ft. lower.

Trial-shaft No. 4 on the down side, Blacktown end, showed that the abutment-wall rests upon a bed of concrete 3 ft. 8 in. thick, and that the height from rail-level to the bottom of the footings of brickwork was 28 ft. 6 in. The foundations at this point consist of blue clay and black mud, interstratified with ironstone in small patches. The shale is 6 ft. 4 in. lower, and between the shale and the bottom of the concrete the material is very soft, so much so, that a small crowbar can be pushed in 9 in. by hand without difficulty.

The District Engineer, Mr. Shellshear, is at present building a face-wall to each of these abutments, which is 9 in. thick at the top, at the level of the bed stones, and battering 1 in 8.

Mr. Shellshear has carried these walls down in every case to the solid shale, and, in one place, as disclosed by trial-shaft No. 4, he has gone 1 ft. into the shale; the shale at this point however, was soft and unreliable at the surface. The old walls and the new are bonded together by cutting out pockets in the old brickwork, and also by inserting old rails and bar-iron. Samples of the materials from the foundations, upon which the abutment-walls have been built, and also of the shale upon which Mr. Shellshear has built his face-walls, were taken out by myself in the presence of Mr. Shellshear, Mr. Lucas, Mr. Townsend, and my assistant Mr. Vicars; they were tied up in canvas bags and numbered with reference to the trial-shafts from which they were taken.

The main girders have been compressed by the abutments moving over, and they have been forced together over the piers; they are in contact with the dwarf-walls on the Parramatta end.

No. 2 Bridge.—The abutment-wall of this bridge at the Parramatta end, leaned over $1\frac{1}{2}$ in. on the down side, and $\frac{1}{8}$ in. on the up side, and the abutment-wall at the Blacktown end leaned forward $\frac{5}{8}$ in. on the down side and $\frac{3}{8}$ in. on the up side, when they were first measured by Mr. Shellshear, on the 6th February, 1888; they are now only $1\frac{1}{4}$ in. over on the down side, Parramatta end, and 1 in. over on the up side. The cracks in the brickwork, and masonry in wing-walls, abutment-walls, and dwarf-walls, are similar to those referred to in No. 1 bridge.

One trial-shaft was sunk under the centre line of railway, close to the abutment on the Parramatta end. The thickness of the concrete upon which the abutment-wall is built is 4' 6", the height from rail-level to bottom of footings of brickwork is 30 feet, the foundations are little better than soft mud, the shale is 15 inches lower.

No. 3 Bridge.—The abutment-wall of this bridge leans over $1\frac{1}{4}$ " on the up side, Parramatta end, and $\frac{7}{8}$ " on the down side; the abutment-wall, Blacktown end, leans over $1\frac{7}{8}$ " on the up side, and $1\frac{1}{2}$ " on the down side. When these corners were measured by Mr. Shellshear on February 6th, they were $\frac{1}{4}$ " less in three cases. The cracks in the wing-walls and abutments are similar to those in No. 1 bridge; thus, on the up side in wing-wall, Blacktown end, there is one crack $\frac{3}{4}$ " open at the top, running out to nothing at the bottom; there is a large crack and a small one on the down side. At the Parramatta end there are two cracks on the down side, open $\frac{1}{8}$ " and $\frac{1}{4}$ ", there are several vertical cracks immediately under the girder bed stones, the dwarf-walls are thrust over and fractured. The central pier is cracked in many places to a slight extent, the joints in the brickwork are more or less unset, and the pier has the appearance of having been shaken with the traffic. Trial-

Trial-shafts were sunk under the centre line of the railway, close to each abutment, from which it was ascertained that the foundations on the Blacktown side consisted of soft clay, interstratified with iron-stone. The thickness of the concrete is 8 feet, and the height from rail-level to the bottom of the footings of brickwork is 29' 6".

The trial-shaft on the Parramatta side showed that the concrete was 5 feet thick, and that the height from rail-level to bottom of footings of brickwork is 28' 9". The foundations here were soft, and a hole 1 foot deep was jumped with a small crowbar, using one hand, in 1 minute. The main girders of this bridge are jambed against the dwarf-walls, or are binding on the expansion bolts on the abutments, Blacktown end, up side, Parramatta end, both on up and down sides, and on central pier they are in contact on the up side.

No. 4 Bridge.—The abutments of this bridge lean over on the Blacktown side $\frac{5}{8}$ " on the down side, and $\frac{7}{8}$ " on the up side. At the Parramatta end they are 1" over on the up side, and $\frac{1}{4}$ " on the down side. The abutments and wing-walls are cracked in a similar manner, but not to the same extent, as in No. 1 bridge.

No. 5 Bridge.—The abutments of this bridge lean over $\frac{1}{8}$ " at each corner on the Blacktown end, and $\frac{1}{4}$ " on the up side, and $\frac{5}{16}$ " on the down side, Sydney end. There are a few slight cracks which occur in the pier and in the abutments.

No. 6 Bridge.—The abutment on the Blacktown end leans over $\frac{1}{8}$ " on the up side only, at the Sydney end it leans over $\frac{1}{8}$ " on the up side, and $\frac{5}{8}$ " on the down side.

The bottom flange of the main girders is 1' 4" above ground; the brickwork and main girders are in fair order. I ascertained that there is not a large quantity of water passing under this bridge in times of heavy rainfall.

No. 7 Bridge.—The abutment on the Blacktown end leans over $\frac{1}{8}$ " on the up side, and $\frac{3}{8}$ " on the down side. At the Parramatta end the abutment is over $\frac{3}{8}$ " on the up side, and $\frac{1}{8}$ " on the down side. There are a few slight cracks on the Parramatta side, and the fifth course of brickwork from the top is unset in a few places. I ascertained that the flood-level has risen on two occasions 18" above the bottom flange of main girders, and that considerable quantities of timber are brought down with the flood.

The underside of the girders are not properly bedded upon the bed-plates.

No. 8 Bridge.—The abutments of this bridge on the Blacktown end lean over 1 $\frac{1}{4}$ " on the down side, and 1" over on the up side. At the Parramatta end they lean over 1" on the down side, and 1 $\frac{1}{4}$ " on the up side. The wing-walls and abutments are badly cracked, and the joints unset immediately under the girder bed stones. Two bed stones on the up side Blacktown end are unset. Two trial holes were sunk under the centre of the railway, one for each abutment. On the Blacktown side it was ascertained that the foundations were blue and yellow clay, mixed with ironstone. A small crowbar was pushed 9" under the concrete by hand. The thickness of concrete is 4', the height from rail-level to bottom of footings of brickwork is 22', the shale is 6" below the bottom of the concrete, and the foundations are very wet on the Parramatta side. The foundations are on the shale in some places, while at others an inch of pipe-clay intervenes between the bottom of the concrete and the shale. The concrete is built leaning over at the top 3 $\frac{3}{8}$ ", the thickness is 3' 6", and the height from rail-level to the bottom of the footings of brickwork is 21'. In every case where trial-shafts were sunk in this and in the other bridges samples of the materials have been selected and tied up in canvas bags, numbered for future reference, if considered necessary.

The main girders of this bridge have been compressed by the movement of the abutments. The end diagonals are in contact with, and grind against, the bed stones.

I have made a general inspection of the bridges between Blacktown and Penrith, in order to compare with those between Blacktown and Parramatta, and shall refer to them in my conclusions.

Testing.

In order to test the deflection of the girders with passing trains, and also the oscillation and vibration, I borrowed Mr. W. C. Bennett's apparatus for testing bridges, and with it I measured the deflection and side oscillations of No. 1 bridge, No. 3 bridge, and No. 8 bridge, and the oscillations only of No. 6 bridge. I also noted the vibrations and oscillations of the girders with trains passing over at different speeds by standing between the girders and on the flanges, holding with my hands the bracing. I was unable to note any great vibrations or oscillations more than those observed in other bridges. The following table gives the deflection, with the number of the engine and the total weight:—

RESULTS OF TESTING THE BRIDGES.

Number of Engine.	Weight of Engine.	Weight of Tender.	Total Weight of Engine and Tender.	Deflections.				Transverse Oscillation.	Remarks.
				Up Line.		Down Line.			
				Outside.	Inside.	Outside.	Inside.		
63	T. cwt. qrs. 37 5 3	T. cwt. qrs. 25 18 3	T. cwt. qrs. 63 4 2	·275"	·2"	·12"	} <i>No. 1 Bridge.</i> Two deflection levers were fixed on the down side only, and one oscillation apparatus was also fixed on the down side.
323	42 8 1	24 6 1	66 14 2	·2"	·175"	·12"	
94	33 16 0	22 11 0	56 7 0	·12"	
91	37 11 3	21 13 3	59 5 2	·12"

V	+.89	+1.78	-3.56	-2.67	-1.78	-.89	+2.67	-8.90	-.92	+1.75	-9.82
VI	-.89	-1.78	+3.56	+2.67	+1.78	+.89	+8.90	-2.67	+.92	+9.82	-1.75
VII	+.89	+1.78	+2.67	-2.67	-1.78	-.89	+5.34	-5.34	+5.34	-5.34

The stresses figured in the above diagram will be somewhat increased in the flanges, as the intersection of the bars in the web does not occur at the centre of gravity as it should do, but above it, hence the flange stresses in the centre of both top and bottom member may be $42.96 \times \frac{6.25}{6} = 44.75$ tons.

Hence unit stress in top flange = $\frac{44.75}{15} = 3$ tons nearly.

" " bottom " = $\frac{44.75}{11.7} = 3.82$ tons.

Unit stresses in tension bars of web.

The sectional area of two flat bars $5'' \times \frac{5}{8}''$ to form diagonal I deducting for one rivet each 1 diameter is $2(5-1.00) \frac{5}{8} = 5.00$ square inches, hence the unit stress is $= \frac{21.46}{5.00} = 4.3$ tons per square inch.

Calculations on the strength of Mr. Townsend's girders.

The sectional area of the channel bars forming diagonal III is $2(9-1.75) \frac{1}{2} = 7.25$ square inches, hence unit stress is $\frac{15.20}{7.25} = 2.09$ tons per square inch. The sectional area of the channel bars forming diagonals V and VII is 5.6 square inches; hence the maximum unit stress in V $= \frac{9.182}{5.6} = 1.64$ tons per square inch; hence the maximum unit stress in VI $= \frac{5.34}{5.60} = .95$ tons per square inch.

The stresses in bar VI alternate between a tension of .95 tons and an equal compression. Unit stresses in compression diagonals of web and factors of safety against buckling.

The stress per square inch at which the struts would buckle according to Professor Rankin, is given by the formula:—

$$\frac{P}{S} = \frac{f}{1 + a \frac{l^2}{h^2}}$$

which for double channel irons as in the present case becomes

$$\frac{P}{S} = \frac{19}{1 + \frac{1}{800} \left(\frac{72}{5}\right)^2} = \frac{19}{1 + \frac{5184}{22500}} = 16 \text{ tons per square inch nearly.}$$

The maximum working stress in diagonal II is $= \frac{21.46}{9} = 2.38$ tons per square inch. Hence the factor of safety against buckling is $= \frac{16}{2.38} = 6.7$.

The maximum working stress in diagonal IV is $= \frac{9.82}{6.93} = 1.4$ tons per square inch. Hence the factor of safety against buckling is $= \frac{16}{1.4} = 11.4$.

Conclusions on the strength of Mr. Townsend's girders.

The maximum working stress in diagonal VI is smaller, and the factor of safety correspondingly larger than in diagonal IV.

The maximum working stress occurs in the six rivets which unite the $5'' \times \frac{5}{8}''$ end bars to the booms, which is 2.27 tons per square inch.

The strength of girders such as these designed by Mr. Townsend, where the line load is about nine times the dead load must be considered with reference to the ratio of the minimum to the maximum unit stresses, as the Board of Trade rules do not apply.

The experiments of Wöhler and Bauschinger, which apply strictly to such cases, show that the maximum working tensile stress should not exceed 4 tons per square inch in the bottom flanges, and in the end bars which are always in tension, but in diagonal V which are subjected to stresses which alternate between tension and an equal compression, the maximum working stress should not exceed 2 tons per square inch. In the top flange 4 tons would not be excessive. Hence it follows from the foregoing calculations that these girders are strong enough for the line load of .9 tons per foot run for which they were designed, which is in excess of the loads due to the heaviest traffic.

Conclusion on Mr. Townsend's design of main girder and side bracings.

I understood Mr. Townsend to say that he designed the bar wider.

The defects in Mr. Townsend's design of the main girder and superstructure are as follows:—

1. The diagonals of web do not intersect at the centre of gravity of the flanges but above it which increases slightly the stresses in the flanges.
2. The end tension bars are weakened by cutting away the area with six rivets $1''$ diameter, five rivets $\frac{7}{8}''$ diameter would have made a stronger joint or the bar should be made wider.
3. The bottom flanges of the two inside girders are not braced to resist side oscillations and mud. There should have been four vertical frames of angle-iron bracing together the two girders under each pair of rails. It is necessary to state that this lateral bracing could be added to the design at a trifling expense.
4. I consider Mr. Townsend's drawings are incomplete.

Conclusions on revised design.

Mr. Townsend says he designed them wider.

1. The design from which the work has been executed has not been altered so as to make the bars in the web intersect in the centre of gravity of the booms.
2. The flat bars $5'' \times \frac{5}{8}''$ have been replaced with the channel bars $5'' \times 2\frac{1}{2}'' \times \frac{1}{8}''$, which meets my objection to the cutting away of plate area. I should, however, have preferred a bar $6'' \times \frac{5}{8}''$, with five rivets $\frac{7}{8}''$ diameter.
3. The lateral bracing referred to has been supplied in the revised design, but I consider it to be an objection to brace the four girders together, as by doing so there is an increased deflection and corresponding stress thrown upon the outside girders over those upon the inside girders; this is clearly proved, as will be seen by referring to the table of deflections on page 15. It is better practice to brace the two girders together under each pair of rails so that each line of way is distinct from that of the other with regard to stress and deflection.
4. The modifications of the horizontal bracing to the top flanges of the main girders in the revised design works in very well with the lateral bracing above referred to, and it is at least as good as the horizontal bracing shown in Mr. Townsend's design.
5. The substitution of cross sleepers on the curves was absolutely necessary, as the longitudinal sleepers shown on Mr. Townsend's design could not be applied. I consider, moreover, that the spacing of the main girders at $5' 6''$ centres to be good practice, as the road is more elastic, since the weight is first brought upon the cross sleepers, which deflect in transmitting the weight to the main girders. I consider this specification to be a very good one.

Mr. Townsend's specification for iron. Comparative cost of bridges built on Mr. Townsend's design and plate-web girder bridges.

I find, by calculating the weight of the ironwork in one span of Mr. Townsend's design, and adding to it the necessary bracing referred to, that the weight for a double line of way is $15\frac{1}{2}$ tons per span. A well designed plate-web girder bridge, completely braced, of the same span, and carrying the same loads, would weigh in ironwork $16\frac{1}{2}$ tons.

By

By referring to the list of contract prices furnished by the Department on page 22, it will be seen that there is a saving in ironwork in Mr. Townsend's design, which is about £15 per span.

Mr. Townsend's design requires more brickwork, the cost of which would more than compensate for this small saving in ironwork. I consider the plate-web girder bridge to be the better of the two.

There is about the same amount of brickwork shown in both designs in the abutment-walls, although in the revised design the wing-walls are thicker. I consider it to be a great mistake to build walls as thick as these abutment and wing walls in ordinary lime mortar, as the lime can only set by absorption of carbon dioxide from the atmosphere, which is impossible in the interior of a thick wall. In Gloucester-street retaining wall I obtained soft mortar six months after it was built. Hence, I conclude that ordinary lime mortar will not set in the interior of a thick wall.

The more slowly the wall is carried up the better chance the mortar will have for setting. So that, in spite of the reduced cost of ordinary lime mortar, I think the advantages are all on the side of either hydraulic lime mortar or of cement mortar, and therefore I agree with the substitution of cement for lime mortar. It is at the same time necessary to state that the specification allowed this change to be made (see page 4, clause 27, specification). There is also a slight advantage in the disposal of the brickwork, as shown in the revised design, where there is more in the body of the wall and less in the counterforts; the thicknesses are well proportioned but they are scant. It should have battered 1 in 12, as in Mr. Townsend's design, which would have considerably increased its stability, and have at the same time reduced the pressure on the foundations, a point that will be subsequently dealt with.

In Mr. Townsend's design a wall of rubble intervenes between the abutment-wall and the filling at the back; this backing is a necessary precaution where the filling is of a retentive character, and in the present case it would at least have had the effect of minimising the earth-thrust. The two walls are compared on the two following pages, although by neglecting the effect of the union with wing-walls, the want of stability and pressures on foundations are slightly overstated in both designs:—

This calculation seems to be inaccurate; the footpaths in Townsend's design have been added; they weigh 1 ton; leave them out, to correspond with plate girder bridge, and the difference in weight is as 14½ to 16½, or 2¼ tons. The price for Townsend's girders, £16 16s. 9d., compares favourably with the price for plate girders, which average, as per list, £18; with these corrections the price for Townsend's girders is not £15 per span cheaper, but £56. — Ch.A.G. Conclusions on the abutments and wing-walls. Both designs.

STABILITY OF ABUTMENTS—MR. TOWNSEND'S DESIGN.

The weight of the wall and four counterforts is equivalent to 10,422 lb. per foot run. The maximum earth-thrust, by Rankins' formula, $\frac{wh^2}{2} \text{tau}^2 \left(\frac{11}{4} - \frac{O}{2} \right)$ where $O = 54^\circ$ in consequence of the rubble backing; and $w = 100$ lb. per foot cube = 2,252 lb. per foot run.

An inspection of the diagram will show that in consequence of the batter of the wall, and the diminished earth-thrust due to the backing, that the resultant pressure falls well within the point A, and the pressure will be distributed unequally over the whole of A B; the maximum pressure at A is found thus : $\frac{2 \times 4.3 - 3 \times 2}{4.3} \times \frac{2 \times 10,422}{4.3} = 2,900$ lb. per square foot nearly = $1\frac{1}{4}$ ton about.

It is necessary to point out that the original drawings of abutments prepared by Mr. Townsend were incomplete in the following particulars. The width of the abutment-wall shown on the drawings was

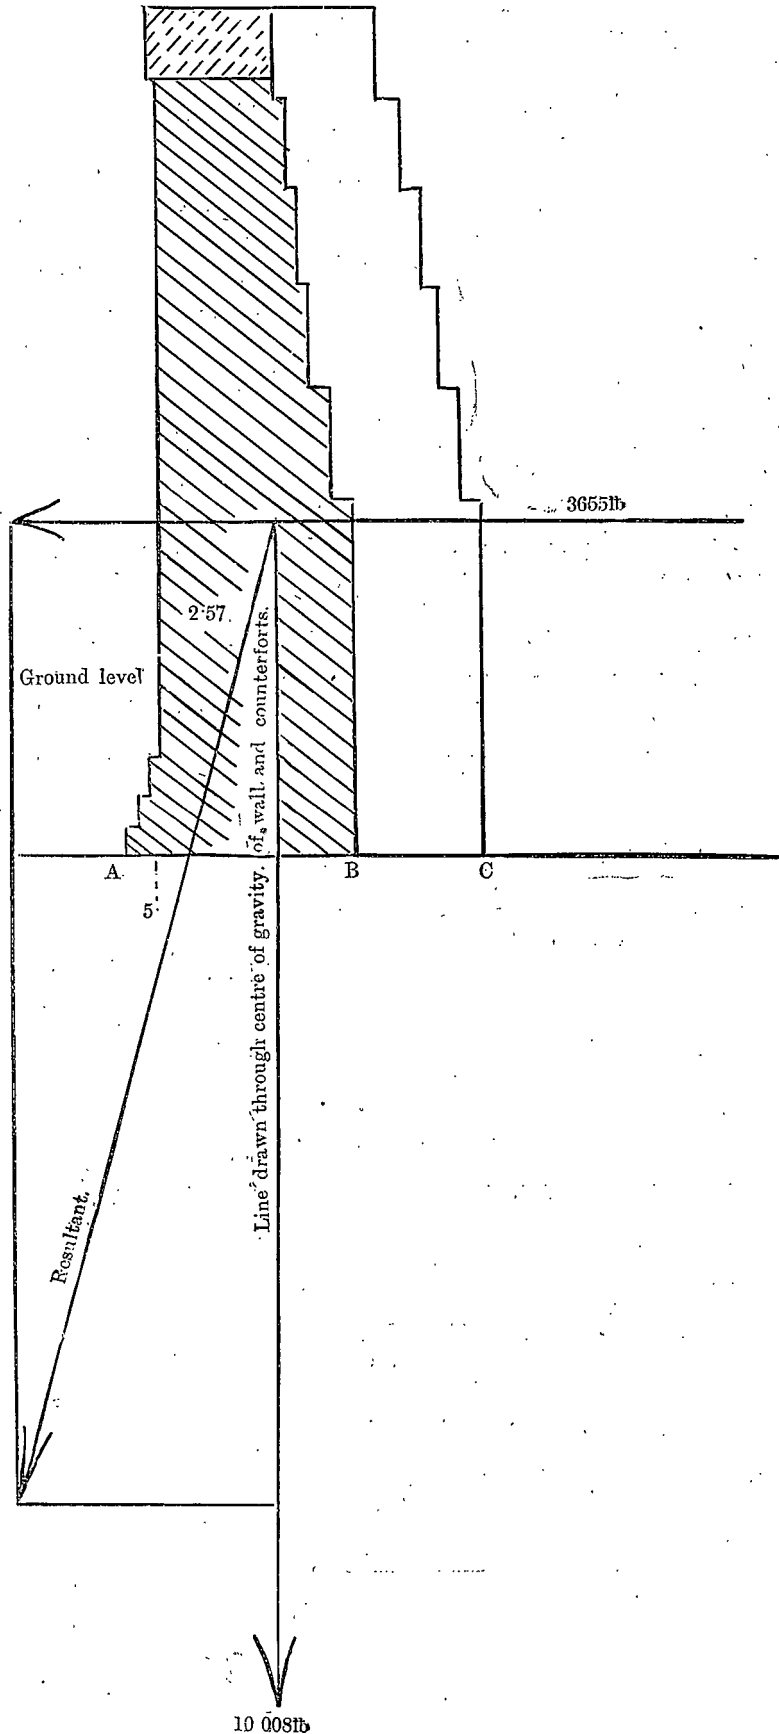

was insufficient, and no provision was made for housing the ends of the main girders, and for holding back the ballast. I consider that the additions shown on the revised design were necessary.

STABILITY OF ABUTMENTS—REVISED DESIGN.

The weight of wall and two counterforts is equivalent to 10,008 lb. per foot run. The maximum earth-thrust, by Rankins' formula, $\frac{wh^2}{2} \tau^2 \left(\frac{H}{4} - \frac{O}{2} \right)$ where $w = 100$ lb. per foot cube, $O = 45^\circ$ is to 3,655 lb. per foot run.

An inspection of the diagram will show that the resultant pressure passes very near to the point A, about which the wall tends to rotate, neglecting the adhesion of the brickwork to the concrete; the pressure 10,008 lb. will be distributed over an area of 1.5 square feet, and the maximum pressure at A is nearly 6 tons per square foot.

Rail level.

Conclusions on the cause of the failure of the abutments.

The summary should have shown thus. It is clear that if the thickness of the wall had been increased the maximum pressure on the foundations would have been less, and though the failure is due to bad foundations, still a better design would have mitigated the evil.

Not Mr. Townsend; the engineer who was responsible was young Mr. Cowdery.

Conclusions on testing.

Bridges between Blacktown and Penrith.

The two sketches on pages 26 and 27 show that Mr. Townsend's design for the abutment-wall, has advantages in stability and smaller pressure on foundations which are due to the batter of 1 in 12, and to the rubble backing. In No. 1 bridge and in No. 3 bridge, although the height of the abutment-walls measured to the ground level is from 3 feet to 5 feet greater than the height shown on the contract drawing, and measured to the level of bottom of footings from 3 feet to 5 feet 6 inches greater, the thickness of the brickwork has not been increased. In No. 2 bridge for an increase in height to ground level of 2 feet 8 inches, and to footings of 6 feet, the thickness of the brickwork has been increased 9 inches.

The contract section as illustrated on page 27 has very little surplus stability, and wherever the height was increased a corresponding proportional increase should have been made in the thickness of the wall. By increasing the thickness of the wall the stability would have been greater and the maximum pressure per square foot on the outer toe of the foundations considerably reduced. As it is the walls have failed by yielding to the excessive pressure on the soft foundations. In the case of No. 8 bridge, although the height of the abutment-walls is not greater than that shown on the contract drawing, the foundations are exceptionally bad on the Blacktown end, owing to the accumulation of soakage water above the shale. It was obviously wrong to stop the foundations at a point so near to the shale 6 inches. In the abutment nearest Parramatta there is a layer of pipe-clay 1 in. thick intervening between the concrete and the shale in some places, although the wall may be on the shale in other places. The compression of this pipe-clay would allow the wall to come over at the top. The foundations should have been taken at least 6 inches into the shale. It should have been ascertained by means of trial-shafts in all these bridges, whether the shale was at a reasonable distance below the surface, and it should then have been considered whether it would be cheaper to spread the concrete out sufficiently to distribute the pressure over the material such as it is, or to go down to the solid shale merely increasing the thickness in proportion to the increased height or depth to foundation level. In the case of No. 1, No. 2, and No. 8 bridges, the foundations should have been carried down to the solid shale. I can prove this from the samples which I have taken from under the foundations of these bridges. In No. 3 bridge the foundations might have been spread over a larger area.

I consider that the District Engineer, Mr. Shellshear, has only exercised ordinary prudence in building the face-walls with which he is strengthening No. 1 bridge upon the solid shale, instead of the soft clay and black mud upon which the present walls have failed. I also agree with the method adopted for strengthening the walls, and suggest that similar face-walls be built to support the abutments which have failed in No. 2, No. 3, and No. 8 bridges. No. 2 bridge is at present propped up with timber.

It is necessary to state that at the time when these foundations were put in there had been a period of drought, and the ground which is now soft clay, and in some cases almost mud, would appear hard and unyielding. Still I consider that the engineer who is responsible for these foundations has at least shown an error of judgment.

In No. 7 bridge the type of girder is unsuitable, as it does not give sufficient headway for the water which comes down with logs of timber in times of flood; a through bridge with cross girders resting on the bottom flanges should have been used. In No. 6 bridge the girders are also unsuitable although very little water comes down; an ordinary plate-web girder bridge of 20 feet space would have been sufficient.

The damage to the piers in No. 1 and in No. 3 bridges is due to the excessive vibration caused by the girders being compressed together and lifted off their bearing plates owing to the failure of the abutments.

The testing of these bridges demonstrated the fact that they possess sufficient vertical and lateral stiffness, and there is nothing to show that the failure of the brickwork is due to the type of girder.

The bridges between Blacktown and Penrith, where Mr. Townsend's girders are extensively used, are in good order, and the ironwork requires nothing more than painting. The abutments on these bridges do not in any case exceed the height shown on the contract drawing to ground level, although the piers are in some cases 10 feet higher.

So that I consider the failure of the brickwork in these bridges is entirely due to the failure of the foundations.

I have, &c.,

W. H. WARREN,

Wh. Se., M. Inst., C.E.,

Professor of Engineering.

No. 9.

Minute of Commissioner.

PLEASE make a synopsis of this report, bringing out the conclusions arrived at with more clearness for the Minister's information,—

- 1st. As to Townsend's design of girder—the character of his abutments, &c.
- 2nd. The general effect of the alteration made in girder, and the result which followed an alteration in the form of abutment.
- 3rd. The cause of the abutments of the bridges showing defects.
- 4th. Are the measures taken for the security of the bridges sufficient.

Ch.A.G., 1/5/88.

Mr. Fisher's synopsis herewith, 5/5/88.

SYNOPSIS

SYNOPSIS of Professor W. H. Warren's report on the strength and stability of the bridges between Parramatta and Blacktown, also on the original designs for these bridges, as prepared by Mr. Townsend.

(1st.) *As to Mr. Townsend's design of girders, the character of his abutments, &c.*

1st. The design of girders shows ample vertical strength, but, as appears from original plan, they were very deficient to resist side oscillation and wind.

It is necessary to state that this lateral bracing could be added to the design at a trifling expense.

Professor Warren considers that Mr. Townsend's drawings are incomplete.

The design of abutments, as regards power of resisting overturning, must be considered good; the rubble backing shown on drawings having the effect of minimising the earth thrust against abutments; the pressure per square foot of foundations being only about $1\frac{1}{2}$ ton.

Professor Warren, however, strongly objects to the proposed use of lime-mortar, as the lime can only set by absorption of carbon-dioxide from the atmosphere, which is impossible in the interior of a thick wall. He points out that clause 27 of specification makes provision for substituting cement mortar for lime mortar, although the schedule of quantities makes provision for only 200 cubic yards of brickwork in cement, and 10,331 cubic yards in mortar.

He also states that,—It is necessary to point out that the original drawings of abutments prepared by Mr. Townsend were incomplete in the following particulars:—The width of abutment-wall shown on the drawings was insufficient, and no provision was made for housing the ends of main girders, and for holding back the ballast.

(2nd.) *The general effect of the alterations made in girders, and the result which followed on the alterations made in the form of abutments.*

2nd. The alterations made in the design of the superstructure—which consisted in providing an efficient lateral bracing, wider spacing of main-girders, and substituting of cross-sleepers for longitudinal sleepers—have tended to generally improve the superstructure.

The amount of brickwork is about the same as in original design, although in the revised design the wing-walls are thicker. The substitution of cement mortar for lime mortar is a decided improvement, although increasing cost. There is also a slight advantage in the disposal of brickwork in revised design, the thickness being well proportioned, but scant. It should have been battered 1 in 12, as in original design, which would have added to its stability and have at the same time reduced the pressure on the foundations, which reaches a maximum of nearly 6 tons at the toe. He considers that the additions shown on the revised design were necessary.

On page 21 of report, Professor Warren gives the cost of a bridge built on Mr. Townsend's design, compared with a well designed plate-webb girder bridge, both of the same span, and concludes that although the plate girders would cost about £15 more per span, Mr. Townsend's design requires more brickwork, the cost of which would more than compensate for this small saving in ironwork. He considers the plate-webb girder the better of the two.

(3rd.) *The course of the abutments of the bridges showing defects.*

3rd. Professor Warren concludes his report thus:—

"To that I consider the failure of the brickwork in these bridges is entirely due to the failure of the foundations." This is substantiated by trial-shafts which have been sunk and which disclosed the fact that some of the abutments were found to be built on very bad foundations. This is very fully dealt with in detail in the report, but Professor Warren adds:—"It is necessary to state, that at the time when these foundations were put in, there had been a period of drought, and the ground which is now soft clay and in some cases almost mud, would appear hard and unyielding. Still I consider that the engineer who is responsible for these foundations has at least shown an error of judgment." He also says that there is nothing to show that the failure of the brickwork is due to the type of girder, which seems to be substantiated by the fact that the bridges between Blacktown and Penrith, which are of the same designs, show no signs of failure.

(4th.) *Are the measures taken for the security of the bridges sufficient.*

4th. At present, face walls are being built to the abutments at No. 1 bridge. Professor Warren considers that the District Engineer has only exercised ordinary prudence in building the face-walls upon the solid shale, instead of the soft clay and black mud upon which the present walls have failed. He also agrees with the method adopted for strengthening the walls, and suggests that similar face-walls be built to support the abutments which have failed in No. 2, No. 3, and No. 8 bridges, of which No. 2 bridge is at present propped up with timbers. The piers at No. 1 and No. 3 bridges which have been damaged indirectly by the defects in the abutments, will necessitate careful observation, and should the damage further develop, may require to be rebuilt entirely.

G.T., 3/5/88.

No. 10.

Minutes by The Commissioner to The Engineer for Existing Lines.

PLEASE furnish me with original drawings for bridges, duplication of line Parramatta to Penrith, also the drawings of the girders at Finnigan's Siding designed by Mr. Townsend, if these cannot be found, please measure the end diagonals.

Engineer for Existing Lines.

CH.A.G., 5/5/88.

Original

Original and amended drawings for these bridges are herewith—the drawings of the girders at Finnigan's Siding were lent to the Road Department some time ago, but cannot be found now; the end tris of these girders measure $5'' \times \frac{3}{4}''$.—G.C., 10/5/88. Secretary.

It stands to reason that if the girders at Finnigan's have end base measuring $5'' \times \frac{3}{4}''$, that Mr. Townsend did not design the end bars for the larger girders $5'' \times \frac{3}{4}''$. If Mr. Cowdery will refer to the correspondence now in the hands of the Official Assignee of J. and R. Robertson, he will see a letter from Mr. Townsend, dated August, 1884, requesting that the end bars might be made $5'' \times \frac{3}{4}''$, the figures $\frac{3}{4}''$ on plan being an error. If this letter be found as stated, and the structure would have been with this foundation strong enough (as I gather from Professor Warren's report, it would have been), why was the design altered in this respect.—Ch.A.G., 17/5/88. Mr. Cowdery.

I have seen the letter referred to but as it was a private communication from Mr. Townsend, I was not until now aware of its existence, consequently seeing that a mistake had been made with respect to this part of the design it became my duty to rectify it. Mr. Townsend never informed me that he had communicated with the contractors on the subject. The alteration was made for other reasons also in order to increase the lateral stiffness of the structure and make the several members of the same more uniform with a view of duplication of the parts.—G.C., 22/5/88. Commissioner.

Put with Professor Warren's report. I should like to see Mr. Townsend on Monday with all papers. Let him see Professor Warren's reply to my communication. Inquire whether weight of foot-paths was included in the $15\frac{1}{2}$ tons per span.—Ch.A.G.

Weight of one 44-ft. span for double line as designed by G. W. Townsend for duplication, Parramatta to Penrith,—

Top boom, $5'' \times 5'' \times \frac{5}{8}''$ angle (2), 44'	...	1760
14'' $\times \frac{5}{8}''$ plate (1), 44'	...	1283
Bottom boom, $5'' \times 5'' \times \frac{5}{8}''$ angle (2), 38'	...	1520

G. W. TOWNSEND.

No. 11.

Minutes by The Commissioner.

Professor Warren's Report upon the Bridges between Parramatta and Penrith.

ON page 21 of his report, Professor Warren says:—"I find by calculating the weight of the ironwork in one span of Mr. Townsend's design, and adding to it the necessary bracing referred to, that the weight for a double line of way is $15\frac{1}{2}$ tons per span."

Ask the Professor if he included in this calculation the foot-path on each side which are provided for in Mr. Townsend's design. The ironwork weighs a little over a ton, and if the foot-paths have been included, the comparison made with the plate-girder bridge, which is without foot-paths, should be as $14\frac{1}{2}$ tons is to $16\frac{3}{4}$ tons—a difference of $2\frac{1}{4}$ tons or 15 per cent.

Again, the Professor—on page 22—gives a statement of the contract prices for ironwork, in which it is shown that the rate per ton of Mr. Townsend's girders was £16 16s. 9d., while the average price paid for the plate girders therein enumerated amounted to £18 per ton.

If the calculation were made on this basis—and I shall be glad to know if there be any objection to the calculation so being made—would not $14\frac{1}{2}$ tons at £16 16s. 9d., and $16\frac{3}{4}$ tons at £18, show a difference in price per span of £56, and not £15 only.

Ch.A.G., 12/5/88.

The

The synopsis furnished—while it brings prominently out the strictures on Mr. Townsend's design—does not, it seems to me, sufficiently make manifest the objections which Professor Warren has taken to the design of abutments and wing-walls substituted for those of Mr. Townsend's. Nor is it shown that the Professor has expressed the opinion that a batter of 1 in 12, with rubble backing as proposed by Mr. Townsend, would have minimised, by reducing the earth thrust, the mistake made in not going sufficiently far for secure foundations. The omission is due no doubt to the belief that these are comparatively unimportant points. On another paper I have directed a communication to be made to Professor Warren as to whether there is not an error in the calculation respecting the comparative cost of spans of bridges to Mr. Townsend's girders, and to the plate girder design to which he refers. The Professor makes the difference of £15 per span in favour of Mr. Townsend's design, whereas if deduction be made for weight of bridge foot-paths introduced in Townsend's design and omitted from the plate girder design, and the actual cost of ironwork in both designs, the difference is £56 per span in favour of Townsend's design. When a reply to that communication is received I will submit the papers to the Minister.—CH. A. G., 15/5/88.

No. 12.

The Secretary for Railways to Professor Warren.

Sir;

Department of Railways, Sydney, 16 May, 1888.

Referring to your report upon the bridges between Parramatta and Penrith, I have the honor, by direction of the Commissioner for Railways, to ask if you included in the calculations appearing on page 21 the foot-paths on each side which are provided for in Mr. Townsend's design. The ironwork weighs a little over a ton, and if the footpaths have been included the comparison made with the plate girder bridge, which is without foot-paths, should be as $14\frac{1}{2}$ tons is to $16\frac{1}{2}$ tons—a difference of $2\frac{1}{2}$ tons or 15%. On page 22 again, you give a statement of the contract prices for ironwork, in which it is shown that the rate per ton of Mr. Townsend's girders was £16 16s. 9d., while the average price paid for the plate girders therein enumerated amounted to £18 per ton.

If the calculations were made on this basis—and I am to say that the Commissioner will be glad to know if there be any objection to the calculation being so made—would not $14\frac{1}{2}$ tons at £16 16s. 9d., and $16\frac{1}{2}$ tons at £18 show a difference in price per span of £56 and not £15 only.

I have, &c.,

D. VERNON,

Secretary for Railways.

Professor Warren to The Commissioner for Railways.

Sir,

University, 18 May, 1888.

I have the honor to acknowledge the receipt of your letter of the 15th instant referring to the conclusions on page 21 of my report on the bridges between Parramatta and Penrith.

With regard to the question "Did I include in the calculations appearing on page 21 the foot-paths on each side which are provided in Mr. Townsend's design," I answer I did not include them. I state on page 21 "I find by calculating the weight of the ironwork in one span of Mr. Townsend's design, and adding to it the necessary bracing referred to, that the weight of one span is $15\frac{1}{2}$ tons."

It will be seen by referring to the conclusions on page 19, clauses 1, 2, and 3, how I consider the bridge should have been designed, the modifications and additions referred to would have increased the weight of the revised design by $\frac{1}{4}$ of a ton. The weight of the ironwork in one span of the revised design (in accordance with which the bridge has been constructed) is $15\frac{1}{4}$ tons.

I have recalculated the weight of ironwork, and I consider that $15\frac{1}{2}$ tons is the minimum weight of one span of a properly designed bridge on Mr. Townsend's principle.

With regard to total weight of ironwork and price per ton in a bridge designed on Mr. Townsend's principle compared with a properly designed plate-web girder bridge of the same span and carrying the same loads with the same rivet stresses, I may state that the bridge recently erected at Strathfield is such a bridge, excepting that the span is slightly less. The total weight of one span is 16 tons, and if the span had been the same as in Mr. Townsend's bridges it would have weighed $16\frac{1}{2}$ tons per span. The Strathfield Bridge consists of four main girders under the permanent-way, with an open deck, so that it is strictly comparable with Mr. Townsend's bridges. In comparing the price per ton it should be noted that 675 tons were contracted for in Mr. Townsend's bridges, while only 16 tons were contracted for in the Strathfield Bridge, which I think suggests that if the quantities had been equal in both bridges, the price per ton would have been still more in favour of the Strathfield Bridge.

It is incorrect to compare a through bridge consisting of two main girders and cross girders, with a deck bridge consisting of four main girders, with no cross girders, hence it is not correct to take the average price per ton from the list given on page 22 of my report as suggested in your letter.

The cost of these bridges is therefore shown as follows:—

$16\frac{1}{2}$ tons,	@ £16 10s. per ton	=	£276 7 6
$15\frac{1}{2}$ tons,	@ £16 16s. 9d. per ton	=	£260 19 7 $\frac{1}{2}$

Difference in favour of Mr. Townsend's £ 15 7 10 $\frac{1}{2}$

I shall be glad to give you fuller particulars on this question, or on any other question arising out of my report on these bridges should you desire it.

I have, &c.,

W. H. WARREN.

Acknowledge the receipt of Professor Warren's letter, and say that I am obliged to him for the explanation he has offered. I accept without question his contention that it is incorrect to compare a through bridge with cross girders with a deck bridge on rail girders. *I should not presume to contest with

*I would, however, point out that in the list of bridges given by Professor Warren, there are two which can, even with this correction, be compared with Townsend's form of bridge, viz., the Strathfield Bridge which the Professor had adopted, and that over Eastern Creek in the duplication between Parramatta and Penrith, the latter has the advantage for the purpose of more correct comparison of having been ordered at the same time as Townsend girders, and met of course a similar market—the price was £19 15s. 8d. Striking an average, however, between this price and the price for the Strathfield Bridge, the amount is £18 2s. 10d., being slightly in excess of the figure which I erroneously suggested should be taken.

with the Professor any scientific point in this matter, but on a question of figures which are open equally to non-professional as to professional men, I hope he will permit me to take advantage of his kindly expressed offer to afford me fuller particulars on any question arising out of his report. I no longer question that the weight of a span of Mr. Townsend's bridges is $15\frac{1}{2}$ tons as stated by the Professor, but I may reasonably ask how it is that the calculation shows that the Strathfield Bridge is 16 tons for 40 feet span, and only $16\frac{3}{4}$ tons for 44 feet span—if the weight increases in proportion to span would not the correct weight be 17 tons 12 cwt.

CH.A.G.

No. 13.

The Commissioner for Railways to Professor Warren.

Sir,

Department of Railways, Sydney, 29 May, 1888.

I have the honor to acknowledge your letter of the 18th instant, and to express my obligations for the explanation you offer. I accept without question your contention that it is incorrect to compare a through bridge with cross girders with a deck bridge on rail girders. I would, however, point out that in the list of bridges furnished by you there are two which can, even with this correction, be compared with Townsend's form of bridge, viz., the Strathfield Bridge, which you have adopted, and that over Eastern Creek in the duplication between Parramatta and Penrith. The latter has the advantage, for the purpose of more correct comparison, of having been ordered at the same time as Townsend's girders, and met of course a similar market. The price was £19 15s. 8d. Striking an average, however, between this price and the price for the Strathfield Bridge, the amount is £18 2s. 10d., being slightly in excess of the figure which I erroneously suggested should be taken.

I should not presume to contest with you any scientific point in this matter; but on a question of figures, which are open equally to non-professional as to professional men, I hope you will permit me to take advantage of your kindly expressed offer to afford me fuller particulars on any question arising out of your report.

I no longer question that the weight of a span of the Townsend bridges is $15\frac{1}{2}$ tons as stated by you, but I may reasonably ask how it is that the calculation shows that the Strathfield Bridge is 16 tons for 40 feet span, and only $16\frac{3}{4}$ tons for 44 feet span. If the weight increases in proportion to span, would not the correct weight be 17 tons 12 cwt.?

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

Commissioner for Railways,

Sir,

University of Sydney, 2 June, 1888.

I have the honor to acknowledge the receipt of your letter of the 29th instant. With regard to the bridge over Eastern Creek, you state "that it has the advantage for the purpose of more correct comparison of having been ordered at the same time as Townsend's girders and met of course a similar market." The reasons why I did not select this bridge from the list for comparison with Townsend's are as follows:—(1) the span is smaller; (2) the design of the girders is such as to render them more difficult to manufacture than either Townsend's girders or the Strathfield girders; (3) I could not add something to them as in Townsend's bridges, but I should have been obliged to have made a radical alteration in the design in order to reduce the weight and cost of manufacture.

I had these considerations in mind when writing the report and also my letter of the 18th instant, but I lost sight of the fact that they were ordered at the same time as Townsend's girders and met a similar market. The question really is what would have been the price per ton of a well designed plate-web girder bridge, such as the one at Strathfield, ordered at the same time as Townsend's bridges? Having regard for all the circumstances of the case I think that the mean of the prices per ton for the Strathfield and Eastern Creek Bridges, viz., £18 2s. 10d., is as nearly correct as possible.

With regard to my estimate of the weight of a well designed plate-web girder bridge of the same span and carrying the same loads with the same unit stresses as Townsend's bridges, I state in my letter of the 18th "that the bridge recently erected at Strathfield is such a bridge." This statement I now see is somewhat misleading. I took the weight of 16 tons from the list given in my report, but I arrived at the weight of the 4-plate web girders and bracing for the same span as Townsend's quite independently by simply remembering the design and calculating the stresses and weights, which gave me $16\frac{3}{4}$ tons for a length of 44 feet, and found that the weight of the Strathfield Bridge could have been considerably reduced with perfect safety then.

1. The effective depth has been taken 2 inches less than the distance between the centre of gravity of the flanges which would increase the stresses and consequently the weight of material beyond that actually necessary. 2. The flange-plates are longer than necessary and there are packing pieces under every T iron stiffener and in other places to avoid joggling with T irons. 3. There is no necessity (except for oxidation) for the $\frac{1}{8}$ web-plates in the centre of the girders.

So that without saying anything against the Strathfield Bridge, which is beyond a doubt the best designed plate-web girder bridge I have seen, I think that $16\frac{3}{4}$ tons is quite sufficient for such a bridge of the same span as Townsend's, although the weight, 17 tons 12 cwt., suggested by you could not be considered excessive if the extra 17 cwt. were disposed of in simplifying the design so as to reduce the cost of manufacture:

Adopting the $16\frac{3}{4}$ tons, we have—

	£	s.	d.
16 $\frac{3}{4}$ tons, at £18 12s. 10d. per ton	303	17	5 $\frac{1}{2}$
15 $\frac{1}{2}$ tons, at £16 16s. 9d. per ton	260	19	0
Difference in favour of Townsend's bridges, £42 18s. 5 $\frac{1}{2}$ d.			

I hope you will not hesitate to write to me again if I have not sufficiently explained myself.

I have, &c.,
W. H. WARREN.

No. 14.

The Commissioner for Railways to Professor Kernot.

Sir, Department of Railways, Sydney, 18 June, 1888.
I am desired by Mr. Secretary Sutherland to ask you to furnish him with a report upon the bridges on the railway line between Parramatta and Blacktown.

I have, &c.,
CH. A. GOODCHAP,
Commissioner for Railways.

The Minister wishes as soon as possible the tracings of bridges; Parramatta to Penrith, supplied to Professor Warren; similar tracings of the 30-foot spans at Eastern Creek; copy of deflection tests taken by Professor Warren.—D.C.M'L., 25/6/88. Will Mr. Cowdery please attend to this matter? Required urgently.—H.M'L., 28/6/88. Mr. Thomson for tracings similar to those supplied to Professor Warren.—G.C., 29/6/88. Please supply tracings as soon as possible.—M.T., 29/6/88. Mr. Fischer. Copies (nine) of original and amended bridge plans, Parramatta to Penrith, herewith.—G.T., 3/7/88; Deputy Engineer. Nine tracings herewith. The deflection tests taken by Professor Warren have not been furnished to me, so I am unable to furnish them.—M.T., 4/7/88. Secretary.

C. A. Goodchap, Esq., Commissioner for Railways,—
Sir, University, Melbourne, 28 June, 1888.
I write to ask whether the Honorable Mr. Sutherland is still anxious that I should report upon the design of the Blacktown Railway bridges, and, if so, when I may expect to be supplied with the necessary documents.
Yours, &c.,
H. C. KERNOT.

Be good enough to furnish me with the plans (or tracings) of the bridge at Strathfield, known as the Phoenix design, adopted by Mr. Fischer.—Ch.A.G., 3/7/88. Engineer for Existing Lines, B.C., 3/7/88. Two blue prints herewith.—G.C., 7/7/88. Secretary. I understand that Professor Kernot has asked for these plans in connection with the report he has to make on Mr. Townsend's design of girder bridges; forward with Minister's approval.—Ch.A.G., 10/7/88. Minister wishes drawings forwarded properly protected.—H.M'L., 10/7/88.
When sending plans to Professor Kernot, of bridges which he is to report upon; please send Professor Warren's deflection tests, they will be found in report on bridges, and a copy of the weights of bridges sent to Warren.—Ch.A.G., 11/7/88.

Sir, Department of Railways, Sydney, 14 July, 1888.
Referring to your letter of the 28th ultimo, asking that you may be furnished with the documents necessary to enable you to report upon the bridges between Parramatta and Blacktown; I am desired by the Commissioner to forward herewith by Parcels Post, in tin cover, tracing showing the bridges, &c., and copy of deflection tests and weights of bridges supplied by Professor Warren:
I have, &c.,
D. VERNON,
Secretary of Railways.

Professor Kernot, the University, Melbourne: Secretary of Railways.

University of Melbourne, 28 July, 1888.
To the Honorable John Sutherland, M.P., Secretary for Works, Sydney,—

Sir,
In obedience to the request contained in the communication addressed to me by the Commissioner for Railways, dated June 18th, No. 3,300; I have the honor to submit the following remarks upon the bridges on the railway line between Parramatta and Blacktown, and also upon certain other bridges, of which particulars were forwarded me on the 14th instant, correspondence No. 3,795.

The bridges are enumerated in their proper order in the subjoined tabular statement:—

No.	Mileage from Sydney.	Number and size of spans.	Area of waterway to lower side of girders.	Area of country drained.	Square feet of waterway per mile of country drained.		
1	15 miles 20 chains	2 of 40 ft.	sq. ft. 1,400	About 20 square miles	220		
2	16 " 48 "	2 of 40 ft.	1,200				
3	17 " 53 "	1 of 40 ft.	440				
4	18 " 53 "	2 of 40 ft.	480				
5	19 " 34 "	1 of 40 ft.	200				
6	20 " 36 "	1 of 40 ft.	320				
7	20 " 72 "	1 of 40 ft.	360				
8	24 " 23 "	5 of 40 ft. and 8 of 30 ft.	3,200			25 square miles	128
9	24 " 78 "	1 of 40 ft.	240				
10	27 " 50 "	1 of 19 ft.	150			4 " "	127
11	28 " 12 "	2 of 19 ft.	120				
12	28 " 50 "	3 of 40 ft.	1,120			12 " "	93
13	30 " "	16 of 40 ft.	9,280				
14	30 " 14 "	3 of 40 ft.	1,920			110 " "	102
15	31 " 43 "	1 of 19 ft.	40				
16	31 " 76 "	1 of 40 ft.	240				
Total.....		29 of 40 ft. 8 of 30 ft. 4 of 19 ft.	510				
Salt Clay Creek, Cootamundra.....		8 ft. barrel culvert	53	20.3 square miles	22		

The first and most important consideration is that of waterway, for while on the one hand a deficiency in this respect may be fraught with great danger both to the railway itself and to adjoining properties, an unnecessary excess may easily lead to an increased cost far greater than, for instance, that which would be involved by the adoption of the least economical instead of the most economical type of iron girder in ordinary use.

The waterway required depends upon the area of the country drained, taken in conjunction with the rainfall and character of the surface.

The areas drained given in the preceding table were obtained from a map of the county of Cumberland, printed at the Surveyor-General's Office, Sydney. The scale is half-an-inch to the mile; and the map shows all the principal watercourses clearly and distinctly. In drawing the watershed lines I have had to some extent to use my judgment as to their probable position between the sources of the watercourses shown. Hence the areas given cannot be guaranteed as minutely accurate. On the other hand they cannot possibly be so largely wrong as to vitiate my conclusions, especially as I have, when in doubt, drawn the line so as to include as much country as possible, and thus reduce the apparently anomalous and excessive proportion of waterway to area drained that I shall presently refer to.

The rainfall is obtained from the statistics of rain gauging which show the district extending from Parramatta to Penrith to be subject to a very much smaller rainfall than that which obtains in Sydney and the immediate suburbs. This latter varies from 40 to 50 inches per annum, while the former is given by rainfall maps in my possession (and which were prepared in the Melbourne Observatory from data furnished by H. C. Russell, Esq., Government Astronomer, Sydney) as being only from 20 to 30 inches, thus corresponding with the rainfall in and about Melbourne, Sandhurst, and many other parts of Victoria where rainfall and stream discharges have been carefully observed for many years.

The determination of the proper waterway of a bridge or culvert draining a given area of country, from *a priori* considerations, is a difficult and somewhat indeterminate problem. Fortunately, however, there is a large mass of accessible experience connected with streams that have been well watched, and their behaviour recorded for twenty, thirty, or even forty years past, by means of which when the rainfall and general character of the country is known, the requisite waterway may be fixed with sufficient accuracy for all practical purposes.

Collating a considerable number of examples of old standing in parts of Victoria, when the rainfall and character of country corresponds with that between Parramatta and Penrith, I find that about 50 square feet of waterway answers very well for 1 square mile of country, 150 square feet for 5 square miles, 250 for 10 square miles, 400 for 20 square miles, and 1,200 for 100 square miles, the number of square feet of waterway required for each square mile of area drained diminishing as that area increases for very obvious reasons.

Comparing the waterways of the bridges between Parramatta and Penrith with the above results, one arrives at the astonishing conclusion that they are in various cases from four to nine times as large as they need be. For instance, we have 4,400 square feet waterway for 20 square miles of country, when 700* square feet should suffice, and 11,200 square feet waterway for 110 square miles of country, when about 1,300 should do.

With reference to the latter of these two instances, I may state that we have in Victoria two important rivers, the Yarra and the Barwon, each draining an area of about 1,600 square miles, which have for the past thirty years found no difficulty in passing through bridges only two-thirds the size of that provided at South Creek, near Penrith, for a catchment of only 110 square miles.

Even if we go to India, with its tropical climate, we find on the authority of Colonel Dickens, as quoted in "Jackson's Hydraulic Manual," a recent and standard book, that the flow of the streams of Bengal and Bahar is only double what has been observed in Victoria, and therefore the waterway required, even according to Indian experience, comes out from one-half to one-fifth of what has been actually provided in the various cases.

I therefore see no way of escape from the unwelcome conclusion that these bridges are enormously larger than is necessary, and so represent a most serious waste of public money.

As an example of a tremendous error in the opposite direction, I may refer to the case of the Salt Clay Creek, near Cootamundra, the scene of the great and fatal disaster of the 25th January, 1885. Here a culvert of 53 square feet waterway was provided to carry off the drainage of 20 square miles of country.

It was stated by Mr. Whitton, Engineer-in-Chief of the New South Wales Railways, in his sworn evidence to have been correctly designed and to represent his ordinary practice in these matters.† It really was a fair provision for 1 square mile of country only, and needed to be increased eightfold to enable it to discharge the drainage of 20 square miles. Mr. Whitton based his opinion on a calculation which started with the utterly erroneous assumption that 1 inch in 24 hours was the maximum rainfall that had to be provided for, whereas there are most abundant and reliable records of rainfalls at Sydney, Melbourne, Adelaide, Sandhurst, Ballarat, and other places of rain storms exceeding 1 inch per hour on numerous occasions during the past thirty years.

This astounding evidence on the part of an engineer of Mr. Whitton's position and experience caused the utmost horror and consternation amongst hydraulic engineers in Melbourne.

The contrast between the practice of the Railway Department at Cootamundra and on the line between Parramatta and Blacktown is most startling. The areas are in each case 20 square miles. The rainfall according to the best information accessible to me is practically the same, the country at least as unfavourable in the former as in the latter case, and yet at one place there is provided 53 square feet of waterway, and in the other 4,400!! Could inconsistency further go?

The only conclusion I can draw is that culverts and bridges on the New South Wales Railways have been constructed without any regard to the real requirements of the case, and I would strongly urge that without any delay measures be taken to determine approximately the areas draining through the various culverts and bridges, and compare the results with approved practice elsewhere. In this way information of the highest value in view of future railway construction will be obtained, and most probably the occurrence of disasters such as that at Cootamundra averted.

The

* I say 700, instead of 400, to allow for the fact that the water is discharged at several openings instead of one, there being several areas of about 3 square miles each instead of one of 20 square miles.

† See *Sydney Morning Herald* and *Daily Telegraph* of 13th June, 1885.

The tabular statement on pages 1 and 2 refer to the bridges as they exist at present. The drawings supplied me show the waterways to have been larger in the original timber bridges, and to have been reduced considerably in bridges 8 and 12, and slightly in the other cases in the original design for the permanent structures, and again in the case of No. 8 largely increased in the amended design. In view of the preceding investigation, I must regard this last alteration as a very grave mistake, involving serious loss of money.

Leaving now the question of waterway, I will proceed to discuss the secondary, but still important, questions of the construction of the brick abutments and piers and the iron girders.

Comparing the original with the amended design of the brick abutments, I find the original design to be superior in the following respects:—

1. The abutment-wall being battered on the face possesses much greater stability than if vertical, and distributes its weight more equally upon the foundation, thereby greatly reducing the liability to settlement.
2. The wing-wall guides the flood-water smoothly into the opening of the bridge, the stream lines (or paths of the particles of water) being less disturbed than in the amended design. This, practically, slightly increases the discharging power of the opening.
3. The counterforts are arranged with a definite relation to the girder seats strengthening the wall at the points where the girders discharge their load.
4. A mass of what appears to be hand-packed rubble is placed behind the wall. This would increase the stability and facilitate drainage.

On the other hand the width of the abutment in the original design is altogether insufficient to stop a double line embankment surmounted by the usual allowance of ballast. If terminated as shown 2 feet 9 inches below the bottom of the rail it would need to be at least 29 feet wide instead of 21 as shown and figured. Had the abutment been built as shown it would have been found necessary to raise the brickwork at least 2 feet 6 inches all round in order to prevent the ballast spilling over the edge.

The drawings of the original design of the abutment are not complete. A front elevation should have been made, and this would at once have revealed the necessity of considerably adding either to the height or width in order to retain the ballast.

The amended design is superior to the original design in the following respects:—

1. It is both higher and wider, and is sufficiently so for its purpose, but without any excess. From this point of view it is correctly designed. 2. The drawings are properly worked out, every view necessary for the information of the persons engaged in carrying out the work being given.

In neither the original nor the amended designs do I see any weepholes shown. This is a very grave omission and if it exists in the work as executed would go far to account for the failures I observed during a cursory inspection last month.

In both the original and amended drawings the thickness of the abutments and wing-walls appears rather scant, and in the original design the footings are decidedly weak, the projection of 9 inches being obtained in three courses only instead of at least six as in good practice. The amended design shows great improvement in this respect.

There is very little difference in the designs for the piers, but the drawing of the original design is rather obscure, so that I am not quite sure how the ends are formed. The piers in the amended design is a very good one and is very clearly shown.

Not having copies of the specification I am unable to discuss the quality of material or mode of construction.

A very brief inspection of some of these bridges leads me to believe that the failures are due to sinking of the foundation under the great pressure at the front edge of the abutment, due to its not being battered as originally designed. The steps being taken to prevent further movement appear judicious. I would suggest that great care be taken to bind the new work well into the old and to see that proper weepholes are left to drain away the water that may accumulate behind the wall.

The next point for discussion is the ironwork. The main girders of the 40 feet spans are of the type known as "Warren girders." This type is not very usual on so small a scale, though often employed for bridges of 80 or 100 feet spans. The usual, though by no means universal practice both in England and America, is to employ plate girders for such spans as those between Parramatta and Penrith. Many arguments have been used for and against both forms of girder, the comparative merits of which are probably nearly equally balanced.

On behalf of the Warren girder it is claimed,—

- 1st. That it is rather more economical of material.
- 2nd. That it requires a smaller number of rivets.
- 3rd. That it offers less surface to wind pressure.
- 4th. That in the event of water rising higher than was expected it can, if necessary, flow through the girders.
- 5th. That the metal being concentrated into comparatively massive bars, instead of being spread out in thin sheets is less likely to suffer serious reduction of sectional area through corrosion.
- 6th. That it is more pleasing in appearance. On behalf of the plate girder it is urged,—
 - 1st. That it is very rigid.
 - 2nd. That the work is simple and straightforward and costs less per ton than in the other (this is certainly true in Melbourne.)
 - 3rd. That it saves a few feet in height of the piers.

My own predictions are in favour of some open form of girder such as the Warren. At the same time I am bound to admit that the practice of the great majority of engineers including some of the highest eminence is in the other direction.

I have computed the stresses on the various parts of the girders both in the original and amended designs, and find that under an engine and tender of 70 tons weight, and 44 feet wheel-base they do not exceed 4 tons per square inch on the top and bottom members, and 2 tons per square inch on the central diagonals. These stresses are in accordance with the best practice and agree with the latest German investigations.

The

The compressive members are stiff enough to be in no danger of lateral buckling. The shearing and bearing areas of the rivets in the original design are ample if not excessive, and the riveted joints are consistently arranged.

The intersection of the mean fibres (or lines drawn through the centre of gravity of the cross sections) of the diagonals and bottom members is fairly accurate. In the case of the top member, this is not the case, the mean fibres of the diagonals meeting about 5 inches above the centre of gravity of the T shaped section built up of the plate and angle-irons. Hence there is a certain bending action. On the other hand the top member is made so massive (being nearly double the sectional area of the bottom member) that this bending action is innocuous. This additional sectional area could not in any case have been dispensed with, as the top member has to act as a beam to carry the weight from one apex to the next.

I have no information as to whether the holes were drilled or punched. If the latter I think that a flat bar only 5 inches wide as used in the end diagonal of the original design rather narrow for a double row of 1 inch rivets. If the former I should not urge this objection.

The top members of the four main girders are braced together in a horizontal plan, by a continuous lattice work of light angle-iron. This bracing is of great importance in view of heavy wind pressure on a train traversing the structure, and is the only lateral bracing that I regard as really essential in such a case. As designed it is abundantly strong for its purpose, but a bracing consisting of fewer and more massive members would have been cheaper and less likely to be injured accidentally during erection or afterwards.

In addition to this the outer girders are braced in a vertical transverse plan by a system of angle-irons,* the primary object of which appears to be to carry a gangway for foot passengers. I do not see what need there was for these overhanging gangways as any person desiring to cross the bridge could do so on the 6-foot.

The inner main girders are not braced in a vertical transverse plane, and would probably oscillate a little during the passage of a train. I do not think such oscillation would be dangerous, and I know of light Warren girders without lateral bracing that have carried railway traffic for years without mishap.

The rails are laid on continuous longitudinal sleepers, bolted on the top members of the girders.

In the amended designs the following modifications have been made:—

1. The girders have been spaced 5 ft. 6 in. apart instead of 4 ft. 8½ in., and transverse sleepers have been used instead of longitudinal. This I regard as an improvement, securing a more elastic road, a more effective gauge tie, and rendering the ironwork more accessible for inspection and painting.
2. The end diagonals have been made of 5 in. x 2½ in. x ¼ in. channel-iron instead of 5 in. x ¾ in. bars. This slightly simplifies construction by reducing the number of sizes of iron needed, but on the other hand renders the rivets rather less accessible, which is not a good thing.
3. The rivets have been reduced from 1 in. to ¾ in. diameter. This facilitates construction, but increases the stress on the shearing and bearing area of the rivets. The pressure on the bearing area is 6½ tons per square inch. This would not be objected to by British engineers, but Americans limit it to 5½ tons.
4. Additional rivets have been introduced connecting the plate and angle irons forming the top member. This I approve of, as in their absence the angle-irons would be deflected by the engine wheels independently of the plate.
5. The horizontal lateral bracing between the top members of the girders has been altogether altered. The alteration is in some respects an improvement, but not in all. The unnecessary overhanging part at each side is done away with, and the total number of bars somewhat reduced. Provision is also made for conveniently erecting one half of the bridge at a time. One of the defects of the amended bracing is that it does not extend to the ends of the main girders, but starts some distance short. Consequently under a heavy wind pressure there is a very considerable horizontal bending stress on the top members of the girders. Another is that the mean fibres of the diagonals do not intersect as they should in the centre line of the girder. I consider that a simple angle-iron bracing like a Warren girder laid on its side, and extending completely from end to end of the main girders, would have been simpler, cheaper, and better. I should apply it only between each pair of girders, leaving the central space under the 6 foot quite open.
6. The vertical transverse bracing introduced in the amended design I altogether object to. The practice of binding four girders together transversely by a stiff vertical system is wrong in principle and injurious in its effect. It causes the whole structure to twist when only one line of rails is loaded, thus increasing the deflection of the outside girder on the loaded side beyond what it would be were both lines loaded. The table of deflection supplied shows clearly how much more severely the outside girder is punished than the inside one. Careful experiments show that this injurious and unnecessary bracing reduces the strength of a bridge by about 10 per cent.

A four-girder bridge for a double line of railway should be made as two entirely separate bridges, each capable of deflecting independently of the other. If it is desired to connect them together so that they may aid each other in resisting wind pressure or other lateral force, the connections should either be made with winged joints (as is actually done in one of the largest and most recent Victorian viaducts), or should be so constructed as to be extremely flexible in a vertical direction while stiff and unyielding horizontally. I recommend that the central portion of this transverse vertical bracing be removed forthwith from all these bridges. The lateral portions are not injurious. They are probably of use in checking vibrations of the lower members of the main girders, but are larger and more complete than is necessary for the very slight stress they have to endure.

In concluding this part of my report I must bear witness to the completeness and clearness of the drawings of the amended design.

Amongst the drawings of the original design there is one (4 B) showing a small Warren girder of 19 feet clear span. With the design of this girder I cannot agree. The tension in the bottom member is but little over 20 tons, and for this a net sectional area of 9 square inches is provided where 6 would

* The drawing is incomplete, not showing at what points or how many times this tracing is introduced in the span.

would be enough. The compression on the end diagonal is 15 tons. This is discharged upon a length of half an inch of a pin $1\frac{1}{8}$ inches diameter, giving a diametrical bearing area of $\frac{1}{4}$ square inch corresponding to a bearing pressure of 16 tons per square inch, whereas 8 is regarded as good practice in England and $5\frac{1}{2}$ in America. The top members of these girders are efficiently but not economically braced in a horizontal plane, but no bracing is shown in a transverse vertical plane. In the present case this is a serious omission, as the girders are supported on the bottom, and not, as in the case with the larger ones, by the top member, and hence need at each end an efficient vertical transverse bracing to prevent them falling over sideways. I note, however, a pencil memorandum which appears to intimate that the drawing is not complete or authoritative.

In bridge drawing No. 3 we have a plate girder designed to replace the preceding. It is in almost every respect preferable, being amply strong and comparatively simple. I must confess, however, to a little misgiving as to the durability of a plate-web $\frac{1}{4}$ inch thick, though I must admit these thin webs are greatly used in Victoria and elsewhere. Fifty years hence more will be known on this question of durability. In any case I would suggest that periodical painting be not neglected.

In drawing No. 1 of contract No. 3 we have details of the additional 30-foot girders for bridge No. 8. These contain sufficient iron to render them equal in strength to the 40-foot Warren girders in the same bridge.

The pressure on the bearing area of the rivets connecting the web and flanges is rather high near the ends of this girder, reaching 8 tons per square inch. Had the pitch been reduced to 3 inches per 8 feet at each end it would have been better practice.

The lateral bracing of these 19 and 30 feet girders is most erroneously designed.

The requirements of the case are threefold, and are stated below in order of importance:—

1. To keep the top flanges from bending sideways under wind-pressure, &c.
2. To keep the ends of the girders perfectly upright.
3. To keep the bottom members from vibrating laterally.

In designing the tracing of their bridges the first two requirements have been utterly ignored. There is no horizontal lateral bracing, and consequently the girders are subject to horizontal bending actions of serious amount, due to wind-pressure. There is no transverse vertical bracing at the ends of the girders, at which point most Victorian bridges of similar design have a massive transverse diaphragm-plate, while the third and least important requirement has occupied the whole attention of the designer, who has introduced costly massive transverse frames, which weaken the main girders 10 per cent. by the objectionable twisting they cause. In the 30-foot spans one of these frames is situated in the exact centre of the span—the spot where it does most harm by causing twisting; and further, its attachments cut away a full square inch of metal at the very place where the tension due to the load is most severe, and all the available strength is needed. I would urge that the objectionable transverse frames be removed from under the 6-foot, thereby allowing each pair of girders to deflect independently; that a horizontal Warren girder bracing of stout angle-iron be introduced between the top flanges of each pair of girders, and that the ends of each pair of girders be united by a diaphragm-plate or stiff bracing frame. If this be done, the bridges will become fairly satisfactory structures.

Lastly, a drawing has been forwarded of a bridge at Strathfield (7 miles 38 chains). This is a most meritorious example of a plate-web bridge. In it all the mistakes I have so far condemned are most carefully avoided. As special points in which it compares favourably with the 30-foot girders previously mentioned, I may note—

1. It has a greater proportional depth, which conduces both to economy and rigidity.
2. The flanges vary in section with the varying stress, instead of being uniform throughout, or, as is actually the case with the 30-foot girders, being weakest when they should be strongest.
3. The riveting is intelligently arranged, the pitch diminishing toward the ends where the horizontal shearing stress increases.
4. Each pair of girders forms a distinct structure capable of deflecting independently of the other, whereby twisting and undue punishment of the outer girder is obviated.
5. The horizontal lateral bracing is well carried out and extends quite up to the ends of the girders.
6. The ends of the girders are substantially braced by a massive transverse frame.
7. The bridge is about one-third stronger than the 30-foot or 40-foot girders between Parramatta and Penrith. The objection of these webs on the score of corrosion of course applies to this bridge. How much weight should be attached to it is a question of debate.

In conclusion, I append a brief summary of the results arrived at:—

1. In view of long experience under similar conditions in Victoria and elsewhere, I am compelled to regard the bridges between Parramatta and Penrith as unduly and wastefully large.
2. That this excess, coupled with the frightful and fatal deficiency at Cootamundra, drives me to the unwelcome conclusion that there is no proper system of proportioning waterways in use in the New South Wales Railway Department.
3. That the original design for the brick abutments was better than the amended one, in view of stability, free flow of water, and intelligent arrangement of counterforts; but that it was defective in not possessing sufficient width and height to stop the bank, in having ill-proportioned footing courses, and in not being fully delineated in the drawings. In these latter respects the amended design was unexceptionable.
4. That the failure was probably due to the foundations yielding under the unequally distributed pressure; and that, had the abutments been built according to the original design (but with the necessary additional width and height), would most likely not have occurred.
5. That the relative merits of Warren and plate girders are a fair subject for difference of opinion.
6. That the original and amended designs of the Warren girders, of 40 feet span, do not differ much in merit; the original being better in point of principle, but the amended better worked out in detail and better shown in the drawings.
7. That the lateral bracing of the bridges, as carried out, causes an objectionable twisting when one line of way is loaded, unduly punishing the outside girder and reducing the strength of the bridge about 10 per cent.

8. That the 19-foot Warren girder is objectionable as having far too great stress on the bearing area of the end pin, and further needs special bracing to keep the ends of the girders upright.
9. That the 19-foot plate girder replacing the last is abundantly strong.
10. That the 30-foot plate girder is about the same strength as the 40-foot Warren girder; but that it suffers, as also does to some extent the 19-foot plate girder, from a most unsuitable system of lateral bracing, which ignores the most important requirements, and weakens the bridge by unduly loading the outside girders.
11. Lastly, that the Srathfield Bridge is a most intelligent design, free from all the faults of the others, about one-third stronger, and highly commendable.

As no particular issues were definitely referred to me with regard to these bridges, I have treated them from a general all-round point of view.

I trust that my remarks may be of use to the Department in the way of enabling it to avoid or remedy past errors, and secure in future structures perfect safety at a minimum cost.

I have, &c.,

W. C. KERNOT, M.A.C.E.,
Professor of Engineering.

6 A.

NOTE *re* supposed effect of Hawkesbury back-water on tributary creeks.

It has been supposed in some quarters that, as the Hawkesbury River backs during high floods up the tributary creeks, it requires larger bridges to be used upon them than would be needed by their own proper discharge. This view I have very carefully considered, and have further made a series of hydraulic calculations and comparisons with Victorian streams whose behaviour is well known, and I cannot see that the view is a correct one.

The country between Windsor, St. Mary's, and Penrith is generally so low and so level that a high Hawkesbury flood would spread far and wide, inundating miles of country just as the Murray about Echuca does. But, owing to the very small fall or hydraulic gradient, this submergence would be by quiescent or very sluggishly flowing water, incapable of any destructive action. Also a great flood in the Hawkesbury would neither rise nor fall instantaneously, but would take many hours, or indeed days, during which comparatively small openings would permit the passage of all the back-water. This is the only conclusion I can arrive at after the most careful study of the question.

W. C. KERNOT.

1888.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

BRIDGES ON DUPLICATED LINE BETWEEN
PARRAMATTA AND PENRITH.

(CORRESPONDENCE, ESTIMATES, AND REPORTS, RELATIVE TO.)

Ordered by the Legislative Assembly to be printed, 1 November, 1888.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 14th June, 1888, That there be laid upon the Table of this House,—

“Copies of all correspondence, estimates, and reports, relative to the bridges on the duplicated line between Parramatta and Penrith (prior to the date of Professor Warren’s Report), together with copies of Mr. Townsend’s plans and sections of these bridges, and the amended plans and sections finally adopted for the construction; also copies of all correspondence relating to and sections of the additional work recently found necessary to strengthen and support the abutments of these bridges.”

(Mr. Lyne, for Mr. J. P. Abbott.)

SCHEDULE.

NO.	PAGE.
1. Minute of Commissioner for Railways <i>re</i> doubling line Parramatta to Penrith, with estimate of cost, &c. 1 September, 1882.....	2
2. Minute of Commissioner for Railways for further particulars as to cost of bridges, with statement, reports, minutes, &c. 22 September, 1882.....	3
3. Minute of Commissioner for Railways <i>re</i> survey and tenders being called for work. 24 March, 1883 ..	4
4. Letter from Mr. T. R. Smith, M.P., and reply thereto. 9 April, 1883 ..	4
5. Minute of Commissioner <i>re</i> Mr. Townsend’s new form of girder, minutes, &c. 26 July, 1883.....	4
6. Letter from Mr. Townsend to Commissioner <i>re</i> girders, with minutes and detailed statement of cost, with Minister’s decision. 18 February, 1884 ..	5
7. Reports from Mr. Townsend, with cost of bridges. 6–29 March, 1884.....	6
8. Question asked in House by Mr. T. R. Smith, M.P., <i>re</i> calling tenders for work. 16 April, 1884.....	6
9. Letter from Mr. Thos. Wearne to Minister <i>re</i> cash deposit required with tenders. 18 July, 1884.....	7
10. Letter from Messrs. D. & W. Robertson to Mr. G. R. Dibbs, M.P., <i>re</i> amount of deposit, minutes, and reply thereto. 18 July, 1884.....	7
11. Letter from Under Secretary for Public Works, enclosing tenders received, with analysis of same, for supply of iron bridges. 29 July, 1884 ..	7
12. Letter from Messrs. D. & W. Robertson to Mr. G. R. Dibbs, M.P., <i>re</i> alteration of specification; minutes; acceptance of D. & W. Robertson’s tender. 2 August, 1884 ..	7
13. Letter from Under Secretary for Public Works covering tenders received for duplication of line; minutes, &c.; acceptance of Mr. John Ahearn’s tender. 29 July, 1884 ..	8
14. Letter from Mr. Ahearn to Commissioner <i>re</i> reduction in amount of deposit; Commissioner’s decision. 31 August, 1884 ..	9
15. Deposit receipts forwarded by Mr. Ahearn. 8 September, 1884.....	9
16. Letters from Messrs. D. & W. Robertson to Engineer for Existing Lines <i>re</i> proposed alteration in bridges and difference in price, with report from Assistant Engineer. 9, 11, & 18 September, 1884 ..	9
17. Minute of Deputy Engineer to Engineer for Existing Lines <i>re</i> nature of alterations—report from Assistant Engineer, Commissioner’s minute, and Minister’s decision. 12 September, 1884.....	10

No. 1.

Minute by The Commissioner for Railways.

Doubling the line from Parramatta to Penrith.

MR. COWDERY to state what the cost of the above work would amount to.

CH.A.G., 1/9/82.

Mr. Hyndman for cost.—G.C., 4/9/82. Urgent. Estimated cost, £84,203.—R.A.H., 4/10/82.
 The Engineer for Existing Lines. Commissioner.—G.C., 5/10/82. Be good enough to furnish details of this estimate. Is not the line made for double way and the bridges also. Why, under these circumstances, should 20 miles of line cost over £4,000 a mile?—CH.A.G., B.C., 6/10/82. Mr. Cowdery. Detailed statement attached.—G.C., 13/10/82.

DETAILED estimate of doubling line Parramatta to Penrith from 14 miles 60 chains to 33 miles 60 chains.

Earthwork	£8,502
Doubling bridges	28,512
Doubling culverts	850
Level crossings	250
Stations	250
Permanent-way	43,939
Over-bridges	1,500
Platforms	250
Timber openings...	150

£84,203

Estimate for the bridges is based upon the assumption that all the present bridges will be replaced by new iron ones, and the proportion due to doubling them is charged to this estimate, that is, the difference between the cost of bridges for double and single way. The banks and cuttings require to be made wider, generally about 11 feet. In some few instances they have been slightly widened. The old bridges are all for single way

Engineer for Existing Lines.

R.A.H., 12/10/82.

My questions are not answered.—CH.A.G., B.C., 18/10/82. Mr. Cowdery. Mr. Hyndman, for replies to Commissioner's questions.—G.C., 18/10/82. No; the bridges and cuttings are not made for double way.—R.A.H., 19/10/82. Engineer for Existing Lines. Commissioner.—G.C., 20/10/82.

No. 2.

Minute of The Commissioner for Railways.

WHAT is the estimated amount to be charged to working expenses in consequence of the renewal of timber with iron bridges for the single way, and which would have to be incurred sooner or later whether the line was doubled or not?

I understand that this amount, whatever it may be, will be in addition to the sum of £84,203—the estimate for doubling the line, and which will, of course, be charged to capital account.—CH.A.G., B.C., 22/10/82. Mr. Cowdery.

Mr. Hyndman.—G.C., 23/10/82. Urgent. £39,798 for renewing timber bridges with iron ones for single way; this sum is in addition to the estimate of £84,203 for doubling the line.—R.A.H., 25/10/82. The Engineer for Existing Lines.

How long would the present timber bridges last if it were determined not to replace them with iron ones, consequent upon the doubling of the line. Please enumerate the bridges and their position, and the cost of renewing each for single way, and the probable time for renewal in each case.—CH.A.G., B.C., 23/10/82. Mr. Cowdery.

Mr. Hyndman.—G.C., 3/11/82. Urgent. A report attached, containing information required by the Commissioner.—R.A.H., 15/11/82. Engineer for Existing Lines. Commissioner.—G.C., 16/11/82.

* To repairing present bridges to make them last from five to seven years. This estimate does not include the domain bridge. † To doubling lines. ‡ Double line.

South Creek Bridge.—It is in such bad repair as to be dangerous, and the white ant has got such hold that it is impossible to say what portion is sound. The same remark applies to a less extent to all the timber bridges.

GEO. WM. TOWNSEND.

Amended estimate for bridges furnished to Mr. Cowdery. Total amount, £66,918.—G.W.T., 14/2/83.

The present timber bridges, if repaired, may last from five to seven years. Such repairs will cost about £6,000. Without such repairs they are at present unsafe. If the line is doubled it will be impossible to keep the present bridges without incurring great needless expense. For remuneration, position, and description of bridges, see detailed report attached. The whole of the wooden bridges ought to be replaced by iron ones at once, as the white ant is in the timber to an alarming extent.—R.A.H., 15/11/82. Engineer for Existing Lines.

The bridges reported to be unsafe must be made safe at once, especially South Creek Bridge reported to be dangerous. Engineer for Existing Lines to note and to return papers early.—CH.A.G., 17/11/82.

Mr. Hyndman to carry out Commissioner's minute, 17/11/82.—G.C., 20/11/82.

Three gangs of men are constantly employed on repairs of these bridges. One gang is now at South Creek. Every precaution is taken, but it is impossible to say any of these bridges are safe.—R.A.H., 24/11/82. Engineer for Existing Lines.

Commissioner.—G.C., 27/11/82.

Mr. Cowdery will please visit these bridges at once and test them. If not safe, as Mr. Hyndman persists in saying, the trains must be run over them at greatly reduced speed; but it is probable that Mr. Hyndman is using alarming language unnecessarily.—CH.A.G., 29/11/82.

I visited these bridges yesterday, and tested two (the South Creek and Eastern Creek) with a heavy engine. The South Creek Bridge is in a bad state. I had some of the worst of the girders bored and found white ant in them. One was very bad, but a temporary support was put under the centre of it, making it perfectly safe for the running of the traffic; but it was so bad that I did not like taking the risk of removing the upright to test the strength with the heavy engine I had for the purpose. Several of the other girders have temporary uprights under them until they can be removed; and the great drawback to this is the non-supply of girders, and which, I believe, has been the case for years. At the present time we want at least 1,000, but they come in very slowly. In the course of a few years this class of timber will be more difficult to obtain than it is now. At the same time we do not feel the want to anything

anything approaching the extent we shall do in a few years, when the bridges on the late extensions begin to decay, some of which are of enormous extent; viz., the Wagga Wagga Bridge and others on the north. I would therefore recommend that no more bridges with wood tops be constructed on any of the extensions or it would be almost impossible to keep pace with the demands for repairs.—G.C., 1/12/82.

What progress has been made towards strengthening these bridges? Mr. Cowdery for early report.—CH.A.G., B.C., 1/2/83. Mr. Hyndman for immediate report.—G.C., 12/2/83. Urgent. Mr. Purton for report.—R.A.H., 13/2/83. Report herewith.—J. P. PURTON, 15/2/83. The District Engineer. *Re* strengthening timber bridges Parramatta to Penrith. 17 miles 9 chains.—A line of temporary girders fixed under road. 24 miles 43 chains, Eastern Creek.—Temporary struts fixed under ten bays. 30 miles, South Creek.—Temporary struts fixed under fourteen bays.—J. P. PURTON, 15/2/83. The District Engineer. Engineer for Existing Lines.—R.A.H., 16/2/83. Report of work done attached.—G.C., 17/2/83. Commissioner.

In an important matter like this I should prefer having Mr. Cowdery's guarantee that the precautions taken have made the bridges safe. Mr. Cowdery sends the paper to Mr. Hyndman, who apparently does not know what has been done, as he sends it to Mr. Purton, and then it is returned to me without comment on Mr. Purton's report. I must have Mr. Cowdery's assurance that the bridges are safe.—CH.A.G., 26/2/83.

These bridges are now quite safe.—G.C., 19/3/83. Commissioner.

No. 3.

Minute of The Commissioner for Railways.

Doubling line from Parramatta to Penrith.

THE bridges on this length have recently been repaired, and will be serviceable, the engineer states, for at least five years. As at the end of that time they must be renewed at an expense of £40,000, it is submitted that they should be made of a size to carry a double line of rails—the cost of renewing the bridges for a double way will be £68,310.

The traffic upon this section of the line is now so great that I think no time should be lost in making provision for doubling it—the cost will be:—

Bridges, £68,310 (of which £40,000 will be chargeable to working expenses) ...	£28,310	0	0
Permanent-way, rails, &c. ...	55,893	0	0
			<u>£84,203 0 0</u>

or (say) £85,000 to be paid from capital.

CH.A.G., 24/3/83.

Provision having been made on the Loan Estimates for this service, these papers might now be returned to the Under Secretary for Public Works.—F.K., 12/4/83. The Under Secretary for Public Works.—J.T., B.C., 12/4/83. Railways.—J.R., B.C., 14/4/83. Mr. Cowdery.—G.B., B.C., 7/5/83. Will Commissioner please say if survey may be made, and plans and sections prepared for the purpose of inviting tenders for this work.—G.C., 18/5/83. Commissioner. Yes.—CH.A.G., 19/5/83. Mr. Cowdery., B.C. Mr. Hyndman to have surveys made and plan and sections prepared.—G.C., 22/5/83. Mr. Townsend.—R.A.H., 23/5/83. Two surveyors put on to this work.—G.W.T., 28/5/83. District Engineer. Two surveyors now engaged on this.—R.A.H., 1/6/83. The Engineer for Existing Lines: Two surveyors are now engaged on this work.—G.C., 2/6/83.

No. 4.

T. R. Smith, Esq., M.P., to The Commissioner for Railways.

Dear Sir,

9 April, 1883.

As the traffic of the Western Line is increasing so rapidly, it appears to me necessary that you should at once approve of a double line to Penrith. This is a matter I have brought before your notice months since.

Yours, &c.,
T. R. SMITH.

Inform that provision has been made by Parliament for doubling the line to Penrith.—CH.A.G., 20/4/83.

Sir,

Department of Railways, Sydney, 21 April, 1883.

With reference to your letter of the 9th instant, urging the necessity for the construction of a double line to Penrith, I have the honor to inform you that provision has been made by Parliament for this work.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

T. R. Smith, Esq., M.P., Sydney.

No. 5.

The Minute of Commissioner for Railways.

MR. TOWNSEND has, I understand, a new form of girder (or new in the Colony) for iron bridges. It is cheaper in construction and lighter in proportion to its strength than any girder we now use, and at the same time is equally, if not more, stable.

I think, if Mr. Cowdery sees no objection, that a specimen girder might be made in our workshops, and be subjected to a test,

CH.A.G., 26/7/83.
Mr.

Mr. Hyndman to have a girder made in shops and tested.—G.C., 27/7/83. Mr. Townsend for drawing.—R.A.H., 30/7/83. Noted.—G.W.T., 30/7/83. Please give charge.—R.A.H., 31/7/83. The Engineer for Existing Lines. Charge to revenue.—G.C., 1/8/83. Mr. Hyndman. Mr. Purton.—R.A.H., 2/8/83. Noted.—J. PURTON, 6/8/83. Engineer for Existing Lines.—R.A.H., 7/8/83.

No. 6.

Mr. G. W. Townsend to The Commissioner for Railways.

Sir,

Redfern, 18 February, 1884.

I have the honor to inform you that the girders I have designed by your orders for replacing the wooden bridges and viaducts are proved under a severe test a complete success. Bridges constructed with these girders will be less than half the weight of any iron bridge of similar span (42 feet) that has hitherto been built on our railway lines while they will be exceedingly rigid under load, and very durable.

I have the honor to request that I may be allowed the necessary machinery for the construction of girder work at a cost not to exceed £2,000, viz., a hydraulic riveter, a multiple driller, and a cold saw; with this machinery I can turn out these girders at a cost for labour only of £7 per ton. I can import suitable iron for about £8 per ton.

I have further the honor to request that I may be allowed to design and construct a bridge for 150 ft. clear span for double line to be charged to Store Advance Account, the weight of main girders not to exceed that of the main girders in our "light lattice girder bridges" of similar span for single line, but the weight of ironwork in the bridge will of course be greater than in our existing bridges by reason of the greater length of cross girders required for double line, such bridge to carry a line load of 3.5 tons to the foot run safely equal to twice and a half the line load, that is considered excessive to apply as a test load on our existing "light lattice bridges."

When I am supplied with the machinery applied for, the cost for proposed bridge will not exceed £18 per ton, after one is made I can turn them out for about £15 per ton, with iron at £8 per ton. I am willing to make the offer publicly if need be, and stand or fall by the result.

I have, &c.,

GEO. WM. TOWNSEND.

If such girders can be made in England at £11 a ton, I do not see why we should pay £18 or even £15 a ton for them.—CH.A.G., 18/2/84. I wish Mr. Cowdery to make an independent test of these girders, and to report exactly their behaviour under trial, and further to express his views on their stability and general suitability.—CH.A.G., 18/2/84.

I have tested these girders with a weight of 64 tons rolling by 9 tons dead load, being equal to the heaviest running load that can be put on them. They are perfectly rigid, the deflection being I may say scarcely perceptible. They are in every way suitable where there is sufficient headway, and particularly so for duplicating a line, as the roadway can be completed before interfering with the old line. I do not quite see the advisability of constructing a bridge 150 feet clear span to be charged to Store Account. If such a bridge was required anywhere it would be different; I could then only recommend it as an experiment, as there is already plenty of work in the Department.—G.C., 7/3/84. Commissioner.

The Minister to see. I cannot recommend any experiment of the kind referred to by Mr. Townsend, but if the Engineer for Existing Lines is satisfied that the girder would be a good one to adopt for the bridges which are to replace the wooden bridges on the double line to Penrith, I would recommend their adoption.—CH.A.G., 18/3/84.

It would be well, before submitting this paper, if Mr. Cowdery would state what the cost of these bridges would be if constructed with these girders, and what the cost would be if constructed upon the design usually adopted here; and also what the cost of wooden bridges would be.—CH.A.G., 18/3/84.

The cost of bridges if constructed with these girders would be £42,600. If constructed of timber, £58,000. If constructed of plate, main girders, and cross girders, £70,000.

Detailed statement attached.—G.C., 25/4/84. Commissioner.

Doubling line—Parramatta to Penrith—Detailed statement of relative cost of bridges.

Proposed new girders 1,704 feet aggregate length double line.

Ironwork in 44 ft. spans, 35 tons per ft., @ £20	£11,928
Brickwork 8,180 cub. yards, @ £3	24,540
Longitudinal sleepers and flooring	6,132
	<u>£42,600</u>

£23.3 per foot run.

Timber 2,670 feet aggregate length double line.

This extra length of opening is necessary to keep the tail of the banks clear of the water.	
2,670 feet, average cost per ft. £16.3	£43,521
Add extra cost of keeping line open	14,479
	<u>£58,000</u>

£21.72 per foot run.

Plate main girders and cross girders 1,704 feet aggregate lengths double line.

1,704 ft. ironwork in 44 ft. spans, 64 tons per foot, @ £36	£39,260
including temporary work for keeping traffic open.	
Brickwork 8,180 cub. yards, @ £3	24,540
Longitudinal sleepers and flooring	6,200
	<u>£70,000</u>

£40.0 per ft. run,

GEO. WM. TOWNSEND, 10/4/84.

Cost

Cost of bridges for doubling line beyond Parramatta to Penrith.

With the new girders, 1,704 ft.	£42,600
With timber, 2,670 ft.	58,000
With plate girders and cross girders similar to the Parramatta Bridge, 1,704 ft.	70,000

(This cost in each case is for double line).

The principal cause of the great cost of timber bridges for this work would be the difficulty of carrying up the portion for the new line while keeping the old open for traffic. The same remark applies to the ordinary iron bridges but not to the new proposed bridges, as with them one line can be built quite independently of the other.

GEO. WM. TOWNSEND.

I recommend the adoption of Mr. Townsend's girders for the bridges to replace the wooden bridges on the double line to Penrith.—CH.A.G., 29/4/84. Can this work be done in the Colony.—F.A.W., 30/4/84. Mr. Cowdery, B.C. Yes; the work can be done in the Colony.—G.C., 2/5/84. Commissioner. I concur in Commissioner's recommendation. Let tenders be called in two forms—(1) work to be imported; (2) work to be done in the Colony.—F.A.W., 7/5/84. Mr. Cowdery, B.C. Mr. Townsend to note and return.—G.C., 12/5/84. Noted.—G.W.T., 13/5/84. The Engineer for Existing Lines. Noted.—G.C., 15/5/84. Commissioner.

No. 7.

Report by Mr. G. W. Townsend.

Re building girders in Permanent-way Shops.

See original.

By importing proper machinery we can reduce the cost of such work in the Colony at least 25 per cent., without in any way reducing the profit, and under the trade independent of skilled labour in case of strikes, for any intelligent labourer is capable of working all the machinery used.

In case of using imported iron, the cost of freight and transport from wharf to yard of such iron, allowing for waste, will be less than that of girders containing the same amount of iron, and will be less liable to damage during transport.

The principal reason of the great difference between cost of girder work done out here and that of imported work is that we use too much hand labour, nearly the whole of which has to be skilled labour. About £2,000 will supply the necessary machinery, viz., multiple driller, travelling riveter, and cold saw.

We require about 700 tons of girders for doubling the line, Parramatta to Penrith. The last imported girder work (Cook's River) cost, landed on the trucks in railway yard, over £17 per ton. I am confident we can turn out this work here for £15 per ton, with iron at £8; so on the one job we can save the cost of the required machinery—£2,000. Suppose we make only the 700 tons, we shall have established an important local industry; for the various firms of contractors will soon profit by our experience, and will successfully compete with us as to price, while we shall have increased the efficiency of our workshops at a trifling outlay.

GEO. WM. TOWNSEND, 6/3/84.

Since writing the above I have made a fresh design for the girders, Parramatta to Penrith, in which I have reduced the number of rivets to less than half of what were in the old design, in which I noticed several minor points that could be improved while retaining the main features of the design, getting a rather stronger girder without extra weight, with greater simplicity of design.—GEO. WM. TOWNSEND, 29/3/84.

Cost of bridges for doubling line beyond Parramatta.

With the new girders, 1,704 ft.	£42,600
With timber, 2,670 ft.	58,000
With plate girders and cross girders, similar to the Parramatta Bridges, 1,704 ft.	70,000

(This cost is for double line).

The four bridges in Parramatta are estimated to cost £22,000. The same to be replaced by timber would have cost about £14,000.

The principal cause of the great cost of timber bridges for this work would be the difficulty of carrying up the portion for the new line while keeping the old open for traffic. The same remark applies to the ordinary iron bridges; but not to the new proposed bridges, as with them one line can be built quite independently of the other.

GEO. WM. TOWNSEND.

The Engineer for Existing Lines.

Return must be made out without reference to works under contract.—G.C., 27/3/84. Mr. Hyndman. I put this information in the return, as the last I sent in was sent back for this same information.—G.W.T.

No. 8.

Question.

LEGISLATIVE ASSEMBLY—WEDNESDAY, 16 APRIL, 1884.

(5) RAILWAY FROM PARRAMATTA TO PENRITH:—Mr. T. R. Smith asked the Secretary for Public Works,—When will tenders be called for doubling the railway line from Parramatta to Penrith?

Mr. Wright answered,—During the currency of the present month.

Mr. Cowdery.—G.B., B.C., 26/4/84. Specifications are now being printed, and will, I hope, be completed in a few days.—G.C., 29/5/84. Commissioner. Mr. Cowdery—G.B., B.C., 9/6/84. Draft advertisements (2) inviting tenders herewith.—G.C., 30/6/84. Commissioner. Let me see specification and plan.—CH.A.G., B.C., 1/7/84. Mr. Cowdery. Two specifications and eight plans herewith.—G.C., 3/7/84. Commissioner. Insert advertisement. I see provision is made for safety of public.—CH.A.G., 5/7/84. Mr. Cowdery.—R.J.S., B.C., 7/7/84. Noted.—G.C., 9/7/84. Commissioner.

No. 9.

7

No. 9.

Mr. T. Wearne to The Secretary for Public Works.

Sir,

386 Sussex-street, Sydney, 18 July, 1884.

I have the honor to respectfully direct your attention to the great disadvantage I, as a local tenderer in common with others, am placed at, through the cash deposits required on contracts. Tenders are now invited for iron bridges required in the duplication of line from Parramatta to Penrith, the cash deposit on which is £2,000.

The whole of my capital, excepting that which I require for labour and material, is locked up in plant and machinery, which I have specially erected to enable me to carry out works of this class to any extent. I have been contracting with the Government for the last sixteen years, and have never failed in completing any contract satisfactorily; but if it is compulsory for me to make the cash deposit to make my tender formal, I shall be debarred from tendering, although I could find approved sureties for the amount required.

Trusting you will kindly give the matter your favourable consideration, and accept the sureties in place of the deposit,—

I have, &c.,

THOMAS WEARNE.

No. 10.

Messrs. D. & W. Robertson to The Acting Secretary for Public Works.

Central Exchange Buildings, York-street, Sydney, 18 July, 1884.

Dear Sir,

Duplication of line from Parramatta to Penrith.

Referring to the ironwork portion of this contract, at present being called for, we notice the deposits required by the specification from the successful tenderers will be £2,300 in all.

As we consider such a very large deposit for such a comparatively small contract to be rather too much we bring the matter under your notice with a view to get it reduced, which would be for the benefit of all likely tenderers.

I have, &c.,

D. & W. ROBERTSON.

P.S.—The total value of this contract is not likely to exceed £15,000 altogether, and we think a deposit more in proportion to what railway contractors have to place, would facilitate tendering.—D. & W.R.

Railways for report.—J.R., B.C., 21/7/84. Mr. Cowdery for report.—R.J.S., B.C., 22/7/84. I cannot recommend that the security be reduced.—G.C., 25/7/84. Commissioner. What is the estimated amount of contract.—CH.A.G., 26/7/84. Mr. Cowdery. Urgent. Estimated amount, £12,825.—G.C., 29/7/84. Commissioner. Inform.—CH.A.G., 29/7/84.

Gentlemen,

Department of Railways, Sydney, 6 August, 1884.

I have the honor to acknowledge receipt of your letter, addressed to the Acting Secretary for Public Works, asking for reduction of amount of deposit required from contractors for duplicating line, Parramatta to Penrith, and have to inform you that I am unable to sanction any reduction in the amount.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Messrs. D. & W. Robertson, Central Exchange Buildings, York-street.

No. 11.

The Under Secretary for Public Works to The Commissioner for Railways.

Sir,

Department of Public Works, Sydney, 29 July, 1884.

The tenders, three in number, for the work specified in the margin, are referred to you for report, and you will have the goodness, as early as possible, to return them to me direct for submission to the Minister.

I have, &c.,

JOHN RAE.

Supply of iron bridges—Duplication of line between Parramatta and Penrith.

The Engineer for Existing Lines.—CH.A.G., B.C., 29/7/84.

Iron bridges for duplication of line—Parramatta to Penrith—Analysis of Tenders.

	£	s.	d.
D. & W. Robertson	11,365	6	3
Mort's Dock and Engineering Co. (Limited)	14,175	0	0
Hudson Brothers (Limited)	14,850	0	0

The tender of D. & W. Robertson is the lowest, and I recommend it be accepted.

G.C., 1/8/84. Commissioner.

Recommended.—CH.A.G., 5/8/84.

Approved.—G.R.D., 11/8/84.

No. 12.

Messrs. D. & W. Robertson to The Acting Secretary for Public Works.

Central Exchange Buildings, York-street, Sydney, 2 August, 1884.

Iron bridges, duplication of line—Parramatta to Penrith.

Dear Sir,

We have the honor to bring under your notice our tender for the supply of the above bridges, amount £11,365, or £16 16s. 9d. per ton overhead.

We

We believe this to be the lowest price such ironwork has been tendered for in N.S.W.; and it is our desire to make them in the Colony, so that they may be made under the inspection of the Government officers while in the course of construction, so much difficulty and dissatisfaction has been lately found with imported work, notwithstanding every precaution having been taken in England, and after the strictest inspection by the Agent-General's representative, John Fowler, Esq.

To make above important work in Sydney would cost a little more than if it were made in England; but not very much in this case, as the specification, we understand, has been got up specially for this purpose. The option, however, was given for importers to tender against colonial manufacturers, and the price has accordingly been cut down to the lowest possible limit.

We are aware of a slight preference having been given for colonial manufacture on one occasion, and we beg respectfully to suggest that if the Government can see no objection in this case, that we be allowed an inducement to make this work in Sydney if the Government decide to accept our tender, as it would enable us to give employment to ironworkers, and would assist the establishment of an important colonial industry.

We would be quite satisfied to make the work in Sydney for the Government estimate.

We have, &c.,

D. & W. ROBERTSON.

P.S.—This suggestion is without prejudice to my tender as it now stands.

Before the letter of acceptance is forwarded will you please report on this letter?—R.J.S., B.C., 12/8/84. Mr. Cowdery. I cannot recommend that the specification be departed from, nor any increased price be given.—G.C., 15/8/84. Commissioner.

Gentlemen,

Department of Railways, Sydney, 20 August, 1884.

I have the honor to accept your tender, dated 29th ultimo, for the supply of iron bridges in connection with the duplication of the Great Western Railway from Parramatta to Penrith, in accordance with plan and specification, and to the entire satisfaction of the Engineer for Existing Lines of Railway for the sum of £11,365 6s. 3d.

Please forward deposit receipt for cash security mentioned in the specification, in order that the bond may be prepared by the Crown Solicitor.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Messrs. D. & W. Robertson, York and Market Streets, Sydney.

No. 13.

The Under Secretary for Public Works to The Commissioner for Railways.

Sir,

Department of Public Works, Sydney, 29 July, 1884.

The tenders, twelve in number, for the work specified in the margin, are referred to you for report, and you will have the goodness, as early as possible, to return them to me correct, for submission to the Minister.

I have, &c.,

JOHN RAE.

Mr. Cowdery for report.—Ch.A.G., 29/7/84

Doubling line—Parramatta to Penrith—Analysis of Tenders.

The tender of John Ahearn is the lowest, and I recommend it be accepted. There is one inaccuracy in the schedule which requires correcting.—G.C., 1/8/84. Commissioner. Recommended.—Ch.A.G., 6/8/84. Approved.—G.R.D., 11/8/84. Mr. Cowdery for specification.—G.B., B.C., 29/8/84.—Noted, and specification herewith. The inaccuracy in the schedule has been corrected by the contractor.—G.C., 3/9/84. Commissioner. Let Mr. Ahearn know at once that his tender is accepted, modified by subsequent arrangement respecting the substitution of iron for wooden sleepers.—Ch.A.G., 27/8/84. Address—Ashfield.

Sir,

Department of Railways, Sydney, 28 August, 1884.

I have the honor to accept your tender, dated the 29th ultimo, for the duplication of the Great Western Railway from Parramatta to Penrith, in accordance with plans and specification, and to the entire satisfaction of the Engineer for Existing Lines of Railways, at the schedule of prices named therein, but modified by the subsequent arrangement as to the substitution of iron for wooden sleepers.

Please forward deposit receipt for cash security mentioned in the specification, in order that the bond may be prepared by the Crown Solicitor.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Mr. John Ahearn, contractor, Ashfield.

No. 14.

Mr. J. Ahearn to The Commissioner for Railways.

Sir,

Ashfield, 31 August, 1884.

I am in receipt of your letter conveying notification of acceptance of my tender for the duplication of line from Parramatta to Penrith, subject to the alteration in schedule of prices, agreed to in my second tender, for iron sleepers to be supplied by the Government, instead of wooden ones supplied by me, and in reply I beg respectfully to point out that under the new conditions the amount of the contract will be reduced by the sum of £15,000. I think the Government should reduce the amount of deposit required for security from £5,000 to £4,000, which means a *pro rata* reduction.

Immediately upon receipt of a reply to this request, I will be prepared to make the necessary deposit, whether the Government look favourably upon this application or not.

I have, &c.,

JOHN AHEARN.

Mr. Cowdery, B.C., 2/9/84.

£4,000.—G.C., 3/9/84. Commissioner.

I see no objection to the amount of security being reduced to

Approved.—CH.A.G., 4/9/84.

Informed.

No. 15.

Deposit Receipts.

Fixed deposit on contract for doubling line from Parramatta to Penrith.

Two deposit receipts for £2,000 each in the Commercial Banking Company, Sydney (Campbelltown Branch), in the name of the Commissioner for Railways, received from Mr. Ahearn this day—No. 1,737, for £2,000, is payable on 21st March, 1885, and No. 1,847, for £2,000, is payable on 6th September, 1885.

R.J.S., B.C., 8/9/84.

Receipt acknowledged.—H.S., 9/9/84. Herewith.—R.J.S., B.C., 9/9/84. Accountant for cashier. Received deposit receipts as above.—J.R.N., 9/9/84. Accountant. I should be glad to know when the contract time expires.—W.W., 10/9/84. Secretary. Crown Solicitor for bond instructions, 19/9/84.

No. 16.

Messrs. D. & W. Robertson to The Engineer for Existing Lines.

Dear Sir,

Central Exchange Buildings, York-street, Sydney, 9 September, 1884.

With reference to the proposed alterations on bridges for the line, Parramatta to Penrith, we have now carefully gone in to the matter, and find that the additions for extra riveting, drilling, substituting channels for flat bars, and extra handling, cutting, &c., &c., will come to £48 14s. 5d. for each bridge.

There are 2,191 extra holes to drill; 301 extra rivets in each bridge to be put in; some £2 10s. per ton extra in price on some of the iron used, and considerable extra handling, which all helps to tell on an overhead price per ton; and we may say that with the former specification and drawings we would be nearer the mark at our contract price than by doing the extra work required at the price specified; we have, however, named this low price with a view to making them in the Colony, and having wired some weeks ago for all the material in accordance with the first drawings, we will be glad if the matter can be finally settled at an early date to let us get on with the work.

Yours, &c.,

D. & W. ROBERTSON.

P.S.—The writer will have the honor of waiting on you at 12 o'clock to-morrow regarding this matter.

D.&W.R.

Central Exchange Buildings, York-street, Sydney, 11 September, 1884.

Geo. C. Cowdery, Esq., Engineer-in-Chief for Existing Lines of Railway,—

Dear Sir,

As requested, we have again carefully considered the price named in ours of 9th instant for proposed extra work on Penrith to Parramatta bridges. Besides the increased number of holes and rivets, we find there is also a difference of some 10 tons in the weight of the cast-iron bed plates, which are lighter than formerly; and as we tendered for malleable iron, including this cast-iron, the new specification would therefore be £75, worse for us than the old one on this account. There are also some bolts shown which would add to the price a little. The channel-iron also would be to our disadvantage.

The weight throughout per ton is now lighter for the labour required to make them. The stiffness of the inspection, which we have had some experience of to our loss, requires very superior work, difficult to obtain in England or even in Sydney. The extra handling on the iron in the new specification is quite 15s. per ton extra.

Up to date we have spent £50 in cablegrams regarding the material which we ordered for the old drawings some weeks ago.

No price per 100 for rivets we might name would represent the extra labour on a large quantity of ironwork like this, or the difference between the two specifications to us, without doing us an injustice in the price we would name, and to do so would be totally outside the recognised customs of the trade or terms of the original specification.

The overhead price quoted for extras per each bridge, £48 14s. 5d., is really the lowest we could do this work at, and as the whole job is at a standstill, we would be obliged for an official notification for our authority to delay further in the matter.

We have, &c.,

D. & W. ROBERTSON.

Central

Central Exchange Buildings, York-street, Sydney, 18 September, 1884.

Geo. Cowdery, Esq., Engineer for Existing Lines,—

Penrith to Parramatta bridges.

Dear Sir,

We will be prepared to make the above bridges to the new specification, showing the alterations from the original contract as under:—

(1.) For labour in putting in each rivet in excess of those on plans, against which we tendered, 1s. sterling each.

(2.) For drilling each hole through one thickness of plate, bar, angle, bar, channel bar, or tee iron, as shown on new plans, in excess of those against which we tendered, 5d. sterling.

In above prices we include all extra labour in handling extras on material substituted from original specification, and all other extras which would be incurred by us on the new specification as compared with the old ones.

Yours, &c.,

D. & W. ROBERTSON.

I HAVE gone into this matter, and find that the alterations which have been made to the 40-foot girders have slightly increased the weight of wrought-iron, viz., from

15.56 tons per span for double line = 33,779 lb.
15.08 tons
to 34,861, or in all 1,082 lb. (say) and increases the cast-iron from 1,522 to 1,620 lb., or 98 lb.

3 p.c. These alterations involve the following extra work, which, as extras, could be paid for at the rates given:—

184 $\frac{3}{8}$ " rivets in place, at £3 %	£5 10 0
1,574 holes, mostly $\frac{3}{4}$ ", to be drilled through one thickness of plate, at £1 %	15 15 0
	<hr/>
	21 5 0
Add contractors' profit, &c., at 20s. %	4 5 0
	<hr/>
	25 10 0
Add 411 rivets to be supplied, $\frac{3}{4}$ " for 3 $\frac{3}{8}$ " plates, say 152 lb., at say £28 per ton	1 18 0
Difference in cost of channel iron and flat bar, in end beam of girders—	
Total weight per span, 1,200 lb., say $\frac{1}{2}$ ton, at £1 10s. per ton	0 15 0
	<hr/>
Total extras per span for double road	£28 3 0

Mr. Cowdery.

F.M.A., 22/9/84.

No. 17.

Minute by The Deputy-Engineer to The Engineer for Existing Lines.

Duplicating Line from Parramatta to Penrith.

Will the engineer be good enough to let me know as soon as possible the nature of alteration (if any) to design for bridge pins and abutments, together with drawings of such alterations. The contractors will be ready to start this part of the work very shortly. With reference to constructing the waterways, as shown on contract plan, I have consulted with Mr. Waring (who is thoroughly acquainted with the country), and he says that in time of flood there is a large quantity of branches and debris coming down the different creeks and lodging against the viaducts, and he is of opinion that the openings should not be contracted much from what they are now, especially if iron girders are substituted for the present wooden structures. He says that often in time of flood men have to be stationed at the viaducts to clear away the debris, &c., in order to keep the openings clear. I am not myself acquainted with the nature of the country with regard to floods, but it seems to me that some of the openings have been contracted too much, especially the Eastern Creek and Pope's Creek (with tributaries).

Please let me know if any alterations are to be made with reference to this.

MAX. THOMSON, 12/9/84.

In company with the District Engineer I have inspected the waterways between Penrith and Parramatta, and I recommend that the following alterations be made in the arrangements originally proposed:—

At 28 miles 12 chains, where one 40-ft. opening is shown, there be provided two openings of 20 ft.—as the creek does not give a proper amount of heading for a girder 5 ft. deep.

At 27 miles 50 chains, where one 40-ft. is provided, one opening of 20 ft. should suffice.

At 24 miles 23 chains (East Creek), where four spans of 40 feet are provided, and the rest of the present waterway, sixteen bays of 22-ft. centres are proposed to be blocked—that the amount of waterway be kept pretty much as it is now, by the introduction of an additional 40-ft. span and eight spans of 30 ft.

At 16 $\frac{1}{2}$ miles (Wentworthville); where there is a single culvert of 12 ft. span, that a 40-ft. opening be provided.

The result of these proposed alterations means the provision of three extra openings of 20 ft. each, eight extra openings of 30 ft. each. The cost of this extra provision will be approximately, as follows:—

For abutments and piers	£2,125
For girders	1,900
	<hr/>
Total	£4,025

Mr. Cowdery.

FRED. M. AVERN,
Assistant Engineer, 19/9/84.

11.

I recommend that these alterations be approved, as I think they are necessary.—G.C., 19/9/84. Commissioner. Recommended.—Ch.A.G., 23/9/84. Approved; it is a pity a little more attention was not paid to this question before work was started.—F.A.W., 26/9/84. Mr. Cowdery.—Ch.A.G., B.C., 26/9/84. Mr. Thomson to note and return at once.—G.C., 29/9/84. Noted.—M.T., 1/10/84. Engineer for Existing Lines. Draft advertisement inviting tenders for the supply of the ironwork herewith.—G.C., 31/10/84. Commissioner. Mr. Cowdery.—G.B., B.C., 8/11/84. Noted.—G.C., 11/11/84. Commissioner.

No. 18.

The Crown Solicitor to The Commissioner for Railways.

Sir,

Crown Solicitor's Office, Sydney, 10 October, 1884.

In compliance with the instructions contained in your B.C., 19/9/84, I have had prepared, and forward herewith, the agreement for duplication of Great Western Railway, Parramatta to Penrith, duly signed by the contractor, and stamped.

The tender and all other papers herein are returned herewith.

I have, &c.,

JOHN WILLIAMS,
Crown Solicitor.

No. 19.

Duplicating line—Parramatta to Penrith.

IN consequence of duplicating Western Line between Parramatta and Penrith, it will be necessary to get out plans, &c., for the management and improvements of the intermediate stations. As I presume such plans will be got out in the Engineer's Office, it would be advisable that they be taken under consideration as soon as possible, in order that the stations may be taken in hand and got ready at the same time as the line.

MAX. THOMSON, 30/10/84.

Mr. Avern.—G.C., 7/11/84. Mr. Parry to submit proposals for this work. He can obtain plans from Mr. Thomson.—F.M.A., 20/11/84.

Will Mr. Thomson please have plans of South Creek, Rooty Hill, and Seven Hills completed as below to enable me to make new designs or alterations to station arrangements. *South Creek*.—Plot on cross-sections from A to B, to boundary line on up side, and to centre of street on the down side, also gradients of main line. *Rooty Hill*.—At east end of station cross-sections on down side A to B as in pencil. At west end of station cross-section on up side A to B as in pencil, new loop marked on and levels of main line through yard for 250 yards east of platform to 400 yards west. *Seven Hills*.—Survey as it exists required Cross Roads—survey required.—J.P., 3/2/85.

Mr. Halligan.—M.T., 5/2/85. Plans.—Wentworthville, Toongabbie, Seven Hills, Rooty Hill, Mount Druitt, South Creek, Cross Roads Siding all complete, sent to Mr. Parry as requested.—E.M.H., 19/3/85. District Engineer.

No. 20.

Messrs. D. & W. Robertson to The Engineer for Existing Lines.

Dear Sir,

Central Exchange Buildings, York-street, Sydney, 22 September, 1884.

Referring to conversation and our correspondence on above matter, we agree to go on with the Penrith and Parramatta bridges new specification at £30 each for extras, we erecting the bridges in yard until you are satisfied they are going together right, and herewith guarantee that the others, which may be passed through not bolted up in position, will be corrected (should anything be found wanting) when such defect is pointed out to us after delivery is taken, as provided in specification, at our yard.

With reference to enclosed cablegram, referring to lengths of plates, we wish to divide the length in two pieces, as it appears to be impossible to get them in one length, and will be obliged if you will give bearer the lengths which would be best, so as to break the joints (say) at 20 ft. and 24 ft., or otherwise as you may direct.

We agree to above arrangement in order to meet your wishes in the matter, although the price, we consider, is very low, and get on with the work, and will cable to-day about the plates if you will give bearer the lengths.

Yours, &c.,

D. & W. ROBERTSON.

Requests Commissioner's approval of the sum of £30 per span of iron bridges on Parramatta to Penrith duplication, being paid to Messrs. D. & W. Robertson as extras to cover cost of extra rivets and slight increase in weight consequent on revision of design, as per detail on back of minute paper, 84/7,401, of 19 September. This arrangement was come to with Messrs. D. & W. Robertson in September last, after considerable trouble. By an oversight Commissioner's approval was not applied for at that time.—F.M.A., 16/12/84, Commissioner (for Engineer for Existing Lines).

Approved.—Ch.A.G., 19/12/84. Mr. Cowdery, B.C. Noted.—G.C., 20/12/84.

No. 21.

No. 21.

Petition.

Seven Hills, 9 February, 1885.

To Charles A. Goodchap, Esq., Commissioner for Railways, Sydney.

Sir,

We, the undersigned landholders in the district of Seven Hills, near Parramatta, and others interested in the good management of the Railway system of this Colony, having heard with much surprise than an application will be probably made to the Government to remove the present station at Seven Hills to a site about half a mile easterly therefrom, and nearer Toongabbie Platform, desire to record our earnest protest against the removal.

We have every confidence that the public interests are safe in your keeping—that you will not permit those interests to be trifled with, and that only by misrepresentation of facts are you likely to be induced to sanction an arrangement which we do not hesitate to say would be unjust, impolitic, and destructive to vested interests.

We would most respectfully remind you that a station at Seven Hills has been established about twenty-two years; the approaches thereto are excellent and cannot be improved; a large amount of public money has been expended in providing all the usual accessories in connection with a station where a large miscellaneous trade is conducted. We would regard a change of site as an unmixed evil, and we are confident there cannot be anything to justify an application to the Government for the purpose.

We have, &c.,

[51 Signatures.]

Presented by Mr. Lackey, M.P.—CH.A.G., 25/2/85.

Informed deputation that I knew nothing of any such proposal, and that I could promise them that nothing would be done under any circumstances until the whole subject had been properly investigated.—CH.A.G., 25/2/85.

Are there any papers on the subject.—D.C.M'L., 26/2/85. Does Mr. Cowdery know anything of this matter.—D.C.M'L., B.C., 4/3/85. Has Mr. Thomson heard anything of such a proposal.—G.C., 5/3/85. No. I have not heard anything about such a proposal.—M.T., 7/3/85. Engineer for Existing Lines. I know nothing of such a proposal.—G.C., 13/3/85. Commissioner. Traffic Manager to say whether he is aware of any such proposal.—D.C.M'L., 17/3/85. Superintendent Richardson for enquiry and report.—W. V. READ, 17/3/85. I do not believe any such thing was ever thought of, and I told some of the deputation so on the morning they waited on the Commissioner.—H. RICHARDSON, 19/3/85. Traffic Manager. I do not know of any proposition to remove Seven Hills Station.—W. V. READ, 20/3/85. Seen.—CH.A.G., 23/3/85.

No. 22.

Mr. J. Ahearn to The Engineer for Existing Lines.

Sir,

Petersham, 1 May, 1885.

As one-half the contract for duplicating line Parramatta to Penrith was finished on the 1st of April, and as the retention money at that time equalled the amount of the deposit (£4,000), the whole of the money now in the hands of the Government as security is over £3,000, I have respectfully to apply to you to recommend that my certificates in future be paid in full and that no per centage be taken off.

I have, &c.,

JOHN AHEARN.

I cannot recommend that the certificates be paid in full, but I see no objection to the security being returned, as we now hold £4,949 3s. 7d. as retention.—G.C., 8/5/85.

I should recommend that £4,000 of the retention money be allowed, certainly not the security money, but before anything is done I should like to know what sum is yet to be paid the contractor for completion of contract, and whether the remainder of the work to be done is more difficult or expensive than that which has been done. How is the contractor situated as regards the "time" portion of the contract? Is there every prospect of the line being completed within prescribed time?—CH.A.G., 13/5/85. Mr. Cowdery, B.C.

Mr. Thomson for report on work yet to be done.—G.C., 14/5/85. Report attached. The sum to be yet paid to the contractor is approximately £37,600.—M.T., 21/5/85. Engineer for Existing Lines.

The amount yet to be paid is about £37,600. The most difficult portion of the work has been completed. The contract time expires on 31 March, 1886, and I have no doubt the contract will be completed before that time.—G.C., 27/5/85. Commissioner.

I recommend that the contractors be allowed payment of £3,000 retention money.—CH.A.G., 28/5/85. Approved.—F.A.W., 29/5/85. Mr. Cowdery.—D.C.M'L., 1/6/85. Noted.—G.C., 2/6/85.

No. 23.

Minute by the Inlocking Engineer to The Engineer for Existing Lines.

HEREWITH I forward tracings, S-329 and S-330, showing new platform and sidings, &c., for Seven Hills Station, and new sidings at Wentworthville, necessitated by the duplication of the line Parramatta to Penrith.

I have not shown an up platform at Wentworthville, as I understand from Mr. Richardson, Coaching Superintendent, that, in all probability, the present platform would be dispensed with. There is, however, room left if it is required. Will you please forward these to Traffic Manager for approval as to accommodation before I estimate the work.

J.P., 25/3/85.

Forwarded

Forwarded for Mr. Read's approval as to accommodation.—G.C., 26/3/85. Mr. Read. Superintendent Richardson for report.—W. V. READ, 27/3/85.

The accommodation, as shown on accompanying plan, will I consider be ample. I am glad to see it is not proposed to put up large and expensive station at Seven Hills. Except at large towns these big stations we are putting up are unnecessary. The Permanent-way Department have not provided for platforms at Wentworthville. I told Mr. Parry I should like to see present platform removed to a more suitable place, but as it was erected at cost of Mr. T. R. Smith, I expect there will be more difficulty in removing it.—H. RICHARDSON, 30/3/85. Traffic Manager.

I concur as regards the accommodation.—W.V.R., 1/4/85. Mr. Cowdery. Mr. Parry to note Mr. Read's minute, 1/4/85.—G.C., 8/4/85. Mr. Parry. Noted.—J.P., 21/5/85.

I forward herewith tracing S-333, showing proposal for alteration to sidings at Cross Roads for duplication of line Parramatta to Penrith. Will you please forward same to Traffic Manager for approval as to accommodation, &c.—J. PARRY. Engineer for Existing Lines.

Forwarded to Traffic Manager as to accommodation.—G.C., 30/3/85. Mr. Read. The accommodation as proposed will do.—W.V.R., 11/5/85. Engineer for Existing Lines. Mr. Parry.—G.C., 13/5/85.

I forward herewith tracings showing proposed rearrangement of station yards at South Creek, Rooty Hill, and Mount Druitt, in connection with the duplication of line Parramatta to Penrith. At South Creek and Rooty Hill I have provided more accommodation for goods than is necessary at present, but have marked on plan which sidings are to go in at once. The others can of course be put in at any time without having to rearrange the yard. I presume you will forward these to the Traffic Department before estimates are prepared.—J. PARRY, 10/3/85. Engineer for Existing Lines.

Forwarded to Mr. Read as regards accommodation.—G.C., 31/3/85. Mr. Read. Superintendent Richardson for report.—W. V. READ, 2/4/85.

Mount Druitt—There should be a through road connecting up and down roads at the South Creek end of yard, as there is no entering into siding at the Rooty Hill end from down road. At Rooty Hill and South Creek there should be a second through road, so that engines can run round the trucks and draw them on to up road, as there is no way of getting into sidings from down road. The cattle pen at South Creek should be on up side and not on down side. The water-closets and urinals should be at the one end of station only, and detached from main building, the same as on Illawarra Line Stations. Lamp-rooms should be provided at Rooty Hill and South Creek. No necessity for station-master's rooms—a good ticket office is all that is required.—H. RICHARDSON, 4/4/85. Traffic Manager.

I agree with Mr. Richardson as regards the accommodation, but it appears to me that the cross-over roads he asks for are already provided for on the tracings. He will be good enough to look at them again. Do these tracings show sufficient siding accommodation for the traffic?—D.K. Mr. Richardson.

I did not notice the through roads from main up road to the sidings on down side were compound crossings. Being compound crossings, there is no necessity for the extra roads I applied for. Yes, I think ample provision has been made at each station. I visited each place with Mr. Parry, prior to these plans being prepared, and we agreed as to accommodation required.—H. RICHARDSON, 13/4/85. Traffic Manager.

I agree with Mr. Richardson, that the cattle pen at South Creek should be on the up side. All gentlemen's water-closets and urinals should be detached from the main buildings, and a lamp-room should be provided at Rooty Hill and South Creek. A station-master's office is not necessary at either of these places, but the booking offices should be fairly large.—W.V.R., 24/4/85. Engineer for Existing Lines.

Mr. Parry to see and forward estimate.—G.C., 28/4/85.

Will Mr. Leggatt please furnish estimate for new station, waiting sheds on down side, and platforms at South Creek, also new goods shed and stage for same. New waiting sheds and platform on down side lengthening in timber, the up platform removing of goods shed and stage at Rooty Hill as per plans.—J.P., 1/5/85.

Estimate herewith.—A.L., 11/5/85. Mr. Parry.

APPROXIMATE Estimate for alterations to Sidings, New Stations, &c., for duplication of line—Parramatta to Penrith.

<i>South Creek Station :—</i>	£	s.	d.
Excavation.....	750	0	0
New sidings, and removing old ones, removal of crane, fencing, &c.....	860	0	0
Cattle pen.....	60	0	0
Metalling apparatus to sidings.....	4,600	0	0
New station, platforms, &c.....	3,710	0	0
Total.....	£9,980	0	0
<i>Rooty Hill Station :—</i>			
14,000 cubic yards filling.....	1,750	0	0
New sidings, crane, &c.....	1,473	0	0
Metalling approach to sidings.....	440	0	0
New station, platforms, &c.....	1,612	0	0
Total.....	£5,275	0	0
<i>Seven Hills Station :—</i>			
New siding and Goods shed, draining, &c.....	440	0	0
New station, platform, &c.....	3,000	0	0
Total.....	£3,440	0	0

Cross Roads and Mount Druitt are only extensions of crossing.

Plans and estimates for new station arrangements—Parramatta to Penrith—duplication of line.

I FORWARD herewith tracings $\frac{s}{280}$ $\frac{s}{306}$ $\frac{s}{307}$ $\frac{s}{329}$ and $\frac{s}{333}$ showing proposals for rearranging station yards, and new station, &c., at South Creek, Rooty Hill, Seven Hills, Cross Roads, and Mount Druitt.

These alterations are necessitated by the duplication of line—Parramatta to Penrith—and will require to be proceeded with so as to be ready for opening new line.

The estimates for same are herewith attached.

Engineer for Existing Lines.

J. PARRY, 21/5/85.

Mr. Leggatt's estimate attached.—G.C., 11/5/85. Mr. Parry. Estimates herewith.—J.P., 21/5/85. Engineer.

In reference to your minute as to work yet to be done on this duplication and value of same, I beg to state that I estimate it at about £37,600, computed since the return of the last certificate May 1st, and is comprised as follows:—

Earthwork, 8,000 cubic yards, at 2s. 9d.	£1,100	0	0
Brickwork, 1,800 cubic yards, at £2 10s.	4,200	0	0
Concrete, 350 cubic yards, at £2	700	0	0
Excavation, foundations, 1,500 cubic yards, at 5s.	375	0	0
Ironbark, 400 cubic yards, at 5s. 6d.	110	0	0
Hardwood, bridge sleepers, &c., 6,850 cubic yards, at 4s. 6d.	1,541	0	0
Ballast, 32,300 lineal yards, at 7s.	11,305	0	0
Forming 400 chains, at 10s.	200	0	0
Sleepers, 26,300, at 5s. 6d.	7,232	10	0
Laying permanent-way, 32,400 lineal yards, at 2s. 6d.	4,050	0	0
Iron girders, &c.	1,686	10	0
Stonework, 400 cubic yards, at £5 8s.	2,160	0	0
		34,660	0
Sum required to complete bridges over streets, Parramatta		1,950	0
Total	£36,610	0	0

G. R. COWDERY,
Resident Engineer, 20/5/85.

Mr. Max Thomson.

Seen.—M.T., 21/5/85.

Detailed estimate herewith with five tracings which I recommend be approved. This work is caused by the duplication of the line.—G.C., 29/5/85. Commissioner. Is the site for the station at Seven Hills to be altered? I made some enquiry about this sometime ago, when some gentlemen from Seven Hills, accompanied by Mr. Lackey, were making representations of a suggested change as to which it was stated there was no foundation.—CH.A.G., 3/6/85.

The expense of all these alterations amount to nearly £19,000. Was this outlay included in the original estimate for doubling the line, and will the vote clear it?—CH.A.G. Mr. Cowdery, B.C. It is not intended to alter the site of the present station. The cost of this work was not included in the original estimate. The present vote will not bear it.—G.C., 26/6/85. Commissioner.

I cannot too strongly condemn this negligent system of making estimates. It seems that these alterations are the direct consequence of doubling the line, and yet the cost of them is not included in estimate. Who made the estimate, and what explanation can be offered?—CH.A.G., 27/6/85. Mr. Cowdery, B.C.

The estimate was made by Mr. Townsend of this Department. The total cost of the new bridges and culverts on duplication of line—Parramatta to Penrith—will be approximately £55,000. The amount to be charged to the renewal of the existing bridges will be approximately £28,500. The exact amount cannot be given before the work is completed, but the above figures represent the cost as nearly as can be ascertained at present.—G.C., 24/7/85. Commissioner.

I wish to have a clear statement of the case. Amount voted for doubling the line; the amount which is to be charged to working expenses by reason of the work being replacement; the amount required to complete work (estimated); the works which require to be authorized.—CH.A.G., 27/7/85.

Mr. Cowdery, B.C.

Mr. Thomson for reply to Commissioner's minute 27/7/85.—G.C., 28/7/85. Please see statement attached.—M.T., 30/7/85. Engineer for Existing Lines.

Duplicating line—Parramatta to Penrith—Statement of Estimated Cost.

Cost of Parramatta Town Bridges	£18,240
Less amount to be charged to working expenses	12,583
To be charged to Vote (say)	£5,700
Construction of Line—	
Ahearn's contract	£76,800
Estimated excess of contract	10,000
Rails and fastenings, 2,500 tons	20,000
Total... ..	£107,000
	Iron

Iron Superstructures (contract prices)	£14,800
Alterations to Parramatta and Penrith Stations (say)	2,000
Other station arrangements	19,000
Temporary cross-over roads, and strengthening old bridges... ..	2,500
	<hr/>
	£151,000
Engineering expenses and contingencies	4,000
	<hr/>
Total estimated cost of works	£155,000
To be divided as under:—	
1. Working expenses— (A.)	
Renewing existing bridges... ..	£28,500
Station arrangements	4,500
	<hr/>
	33,000
2. Capital amount	122,000
	<hr/>
Total... ..	£155,000
	<hr/>
The following items are authorized:—	
Parramatta bridges	£5,700
Renewing existing bridges	28,500
Amount voted for duplicating line	85,000
	<hr/>
Total... ..	£119,200
	<hr/>
The following items require to be authorized:—	
Chargeable to Vote—	
To complete construction of line	£12,300
Alterations—Parramatta and Penrith	2,000
Other station arrangements	14,500
Temporary cross-over road, &c.	2,500

	<hr/>

MAX THOMSON, 30/7/85.

Full statement herewith.—G.C., 11/8/85. Commissioner.

It may be full, but it is not clear. In the first place, the first total is wrong, viz., £155,000, as it does not include that portion of the cost of the bridges which is to be charged to working expenses. Let me know how much of the whole sum is to be charged to working expenses, and why? And what amount in addition to the £85,000 voted for duplicating line is required to be provided by capital?—CH.A.G., 13/8/85.

Mr. Cowdery, B.C. Mr. Thomson.—G.C., 14/8/85. Urgent.

The £155,000 includes the cost of running the existing bridges and station arrangements, which is to be charged to working expenses, as will be seen from the summary marked (A) and the details on page 2 of the statement; but of the whole sum (£155,000) the following amounts are chargeable to working expenses, viz.:—

Renewing existing bridges	£28,500
Renewing and improving present station arrangements	4,500
	<hr/>
Total	£33,000

The amount for bridges (£28,500) is chargeable to working expenses by reason of the work requiring to be renewed irrespective of duplicating the line, and the amount for station arrangements (4,500) is chargeable to working expenses for the same reason. In addition to the £85,000 already voted, £37,000 is required to be provided by capital, divided as under:—

Completing Parramatta bridges	£5,700
To complete construction of line	12,300
Alterations—Parramatta and Penrith Stations	2,000
Other station arrangements	14,500
Temporary cross-over roads	2,500
	<hr/>
Total	£37,000

Engineer for Existing Lines.

M.T., 15/8/85.
Commissioner.—

Commissioner.—G.C., 17/8/85. I wish to know how the £28,000 is made up—what bridges; and let me see authority for charging same to working expenses.—CH.A.G., 20/8/85. Mr. Cowdery, B.C. Mr. Thomson for reply to Commissioner's minute, 20/8/85.—G.C., 20/8/85. Please let me have previous papers referring to this matter (duplicating line, Parramatta to Penrith).—M.T., 21/8/85. Engineer for Existing Lines. Papers herewith.—G.C., 22/8/85. Mr. Thomson.

The total cost of the new bridges between Parramatta and Penrith will be about £55,000. Half of this amount, or £27,500; plus £1,000 for strengthening the old bridges=£28,500, will be the cost of renewing the existing bridges. List of bridges attached. The Commissioner minuted, 24/3/83, that the cost of renewals would be chargeable to working expenses.—M.T., 25/8/85. Engineer for Existing Lines. Commissioner.—G.C., 26/8/85.

Full cost of doubling line from Parramatta to Penrith	£155,000
Deduct amount chargeable to working expenses for renewals	33,000
								£122,000
Account voted...	85,000
								£37,000

I wish an explanation of the reason the cost of this work chargeable to capital was under-estimated, viz., £37,000, being nearly 50 per cent.

Mr. Cowdery, B.C.

CH.A.G., 28/8/85.

This estimate was prepared by Mr. Townsend, under Mr. Hyndman, and I regret to say was very much under the amount required, nothing being allowed for station arrangements.—G.C., 27/8/85. Commissioner.

The additional amount of £37,000 must be provided for. Will Minister approve of its being placed on estimate?—CH.A.G., 1/9/85. I cannot acquit Mr. Cowdery of contributory negligence in this matter; he should have carefully revised the estimate.

Seen.—G.C., 11/9/85. Commissioner. Accountant to note for estimates.—D.C.M'L., 12/9/85.

No. 24.

The Deputy Engineer to The Engineer for Existing Lines.

Station Arrangements—Parramatta to Penrith.

REFERRING to my memo. of 31st October, 1884, *re* arrangements of stations between Parramatta and Penrith in consequence of duplicating line, I would again point out the necessity for a speedy settlement of this matter, as if not taken in hand at once serious inconvenience and delay to the traffic will ensue, the works of duplicating being otherwise in a very forward state of progress.

MAX THOMSON, 30/6/85.

See minute paper returned to you to-day.—G.C., 2/7/85. Mr. Thomson. Mr. G. R. Cowdery to see, also note my minute on separate slip attached.—M.T., 3/7/85. Noted.—G.R.C., 7/7/85. District Engineer. Seen.—M.T., 8/7/85. Engineer for Existing Lines.

List of bridges to be renewed in duplication of line—Parramatta to Penrith.

At 15 miles	20 chains	7 20 ft. Bays.	At 24 miles	78 chains	8 12 ft. Bays.

M.T., 26/8/85.

No. 25.

Mr. J. Ahearn to The Commissioner for Railways.

Sir,

Petersham, 7 September, 1885.

Of the deposit of £4,000 which is to your credit in the Commercial Bank, Campbelltown, a security for the completion of my contract for duplicating the line, Parramatta to Penrith, one half of it, or £2,000 is at interest, and the time (12 months) expires to day. Will you please forward to the Local Manager, the deposit receipt for renewal for a further period of six months at the ruling rate of interest.

I am, &c.,

JOHN AHEARN.

Accountant.—D.C.M'L., 9/9/85. I am not aware of the date on which the contract expires for this work. Should the deposit be renewed? Please say.—J.V., 11/9/85. Secretary. Urgent. Will Mr. Cowdery please say.—G.B., B.C., 11/9/85. Urgent. The contract time expires on 31 March, 1886.—G.C., 12/9/85. Commissioner. Deposit should be renewed.—D.C.M'L., 14/9/85. Accountant. Better renew for 6 months.—J.V., 15/9/85. Mr. Neale. Renewed to 6 March, 1886.—J.R.N., 17/9/85. Accountant. Entered.—W.W., B.C., 1/10/85. Secretary.

No. 26.

Mr. J. Ahearn to The Commissioner for Railways.

Sir

Burwood, 23 October, 1885.

My last certificate for the duplication of line—Parramatta to Penrith—is still unpaid, owing, I believe, to the vote having been exhausted.

As the work is so far advanced could you not recommend the payment to me of one-half the £4,000 deposit held by you as security for the due performance of the contract. I could then willingly await the uncertainty of a fresh vote being granted within a reasonable time by the new Parliament.

I wish respectfully to point out that the Department hold of my money at present the sum of £11,600 upon this contract, made up as follows:—

	£	s.	d.
Deposit as security.	4,000	0	0
Retention money, 10 per cent.	3,800	0	0
Last certificate	1,800	0	0
Work done and not yet returned for	2,000	0	0
	£11,600	0	0

I think you will admit that the amount above stated is rather excessive and will justify me in assuming that you will take a favourable view of this application.

I have, &c.,

JOHN AHEARN.

Mr. Cowdery.—D.C.M'L., 24/10/85. If the vote is exhausted I see no objection.—G.C., 26/10/85. Commissioner. Accountant. Is vote exhausted?—D.C.M'L., 26/10/85. Urgent. Yes.—W.W., B.C., 27/10/85.

I recommend that £2,000 be allowed Mr. Ahearn out of security money. Indeed, as it seems we have £3,800 in hand as retention money, I should offer under the circumstances no objection to the contractor having all the security money, but he applies only for half and promises to wait till further vote be taken if half be granted. I recommend that course.—CH.A.G., 28/10/85.

Approved.—W.J.L., 3/11/85. Mr. Cowdery, B.C. Seen.—G.C., 6/11/85. Commissioner. Accountant—Please have the matter arranged.—D.C.M'L., 10/11/85. Deposit receipt herewith for Commissioner's signature.—W.W., 11/11/85. Signed.—CH.A.G. Received the above.—JOHN AHEARN. Noted.—J.H.N., 17/11/85. W.W. Accountant, B.C., 23/11/85. Secretary.

Sir,

Department of Railways, Sydney, 10 November, 1885.

I have the honor to acknowledge your letter of the 23rd ultimo, respecting the non-payment of your last certificate for the duplication of the line—Parramatta to Penrith—owing to the vote having been exhausted, and asking for return of one-half the £4,000 deposit for due performance of the contract pending a further vote. In reply, I have to inform you that the matter has been considered, and Mr. Secretary Lyne has approved of a compliance with your request.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

John Ahearn, contractor, Burwood.

No. 27.

Minute from The Deputy Engineer to The Engineer for Existing Lines.

Station Arrangements—Parramatta to Penrith.

REFERRING to my previous memos. *re* this subject, I will again point out the necessity for these works (including Blacktown) being taken in hand without delay. The contractor is progressing very fast with the laying of the permanent-way, and in order not to stop the progress of his work I have to make all sorts of temporary provisions (temporary cross-overs, &c.), which all means additional expense that might have been avoided if the stations were rearranged as required, or at least the work of doing so in hand.

The Engineer for Existing Lines.

MAX THOMSON, 4/9/85.

Urgent.

Forwarded to Commissioner. This refers to minute paper returned to Commissioner, 28/8/85.—G.C., 9/9/85. Commissioner. Mr. Cowdery, 10/9/85. Papers returned to-day. Will Commissioner please say if station arrangements can be proceeded with as it is urgent.—G.C., 11/9/85. Commissioner. Yes.—CH.A.G., 14/9/85. Mr. Cowdery, B.C. Mr. Thomson to carry out.—G.C., 16/9/85. Please have duplicate tracings made of these station arrangements (Blacktown included) at once.—M.T., 17/9/85. Mr. Halligan. Very urgent. One set of tracings herewith; second copies being made.—E.M.H., 23/9/85. District Engineer. Mr. Waring to carry out according to tracings herewith. Mr. G. R. Cowdery will set out the work and furnish levels and other information required.—M.T., 24/9/85. Mr. Waring. Noted.—J. WARING, 26/9/85. District Engineer. Mr. Purton to carry out platforms, &c., required in accordance with tracings, which will be ready in a few days. Mr. G. R. Cowdery will set out and furnish particulars.—M.T., 28/9/85. Mr. Purton. Noted.—J. T. PURTON, 30/9/85. District Engineer. Please set out this work, and furnish levels, &c., as required. See tracings herewith, of which please take copies for your own use, and return originals as soon as possible. Duplicate tracing of Cross Roads, Mount Druitt, attached for your own use.—M.T., 7/10/85. Mr. G. R. Cowdery. I return original plans of Cross Roads, Mount Druitt, and Seven Hills, retaining South Creek, Rooty Hill, and Blacktown until copies have been taken.—G.R.C., 10/10/85. District Engineer.

I think the small waiting sheds at Seven Hills and Mount Druitt, as well as several goods sheds and loading platforms, might with advantage be constructed by the Department in connection with platforms and sidings—the goods shed at South Creek has already been approved of in another paper, to

be renewed by the Department.—M.T., 11/10/85. Engineer for Existing Lines. Approved.—G.C., 12/10/85. Mr. Thomson. Mr. Purton to carry out.—M.T., 14/10/85. Noted.—J. Purton, 15/10/85. District Engineer. Mr. G. R. Cowdery to note.—M.T., 17/10/85. Noted.—G.R.C., 21/10/85.

It will be necessary to have the plans for main station buildings at Seven Hills and South Creek, as well as Station-master's residence at the latter place, prepared as soon as possible.—M.T., 24/10/85. Engineer for Existing Lines. Mr. Leggatt for plan.—G.C., 26/10/85.

No. 28.

Messrs. D. & W. Robertson to The Commissioner for Railways.

Exchange Buildings, York-street, Sydney, 12 August, 1885.

Penrith to Parramatta bridges.

Dear Sir,

The question of penalties having been raised by the Department, we desire to bring under your notice the following—why no penalties whatever should be deducted from vouchers for this contract:—

1st.—The time of completion originally specified is 1st July, 1885; but as our tender was not accepted until the 20th August, or twenty-two days after tenders closed, and that thereafter the whole design of the bridges were altered—adding a great deal of extra work which took us time to do, and delayed the plans and final instructions to proceed for an additional two months—our time for completion is therefore 20th September, 1885.

2nd.—One delivery was in our own premises, Pymont, and we have had this work finished for a considerable time, waiting instructions, and have been told that we were completing it too rapidly, as they were not able to utilize it, and could not remove it. We wrote, frequently urging the Department to take delivery. We will have the whole of this work away by the 20th September. We have only some 15 tons to supply still out of a total quantity of 670 tons.

Yours, &c.,

D. & W. ROBERTSON.

Mr. Cowdery for report upon these representations.—D.C.M'L., 13/8/85 Mr. Thomson for report.—G.C., 14/8/85.

The representations made by the contractors are quite correct, and I do not think the Department is justified in incurring any penalties in this case. In the first instance, the contractors were considerably delayed (nearly three months, I believe) through the design being altered, and through delays in accepting the tender. Secondly.—The contractors were debarred from delivering the girders when ready, through the delay in obtaining lighters to carry the work round to the Railway wharf. Thirdly.—The work is even now being delivered faster than required.—M.T., 15/8/85. Engineer for Existing Lines.

Under the circumstances I recommend no penalties be enforced.—G.C., 17/8/85. Commissioner. Penalties cannot be enforced under the circumstances.—Ch.A.G., 21/8/85. Inform.

Gentlemen,

Department of Railways, Sydney, 24 August, 1885.

Referring to your letter of the 12th instant, in which you urge reasons why the penalties incurred by your firm in connection with contract for iron bridges, Penrith to Parramatta, should not be enforced, I have the honor to inform you that upon a careful consideration of the facts of the case I have approved of the fines being remitted.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Messrs. D. & W. Robertson, York-street, Sydney.

Mr. Cowdery.—D.C.M'L., 25/8/85. Mr. Thomson to note.—G.C., 26/8/85. Noted.—M.T., 28/8/85. Engineer for Existing Lines.

No. 29.

Minute by The Examiner of Accounts.

Supply of iron bridges for duplication of line from Parramatta to Penrith. D. & W. Robertson Contractors.

THE tender for the above work was accepted on 20/8/84; specified time for completion, 1/7/85.

The contract was completed on 31/8/85, and Commissioner decided on M.P. 85-4,707c, that penalties for non-completion at specified time could not be enforced, as delay was caused by Department.

The contract price is	£11,365	6	3
Authorized extra £30 on each span—forty spans	1,200	0	0
	£12,565	6	3
Amount of final certificate	12,976	15	7
Amount in excess	£411	9	4

This is caused by the increased weight of girders, &c., 699 tons 8 cwt. 3 qrs. being supplied, and only 675 tons specified. I presume final certificate may be passed.

The Secretary.

JOHN P. FINEGAN.

I shall require some explanation of this increased weight; was it authorized?—CH.A.G., 18/9/85. Mr. Cowdery, B.C. Mr. Avern for report.—G.C., 18/9/85. The weight of girders was increased in consequence of an alteration in design, and was approved on Commissioner's minute attached.—G.C., 23/9/85. Pass.—CH.A.G., 24/9/85. Examiner, B.C. The examiner calls my attention to the wording of the minute, upon which my approval was obtained, for allowing £30 per span additional. It would seem that the increased weight of iron was included in that item.—CH.A.G., 25/9/85. Mr. Cowdery, B.C.

The difference in weight is caused by the iron being rolled slightly heavier than the calculated sizes, and as it is only a small percentage on the whole, and the bridges are proportionately stronger, I think it should be allowed. The allowance of £30 per span does not interfere with it.—G.C., 26/9/85. Commissioner. Approved.—CH.A.G., 28/9/85. Examiner, B.C. Voucher forwarded for payment.—T.S., 29/9/85. Secretary. Mr. Cowdery.—L.P.J., 1/10/85. Seen.—G.C., 2/10/85. Commissioner.

No. 30.

Minute by The Assistant Accountant.

THE enclosed voucher, being advance (No. 4) to John Ahearn, in contract for doubling the line to Penrith, has been returned from the Treasury, there not being a sufficient balance on the vote for this work to meet this payment.

I would suggest that a letter be written to the Treasury enclosing the account, and requesting that this and similar items may be paid from the Treasurer's Advance pending the passing of a supplementary vote for the work.

The matter is urgent, as the sum due should be paid without delay.

The Secretary.

J. VERNON, 17/9/85.

The Commissioner, B.C., 17/9/85. For Minister's approval.—CH.A.G., 17/9/85. Approved.—F.A.W., 19/9/85.

No. 31.

The Commissioner for Railways to The Under Secretary for Finance and Trade.

Sir, Department of Railways, Sydney, 21 September, 1885.

Referring to the voucher advance (No. 4) to Mr. John Ahearn, on his contract for doubling the line to Penrith, returned by you to this Department, the balance of vote for the work in question being insufficient to cover payment of the certificate, I have the honor to enclose the account, and shall be glad if this and similar items can be paid from the Treasurer's advance, pending the passing of a supplementary vote for the work.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

The advance account will not cover this or similar items. The Commissioner must give me full particulars of the extent to which he is likely to require—payments in excess of votes—that I may ask Parliament for a special vote (temporary).—G.R.D., 25/9/85.

The Commissioner for Railways.—G.E., B.C., 28/9/85. The accountant will please prepare statement showing amount required to cover liabilities incurred and to be incurred in excess of votes—say to June, 1886.—CH.A.G., 29/9/85.

No. 32.

The Commissioner for Railways to The Under Secretary for Finance and Trade.

Sir, Department of Railways, Sydney, 26 November, 1885.

With reference to the endorsement of the Honorable the Colonial Treasurer upon my letter of the 21st September, in which he inquires particulars as to the extent the Department is likely to require payment in excess of votes for railway works, I have the honor to inform you that the votes exceeded are "Tamworth to Tenterfield," "Wallerawang to Mudgee," "Albury to the River Murray," and "doubling the Western Line to Penrith." Information regarding the first-named vote has, I understand, been sent to the Public Works Department, and doubtless the Engineer-in-Chief has perused the same course in respect to the items "Wallerawang to Mudgee" and "Albury to the River Murray." As regards the doubling of the line to Penrith, however, the sum of £70,000 is required to complete before June next.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

Mr. Thomson.—G.E., 8/12/85. It is impossible for me to deal with this unless the sums required are mentioned in connection with each service. Perhaps the Commissioner might be requested to give them.—J.T., 8/12/85. The Commissioner for Railways.—J.T., B.C., 22/12/85.

No. 33.

Mr. J. Ahearn to The Commissioner for Railways.

Sir, Burwood, 4 December, 1885.

In connection with my contract for duplicating the line, Parramatta to Penrith, I have respectfully to point out that my last three certificates for payment of advances remain unpaid, notwithstanding that one of the clauses in the general conditions states that the "Contractor will be paid 90 per cent. monthly as the work proceeds."

I think you can pay it out of some vote other than the one taken for the contract, and in view of the fact that bank interest on overdrafts, which I have to avail myself of, is 8 per cent., the Department should find some means of paying me.

I have, &c.,

JOHN AHEARN.

Mr.

Mr. Ahearn said that if we gave him what he last asked for—return of part of security money, he would wait for a vote.—CH.A.G., 5/12/85.

What was the amount of the three last certificates, and to what extent did the advance of £2,000 from security money pay them. Could not the balance of the security money be returned, and could not the vote for additions and alterations be made available for the payment of the amount due?—it is a vote peculiarly applicable to this particular service.—CH.A.G., 7/12/85.

Accountant, B.C., 7/12/85.

Memo. by Accountant.

Mr. Ahearn's Certificates:—

	£	s.	d.
No. 12.—	1,789	1	7
13.—	2,431	5	9
11.—	4,071	1	5
			£8,291 8 9
Security returned	...	2,000	0 0
Balance	£6,291 8 9

The retention money amounts to £4,243 18s. 3d., and security now held is £2,000.

The vote for alterations and additions has been operated upon to a large extent by the Treasury advancing, temporarily, for claims—Tamworth to Tenterfield and other extensions. I see no reason why Mr. Ahearn's claims should not be paid from the same source.
Commissioner.

H. WICKHAM, 9/12/85.

Approved. Please make arrangements, and inform Mr. Ahearn when he can get money.—CH.A.G., 9/12/85. Mr. Ahearn has been paid.—H.W., 18/12/85. Commissioner.

Duplication of line from Parramatta to Penrith—John Ahearn, contractor. On the certificate of work performed on the above contract during the month of December there is an amount of £66 10s. for cartage of iron girders from Finegan's Siding to Parramatta at the rate of 7s. per ton. Will you be good enough to let me have Commissioner's authority for this.—J.P.F., 12/1/86. Mr. Cowdery.

I arranged with Mr. Ahearn to cart these girders direct, as required, and now forward for Commissioner's approval.—G.C., 13/1/86. Commissioner. Approved.—CH.A.G., 16/1/86. Mr. Cowdery, B.C., 17/1/86. Noted.—G.C., 19/1/86.

No. 34.

Mr. J. Ahearn to The Commissioner for Railways.

Sir,

Burwood, 9 April, 1886.

I have respectfully to apply for an advance of £2,000 upon the retention money for the contract for the duplication line, Parramatta to Penrith. Should you accede to my request you will then have as security for the completion of the work the following amounts:—

Deposit receipt	£2,000
Retention money	3,300
Work unpaid for	1,000
Material worked, but not fixed, and for which no advance has been made	1,000
									£7,300

The contract being so near completion the above amount should be considered fair security, as £5,000 will complete the whole of the work now to be performed. I may state in justification of this request, that I require the money for working other contracts I have with your Department. Trusting you will take a favourable view of this application.

I have, &c.,

JOHN AHEARN.

Mr. Cowdery, B.C., 10/4/86. Mr. Thomson for full report.—G.C., 12/4/86.

The value of the work yet remaining to be done on this contract is estimated at about £8,800. I would suggest, that if the contractor's application for extension of contract time (now under consideration) be granted, he be paid in accordance with the monthly returns of work performed until the job is completed.—M.T., 18/4/86. Mr. Cowdery.

As the extension of time has been granted the monthly payments can be made as usual.—G.C., 22/4/86. Commissioner.

Since writing the above I have seen Mr. Ahearn, and he wishes £2,000 of the retention money paid to him, independent of the monthly payments. I see no objection to this, as we will then have over £3,000 retention money, and £2,000 balance of security, in hand.—G.C., 27/4/86. Commissioner.

Approved.—CH.A.G., 27/4/86. Mr. Cowdery, B.C., 27/4/86. Noted.—G.C., 29/4/86. Commissioner.

No. 35.

Minute by Mr. J. Waring to The District Engineer.

THE new up-line between St. Mary's and Penrith will in a short time be ready for traffic. This cannot be opened for traffic until necessary alterations are made at the east end of Penrith Station. I have not been supplied with a tracing of necessary alterations. I saw Mr. Parry this morning, and find this matter has not yet been settled. Please see into this, and supply me with a tracing as soon as convenient.

J. WARING, 1/6/86.

Very

Very urgent. Has Mr. Parry arranged the plan for these alterations.—M.T., 3/6/86. Engineer for Existing Lines. Mr. Parry.—G.C., 3/6/86. Plan herewith.—J.P., 3/6/86.

Penrith station-yard—Alteration for duplication of line.—I forward herewith tracing^s₇₉₈, showing in red alterations to roads at Penrith, which will be required for the opening of the duplication of line, Parramatta to Penrith. The District Engineer has made application for this plan in order to do the work, so as not to delay the opening.—J. PARRY, 3/6/86. Engineer for Existing Lines.

Approved.—G.C., 3/6/86. Mr. Shellshear. Mr. Waring to carry out.—W.S., 5/6/86. Will be carried out immediately tracing is received.—J.W., 7/6/86. District Engineer. Tracing to Mr. Waring.—H.J.M., 7/6/86. This work will be taken in hand at once.—M.T., 8/6/86. The Engineer for Existing Lines.—G.C., 9/6/86.

No. 36.

Mr. J. Ahearn to The Commissioner for Railways.

Sir,

Burwood, 2 July, 1886.

In connection with my contract for the duplication of line, Parramatta to Penrith, I have respectfully to call your attention to the fact that although the section from St. Mary's to Penrith was ready for opening five weeks ago, owing to delays of the Department that portion is not yet open for traffic, thus preventing me completing the South Creek Bridge within my contract time, which time expired yesterday. As it is uncertain when this section will be opened, Executive sanction not yet having been obtained, I have to apply for an extension of time of two months.

I am, &c.,

JOHN AHEARN.

Mr. Pickering.—Please see about this at once. We applied for Executive sanction about a week ago.—D.C.M'L., 5/7/86. Mr. Budge informs me that Executive sanction was given to-day to the opening of the line referred to. Papers will be sent to this office to-morrow morning.—J.E.P., 6/7/86.

Sir,

Department of Railways, Sydney, 10 July, 1886.

In reply to your letter of the 2nd instant, stating that in consequence of the delay which has occurred in opening the duplicated railway line from St. Mary's to Penrith you have been prevented from completing the South Creek Bridge, I have the honor to inform you that Executive sanction was given on the 6th instant to the opening of the line in question.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

John Ahearn, Esq., Burwood.

Mr. Cowdery for report *re* extension of time asked for.—D.C.M'L., 12/7/86. Mr. Shellshear for report.—G.C., 14/7/86. Mr. G. R. Cowdery for report.—W.S., 17/7/86.

Delay of about three weeks arose in obtaining Executive sanction. This, coupled with the delay of a fortnight in making the necessary alterations by Department at Penrith to work the new up-line, has hindered the contractor from commencing work on the down side line, St. Mary's to Penrith. The contractor is also being further delayed in the Department removing the old wooden bridges. South Creek Bridge cannot be pulled down within the next three weeks unless a larger gang is employed. Of course this is delay to the contractor, and prevents him from completing the work expeditiously.—G.R.C., 9/7/86. The District Engineer.

The new line from Parramatta to Penrith is complete, and the work remaining to be done by the contractor is the renewal of the bridges at South Creek. There has been some considerable delay in getting Executive sanction for opening the different sections of the new line, and the work of removing the old bridges by the Department has delayed the contractor. I consider he has a fair claim for an extension of time.—W.S., 22/7/86. Mr. Cowdery.

No. 37.

Mr. J. Ahearn to The Commissioner for Railways.

Sir,

Burwood, 15 July, 1886.

Referring to my letter of 2nd July, applying for an extension of time of two months for my contract—duplication line, Parramatta to Penrith—I have now to apply for an extension of time for three months on this contract. The line to Penrith was opened on the 13th instant. The Department have still to pull down South Creek old bridge before I can commence the erection of the new one. This operation will probably occupy the men three weeks more, so that practically I cannot proceed until five weeks of the time has elapsed. The delay having been caused through the line not being taken over, as completed, I respectfully submit that my application should receive your favourable consideration.

I have, &c.,

JOHN AHEARN.

Mr. Cowdery for report.—D.C.M'L., 17/7/86.

As the completion of this contract is being delayed through work having to be done by this Department in pulling down the old bridges, &c., and through the long time elapsing before obtaining Executive sanction to open the line, I recommend that the extension asked for be granted.—G.C., 24/7/86. Commissioner.

What has delayed the pulling down of South Creek old bridge?—CH.A.G., 28/7/86. Mr. Cowdery, B.C., 28/7/86. Mr. Shellshear for report.—G.C., 28/7/86.

The work of removing the old bridge could not be taken in hand until the traffic had been turned on to the new up-line. This was done on the 13th July. Since then a large gang of men have been employed, and the work is being proceeded with as rapidly as possible.—W.S., 30/7/86. Mr. Cowdery, Commissioner.—G.C., 30/7/86.

Under the circumstances stated the contractor is entitled to the extension of time asked for (3 months).—CH.A.G., 31/7/86. For Minister's approval. Approved.—W.J.L., 3/8/86.

No. 38.

No. 38.

Mr. J. Ahearn to Mr. Cowdery, Resident Engineer.

Sir,

Burwood, 16 September, 1886.

Before finally settling up for the iron bridges on the railway, Parramatta to Penrith, I wish to direct your attention to the fact that the bridges as erected by me from amended plans supplied to me by the Department, include a large quantity of extra riveting to bracing, &c., not contemplated by or calculated for by me, such riveting not appearing on the plans signed by me when I undertook to erect these bridges for a lump sum of £1,687 10s. The number of rivets in excess of the quantity originally contracted for is 400 per span. The riveting, as sublet to some of the men in the early part of the work, cost me for wages about £2 per 100 rivets. Add to this the cost of coal, tools, supervision, &c., I find that the cost in excess to me has been £2 10s. per 100 rivets, or £10 per span. This amount, although barely covering the cost, I am agreeable to accept for the forty spans of 40 feet each, which I have erected on the line. The total amount, therefore, that I claim will be £400.

A comparison of the original plan with the one that I have worked to, will convince you of the equity of this charge.

I have, &c.,

JOHN AHEARN.

As I have never seen original plan of these girders I cannot say the number of rivets in them. If there is a difference, as stated by Mr. Ahearn, I think it is clear he has a fair claim against the Department. The following are the number and sizes of rivets in the single 44 feet span, viz.:— $1\frac{7}{8}$ " x $\frac{3}{4}$ " rivets, 206; $2\frac{1}{8}$ " x $\frac{3}{4}$ " rivets, 176; $2\frac{1}{4}$ " x $\frac{3}{4}$ " rivets, 208; $3\frac{1}{4}$ " x $\frac{3}{4}$ " rivets, 48; total, 638.—G.R.C., 17/9/86. District Engineer.

This refers to the extra riveting in the cross bracing of the bridges. This bracing was added after the contract was let, and I consider the amount asked a reasonable claim for the extra work.—W.S., 18/9/86. Engineer for Existing Lines. Mr. Thomson for report.—G.C., 20/9/86.

After the contract was let and signed by Mr. Ahearn, the plan of the girders was altered and improved, involving the addition of about 400 extra rivets in each span. The contractor has a just claim for this extra work, and I consider his charge of £10 per span reasonable.—M.T., 22/9/86. Engineer for Existing Lines.

I recommend this extra of £10 per span be approved.—G.C., 22/9/86. Commissioner. Payment is not authorized.—Ch.A.G., 2/10/86.

I can see no justification for such a departure from the original plan without authority; besides, the contractor should have taken exception at the time. The lump sum was £1,687; to increase this by £400, nearly 25 per cent., apparently without authority, was unjustifiable. A very full explanation must be afforded.—Ch.A.G., 2/10/86. Mr. Cowdery, B.C., 2/10/86. Mr. Thomson for full explanation.—G.C., 5/10/86. The matter was, I believe, explained when the alterations to the girders were sanctioned. Please attach previous papers.—M.T., 5/10/86. Engineer for Existing Lines. Papers herewith.—G.C., 6/10/86. Mr. Thomson.

At the time the original design for these girders was revised and altered, it was pointed out that there would be additional riveting to be done, for which work it was approved to pay the manufacturers of the girders £30 per span extra. Please see Engineer's minute of 16/12/84, and Commissioner's approval. The contractor states that at the time he took no particular notice of the altered design, and did not notice the extra riveting before he started erecting the girders.—M.T., 7/10/86. Engineer for Existing Lines. Report herewith.—G.C., 7/10/86. Commissioner.

Examiner to see me. Ahearn, I presume, is the contractor for the erection, D. & W. Robertson for the construction. £30 a span was authorized for the construction. Did Ahearn tender to the old or new design? When did Ahearn tender—how long after the acceptance of D. & W. Robertson's tender for the construction of these bridges?—Ch.A.G., 10/10/86.

Ahearn is the contractor for the erection, D. & W. Robertson for the construction. £30 per span was authorized on 19/12/84. Ahearn tendered to the old designs and signed the original plans. D. & W. Robertson's tender was accepted on 20/8/84, Ahearn's tender accepted on 28/8/84.—J.P.F., 12/10/86.

For Minister's approval. The charge, it seems, is very reasonable.—Ch.A.G., 12/10/86. Since writing this minute I have been informed that Mr. Ahearn will have some further claim. I will not make any settlement till I know what the full amount of claim is.—Ch.A.G., 13/10/86. Mr. Cowdery, B.C., 14/10/86. Mr. Thomson for reply to Commissioner's minute.—G.C., 14/10/86.

Please let me have the following information:—1. The number of spans (44 and 20 feet respectively) originally provided for in the contract. 2. The number of extra spans (30 feet and 20 feet) afterwards introduced. 3. The number of rivets put in by Mr. Ahearn in the 30 feet and 20 feet spans, and the number of rivets which he would have had to put in the 20 feet spans as originally designed.—M.T., 21/10/86. District Engineer.

Mr. G. R. Cowdery to supply.—W.S., 22/10/86.

Attached is the information required.—1st. Forty 44-foot spans and one 20-foot span were originally provided in specification. 2nd. Three 20-foot spans and eight 33-foot spans were afterwards added. 3rd. Number of rivets put in a single 33-foot span by Mr. Ahearn was 285, and in a 20-foot span 174 rivets. As no bracing was shown in the original 20-foot span, of course no rivets were required.—G.R.C., 28/10/86. District Engineer.

The Deputy Engineer.—W.S., 28/10/86.

The original contract was for forty spans of 44 feet and one span of 20 feet—£1,687 10s. Since the contract was let eight 33-foot and three 20-foot spans were added, the price for erecting which at the original schedule price will be £31 5s. and £20 16s. 8d. per span respectively. For extra riveting £10 per span of 44 feet is claimed. Worked out *pro rata*, the total amount of extra on this then will be as under:—Erecting eight 33-foot spans at schedule rate, £31 5s.—£250; erecting three 20-foot spans, at £20 16s. 8d.—£62 10s. Extra riveting:—Forty 44-foot spans, at £10—£400; eight 33-foot spans, at £7 10s.—£60; four 20-foot spans, at £5—£20; total, £792 10s.—M.T., 3/11/86. Engineer for Existing Lines.

Commissioner.—G.C., 4/11/86.

Mr. Badham.—Please prepare *précis*.—D.C.M.L., 5/11/86.

Précis

Précis.

Mr. John Ahearn's claim for extra work in connection with duplication of line, Parramatta to Penrith.

UNDER date of 8th October, 1884, Mr. Ahearn entered into a contract for the duplication of the line from Parramatta to Penrith. In this contract an item of £1,686 10s. was included for erecting iron bridges.

The contract for the construction of these bridges was taken by D. and W. Robertson, who for certain extra work in them, rendered necessary by a departure from the original design, were paid £30 per span over and above the contract price.

Under date of 16/9/86 Mr. Ahearn wrote that the bridges as erected by him contained a quantity of extra riveting not shown in the plan which he had signed. There were 400 rivets per span more than he had contracted to supply. He had sublet some of the riveting and paid £2 per 100 rivets. Adding coal and other items the cost would be £2 10s. per 100 or £10 per span. That would barely cover the outlay, but he was willing to accept it for the forty spans, which would make £400.

Mr. Shellshear minuted that this was the riveting for the extra bracing which was added after the contract was let, and the claim was reasonable.

Mr. Thomson concurred, and Mr. Cowdery recommended payment.

Commissioner could see no justification for such a departure from plan without authority. The lump sum (in contract) was £1,687, and to add 25 per cent. (£400) to it was unjustifiable. A very full explanation would be required.

Mr. Thomson minuted that when the plan was altered it was pointed out that there would be extra riveting and that for this the makers with Commissioner's approval had been paid £30 per span extra.

Commissioner minuted that he presumed—(1) that Ahearn was contractor for the erection; (2) D. and W. Robertson for the construction; (3) that £30 per span was authorized for the construction; (4) did Ahearn tender to the old design; (5) how long after the acceptance of Robertson's tender did Ahearn send in his tender?

Examiner replied—(1) yes; (2) yes; (3) yes; (4) yes; (5) that Robertson's tender was accepted, 20/8/84; Ahearn's, 28/8/84.

Commissioner minuted that he was informed Ahearn would have some further claim and that he must know what the full amount would be.

Mr. Thomson reported that the original contract was for forty spans of 44 feet and one span of 20 feet, that eight 33-feet and three 20-feet spans had since been added, and these at the original schedule prices would be £31 5s. and £20 16s. 8d. each respectively. Worked out *pro rata* the claim would stand as under:—

Erecting additional spans—				£	s.	d.
Eight 33-feet spans, at £31 5s.	250	0	0
Three 20 do at £20 16s. 8d.	62	10	0
Extra riveting—						
Forty 44-feet spans, at £10	400	0	0
Eight 33 do at £7 10s.	60	0	0
Four 20 do at £5	20	0	0
				£792	10	0

C.A.B., 15/11/86.

Why was design altered? I should like to see Mr. Thomson.—CH.A.G., 21/11/86.

Please attach all papers referring to duplication of line, Parramatta to Penrith, also papers referring to Mr. Townsend's iron girders and papers referring to Wearne's contract for iron girders.—M.T., 23/11/86.

The design of these girders was altered in order to introduce a proper system of lateral bracing and flooring, so as to make better provision against wind-pressure and the effects of floods, the creeks carrying a lot of debris and drift-wood in time of flood. The extra 33-feet spans were obtained in order to preserve the original waterway at Eastern Creek, and the extra 20-feet spans were used for the same purpose at other creeks. (The papers referring to these extra spans are not with this file).—M.T., 1/12/86. Engineer for Existing Lines.

Commissioner.—G.C., 2/12/86. The papers should be found, and a *précis* made of them.—CH.A.G., 10/12/86. Papers herewith.—J.J.W., 20/12/86. Mr. Badham for *précis*.—D.C.M'L., 21/12/86.

Précis.—Mr. Ahearn's claim.

MR. COWDEY submitted a claim in favour of Mr. Ahearn for extra work on the bridges between Penrith and Parramatta.

Commissioner called for the papers on which the extra work was authorized.

These papers are now submitted, and it appears that, after the tenders had been received and accepted, the designs were altered, and three 20-feet and eight 30-feet bays added to the bridges.

Mr. Secretary Wright sanctioned the additions, but thought it was a pity a little more attention had not been paid to the question before the work was started.

The above agrees with the claim now put forward for Mr. Ahearn for additional bays.

As will be seen by the *précis*, there was also extra bracing to all the bridges, which involved additional riveting. This makes up the remainder of Mr. Ahearn's extra claim.

The amount claimed is £792 10s.

C.A.B., 2/2/87.

This is a very urgent matter. It has been so very long delayed through no fault of Mr. Ahearn, who has had to suffer.—A.R., 3/2/87. Pay—authority having now been found for incurring outlay.—CH.A.G., 3/2/87. Engineer for Existing Lines, B.C., 3/2/87. Please note, and furnish final certificate at once.—M.T., 4/2/87. District Engineer. Final certificate herewith.—G.C., 21/2/87.

No. 39.

Minute by The Examiner of Accounts.

Duplication of line—Parramatta to Penrith—John Ahearn, Contractor.

ENCLOSED is the final certificate for the above work amounting to £91,267 16s. 6d. This exceeds the sum of the contract price (£79,343 1s. 6d.) and authorized extras (£1,635 4s. 8d.) by £10,289 10s. 4d.

Will you please furnish particulars of the excess for the Commissioner's information.

JOHN P. FINEGAN,

Mr. Cowdery.

23/2/87.

There are other papers explaining this matter in which it was pointed out that an error had been made in the estimates and quantities of this work and fully explained to the Commissioner, who consequently obtained supplementary supplies to carry out the work. The papers referred to will show that I pointed out that the original estimates were not correct, and that consequently it would be necessary to obtain additional supply, and it was there further pointed out that Mr. Ahearn's contract would be exceeded by some £10,000 or more (I am speaking from memory only), and combined with other works the result was that the supplementary vote was obtained. The excess of this contract has been duly authorized, but at the same time the papers referred to should be found and attached. They contain the original and my amended estimates.—M.T., 24/2/87. Examiner.

Will Commissioner please say if final certificate may be passed.—J.P.F., 26/2/87. Secretary. Will Mr. Badham please make statement of case for submission to Commissioner.—D.C.M'L., 1/3/87.

DUPPLICATION of line, Parramatta to Penrith—Mr. Ahearn's Contract.

Particulars.	Amount.		Amount.	
	£	s. d.	£	s. d.
Total amount of final certificate.....			91,267	16 6
Mr. Ahearn's tender amounted to	79,343	1 6		
Authorized extras, as under :—				
To riveting and erecting additional spans of bridges consequent upon alterations of bridge designs.....	792	10 0		
To cartage of girders from Finegan's Siding	66	10 0		
To difference in cost between laying and ballasting hydra-headed rails, at 7s. 4d. per yard, and laying ordinary Permanent-way, at 2s. 6d. per yard; 3,212 yards, at 4s. 10d.....	776	4 8		
			80,978	6 2
Balance for which no specific authority has been obtained		*£	10,289	10 4

* As regards this difference between the amount of the final certificate and the tender and authorized extras quoted, Mr. Thomson informed me that he bases the authority for incurring this extra expenditure on an item of £10,000 which was included in the statement furnished by him on 30/9/85 in connection with the supplementary vote of £70,000 for the completion of the duplication of the line.

On the 8/9/85 the then Secretary for Public Works (Mr. Wright) in a condemnatory minute as to the careless manner in which the estimates for works are prepared, approved of the additional amount being provided for the completion of the line, but the papers do not, as Mr. Thomson admits, show any special authority (beyond the mere inclusion of the item referred to in the supplementary vote of £70,000) for the work which has absorbed the amount of the difference shown. Mr. Ahearn as per final certificate on file has been paid £90,267 10s. 5d. on account of contract, and the balance therefore due is £1,000 6s. 1d. G.A.S.; 1/4/87.

No. 40.

Mr. J. W. Townsend to The Secretary for Public Works.

Sir,

Athenæum Club, 26 January, 1888.

Referring to a recent conversation *re* estimate for doubling the line, Parramatta to Penrith, I have the honor to inform you that drawings and estimate for this work were prepared in the Sydney District Engineer's Office, of which office I was in charge as District Engineer. Drawings, estimate, and specification when completed were handed to Mr. Cowdery, were examined, and, I presume, found correct in his office, as they were signed by him. The contract was let for a term closely approximating the office estimate; but after the work was commenced numerous alterations were made that largely increased the cost of the work, for which I am in no way responsible, as before the work was commenced I had been transferred to Mr. Whitton's branch for the purpose of making the Colo Valley survey.

I have, &c.,

J. W. TOWNSEND.

The contract price for the iron bridges on this work, which were my design, was the lowest either per ton or per span for which such work has ever been done in the Colony.—J.W.T.

It had been represented to me that to a large extent Mr. Townsend was responsible for the under estimate of the cost of doubling line to Penrith, that several necessary works had been omitted by him. I do not know that he ever had an opportunity of explaining the matter before, but he does not seem disposed to accept any responsibility.—C.R.A.G., 8/2/88.

The Commissioner will be glad to receive your report *re* this, Engineer for Existing Lines.—A.R., 8/2/88. Full report herewith.—G.C., 9/3/88.

Duplicating

Duplicating line—Parramatta to Penrith.

In October, 1882, Mr. G. W. Townsend submitted preliminary estimate for this work, amounting to £84,203. A supply of £85,000 was obtained in consequence, and survey proceeded with. This estimate did not provide for the expenses to be incurred in altering the existing station arrangements, &c.

Subsequently tenders were accepted for the supply of ironwork for bridges and for the construction of the line, amounting to, as under:—

	£	s.	d.
1. Superstructure for bridges	11,365	6	3
Necessary alterations to bridges to make them safe	1,200	0	0
2. Additional bridges at Eastern Creek (superstructure)	2,138	9	5
3. Construction of line	79,343	1	6
	<u>£94,046</u>	<u>17</u>	<u>2</u>

To which is to be added extras:—

1. Under estimated weight of ironwork	419	9	4
3. Excess caused mainly by under estimated quantities, and concrete required to secure good foundations, &c.	11,924	15	0
	<u>£106,391</u>	<u>1</u>	<u>6</u>

To which should be added the cost of permanent-way material and station arrangements.

The total cost of the work, as far as can be ascertained, will be about £169,250, out of which £33,000 is to be charged to working expenses for removing existing bridges and stations, leaving £136,250 for new work, or some £52,000 in excess of the original estimate.

The alterations made, referred to by Mr. Townsend, were:—Dispensing with hand-packed rubble behind the abutments, and building the latter in cement instead of mortar, by which a saving of some £4,600 was effected, which, however, was swallowed up through the extra foundations which had to be provided for the abutments. The alterations to the bridge superstructures were necessary in order to ensure their stability and safety, and involved an extra expenditure of some £3,000.

It is true that Mr. Townsend afterwards submitted an estimate for constructing the line without supply of iron bridges, rails, or station arrangements, but it did not agree closely with the contract price as stated (being some £4,400 below the latter, and required revision and correction), and does not alter the fact that the original estimate was wrong and the quantities undermentioned, as shown above.

M.T., 2/3/88.

Mr. Townsend may be supplied with a copy of report. I have not seen Mr. Townsend's estimated quantities, &c., nor the comparison which I asked for between the actual quantities and Mr. Townsend's quantities.—CH.A.G., 13/3/88. Engineer for Existing Lines.

Comparative statement of original estimate and actual cost now attached—the latter as near as can be ascertained at present, to which will have to be added some £400 for completing St. Mary's Station, now under construction.—M.T., 27/3/88. Secretary.

M.T., 27/3/88.

No. 41.

Minute by The Chief Commissioner for Railways.

Is there any correspondence in the office—tempus 1884—re Townsend girders? Some press correspondence, I think.—CH.A.G., 5/5/88.

Herewith.—C.A.B., 11/5/88.

Be good enough to separate the papers referring to the design of girders. Make a *précis* of them, and place the whole with Professor Warren's report on these bridges. I wish Mr. Townsend to see these papers; they may account for some discrepancies to which he has called my attention. I refer to the correspondence with D. and W. Robertson re price to be charged for extras, and the late Mr. Avern's report thereon.—CH.A.G., 10/5/88.

Mr. Badham, please make *précis*. Mr. Townsend has seen papers.—H.M.L., 10/5/88.

Mr. Townsend's design of girder for bridges—Parramatta to Penrith.

UNDER date of 18th February, 1884, Mr. Townsend reported that the girders he had designed under Commissioner's instructions to place wooden bridges and viaducts had proved a complete success under a very severe test. Mr. Townsend also made some suggestions in regard to providing machinery for the making of a bridge for further trial, but as they were not acted upon no further reference need be made to them.

Commissioner thereupon directed Mr. Cowdery to make an independent test of the girders, reporting their behaviour under test, and expressing his view as to their stability and suitability.

Mr. Cowdery reported that the girders had been tested with the heaviest running load that could be put upon them, and that he found them perfectly rigid, the deflection being scarcely perceptible. They would be very suitable where there was sufficient roadway, and especially in duplicating a line, because the roadway could be completed without interfering with the old line.

Commissioner thought it would be well before submitting to state the cost of bridges to this design in comparison with the cost of wooden bridges, &c., for the duplication of the line, Parramatta to Penrith.

Mr. Cowdery reported that the bridges would cost, if made of this design, £42,600; if of timber, £58,000; if of plate, main girders, and cross girders, £70,000.

Commissioner recommended the adoption of the Townsend girder for the bridges, Parramatta to Penrith.

Mr. Secretary Wright approved. Tenders to be invited (1) for imported work, and (2) for work to be done in the Colony.

Tenders were invited accordingly, and the tender of D. & W. Robertson was accepted.

C.A.B., 11/5/88.

Did

Did the bridges cost more or less than £42,600?—CH.A.G., 14/5/88. Engineer for Existing Lines.—A.R., 15/5/88. The total cost of the bridges and culverts was £62,161. The cost of the culverts has not been kept separately, but would not amount to more than £2,000.—G.C., 18/5/88. Commissioner.

Perhaps Mr. Cowdery can explain why he estimated the cost of these bridges at £42,600, or rather, why they have cost £60,000. The alterations made to the design did not affect the price very much, and, if my memory serves me, the cost of the iron per ton was less than the original estimate.—CH.A.G., 23/5/88.

The estimate for these bridges (on which the money for carrying out the work was obtained) was £28,512 for single line bridges, which should have been pointed out in the prices, and corresponds pretty nearly with the actual cost taken in proportion to the double line. In addition to the bridges originally provided for eight spans of 30 ft., and three spans of 20 ft. were added, and the alteration to the design increased the cost, also both in the cost of the ironwork, and the quantity of timber for sleepers. The discrepancy between the original estimate of £28,512 for single line bridges, and Mr. Townsend's later estimate of £42,600 for double line bridges, escaped my notice at the time.—G.C., 30/5/88. Commissioner.

I wish to know what the figures £42,600 should have been at the time the estimate was given to me. Of course the eight spans of 30 ft., and the three spans of 20 ft., must be included, and also cost of alteration in design. Are the other figures correct—£58,000 for timber bridges, and £70,000 for bridges—in the design then in use when Mr. Townsend's girders were accepted?—CH.A.G., 1/6/88.

I am not aware what Mr. Townsend included in his estimate of £42,500, or what he intended to do for that amount, but the estimate should have approached nearer to the actual cost of the work and the estimate previously furnished to me by Mr. Townsend, and on which latter the moneys for the work were obtained. And I now notice that in this estimate of £42,600 Mr. Townsend has not made any allowance for masonry and excavation for foundations, nor for the strengthening of and pulling down the old bridges, which amount to some £12,000, bringing up the estimate to something like £54,000, being approximately the actual cost of the work, exclusive of the additional 30 feet and 20 feet spans. With regard to the other estimates of £58,000 and £70,000 submitted by Mr. Townsend for timber and plate girder bridges respectively, Mr. Thomson, Mr. Fischer, and myself have carefully considered the same, and basing the estimates on the figures assumed by Mr. Townsend, I find that timber bridges could have been constructed for about £45,000, and iron plate girder deck bridges for about £46,000, which in both cases includes the cost of strengthening and pulling down the old bridges (which amounts to about £4,500, and was not provided for in Mr. Townsend's estimate of £42,600); but in order to make the comparison equitable the masonry and excavation are not included, as these items were omitted by Mr. Townsend in his estimate. I notice, moreover, that Mr. Townsend in his estimate puts £36 per ton for plate girders against £20 per ton for his own design. The reason for this I do not know, as at any time plate girders would be obtained as cheap, if not cheaper, than lattice girders. I do not want to excuse myself if any blame can be attached to me in this matter, but I must point out that the estimates of Mr. Townsend now under question were submitted to me after the money for the work had been granted on a more accurate estimate, and then they were forwarded on to the Commissioner by my Chief Clerk during my absence without my seeing them in the first instance, hence I came to overlook them and not compare them with the original estimate. In matters of this kind I must of course rely on my subordinate officers to a certain extent. If I were to personally check all figures and quantities, whether in the field or office, I should find time for nothing else.—G.C., 11/6/88. Commissioner.

I think Mr. Townsend should have an opportunity of replying to this statement.—J.S., 12/6/88.

No. 42.

Reply by Mr. G. W. Townsend to Mr. Cowdery's 88-2,899.

MR. COWDERY says on his M.P.: I am not aware that Mr. Townsend included in his estimate of £42,600, or what he intended to do for that amount, but the estimate should have approached nearer to the actual cost of the work than the estimate previously furnished to me by Mr. Townsend, and on which latter the moneys for the work were obtained.

Estimate previously furnished.

Mr. Cowdery's M.P.: And I now notice (11/6/88) that in this estimate of £42,600 Mr. Townsend has not made any allowance for masonry and excavations for foundations, nor for the strengthening of and pulling down the old bridges, which amount to some £12,000, bringing up the estimate to something like £54,000, being approximately the actual cost of the work, exclusive of the additional 30 feet and 20 feet spans.

My estimate of £42,600 for forty 44-foot spans of iron bridges on brick piers and abutments as designed by me, included all necessary masonry for coping and bedstones, and all excavations for foundations, those being covered by the price of £3 per cube yard for brickwork (50s.) being a fair price. The designs were not completed when this estimate was furnished, so I put a high price on the brickwork to cover detail contingencies. This estimate allowed £28,000 for single-line bridges on a less economical design than that which was subsequently adopted.

As above stated the masonry and foundations were included in the high price of £3 per cube yard for brickwork, 50s. being a fair price.

Strengthening the old bridges I considered should certainly not be charged to the cost of the new ones, but to maintenance. Pulling down the old bridges should have been paid for by sale of material.

My estimate of £42,600 was for forty spans of 44 feet each.

The work done comprised fifty-one spans, viz., forty of 44 feet, eight of 30 feet, and three of 20 feet. These have been made to cost £62,161, but that sum really includes about £2,000 for culverts, leaving £60,161 for the cost of the fifty-one spans.

The brickwork, concrete, masonry, and excavations cost about the same for large and small spans.

The cost of superstructure will be about £960 less for the eleven small spans than it would for the same number of 44-foot spans. By deducting the sum of £4,500 for strengthening and pulling down the old bridge from and adding £960 to £60,161, we get £56,621 as the actual price for comparison, and can arrive at what the forty spans of 44 feet cost, viz., £44,408. This gives an excess of £1,808 over my estimate of £42,600, which, considering the alterations which were made from my design, is close enough. With

With regard to the other estimates of £58,000 and £70,000, submitted by Mr. Townsend for timber and plate girder bridges respectively, Mr. Thomson, Mr. Fischer, and myself have carefully considered the same; and, basing the estimates on the figures assumed by Mr. Townsend, I find that timber bridges could have been constructed for about £45,000, and iron plate girder deck bridges for about £46,000, which, in both cases, include the cost of strengthening and pulling down the old bridges (which amounts to about £4,500, and was not provided for in Mr. Townsend's estimate of £42,600); but, in order to make the comparison equitable, the masonry and excavations are not included, as these items were omitted by Mr. Townsend in his estimate. I notice, moreover, that Mr. Townsend puts £36 per ton for plate girders against £20 for his own design. The reason for this I do not know, as at any time plate girders would be obtained as cheap, if not cheaper, than lattice girders.

Mr. Cowdery's M.P.: I do not want to excuse myself if any blame can be attached to me in this matter; but I must point out that the estimates of Mr. Townsend now in question was submitted to me after the money for the work had been granted on a more accurate estimate.

And they were forwarded on to the Commissioner by my Chief Clerk during my absence, without my seeing them in the first instance; hence, I came to overlook them and not compare them with the original estimate.

Mr. Cowdery's M.P.: In matters of this kind I must of course rely on my subordinate officers to a certain extent. If I were to personally check all figures and quantities whether in the field or office, I should find time for nothing else.

G.C., 11/6/88.

Please make a *précis* leaving out personal references.—CH.A.G., 24/6/88.

Mr. Townsend's design of girder for bridges, Parramatta to Penrith.

In *précis* of 11/5/88, it is shown that the estimated cost of the above bridges if Mr. Townsend's design of girders were used was £42,600. If timber were used £58,000; and if plate-iron main girders and cross girders were used £70,000. These estimates were prepared by Mr. Townsend while acting as District Engineer under Mr. Cowdery.

Townsend's girders were used in the bridges for the duplication of the line from Parramatta to Penrith, and the bridges cost £60,000.

Commissioner asked for an explanation of this, and Mr. Cowdery replied, stating that the original estimate was £28,512 for single line bridges, and that amount doubled would be pretty near to the actual cost. The discrepancy between the original estimate and Mr. Townsend's later figures £42,600 for double bridges, escaped his notice at the time. In addition to the bridges originally estimated for, eight spans of 30 feet each, and three spans of 20 feet each were supplied, and the designs being altered as well as the cost was increased.

Commissioner then requested to know what the figures £42,600 should have been at the time the estimate was given to him.

My price for the timber bridges was £43,521; cost of keeping traffic open during construction, £14,479; making a total of £58,000. This was for a length of 2,670 feet, the extra length being required to keep the toe of the banks clear of the running water.

I gave no estimate for deck bridges with plate girders; but for through bridges, such as were then being built, with two main girders and cross girders. Four such bridges were being erected over the streets in Parramatta at the time I made the estimate in question, the ironwork for which cost, I believe, £22 per ton, and the erection, including temporary work, cost fully £14 a ton more. It was upon this work that I based my price of £36 per ton, as stated in note upon the estimate—£22 per ton, with £14 per ton added for erection and temporary work—which was about the cost of the Parramatta bridges. My bridges cost, erected, about £20 a ton. Those four bridges in Parramatta, of an aggregate length of about 350 feet, were estimated to cost £22,000. Numerous others, equally wasteful and extravagant work, were being carried on about the same time, from 1883 to 1885; and I determined, if possible, to make a change.

As to plate girder deck bridges, Professor Warren has shown that of the very highest and best construction possible they would cost £42 per span more than mine. If of the type of the Phoenix Co's design, which has been copied and made use of at Strathfield, which Professor Warren reduced in weight considerably for comparison, the difference in favour of my design would be £57 per span for 44-foot spans—the brickwork, masonry, and excavations being the same in either case; but these are far more economical than any plate girders in use at that time, and are of the newest and most approved American design.

Then why was the money not sufficient?

There was no necessity for the extra openings that were put in at Eastern Creek. I had allowed ample waterway from an accurate knowledge of the watershed area. It is this and other extra work ordered after the estimate was prepared that caused the estimate to be exceeded.

The estimate in question was prepared by me and sent to Mr. Cowdery, from whom I received it back with a request that I would give some instance in support of the high price given by me for through bridges with two main plate girders and cross girders. I copied the first estimate exactly with the exception that I inserted a note as follows, "The four bridges in Parramatta are estimated to cost £22,000, the same replaced by timber would have cost about £14,000." I then sent to Mr. Cowdery the original estimate together with the copy with note inserted. A few days afterwards I received the two back with the following note on the second one in Mr. Cowdery's own handwriting. "Return must be made without reference to works under contract." I wrote across the note objected to, "I put this information in the return as the last I sent in was returned for this same information." I then made a fresh copy of the original, and sent the three back to Mr. Cowdery. Mr. Cowdery's note is signed, G.C., 27/3/84. The date of my last copy of estimate is 10/4/84. The three papers in question I saw recently amongst the papers relating to this subject. Mr. Cowdery is therefore in error when he says he did not see or check these estimates.

G. W. TOWNSEND, 22/6/88.

23/5/88;

1/6/88

Of

Of course the eleven additional spans must be excluded and also the cost of the alteration of design. ^{1/6/88.} Would like also to know if the other figures £58,000 and £70,000 were correct for bridges to the design then in use when Townsend's girders were accepted.

Mr. Cowdery says he is not aware what Mr. Townsend included in the estimate of £42,600, or what he intended to do for that amount, but notices now that no allowance was made for masonry, excavations for foundations, strengthening of some and pulling down other old bridges, which exclusive of the eleven additional spans would bring the £42,600 to something like £54,000. ^{11/6/88.}

Regarding the other items of £58,000 and £70,000, Mr. Cowdery says, he together with Messrs. Thomson and Fischer have carefully considered them and find that timber bridges could have been built for about £45,000 and iron plate girder deck bridges for about £46,000. These figures include the cost of strengthening and pulling down the old bridges (about £4,500), but they exclude the cost of masonry and excavations in order to make the comparison with Mr. Townsend's figures an equitable one.

Mr. Cowdery observes further that Mr. Townsend estimated £36 per ton for plate girders against £20 per ton for his own design, whereas at any time plate girders would be as cheap if not cheaper than lattice girders.

The Minister thought Mr. Townsend should have an opportunity of replying to Mr. Cowdery's statement, and he has now done so.

Mr. Townsend says his estimate of £42,600 did include the cost of masonry and excavations, but he did not include the cost of strengthening or pulling down of old bridges. He thought the strengthening of bridges was a charge against maintenance, and the pulling down of the old bridges should have been paid for by sale of material.

From the actual cost of the bridges, viz., £60,161, the following amount must be deducted:—

Item strengthening bridges and pulling down	£4,500
		£55,661

Add difference in proportionate cost of superstructure of eleven spans and the price of the 44 ft. spans originally stipulated for	960
--	--------	-----

Total cost of fifty-one spans	£56,621
-------------------------------	---------	---------

The forty spans originally estimated for will thus be £44,408, which exceeds the original by £1,808:

The estimate for timber bridges, viz., £58,000, is arrived at as under:—

Timber and construction	£43,521 (for a length of 2,670 ft.)	
Extra cost in having to keep trains running	£14,479
		£58,000

In his estimate of £70,000 for iron bridges of two main girders and cross girders, such as were being built at the time, Mr. Townsend estimated £22 per ton for ironwork, and £14 per ton more for erection and temporary work, which was the same as the work then proceeding over the streets in Parramatta was costing.

His own design of girders cost about £20 per ton including erection.

As to plate girder deck bridges Professor Warren has shown that the very lightest and best construction would cost £42 per span more than his (Mr. Townsend's) design, and in the Phoenix type which has been reduced in weight considerably for comparison, the difference in favour of Townsend's design is £57 per span of 44 feet. These are of the newest and most approved American design and in either case are far more economical than any plate girders in use at the time of Mr. Townsend's estimate.

Extra work ordered after the estimate was prepared caused the amount to be exceeded. There was no necessity for instance, for the extra openings that were put in at Eastern Creek.

A.P., 28/6/88.

This case is now ready for submission to the Minister—it seems that £4,500 incurred for removing old structures, charged as portion of Mr. Townsend's figures, were not included in his estimate, and that his estimate of £42,600 has only been exceeded by £1,808, the expenditure in excess of this amount, viz., £11,253, was caused by extra work ordered after the estimate was made.—CH.A.G., 29/6/88.

No. 43.

Minute by The Commissioner for Railways.

Mr. Townsend's reply to Mr. Cowdery's report of 11/6/88 *re* the causes which explain why the cost and estimate of cost of certain bridges do not correspond.

I SHOULD like to know how the sum of £4,500 for strengthening some and removing others of the old bridges was made up. Has credit been taken for the value of the old material?

It seems to me that Mr. Townsend, in framing his estimate of the cost of timber bridges, was right to take into consideration the cost of keeping traffic open during construction.

One of the reasons urged for the adoption of the Townsend girders was that they would admit of the traffic being carried on at small cost, and in regard to the plate girder bridges estimate Mr. Townsend was also right to compare the cost of his new girders with the cost of plate girder bridges at that time in existence. It seems the Parramatta bridges did cost £36 a ton as against £20 for the Townsend Bridges; the cost of erection in the former case being £14 a ton, while in the latter it was something less than £4.

Mr. Cowdery may have some observations to offer on the point to which Mr. Townsend has addressed himself.

I shall be glad to have papers back by the 12th instant.

CH.A.G., 5/7/88.

Please see report attached.—G.C., 12/7/88. Secretary.

Report.

IN reply to Commissioner's minute, 5/7/88, I may mention that no credit has been taken for the old material from the old timber bridges between Parramatta and Penrith, as the timber cannot be used for any similar purpose again, but only for backing up and small repairs.

The item of £4,500 for strengthening and pulling down the old bridges was made up from the actual expenditure on this item, which amounted to £4,608 3s. 9d. in all. A large amount of this was incurred through several piers of the new bridges coming just in the site of the old ones, which necessitated the employment of temporary piers during construction.

With regard to Mr. Townsend's statement that he included the excavation and masonry in his price for brickwork, I am not inclined to believe that such was the case, as at the time he made his estimate in question we paid as much as £3 and more per cubic yard for brickwork, and up to the end of 1884 not less than £2 15s. (Mr. Townsend's estimate was furnished in the beginning of 1884); and this belief is borne out by Mr. Townsend's own figures, as in his first estimate he provides for 8,180 cubic yards of brickwork only, which is said to include excavation and masonry, whereas in his Schedule quantities for the contract he provides for 10,330 cubic yards of brickwork, exclusive of excavation and masonry, which latter items are provided for separately, besides 900 cubic yards of dry rubble not mentioned in his first estimate.

I notice that in his report Mr. Townsend avoids any reference to the extra expenditure which had to be incurred in order to secure a safe formation for the abutments and piers. Mr. Townsend represented to me at the time that he had made accurate borings, showing the depths to which the piers and abutments had to be carried, and these supposed depths were submitted to me on the general plan of the bridges, and I naturally took Mr. Townsend's report and representations as being correct, he being deputed to carry out and conduct all details connected with the work in question. On carrying out the work in practice it was found that the abutments and piers had in all instances to be carried to a greater depth in order to secure a firm foundation than what was provided for by Mr. Townsend.

The cost of strengthening the old bridges having to be incurred as a consequence of the construction of the new ones, should, I think, be charged against the construction. With regard to the pulling down the old bridges, it would be a matter of opinion how the cost should be charged. Such portions as were pulled down in consequence of the new bridges having to be erected, but not requiring immediate renewals, otherwise the cost might fairly be charged to construction, and in case of such as required immediate renewal the cost would of course be chargeable to maintenance. Mr. Townsend's estimate of £14,479 for keeping the traffic open during constructing timber bridges is altogether excessive and out of proportion, as the construction of timber bridges would not impede the traffic more than the construction of iron bridges, as in either case one line could be constructed independently of the other with a judicious arrangement of details.

Mr. Townsend states that he based his estimate for plate girders on the basis of those at that time being constructed in Parramatta. These latter had of necessity to be made "through bridges" with cross girders in order to obtain headway for the street traffic under them, but in the case of the duplication no one would have thought to adopt a similar construction, because the circumstances were quite different, and, as a matter of course, if plate girders had been adopted the bridges would have been constructed as "deck bridges," and in order to show what reliance can be put on Mr. Townsend's figures, I would point out that while he says that the Parramatta bridges cost £36 per ton erected, the actual cost was only £23 16s., viz., £19 5s. per ton of ironwork supplied, and £4 11s. for erection, including temporary staging, &c., and it might further be pointed out that when Mr. Townsend submitted his estimate we were obtaining girder-work, both plate and lattice work, such as Redfern tunnel, Orange footbridge, &c., for £17 per ton, and extra high-class work such as roofs at Eveleigh, at £17 15s. per ton, so there was no justification for Mr. Townsend to put such a high price on his estimate for plate girder-work.

With regard to Professor Warren's report on those bridges, I can have nothing to say as it has not been sent to me for either report or perusal, and I have never seen it, whereas Mr. Townsend has apparently had the advantage of having perused it.

With regard to the bridge at Strathfield, I would point out that it is not a copy of the Phoenix Co.'s design; it contains as much of the Keystone Co.'s design as of the former or any other design, if in any case it can be said that any bridge design can belong to any particular company or individual. The bridge at Strathfield is one of our recent standard patterns designed specially for renewal of timber bridges; and the depth of girders, dimensions, and general construction are specially adapted for this particular purpose.

With regard to the necessity for the extra openings put in at Eastern Creek, I have simply to state that in times of flood during the time of the old timber bridges the water has been known to rise nearly up to rail level, which sufficiently proves, I think, the necessity for not decreasing the waterway from what it was before, as Mr. Townsend proposed to do, and that I acted wisely in preserving the original waterway.

I think that on a fair comparison the above explanation will put a different aspect on this case to that which Mr. Townsend has been trying to imply.

Commissioner.

No. 1.

Memo. from Heyde, Todman, & Co. to The Secretary for Railways.

York-street, Wynyard Square, Sydney, 6-15 September, 1879.

A VALUABLE constituent of ours in Hay, New South Wales, writes:—"Will you get us a copy of the railway rates on goods from Sydney to Wagga also-memo. of rebates allowed by the Department (if any) on goods to be shipped by river steamers."

Will you kindly furnish us with the required information, as you may be aware all the goods for this district have hitherto been forwarded *via* Melbourne, so that if there is any rebate or inducement within the power of the Department to offer, it is as well to do so as an inducement to have goods forwarded through our own Colony.

HEYDE, TODMAN, & CO.

Inform of the rebates allowed for distances which in effect are rebates for goods being carried to Hay and other places in Riverina. Show what the rate would be Sydney to Wagga—if no rebate was allowed, and what it is.—CH.A.G., 16/9/79.

Messrs. Heyde, Todman, informed, 19/9/79.

Department of Public Works, Railway Branch, Sydney, 19 September, 1879.

Gentlemen,—

In reply to your memo. of the 6th instant, asking to be furnished with a copy of the rates charged on the New South Wales lines, and enquiring whether any rebate is allowed on goods consigned for shipment by the Riverina steamers, I have the honor to inform you that no special rebate is made on goods to be shipped by the river steamers, but a general reduction is made on all goods carried for long distances, which in effect is a rebate on all goods consigned to any part of Riverina. The reduction is in proportion to the distance carried, thus on goods over 100 miles a reduction of 10 per cent. is allowed on the rate per mile; over 150 miles, 20 per cent.; over 200 miles, 40 per cent., and a further reduction of 20 per cent. is made on all goods comprised in the 1st, 2nd, 3rd, and 4th classes, conveyed for distances over 300 miles (the distance from Sydney to South Wagga Wagga is 309 miles). The character of the rebate will be seen more plainly by the figures quoted in the margin, where I have shown the price that would be paid per ton for goods consigned to Wagga Wagga if the uniform rate per mile was charged, and the amount that is charged with the reductions allowed. It will be observed on reference to the figures quoted that the concessions made are very liberal, and such as to offer every reasonable inducement to residents in the Riverina districts to obtain their supplies direct from Sydney.

Enclosed please find rate sheet asked for.

I have, &c.,

D. VERNON,
Secretary of Railways.

Messrs. Heyde, Todman, & Co., York-street, Sydney.

No. 2.

Minute to Mr. Traffic-Inspector Roberts.

THE Commissioner would be obliged if Mr. Roberts could give him any and all information possible as to the nature and amount of the traffic which we do now by river, so that he could form some idea of the extent to which present revenue would be affected by any changes which may be made in the direction referred to by Heyde, Todman, & Co.

If any extra traffic could be gained the proposition would be worth entertaining.
Reply early.

D.V., 27/9/79.

Mr. Inspector Roberts.

J. WALKER, 11/10/79;

TONNAGE of Goods received by Mr. Barbour and his officers, and forwarded by his steamers, viz. :—

Tons	cwt.	qr.	lb.
25	16	0	0

TONNAGE of Goods forwarded by steamers for various consignees between Wagga and Narrandera (inclusive):—

Tons	cwt.	qr.	lb.
36	9	0	18

TONNAGE of Goods forwarded by steamers for various consignees between Narrandera and Hay (inclusive):—

Tons	cwt.	qr.	lb.
23	2	1	7

It is only within the last few months that we have had any traffic worth speaking of with the river steamers. Mr. Barbour, the proprietor of the steamers plying between Wagga and Hay, is the principal consignee of goods, such as flour, potatoes, groceries, &c., which he disposes of to the settlers on the banks of the river, as per statement attached. It appears he received 25 tons 16 cwt. For

For the various consignees who reside between Wagga and Narrandera, it appears that 36 tons 9 cwt. 0 qr. 18 lb. of goods was dispatched by the steamers. These are not new customers to us; they prefer getting their goods by steamer when the river is navigable, the freight being cheaper than by road.

The various consignees situated between Narrandera and Hay are all new customers, and appear to have received 23 tons 2 cwt. 1 qr. 17lb. of goods; but I am of opinion that these people would not trade with Sydney unless the river is navigable, the freight by road being too high, but will, on completion of the Narrandera line become permanent customers.

The Secretary.

G. J. ROBERTS,
14/10/79.

No. 3.

Minute by The Commissioner for Railways.

MR. COLIN SIMPSON, M.P., and Mr. Andrews (of Andrews and Turnbull, Hay), waited upon the Minister with reference to some scheme being adopted to enable storekeepers and others at Hay, and places between that and Narrandera, to obtain their supplies from Sydney instead of from Melbourne as heretofore, by a system of rebates on river-borne goods, similar to the system adopted by the Victorian Railway Department.

The Minister thinks it desirable that a scheme should be prepared for the consideration of the Government. The Victorian rates and rebates allowed are shown in accompanying paper. Will the Secretary be good enough to look into the matter, and submit a list of rates which will correspond with those of Victoria, and which would, in all probability, be the means of securing the object of the deputation.

CH.A.G., 23/10/79.

I think it is desirable that fuller information should be obtained in regard to the traffic to Hay, and the means of diverting it to our railways, and for the purpose, I propose that the Secretary (Mr. Vernon) accompanied by an officer of the Traffic Branch, should proceed to Hay by the river from Wagga Wagga, and should place himself in communication with the merchants, shopkeepers, and others who, being desirous of trading with Sydney, will be glad to afford him particulars of the traffic, and the most effectual means of securing it with the least disadvantage to the Department. I am disposed at present to concur in the proposal for a through rate, the Department undertaking to deliver at Hay; but it will be necessary to ascertain first what facilities are available for conducting the river traffic, &c.

It is not improbable that the Railway Department of Victoria will further reduce the rate for goods landed between the Wakool Junction and Wentworth to the rate which they charge for goods landed beyond that point, viz., 30s. a ton, but this action could be met I have no doubt.

48s to 30s a ton.

The first step, however, is, I think, to obtain full information respecting the traffic, and the way in which it can be controlled under existing circumstances, and I recommend the course I have suggested for the Minister's approval.

CH.A.G., 29/10/79.

As far as circumstances have permitted, since the date of Commissioner's minute of 23rd instant, I have looked into the question brought under notice by Messrs. Colin Simpson and Andrews with respect to the desirability of establishing business relations with Hay. With a view of obtaining as much and as recent information as possible I have, since Commissioner's minute, paid a visit to Wagga. There cannot, I think, be the slightest doubt as to the necessity which exists for measures being taken by this Department to secure traffic for the Railway, which we have now extended to the borders of a district, the trade of which hitherto has been solely with Victoria and South Australia. It is equally evident that, unless we are to content ourselves with merely the local traffic about Wagga (and the same thing may be said when we open to Narrandera), which, of course, would leave our railway extension comparatively useless and certainly unremunerative, if we are to secure any portion of this hitherto purely Victorian or South Australian trade we must be prepared to do it upon much the same terms. If equally favourable rates are not offered the result is very certain, we shall do no business. Taking for the present the district, of which Hay may be said to be the centre, and confining myself to river-borne traffic, the cost of carriage between Hay and Echuca and between Hay and Wagga is about equal. Considering how unequal the distances between these point are, this may at first be matter of surprise; but may be accounted for by remembering the amount of traffic which is being done, the efforts which are being made to keep it, the greater depth of water permitting of larger boats and larger cargoes, and such like facts. As regards the passage by river between Hay and Echuca, it is open, I understand, for about five or six months in the year. With the aid of the Engineer-in-Chief for Harbours and Rivers, and as far as present information will serve, I do not think there will be any difficulty in keeping the river between Wagga and Hay open pretty well the whole year round. Of course the boats used must be suitable for the purpose, drawing very little water, and, if necessary, they might carry light cargoes. Let the trade once offer, and I do not anticipate there will be any difficulty in the matter of boats and appliances for the traffic by water. To come now to the charges by rail. As the Commissioner is aware, the Victorian terminus, Echuca, is about 156 miles from Melbourne. The distance of the New South Wales terminus from Sydney being 309. The ordinary rates from Melbourne to Echuca for 1st, 2nd, 3rd, and 4th classes respectively are 52s., 65s., 78s., and 91s. per ton. That for all goods going below Wentworth on the Murray or beyond Wentworth on the Darling, these rates are reduced to a uniform rate of 30s. per ton only, and to 48s. per ton for all goods landed between the Wakool Junction and Wentworth. This latter represents the business with which we are more immediately concerned, and which we should direct either in part or whole. Our railway charges (309 miles) to Wagga are, for 1st, 2nd, 3rd, and 4th classes respectively, 61s. 8d., 84s., 117s. 1d., and 150s. 11d., and it appears to me we have no resource but to offer at once such rebates as will bring them down to a uniform rate per ton, corresponding to that of the Victorian Railway Department, viz., 48s. per ton for all goods going below "Darlington Point," on the Murrumbidgee, which is the point at which the Victorian rebates commence to operate. In carrying this into effect I would suggest it should be done by adopting a through rate. This would involve the necessity for proper arrangements being entered into by the Department for the carriage of the goods by river. Any risk could in this respect be covered by insurance. There would be no difficulty in carrying

this

this system out I think, and it is the one which offers the surest protection against fraud. The plan adopted by Victoria is, as Commissioner is aware, to require bonds, and declarations, &c., which, in my opinion, is not nearly so satisfactory. With respect to wool—river-borne. I believe that were proper facilities and appliances for the water carriage afforded, wool could be landed now as cheaply, per bale, in Sydney as it can at present be delivered in Melbourne. The saving of time will always be an advantage in favour of Sydney; as also will the fact of an open water-way for a much longer period than is the case between Hay and Echuca. I cannot, however, vouch for the correctness of the latter remark, indeed, on many points more precise and reliable information is desirable than was at all possible for me to obtain, and this should be obtained without loss of time. I should like to point out, while dealing with the wool other than river-borne, we draw nothing at present from stations south of the Murrumbidgee and west of a line drawn (say) from Wagga through Tarcutta, Oberon, and Adelong Crossing. A great deal of this might be drawn to Wagga by offering a slight rebate (say) of 1s. to 1s. 6d. a bale, and having certain impracticable portions of road put in order. In fact there are some few thousands of bales that might now be secured were the offer of a rebate sanctioned, at least, I believe, it is not too late. This is a step which I also think, in the interest of our railways, we should take, and which will bring in a great deal of business to Wagga which now goes to Wadonga. There is the Tumberumba district, which might perhaps be mentioned as an instance. Although 30 miles nearer to Wagga than to Wadonga, the traffic all goes to the latter station, on account of the nature of the road. Then again we have lost the wool from stations very much nearer Wagga, that we might have had by offering a rebate of 1s. or 1s. 6d. a bale. Unless the Department is prepared to adopt some such measures, it is out of the question to expect the traffic. There are one or two items, such as fencing wire and rock-salt, for which a special rate should be allowed, and here again I would suggest that we carry such articles on the same terms as they are at present conveyed by the Victorian Railway Department. I may observe the cost of carriage between Hay and Echuca and Hay and Wagga would be something like 40s. per ton. As traffic, however, became diverted to this side the tendency would be to cheapen this rate, while, as traffic grew slack on the other side, the tendency would be in an opposite direction—the less there was to do between Hay and Echuca the higher the price would rise. I must apologise for these crude and hasty observations, time has not permitted of my more efficiently dealing with the subject.—D.V., 28/10/79.

No. 4.

R. Barbour, Esq., M.P., to The Secretary for Public Works.

Dear sir,

Parliament House, Sydney, 22 September, 1879.

Now that our railways have reached Wagga Wagga, and tapped the Murrumbidgee, one of the navigable rivers of the south-western part of New South Wales, it is I have no doubt your desire to acquire a knowledge of the trade of this locality to enable you to make such arrangements as will increase the traffic returns upon our railways, and bring all the trade possible into New South Wales.

The great distance from the seaboard and from the metropolis has hitherto shut out this district from rapid direct communication with Sydney, the trade has consequently gravitated to Melbourne, and having so largely benefited thereby for the last fifteen years, she will no doubt make great exertions to retain it. However, as New South Wales has determined to extend her railways into the interior, she must also see that her trains shall not run empty, but that whatever traffic there is to be done with her own territory, shall be done by her, that her railways may become the benefit they are intended to be, not only as a source of revenue and profit, but to encourage settlement and bring trade to her merchants.

It was about the year 1865 that Victoria extended her railway system to Echuca, on the Murray River border, and as this connected her with the Edwards, the Murrumbidgee, and the Darling Rivers, all of which are in New South Wales territory, the building of river steamboats followed and increased rapidly, until the trade now done on these rivers is enormous. Now, however, that New South Wales railways have reached the Murrumbidgee River at Wagga, and will shortly reach the Murray at Albury, she will be expected to also compete for the river trade in addition to Victoria and South Australia, and the question is, will we allow the other two Colonies to run away with the trade, or will we seriously realize the position, and offer to the New South Wales colonists the opportunity of dealing with Sydney by making the rates of carriage upon our railways equivalent to those chargeable by the other Colonies.

As will be seen by the latest goods classification issued by the Victorian railways, a difference is made in the freight of goods that pass into New South Wales, there is the produce rate, corresponding to our own of about a 1d. a ton, the special or miscellaneous rate, and the 1st, 2nd, 3rd, and 4th class rates, ranging from 52s. to 91s. per ton from Melbourne to Echuca, and upon all such goods taken by steamers a rebate is made which reduces the classes 1, 2, 3, 4, to 48s. per ton, and fencing wire to 30s. a ton.

The connection with those navigable rivers will open a large extent of our own territory to us, but to induce our people to use our railways, and to draw them to our own capital we must at least place them on a par so far as prices are concerned with those of the other Colonies, for claiming to belong to a free trade Colony, they will also claim to buy in the cheapest market. I have every reason to believe that the steamers freight from Wagga Wagga will compete with these from Echuca in so far as the Murrumbidgee River is concerned, but our railway freights must be altered to compete with the Victorian railway freights, otherwise the trade on these rivers will still go to Melbourne.

I would therefore recommend that a rebate be made upon all freights on goods intended to be sent riverwards, equal to the rebate made upon the Victorian railways. And when we remember that a steamer takes 80 to 100 tons at a time, and that it secures an additional and altogether extra traffic and profit to our merchants, and that even in the matter of fencing wire at 30s. per ton (which may well be carried in empty cattle trucks), would bring £7 10 per truck, and for classification goods 48s., or about £12 per truck load; experience may yet prove that these are good payable rates after all.

I have not specially referred to wool carriage, because arrangements have already been made, and no alteration now will influence a single extra bale, but next season, say not later than June, inducements should be offered, and thousands of bales will come to Sydney in place of going to Melbourne.

I have, &c.,

ROBT. BARBOUR.

No. 5.

Mr. W. Turnbull to The Secretary for Public Works.

Sir,

Sydney, 15 October, 1879.

I have the honor herewith to hand you statement *re* railway goods charges as approved of by the deputation who waited on you this morning.

Any further information you may desire I shall be happy to afford.

I have, &c.

W. TURNBULL,
(Care of Messrs. Anderson & Son, York-street.)

[Enclosure.]

Sydney, 15th October, 1879.

STATEMENT made with the view of having the railway goods tariff so modified as to develop the trade of Sydney with Riverina.

THE following figures will show that the Victorian Government have taken active measures to counteract the legitimate results to be expected from the extension of the Railway to Wagga Wagga. By a system of drawbacks they have practically abolished the classification of goods, and made an uniform rate of 48s. per ton to Echuca. This action of the Victorian Government would be effectually checked by carrying 1st, 2nd, 3rd, and 4th class goods to Wagga Wagga, to be there shipped for stations below Wagga Wagga at an uniform rate of 48s. per ton; wire and galvanized iron (our greatest imports) at a rate of 30s. per ton; produce, as at present, viz., 26s. 2d. per ton to Wagga Wagga.

Goods are landed at Hay from Melbourne free of all charges (insurance excepted) by all the agents at an uniform rate (through) of £4 per ton; produce, wire, rock salt, at £3 per ton.

Wool is carried from Hay to Melbourne at a through rate of £3 15s. per ton (insurance extra), £1 5s.; total, £5.

Echuca and Melbourne Class.	Victoria : Usual Rates.	Victoria : Rebate in goods for Murrumbidgee.	Victoria : Net Charges.	New South Wales : Sydney to Wagga Wagga.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Produce.....	1 0 6	Nil.	1 0 6	1 6 2
Wire	2 12 0	1 2 0	1 10 0	3 7 8

Wool downwards from Darlington Point, per bale of 4 cwt.	0 5 9	0 9 0
Wool dumped	0 4 9	0 7 6
Wool above Darlington Point	0 5 0	0 9 0
Wool dumped	0 4 0	0 7 6

River carriage may be considered from Wagga to Hay at same rate as from Echuca to Hay—30s. per ton.

Mr. Read should visit Narrandera, and see what is required to facilitate traffic between the railway terminus and the river—in what way the residents on the southern bank of river can best communicate with Narrandera, so as to reach the railway; what the facilities are for conveying goods between Hay and Narrandera, and what inducements should be offered so as to turn the tide of traffic from South Australia and Victoria to New South Wales. Mr. Read will ascertain whether there are any impediments to the navigation of the river between Narrandera and Hay, which it is desirable should be removed. The Traffic Manager will probably be unable to spare the time at present to visit Hay; but he should send an intelligent and trustworthy officer of his staff (Mr. Kirkcaldie might well be entrusted with this duty) along the river to Hay, and to make report as to wharfage accommodation at that place, the extent of trade done, the cost of carriage from where it comes from, including all charges of insurance, &c., &c.; and what the difference is between our charges and river charges to Hay, and the charge made where goods are obtained from or forwarded to South Australia and Victoria,—CH.A.G., 4/2/80.

No. 6.

Minutes relative to charges for goods forwarded to Junee.

Telegram from Station-master, Junee, to Sydney Goods, 7/1/80.

I SEE you are still invoicing 1st, 2nd, 3rd, and 4th class goods at North Wagga rates hence it causes me a great deal of trouble in rectifying the under charges. I have been advised by the Traffic Manager to charge goods in accordance with the new rate sheet from Sydney to Junee.

I presume Commissioner's 78-10,492, authorising the charge of Wagga Wagga rates for goods to Junee has not been withdrawn.—J. HARPER, 7/1/80. Superintendent.

Not that I am aware of. It may, however, be just as well to raise the question.—G. T. EVANS, 7/1/80. Traffic Manager.

Papers on same subject were sent from Audit. Would Commissioner please say if the Wagga rates are still to be charged on Junee goods.—W.V.R., 7/1/80. What effect has the reduction had in increasing the tonnage?—CH.A.G., 9/2/80. Traffic Manager. Urgent. B.C.

Since the opening of the line from Sydney to Junee in September, 1878, the higher tonnage during that month is attributed to the fact that Junee was the terminus of the Southern line for about ten days during the early part of September, and some 30 or 40 tons of Wagga goods were consigned there. The busy season of 1878-79, including October, November, December, and January, shows an average of 39 tons 15 cwt. per month. The busy season of 1879 and 1880, including September, October, November, December, and January, shows an average of 134 tons 7 cwt., but as Messrs. Fishburn and Morton commenced sending their contract material in September, 1879, this average requires to be reduced by 48 tons. That being the average tonnage of that firm for the month in question the net ordinary tonnage of the station has therefore been 86 tons 6 cwt., an increase of 46 tons 11 cwt., or over 100 per cent.—G. T. EVANS, 12/2/80. Traffic Manager.

Sydney

Sydney Goods.—Will Traffic Manager please decide whether we are correct in charging North Wagga rates on goods consigned to Junee, as per Commissioner's paper, No. 78-10,492. Up to the present time no notice of its withdrawal has reached us.—J. HARPER, 9/2/80.

I may state that owing to the action taken by Junee in the matter I understand consignors are now sending their goods to Wagga, and returning them from thence to Junee, thus involving an additional haulage of 17 miles.—J.H.

The Commissioner's authority has never been withdrawn so far as I am aware, and I recommend that the practice of charging North Wagga rates for Junee traffic be at once reverted to. I understand, however, Mr. Carlisle gave a decision to the contrary a short time ago. (For Goods Superintendent), DAVID KIRKCALDIE, Traffic Manager.

The Commissioner to see.—W.V.R., 12/2/80. Seen.—CH.A.G.

Memo. to The Traffic Auditor.

Sir,

Junee Station, 6 February, 1880.

Referring to my memo., No. 45, of 22nd January, relative to the way in which goods are being invoiced from Sydney to this station, viz., the wrong rates being charged. This is still being continued, and which is causing me a great deal of unnecessary work, by my having to make under-charges on nearly every entry. I shall be very thankful if you would kindly have this matter rectified at once.

CHAS. HORN.

Mr. Harper for report and particulars of wrong charges referred to by S.-M., Junee.—THOS. CARLISLE, 10/2/80. Clerk in Charge, Sydney Goods.

Junee goods, under authority of Commissioner's M.P. 78-10,492, which has never been withdrawn. I again submitted the question to the Traffic Manager, and have reason to think he decided that we were correct.—J. HARPER, 10/2/80. Traffic Auditor.

I presume the minute referred to is still in force, although the rates were revised on 1st January, 1880.—THOS. CARLISLE, 13/2/80. The Commissioner. Yes, for the present.—CH.A.G., 16/2/80.

Traffic Manager.—G.B., B.C., 17/2/80. Goods Superintendent to note.—W.V.R., 18/2/80. Station-master, Junee, to note.—G. T. EVANS, 18/2/80. Noted. I have made under charges on goods invoiced up to 18th instant, which I presume will be passed.—CHAS. HORN, 20/2/80. The Superintendent, Sydney. I presume the charges made by Junee had better remain as they are.—G. T. EVANS, 21/2/80. Traffic Manager. Yes.—W.V.R., 23/2/80. Goods Superintendent. Station-master, Junee, to note.—G. T. EVANS, 23/2/80. Noted.—CHAS. HORN, 24/2/80. Superintendent Evans, Sydney. The Commissioner.—W.V.R., 26/2/80.

No. 7.

Report of Mr. Traffic-Manager Read.

IN accordance with the Commissioner's instructions, as contained in M.P. 80, I visited Narrandera on the 13th and 14th instant, with the following results:—The railway station is conveniently situated for the town and surrounding districts, but is about $1\frac{1}{2}$ mile from the river, and will have ample accommodation for carrying on of the coaching and goods traffic; but no arrangements appear to have yet been made for the live stock traffic. There is a most suitable place for the yards on the opposite side to the station, about 100 yards on the Junee side of it. It can be approached by a public road through a Government reserve, as during the greater portion of the year the live stock will be the principal traffic. I would ask that the erection of yards be proceeded with in such time that they may be completed by the opening of the railway.

River Loading.—The station being about $1\frac{1}{2}$ mile from the river, some arrangements for receiving loading direct from vessels will be necessary. From information gained from old residents there is no site so suitable as that on which Fishburn and Morton are unloading the rails, &c., they have brought down the river from Wagga, as the water near it is deep. The banks are high, and parts of it have never been known to have been under water, even during the very high flood of 1870. It is situated on a Government reserve, and to it the contractors are laying a temporary line for hauling their material. This temporary line could be made available at least whilst the terminus is at Narrandera for the hauling of wool, &c., from and of stores to the vessels. A small wharf would have to be erected, and a small steam launch with a jib would be required for hoisting and lowering. The wharf, or part of it, should be built about 4 feet above our rail level, and connected with it should be an 8 or 10 feet wide platform, running out to take in about ten trucks, or the line should be brought round with a curve to run alongside the wharf. The erection of the wharf might be left to the Harbours and Rivers Department, one of whose officers (Mr. Bertham) has before erected wharves on the Murrumbidgee. Communication to the southern side of the river is by a punt. It is a very fair one. It is private property, and belongs to a Mr. Jenkins, who leases it to the man now working it at £190 per annum. The tolls charged are as follows:—Each passenger, 2d.; horses, &c., 6d. each; two-wheeled vehicles, 1s. each; four-wheeled vehicles, 1s. 6d. additional; cattle (under ten), 4d. each; cattle (over ten), 3d. each; lamb, sheep, or goat, $\frac{1}{2}$ d. each. The approaches to the punt are not good, and require repairing.

State of the River.—The river is now at summer level, and not navigable at least between Wagga and Hay. From inquiries made of masters of steamers and others it would appear that some little work at snagging it would make it navigable much longer in the year between Narrandera and Hay, and it was to this portion of the river that I chiefly directed my inquiries. From Narrandera, for about 120 miles, down to a place called Groongal, there is a considerable amount of snagging to be done. Beyond that, to Hay, the river is comparatively clear. There is nothing to prevent these difficulties being removed, so I am informed, by October next, if the work is proceeded vigorously with. There is no work going on at present. The steamers are laid up and the men discharged, it is reported, for want of funds, and this is the most suitable time of the year for snagging. The sole chance of our bringing the traffic from down the river depends on its being made navigable at reasonable times, and I would impress on the Commissioner the necessity of the work being at once vigorously proceeded with. There are five winches on the river belonging to the Government waiting to be employed.

Traffic

Traffic to Hay.—I sent Mr. Kirkcaldie on to Hay to make inquiries about this traffic, and will report further on his return; but there will be great difficulties in the way of our securing it until the railway is pushed on to Hay, and I would impress this fact upon the Commissioner, in order that the Parliamentary approval may be obtained to its construction this session. On the other matters mentioned by the Commissioner I will report on Mr. Kirkcaldie's return.

W.V.R., 16/2/80.

The Commissioner.

In continuation of previous report *re* arrangements opening Narrandera line and securing river traffic, I now beg to enclose Mr. Kirkcaldie's report. On Mr. Kirkcaldie's journey towards Hay he called upon nearly all the principal squatters, and they, as well as the people of Hay, all expressed a wish to trade with and forward their wool to Sydney, if satisfactory arrangements could be made. The information obtained shows that there is a very large traffic, and that it would be of great benefit not only to the railways but to Sydney if it could be secured. The trade is now with Melbourne, and the figures show that wool can be conveyed to Melbourne from Hay at from 75s. to 90s. per ton. Insurance would be about 25s. per ton. The rates on general merchandise from Melbourne to Hay are about the same *ex* insurance, which, of course, would be in accordance with value and quality of merchandise. Rates on produce and fencing wire are 20s. per ton lower. To compete with above charges, and, as Mr. Kirkcaldie points out, they may be lowered, we should have (taking Hay as point of competition) to carry between Sydney and Narrandera, wool at about 85s. per ton, as from what I can gather, the steamer charges between Hay and Narrandera will be about 15s. per ton, and the insurance from 7s. 6d. to 10s. per cent.—this would be at 17s. per bale—our rates will only be 10s. per bale from Narrandera, so that we may make pretty certain of the wool. But it is upon the 1st, 2nd, 3rd, and 4th class goods we shall have to make large concessions, and carry all goods at about the above-mentioned rates, viz., 85s. per ton. On the more valuable goods, on which insurance is high, a higher rate might be obtained. On galvanized iron and fencing wire extra concessions will have to be made. To offer extra advantages to those using the New South Wales railways I would suggest that the wharves at Hay belonging to the Government be reclaimed and made free New South Wales railway wharves, and that when used for traffic to or from the other Colonies wharfage dues be charged. There would be the expense of a wharfinger, but he could at the same time represent the Railway Department at Hay, and give information as required by the public. The matter of river dues, I am aware, the Commissioner has already taken in hand. I can only add that I hope they will be approved by the Government, as their adoption will enable us to compete on more even terms with the adjoining Colonies for the river traffic. Mr. Kirkcaldie's suggestions *re* live stock traffic are brought under the Commissioner's notice. In special cases reductions might be made, but I think the market will in a great measure influence the direction in which stock will be forwarded. We get so little out of this traffic now that I am hardly prepared to recommend further reductions, unless in special cases. The necessity for the early opening of the Narrandera line—August next—is also brought under notice.—W.V.R., 9/3/80. The Commissioner.

Murrumbidgee Traffic.

Sir,

Sydney, 27 February, 1880.

In accordance with your directions I proceeded to Hay for the purpose of obtaining some information as to the wharf accommodation there, the extent of trade done, and the rates of freight and insurance to and from the various quarters of that district, and have now the honor to submit my report thereon.

I may mention at the outset that I visited all the squatting stations—except two, and in those cases I was informed that the proprietors were out of the Colony—from a point 50 miles west of Narrandera, with the view of ascertaining the feeling of the owners or (in their absence) the managers as regards a diversion of their trade from Victoria to New South Wales, and I found that without exception they are all anxious to trade with Sydney instead of Melbourne, provided the rates are suitable, and that arrangements can be made for taking the wool regularly away from the stations as has been done hitherto, and for delivering it promptly on arrival at Sydney.

I should state, however, that the shearing at stations below Narrandera commences about the 5th to the 20th of August and finishes about the end of September or beginning of October, so that unless arrangements can be made for improving the navigation of the river between Narrandera and Hay, and for opening the railway to Narrandera during August next, there is little probability of our getting any wool to load there this season; and I fear the river rates between Hay and Wagga by river would be so high as to preclude the possibility of holding out any inducements to the squatters in that direction. The tenders for the freight of the wool are generally sent by the contractors at Hay to the squatters during the months of May and June, and are always accepted in July, so that in order to secure any of the trade some definite action would require to be taken before that time.

As soon, however, as the navigation of the river is improved, the railway opened to Narrandera, and facilities are provided there for removing the wool from the boats and loading it direct into the trucks—the squatters have an objection to their wool being too much handled—I think we are certain to secure a large proportion of the wool that now goes to Victoria; and when the railway is constructed through to Hay, I have no doubt but that we shall get every bale of it.

Storage and Wharfage Accommodation at Hay.

There are altogether six wharves, exclusive of one belonging to a firm of brewers, and used only for their own traffic; and in the busy season the river banks are also frequently, I might say constantly, used with advantage for the loading and unloading of boats.

Taking them in order as Hay is approached from Narrandera, the first wharf is at the east end of the town, and belongs to Messrs. Wm. M'Culloch & Co. (Limited), forwarding agents. It has a frontage of from 200 to 250 feet to the river, and although so awkwardly constructed as to have no room for the storage of goods upon the wharf itself, there is large shed accommodation immediately at the back of it, and a small tramway enables Messrs. M'Culloch & Co. to run all goods direct from the boats into the shed. There is also a small derrick crane upon the wharf capable of lifting from 25 to 30 cwt., and it is worked by a donkey-engine. Messrs. M'Culloch & Co. only discharge goods at this wharf. All the wool arriving

arriving in Hay by teams consigned through them is loaded into boats from the bank at a point about 2 miles further down the river—1 mile by road—where they have a shed capable of holding from 1,000 to 1,200 bales, but no crane or other facilities.

About 700 or 800 yards beyond Messrs. M'Culloch & Co's. wharf, and at the west end of the town the other five are all ranged adjacent to each other; for their positions I beg to refer you to the accompanying tracing.

Pollard's wharf has a frontage of about 12 feet to the river and carries a derrick (worked by hand power) capable of lifting about 20 cwt. It is on private ground and has fair shed accommodation.

Blewett's wharf has a frontage of about 10 feet to the river, but is not strong and is not, therefore, much used. It has, however, fair shed accommodation but no crane. The ground on which this wharf stands is Government leasehold property and I am informed that the lease expires in December next.

Moss's wharf has a frontage of about 20 feet to the river, and carries a derrick (worked by a donkey-engine) capable of lifting 15 to 20 cwt. The wharf is on Government leasehold property too, and I am informed that the lease expires in December next at the same time as Blewett's. Moss's wharf, and the store accommodation connected with it (the latter of which is private property), are at present occupied by Messrs. Permewan, Wright & Co., forwarding agents.

The Government wharf has a frontage of 75 feet to the river, is in a very good and convenient position, and, except that it has not so much frontage as M'Culloch & Co's., is in every respect the best in the place, as it is quite new and projects 10 or 12 feet nearer the channel of the river than any of the others, so that boats can lie alongside when they cannot get near the other wharves. It has, however, no shed or tramway accommodation nor crane appliances, but there is a Government Reserve immediately behind it capable of holding more goods or wool than are ever likely to be laid upon it. By referring to the tracing it will be seen that part of this reserve has been or is proposed to be granted to the town for the erection of Municipal Chambers, but it is still unfenced and is not likely to be used for a number of years.

Simson's wharf is about 50 or 60 yards on the west side of the Government wharf. It has about 25 feet frontage to the river, but is seldom or ever used, and has no appliances of any kind except that it has very fair shed accommodation.

When at Hay, I was informed that while a sum of £5,000 had been voted for the construction of the Government wharf there, it had only cost about half that amount, and that Messrs. M'Culloch & Co., had either applied or intend applying to the Government to expend the balance in building another wharf contiguous to their shed and loading place further down the river. Were it not intended to construct a railway to Hay, the best course, in my opinion, would be to cancel Blewett's and Moss's leases at the end of the year, and, as the wharf accommodation is limited, extend the wharf recently erected by some, thing like 150 feet so that two boats could be alongside at the same time (each boat is about 120 feet long), and provide sufficient sheds and cranes. But in view of the railway being constructed to Hay at no distant date, I think it would be preferable to erect a wharf adjoining Messrs. M'Culloch & Co's. shed about 2 miles further down the river, being as I was informed, the nearest point to the place at which it is intended that the railway station shall be built, and because the whole of the land between the two places belongs to the Government, so that a siding could be run alongside the wharf without encroaching on private property, while to gain similar access to any of the other wharves a good deal of private property would require to be purchased (*see* attached plan of the town of Hay). From these remarks it will be seen that more wharf accommodation is required, and it is just a matter for consideration where it should be placed. As far as I could see, however, there is no urgent need for it, because the traffic seems to have been satisfactorily conducted hitherto, and the Government wharf has since been added.

In the event of our commencing a river trade between Hay and Narrandera, I think it is worth consideration whether the new Government wharf should not be leased to one or other of the forwarding firms, because while it remains a purely public wharf every one will claim a right to it, and although it is not likely to be often used by the general public, it may be sufficiently often used by them as to make it practically useless to any of the two large firms, Messrs. M'Culloch & Co. and Permewan Wright & Co., either of whom would, I should think, be able to make good use of it, while the small wharves would be amply sufficient for any other boats plying on the river.

Extent of Trade.

During the season 1879-80 the following is as nearly as possible a correct statement of the traffic forwarded and received at Hay and the various stations on the river:—

Wool forwarded to Melbourne from stations between Narrandera and Hay	*15,026 bales.
" " Hay by river to Echuca from back country	22,382 "
" " Hay by teams to Deniliquin from back country, arrived too late for water carriage, say	3,500 "
" " stations between Hay and Lachlan Junction, say	7,100 "
" " stations between Lachlan Junction and Balranald, say	2,000 "
" " Balranald and stations below, say	10,000 "
		Total	60,008 bales.

Goods received from Melbourne at places between Lachlan Junction and Darlington, about 4,000 tons.

The season in question is generally represented as a bad one, but I could not get sufficiently reliable data of any previous ones. I was informed that in consequence of its having been a bad season the squatters had suspended all improvements which would otherwise have been carried on. It is said that next season the wool clip will not only be larger but that the inwards traffic may be expected to reach about 8,000 tons. I was told that in former season's the traffic has reached to from 8,000 to 10,000 tons.

Rates.

* These figures are correct, the others are estimated as nearly as possible.

Rates of Freight and Insurance.

The through rates on wool to Melbourne last season (exclusive of insurance) were as follows:—

	Greasy, per ton.	Scoured, per ton.
From Cuba and Darlington Point respectively, 59 and 66 miles west of Narrandera ...	105s.	120s.
„ Hay and Stations near Hay	75s.	90s.
„ stations below Hay	70s.	85s.

From stations above Darlington Point the rates are proportionately higher, and between Darlington Point and Hay they are gradually reduced according to distance. The through rates charged being so much per ton; scoured wool is charged 15s. per ton more than greasy on account of the railway trainage from Echuca to Melbourne being the same per bale, while the scoured bales are considerably lighter than the others; they occupy as much space. These rates may be divided as follows:—

Greasy Wool—

From Hay to Echuca	25s. per ton.	I am told this pays.
Commission to Forwarding Agents at Echuca	5s. „	
Wharfage at Echuca	3s. „	Collected by Victorian Customs.
Railway trainage to Melbourne, say	32s. „	Computing 5½ bales to the ton at 5s. 9d. per bale.
	65s. „	
Leaving	10s. profit to Agents at Hay.	
	75s.	

The trainage on scoured wool may be taken as about 12s. per ton more than the greasy, thus leaving a profit of about 13s. to the forwarding Agents.

The rates of insurance are equal to 5s. per bale, each bale being insured at £20 at 25s. per cent. I hear that these rates are likely to be reduced, and I may also mention that several stations have now a floating policy, and they thus get their insurance done considerably cheaper.

When wool has to be taken by team to Deniliquin the rate varies from 50s. to 60s. per ton.

I was unable to find out whether the Victorian Government allow any drawback on wool river-borne to Echuca from stations on the Murrumbidgee. It does not appear on their wool rate-sheet, and if there is such an arrangement it must be a private one.

Stores from Melbourne.

The through rates for general goods from Melbourne to Hay vary according to the competition on the river from 80s. to 90s. per ton, *ex* insurance. Last season the rate was 90s. For produce and fencing wire the rates were 60s. to 70s. per ton, *ex* insurance.

The general goods rates are made up as follows:—

Railway trainage Melbourne to Echuca	48s. per ton.
Commission to Forwarding Agents at Echuca	5s. „
Steamer freight	25s. „
	78s. „
Leaving from	2s. to 12s. per ton profit for the Agents at Hay.

The insurance rates by river are:—

	Imperishable Traffic.	Perishable Traffic.
Echuca to Balranald	20s. per cent.	40s. per cent.
„ Lachlan Junction	22s. 6d. „	45s. „
„ Hay	25s. „	50s. „
„ Cuba	27s. 6d. „	55s. „
„ Narrandera	30s. „	60s. „
„ Wagga Wagga	37s. 6d. „	75s. „

Liquids in bulk, timber, metals (not ore), and tallow, are insured at half the imperishable traffic rates.

When the river is not navigable the rates by team from Deniliquin to Hay vary from 60s. to 100s., and when feed is scarce, they reach as high as 140s. per ton. The following are as nearly as possible the rates for team carriage to and from the back country in good seasons:—

Under 50 miles, 1s. per ton per mile.
50 to 100 miles 10d. „ „
100 to 150 miles, 8d. „ „
Upwards 6d. to 7d. „ „

These rates are very much higher in bad seasons when feed is scarce. I think it right to mention these particulars, and to state that as regards wool the forwarding agents generally contract for a through rate from the stations to Melbourne and they arrange for the cartage.

As regards the wool traffic, I think it is highly probable that the Victorian Government will offer further inducement in the shape of reduced rates, and in order to counteract the effect of such a step, I am of opinion that power should be obtained to impose sufficiently high river dues both on cargo and the registered tonnage of the boats (they average from 80 to 300 tons each) as would keep the trade in the Colony, and still leave a margin of profit. As regards stores, I fear the same course will have to be adopted as the Victorian Government have had in force—viz., to make a general charge per ton on all classes of goods. River dues should be imposed on them too, and in all cases where the traffic is carried over the N.S.W. Railways (especially for long distances) the dues might be remitted.

I made inquiries respecting the probable cost of river freight from Hay to Narrandera, and was told it would be something like 20s. per ton, and insurance about 10s. per cent. additional.

From Hay to Wagga Wagga the rates would be about 40s. per ton, and insurance about 17s. 6d. to 20s. per cent. additional; but it is said that, in the present state of the river, it is seldom possible to take

take any but light draught boats higher up than Narrandera, and not often even so far. When they do go they are gradually loaded at the different stages on the way down the river, while the reverse would be the case if we were to take the trade up the river. I have no doubt that these rates would be considerably less if the river were more free of impediments.

There have been no South Australian boats in the Murrumbidgee during the past season.

Live Stock Traffic.

In consequence of the Victorian stock tax and the high rate of commissions charged in Melbourne as compared with those of Sydney, I am inclined to think that a large trade might be done with Sydney if it were generally known among the squatters that a discount is given on consignments of twenty trucks and upwards. Only those who are constituents of Messrs. Wilkinson, Graves, Minchin, and Lavender seemed to be aware of such an arrangement, and none of them forward less than 2,000 or 3,000 at a time. Such an arrangement should be generally known among the squatters, and it is worth consideration whether a similar concession should not be made on large consignments of cattle. I may add that in Victoria live stock are loaded by the Railway Department, while in this Colony the trucking agents charge the squatters from 3s. 6d. to 4s. per truck for this service.

I have, &c.,

DAVID KIRKCALDIE.

No. 8.

Mr. W. Turnbull to Mr. Traffic-Manager Read.

Dear Sir,

Hay, 5 April, 1880.

Enclosed I beg to hand you a clipping from the Melbourne *Argus* of the 2nd instant. This will give you an idea of the wool that left the Murrumbidgee for Echuca up to December, 1879; but since that date a large quantity has been conveyed by teams to Deniliquin, in transit to Melbourne. This is, of course, irrespective of any that may have gone to Adelaide.

I perceive that the Melbourne Frozen Meat Company intend establishing a depôt at Deniliquin for killing and sending meat to Melbourne; should a similar company be started in Sydney, Hay would be without description the best and most central position in the Colony, and should be glad if at any time you can say a word in its favour.

It is the general opinion here that the line from Hay to Narrandera, or rather *vice versa*, ought to be commenced at both ends, and should be stipulated for in applying for tenders. Would you kindly mention the matter to Mr. Goodchap?

I am, &c.,

W. TURNBULL.

[*Enclosure.*]

EXTRACT from the *Argus* dated April 2nd, 1880.

THE MURRAY RIVER TRADE.

THE official statistics of the Murray River trade for the year 1879 are not yet available for publication, but from trustworthy sources I have gathered sufficient information to prove that the season just closed was a very prosperous one in regard to imported tonnage, and a very inferior year as regards exported goods. In round numbers, 110,000 bales of wool were received at Echuca last season. Out of this total 81,000 bales were river-borne. Of the total river-carried wool, about 17,000 bales came from the Darling, about 8,000 from the Edwards, the great bulk of the wool being received from the Murrumbidgee, and a not inconsiderable quantity from stations with Murray River frontages. Last year only 98,000 bales of wool (all sources told) passed through Echuca, so an increase of 12,000 is apparent, due to favourable seasons, absence of drought, and the fact that the selectors are growing a large amount of wool. The inward tonnage (imports) for the season amount to 20,082 tons, and the outward tonnage (exports) to 7,290. The previous season's figures were:—Inward, 22,000 tons; outward, 12,000 tons; showing a falling off of inward, 2,000 tons; outward, 5,000 tons. The falling off is chiefly attributed to the extension of the Riverina railway, and the fact that the South Australian shippers reaped an advantage when the Darling was flooded before the Upper Murray rose. Complaints were made of the wharfage dues demanded on wool, 3s. per ton, equivalent to 7d. per bale of greasy. A new branch of the river trade is apparent in regard to the carriage of grain, of which 20,000 bags came by river to Echuca last season, against 3,000 during the preceding season. The red gum carriage has shown a great falling off, which is chiefly attributable to the action of the late Government in calling for tenders for 1,000 sleepers at a time, instead of ten times that amount. The wool which arrived at Echuca during the late season was valued at between two millions and a quarter, and two millions and a half sterling.

Forwarded for the Commissioner's information. Mr. Turnbull called on me when in Sydney some time back, and gave me considerable information *re* Riverina traffic.—W.V.R., 8/4/80.

No. 9.

Reports from Mr. Connebee to Mr. Traffic-Manager Read.

Sir,

Wagga Wagga, 13 August, 1880.

I now beg to report as follows:—

Pominalarna Station (Mr. G. Wilson).—I visited this on 5th instant. There will be 350 bales wool, which will be forwarded to Sydney, *via* South Wagga.

Berrigery (J. Leitch).—About 150 bales will be forwarded, same as last station.

Warrengoberry (Rudd).—Small clip will forward as above.

Finding that I could not proceed to Buckinbong, owing to creeks and lagoons being flooded, I returned to Wagga, and started for Narrandera, where I arrived on Saturday evening, 7th instant. On Monday, 9th, I visited the Narrandera punt, and with reference to this have to report:—

1. That the approaches on both sides to the punt are flooded when river is high, and that all traffic is stopped then.
2. That the difficulties of crossing from the south side to the north greatly impede wool and stock traffic, because the river is most liable to flood just at the wool season.
3. A steam punt would not meet the want here, as, without good approaches to the river on both sides, a punt is rendered useless.
4. There is not any good site for a punt within a distance of 2 miles.
5. To secure the traffic from the south side of the river, *i.e.*, Yanko South, Yamma, and other stations, at all times of the year, a bridge is necessary.

The

The scale of charges at this punt are as follows:—Sheep 40s. per 1,000, in small lots, and 30s. per 1,000 in large lots; horses, 6d. each; cattle, 4d. each.

Buckinbong Station.—I found that the manager was absent, and did not go there. The wool from this station will go to Melbourne, *via* Walignuyah.

North Yanko (H. and C. Douglas).—I visited on Monday evening, 9th. Mr. Douglas absent in Sydney. Mr. Flockhardt, manager, informed me that the wool would be sent to Melbourne, through Messrs. M'Culloch & Co. The rate to be paid will cost Messrs. Douglas quite 18s. per bale. Shearing commences on 26th instant. The clip will be 1,000 bales.

Tubbo (Executors of Mr. Peters).—This wool has been engaged for Melbourne, through Messrs. Permewan, Wright, & Co. Shearing commences 15th instant; clip about 800 bales; rate similar to North Yanko.

Gogeldree (Messrs. Hebden & Sons).—This clip was sent to Sydney last year, *via* Wagga. Mr. Hebden states that he had so much trouble with teams and Messrs. W. H. & Co. that he decided to send to Melbourne this year. Would have sent to Sydney had railway been completed to Narrandera in time. Shearing commences 13th instant; clip about 800 bales. Rate to Melbourne similar to Yanko and Tubbo.

Cuba (Messrs. M'Gaw & Co.).—Mr. M'Gaw was from home. This clip will go to Melbourne, through M'Culloch & Co.

I arrived at Darlington Point on Tuesday, 10th instant. The punt at this place requires great improvement. At present the punt used is quite inadequate for the traffic. At the most not more than 30 cwt. can be conveyed across. Teams have to unload. Not more than 100 sheep can be crossed at one time. A narrow pontoon bridge is being provided, but this will only help sheep traffic.

The cost of crossing is high, and much delay is caused.

The approaches to the punt are liable to flood, and there is not any place between Darlington Point and Waddae where a punt could work during flood, except a steam punt were provided. A good crossing could then be made between a point known as the Red Bluff, on the south side of the river, township of Waddae, and the point where Bennett's store is situated at Darlington Point.

If good provision is made here for crossing wool, goods, and stock, it will greatly help to induce the stations on the south side to send to Darlington Point railway station.

Bynya Station (Leonard.) This clip (500 bales) will be sent to Melbourne *via* Woligumyah. Messrs. Permewan & Co. have contracted at a through rate of £7 per ton, which cannot possibly pay them. Teams will want £5 10s. at least.

Benerembah, Kerarbury, and Groongall.—Wool from these stations will all go to Melbourne this season.

Bundigery.—This wool will come to Sydney;—a small clip.

Midgeon.—Will be loaded at Narrandera if railway open; otherwise sent to Wagga.

Grong Grong and Berembed.—To Sydney.

On Thursday I went along the line from Narrandera. The contractors are pushing work at the Narrandera end, and have now about 17 miles completed there. After making about 3 miles more, the supply of rails will have run out, and stop work there.

Kiandra (Mr. Stinson).—On my way to Junee I called, but found that Mr. Stinson had gone to Sydney. This wool will come to Sydney, and will be loaded at Cowabbie if line opened in time. Clip, about 300 bales. Shearing commences next month.

The line between Junee and Narrandera is completed from the Junee end up to 29-mile post. From what I can learn, there seems to be but little prospect of the whole line being completed under 8 weeks from now, which will be too late for many of the stations, as shearing will be in full swing about September or October, and several stations have not storage room for any great quantity of bales.

Hanging Rock (Mr. King), and Pullitop (E. & A. Westley).—I have just met Mr. King and Mr. A. Westley. Both speak of sending to Melbourne *via* Wodonga. They wish me to go to their stations next week, and will enter fully into matter of tariff.

Bullenbong (Davidson).—This clip came to Sydney last year, and was then forwarded to Melbourne. I understand it will be sent direct to Melbourne this season, but will see Mr. Davidson next week.

T. W. CONNEBEE,

13/8/80.

From all I can gather it would not be advisable to offer the contractors any considerable bonus for opening by the end of October; it will be too late in the season to secure this year's wool. Nearly all the squatters have decided as to where they will send their wool, and the opening of the railway at once would not cause them to alter their arrangements.—W.V.R., 16/8/80. The Commissioner.

The Traffic Manager,—

Sir,

Sydney, 16 August, 1880.

As I wish to receive your instructions with respect to my future route, I have come to Sydney this morning for that purpose.

While in the train last evening I met Mr. Wright, of Messrs. Wright, Heaton, & Co., who informed me that Marrar Station wool would be sent to Melbourne by teams from station to Wodonga, and thence by rail; also that several other stations were forwarding wool in like manner. Mr. Wright complains much of the delay occasioned last season in delivery by the Railway Department and delay in shipment by the wool brokers. He mentioned that in some instances weeks had elapsed in the delivery of several parcels of wool. He further stated that, owing to the lax management in Sydney that he had ceased to urge station owners to consign to Sydney (although he had previously fought hard for same), and now he endeavoured to secure the wool equally for Melbourne as for Sydney.

From my observation and from information gathered during my recent trip, I am of opinion that the wool brokers of Sydney do not urge their claims upon the wool trade of Riverina, and do not support the Railway Department in its endeavours to secure same.

I am also inclined to the belief that Messrs. Wright, Heaton, & Co. work as much for Melbourne market as this, especially as Mr. Wright informed me that Wm. M'Culloch & Co. were forwarding wool, &c., for which they had contracted at half commission.

The

The reduction of the rates for conveyance of wool from Riverina to Victoria is not so much the inducements held out by Victorian railways as the fact that the competition between forwarding agents, M'Culloch, Permewan, and others, is keen. Nearly all the station owners and managers admit that the rates by N. S. Wales railways are lower than sending to Victoria.

The facilities offered in Melbourne with regard to finance is also urged as an inducement to do business with Melbourne, and with respect to wool sales the prices obtained in Melbourne and for wool shipped from there to London have been much better than the Sydney market or wool shipped therefrom.

Lachlan District.—Every station of any importance in the vicinity of Hillston, Booligal, Mossiel, and thence south to Hay and Balranald has been secured to Victoria for the present season.

Darlington Point.—I enclose rough sketch showing the positions of the Red Bluff and Darlington Point referred to in my memo. of 13th instant.

Future Route.—With reference to this, I would respectfully suggest that I take about a week or eight days to visit the stations between Hanging Rock and Albury.

After doing so, I am of opinion that further travelling will be unnecessary for the present season.

T. W. CONNEBEE.

The Commissioner.—W. V. R., 16/8/80.

This has been approved. Mr. Connebee proceeds south again to-night.—W. V. R., 16/8/80.

The Traffic Manager, Sydney,—

Wagga Wagga, 25 August, 1880.

I now beg to report having visited the following stations, namely:—

Sandy Creek (F. Best).—Will shear 25,000 sheep in October. Had arranged to sell in the Melbourne market, but will now probably send to Sydney via Sandy Creek station, and if price not satisfactory ship to Melbourne.

Hanging Rock (John King).—This wool will go to Melbourne via Sydney. Will be sent to Hanging Rock station. Clip about 200 bales; shearing in October. The wool from Mr. King's station in the north will go to Murrumburrah.

Mangopla and Grubben (Cox Bros.).—The wool from these stations will all be shorn at Mangopla, and will be forwarded by Wright, Heaton, & Co. to Wodonga and thence to Melbourne at a through rate from station to Melbourne of £5 per ton. This had been arranged. If this wool were forwarded to Sydney it would cost, station to Sydney, £3 15s. per ton. The total clip of two stations will be 500 to 550 bales. Shearing in October.

Doodle Cooma (P. Keighran).—Clip 150 or 160 bales. Shearing in October. This wool has been engaged by Messrs. W. M'Culloch & Co. at a through rate, station to Melbourne, of £4 per ton. Mr. Keighran has never done any business with Sydney. He admits that wool and stock rates to Sydney are cheaper. This wool, if sent from Yerong to Sydney, would cost £2 17s. per ton.

Mundawaddera (Charles Edgehill).—This clip will be 250 bales or more. Shearing in October. Provided that provision is made at Yerong Creek station for the reception of the wool he will send it via that station to Sydney for shipment to London. The wool would be carted to railway by his own team. Kindly state whether it is the intention of Department to provide a platform for same.

Mittagong (R. Gillman).—This clip of (say) 250 bales will go to Melbourne this season via Wodonga at a cost of £5 5s. per ton through.

Teams have already been engaged to take the wool to Wodonga—price, £3 per ton. If this clip was sent via Hanging Rock to Sydney it would only cost £2 15s. per ton, and if then forwarded to Melbourne by steamer £2 additional.

Egan Creek (Wm. Love).—This clip will be scoured on station and sent to London. Mr. Love intended sending to Melbourne, but is now disposed to send to Sydney for shipment, provided platform is made at Yerong. Shearing commences in October. Clip about 150 bales.

Pullitop (E. & A. Westby).—Will shear 500 bales in October. Arrangements for this year have been concluded with Melbourne. It will cost £5 at least to land from station to Melbourne; whereas if sent to Wagga, and thence to Sydney, would cost only £4 per ton. Principally washed wool from this station. Messrs. Westby are quite satisfied that New South Wales railway rates are lower than Victoria, and will no doubt do their business with Sydney next season.

Several matters have been suggested to me by Messrs. Westby, King, and others, to bring under your notice, which I will do to-morrow as I have not time to do so by this post.

Since my arrival in Wagga, to-day, I met Mr. R. Cox (of Marrar). This wool will come to Sydney via Junee, if the line is not completed in time to take wool from Cowaby Station. Clip about 300 bales. Shearing commences 7th October.

Brookong.—120 bales of this wool was at Hanging Rock station yesterday afternoon, and other teams were close at hand. No provision had been made for taking delivery of same at Hanging Rock, but I have been informed that Wright, Heaton, & Co. have now sent men to attend to it.

Merchandise Rate Books.—Have you a supply of these, as I have promised to send copies to a number of stations. The squatters express a wish to be brought more in direct communication with the Department than hitherto, both with regard to wool and live stock traffic, instead of doing their business through agents. This and other items I will report further upon.

Finance.—From what I can judge, I am inclined to think that the Melbourne financial companies have been more liberal (or more speculative) with the graziers of Riverina than the Sydney companies, and there is but little doubt that the fact of the Melbourne market having been better up to the present time, and financial arrangements combined, now, cause so many station owners to do business with Melbourne, although their inclination is to do business with Sydney.

T. W. CONNEBEE, 25/8/80.

Wagga Wagga, 26 August, 1880.

To the Traffic Manager, Sydney,—

Referring to my report of yesterday's date, I now beg to submit for your attention the following suggestions, viz:—

Approaches to Culcairn.—It has been suggested to me to bring under your notice the desirability of advising the Public Works Department to improve the approaches to the Culcairn Railway Station, by making a bridge on the road from Germanton to the station, and also to make a siding on the road north side of the creek.

Trucking

Wool will be received at this siding.—W. V. R.

Obtain distance on line it is from Sydney, and estimated traffic.—W. V. R.

Arrangements will be made for receipt of wool at Yerong Creek siding.—W. V. R.

Supply Mr. Connebee with the number he requires.—W. V. R.

The Commissioner's attention is drawn to this.—W. V. R., 30/8/80.

Trucking of Stock.—Most of the station proprietors whom I have visited agree in the opinion that it is desirable for the Department to appoint a thoroughly competent man at each trucking station, to superintend the trucking of sheep and cattle. All would be willing to pay an increased rate to cover this extra cost, and it is also argued that the increased rate would more than pay for contingent losses, through death in stock while in transit. At present agents charge for trucking, and do not do it satisfactorily, because they employ men who do not thoroughly know their work, and the result is that the sheep and cattle do not arrive in the Sydney market in as good condition for sale as they would if more carefully trucked.

Agents.—A number of the station proprietors express a wish to do their business more directly with the Department instead of through agents, and I would respectfully suggest that this matter is worthy of consideration.

During my late travelling in the district between Wagga Wagga and Albury, and while I have endeavoured to rather assist the forwarding firm of Wright, Heaton, & Co. than otherwise, the fact is forced upon me that Messrs. Wright, Heaton, & Co. have not used their best efforts to bring trade to the New South Wales railways, and I have reason to believe that there exists a mutual understanding between the forwarding firms, Messrs. Wright, Heaton, & Co., of New South Wales, and Messrs. Wm. M'Culloch & Co., of Victoria, and that either firm shall not trespass beyond a certain fixed boundary upon the trade of the other firm.

Team Carriage.—The following are the rates of carriage being paid to teams for conveyance of wool from stations north of the Murrumbidgee to Hay, viz. :—

Per Wm. M'Culloch & Co.

	£	s.	d.	
Gunbar	2	7	6	per ton.
Merringle	3	0	0	"
Yandembah... ..	3	10	0	"
Lown's Lake	3	10	0	"
Trida	4	8	9	"
Hunthawong	3	10	0	"
Coombie	4	10	0	"
Coan Downs	5	10	0	"
Marooba	4	7	6	"
South Merrowie	3	0	0	"
Wholy	5	0	0	"

Per Permewan, Wright, & Co.

Mein Merrigal	4	10	0	per ton.
North Merrowie	3	7	6	"
Yathong	5	10	0	"
Wichelba	6	0	0	"
Cowl Cowl	3	0	0	"
Bedooba	6	0	0	"
Thrile	5	10	0	"
Wirlong	6	0	0	"
Willandra	3	17	6	"
South Thononga	2	5	0	"

T. W. CONNEBEE, 26/8/80.

Walsh & Co. represent to me that goods for Temora sent to Junee are charged North Wagga rate, less 20 per cent. for distance. I do not recollect that this was authorised. Is it done?—CH.A.G., B.C., 3/8/80. Mr. Read.

North Wagga rates are charged to Junee. All papers were returned to your office on 26th February last.—W. V. READ, 6/8/80. Commissioner. Must be discontinued directly the line to Narrandera is opened.—CH.A.G., 12/8/80. Manager.—D.V., 12/8/80. Mr. Harper to see and carry out.—W. V. READ, 12/8/80. Inspector Roberts to see.—J. HARPER, 13/8/80. Noted, and Junee and North Wagga informed accordingly.—G. T. ROBERTS, 14/8/80. Goods Superintendent. The Sydney staff and all others concerned have been advised.—J. HARPER, 16/8/80. Traffic Manager.

I presume we shall soon be carrying permanent-way material for the Narrandera and Hay extension, which, I suppose, will be charged at the ordinary Junee rates, otherwise we shall be charging one rate for it before we open to Narrandera and another (higher) rate afterwards. I presume we had better charge the actual mileage rate all through in that case, had we not?—W.V.R., 16/8/80. Commissioner.

It has since been decided that rate-sheet rates to Junee are to be enforced in all cases.—CH.A.G., 21/8/80. Mr. Read.

Charges to Junee.—The new system of charges for goods for Junee will not come into operation till to-day. All goods consigned before 4 o'clock to-day will be taken at old rates.—CH.A.G., 23/8/80. Traffic Manager. Mr. Harper to arrange accordingly.—W.V.R., 23/8/80. Adjust the charges by cash-book account sheets.—JOHN HARPER. Station-master, Junee. Noted.—CHAS. HORN, 26/8/80. Mr. Harper. I have informed all concerned.—G.T.E., 28/8/80. Traffic Manager. Commissioner.—W. V. READ, 30/8/80.

No. 10.

Minute by The Commissioner for Railways.

Extract from Newspaper dealing with the Victorian Policy of Differential Rates for New South Wales Traffic.

TRAFFIC Manager for report. It seems to me that we must follow the practice of Victoria and draw an imaginary line, beyond which only the discount will take effect. It is beyond measure objectionable to promote the interests of the traders at one place against the traders of another place. It is conceived to be contrary to public policy when private railway companies make differential rates with this object, and the law can be mocked to remedy the evil. How much more is it to be objected to when a state railway is so worked to have the effect pointed out in the paragraph? The result is incidental and not substantive; but immediate steps must be taken to prevent injustice.

CH.A.G., B.C., 17/8/80.

See my M.P. 80-15,289 of this date.—W.V.R., 23/12/80. Commissioner. On and after to-day actual Junee rates are to be charged on all goods traffic forwarded to that station instead of 20 per cent. off South Wagga rates as heretofore.—W. V. READ, 20/8/80. Mr. Harper. Station-master, Junee, to note.—J. HARPER, 21/8/80. Noted.—CLAS. HORN, 22/8/80. Mr. Harper. I have advised the staff at Sydney as also the staff at Junee.—J. HARPER, 23/8/80. Traffic Manager. Seen.—W. V. READ, 23/8/80. Commissioner.

No. 11.

J. & E. Barnes and others to The Secretary for Railways.

Sir,

Cootamundra, 19 August, 1880.

We, the undersigned, being in business in Cootamundra, respectfully request you to take into consideration the unfair difficulties under which we are at present labouring in consequence of the railway rates from Sydney to North Wagga Wagga, as compared to those from Sydney to Cootamundra. In the rate-sheet, published on the 1st January of this year, the following articles are altered:—Woolpacks, galvanized iron and wire, from one class to another, also a deduction of 20 per cent. from the class rates. We are in a position to state that some persons at Junee had their goods forwarded from Sydney to North Wagga Wagga and to Junee, saving some 7s. per ton thereby. Your Department, we suppose, to avoid the extra haulage, has since charged Junee, North Wagga Wagga rates. It did not matter much to Cootamundra till brought into competition for the Temora trade; but now that this competition exists, and that goods are sent out of their usual way to save railway carriage, we are placed at a great disadvantage, as you will see by the appended list of rates. We, therefore request that you will, in all fairness, give immediate orders either that persons at Junee pay the rates on the rate-sheet, or that we be allowed to pay North Wagga Wagga rates.

We have, &c.,

J. & E. BARNES.
MATTHEWS BROS.
EDWARD STRONGITHAM.
RICHARD JONES.
FRED. PINKSTONE.
T. C. BROWN.
JAMES SIMPSON.
A. N. TAYLOR & CO.

[Enclosure.]

TABLE of rates, showing the extra charges on goods from Sydney to Cootamundra, as compared to Sydney to North Wagga Wagga.

Specification.	Charge to Cootamundra.	Charge to North Wagga Wagga.	Extra charge, Cootamundra.
	Per ton. £ s. d.	Per ton. £ s. d.	Per ton. £ s. d.
Woolpacks.....	3 13 3	3 0 4	0 12 11
Galvanized iron, wire, and beer	4 11 1	3 6 10	1 14 3
Class No. 1	3 13 3	3 6 10	0 6 5
Class No. 2	4 11 1	4 3 1	0 8 0
Class No. 3	6 6 9	5 15 8	0 11 1
Class No. 4	8 3 4	7 9 1	0 14 3

Cootamundra, 19 August, 1880.

Junee rates, as per rate-sheet, are to be charged. No rebate to be allowed to goods consigned to Wagga and reconsigned to Junee. Give directions to station-masters at Wagga and Junee to keep a good look-out that this decision is not evaded. Inform storekeepers and consignees generally who trade with Temora, in order that they may not be taken by surprise.—CH.A.G., B.C., 20/8/80. Traffic Manager, Mr. Harper to note and inform all concerned.—W. V. READ, 21/8/80. Inspector Roberts for attention.—G.T.E., 24/8/80. Noted, and Junee and Wagga informed accordingly.—G. J. ROBERTS, 25/8/80. Goods Superintendent. It would be as well, I think, to advertise this in the Sydney papers.—J. HARPER, 28/8/80. Manager.

Memorandum

Memorandum to Station-master, Junee.

South Wagga Station, 25 August, 1880.

It has hitherto been the practice to consign Junee goods to North Wagga, and then reassign them back to Junee, as it has been found the cheaper way of transmitting goods from Sydney to the latter station; but, in consequence of complaints arising among the storekeepers at Cootamundra, the Commissioner has decided that the Junee rates must be charged in every instance, and no rebate allowed. You will therefore be on the *qui vive*, and any instances of reassignment of goods from North Wagga to Junee will be immediately reported to the Goods Superintendent.

G. J. ROBERTS.

Sir,

Railways, Junee, 7 September, 1880.

In accordance with attached instructions received from Inspector Roberts, I have to report for your information that Mr. George Dobbins, storekeeper at Junee, is now having his goods consigned from Sydney to North Wagga, then reassign from the latter station, in order to get the rebate allowed on goods carried the distance of 300 miles.

I am, &c.,

CHAS. HORN.

I see no necessity for advertising.—W. V. READ, 31/8/80. Commissioner.
Inform what has been done, and point out till the opening of the Temora Gold-fields the concession made to squatters, traders, and others in the Riverina country did not affect the trade of Cootamundra, and that so soon as it was found to be detrimental to the interests of the traders of Cootamundra, the rebate was discontinued.—CH. A. G., 2/9/80.

Gentlemen,

Department of Railways, Sydney, 4 September, 1880.

In acknowledging the receipt of the memorial signed by yourselves and others, resident in Cootamundra, representing the disadvantageous position business people are placed in as compared with other stations on the Southern line, in consequence of the unequal rate charges to Cootamundra and North Wagga, I have the honor to inform you that, with the view of allowing Junee no undue advantage over any other station on the line, directions have been given that Junee rates, as per Classification Sheet, are to be charged on all goods sent to that station, and that no rebate is to be allowed on any goods consigned to Wagga Wagga and reassign to Junee.

I may add, that until the opening up of the Gold-fields at Temora, the allowance made to squatters, traders, and others in the Riverina country, did not affect the trade of Cootamundra; but so soon as it was found that the concession was detrimental in its operation to the interests of the traders of Cootamundra, the rebate was discontinued.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Messrs J. & E. Barnes, Matthews Bros., E. Strongitharm, Cootamundra.

For the Traffic Manager's information. Please advise.—G. T. EVANS, 10/9/80. If the goods were consigned to North Wagga in the first instance, who reassign them there to Junee? Is this practice carried on to any extent?—W. V. READ, 11/9/80. Goods Superintendent. Station-master, Wagga Wagga, for report.—G. T. EVANS, 13/9/80. Station-master, North Wagga, will please give the required information.—JOHN GRAY, 14/9/80.

Consignees instructed me by letter and wire to forward any goods that were at North Wagga for them to Junee. Mr. Dobbins is the person who principally takes advantage of the discount. We have had four reassignments, three of which have been for Mr. Dobbins, this month. Weight of reassign goods amounts to about 10 tons; value of freight, omitting extra trainage to Junee, £30.—S. W. ALLIBAND, 15/9/80. Goods Superintendent.

Traffic Manager.—G. T. EVANS, 16/9/80.

I should like to have a detailed statement of the goods reassign from North Wagga to Junee, showing the weight, rate, and trainage on the down journey, and also between the stations named. Against each entry I should like to know what the trainage would have been if the goods had been invoiced from Sydney to Junee direct.—W. V. READ, 16/9/80. Goods Superintendent. Urgent.

Mr. Alliband for attention. Let me have the statement on a separate paper.—G. T. EVANS, 17/9/80. I attach the return. We have lost about £6 in freight.—G. T. EVANS, 23/9/80. Traffic Manager.

When goods are first consigned to North Wagga, and then reassign to Junee, in order to benefit by the reduction of the rates which applies to North Wagga, the trainage between North Wagga and Junee should be charged at the difference between the North Wagga and Junee and Sydney rates. For instance, the rate from Sydney to Junee, third-class, is 138s. 7d. per ton, and to North Wagga 158s. 8d., leaving a difference of 22s. 11d. per ton; while the rate from North Wagga to Junee is only 10s. 2d. You will, therefore, issue instructions that all goods reassign in this way are to be charged at the higher rate.—W. V. R., 24/9/80. Goods Superintendent.

Inspector Roberts to see and inform all concerned.—G. T. EVANS, 23/9/80. Noted, and Junee and North Wagga informed.—G. J. ROBERTS, 30/9/80. Goods Superintendent.

Is the rate laid down in my minute of the 24th September still being adhered to, and are goods still being consigned to North Wagga, and from there to Junee to any extent?—W. V. READ, 3/11/80. Inspector Roberts for report.—G. T. EVANS, 4/11/80.

Mr. Dobbins is the only person who gets his goods consigned to North Wagga and then reassigns them to Junee. The rates laid down by the Traffic Manager in his minute of the 24th September is being adhered to. Mr. Dobbins calls at North Wagga, pays freight, and carts the goods outside of the yard and then returns with them and consigns to Junee. In these cases only ordinary rates can be charged.—G. J. ROBERTS, 10/11/80. Goods Superintendent.

Please see Inspector Roberts' report.—G. T. EVANS, 11/11/80. Traffic Manager. Does Mr. Dobbins get much goods consigned in this way?—W. V. R., 12/11/80. Inspector Roberts.

In October Dobbins received 4 tons 16 cwt. 1 qr.; Walsh, 6 tons 12 cwt. 2 qr.; and Meagher 5 tons 8 cwt.; and in November (up to 13th instant), Dobbins has received 3 tons 17 cwt.—G. J. ROBERTS, 20/11/80. Traffic Manager.

I think this is a matter upon which it would be well to have the Crown Solicitor's opinion. Mr. Dobbins takes delivery of his goods at North Wagga, takes them outside the station gates, and then brings them back and reconsigns them, and he therefore gets the advantage of the 20 per cent. discount for distances over 300 miles, and only the ordinary rates are charged from North Wagga to Junee. I am not certain whether by doing this a fresh consignment is constituted, because no doubt the goods he consigns to Junee are those he gets from Sydney, and the fact of his taking delivery at North Wagga is only that he may save a little money. I think that, notwithstanding his having taken delivery and then reconsigning the goods, we would be justified in charging the higher rate named in my minute of 24/9/80, were it not that Mr. Dobbins might add to the packages when he got them at North Wagga, in which case he might have an action against us if we refused to accept them as a new consignment.—W. V. READ, 22/11/80. Commissioner.

State a case for the Crown Solicitor.—CH.A.G., 25/11/80.

Minute by the Commissioner for Railways to the Crown Solicitor.

I HAVE to invite your attention to the matter hereunder, and to request that you will please furnish me with your opinion upon it.

As the Great Southern and South Western Railways are extended towards the Border, there is keen competition between the Railway Departments of the respective Colonies for the trade of the Border Districts. In order to secure the trade for this Colony, a reduction of 20 per cent. in the railway rates has been made on all goods of the 1st, 2nd, 3rd, and 4th classes, carried over 300 miles. Thus, for a ton of goods sent 290 and 301 miles the rates would be respectively:—

	290 miles.	301 miles.
	£ s. d.	£ s. d.
1st class	4 0 8	3 6 3
2nd „	5 0 4	4 2 6
3rd „	6 19 8	5 14 10
4th „	9 0 0	7 8 0

A person consigning goods to a station (say) 290 miles from Sydney would find it cheaper to send them the longer distance, and then have them reconsigned and pay the rate charged for the carriage of goods for 11 miles.

The station that is principally affected in this way is Junee, distant 287 miles from Sydney, the rates for goods being respectively:—

	£ s. d.	£ s. d.	
1st class	4 0 1	3rd class	6 18 7
2nd „	4 19 7	4th „	8 18 8

North Wagga Wagga is distant 304 miles from Sydney, and goods sent to this station, therefore, obtain the benefit of the discount of 20 per cent., the rates charged to North Wagga Wagga being as follows:—

	£ s. d.	£ s. d.	
1st class	3 6 10	3rd class	5 15 8
2nd „	4 3 1	4th „	7 9 1

From North Wagga Wagga to Junee is 17 miles, and the rates for the carriage of goods for this distance are respectively:—

	£ s. d.	£ s. d.	
1st class	0 6 8	3rd class	0 10 2
2nd „	0 7 10	4th „	0 13 6

Persons sending goods from Sydney to Junee find it cheaper to send them first to North Wagga Wagga and then have them reconsigned to Junee, the rates per ton, in comparison, showing as follows:—

	1st class.	2nd class.	3rd class.	4th class.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
From Sydney to Junee direct.....	4 0 1	4 19 7	6 18 7	8 18 8
From Sydney to Junee, via North Wagga	3 13 6	4 10 11	6 5 10	8 2 7
And saving.....	0 6 7	0 8 8	0 12 9	0 16 1

This course was adopted by some of our customers at Junee; but as it was found to act against the interests of the Department and injure storekeepers in their business at Cootamundra (in supplying goods to Temora), directions were given that on all goods reconsigned in this way, instead of charging the ordinary rate from North Wagga Wagga to Junee, the difference between by the direct rate from Sydney to Junee and that from Sydney to North Wagga Wagga was to be charged. This has been adopted, but some of our customers, to defeat the end we have in view, transact their business in the following manner:—The goods are received at North Wagga Wagga and paid for; they are then taken outside the station premises, brought back, and then sent to Junee as a fresh consignment. They are, however, practically the same goods; but we are doubtful, under the circumstances, whether we can enforce the direct and higher rate from Sydney to Junee, and I shall be glad if you will please advise me, in the matter.

CH.A.G.; B.C., 27/11/80.

Sir,

Crown Solicitor's Office, Sydney, 8 December, 1880.

I have the honor to return herewith your minute of date, 27th November last, respecting the carriage of goods between Sydney and North Wagga Wagga and North Wagga Wagga and Junee, and to state that I have submitted same to Mr. Attorney-General, a copy of whose advising thereon will be found attached.

have, &c.,

JOHN WILLIAMS,

Crown Solicitor.

[Enclosure.]

[Enclosure.]

OPINION.

I AM clearly of opinion that it is not in the power of the Commissioner for Railways to charge on goods forwarded from Sydney to Wagga and back to Junee, under the circumstances mentioned in Mr. Goodchap's minute, the higher rate chargeable on goods sent direct from Sydney to Junee.
8/12/80.

ROBERT WISDOM, A.G.

Traffic Manager will act accordingly.—CH. A. G., B. C., 9/12/80. Goods Superintendent.—W. V. READ, 10/12/80. Inspector Roberts to see Attorney-General's advice, and inform all concerned, for future guidance.—G. T. EVANS, 13/12/80. Noted. I have cancelled my previous instructions to Junee and North Wagga, and told them to resume charging the usual rates.—G. J. ROBERTS, 14/12/80. Goods Superintendent. Mr. Harper to see.—G. T. EVANS. Seen.—J. HARPER, 15/12/80.

No. 12.

Memo. from Mr. Traffic-Manager Read to The Commissioner for Railways.

Wool Rates.

As I personally informed the Commissioner, full replies to his minutes respecting the rates for wool were not sent for the reason that I was waiting for information as to what the competing rates from Hay to Melbourne by river, *via* Echuca, would be. Last year they were 75s. per ton, but this year I am afraid they will be less, and it was only on a request through the telephone that a rate for wool from Hay should be at once sent, that my minute of 16th April, 1882, was written.

The rate per bale from Hay to Sydney being fixed at 12s., I recommend the following rates from other stations on the South-western line:—

	Present rate.	Rate recommended.
Carrathool to Sydney	11s. per bale.	11s. 6d. per bale.
Darlington „	10s. 6d. „	11s. „
Hulong „	10s. 3d. „	10s. 9d. „
Narrandera „	10s. „	10s. 6d. „
Cowabbie „	9s. 6d. „	10s. „

I hardly think it probable that we shall be asked to carry wool for Melbourne, *via* Albury, from the South-western line, as the rates to Sydney and thence to Melbourne by sea will be considerably less than by Albury; but should the Commissioner decide on publishing a rate, I would recommend the following:—From Hay to Albury, 12s. per bale, and from the other stations, corresponding rates as to Sydney. The grounds for charging such rates would be the reconsigning of the wool at Junee, as at that place it would have to be detached from the train and forwarded in a different direction. Our ordinary rates for—

168 miles, Hay to Junee, would be	8s. 6d. per bale.
99 „ Junee to Albury	6s. 3d. „
	14s. 9d.;

but in this case we would not have to unload the wool at Junee. But I would not recommend the publishing of a rate for wool to Albury at all. We do not quote one from Wagga Wagga and other stations on the Southern line. If it is published, it will show a great disparity as compared with the rates for corresponding distances to Sydney. The public will not understand the grounds upon which the rates are based.

Although we carry at these reduced rates from Hay and other stations on the South-western line, on account of the competition there is for the wool traffic, I am not prepared to recommend a general reduction to make the rates uniform throughout the lines. It would be better to sacrifice the Hay traffic altogether than do that; but the latter procedure is not necessary, as, on the South-western traffic, we do obtain a profit, although much less than on the other lines.

W. V. R., 24/4/82.

Wool rate-sheet to be prepared as proposed for submission to His Excellency the Governor and Executive Council.—CH. A. G., 29/4/82.

I have to inform you that the Commissioner has approved of the wool rate from Capertee being fixed at 7s. 3d. per bale. Will you please issue the necessary instructions accordingly. It is not proposed to issue the amended wool sheet until the line to Hay is opened, because if it were issued now the rate from the stations on this side of Hay would all be increased, and it is presumed that you do not intend the increased rate from those stations to be charged until the line is opened for traffic to Hay.—G. B., B. C., 5/5/82. Traffic Manager.

Instruct Goods Superintendent to inform all concerned that the rate for wool from Capertee to Sydney will be 7s. 3d. per bale.—W. V. R., 8/5/82.

Chas. A. Goodchap, Esq., Commissioner for Railways, Sydney,—

Dear Sir,

Melbourne, 24 April, 1882.

In view of the approaching wool season, we have the honor to request you will inform us what the rates of carriage on wool between Hay, Carrathool, and Hulong, or any intermediate sidings between Hay and Hulong and Sydney, will be; also, what allowance will be made for dumped wool.

As we are now making our contracts, we will be glad to know what the rates will be at your earliest convenience, as we anticipate arranging for a large quantity of wool for Sydney.

We have, &c.,

WM. McCULLOCH & CO. (LTD.)

Gentlemen,

Gentlemen,

Department of Railways, Sydney, 1 May, 1882.

With reference to your letter of the 24th ultimo, asking the rates proposed to be charged for the carriage of wool between Hay and Hulong and intermediate places to Sydney, and the allowance on dumped wool, I have the honor to inform you that the following have been fixed as the charges to be made when the line is open to Hay.

From Hay ...	12s.	per bale.	From Hulong ...	10s. 9d.	per bale.
„ Carrathool	11s. 6d.	„	„ Narrandera ...	10s. 6d.	„
„ Darlington	11s.	„	„ Cowabbie ...	10s.	„

An allowance of 15 per cent. will be made on the above rates for all wool properly dumped and hooped with iron, and for all bales not exceeding 250 lb. in weight.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

Messrs. Wm. M'Culloch & Co., 123, Collins-street West, Melbourne.

The enclosed is a proof copy of the new wool rate to be issued on the opening of the extension of the railway to Hay. Will Traffic Manager please say whether it is correct, or whether there are any other stations which should be inserted? Please return early, as the papers are to be submitted at the next Executive Council meeting.—D.C.M'L., 2/5/82. Traffic Manager.

It is correct. I do not think it necessary to insert any more stations.—W.V.R., 3/5/82.

The Traffic Manager has omitted Capertee. This station will open this month, and a rate should be inserted. I have asked, by telephone, what rate the Traffic Manager proposes, and he names 7s. 3d. per bale. Does the Commissioner approve?—D.C.M'L., 4/5/82.

Yes.—CH.A.G., 5/5/82.

No. 13.

The Secretary, Victorian Railways, to The Commissioner for Railways, Sydney.

Sir,

Railway Department, Melbourne, 19 May, 1882.

Adverting to the very low rates charged for the conveyance of wool from Hay to Sydney, I have the honor to inquire whether you will be prepared to enter into some mutual arrangement with this Department respecting the Riverina traffic, with a view to prevent the charges for wool and merchandise being reduced to so low a pitch that they will pay neither Colony.

I have, &c.,

P. P. LABERTOUCHE.

Secretary.

Sir,

Department of Railways, Sydney, 30 May, 1882.

With reference to your letter of the 19th instant, respecting the rates charged for the conveyance of wool from Hay to Sydney, and asking whether I am prepared to enter into some mutual arrangement with your Department "respecting the Riverina traffic, with a view to prevent the charges for wool and merchandise being reduced to so low a pitch that they will pay neither Colony," I have the honor to inform you that you are wrong in the assumption that the rates fixed for the carriage of wool and merchandise between Hay and Sydney are unremunerative, as both rates return a good profit to the Department, and could, in fact, be further largely reduced without actual loss.

It is to be regretted that the tariff of your Department should be, with a view to secure the Riverina traffic, so fixed as to result in a loss in consequence of the charges being unremunerative; and this Department would be willing to entertain favourably any proposition which, while not disturbing the natural course of trade, would have the effect of increasing the rates of carriage in both Colonies. As, however, the rates of carriage in this Colony are not, as it seems they are in Victoria, below the earning-point as regards the Riverina traffic, an uniform rate of increase would clearly be unnecessary.

I may add that I regret to observe that, notwithstanding your admission that your rates of carriage for supplies required in New South Wales, and for the produce thereof, are unremunerative, your Department has, since the date of your letter under reply, further reduced the rate for the carriage of wool grown in this Colony.

I have, &c.,

The Secretary, Railway Department, Melbourne.

CH. A. GOODCHAP,

Commissioner for Railways.

Wool Rates from Hay.

I HAVE seen rates quoted for the carriage of wool from Hay to Melbourne which show clearly that privately, bonuses are being given by the Railway Department of Victoria to the railway carriers for bringing the wool to their metropolis.

The price quoted by M'Culloch & Co. in a private letter is £3 10s. per ton. Our rates, at 12s. per bale, will amount to £3 12s. a ton.

Twelve shillings was fixed in the first instance, so as to admit of our reducing the rate should the Railway Department of Victoria reduce their existing rate. It was considered better to have a margin than to go at once to the minimum charge. They have publicly made a reduction of 9d. per bale in their rate, and privately, by giving a bonus to the carriers, they are making a further reduction.

I would therefore recommend that our rate from Hay and Carrathool be reduced to 11s. per bale.

Enclosed is a letter from the Secretary of Railways of Victoria, with my reply thereto, on the subject of a mutual arrangement for a revision of the rates in both Colonies for the carriage of the Riverina traffic.

At the time the Railway Department of Victoria addressed their letter to me they had determined upon a further reduction in their rates, and so there is reason to doubt their sincerity in the matter.—CH.A.G., 31/5/82.

Approved.—

Approved.—J.L., 31/5/82.

Traffic Manager to see and to return at once. Wright, Heaton, & Co. have been informed of the reduction. Let other forwarding agents know, also Mr. Cottee and the other financial managers. The publication of the reduced rates may be postponed till the Railway Department of Victoria have had an opportunity of replying to my letter of 30th instant.—CH. A. G., 31/5/82.

Seen and attended to.—W.V.R., 5/6/82. Commissioner.

No. 14.

Report of Mr. Assistant Traffic-Manager Kirkcaldie to Mr. Traffic-Manager Read.

Merchandise Rates.

Traffic from Melbourne, via Wodonga.

WHILE in the southern district I have taken occasion to make some inquiries respecting the rates charged on the Victorian lines for traffic coming into New South Wales, and I find that for general goods coming from Melbourne to stations north of Gerogery, and including all the country north of an imaginary line drawn straight from Jingelle on the Murray; thence to the southern portion of the Urana Swamp; thence to the south-west boundary of Thurowa Station, to include in that line Cocketgedong, Colombo, and Thurowa Stations; thence in a northerly direction to the south-west boundary of Ugobit Block A, to include in that line Bundure, Yanko F east, and Ugobit Block A; thence in a westerly direction along the south boundary of the river back blocks to the intersection of the Murrumbidgee River at Balranald,—the rates to Wodonga have been reduced from 62s. 6d. per ton first class, and 65s. for second, third, and fourth classes, to 30s. per ton all round; and even upon Albury goods the same low rate is now charged for the following goods, carried in lots of not less than 5 tons, viz.:—Wire, woolpacks, salt, rocksalt, timber, sugar, cement, tea, kerosene, candles, oilmen's stores, spirits in cases or casks, bottled beer, bar iron, and tanks of malt. These greatly reduced rates, which came into operation on the 1st instant, have had the effect of driving the Wagga Wagga storekeepers and others to Melbourne for their supplies, particularly as, at the present time, the rate by team from Wodonga to Wagga Wagga for general goods is only 35s. per ton; and I even saw a letter, dated the 3rd instant, from Messrs. Wm. M'Culloch & Co., of Wodonga, to Messrs. Wright, Heaton, & Co., at Wagga Wagga, intimating they had had the offer of teams for 30s., and as low as 28s., per ton. This, I am informed, will continue until March next, during which time wool will be being conveyed to Wodonga by teams, and even after that time I am told the rate of carriage will not exceed 40s. per ton; and, if that be so, the maximum rate from Melbourne to Wagga Wagga will henceforth be, allowing 5s. for forwarding charges at Wodonga, equal to £3 15s. per ton. Last week five bullock teams left Wodonga for Wagga Wagga with 25 tons of general goods, viz., groceries, drapery, sugar, wines, spirits, ironmongery, &c., and two more teams were loading yesterday with 10 tons of sugar and groceries.

Our existing rates from Albury to Wagga Wagga are as follows:—40s. 1st, 49s. 3d. 2nd, 67s. 9d. 3rd and 4th class, and to each of these would require to be added at least 5s. for forwarding charges and cartage from Wodonga to Albury. These rates, it must be admitted, were fixed high for obvious reasons, and the result, until the present reduction on the Victorian lines, has fully justified the step that was taken; but some alteration will now be necessary to counteract the action taken by the Victorian Railway Department.

My opinion is that the rates between Albury and Wagga Wagga should be left as they are, and that whatever concession is made should take effect from the Sydney end, whence the maximum rate for any class of goods (except explosives) should be £3 10s. per ton to stations on the Southern and South-western lines distant over 305 miles from Sydney, and that a truck rate of £20 should be fixed for any or all kinds of 1st, 2nd, 3rd, and 4th class goods not exceeding 6 tons, and, if that be agreed to, the truck rate for sugar would of course have to be reduced from £24 to £20. Assuming that 5 tons can be put in a truck (and it is very rarely indeed that such a weight of 3rd or 4th class goods can be got into one—in fact, the average weight of trucks forwarded from Sydney to Wagga Wagga during September was 3 tons 16 cwt. 3 qr.), that would be equal to £4 per ton; and I am inclined to think we would get that rate; but as the rates from Melbourne are now so very low, I do not think we will get more. It would hardly be possible to estimate the loss to the revenue consequent upon such a reduction, because, notwithstanding the reduction of the rate per ton, we would secure full loading for the trucks. I am having a return prepared of the 1st, 2nd, 3rd, and 4th class goods received at Wagga Wagga from Sydney during the first nine months of this year, but it will not be finished for several days yet; and a statement is also in course of preparation of the traffic that has come from Victoria into New South Wales at Albury during the six months ended 30th September ultimo.

The only possible way that the Victorian reduction could be resented would be by placing several heavy tolls on this side of the Border; but I understand that the road between Albury and the Murray is within the municipality of Albury, and that after leaving that town, northwards, there are so many different roads which the teams could take, that such a plan would be impracticable, and, therefore, the only alternative is to lower our own rates.

When at Albury, I was informed that after the extension from Albury to Wodonga is opened early next year, the Victorian Railway Department will have a goods shed at Albury, and that they will receive and deliver all their New South Wales goods there. If that be so, it will be so much the more in favour of that Department.

I saw the first of the New South Wales wool (five teams) arrive at Wodonga from the Urana district, and I have ascertained that up to Saturday, the 7th instant, 426 bales of New South Wales wool have been taken to Wodonga by team and taken to Melbourne.

Traffic from Melbourne, via Echuca and River, to Hay.

THESE rates have also been reduced from 48s. to 30s. per ton for 1st, 2nd, 3rd, and 4th class goods; and when at Hay I was shown a letter from Messrs. Wm. M'Culloch & Co. to the principal storekeepers (Messrs. Meakes & Fay who informed me that during the past six weeks they had paid Messrs. M'Culloch and Co. nearly £1,200 in freight alone, and that, all things being equal, they would much prefer dealing in

I always thought it was a great mistake to allow Victoria to bring their gauge of line into Albury.—
CH. A. G.,
12/10/82.

in Sydney), quoting a through rate of 57s. 6d. per ton for general goods from Melbourne to Hay, and 52s. 6d. for such traffic as corrugated iron, wire, &c. The insurance charges have of course to be added to these rates, but they are now also very low—being 10s. per cent. for iron, wire, &c., 20s. per cent. for liquids, drapery, produce, &c., and 40s. per cent. for sugar, salt, cigars, &c. I make full allowance for all these charges when I recommend a maximum truck rate of £20.

See paper sent to Traffic Manager some days ago reducing silicate of soda to same rate as caustic soda.—CH. A. G., 10/11/82.

At Hay I was introduced to a Mr. Gordon, who has commenced the manufacture of soap in that district, and he called my attention to the high rate for silicate of soda as compared with soda crystals and soda caustic, and he informed me that of the former he uses about 30 tons per annum. I told him there were objections to the reduction of the rate for soda silicate, which he recognized; but he said he could not possibly pay 130s. per ton from Sydney when he can get it from Melbourne for about 60s. I have no doubt that the £20 truck rate would secure the traffic, and I merely mention the incident in support of my recommendation.

Complaints were also made to me at Hay about the rates for gunpowder and other explosives from Sydney, which are at present £22 14s. for quantities in excess of 10 cwt., and £35 1s. for smaller quantities. As the revenue will not be effected to any material extent, I think the maximum rates from Sydney might be fixed at £10 and £15 per ton respectively for any line.

In the course of a few days the Western line will be opened to Warren Road, and whether the maximum rate of £5 10s. per ton or £20 per truck should apply to that line is quite another matter. My opinion is that the reductions herein recommended should apply solely to the Southern and South-western lines, and only because of the special circumstances of the case. I hope that at no very distant date we shall be able to raise the rates again as far as the more distant stations on the South-western line are concerned, but that will only be possible after river dues have been imposed to such an extent as to raise the rates on the Victorian lines to the same amounts as are charged to those persons who live in that Colony (Echuca for instance) or to those who do not live within the favoured imaginary line.

The wool traffic from Hay up to Saturday the 7th instant amounted to 1,688 bales forwarded to Sydney, and 10,645 bales to Melbourne, and it is generally believed in the Riverina districts that next year we shall get a large number of the clips that this year are being forwarded to Melbourne.

I am strongly of opinion that if the reductions recommended are approved, they should be brought into operation at the earliest possible moment, because there can be little doubt, I think, that every day's loss of time since the reductions in Victoria will tend to alienate the trade from Sydney, particularly as far as Wagga Wagga is concerned. As regards the Hay trade, we have only been getting a very limited share of it yet; but I think the reduction proposed will tend more than anything else to induce the store-keepers to look to Sydney for their supplies.

The rates for live stock are, in my opinion, already low enough, and reductions are neither desirable nor necessary, even if it should be decided to abolish the stock tax in Victoria.

Our rates from Hay to Homebush are as follows:—

Cattle (say ten head), £10 5s. per truck	£1 0 6 per head.
Sheep (say one hundred head), £8 10s. 3d. per truck	0 1 9 "

While the rates to Melbourne are:—

Deniliquin to Melbourne—

Cattle (say ten head), £6 7s. 9d. per truck	0 12 5 per head.
Driving to Deniliquin and depreciation	0 5 0 "

0 17 5

Deniliquin to Echuca and Echuca to Melbourne—Sheep (say 100 head) £6 0s. 3d. per truck

... ..	0 1 2 per head	
Driving to Deniliquin and depreciation	0 0 7 "

0 1 9

The rates to Melbourne are of course exclusive of the Victorian stock tax, and the impression among the squatters is that our live stock rates are very reasonable.

DAVID KIRKCALDIE, 10/10/82.

Report to Commissioner that Mr. Kirkcaldie visited Hay, Wagga, and Albury, with a view of reporting on the effect of recent reductions in Victorian railway rates, &c., on our traffic, and that his report shows that to retain the Riverina, Wagga, and Albury traffic it will be necessary to fix the maximum rates for all goods, except explosives, on the Southern and South-western lines at £5 10s. per ton, and £20 per truck, for distances over 305 miles.—W. V. READ, 11/10/82. Commissioner.

I must recommend this for the present. The rates proposed will pay us, and we must sacrifice some of the profit we are making to retain the trade and get more of it. I shall be glad if the Secretary will obtain the Minister's approval, if possible, to-morrow, for I should like to advertise at once at Wagga and Hay what the new truck rates will be £20 instead of £24. They should come into operation at once, before the reduced rates of Victoria get too great a hold of the trade.—CH. A. G., 12/10/82.

Approved.—J. L., 13/10/82. Traffic Manager. Please submit draft advertisement early to-morrow.—J. P. I., 13/10/82. Draft advertisement enclosed. I am issuing general order to-day and will watch the effect.—W. V. READ, 14/10/82. Commissioner.

EXTRACT from newspaper on the subject of the Riverina traffic was submitted to the Commissioner, who wrote:—

"A good horse team—eight horses—will carry 6 tons (that is £12) between Wagga and Albury. There would be no return traffic, or (say) at the outside 2 tons—in all £16 for the double trip. The double journey would take ten days. If in constant work, thirty trips in the year could be made. The gross earnings being—thirty trips at £16 = £480, what would the expenses be? The teamster would have to be paid £110 a year; the wear and tear of plant and renewals would be £60 a year; the horse feed would be 10s. a week for each horse, or £4 a week, equal to, (say) £200 a year; leaving a margin of £110 a year to meet interest upon capital and profit. It does not seem good enough."

It

It may be, however, that the traffic or trade is going to Melbourne from Wagga. Of course it is expected that the Traffic Manager will watch the course of traffic, and give me timely notice. I should like to see Mr. Roberts, the local Inspector's report, on the representation made.

CH. A. G., B. C., 7/10/82.

Traffic Manager.

I beg to refer the Commissioner to my report of this date respecting the rates between Melbourne and Wodonga and Echuca.—W. V. READ, 11/10/82. Commissioner.

No. 15.

Report of Mr. Assistant Traffic-Manager Kirkcaldie to Mr. Traffic-Manager Read.

Passenger Fares to and from the Riverina District.

THE reduction of the passenger fares, which came into operation on the 4th instant, is being favourably commented upon in Riverina.

The new fares from Hay to Sydney are—1st class, 72/6; 2nd class, 48/9; 1st excursion, 96/9; 2nd excursion, 65/-; while Melbourne they are as follows:—

	1st class.	2nd class.	1st excursion.	2nd excursion.
Hay to Albury	49/3	33/-	65/9	44/-
Coach to Wodonga	1/6	1/6	3/-	3/-
Wodonga to Melbourne	31/-	20/6	46/6	31/-
	<u>81/9</u>	<u>55/-</u>	<u>115/3</u>	<u>78/-</u>
			A	A
Hay to Deniliquin by coach	30/-	30/-	50/-	50/-
Deniliquin to Echuca	12/-	9/-	24/-	18/-
Echuca to Melbourne	26/-	17/-	39/-	25/6
	<u>68/-</u>	<u>56/-</u>	<u>113/-</u>	<u>93/6</u>

A—Available for one month.

Excursion tickets on the Victorian lines are only issued on Fridays and Saturdays.

I do not think there is any necessity at present, at any rate, for issuing excursion tickets every day from Hay to Albury, as is done to Sydney, because, although I ascertained that the coaches are being tolerably well patronised from Hay to Deniliquin, it is principally by shearers returning to the Deniliquin and Echuca districts after finishing the shearing in the district of Hay. The journey is about 80 miles, and occupies about fourteen hours, including the whole of the night, so that it is difficult to conceive that first-class Melbourne passengers would undergo such fatigue for the difference of a few shillings going round by Albury; and it will be seen that the second class fares are about the same, and indeed excursion tickets are considerably cheaper by Albury. Of course persons going by way of Albury have to stay a night *en route* both going and returning, but even that is not much consequence compared with the discomfort of travelling by coach. For the present, therefore, I would not recommend any alteration of existing arrangements. I think, however, that excursion tickets to the South-western line should be issued at main line stations by the Thursday evenings' mail trains, and at the South-western stations by the Friday's day trains, seeing that there are no night trains on that line.

I requested the station-master at Hay to keep himself conversant, as far as he possibly can, with the course of the traffic, and to advise you regularly what is going on.

Parcels Rates.

These are greatly complained about at Hay, and have been the subject of considerable comment in the public Press there, and I strongly recommend an immediate and substantial reduction.

The present rates from Sydney are:—

3 lb.	3 lb. to 7 lb.	7 lb. to 14 lb.	14 lb. to 28 lb.	28 lb. to 56 lb.	56 lb. to 84 lb.	84 lb. to 112 lb.	Every 28 lb. or part thereof.
2s. 4d.	4s. 8d.	5s. 8d.	8s.	10s. 4d.	12s. 8d.	14s. 3d.	3s. 3d.

while the rates from Melbourne and coach from Deniliquin are, except for light parcels, considerably lower.

I recommend, therefore, that the maximum rates to and from Sydney be fixed at the 315 miles rates as follows:—

3 lb.	3 lb. to 7 lb.	7 lb. to 14 lb.	14 lb. to 28 lb.	28 lb. to 56 lb.	56 lb. to 84 lb.	84 lb. to 112 lb.	Every 28 lb. or part thereof.
1s. 6d.	3s.	4s.	5s. 6d.	7s.	8s. 6d.	10s. 1d.	2s. 5d.

W. V. Read, Esq., Traffic Manager.

DAVID KIRKCALDIE, 10/10/82.

Seen. Recommend for Commissioner's approval that the maximum rate for parcels be the rate for 315 miles.—W. V. R., 11/10/82. Commissioner.

I recommend this strongly. A parcels trade leads to a general goods trade, and as our passenger trains must run to Hay I do not see why we should not carry parcels, even at a lower rate if necessary; but the rates proposed will catch the traffic.—CH. A. G., 12/10/82.

Approved.—J. L., 13/10/82. I have included the reduction in the draft advertisement respecting the goods rates.—W. V. R., 14/10/82. Commissioner.

[Draft

[Draft Advertisement.]

REDUCTION OF MERCHANDISE AND PARCELS RATES.

Merchandise Rates.

On and after Monday, the 16th October, a truck rate of £20 will be charged for 1st, 2nd, 3rd, and 4th class goods conveyed from Sydney to stations on the Southern and South-western lines, for distances 305 miles therefrom, and load not to exceed 6 tons. Wire will, however, remain at £18 per truck as at present. For smaller consignments under the classes named the maximum rate to the stations indicated will be £5 10s. per ton.

For gunpowder and other explosives, the rate for quantities in excess of 10 cwt. will be £10 per ton, and for smaller quantities £15 per ton.

Parcels Rates.

The maximum rates for parcels between Sydney and any station on the South and South-western lines will be reduced as follows:—

3 lb.	3 lb.	7 lb.	14 lb.	28 lb.	56 lb.	84 lb.
	to	to	to	to	to	to
	7 lb.	14 lb.	28 lb.	56 lb.	84 lb.	112 lb.
1s. 6d.	3s.	4s.	5s. 6d.	7s.	8s. 6d.	10s. 1d.

and for every additional 28 lb. or part thereof, 2s. 5d.

For further particulars apply to the Traffic Manager or the Station-masters.

Commissioner for Railways.

Department of Public Works, Railway Branch, Sydney, 14th October, 1882.

No. 16.

Alleged diversion of New South Wales Traffic to Melbourne.

Newspaper article containing statement that New South Wales traffic was being served from Melbourne, submitted to Commissioner, who wrote:—

THE new railway rates will come into operation on the 4th October next. The Traffic Manager should keep himself informed of the course of traffic at Wagga.

I discredit the statement that recourse is being had to the Melbourne markets. As to carriage by road competing with the rates between Albury and Wagga, it is not possible I think.

CH.A.G., 28/9/82.

I regret to find that the paragraph is quite correct. The Victorian Railway Department reduced their rates on the 1st instant from Melbourne to Wodonga to 30s. per ton for 1st, 2nd, 3rd, and 4th class goods, whereas they were previously 62s. 6d. per ton first class, and 65s. for 2nd, 3rd, and 4th classes. See my report of yesterday, please.—W. V. READ, 12/10/82. Commissioner.

No. 17.

Mr. J. Caro to Sir Patrick Jennings.

Dear Sir,

Dubbo, 28 October, 1882.

Referring you to our conversation, *re* the railway charges, I take the liberty to send you enclosed a table showing the differences so much in favour of Warren.

If you will, as you kindly promised, interest yourself in this matter, and get the authorities, in justice to Dubbo business men, to equalise the charges, you will confer a great favour on them and be of great benefit to the town generally.

Regretting that I am compelled to trouble you.

I am, &c.,

JULIUS CARO.

Traffic Manager for report.—CH.A.G., 27/11/82. If these figures are correct, the discounts make the charge Sydney to Nevertire less than the charge Sydney to Dubbo in most cases.—CH.A.G.

[Enclosure.]

	Sydney to Dubbo.	Dubbo to Nevertire.	Total cost to Nevertire.	Sydney to Nevertire Direct.	Difference in favour of getting goods from Sydney to Nevertire.

Minute by Mr. Traffic-Manager Read.

Mr. CARO is mistaken in deducting 20 per cent. from the A and B rates between Sydney and Nevertire, therefore the difference between the through and the two terminal rates are 3s. 4d. and 4s. 8d. per ton respectively, not 8s. 2d. and 13s. 9d. as stated by that gentleman. On the other hand he ought to have deducted 20 per cent. from the 1st and 2nd class rates between these stations, because the distance is 341 miles, and according to the rate-book such a discount is allowed on all 1st and 2nd class rates for distances over 340 miles. When such a discount was first made, it was, as the Commissioner is aware, to enable us to compete with the Victorian lines in the southern and South-western districts. When the present goods rate-book was being prepared the opening to Nevertire was not taken into consideration, otherwise the clause respecting the 20 per cent. discount, and the arbitrary rates of £6 10s. and £7 10s. for the 3rd and 4th classes would have been altered so as to apply to the Southern and South-western lines only, because there is really no necessity for our making it on the West. If the Commissioner approves, a new rate-book could be brought out on the 1st January, or perhaps as we have begun giving the discount any charge had better be deferred until we open to Nyngan two or three months hence, and then the alteration will have less chance of being noticed, because the traffic to Nevertire will then be almost nil. To revert to Mr. Caro's letter, I may state that the differences on the through rates between Sydney and Nevertire, and the rates to Dubbo and then to Nevertire, are 27s. 7d. 1st class, and 33s. 11d. 2nd class; they would have been 9s. 5d. and 11s. 3d. respectively but for the discount alluded to. Mr. Caro has correctly stated the truck rates for sugar, wire, and galvanized iron. For the former the rate per truck to Nevertire is 16s. 4d. more than to Dubbo, and for wire and galvanized iron the rates are the same to both stations. Mr. Caro is one of those gentlemen who think that two terminal rates should be the same (or only a trifle more) than the through rate. I would refer the Commissioner to the evidence he gave before the Rates Commission twelve months ago.—W.V.R., 5/12/82. Commissioner.

At the time the reduced rates were made to apply to the Western line over a certain distance, storekeepers and others were obtaining their goods in Melbourne and sending them to Narrandera and thence by teams to Cobar, it was deemed, owing to the road being better and the rates lower the more desirable route, I do not know whether the circumstances have altered. Traffic Manager should look into this.—C.R.A.G., 12/12/82.

No traffic is now being taken from Narrandera or Hay to Cobar now, the distance from Hay being 280 miles, and from Narrandera even more, while from Nevertire it is only about 86, and when the line is opened to Nyngan the distance to Cobar will only be 55 miles. The only thing we have to fear will be the competition by the Darling, but the distance from the river at Louth (the nearest point) to Cobar is about the same as from Nyngan, and the uncertainty of the navigation of the river will tell most materially in favour of the regularity and despatch by railway. For a considerable time we have been carrying 1st, 2nd, and 3rd class traffic from Sydney to the Western terminus for the Great Cobar Company at 2nd class rates, but when the line is opened to Nyngan there will be no necessity even for that. As the extension will, I presume, be opened within the next few weeks, I shall be obliged if the Commissioner will be good enough to give the matter his early consideration.—D.K., 23/1/83. Commissioner.

No. 18.

Elwin & Co. and C. J. Graham to The Commissioner for Railways.

Memorandum of rates charged for the carriage of ale on the Southern and Western Railways and remarks thereon.

Orange, 22 December, 1882.

COUNTRY brewers suffer seriously from the great advantages given to competitors in Sydney by the excessive reduction in rates for long distances.

Reductions in which they do not share, whilst they have to pay the high rates attaching to shorter distances on the merchandise they get from Sydney and use in their business.

Taking the case of Orange, where we carry on our business, and Nevertire, the present terminus of the railway, as an instance, the injustice of which we complain becomes very apparent.

We in Orange pay the comparatively high rates attaching to a distance of 192 miles on hops, malt, sugar, casks, and other material, averaging between us about £200 per month. If we sell ale to any customer at or beyond Nevertire station, the charge for carriage from Orange (149 miles) is £4 4s. 4d. per ton. At the same time the brewer in Sydney can sell his ale to a customer in the same locality, and though he has paid no carriage on the material used and never does pay any trainage for any purpose whatever; in fact is not a contributor to the railway revenue, the Department carries his produce to Nevertire, a distance of 341 miles, for £4 4s. 10d. per ton.

Thus the charges are as follows:—

Sydney to Nevertire, 341 miles	£4 4 10
Orange to Nevertire, 149 miles	4 4 4

So that we are very large contributors to the railway revenues, and should contribute much more largely; but for these anomalous rates, find ourselves shut out by men who, through no merit of their own, but simply because they reside in Sydney, carry on business there, and contribute nothing to the railway revenue, have their manufacture carried by the Railway Department, a distance of 341 miles, for the same sum (less 6d.) that is charged for carrying and manufacture 149 miles. In other words, the Department carries the Sydney man's manufacture a distance of 192 miles for nothing. If our material was brought here for nothing we should have less ground of complaint, but the Department charges us high rates. The general allowance for long distances is also very excessive and unfair. We could not complain of a reasonable allowance of a small percentage for every 100 miles, representing labour of unloading and loading, &c., but the reduction made is not reasonable.

	£	s.	d.
Thus, if we send our ale from—			
Orange to Dubbo (86 miles) we pay	2	10	5
Sydney to Orange (192 miles) is charged	5	4	5
		—	
Sydney to Dubbo, in the two journeys	7	14	10
Actual charge is, for 278 miles	6	15	6
Again—Sydney to Dubbo	6	15	6
" Orange	5	4	5
		—	
Orange to Dubbo, paid by Sydney	1	11	1
Orange to Dubbo, paid by us	2	10	5
		—	
Balance in favour of Sydney... ..	0	19	4

So that our goods, travelling over a certain piece of line 82 miles long, are charged 19s. 4d. more than are the Sydney goods, travelling over the same piece of line, after their journey to Orange.

It must be borne in mind that, besides being ourselves large contributors to the Railway Department in the shape of carriage on material, we have frequently to visit Sydney on business, and so contribute to the passenger revenue. We also employ a number of men, whose tea, sugar, wearing apparel, and all other imported necessaries have to come up by rail. We therefore contribute largely in an indirect way to the railway revenue. The larger our establishment the more men we employ, and the greater the revenue; yet in spite of this the whole system of railway rates is made favourable to the non-contributing Sydney manufacturer, and not only unfavourable, but in many cases prohibitive to us.

We feel our grievance is a real one, and that we have a fair claim to redress.

W. H. ELWIN & CO.,
C. J. GRAHAM,
Brewers, Orange.

These figures must, I think, be wrong. A ton of beer, Sydney to Nevertire, would be charged, would it not, £6 10s., not £4 4s. 10d., as stated, unless there be (which I am not certain of) an arrangement by which a truck to hold 6 tons is given for the payment of a sum equal to 4 tons.—CH.A.G., B.C., 16/1/83. Traffic Manager.

The figures given by Messrs. Elwin & Co. and Mr. Graham are correct with the exception that the present rate from Sydney to Nevertire for ale is £4 10s. 5d., not £4 4s. 10d., as stated, and the reason of its being so low is that when the present rate-book was published the opening to Nevertire was not taken into consideration, otherwise I would have recommended that the 20 per cent. discount allowed upon 1st and 2nd class traffic for distances over 340 miles on the Southern line should not be allowed on the West, because there is not the same necessity for it. Nevertire is just 341 miles from Sydney, is entitled under the present rate-book to the discount alluded to, but I recommended that advantage might be taken on the opening of the line to Nyngan to abolish the discount on the Western line. It so happens, too, that while ale is charged 3rd class rate for distances not exceeding 340 miles, greater distances are charged 2nd class rates, so that with a further allowance of 20 per cent. the difference in the rates for long and short distances is very great. When the next rate-book is published (and I think this should be done on the opening of the line to Nyngan), I would recommend that the 20 per cent. discount on 1st and 2nd class traffic be abolished, and that as the truck rate to stations distant over 305 miles from Sydney on the Southern and South-western lines does away with any necessity for transferring goods from the 3rd to the 2nd class, the present practice of charging the lower class for distances over 340 miles is no longer necessary and may fairly be discontinued. If that be done the rates for ale would be as follows:—

	s.	d.
Sydney to Orange	104	5
Orange to Nevertire	84	4
	—	
	188	9
Sydney to Nevertire direct	157	6
	—	
Difference	31	3

The difference, doubtless, seems a large one, but it can only be altered by modifying the discounts allowed for long distances. Messrs. Elwin & Co. and Mr. Graham should not forget, however, the rate for malt in bags from Sydney to Orange is only 60s. 7d. per ton; sugar, 75s. 2d. per ton in small quantities, or in truck loads, 59s. 7d. per ton, and new casks, 30s. 3d. per ton, so that although they pay a proportionately higher rate for the ale in consequence of the shorter distance carried they get the raw material carried much more cheaply.—D.K., 23/1/83. Commissioner.

I forgot that for distances over 340 miles 3rd-class goods were carried at 2nd-class rates. This must be, with discount added, remedied at once,—at all events as regards articles like beer, which can be made locally, and is made at many places along the line. The chief reason that the discount rate was made to apply to long distances on the Western line was the practice that was growing up, for consignees living at Cobar obtaining their goods from Melbourne, and sending them *via* Narrandera to Cobar. This made Melbourne and not Sydney the cheaper source of supply, and to remedy the effect of this the policy of giving exceptionally high discounts for distance was adopted. However, the extension of the Western line from Dubbo has again made Sydney, owing to the reduced rate of road carriage as between Nevertire and Cobar and Narrandera and Cobar, the cheaper source of supply, and advantage should be taken of this to abolish the high rate of discounts for long distances.—CH.A.G., 24/1/83.

Messrs. Elwin & Co. and Mr. Graham complain that in consequence of high rates of discounts for railway freight carried long distances, the manufacturer of beer in Sydney is placed in a superior position to the brewers of Orange. See papers herewith. Traffic Manager will lose no time in modifying rate-sheet in the way suggested in accompanying minutes.—CH.A.G., 26/1/83.

Gentlemen,—

Gentlemen, Department of Public Works, Railway Branch, Sydney, 30 January, 1883.

In reply to your letter of the 22nd ultimo, with reference to a disadvantage under which brewers on the Western line labour in consequence of the reduction in rates allowed to Sydney brewers for long distances, I have the honor to inform you that the large discounts referred to by you were allowed in order to divert the traffic of the far western districts from Melbourne and Adelaide to Sydney. It is admitted that, with regard to goods which can be manufactured, like beer for instance, at intermediate places between Sydney and Nevertire, these large discounts place the country brewers at some disadvantage, and immediate steps will be taken to modify the rates of discount to meet such cases.

I have, &c.,

Messrs. W. H. Elwin & Co., brewers, Orange.

CHAS. A. GOODCHAP,
Commissioner for Railways.

Minute by Mr. Wm. Clarke, M.P.

This paper has reference to the other paper I left with you signed by W. H. Elwin and C. J. Graham, about which you expressed an opinion that the rates had not been correctly stated. Please inquire.—WILLIAM CLARKE, 29/1/83.

Memorandum, *re* calculation of railway rates charged for the carriage of ale from Sydney to Nevertire, and from Orange to Nevertire.

Sydney to Nevertire	341 miles.
Orange to Nevertire	149 miles.

Taking the pamphlet of rates dated 4th October, 1882, which I believe is the latest, refer to page 8, and under the head of "ale in bulk" we find for distance "under 340 miles, class 3," "over 340 miles, class 2." Now refer to pages 13 and 15, and we find on page 13 that the charge for ale in bulk, 149 miles, Orange to Nevertire, is £4 4s. 4d., being rate charged for class 3. On page 15 we find the charge for ale in bulk, 341 miles, Sydney to Nevertire, is £5 13s. 1d.

Thus up to this point we have as follows:—

	£	s.	d.
Sydney to Nevertire, 341 miles	5 13 1
Orange to Nevertire, 149 miles	4 4 4

Turn now to page 21, and as a foot-note to the general table of rates we find as follows:—

"N.B.—A reduction of 20 per cent. on the above rates will be allowed on 1st and 2nd class traffic carried between Sydney and stations distant over 340 miles."

We must, therefore, discover what is 20 per cent. on £5 13s. 1d.; this proves to be £1 2s. 7d., leaving £4 10s. 6d. as my calculation, though £4 4s. 10d. was given as the rate at the station.

NOTE.—On examining the figures it appears evident that the clerk who made the calculation at the station allowed 25 per cent. instead of 20, and hence the mistake. The rates therefore are:—

	£	s.	d.
Sydney to Nevertire, 341 miles	4 10 6
Orange to Nevertire, 149 miles	4 4 4
Subtracting	0 6 2

We get 6s. 2d. as the price paid by a Sydney brewer for the carriage of his ale over 149 miles of railway, whilst the Orange brewer pays for the same service £4 4s. 4d., after having already paid heavily for the carriage of the material with which the ale is made.

Orange, 22nd January, 1883.

C. J. GRAHAM.

The Honorable the Minister for Works,—

Sir,

Newcastle, 29 January, 1883.

I have the honor to draw your attention to the following injustice in the railway rates, to which I am sure it is only necessary to call your attention to have them altered, viz., the rates charged on Colonial ale in comparison with Colonial wine.

From Newcastle to Uralla, a distance of 245 miles, Colonial wine is charged under table B, £1 15s. 10d. per ton, whilst Colonial ale is charged for the same distance, under table 3, £6 3s. 11d. per ton. Now Colonial wine pays almost nothing to the revenue; the grower, manufacturer, or seller pay nothing until it comes to the retailer, who pays a wine license of £2 per annum. Whilst with Colonial ale the brewer pays a license of £30 per annum in Sydney, £20 in the country, and the material beer is made from—hops, malt, and sugar—pays a duty to the revenue, and the retailer pays a duty of £30 per annum. Is this just?

It may be argued that to reduce the rate would be detrimental to the interest of up-country brewers; but that would be protection. The material they make their beer from, viz., hops, malt, and sugar, does not come to more than one-third (I am advised) of the weight of beer, that is, the material is only one-third of the weight of the manufactured article; so in sending beer up the country, it is necessary to pay freight on two-thirds water.

The railway would be no loser by the reductions prayed for, as the increased quantity would more than compensate for the difference.

It is argued, I know, that if the rate on Colonial ale was reduced, it would be necessary to do so on the imported article, but this would apply equally to wine.

Praying your favourable consideration of the above,

I have, &c.,

SAMUEL BELL

(Representing Wood Bros. & Co., and Prendergast, Wood, & Co., Newcastle.)

What is being done *re* the rebate made to brewers for carrying beer long distances? See Mr. Dalton's remarks in House on debating Financial Statement. In fixing the rates for long distances, so as to compete with Victoria for the traffic, attention should have been given to the fact that too high rebates would affect country brewers. The question, however, was gone into before Mr. Dalton alluded to it, and I made arrangements for rectifying the oversight. Let me have papers.—CH. A. G., B. C., 19/2/83.

Minute

Minute by Mr. Traffic-Manager Read.

Alteration of Goods Rates.

As stated in my minute of the 23rd ultimo, when the railway is open to Nyngan, we shall be even in a better position as regards retaining the Bourke, Cobar, &c., trade than we are at present, because, as far as Cobar is concerned, it will be about equi-distant between the railway and the Darling, and as the latter is navigable up as far as Louth only a few months in as many years, as a rule there is no reason, in my opinion, to make a special bid for the traffic of the district.

When the river is not navigable, there are no other means of getting goods to Cobar and Bourke than by rail (as has been the case for some time), and when it is navigable, even the reduced rates which apply on the South and South-west will not secure the traffic.

I recommend, therefore, that the reduction of 20 per cent. on the 1st and 2nd class rates between Sydney and stations distant over 340 miles, and the 3rd and 4th class maximum rates of £6 10s. and £7 10s. per ton, respectively, be confined to the Southern and South-western lines, and that the rates as they appear in the rate-book be charged to stations on the Western and Northern lines.

This will not get rid of the difference between one and two or more terminal rates, nor is it possible to do so without reducing the rates for the shorter distances (which would mean throwing away a large amount of revenue) or increasing them for long distances, which I do not think it is desirable to do, as they are quite high enough already. These differences are caused by the large discounts given upon long distances, and there is no other method of reducing them, except by altering these discounts and making them lower than they are (which, as I have said, would increase the rates for long distances) or lowering the rate per ton for the shorter distances.

The truck rates for corrugated iron and fencing-wire should also be confined to the Southern and South-western lines, and the ordinary tonnage rates charged on the West and North; and the maximum rate of £24 per truck for sugar should also apply to the South and South-western only.

Galvanized screws and washers and nails are carried at second class rates up to 380 miles, and first class rates for greater distances; the latter should only apply to the South and South-western, and so also should the rate for ale and porter in-bulk for distances over 340 miles.

The special rate of £20 per truck for 1st, 2nd, 3rd, and 4th class goods from Sydney to stations on the Southern and South-western lines, distant over 305 miles from Sydney, should be published. Truck rates for hay, straw, and chaff. There is a foot-note to these rates that "the charge for distances not shown will be one-fifth of the difference in rate between every 5 miles." The distances shown are 16, 26, 35, 41, 46, 54, &c., so that the remark referred to does not apply, and some doubt has been expressed as to how 18 miles, for instance, should be charged for. I propose that the first distance be made 15 miles, then 26, and so on, and the apparent anomaly will thus be got rid of.

Cattle and sheep, page 37.—The minimum rate of 15s. has been, by some overlook, left out of the present book; it should be reinstated in the next, and so also should the remark be added to the sheep rates "for single-decked trucks only two-thirds of these rates will be charged."

Powder or other explosives, page 36.—A regulation should be inserted to the effect that "Powder or other explosives will not be left at any place where there is not an officer in charge unless there is someone present to take delivery, but will be taken on to the next station and left there."

W.V.R., 21/2/83.

Prepare rate-sheet on this basis for approval.—Ch.A.G., 2/3/83. Traffic Manager, B.C. The Commissioner requested, per telephone, that these papers should be returned. Please return as early as possible.—W.V.R., 22/5/83.

Sir,

Department of Railways, Sydney, 1st March, 1883.

Referring to your letter of the 29th January last, respecting the alleged anomaly in the rates charged for the carriage of Colonial ale and Colonial wine, I have the honor to inform you that several considerations determined the Government in making the difference between the rates charged for the articles mentioned. Colonial wine is generally carried in bottle, while Colonial beer is invariably carried in bulk. The weight of the bottles is equal to 70 or 80 gallons to the ton which beer gains, and the wine loses. Then again, Colonial wine is not sent to districts where it will compete with wine locally grown; not so with Colonial beer. Country brewers have a good deal to contend with in competing with the beer made in Newcastle and Sydney. Some of the brewers located a few miles only from the places named have been, even with the present freight charges, obliged to close, and if Colonial beer were carried as cheaply as Colonial wine, country breweries, with immaterial exception, would all have to close, unless indeed the charges for the carriage of sugar, glucose, and malt were also greatly reduced. Those considerations, while showing that the charge for Colonial ale should be maintained, it is admitted, do not wholly account for the great difference that is made in the rates for the two articles. Judged from a railway economic standard the rate charged for the carriage of Colonial wine is too low; the concession was made, however, by the Government principally on social grounds, to give encouragement to the consumption of Colonial wine in preference to the deleterious alcoholics, which it was represented the non-wine growing districts of the Colony were being supplied with.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

Samuel Bell, Esq., Newcastle.

[This letter was not sent. Mr. Bell called on Commissioner, and on the next page the purport of what transpired is stated by Commissioner.]

I have seen Mr. Bell, and argued the matter out with him. He does not seem able to take up readily new impressions. After admitting one by one the principles I laid down, the result of which went to prove that the charge for beer trainage could not be reduced to the metropolitan brewers without doing injustice to the local brewer, he was unable to grasp the conclusion his admissions confined him to, and he came back with illogical but renewed vigour to his first demand that there should be a reduction.

His

Exclude ale and
porter from the
concession
altogether on
any line.—
Ch.A.G.

His trump card argument seemed to him to be unanswerable, viz., large quantities of water were used for beer, and consequently, in our charges for carrying beer, we were charging a high rate for the carriage of the water it contained. He could not understand the obvious reply that the vendor did not charge for the beer as he would if it were water, and that it must be carried at the value the brewer set upon it. If it were lost or destroyed by the Department, the basis of the claim for compensation would be on the value of the beer, not on the value of its component parts. I think the paper may be put by.—
CH.A.G., 6/3/83.

The Hon. the Minister for Works,—
Sir,

15 March, 1883.

I have the honor to remind you of a petition I forwarded you, praying for the reduction of the railway rates on Colonial ale, it being charged under table or class 3, whilst Colonial wine is under table B.

The manufacture of Colonial ale is a large industry, and the materials, malt, hops, and sugar, from which it is made, pay a duty to the revenue. The brewer in Sydney pays £30, the country brewer, £20, per annum, and the retail seller, £30 per annum, against Colonial wine, which pays nothing to the revenue, except the retail seller, who pays £2 per annum. The distance from Newcastle to Uralla is 245 miles. For this distance Colonial ale pays £6 3s. 11d., whilst Colonial wine only pays £1 15s. 10d. per ton, and not even 4 hhd. carried to the ton.

The materials from which beer is manufactured, hops, malt, and sugar, are only one-third of the weight of the manufactured article. The persons in the country who get it, having thus to pay on two-thirds rates, whilst the up-country brewers get more than one-third advance in price.

I may instance Armidale, from which place I write, where the brewers get £5 per hhd. against our £3 12s., which is more than one-third advance, and they have only to pay on material.

English ale can afford to pay this rate, as it commands double the price.

But it is subjected to a duty which Colonial beer is free from. I think it would be unreasonable to carry Colonial beer at a cheaper rate than English beer.—CH.A.G.

I had the honor of seeing Mr. Goodchap on the subject. He, very courteously, showed me the Commissioner's report on this subject, but it appears to me that he was the only person examined on the matter, and as he appears to be prejudiced against a reduction of these rates, from the fact of his stating to me, "He would not allow one penny to be taken off if he could help it," can hardly be taken for an impartial witness.

This is not the case. Several gave evidence on the subject.—CH.A.G.

From the fact of this high rate goods are sent to Glen Innes and Vegetable Creek* by way of Grafton which ought to come this way, thereby driving freight from the Government railway, carriage being cheaper that way, bad as the roads are.

Why not? If I am satisfied that the charge is not too high, and that to lower it would be to prefer the metropolitan to the country brewer, a strong expression of my intention to resist a reduction does not show that I am partial.—CH.A.G.

The railway would be no loser by this reduction, as the amount carried would be so much increased as to make up for any deficiency.

The relative value of the two articles being—Colonial ale, 1s. 4d. per gallon; Colonial wine, at a low average, from 6s. to 7s. per gallon.

Praying for a redress of this grievance.

I have, &c.,

SAMUEL BELL

(Representing Wood Brothers & Co. and Pendergast, Wood, & Co., Newcastle).

* Beer is not sent this way.

A letter was prepared to be sent to Mr. Bell on the 1st March, but he called to see me before it was sent, and I have, on the back of that letter, stated what transpired at the interview. That letter, the endorsement thereon, and my comments on Mr. Bell's present letter will show how the matter stands.—
CH.A.G., 24/3/83. Under Secretary, Public Works.

Mr. Bell admitted to me that his object in seeking a reduction in the rate was to supply the navvies engaged on the railway, who were now being supplied by the local brewers of Tamworth and Armidale at a cheaper rate than he could supply them, but I fail to see that the rate-sheet should be so framed as to admit of the metropolitan brewers competing successfully with local brewers. If, as Mr. Bell states, beer contains so much water (the valueless, or nearly valueless nature of which should induce, he says, cheap carriage), it seems to me that this very quality of cheap material should enable him to lower his price for the beer he sells.—CH.A.G., 24/3/83.

I consider this quite untenable. It would be introducing a most novel phase of protection, that goods made in the Colony should be carried at lower rates than goods introduced into the country of same character.—A.S., 26/5/83.

Railways.—J.R., B.C., 5/6/83. Inform.

Telegram from Mr. H. A. Elworthy to The Commissioner for Railways.

Orange Station, 21 May, 1883.

A DEPUTATION of country brewers desire to wait on you on Wednesday morning, 12 o'clock, re your letter, 31st January.

H. A. ELWORTHY.

I asked Mr. Berner to get me all the information to reply to deputation. There was a return showing quantity of beer sent by Sydney brewers. What is being charged now? Where is rate-sheet? It is of little use returning me the papers in this shape.—CH.A.G., 22/5/83.

I saw the deputation and promised that the alteration should be made on the opening to Nyngan. Malt in tanks to be lowered. They say the difference between malt in bags and malt in tanks is too great.—CH.A.G., 23/5/83.

Altered in new rate-book.—W.V.R., 26/5/83. Commissioner.

No. 19.

Dalton Bros. to The Commissioner for Railways.

Sir, Sydney, 6 June, 1883.
 Will you be good enough to inform us if the same regulations for truck loads obtain, on the Western, as on the Southern line of Railway.
 The rate per truck for special trucks from Redfern to Nyngan (for mixed goods) ?
 The distance from Redfern to Nyngan ?
 Your early reply will oblige.

Yours, &c.,
 DALTON BROS.

The truck rates for general goods do not apply to the Western line. Actual mileage rates are charged on actual weight.—W.V.R., 18/6/83. Commissioner.

Gentlemen, Department of Public Works, Railway Branch, Sydney, 7 July, 1883.
 With reference to your letter of the 6th ultimo, respecting the regulations and rates for the conveyance of goods at truck rates on the Great Western line, I have the honor to inform you that truck rates for general goods do not apply to this line, actual mileage rates being charged on actual weight.
 The distance from Sydney to Nyngan is 377 miles.

Messrs. Dalton Bros., Pitt-street, Sydney.

I have, &c.,
 D. VERNON,
 Secretary of Railways.

No. 20.

Minutes relating to issue of new goods rates pamphlet.

I HAVE to enclose herein the Executive minute, approving of the amended goods pamphlet, together with the latest proof of the same; and shall be glad if you will have the final amendments made, in order that the copies can be printed and the amended rates brought into operation.

G.B., B.C., 10/7/83.

I enclose a proof which I only got from the Government Printer yesterday afternoon. I have inserted the Camden Tramway rates on page 40, but as there are no C and D classes in the railway classification now, they should be altered in accordance with my minute, which also embodied live stock rates. I should greatly like to see the Camden rates in the new book, but if there is not time to decide upon them, they had better be expunged for the present. I have, however, shown the rates as I think they should be, and shall be glad if the Commissioner will approve of their being inserted.—W. V. READ, 20/7/83. Commissioner.

I have not time to revise the rate-book, but the Secretary should see that it is correct in accordance with decisions. Please look at Mis. rates for Camden Tramway, page 40, *re* 5 tons, with the exception of firewood and mining props, the minimum which is 5 tons. What does it mean?—CH.A.G., 23/7/83.

I have looked into above. It was a clerical error to quote the minimum for firewood and mining props as 5 tons. It should be 4 tons. The book has been corrected.—D.C. M'L., 24/7/83. Traffic Manager.—G.B., B.C., 16/7/83.

The new rate-book, which is now in the printer's hands, provides for bulk ale and porter being charged at second-class rates for all distances, instead of, as at present, third-class for distances not exceeding 340 miles, and second-class for greater distances, so that the great differences to which Mr. Graham refers will be done away with. I need hardly remind the Commissioner that the second-class rate for distances over 340 miles was made some time after the South-western line was opened beyond Ale sent from Sydney to distant stations and—*, as almost nil. The paper is not among these that are in my hands respecting the alteration of the rates, but I presume it is in the Commissioner's office, and if it could be found, it would show very clearly that what I say is correct. Moreover, if the country brewer has had to pay a high rate for the manufactured article, he has always had the raw material carried at a cheap rate. In the new rate-book it has been provided that malt in tanks shall be reduced from 2nd to 1st class.—W.V.R., 16/7/83. Commissioner.

The Commissioner will not accept this without previous papers.—G.B., 17/7/83. Traffic Manager.

The papers are now herewith, with a complete proof of the new rate-book which I got from the Government Printer yesterday afternoon. I should like to see it printed and distributed at once.—W.V.R., 20/7/83. Commissioner.

Is book to be printed and issued?—D.C. M'L. Yes.—CH.A.G., 23/7/83.

No. 21.

Memo. by Mr. Traffic-Manager Read.

I TOLD Mr. M'Kee some time ago to keep a sharp look out upon the traffic between Hay and Melbourne, and keep me advised of what was going on.

For some months the river has not been navigable, and almost all the traffic has consequently gone from Sydney, but the river is now navigable, and I should like Mr. M'Kee to inform me, if he possibly can, what the prospects are of wool coming to Sydney this season, and also whether, from all he sees and hears, the trade of the district is being diverted to Sydney, or if it still comes from Melbourne when the river is up.

W.V.R., 6/8/83.

I have been keeping a sharp look out for the trade between Melbourne and Hay, and feel convinced, from what I can hear and see, that the trade is gradually finding its way to Sydney. The chances of an increased quantity of wool for Sydney this season are extremely probable. I base my opinion upon the experience of last year, the influencing causes then existing being present to a much greater extent this year.

year. Last season forwarding agents and carriers had entered into contracts to lift the clip early in the season. There was a plentiful supply of feed, and consequently carriage low; the river was also navigable much earlier. Notwithstanding, a large quantity of wool brought in and stored for transit by river, had to be carted to the station and despatched by rail to Sydney, entailing extra charges and knocking about of wool. I find arrangements have not been entered into so early or extensively this year, and shearing later; consequently wool will be later reaching Hay, when, guided by the past, there will be no river expedition, and safety ensured by rail must eventually count, and I think lead the trade to Sydney. Those who have capital sunk in boats will, of course, do all they can to work the trade by river. I do not think freights are likely to be lowered, and I am still assured that insurance rates will be higher. I hope to forward you statement of river-borne goods for July in a few days.—W.M. M'KEE, 10/8/83. Traffic Manager.

I sincerely hope Mr. M'Kee's expectations will be realized, but I must admit that I have doubts about it. The proprietors of river boats and the Victorian Railway Department will offer all the inducements they possibly can to secure the traffic. Our rates are now so low that I do not think they should be made lower. We give a far better service than can be obtained under the best conditions with Melbourne; and if that, combined with our low rates, does not secure the traffic, there seems to me to be nothing for it but to adopt the measures I have previously recommended.—W.V.R., 13/8/83. Commissioner.

No. 22.

Mr. G. E. Cass, M.P., to The Secretary for Public Works.

Sir,

122, George-street West, Sydney, 13 August, 1883.

Referring to my interview with you on the 3rd instant, in accordance with the wishes of the residents of Nyngan, bringing under your notice the existing high rates of carriage charged for merchandise, &c., on the Western line, I do myself the honor to forward you a telegram received by me from W. N. Willis, Esq., chairman of a meeting held to protest against the same, and to request that you will, without delay, cause the necessary inquiries to be made with a view to granting what the residents of Nyngan require.

Respectfully requesting your prompt attention.

I have, &c.,

GEO. E. CASS.

[Enclosure.]

Telegram from Nyngan Station to G. E. Cass, Esq., M.P.

MONSTER meeting of indignation held here Tuesday night to protest against the existing high rates of carriage charged for merchandise on Western line. It was resolved to wire Mr. Cass, the senior member for the district, asking him to interview the Hon. Minister for Works and request abolishment of truck system. Meeting well attended. Stormy feeling expressed on the matter. Do all you can. Wire me.

W. N. WILLIS,

Chairman of meeting, Nyngan.

No. 23.

Memo. by The Secretary for Public Works.

Reductions in Wool Rates on Victorian Lines.

WILL Commissioner for Railways please note and report?—F.A.W., 14/8/83.

Traffic Manager, B.C., 15/8/83.

There is not the slightest necessity for granting the same low rates on the Western line that are in force between Sydney and stations on the Southern and South-western lines; because, were it not for the competition on the latter lines, the rates would be as high as they are on the West. They would at least be assimilated. When the line was only open to Dubbo the people of the district of Nyngan had heavy cartage to pay from there, whereas the following are the differences in our rates between Sydney and Dubbo and Sydney and Nyngan:—

A.	B.	Mis.	1st.	2nd.	3rd.	4th.
4s. 11d.	9s. 11d.	4s. 2d.	19s. 10d.	24s. 9d.	34s. 7d.	54s. 7d.

and the distance is 99 miles. No reason has been given by the public why the rates to Nyngan should be reduced, except that they are higher than those to stations on the Southern and South-western lines, a similar distance from Sydney, and I presume they will not contend that they are paying as high rates now as they were formerly by team, and the service is not to be compared. As the Commissioner very fairly puts it, if the rates on the Southern and South-western lines had not been reduced as they were we would most certainly never have got the traffic either from Wagga Wagga or Hay, and the loss to the revenue would therefore have been greater than it is while the expenditure would have been very little less than it is at present. As I have stated before, I am not in any way wedded to the present rates. If they were prohibitive I would at once say reduce them, but nothing has been advanced to show that they are so, and I am therefore of opinion that they should not be reduced at present, for the simple reason that we cannot afford to forego the revenue. If we were to reduce the rates to Nyngan it would be strengthening, in a very great degree, the arguments of such gentlemen as Mr. Mugridge and many others, who were examined before the Rates Commission, and who stated that the rates were to favour Sydney at the expense of certain districts.—W.V.R., 17/8/83.

No. 24.

Memorials from Residents of Mount Hope and Nymagee.

Petition presented by R. BARTON, Esq., M.P., 19 September, 1883.

To the Honorable the Minister for Public Works, Sydney,—

Honorable Sir,

The humble petition of the undersigned inhabitants of Mount Hope,—

RESPECTFULLY SHOWETH:—

That at a public meeting, convened by the said inhabitants, to consider the present high rates of carriage charged on goods between Sydney and Nyngan, it was decided to ask,—

That you would be graciously pleased to cause the present rates to be lowered to the same as the rates charged on the other railway lines of this Colony, which would give a great impetus to traffic on the line of road between Mount Hope and Nyngan.

And your petitioners, as in duty bound, will ever pray.

We have, &c.

[Here follow signatures.]

Petition presented by R. BARTON, Esq., M.P.

To the Honorable the Minister for Public Works, Sydney,—

The humble petition of the undersigned residents of Nymagee and district,—

SHOWETH:—

That your petitioners would most respectfully protest against the increase in the railway rates on goods from Sydney to Nyngan, as such increase if persisted in must materially injure the prospects of this rapidly rising town and district. Your petitioners beg to draw your attention to the fact that this district is mostly supported by the working classes; that their wages are not equal to those ruling in Sydney; and that the additional rate of trainage will materially increase the cost of living, which is already too high, and must in the end seriously injure this great mining and squatting district.

Your petitioners would further add that this increase of rates will divert the trade from Sydney to South Australia, as goods can be delivered in Nymagee at a far less figure from South Australia as soon as the Darling River is navigable.

Your petitioners sincerely trust you will give this matter your careful consideration, and cause a reduction to be made in the said rates.

And your petitioners, as in duty bound, will ever pray.

[Here follow signatures.]

No. 25.

Minute by Mr. Traffic-Manager Read.

Re a paragraph in *Sydney Morning Herald*, of 14th August, 1883, on Extension of Victorian wool rates concessions to certain districts of New South Wales.

SUBMITTED to the Commissioner, who wrote in reference to statement that Victorian rates were being lowered to catch wool from New South Wales:—"Traffic Manager to say how this will affect our wool traffic in and about Narrandera; wool previously brought to that station may by this extension of the 'imaginary line' be diverted."—CH. A. G., 16/8/83.

The clause formerly read:—

"Wool.—The clip of stations north of an imaginary line drawn from the southern portion of Urana Swamp, on the west to Gerogery Station on the North-west line on the east, and east of an imaginary line drawn from Gerogery Station to Jingelee on the Murray."

I suppose the above may be accepted as the decision of the Victorian Railway authorities, as to the greater facilities that are to be given to draw the wool away from New South Wales, although I cannot think that they can ever hope to draw to Wedonga the clips of such stations as Yanko, Goolgumbla, Singorambah, or even Coree, and it seems more strange still that the line should be drawn westward to the intersection of the Murrumbidgee at Balranald. No doubt the concession is made so that they can retain their hold of the wool from the Urana and Jerilderie districts; but, to my mind, it goes further than that, and almost appears to anticipate the imposition of river dues on the Murrumbidgee, although why they should do so in the absence of some tangible demonstration from this side I cannot imagine. I am trying to find out what wool clips we may expect from the Murrumbidgee this year, but have not yet been able to ascertain. In view, however, of the low rates to Melbourne, I am very doubtful of getting much, if any, from the south side of the river to the west of Buckinbong, even if we get that station's clip. There is very little doubt in my mind that all the wool on the south side, and within an easy distance of the river, will go by river to Echuca as formerly. I hear that Burrabogie wool will go to Melbourne this year. Jerilderie and Urana wool will doubtless be taken to Wahgunyah by team, from which station the rate to Melbourne is the same as from Wedonga, and that is 4s. 6d. per bale, and 5s. to Williamstown or Sandridge, so that even when we open to Jerilderie our hold upon the traffic there or of the Urana, will be very insecure, unless special rates are quoted. Urana, even then, will still be 15 or 16 miles from the railway, and the railway journey to Sydney will be about 380 or 390 miles, against which there are 55 miles of road to Wahgundah, and 173½ miles of railway from there to Melbourne. Still, if we could secure the traffic on the south bank of the river by imposing river dues, we ought to be able to secure pretty well all the wool between Jerilderie and the Murrumbidgee, when the Jerilderie line is opened. I could not fairly recommend a further reduction of our rates, but am of opinion that whatever action is taken should be in the shape of an impost upon boats and traffic taken along our rivers, which are kept open at our expense.

W. V. READ, 28/8/83.

Commissioner.

Minute by Mr. Traffic-Manager Read.

It is indeed surprising after all the Department has done towards securing the Riverina trade to Sydney as against Melbourne, that a Sydney newspaper should be found to misrepresent the facts to the extent the *Echo* does on 8th instant. The reduction of rates was first made on the Victorian side, and New South Wales was thus compelled to follow suit, or be content to see the whole of the Riverina district supplies drawn to Melbourne, moreover the rate from Sydney was not reduced to £3 per ton, but to £20 per truck of 6 tons, and as trucks generally contain from $4\frac{1}{2}$ to 6 tons, and smaller consignments are chargeable at £5 10s. per ton, the average is considerably over £3, and never in any case below £3 6s. 8d. per ton.

Albury has a great advantage over Wagga with regard to Melbourne traffic, while so far as Sydney is concerned, it has the benefit of the same rates as Wagga, although 77 miles further away. It is not true that the rates from Albury to Wagga are equal to or more than those charged from Sydney to Albury, but even if they were, it appears to me that the advantage is all the more on the side of Albury, because it would furnish a good argument for advancing the latter. As the rates stand, Albury merchants may draw supplies from Melbourne and send them on to Wagga at the same cost as the Wagga merchant can supply himself direct, which is an advantage on the side of Albury not obtainable at any other station midway between the points of import and consumption. If Sydney is to supply the Riverina district, the Wagga merchant must have an advantage in his own neighbourhood over Albury, as it would be absurd to suppose that the Department would carry first from Sydney to Albury and then from Albury to Wagga at a less cost than from Sydney to Wagga direct. If, on the other hand, the question is left open, I think it will be generally admitted that the Sydney importer should have the advantage rather than the Melbourne one.

W.V.R.,
2/11/83.

Précis.

Hay requirements—Mr. C. A. Simson's letters.

MR. SIMSON wrote a note expressing his regret that when he called to ask to have a decent 1st class carriage put on between Junee and Hay, he found Commissioner out. 3 Aug., 1883

Commissioner asked Traffic Manager if it was proposed to give the Hay passengers any advantage in connection with the Express, remarked that he had himself noticed the inferiority of the first class carriages on that line, and directed that a really good first-class carriage should be put on that line.

Traffic Manager reported, that for reasons stated, they could not do better in respect of train accommodation than they were now doing until the traffic would warrant their putting on a separate train for passengers between Junee and Hay. As regarded carriages, one 1st class (doubtless the one referred to by Commissioner) had recently been withdrawn, and all the carriages on that line were now in fair condition.

On the 9th June, 1884, Mr. Simson wrote again, stating that there was a strong feeling in the Hay district in favour of railway communication with Deniliquin, but that he had refused to sign the petition for it, believing it to be unnecessary, that the coach carries double as many passengers as the railway does, that if the trains were run to meet the express or other passenger trains to Melbourne, the passenger traffic would be quadrupled, it would be a great boon to the public and profitable to the Department; complained again of the uncomfortable carriage arrangements, and stated that if some consideration were shown to passengers from Hay, it would do much to allay the desire for a railway to Deniliquin.

Commissioner minuted that he had paid attention to the improvements of carriage accommodation on the Hay line, and that he thought it would be desirable to run a train to meet the express train to and from Melbourne, there being no steep grades, and therefore the additional carriage would not impede speed between Junee and Albury. June, 1884.

Traffic Manager reported that it would be better for through passengers if the S.-W. trains ran in connection with main line express, but the difficulty was that the latter did not carry 2nd class passengers, and only ran five days a week. The first named difficulty might easily be got over, but the last not so easily, unless on the other two days the S.-W. train were run in connection with the mail. The great object of the Department was to induce people to come to Sydney instead of going to Melbourne, but he did not see how the proposed change would affect this, for although Victoria refused to carry 2nd class passengers between Sydney and Melbourne, they would not object in the case of passengers from the Hay district, which was the competition ground between the two colonies, and therefore Hay people would still go to Melbourne, although some might go by way of Albury. Aug., 1884.

Coach proprietors would not let passenger traffic go without a struggle.

Cobb & Co. now issue excursion tickets, Hay to Melbourne, *via* Deniliquin, 1st class, £5; 2nd, £4 5s. Ours, to Sydney, are £4 16s. 9d. and £4 5s. respectively; while to Melbourne, *via* Wodonga, £6 9s. 3d. and £4 6s. Thus excursion tickets to Sydney are, 1st, 3s. 9d., 2nd, 20s. less than to Melbourne, proving, Traffic Manager maintains, that it is no question of cost or convenience which takes passengers to Melbourne instead of Sydney, but business. Had always maintained that if we could secure the goods traffic the passenger traffic would follow. Unfortunately the opposition rates are more favourable when the river is navigable, which it always is during wool season. Could not, however, recommend reduction of rates, while large sums are being spent in snagging river, and so providing a highway for traffic to other colonies. Reverting to the question of passenger traffic from Hay, pointed that, although there is no difficulty between Albury and Junee, there are steep grades on this side of Junee that we could not limit number of passengers from South-western line, and that in holiday time express might require two engines, in which case it could not keep time.

On the 12th instant Mr. Simson again wrote charging Commissioner with discourtesy in not replying to his two previous communications, and enclosing a sheet of Victorian wool-rates, showing that that Colony is making large reductions on carriage of wool from Riverina. Recommended Commissioner to "do likewise."

As regards the imputation of discourtesy, it is true that Mr. Simson's first note was not answered, but his complaint was remedied, and I doubt if it was essential that a note of so informal a character should be answered.

Mr. Simson's second communication has not been answered, because Traffic Manager's report, upon which the reply would necessarily be based (and of which an abstract is given on the other side), has only just come to hand.

C.A.B., 22/8/84.

Victorian Competitive Rates.

A PERUSAL of attached paragraphs by the general public not directly interested in the rates would lead to the supposition that the Victorian authorities had taken the first step towards the abolition of a regrettable competition between the two Railway Departments for the Riverina traffic. It is a step in the right direction no doubt, but the rates they charge from Melbourne to Albury are still very much lower than from Melbourne to Wodonga, while from Melbourne to Albury, if the goods be consigned to Gerogery or any point north of Gerogery, the net cost to the consumer is very much lower still.

The figures are:—

	Misc.	1st.	2nd.	3rd.	4th.
Melbourne to Wodonga, 187 miles ...	48/-	62/6	78/6	94/-	109/6
Melbourne to Albury, 191 miles ...	42/6	53/6	53/6	63/6	63/6

If goods are consigned to Gerogery or any point north thereof the net rates, after allowing rebate, are as follows:—

	Misc.	1st.	2nd.	3rd.	4th.
Melbourne to Albury, 191 miles ...	32/6	33/6	33/6	33/6	33/6

Prior to the opening of New South Wales railways to Albury, the Victorian Department charged one rate for Wodonga traffic, a lower one for Albury, and a lower still for Riverina traffic. At the time our lines opened to Albury they revised their rates and put Albury traffic on the same footing as other places in the Riverina. I never could see any reason for so sweeping a reduction, and I think if any reports are turned up it will be found that I expressed myself at the time to that effect. Finding their mistake the Victorian authorities have again advanced the rates as far as Albury is concerned, but not to the figures they formerly charged to Wodonga, while to other places in Riverina, Wagga for instance, no charge has been made at all. It is sheer nonsense therefore to talk of the new rates being "expected to remove all legitimate grounds on the score of unfair competition between the Victorian and N. S. Wales Railways."

While increasing the rates to Albury, it would appear they have actually reduced those for wool from the Murrumbidgee and Darling Rivers.

The reason given for the further reduction, is that the railway station "at Hay has been found to have attracted a considerable portion of the Victorian (?) trade during the past few years." The fact is, the Victorian Department have deliberately resolved to continue the struggle for New South Wales traffic, and instead of endeavouring to remove grounds of complaint on the score of unfair competition they are actually making the difference greater.

I am not prepared to recommend any reduction upon our rates, but I do wish something could be done to check these persistent reductions made upon wool conveyed to Melbourne, and that could be done as far as river-borne wool is concerned.

Commissioner.

W. V. READ,
23/8/84.

Dear Sir,

Mungadal, Hay, N.S.W., 12 August, 1884.

Although you have not had the courtesy to reply to my two previous communications, I still venture to forward you a third from which you will see Victoria is making a large reduction in the carriage of wool from Riverina. New South Wales will require to do likewise or take a back seat.

Yours truly,

C. A. Goodchap, Esq., Commissioner for Railways, Sydney.

C. H. SIMSON.

Minute by Mr. Traffic-Manager Read to The Commissioner for Railways.

I REPORTED fully on the rate question, to which I have nothing to add.

If the Victorian Railway Commissioners are willing to carry Murrumbidgee wool from Echuca, Wodonga, or Wahgimyah to Melbourne for such a low rate as 3s. per bale, while for wool grown at Wodonga they would charge 7s. 6d., it shows how much they value the trade of the district, and how little importance is to be attached to their statement about removing the cause of the competition between the Victorian and N.S.W. Railways.

I am not disposed to recommend any further reduction in our rates. The fact that the Victorian Railway Department considers it necessary to further reduce theirs is almost the best assurance we can get that they feel the result of the competition in N. S. Wales, and if we did make a reduction it is just as likely that they would follow it with another, and the result would be a ruinous competition.

Even if we did reduce our rates I do not believe that all the extra traffic we would get would make up more than what we would lose on that traffic which we are sure of.

I do not think the present competition will ever cease until something is done by this Colony to check it.—W. V. READ, 2/9/84.

Mr. W. H. Matthews to The Commissioner for Railways.

Sir,

Cootamundra, 1 September, 1884.

I send you herewith particulars *re* differential rates between the towns between Harden and Wagga, and hope that you will see your way clear to make such concessions as may so equalize the tariff, that no one town will be in a better position, as far as competition is concerned over railway rates than another:—

	£	s.	d.	£	s.	d.	£	s.	d.
Wagga	20	0	0
Junee	41	11	6	3	18	6	23	18	6
Cootamundra	38	0	6	9	17	6	29	17	6
Harden	35	12	0	14	5	0	34	5	0

I have, &c.,

W. H. MATTHEWS,

Hon. Secretary, Deputation *re* Railway Rates.

Traffic Manager for report. There is a district which is so situated that with some small difference it can be equally well supplied by Wagga or by Murrumburrah storekeepers. The low rates to Wagga seriously handicap the Murrumburrah storekeeper. The proposal made if accepted would not, as regards Murrumburrah, affect the revenue to any material extent, but with Cootamundra the difference is greater, and with Junee it is of course nearly double. If, however, a storekeeper at Wagga wished to compete with a storekeeper at Junee, the latter would be placed at a great disadvantage. The Wagga storekeeper could deliver at Junee, after paying freight from Sydney to Wagga, for £3 18s. 6d. per truck, the whole cost being £23 18s. 6d., while the Junee storekeeper has to pay £41 17s. 6d. per truck. These figures, I am sure, are incorrect, because the compiler of them has gone on a wrong basis; he has assumed the truck to contain more than in practice it really does contain.—CH.A.G., 4/9/84. Urgent.

I shall be glad if the Goods Superintendent will let me know without delay whether full loads of 6 tons of third-class goods, are, as a rule, put in trucks for Wagga Wagga, or, indeed, whether 6 tons of any kind of general goods are ever put in one waggon for that station. In the figures given by the Messrs. Matthews, it is assumed that the trucks contain 6 tons of third-class goods in each case. As a rule, what is the gross weight put into a waggon (charged at the £20 rate) for Wagga Wagga, and what are the weights of the respective classes?—D.K., 8/9/84. Goods Superintendent.

It will be advisable to show a fortnight's traffic to Wagga.—G.T.E., 9/9/84. Mr. Harper.

Nearly the whole of the goods consigned to Wagga Station are carried in truck loads; and in most instances the load reaches or exceeds 6 tons. We cannot give the weights of the respective classes as the consignments are not separated for classification purposes, but a large proportion of the goods are of the third-class.—JNO. HARPER, 10/9/84.

There can be no doubt the £20 rate for 6 ton lots has had the effect of improving our average loads to Wagga, and it would be found that the same argument applies to stations on the South-western line. Mr. Matthews bases his argument on the 6-ton lots, but would he be able to guarantee full loads for the three other stations enumerated. I have no doubt Junee could hold its own, in fact it is the rule for one firm to send their goods to Wagga, and return them to Junee, that course being cheaper than through rate from Sydney.—G.T.E., 10/9/84. Traffic Manager.

*If the trucks were always fully loaded with 6 tons of third-class goods, Mr. Matthews' figures, with one exception, which I have corrected, would be correct, but it is very rarely indeed that 6 tons of third-class goods can be put in an ordinary D truck, and the load is therefore generally made up of heavy goods of the first or second class, but unfortunately we cannot give the weights of the different classes, because, not being charged at a tonnage-rate, we have no occasion to keep them separately. Inform that I find upon inquiry that his figures are wrong, inasmuch as they are based upon the assumption that the truck carries 6 tons of third-class goods to Wagga. In practice it is found that the truck load consists of a large proportion of articles, subject to lower than third-class rates, and consequently the difference is not so great; there can be no doubt that the storekeeper of Wagga gets an advantage by the truck system, but if it were taken away, and he was charged at a mileage basis, it would not serve the interests of the traders of Cootamundra or Murrumburrah, as he would simply obtain his goods from Melbourne, and would be able to undersell other traders competing for the trade of the district referred to. With the present low rates the Department has all it can do to compete with Victorian railways for the carriage of the merchandise taken at Wagga, and some storekeepers continue to have their commercial relations with Melbourne. Point out to Mr. Matthews that if we lost this trade, the inevitable result would be that we would have to increase the charges made to other stations, so as to earn the money required to pay interest upon the capital expended, an increase in the rate to Wagga would therefore have no beneficial effect in diverting the trade of Temora and other places to their more legitimate, because nearer market, as Wagga merchants would still hold the trade with goods obtained from Melbourne, &c.—CH.A.G., 26/9/84.

* The remainder of this minute has unfortunately been lost.—J.E.P.

* Take Cootamundra, and assume that of the 6 tons, 3 tons only were 3rd-class goods:—1 ton, 2nd class; 2 tons, 1st class—the charge instead of being £38 0s. 6d., would be £30 17s. 10d. Point this out.—CH.A.G., 26/9/84.

Sir,

Department of Railways, Sydney, 2 October, 1884.

I have the honor to acknowledge the receipt of your letter of the 1st ultimo, with particulars respecting the goods rates from Sydney to Wagga Wagga, Cootamundra, and Harden, and requesting that such concessions may be made to Harden and Cootamundra, as will place them in equally as good a position as Wagga Wagga, to compete for the trade of the district.

In reply I have to inform you that the matter has been carefully considered, and I may point out, in the first instance, that the figures quoted by you are not altogether correct, inasmuch as they are based upon the assumption that the trucks carry 6 tons of 3rd class goods to Wagga Wagga. In practice it is found

found that the truck load consists of a large proportion of articles which are subject to lower than 3rd-class rates, and consequently the difference is not so great. For instance, the truck might, as an average load, be assumed to contain 3 tons of 3rd class, 1 ton of 2nd class, and 2 tons of 1st-class goods, and at the ordinary rate the freight to Cootamundra would amount to £30 17s. 10s., instead of £38 0s. 6d. per truck, quoted in your letter. There can be no doubt that the storekeeper of Wagga reaps an advantage by the truck system, but if it were taken away, and he were charged upon a mileage basis, it would not serve the interests of the trader of Cootamundra or Murrumburrah, as he would simply obtain his goods from Melbourne, and would be able to undersell the other traders competing for the trade of the district referred to. With the present low rate the Department has all it can do to compete with Victorian railways for the carriage of merchandise taken at Wagga Wagga, and some storekeepers continue to have their commercial relations with Melbourne. I might point out that if we lost this trade, the inevitable result would be to increase the charges made to other stations, so as to earn the money required, to pay interest on the capital expended. An increase in the rate to Wagga Wagga would therefore have no beneficial effect in diverting the trade of Temora and other places, to their more legitimate, because nearer, market, as Wagga Wagga merchants would still hold the trade with goods obtained from Melbourne.

I have, &c.,

CH. A. GOODCHAP,
Commissioner for Railways.

No. 29.

Mr. F. S. Falkiner to The Commissioner for Railways.

Sir,

Moonipia Spring Plains, 4 September, 1884.

This property is midway between Jerilderie and Deniliquin. If you take my wool to Sydney at the same rate the Victorian Railway are taking Sir Samuel Wilson's Yanko wool, viz., 5s. 10d. per bale, to Melbourne from Deniliquin, I will send my wool to Sydney *via* Jerilderie. If not, it goes to Melbourne. As I am the owner of two stations I have more bales than Yanko, which joins this property.

I have, &c.,

F. S. FALKINER.

Traffic Manager.—R.J.S., 10/9/84. Urgent.

If we can only get 5s. 10d. per bale, I should say by all means let the wool go to Melbourne. It would be absurd to think of carrying it 406 miles to Sydney for 5s. 10d. a bale.—W. V. READ, 11/9/84. Commissioner.

Twenty-eight bales can be carried in a truck, and at 5s. 10d. will realize £7 3s. 4d. The working expenses are about equal to 3d. per truck per mile; empty and full, the running would be equal to 600 miles, which represents a cost of £7 10s. I therefore cannot recommend that any effort should be made to obtain this wool at the price named.—CH.A.G., 16/9/84.

I concur. Let the wool go to Melbourne.—F.A.W., 18/9/84.

Sir,

Department of Railways, 24 September, 1884.

With reference to your letter of the 4th instant, stating that you are prepared to send your wool to Sydney from Jerilderie if it be carried at 5s. 10d. per bale, the same rate as the Melbourne Railway Department charge for conveying it from Deniliquin, I have the honor to inform you that I am unable to approve of your clip being carried at the price named as it would not be remunerative to the Department.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

F. S. Falkiner, Esq., Moonipia Spring Plains, *via* Jerilderie.

Respecting differential charges for competitive purposes, Victoria *v.* New South Wales.—I do not see that any action is required upon these papers. Commissioner has marked "Seen" upon the only papers which have come in since *précis* was submitted.—C.A.B., 1/10/84. Acting Secretary.

Does Commissioner require these papers again?—G.B., 1/10/84.

See minute paper sent to Traffic Manager the other day. Statistics required showing effect of abolition of competitive rates in both Colonies.—CH.A.G., 3/10/84.

No. 30.

Minute by Mr. Traffic-Manager Read.

If differential rates were abolished in both Colonies, the rates for goods traffic between Sydney and stations on the Southern and South-western lines, and between Melbourne and the same stations will be found in the following figures, and, for the purpose of comparison, I shall also give the present rates. I do not consider it necessary to quote the special or miscellaneous rates, because there is really no competition to speak of in such traffic:—

	1st.	2nd.	3rd.	4th.
Sydney to Wagga (non-competitive) ...	84/6	105/1	146/4	188/7
Melbourne to Albury do ...	60/-	81/6	97/-	112/6
Albury to Wagga do ...	26/8	32/10	45/2	58/6
	92/8	114/4	142/2	171/-
Sydney to Wagga, present (competitive)	84/6	105/1	110/-	110/-
Melbourne to Albury do ...	33/6	33/6	33/6	33/6
Albury to Wagga do ...	40/-	49/3	67/9	87/9
	73/6	82/9	101/3	121/3

It

It will be seen, therefore, that our first and second class non-competitive rates from Sydney are lower than the non-competitive rates from Melbourne, but the third and fourth class rates on the Victorian lines are each 1d. per ton per mile lower than ours, so that those rates would be 4s. 2d. and 17s. 7d. per ton respectively lower from Melbourne than from Sydney. These differences would not prejudicially affect the Sydney market if there were nothing else to consider; but the Commissioner will remember two years ago, when the general goods rate from Melbourne to Wodonga was reduced to 30s. per ton all round, teams were found to convey the goods from Wodonga to Wagga Wagga for 30s. more (60s. in all), and it was at that time that we were obliged to quote a special rate from Sydney of £20 per truck not exceeding 6 tons, and as most of the traffic to Wagga Wagga is conveyed in 6-ton loads the rate is virtually 66s. 8d. per ton instead of 84s. 6d., 105s. 1d., 110s., and for 1st, 2nd, 3rd, and 4th class respectively.

I merely mention this lest in the event of competitive rates being abolished it were possible to convey goods from Wodonga to Wagga Wagga by team again for 30s. per ton, because in that case the rates would be:—

	1st.	2nd.	3rd.	4th.
Melbourne to Wodonga	62/6	78/-	93/6	109/-
Wodonga to Wagga	30/-	30/-	30/-	30/-
Inclusive of delivery at Wagga ...	92/6	108/-	123/6	139/-
While from Sydney to Wagga they would be, exclusive of delivery ...	84/6	105/1	146/4	188/7

I may say, however, that teams could not afford to convey goods from Wodonga to Wagga Wagga for 30s. per ton unless they were to get loading both ways, which would be most improbable, except during the wool season, and not even then if the competitive wool-rates were abolished on the Victorian lines. (I shall deal with the wool-rates further on).

It is hardly necessary to deal separately with all the stations south of Wagga Wagga, because the further we go south the more favourable do the rates become towards Melbourne. I shall, therefore, content myself by showing the respective rates to Culcairn (as being the most central station between Wagga Wagga and Albury) and Albury:—

	1st.	2nd.	3rd.	4th.
Sydney to Culcairn (non-competitive)	93/10	116/10	162/9	206/-
Melbourne to Albury do ...	66/-	81/6	97/-	112/6
Albury to Culcairn do ...	11/-	13/3	17/9	23/3
	77/-	94/9	114/9	135/9
Sydney to Culcairn present (competitive)	75/1	93/6	110/-	110/-
Melbourne to Albury do ...	33/6	33/6	33/6	33/6
Albury to Culcairn do ...	16/6	19/10	26/7	34/10
	50/-	53/4	60/1	68/4
Sydney to Albury (non-competitive)	99/10	124/4	173/4	223/2
Melbourne to do do	66/-	81/6	97/-	112/6
Sydney to Albury present (competitive)	79/10	99/6	110/-	110/-
Melbourne to Albury present (competitive)	53/6	53/6	63/6	63/6

Of course the £20 truck rate from Sydney applies to Culcairn and Albury also.

In respect of wool grown in Victoria, the rate for a 4 cwt. bale from Wodonga to Melbourne is 7s. 6d., while, if grown in the competitive district of this Colony, the rate is only 4s. 6d. Our wool-rates can hardly be said to be competitive; certainly they would perhaps be a little higher from the most distant stations on the Southern and South-western lines were it not for the competition with Victoria, but the difference would not amount to much.

The rates to stations on the South-western line are rather more difficult to deal with, because, in addition to the trainage from Melbourne to Echuca, we have the more difficult problem of river freight to consider.

The competitive rates for general goods from Melbourne to Echuca, for places on the Murrumbidgee which can be served by our South-western line, have for a long time been 30s. per ton all round, and the freight from Echuca to Hay has, since the South-western line was opened to that town, been as low as from 22s. 6d. per ton for rough traffic to 27s. 6d. and 30s. per ton for general goods, in each case exclusive of insurance.

If the competitive rates were abolished in both Colonies the rates from Melbourne and Sydney to Hay would be:—

	1st.	2nd.	3rd.	4th.
Sydney to Hay	113/6	141/4	197/1	253/10
Melbourne to Echuca	52/-	65/-	78/-	91/-

and from Echuca to Hay the present river freight would doubtless be considerably increased; but they would still be kept very much below the rates from Sydney, so that, unless we could control the river freight by a tremendously high impost, the abolition of the competitive rates would, as far as we are concerned, be simply playing into the hands of Victoria.

The

The only feasible arrangement I can see is that both Departments should endeavour to come to some understanding whereby the present great and necessary reductions should, to a great extent, be done away with. I do not suppose the Victorian Commissioners would agree to abolish entirely their competitive rates if we agreed to increase ours by amounts equal to the differences between their competitive and non-competitive rates, because that would be asking them to do a thing which we are not prepared to do ourselves.

Perhaps a discussion of the matter might lead to good results, but I cannot see how we can possibly dispense with our competitive rates, and the only effective way I can see of getting a fair and reasonable return for the conveyance of traffic on the South-western line is by the imposition of river dues on a pretty extensive scale, on all traffic that can be readily accommodated by the railways. Five years ago, before any of the South-western line was laid, the rates for general goods and wool between Melbourne and Hay, varied from 80s. to 90s. per ton, exclusive of insurance, and of that amount the Victorian Department got 48s. per ton, but that was reduced about two years ago to 30s.

To the north of Hay there has been very little traffic from Melbourne by the river, since the South-western line was opened, but I have no hesitation in saying that if the competitive rates were abolished without our exercising any control over the river freight, a very large proportion of the Riverina supplies would again be obtained from Melbourne.

In the case of Narrandera, for instance, our non-competitive rates would be 94s. 10d., 118s. 1d., 164s. 6d., and 211s. 11d. for 1st, 2nd, 3rd, and 4th classes respectively, and goods could be landed much more cheaply from Melbourne than that.

The effect, therefore, of abolishing the competitive rates would be that Melbourne would be the best market for all supplies for places south of Wagga Wagga (and even Wagga Wagga itself we could not be too sure of) and Narrandera and stations on the South-western line to Hay; indeed it has only been the £20 truck rate that has enabled us to retain a considerable portion of the traffic for these places hitherto.

Commissioner.

W.V.R.,
22/10/84.

*Vide No. 42.

Differential rate.—I can add nothing to the reasons given in enclosed letter. The paper* which I submit herewith shows clearly that two Committees of the House of Commons, appointed to inquire into the alleged injustice of differential rates on railways have pronounced directly in their favour, as being framed in the interests of the general public.—CH.A.G., 9/5/85.

No. 31.

Memo. by Mr. Traffic-Manager Read.

I BEG to recommend that the rates for wool per bale, not exceeding 4 cwt., from Bungendore and Young to Sydney be fixed as under:—

Bungendore	8s.
Young	9s.

And in view of the opening of the line to Bourke, I would recommend that the rate from that station to Sydney be 15s. per bale not over 4 cwt. The rates from Jerilderie and Hay are 11s. 6d. and 11s. respectively; but the reasons for these low rates are obvious: On the Northern line we charged 12s. per bale from Glen Innes to Newcastle, a distance of 324 miles, so that my recommendation to charge 15s. from Bourke to Sydney (504 miles) is not out of the way.

To bring the rates more equable from other stations on the Western line, I propose that the rates from Byrock, Girilambone, Nyngan, and Nevertire be increased as under:—

Byrock from	12/6 to 13/6
Girilambone „	11/6 to 12/6
Nyngan „	11/- to 12/-
Nevertire „	11/- to 11/6

I shall be glad if the Commissioner will consider these recommendations as soon as possible, so that if approved they may be included in the rates-pamphlet now under revision.

W.V.R.,
18/5/85.

There has been a revision of the wool-rates recently on the Victorian line. I should like to know the direction it has taken before making any alteration in our rates.—CH.A.G., 21/5/85.

I attach copy of present Victorian wool-rates. A new one will appear in about a fortnight.—H.M'L., 27/5/85. Forward to Traffic Manager. I should like to see Victorian rates which are to come into force for next wool season.—CH.A.G., 28/5/85.

A copy of the new Victorian wool-rate sheet is attached. The only alterations to speak of are that the wool will be conveyed from Kerang and Numurkah at the same rates as from Wodonga, Wahgunyah, and Echuca, and the additional 6d. per bale that used to be charged from Melbourne to Port Melbourne and Williamstown has been struck off all wool arriving at any of their border stations by road or rail. There is nothing in these alterations to induce me to recommend a reduction of any of our rates, and I therefore ask the Commissioner's approval to those named in my minute of 18/5/85.—W.V.R., 11/6/85. Commissioner.

The Traffic Manager recommends the following rates from new stations:—

177 miles—Bungendore	8/- per bale
249 miles—Young	9/- „
504 miles—Bourke	15/- „

For existing Southern stations no alteration, but the following changes on West so as to make the rates throughout more equitable:—

455 miles—Byrock	12/6 to 13/6 per bale
405 miles—Giralambone	11/6 to 12/6 „
377 miles—Nyngan	11/- to 12/- „
341 miles—Nevertire	11/- to 11/6 „

H.M'L., 16/6/85.

I do not think we should increase rates *now*—it is too late. Contracts for the carriage of wool have been made on the faith of present rates. For Minister's approval.—CH.A.G., 18/6/85. I concur.—F.A.W., 22/6/85. Traffic Manager.—G.B., B.C., 22/6/85.

Seen. But I may point out that 15s. from Bourke will seem a high rate as compared with 12s. 6d. from Byrock, the difference in the distance being only about 48 or 50 miles.—W.V.R., 30/6/85. Commissioner.

Get approval of Governor and Executive Council to the rate from Bourke. It must be explained that immediately this season is over the rates from Byrock will be increased.—CH.A.G., 4/7/85.

Sir,

We shall be glad to know, at your earliest convenience, the rate fixed for carriage of wool from Bourke to Sydney.
The Commissioner for Railways, Sydney.

Sydney, 27 May, 1885.

We have, &c.,

GARRICK & CO.

Traffic Manager.—D.C.M'L., 28/5/85. Some days ago I recommended a rate of 15s. per bale.—D.K.; 23/5/85. Commissioner. Question of Bourke rates now submitted.—H.M'L., 16/6/85.

Gentlemen,

Department of Railways, Sydney, 6 July, 1885.

In reply to your letter of the 27th May last, asking the rate for carriage of wool from Bourke to Sydney, I have the honor to inform you that the rate will be 15s. per bale. The line will probably be ready for opening early in September.

I have, &c.,

CH. A. GOODCHAP,

Commissioner for Railways.

Messrs. Garrick & Co., 95, Pitt-street, Sydney.

Wool-rates from various Stations to Sydney.

I HAVE the honor to subjoin a list of rates which it is proposed to charge for the carriage of wool from certain stations to Sydney, and to request that you will be good enough to obtain the approval of the Governor and the Executive Council to the same as soon as possible:—

From Bungendore to Sydney	8/- per bale
From Young to Sydney	9/- "
From Bourke to Sydney	15/- "

Although the rate from Byrock (12s. 6d.), the present terminus, is low compared with that proposed for Bourke, it is not intended to increase it until immediately after the next wool season, because contracts for the carriage of wool have been made on the strength of the present tariff.

Under Secretary, Public Works.

G.B. (*pro* Commissioner), 8/7/85.

Write minute for Executive Council.—J.R., 10/7/85.

Department of Public Works, Sydney, 10 July, 1885.

I HAVE the honor to submit for the approval of His Excellency the Governor and the Executive Council the following amended rates for the carriage of wool on the Great Southern and Western lines of railway, viz.:—

From Bungendore to Sydney	8/- per bale
From Young to Sydney	9/- "
From Bourke to Sydney	15/- "

F. A. WRIGHT.

The Executive Council advise that the amended wool-rates, herein recommended, be approved.—ALEX. C. BUDGE, Clerk of the Council. Approved.—A.L., 13/7/85. Railways.—J.R., B.C., 22/7/85. Write memo. to those concerned, and see that the new rates are included in the new rate-book, &c.—D.C.M'L., 23/7/85.

Referring to the Commissioner's minute of 18/6/85, I beg to inform him that I have received a letter from Messrs. Goldsbrough & Co., respecting the rates proposed for the conveyance of wool from Bourke to Sydney, copy of which I enclose. I have replied that the matter has already been fully considered, and that it is not proposed to make any alteration this year.—W. V. READ, 7/8/85.

Seen.—CH.A.G., 11/8/85.

Sir,

We have the honor to call your attention to the apparent excessive rate proposed to be charged by the Railway Department, for the carriage of wool from Bourke to Sydney, and would beg to bring under your notice the following:—

1. When the head of the railway extension was at Nyngan the charge per bale was 11s.
2. When at Byrock (78 miles further) the charge was 12s. 6d.
3. The distance from Byrock to Bourke being 48½ miles, an increase of 2s. 6d. for this distance in comparison with 1s. 6d. for 78 miles seems disproportionate.
4. A *pro rata* charge would be from 13s. 10d. to 14s., and we beg to commend the matter of a reduction to your consideration.

We have, &c.,

R. GOLDSBROUGH & CO.

W. V. Read, Esq., Traffic Manager, Redfern Railway Station.

No. 32.

Correspondence relative to the opening of Railway to Bourke and the diversion of the Darling River Trade to Sydney.

[Extract from the *Sydney Morning Herald*, Tuesday, 15 September, 1885.]

THE DARLING RIVER TRADE.

THE opening of the railway line to Bourke is an achievement long talked of. Parliamentary discussions on the question have been innumerable—on the time when it would be accomplished, on the traffic it would divert to Sydney, on its effects in the opening up of the country, and on other points. Experience will show how far it attains these various objects.

The history of the Darling River does not go back much beyond a generation—settlement before that was very inconsiderable; but the immense area of the country watered by the river, its natural richness in pastoral resources, the possibility of irrigation, and the consequent improvement of parts of it for agriculture, and the valuable discovery of copper, silver, and lead within its boundaries, open out a future to which the leading Colonies of the group are fully alive. The competition for the trade of the Darling and its tributaries has for many years been very active. Although for the principal part of its course the great Australian river traverses the territory of New South Wales, this Colony had for a long time but a very small portion of the trade, and indeed at present it has but a very little. Whatever the railways have done in securing for Sydney the commerce of the Murrumbidgee and the Lachlan, they have yet made no very great diversion of the trade of the Darling. Before the railway was finished much of the trade of Walgett and Bourke found its way to Sydney. It can hardly be doubted that nearly all the traffic of the river from Bourke upwards will henceforth be by our railway, whatever may be the course of that of the lower part of the river.

South Australia was the first Colony to take energetic measures to open up commercial relations with the Darling. On the authority of the special correspondent of the *South Australian Register* we learn that, through the encouragement of a bonus of £4,000 from the Government of that Colony for the first two iron steamers that should successfully navigate the Lower Murray from Goolwa to Wentworth, the Murray Steam Navigation Company was formed, and a steamer named the "Lady Augusta" started on her trial trip on the 27th August, 1853. She navigated the Lower Murray as far as Swan Hill, and thence carried a cargo of wool for Adelaide, establishing commercial relations which, in 1879, had swelled to such dimensions as to require the service of ninety steamers and eighty barges, with an aggregate of about 17,000 tons. These vessels navigate the Darling as far as Bourke, and occasionally a good deal further.

Victoria also has striven vigorously to secure a share of the Darling trade, and a very considerable part of it has been directed by way of Wentworth and up the Murray to Echuca; thence by railway to Melbourne. No effort has been spared to accomplish this object. Railway rates have been reduced to a non-paying point; and, for the loss on which, compensation was supposed to be found in direct benefits, present and prospective. Even differential rates were made in favour of the wool-growers of the Darling, so that they should find it worth their while to use the Victorian railway. Such was the value set on the commercial connections that it was suggested in some quarters that Wentworth should be connected by railway with the nearest point on the Victorian line, so that the productions of the district should be taken direct to Melbourne, but that suggestion was never carried out; and, from tables published below, it will be seen that the course of trade from Wentworth has tended down the Murray to South Australia rather than up that stream to Echuca and thence by rail to Melbourne.

What the amount of the Darling River trade is will appear by the following tables, taken from the last volume of the Customs statistics. They also show the tonnage of the vessels passing Wentworth both ways during the past decade:—

INWARD.					OUTWARD.				
Year	South Australia.		Victoria.		Year	South Australia.		Victoria.	
	Value.	Tonnage.	Value.	Tonnage.		Value.	Tonnage.	Value.	Tonnage.
1875	£ 265,622	11,732	£ 73,555	7,302	1875	£ 564,213	12,598	£ 280,666	5,626
1876	417,421	15,349	72,560	6,763	1876	552,812	14,415	163,846	5,602
1877	253,838	16,549	40,860	8,013	1877	209,914	17,540	50,953	5,879
1878	387,180	26,973	102,771	15,367	1878	954,754	26,510	201,155	14,664
1879	289,306	26,200	83,378	15,390	1879	629,465	27,006	247,031	17,037
1880	238,157	26,930	92,482	12,577	1880	637,152	26,986	214,093	12,238
1881	234,897	17,188	90,459	10,630	1881	298,004	16,133	111,453	10,155
1882	410,127	28,035	89,085	11,297	1882	921,427	27,947	150,021	10,003
1883	404,322	32,005	54,241	13,093	1883	771,010	30,417	71,122	12,309
1884	218,937	17,781	39,732	8,389	1884	1,029,134	21,665	330,652	12,969

From these returns we gather that on the whole there has been a considerable increase in the volume of the Darling River trade during the past decade. The figures do not represent the full measure of the increase, because wool and other produce that formerly went by the course of the river has for two or three years past been coming in increasing proportions to Sydney. For instance, copper from the Cobar Mines, which a few years back went *via* Louth and Wentworth for shipment, is now sent by rail to Port Jackson. What is the total value of the trade thus diverted to the Pacific Coast cannot be told; but the figures indicate that, after all has been withdrawn on that account, there still remains a growing volume of river trade, which last year assumed dimensions reckoned at over £1,600,000 in value, of which about £1,250,000 was with South Australia, and £350,000 with Victoria. It will be seen that the tendency of the increase in the trade has been towards South Australia rather than towards Victoria. We imagine that the increase in the volume has been greater than the increase in the value of the trade,

no doubt attributed to the reduced prices of both our exports and imports, of which it is to be assumed our Customs authorities take cognizance in their valuations. And this view is borne out by the fact that the tonnage arriving and departing from Wentworth, on the whole, shows a much greater increase than the value, whilst the numbers of the vessels increased from 93 in 1875 to 199 in 1883. A striking feature of the river trade is shown in the yearly fluctuations of both volume and values, due not so much to the falling off in the production, or the requirements of the district to which the Darling serves as a highway, though bad seasons must exercise some influence, but to the state of the river itself. In some years the stream is scarcely navigable, and in consequence the wool and other produce has to be got to market in other ways, or to be kept on the stations until the river rises. This feature is shown in a still more marked manner by the following table, which we also quote from the Customs statistics. The table shows the number of bales of wool exported *via* Wentworth to South Australia and Victoria, with remarks from the Collector of Customs on the state of the river:—

Year.	S. Australia.	Victoria.	Remarks.
	Bales.	Bales.	
1874	13,273	11,089	Navigable.
1875	15,379	9,993	do
1876	24,770	8,812	do
1877	5,706	2,744	Very low.
1878	39,282	11,924	Navigable.
1879	24,936	13,553	do for short period.
1880	25,432	13,238	do do
1881	14,193	6,011	do very short time.
1882	50,798	7,828	Rose twice during the season.
1883	38,075	2,992	Unnavigable nearly the whole season.
1884	45,937	13,478	Navigable twice for short time.

This table confirms the view of a very considerable increase in the volume of the Darling River trade.

Wool constitutes probably more than nine-tenths of the river-borne traffic downwards. As the wool has increased, so probably has all other produce, whilst the return trade in the shape of station supplies no doubt increased in something in nearly the same ratio. Teams usually look for traffic both ways, and steamers likewise find it profitable to carry cargo up as well as down the Darling River.

The river-borne traffic of the Darling district being determined at about one million and a half sterling; the next question is as to where it is gathered. The country watered by the Darling is of immense area—estimated at about 200,000 square miles. The length of the river itself is reckoned at about 1,160 miles from its source to its junction with the Murray at Wentworth. It is navigable about 530 miles, from Wentworth to Bourke, and sometimes to Walgett. After leaving Wentworth, which is 620 miles from the mouth of the Murray, a steamer proceeding up the river would reach the first considerable place, Pooncarie, in 130 miles, where there is a growing trade. A further distance of 90 miles would bring her to Menindie, which it was reckoned a few years back had a trade of £250,000. 100 miles further on she would reach Wilcannia, which is regarded as having a business larger than that of Bourke, and estimated in some quarters as approaching a million sterling. 130 miles still higher up the river is situated Louth, where the Cobar Copper Company at one time shipped their produce, and 78 miles still higher the voyage might end at Bourke, 528 miles from Wentworth. The commerce of Bourke has been reckoned at £750,000; but we have no very satisfactory data on which to base calculations as to the proportion of the trade gathered at each particular place. Some estimates published have exceeded the figures shown in the Customs statistics, but these must be regarded as the most trustworthy. The South Australian writer to whom reference has already been made admitted that, five years ago, a very great deal of the Bourke and Walgett trade went to Sydney. Every year since, as the railway approached it, a still larger proportion has come this way, and it may be doubted therefore whether any very considerable part of the business of those districts is included in the figures representing the aggregate traffic at Wentworth.

The question as to the proportion of the Darling River trade that will be secured by the Bourke railway has yet to be determined. Some suppose that all the trade from Wilcannia will go down the river; whilst others think that probably some portion of the wool and other produce from that port, and most of that from stations above, will be conveyed by steamer to Bourke—that, in fact, Bourke will be a great central dépôt for the gathering of the productions of the country north and west, as well as of all the country watered by the northerly branches of the Darling. It is believed that, by the use of small steamships of light draught, flat-bottomed barges can be advantageously utilized in bringing produce down the river from Walgett, and up the river from Wilcannia, when it would be found impossible to take the larger steamers and barges now employed from Bourke to Wentworth. These vessels gathering produce would return station supplies. If this view be realized the future of Bourke can hardly fail to be one of great importance. It will be the great central city of Australia, and the railway traffic to and from Sydney will eventually assume vast dimensions. Even should no considerable portion of the lower river traffic trend to Bourke, as some have supposed, there is still an immense country of which it will be the commercial dépôt, furnishing an ever-increasing traffic for the New South Wales railway system—a traffic that, without the railway, would in a large measure go to swell the volume of the river trade going by Wentworth to the sea. If it is found that Bourke secures the commerce of Wilcannia, the necessity for the line sanctioned from Orange *via* Forbes to that place will not be very apparent; and it may be found desirable rather to construct the second line across the plains to Menindie or Pooncarie, lower down the river, and thus divert all the New South Wales traffic of the Darling River to Port Jackson. If two lines across the great western plains will suffice, there is no reason why a third should be constructed.

DARLING RIVER TRADE.

THERE is a very exhaustive and suggestive article in the *Herald* of to-day with reference to this trade of the Darling, and a suggestion is made that probably private enterprise may direct the river traffic to Bourke from Wilcannia on the one side and Walgett on the other, by means of barges of very light draught which would be able to travel nearly all the year round.

I should feel greatly disposed to give every official encouragement to such a scheme. It is true that as regards Walgett we have already obtained the traffic, either by the way suggested or else by cross-country to Narrabri, where it is taken up by the North-western railway; but a river service between Wilcannia and Bourke, 208 miles, would be the means of diverting an immense trade to Sydney, and, as I said before, I would be prepared to give encouragement to the enterprise.

I wish the Traffic Manager to institute inquiries, and to see on what terms a through rate could be established, and the probable time goods could be delivered at Wilcannia by this route, as compared with the river route from either Echuca as the river port, which is the entrepot for goods to and from Adelaide.

Mr. Kirkcaldie might journey to Wilcannia perhaps *via* Bourke, and from thence per river or road, and ventilate the proposal there with the steamboat proprietors. Much will of course depend upon the facilities of river navigation between Wilcannia and Bourke.

CHAS. A. GOODCHAP, 15/9/85.

If the merchants of Sydney will assist in the scheme, I think that goods could be delivered at Wilcannia cheaper and quicker than by any other route.

As the Commissioner has asked for the return of these papers this afternoon, I need hardly say, in sending them, that I have not had the time to give the subject that consideration which its great importance demands; but I have long foreseen that the opening of the Western line to Bourke would raise the question of the importance of the trade of the Darling to this Colony. I think a report similar to that written about five years ago on the Murrumbidgee trade would be of very considerable advantage to the Department, and I am inclined to think that we would not have the same difficulty in securing the trade of the Darling as we have had with that of the Murrumbidgee; but in order to arrive at a fair idea of the extent of the trade at the various points, and the practicability or impracticability of the navigation, the best plan will be to do as the Commissioner says and make inquiries on the spot. It may be advisable to expend a sum of money in improving the navigation between Bourke and Wilcannia, and probably as far as Menindie.—W.V.R., 17/9/85.

I understand that Mr. Kirkcaldie will be able to start this week. It is a report similar to that which he made at my request on the Murrumbidgee traffic which I require of the Darling River traffic.—CHAS. A. GOODCHAP, 17/9/85.

Write to the leading firms of Sydney and state what is proposed to be done, and ask them to cooperate by endeavouring to establish commercial relations with the storekeepers and others at Wilcannia.—CHAS. A. GOODCHAP, 17/9/85.

Firms written accordingly.—18/9/85.

Permewan, Wright, & Co. to The Commissioner for Railways.

Dear Sir,

Sydney, 10 October, 1885.

There are several clips of wool ready for transit in the Wilcannia district. I think a good few of those could be brought to Sydney by a reduction of freight from Bourke to Sydney. Land carriage is comparatively low at present, and there is a good opportunity, although the owners are holding back for river traffic.

If you think this matter of sufficient importance, I could see you on Monday evening, and discuss it with you. I shall be running Sydney on Monday night, and shall be away on next week.

I may mention that we are now bringing the following clips from that district to Bourke, viz., Tonga, Nelyambo, Winbar, and we are now in treaty for Cultowa.

Yours truly,
JAS. STEERS,
Manager.

Traffic Manager.—CH.A.G., B.C., 13/10/85.

Please see my report of this date in which I stated that I had offered to convey from Bourke to Sydney any wool clips from and near Wilcannia at the 250-lb. rate (12s. 9d.) on all bales weighing not more than 280 lb. That is equivalent to a reduction of 18s. per ton on bales weighing over 250 lb. and not exceeding 280 lb., which will embrace nearly all the scoured wool. There is not any appearance of a rise in the river, and I do not think it is necessary to make a further concession this season, except perhaps on scoured wool properly dumped. The space that would be saved by such a process, and the consequent saving in working expenses to the Department, would fully justify the Commissioner in allowing a further rebate of 10 per cent., which would reduce the rate for dumped scoured wool in bales not exceeding 280 lb. in weight to 11s. 3d. In view of the river being navigable next wool season, further reductions are recommended for adoption before that time. If the Commissioner agrees to the reductions recommended for this season's wool they should be well advertised in the Wilcannia newspapers, so that the squatters may be conversant with them; and, if the other reductions recommended in my report are approved of, it might be added that further reductions are in contemplation before next wool season.—D.K., 30/10/85. Traffic Manager.

I have recommended the adoption of these proposals on Mr. Kirkcaldie's report on the trade of the Darling which accompanies this.—W.V.R., 31/10/85. Commissioner.

Mr. Assistant Traffic-Manager Kirkcaldie to Mr. Traffic-Manager Read.

Sir,

I have the honor to report that, in accordance with the Commissioner's instructions, I have visited Bourke and Wilcannia, (and, while doing so, took the opportunity of calling at the stations between those towns), for the purpose of making inquiries as to the most effective means of diverting to Sydney the trade of that immense district drained by the Darling River, which, until within the last year or two—when our Western line has been rapidly approaching towards Bourke, and has now been extended to that town—was nearly entirely monopolized by Adelaide and Melbourne. If

If the river were as navigable as the Murrumbidgee, there can be no doubt that we would have to make considerable concessions to secure the trade; but the great uncertainty of the navigation impresses me with the belief that, with the exception perhaps of two or three leading lines of heavy goods upon which it may be advisable to make a reduction, the trade of Bourke and for a large district round about, will now naturally trend to Sydney, in consequence of the certainty of conveyance and the quick dispatch afforded by the railway. The country in question being, as is well known, an exclusively pastoral one, it will perhaps be as well that I should deal with the wool rates before touching upon those applicable to general goods; and I may here mention that my attention was called to the inequality of the wool rates from Bourke, Byrock, Girilambone, and Nyngan. No one contended that the Bourke rates are too high; but they are generally regarded as excessive as compared with those from the other stations named. I assured those who mentioned the subject to me, that it would be fairly considered, and the rates equalized before next wool season.

The navigation of the river is so very uncertain, and so much depends upon the availability or otherwise of barges when a rise (not unfrequently only lasting a few days) does occur, that the rates of freight vary to a great extent; and so many boats have sunk in the river during the last few years, that about two years ago the rate of insurance upon wool was doubled, and is now as high as 47s. 6d. per cent. from Bourke, and 45s. per cent. from Wilcannia to Adelaide or Echuca.

The following are, however, regarded as fair average rates from Bourke to Adelaide or Melbourne, viz. :—

<i>Greasy.</i>		<i>Scoured.</i>	
Freight, 100s. per ton, =	20s. per bale.	120s. per ton, =	15s. per bale.
Insurance, 47s. 6d. %, estimated value £50 per ton...	4s. 9d. ,,	47s. 6d. %, estimated value £150 per ton	8s. 11d. ,,
	<u>24s. 9d.</u>		<u>23s. 11d.</u>

The rates to Sydney, including delivery, are 15s. per bale not exceeding 4 cwt., and 12s. 9d. per bale not exceeding 250 lb. in weight, so that I am decidedly of opinion we have nothing to fear from river competition, even under favourable circumstances, in respect of wool coming from the districts north of Bourke, or as far to the south-west as Curranyalpa or Kallara, or from the country to the east of the Paroo River, but the wool from stations at a distance from the railway or river is burdened with such a high rate of team carriage that, where water is available for the purpose, it is nearly all scoured before being dispatched; and that suggests a question which it may be well not to pass unnoticed. Bales of scoured wool vary in weight from 2 cwt. 1 qr. (252 lb.) to 2 cwt. 2 qr. (280 lb.), and as we charge the full 4 cwt. rate on all bales in excess of 250 lb. it follows that the squatters (very few of whom are conversant with our rates, and who generally enter into a contract for the wool to be lifted from the station and delivered in Sydney at a rate agreed upon), must either limit the quantity of wool that can be put into a pack or forego the rebate of 15 per cent. allowed upon the bales weighing not more than 250 lb.

If the rebate of 15 per cent. were given on all bales weighing not more than 280 lb., instead of 250 lb., nearly all bales of scoured wool would come within the scope of the concession; and, considering the extent of the difference between the present 250 and 280 lb. rates, I recommend that the alteration be brought into operation *generally* before next wool season. The woolpacks being of the same size, it follows that the 280-lb. bale is not more bulky than the one weighing 250 lb. (the only difference being the one is better pressed than the other), so that an equal number of bales can be got into a truck, and in that way the direct loss to the Department would not be great, while the advantage to the squatter would be considerable.

I recommend this for adoption.—W.V.R.

The effect on a clip of 250,000 lb. (exclusive of the weight of the woolpacks) would be as follows :—

Present rate 250,000 lb. ÷ 250 = 1,000 bales at 12s. 9d. =	£637 10 0
Proposed „ 250,000 lb. ÷ 280 = 893 „ „ =	569 5 9
Difference	£68 4 3

but the number of trucks used in the conveyance of the wool would be reduced by three; and as it is well known that we have to send numbers of empty trucks both west and south-west in the season to bring wool to Sydney, it is apparent that the direct loss to revenue would be largely compensated for by the saving in working expenses.

And as an inducement to squatters and others to dump *scoured wool*, whereby from 20 to 25 per cent. more bales can be loaded in a truck than those undumped, without exceeding the weight the truck is authorized to carry, I strongly recommend a *further* rebate of 10 per cent. upon all scoured wool properly dumped. I consider this of even greater importance than the extension of the limit of light bales from 250 lb. to 280 lb., inasmuch as the saving in working expenses would largely exceed the amount of the concession.

Recommended.—W.V.R.

The river has been entirely unnavigable for the last six months, and, to a great extent, during the last two and a half years; but it is generally stated that during the last three years it has been unusually impracticable, and that for four or five previous successive seasons it was always navigable within two or three months after shearing to such an extent as to permit of the wool being taken away; in fixing our rates, therefore, we must anticipate such seasons again.

From Buckambie Station, which is nearly equi-distant between Bourke and Wilcannia, wool can be sent to Melbourne or Adelaide when the river is navigable at the following rates, viz. :—

<i>Greasy.</i>		<i>Scoured.</i>	
Freight, 80s. per ton, =	16s. per bale.	100s. per ton, =	12s. 6d. per bale.
Insurance, 45s. %, estimated value, £50 per ton	4s. 6d. ,,	Estimated value, £150 per ton	8s. 5d. ,,
	<u>20s. 6d.</u>		<u>20s. 11d.</u>

while

while the rates by river to Bourke and the trainage to Sydney would be :—

River freight (say) 25s. per ton, = 5s. per bale;	30s. per ton, = 3s. 9d. per bale.
Insurance (say) 15s. per cent., = 1s. 6d. „	Estimated value, £150
Trainage to Sydney 15s. „	per ton... .. 2s. 10d.. „
	Trainage to Sydney 15s. „
—————	—————
21s. 6d.	21s. 7d.

but if my proposal to allow 15 per cent. on all bales not exceeding 280 lb. in weight is adopted, the through rate on scoured wool will be reduced from 21s. 7d. to 19s. 4d. per bale.

It will be observed that I have based my estimate of the value of the wool upon the present very low ruling prices, but I have done this purposely, because, although the price of wool will doubtless increase, it is not at all improbable that the rates of insurance will be considerably reduced when the river becomes once more fairly navigable, which would still leave the gross rates about the figures quoted; and in addition to that we must, in such a case, anticipate considerable reductions in the river freights as well.

I am therefore of opinion that the only effective method of diverting the trade, short of constructing a railway to the district, will be to make considerable concessions upon all wool, put on the rail at Bourke from Buckambie and stations below having a frontage to the Darling on the eastern side, and on the western side from Marra and all stations south and south-west thereof, and lying wholly to the west of the Paroo River.

This concession should, I think, be about 25 per cent. on the present rates for greasy wool, and the same on the rates herein recommended for scoured wool, dumped or undumped, which would make the rate from Wilcannia to Sydney as follows :—

<i>Greasy.</i>	<i>Scoured.</i>
Freight to Bourke (say) 35s. per ton, = 7s. per bale;	(say) 40s. per ton, = 5s. per bale.
Insurance (say) 20s. per cent., = 2s. „	= 3s. 9d. „
Trainage to Sydney = 11s. 3d. „	= 9s. 7d. „
—————	—————
Through rate for undumped wool, = 20s. 3d.	= 18s. 4d.
Rebate for dumped wool 1s. 8d.	10 per cent. on 9s. 7d., 11d.
—————	—————
Through rate for dumped wool ... 18s. 7d. „	17s. 5d.

While the rates by river to Adelaide or Melbourne are :—

<i>Greasy.</i>	<i>Scoured.</i>
Freight, 60s. per ton, = 12s. per bale;	80s. per ton, = 10s. per bale.
Insurance = 4s. 6d. „	= 8s. 5d. „
—————	—————
16s. 6d. „	18s. 5d. „

the latter being capable of considerable reductions while the river is navigable.

I have a strong impression that the reduction I have mentioned would cause a large quantity of wool to be sent to Sydney, even by teams to Bourke when the river is unnavigable, which is now held back for a rise in the river, or is sent to Adelaide, *via* Terowie.

The utter impracticability of the river has secured us all the wool this season as far down as Nelyambo (about 180 miles from Bourke) on the eastern side, and from Marra on the western side; but from all I could gather we would not have got any from Buckambie or stations lower down, possibly not even from one or two of those higher up, if the river had been navigable.

All clips below those stations are being held for a rise in the river, partly, very probably, because of the very low price of wool at the present time, and in the hope that the market will improve, and partly because of the high rates to Sydney, the team carriage from Wilcannia to Bourke being as high as £8 per ton = 20s. per bale on scoured wool.

While in the district I offered to convey all bales weighing not more than 280 lb. of Cultowa and Momba wools (the former clip is about 1,500 and the latter 4,000 bales) from Bourke to Sydney at the 250 lb. rate; and I also let it be known that any other clips coming from stations further down the river would receive the same concession. I am inclined to think that the owners of the clips in question will send to Sydney at the rates offered, and should they do so I shall be glad to have approval of the concession.

While in Wilcannia I was interviewed by a number of business gentlemen of that town and district, who impressed upon me that the trade of the district would never be effectively secured to Sydney until the line is constructed to that town. I pointed out to them that the question of the railway did not come within the scope of my commission, but that if they could furnish me with any statistics showing to what extent such a railway would still further tend to divert the trade to Sydney, I would be glad to lay them before the Commissioner; and in response to this I have received two communications from Mr. Haydon, the Manager of the Commercial Bank in Wilcannia, which I attach. I need hardly say that I am not in a position to check Mr. Haydon's figures, but a glance at the map will suffice to show that on the completion of the South Australian Railway to the border of that Colony with New South Wales, the clips of very nearly all the stations named in his statement will be sent overland to Adelaide when the river is impracticable; because the railway named will then be within about 150 or 160 miles of Wilcannia, and the distance by rail to Adelaide will only be 330 or 340 miles, while the distance from Wilcannia to Bourke is about 230 miles, and the railway to Darling Harbour 504 miles.

Before quitting this part of my report, I think it advisable to recommend that the restriction as regards bales of dumped wool being hooped with iron be rescinded. It appears that some stations are now provided with improved dumping presses, which render the hooping of the bales unnecessary; and so long as the latter do not exceed twenty (20) feet cubic measurement the regulation as to hooping might be readily dispensed with.

Recommended.
—W.V.R.

As regards merchandise from Sydney, I am of opinion that, with the exception of two or three heavy leading lines, there is no necessity to make any reductions in the present rates upon traffic for stations north of Buckambie or Marra, or east of the Paroo River,—the lines referred to being sugar, galvanized iron, and fencing wire. Traffic of this kind is generally ordered in large lots, and when there is a good river it can be conveyed from Adelaide to Bourke for £4 10s. to £5 per ton, including insurance; and in such a case there would always be an inducement to order supplies of general stores which, when forming the same cargo, would be conveyed at the same low rate of freight, although, according to value, the insurance would be higher. Recommended
—W.V.R.

Our rate for sugar in truck-loads, from Sydney to Burke, is £36 13s. 8d. = 122s. 3d. per ton; while for galvanized iron and fencing wire it is 123s. 3d. per ton, in lots of not less than one ton; and I am of opinion that if a maximum truck rate of £30 per truck on each or all these lines of goods were fixed for the Western line, all the other rates might be left as they are. Recommended.
—W.V.R.

The only other station of any importance that would be affected by making the rate in question the maximum for the Western line would be Byrock, to which place all traffic for the Brewarrina district is consigned; and the reasons which induce me to recommend the reductions in the case of Bourke apply with much the same force to Brewarrina.

For traffic consigned from Sydney to the district from which I have recommended a reduction of 25 per cent. on the wool rates, I suggest a truck rate of £24 for sugar, galvanized iron, and fencing wire, and £30 per truck (=100s. per ton on third class goods) on all other general goods except explosives. Recommended.
—W.V.R.

The reduced rates, except those respecting the wool, should, in my opinion, be brought into operation as soon as possible (the sooner the better), so that we may get a good hold upon the trade before the river rises again; but it would be better, I think, not to publish the reduced wool rates for some months yet, particularly as I understand that the Queensland Government purpose making considerable reductions on the railway rates in that Colony, and it is not desirable that, before doing so, they should be aware of any action that may be taken in this Colony in that respect.

I mention these rates after careful consideration both of the navigation of the river and in view of the completion of the South Australian Railway to the border of that Colony (within about 15 or 16 miles of Silvertown), which will be a formidable competitor for the trade of a very large district northwards, and eastwards towards Wilcannia. This line is expected to be completed in December, 1886, and extensions will be opened before that time. I have had considerable difficulty, in consequence of the impracticability of the river during the last two or three seasons, in defining the district, which will, with a navigable river be competitive, or in suggesting the extent of the reductions which should in such a case be made, but the proposals I have made appear to me to be the most fair and equitable.

It will, however, be to the advantage of the Department if an officer is sent throughout the district about the same time next year, when the river may be navigable, and when it is expected that a considerable portion of the Terowie-Silvertown Railway will be opened for traffic; he will then be better able to form an opinion whether the competitive district has been sufficiently well defined, or whether it will be necessary to make even greater reductions than those now recommended.

I may mention that I saw a number of teams conveying goods from Bourke to Wilcannia; but as the through rate from Sydney by train and team is about £20 per ton on third-class goods, storekeepers naturally keep their orders as low as possible, in expectation of the river rising.

While in Wilcannia I was fortunate enough to meet Mr. Byrnes, who is in charge of the snagging of the river, and with whom I had a conversation respecting the practicability of improving the navigation between Bourke and Wilcannia, so as to permit of the passage of boats drawing not more than 3 feet of water. It appears that the river has been thoroughly cleared of snags between Wilcannia and Wentworth, but as yet nothing has been done to that portion of it between Wilcannia and Bourke, where snags abound to a great extent, and where the rocks in the bed of the river are much more extensive than they are below Wilcannia.

A better time for improving the navigation, now that the river is so low, could not possibly be had, and I strongly recommend that the work be commenced at once. The snags could at least be all removed, and the Engineer for Harbours and Rivers might perhaps consider whether it is not also practicable to further improve the navigation, when the river is low, by cutting a channel off the tops of the rocks, the worst of which are at Jandra, Toorale, Curranyalpa and Kennedy. I do not mean to say that that would give a continual navigation, but Mr. Byrnes and Captain Pickhills (who has been on the river for twenty-seven years) are of opinion that if it were done we would in most seasons have river navigation five or six months out of the twelve, in which case, with the reductions recommended in the rates, I feel strongly of opinion that the great bulk of the trade as far down as Wilcannia would be conducted with Sydney.

The work, I am informed, will not be a very expensive one; and Mr. Byrnes was to write to Mr. Moriarty on the subject after I saw him.

In connection with this, I have to refer to the report I sent you from Bourke regarding the position of the wharf which is to be erected there. If the wharf is to be of any practical value it should be on or near the Gaol reserve, and not in the centre of the town as was intended. This is a matter
which is deserv-
ing of the most
careful con-
sideration.—
W.V.R.

The latter would necessitate cartage of all traffic between the river and the railway station, at a cost of about 3s. 6d. per ton, while by placing it on the Gaol reserve and extending the railway to it (a distance of between 950 and 1,000 yards) that expense and the double handling of the traffic would be saved.

The wharf is not required for the town of Bourke, because there can be no doubt that the whole of the trade of that town will be done through the railway, but for traffic going down or coming up the river it will be a great advantage if placed on the site I have named. This, too, is a work which should be taken in hand and completed as soon as possible, so as to be of advantage when the river is navigable.

Some modification of the parcels rates is also desirable, and would very probably lead to an increase of traffic in that direction.

The present rates are—

Distance.	3 lb.	3 to 7 lb.	7 to 14 lb.	14 to 28 lb.	28 to 56 lb.	56 to 84 lb.	84 to 112 lb.	Every additional 28 lb. or part thereof.
315 miles	s. d. 1 6	s. d. 3 0	s. d. 4 0	s. d. 5 6	s. d. 7 0	s. d. 8 6	s. d. 10 1	s. d. 2 5
And for every additional or part of additional 15 miles	0 1	0 2	0 2	0 3	0 4	0 5	0 5	0 1

which makes the rates from Sydney to Bourke—

	s. d. 2 7	s. d. 5 2	s. d. 6 2	s. d. 8 9	s. d. 11 4	s. d. 13 11	s. d. 15 6	s. d. 3 6
--	--------------	--------------	--------------	--------------	---------------	----------------	---------------	--------------

Considering that we generally refuse to carry single articles under 56 lb. by goods train, it follows that the rate from Sydney to Bourke for a parcel weighing upwards of 28 and not exceeding 56 lb. by passenger train would be 11s. 4d., while a 56 lb. parcel by goods train would only be 5s. 6d.

I recommend the adoption of the following scale in lieu of the present:—

Recommended.
—W. V. R.

Distance.	3 lb.	3 to 7 lb.	7 to 14 lb.	14 to 28 lb.	28 to 56 lb.	56 to 84 lb.	84 to 112 lb.	Every additional 28 lb. or part thereof.
315 miles	s. d. 1 6	s. d. 3 0	s. d. 4 0	s. d. 5 6	s. d. 7 0	s. d. 8 6	s. d. 10 1	s. d. 2 5
And for every additional or part of additional 50 miles	0 1	0 2	0 2	0 3	0 4	0 5	0 5	0 1

which would make the rates between the stations named—

	s. d. 1 10	s. d. 3 8	s. d. 4 8	s. d. 6 6	s. d. 8 4	s. d. 10 2	s. d. 11 9	s. d. 2 9
--	---------------	--------------	--------------	--------------	--------------	---------------	---------------	--------------

W. V. Read, Esq.,
Traffic Manager.

I have, &c.,
DAVID KIRKCALDIE,
30/10/85.

The Commissioner.—W. V. R., 30/10/85.

At your verbal request I have seen Mr. Barling, of the Harbours and Rivers Department, respecting my report on the Darling River trade, and he tells me it will take some time to report on the improvement of the navigation. I knew that that could hardly fail to be so, but that part of the question need not delay the settlement of the rates by railway. They should be decided at once, so that store-keepers and others may probably be induced to come from Wilcannia to Sydney to get their supplies. If the river gets in flood again before anything is done it will militate very much, and perhaps for a considerable time, against our getting a hold upon the trade. The river question can be settled afterwards, although, in that respect too, if anything is to be done no avoidable delay should take place in doing it.—D. K., 29/12/85. Commissioner.

I recommend the adoption of the proposed rates, and that the railway be extended to the river,—CH. A. G., 31/12/85.

I have carefully read these papers, and with especial satisfaction the admirable report of Mr. Kirkcaldie. I am favourably disposed towards the proposed alteration in traffic rates; but as I understand the wool contracts will not be taken for some time, and the success of the scheme largely depends upon the free navigation of the Darling between Bourke and Wilcannia, I think the further consideration of the question might be deferred until we are in receipt of the Harbours and Rivers report, which I have this day requested Mr. Moriarty to expedite.—J. G., 5/1/86.

I approve of the rates herein referred to.—J. G., 1/2/86.

Report on the best means of securing Darling River trade.—The Commissioner has desired me to ask when Mr. Kirkcaldie's report on the above matter will be furnished, and also to say that, as the construction of the Government wharf at Bourke has been suspended until the receipt and consideration of such report, and as it is desired to minimise the amount to be paid to the contractor for the stoppage of the work, it is hoped that no time will be lost in supplying what is required.—D. C. M. L., B. C., 26/10/85. Traffic Manager.

Herewith. The report would have been sent forward some days ago but that Mr. Kirkcaldie has been waiting for some information from Darling Harbour respecting the wool traffic.—W. V. R., 30/10/85. Commissioner.

Before any action is taken I should like the Engineer-in-Chief for Harbours and Rivers to read Mr. Kirkcaldie's report, with special reference to the site for the wharf at Bourke and the improvement of the navigation of the river between Bourke and Wilcannia. I shall be obliged to Mr. Moriarty if he will return me the papers as early as he possibly can, in order that I may submit them to the Minister.—CH. A. G., 2/11/85.

Extract taken and paper returned to Commissioner, with thanks. I will now deal with the matter.—E. O. M., 6/11/85.

I recommend that the measures to secure the diversion of the Darling River traffic from South Australia, Victoria, and Queensland to our lines, proposed in the accompanying report from the Assistant Traffic Manager, be adopted. The mercantile community of Sydney have been communicated with, and have promised their co-operation in a well-designed attempt to secure the trade. It must be remembered that it is the trade of our own territory, and that until the extension of the railway to Bourke we have not been in a position to compete for it.—CH. A. G., 10/11/85. Besides

Besides the alterations of rates, the following measures will be required to be carried out:—

1. Improvement of the navigation of the river between Wilcannia and Bourke.
2. The construction of the proposed wharf for Bourke at a site which will contribute to the completion of the scheme for diverting the traffic.
3. The extension of the railway line from its present terminus at Bourke to the river, in the immediate vicinity of the proposed wharf.

CH.A.G., 10/11/85.

Will Mr. Moriarty report upon the navigation of the Darling River, herein referred to.—W.J.L., 11/12/85. Under Secretary for Works, B.C., 11/12/85. Mr. Moriarty, B.C., 17/12/85.

Darling River traffic.—Will the Commissioner please inform me whether any decision has yet been come to respecting the rates for the Darling River trade. In the present state of the river, a suitable reduction of rates would almost to a certainty induce storekeepers and others in the Wilcannia district to send to Sydney for their supplies, but the opportunity will in all probability be lost if the river should again become navigable before the diversion is effected. My opinion is that, if any reduction is to be made, it should be done as soon as possible.—W.V.R., 17/12/85. Commissioner.

Obtain papers at once. Mr. Secretary Lyne was favourable to the rates proposed, but was doubtful about the scheme for making the river navigable.—CH.A.G., 29/12/85.

No. 33.

Messrs. Headley and Laughamer to G. Day, Esq., M.P.

Sir,

Albury, 1 December, 1885.

We wish to bring under your notice the hardship that Albury manufactures are subject to by the excessive railway charges on goods from Albury instituted to handicap Victorian productions, and although Mr. Goodchap states a mileage rate is charged on Albury goods this is not done or only in exceptional cases; but should the Hon. Minister for Works write a minute at the Albury station that all *bona fide* Albury productions be charged at mileage rates, the vexatious question would be satisfactorily settled. As we know this subject has been previously ventilated, we will not further trespass on your valuable time.

And remain, &c.,

HEADLEY & LAUGHAMER.

I am told that the goods manufactured at Albury are being sent along the road. Brewers, iron-workers, furniture makers, and farmers send their wares in that way, but they would not do so if the usual rates were charged. We are already bringing the special class goods from Albury at the ordinary rates, and it is a question whether goods manufactured in Albury should not also be taken at ordinary rates. The objection would be, in the case of a competitive manufacturer (say) at some place between Albury and Wagga. If he obtained his raw material from Melbourne he would be charged the excess rate on that material, while the manufactured article might be carried for an Albury manufacturer at as cheap a rate or cheaper. Let me know how the matter really stands. For some years probably there will be no manufactory established between Wagga and Albury.—CH.A.G., 4/12/85.

Are not all articles manufactured in Albury (or rather north of the Murray) charged the ordinary mileage rates when sent along the line? Reply fully and quickly, please. What are the principal manufactures?—D.K., 5/12/85. Goods Superintendent.

Station-master, Albury, for early report.—J.D., 7/12/85. Please report on this at once, referring to the particular instances in which mileage rates have been charged by authority.—A. WILLIS, 9/12/85. Mr. Cullen.

Mr. Headley was under the impression that he was charged at the rates for Victorian importations, and on referring to his consignments of Colonial ale in bulk, I convinced him this was not the case. He had been charged only mileage rates. Mileage rates have been charged on goods manufactured in Albury in all instances, namely, in the case of goods from breweries, farms, soap manufactories, iron-workers, and furniture makers.—T.W.C., 10/12/85.

To see A. Willis.—SUPT. EVANS, 11/12/85. I note the Commissioner speaks of local manufacturers obtaining the raw material from Melbourne. This I know to be the case in one instance, if not more.—A. WILLIS, 11/12/85.

I should like to have Mr. Headley's assurance in writing that he is satisfied mileage rates only are charged. I presume the firm obtain their raw material from Sydney.—J.D., 12/12/85. Station-master, Albury.

Please obtain this. You had better go yourself to the brewery.—A. WILLIS, 14/12/85. Mr. Cullen. I attach a memo. from Mr. Headley giving the desired information, and as he was out of town for a few days I was unable to get it earlier.—T.W.C., 19/12/85. Goods Supt. Traffic Manager.—G. EVANS, 22/12/85.

Sir,

Albury, 18 December, 1885.

Since my previous communication we have ascertained that our goods are sent at mileage rates, which are satisfactory, and as we make all our own malt from the local barley, we consider we are fairly entitled to the concession we asked.

Yours, &c.,

HEADLEY & LAUGHAMER.

Messrs. Headley and Laughamer are now satisfied that mileage rates are charged on goods manufactured in Albury sent north by rail. They were under a misapprehension when they wrote to Mr. Day, M.P.—W. V. READ, 24/12/85. Commissioner. Inform Mr. Day.—CH.A.G., 29/12/85.

Sir,

Sir,

Department of Railways, 31 December, 1885.

With reference to the letter of Messrs. Headley and Laughamer, brewers, of Albury, forwarded by you to this office, complaining of excessive railway charges on goods from Albury, I have the honor to inform you that from verbal inquiries it seems the firm were under the impression that they were charged at the rates for Victorian importation, but are now convinced they have been charged only the mileage rate, with which they are perfectly satisfied. I may add that I am in receipt of a letter from Messrs. Headley and Laughamer to this effect.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

George Day, Esq., M.P., Arleston House, Petersham.

No. 34.

A. J. Bolton, Esq., M.P., to The Secretary for Public Works.

Sir,

Sydney, 24 November, 1885.

In compliance with the request of the inhabitants of Junee Junction, I do myself the honor to draw your attention to the inequitable rates charged upon goods carried by rail to that place.

As I am informed, the rate charged for 3rd class goods to Junee Junction, which is 287 miles from Sydney, is £6 18s. 7d., and no reduction is made where a full truck is taken. The same class of goods are carried distances over 305 miles at £20 per truck, equal to £3 6s. 8d. per ton. Galvanized iron and wire is carried to Junee Junction at the rate of £24 per truck, and to distances over 305 miles at £18 per truck.

The inhabitants claim that they are entitled to the same consideration as the inhabitants of other places, and therefore request that if the truck system is to be continued, it may be adopted with regard to their town, and if that be not conceded, that their goods may be booked direct to Junee Junction at a rate equal to the truck rate with the return charges added thereto, and thus avert the necessity of further continuing the farce of having goods consigned to a greater distance than is required, to be then re-consigned back to place of destination.

It appears to me that the demand is so in accordance with just rights that I feel you will see your way to at once comply with it. To carry goods past their destination in the first place, and then consign them back appears to me so absurd that I feel your sense of justice will at once prevent the farce being perpetrated any longer.

I have, &c.,

A. J. BOLTON.

I should like this question reported upon by Mr. Goodchap, and a clear statement prepared why the present system should be continued or why the request made should not be granted.—G.R.D., 24/11/85.

The Commissioner for Railways for report.—J.H.L., 24/11/85. J.R., B.C., 25/11/85. Traffic Manager.—G.B., B.C., 27/11/85. Urgent.

This matter has already been pretty fully reported on on several occasions, and nothing has since transpired to induce me to alter my opinions or to make any alteration on the present arrangement.

As the Commissioner is aware, the truck rate of £20 from Sydney to stations on the Southern and South-western lines, distant over 305 miles from the metropolis, was established because of the great reductions that had been made on the Victorian lines upon goods coming into this Colony; but it has never been considered necessary to reduce the rates to Junee Junction or stations further north. It is quite true that goods sent from Sydney in truck loads are conveyed to Wagga Wagga, and can be returned from there to Junee at tonnage rates at a large saving to the storekeeper, the saving on 1st, 2nd, 3rd, and 4th class goods being 5s. 1d., 23s. 58s. 10d., and 94s. 9d. per ton respectively. It is also a fact that the great bulk of the Junee traffic is first sent to Wagga Wagga in this way and returned from there, the tonnage during the months of August, September, and October being:—

1st class.			2nd class.			3rd class.			4th class.		
t.	c.	q.	t.	c.	q.	t.	c.	q.	t.	c.	q.
6	9	2	36	14	0	94	5	2	1	1	1

while that sent direct to Junee was—

1st class.			2nd class.			3rd class.			4th class.		
t.	c.	q.	t.	c.	q.	t.	c.	q.	t.	c.	q.
9	12	2	19	2	0	30	11	1	1	3	3

upon which, of course, ordinary mileage rates were charged. If the traffic which was sent to Wagga Wagga had been left at Junee on the down journey and the Wagga truck rate, plus the tonnage rates, from there to Junee had been charged as is suggested, it would of course have saved the haulage of 138 tons 10 cwt. 1 qr. (= twenty-three trucks) a distance of 44 miles; but, on the other hand, we would have lost the difference between the foregoing rate and the actual mileage rates on the traffic that was sent direct from Sydney to Junee, and that difference amounts to £117 19s. 3d. Nor is that all. If the concession were made as regards Junee it could hardly be denied to stations further north similarly affected. The rates from Sydney to Cootamundra, for example, are:—

1st class.	2nd class.	3rd class.	4th class.
73/3	91/1	126/9	163/4

while to Wagga Wagga, at the truck rate, and back to Cootamundra, at the tonnage rate, they would be:—

1st class.	2nd class.	3rd class.	4th class.
66/8	66/8	66/8	66/8
19/8	24/1	32/11	42/9
<u>86/4</u>	<u>90/9</u>	<u>99/7</u>	<u>109/5</u>

thus making a difference of 27s. 2d. per ton on 3rd and 53s. 11d. per ton on 4th class goods in favour of the journey to Wagga Wagga and back. During the months of August, September, and October 36 tons 5 cwt. 1 qr. of third and tons cwt. qr. of 4th class traffic for Cootamundra was first sent to Wagga Wagga

The cost of this running to the Department might fairly be estimated at £14.—Ch.A.G. £14 as against £117 19s. 3d.

Wagga at the truck rate and returned from there at tonnage rates. It would doubtless have been better if we had not hauled these goods 112 miles for nothing; but, during the same months, 490 tons 17 cwt. of 3rd class and 13 tons 16 cwt. 2 qr. were consigned direct from Sydney to Cootamundra; upon these ordinary mileage rates were charged, and if these had been carried at Wagga Wagga truck rates, plus tonnage rates from there to Cootamundra, the Department would have sacrificed revenue to the extent of £724 14s. 4d. If all Cootamundra and Junee goods were first consigned to Wagga Wagga and returned from there, it would be unquestionably to the interests of the Department to comply with the request that has been made; but, so long as such a large proportion of them are sent direct, it would, in my opinion, be very inadvisable to alter our present arrangements. If the request of the inhabitants of Junee were conceded it would save those even of Harden 3s. 10d. per ton on 3rd and 23s. 11d. per ton on 4th class goods if the concession were extended to that station; and if granted in one case it could hardly be refused in another.—W.V.R., 9/12/85.

Twelve trucks at outside. The cost to Department might fairly be taken at £23.—Ch. A. G. £23 as against £724 14s. 4d.

The Department would lose a large amount of money by adopting the course suggested. I cannot, therefore, recommend it.—Ch. A. G., 12/12/85. For consideration of my successor.—W.J.L., 17/12/85.

I have not had time during my tenure of office to go thoroughly into this question as it needs; but that it needs revision, if not an entire revolution, I am fully persuaded.—J.G., 18/2/86.

No. 35.

Minute by Mr. Traffic-Manager Read.

I now enclose a draft advertisement, which should be pretty freely inserted in the newspapers at Sydney, Bourke, and Wilcannia.

Since Mr. Kirkcaldie's visit to the Darling district, followed the appearance of some well-written articles, which appeared in the *Sydney Morning Herald*, in September last, it would be to our advantage if that and other papers were to comment at some length at the action that has been taken, so as to give as much prominence as possible to the reductions that have been made.

If that were done it might safely be assumed that if any exception is to be taken to the proposals that have been made and adopted (and it is not to be expected that they will please everyone) someone would point out any weak points either to the Commissioner or through the columns of the press, and such criticism would be useful for future guidance.

I think, too, that it would be well to have hand-bills printed and freely circulated, and I enclose a draft of that as well.

The question of improving the navigation of the river should not be lost sight of. If that can be accomplished, the reductions that have been made in the railway rates should go a long way towards securing the trade of the Wilcannia district.

As the Commissioner has approved of an officer being sent through the district, I think the journey should be undertaken some time in May.

W.V.R., 8/2/86.

Department of Public Works, Sydney, 6 February, 1886. New South Wales Government Railways—Reduction of Merchandise Rates between Sydney and the Darling River district.

On and after Wednesday, the 10th instant, the maximum rate for sugar, galvanized iron, and fencing wire from Sydney to any station on the Western line will be £30 per truck load not exceeding 6 tons; smaller quantities will continue to be charged at the ordinary tonnage rates.

From the same date the maximum rate for any class of merchandise (except gunpowder and other explosives, and sugar, galvanized iron, and fencing wire) from Sydney to Bourke for the district from Buckambie station, and all stations below having a frontage to the Darling River on the eastern side and on the western side, including Marra and the whole district south and south-west thereof, and stations lying wholly to the west of the Paroo River, will be £30 per truck not exceeding 6 tons, but the ordinary tonnage rates will be charged in the first instance and the rebate allowed on production of a certificate on a form, which will be provided by the Department, to the effect that the goods have been delivered in the districts named.

Sugar, galvanized iron, and fencing wire for these districts will be charged £24 per truck.

Wool Rates.

The rebate hitherto allowed on bales weighing not more than 250 lb. each will be extended to bales weighing not more than 280 lb., and will be applicable to all lines.

A further discount of 10 per cent. will be given upon all scoured wool properly dumped.

The necessity of hooping dumped wool of any kind with iron bands will not be insisted upon, but the rebate will be allowed, provided the bales do not exceed 20 cubic feet measurement each.

Wool put on the rail at Bourke from the districts specified in clause 2 will be allowed a rebate of 25 per cent. upon the ordinary rates.

CH. A. GOODCHAP,
Commissioner for Railways.

Re New Rail Rates for Lower Darling and west of Paroo.

Sir,

Bourke, New South Wales, 16 March, 1886.

Would you kindly advise us whether the truck rates for mixed goods will be allowed Nocoléché station, which has leasehold lands on both sides of Paroo, and Wanarring station, which has leasehold lands only on the west side of Paroo, but are in present occupation of resumed lands on east side. In the event of your deciding in favour of truck loads for Nocoléché, the stations further up the Paroo will, of course, also participate in same advantages. We would point out that until lately these stations were supplied with goods and sent their wool to Wilcannia.

We also read that our customers are entitled, under the new rates, to put (say) 2 tons each of wire, galvanized iron, and sugar, making 6 tons in all, and paying £30 or £24 per truck, according as to whether they are in or out of bounds named. Would you kindly put us right upon this subject?

Another matter we are interested in, and that is, that the truck rates, &c., may be extended to goods going into Queensland. A great number of our customers live west of the Paroo, in Queensland. Do we understand they are entitled to truck rates and advantages named in your late memo? At present we do a fair share (or rather not we, but New South Wales) of business with the Warrego and South Gregory districts of Queensland. The first-named district will—or at least part of it will—for some time deal through this Colony, but the South Australian Railway to Milparinka (perhaps to Innaninka) must draw the trade of the South Gregory district at an early date if your office do not extend some such facilities of transport as are now offered to the Albert district of this Colony. Our questions are many and our letter long, but we hope the importance of the questions will atone for same, and asking your kindest and most convenient reply.

Yours, &c.,

WILLIAMS & CO.

P.S.—We have already received orders from two stations in the Albert district, who never dealt in Sydney before. Thus the change in rates has already had a small but successful influence. The Commissioner for Railways, Sydney.

I could not well answer this at the time, but I have since seen Mr. Williams, of Williams & Co., and informed him that, for the present at all events, no further concession will be made than has been already advertised.—W. V. READ, 9/4/86. Commissioner.

Dear Sir,

27 March, 1886.

We are sending a representative of this Company to the Queensland border district, and should like to know if we may anticipate any reduction in the rates for wool, &c. from the district named *via* Bourke.

You will no doubt have noticed the reductions made by the Queensland railways.

The favour of an early reply will oblige.

Yours, &c.,

PERMEWAN, WRIGHT, & CO.

The Commissioner for Railways.

Traffic Manager.—C.A.G., 2/4/86. Urgent.

If I mistake not, Wright, Heaton, & Co.'s representative has already gone to Southern Queensland, and I need hardly point out that it would not be right to give Permewan, Wright, & Co. information which the former firm has not got. In any case, I am not aware whether it is necessary to give any facilities beyond the ordinary rates for any of the traffic of that district. I have heard, however, that some concession will have to be made if we are to bring the trade to Sydney, and when an officer goes through the Wilcannia district about the month of June, it would doubtless be well if he, or some other, should visit the country about the Queensland border, and elicit all the information possible about the trade and the rates.—W.V.R., 6/4/86. Commissioner.

Approved.—C.A.G., 12/4/86.

Gentlemen,

Department of Railways, 14 April, 1886.

Referring to your letter of the 27th ultimo, intimating your intention to send a representative to the Queensland border district, and asking whether it is probable any reduction will be made for wool forwarded from that district to Sydney, *via* Bourke, I have the honor to inform you that the matter has had attention, but so far, nothing has been decided in favour of giving any concession in the direction mentioned, but an officer from this Department will probably be sent to Queensland border about the month of June, to elicit all the information possible about the trade and rates.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

Messrs. Permewan, Wright, & Co., Sydney.

Darling River Trade.

In accordance with instructions, I enquired at the Harbours and Rivers Department as to the matters referred to by Mr. Kirkcaldie in his minute of 12/3/86. I was informed that the officer who was detached to report on the question of improving the navigation of the Darling River has not done so; that a sum of £5,000, which was placed on the Estimates dated 4th February, 1886, for snagging that river, had been reduced by Mr. Secretary Lyne to £2,500; and further, that the site proposed by this Department for the wharf at Bourke had been adopted.—J.E.P., 13/4/86. Mr. D. M'Lachlan.

Traffic Manager to see.—D.C.M'L., 13/4/86. Seen.—D.K., 27/4/86.

Dear Sir,

16 April, 1886.

We are in receipt of yours of 14th inst., and regret you cannot give us a more definite reply. Our traveller will be at Hungerford next Sunday week, and we should like to place him in possession of full information.

The arrangement for wool will be complete by the middle of May, and if nothing is decided before that date, it will be too late to influence the wool to our border.

We must respectfully ask you to reconsider this matter, as we have several old constituents in the Queensland border district, whom we should not like to see sending their traffic to the Queensland ports. We have to submit our rates at once, and if the Queensland traffic is less than ours, we cannot expect to retain the business.

If you think it advisable we will see the Minister on the matter.

Your early consideration will oblige.

We have, &c.,

PERMEWAN, WRIGHT, & CO.

The Commissioner for Railways.

If contracts are to be made in May the Traffic Manager will see that a decision as to the rates should be arrived at before. To postpone the question till June seems to be postponing it beyond available opportunity of benefiting in the decision.—C.A.G., 20/4/86.

Until

Until some one has been over the ground it is simply impossible to say what concessions will be made to divert Queensland traffic to Bourke or where the imaginary line will be drawn, beyond which the concession will be given. As far, however, as I can see at present it will not be necessary to make any reduction upon traffic to and from the Hungerford district, and Permewan, Wright, & Co. had better act upon our existing rates. If I am not mistaken Messrs. Wright, Heaton, & Co., and Lee, and M'Alister have already been over the ground and they have no more information than Permewan, Wright, & Co.—W.V.R., 26/4/86. Commissioner.

Inform that it is not likely that any reduction will be made as regards the Hungerford district.—C.A.G., 30/4/86.

Gentlemen,

Department of Railways, Sydney, 3 May, 1886.

With reference to your letter of the 16th ultimo, further respecting the proposed reduction in the rates for wool from the Queensland border district *via* Bourke, I have the honor to inform you that it is not likely that any reduction will be made as regards the Hungerford district.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

Messrs. Permewan, Wright, & Co., 178, Clarence-street, Sydney.

Re Differential Rates, Junee.

A DEPUTATION, consisting of Messrs. Humphreys, Davies, and Emslie, introduced by Mr. Gormly, M.P., waited upon me to-day with reference to the position of Junee with regard to the differential rates. Junee is 287 miles from Sydney, and is therefore shut out from participating in the reduction allowed on goods carried for distances 305 miles or more. Wagga Wagga is 22 miles further from Sydney, yet a truck of 6 tons of goods to that town is carried for £20; but against this they had to pay £6 18s. 7d. per ton, or £41 11s. 6d. for 6 tons, and in fact they could send their goods from Sydney to Wagga and have them returned to Junee for £4 5s. per ton, as against £6 18s. 7d. if they were forwarded direct. Again, on the other hand, Junee was under a disability on the up journey. They could send a ton of goods to Albury for £2 18s., but if they wanted to bring goods from Albury they had to pay £4 7s., while the same goods would be carried from Albury to "Old Junee," 5 miles further on, for £3 0s. 2d. These rates were for 3rd class goods, as it was these that were principally affected, and under the present system their town was unduly handicapped against their rival Wagga Wagga. They asked, therefore, for two things:—

1. That ordinary mileage rates be charged from Albury, or
2. The £20 truck rate be extended to Junee.

It was mentioned further that, on the South-western line, the distance where the concession commenced was 340 miles, and as Narrandera was 341 miles it enjoyed the reduction.

I informed them that, at the present time, I did not feel favourably inclined towards making any alteration in the rates from Albury to Junee or Sydney to Junee. The reason for the differential rates was on account of the ridiculously low rates fixed by Victoria to her border for the purpose of securing the border trade, and we had therefore to introduce the differential rates to compete with Victoria. That was the real object of them. In fixing these rates the line of limitation had to be drawn somewhere, and unfortunately for Junee it was drawn so as just to shut her out, other towns by the accident of their position enjoying lower rates under the differential system; but there was no doubt that, unless we adopted this system, the trade of the Riverina district would be diverted to Melbourne, and the railway revenue would suffer considerably. No doubt the differential rates were very low, but they were not fixed below a paying point.

With regard to the rebooking of goods from Wagga to Junee, I promised to obtain a return showing the extent of the rebooking. I had this information with regard to Cootamundra and quoted figures. I pointed out that the whole question required very careful consideration, as a very slight error might make a serious difficulty. I would be glad, as far as possible, to remove any disability under which they laboured, and if I could meet their wishes in any way without disturbing the system materially I would do so. I stated I was not aware Narrandera enjoyed the benefit of the truck rates, and could hardly see it was necessary as the competition with Victoria could not well extend to that town, but I promised this would have consideration in connection with the general question.—W.J.L.

Traffic Manager
for report on
this.—Ch. A. G.,
21/5/86.

No. 36.

Minute by The Secretary for Public Works.

WILL the Commissioner report?

W.J.L., 15/5/86.

Traffic Manager to furnish return of rebooking Wagga to Junee, and to report generally as to relief.—Ch. A. G., B.C., 21/5/86.

Competitive Rates—Deputation from Junee.

No doubt all the arguments advanced by the deputation which waited upon the Minister are perfectly true, but the Minister was equally to the point when he informed them that the line had to be drawn somewhere, and that, unfortunately for Junee, it had been drawn so as just to shut out that township from the reduced rates.

Had it been possible to draw the line at Wagga Wagga it would have been greatly to the advantage of the Department, from a monetary standpoint, to have done so; but if that had been done it would have resulted in our losing the Wagga Wagga trade almost entirely. Indeed, we know that just before the truck rate was introduced, goods in considerable and increasing quantities were conveyed by rail from Melbourne to Wodonga, and by team from Wodonga for as low as £3 per ton.

There has never been any necessity to apply the truck rate to Junee.

No

No doubt my minute of 9/12/85 shows that a considerable proportion of Junee traffic is consigned from Sydney to Wagga Wagga, and reconsigned from there to Junee, so as to escape the ordinary higher rates from Sydney to Junee direct; but I also showed that the small cost the Department was put to in respect of extra haulage was far more than counterbalanced by the trainage derived from the goods that were consigned direct. For the months of September and October last the extra haulage alluded to amounted to about £14, while the Department avoided a loss of £117 19s. 3d. by maintaining the ordinary rates on those goods that were sent direct.

If, in response to the wishes of the deputation, the £20 truck rate were extended to Junee, there would be no good ground for refusing it to Cootamundra (where it has already been repeatedly asked for) or even to Murrumburrah and Harden, and that, it is needless for me to say, would result in a very considerable loss of revenue.

Nor can I recommend ordinary mileage rates from Albury to Junee, because the increased rate was put on simply to counteract the very low rate charged upon the Victorian railways in respect of all goods sent from Melbourne to New South Wales north of Gerobery; but for that low rate there would be no necessity to charge more than the ordinary rate from Albury to Junee.

It was not without due consideration that the reduced rates were applied to Narrandera. It is well known that the Murrumbidgee is navigable as far up as, and often beyond, Narrandera for several months every year, and I do not doubt for one moment that if the ordinary mileage rates were charged to and from the Narrandera district (and of course the argument becomes stronger the further we go towards Hay), the trade would be done with Melbourne by river, as it was in former years.

Nothing has as yet been advanced to induce me to recommend any modification of the existing rates.
W.V.R., 28/5/86.

Uniform mileage rates, which some large number of persons advocate, because of the apparent justice of this mode of charging, would have no other effect than to enhance unduly the value of property and the development of its resources within a certain area of the shipping ports or markets of disposal, and to render unprofitable for cultivation all land beyond that area. Differential rates are therefore absolutely necessary for the development of the resources of a country and to create traffic for its railways, even in circumstances in which the element of competition for the traffic is absent. In cases where the traffic is competed for by opposing systems of carriage, or by different routes to reach the same, or perhaps another central market, the introduction of anomalies in the rates of charges is carried necessarily to a degree which, to the uninitiated, seems absurd. We have an instance of this in the conditions which operate in connection with our efforts to secure the trade of Riverina, and their peculiar application to the goods consigned to Junee; but such anomalies are not confined to our railways. Only recently the farmers of Penzance, in England, appealed to the Railway Commission for redress against the action of their railway company, which established charges by which foreign grown produce was carried from Penzance to London at a considerably less rate per ton than the same description of produce locally grown. The Company, however, successfully contended that this apparent injustice to the local farmer was really a benefit to him, for unless they had secured for their railway the traffic of the foreign grown produce—and they could not have secured it except by charging exceedingly low freights—the farmers of Penzance would have had to pay a higher charge even than they were then paying, in order that the railway might be able to make a proper return to its capital expended. If we are to continue to compete with Victoria and South Australia for the trade of our border land, I do not see how the anomalies which arise from our system of charges to secure that object are to be removed.—*C.H.A.G.*, 1/6/86.

The figures show that it is more profitable to the Department to continue the system of running goods for Junee to Wagga and return than to put them out at Junee, with the additional charge on them, because all goods are not so consigned as to escape the higher rate, and those sent direct to Junee bring in proportionately a revenue in excess of the revenue derived from the goods sent *via* Wagga even, when credited with the expense incurred in the extra haulage which that route necessitates.—*C.H.A.G.*, 1/6/86.

No. 37.

Mr. D. Brown to The Commissioner for Railways.

Sir,

Kallara Station, by Bourke, 19 May, 1886.

Allow me to bring to your recollection an interview I had with you in February last, in company with Mr. Quinn, M.P., referring to the special rates for carriage of wool and goods from and to the stations on the Darling.

I then explained, that as Kallara wool and goods required to be carried as far as there from Buckambe, we were equally entitled to the concession, and Mr. Quinn corroborated my contention. Buckambe is 128 miles from Bourke, on the same or east side of the river. Kallara is 120 miles from Bourke, but on the opposite or west side of the Darling; and, as the bridge is 4 miles above Bourke, we have that 4 miles to travel up and back again, thus making our distance quite equal to that of Buckambe.

No other station is in this position on our side of the river, the west side. The next station is Dunlop, 40 miles nearer Bourke, and, therefore, at the average rate of cartage, viz., 1s. per ton per mile, £2 a ton more favourably situated than Kallara. On the east side, the next station to Buckambe is Barranyalpa, 20 miles nearer Bourke, and, therefore £1 a ton, or just about the amount of the concession, more favourably situated. Kallara, having the same distance of road cartage as Buckambe, is, therefore, without the concession, £1 per ton at a disadvantage as compared with Buckambe and Barranyalpa, and £2 as compared with Dunlop. I therefore submit that we are equally entitled to the concession with Buckambe, and beg to ask that my contention may be considered. With the concession, I am prepared to engage that all the wool shall go by rail to Sydney. Whether there be a river or not, without the concession the wool must go *via* Adelaide. In the event of the river being navigable, anticipated clip 2,000 bales.

I am, &c.,

D. BROWN.
Traffic

Traffic Manager.—D.C.M'L., 27/5/86.

I reported upon this matter on the Commissioner's M.P., 86-1,037d, and have nothing to add thereto. For the reason stated in that report, I do not favour the granting of the reduced rate to Kallara.—W.V.R., 2/6/86. Commissioner.

Is there no paper referring to the interview which Mr. Quinn and Mr. Brown had with me.—C.H.A.G., 5/6/86. No trace of any.—L.P.I., 6/6/86. Inform.—C.H.A.G., 9/6/86.

Sir,

Department of Railways, 10 June, 1886.

With reference to your letter of the 19th ultimo and previous interview, asking that the special rates for the carriage of wool, &c., from, and goods to stations west of the Paroo may be extended to your Kallara station, I have the honor to inform you, with regret, that I am unable to comply with your request.

I have, &c.,

C. A. GOODCHAP,

Commissioner for Railways.

David Brown, Esq., Kallara Station, *via* Bourke.

No. 38.

Memo. by The Commissioner for Railways to Mr. Traffic-Manager Read.

Rates for wool from Bourke.

I WROTE recently to know whether the rise in the river would require us to revise our rates. The Minister is now inquiring on same subject. Let me know early how our rates and time of carriage compare with river-borne goods.

C.H.A.G., 23/6/86.

In accordance with your instructions I proceeded to Bourke to inquire into the prospects of the river traffic and the alleged intention of the Bourke merchants to deal with Adelaide unless large concessions in freight were made to them by this Department. My telegram on Monday conveyed to you the actual state of the case. The river is now navigable from Menindie to Brewarrina, but there being no water in the Murray to back the Darling up, and the Darling itself having commenced to fall at Mogil, unless additional rains fall in the country drained by the Namoi, Macintyre, and their tributaries, the present navigation cannot last long. None of the Adelaide steamers have yet been placed on the berth for Bourke, as although it is just possible that steamers might reach Bourke, on the present fresh it is very doubtful whether they could get back, and the experience of the last two or three years is against risking a detention in the upper waters that might last for many months or even a year. Further interviews, however, convinced me that the river traffic is not the real point of issue with the merchants at Bourke. They would deal with Adelaide quite as willingly as with Sydney. Their real grievance is (and it must be admitted that their grievance is a real one, as it affects their pockets) that owing to the concessions made to Wilcannia and the Paroo country, two or three towns are able to send goods back and undersell them at their very doors, and that much of the traffic between the Darling and the Paroo; up to the Queensland border, that used to be done with Bourke is now done by Wilcannia and other places within the favourite area. So long as the river was closed, although this concession to Wilcannia was felt at Bourke, it did not handicap the Bourke merchants so heavily as at present, when steamers can ply between Bourke and Wilcannia, carrying goods that have come from Sydney at £5 a ton down to Wilcannia for 30s., and bring them back to some station near Bourke for 20s., making the whole charge £7 10s. for freight, whereas the Bourke merchants have to pay £10 14s. 3d. a ton for 3rd class goods, and (say) £1 per ton steamer's carriage to the same place. In such an instance the differential rates would directly favour Wilcannia at the expense of Bourke to the extent of £4 4s. a ton, and in revenge for this loss of business they threaten to deal with Adelaide as soon as they can unless placed on the same footing as Wilcannia. If the river navigation was permanent the Department would, no doubt, be forced to come to terms, as the railway, except at a heavy loss, could not compete with the water carriage; but it is most intermittent, and steamship owners prefer, if possible, to load a whole cargo for one person, except when shipping on their own account, to sell on arrival. It was, therefore, the usual custom for a merchant in Bourke, taking advantage of what might be the only flood of the season to get up 500 tons of goods at a time, for which he had to pay on arrival, or in many instances before arrival. Since the railway has been opened they have been buying a few tons at a time from Sydney on the usual terms, and although, no doubt, the Adelaide merchants would meet them in every possible way, it may be questioned whether a large stock to lie idle for several months, even at cheap freight, would pay better than small stocks, the value of which was constantly being turned over and over, at a high freight. The present flood in the river has come too early for the wool. That will not be ready for another four weeks at least. I notice that the wharf at Bourke is getting on very slowly. At the present rate of progress it will not be finished this year, and that the line has not yet been extended to the river side. It is most important that we should be in a position to truck wool direct from the steamer, otherwise, should it be possible for the steamers to get down, we may lose several clips. The 3s. 6d. a ton cartage through the town of Bourke and the extra handling involved would tend to keep the wool on the steamer.—M. A. HORNIDGE, 23/6/86. Traffic Manager.

Be good enough to see the attached report from Mr. Hornidge respecting the trade of the Darling district. Nothing has occurred as yet to induce me to recommend an alteration of the existing rates in any way. As Mr. Hornidge points out, it is very questionable whether the river will remain navigable so long as to permit of boats getting up as far as Bourke, and even if it does, I am doubtful whether storekeepers and others will venture to get up such large supplies as they must obtain by river when they can keep themselves in small stocks, although for these stocks they have to pay a higher rate per ton for the finer class of goods than by river. My opinion is, that we have very little, if anything, to fear as regards the trade of the Bourke district being again diverted to Melbourne or Adelaide, so long as it is well served by railway. The cause of the agitation amongst the storekeepers is not far to seek; the reductions that were made in the rates some months ago have enabled the storekeepers of that town to outbid those of Bourke for a certain portion of the trade between the towns named, as well as a portion of the trade to the west of the Paroo, which would be done by the Bourke storekeepers if those in Wilcannia

Wilcannia had to pay full mileage rates and team carriage in addition. It must not be forgotten, however, that with a navigable river, the Wilcannia people can get their supplies landed there from Melbourne or Adelaide for rather less than we land them at Bourke, even at the reduced rates, and if we were to charge them the full mileage rates, we would get very little goods to carry for that district, even if the river were not navigable, because when the railway is completed to Silverton (or near to there) it will be from 70 to 80 miles nearer to Wilcannia than Bourke is. It is therefore in my opinion of great importance that we should get a firm hold of the trade of the district before that occurs. What may be a loss to Bourke is a gain to Wilcannia, and to the merchants of Sydney, as well as to this Department.—W.V.R., 6/7/86.

If the river runs for any length of time, we may have to reduce the advantage which Wilcannia gets over Bourke in supplying stations, in consequence of the concession made on goods going west of the Paroo, but at present there does not seem to be any reason for making a change. To foster the traffic on our railway, I must again urge the desirability of the wharf and the railway to the wharf being completed as early as possible.—CH.A.G., 9/7/86.

No. 39.

T. Jones, Esq., M.P., to The Secretary for Public Works.

Dear Mr. Lyne,

20 August, 1886.

Would you kindly have the enclosed letter from one of Mr. Want's constituents replied to and forwarded to me.

I handed you another letter on the same subject about three weeks back (I think in your office) from Mr. F. Cohen, the Secretary Adelong Progress Committee, which has not been replied to, that I am aware of. Would you oblige by seeing that it is also forwarded.

Yours, &c.,

T. JONES.

[Enclosure.]

Dear Sir,

Gundagai, 18 August, 1886.

May I call your immediate attention to the following facts that are at present acting so adversely to the prosperity of this township and district. The wool season is close at hand, and the price of wool per ton from Gundagai is fixed at £2 18s. 6d., whilst from Wagga, some 20 miles further, it is £2 8s. The carriage of all shearing supplies from Sydney by these confounded differential rates present the same disproportion, and unless something is done the entire trade of this district must, to the injury of every trader, be absorbed by Wagga. I was yesterday offered a very large order for shearing supplies and station requisites for a station holder a few miles south of here, but in the face of these rates there is no chance of competition, and without some alteration the entire trade must pass away to that highly favoured locality Wagga. Cannot something be done to meet this emergency. Our district, by population, production, and age, is entitled to equal consideration, and surely the Railway Commissioner must have learned by this time that these differential rates made for the purpose of securing trade to Sydney are to districts situated like ours the death stroke of their prosperity. Can you, my dear Sir, see him and urge these matters, as you know how, upon his attention, and by some change add one more to the many benefits we have received from your exertions.

I am, &c.,

W. BIBO.

Gundagai would appear to labour under the same disadvantages as Juneec as compared with Wagga, but so long as we have to compete with Melbourne for border trade I do not see that any alteration can be made, and the differential rates, though perhaps an evil, must be a necessity.—W.J.L., 20/8/86.

Sir,

Department of Railways, 24 August, 1886.

With reference to your letter of the 20th instant, enclosing communication from Mr. W. Bibo complaining of the disproportionate rate charged for the carriage of shearing supplies, ironmongery, &c., from Sydney to Gundagai, as compared with the rate current from Sydney to Wagga Wagga, I have the honor, by directions of Mr. Secretary Lyne, to inform you that he has given attention to the matter, but he is unable, so long as we have to compete with Melbourne for the border traffic, to see any method by which the present arrangements and differential rates can be altered.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

T. Jones, Esq.

No. 40.

Minute of The Commissioner for Railways.

Papers about Rates.

REPRESENTATION that now the Darling is navigable unless the Railway Department makes considerable concessions on freight charges the trade will be lost to Sydney at Bourke.

Reports of officers show that no change is required at present. The concession made to Wilcannia (west of the Paroo) is militating against the interests of the storekeepers at Bourke may require to be revised.

The completion of wharf at Bourke to which the railway is to be taken is a matter of importance.

End of month to see what progress has been made with wharf and railway to the river, and whether the situation has changed as regards differential rates.

Resubmitted, 1/9/86.

Traffic Manager for report.—D.C.M'L., 1/9/86.

CH.A.G., 3/8/86.

Re Bourke River traffic.

Traffic Inspector's Office, Wellington, 9 September, 1886.

THE wharf is under water, and has been for the last four weeks. The work has in consequence been suspended. It is in a very incomplete state.

So far as the goods traffic inwards is concerned the state of the river has made no perceptible difference either one way or the other. The wool, owing to the rain and strike among the shearers, is very late. It is therefore premature to report upon that traffic. It is, however, generally understood that the railway will carry the bulk of it, notwithstanding the cheap freights offered by the steamers.

Traffic Manager.

M. A. HORNIDGE.

Re

Re Murrumbidgee River traffic.

Traffic Inspector's Office, Junee Junction, 10 September, 1886.

Hay.—Up to the present, the rise in the river has not affected the traffic, except to the extent of about 16 tons of timber, which has arrived from Echuca, but I understand that the greater part of wool from district will go by river.

Carrathool.—No traffic has gone by the river yet, but I am informed that some of the wool that was sent by rail last year will go by the river.

Darlington.—I am informed that the Kerrarbury clip, which amounts to about 450 or 500 bales, will go by the river this year. The information I have been able to obtain up to the present is very vague, and I am short of replies from Narrandera, and full information from several other stations. However, I will make further inquiry, and let you know the result as early as possible.

G. J. ROBERTS.

Traffic Manager.

Be good enough to peruse the attached reports from the Traffic Inspectors. From inquiries made by Mr. Hornidge, it appears to be thought that notwithstanding the cheap freights offered by the steamers on the Darling the bulk of the wool will be forwarded by railway. My own opinion is, however, that we shall not despatch nearly so much wool from Bourke this season as we did last, and that will be due partly and no doubt principally to the low river freights, and partly to the increase which was recently made upon the railway rates, such increase having, as I have already repeatedly stated, been made at a very inopportune time. I refer of course to the increase from the competitive districts only. I have been in hopes that the wharf would have been completed at Bourke, and the railway extended to it before the wool season commenced, so that, with tolerably low railway rates, we might have reasonably expected to get a large portion of the wool from both up and down the river, but as things are I confess I do not expect to get much of it in that way, because of the expense of cartage between the river and the railway, and the additional handling. It appears from Mr. Hornidge's report that the wharf is now under water, but I should think it is hardly likely to remain so for any length of time, and very probably it will be free from water before the wool season, which, is late, begins.

I must say that I was particularly anxious to get, if possible, a firm hold upon the Darling trade this season so that commercial relations with Sydney on such a basis that there would not have been much inducement to alter them, but I now fear that, to a considerable extent, this will not be accomplished, and as the railway to the South Australian border is expected to be finished within three or four months, we shall always have a difficulty in securing a hold of the trade of the Wilcannia district. The subject is of very considerable importance, and I suggested that Mr. Evans should be sent west to make some inquiries, but have had no reply. Mr. Roberts' report *re* the Murrumbidgee trade is also enclosed, but it is not very complete. I do not, for instance, attach much importance to the statement that "up to the present time the rise in the river has not affected the traffic," because wool shearing in the district has but very recently commenced, and boats will not come up the river to lie for weeks until they can get a cargo back again. It is significant, however, that information is received both from Darlington and Carrathool to the effect that wool which was sent by rail last year will this year go by river. While competition lasts I am of opinion that it would well repay the Department to send an officer to make a tour of the competitive districts every year about the months of March or April, because the conditions are continually changing, and he could, by collecting information on the spot, know what was necessary to secure the traffic. Forwarding agents send a representative through the whole of the districts, and if it pays each firm to do so I think the money spent by the Department in the same direction would be well expended.—W.V.R., 21/9/86. Commissioner.

If it is not too late I would even now recommend such a reduction of rates as would induce at least a large quantity of the Darling and Murrumbidgee wool to be sent to Sydney.—W.V.R.

No. 41.

J. Gormly, Esq., M.P., to The Secretary for Public Works.

Sir,

Legislative Assembly, 16 September, 1886.
