Sir, Department of Public Instruction, Sydney, 4 April, 1891. Reforring to the renewed application, dated 5th March ultimo, for the establishment of a public school, at Huntingdon, and to a further report into the circumstances of the case, I am directed to state that notice of the application has been sent for publication in the Government Gazette, in accordance with the requirements of the 34th section of the Public Instruction Act of 1880.

2. A further communication will be made to you when the accompanying form of lease of the building, offered by Mr. D. Lindsay, at a nominal rent, filled up, signed by him, and returned to this office. I have, &c.

J. GIBSON

(For Under Secretary).

#### No. 17.

#### Notice for Government Gazette. New Public School.

Department of Public Instruction, Sydney, 7 April, 1891. It is hereby notified, for general information, in accordance with the provisions of the 34th section of the Public Instruction Act of 1880, that it is proposed to establish a public school at Huntingdon, Hastings

J. H. CARRUTHERS.

## No. 18.

## Lease, David Lindsay to Her Majesty the Queen.

This indenture, made the 10th day of April, in the year of our Lord 1891, between David Samson Lindsay, Huntingdon (hereinafter designated lessor), of the one part, and Her Majesty the Queen (hereinafter designated lessee, and who has agreed to take a lease of the lands and hereditaments hereinafter described on behalf of the Department of Public Instruction in the said Colony), of the other part, witnesseth that, in consideration of the rent hereinafter reserved, and the covenants, provisos, conditions, and agreements hereinafter contained, and on the part of the lessee, her successors, and assigns, to be paid, observed, and performed, the said lessor doth hereby demise and lease unto the said lessee, her successors, and assigns, all that wooden building, 24 feet by 14, situated on Huntingdon, with 1 acre of land, on which the building is erected, together with all the rights, easements, and appurtenances thereunto belonging, to hold the said messuage or tenement and premises hereby demised unto the said lessee, her successors, and assigns, from the 10th day of April, 1891, for the term of ten years thence next ensuing (determinable, nevertheless, as hereinafter provided), yielding and paying yearly and every year during the said term, unto the said lessor, his heirs and assigns, the clear yearly rent of one peppercorn, if demanded. And also shall and will, at all times during the said term, keep the said premises, excepting the roof and external walls, with their appurtenances, in as good and tenantable repair and condition as the same now are. And also that the said lessee, her successors, or assigns, shall not nor will assign or underlet or part with the possession of the said premises hereby demised, or any part thereof, without the consent in writing of the said lessor, his heirs or assigns, for every such purpose first had and obtained. And shall and will at the expiration, or sooner determination, of the said term hereby granted, which shall first happen peaceably and quietly, yield and give up unto the said lessor, his heirs or assigns, the said premises hereby demised or intended so to be, with the appurtenances, in as good tenantable repair and condition as the same now are. Provided always, and it is hereby declared that if the said yearly rent hereby reserved, or any part thereof, shall be in arrear for the space of twenty-eight days next after any hereinafter contained, and on the part of the lessee, her successors, and assigns, to be paid, observed, and hereby reserved, or any part thereof, shall be in arrear for the space of twenty-eight days next after any of the days on which the same ought to be paid as aforesaid, whether the same shall or shall not have been legally demanded, or if all or any of the covenants and agreements hereinbefore contained, on the part of the said lessee, her successors, and assigns, shall not be observed and performed according to the true intent and meaning of these presents, then, and in any of the said cases, it shall be lawful for the said lessor, his heirs, executors, administrators, or assigns, at any time thereafter, into and upon the said said lessor, his heirs, executors, administrators, or assigns, at any time thereafter, into and upon the said demised premises, or any part thereof, in the name of the whole, to re-enter, and the same to have again, ropossess, and enjoy, as of his or their first or former estate, anything herein contained to the contrary notwithstanding. And the said lessor, for himself, his heirs, and assigns, doth hereby covenant with the said lessee, her successors, and assigns, that she and they duly and and punctually paying the rent hereby reserved, and observing and performing the covenants, provisos, and agreements hereinbefore contained, and on her and their part to be observed and performed, shall and may peaceably hold, occupy, and enjoy the said premises hereby demised during the said term without any interruption by the said lessor, his heris or assigns, or any person or persons lawfully claiming, or to claim, by, from, or under him or them. Provided also, and it is hereby agreed and declared, that if the said premises hereby demised, or any part thereof shall at any time during the said term be destroyed or rendered uninhabitable by fire or tempered. thereof, shall at any time during the said term be destroyed or rendered uninhabitable by fire or tempest, then and in such case the payment of the rent hereby reserved, or a proportionate part thereof, according to the extent of the damage incurred, shall be suspended until the said premises shall have been rejustated and again rendered fit for habitation. And if any question shall arise whether the said premises or any part thereof shall have been rendered uninhabitable by reason of fire or tempest within the meaning of the aforesaid provise, or as to what proportion of rent ought to be suspended on account thereof, such question shall be referred to arbitration in the usual way, under and subject to the provisions of the Act or Acts then in force in the said Colony relating to arbitration.

DAVID LINDSAY (L.S.)

Witness,

#### RICHARD RICHARDSON.

The Honorable Joseph Hector Carruthers, Minister for Public Instruction for the time being of the said Colony of New South Wales, doth hereby approve of these presents, as obligatory on Her Most Gracious Majesty the Queen, and on the Government of New South Wales.

As witness his hand this 14th day of April, in the year of our Lord 1891.

#### No. 19.

## Mr. District-Inspector Lobban to The Chief Inspector of Schools.

Chief Inspector, I advise that the Minister adhere to his decision to reopen the school at Huntingdon. This will cost the Department little, and will practically decide the relative claims of the two factions. The people on the Brombin side of the river think that the Huntingdon people should be made to send their children across the river; but I venture to assert that they would cry out as bitterly as their opponents if they were asked to send their children to Huntingdon. A.L.

Under Secretary,-I concur.-W.M., 22/4/91. Submitted.—E.J., 25/4/91. Approved .-J.H.C., 28/4/91.

#### No. 20.

Mr. District-Inspector Lobban to The Chief Inspector of Schools.

Chief Inspector, Former papers were posted before I received those now on hand. See my recommendation on paper attached.\* I would only add hereon that Mr. Summerville is married to a sister of Mr. No. 19. Lindsay, and I understand that the families are unfriendly; and while there is no school at Huntingdon, a number of children are growing up in ignorance, as the river is a sufficient barrier to prevent successful action being taken under the compulsory clauses of the Public Instruction Act. I can only repeat the recommendation given on the attached letter from Mr. M'Kenzie, viz., that the Minister adhere to his decision to reopen the school at Huntingdon.

The Under Secretary, Department of Public Instruction, to J. II. Young, Esq., M.P.

Establishment of Public School.

Sir,

Department of Public Instruction, Sydney, 22 April, 1891.

With reference to a letter from this office dated 4th instant, in which you were informed that notice of the application for the establishment of a public school at Huntingdon had been sent for publication in the Government Gazette, I am now directed to acquaint you that the Minister of Public Instruction has finally resolved to establish a public school at that place.

2. The lease of the proposed building having been received at this office, steps are being taken for

the appointment of a suitable teacher.

I have, &c.,
J. GIBSON (For Under Secretary.)

#### No. 22.

The Under Secretary, Department of Public Instruction, to W. H. Vivian, Esq., M.P.

Establishment of a Public School.

Sir, Department of Public Instruction, Sydney, 22 April, 1891. #### No. 25.

The Under Secretary, Department of Public Instruction, to Mr. J. Summerville.

Department of Public Instruction, Sydney, 4 May, 1891. With reference to your letter of the 2nd ultimo, protesting against the establishment of a public school at Huntingdon, I am directed to acquaint you that, having again considered the matter, the Minister of Public Instruction has resolved to adhere to his former decision, viz., that a public school be opened in that locality.

I have, &c., J. GIBSON (For Under Secretary).

#### No. 26.

The Under Secretary, Department of Public Instruction, to Mr. District-Inspector ·Lobban.

Huntingdon-Proposed establishment of a public school at-Protests by Messrs. Mackenzie and Summerville.

Department of Public Instruction, Sydney, 4 May, 1891. THE abovementioned gentlemen have been informed that, having again considered this matter, the Minister has resolved to adhere to his former decision, viz., to open a public school at Huntingdon.

J. GIBSON (For Under Secretary).

#### No. 27.

Mr. J. Summerville to The Under Secretary, Department of Public Instruction.

Orange Grove, Hastings River, 11 May, 1891. In reply to yours of the 4th ultimo, I still protest against the establishment of a school at Huntingdon, as it means closing Brombin Public School within six months. The proposed school at Huntingdon is three-quarters of a mile from Brombin school. The river is a mere excuse, as there is not more than 1 chain of water for the boat to cross, and as still as a millpond. It will be one of the greatest injustices done to any community to break up one school for the establishment of another, which it will do in this case, which has been shown by Inspector Willis and Inspector Nolan, and all local correspondence has been looked upon as unworthy of notice.

I have shown the matter as fair and clear as possible.

JAS. SUMMERVILLE,

Member of Public School Board, Sub-district of Wauchope.

District-Inspector Lobban for report.—J.M.G. (for Chief Inspector), 22/5/91.

#### No. 28.

J. H. Young and W. H. Vivian, Esqs., Ms.P., to the Minister of Public Instruction. Sir,

Sydney, 14 May, 1891. We have the honor to request that we may be furnished with copies of all correspondence, minutes, reports, &c., connected with the reopening of the public school at Huntingdon.

Yours, &c.,

J. H. YOUNG, W. H. VIVIAN.

Submitted.—This is the first application of its kind.—E.J., 20/5/91. This matter must be declined, as such are only furnished on Parliamentary resolution. -J.H.C., 25/5/91.

#### No. 29.

The Under Secretary, Department of Public Instruction, to J. H. Young and W. H. Vivian, Esqs., Ms.P.

Department of Public Instruction, Sydney, 20 May, 1891. Gentlemen, In acknowledging the receipt of your letter of the 14th instant, applying for copies of all correspondence in connection with the reopening of a public school at Huntingdon, I have to state that the request has been submitted for the Minister's consideration, and that a further communication in the matter will be addressed to you as early as possible.

I have, &c., E. JOHNSON,

Under Secretary.

#### No. 30.

The Under Secretary, Department of Public Instruction, to J. II. Young and W. H. Vivian, Esqs., Ms.P.

Gentlemen, Department of Public Instruction, Sydney, 21 May, 1891. With reference to your letter of 14th instant, requesting that you may be furnished with copies of all correspondence, minutes, reports, &c., connected with the reopening of the public school at Huntingdon, I am directed to acquaint you that the Minister of Public Instruction is not prepared to accede to your application, inasmuch as such documents are only supplied upon a resolution of Parliament. I have, &c..

E. JOHNSON, Under Secretary.

#### No. 31.

Mr. District-Inspector Lobban to The Chief Inspector of Schools.

Chief Inspector, I still advise that the Minister's decision be adhered to. The Department will be put to little expense in the matter, and if it be true, as Mr. Summerville asserts, that the opening of a public school at Huntingdon will close the one at Brombin in six months; the only inference I can draw therefrom is that the latter school was established in the wrong place.

A.L..

26/5/91.

#### No. 32.

## Mr. J. Summerville to G. R. Dibbs, Esq., M.P.

Dear Sir. Orange Grove, Hastings River, 4 June, 1891. Mr. Young will ask for all papers connected with the proposed public school at Huntingdon to be laid on the Table of the House. Would you be kind enough to take the proper steps to have the matter properly discussed. You will see by all the correspondence that it is an unjust act for the Minister of Public Instruction to break up Brombin Public School to erect another within 1½ mile through a small river. The Huntingdon children have attended Brombin school for seven years, and can I remain, &c.

JAMES SUMMERVILLE.

District-Inspector Lobban for report.—J.M.G. (for Chief Inspector), 19/6/91.

#### No. 33.

The Under Secretary, Department of Public Instruction to G. R. Dibbs, Esq., M.P.

Department of Public Instruction, Sydney, 19 June, 1891. I am directed to acknowledge the receipt of Mr. James Summerville's letter, dated 4th instant, presented by you, objecting to the erection of a public school at Huntingdon, on account of the proximity of the public school at Brombin, which is situated upon the opposite side of the Hastings River.

2. I have further to state that upon the urgent representations of the residents of Huntingdon, supported by the Members for the district and in view of the effect of a temporary building at a person

supported by the Members for the district, and in view of the offer of a temporary building at a peppersupported by the Memoers for corn rental, the Minister of Public Instruction authorised one respectively.

The Minister, however, has not decided to erect school buildings.

I have, &c.,

J. GIBSON corn rental, the Minister of Public Instruction authorised the reopening of the public school at that

(For Under Secretary).

#### No. 34.

## Mr. District-Inspector Lobban to The Chief Inspector of Schools.

Chief Inspector, I have no personal interest in this matter, and my recommendation "That a temporary school be opened at Huntingdon in the premises offered free of cost by Mr. Lindsay," was simply due to the fact that I desired to give the residents on that side of the river a chance of availing themselves fully of the means of education afforded by the Department without having to incur the risk of accident in crossing a river which is often swellen, and on which there is no ferry. My proposal, which was adopted by the Minister, will test the matter thoroughly as to where the bulk of the school population is centered; and if the vested buildings are found to be on the wrong side of the river, there should be no hesitation in recommending their removal to a more suitable site on the opposite side of the river. I cannot see that school-buildings should not be removed if they become uncentral, even although a small minority should suffer in consequence. It is, however, not contemplated to close the Brombin Public School, nor has any one except Mr. Summerville suggested such a thing.

District Inspector.

Under Secretary. I recommend that Mr. Dibbs, M.P., and Mr. Young, M.P., be informed of the substance of this report.—W.M., 6/7/91. Submitted.—E.J., 8/7/91. Approved.—J.H.C., 9/7/91.

#### No. 35.

The Under Secretary, Department of Public Instruction, to G. R. Dibbs, Esq., M.P.

Department of Public Instruction, Sydney, 15 July, 1891. With further reference to Mr. James Summerville's letter of 4th June, objecting to the crection of a public school at Huntingdon, Hastings River, and adverting to my communication of 19th June, No. B. 91-6,936, addressed to you, I am now directed to acquaint you that it was the Minister's desire to give the residents on that side of the river a chance of availing themselves fully of the means of education offered by the Department, without having to incur the risk of accident in crossing a river which is often swollen, and on which there is no ferry. The proposal will thoroughly test the question as to where the bulk of the school population is centered. Moreover, it has not been contemplated by the Minister to close the Brombin school on the opposite side of the river, nor has anyone except Mr. Summerville suggested such I have, &c., E. JOHNSON,

Under Secretary.

No. 36.

#### No. 36.

The Under Secretary, Department of Public Instruction, to J. H. Young, Esq., M.P.

Sir,

Department of Public Instruction, Sydney, 15 July, 1891.

Adverting to my letter of 21st May last, No. B. 91-5,946, and to previous correspondence, with respect to the opening of a public school, at Huntingdon, Hastings River, I am directed to acquaint you that the Minister of Public Instruction has had under notice a letter, dated 4th June, from Mr. James Summerville, presented by Mr. Dibbs, M.P., in which objection is taken to the erection of a public school at that place, on account of the proximity of the public school at Brombin, which is situated upon the other side of the river other side of the river.

2. In connection with this matter, I have to state that upon the urgent representations made, and in view of the offer of a temporary building at a peppercorn rental, the Minister authorised the reopening of a school at Huntingdon. It was desired to give the residents on that side of the river a chance of availing themselves fully of the means of education afforded by the Department, without having to incur the risk of accident in crossing a river which is often swollen, and on which there is no ferry. The proposal will test the question thoroughly as to where the bulk of the school population is centered.

3. The Minister also wishes it to be understood that it has not been contemplated to close the

Brombin School, nor has anyone except Mr. Summerville suggested such a thing.

I have, &c., E. JOHNSON, Under Secretary.

(RETURN, &c.)

Ordered by the Legislative Assembly to be printed, 7 October, 1891.

[Laid upon the Table of the House in answer to Question No. 9 of Wednesday, 7 October, 1891.]

## Question.

(9.) Workshors, Cookery Classes, Garden Work, &c., established in Schools:—Dr. Ross asked The Minister of Public Instruction,—In how many schools have workshops, cookery classes, garden work, tree-planting, bee-keeping, &c., been established, and the name of the school and district in each case respectively?

#### Answer.

#### Workshops.

Fort-street. Sydney.
Crown-street ...
Blackfriars ...
Sussex-street ...
\*Maitland High School, Maitland.
\*West Maitland

\*East Maitland, Maitland.

\*St Ethel's "

†Goulburn, Goulburn.

†North Goulburn "

†South Goulburn ",

#### COOKERY CLASSES.

Fort-street, Sydney. Blackfriars ,, Crown-street ,, Glebe ,, Newtown, Sydney. Balmain ,, Bathurst. Bathurst.

No special classes for garden work or bee-keeping have been established, but wherever good practical instruction in those subjects has been given the teacher is awarded a bonus. Last year thirty-five teachers received bonuses. The names of the teachers and their schools are published in the Annual Report of the Department.

† One workshop provides for these schools.

<sup>\*</sup> One workshop provides for these schools.

## UNIVERSITY OF SYDNEY.

#### No. 1.

The Chancellor to The Minister of Public Instruction.

Sir, Wallaroy, 3 April, 1891. I have the honor to inform you that at a large meeting held on the 18th ultimo, under the presidency of the Countess of Jersey, of the committee for obtaining the necessary subscriptions for the proposed Women's College in affiliation to the University, it was reported by the honorary treasurer that the sum of £5,000 required for building, under the terms of the Act of Parliament, for the establishment and endowment of the college, had been fully subscribed, together with a surplus of about £300, and that about £3,000 of the amount had been paid, and that the rest was secure, and principally secured

by writing.

I have further to state that the meeting (many of the members of which were already cognisant of the facts) was satisfied with the report; and that, in view of the fact that it devolved on me as Chancellor of the University to convene a meeting for the election of councillors, and in view of the further facts that the satisfaction of the Governor as to the due contribution of £5,000, and the payments and securities, and the election of the twelve councillors required by the Act, constituted the sole conditions for the proclamation for the incorporation of the college, the meeting requested me to communicate with the Government in respect of the former of these conditions, and to convene a meeting for the election of councillors as required by the latter.

I have since examined the books and vouchers of the treasurer, and am personally and officially satisfied that more than the requisite proportion of actual payments has been made to satisfy (pro rata) the provisions of the General Affiliated College Act, and that the required balance is sufficiently secured.

It would seem, therefore, that as no priority is assigned by the Act to either the satisfaction of the Governor on this subject, or the election of councillors, it would be competent to me now to convene a meeting for the latter purpose, but I have declined to do so, until the "satisfaction of the Governor," in accordance with the first section of the Women's College Act, shall have been signified or become officially assured.

With the view of obtaining this signification or assurance, I now do myself the honor to address you as the Minister, through whom His Excellency, with the advice of the Executive Council, must be approached, and to invite you to make such inspection of the vouchers for the subscriptions, as you may

think necessary.

For this purpose, the honorary treasurer, Mr. A. Newham, B.A., and if practicable, the honorary auditor, Mr. Weigall, will wait upon you with the vouchers at your convenience, and I will myself accompany them.

Should you, as Minister, be then satisfied that the requirements of the Act have been met, I shall be prepared to assume that the formal "satisfaction" of the Governor will be signified in due course;

and I will at once convene the meeting for the election of the councillors.

I may state that the surplus over £5,000 already announced, together with further contributions which will be sought by the committees, will be applied to the equipment of the college, which will be at the sole cost of the subscribers. Meanwhile, the existing surplus of subscription constitutes a margin which may be relied on as more than sufficient to cover any supposable deficiency, and in realising portions of the requisite £5,000.

The committee are anxious to secure the incorporation of the college without delay, so that the council may be in a position to proceed promptly to the practical establishment of the college, and the discharge of all incidental functions. I would therefore ask the favour of an early appointment for

examining the subscription lists and vouchers.

Perhaps you will permit me to state that Monday next, 6th instant, 2.30 p.m., would very conveniently fall in with my arrangements for University work.

I may add that I am desirous of announcing the completion of the money conditions in my Commemoration address on the 11th instant.

Mr. Newham and I, and perhaps Mr. Weigall will therefore be at your offices at that time, in the hope of finding you disengaged, unless warned that it will not be suitable to yourself.

I have, &c., W. M. MANNING,

Chancellor, Sydney University. I think that as this matter involves a large sum, £5,000, my honorable colleague, the Treasurer should be asked to depute an officer to attend and investigate this matter. I should prefer it to be left to our respective Under Secretaries. See Mr. McMillan to get an appointment made, if he concurs, and inform the Chancellor that I cannot receive him to-day, owing to other business, but will let him have an appointment later in the week.-J.H.C.

Sir W. Manning informed by telegram and note.—T.G.W., 6/4/91, a.m. Letter to Sir William

Manning, 10/4/91.

#### No. 2.

The Under Secretary of Public Instruction to The Chancellor.

Department of Public Instruction, Sydney, 10 April, 1891. Sir. With reference to your letter, dated 3rd instant, I am directed to acquaint you that the vouchers and other documents submitted by the honorary treasurer of the Women's College Fund do not contain sufficient information to enable the matter to be dealt with under clause 1 of the Women's College University Endowment Act.

2. Mr. Newham has been communicated with for further necessary information, but, in any case,

the approval of His Excellency the Governor could not be obtained for at least a fortnight.

I have, &c. E. JOHNSON,

Under Secretary.

## No. 3.

Mr. A	L. I	Newham	to	The	Minister	of	Public	Instruction.
-------	------	--------	----	-----	----------	----	--------	--------------

Chambers, 89, Elizabeth-street. Dear Sir, I beg to enclose the statement of our account current and deposits received from the Commercial Bank.

The amount in account current is about £1,000 greater than when I made my statement for your perusal, showing that Miss E. Walker's subscription is now paid. Yours, &c., A. NEWHAM,

Hon. Treasurer.

[Enclosures.]

The Hon. Treasurer, Women's College.

Hon. Treasurer, Women's College.

Dear Sir,

I beg to advise you that the amount at the credit of your account is £1,19 ) 10s.

Yours, &c.,

F. A. SCRIVENER

				Hon.

Dear Sir,

Chambers, 89, Elizabeth street, 16 April, 1891.

There is a meeting of the Ladies' Committee of the Women's College to-morrow, at 11 a.m. I should be very much obliged if you could let me have the Women's College books back some time to-day, so that I may be able to get them entered up, and use them at the meeting.

I should like to announce to the meeting that the Minister and the Governor are satisfied with the state of the

I have, &c., A. NEWHAM. subscription list if such is the fact.

E. Johnson, Esq., Under Secretary of Public Instruction, -Received three books for Mr. Newham. -M. Francis, 16/4/91,

## No. 4.

## Mr. A. Newham to The Under Secretary of Public Instruction.

Chambers, 89, Elizabeth-street, 21 April, 1891. Sir, I am in receipt of your favour of the 16th instant, the contents of which, I will own, disappointed me. I had understood from the Minister that it was not his intention to insist on any extreme formality in the securities so long as it was certain that the subscriptions would be paid.

I have no doubt that I can get more formal securities if the Minister insists upon it; but before doing so, I should like to hear from you what are the Minister's views on the subject, and which of our present ones he regards as insufficient.

I will do myself the honor of waiting upon you at 2.30 p.m. to-morrow (Wednesday), if quite convenient to you, to learn from you what form of security would be regarded as sufficient within the I have, &c., A. NEWHAM, meaning of the Act.

Hon. Treasurer, Women's College Fund.

Informed that Under Secretary will be engaged on Wednesday, at 230, but that he would be glad to see Mr. Newham at 230 on Thursday.—H.W., 21/4/91.

#### No. 5.

## Minute of The Chief Clerk.

Women's College.

13 April, 1891.

Two certificates have been received from the Commercial Banking Company of Sydney, stating that there is to the credit of the fund on a fixed deposit £2,957 19s. 9d.; on current account, £1,190 10s.; total, £4,148 9s. 9d. Written promises to pay certain sums, ranging from £1 1s. to £600, at various periods extending in some instances over three years, are furnished, amounting in all to £956 4s., but it is a question if such promises can be accepted in terms of clause 1 of the Act (copy herewith), as the contributions are not secured, only promised.

J. GIBSON, Chief Clerk.

Submitted.—E.J., 13/4/91. Securities not approved of.—H.P., 13/4/91. Inform Sir William Manning and Mr. Newham that the subscriptions are not secured to the satisfaction of the Minister.— Inform Sir William J.H.C. Informed.—A.R.C., 16/4/91.

## No. 6.

## The Under Secretary of Public Instruction to The Chancellor.

Sir,

Department of Public Instruction, Sydney, 16 April, 1891.

With reference to my letter of 10th instant, respecting the Women's College Fund, Mr. Carruthers desires me to acquaint you that the subscriptions alluded to in Schedule A, furnished by Mr. Newham, are not secured as required by section 1 of the Women's College University Endowment Act. J have, &c., E. JOHNSON,

Under Sccretary.

#### No. 7.

## The Under Secretary of Public Instruction to Mr. A. Newham.

Sir. Department of Public Instruction, Sydney, 16 April, 1891. With reference to your letter, received at this office on Saturday last, enclosing statements of accounts in connection with the Women's College Fund, Mr. Carruthers desires me to acquaint you that the subscriptions, referred to in Schedule A, furnished by you, are not secured as required by section 1 of the Women's College University Endowment Act. I have, &c., E. JOHNSON,

Under Secretary.

#### No. 8.

## Mr. A. Newham to The Under Secretary of Public Instruction.

Sir. Chambers, 89, Elizabeth-street, 23 April, 1891. With reference to your letter of the 16th instant, and a conversation that I had yesterday with the Chief Clerk of your Department on the subject of subscriptions to the Women's College Fund promised, but not at present paid, I have the honor to request that you will kindly ascertain what security for the due payment of such subscription would be considered sufficient by the Honorable the Minister I have, &c., A. NEWHAM, of Public Instruction.

Hon. Treasurer, Women's College Fund.

A security will be accepted as sufficient when there is a promise which can be enforced either against the promissor or his personal representatives. At present the securities tendered could be repudiated in case of the death of the promissor. Letters from the principal donors, stating that, in consideration of the Government and the council proceeding with the carrying out of the provisions of the Act, they promise to pay the several sums set out, will be sufficient.—J.H.C.

Sir William Manning and Mr. Newham informed.—T.G.W., 29/4/91.

#### No. 9.

## The Under Secretary of Public Instruction to Mr. A. Newham,

Sir. Department of Public Instruction, Sydney, 27 April, 1891. 1 am directed to acknowledge the receipt of your letter, dated 23rd instant, inquiring what security for the payment of promised subscriptions to the Women's College Fund would be considered sufficient by the Minister of Public Instruction.

1 have, &c., l have, &c., J. GIBSON

(For Under Secretary).

#### No. 10.

## The Under Secretary of Public Instruction to The Chancellor.

Sir. Department of Public Instruction, Sydney, 29 April, 1891. I am directed to acquaint you that the Minister of Public Instruction has had under notice your letter dated 25th instant, in which you suggest that he should personally look into the matter of the security of certain promised subscriptions to the proposed Women's College.

2. In connection with this matter, Mr. Carruthers has now made the following minute:-A security will be accepted as sufficient when there is a promise which can be enforced either against the promissor or his personal representatives. At present the securities tendered could be repudiated in case of death of the promissor. Letters from the principal donors, stating that, in consideration of the Government and the council proceeding with the carrying out of the provisions of the Act, they promise to pay the several sums set out, will be I have, &c., E. JOHNSON, sufficient.'

Under Secretary.

## No. 11.

## The Under Secretary of Public Instruction to Mr. A. Newham.

Department of Public Instruction, Sydney, 29 April, 1891. Sir. I am directed to acquaint you that the Minister of Public Instruction has had under notice your letter dated 23rd instant, in which you inquire what security for the payment of certain promised subscriptions to the proposed Women's College would be regarded as sufficient.

2. In connection with this matter, I am instructed to subjoin a copy of the Minister's minute:-"A security will be accepted as sufficient when there is a promise which can be enforced either against the promissor or his personal representatives. At present, the securities tendered could be repudiated in case of death of the promissor. Letters from the principal donors stating that in consideration of the Government and the council proceeding with the carrying and the provisions of the Act they promise to pay the several summent and the council proceeding with the carrying and the council proceeding with out of the provisions of the Act, they promise to pay the several sums set out, will be sufficient."

I have, &c., tc., E. JOHNSON, Under Secretary.

#### No. 12.

## The Chancellor to The Minister of Public Instruction.

25 April, 1891.

I daresay you will recollect my telling you that I was calling a meeting for the election of councillors for the Women's College on 2nd May, and that you told me to the effect that you had no doubt that the question of the Governor's satisfaction as to the subscriptions would be all right by that

This was at the Commemoration.

Since then I have received two official letters from your Under Secretary suggestive of some difficulties about the securities for the unpaid amounts, but without stating their nature. The honorary treasurer of the committee has also been in communication with that officer, but without as yet obtaining any light as to the nature of the difficulties, if any: If they were mentioned, they could be removed

oither by explanation or by the application of a remedy.

I cannot myself conceive how there can be any substantial difficulty, as more than £4,000 is actually in hand, and for the rest—up to the further sum of £1,000—the securities are such as no man can question within the meaning of the Act. So at least I should think.

But this hanging on of the supposed difficulties is very embarrassing to me, and I must carnestly

ask you to take the matter in hand personally—you will see that in my statutory position as convener of the election meeting, I shall be expected to explain about the money question, and it would be very unpleasant to tell the subscribers that there was an undisclosed hitch on the part of the Government as to the security of some of their subscriptions.

But I feel sure that you have only to look into the matter yourself, from the higher point of view of adviser to his Excellency, to be satisfied at a glance either that there is nothing unsatisfactory or that

it is outside the limits of the £5,000.

Yours, &c., W. M. MANNING.

Mr. Gibson will personally submit the papers at 11 a.m., to-morrow, Tuesday.—J.H.C.

## No. 13.

## The Under Secretary of Public Instruction to The Chancellor.

Sir,

Department of Public Instruction, Sydney, 28 April, 1891.

I am directed to acknowledge the receipt of your letter dated 25th instant, in which you suggest that the Minister of Public Instruction should personally look into the matter of the security of the subscriptions to the proposed Women's College, and to acquaint you that the matter is under consideration.

I have, &c.,

E. JOHNSON, Under Secretary.

## No. 14. Memorandum of The Crown Solicitor.

Memo. re Women's College.

Sir. Crown Solicitor's Office, Sydney, 29 April, 1891. It appears to me under the Act 18 Vic. No. 37 sect. 2. the Governor is bound to see that the balance is satisfactorily secured.

A more promise or even a bond is not sufficient, unless there is a good and satisfactory penalty

properly and sufficiently secured.

A mortgage on land, or a deposit receipt in a bank, or a bond with two good and sufficient sureties in a penal sum of, say, £1,800 to secure the balance, is a sufficient security.

If no other security can be obtained, then a joint and several bond of a sufficient number of the subscribers might be taken limiting the liability of each to an amount, say in all, not exceeding 20 nor subscribers might be taken limiting the liability of each to an amount, say in all, not exceeding 20 per cent. in excess of his promised subscription or contribution.

Or a bank could discount (as it were) the promises, and give their deposit receipt for the amount

payable at the expiration of the time fixed in the Act.

I have, &c., E. S.

(Pro John Williams), Crown Solicitor.

Submitted.—E.J., 29/4/91. Send the letter on my minute as noted.—J.H.C., 29/4/91. William Manning and Mr. Newham written to.—T.G.W., 29/4/91.

## No. 15. The Chancellor to The Minister of Public Instruction.

Women's College.

Sir, 30 April, 1891. I have to acknowledge your favour of the 29th instant, and to state in reply that I will advise

the honorary treasurer of the committees for the fund to obtain undertakings in the form you desire, and that I anticipate no difficulty in the matter.

I take the opportunity for saying that although I am acting as Chancellor of the University, I do so only in virtue of the Women's College Act, and not otherwise officially as Chancellor, or on behalf of the Senate. The University will not be concerned with the college until it has been incorporated. For the Senate. The University will not be concerned with the c this reason I write personally and not through the Registrar. I have, &c., W. M. MANNING.

Submitted.—E.J., 4/5/91. I have replied.—J.H.C., 4/5/91.

#### No. 16.

## Mr. A. Newham to The Under Secretary of Public Instruction.

Chambers, 89, Elizabeth-street, 12 May, 1891. I have the honor to forward, for the inspection of the Honorable the Minister of Public Sir, 1. Letter from Professor Scott, securing his subscription of £600 in the form given by the

Minister's minute communicated by you to me in your letter of the 29th ultimo.

2. Certificate by Commercial Banking Company that the fixed deposits on account of the Women's College Fund amount to £4,477 19s. 9d.

3. Certificate that the amount to the credit of the Women's College, in account current, is £2 13s.
4. These sums, together with the £600 subscription of Professor Scott, amount to £5,080 12s. 9d.

This is in addition to £285 3s. promised in writing, and included in my former schedule, and which the Minister regarded as not sufficiently secured, and which is still outstanding.

There is also £140 16s. 10d. promised, but not secured in any way by writing.

The necessary expenses of the fund up to date have amounted to £90 13s. 7d., against which we have received interest to the amount of £49 19s. 9d.

There is also interest accruing on the fixed deposits to the extent of about £212.

I have, &c. A. NÉWHAM.

/91. I think all is now satisfactory, and the Executive minute may be Executive minute prepared, 21/5/91. Mr. Newham and the Honorable Submitted.—E.J., 18/5/91. prepared.—J.H.C., 20/5/91. E Sir William Manning asked to furnish names of the twelve elected councillors, 22/5/91.

#### [Enclosures.]

Dear Sir Commercial Banking Company of Sydney, 11 May, 1891. I beg to advise you that the amount at the credit of your account is £2 13s.

Yours, &c. ROBERT DEANE

(For Accountant).

A. Newham, Esq., Hon. Treasurer, Women's College, 89, Elizabeth-street.

#### No. 20.

#### Mr. A. Newham to The Under Secretary of Public Instruction.

Chambers, 89, Elizabeth-street, 27 May, 1891. Sir, The Chanceller of the University, Sir William Manning, has forwarded to me your letter of the 22nd instant, and requests me to convey to the Honorable the Minister of Public Instruction through you his thanks for the communication, and requests me also to state that the election of twelve councillors, of whom four at least shall be women, is to take place on Saturday, the 30th instant, under nominations already made of twelve gentlemen and eighteen ladies, and that he will forward to the Minister a return of the results of the ballot as soon after its termination as practicable.

1 have, &c., A. NEWHAM, Hon. Treasurer, Women's College Fund.

#### No. 21.

#### The Chancellor to The Minister of Public Instruction.

University of Sydney, 6 June, 1891.

I have the honor to certify for the information of His Excellency the Governor that, in accordance with the Act passed in the 53rd year of Her Majesty's reign, entitled "An Act to establish and endow a college for women within the University of Sydney."

The following persons were, on the 30th May now last past, duly elected by the subscribers and contributors to the endowment fund mentioned in that Act to be the twelve elected councillors of the college. That is to say:—Walter Scott, M.A.; James Thomas Walker; Mungo M'Callum, M.A.; Richard Teece; George Edward Rich, M.A.; William Henry Suttor, M.L.C.; Albert Bythesea Weigall, B.A.; Johanna Cornelia Gurney; Mary Isham Garran; Mario Florence Fairfax; Jane Foss' Russell, M.A.; Emmeline Mary Woolley.

2. It will be seen that the requirement of the Act that of the number of twelve councillors "at least four shall be women "has been fulfilled; five women having been elected.

3. This report is made by me as being the officer directed by the Act to convene the meeting for the election, and on whom, therefore, has impliedly devolved the duty of certifying the result for the information and satisfaction of His Excellency the Governor, under the first section of this Act.

I have, &c, W. M. MANNING, Chancellor of the University of Sydney, and President at the ballot. Sir,

University of Sydney, 6 June, 1891.

Referring to my accompanying certificate of the due election of twelve councillors for the Women's College, and to the communications you have already received as to the subscriptions and contributions to the endowment funds, I have now the honor to express the hope that you will be good enough to lay them before His Excellency the Governor, and to move His Excellency to issue the proclamation contemplated by the first section of the Act for the incorporation of the college.

2. I may be permitted to observe that the election of the twelve elected councillors only is required to precede the proclamation, and that the addition of two ex-officio councillors by the Senate must be subsequent to the incorporation, inasmuch as the college will not until then be legally affiliated to the University.

I have, &c.,

W. M. MANNING,

Chancellor of the University.

### No. 22. Proclamation.

New South Wales, to wit.

PROCLAMATION by His Excellency the Right Honorable Victor Albert George. Earl of Jersey, a Member of Her Majesty's Most Honorable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South

(L.S.) JERSEY. Governor. Wales and its Dependencies.

In pursuance of section 1 of the Women's College University Endowment Act 53 Vic. No. 10, I, Victor Albert George, Earl of Jersey, the Governor aforesaid, with the advice of the Executive Conneil, do hereby notify that it has been shown to my satisfaction that the sum of £4,480 18s. 9d. has been paid towards the endowment of the proposed college for women, within the University of Sydney, and that a further sum of £600 (making a total of £5,080 12s. 9d.) has been secured to be paid, and that the undermentioned twelve councillors for the government of the said college, in accordance with the constitution thereof, have been duly elected:-

Walter Scott, M.A. James Thomas Walker. Mungo M'Callum, M.A. Richard Teece. George Edward Rich, M.A. William Henry Suttor, M.L.C. Albert Bythesea Weigall, B.A. Johanna Cornelia Gurney. Mary Isham Garran. Marie Florence Fairfax. Jane Foss Russell, M.A. Emmeline Mary Woolley.

Given under my hand and scal at Government House, Sydney, this seventh day of July, in the year of Our Lord, one thousand eight hundred and ninety-one, and in the fifty-fifth year of Her Majesty's reign.

By His Excellency's Command,

GOD SAVE THE QUEEN!

J. H. CARRUTHERS.

#### No. 23.

Minute Paper for the Executive Council.

No. 503.

University of Sydney-Endowment of Women's College.

Department of Public Instruction, Sydney, 9 June, 1891.

Pursuant to section 1 of the Women's College University Endowment Act (53 Vic. No. 10), I submit, for the approval of His Excellency the Governor-in-Council, papers and statements showing that the sum of £4,480 12s. 9d. has been paid towards the endowment of the proposed college for women, within the University of Sydney, and that a further sum of £600 (making a total of £5,080 12s. 9d.) has been secured to be paid; and that the under-mentioned twelve councillors for the government of the said college in accordance with the constitution thereof has been dally elected. college, in accordance with the constitution thereof have been duly elected :-

### LEGISLATIVE ASSEMBLY.

## NEW SOUTH WALES.

## EDUCATION.

(MINUTE BY THE MINISTER OF PUBLIC INSTRUCTION, DATED 7TH FEBRUARY, 1890, ON THE SUBJECT OF FREE ELEMENTARY EDUCATION.)

Ordered by the Legislative Assembly to be printed, 14 March, 1892.

RETURN to an Order made by the Honorable the Legislative Assembly of New South Wales, dated 10th February, 1892, That there be laid upon the Table of this House,-

"Copies of all papers, minutes, and documents of record in the Department " of Public Instruction upon the general subject of free education in public "schools."

## (Mr. Alfred Allen.)

## Minute by the Minister of Public Instruction.

Subject :- Free Elementary Education.

Department of Public Instruction, Sydney, 7 February, 1890.

I RECOMMEND for the consideration of my honorable colleagues, that a Bill be introduced into Parliament to make elementary education free, and I do so on these grounds:—

1. That the Legislative Assembly, by a resolution passed on the 6th February, 1883, decided "that payment of fees for elementary education in the Public Schools of the Colony should be discontinued.

2. That, inasmuch as the Public Instruction Act makes it obligatory on parents and guardians of all children between the ages of 6 and 14 years to cause such children to attend school for a period of not less than seventy days in each half-year, the State has no inherent right to demand payment for schooling

less than seventy days in each half-year, the State has no inherent right to demand payment for schooling received by children under such conditions.

3. That at present a nominal fee of 3d. or something less per week is charged for each child attending school, whereas the actual weekly cost of a child's education is 2s. 6d., and free conveyance to school by public railways, &c., is provided. Any allegation, therefore, to the effect that to abolish this nominal fee would tend to pauperise the people can have no force, as the people are already subsidised by the Government to the extent of nine-tenths of the cost of their children's schooling.

4. That education is undertaken by the State on account of the good resulting to the people as a whole, and not on account of any benefit to be derived by individual parents or guardians; that payment therefore by the people, i.e., by the State, is justifiable on the grounds of value received.

5. That the yearly amount now received in fees is £70,000, out of a total expenditure of about £600,000 for school purposes; that the cost of collecting this sum is over £4,800, while the teaching staffs are largely withdrawn from their proper functions to attend to this duty of collection; that inquisitorial work of a very annoying, and often-times offensive character, has constantly to be undertaken by the officers of the department, from the highest to the lowest.

6. That in innumerable instances, the lower courts are occupied in adjudicating upon cases in

6. That in innumerable instances, the lower courts are occupied in adjudicating upon cases in which parents are sued for fees; and by such proceedings, not only are teachers and others brought into antagonism with sections of the community, but a doubtful poverty is paraded before the public to the detriment of a full appreciation of the Public Instruction system.

7. That in some respects, therefore, the administration of the Act operates very inequitably as regards the children of the rich and the children of the poor. A rich man's child may receive free railway travelling and a present of nine-tenths of the cost of his child's schooling without any brand of pauperisation; whilst the poor man's child, who begs and receives forgiveness for the paltry mite now charged as a fee, whist to bear the stamp and repreach of a poverty ascertained through departmental inquiry of a probing and silting character often involving testimony of a most painful nature.

8. That the collection of the fee operates unfavourably on school attendance, inasmuch as, when a public holiday or a wet day occurs on the first or second day of a week, many parents keep their children at home for the rest of the week, simply because they object to pay the fee for only a part of the week's instruction.

instruction.

J. H. CARRUTHERS.

## NEW SOUTH WALES.

## EDUCATION.

(AMENDED REGULATION RELATING TO THE PROVISION OF RESIDENCES FOR TEACHERS.)

Bresented to Parliament, pursuant to Act 43 Vic. So. 23, sec. 37.

Department of Public Instruction, Sydney, 24 March, 1892.

# PUBLIC INSTRUCTION ACT OF 1880.—AMENDED REGULATION AS TO THE PROVISION OF RESIDENCES FOR TEACHERS.

His Excellency the Governor, with the advice of the Executive Council, has been pleased to approve of the following amended regulation in substitution for that relating to the provision of residences for teachers in charge of Public Schools, of date 1st July, 1891:—

111. In addition to these salaries, residences, vested or rented, shall be provided for classified married male teachers in charge of classified Public Schools; but a residence rented for a teacher shall be as near as practicable to his school.

Appointment of officers appropriated therewish so appointed shall be Civil Servants of the Crown all officers connected therewith so appointed shall be Civil Servants of the Crown Provided that until such Inspectors Teachers and other officers as may be necessary shall be so appointed the persons employed by the Council of Education shall be continued in their respective offices.

4. All lands acquired under this Act or by grant purchase or bequest in future Land for the for the purposes of Public Instruction shall be held by the Crown in trust for the purposes of Education. maintenance of the several classes of schools herein provided for and for no other except in cases wherein other conditions shall be imposed by law and the Minister shall have power subject to the Governor to sell any such lands and to convey the same to the purchasers thereof and to invest the proceeds arising therefrom in the purchase of other lands or in the erection of school buildings for the purposes aforesaid.

5. All schools hitherto established and maintained by the Council of Education Public Schools.

as Public Schools shall become and are hereby declared to be Public Schools under the provisions of this Act.

6. The several classes of Schools herein defined may be established and maintained Classes of schools to be established under this Act as fully organised Schools namely-

(r.) Public Schools in which the main object shall be to afford the best primary education to all children without sectarian or class distinction.

(II.) Superior Public Schools in towns and populous districts in which additional lessons in the higher branches of education may be given under such regulations for the purpose as may be approved by the Governor.
 (III.) Evening Public Schools in which the object shall be to instruct persons who

(v.) High Schools for girls. 161-A

may not have received the advantages of primary education.

(IV.) High Schools for boys in which the course of instruction shall be of such a character as to complete the Public School curriculum or to prepare students for the University.

7.

Secular instruction.

7. In all schools under this Act the teaching shall be strictly non-sectarian but the words "secular instruction" shall be held to include general religious teaching as distinguished from dogmatical or polemical theology and lessons in the history of England and in the history of Australia shall form part of the course of secular instruction.

Public Schools may be established.

8. A Public School may be established in any locality where after due inquiry the Minister shall be satisfied that there are at least twenty children who will regularly attend such school on its establishment.

Superior Public Schools.

9. On the advice of the Minister after due inquiry any Public School may by proclamation in the Gazette by the Governor be appointed to be a Superior Public School.

Evening Public Schools.

10. If in any locality where a Public School has been established the parents guardians or other residents apply by petition on behalf of not fewer than ten persons for the establishment of an Evening Public School the Minister may on being satisfied of all the circumstances establish such school Provided that all such schools shall be

Public School fees.

in the charge of a properly trained teacher.

11. In all Public Schools the weekly fees shall not exceed threepence for each child up to four children of one family and for four or any larger number of the same family the total amount of fees shall not exceed one shilling And in every case the fees shall be payable to the teacher in charge of the School or other person appointed by the Minister to receive them and may be recovered by the person so appointed in a summary way before any Justice of the Peace and under regulations to be made for such purpose shall be remitted to the Colonial Treasurer and shall be paid into the Consolidated Revenue Fund.

Fees in Evening Public Schools.

12. The fees for the teaching in Evening Public Schools shall be fixed by regulations approved by the Governor and all such fees shall be paid to the teachers performing such special duties and may be recovered by such teacher in a summary way before any

Payment of school fees no enforced in certain cases. not Justice of the Peace.

13. The Minister or the Public School Board of the district under regulations to

Free railway passes to school children.

be made for that purpose may relieve parents or guardians from the payment of school fees in any case where their inability to pay such fees is satisfactorily shown.

14. It shall be lawful for any Station-master on the Government Railways to issue a free pass to any child to travel in a suitable railway carriage or van to and from any school established or declared to be certified under this Act Provided that such school if a Public School shall be the one nearest the residence of the parents or

Class-rooms to be provided for Public Schools.

guardians of such child. 15. Every Public School where there is a regular attendance of not fewer than fifty pupils shall have attached to it a class-room adapted for the more efficient conduct of the said school and the buildings of larger Public Schools shall have attached to them one or more similar class-rooms as may after due inquiry be considered necessary for the

Apportionment of space in School buildings

number of pupils attending such schools.

16. In the construction of all Public Schools the apportionment of space inside the building shall not be less than one hundred cubic feet for each child ordinarily in attendance Provided that no child shall be refused admission to or be entitled to claim exemption from attendance at any such school by reason of the space for each child

Hours for secular estruction. Heligious Instruction may be given.

falling temporarily below such rule of apportionment.

17. In every Public School four hours during each school-day shall be devoted to secular instruction exclusively and a portion of each day not more than one hour shall be set apart when the children of any one religious persuasion may be instructed by the clergyman or other religious teacher of such persuasion but in all cases the pupils receiving such religious instruction shall be separated from the other pupils of the school. And the hour during which such religious instruction may be given shall be fixed by mutual agreement between the Public School Board in consultation with the teacher of such school and the clergyman of the district or such other person as may be duly authorised to act in his stead and any class-room of any Public School may be used for such religious instruction by like agreement Provided that if two or more clergymen of different persuasions desire to give religious instruction at any school the children of each such different persuasion shall be so instructed on different days Provided also that the religious instruction to be so given shall be the religious instruction authorised by the Church to which the clergyman or other religious teacher may belong Provided further that in case of the non-attendance of any clergyman or religious teacher during any portion of the period agreed to be set apart for religious instruction such period shall be devoted to the ordinary secular instruction in such school.

Objection to religious instruction.

18. Notwithstanding anything to the contrary in the last preceding section no pupil in a Public School shall be required to receive any general or special religious instruction if the parents or guardians of such pupil object to such religious instruction

Public School Districts and Boards.

- being given 19. The Governor by proclamation in the Gazette may constitute and define Public School districts containing one or more Public Schools and may appoint a Public School Board for any such district to consist of not more than seven persons And the
- duties of every Public School Board shall be—

  (1.) To regularly visit inspect and report upon the School placed under their supervision.
  - (11.) To suspend any teacher for misconduct in cases not admitting of delay and to
  - report immediately the cause of such suspension to the Minister.
    (111.) To use every endeavour to induce parents to send their children regularly to school and to report the names of parents or guardians who refuse or fail to educate their children.

- 20. After the expiration of three months from the passing of this Act it shall be buty of parents obligatory upon the parents or guardians of all children between the ages of six and fourteen years (unless just cause of exemption can be shown) to cause such children to attend school for a period of not less than seventy days in each half-year But any of the following reasons shall be held to be a just cause of exemption-
  - (I.) That the child is being regularly and efficiently instructed in some other manner.
  - (II.) That the child has been unable to attend school from sickness or infirmity or from fear of infection or other unavoidable cause.

That there is no school maintained under this Act within two miles by the nearest road of the residence of the child.

nearest road of the residence of the child.

(iv.) That the child has been educated up to the standard of education required.

21. The Governor by proclamation in the Gazette may declare any Public School runishment for District to be a portion of the Colony where the obligation upon parents enacted by the end children to last preceding section may be enforced and any parent or guardian in such proclaimed school. district who shall neglect to send his children to school without just cause of exemption may be summoned by any person appointed for that purpose by the Minister before two or more Justices in Petty Sessions assembled and on conviction of the first offence shall forfeit and pay a sum not exceeding five shillings and for every succeeding offence a sum forfeit and pay a sum not exceeding five shillings and for every succeeding offence a sum not exceeding twenty shillings and in default the person so offending may be imprisoned

for a term not exceeding seven days.

22. In remote and thinly populated districts where no Public School may exist Provisional the Minister may establish Schools which shall not be classed as fully organised but as Schools may be provisional only under Regulations for that purpose to be approved by the Governor certain cases. Provided that in all such schools the course of instruction shall be wholly secular and that all such schools shall be subject to the same control and inspection as are prescribed for Public Schools Provided further that so soon as twenty children shall have been in regular attendance at any such school for three months the said School shall be converted

into a Public School.

23. In districts where from the scattered state of the population and from other Itinerant causes it is not practicable to collect a sufficient number of children to form a permanent teachers may be causes it is not practicable to collect a sufficient number of children to be appended. school the Minister may appoint itinerant teachers under Regulations to be approved of by the Governor.

24. Training Schools shall be established for the education of teachers both male Training Schools and female and the teachers so trained and educated shall be classified according to their to be established, attainments and skill in teaching and shall receive certificates of competency which shall

qualify them for corresponding grades in the School Service.

25. High Schools for boys may be established in which instruction shall be given High Schools for in ancient and modern languages in history in literature in mathematics and in physical lished.

26. High Schools for girls may be established in which instruction shall be given High Schools for Schools for girls may be established in which instruction shall be given High Schools for in modern lauguages history music the elements of mathematics and physical science girls to be established.

together with such other subjects as the Minister may from time to time direct.

27. The fees to be charged and the discipline to be maintained in High Schools rees and disand for the higher classes in superior Public Schools and all other matters necessary to schools. be done for the efficient conduct of such Schools shall be determined by Regulations approved by the Governor.

28. Subject to the provisions hereinafter contained all Denominational Schools and to Denomic certified by the Council of Education at the passing of this Act shall be continued and national Schools to cease. held to be so certified until the thirty-first day of December one thousand eight hundred and eighty-two after which date all aid to such Schools from the Consolidated Revenue shall wholly cease. Provided that all such certified Denominational Schools shall in the meantime be subject to the same course of secular instruction the same Regulations and the same inspection as may be prescribed by this Act or by the Regulations made thereunder in respect to Public Schools.

29. It shall be lawful for the Minister at any time to withdraw the certificate withdrawal or certificate.

from any Denominational School for either of the following reasons—

(I.) The regular attendance of pupils falling below the minimum of thirty.

(II.) The dilapidated or unhealthy state of the building in which the school is held.

30. In all Denominational Schools held to be certified under this Act and during rees payable at the currency of the certificates the fees payable for pupils attending such schools shall benominational be the same as those payable at Public Schools and shall in like manner be remitted by the teacher in charge of the school to the Colonial Treasurer and shall be paid into the

Consolidated Revenue Fund. 31. At the expiration of the term allowed for the continuation of Certified Public Schools Denominational Schools the place of such schools shall be supplied where necessary by place of Public Schools and steps shall be taken previous to the thirty-first day of December Denominations Schools. one thousand eight hundred and eighty-two wherever it may be deemed expedient for the establishment of such Public Schools.

32. It shall be lawful for the Minister to purchase the buildings of such Denomi-Buildings of national Schools as may be discontinued after the Government aid shall have been with-discontinued drawn the value of such buildings in every such case to be ascertained by arbitration in Schools may be accordance with Regulations under this Act Provided that in every such case the building shall be suitable for the purposes of a Public School.

33. In addition to any sum which may be specially appropriated by Parliament for scholarships and any such similar purpose any private person may collect raise or give a sum of money to-exhibitions. wards founding a scholarship or exhibition at the University of Sydney in connection with any Public School and money or land or both may be bequeathed for that purpose And every such scholarship or exhibition shall be open to any child on the roll of such school

and in the event of any school for which a scholarship or exhibition shall be founded being discontinued the Minister may direct that the scholarship or exhibition shall attach to some other Public School.

Notification of new schools.

34. Notices of all proposals to establish schools as classified under section six of this Act shall be published four times in the Gazette previous to the final decision thereon of the Minister.

Certificate to pupils.

35. When any child attending a Public School is educated up to the standard of education required by this Act such child shall receive a certificate in the form of Schedule A hereto.

Annual report.

36. On or before the thirty-first day of March in every year the Minister shall lay before the Governor his report on the condition and progress of the several classes of Schools established and maintained under this Act together with a detailed statement of the expenditure in the maintenance of such schools and copies of the same shall be laid before both Houses of Parliament within one month if Parliament be then sitting and if Parliament be not sitting then within one month after the commencement of the

Regulations to have the force of law.

next ensuing Session thereof.

37. It shall be lawful for the Governor to make Regulations for carrying out the provisions of this Act and copies of all such Regulations shall be laid before both Houses of Parliament within one month if Parliament be then sitting and if Parliament be not then sitting then within one month after the commencement of the next ensuing Session thereof and if not disallowed by resolution of both Houses within one month of their being so laid before Parliament such Regulations shall have the force of law and shall thereupon be published in the Gazette for general information.

No action or suit shall be maintalned against the Minister,

Interpretation of terms,

38. No action or suit shall be brought or maintained against any person who may have held or shall hold office as Minister of Public Instruction for any nonfeasance or misfeasance in connection with the duties imposed upon him by this Act.

39. In the construction and for the purposes of this Act the following terms shall if not inconsistent with the context or subject matter have the respective meanings hereby assigned to them that is to say-

"Governor" shall mean the Governor with the advice of the Executive Council.
"Denominational School" shall mean the schools certified as such under the ninth

section of the "Public Schools Act of 1866."
"Minister" or "Minister of Public Instruction" shall mean any Member of the Executive Council holding a political office who may administer this Act. "Teacher" shall include assistant or pupil-teacher or any person forming part of

the educational staff of a school.

"Guardian" shall mean any person legally appointed as such or any person known to have habitual charge of a child.

"History of England" shall mean and include the History of Great Britain and Ireland.

"Standard of Education" shall mean and include competency in reading writing and arithmetic to the satisfaction of a duly appointed Inspector of Schools. "Gazette" shall mean the Government Gazette of the Colony.

Commencement of Act. Short title.

40. This Act shall come into operation on the first day of the month next following its passing and becoming law and shall be called and may be cited for all purposes as the "Public Instruction Act of 1880."

#### SCHEDULE A.

Certificate of a child being sufficiently educated.

I HEREBY certify that has been educated up to the standard of education required by the "Public Instruction Act of 1890."

#### SUPERIOR PUBLIC SCHOOLS.

9. Any Public School may be declared a Superior Public School, if, after due inquiry, it shall be found that the attendance thereat is sufficient to enable a class to be formed of not less than twenty pupils, who have been educated up to the standard that completes the course prescribed for a Fourth Class.

10. In addition to more advanced work in the ordinary subjects, lessons in other branches shall be given to the highest class, as under:

To Boys.—In Mathematics, Latin, Science, and Drawing.

To Girls.—In French, Drawing, and Sanitary Science.

Instruction may also be given in such other branches as the Minister may from time to time consider expedient.

Instruction may also be given in such other branches as the minister may from time to time consider expedient.

11. No special fee shall be charged.

12. Necessary text-books shall be supplied by the Minister.

13. In cases where the regular staff is unable to teach any prescribed subject efficiently, the Minister may employ a special teacher for such subject, and pay him such salary as he may deem expedient, provided that the special class so taught shall be drafted from the highest class, and contain not less than twenty pupils

not less than twenty pupils.

14. The course of instruction to be carried out in the highest class of a Superior Public School shall be that prescribed for a fifth class in the Standard of Proficiency; and such portions of the course shall be studied each year as will coincide with the subjects prescribed annually for the Junior or Senior Examinations of the Sydney University.

#### EVENING PUBLIC SCHOOLS.

15. Application for the establishment of Evening Public Schools must be made by petition to the Minister of Public Instruction in the form quoted after Regulation 30.

#### Signatures to Petition.

16. Every such petition must be signed, on behalf of not fewer than ten persons, by the parents, guardians, or other residents of the locality in which it is desired to establish an Evening Public School.

#### Persons not eligible to be Pupils.

17. No person below the age of fourteen years shall be received as a pupil in any Evening Public School, until such person has received a certificate under section 35 of the Public Instruction Act; and no teacher or pupil-teacher employed in any school established or maintained under this Act shall be eligible for admission into such Evening Public School unless authorised by the District Inspector.

Appointments of Teachers.

18. Teachers of Evening Public Schools will be appointed by the Minister, but no teacher can be appointed unless he has been trained and classified.

#### Place of holding Evening Public Schools.

19. An Evening Public School may be conducted in any Public School-room, in any class-room attached thereto, or elsewhere in a suitable place.

#### Furniture and Apparatus.

20. The ordinary school furniture and apparatus of any such Public School may be used in the management of an Evening Public School.

21. Necessary supplies of reading books will be granted to Evening Public Schools.

#### Time of Meeting.

22. The pupils of an Evening Public School shall meet for instruction three times weekly at least, and every such meeting shall be of not less than two hours' duration.

Course of Instruction.

23. The course of instruction shall comprise Reading, Writing, Dictation, Arithmetic, Grammar, and Geography, and such other subjects as the Minister may from time to time determine.

### Instruction to be Secular.

24. The instruction imparted must be secular, in accordance with section 7 of the Public Instruction Act.

Fees.25. Every pupil in an Evening Public School shall pay to the teacher weekly, in advance, a fee not exceeding one shilling; but the Minister may relieve any pupils from the payment of school fees where inability to pay is satisfactorily shown, and shall make good the payment to the teacher.

#### Salaries.

26. The salaries of teachers of Evening Public Schools shall be at the following rates:—

For an average attendance of 10 to 15, £20 per annum.

15 to 20, £26

16 to 20, £26

17 to 20, £26

20 to 30, £32 30 to 40, £38

#### Fuel and Light.

27. The expense of providing fuel and light must be borne by the Teacher.

## Registers.

28. A class roll for recording the attendance of pupils, and a lesson register, shall be kept in every Evening Public School. Returns.

29. Quarterly and annual returns shall be furnished in the same form as in Public Schools.

## Inspection and control.

30. Evening Public Schools shall be subject to the same inspection and control as Public Schools.

#### FORM OF PETITION.

To the Honorable the Minister of Public Instruction.

The petition of the undersigned parents, guardians, and other residents, humbly showeth:—

THAT your Petitioners desire that an Evening Public School may be established at in accordance with the provisions of section 10 of the Public Instruction Act of 1880.

That your Petitioners guarantee the regular attendance for a period of months at such school, when established, of the persons named in the annexed Schedule.

That your Petitioners undertake, on behalf of the said persons, that they shall conform to the Regulations for the conduct of Evening Public Schools now in force or that may hereafter be framed by authority. authority.

And your Petitioners will ever pray.

#### Schedule showing the names of persons who will attend an Evening Public School at

Full Name. Age next birthday.		Occupation (if any).	Signature of parent, guardian, or employer.

#### PUBLIC HIGH SCHOOLS.

31. Examinations for admission to Public High Schools as well as for Scholarships and Bursaries shall be held half-yearly, in June and December, and at these examinations Scholarships and Bursaries may be awarded to those who gain the most marks and show the requisite proficiency, as follows:—

#### SCHOLARSHIPS.

- 15 (7 to boys and 8 to girls in June; 8 to boys and 7 to girls in December), Sydney High School.
  5 Bathurst Girls' High School.
  10 (5 to boys and 5 to girls), Maitland High School.

#### BURSARIES.

- Bursaries.

  10 half bursaries for Metropolitan and Sub-metropolitan children tenable at the Sydney High, Grammar, or Superior Schools.

  5 full bursaries (2 to boys and 3 to girls in June; 3 to boys and 2 to girls in December) for country children tenable at the same schools.

  2 full bursaries in June and 3 in December, Maitland Girls' High School.

  2 full bursaries in June and 3 in December, Bathurst Girls' High School.

  5 full bursaries, Maitland Boys' High School.

  In the case of children whose parents reside within convenient access of the country schools only half bursaries will be awarded, and no child so residing will be permitted to compete for a Sydney bursary. Vice versa, no Sydney child may compete for a country bursary.

  Every applicant for either a scholarship or a bursary must state in his application what schoole intends to enter.

  Country children are expected to attend the High School nearest by a practicable route to their
- Country children are expected to attend the High School nearest by a practicable route to their places of residence. In exceptional circumstances, however, the Minister may, on application being made, sanction a departure from this rule. The application should accompany the form notifying intention to compete.
- 32. There shall be two groups of subjects for examinations, one for Scholarships and one for Bursaries. They are

#### FOR SCHOLARSHIPS.

- Grammar.—To parse the more difficult words in a passage of about six lines. To distinguish the true subjects and the true predicates in sentences. To correct inelegant or ungrammatical expressions. To exemplify the correct usage of picked words.
   Dictation.—To write a passage of about fourteen lines, dictated from some standard author or from an ordinary newspaper, with correct spelling and punctuation.
   Arithmetic.—To solve questions in Proportion, Vulgar and Decimal Fractions, Interest and Discount.\*
- and Discount.\*
- (4.) French (for girls) As prescribed for Fifth Classes in Public Schools, First Half-year. Latin (for boys) As prescribed for Fifth Classes in Public Schools, First Half-year.
  (5.) Euclid (for boys only).—Book I, Definitions, &c.; Propositions 1 to 20 inclusive.
  (6.) Algebra (for boys only).—First Four Rules.

#### FOR BURSARIES.

- Grammar.—As for Scholarships.
   Dictation.—As for Scholarships.
   Arithmetic.—As for Scholarships.
   History.—Henry VII to Victoria inclusive, as prescribed for fourth classes in Public Schools; History of Australia as taught in Public Schools.
   Geography.—Europe, Asia, America, and Australia, as prescribed for third and fourth classes in Public Schools.
- (6.) Drawing and Music.—As prescribed for third and fourth classes in Public Schools. Candidates shall be eligible for admission to a High School who pass satisfactorily in the subjects numbered (1), (2), and (3), and in one other subject selected from Nos. (4), (5), and (6) in either group.
- in either group.

  33. A Scholarship will be tenable for three years, subject to good reports from teachers, and will entitle a pupil to a free grant of text-books and to free education in a State High School. A bursary will be tenable for three years, subject to good reports from teachers, and will entitle a pupil to a free grant of text-books and to free education in Sydney High School, in a Sydney Superior Public School, or in the Sydney Grammar School, or in one of the Country High Schools. When a pupil holding a Bursary must necessarily board away from home in order to attend one of these schools, an allowance not exceeding £30 a year, in addition to free education and text-books, will be made.

  34. No pupil will be awarded a Bursary whose parents or guardians are in a position to pay for his education; but, subject to this proviso, the examination for Bursaries will be open to all boys and girls under fourteen years of age who have attended a Public School with reasonable regularity for the two years preceding the date of examination.

  35. The examination for scholarships will be open to all boys and girls under fourteen years of age.

  36. Candidates who compete for a Bursary or Scholarship more than once will be eligible for a Bursary or Scholarship only for the period remaining out of three years from the date of their first competition, and no candidate will be permitted to compete after having attended a High School.

  37. The fee to be charged at a High School shall be £2 2s. per quarter payable in advance.

  38. The fees shall in no case be the property of the teachers but shall be forwarded to the Cashier for payment into the Consolidated Revenue Fund.

  39. The parents or guardians of candidates for Bursaries or Scholarships must fill in and forward to the Under Secretary the necessary forms of application at least six weeks before the date of examination. Such forms may be obtained at this office.

## STATE BURSARIES FOR UNIVERSITY EDUCATION.

- 40. Ten Bursaries, six to boys and four to girls, tenable for three years at the Sydney University, will be awarded annually on the position of candidates at the March Matriculation Examination.

  41. Candidates must be under eighteen years of age, and must have attended a State High School, a Public School, or, as State Bursars, the Sydney Grammar School, for the year previous to the examination; and they must produce satisfactory testimonials of character from the headmasters of the school they have attended. they have attended.

- 42. They must satisfy the Minister of Public Instruction that their own and their parents' means are unequal to the expense of the University education. To a successful competitor who resides at such distance from the University as to be unable to travel to and fro daily a full bursary will be awarded, while to one who resides in the metropolitan or sub-metropolitan inspectoral district, within easy access of the University, part of a Bursary only will be awarded. The candidate's status as to whether he can be deemed eligible for a full Bursary or part of a Bursary will be decided by the Minister before his admission to examination.
- admission to examination.

  43. A Bursary shall entitle pupils to text-books and free education, together with an allowance not exceeding £20 per annum to those who need not board away from home, and not exceeding £50 to those who must necessarily do so.

44. Every Bursar must matriculate at the University and attend lectures; and he shall continue to hold the Bursary only on condition that his conduct be good, and that he pass creditably the examination at the end of the first and second years after his matriculation.

45. The parents or guardians of candidates must fill in and forward to the Under Secretary the necessary forms of application for University Bursaries at least six weeks before the date of the Matriculation examination. Such forms may be obtained at this office.

#### PROVISIONAL SCHOOLS.

46. Application for the establishment of a Provisional School must be made in the form shown

46. Application for the establishment of a Trouble after Regulation 55.

47. A Provisional School may be established in any locality where not fewer than twelve, but not more than nineteen, children between the ages of six and fourteen years can regularly attend such school: provided that no Provisional School shall be established within four miles, by the nearest route practicable for children, of any existing Public, Provisional, or Half-time School.

48. The necessary school buildings and furniture for a Provisional School, as well as the requisite heads and appearance will be provided at the cost of the Department, subject to the following conditions:—

- (a) That the grant in aid of the building and furniture shall be limited to £45, when, in the opinion of the Inspector, the average attendance will be from 12 to 15, and to £60 when the average attendance is likely to be 18; that payment shall not be made until the building has been erected, and reported by an Inspector or other officer of the Department of Public Instruction to be ready for occupation.
- (b) That the building shall be placed on Crown lands, if a site thereon central to the school population and otherwise suitable can be obtained, and that, if built on private land, the right-of-way shall be secured, and the property leased to the Minister of Public Instruction for a term of years, as may be agreed upon, at a peppercorn remet, the Minister having the right to remove the building before or at the expiration of that term.
- (c) That where the average attendance is expected to range from 12 to 15, the schoolroom shall measure 14 feet in length, 12 feet in width, and 9 feet in height to the wall-plates, and shall have a pitched roof, two windows, a boarded floor, and a fireplace; two out-offices must also be provided, and the following articles of furniture supplied, viz.:—

2 desks, each 10 feet 6 inches long. 2 forms, each 10 feet 6 inches long.

1 book-press or box. I table, 3 feet by 2 feet.

(d) That when the average attendance is expected to be 18, the schoolroom shall measure 17 feet in length, 14 feet in width, and 9 feet in height to the wall-plates, and shall have a pitched roof, two windows, a boarded floor, and a fireplace; two out-offices must also be provided, together with the following articles of furniture, viz.:—

4 desks, each 7 feet 6 inches long.

4 forms, each 7 feet 6 inches long.

1 book-press or box.

1 table, 3 feet by 2 feet.

1 chair.

1 chair.

- (e) That the applicants for a Provisional School state, on the usual form of application, the arrangements which they deem best for having the building erected, and the furniture supplied, with the least possible delay.
- 49. Teachers of Provisional Schools will be appointed by the Minister, after their competency for the office has been ascertained.
- 50. To ensure the continuance of a Provisional School, the provisions of the Public Instruction Act must be duly observed, and an average attendance of not less than 12 pupils maintained.

  51. Provisional Schools shall be classified in the following manner:

Schools with an average attendance below 20, but not } First-class Provisional Schools.

Schools with an average attendance below 18, but not Second-class Provisional Schools. below 15. Schools with an average attendance below 15, but not

Third-class Provisional Schools, below 12.

The Salaries of Teachers of Provisional Schools shall be at the following rates:

52. The Salaries of Teachers of Provisional Schools shall be at the following rates:

In First-class Provisional Schools, £96 per annum.
In Second-class Provisional Schools, £84 per annum.
In Third-class Provisional Schools, £72 per annum.

53. School fees shall be paid at the same rate as prescribed for Public Schools, and the sums received shall be paid to the Consolidated Revenue.

54. Provisional Schools must be conducted in every respect as Public Schools, and be subject to all the provisions of the Public Instruction Act with respect to religious instruction.

55. The course of secular education shall embrace Reading, Writing, Arithmetic, Grammar, Geography, and History, with needlework for girls, whenever practicable; and the instruction must be imparted in accordance with the prescribed standards of proficiency.

#### SCHOOLS TAUGHT BY ITINERANT TEACHERS.

#### (A) Half-time Schools.

- 56. Wherever twenty children, between the ages of six and fourteen years are residing within an estimated radius of 10 miles from a central point, and can be collected in groups of not less than ten children in each, the Itinerunt Teacher shall visit two such places only, and the schools so established shall be designated Half-time Schools.
- 57. Applications for the establishment of Half-time Schools must be made in the form appended; but aid will not be granted towards the maintenance of such schools unless suitable school-houses be provided by the applicants.
- 58. No schoolroom shall be approved unless it be at least 10 feet in width, be floored, be provided with a fireplace, and be properly lighted and ventilated.
- 59. A full supply of furniture and school books shall be granted as a first stock to all schools newly established, and further grants will be made from time to time, as may be deemed expedient.
  - 60. The same Registers are to be kept, and the same Returns furnished as in Public Schools.
- 61. Every teacher must divide his time between the schools under his charge, in such a way as to effect the largest amount of good. Where practicable, he is to devote the mornings to the teaching of one school, and the afternoons to the teaching of the other; but, if found more suitable, other arrangements may be adopted, under the authority of the Inspector charged with the supervision of the schools. The purent or guardian of each child is to be supplied by the Teacher with a time-table showing the house at which school owers and classes. the hours at which school opens and closes.
- 62. Half-time Schools shall be classified in the same manner as Public Schools, according to the total average attendance of pupils at the stations at which teacher gives instruction.
  - 63. Teachers shall be paid the full rates of salary attached to the classification of their schools.
  - 64. The scale of fees for Half-time Schools shall be, for five days teaching-

For one child in a family, three pence.

For two children in a family, six pence.

For four or more children in a family, nine pence.

For four or more children in a family, one shilling.

The sums received shall be forwarded by the Teacher to the Cashier for payment into the Consolidated Percents.

- 65. Teachers shall be paid an annual allowance of £10, where necessary, for forage, in addition to the salary attached to their schools.
  - 66. As regards instruction, every Half-time School is to be conducted in all respects as a Public School.
  - 67. Teachers are required to ins at on the carrying out of a systematic course of Home Lessons.
- 68. Teachers shall be held directly responsible to the Inspectors under whose supervision they are placed. 69.

69. At the end of each month a report upon the work done during by Teachers to the Inspector.	that period must be furnished

#### GENERAL REGULATIONS.

#### Grants of School Books, &c.

80. Grants of school books and apparatus shall be made from time to time, as may be deemed expedient, to all schools under supervision of the Minister, in proportion to the average number of children in attendance. A full supply will be granted to schools newly established.

#### Requisitions for School Materials,

81. Requisitions for supplies should be forwarded at the end of a quarter only,

#### Character of School Books.

82. Such books only as are supplied or sanctioned by the Minister shall be used in any school for ordinary instruction.

#### Apparatus.

83. The term Apparatus shall be held to include maps, diagrams, pictures, black-boards, easels, ball-frames, and Kindergarten appliances.

#### Registers, &c., to be kept.

84. The undermentioned Registers and Forms shall be kept, according to directions supplied with them, by every teacher: (a) Admission Register, (b) Class Roll, (c) Daily Report Book, (d) Punishment Book, (e) Lesson Register, (f) Time-table, and (g) Programme of Lessons for each Class.

#### Relarne

85. Quarterly and Annual Returns shall be furnished from every school. Each Quarterly Return must be neatly made out in duplicate, one copy to be retained by the teacher as a record, and the other to be furnished to the Inspector on the last Saturday preceding the Midwinter and Christmas vacations, and in other cases on the last Saturday in the months of March and September. The Annual Return must be forwarded, with the Quarterly Return, immediately after the close of the December quarter.

#### Default as to Returns or Registers.

86. Negligence in compiling or sending Returns, or in keeping School Registers, shall render a teacher liable to a fine, or, if repeated, to a loss of classification. Any teacher guilty of fraudulently making false entries in any Register or Return will be dismissed.

#### Appointment and Training of Teachers.

87. Every applicant for employment as a teacher, unless he be a University graduate, or a person holding a certificate from a recognized training institution, must show that he has gained in the Colony, either as a pupil in a State School, or otherwise, a sufficient experience of the established Public School system to warrant his employment. Every untrained applicant must undergo a course of training before being permanently appointed, and he must sign an undertaking to accept such employment in any locality indicated by the Minister.

#### Position of Teachers.

88. Teachers employed under the Department of Public Instruction are Civil Servants of the Crown, and are entitled to the advantages and subject to the restrictions of that position.

#### Teachers not to seek Outside Influence.

89. Teachers are appointed, promoted, and removed on a due consideration of their claims and merits. They are, therefore, prohibited from seeking the interest of influential persons outside the Department to obtain promotion, removal, or other advantage. Any infringement of this Regulation will be severely dealt with.

#### General Qualifications.

90. As a general rule, no person will be appointed as a teacher unless he has been examined and classified. In some cases a teacher may be appointed provisionally who has not undergone examination; but his appointment will not be ratified until his competency has been tested in that manner.

#### Examination and Classification.

91. The attainments of Teachers, Students of the Training Schools, and Candidates for employment as Teachers, shall be tested by written and oral examinations, and their skill in teaching determined by their ability to manage a school or class; and, according to such attainments and skill, they will be classified in the following grades:—The first, or highest, class, will have three grades, distinguished as IA with Honors, IA (without Honors), and IB; the Second Class will have three grades, distinguished as IIA with Honors, IIA (without Honors), and IIB; and the Third Class will have three grades, distinguished as 3A, 3B, and 3C. A classification awarded to a Teacher, a Student of the Training School.

School, or a Candidate for employment, after his first successful examination, shall be provisional only, and be confirmed at the end of three years from the date of examination if the Inspectors' reports upon his school work be fully satisfactory: provided that the classification of any Teacher in the School Service shall be liable to reduction or cancellation for in-flicioncy, gross neglect of duty, or serious misconduct on the part of the person helding such absolute. the part of the person holding such classification.

#### Commencement of duty.

92. When a teacher is appointed to a school, he must report to the Inspector of the District the fact of arrival at his post, and the date of commencing duty.

#### Resignation of a Teacher.

93. A teacher is required to give not less than one month's notice of his intended resignation, which shall take effect on the last day of the month indicated. Before receiving salary for the last month, he must hand over to a person duly authorized all school property belonging to the Minister, and make out, in duplicate, an inventory of the same: one copy, to be forwarded to the Inspector, the other to be left with the School Records.

#### Teachers not to engage in other Occupations.

94. Teachers in the service of the Minister are prohibited from engaging in any occupation not having a distinctly educational character, unless the sanction of the Minister has been previously

#### Duties of Teachers.

Duties of Teachers.

95. The duties of Teachers shall be:—
To observe faithfully these Regulations.
To carry out the suggestions of Inspectors.
To teach according to the Course of Secular Instruction.
To maintain the discipline prescribed in the Regulations.
To keep the School Records nearly, and to furnish Returns punctually.
To see that the undermentioned documents are kept posted in a conspicuous place in the school-room, namely:— (a) The Regulations; (b) Notice to Visitors; (c) Course of Secular Instruction; (d) Time-table; (e) Programme of Lessons; (f) Scale of Fees; (g) Proclamation as to obligatory attendance; List of Public School Board.

To take charge of the school buildings and all property belonging to the Minister, and to be responsible for keeping the school premises in good order and tenantable repair—reasonable wear and tear excepted—and to see that they are not used for any private purposes without the Minister's permission. without the Minister's permission.

#### Teachers' Wices.

96. In a school containing female children but no female teacher, it will be the duty of the teacher's wife to teach needle-wook to the girls during at least four hours in each week. In forming an estimate of the efficiency of a school, the competency and usefulness of the teacher's wife, and the time she devotes to school duties, will be taken into account.

97. Assistant teachers may be appointed to schools in which the average daily attendance exceeds seventy. They may be (a) persons who have served for four years as pupil-teachers, or, (b) persons who have been examined and classified.

#### Pupil-teachers.

98. Pupil-toachers may be employed to serve for not less than four years in any school in which the average attendance has not been less than fifty for the preceding quarter, provided that the teacher holds a classification not lower than Class II.

#### Conditions of Appointment.

99. Candidates for the office of pupil-teacher must be not less than thirteen nor more than seventeen years of age, and free from any bodily infirmity likely to impair their usefulness. They must also pass an examination in the subjects specified in Regulation 101.

#### Remuneration.

100. The remuneration of a pupil-teacher will consist partly of instruction to be given by the teacher, for at least one hour on every school day, and partly in a yearly salary.

#### SUBJECTS OF EXAMINATION FOR TEACHERS AND PUPIL-TEACHERS.

101. The subjects in which teachers and pupil-teachers shall be examined for classification are those stated hereunder.

#### FOR A THIRD-CLASS CERTIFICATE.

Reading—Full value, 800 marks. Prose and Poetry.

Writing and Dictation—Full value, 1,000 marks. Specimens of Copy-setting in round hand, half-text, and small hand.

and small hand.

Arithmetic—Full value, 1,000 marks. Simple and Compound Rules, Reduction, Proportion, Practice, Simple and Compound Interest, Vulgar and Decimal Fractions.

Group 4

<sup>\*</sup> Note.—In this group at least two languages must be taken, one of them being Latin.

Any four of these Sciences may be taken.

Group IV.

Euclid—Full value, 1,000 marks. Books, I to VI, with Deductions.

Text Books—As in Group I.

Algebra—Full value, 1,000 marks. Inclusive of the Binomial Theorem.

Text Books—As in Group I.

Latin—Full value, 1,000 marks. Cæsar, De Belle Gallico. First two books.

Virgil's Æneid. Book I.

Text Books—As in Group II.

Group V.

Euclid—Full value, 1,000 marks. Books I to VI, with Deductions.

Text Books—As in Group I.

Algebra—Full value, 1,000. Inclusive of the Binomial Theorem.

Text Books—As in Group I.

And any two Sciences of the Science Group already specified in Group III. Full value, 1,000 marks.

Group VI.

Latin—Full value, 2,000 marks. Virgil's Æneid. Books I, II.
Livy. Book XXI.
Horace's Odes. Books I, II.
Grammar and Composition.
Text Books—As in Group II.
Together with any two of the Sciences in Group III.
Full value, 1,000 marks.
Text Books—As in Group III.

Text Books-As in Group III.

Alternative Groups for Females.

Group I.

French—Full value, 2,000 marks. Grammar, Translation, Composition.

Text Books—Subjects as for the Senior University Examination of the current year,

Havet's French Grammar.

Hallard's French Grammar.

Group II.

German—Full value, 2,000 marks. Grammar, Translation, Composition.

Text Books—As for Males.

Group III.

Latin—Full value, 2,000 marks. Grammar, Translation, Composition Text Books—As for Males.

Group IV.

Euclid—Full value, 1,000 marks. Books I to IV, with Deductions.

Text Books—As for Males.

Algebra—Full value, 1,000 marks. To Quadratic Equations including Surds.

Text Books—As for Males.

Group V.

Any two of the following Sciences:

Experimental Physics—Full value, 1000 marks.
Chemistry—Full value, 1,000 marks.
Geology—Full value, 1,000 marks.
Botany—Full value, 1,000 marks.
Physiology—Full value, 1,000 marks.
Text Books—As for Males of First Class.

Note 1. In lieu of the Alternative Subjects of examination herein prescribed for a Second-class or a First-class Certificate, the subjects of the Sydney University Arts' Course (as set forth in the By-laws and annually published in the Calendar) shall be taken up in the Training Schools by those students who have passed the University Matriculation Examination and who may desire to compete, in subsequent University examinations, for the special privilege of remaining a third year in Training and proceeding to the final examination for the Bachelor of Arts degree.

NOTE 2. Graduates of any recognised British or Colonial University of not more than five years standing may be exempted from examination in the Alternative Groups for Class I or Class II.

NOTE 3. Any Teacher who can show, to the satisfaction of the Minister, that he is unable to take Music or Drawing, may substitute for each or either of these any one of the Sciences specified in Group IV, Class II.

Note 4. Certificates issued to Teachers and Pupil Teachers by the Technical Education Branch in the undermentioned subjects, will exempt the holders from further examination in such subjects;—

Physics, Chemistry, Geology, Botany, Physiology,
Freehand Drawing (first year)—any grade—for applicants for employment as Pupil Teachers.
Freehand Drawing (second year)—any grade—for Teachers and Pupil Teachers.
Model Drawing (first year)—any grade; Perspective Drawing (first year)—any grade—Section 1.
Geometrical Drawing (first year)—any grade.

#### SUBJECTS OF STUDY FOR PUPIL-TEACHERS.

Before Appointment-Candidates.

Reading—Full value, 100 marks. To read an advanced Class Book, sanctioned by the Minister, with ease, fluency, and expression, to spell well, and to understand the meaning of the passage read.

Writing-Hull value, 100 marks. Specimens of penmanship, not fless than two lines, in round and small hand.

Dictation—Full value, 100 marks. As for a Fourth Class.

Arithmetic-Full value, 100 marks. To know the Arithmetical Tables, and to work the rules in Vulgar Fractions, Proportion, and Practice.

Grammar—Full value, 100 marks. To Parse and Analyse correctly a passage taken from an ordinary Class-book; to know the Elements of Grammar, including Prefixes, Affixes, and Common Roots.

Geography—Full value, 100 marks. To understand the Geographical Terms, to have a general knowledge of the Map of the World, and the Outlines of the Geography of Australia.

Drawing-Full value, 50 marks. Freehand Tests, as prescribed for a Third Class in the Standard of

Vocal Music-Full value, 50 marks. As prescribed for a Third Class in the Standard of Proficiency.

Skill in Teaching-To Teach a Junior Class in the presence of an Inspector.

#### Pupil-teachers-Class IV.

Reading—Full value, 100 marks. To read the Fifth Reading Book, sanctioned by the Minister, with fluency and expression, give synonymous words and phrases, and answer upon the subject matter; to repeat from memory 50 lines of Poetry.

Writing—Full value, 100 marks. Specimens of copy-setting.

Dictation—Full value, 100 marks. Coutie's Word Expositor, to page 41.

Arithmetic—Full value, 100 marks. To work questions in Proportion, Vulgar and Decimal Fractions, and Practice.

and Practice.

School Management—Full value, 50 marks. Gladman's School Method. The Kindergarten Principle (Laurie's Kindergarten Manual).

Needlework (for Females)—Full value, 50 marks. 1. Cut out young child's dress in paper, and tack.

2. A patch in calico print and flannel. 3. A sampler as for last year, but showing greater skill.

Pupil-teachers-

#### . Pupil-teachers-Class I.

Pupil-teachers—Class I.

Reading—Full value, 50 marks. To read with case and expression from a standard author.

Writing—Full value, 50 marks. Specimen of Penmanship; three hands, with increased skill.

Arithmetic—Full value, 100 marks. Application of Rules and Principles. Mensuration of Surfaces.

Text Books—Barnard Smith's Arithmetic.

Todhunter's Mensuration. Chapters 7 to 17 inclusive.

Grammar—Full value, 100 marks. Accidence, Parsing, Analysis, Derivations, Composition.

Text Book—Lenuic's Grammar, and Special Text-book for Junior Examination of current year.

Geography—Full value, 80 marks. See Cycle in Class IV.

History—Full value, 70 marks. English History, and Australian History. See Cycle for Class IV.

Drawing—Full value, 50 marks. Advanced proficiency expected in the three sections.

Focal Music—Full value, 50 marks. Stimpson's Class Book, Chap. XVI to end.

Geometry—Full value, 100 marks. Books I, II, and III, with deductions from Book I.

Algebra—Full value, 100 marks. Quadratic Equations, with Surds, to Chap. XXVI, inclusive, omitting Chapter XXII.

Latin—Full value, 100 marks. Via Latina, to exercise 93; Appendices 2 and 5. Easy translations.

Chapter AAII.

Latin—Full value, 100 marks. Via Latina, to exercise 93; Appendices 2 and 5. Easy translations.

Casar, De Beilo Gallico. (Chaps. I to III).

French (for Females)—Full value, 150 marks. Macmillan's French Course, Second Year. Macmillan's First French Reader, pages 1-73.

School Management—Full value, 50 marks. Gladman's School Method. The Kindergarten Principle

(Laurie's Kindergarten Manual).

Needlework (for Females)—Full value, 50 marks. 1. A young child's dress, showing gathering and stroking, ornamented with various stitches as shown in former samplers; tucks to be run, frill-whipped and hem-stitched to be used as a trimming. Also cut out any garment required as in former classes. 2. A six-inch sampler done in coloured silk with threads drawn showing all the various stitches used in needlework.

Note 1.—The course herein prescribed is for all pupil-teachers alike. It is recommended, however, that the Sydney University Matriculation subjects (as set forth in the by-laws and annually published in the Calendar) be also studied by those pupil-teachers who may desire or intend, after admission to the Training School, to present themselves at the Matriculation examination and to compete, in subsequent University examinations, for the privilege of remaining three years in training and proceeding to the final examination for the Bachelor of Arts degree.

Note 2.—Any pupil-teacher who may have passed the Junior or the Senior University examination in Euclid, Algebra, Latin, or French may be exempted from further examination in such subject or subjects in Classes IV, III, and II.

Note 3.—Drawing must be taken by all candidates for scholarships, even though the standard has been proviously satisfied.

satisfied.

Note 4.—See also Note 4, at end of Subjects of Study for Teachers.

#### Examinations.

102. An examination of teachers shall be held yearly in each Inspector's district. Teachers who desire to be examined, with a view to promotion, must apprise the Inspector of their wish at least one month before the date of examination, and furnish him with a list of the alternative subjects, if any, upon which they are prepared for examination.

#### Promotion for Good Service.

103. Teachers can be promoted from one class to another by examination only. But in each class a teacher may, without examination, be advanced to a higher grade for good service, counting from 1885; that is to say, if in the last five years during which he has held his classification, his school has increased in efficiency, if the Inspectors' Reports throughout that period have been satisfactory, and the Report for the fifth year indicates that the applicant's practical skill is equal to that required for the grade sought, and if his general conduct has merited the Minister's approval.

#### Promotion by Removal.

104. Teachers desirous of being promoted to more important schools must intimate their wishes to the Inspector of the district, in writing. A list of such teachers will be kept in the Department of Public Instruction; and, except in special cases, promotions will be made in accordance with the principle of classification and seniority.

#### Efficiency of Teachers.

105. In judging of the efficiency and usefulness of Teachers and of their claims to promotion, the successful work carried on by them in connection with (a) the initiation and management of School Savings' Banks. (b) the planting and beautifying of school grounds, (c) the instructing and drilling of Public School Cadet Corps, and (d) the passing of pupils at the Junior or Senior Examinations, will have full value awarded to it. have full value awarded to it.

### Classification of Schools.

106. Primary schools established or maintained under this Act shall be classed as follows :-

#### First Class Schools.

All schools in which the average daily attendance is not less than six hundred in three departments, boys', girls', and infants', and in which the standard of proficiency prescribed for that class of school is fully reached.

#### Second Class Schools.

All schools in which the average daily attendance is not less than four hundred children nor more than six hundred in three departments, boys', girls', and infants', and in which the standard of proficiency prescribed for that class of school is fully reached.

#### Third Class Schools.

All schools in which the average daily attendance is not less than three hundred nor more than four hundred in three departments, boys', girls', and infants', and in which the standard of proficiency prescribed for that class of school is fully reached.

#### Fourth Class Schools.

All schools in which the average daily attendance is not less than two hundred nor more than three hundred in two departments, and in which the standard of proficiency prescribed for that class of school is fully reached.

#### Fifth Class Schools.

All schools in which the average daily attendance is not less than one hundred nor more than two hundred children, and in which the standard of proficiency prescribed for that class of school is fully reached.

<sup>\*</sup> From female pupil-teachers in country districts the following will be accepted in lieu of French, where it can be shown that the examinee has had no means of acquiring a knowledge of the language in question:

Latin, or

Exclude and Algebra.

As for Males.

#### Sixth Class Schools.

All schools in which the average daily attendance is not less than fifty nor more than a hundred children, and in which the standard of proficiency prescribed for that class of school is fully reached.

#### Seventh Class Schools.

All schools in which the average daily attendance is not less than forty nor more than fifty, and in which the standard of proficiency prescribed for that class of school is fully reached.

#### Eighth Class Schools.

All schools in which the average daily attendance is not less than thirty nor more than forty children, and in which the standard of proficiency prescribed for that class of school is fully reached.

#### Ninth Class Schools.

All schools in which the average daily attendance is not less than twenty nor more than thirty children, and in which the standard of proficiency prescribed for that class of school is fully reached.

#### Tenth Class Schools.

All Public Schools in which the average daily attendance does not reach twenty.

#### Condition of Retention in Class.

107. Where a school fails to meet the conditions above specified, the Minister may remove such school to a lower class.

### Eligibility of Teachers for appointment to certain Schools.

108. Teachers who have gained their classifications by examination, or by promotion under Regulation 103, shall be eligible for appointment to any school or department, in accordance with the following Schedule:-

Class of School or Department.	Teacher's Classification.
II	
III	
IV	
<u>_Y</u>	
<u>VI</u>	
VII	
VIII	<u>III</u> . <u>B</u> .
IX	
X	,

109. A teacher may be removed from the school in which he is employed to another of a lower class, should he fail, through any default on his part, to maintain the requisite number of pupils in average attendance, or to satisfy the conditions of the standard of proficiency.

#### Teachers' Emoluments.

110. The salaries of male teachers shall be according to the following scale:-

For a teacher	in charge	of a school of	the First Class	£400
Do	ďo	do	Second Class	336
Do	do	do	Third Class	252
Дo	do	do	Fourth Class	240
Do	do	do	Fifth Class	228
Лο	do	do	Sixth Class	216
Dо	do	do	Seventh Class	180
$\mathfrak{D}_{0}$	do	дo	Eighth Class	156
Do	do	do	Ninth Class	132
Do	do	do	Tenth Class	108

In schools ranking below the fourth class, the salaries of unmarried male teachers, of married teachers who are not assisted by their wives, as required by regulation 96, and of female teachers in charge, shall be £12 per annum less than the foregoing rates.

111. In addition to these salaries, residences, vested or rented, shall be provided for classified male teachers in charge of classified Public Schools; but a residence rented for a teacher shall be as near as practicable to his school.

112. The salaries of mistresses shall be according to the following scale:-

	ge of a girls or infants department of a	
School of the	First Class	£300
$\mathbf{p}_{\mathbf{o}}$	Second Class	
$\mathbf{Do}$	Third Class	
$\mathbf{p}_{\mathbf{o}}$	Fourth Class	192
$\mathbf{D}_{0}$	Fifth Class	

#### Assistant Teachers.

113. Salaries shall be paid to assistant teachers as follow:--

To a First Assistant, holding a First Class Certificate, in a school of the First Class	Male. £250	Female. £168
To a Second Assistant, holding a Second Class Certificate, in a school of the First Class	150	120
To a Third Assistant, holding a Third Class Certificate, in a school of the	108	100
To a First Assistant, holding a Second Class Certificate, in a school of the Second Class	180	144
Fourth, or Fifth Class	150	114

#### Pupil-teachers.

114. Salaries shall be paid to Pupil-teachers at the following rates :-

First Class	Male. £72	Female. £48
Second Class	60	86
Third Class	48	30
Fourth Class	42	24

Work-mistress

#### Work mistresses.

115. Work-mistresses may be appointed to schools of the first and second classes; and their salaries shall be at the following rates:-

To Tall All Dr. Co. 1 to 100	Per annum
In a First Class School with an average daily attendance of not fewer than 250 gi	rls £120
In a First Class School with an average daily attendance of not fewer than 250 girls in a First Class School with an average daily attendance of fewer than 250 girls	-6100
In a Second Class School	000
In a Second Class School	£90
116. The time devoted to their duties by Work-mistresses shall be as follows:-	
• • • • • • • • • • • • • • • • • • • •	Days a week.
In First Class Schools with an attendance of 250 girls	5
Ta Find Class Calcal with a section to the gain and the section of the gain and the section of t	
In First Class Schools with an ottendance of fewer than 250 girls	4
In Second Class Schools	. 4

117. Each Work-mistress shall be required to keep a record showing the names of the pupils, as well as the dates of commencing and completing each piece of work. The record is to be preserved for the information of the Inspector, and of the Directress of Needlework.

113. The regular Teachers of such classes as may be receiving instruction in Needlework will be expected to assist the Work-mistress in the performance of her duties.

#### TRAINING SCHOOLS.

#### Classes of Candidates.

Classes of Candidates.

119. The Minister may authorize to be received into the Training Schools, annually, three classes of candidates, namely, First Class, or Scholarship Candidates—Thirty pupil-teachers whose term of service has expired, and who have obtained the highest marks among those passing the entrance examination successfully; Second Class, or Half-Scholarship Candidates—Twenty pupil-teachers whose term of service has expired, and who have obtained, after the first thirty, the next highest marks among those passing the entrance examination successfully, and are prepared to pay half the cost of their maintenance while in training; Third Class, or non-Scholarship Candidates—Other Pupil-teachers whose terms of service have expired, untrained teachers who have had charge of schools, and persons entering the teaching profession for the first time, who have passed the entrance examination successfully, and are prepared to pay the whole cost of their maintenance while in training.

#### Qualifications.

120. Candidates must apply for admission in a form prescribed by the Minister. They must, except in the case of pupil-teachers, be not less than twenty years of age, and, as a general rule, not more than thirty; they must be free from any bodily infirmity likely to impair their usefulness as teachers, and be persons of active habits and unblemished reputation. They must also satisfy the Ministers to their previous history and their purity and t Minister as to their previous history and their qualifications,

#### Conditions of Admission.

121. Before admission, every candidate must make a declaration that he intends, in good faith, to tollow the profession of a teacher in schools under the Minister, and that he will accept a situation in any district, as the Minister may see fit. He must also procure a guarantee from two responsible persons that the whole expense of his training defrayed by the State will be refunded, if, from any cause whatever, he shall not enter the service of the Minister, or shall leave it in less than three years from the date of his first appointment.

#### Terms of Training.

122. Entrance examinations shall be held yearly in December; and the periods of training will be one year, two years, or three years, as may be found expedient.

### Allowances during Training.

123. The following allowances may be made to students who satisfy the aforementioned conditions and pass successfully the prescribed examinations:—To scholarship students, £6 per month; to half-scholarship students, £3 per month. When the school is prepared to receive students into residence, these allowances are not paid, board and lodgings being provided instead.

124. The students shall be trained in the practical management of schools by attendance at the Practising School.

#### Examinations.

125. Oral examinations of the students shall be held periodically to test their attention and progress; and written examinations shall take place yearly, in December, when classifications will be awarded according to attainments and teaching skill to students who have completed their course. No certificate shall be given until the Inspector's Report shows that the student is successful in the management of a

#### GOVERNMENT OF SCHOOLS.

#### Public School Roards.

126. The Minister reserves to himself the power of controlling, through his officers, the internal management of schools; but, for other purposes, he will avail himself of the assistance of Public School Boards, wherever suitable persons are found to fill the office.

127. Every Public School Board, at the first meeting thereof, shall elect from the members a Chairman, whose duty it will be to correspond with the Minister on behalf of the Board; and the Board may in like manner appoint such other honorary officers, being members of the Board, as the Board may deem expedient.

may in like manner appoint such other honorary officers, being members of the Board, as the Board may deem expedient.

128. A Public School Board may, by resolution passed at a duly constituted meeting thereof, appoint any member or members to perform the duty, prescribed by the 19th section of the Public Instruction Act, of visiting any of the schools placed under the supervision of the Board; and it shall be the duty of the member or members so appointed to report the results of any such visitation to the Board, who will, if necessary, report to the Minister.

129. The grounds upon which any Public School Board shall exercise the power conferred on it by the section beforementioned to suspend a teacher for misconduct, shall be the following:—Unfitness on the part of such teacher to perform his duties from intemperance, immoral conduct, gross neglect of duty, or continued absence from duty without leave.

130. Public School Boards shall, before leaving the school under visitation, report to the Minister any case in which a teacher is suspended by them, and apprise the Inspector having charge of such school by letter.

131. Public School Boards are expected to use every endeavour to induce parents to send their children regularly to school, and to report the names of any parents or guardians who refuse or fail to educate their children, for which purpose necessary forms will be provided.

132.

132. When the course laid down in Regulations under the 13th section of the Public Instruction Act for relieving parents and guardians from payment of school fees by the Minister is not convenient, application may be made by parents or guardians to the Public School Board of the district; and, if satisfied as to the inability of the applicants to pay school fees, such Public School Board may issue a certificate of exemption from payment thereof for a period not exceeding three months, and shall thereupon report the case to the Minister.

133. In fixing the hour for special religious instruction, in accordance with section 17 of the Public Instruction Act, the Public School Board should take care that the daily routine of the school, as laid down in the Regulations, is not unduly interfered with.

134. In addition to the powers conferred on such Boards by the Public Instruction Act, the Minister entrusts to them the following duties:—(a) To take care that the school buildings are not used for any improper purpose. (b) To see that a sufficient quantity of suitable furniture and apparatus is provided. (c) To take precautions for excluding from the school, during its ordinary business, all books not sanctioned by the Minister. (d) To inspect periodically the School Registers and Records. (c) To see that the school is open on all the usual school days, and that the teacher is present at his work. (f) To observe whether the teacher discharges his duties, to report his conduct to the Minister when he is in fault, and to protect him from vexatious complaints.

Inspectors of Schools.

#### Inspectors of Schools.

135. Inspectors and other persons deputed by the Minister to visit any school shall be furnished with proper credentials. Every teacher is required to treat such persons with deference; to carry out their suggestions for the improvement of the school; and to obey their instructions in all matters relating to the Public Instruction Act and these Regulations.

#### Duties of Inspectors.

136. Inspectors are to enforce observance of the provisions of the Public Instruction Act and of the Regulations; but their decisions shall be subject to appeal to the Minister. They are to examine into condition of the schools, and to inquire into all matters which it may be expedient to report to the Minister. They are authorized to determine all questions of school management, and to take the teaching of a class or of a school into their own hands for a time, to show the teacher how defective methods may be improved. improved.

#### Annual Inspections.

187. Once at least in the year, every school in each Inspector's district shall be visited by him and the pupils be examined as to their proficiency in the several branches of instruction as authoritatively prescribed. He shall, within six days of such inspection, send a report thereupon to the Minister, together with such observations on the state of the school generally as shall appear to him to be called

#### Conduct of Inspectors.

138. In their intercourse with teachers, Inspectors should be guided by feelings of respect for the teacher's office, and of sympathy with his labours. They should exhibit towards teachers every possible courtesy, treating them at all times with the consideration and kindness which the difficulties of their position demand.

#### Observation Book.

139. The Inspector's remarks upon the state of a school visited by him, shall, at the close of the examination, be entered in the Observation Book of the school, which, as a record, is to be carefully preserved. Entries therein must not be erased or altered.

#### SCHOOL ROUTINE AND DISCIPLINE.

#### Punctuality.

140. With a view to the proper training of their pupils, teachers must conduct the operations of their schools with punctuality and regularity.

#### Cleanliness.

141. Habits of personal neatness and cleanliness are to be encouraged among the pupils, not only by precept, but by the personal example of the teachers, and, if necessary, may be enforced. Teachers are also responsible for keeping the schoolrooms and furniture clean and arranged in an orderly

#### Order and Conduct.

142. Teachers are to instil into the minds of their pupils the necessity for orderly and modest behaviour, as well as for obedience to teachers and to the rules of the school. Pupils should also be trained to exhibit respect for the property of others, whether public or private; to regard the feelings of their fellows; to be honest and truthful, attentive under instruction, and conscientious in the discharge of every duty.

#### Government of Pupils.

143. In the government of pupils a teacher must avoid all degrading punishments. His discipline should be mild but firm, his manner kindly, his demeanour cheerful, and his language marked on all occasions by strict propriety. While overlooking no offence, his aim should be to prevent the necessity for punishment by effecting the improvement of the offender.

## Corporal Punishment.

144. Corporal punishment may be inflicted, but by the principal teacher only, or by an assistant with his approval. It should be restricted as much as possible to extreme cases; and the teacher must keep a record of the time and place of punishment, its amount, and the nature of the offence.

#### Expulsion of Pupils.

145. No pupil shall be expelled from any school except by the authority of the Minister.

#### Suspension.

146. A pupil may, nevertheless, for gross insolence, persistent disobedience, profanity, or immoral conduct, be, by the teacher, forthwith removed from the school: provided that, in every such case, the matter shall be reported without delay to the Minister; and, until its settlement by him, the pupil shall not be re-admitted.

#### Playground Supervision.

147. The conduct of pupils in the playground must be carefully supervised by the teacher; and he must see that, in proceeding to school and returning from it, their behaviour is orderly.

#### Religious Views of Pupils or of Parents.

143. Nothing must ever be said or done by any teacher, in a pupil's Le ring or presence, calculated to offend the religious views of that pupil, or of any other in the school, or of the parents of any such pupil.

#### Daily Routine

149. In all schools maintained or aided by the Minister, the daily routine shall be that specified hereunder: Provided that, by permission of the Minister, the time of assembling may be half an hour ater than so specified; in which case, the several times stated will be later in the same proportion.

#### Morning.

At 8.45. Pupils to assemble in the playground. All school materials to be prepared for lessons.
 At 8.55. Pupils to be arranged in ranks, inspected as to cleanliness, and marched into school.
 At 9. Lessons (or Special Religious Instruction) to commence; as noted in the Time-table prescribed by Rule 150.

At 10 30. Recess for ten minutes, to be spent in the playground by pupils and teachers. At 10.45. Lessons to be resumed according to the Time-table.

At 11.55. Class roll to be called and marked.

At 12. The school to be dismissed for mid-day recess.

From 12 to 1.20. Recess for dinner and recreation, under the superintendence of the teachers At 1.20. Pupils to re-assemble in the playground. School materials to be prepared for lessons. At 1.25. Pupils to be arranged, inspected, and marched into school.

At 1.30. The Roll to be called and warked.

At 3.25. The school to be discussed.

At 3:30. The school to be dismissed.

150. The Time-table to be observed in the schools is the following, except that, in cases within the proviso to the preceding Regulation, the time in each instance will be half an hour later than specified:—

From 9 to 10. Special Religious Instruction; or, in Public and Provisional Schools, where no Religious Teacher is in attendance, Ordinary Instruction.

From 10 to 12. Ordinary Instruction.

From 12 to 1:30. Recess for dinner and re-assembling.

From 1:30 to 3:30. Ordinary Instruction.

#### Special Religious Instruction.

151. Where the time specified for special religious instruction is inconvenient, some other hour may be fixed by mutual agreement between the Public School Board, the teacher, and the person giving such instruction.

#### Vucations and Holidays.

152. The vacations sanctioned by the Minister are—three weeks at Christmas, one week at Eas'er, and a fortnight at Midwinter. The holidays allowed, other than those occurring in vacation, are—the Anniversary of the Colony, of the Queen's Birthday, and of the Prince of Wales' Birthday; and Good Wilder. Friday.

Teachers are to enter on their Time-tables these Vacations and Holidays.

#### Closing Schools.

153. No school is to be closed upon any school-day without the written direction of the Minister or other person duly authorized by him on that behalf.

#### Infectious Diseases.

154. The attendance of any pupil suffering from any contagious, offensive, or infectious disease, may be temporarily suspended by the teacher under rules approved by the Minister.

### Instruction in Schools.

#### Course of Instruction.

155. The Course of Secular Instruction, as the term is defined in the Public Instruction Act, shall be as follows for each class :-

#### INFANTS' DEPARTMENT.

#### (Course, 2 years.)

(Course, 2 years.)

Reading—Primer and Reader I—"Australian School Series."

Writing—On slates, from copies and dictation.

Arithmetic—Notation to four places, and Simple Addition on slates; casy mental operations in Addition and Subtraction, and the Multiplication Tables to "7 times."

Object Lessons—Familiar Objects, Domestic Animals, Common Vegetables, Common Materials.

Form—Lines and Angles, Three and Four-sided Figures, Curved-line and other Plain Figures.

Colour—Primary, Secondary, and Tertiary Colours; Combination, Shades and Tints.

Singing—Simple Melodies by Ear.

Scripture—Narratives and Moral Lessons.

Drill—Inspection Drill, Free Exercises, Gallery Exercises, Marking Time.

Drawing—On Slates, Lines, Angles, Parallels.

### FOR PRIMARY SCHOOLS AND FOR BOYS' AND GIRLS' DEPARTMENTS.

#### First Class.

#### (Course, 11 year.)

Reading-Primer, Reader I - A. S. Series; or, I.N.B. Series as far as Book II, Section III, Lesson &

Writing—On slates from copy. Dictation—From Lessons read.

Arithmetic— As in Infants' Department.

Singing— Scripture—Nurratives and Moral Lessons; Old Testament, No. 1.

Object Lessons—
Drawing—
As in Infants' Department.

Needlework-Hem, top-sew, make holland or calico work apron or sachet. Name to be marked.

Second

#### Second Class.

(Course, I year.)

(Course, 1 year.)

Reading—Reader II, A.S. Series, or I.N.B. Series, Book II, with Sequel I.

Writing—On slates from copy; in copy-books.

Dictation—From Lessons read.

Arithmetic—Notation; Simple Rules; Mental Arithmetic—Simple Rules, Tables, Money.

Object Lessons—Domestic Animals, Common Objects, and Materials, Common Animals, and Vegetables.

Singing—Simple Melodies by Ear; Scale Exercises, Two and Three Pulse Measures.

Scripture—I.N.B., Old Testament No. I; Morai Lessons.

Drawing—Freehand, on Slates; Simple Right-lined and Curved Figures.

Drill (for Boys)—"Infantry Drill for 1889"; Squad Drill with Intervals; Sections 1, 2, 3, 4, 5, 6, 25, 26; Marching, 12, 13, 15, 16, 17, 18, 19, 31, 32, and 50; Exercises, 1, 2, 3, 4.

Drill (for Girls)—Dressing with Intervals; Turnings by Numbers; Free Exercises and Body Flexions (six exercises); Marching in Single Rank.

Needlework—Hemming, Top Sewing, Feather Stitch, Satin Stitch; a Pinafore, Pillow-slip, &c.; Seams top-sewed and felled-finished with tapes.

Third Class.

#### Third Class.

#### (Course, 2 years.)

Reading - Readers III and IV, A. S. Series; or, I.N.B. Series, Books III and IV; Synonyms, Meanings, Derivations; Repetition of Poetry, 130 lines.

Writing—In copy-books.

Dictation—From the Reading Lessons, with correct spolling and punctuation.

Arithmetic—Compound Rules and Reduction; Simple and Compound Proportion. Mental Arithmetic—Prices of Dozens and Scores, Exercises in Buying and Selling Transactions, and in Proportion.

Grammar—All the Parts of Speech; Accidence, Parsing and Analysis of Simple Sentences; the Rules of Syntax; Composition—Letter-writing, description of places and events.

Geography—School Locality, Cardinal Points, Definitions, Map of World; Outlines of the Geography of Australasia and Polynesia; Physical Geography, and Towns of New South Wales and Europe; Manning. Mapping.

Mapping.

Object Lessons—Animal and Plant Life, with Special Reference to Agriculture; the Human Frame and Laws of Health; Elementary Physiology; Important Manufactures.

History—Nelson's Brief History of England; History of Australia; Outlines of English History.

Singing—Part-singing; Notation, Pitch, Accent, Length of Sound; Double, Triple, and Quadruple Measures; Time Signatures; Scale, &c.

Drawing—On Paper; Freehand Exercises from Models and Common Schoolroom Objects; Geometrical Figures, with Rulers and in Freehand.

Scripture—I.N.B. Old Testament No. 1; New Testament No. 1.

Needlework—Plain Under-gurnents, Stitching, Herring-boning, Eyelet and Button Holes, Felling, Running, Darning, &c.; Sampler showing various stitches used in needlework.

Drill (for boys)—"Infantry Drill for 1899"; Physical Training, section V, Exercises 5, 6, 7; Marching—Sections 7, 8, 10, 11, 20, 21, and 22; and Squad Drill, sections, 37 to 50.

Drill (for girls)—File Marching; Wheeling in File; Marking Time; Changing Step; Free Exercises while Marching and Marking Time.

Fourth Class.

#### Fourth Class.

#### (Course, 1 year.)

Reading-Reader V to Lesson 56, AS. Series; or I.N.B. Fourth Supplement, to page 155. Repetition of Poetry--100 lines.

of Poetry-100 lines.

Writing—In copy-books.

Dictation—From any portion of books read, with punctuation.

Arithmetic—Practice; Vulgar and Decimal Fractions; Interest; Discount, Profit and Loss; Mensuration of Surfaces Mental Arithmetic.

Grammar—Accidence; Parsing and Analysis generally; framing Sentences; simple Essays.

Geography—Physical features and Chief Towns of Asia and America; Mapping.

Object Lessons—As in Third Class (advanced), with the Chemical and Physical principles involved in Agriculture; Health; Elementary Physical Science.

History—Nelson's History of England for Junior Classes, Henry VII to Victoria; History of Australia.

Also Work of Class III.

Singing—As in Third Class; Sharps, Flats, Transition, Staff Notation, Key and Time; Signatures and

Also Work of Class III.

Singing—As in Third Class; Sharps, Flats, Transition, Staff Notation, Key and Time; Signatures and Intervals fully; Three Part Songs; Easy Passages at Sight.

Drawing—Freehand Drawing, from copies of common objects, which should be enlarged or reduced from the example; Drawing Plans and Elevations of Plane Figures and Rectangular Solids, in simple positions; Drawing Geometrical Figures with Instruments; Drawing to Scale in a limited manner.

manner.

Scripture—I.N.B. Whole Series.

Ewelid—Book I, to Proposition XII.

Drill (for boys)—"Infantry Drill for 1889"; Company Drill; Formation and Movements—Sections
1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 20, 22.

Drill (for girls)—Marching in line; Balance Step, with and without advancing; Body and Limb Flexions; Pole Exercises; Dumb Bells (\frac{1}{2}\) ib.).

Needlework—The Work of the Previous Standards, with advanced skill; Patching in Calico, Flannel, and Print; Cutting out Garments, and Setting Work. Ornamental Work and Knitting to be introduced when standard of plain needlework prescribed for the Third Class has been completed.

#### (Course, 1 year.)

Reading—As prescribed for University Junior Examination. Writing—As in Fourth Class.

Dictation—On unruled paper, ordinary prose—15 consecutive lines.

Arithmetic—Full Course, from Hamblin Smith's Manual, or any equivalent. Mensuration—Regular Surfaces and Solids.

Grammar— Geography— As prescribed for Junior and Senior Public Examinations at the Sydney University.

History— ) Natural Science--Physics or Physiology, or one of the Science Subjects prescribed for University Examinations or

Examinations or

Cooking: For girls.

Geometry—Euclid, Books I and II, with easy exercises.

Algebra—Hamblin Smith's Algebra to Chapter 13.

Latin (for boys)—Abbott's "Via Latina," to page 53, with the first conjugation and the verb sum.

French (for girls)—Macmillan's Progressive French Course to the end, with Macmillan's "First Reader,"

to page 28, or an equivalent.

161—I)

Needlework—

Needlework—As for Fourth Class; Child's Frock in Washing Material; Cutting out and Fixing Work
Fancy Work and Knitting at discretion of Work Mistress.

Drill (for boys)—As for Fourth Class.

Drill (for girls)—As for Fourth Class.

Drawing—Similar to Class IV, but of greater difficulty; Drawing from Common Objects and from Casts
on Ornaments in Light and Shade; Plans and Elevations of Circular Solids, with sections.

Music—As in Third and Fourth Classes; Major and Minor Modes; Inversions, &c.

Scripture-As in Fourth Class.

Note I.—Where there are pupils in a Fifth Class in third half-year, it is expected that Trigonometry will be introduced; also Euclid Book III; Algebra to Quadratics.

Note 2.—Where there are not as many as ten pupils to form a Fourth Class or a Fifth Class, as required, the Fourth Class and Fifth Class courses are to be taken as additions to the courses of the Third and Fourth Classes respectively.

#### THE STANDARDS OF PROFICIENCY FOR THE SEVERAL CLASSES IN SCHOOLS SHALL BE AS FOLLOW:-

#### First Half-year of Enrolment.

-To read Primer, Part I (Australian School Scries), to Lesson 20.

Writing—To write on Slates—i, u, n, m, v, r, w.

Arithmetic—To count and read up to 10; to know ball-frame exercises in Addition, and Addition of other Concrete Quantities as far as 10.

Object Lessons—Familiar Objects.

Form—The different kinds of Lines and Angles.

Colour—First (Primary) Colours.

Singing—Simple Melodies by Ear.

Scripture—Narratives and Moral Lessons.

Drill—Inspection Drill for Cleanliness; Free Exercises; Gallery Exercises.

Drawing—On Slates—Lines, Angles, and Parallels.

#### Second Half-year of Enrolment.

Reading—To read Primer, Part I, to the end.

Writing—To Write on Slates all the Letters of the Alphabet, with easy combinations.

Arithmetic—To Count and Read as far as 20; Addition, in single column, to 20; to add and subtract mentally numbers not involving results higher than 20.

Object Lessons—Domestic Animals.

Colour Lessons—Donnestic Animals.
Form—Three and Four Sided Figures.
Colour—Secondary Colours.
Singing—Simple Melodies by Ear.
Scripture—Narratives and Moral Lessons.
Drill—As for last half-year.

Drawing - As for last half-year.

#### Third Half-year of Enrolment.

Reading—Primer, Pert II, to the end.

Writing—To Write on Slates from Copies,

Dictation—Words from Lessons Read.

Arithmetic—To Read and Notate as far as 100; Addition to three places—three addends; Mental

Arithmetic up to 30; tables to "4 times."

Object Lessons—Common Vegetables.

Form—Curved Line Figures.

Colour—Tertiary Colours.

Singing—Simple Melodies by Ear.

Singing—Simple Melodies by Ear. Scripture—Nurratives and Moral Lessons. Drill—As for last half-year.

Drawing-As for last half-year.

#### Fourth Half-year of Enrolment.

Reading—Australian School Series—Reader I, to the end.

Writing—On slates from copies.

Dictation—From lessons read, 8 lines.

Arithmetic—To read and notate up to 1,000; Addition, 4 places, 4 lines; mental operations in Arithmetic and Subtraction; Multiplication Tables to "7 times."

Object Lessons—Common materials.

Form—Other plain figures.

Colour—Combination; shades and tints.

Singing—Simple melodies by car.

Drawing—Freehand Drawing on slates—lines, angles, and parallels.

Scripture—Narratives and Moral Lessons.

Drill—As for previous half-years, with marking time—(1) with left foot; (2) with right foot; (3) with left foot and right foot alternately.

Drawing—As for previous half-year.

Drawing-As for previous half-year.

FOR

#### FOR PRIMARY SCHOOLS AND FOR BOYS' AND GIRLS' DEPARTMENTS.

#### FIRST CLASS,

#### First Half-year of Enrolment.

Reading-One of the following books, or an authorized equivalent :-

1. Australian School Series: Primer I, to Lesson 40.

2. I. N. B.: Book I, to Sec. II, Lesson 12.

2. 1. N. B.: Book 1, to Sec. 11, Lesson 12.
Writing—To write on slates, from the blackboard, the following letters, with their combinations, in words of four letters—i, u, n, m, o, a, c, e, v, w, r, t, d, l, b, h, j, f, y, g, p, q.
Arithmetic—To count and road any number as far as 20; to add in single columns numbers not involving a higher result than 20; to notate as far as 20; to add and subtract, mentally, numbers not involving results higher than 20.
Drawing—Freehand Drawing, on slates—lines, angles, and parallels.
Object Lessons—As for Infants' Schools; oral lessons on form and colour, on the properties of common objects and materials, and on common animals and vegetables.
Needlework—Hem 2-inch Strips with coloured cotton.
Singing—Simple melodies by ear.
Scripture—Narratives (Old Tostament No. 1)—Moral Lessons. (First and Second Classes may be taken together.)

taken together.)

Drill—As for Infants' Schools, first half-year.

#### Second Half-year of Enrolment.

Reading-1. Australian School Series: Primer II, to the end.

2. I. N. B.: Book I, to the end. Writing-To write on slates from copies.

Writing—To write on slates from copies.

Dictation—Words from lessons read.

Arithmetic—To read and notate easy numbers as far as 100; to work sums in Addition—three addends; to add, mentally, numbers involving results not higher than 30; Multiplication Tables to "4 times."

Drawing—As for first half-year.

Object Lessons—As for first half-year.

Needlework—Hom and top-sew together strips with coloured cotton, and plain hems.

Singing—Simple melodies by ear.

Seripture—Narratives and Moral Lessons; Old Testament, No. 1.

Drill—As for Infants' Schools, first half-year.

#### Third Half-year of Enrolment.

Reading—1. Australian School Series: Reader I, to the end.
2. I. N. B.: Book II, to Section III, Lesson 8.
Writing—On slates from copies.

Dictation—From lessons read.

Arithmetic—To read and notate numbers as far as 1,000; to work sums in Addition to 4 places, 4 lines; to perform easy mental operations in Addition and Subtraction; Multiplication Tables to "7 times."

Drawing—As for first half-year.

\*Object Lessons—As for first half-year.

Singing—Simple melodies by car.

\*Scripture—Narratives and Moral Lessons: Old Testament, No. 1.

Drill—As for Infants' Schools, fourth half-year.

Needlework—Make Work-apron or Sachet with holland or calico. Name to be worked.

#### SECOND CLASS.

#### First Half-year of Enrolment.

Reading—One of the following books, or an authorized equivalent:—

1. Australian School Series: Reader II, to Lesson 50.

2. I.N.B.: Book II, to the end.

Writing—In copy books.

Dictation—Bight lines from lessons read.

Arithmetic—Notation as far as six places, three lines; Subtraction; Multiplication by two digits; Mental

Arithmetic; More difficult operations in Addition and Subtraction; Multiplication Tables to

"12 times."

Singing—Simple melodies by car; Easy Exercises on the Modulator. \*Scripture—Old Testament, No. 1.

\*Scripture—Old Testament, No. 1.

Drawing—Freehand Drawing on slates, of simple right-lined and curved figures.

\*Object Lessons—Properties of common objects and materials, common animals, and vegetables.

Drill (for boys)—"Infantry Drill for 1889"; Squad Drill with intervals; Sections 1, 2, 3, 4,6, 25, 26;

Marching, 12, 13, 15, 16, 17, 18, 19, 31, 32, and 50.

Drill (for girls)—Dressing with intervals; turnings by numbers; free exercises and body flexions (six exercises); marching in single rank.

Needlework—Hem and top-sew a 9-inch sumpler of jaconet with coloured cotton, and feather-stitch all round. Initial or name in satin-stitch.

#### Second Half-year of Enrolment.

Reading—I. A. S. S.: Reader II, to the end.
2. I. N. B.: Sequel I, to the end.
Writing—In copy-books.

Dictation—Eight lines from lossons read.

Arithmetic—Notation to 9 places, 3 lines; Multiplication in full; Short Division; Mental Arithmetic;

Exercises in simple Rules; Tables—Money.

Singing—

<sup>\*</sup> In small schools, the First and Second Classes should be combined for Object Lessons and Scripture, and should receive in each subject not less than one half-hour lesson per week; the inspection to be conducted on the lessons actually

Singing—Tonic Sol-fa Notation—Scale Exercises (without accidentals); two and three pulse measures (without subdivision of pulse); simple melodies.

\*Scripture—Old Tostament, No. 1; Moral Lessons. (Moral Lessons to be given orally.)

Drawing—Freehand Drawing on slates, of simple right-lined and curved figures.

\*Object Lessons—As for previous half-year.

Needlework—Make a plain pillow-slip, pinafore, handkerchief, or similar useful article; seams to be top-sewed and felled-finished with tapes.

Drill—As for previous half-year; and Physical Training, section 5; Exercises 1, 2, 3, and 4.

#### THIRD CLASS.

#### First Half-year of Enrolment.

Reading—One of the following books, or an authorized equivalent:—

1. Australian School Series: Reader III, to Lesson 20.

2. I.N.B.: Book III, to Lesson 30.

Repetition from memory of twenty lines of poetry.

Repetition from memory of twenty lines of poetry.

Writing—In copy books.

Dictation—Eight lines from lessons read.

Arithmetic—Notation, Long Division, Addition, Subtraction, and Multiplication of Money; Mental Arithmetic—Easy Exercises; Tables—Weights and Measures.

Geography—To know the school locality and the cardinal points; and the names and positions of the Continents, Oceans, and chief divisions of land and water marked on a Map of the World.

Grammar—To define the noun, pronoun, adjective, and verb, and to distinguish each in easy sentences.

†Singing—Tonic Sol-fa Notation: scale exercises; easy time exercises; two, three, and four-pulse measures (pulse, half-pulse, hold marks, and rests); simple two part songs and rounds.

History—Celtic Period to Henry II; to page 21, Nelson's Brief History of England.

Drawing—On paper, from simple rectangular and circular models, and from common objects about the school-room; also simple geometrical figures, to be drawn with rulers and in free-hand.

Scripture—Old Testament, No. 1; New Testament, No. 1; Moral Lessons.

Object Lessons—Lessons on animals and plants, with special reference to agriculture; on the human frame, and laws of health; on elementary physiology; and on important manufactures.

†Drill (for boys)—"Infantry Drill for 1889"; Physical Training as for Second Class; Marching—Sections 7, 8, 10, 11, 20, 21 and 22.

Drill (for girls)—File marching; wheeling in file; marking time; changing step; free exercises while marching and marking time.

Needlework.—A plain chemise, gathered at neck into a stitched band, ornamented with feather-stitching; or similar useful article which can be completed by stitches already taught.

Second Half-year of Enrolment.

#### Second Half-year of Enrolment.

Reading—1. Australian School Series: Reader III, to the end.
2. I.N.B.: Book III, to the end.
Repetition from memory of thirty lines of poetry.

Writing—In copy-books.

Dictation—Twelve lines from the reading lessons.

Arithmetic—All the Compound Rules; Mental Arithmetic.

Grammar—To distinguish readily all the parts of speech. Composition—To write a letter of not less

Grammar—To distinguish readily all the parts of speech. Composition—To write a letter of not less than twelve lines.

Geography—To know the outlines of the Geography of Australia, Tasmania, and New Zealand.

Object Lessons—As for previous half-year.

History—To death of Richard III; to page 44 of Nelson's Brief History of England.

Singing—Staff Notation (movable dok system); Treble Clef; Pitch and Time; Names; Relative Value of Notes; Two-part Songs and Rounds from Tonic Sol-fa Notation.

Drawing—As for previous half-year.

Scripture Lessons—Old Testament, No. 1; New Testament, No. 1.

Drill (for boys)—"Infantry Drill for 1889;" Physical Training, section 5; Exercises, 5, 6, and 7; Squad Drill, sections 37, 38, 39, 40, 42, 43, 44, 45, 46, 47, 48, 49, 50.

Drill (for girls)—As for first half-year.

Needlework—A linen sampler, with threads drawn, showing the various stitches used in Needlework, namely: top-sewing, stitching, herring-boning, various feather-stitching, eyelet and button-holes, small square of darning, loops; name done in satin-stitch.

#### Thira Half-Year of Enrolment.

Reading—1. Australian School Series: Reader IV, to the end of Lesson 30.
2. I. N. B., Book IV, to end of Section II.
Repetition from memory of forty lines of poetry.

Weiling—In carry books

Repetition from memory of forty lines of poerry.

Writing—In copy, books.

Dictation—Twelve lines from the Reading Lessons.

Arithmetic—Reduction; Miscellaneous Exercises in Simple and Compound Rules; Mental Arithmetic;

Easy Questions in Buying and Selling.

Grammar—Parsing of Simple Sentences; Accidence, and Analysis of Simple Sentences. Composition—

To write on paper a letter of not less than twelve lines.

Geography—New South Wales—Physical Features and Chief Towns; Mapping.

Object Lessons—As for first liaft, year.

Object Lessons—As for first lialf-year.

History—Nelson's Brief History of England, to page 70; Outlines of English History, to the Abdication of James 11.

Singing—Staff Notation—2 and 2 times; Time Exercises on Minim and Crochet (with corresponding rests); Scale Exercises on the Staff; Two-part Songs and Rounds from Tonic Sol-fa Notation. Drawing-

\* Note.—In Schools below the Sixth Class, the standard in singing for Second Class shall also be that for Third Class. 
‡ Note.—In schools below the Sixth Class, the standard for drill will be that for the Second Class.

<sup>\*</sup> In small schools, the First and Second Classes should be combined for Object Lessons and Scripture, and should receive in each subject not less than one half-hour lesson per week; the inspection to be conducted on the lessons actually

Drawing—As for first half-year.

Scripture Lessons—Old Testament, No. 1; New Testament, No. 1.

Drill (for boys)—Same as second half-year.

Drill (for girls)—As for first half-year.

Needlework—1. Sampler as in last half-year.

2. A pair of drawers, tucked, finished with button-holes in band; or similar useful article.

#### Fourth Half-year of Enrolment.

Reading—1. Australian School Series; Reader IV, to the end.

2. I. N. B., Book IV, to the end.
Synonyms, Meanings, Derivations; Repetition from memory of forty lines of poetry.
Writing—In copy books.
Dictation—Twelve lines from the Reading Lessons, on paper.
Arithmetic—Simple and Compound Proportion, with Miscellaneous Exercises in back Rules
Arithmetic

Arithmetic.

Grammar—Parsing and Analysis of Sentences, with a knowledge of the Rules of Syntax; Composition.

Geography—Europe—Physical Features and Chief Towns of each Country; Mapping.

Object Lessons—As for first half-year.

History—English History; Nelson's Brief History, to the end; Outlines of English History to the present time; History of Australia.

Singing—Staff Notation, \$\frac{3}{2}, \frac{3}{4}, \text{and \$\frac{4}{2}\$ Times; Time Exercises on Minim, Crochet, and Quaver (with corresponding rests); Scale Exercises on the Staff, introducing fe and ta; Two-part Songs and Rounds, from Tonic Sol-fa Notation.

Drawing—As for first half-year

from Tonic Sol-ia Notation.

Drawing—As for first half-year.

Scripture Lessons—Old Testament, No. 1; New Testament, No. 1.

Needlework—I. Running and felling seams with tucks run and gathered into band, in chemise or similar useful article; name or initial in satin-stitch.

2. Darning in stocking-web material.

3. Button-holes in cloth.

Drill (for boys)—Same as for second half-year.

Drill (for girls)—As for first half-year.

Note 1.—Where there are not ten pupils to form a Fourth Class, the atandard prescribed for the first half-year in the Fourth Class shall be that for the fifth half-year in the Third Class.

Note 2.—The work prescribed in Object Lessons, Scripture, and Drawing, is for the whole period pupils remain in the Third Class. The examination will be on the subjects taught.

Note 3.—When the standard of plain needlework prescribed for the Third Class has been completed, ornamental work, or knitting, or both, should be introduced.

#### FOURTH CLASS.

#### First Half-year of Enrolment.

Reading—One of the following books, or an authorized equivalent:—

1. Australian School Scries: Reader V, to end of Lesson 22.

2. I. N. B.; Fourth Supplement, to page 63.

Repetition from memory of fifty lines of poetry.

Repetition from memory of fifty lines of poetry.

Writing—In copy-books.

Dictation—Twelve consecutive lines from Lessons read.

Arithmetic—Practice; Vulgar and Decimal Fractions; Mental Arithmetic—the full course, as treated in any Standard Work.

Grammar—Parsing passages from Reading Lessons; Accidence; Analysis of a Compound Sentence;

Composition

Composition.

Composition.

Geography—Asia; Physical Features and Chief Towns of each Country; Mapping.

Object Lessons—Lessons on Animal and Plant Life, and on the Chemical and Physical Principles involved in Agriculture; more Advanced Lessons on Third-class Subjects, with Light, Heat, and Air in relation to Health; also Lessons on Elementary Physical Science.

History—English History: Nelson's "History for Junior Classes"—Henry VII to James II revision of Third-class Work; Australian History.

Singing—Staff Notation only; Key Signatures, C, F, and G; Structure of Scale, Tetrachords, Common Marks of Expression, Abbreviations, and Symbols. Time Signatures, 2, 2, 2, 4, and 2 Times; Easy Accidentals; Time Exercises on Minim, Dotted Minim, Crotchet, and Quaver (with corresponding rests); Three-part Songs and Rounds; very easy passages at sight.

Drawing—Freehand Drawing, from copies of Common Objects, which should be enlarged or reduced from the example; Drawing Plans and Electations of Plane Figures and Rectangular Solids, in simple positions; Drawing Geometrical Figures with Instruments; Drawing to Scale in a limited manner.

Scripture Lessons—The whole series (Fourth Class and Fifth Class may be taken together).

Euclid—Definitions of, Book I.

Scripture Lessons—The whole series (Fourth Class and Fifth Class may be taken together).

Euclid—Definitions of, Book I.

Drill (for boys)—" Infantry Drili for 1889"; Company Drill; Formation and Movements—Sections I,

2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 20, 22.

Drill (for girls)—Marching in Line; Balance Step, with and without advancing; Body and Limb

Flexions; Pole Exercises; Dumb Bells (\frac{1}{2} \) lb.)

Needlework—1. Sampler with greater skill than before.

2. A petticout with tucks run, gathered and stroked into band; or similar useful article.

3. Durning and button-holes, as in last half-year.

## Second Half-year of Enrolment.

Reading—1. Australian School Series: Reader V, to end of Lesson 56.
2. I. N. B., 4th Supplement, to page 155.
Repetition from memory of fifty lines of poetry.

Writing—As for last half years

Writing—As for last half-year.

Dictation—Selected passages of twelve consecutive lines from books read.

Arithmetic-Interest; Discount; Profit and Loss; Mensuration of Surfaces. Grammar—Accidence; Parsing and Analysis generally; Simple Essays.
Geography—America; Physical Features, and Chief Towns of each Country.

Object Lessons—As for first half-year.

History—English History (Nelson's "History for Junior Classes")—William III to present time;

History of Australia.

Singing—Staff Notation only; Key Signatures, B.D. D. Eb. A; Time Signatures fully; Time Exercises as in last half-year, with Dotted Notes, Ledger Lines, Accidentals, Definitions of most common Musical Torms; Three-part Songs and Rounds; Easy Passages at Sight.

Drawing—As for first half-year.

Scripture Lessons-The whole series

Book I, to Proposition 12.
 Drill (for boys)—As for first half-year.
 Drill (for girls)—As for first half-year.
 Needlework—1. A plain night shirt, showing top sewing, stitching, button-holes, and gathers, and finished with gussets; or a night-dress tucked and trimmed, or any similar article.
 Patching in calico and finnel.
 This class will be expected to set their own sewing, with the advice of the Work-

3. This class will be expected to set their own sewing, with the advice of the Workmistress; and pupils over 14 years of age should be able to cut out and fit garments specified in Third Class.

Nors.—When there are not ten pupils to form a Fifth Class, the standard prescribed for the first balf-year in Fifth Class shall be that for the third half-year of the Fourth Class.

#### FIFTH CLASS.

#### First Half-year of Enrolment.

Reading-The Text-book prescribed for the University Junior Examination.

Writing-In copy-books.

Dictation—Passages of ordinary prose, fifteen consecutive lines.

Arithmetic—Compound Interest, Profit and Loss, as treated in Hamblin Smith's Manual, or any equivalent; Mensuration; Area of Regular Surfaces.

Grammar— As prescribed for the Senior or Junior Public Examinations at the Sydney University.

Natural Science—Physics or Physiology, or one of the Science Subjects prescribed for the University Examinations or

Cooking: For girls. Euclid—Book I.

Euclid—Book I.
 Algebra—As shown in Hamblin Smith's Algebra, up to Chapter 6, omitting Exercises 15 to 32.
 Latin (for boys)—Abbott's "Via Latina" to Exercise 21, page 29.
 French (for girls)—Macmillan's Progressive French Course, to Lesson 25.
 Drawing—Similar to Class IV, but of greater difficulty; Drawing from any Common Objects and Casts of Ornaments, in Light and Shade; Drawing Plans and Elevations of Circular Solids with Sections.
 Music—Key and Time Signatures fully; Time Exercises on all the ordinary notes and Rests, with Dots, Triplets, Simple Passages at sight, Syncopation, Modulation, Double Dotted Notes, Double Sharps and Flats, Three-part Songs.
 Sanistance Lessons—The whole series. (The Class may be taken with Fourth Class in this subject.)

and reass, incre-part Songs.

Scripture Lessons—The whole series. (The Class may be taken with Fourth Class in this subject.)

Drill (for bys)—

As for Fourth Class.

Needlework—1. Patching in print, flannel, and cloth.

1.—1. Patching in print, flannel, and cloth.
2. A linen sampler as in Third and Fourth Classes; also a child's dress made of washing material.

3. The pupils will be required to cut out and fix their own sewing; also any garment named in former classes.

#### Second Half-year of Enrolment.

Reading-As for last half-year. Writing Dictation-

Arithmetic—The full course, as treated in ordinary Text-books, such as Hamblin Smith's Arithmetic; Mensuration—Regular Surfaces and Solids.

Gramman Geography History— Natural Science—

As for last half-year.

MusicScripture Lessons-

Drawing-Euclid - Books I and II, with easy Exercises.

Encette—Books 1 and 11, with easy Exercises.
 Algebra—Hamblin Smith's Algebra, to chapter 13.
 Latin (for boys)—Abbott's "Via Latina," to page 53, with the first conjugation and the verb sum.
 French (for girls)—Macmillan's Progressive French Course to the end, with Macmillan's "First Reader," to page 28, or an equivalent.
 Needlework—As for last half-year.
 Dwill (for boys)—As for Equith Class.

Drill (for boys)—As for Fourth Class.
Drill (for girls)—As for Fourth Class.

Note 1.—Where there are pupils in a Fifth Class in third half-year, it is expected that Trigonometry will be introduced; and provided the pupils are able to work as far as page 104 of Todhunter's "Trigonometry for Beginners," full marks (100) will be awarded. (Euclid in the third half-year, Book III; Algebra to Quadratics.)

Note 2.—Muxic—Inseparate boys and girls departments the sexes may be combined for singing lessons at the discretion of the teachers; but the teachers of the respective departments will be held responsible for instruction in the theory of music.

Note 3.—Drill—In all schools under one teacher, the standard for the second-class shall be the highest required for any class. Subject to this provision, rifle drill should be taught to third and higher classes whenever not fewer than ten pupils can be assembled.

Note 4.—Writing—All writing will be rejected as a failure if there is no attempt made to imitate the copies set.

Note 6.—Arithmetic—Pupils of girls schools will not be expected to work Discount, Stocks, or Cube Rook.

#### Provisional Schools.

156. The last preceding Regulation, with all others respecting routine, discipline, and inspection, shall apply equally to Provisional as to other schools.

#### Special Religious Instruction.

157. No pupil is to be required to receive Special Religious Instruction if the parents or guardians of such pupil object to such religious instruction being given.

#### General Religious Instruction.

158. Where any parent or guardian objects to a pupil receiving the General Religious Instruction prescribed in the Course of Instruction, notification to this effect shall be made to the teacher in writing.

#### Denominational Books.

159. The Teacher, in all schools under the superintendence of the Minister, shall see that the religious books employed in the Classes for Special Religious Instruction are confined to the time and place of such instruction, and not left in the way of children whose parents may object to them.

#### Methods of Teaching.

160. Every Teacher shall make himself acquainted with improved methods of teaching, and practise them in his school; and, as the efficiency of Teachers will be judged of by the attainments, as well as the mode of instruction, should be kept in view.

#### Teaching power to be justly distributed.

161. Teachers shall provide for the equitable distribution of their time through all the classes, so that the instruction of no pupil be neglected.

#### Persons visiting Schools.

162. Visitors shall have access to every school maintained or aided by the Minister, during the hours of Secular Instruction—not to take part in the business or to interrupt it, but simply to observe how it is conducted.

#### Duty of Teachers to Visitors.

163. Every Teacher shall receive courteously visitors seeking to inspect his school, and afford them access to the schoolroom, and liberty to observe what books are in the hands of the children or on the desks, what tablets are on the walls, and what is the method of teaching; but teachers shall not permit any person to interrupt the business of the school by asking questions of the children, examining classes, calling for papers, or in any way diverting attention from the usual business.

#### Official Visits.

164. The restriction expressed in the preceding Rule will, of course, not interfere with the provision in Section 17 of the Public Instruction Act, whereby access is afforded to Religious Teachers for the purpose of communicating Special Religious Instruction.

#### Visitors' Book.

165. Every Teacher shall have the "Visitors' Book" lying upon his desk, in which the visitors may enter their names, and, if they think proper, any remarks. Teachers are by no means to erase or alter any remark so made.

#### INSTRUCTIONS TO TEACHERS.

THE following Instructions, issued for the information and guidance of Principal Teachers of Schools and of Mistresses of Girls' and Infants' Departments, are also to be acted upon as far as practicable by Teachers generally.

#### I. Instructions relating to Phincipal Trachers only.

The Principal Teacher will keep a Teachers' Time Book, and will see that all Teachers enter therein the time of their arrival at and departure from school.

2. He will report to the Inspector all Teachers absent from duty without leave, and any who are

2. He will report to the Inspector all Teachers absent from duty without leave, and any who are habitually unpunctual.

3. He will visit the other School Departments once a day at least, to ascertain that the Teachers are at their posts and are observing the Time-tables. He will see that all documents required by the Regulations are exhibited in their proper places. It is not intended that he shall interfere with the teaching, the discipline, or the internal management of the other Departments; nor is he at liberty to remove children therefrom to his own Department without the sanction of the Inspector; but he is empowered to decide questions relating to the general order and routine of the entire school, subject to appeal to higher authority. appeal to higher authority.

4. He will, with the concurrence and aid of the Heads of Departments, arrange for the regular cleaning of the schoolrooms, will see that the water-closets and all external premises are kept clean, and that the fences and gates are uninjured by the pupils. He will report promptly any damage done to the school buildings, as also any necessity for emptying the water-closets. If the water for the use of the pupils should become bad, the Inspector should be informed to that effect; and, in dry scasons, care is to be taken to prevent any persons, other than the pupils or the Teacher's family, from obtaining water from the school tanks or wells.

5. He will receive all letters addressed to Teachers at the School, and deliver them to the owners as soon as convenient. At the same time he will impress upon Teachers that having private letters addressed to them at the school is an inconvenient arrangement, justified only by urgent circumstances. Letters intended for pupils, and non-official letters addressed to Pupil-teachers, should be forwarded to the parents of the persons concerned.

6. Persons visiting the School, or calling upon Teachers, should in the first instance be brought to the Principal Teacher.

the Principal Teacher.

7. He will receive and investigate complaints from parents and others. It is expected that he will attentively consider such complaints, that he will endeavour to ascertain whether they are well founded, and that he will afford the redress which their nature may require or suggest.

8. The Principal Teacher will register all children applying for admission to the School, and will the principal the Department of the Principal Teacher will register all children applying for admission to the School, and will

determine the Department for which they are fit.

9. Under the heading in the Annual Return, "Number of Scholars on the Records," pupils who have left, but who have subsequently been re-curolled in the same school during the year, should only be counted once. A School with two or more Departments is to furnish but one Annual Return, in which children transferred from one Department to another during the year arc only to be counted once.

#### II. INSTRUCTIONS BELATING ALIKE TO PRINCIPAL TEACHERS AND MISTRESSES OF DEPARTMENTS.

10. He will give vigilant attention to the ventilation and temperature of the rooms, and will especially avoid an excessive degree of heat. At each recess the doors and windows should be opened so as to secure an effectual change of air. Windows should be opened, where practicable, by lowering them from the top; and children must not be allowed to sit in a strong current of air.

11. He will note the methods employed and the discipline maintained by the several Teachers under his immediate supervision, and will have power to interfere whenever he may consider either to be defective.

to be defective.

12. He will arrange his classes, if four or more, in sections, each section to contain two or three

12. He will arrange his classes, if four or more, in sections, each section to contain two or three classes; and will place in charge of each section an Assistant Teacher, who, when the staff admits, will be aided by a Pupil-teacher.

13. For all purposes of classification and examination, the actual attendance of a pupil in days shall determine his half-year in class, such half-year to consist of 110 days.

14. When a subordinate Teacher relinquishes the charge of a class or section, it should be examined by the Head of the Department in the presence of the outgoing Teacher and his successor. A record of the condition of the class or section, as clicited by such examination, should be entered in the Lesson Register, and be attested by the signatures of all the persons concerned.

15. A similar course should be followed with respect to the materials used by the class or section in charge of the outgoing Teacher.

in charge of the outgoing Teacher.

16. He will carefully preserve in the School all completed records and duplicate returns, for the

use of future Teachers.

17. Corporal punishment must not be inflicted except by the Head of the school, or Department, or—under his direction and responsibility—by an Assistant Teacher. Pupil-teachers are, under no circumstances, to be allowed to inflict corporal punishment. Careful attention must be paid to the Regulation which provides that corporal punishment "should be restricted as much as possible to extreme cases." Failure or inability to learn is not to be regarded as an extreme case; and corporal punishment is not to be recognized as a proper aid to teaching. The boxing of pupils' care is strictly forbidden, as is not to be recognized as a proper sid to teaching. The boxing of pupils' ears is strictly forbidden, as is also the corporal punishment of female pupils twelve years of age and over; and no corporal punishment may be inflicted for neglect to prepare home lessons. All cases of corporal punishment are to be recorded, at the time the punishment is inflicted, in the Punishment Book supplied to all schools by the Department.

18. Home Lessons :-

(a.) No home lessons or written exercises of any kind shall be given to children attending Infants' Schools or First Classes in other schools.

(b.) Children in the Second Class shall have no written exercises of any kind; but they may be required to prepare lessons on Reading, Spelling, or Tables, provided such work take up not more

than half-an-hour each evening.

(c.) Children in the Third Class may be given home lessons four evenings in the week, the subjects being left to the discretion of the Teacher; but each night's lessons must not take more than

- one hour to complete.
  (d.) In the case of Fourth and Fifth Classes it is left to the discretion of the Teacher to give such home lessons as he may consider necessary.
- 19. Pupils shall not be detained in School for study or for punishment during any part of the

forenoon recess.

20. The Teacher shall make the necessary arrangements for the proper oversight of the playground during recesses. It is competent for the head of a School or of a Department, the staff of which contains more than one Teacher, to so arrange that each half of the staff shall be relieved of playground supervision during an equal portion of the recess for dinner. Principal Teachers and Mistresses of Departments must undertake playground duty equally with the other Teachers.

21. He will construct Programmes of Lessons for classes in his Department taught by Pupilteachers, and will decide upon the suitableness of those framed by Assistant Teachers. His signature is to be attached to these documents, in evidence that they have been examined by him and have received his approval.

is to be attached to these documents, in evidence that they have been exemined by him and have received his approval.

22. He will devote a portion of his time weekly to the instruction of each class in his Department.

23. He will examine each class in his Department at least once a month, and will record the results, note the defects, and enter suggestions for their remedy in a book kept for the purpose. Such entries should be signed by himself and the Teacher of the class.

24. He will be responsible for the progress of all children in his Department, and for the condition of the Department in all other matters, excepting those points of organization for which he cannot reasonably be held accountable.

25. He will devote at least one hour daily to the instruction of Pupil-teachers, and will see that all the prescribed subjects are duly studied by them. Suitable programmes are to be prepared, and a Register is to be kept showing (a) the time of commencing the daily lesson and the time at which it was concluded, (b) the exercise or home-lesson appointed for the day. It must be clearly understood that Mistresses of Departments are to perform a fair share of the work of instructing Pupil-teachers.

26. He will be responsible for posting Quarterly Returns on the last Saturday preceding the Mid-

26. He will be responsible for posting Quarterly Returns on the last Saturday preceding the Midwinter and Christmas vacations; and, in other cases, on the last Saturday of the months of March and September. In country places, where no post leaves on Saturday or the preceding Friday evening, the Returns must be sent, without fail, by the first subsequent opportunity.

27. In making application for increased assistance, he will give attention to the following Rules, by which the numerical strength of Teaching Staffs is regulated.
In a mixed school, or in a separate Boys', or Girls' Department, having an average attendance of—

mixed school, or in a separate Boys', or Girls' Department, having an average attendance of 50 pupils, the staff may consist of Teacher and Pupil-teacher.

70 pupils, the staff may consist of Teacher and Assistant.

80 to 110 pupils, the staff may consist of Teacher and 2 Pupil-teachers.

110 to 140 pupils, the staff may consist of Teacher, Assistant, and Pupil-teachers.

140 to 180 pupils, the staff may consist of Teacher, Assistant, and 2 Pupil-teachers.

180 to 220 pupils, the staff may consist of Teacher, Assistant, and 3 Pupil-teachers.

220 to 270 pupils, the staff may consist of Teacher, 2 Assistants, and 2 Pupil-teachers.

270 to 310 pupils, the staff may consist of Teacher, 2 Assistants, and 3 Pupil-teachers.

310 to 350 pupils the staff may consist of Teacher, 3 Assistants, and 4 Pupil-teachers.

450 to 450 pupils, the staff may consist of Teacher, 3 Assistants, and 5 Pupil-teachers. 450 to 500 pupils, the staff may consist of Teacher, 3 Assistants, and 6 Pupil-teachers.

In every separate Infants' Department having an average attendance of

60 pupils, the staff may consist of Teacher and a Pupil-teachers.

100 to 120 pupils, the staff may consist of Teacher and 2 Pupil-teachers.

120 to 160 pupils, the staff may consist of Teacher, Assistant, and Pupil-teachers.

120 to 200 pupils, the staff may consist of Teacher, Assistant, and 2 Pupil-teachers.

200 to 240 pupils, the staff may consist of Teacher, Assistant, and 3 Pupil-teachers.

240 to 300 pupils, the staff may consist of Teacher, 2 Assistants, and 3 Pupil-teachers.

300 to 340 pupils, the staff may consist of Teacher, 2 Assistants, and 4 Pupil-teachers.

340 to 380 pupils, the staff may consist of Teacher, 3 Assistants, and 5 Pupil-teachers.

440 to 480 pupils, the staff may consist of Teacher, 3 Assistants, and 6 Pupil-teachers. 480 to 550 pupils, the staff may consist of Teacher, 3 Assistants, and 7 Pupil-teachers.

28. Principal Teachers and Mistresses of Departments, respectively, are empowered to grant leave of absence to Assistants and Pupil-teachers employed under their supervision for a period not exceeding one day, subject to the conditions stated in paragraph 3 of the Rules regulating leave of absence. It must, however, be distinctly understood that such leave of absence can only be granted in cases where the necessity for it is clearly shown. In forwarding applications for leave of absence for more than one day, the Principal Teacher or Mistress of a Department, will state thereon the arrangements proposed for the performance of the duties of those applying; will express an opinion as to whether such arrangements are satisfactory; and will state what provious leave has been granted, and on what terms, during the past twelve months. Applications for sick leave for three or more days should be accompanied by medical certificates.

medical certificates.

29. All correspondence and returns (except those relating to fees) should be sent to the Inspector under whose immediate supervision the school is placed. Salary abstracts should be sent direct to the

Accountant.

Accountant.

30. Teachers of all ranks are required to abstain from participation in any public meetings or other gatherings on party, political, or sectarian topics, and generally to refrain from all action in such matters calculated to give offence to any section of the community or to impair their own usefulness as teachers; they must also abstain from public controversy upon the merits of the system of education now in force, and from acting as local preachers, lay readers, or local correspondents of newspapers.

31. It is incumbent on teachers to attend to directions given them by Inspectors, and all departmental orders issued to them must be strictly observed. Should a Teacher at any time feel aggrieved, he may appeal to the Minister for redress, but such appeal must be made in a proper and respectful manner. Pending an appeal, no Teacher will be justified in disobeying orders, nor in the course of an appeal shall he knowingly make unfounded charges or improperly introduce subjects foreign to the matter of appeal.

32. No sectarian or denominational publications of any kind whatsoever shall be used in school, nor shall any denominational or sectarian dectrines be inculcated.

33. It shall be the duty of all Teachers to impress on the minds of their pupils the principles of morality, truth, justice, and patriotism; to teach them to avoid idleness, profanity, and falschood; to instruct them in the principles of a free Government; and to train them up to a true comprehension of the rights, duties, and dignity of citizenship.

the rights, duties, and dignity of citizenship.

Sydney: George Stephen Chapman, Acting Government Printer-1891.

[1s. 6d.]

1891.

(SECOND SESSION.)

#### NEW SOUTH WALES.

## UNIVERSITY OF SYDNEY.

(REPORT FOR 1890.)

Presented to Parliament, pursuant to Act 14 Vic. So. 31, sec. 22,

REPORT of the Senate of the University for the year ended 31st December, 1890.

- 1. The Senate of the University of Sydney, in pursuance of the Act of Incorporation, 14 Victoria No. 31, has the honor to transmit the account of its proceedings during the year 1890, for the information of His Excellency the Governor and the Executive Council.
- 2. Out of a total of 245 candidates who presented themselves for the matriculation examination in March, 171 qualified themselves for matriculation. In addition to this number, 27 passed the senior public examination, and 37 the junior public examination in the subjects prescribed for matriculation, and 66 passed the matriculation examination for articled clerks.
- 3. The following are the numbers of matriculated students attending lectures in the various faculties during the year:—Faculty of Arts, 284. including 50 evening students; Faculty of Law, 10; Faculty of Medicine, 65; Faculty of Science, 3; Department of Engineering, 14; total, 376. In addition to the above, the day lectures were attended by 12 and the evening lectures by 21 non-matriculated

4. The following degrees were conferred after examination:—
Master of Arts (M.A.):—William Hessell Hall, B.A.; Edmund Murray Noble, B.A.; Thomas

Master of Arts (M.A.):—William Hessell Hall, B.A.; Edmund Murray Noble, B.A.; Thomas Rigg, B.A.; Robert A. Woodthorpe, B.A.

Bachelor of Arts (B.A.):—Jeanie Cairns Amos, Hugh Miller Anderson, Donald McKay Barnet, Mary Booth, Frank Nunan Brierly, William John Leech Closs, Nicholas John Cock, Herbert Raine Curlewis, William Leslie Curnow, John Synott D'Arcy, Henry Davis, William Thomas Dick, Norman John Dunlop, Edith Adelaide Fairburn, John Timothy Fitzgerald, Arthur Vaughan Hilliard, Michael O'Gorman Hughes, Ella Russell Johnston, Thomas Kelly, William Henry Kemmis, John Patrick Daunt Leahy, Frederick Lloyd, Pearson Lyon, Sidney Mack, William Donald M'Intyre, Daniel M'Laughlin, Godfrey William Millard, Torrington Hawke Pincombe, James Quigley, George Frederick Greenwell Robinson, Mabel Fuller Robinson, Thomas Ernest Roseby, Arthur Joseph Perkins Goulburn Reynolds, Richard Pickering Sellors, John Patrick Sheridan, Alfred John Milner Stephen, John Hunter Stephenson. Alexander Stewart, Peter Sutherland, Louis Stanislaus Veech, John Alexander Watt, Harry Wolstenholme, Frederick Ernest Wood.

John Alexander Watt, Harry Wolstenholme, Frederick Ernest Wood.

Doctor of Law (LL.D.):—John Marden, M.A., LL.B.

Bachelor of Law (LL.B.):—Laurens Frederick Matthew Armstrong, B.A., James Gordon Liegge, M.A.

Bachelor of Madising (M.B.).—Laurens T. W. Z.

Bachclor of Medicine (M.B.):—Leslie Thomas Hollis, Gavan Morton, John Morton, Leopold Edward Flood Neill, B.A., Herbert Russell Nolan, Cecil Edward Purser, B.A., Arthur

Murray Sheppard, Percy Langford Townley, B.A., Colin Georgo Wilson.

Master of Surgery (Ch.M.):—Loslie Thomas Hollis, Gavan Morton, John Morton, Leopold Edward Flood Neill, B.A., Cecil Edward Purser, B.A., Arthur Murray Sheppard, Percy Langford Townley, B.A., Colin George Wilson.

5. The following graduates of other Universities were admitted ad eundem gradum, in accordance with the provisions of the "Ad Eundem Degrees Act," 44 Victoria No. 22:—

Master of Arts (M.A.):—Francis Anderson, M.A., Glasgow; James Edward Hogg, M.A.,

Oxford.

Doctor of Medicine (M.D.): -George Lane Mullens, M.D., Trinity College, Dublin.

- 6. The total number of Degrees conferred during the year was thus 70, divided as follows:—M.A., 6; B.A., 43; LL.D., 1; LL.B., 2; M.D., 1; M.B., 9; M.Ch., 8.
  - 7. The following are the honours conferred at the Degree Examinations:—

Faculty of Arts-Honours at the M.A. Examination.

School of Logic, Moral, Mental, and Political Philosophy :- Robert A. Woodthorpe, B.A. Honours

#### Honours at the B.A. Examination.

Classics—Class I:—F. Lloyd (University gold medal for Classics, and Wigram Allen Scholarship), A. J. M. Stephen, H. R. Curlewis. Class II:—A. Stewart, S. Mack.

French and English—Class I:—M. O'G. Hughes.

Latin and English—Class II:—T. H. Pincombe. (Class III, in French) Mary Booth.

Latin and French—Class III:—Jeanie C. Amos.

Mathematics—Class 1:—R. P. Sellors (University gold medal for Mathematics). Class III:— W. T. Dick.

Logic and Mental Philosophy—Class I:—A. Stewart (University gold medal for Logic and Mental Philosophy). Class II:—F. Lloyd, N. J. Cock,  $\alpha q$ ., A. J. P. G. Reynolds. Class III:—H. Davis, A. J. M. Stephen.

Zoology—Class II:—M. O'G. Hughes, D. M'Laughlin, T. Kelly.

Geology and Pakentology—Class I:—II. Wolstenholme.

Physics-Class II:-Mabel F. Robinson.

Faculty of Medicine-Honours at Graduation as M.B. and M.Ch.

Class I:—C. G. Wilson (gold medal). Class II:—L. E. F. Neill, B.A., J. Morton.

8. The following Scholarships were awarded:-

(a) Matriculation Examination.
Bowman Cameron Scholarship for General Proficiency—Daniel Levy.

Lithgow Scholarship for Modern Literature—Daniel Levy.
Barker Scholarship No. 2 for Mathematics—William Thomas Joseph Newton.

Cooper Scholarship No. 2 for Classics-Alfred Chalmers Gill.

(b) First Year Examination in Arts. Cooper Scholarship No. 3 for Classics—W. A. Parker. George Allen Scholarship for Mathematics—J. W. Fell.

Levey Scholarship for Chemistry and Physics-J. W. Fell.

(c) Second Year Examination in Arts.
-Cooper Scholarship No. 1 for Classics—E. M. Stephen.
Barker Scholarship No. 1 for Mathematics—E. M. Stephen.

(d) First Professional Medical Examination.

Renwick Scholarship for General Proficiency-A. S. Vallack prox acc. G. E. Smith.

(e) Second Professional Medical Examination.

John Harris Scholarship for General Proficiency-G. H. Abbott, B.A.

9. Prize Books, stamped with the University Arms, were awarded to those who obtained first classes in Honors at the yearly examinations:

#### Faculty of Arts.

First Year Examination—Classics:—W. A. Parker, J. B. Peden, J. P. Pickburn. Latin and French:—Ruth Bowmaker. Mathematics:—J. W. Fell, H. de B. O'Reilly, H. Marks, G. E. Flannery. Chemistry and Physics:—J. W. Fell. Physics:—S. H. Barraclough. Second Year Examination—Classics:—E. M. Stephen, C. J. Brennan. Mathematics:—E. M. Stephen, Latin and English.—E. R. Holman.

Stephen. Latin and English:--E. R. Holme.

Faculty and Medicine.

First Professional Medical Examination-Botany, Chemistry, and Zoology:-A. S. Vallack.

Botany and Zoology:—G. E. Smith.
Second Professional Medical Examination—Anatomy, Physiology, Pathology, and Materia Medica: G. H. Abbott, B.A.

10. Special Annual Prizes were awarded as follows:-

Norbert Quirk Prize for Mathematics—E. M. Stephen.
University Prize for Natural History—J. W. Roberts.
Smith Prize for Physics—J. W. Fell.
Slade Prize for Chemistry—J. W. Fell.
Dr. Wilkinson's Prize for Pathology—G. H. Abbott.
Dr. Dixon's Prize for Materia Medica—G. H. Abbott—prox. acc., C. L. W. Hunt.
Professor Anderson Stuart's Prize for Physiology—J. P. D. Leahy.
Dr. Milford's Prize for Surgery—ac., Lza. F. Coghlan, Frank Tidswell.

Dr. Milford's Prize for Surgery— $\alpha q$ ., Iza. F. Coghlan, Frank Tidswell.

Professor MacCallum's Prizes for English Essays—First year—Lizzic Proctor; second year—W.

Pratt and J. P. Pickburn  $\alpha q$ .; third year—Elmina L. Sutherland and E. R. Holme,  $\alpha q$ .

11. The following Bursaries were awarded:-

Levey and Alexander Bursary.

John Ewan Frazer Bursary. William Charles Wentworth Bursary, No. 1 (one half). William Charles Wentworth Bursary, No. 2 (one half).

Hunter Baillie Bursary, No. 1 (one half). Hunter Baillie Bursary, No. 2 (one half).

The J. B. Watt Exhibition. James Aitken Bursary.

Walker Bursary, No. 1.
Walker Bursary, No. 2 (one half).
Walker Bursary, No. 3 (one half).
Nineteen students—including eight State Bursars—in addition to the holders of University

Bursaries, were permitted to attend lectures without the payment of fees.

Forty-six students of the Training Schools for male and female teachers were also permitted to attend at a reduced fee paid by the Government, in accordance with arrangements made with the Minister of Public Instruction.

12. The following courses of lectures under the University Extension Scheme were delivered during the year:—

Lent Term.—Sydney—Subject: "Introduction to the Study of Philosophy." Lecturer, Professor Anderson, M.A.; number of students attending, 54. Sydney—Subject: "History of Europe from 1453-1600." Lecturer, Mr. R. F. Irvine, M.A.; number of students attending, 52.

attending, 52.

Trinity Term.—Sydney—Subject: "Introduction to the Study of Philosophy." Lecturer, Professor Anderson, M.A.; number of students attending, 32. Sydney—Subject: Revolutionary Epochs in English History." Lecturer, Mr. J. Garland, M.A.; number of students attending. 16. Bathurst—Subject: "Leaders in Modern English Literature." Lecturer, Mr. A. W. Jose; number of students attending, 72. Parramatta—Subject: "The Victorian Age of Literature." Lecturer, Mr. J. P. Creed, B.A.; number of students attending, 46. Burwood—Subject: "The Elizabethan Drama." Lecturer, Mr. R. F. Irvine, M.A.; number of students attending, 91.

Irvine, M.A.; number of students attending, 91.

Michaelmas Term.—Sydney—Subject: "Introduction to the Study of Philosophy." Lecturer, Professor Anderson, M.A.; number of students attending, 25. St. Leonards—Subject: "Worthies of the Elizabethan Age." Lecturer, Mr. A. B. Piddington, B.A.; number of students attending, 15. Goulburn—Subject: "The History, Literature, and Social Life of the Reign of Queen Anne; number of students attending, 41.

13. The Senior and Junior Public Examinations were held in the month of September in Sydney, and in the following local centres:—Albury, Armidale, Bathurst, Berrima, Bega, Blayney, Brisbane Cooma, Deniliquin, Emmaville, Frederickton, Glen Innes, Goulburn, Grafton, Inverell, Ipswich, West Kempsey, Kiama, Lismore, Lithgow, West Maitland, Maryborough, Mittagong, Moruya, Mount Victoria, Mudgee, Newcastle. Orange, Parramatta, Port Macquaric, Queanbeyan, Rockhampton, St. Mary's, Scone, Singleton, Tamworth, Tarce, Terara, Townsville, Toowoomba, Wagga Wagga, Wellington, Wentworth, Wilcannia, Windsor, Wingham, Wollongong, Young. 129 candidates presented themselves for the Senior Examination and 1,172 for the Junior Examination. Of these, 101 senior candidates and 798 junior candidates were successful.

14. The prizes for general proficiency at these Examinations were awarded as follows:-

#### Seniors.

University Prize and John West Medal:—George Ernest Dennis, Brisbane Grammar School. Fairfax Prize for Senior Females:—Edith J. Howe, Mrs. Wolstenholme.

#### Juniors

University Prize:—George Washington Waddell, Sydney Grammar School, prox. acc., Tom Percival Strickland, Sydney Grammar School.

Fairfax Prize for Junior Females: - Edith Hirst Hansard, Riviere College.

A complete analysis of the examinations will be found in the "Manual of Public Examinations," which accompanies this report.

- 15. Four examinations of candidates for the Civil Service were held during the year. At these 290 candidates presented themselves, and 93 were successful.
- 16. Three Law Examinations, similar to that prescribed for Matriculation, for candidates for Articles of Clerkship with Attorneys, were held. At these 97 candidates presented themselves, and 66 were successful.
- 17. During the year the Senate held twenty-two regular meetings, one adjourned and seven special meetings, in addition to two meetings of the Conjoint Board, consisting of the Senate of the University, and the Board of Directors of the Prince Alfred Hospital, and the Annual Commemoration. The attendances of the various Fellows were as follows:—

18. The triennial election to the office of Chancellor took place in the month of May, and resulted in the unanimous re-election of the Hon. Sir William Montagu Manning, LL.D., M.L.C.

19. The annual election to the office of Vice-Chancellor took place in the month of April, and resulted in the re-election of the Hon. Arthur Ronwick, B.A., M.D., M.L.C.

20. The Senate has with great regret to announce the death, on the 22nd of November, of Professor W. J. Stephens, M.A., the Professor of Geology and Physical Geography. Professor Stephens was originally appointed to be Professor of Natural History in the year 1881, the title of his Chair being subsequently altered to Geology and Physical Geography upon rearrangement of the teaching on the subsequently altered to Geology and Physical Geography upon rearrangement of the teaching on the appointment of Professors under the Challis Bequest. Professor Stephens was an ex officio Fellow of the Senate from 1884 until the time of his death.

In order to fill the vacancy thus created the Senate has invited applications both in the Australian Colonies and in the United Kingdom, and has requested a Committee, consisting of the following gentlemen in the United Kingdom, to report upon the applications and to recommend one candidate for

appointment by the Senate:

The Hon. Sir Saul Samuel, K.C.M.G., Agent-General for New South Wales. Sir Charles Nicholson, Bart., D.C.L., M.D.
Professor Judd, F.R.S. of the Royal School of Mines, London.
Professor Boyd Dawkins, F.R.S., Owens College, Manchester.
Dr. Geikie, F.R.S., Director of the Geological Survey of Great Britain and Ireland.

It is anticipated that the gentlemen appointed to the Chair will enter upon his duties at the latest on the 1st of September of this year.

21. In the month of August leave of absence from the meetings of the Senate for a period of three months was granted to the Hon. Sir William Macleay, on the ground of his inability to attend the meetings through ill health

22. In the month of September leave of absence from the meetings of the Senate for a period of six months was granted to Dr. P. Sydney Jones, who proposed to be absent from the colony for that time.

23. In the month of April leave of absence was granted to Professor Stuart for Michaelmas Term, 1890, and for the same term in 1891, in order to enable him to visit Europe. Professor Wilson was appointed to be Acting Dean of the Faculty of Medicine during the absence from the Colony of Professor Stuart.

24. In the month of August the Senate filled up the sixth and last ex officio Fellowship by the adoption of a by-law, constituting the Professor of Law an ex officio Fellow of the Senate under the Act of 1861.

25. In the month of December Mr. J. F. M'Allister, M.B., Ch.M. (Melb.), was appointed to the office of Tutor in Surgery, in connection with the Faculty of Medicine, at a salary of £100 per annum.

26. In the month of September Miss Helen P. Phillips, then Principal of the Clergy Daughters' School, was appointed to the office of Tutor to the women students, at a salary of £250 per annum.

27. In the month of October Mr. L. F. Armstrong, B.A., L.L.B., resigned his office of Assistant Lectures in Clercian from March, 1901.

Lecturer in Classics from March, 1891.

In the following month, acting upon the suggestion of Professor Scott, the Professor of Classics, the Senate resolved that the Chair of Classics should be divided into a Chair of Latin and a Chair of Greek, the Professor of Latin to be assisted by an Assistant Lecturer in Latin; that Professor Scott should be appointed to the Chair of Greek, and Mr. Thomas Butler, B.A. (Syd.), who has acted as Assistant Lecturer in Classics for ten years, to the Chair of Latin, at a salary of £900 per annum without fees; and that this arrangement should come into force in the beginning of March, 1891.

In the month of December Mr. F. Lloyd, B.A. (Syd.), a distinguished classical student, was appointed to the office of Assistant Lecturer in Latin.

28. Reports were received in the month of January from the Committees of gentlemen who had been requested by the Senate to consider the applications received in London for the four Challis Chairs of Law, History, Anatomy, and Logic and Mental Philosophy. The Committees had been requested after consideration of the applications to recommend the names of three candidates for each Chair for the special consideration of the Senate. This was done, except in the case of the Chair of History, the appli-

cations for which were not, in the opinion of the Committee, up to the required standard.

The Committees' reports were carefully considered at a meeting of the Senate, held on the 3rd of February, when the testimonials of the three candidates recommended for each Chair were carefully com-

pared with those of the local applicants.

For the Challis Chair of Law the choice of the Senate fell upon Mr. Pitt Cobbett, D.C.L. (Oxford), Barrister-at-Law

The Challis Chair of Anatomy was filled by the appointment of Mr. James T. Wilson, M.B., Ch.M. (Edinburgh), who had for the three previous years acted as Demonstrator in that subject.

For the Challis Chair of Logic and Mental Philosophy the Senate selected Mr. Francis Anderson,

M.A. (Glasgow), for two years the University Lecturer in the same subject.

All these gentlemen have taken the highest academic honours in their respective subjects, and have not only had considerable experience in University teaching but have proved themselves to be excellent teachers.

Upon consideration of the unsatisfactory report of the English Committee upon the applicants for the Chair of History, which it was thought was partly due to the fact that the salary attached to the Chair had been fixed at a lower rate than that of the others, the Senate decided to increase the emoluments of the Chair from £800 to £900 per annum, with three increments of £100 each at intervals of five years, and called for fresh applications. After consideration of a large number of additional applications the choice of the Senate fell upon Mr. G. Arnold Wood, B.A. Mr. Wood graduated as Bachelor of Arts both in the Victoria University, Manchester, and at Balliol College, Oxford, where he gained the highest honours in Modern History.

29. In the mouth of February, Mr. F. B. Guthrie, F.C.S., was appointed to the office of Demonstrator in Chemistry, on the recommendation of Professor . JA. Millar Thomson, of the Royal School of Mines, and Professor Thorpe, F.R.S., who had been requested to select a suitable candidate for the office.

30. In the month of March the position of Demonstrator in Physics became vacant, through the resignation of Mr. J. F. Adair, M.A. The office was filled by the appointment of Mr. J. A. Pollock, B.Sc., of the Sydney University.

31. The Demonstratorship in Anatomy, rendered vacant in February by the elevation to the Chair of Anatomy of the occupant, Dr. Wilson, was filled in March by the appointment of Mr. A. E. Mills, M.B., Ch. M. (Sydney) for a period of one year.

32. The four Challis Lectureships in Law were filled in the month of February, by the appoint-

ment of the gentlemen whose names are given below, all being graduates of the Sydney University:

The Law of Wrongs (Civil and Criminal), Mr. F. Leverrier, B.A.. B.Sc.

The Law of Obligations (Personal Property and Contracts), Mr. G. E. Rich, M.A.

The Law of Property (Real Property and Equity), Mr. W. P. Cullen, M.A., LL.D.

The Law of Procedure (including Evidence), Mr. C. A. Coghlan, M.A., LL.D.

33. In the month of December the Australian Trustees of the Challis Estate handed over to the

University the major portion of the Australian part of the estate, consisting of £199,362 10s. in investments, and £3,228 4s. 2d. cash balance. The period of five years, during which, by the testator's direction, the property was to accumulate in the hands of the Trustees, expired on the 19th of September, 1889, but the settlement of certain technical legal difficulties delayed the transfer until the end of 1890. The

capital sum realised on the 19th of September, 1889, was £193,225.

34. In order to meet the deficiencies in some of the sub-departments of the Library the Senate was able to make a special grant from the interest of the Fisher Fund of £500 for the purchase of books in Law, £250 for the purchase of books on Anatomy, and £250 for the purchase of books in the

department of Logic and Mental Philosophy.

35. The resolutions of Convocation passed at a meeting held in September, 1988, and having reference to the tenure of Fellows of the Senate and to the question of ex-officio members, were considered by

the Senate on two occasions after reference from Sub-Committee, but no definite action was taken.

36. The By-laws for the Faculty of Law, which were drawn up by the Senate in the end of 1889, have been revised during the year at the instigation of the new Professor of Law (Professor Pitt Cobbett). No change has been made in the time of study required for a degree in Law; but it has not been made compulsory for a student in Law to take a degree in Arts, the ordinary course being two years in Arts and three in Law. The student may, however, if he thinks fit, graduate in Arts as well as in Law, by taking up a language in his first year in Law, which year will then be common to the two Faculties of Arts and Law, and he may graduate in Arts in the ordinary way, and graduate in law after two years of subsequent study.

Upon the application of the Senate, the Board for the Admission of Barristers has consented to recognise the examinations proposed in the LL.B. course as sufficient under the Barristers' Admission Act to entitle the University Graduates in law to admission to the bar without further examination. hoped also that regulations will soon be made by which articled clerks may have an opportunity of obtaining a certain amount of University legal training.

In order that the Law lectures and Law library may be in a central position for the convenience of articled clerks and students at Law, and near the Law Courts, the Senate has temporarily rented convenient premises in Phillip-street, the property of the Parish of St. James'. These buildings will be utilised also for meetings of the Senate, and possibly for University Extension Courts.

37. Following upon a resolution passed by the Senate in August, 1889, affirming the expediency of establishing a full course of instruction in architecture, the Senate has had under consideration, after reference to the Faculty of Science, the details of a full curriculum for the Degree of Bachelor of Science in Architecture, which it is proposed to confer after a three years course of study and examination. The full details of the curriculum, however, have not yet been finally settled, nor has any definite conclusion been arrived at as to what additional teachers will be required to carry it out.

38. A communication was received from the Agent-General for New South Wales, in the month

of May, covering a copy of an order of Her Majesty's Privy Council, to the effect that the second part of the Medical Act of 1886 should be deemed to apply to the Colony of New South Wales. This recognition cuabled the Senate of the University to make application to the General Medical Council for the recognition under that Act of the medical diplomas of the University of Sydney. Such recognition

has since been granted by that body.

39. In the month of March the following resolution was passed by the Senate in regard to the salaries of present and future Professors:—"That the salaries of all Professors shall hereafter carry increases on account of length of service as follows, that is to say, such salaries shall be increased by £100 after five years' service, another £100 after ten years' service, and a final £100 after fifteen years' service, such periods to commence from the date of this resolution in respect of existing tenures of office, and from the dates of appointment in all future cases, provided that in the case of any Professor who shall be in receipt of lecture fees, or any portion of such fees, the amount so received by him in any

year shall be set against any such increase."

40. In the month of December a Committee was appointed by the Senate to consider and report what branches of learning should be represented on the Senate, in accordance with the provisions of the University Act, 24 Vic. No. 13, it being considered that the great increase in the number of Professors

would probably call for some change in the present method of ex officio Fellowships.

41. The question of the erection of residences for certain of the University officers has been under the consideration of the Senate; and in the month of August it was decided that it is desirable that a certain number of residences for the Professors and the Registrar should be erected on the University grounds. It was referred to the Finance Committee to report as to the best means of obtaining funds for erection of the buildings, and to the Building, Grounds, and Improvement Committee to report on the sites, character of the buildings, and other matters connected therewith.

42. At the commencement of the academic year, in March last, the new arrangements made by the Minister of Public Instruction, whereby the students under training in the Training Schools for male and female teachers are to attend the ordinary University lectures in the Faculty of Arts, came into operation. The Senate has also consented to give up a portion of the University domain, between the grounds of St. Paul's and St. Andrew's Colleges, as a site for a residential college for male students in training for the office of public school teacher. It is proposed that the College should be affiliated to the University, and that the Principal should, like the Principals of the other affiliated Colleges, be ex officion a member of the University. The College will be under the direct control of the Minister of Public Instruction.

- 43. In the month of April, upon the representation of the Professor of Engineering, it was deemed necessary that a special Lecturer in Surveying should be appointed at a salary of £250 per annum. After applications had been publicly invited, the Senate appointed Mr. G. H. Knibbs, lately an officer in the Government Service, to be the Lecturer in that subject.
  - 44. The following benefactions have been made during the year:-
    - Dr. George Bennett has signified his intention of bequeathing to the University the whole of the works of John Gould, chiefly upon Ornithology, valued at £1,000. He has already presented to the Library a certain portion of these books.
    - The late Mr. Arthur Leake, of Tasmania, has bequeathed the sum of £10,000 for Scholarships Ine late Mr. Arthur Leake, of Tashama, has bequeatined the sum of £10,000 for Schloarships for Sculpture, and £10,000 for Schloarships for Painting, to be held at one of the Australian Universities or schools; also a third sum of £10,000 for the establishment of an Astronomical Observatory. The Trustees, who have charge of the fund at present, have not yet communicated to the University their decision in regard to the disposal of this bequest.

      Mrs. John Frazer and family have handed to the Senate the sum of £2,000 as a bequest by the late Hon. John Frazer towards the establishment of a Chair of Ancient and Modern History.
    - History.
    - The Commissioners for the English Exhibition of 1851 have offered to the University for the year 1891 the nomination of a Science Scholarship for £150, tenable for two or three years by a student of three years' standing, and have at the same time intimated that the offer may be repeated on future occasions. The object of the scholarship is to enable the holder to proceed with his studies in his special branch of science with a view of developing the
    - manufactures and industries of his country.

      Sir Charles Nicholson, Bart, has presented to the University a copy of a valuable book, lately published by the Trustees of the British Museum, containing a fac simile of the Papyrus of Ani, or the Book of the Dead.
    - Class prizes and books from Professors Haswell, M'Callum, Anderson and Wilson, Dr. M'Cormick, and Dr. Dixson
    - A large number of donations of books for the University Library from various persons and institutions.
- 45. The annual statements of receipts and expenditure, duly certified by the Auditor, the Hon. Geoffrey Eagar, and also a statement showing the condition of the various private foundations of the University are appended to this report.

H. E. BARFF, Registrar.

#### NEW SOUTH WALES.

## OF SYDNEY.

(NEW AND AMENDED BY-LAWS ADOPTED BY THE SENATE AT A MEETING HELD ON 21 DECEMBER, 1891.)

Presented to Parliament, pursuant to Act 14 Vic. Ao. 31, sec. 21.

AMENDED BY-LAWS ADOPTED BY THE SENATE AT A MEETING HELD ON 21ST DECEMBER, 1891.

To stand in lieu of Chapter 7, Section 3:-

A Dean for each of the Faculties in the University shall be appointed by the Senate from time to time for a term not exceeding two years.

To stand in lieu of Chapter 15, Section 26:-

Candidates for the Degree of M.A. shall elect to be examined in one or more of the following branches of knowledge-

Classical Philology and History.
 Mathematics and Natural Philosophy.

3. Logic, Moral, Mental, and Political Philosophy.

Modern Literature and Language.

The candidate most distinguished in each branch at the examination shall, if he possess sufficient merit, receive a gold medal.

To stand in lieu of Sections 18, 19, and 20 of Chapter 18:-

- 18. Candidates for the Degree of Bachelor of Engineering must produce evidence of having graduated in Arts or in Science, or of having attended the lectures of the first year of the Arts course, and passed the first year Examination in Arts, or of having passed the Senior Public Examination in the following subjects, viz., Latin, one of the three languages French, Greek, German, and three of the sections in Group 3 of the subjects for which Senior Candidates may enter, viz., Arithmetic, Algebra, Geometry, Trigonometry, Elementary Surveying, and Astronomy, Mechanics, Applied Mechanics; and shall during the first year attend the courses of instruction upon and pass the examinations in the following subjects :-
  - Chemistry, Inorganic (with two terms Laboratory practice).
     Descriptive Geometry and Drawing.

3. Mathematics.

- 4. Applied Mechanics (with Laboratory practice).5. Physics (with one term Laboratory practice).

6. Physical Geography and Geology.

Provided that students shall only be required to attend the lectures upon and pass the Annual Examination in such portions of the Mathematical course of the first year as they have not already passed at the abovementioned examinations.

- 19. Candidates for the Degree of Bachelor of Engineering in Civil and Mechanical Engineering shall, during the second year, attend the courses of instruction upon and pass the examinations in the following subjects:
  - Applied Mechanics (with Laboratory practice).
     Civil Engineering.

- 3. Drawing.
- 4. Geology.
- 5. Mathematics.
- 6. Physics (with one term Laboratory practice).

7. Surveying.

827-

- 20. Candidates for the Degree of Bachelor of Engineering in Civil and Mechanical Engineering shall, during the third year, attend the courses of instruction upon and pass the examinations in the following subjects:—
  - 1. Drawing and Design.
  - 2. Materials and Structures (with Laboratory practice).

3. Mathematics.

4. Surveying.

- 5. One of the following:
  - A. Civil Engineering and Architecture.
  - B. Mechanical Engineering and Machine Construction.

Every candidate is required to prepare and submit to the Board of Examiners an original set of working drawings and specifications for machinery or works.

To stand as Sections 23 and 24 of Chapter 18—the sections at present so numbered and following sections to be numbered 25, 26, &c.:—

- 23. Candidates for the Degree of Bachelor of Engineering in Electrical Engineering shall, during the second year, attend the courses of instruction upon and pass the examinations in the following subjects:—
  - 1. Applied Mechanics (with Laboratory practice).

2. Mechanical Drawing.

- 3. Mathematics.
- 4. Physics (with two terms Laboratory practice).
- 5. Surveying.
- 24. Candidates for the Degree of Bachelor of Engineering in Electrical Engineering shall, during the third year, attend the courses of instruction upon and pass the examinations in the following subjects:—
  - 1. Electrical Engineering.
  - 2. Electric Theory (with Laboratory practice).
  - 3. Dynamo and Motor Drawing and Design.
  - 4. Mathematics.

Every candidate is required to prepare and submit to the Board of Examiners an original set of working drawings and specifications for an electric light or power scheme, or for an electric railway.

#### To stand in lieu of Section 27:-

27. Every candidate shall be required to produce to the Board of Examiners satisfactory certificates or other evidence of having been engaged during three years in the practice of one of the four branches of Engineering specified in By-law 28, one year at least of which must have been spent in acquiring a practical knowledge of the branch or branches selected, under the direction of an Engineer or Architect practising the branch or branches in which he wishes to be examined.

#### To stand in lieu of Section 28:-

- 28. Candidates for the Degree of Master of Engineering shall be required to pass examinations in one of the following divisions or branches:—
  - 1. Civil Engineering, Architecture, and Building Construction.
  - 2. Mechanical Engineering and Machine Construction.
  - 3. Mining Engineering, Metallurgy, and Assaying.
  - 4. Electrical Engineering.

1891.

## Commission to inquire into Technical Education.

By His Excellency the Right Honorable Charles Robert Baron Carrington, a Member of Her Majesty's Most Honorable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

To Edward Combes, Esquire, of Glanmire and Sydney, in the Colony of New South Wales, Companion of the Most Distinguished Order of Saint Michael and Saint George, Officer of the Legion of Honour of the French Republic,—

#### Greeting:-

Know you, that reposing great trust and confidence in your zeal, discretion, and integrity, I, Charles Robert Baron Carrington, as Governor of the Colony of New South Wales, with the advice of the Executive Council thereof, do by these presents appoint you, the said Edward Combes, Esquire, to attend, on behalf of the Government of the said Colony, the International Exhibition in Paris, with a view to making such inquiries respecting Technical Education and the progress of Technological Science as may be of service in extending those branches of instruction and knowledge in the said Colony.

Given under my Hand, and the Seal of the Colony of New South Wales, at Government House, Sydney, aforesaid, this second day of September, in the year of Our Lord one thousand eight hundred and eighty-nine, and in the fifty-fourth year of Her Majesty's Reign.

(L.S.) CARRINGTON.

By His Excellency's Command,
HENRY PARKES.

## REPORT.

Edward Combes, Companion of the Most Distinguished Order of Saint Michael and Saint George and Officer of the Legion of Honour, of the French Republic, to His Excellency the Right Honorable Victor Albert George, Earl of Jersey, a Member of Her Majesty's Most Honorable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

### MAY IT PLEASE YOUR EXCELLENCY,—

As the Commissioner appointed by Your Excellency's predecessor, the Right Honorable Charles Robert, Baron Carrington, to attend on behalf of the Government of the Colony of New South Wales the International Exhibition in Paris, with a view to making such inquiries respecting Technical Education and the Progress of Technological Science as may be of service in extending those branches of instruction and knowledge in the said Colony, I humbly submit to Your Excellency the following Report:—

The Commission was issued on the 2nd September, and as the Exhibition closed on the 6th November, there was no time to be lost. I at once left for Paris by the Peninsular and Oriental steamship "Victoria," which sailed from Sydney on the same date. I landed at Brindisi on the 10th and arrived at Paris on the 12th of October.

I at once presented my credentials to the French Authorities, and commenced my inquiry in the Exhibition Building the same day.

In attempting to give a comprehensive description of what has been accomplished in Europe and the United States of America in matters pertaining to technical education, I shall confine myself chiefly to what has been done since my inquiry in 1886, the report of which was furnished to your Excellency's predecessor in 1887.

I have for many years been deeply impressed with the urgent necessity of providing technical instruction for the masses, and in 1878, while fulfilling my duties as Executive Commissioner at the Paris International Exhibition, I gave the subject my most serious attention. From that time I have never ceased to study the question. I have visited most of the representative technical schools in Europe and America, for the express purpose of gaining the experience necessary to assist in the judicious and progressive development of technical education in New South Wales.

In 1878 technical instruction, as now understood, was in its infancy. It is true that in England, France, Russia, Germany, Belgium, and Switzerland, institutions had been founded long previously to form links between the primary school and the workshop, but those institutions, both in form and expression, were organised to attract the support of industrial societies, and were chiefly those we may class under apprenticeship, and professional schools. Typical schools of this class, such as the artisans' school at Rotterdam, apprenticeship school at Hâvre, the Imperial Technical School at Moscow, were described by me in my 1880 report. The institution, however, which perhaps did more to popularise technical instruction, and which also has been the longest established, and which, with its grand industrial museum and rich collections of models and machinery, still holds the field, is the Conservatoire des Arts et Métiers at Paris. This marvellous institution, together with the South Kensington collections and systems, were also fully described in the same report.

These schools, however, did not profess to carry out in their entirety the opinions of Pestalozzi, Fræbel, Condorcet, Rousseau, Locke, and Montaigne, as regards making manual training a main factor of education. It is now generally conceded that the principles which underlie these opinions are essentially necessary.

By technical education is understood the careful and practical instruction of our youth in the scientific and artistic knowledge demanded by any branch of industry, so as to make each one of them a most thoroughly efficient and economic workman.

To fully effect this we must ingraft the industrial element into education, and this can only be accomplished by instruction in manual training at an early age.

The great movement that has been made in primary education during the last half-dozen years, almost entirely relates to the co-education of the head and hand. That this can be easily accomplished has been indubitably proved by the success attained in the introduction of manual training to public schools, and making it an integral part of general education. It is the progress actually made towards the attainment of this object that struck every visitor to the Paris Exhibition. The useful combined with the intellectual. The new education is undoubtedly revolutionising the systems of primary education throughout the world.

Manual training is not supposed to take the place of the workshop or to make artisans. It is a kind of teaching that has shown itself to be a great power in the development of mental capacity, giving a relish to school work by connecting it with actual work. It continues the Kindergarten method of object lessons and develops the senses of touch and perception. It brings the eye and hand into unison, which, in itself, is half the battle in training a pupil to express his thoughts by drawing and construction.

Manual training exercises the judgment and the executive faculties, cultivates the power of thought and induces originality. These make it an absolute necessity as a branch of common school instruction, if we are to do the best we can for the masses. It was our own great philosopher Locke who said:—"Since it cannot be hoped that a child will have time and strength to learn everything, the result is, that he should be taught especially those branches of which he is most in need, and which will be the greatest and most frequent use to him in the world." Ninety-five per cent. of our children unquestionably require to be taught manual training, as being of the "greatest and most frequent use" and there can be little doubt that it would greatly improve the remaining five per cent.

We are confronted in our day by some most intricate questions, which demand immediate attention. Many of these questions are relative to methods of education. Certain popular tendencies are everywhere perceived towards that instruction which not only teaches a child how to read, write, cypher, and draw, but how to use his hands as well as his head. It is only since 1878, that this question has caused so much interest and anxiety, and given rise to inquiries all over Europe and America as to the best method of carrying into effect what all feel must be accomplished without loss of time. The intellectual action consequent is most intense. The popular mind in every country of the world has received a new and unwonted impulse. Every one is agreed upon the necessity for change and action, but there is some hesitation before determining absolutely the best method of going to work.

In making this inquiry I collected a large amount of information respecting manual training, showing conclusively that it has been cordially welcomed wherever it has been introduced, and that its practical operation will soon become universal. This operation is founded upon the truth that manual training powerfully assists in giving a better and more rational education than the system of teaching now followed in the ordinary primary schools, which only cultivates the intellect, to the almost total exclusion of the tactual and visual perceptive powers.

Fræbel and Pestalozzi defined the Kindergarten system, and it remains to the present time much as they left it, and children taught by this method are always more intelligent and better observers. As a rule, they make much greater progress in common schoolwork. In my last report I stated at some length the methods employed in these schools or gardens, where play takes the place of work and creates the interest which is made subservient to instruction. Books are not used, and no attempt is made to force or strain the child's faculties, but objects for playing games, called "gifts," direct them into occupations which give the mind strength and develop its powers. By keeping the children pleasantly occupied discipline is maintained without any harsh measures but simply by suggestions and games. There can be no doubt as to the value of these institutions as a sub-department of manual training in the public school system, but it would also mean a large increase in the number of children entitled to the privileges of the public schools, and, consequently, a vast increase in the expenditure. If the Kindergarten were made a free public institution I believe the school attendance would be almost doubled, unless the age for leaving school was reduced from 14 to 11 or 12 years. This might easily be arranged under certain restrictions. In France, for example, a child is allowed to work six hours a day at 11 years of age, provided he has passed the examination for the certificate of primary elementary studies; whereas, without this certificate he is not allowed to work six hours per day until he is 15 years old. indispensable that poor men's children should contribute to the support of the family as soon as possible, that prohibitory laws are really of little avail; therefore the instruction given should be commenced as early as practicable. comparatively new institution in France, called the "Maternal School,"—which has taken the place of the old Salle d'Asile I shall speak further on. There can be little doubt that it is a step in the right direction, as the results have been exceedingly successful. These schools provide the care of a kind intelligent mother, with Kindergarten instruction, where the physical, intellectual, and moral elements of the child's nature are brought into play by means of the most simple and perfect method

ever conceived. I have no hesitation in saying that, in nine cases out of ten, a child is, in every way, far better cared for, entertained, and amused in a maternal school, than it possibly can be at home, unless the mother is a most exceptional woman, in easy circumstances, and is, moreover assisted by a Kindergarten instructress. This truth applies both morally and physically. (See Appendix B.)

The Universal Exhibition of Paris of 1889 was divided into nine groups for the convenience of classification and arrangement. These groups were as follows:--(1) Works of Art; (2) Education and Instruction—Apparatus and Processes of the Liberal Arts; (3) Furniture and Accessories; (4) Textile Fabrics, Clothing, and Accessories; (5) Mining Industries, Raw and Manufactured Products; (6) Apparatus and Processes used in the Mechanical Manufactures-Electricity; (7) Food Products; (8) Agriculture and Pisciculture; (9) Horticulture. It is with the second and eighth of these I had to do, which included the classes from 6 to 16, and comprised education of children, primary instruction, instruction of adults, organisation and appliances for secondary instruction; organisation, methods, and appliances for higher instruction; printing and books, stationery, bookbinding, painting and drawing materials; general application of the arts of drawing and modelling; photographs and photographic apparatus; musical instruments; medicine and surgery, and veterinary medicine; instruments of precision; maps, and geographical and cosmographical apparatus, and topography. The eighth group comprised everything relating to agriculture and vine culture.

The space for the exhibition of the articles pertaining to the second group was provided for in the palace of the Liberal Arts, most conveniently arranged in galleries and many separate compartments. Each school was provided for separately, and each publisher's compartment was enclosed on three sides, open in front, with a table in the centre for models and apparatus. The sides were devoted to bookshelves and maps. The ground floor was chiefly devoted to industrial, professional, and trade schools, musical instruments, the grand collections of the Conservatoire des Arts et Métiers and the Art and Trade schools of France. All nations here exhibited their school systems and educational appliances. The galleries were devoted to various school collections, maps and books, instruments, and apparatus. (See Appendix A.)

Besides this immense building, the Municipality of Paris had an exhibition of its own in separate pavilions, where class-rooms were arranged, exactly as they exist in the schools, with the work of the pupils shown on the walls. Never before had educational exhibits been got together in such a complete manner. They were all selected with the greatest care, and excellently arranged, from the Kindergarten and Maternal schools, to the finished productions of the Industrial and Professional schools. All of these exhibits gave evidence of the vast progress made during the last few years in technical education, manual training, drawing, physical culture, &c.

The Governments of Great Britain, Russia, and Germany declined to cooperate with France at this exhibition. In England, however, private enterprise interfered. Many distinguished citizens, headed by the Lord Mayor of London, got together a fair collection of its arts and manufactures, but considering the importance of the British nation, nothing worthy of its commercial or industrial grandeur. The collection of paintings, both in oil and water colours was fairly representative of British art; but with the exception of the City and Guilds of London Institute, and the Manchester Technical School, England was not represented, either as regards regards her national educational system, or with reference to her technical teaching. I therefore prosecuted my inquiry in England, by visiting the English Technical Schools, and obtained the information I required in that way.

The French educational exhibits and those from other countries contained almost everything that was noteworthy, especially as regards technical teaching. In these were full contributions from France, Belgium, Switzerland, and Japan; while the exhibitions from Sweden and the United States of America, although not nearly so extensive as could be wished, furnished much valuable information regarding their well-known institutions, and their methods of working.

Unfortunately, I arrived in Paris too late to make the inquiry as exhaustive as I could have wished, but I found ample work in the examination of the great French collection, which was far more interesting than that of all other nations put together.

The immense collection of apparatus and of work executed at the Professional, Industrial, and Apprentice Schools established in Paris, and most of the large cities in France, unmistakably showed the important place that manual training has taken in that country. This collection consisted of drawings, specimens of modelling in clay and wax, woodwork of all kinds, iron-work, both wrought and cast, bookbinding, furniture, wood-engraving, printing, clock and watch making, jewellery, &c. Besides all these collections of work, the Minister of Education exhibited examples of work done in the primary schools where manual training was taught.

Two immense and beautiful pavilions were creeted in the Exhibition grounds by the Municipality of Paris, for the express purpose of showing the work performed by that body in education of all kinds, hygiene, hospital and asylum service, fire, water, police and public works, together with all matters affecting the health, comfort, and safety of the inhabitants. Twelve rooms and a large share of the open spaces of these pavilions were devoted to school work. We find examples of the various primary schools and class-rooms. Commencing with the école maternelle which is the class of school I before alluded to, provided for infants and very small children. while their mothers are performing their daily work in factories, stores, or other workshops. Here we find a model class-room furnished precisely in the same manner, as the actual school-room belonging to the municipality. The little desks are arranged for two pupils—the top is divided into two parts, each of which is divided into 100 squares, to facilitate proportion in drawing. It also familiarises the child's mind with distances, and teaches him to count. On the walls of this class-room are suspended reading and number charts, geometric forms, and counting frames, with the usual specimens of Kindergarten work for cutting, weaving, and folding paper.

The typical class-rooms in the primary school (école primaire élémentaire) and the upper primary (école primaire supérieure) are also exhibited together with their special furniture and apparatus.

The full course of study in drawing is also exemplified from the earliest rudiments in the école maternelle to the finished and masterly drawings of the technical school.

The gymnasium, showing complete examples of apparatus for physica training, is also here represented.

Then come the exhibits from the Paris technical schools—of which I shall give examples further on—also of the work done by the primary schools in the manual training classes.

The

The work of girls schools is also largely exhibited, and the specimens of needle work and embroidery were very excellent and highly interesting.

The French exhibit many models of new school buildings which show that the greatest attention is given to the proper quantity of floor and air space, while providing for proper lighting, heating, and ventilation. The specimen charts and drawings for the school-room are especially to be remarked, as they provide the teachers with a foundation for verbal teaching. Apparatus is also exhibited that has been made by the advanced pupils for the use of the rudimentary classes, and which answers its purpose admirably.

As I before stated, in the Palace of the Liberal Arts there is a grand hall forming its entire front, where the exhibits of the technical, industrial, and commercial schools of France are displayed in a most picturesque but thoroughly methodical manner, so that they could be readily and easily examined.

Of these the National Trade and Art Schools (*Ecoles Nationales des Arts et Métiers*), which have been established to train artisans in the best possible way to fit them for high class positions, as superintendents and foremen in industrial works, are the most important. They give students a thorough training in the theory and practice of the mechanic arts. The operative engineering work of these schools appears to be quite equal to that turned out from the best manufacturing establishments, and steam-engines, water-wheels, dynamos, pumps, electric motors, and gear work left nothing to be desired, either as to design or manufacture.

These schools, which are three in number, are open to all boys whether from public or private schools, but limited to 100 yearly admissions in each. They are are situated at Châlons-sur-Marne, Aix, and Angers. The admission examination extends over writing and arithmetic, grammar, elementary geometry, algebra (to quadratic equations), and the elements of French history and geography. Candidates also have to write from dictation, make a frechand drawing in pen and ink, and execute an exercise of manual training both in wood and iron. These schools are of the utmost importance to a nation's success in the arts and manufactures, as the three schools above mentioned turn out three hundred first-class men every year fully competent to manage any operative engineering works. One can easily conceive the good effect this must have in keeping a high standard for the qualifications of managers and foremen.

All students are obliged to board in the institution and the charge for tuition and board is 600 francs—£24 yearly. The pupil also pays a further sum of 340 francs—£13 12s. for his outfit. All charges are payable in advance, but relief from payment of a portion, or the whole sum, may be obtained by persons in destitute circumstances, on application to the Minister of Agriculture and Commerce, in whose department these schools are placed.

The theoretical instruction embraces the following branches: arithmetic, elementary geometry and algebra, plane trigonometry, descriptive geometry, mechanics, cinematics, physics, chemistry, drawing, accounts, geography, and grammar. The practical branches are taught in four workshops as follows:—Pattern-making and joinery, casting, forging, and fitting. Prizes are given after each year's examination, and at the end of the three years' course, certificates are given to those who have completed it in a satisfactory manner, and a medal is awarded for "exceptional merit." The three schools are identical in everything,

and the work done by each is fairly uniform, well designed, the parts well proportioned and carfully finished. The work consisted of steam engines, lathes, drills, pumps, and dynamos. There were also some exhibits of loam castings as good as anything I have ever seen of a like character.

The time is from 5.45 in the morning until 8.45 in the evening; fifteen hours, from which may be deducted two and a half hours for meals and three quarters of an hour for prayers; making the hours of actual work eleven and three quarter hours, or, practical work in the shops six and a quarter hours, and five and a half hours in the class-rooms. The conditions of admission are,—1. That the candidate shall be French by birth; 2. That he be between the ages of 15 and 17; 3. That he be furnished with a certificate that he is accustomed to manual labour; and 4. That he pass the admission examination above alluded to.

These Schools of Arts and Trades are progressing immensely in the class of work they turn out. There is a great deal of emulation between the schools, and as they can sell the machinery they manufacture, or receive orders from the Government, such as small marine and pumping engines, the pupils feel they are doing real work, and exert themselves accordingly.

The Apprenticeship School of the city of Paris, situated on the Boulevard de la Villette, I fully described in my last report. It will suffice to say that this school continues to be eminently successful and progressive. It has fully borne out the principles on which it was founded and so ably stated by M. Gréard, the Inspector-General of Public Instruction. The following is a *précis*, viz.:—

- No premature admission, since the physical forces, as well as the mental powers of the child are unable, before a certain age, to endure the serious work of an apprenticeship.
- No crowding of pupils, nothing being more fatal to the moral tone which it is desired to establish.
- No hasty specialisation, since the hand as well as the mind is improved by a wide variety of exercises.
- No tuition fee, the institution being intended for the poorest classes.
- No dormitory system, since the family should have the charge and the honor of following the education of the child.
- No exercises sufficiently prolonged to produce fatigue of the body or the mind, the variety of exercises being an indispensable condition of a symmetrical development of the physical, intellectual, and moral forces of the apprentice.
- No instruction in abstract sciences, properly so called, since the instruction in an apprentice school should, in order to bear fruit, be based not on theories but on facts, and it should be supported only by those theories whose materialised applications can be shown.

The days' work during the first two years consists of six hours in the work-shop and four hours of study and recreation; and in the third year, eight hours in the shop and two hours of mental work. Two hours of recreation is allowed each day, of which one hour, three times a week, is devoted to gymnastics. No piece

of work is begun until the pupil has made a working drawing with figured dimensions, in order that he may comprehend to the fullest extent that which he is about to do.

The discipline of the school continues to be excellent, the only punishment is a reprimand or dismissal. I have visited this school many times, and have invariably been struck with the diligence and application of the boys. The Director is an exceedingly able man and an excellent teacher.

Different means, concurring towards the same end, have been employed as experiments by the Municipality of Paris. It is claimed on one hand that the work of the school should be extended to the workshop, while on the other that there would be great advantage in placing the pupil in a position to recognise, himself, his aptitudes by the practice of the elementary processes of the workshop, and that moreover the skilfully-managed alternation of manual labour with study would insure the equal development of his faculties. M. Gréard tersely puts it:—"The school in the workshop, or the workshop in the school." The first of these plans is represented by the Diderot School, and the second by the School in the Rue Tournefort.

Wherever any interest is shown in what we now call manual training—which is a different thing altogether from the old acceptation of the term—the name of Salicis will be held in esteem and honor. I met him repeatedly, and enjoyed his enthusiasm, for we held precisely the same views with reference to educating the masses in a manner that would fit them for a practical life.

The Tournefort experiment was based on the proposition that whatever be the actual final industrial calling of the child, there are a certain number of leading topics, common to all, and to which all instruction should conform. These are the continuance of school instruction, the maintenance of examinations, the study and management of raw materials, drawing from patterns in relief, modelling, moulding, sculpture in soft stone, marble, and wood, graphic drawing and ink shadings in line. The practice of general processes and tools—such as work at the bench, at the forge, at the lathe, and at the vice. To these are added book-keeping, industrial and commercial geography, and the first elements of economy; the delineation with scale and dividers of a piece of finished work, or a machine; making a working plan to a given scale, with dimensions figured thereon; making a sketch or freehand drawing, and practically the execution of work after a given plan on scale, or after a rough draft with dimensions; the invention, plotting, and execution of simple plans; with these go the teaching of morals, the duties of men and citizens, the mutual relations of child and parent, man and master, and the duty he owes society and his country. Also, habits, personal order, order in tools, order in labour, order in the shop, order in accounts, order in thought and spirit, and hence, order in conduct.

These are common to all trades, and when it is taken into consideration that in a great city workmen of almost all trades fall into one or another of the following classes:—(1.) Workers in Art: Modellers, carvers, sculptors, and workers in ornament. (2.) Turners. (3.) Workers in Wood: Carpenters, joiners, builders, carriage manufacturers, cabinet and furniture makers, &c. (4.) Workers in Metals: Blacksmiths, locksmiths, operative engineers and machine makers, &c. From this results the necessity of teaching modelling, and work at the bench, the forge, and the vice; accordingly M. Salicis organised four workshops and attached them to the school

corresponding.

corresponding to the above-named classes. The course is for three years, and the pupils of the first and second years, as at the Diderot School, all participate in rotation in all the exercises. In the third year they divide into specialities, after deciding as to the trade they intend to actually follow, whether carver or sculptor, smith, carpenter, or machinist. One day in each week, however, the pupils in modelling and carving, return to the bench and forge; the joiners and turners to the forge and to modelling; and the smiths and machinists to modelling and carpentry. The workshops are open from 9 to 11 a.m. and from 1.30 to 3 p.m. Every pupil has his work account book kept by a monitor, verified and approved by the professor. From 1 to 1.30 p.m. there is a technical lesson on raw materials, tools, joints, mortises and tenons, and the elements of applied geometry. pupils are exercised in freehand drawing, and plans with reference to constructions. On Thursday mornings they practice artistic drawing, and in the afternoon, in fine weather, they are taken to visit some distinguished workshop, laboratory, or factory. The general instruction is that given in the primary schools, with the addition of the elements of the physical, chemical, and natural sciences; also industrial history and invention. These pupils take part in the examination for the certificate of primary studies, and it is invariably found the number of successful pupils is not less than at the ordinary primary schools of the old regime, where the whole time of the pupil is occupied with general instruction.

By the logic of facts M. Salicis proved the comprehensiveness of manual training, not as apprenticeship or technical teaching, but as a factor of education in its broadest sense which is "the harmonious development of all the powers of a human being." Manual training, as the New Jersey Council of Education has defined it: "Training in thought expression by other means than gesture and verbal language, in such a carefully graded course of study as shall provide adequate training for the judgment and the executive faculty," in other words, "it puts the whole boy to school" and sets in activity the greatest number of the mental powers —for the boy who begins to make things for himself is compelled at once to begin to think, deliberate, reason, and finally decide how it is best to be done. It was one of M. Salicis' favourite illustrations, when reproached for attempting to make a workshop of the school, "that manual training bears the same relation to the technique of the workman or the artist, that orthography does to literature or poetry." He clearly saw that in the neglect of the training of the mind through the hand, the schools were ignoring one of the most vital principles of education, and he set himself the task, with the energy and courage his military experience had given him, to make experiments with the view of proving conclusively that such was the case, and a determination to endeavour to bring a better system about.

In the École de la rue Tournefort, he had the assistance of M. Laubier, the director, into whom he had infused his own energy and impressed deeply with his own ideas. Together they definitely proved M. Salicis' argument, and made a glorious success of the school. M. Salicis visited many European States for information and wrote several reports on, what was to him, the great question, viz.:— The Status of Manual Training. M. Salicis was appointed an Inspector of Public Instruction in 1885, and instructed to formulate courses of study for the introduction of manual training into the Normal Schools. He was again successful, and to-day not only do all the Normal Schools of France train their students to teach manual training, but it is being rapidly introduced to all primary elementary schools in accordance with the law of the land.

Unfortunately

Unfortunately for all who are concerned in the subject of manual training, and everyone should be, for much remains to be done, M. Salicis is lost to us. He died on the 1st of last December, working to the last, with a consuming energy which, no doubt, largely contributed to shorten his days. One of his last works was a paper sent to Dr. Butler, the distinguished Director of the College for the Training of Teachers, New York, which I quote from, and which I shall append in its entirety to this report, hoping it will be attentively read by every one interested in the subject. (See Appendix C.)

M. Salicis says, that "it would seem as though the book, or the paper, were the only things those classes, whose livelihood depends on the daily work of their own hands, would have to handle, and the pen the sole tool they would have to make use of. Book, pen, and paper are put into the hands of children from their fifth to their thirteenth year, and they submit with passive indifference to being saturated with the one taste for literary things; then when they have been carefully perverted both intellectually and physically, with respect to the future which awaits them, and when the gate of life finally stands wide open before them, they are calmly expected to enter it not only unarmed but wholly unprepared." M. Salicis asks, "Does this mean that the actual primary instruction should be slashed to pieces, and that one excess should be substituted for another? What rash voice could formulate such an idea? By no means, for every nation has its main roots deeply buried in the mass of elementary knowledge. If it be in the nature of things that the children of the same country are called upon to follow different paths, we may at least have the same language, write it in the same way, and share the same However, if the introduction of manual training become general, let no one scorn the tools, the scissors, and the needles that we have all learned to handle. On the contrary, let each one esteem modesty and courage in their attempts to lead a creditable and useful life."

"Farther from wishing to weaken primary instruction, I believe it can be understood as strengthened, but in a different way. It would be reduced perhaps by half, as a time for study, but in return a double harvest would be reaped by thinning out the subjects, very much in the same way that a forest is thinned in order to strengthen the trees. The new departure would consist chiefly in introducing into the new system concrete methods of instruction, revealing such principles as can be assimilated on the spot, and yielding such results as will be useful later on."

The hand is of the most vital importance intellectually, for by its action the mind is led to understand the various objects. To touch, to examine, to imitate, belong to the hand and eye as much as to the mind; without the training of these organs and bringing them together in their action, we are certainly neglecting that class of culture which, to 95 per cent. of the people, is of most use to them. As I before stated, all the Normal Schools of France train their students to teach manual training, and it has been conclusively proved that half the ordinary school-time can be given to the training of the hand and eye in elementary schools, without lessening the effect of the ordinary instruction in the usual course of school studies. As a matter of fact, it makes the pupil more eager to learn, and keeps his brain clear, so that the retentive faculty develops, and becomes much stronger. Mr. Salicis notices the fact that the Chamber of Deputies in 1882 voted in favour of making manual training compulsory for all the different grades of primary instruction, thus realising

the scheme which Condorcet laid before the Convention a century previously, and which the strong heads of the time naturally called "Condorcet's Utopia." How is the world changed since that time! He also says: "The manual training that existed in France previous to 1882 consisted chiefly of apprenticeship schools, industrial schools, technical schools, schools of arts and trades, and so on. These institutions were private corporations; their number comparatively limited, and they could not give the pupils the general stamp which is inherent in a well-ordered national instruction."

"Beginning at the very foundation and in keeping with the spirit of the law, the State has organized and is still busily engaged in organising, institutions which are primary above all; just as those whose fundamental principles are the book and the pen. The State should no more attempt to turn out accomplished workmen after a course in simple manual training, than it claims to graduate thirteen year old literati and historians on a pen and book instruction. But just as it ought to provide the pupils as far as possible with the knowledge to spell their language correctly and also with the elements of a tolerable style, just so in manual courses, it can spread a knowledge of the correct use of the principal tools and of the ordinary operations with them."

These are the practical opinions of the man above all others to whom manual training owes so much, but I can easily imagine that with professional educators of the old system, there are many who would hinder the reform in educational methods, and consequently oppose the introduction of manual training to our public schools. They are satisfied with the old system, "what was good enough for us is good enough for our children," and they will not take the necessary trouble to examine into the matter and learn and judge for themselves. I have heard numbers of school teachers say that manual training is simply the equivalent of trade teaching; whereas it is nothing of the sort. A statement of this kind coming from a class that ought to know better indicates gross ignorance. If it be true that "education is the just and legitimate familiarity betwixt the mind and things," then it follows that it is only by instruction in manual training that this familiarity can be brought about. It is not learning a trade, but getting an education, and that of the highest and noblest character. It may also be noticed that the class who decry manual training, are the strongest advocates of cramming for competitive examinations. that public schools should not be converted into shops, while at the same time they would allow the brain to be tortured in committing to memory hosts of things and dates comparatively useless, and which the brain throws off as useless immediately after the examination. Professor Huxley's contempt for cram, is as well known as it is pronounced. He once said in conversation with me, "that with the ordinary boy the memory scarcely ever retained for many months, anything of the subjects he had been cramming for, and which he had been struggling to learn for a competitive examination." There is no solid foundation for a life of usefulness in the ordinary public school system, as it is by hand work and not literature the masses have to live, moreover it is in strict accordance with common sense, that tasks which have for their object to draw the plan and execute the work, must be of more advantage to the pupils than to clog their memory with loads of dry facts and figures, uninteresting in themselves and totally without use in cultivating the faculties of observation. The thinking public have begun to be impressed with the importance of these truths, and are even now crying for reform.

In the school of the Rue Tournefort M. Salicis was still experimenting at the time of his death. His general ideas in his own words were as follows:—

"The needs of a child are made evident by his love for hoops, tops, ball playing in all its phases, and so on. A child must dig ditches, build dams, climb trees, and experiment with the power of his lungs; he must do all this and in the same day. He will even skip his meals in order to do this if he has a chance to do so.

"It is very true these things cannot be done in a school; still the natural inclinations of a child should not be tampered with, but this overflow of vital energy should be controlled in such a way as to direct the main course into a channel of future usefulness.

"Thanks to the freedom of scope and means which the Municipal Council of Paris has given us, it is on these lines that we seek to promote manual training in the public school of the Rue Tournefort. We lay special stress upon our methods, because this institution realises a type whose tendency is to spread either as a whole or a part.

"There all children, from the ages of six and seven years, have a part in actual manual work. As soon as they are admitted to the school they begin modelling, and they keep up the study during the entire school course. They are also taught to treat soft wood with the saw, the rasp, and the chisel. They are then advanced to the plane, the turning lathe, and the iron work at the forge. At a very early age they begin to sketch on a given scale, all drafting being recorded in a note book which is never to leave them. These memoranda are chaotic at first, but they assume rapidly a definite shape. The accounts of daily work are tabulated as regards the nature of the work, its material, and the time spent on it."

The school is made up of five classes, the highest being intended for special or post-graduate work, 12 to 14 years. Special class devotes 21 hours a week to manual work; from 10 to 12, called the 1st class,  $8\frac{1}{2}$  hours; from 9 to 11, called the 2nd class, 5 hours; from 8 to 10, called the 3rd class, 4 hours; from 7 to 9, called the 4th class, 3 hours per week, or half an hour daily. No attempt is made to specialise before a pupil gets into the special class. Once there, they get finished in a complete general training, and have access to such special branch for which they show a well-defined aptitude. The children thrive, notwithstanding the fact that their attendance in school is longer by two hours than the usual regulations provide. Their occupations are so varied, according to their mental and physical aptitudes, that there is no sign of weariness after their exertions of mind and body. Ardour pervades them in a characteristic way: their beaviest punishment is to be debarred from the workshop. The practical results are made manifest in the facilities for finding lads who make good apprentices with a reduction of the length of the term of apprenticeship; they are also earlier compensated for their work, and earn workman's pay sooner by two or three years than ordinary apprentices. M. Salicis adds "that they have turned out many choice workmen devoted to their calling, and that the school had graduated expert accountants, teachers, professors even of the higher branches, and artists. One of these boys was, when only twenty years old, famous for his water-colour drawings, and is now much sought after by New York publishing houses."

The school known as the École Professionelle Ménagère, the Municipal Housekeeping School, has been in existence since 1881. It was founded for the purpose of giving girls, on leaving the primary schools, an opportunity of learning household duties, as well as some useful handicraft that will enable them to gain a living. The morning is devoted to the ordinary subjects of primary instruction, in order to strengthen and improve them in the ordinary school work, while special technical classes comprise a general course, compulsory for all pupils, and special technical courses for the special business or profession chosen by the pupil.

The conditions for admission are as follows:—The child must be at least 12 years of age and not over 15 years, and must hold the primary elementary certificate.

Of the trades taught, ordinary dressmaking for the working and lower middle classes, appears that for which there is the greatest demand, and next to this is millinery and laundry work. There is a competent staff of teachers for needlework, embroidery, artificial flower-making, stay-making, for cutting out and making up dresses, as well as for gymnastics, housekeeping, washing, and ironing. The pupils receive a premium proportionate to the value of the work done by them. They all take their turn at the household work, including cooking.

This school has been so successful that the municipality of Paris have established four other schools of the same character, in those quarters which are mostly inhabited by the working classes, and are training at the present moment over a thousand girls, who are being prepared in these schools to earn a living by the use of their hands.

The École Centrale des Arts et Manufactures, &c., Paris, is an institution of the highest class for the preparation of students for the professions of civil and mechanical engineering, metallurgy, and chemistry applied to the arts. It is, to all intents and purposes, a private self-supporting establishment, founded in the year 1826, chiefly through the interest and representations of M. Dumas. It has lately been taken over by the Minister of Agriculture and Commerce, and the Government are building, near the Conservatoire des Arts et Métiers, new extensive and handsome premises for the use of the school.

The examination for admission is a severe one; but, as the school is extremely popular, there is always considerable competition for any vacancies. No students are boarded in the school, but this will be changed when the new buildings are ready.

The course extends over three years, and diplomas are awarded at the end of the course, after an exceedingly strict examination and working out a thesis. A strict system of continuous examination and marking is carried out, the work of each student being carefully entered by each examiner, and the results of the entire three years' work are added up, and the special grade of the diploma made out accordingly.

The first year's course consists of instruction in general science without much applied science, almost similar to that given at the *École Polytechnique*, whilst in is similar to that given at the *École des Mines*. The later teaching has special the second and third years the teaching is especially directed to applied science, and reference to the practical applications of each subject. Should the student fail to obtain his diploma at the end of the course, he may pass the examination, without re-entering the school, at any period within six years after leaving.

Each

Each student pays £32 a year, the governing body of the school managing the whole of its financial business as well as the arrangement of the curriculum. There are thirty professors and thirty tutors and assistant lecturers, and two directors of studies.

In the system of education pursued at the *Ecole Centrale*, one of the most salient features is the theses written by the students at the end of the last year. The courses of instruction upon which these theses are based are mechanics, metallurgy and mining, technical chemistry and engineering. Each student takes up one of these subjects, and is allowed a month for the preparation of his thesis. The whole work, including drawings, descriptions, and calculations is carefully examined by a council of professors, and the student examined on its details.

Programme of the Ecole Centrale des Arts et Manufactures, Paris:-

### First Year.

During each year the students work in the laboratory under the immediate direction of the professors, and also prepare their drawings and designs under supervision.

I have described in broad outlines this school, for the reason that it has for many years enjoyed a distinguished reputation for its success in educating men, who have become masters in the various industrial pursuits. At the present moment, its character is as distinguished as ever, and the most famous manufacturers take considerable pains to obtain admission for their sons. There is no doubt of its great success, or of the thorough education it imparts to its students. I attribute this success chiefly to the great excellence of its staff of instructors, and to individual teaching. The new building gives every facility and convenience for technical science teaching, and the chemical laboratory is most admirably fitted up with the newest and best appliances. The work benches are of brick, and the casings of the tables are cemented and covered with porcelain tiles. Each bench has its hood provided with a flue for the escape of gasses. The physical laboratory is equally well arranged and fitted, and the class-rooms for light and air space leave nothing to be desired.

The Ecole Centrale Lyonnaise is an excellent school, partaking of the character of the schools of Châlons, Aix, and Angers, but perhaps somewhat less practical as regards workshop practice, while more theoretical. . It has a three-year course, as follows: -- Mathematics, physics, chemistry, metallurgy, elementary notions of anatomy and physiology, general hygienics, and workshop practice, for the first In the second year, statistics, algebra, analytical geometry, industrial physics, descripive geometry, mechanics, organic chemistry, machine construction, metallurgy, professional hygienics, and workshop practice. The third year's course consists of descriptive geometry, mechanics, hydraulics, applied mechanics, machine construction, analytical chemistry, civil engineering and architecture, and workshop practice. In connection with these is a course of pathology for immediate use in factories in case of accidents. Drawing, both mechanical and geometrical, as well as architectural, is practiced. The arrangement of the workshops is excellent, and the work turned out fairly good, consisting of steam-engines, electric motors, and dynamos. Pumping machinery is also made here, and the pupils receive a thorough preparation for actual wood and metal construction, so that they may be able to superintend work and manage machinery.

There is a small museum connected with the school, consisting of patterns in wood and metal models of various machines, also a complete set of models representing the machinery employed in the manufacture of steel by the Bessemer process.

After leaving the school the certificated student has not much trouble in finding a situation as assistant engineer, or as a foreman in a factory.

At Nantes there is a school called the *Institution Livet*, from the fact of its being founded by M. Livet in 1846. This gentleman was one of the pioneers of manual training, and has devoted almost his whole life to the development of his theory of combining theoretical instruction with manual practice. The institution is a combination of an apprentice school, higher and elementary primary school, and a higher class technical school. The Government gives it the same grade as the National Schools of the Arts and Trades, and its graduates are accepted by the navy on the presentation of their diplomas. The reputation of the school was so great

that

that the Government appointed a Commission to inquire into the methods and system of M. Livet, and the result was so favourable that the school was classed with those of the *Arts et Métiers*, as above stated.

It has room for 400 pupils, but fully half these boys are under 12 years of age, and belong to primary classes. The pupils above 12 belong to classes under the term of primaire supérieure, and is a three years' course, at the end of which they receive their certificates. Boys from 15 to 18 pass through a further course of two years of regular professional and technical instruction, the principal part of which is in physics, chemistry, surveying, languages, mechanical engineering, and workshop practice. The teaching staff is very able, and the quality of the work excellent. The geometric and mechanical drawings are made from actual objects, from which they make measurements and calculations, as well as a completed drawing. M. Livet is of opinion that students become better draftsmen and engineers from working direct from the model, and there can be little doubt that such is the case, as actual measurement, combined with drawing and calculation of contents, must naturally sink deeper into the memory than when the instruction is more superficial.

Languages are taught in the same way, and in both English and German the exercises were of a very superior character. In all subjects the system of M. Livet is an endeavour to reach the understanding by practical methods. He is utterly opposed to learning by note from text books, so that what the pupils do learn they really understand.

The workshops are extensive and arranged with great judgment. The lathes, planing machines, drills, and slotting machines are such as are met with in well-ordered machine shops. Many of the machine tools are made by the pupils themselves. There are also watchmakers' and modellers' workshops. The work of the modelling class is of a very high order.

The pupils are both boarders and those who board and lodge at home, but most of the pupils take their luncheon at the school. The payment for full boarders is from 600 to 800 francs (£24 to £32) a year. The actual cost of maintenance, inclusive of domestic service, is about one franc (10d.) per day. The Government subsidy is only 3,000 francs, or £120 per year, but the fees amount to about £7,000 a year.

The High School of Commerce and Industry, Bordeaux, is a modern institution in which instruction is given both of a technical and commercial character. The Philomathic Society of Bordeaux is composed of gentlemen who give their time and assistance generally to the cause of education. It has especially interested itself in technical education, so much so that in 1886 it called together an International Congress of the promoters and leaders in the work of technical education. I had the honor of being a delegate on that occasion, and upon which I reported in 1887. A school of Arts et Métiers was projected, and at the same time the Chamber of Commerce had under consideration the establishment of a High Commercial School. An institution somewhat similar was already in existence, and the present school is the outcome of the whole of these enterprises. It has been placed under the direct control and management of the Société Philomathique, with the co-operation of the City Council and Chamber of Commerce. The administrative council is composed of fifteen members, five of whom are town councilmen, five members of the Chamber of Commerce, and five members of the Société Philomathique, the president of which is the president of the administrative council Tho of the school.

The school consists of two branches, viz.:—An industrial course and a commercial course. The object of the first of these is to form high-class workmen for foremen and managers of industrial establishments, possessed of sufficient scientific knowledge to qualify them to become masters in manufacturing enterprises. The commercial school's object is to turn out good business men, competent to conduct commercial undertakings of all kinds.

These courses are of two years, and the school hours from 7.30 until 11.30 in the morning, and from 1.30 to 5.30 in the afternoon. There is a half holiday on Thursday afternoons for those whose work is not in arrear.

The age for admission is 15 years, and pupils have to pay an annual fee of 200 francs. There is, however, a number of free scholarships which enable really meritorious, but poor, pupils to participate in the advantages of the school. There are also travelling scholarships of 1,500 francs for Europe, and one of 2,500 francs for extension beyond Europe under certain prescribed conditions. There is also another feature worthy of imitation: the controlling body makes it a duty to find situations for the pupils after they have left the school. For this purpose registers of all graduates are kept at the school, and which are always open for public inspection.

The work performed is both theoretical and practical, and the course of studies is as follows:—

# INDUSTRIAL SECTION.

First Year.—Mathematics, mental arithmetic, geometry, trigonometry, algebra, mechanics, descriptive geometry, physics in general, general chemistry, French and French composition, and political economy. To these are added manual training.

Second Year.—Mechanics, mathematics, machine construction, industrial physics, industrial chemistry, metallurgy, building of public works, mining, railway building, bookkeeping, political economy, cost of construction, surveying, levelling, stone, wood, and iron construction.

## COMMERCIAL SECTION.

First Year.—French language, and composition, English, German, and Spanish, arithmetic, physics, commercial and industrial geography, chemistry, knowledge of merchandise, commercial and industrial law, and political economy.

Second Year.—Book keeping and counting house practice, French, English, German, Italian, and Spanish, commercial geography, chemical analysis, knowledge of merchandise, commercial and maritime law, political economy, and history of the development of commerce and statistics.

For both these sections, there are, common to both, drawing and modelling, and actual work in the joiners, pattern-makers, smiths and fitting shops. The manual work is not carried so far as in the Écoles Nationales des Arts et Métiers, it is sufficient, however, to give the pupils a thorough knowledge of the principles of construction, and of actual work. The workshops are everything that could be wished, and the instruction given by practical mechanics and master workmen.

The Commercial Museum consists of several large halls in the upper storeys of the building, with all the improvements of lighting and ventilation, which are filled with collections of raw materials and objects, arranged to show, in all important 138—D industries,

industries, a complete set of articles from the raw materials to the finished goods. The textile fabrics are very fully represented. Linen, for example, begins with the flax plant, and finishes with the finest damask linen. Silk and cotton are similarly shown. Pottery, glass-making, iron and steel, are all represented from the crude minerals to the finished products. Ship-building operations with models of vessels, from fishing boats to the gigantic ocean steam-ships, are exhibited, with all their details of manufacture. Cordage, chain cables, wire rigging, materials and machinery used in the equipment of vessels and dry docks. There is also a fine collection of machines used in agriculture, horticulture, and viticulture, for both small and large farmers and vignerons, with all the new appliances for wine-making and distilling. Altogether the Bordeaux Commercial Museum is of special interest and of the greatest use to the school.

I must describe another typical technical school, the National Professional School of Vierzon, which was established after a Commission had been appointed, in May, 1881, by the French Government, to inquire and report upon the organisation, plan of studies, and generally as to the best methods, &c., of conducting technical instruction and manual training. Senator Tolain was the President of this Commission, and he reported in August, 1882. This report went fully into the subject and recommended most of the reforms both in the legislation and the programmes of primary education, as well as those in manual and technical training. "The report said among other things that the situation could only be remedied by encouraging the creation in industrial centres of special professional schools for each branch of industry, able to replace, and even more than to replace, what apprenticeship had formerly been for young people. The utility of the creation of such establishments needs no longer to be shown. A number of industrial centres have recognised it, and have taken, in this respect, a praiseworthy initiative." They then enumerate those pioneer schools and state "that the law of December 11, 1880, has a double purpose; first, to form in the special schools of apprenticeship and train for the industries workmen completely initiated to the labour of their profession; second, to give the manual dexterity and the technical knowledge necessary for young people who propose to enter the special schools of apprenticeship of the secondary grade." They then state, "that it is with this view the Minister has been anxious to create a national school of superior primary instruction, and of professional instruction, preparatory to apprenticeship, and destined to serve as a type for establishments of the same kind which will be founded under the law. It is the programme of this school which the Commission named by the decree of May 31, 1881, has been charged to elaborate." I shall give a concise description of the present "Maternal School" and the Primary Elementary School as it developed from the recommenda-(See Appendix A.) The Commission further states "that the tions in this report. manual exercises of the superior primary school should have as a foundation the working of wood and of iron; that labour upon these two materials offers an almost unlimited field for the general and unspecialised preparation which pupils ought to receive. The working in wood and iron to alternate, so that at the end of the year, the pupil will have been exercised during two periods of sixty days in each of the two shops. The two kinds of labour connected in this way will complement each other. It is thus that after having studied the practice in wood-turning, one will be able to pass more readily to the turning of metals, and that after having constructed any piece of joinery whatever, one will be better able to meet the difficulties presented by the fitting of two pieces of metal." \* \* \* That freehand drawing should

should hold one of the most important places in this branch of instruction. \* \* That in the last year the exercises in drawing should consist principally in sketching and in drawing, with sections, the different tools and instruments employed in the shops, and the shop work of the pupils will, in all cases, be executed according to sketches made by themselves.

This was the gist of the recommendations made by this Commission, and on the 9th July, 1881, the Government decreed the establishment, at Vierzon, of "a National School of primary instruction and of professional instruction, preparatory. to apprenticeship, destined to serve as a type for institutions of the same kind" as provided for by the law of 1880. The city had already voted the funds, chosen the location, and prepared the plans. In 1883 the foundation stone was laid by M. Brisson, then President of the Chamber of Deputies, and in a speech made by the Minister of Public Instruction, M. Jules Ferry, on the occasion, he set forth the design and purpose of the school in a very eloquent manner. He said :-- "We wish to attempt here and to realise on a large scale, an idea which the first Republic pursued and cherished; which it formulated with remarkable precision, and which has found renewed favour in the public mind wherever Democracy has made a step in advance, as well after the Revolution of 1830, as after that of 1848. This creative thought, this settled purpose, which had its origin in our country nearly a century ago, and which to day finds itself realised, the idea which should be engraved upon the front of this edifice is, that the National School in a Democracy of progress like ours should be essentially a school of work. It is from this point of view that we have revolutionised the school. We have begun this beneficial transformation, and if the future is granted to us, it shall suffer no harm in our hands.

"The supreme purpose, the final aim, the essential mission of the modern school is the education of this democracy of working men, who are not only a majority in numbers, but whose vigorous virtues make the strength of the country. Thence arises the professional character of our primary education, as it is established in the new programmes. I mark this fact important to the labourers who listen to me, and to whom we can allow it to be said that our policy is, in respect to what concerns them, not barren or indifferent. The primary school of to day which we have organised after the ideal entertained by the French Revolution, this little school is from its first hour professional. That is to say, its aim is to prepare the child to become like the immense majority of French citizens, a workman. grammes rest upon this double idea: First, that primary education in a Democracy should comprise at the outset a general education, without which there is no durable specialty, no solid and serious professional instruction; and in the second place, in a series of exercises tending to place the child by progressive and well-arranged imitations, in contact with the realities of life. To form from childhood the man and the citizen; to prepare workmen for the shop is our task, and if the present generation has time to fulfil it, it will be able to rest gloriously in its grave. Thus are passed the first years of the primary school, but when the primary cause has finished this first circle, a singular and disturbing chasm opens beneath the feet of the youth: no more school no more anything between his 12th and 13th year, and the beginning of apprenticeship. It is this chasm which we wish to fill by the professional school, and it is a typical professional school of this order that we wish to establish here. I desire to clearly define its character, and to estimate with precision, its extent and We do not wish to create at Vierzon a professional school which duplicates

or which copies the Schools of Arts and Trades of Châlons, of Aix, and of Angers. No: these schools have a determinate end, they undertake to form superintendents, the sub-officers, for the army of labour; here we wish to prepare the soldiers for this army. Engineers, managers of works, designers, superintendents are the cadres of French labour and industry. It is not with these we here preoccupy ourselves, it is with the great working mass itself. It is the labourer whom we wish to It is to him we wish to give a practical and intellectual education, which will render him superior to his daily task, and which, far from disgusting him with it, or from withdrawing him from it, will attach him to it by a bond more intimate and more profound. I know the old doctrine, the aristocratic doctrine, which said, 'It is imprudent to give education to the people; it is imprudent to teach the workman anything beyond what is necessary for his daily task; he will take a dislike to his trade if he once looks beyond its lowly horizon.' That is an aristocratic conception, and a false conception. The democratic conception, which is ours, is precisely antipodal. We judge in fact, that the more the workman shall be familiarised with the natural laws, of which he is too often the ignorant auxiliary, the better he will understand his daily labour,—the more he will honor and love his trade.

"There is upon this point a fine saying of Channing, one of the men who have best loved the people, and best known modern democracy. Channing has made the remark that industrial labour—the labour of the shops—sets in operation incessantly all the discoveries of science and all scientific notions, the oldest as well as the newest, and he recommends statesmen to spread abroad in the shop these scientific knowledges, these positive conquests of humanity; 'for,' says he, 'there is no more certain means of ennobling a manual profession than by showing the intimate relation which connects it with the natural laws of the world.'

"To ennoble manual labour is our earnest desire, and this purpose we have inscribed in large letters upon our programmes. The programme of moral and civic instruction, decreed by the Superior Council of Public Instruction, contains an article with this title, 'The Nobility of Manual Labour'; and in order that the nobility of manual labour may be recognised, not only by those who exercise it but by the whole of society, the surest and only practical means have been taken, manual labour has been placed in the school itself. Be well assured that when the plane and the file shall have taken the same place—a place of honor—by the side of the compass, the chart, and the book of history, and shall be the object of an intelligent and systematic instruction, many prejudices will disappear, many antagonisms of classes will vanish, social peace will begin on the benches of the primary school, and concord with its radiant light will illumine the future of French society.

The professional instruction which shall be given here will have for its distinctive character not to constitute a separate instruction for any single industry. It will be professional without specialisation; it will teach the general principles upon which all industries rest; it will associate, for example, the notions which control the iron industry with those which direct the wood industry. During the three years which the young pupils of Vierzon shall pass in the professional school, between the twelfth and sixteenth year, they will become without difficulty experts in these two fundamental branches of manual labour, the working of iron and of wood. Trials have been made and succeeded; and what will be the consequence of this general professional education, which will not give a trade, but which will render

render the pupil capable of learning much more quickly and much better the work he shall choose to do? This consequence will be double. In the first place, it is evident that the duration of apprenticeship will be notably reduced, which is a considerable advantage; and, in the second place, during these three years of study the child will have time to do, what he cannot now do, choose freely, and with the knowledge of his reasons, the career which befits him—i.e., he can determine his own vocation; finally, he will be armed against that danger of mechanical specialty arising from the unlimited division of labour, which is one of the necessities of modern industrial progress, but the evil effects of which it is the object of human wisdom—of the wisdom of a Government and of the teachers of the people—to anticipate and diminish. He will then be able to contend against a tyrannical specialisation; he will be able at need to choose a trade, and will not be necessarily bound to the iron industry, since he will also be well prepared for working in wood.

\* \* \*

"Knowledge is, for the workmen, without doubt a great instrument of power—of dominion over matter; but it is also a great means of quiet and pacification. The passions which foster anarchy are all the daughters of ignorance. To teach the workman, not only the natural laws which he employs in the exercise of his trade, but to teach him equally the social law; to make him see clear amid these economic phenomena which the adversaries of existing society—which is, however, the most free and the most democratic of societies—seek to travesty or to obscure; to give to the workman just notions respecting social problems is greatly to promote the solution of them. What was in other times only a religious or sombre resignation to necessities not understood, may become, through the progress of knowledge and the habit of reflection, a considerate and voluntary adhesion to the natural law of things—an adhesion which compensates itself in some degree by a more practical conception of the means by which one can lighten its severity.

"We have all about us, at our gates as well as beyond the Atlantic, most formidable competitions in free labour. Their products which reach us, the reports which are made to us, above all the competition which we meet in foreign markets, give us in this respect warnings which we must not despise. Thus upon the field of industrial battle, as well as upon the other, nations may fall and perish; upon this field of battle, as upon the other, one may be surprised; one may, by excess of confidence, by admiration of himself, or by sluggishness of the public powers, lose in a brief time a superiority professionally uncontested. It is for this great danger that professional industry in our country should prepare. There is no national interest more important, and I can say and repeat here without fear of contradiction from any one,—To elevate the workshop is to elevate the country."

So far M. Jules Ferry. He was no doubt greatly influenced by M. Brisson, the very able and distinguished Director of Primary Instruction in 1882, who was instigated and urged on by M. Salicis. I have made this long extract as I believe it should be written in letters of gold, and is applicable to all communities and to all nations. Together these gentlemen recognised the great want of a special Normal School for Manual Training, and set to work to bring it about, which was done by M. Jules Ferry, who, as we have seen, was determined the system should have a fair trial. The model school was instituted at Vierzon, and the public primary elementary school became the arena for future manual training.

The law of the 28th March, 1882, introduced into the programme of primary teaching all the ideas necessary to institute a complete primary instruction, appropriate to a democratic, social, and political State, and to the progress of the applications of scientific discoveries which have completely changed the old order of things. The Nääs Normal School, for the training of teachers in hand work, or manual training, of which I gave a report in 1887, had been very successful under the directorship of M. Otto Salomon for several years previous to 1882, and before the great alteration was made in primary education, the Minister of Public Instruction sent a Commission of three teachers to investigate and study the system. These gentlemen reported favourably, and rendered every justice to the true and real spirit of pedagogy which inspired M. Salomon's system; but France can certainly claim for herself the association in one institution, and that institution the primary school of manual and intellectual education. Léonard Bourdon, in 1792, proposed to the Municipality of Paris to establish workshops in the twelve public primary schools which were then in existence in the different parts of the city, and in 1832, M. César Fichet founded in Paris, in the Rue Basse-des-Remparts, an industrial school, in which workshop exercises were associated with theoretic instruction; and, in 1871, M. Gérard, in his report upon apprenticeship schools, indicated, as a means to shorten the term of apprenticeship by previous instruction, "that the workshop should be in the school." In 1873 he organised the School of Apprenticeship on the Boulevard de la Villette, and favoured the creation in one of the Communal schools of the City of Paris, of the school of the Rue Tournefort, for the special purpose of making the experiments of the association of manual training with primary instruction, properly so called. The success attained here by M. Salicis and the director of the school, M. Laubier, has been already alluded to.

There is now, in Paris alone, 191 boys' schools with 70,694 places, and 174 girls' schools with 60,509 places. In all of these manual training is taught, and the arrangement of the teaching staff is in accordance with the law of 1886, and of which I shall hereafter speak more fully.

These gentlemen, the pioneers of the system, recognized the great difficulty they would have to encounter in getting teachers, so at once determined to institute a Special Normal School for Manual Training. Admission was obtained by competition, and forty-eight school teachers, all of whom were graduates of the Université de France were there taught for one year the following branches:—

- 1. Experimental physics and chemistry, as illustrated in simple phenomena, *i e.*, such experiments as might be repeated in elementary schools; the instruction was collective, but the students had the privilege of individual manipulation.
- 2. Natural history, treated in the same way.
- 3. Plane trigonometry, algebra, and elementary mechanics.
- 4. Descriptive geometry, with direct applications to perspective and to stereotomy.
- 5. Drawing, modelling, moulding, and graphic designing.
- 6. Treatment of wood at bench and turning-lathe.
- 7. Treatment of iron at the forge, vice, and turning-lathe.
- 8. As subordinate studies: Choral music, French literature, fencing, and fire-brigade practice.

This programme was to be completed at a later period, by a scientific study of various fertilisers in their relation to the nature of the soil, and to special productions. Although the programme was a little overcrowded for immediate needs, it was thoroughly carried out, and was satisfactorily assimilated in all its parts.

From an essentially manual point of view it about covered the following ground:—

- Stereotomy.—Design and construction of a soffit, of a full centre, of a segmental arch, of a stilted arch, of a rampant arch; development of the same; stringer of a staircase.
- Drawing and Modelling.—Rendering of twelve models, selected from the collection of the National School of Fine Arts. No modelling was done unless preceded or followed by a design of the object.
- Joinery.—Besides preliminaries, twenty exercises in joinery and ten summaries.
- Smith's work.—Introductory details, fire making, striking in company with one, two, and three other strikers, welding, rolling, swaging, use of the callipers, tempering.
- Millwright's work.—Practice with flat and half-round files, mortise-chisel, graver, and saw.
- Wood-turning lathe.—Railings of different styles, Medicis Vase.
- Metal-turning lathe.—Use of slide rest, turning cylinders, bearings.

"Every object made," says M. Salicis, "was to be a material rendering of an off-hand sketch." A memorandum of each sketch was entered in a special workshop note-book along with the teacher's private explanations and estimates. "The close of the year witnessed the establishment of a certificate of proficiency for such as were fit to teach manual work in the Normal Schools, and in the Higher Primary Schools. On examination this certificate was awarded to most of the students in the first promotion, the few backward ones obtained this distinction in the following year, along with twenty-four new students of the second promotion. The special Normal School has thus graduated seventy-two professors of manual training; since then the Normal School at St. Cloud has swollen the list by a few adepts, and some independent teachers have shown themselves so well versed in the several requirements as to pass satisfactory examinations in the same. Thus it is that now, in strict compliance with the law, each one of our ninety Normal Schools, including Corsica and Algeria, is provided with a competent professor of manual training. On the other hand, these schools are fully equipped with laboratories, workshops, and tools. With respect to the new branches, the programme is identical with the one adopted by the special Normal School, minus the above-mentioned 3rd, 4th, and the latter The course is completed within three years, at the rate of part of the 8th branches. four hours per week, a rate which seems very inadequate. Still these Normal Schools are beginning now to graduate every year something like 1,500 teachers, who are pretty well fitted to introduce the new studies in the numerous primary and continuation schools. Summer courses are being opened gradually in the Normal Schools to those teachers in each department who will pledge themselves to regular attendance. These voluntary teachers carry back to their schools a manual knowledge which is sufficient, inasmuch as it is primary; their own works are their models,

models, and their note-book is their guide. The remainder of their equipment, which in the beginning need be only slight in the way of buildings and tools, will depend on the General Councils and on the Municipalities."

M. Salicis goes on to say, "That in fifteen years' time nearly all the Primary High Schools, and most of the 40,000 Elementary Schools for boys, ought to provide our 2,750,000 male children of the working-classes with the instruction that will fit them completely for the future work to which they may be destined.

"It is a fact that everywhere, without exception, where the equipment is decent and the professor suitable, manual training is as much of an attraction to the pupils of various ages as to the student-teachers of the normal schools. The recent convention of academical rectors, and of general inspectors of primary instruction, presided over by the Minister was unanimously in favour of the new departure; such was the interest manifested by the students of the normal schools, that at times it had even been necessary to restrict their enthusiasm in workshop matters. We wish it to be always well borne in mind, that we are dealing here only with the question of primary manual training, such as is given by the State.

"Of the two hundred boys schools in the city of Paris, about one-half are already equipped with benches and turning lathes at which the older scholars do manual work. The Municipal Council and the Board of Instruction are both endowed with the very best will, and still they have not definitely settled the exact amount of importance to be attached to primary manual training. This state of affairs will soon be changed, for the teachers will all be recruited from the ranks of the normal school graduates of the Department of the Seine." This was written late in the year 1890 and only a short time before his death. Convinced of the utility of manual training M. Salicis never relaxed his efforts, but worked energetically to secure its position in all primary schools until the end of his life.

In accordance with special decrees and ministerial resolutions, every primary high school must be provided with a workshop and there are certificates of proficiency awarded in higher primary studies, including manual work. These two, three, and four year schools are urgently demanded by the departments and cities; they apply to a portion of the studying population that has already received the certificate for elementary primary instruction, and that is not compelled to immediately seek an apprenticeship. It has been well said that France has not only set herself to educate her people, but she has especially set herself to adapt that education to the needs of the present industrial era. Since the Universal Exhibition of 1878 many of the ablest men in France have most diligently applied themselves to solve the problem of how the basis of general knowledge could be broadened, and at the same time to introduce into the schools another kind of training, that would prepare the youth to become intelligent workers in wood and iron. Recognising the truth that the value of work diminishes as the intelligence of the workman declines, they found, as the Swedish authorities had previously found, that the only effectual remedy is to give such an education to the children, as will awaken in them the feeling that formerly prevailed among artisans, when they took an honest pride in their hand-work. do this it was necessary to develop their intelligence and at the same time to increase their technical knowledge. With this view the question was studied and the organisation of manual training made an accomplished fact.

The definite change was made in 1882 when manual training was first made a subject of tuition and primary instruction compulsory. It will be necessary here to state concisely of what primary instruction consists and how it is carried out. I intend,

intend, however, to append to this report my own views as regards French primary instruction at greater length than would be convenient in this place. (See Appendix A.)

Primary instruction is given in four different kinds or grades of schools:-

- 1. The maternal schools— $\acute{E}coles$  maternelles, and infant classes.
- 2. Elementary primary schools—Écoles primaires élémentaires.
- 3. Higher primary schools—*Écoles primaires supérieures*, and higher classes in primary schools called complementary courses.
- 4. Manual apprenticeship schools—Écoles manuelles d'apprentissage.

In all of these schools some form of manual training is required and the programme of primary education includes:—Moral and civic instruction, reading, writing, french, geography, and history (particularly that of France,) general notions of law and science, the elements of drawing, modelling and music, and gymnastics. The extent of the manual exercises can be gathered from the programme prepared by Senator Tolain's commission which formed part of the report, and which I now give for boys alone. The programme includes work for girls, also arranged in three courses, and comprises knitting, plain sewing, and embroidery, to which are added, in the elementary course, manual exercises designed to develop dexterity, such as cutting out and fitting pieces of coloured paper; first attempts at modelling. In the superior course, instruction is given in the elements of domestic economy with practical applications to the kitchen, laundry, the house generally, the garden and yard; practical instruction is given in the school and at home.

#### PROGRAMME.

# INFANT CLASSES AND MATERNAL SCHOOL.

Application and extension of the Fræbel system and manual exercises intended to develop the children's skill of hand.

# ELEMENTARY PRIMARY SCHOOL.

Elementary Class, 7 and 8 years old; 1 hour per day.

Elementary exercises in freehand drawing, symmetrical arrangement of forms; cutting out pieces of coloured paper and applying them upon geometrical forms; exercises in colouring; cutting out geometrical forms in cardboard; representations of geometrical solids. All these exercises to be done first on squared and subsequently on plain paper.

Small basket work.—Arrangement of strips of coloured paper—first in interwoven forms; second in plaited patterns.

Modelling.—Reproduction of geometric solids and simple objects.

Intermediate Class, 9 and 10 years old; 1 hour per day.

Cutting out cardboard patterns; construction of regular geometrical solids; construction by the pupils of cardboard models, covered with coloured drawings or coloured paper.

Small basket work:—Combination of plaits; basket making.

Objects made of wire:--Trellis or netting; wire-chain making.

Combination of wire and wood: -Cages.

Modelling: -Simple architectural ornaments.

Object lessons:—Principal characteristics of wood and the common metals.

138—E

Upper

Upper Class, 11 and 12 years; 2 hours per day.

Drawing and modelling.—Continuation of the exercises in the preceding class; repetition of the ornaments previously executed, in the form of sketches, with dimensions attached to them; drawing the requisite sections for this purpose; reproducing the sections as measured sketches; study of the various tools used in working wood-hammer, mallet, chisel, gimlet, centre-brace and bits, screw-driver, compasses, square, marking gauge, saws of different kinds, jack plane, trying plane, smoothing plane, files, rasp, level.

Theoretical and practical lessons on the above.—Sawing and planing wood; construction of simple joints.

Boxes nailed together, or jointed without tacks.

Wood lathe.—Tools used in turning; turning simple geometrical forms.

Study of the tools used in working iron-hammer, chisel, cutting tools, cold chisel, squares, compasses, files, &c.; theoretical and practical lessons concerning them.

Exercises in filing, smoothing, and finishing rough forgings or castings; cubes; polygonal nuts.

The practical work in the shops in primary schools to be followed by gymnastic exercises, in accordance with a special programme.

In the superior primary schools the instruction comprises-Morals, the duties and rights of the citizen, French language and grammar, writing, history, geography, and one modern language, at least; mathematics, including arithmetic, geometry, algebra, and the elementary principles of trigonometry as applied to the estimation of triangles; clementary principles of solid geometry and their application; the common curves.

Accounts and commercial book-keeping.

Physics and chemistry; natural history.

Drawing.—Geometrical, plans and tinting, perspective, figured sketches, essential parts of machinery and plans of buildings, freehand drawing from relief and objects, singing, and gymnastics.

The manual instruction is as follows:--

First Year—2 hours per day.

Drawing and modelling.—Execution of the regular geometric solids of given dimensions from figured sketches.

# Workshop Teaching.

First period.-Working in wood: A box, a drawing-board, a mortise and tenon joint, an oblique joint, a slit and tongue joint, a joint halved together obliquely, a St. Andrew's cross, various kinds of scarfed joints.

Second period.—Working in iron: Exercises with the file on an uneven piece of iron; make rectangular parallelopiped, with a square base of given dimensions; this to be converted into an octagonal prism, and then into one with sixteen sides; this to be filed round; then in the lathe to turn this into a cylinder of specified diameter, and finally to convert it into a hexagonal prism. Third

Third period.—Working in wood: Various kinds of dovetail joints, splices, skew splices, halved together, two kinds, scarfs halved with dovetail pieces.

Fourth period.—Working in iron: Tool-making, two straight edges of given dimensions, two plain squares, a pair of callipers, exercises with the lathe and also with the cold chisel.

#### Second Year.

Drawing and modelling.—Execution of a graduated series of ornamental casts, composed of elements of solid geometry, arranged systematically; rosettes, &c.

# Work in the shops—3 hours per day.

First period.—Working in wood: Mortise and tenon in mouldings, tenon for a mitre joint, mortise and tenon with champered dovetail, tongued joint with cross-ties, mortise and tenon for quoins.

Second period.—Working in iron: An angle out of square, a pair of pointed compasses, a hand-vice.

Third period.—Working in wood: Angle open mortise joint, slit and tongue joint in two thicknesses of stuff, stepped mortise and tenon, square joint of two cylinders, oblique joint of two cylinders, a pair of screw clamps.

Fourth period.—Working in iron: Bit pinchers, screw-wrench, exercise with the lathe, exercise with the cold chisel.

## Third Year.

Drawing and modelling.—Elements of architecture, orders, and styles.

Industrial drawing.—Theoretical principles of composition and of the arrangement of colours.

General principles of the application of drawing to pottery, to fret cutting in wood and metal, to artistic locksmith's work, and to the ornamental stamping of paper and fabrics.

Chemistry.—Experiments in the laboratory, manipulation, analysis, mode of fixing colours, as applied to pottery, paper, and woven fabrics.

Accounts.—Industrial account keeping, fixing of a scale of profits, applying the same to the work of tools and simple machines.

Work in the shops—5 hours per day during the first six months, and 7 hours daily during the last six months.

First period.—Working in wood: The making of tools, moulding block, mitre block, wood-bench clamp, tenon saw, small hand saw, inlaying saw, a plane, use of the wood lathe.

Second period.—Working in iron: The making of tools, a pair of steel squares, one of them to be a rim-square, a tap wrench, working with the cold chisel and file.

Third period.—Working in wood: The making of tools, a plane, jack plane, square, marking gauge, grooving plane, lathe work and pattern-making.

Fourth period.—Working in iron: Making a shifting gauge, working at the forge, elementary work, making of tools, chisels, cross-cut chisels, drills, and boring bits, &c.; working at the lathe, and with the cold chisel.

As a rule, and after the three years' course, the pupils may, if they request it, be maintained at the schools to work all day long in the shops throughout the holidays. Many take advantage of this and construct some machine work to show their skill, such as a lathe, drill, or the working model of a steam engine.

In the primary schools the professional and literary work are varied as much as possible, the one is interwoven with the other, so as to avoid fatigue either way, the one acting as a recreation after the other; for it is absolutely true that relaxation for the mind is found in manual exercises and in doing useful work. M. Corbon says that "manual exercise is for all men a natural requirement which needs to be satisfied, and the level of the general capacity will be made higher by its constant practice." Whatever may be the avocation of the individual all and everyone should know how to work.

M. Corbon further says, "it is high time to understand the indications furnished by the instinct of children, and to give as soon as possible satisfaction to their twofold need of working with their hands, and of knowing the reason of things, that is to say, it is time to bring about a veritable revolution in the manner of raising youth. If one wishes to follow resolutely the course of nature and the clear indications furnished by the instinctive dispositions of children, if manual exercises are considered as essential, they should have a serious part in education, commensurate with their importance. In the end it will be found that it is possible to shorten the time of class work, in order to give a sufficient amount of time to manual exercises, and that this will be done not only without injury to the intellectual development, but that, on the contrary, it will promote it. In the first place manual exercises are not carried on without awakening the intelligence, and still further, it is doing violence to the active nature of the children to confine them three hours in succession, twice a day, before the school desk. They submit, but with reluctance; they are subject to constraint, but they are ill at ease physically and morally. They would certainly learn better in two hours, if the third were given to manual exercises."

Professor C. Wellman Parks, of the Troy Polytechnic Institute, had charge of the United States Educational Exhibition at the Paris Universal Exposition of 1889. He informed me that he found the prevailing notion, among the European educationists at the Exhibition, against making a hard and fast school age of from 6 to 13 years of age, and require every child of such age to pursue the course of training such as had been common to schools. That where intellectual and manual work are separated, the tendency is invariably to neglect the latter and to give the whole of the attention to the former. "They are of opinion," said he, "that such a school course does not tend to create a well-informed working class, but rather to cause the child to look forward with discontent to a possible life of manual labour, and to determine, if possible, to live by intellectual work alone, as directors, counsellors, and other clerkly professions, the world cannot well employ more than five per cent. of its people, and the other ninety-five per cent. must supply these with a living, and they think if some of these aspirants cannot occupy the lawful callings for which they may be fitted by education, that they may become a part of the body of educated robbers, who are so much worse than uneducated highwaymen, because they are able to steal lawfully; but assuming that the prime object of the public school is so to train children that they shall become able to occupy the highest possible position in the social scale, shall we then prepare our course of study which takes seven or eight years of the child's life, so that at the end of the course all the children

children shall wish to enter the so-called learned professions, and that none of them shall see any good in the trades? It would seem as though the present plan, which produces so many clerks, book-keepers, salesman, &c., were of this order, and to a certainty it is not beneficial. It is upon the productions of a nation and its industrial enterprises that the national wealth depends, and the way to secure these is that the people should be taught to be industrious, and to be in love with their work. The great defect of all the so-called intellectual curricula is that precise knowledge is not the outcome which follows them, for we find the graduates of such courses with only the most general ideas of their surroundings, and possibly a memory stored with selections that are useless, or which they are unable to properly use. If one is asked to describe some object or process he will use a multitude of words, and will endeavour by the quantity of his words to create the impression that he does know, when in reality he is entirely ignorant of the details. The modern idea is that a child gains far more by seeing the object and handling it at the same time that he reads about it, and that he will gain more intellectually by using his fingers than by memorising the facts he may read about. On the printed page he overlooks details; in the object he sees their relation to the whole, and then stores the truths in his mind with less labour, and more certainty that he has gained more knowledge."

In France Professor Parks said he had found the idea of object teaching carried out more fully than in any other country, as provision is made for such teaching between the ages of two and (say) fifty years. Under the Chairmanship of the Minister of Education and Fine Arts, the General Council of Education of France prepares plans for all school work, using such expert assistance as may be necessary. For the ages of from two to six years the maternal or Kindergarten schools are provided, which are attended by about one-third of all the children in France of such ages. The programme is about the same as that used in the Kindergartens now becoming common in many large cities of the United States. Under the charge of 69 General Inspectors, 89 Academy Inspectors, and 456 Primary School Inspectors, there exists a system of public primary instruction that reaches to every district and community of France and her Colonies, there being only eight communes without schools, and the total population of these is less than 800. Practically, all the children, if of school age, are to be found in these schools, and nearly half a million children over thirteen years of age attend. Besides the subjects studied in our schools one finds also, nearly all over France, that an hour or two in each day is devoted to Drawing, cutting of paper or cardboard for the manual training of some sort. formation of geometrical figures, modelling of geometrical solids and architectural ornaments, study of the properties of woods and metals and practice of the use of tools used in fashioning woods, metals, stones, and clay. In planing, turning, filing, and fitting wood and metals, the work being so arranged that the results serve for toys in the Kindergarten, and for tools for the classes below those which make them, thus saving the cost of such supplies. At the same time, we must remember that the aim is to train the intellect, and not to In drawing classes no lithographic copy-books are used, but build machines. most of the work is freehand-work from the round, with very satisfactory results in most cases. The child who has completed such a course of study can read drawings, perhaps make them, knows the properties of the materials that serve him for food, shelter, work, and enjoyment, and can tell the proper use for all the ordinary tools used in the working of these materials. not a skilled mechanic, not even an apprentice, but, in all probability, has a genuine respect for the power of tools, and also for the educated mechanic who can use them. At this time he is either free to leave school, or to remain and pursue a course in the Superior Primary School, corresponding to our High School, where the time is divided as follows:—Literary instruction, nine hours a week; scientific instruction, nine hours; modern languages, four; workshop, four; drawing, three; and singing, one hour per week.

These superior primary schools, attended by about two per cent. of the children between thirteen and sixteen years of age, are located in the principal towns, and are made available to all by means of State scholarships, ranging in value from 100 to 500 francs each per year. It may be interesting to know what becomes of the boys who complete the course in this grade of schools, and, therefore, I give the figures for 1887: - Entered normal schools to become teachers, 643; the National Schools of Arts et Métiers, 202; schools of fine arts, &c., 366; colleges and other higher educational institutions, 1,775; School of Roads and Bridges, 113; post, telegraph, and customs, 286; army, 259; clerks, secretaries, &c., 683; teachers, 163; agriculture, 1,344; trade, 2,281; manufactures, office, and workshop, 2,468; without occupation, 1,182; total for the year, 10,730. Thus it will be seen that one-sixth of the graduates continue their studies in the day schools, and that more than one-half commence at once to earn a livelihood, but many of these continue their studies in the well-arranged evening courses, of which there were, in 1887, 22,646 schools, attended by 484,043 adult pupils.

I will also state here that for the training of teachers there are 171 normal schools, or training colleges—ninety for the preparation of male teachers, and eighty-one for female teachers. The former, with a teaching force of about 1,100 professors, and an attendance of 5,443 in 1887. It was found during that year that the graduates of the primary schools furnished fully one-third of the total number of admissions. The eighty-one female normal schools are taught by a total staff of about 900 professors, with an attendance of 3,544.

To assist in the development of special industries this grand system of instruction is supplemented by special schools, apprenticeship schools, and other professional schools, for the youth of both sexes, to impart instruction in the various trades, clock and watch making, mathematical instruments, furniture, artificial flowers, printing and type-making, carriage building, &c., &c., &c. And besides all these supplementary schools there are many museums for the people of the same class as that in connection with the High School of Commerce and Industry at Bordeaux. In these, which are exceedingly well arranged for the dissemination of knowledge, one can study the rise and development of the various great industries. In iron, for example, would be shown the various ores from the rich magnetites and hematites to the poor colitic ores. Then the rude manufacture, by the Indian and Catalan processes, of reducing these very rich ores—chiefly of magnetic ironstone to wrought iron and steel. Then a step further, and we have the low blast furnace, with its blast of several large bellows. Then the "tromp" or water blast. on the high-blast furnace with its blowing cylinders and water-tuyeres. Then the hot-blast, as at first constructed, and as now with the Whitwell ovens, where the blast is heated to 1,200 or 1,300 degrees Fahr. There are details of all these processes and models of the furnaces and machinery connected with them. Further on the treatment necessary to turn the rough crystalline cast iron into the tough, fibrous malleable metal, of which all our wrought iron articles are

made.

Then as to the various methods of converting iron to steel-the various kinds of steel-the ordinary steel of cementation or blister steel, cast steel, and the management of the pot furnaces, crucibles, &c. Then the direct methods of making steel, headed by the marvellous invention of Bessemer, by which steel of any degree of hardness, from that of chilled steel down to that of soft iron, can be made in one process direct from the molten east iron of the blast furnace. The models of the machinery to work the converters with samples of pig iron, speigle iron, or ferromanganese used to supply the required quantity of silicon and carbon to give to the decarbonated cast iron the qualities of steel. All this is explained in printed matter hung round on the walls. Then the various kinds of furnaces for working the open-hearth processes of Siemens and Martin, with many others. Machinery for casting huge ingots of steel up to 40 and 50 tons, from which are hammered out those enormous shafts of metal for the screw propellers of steam ships. steel rails, and machinery for rolling them, as well as that of railway wheel tyres. It is the same with all all other industries. Sugar-making, both by crushing the cane directly, or by the diffusion process from both cane and beet roots; starchmaking from grain, potatoes, &c. Then the starch converted to dextrine-British gum-and afterwards to glucose or grape sugar, substances very largely used in brewing, distilling, confectionery, calico-printing, glazing, &c. Copper and tin smelting, with the different forms of furnaces employed; the precious metals and the various methods of extracting them. In point of fact, one finds in these museums models, processes, and apparatus of every kind relating to the particular industries of the district, and these are always open for inspection and study. The thoughtful workman or student, who thinks he has found an idea which can be worked into a new process, will go to the museum and see what has been already done, and find out at once whether his discovery is original or not, whether it is good enough to go on with, or whether he had better abandon it. I cannot conceive a more economical way of disseminating industrial knowledge than by museums of the character I have described, and of which by far the finest example is that of the Conservatoire des Arts et Métiers at Paris, and where, in connection with the marvellous collection of machines, apparatus, plans, models, and descriptions, we have regular courses of geometry applied to the arts, descriptive geometery, mechanics applied to the arts, construction, natural philosophy applied to the arts, general chemistry in its industrial relations, industrial chemistry, chemistry applied to dyeing, ceramics and glass-making, agricultural chemistry and chemical analysis, agriculture, agricultural buildings and rural engineering, spinning and weaving, political economy and industrial legislation, industrial economy and statistics, besides a library of 25,000 volumes, with portfolios of working drawings of new machinery, as well as old, from every part of the world. One can easily realize the incalculable good this grand institution has effected, and its inestimable value to the working man, not only as a temple of instruction but a place in which he can obtain the most reliable information, in matters of reference, that can possibly be procured.

Among the exhibits from professional and apprenticeship schools, there were numerous models of machinery and apparatus, patterns of work in wood and iron as well as in woven fabrics and ceramics. The Commercial School of Lyons exhibited most excellent work in designing, weaving, and dyeing, in silks and other fabrics, while the hammered iron designs for gates and balustrades were rich and beautiful, and well put together. The Free Professional School of Design and Modelling of Paris had some very fine exhibits, both in hammered iron and brasswork, also in art bronzes, and in artificial flowers.

Altogether,

Altogether, France continues foremost among the nations in the opportunities afforded her citizens of obtaining, in the easiest manner, not only a sound, practical, primary education, but that manual training which serves to perfect and complete the instruction which the man who has to gain his living by his hands, will find of the most use to him in the future. The impetus given to mechanical instruction in the time of the first Republic has, so far, kept her ahead of all other nations, but the United States of America are running her closely. This great nation, having the example of Europe before her, is rapidly developing a system, which if persevered in, and carried out in its integrity, will very soon leave all other nations behind. The evidence of the Paris Exhibition is conclusive as to what has already been accomplished by manual training and other technical instruction, not only in Europe, but in America. Its results, shown in the exhibits, are simply marvellous, and I do not think it too much to say that, in my opinion, manual training is destined to entirely revolutionise the ordinary systems of elementary instruction.

#### SWITZERLAND.

The country that came next to France in the quantity of educational exhibits was Switzerland. Here, both primary and secondary education are gratuitous, and the primary compulsory. Their system of instruction comprises the following schools, viz.: Primary, Secondary, Evening Schools, and High Schools. children between the ages of six and fourteen years of age must attend school and remain in the primary school until the age of twelve years, after which, and having their primary certificate, they can enter the secondary school, or may, subject to the prescribed attendance at a supplementary school, enter into practical life. school course in the secondary schools extends over four years. Children entering these schools and remaining two years, are absolved from further school attendance, while those who do not enter the secondary school are obliged, by law, to attend for four years in a supplementary school, which is held on two half-days per week. The great aim of this school is to enable the youth to retain that which they have learned in the primary school, and if possible to make further progress. It is well worthy of remark, as showing the democratic character of Swiss education, that ninety-seven and a half per cent. of the children of all classes attend the public primary schools.

These primary schools are divided into four classes :-

- 1. The infantine school, which is more of the old Salle d'asile class than that of the modern maternal school of France. It is organised after the Kindergarten system, and Fræbel's teaching is closely followed. There are 544 of these infantine schools—Kinderschule.
- 2. The primary school—*École primaire*—is modelled after the old French style. There are 7,180 primary schools with 467,597 pupils. These have 9,018 teachers—6,128 of which are male and 2,890 female, giving a mean of 52 children to each instructor.
- 3. Continuation or Supplementary School—École de répétition et de perfectionnement professionnel. This institution in most of the Swiss Cantons is destined to preserve the knowledge acquired in the primary school as above stated, but further, it prepares all recruits for examination. In manufacturing districts, however, these schools are devoted to manual exercises and professional instruction, and are largely made use of by apprentices and workmen. Drawing is taught in all

these

these schools, book-keeping, geometry, and often foreign languages. They also furnish the means of bridging the chasm between the primary school and the workshop. Besides these free day-schools, there are evening and Sunday schools; and it must be said that in several of the Cantons both apprentices and workmen have none but themselves to blame if they do not continue their education in any direction they may wish to take, for the educational facilities offered to the poor in Switzerland are very great, and moreover, highly appreciated by the men.

4. The secondary primary schools, regional schools, and district schools, or primary superior schools, which exist in almost all the Cantons, complete the primary instruction.

The secondary instruction in Switzerland includes the normal schools, the girls' high schools, the *gymnases* or grammar schools, the agricultural schools, and the schools of arts and trades. There is also a veterinary school.

The cantons of Zurich, Berne, Lucerne, Schwytz, Fribourg, St. Gall, Argovic, Thurgovie, Tessin, Vaud, and Valais have each of them special institutions for the formation of the teacher. The duration of instruction in the normal schools varies from two to four years; and the number of students that graduated in 1887 in the official normal schools amounted to 1,638, of whom 1,090 were men, and 548 women.

High schools for girls exist in four Cantons. Girls are not admitted until they are 16, and the course varies from three to four years. The number of pupils in 1887 was 3,221.

Grammar schools—progymnases and gymnases. These establishments prepare students for the universities and the Federal Polytechnic School. They are divided into two classes. The grammar schools, where the dead languages are almost exclusively studied, with a special view towards the so-called learned professions of law, medicine, and divinity, and the other towards industrial purposes. In 1887 the numbers of students were respectively 7,115 and 2,630; and in the Commercial School, 274.

In Switzerland there are three professional agricultural schools: the Strickhof, Zurich; la Rutti, Berne; and the Cernier, Neufchatel. These are all subsidised by the Confederation. The Polytechnic also comprises an agricultural section. The studies extend over five semestres. Students are not admitted to this course until they are over 18 years of age.

- 5. The Schools of Arts and Trades—Ecoles des Arts et Métiers—are eight in number, not counting the special schools that have been founded for special trades, or for particular industries. They are also subsidised by the Confederation. They are as follows:—
  - 1. The *Technicum* of Winterthour. This school is divided into seven sections, which include building construction; mechanical construction; electricians, or electric engineering; chemistry, and chemistery applied to the arts; civil engineering; commercial economy; decorative art, and the training of art masters.
  - 2. The School of the Industrial Arts-Kunstgewerbeschule-of Zurich.
  - 3. The School of the Industrial Arts of Lucerne.
  - 4. The School of Design and Modelling of Basle.
  - 5. The School of Design of the Industrial Museum of Saint Gall.

6.

- 6. The School of Industrial Art of Geneva, of which the programme comprises sculpture, modelling, enamel painting, decorative painting upon porcelain, and stoneware, wood carving and engraving.
- 7. The School of Art of the town of Geneva.

In the higher instruction Switzerland has five Universities—Zurich, Basle, Berne, Geneva, and the Etat de Vaud or Lausanne. The state of Fribourg has also decided upon the creation of a University.

The Federal Polytechnic School of Zurich—*Ecole Polytechnique*—is the only educational establishment for the higher instruction that has been created by the Confederation. This school comprises a school of architecture, of which the duration of the course is seven semestres; civil engineering, the course of which takes the same time; a school of mechanical engineers, six semestres; school of pharmacy, four semestres; agricultural school, sylviculture, six semestres; and the purely agricultural section, five semestres; special training school for teachers of physics and mathematics, six semestres; general section of philosophy and political economy. Besides these there are courses of mathematics, physics, and of military science.

In addition to these institutions there are four pedagogical museums situated at Zurich, Berne, Fribourg, and Neufchatel.

The exhibition was complete in every way. The apparatus used was efficient, together with the results of manual training from all grades of schools. The enthusiasm displayed by the French in the subject of manual training is participated in to the utmost by the Swiss, and indeed in common with the entire north of Europe.

#### BELGIUM.

Belgium occupied nearly the same amount of space as Switzerland, and made a most interesting and comprehensive display. The extent and quality of work from the apprenticeship, professional, and primary schools, where manual training was practiced, proved conclusively the hold that technical instruction has taken upon the population. In my report of 1887, I gave a full account of the system of general education adopted in Belgium, and also of the industrial and apprenticeship The progress during the three years subsequent to my visit seems to me to be astounding. Undoubtedly there has been no school question more thoroughly threshed out in Belgium than that of industrial instruction, and this instruction has been placed within reach of all the working classes. It is usually divided into two distinct sections, the one general for all industrial schools, without distinction, and the other special to each school according to the prevailing industries of the town or district. The first part comprises drawing—geometrical, mechanical, and freehand, together with their various applications in the decorative and other arts—geometry, arithmetic, book-keeping, physics, chemistry, mechanics, hygiene, and industrial economy. The second part comprises metallurgy, the theory of stone-cutting, the working of mines, construction of buildings, weaving, dyeing, the applications of electricity, and the management of the steam-engine. In Belgium as well as in Switzerland the results obtained from the comparatively small sums expended are more than satisfactory, they are simply surprising both in character and extent.

#### HOLLAND.

What has been said about Belgium applies equally to Holland. This country had a fairly representative and interesting collection of work turned out by the pupils of the various professional schools, notably the Artisans' School at Rotterdam, of which an account appeared in my report of 1880, and of the various primary schools into which manual training has been introduced.

In

In the Netherlands, primary education is divided into elementary and superior. The first comprising the elements of the Dutch language, reading, writing, arithmetic, history, and geography, the intuitive teaching of geometrical forms, some elementary physics and singing. The superior section of primary instruction includes the modern languages, drawings, mathematics, agriculture, gymnastics, manual training, and in the girl's schools needlework.

The control of primary schools, both public and free is exercised: 1st. By local committees, appointed by the Commune and Council; 2nd. By district inspectors; 3rd. By provincial inspectors. The district inspectors serve without pay, but the provincial inspectors have a fixed salary. Their duties are to act between the district inspectors on the one hand, and the provincial and central administration on the other. They also advise the Minister of the Interior in whatever relates to primary instruction, and form with him a superior council of education which meets—at least—once a year.

In secondary instruction there are four classes of schools the burgerscholen, or lower intermediate schools; the noogere burgerscholen, or higher intermediate schools; the agricultural schools, and the Polytechnic School. There are also secondary or higher schools for girls.

The State Agricultural Institute of Wageningen was created in 1876, and has a three years' secondary school of the superior grade attached to it, as a preparatory school, and its course is composed of two sections of different grades of pupils. One section is intended for the sons of those who make farming their actual occupation; the other for the sons of those who conduct agricultural operations on a large scale, and for those others who desire to obtain a thorough knowledge of agricultural science. For admission to the first section admission is given on the primary school certificate, and as the course is for three years, young men who complete the course are supposed to be educated sufficiently to engage successfully in practical agriculture. The course in the second section is for two years, but is designed for those who have graduated at a higher secondary school.

No model farm is attached to this institute; there is, however, an experimental station for the examination and analysis of grains, soils, and manures, and for all experiments and observations bearing upon subjects relating to agriculture. Moreover, excursions are made by the professors and their pupils, for the purpose of seeing practical work with machines and implements upon farms in the vicinity of the institution, where they are taught by actual observation, as to matters relating to general agriculture, and also instructed as to the breeding and rearing of cattle.

This State institute has a good museum, in which are exhibited collections of agricultural implements and machines, models, and agricultural products. It also has a botanical and vegetable garden large enough to make experiments with new varieties. The school fee is 40 florins—£4 a year for the whole course; and from 5 to 20 florins—10s. to £2—for a single branch.

Although the Polytechnic is classed as secondary, and not, as in European countries generally, as among the highest schools of superior instruction, it is designed to fill a position higher than that of the higher secondary schools, for besides giving a superior general industrial and technological education, it specially prepares civil, mechanical, electrical, and mining engineers, as well as architects and naval constructors. There are twelve professors, one of whom is the principal director,

eight associate professors, and six temporary professors. Eight professors are charged to give instruction in mathematical and mechanical science, two in physics, three in chemistry, one in metallurgy, and the working of mines and mining, three in civil architecture, two in hydraulic construction, two in naval architecture, two in artistic and decorative drawing, two in modelling and sculpture, and one in social economy and administrative law.

#### SWEDEN.

Sweden—as might have been expected—made a most comprehensive and excellent exhibition of the work done at its industrial and primary schools. The manual work is designed to produce useful household articles, at the same time that it is used for the development of the intellect. The primary and secondary schools of Sweden are similar to the Swiss and German schools, but slöjd, which is equivalent to manual training, is now taught in all primary schools—secondary instruction, nearly corresponding to the *gymnases* and real schools of Germany, do work of an excellent character. There are ten normal schools, and special schools of agriculture, arts and trades, navigation and forestry.

Sweden is the home of the slöjd, and in 1887 I detailed the methods followed at the Normal School of Slöjd, at Nääs. I also stated that I wished further to study the slöjd, and obtain further information as to its working. I have carried out those intentions as well as I possibly could, and can now speak positively as to its practical and educational value.

As I said in my last report the word  $sl\ddot{o}jd$  has no exact equivalent in the English language—it means working with the hands and with simple tools, it does not mean any handicraft or special profession, but in speaking of a farm labourer, for example, it may be said of him that he is a "sl\ddot{o}jdare," which means that while simply he is a labourer, and not an artisan, that he is able to repair the tools and implements in use on the farm, as well as to work in the fields.

There is an institution called the English Slöjd Institute, which, in its publications, describe slójd as follows:—"Slöjd is a carefully graded system of manual training. Many different kinds of educational hand-work have been tried in Sweden; but the kind which has proved far the most successful, and is now universally practised throughout Scandinavia, is wood slöjd, or educational carpentering.

"Slöjd aims at the following results:—(1.) To implant respect and love for work in general. (2.) To implant respect and love even for the coarser kinds of honest manual work. (3.) To develop activity. (4.) To foster order, accuracy, cleanliness, and neatness. (5.) To encourage attention, industry, and perseverance. (6.) To develop the physical powers. (7.) To train the eye and sense of form.

"Slöjd is the ABC of technical education, because it trains the eye and hand during the plastic age, developing them so carefully and systematically as to enable their possessor to learn with comparative ease any handicraft he may afterwards follow.

"Slöjd fits its pupils for practical life. In every article made they have to depend entirely on themselves from first to last, it being a cardinal principle in slöjd that, while the teachers should lead, direct, and control the work, he should not put his hand directly to it. Thus the pupils learn to rely on themselves, to exercise forethought, and to use their common sense.

"Slöjd

- "Slöjd tells with advantage on the ordinary school subjects; greater and more intelligent progress is made in them wherever it has been introduced, so that instead of losing by the time taken from them and given to slöjd, they are the gainers. After all this is natural enough; for slöjd develops all the powers—physical, mental, and moral, and this growth of faculty must manifest itself in every subject with which it comes in contact.
- "Slöjd fosters home love. It strengthens and tightens the bond between home and school, and is a strong link between the teachers and the pupil.
- "Slöjd develops the *physique*. It calls forth every variety of movement, brings all the muscles into play, and exercises both sides of the body.
- "Slöjd develops the *mental* powers. It draws out and exercises energy, perseverance, order, accuracy, self-reliance, and the habit of attention. It has, in innumerable cases, proved to be the key which has unlocked the latent powers of so-called *dull* children, whose dullness too frequently means that they have not been able to find a medium through which they can express themselves—their *executive* faculty being stronger than their *word* faculty.
- "Slöjd was a marked influence on character. In the class-room, the pupils are treated as parts of a whole; in the work-room they are treated as individuals, and they thus begin to acquire a sense of personal responsibility, a most important factor in their moral development. They also learn to respect thorough work, and to enjoy the satisfaction which is the outcome of every honest effort. In the slöjd room, too, they begin to gain a habit of self-control and patience under difficulties—an excellent preparation for the battle of life.

"To sum up, slöjd *educates* in the true sense of the word by drawing out all the faculties, prepares for practical life, fosters home-love, and in short, helps to form better, more capable, and consequently, happier men and women."

There can be no doubt that the introduction of manual training into the ordinary school organisation will radically modify the ordinary character of the popular school, and in seeking to find the first cause for the efforts made, it is patent that a marked difference prevails. Setting aside small details the question may be reduced to two systems:—The economic system and the pedagogic system. first of these is to the effect that the primary school should be the means of awakening aptitudes to develop them, and to prepare the pupils for the different trades as completely as possibly, so that on leaving school they have at once the skill whereby they can obtain a livelihood, and thus that the creative powers of social and national wealth would be largely increased. On the other hand, the pedagogic system regards manual training as a direct means of education to give skill to the hand, and a general aptitude for the diverse circumstances of practical life, and equally adapted to execute a task for labour, and to exercise vigorously the faculties of attention, perception, and intuition. The aim is therefore a purely pedagogic one. This then is the great principle that is contended for in slöjd. It is more elevated and more general, "the school should form the whole man; should develop systematically and harmoniously all the faculties of the child without attempting to prepare him for any given occupation." The economic system transforms the class-room into a school of apprenticeship, and annexes the school to the workshop; the pedagogic system preserves for the school its essentially pedagogic character by organising manual labour in it according to the general principles which control all primary instruction.

Both of these systems have been tried in Sweden, and practical conclusions arrived at. Apprenticeship and professional schools do excellent work, and successfully serve the purpose for which they were instituted, but they have been found not adapted for the primary school. I shall here give the opinions of various authorities with reference to the two systems, and first that of the Industrial Education Commission, appointed by the Pennsylvania Legislature to inquire and report on the subject. The Commission state, with reference to the economic system, as follows: -- "The great majority of children in all civilized countries are destined to become industrial or agricultural workmen, living from day to day upon wages painfully carned. The sub-primary and the primary school take possession of them, and hold them under their discipline from three years of age until they are twelve or fourteen, and during this long period give them an instruction which is in direct relation to the occupations which they are to engage in. As a whole, this instruction is almost the same as that given to the sons of the bourgeois, although the latter are in general destined to a wholly different kind of life. They will not have to engage in manual labour to secure their existence. They will become lawyers, physicians, professors, merchants, manufacturers, &c. The children of workmen and peasants learn to read, to write, to cypher; they are taught the first elements of history, of geography, of the natural sciences, drawing, singing, &c., but they are not subjected in the primary school to a course of training adapted to prepare them for the manual occupation which they will have to exercise during their whole life. They will have to work in wood, in stone, in metals, by means of various tools, and their hand is never specially exercised with this aim, for one can attach no importance, in this respect, to the handling of pen and pencil during lessons in writing and drawing. Gymnastics itself is useless in this respect. It strengthens the muscles, increases the physical energy and the moral energy, but hardly develops at all the technical aptitude.

"During all the school period, boys who are destined to the rude life of the workman acquire sedentary habits. They are obliged, by the theoretical exercises of the school, to remain sitting before a desk five or six hours every day. position enervates their bodies, and is little adapted to inspire in children a taste for manual exercises. Hence, when the critical moment arrives for choosing an occupation, this son of a farmer or a working man is greatly perplexed. He feels himself hardly fitted for any trade whatever. His aptitudes have not been awakened by the course of training to which he has been subjected; often, in fact, he feels an unconquerable aversion to all manual labour. The condition of his father does not greatly attract him. He has seen only its hard and disagreeable features. father himself does not advise him too strongly, for he does not cease to repeat that if he were to begin life over again he would not choose an occupation so difficult, so wearisome, and so poorly paid. In general, this boy, if he has profited well by the purely theoretical studies of the school, desires to engage in a career in keeping with the life which he has spent up to this time. He desires to enter the normal school or the seminary; or, perhaps, he dreams of spending his life in an office. These sedentary employments fall in with the habits acquired at school better than any trade whatever. The parents, proud of the success of their son, hope to see him acquire a brilliant position—thanks to his talents, which they imagine to be altogether exceptional because they are incapable of appreciating them. They decide to make every sacrifice in order that their son may acquire the knowledge necessary to obtain the position so much envied. Agriculture and manual work are thus continually

continually described by the most intelligent sons of workmen and peasants. Most of them find the employments filled, and swell the crowded ranks of the declassed; constitute in the bosom of our society a species of literary proletariat, more to be lamented than the industrial proletariat.

"As for the child of the people who, on leaving the primary school has not received instruction enough to venture to entertain these lofty views, he is hesitating when he ought to decide upon a choice. He no longer cares to ask himself what is his calling; what are his aptitudes? He is guided by wholly different considerations. Frequently his parents choose for him, although they have only very rarely any precise notion of that for which he is adapted. He enters, then, as an apprentice; he is loaded with difficult tasks,—to clean the shop, to blow the bellows of the forge, to do errands. During many years the young apprentice receives no regular, methodical, technical instruction. But if he does not learn his business, he acquires, in contact with the workman, habits which certainly do not always exercise a good influence on his morality. Fortunate is he if he can still, after the fatigues of the day, follow for an hour or two the lessons in the adult schools, which will keep up and develop what he has learned in the primary school.

"After some years of this irrational apprenticeship he knows his trade but imperfectly. He is a half-workman; his wages are small, and he runs great risk of remaining at that stage unless he is unusually gifted. Many young people give up their first attempts; change their trade again and again; never succeed in completing their apprenticeships, and end by resigning themselves to be messengers, agents' clerks, domestics, &c., &c. The want of a methodical organization of apprenticeship to the trades is thus the cause of an immense loss of productive force; thus, then, the partisans of the economic system conclude:—'On the one hand the primary school does not inspire the taste for manual labour, and does not develop technical aptitudes; and, on the other hand, apprenticeship in shops is given over to chance, and produces rarely any good results. Is it surprising that under such conditions accomplished workmen become more and more rare, and that agriculture makes so little practical progress?'

"In order to remedy this situation, to elevate national labour, to put a check upon the desertion of manual and agricultural occupations by the sons of workmen and peasants, to diminish, as far as possible, the number of the declassed, it is necessary to reorganise the public school—to give it a more practical character; to introduce into it the teaching of trades; in a word, to establish there a course of training which shall closely unite general studies and industrial exercises."

Such are the conclusions arrived at by those who place themselves especially at the economic point of view, in the discussion of the proper character of popular instruction.

M. Corbon, the French Senator, in his book upon technical instruction, eloquently sets forth the grave defects of apprenticeship in the shops and the deplorable consequences for the working classes in the material, intellectual, and moral points of view, concludes in favour of technical instruction beginning at the primary school. "I believe," says he "that every primary commercial school ought to enlarge the circle of its instruction, and become, like the Martinière School of Lyons, a technical school. It would give to industry so many skilled workmen. The extension of the primary school of which I speak would be an easy thing for rural schools. The teacher in most cases would suffice for the work, and the increased

expense would be almost nothing. In cities, and for preparation for the different industrial trades, the modification would be much more expensive, but not so much so that it ought to alarm anyone. In the city school the teacher can hardly do more than instruct his classes. There would be needed, I suppose, as many teachers of manuel exercises as of primary classes, but no more. There would be needed one shop at least as large as the class-room, and furthermore, a court or some ground. In the shop there would be a forge, with anvil, hammers, vyces, files, &c., that is to say, whatever is indispensible for the making of certain simple products in iron. It would be necessary also to have some lathes, carpenters' benches, with the usual In the court there would be some blocks of stone to be cut and recut until they were used up. If the school has ground enough it would be well to reserve a part of it, and accustom the children to make a garden of it. It is evident that the teacher, however intelligent and active he may be, could not be at the same time, at the forge, the lathe, the bench, in the shop and in the court, where the little stonecutters, the boys with wheel-barrows, or the little gardeners are working,-doing everything at the same time; but the difficulty would be relieved by the appointment of corporals and sub-officers, chosen by the pupils among themselves."

The Pennsylvanian Commission remarks upon this, "That the utilitarian conception of the school has naturally formed many partisans at a time when industrial labour has received enormous development, and when questions relating to working men have become the object of general attention. There is a serious foundation of truth in the accute criticism upon the actual organisation of popular education which we have just quoted. It is necessery, however, to recognise that it is greatly exaggerated. Those who maintain it place themselves too exclusively at a single point of view. They require that primary instruction should have for its principal object the direct preparation for the manual trades, and they think that the only means of arriving at this result is to attach workshops of apprenticeship to the school; but the true mission of primary instruction is more general, more elevated. It should develop the child in all his faculties and his aptitudes, and form the man and the citizen, and not the carpenter, the blacksmith, the trader, or the employee.

"Even from the special point of view of preparation for the manual occupations, it is certain that a rational course is pursued in teaching children to read, to write, to cypher; in opening their intelligence and developing it by exercises of observation upon things lying in the domain of nature, the arts and industries; in teaching them drawing and geometrical forms; in submitting them to a moral regime, and in increasing their natural energy by gymnastics. It is indisputable that children who have successfully followed the complete courses of a well-organised primary school are better fitted to learn any trade whatever, quickly and well, than those who have been left to stagnate in ignorance, or who have been sent too early into shops, the mines, or the factories, where their health is weakened, at the same time that their intelligence is stupified. It is not, therefore, just to accuse the primary school indiscriminately of being useless in respect to the immediate interest of the popular classes; but it is true to say that it has still too much of a theoretical character, and that it does not develop the technical aptitude. Something is needed beyond question to improve and complete its organisation, and we are of opinion that the solution of the problem lies in the development of the principles of Fræbel's method, which have already entered into our elementary instruction, but which have not yet been carried into every branch of primary instruction."

"As to the many in conveniences of apprenticeships in the ordinary workshops, they cannot be denied. They are the fatal consequences of an economic situation occasioned by the introduction of machinery into industry, and by the division of labour pushed to its extreme limits. It does not enter into the plan of our study to set forth this question in all its details and to discuss whether it is for the benefit of the working classes and of industry to organise a special technical school for boys, independent of primary instruction, and forming a complimentary training for children destined to industrial pursuits.

"Let us examine whether in practice the apprenticeship to trades in the primary school, properly so called, offers important advantages. At Gothembourg manual instruction is organised in the primary schools with reference to its economic results.

"Towards the age of ten or eleven years the children are sent to shops attached to all the primary schools. During the first year they are subjected to a course of rotation—that is to say, they are exercised successively in wood-working, carpentry, turning, carving; in ironwork, forging, lockmaking, &c.; in work with paper and cardboard; binding, with colours; house-painting; and with osiers, basket-making. More importance is attached apparently to the working of iron and wood; at least, that is the impression which several visits to the school have left upon us.

"The course for the first year has for its sole aim to give to the pupil a first taste for labour, to allow him to ascertain his fitness and his calling, and to choose judiciously the trade which he will definitely adopt. He passes several weeks in each shop, and learns to handle the principal tools there, and to perform the elementary works. The second year he indicates what trade he wishes to learn. If he finds later that he was mistaken in his choice, he can change his first decision and enter another shop; but this case, we were informed, was very rare. The apprenticeship is followed until the age of fourteen years. As a measure of economy, the shops are placed in the basement or under the roof. They are very well furnished with tools, air and light are abundantly supplied, and the general arrangement leaves nothing to be desired.

"The technical instruction is intrusted to select workmen, and the lessons are given in groups of twelve on the average, who, during their work, are all under the exclusive direction of the foreman, who is responsible for the order and discipline There is neither method nor programme rigidly determined. and the results. foreman of the shop has no other guide than himself, except, of course, the instructions given by the special inspector of manual work. Thus the succession of exercises is not fixed—in other words, there is no series graduated by models and constituting a methodical whole. The works to be executed depend upon the requirements made for the needs of the schools. In these shops are made a considerable number of objects utilised in the commercial schools, such as chalk-boxes, blackboards, counting-frames, ironwork for desks, barometers, playthings of wood and of painted metal, tools for the different shops, &c., &c. The products are brought together and exhibited. They are sold or distributed among the schools. The work in the shops takes place twice a week-four hours at a time-for each section of twelve to sixteen scholars. Every year those who have distinguished themselves by their diligence and progress receive a reward consisting of tools of the trade in which they are engaging. A sum of 1,000 crowns—about £55—is devoted annually to 138--- Gr this

this distribution of prizes. From the fact that the scholars of the different classes . of each school go to the shops at different hours, an advantage is gained over the ordinary teaching force; the number of teachers being less than for other classes. It is estimated that this annual saving amounts to about one-sixth. Taking account of all these elements, the total expense is very considerably reduced." Engineer, M. Grieson, is the organiser and inspector of this instruction. He declared to the Commission that neither employers nor workmen nor parents were unfavourable to the introduction into the primary schools of apprenticeships to trades. Those who at the outset, thought that this innovation had no practical bearing, have since recognised their error. The pupils who leave school at fourteen years-after three years of apprenticeship-receive immediately a small salary from their employers, because they are already able to render some service in the shops. The Commission goes on to say that "although at first view such a system seems to present real advantages, we do not think it advisable to establish this in our primary schools. the first place, regarding it even from the economic point of view, it is very incom-It would be impossible to attach work-shops of apprenticeship to the primary schools for all the trades followed in a given locality. A limit must be placed, a choice made, and then the problem of giving technical instruction in the primary school remains incompletely solved. By rotation it is intended to bring the child to a recognition of its aptitudes; but in reality he is made to run through only two or three special shops, and his choice is narrowly limited. Moreover, on what principle shall the trades to be taught in the school be selected? Why shall a certain industry be favoured rather than another? Is it proposed to transform all the children who attend primary schools into carpenters, or blacksmiths, or basketmakers? The reply to these objections is, that a more complete organisation would cost enormously; that, furthermore, when the young man who has learned one trade during three or four years is obliged to undertake another, he makes rapid progress in his new apprenticeship, because he has already acquired the habit and taste for manual labour. This observation is important, but it favours the pedagogical system. It is in fact the habit and taste for labour which it is necessary to acquire at the primary school, and it is useless to organise for this purpose shops of This result is reached more completely by apprenticeship properly so-called. methodical exercises specially arranged to promote the acquisition of a general aptitude of the hand. This opinion prevails in Sweden, and Mr. Hedland declared to us that he had been brought to it in consequence of a thorough comparative study of the different systems.

"The apprenticeship to a definite trade should be put off until the age of four-teen years at least, children younger than that are not sufficiently developed physically and intellectually to undertake it with success. What is especially needed in a professional instruction like that of the schools of Gothembourg, is a good pedagogical direction. These exercises do not follow a methodical order, because they are in general subordinate to economic considerations foreign to pedagogical principles. From ten to fourteen years a boy is still only a child, and in order that any work whatever may exercise upon him a real educative influence, it is necessary, above all, that he become keenly interested in it, a thing which can be secured only on condition that the exercise be varied, graduated, and proportioned to his physical strength. Accordingly we do not think that by the system of apprenticeship at Gothembourg, sufficient interest can be excited, without which no efforts can obtain satisfactory results. Thus when a child is obliged to make a given object—iron work, balls

balls for counting frames, &c., a considerable number of times, it is necessary that he go over the same work incessantly day after day, and week after week. After . the third or fourth time, his interest disappears; one can see from the manner in which he handles his tools, from his listless air, that he is doing a veritable task, quite similar to that of scholars, upon whom it was formerly the custom to impose as a punishment the copying ten or twenty times of the same page of writing, the same verb, or the same lesson. The mechanical repetition of an exercise invariably provokes disgust with his work. It will be said that the workman is obliged, in many trades, to do the same work over again many times, and that it is not a bad thing to make a child acquire the habit of working under the conditions in which he will be placed somewhat later; but a child of school age cannot be treated as an adult workman. The workman must work in order to live; the pupil works in order to develop himself, to acquire the taste and the aptitude for study in general, and for manual skill, and, if the exercises imposed upon him are not graded and varied, he executes the task without pleasure, and quits it without success. Furthermore, it is evident, under these circumstances, the pupil is no more skilful for having made the same object ten or twenty times, the second specimen is sometimes better than the first, but the following ones, instead of showing progress in correctness of execution, are likely to show the contrary."

The study of the method adopted in the normal school at Nääs will show the superiority of the pedagogic system over that of the economic, as practised at Gothembourg.

In my 1887 report (pp. 148-157), as I before stated, I detailed the work of this excellent institution, and now, in order to corroborate what I then said, I will quote the description given by the Philadelphian Commission of this system of manual training, based upon pedagogic principles.

"Nääs is an ancient lordship, situated in the district of Elfsboy, near the line of railroad which unites Gothembourg and Stockholm, and about 50 miles from the former. Herr Abrahamson, on acquiring the property some years ago, founded three free schools, to which he gave an endowment of 225,000 crowns (£12,000). His purpose was not only to furnish primary instruction to boys and girls of the locality, but also to furnish an example of methodical instruction in manual training, according to the views of the most advanced educators. The primary schools for boys were opened in 1872. It is attended by children from ten to fourteen years, who have already received the first grade of instruction in the primary school. This instruction, which is obligatory in Sweden, is given in two grades of schools-the elementary schools, for children from six to to ten years, and the public schools, for children from ten to fourteen years. Twenty-two hours a week are devoted to instruction in the following branches: -Religious instruction, the Swedish language, history, geography, the natural sciences, reading, writing, drawing, singing, gymnastics, the manual of arms, and horticulture. In Sweden, besides gymnastics, military drill and the manual of arms are taught in the schools. Besides this, the pupils work two hours every day in the shop. The work is not so directed as to prepare the boys especially for trades. The question here is not at all how to maintain a school of apprenticeship annexed to the primary school. The aim is purely pedagogic; the manual work is made educational as much as the other branches of the pro-The teacher directs it. By the methodical handling of tools, the making of a hundred objects, forming a progressive series, the scholars are made to acquire a skill—a general address of the hand, which renders them fitted, on leaving the school,

school, to undertake, under favourable conditions, the apprenticeship to any trade whatever, and to execute, without assistance, works of every kind which present themselves every instant in practical life. Furthermore, this instruction constitutes a vigorous gymnastic, which contributes, with gymnastics properly so-called, to re-establish in the organism the equilibrium, which is inevitably disturbed to the detriment of the health of body and mind by studies exclusively intellectual. Finally, it inspires in pupils a taste for labour, and develops the faculties of attention and intuition. \* \*

"Sixteen boys, the youngest eleven and the oldest fourteen years and a half, Their joyous air, their unconstrained bearing, shows with what enter the shop. Each one goes to his bench, takes his tools, pleasure they engage in their work. examines them, tries them. Each one understands them well, knows how to mount and dismount them, to sharpen them, to repair them in case of need. observes that the blade of his plane projects too far; some blows of the hammer, well applied, presently place the tool in its proper condition. Another finds his chisel notched; he goes to the grindstone and sharpens the instrument. who is setting his saw; still, another carefully cleans the file he is about to use. The instructor, during this preparatory work, has been distributing the models. The pupils who have a new article to make, go, without waiting for directions, to select in the wood-room the piece of timber or the plank, of which they are to make a spoon, a stool, a boot-jack, a mallet, or any other article in the series of models. All have learned by practice to distinguish the qualities of wood. All this is done quickly, but without haste, and in good order. The spectacle becomes truly The hatchet strikes the block squarely; the saws grate; the planes gnaw; the knives cut; the files smooth the roughness of surfaces; the sand-paper vigorously rubbed upon an article gives it a finish. It is the humming swarm of The teacher does not directly aid the pupils. labour, full of life and movement. We see him go from one to the other, controlling, criticising, correcting, and encouraging the little workmen. The strictest discipline reigns in the shop. It maintains itself naturally, because it springs from the labour itself, which exercises upon the pupils a veritable attraction, and requires the steady concentration of their attention. A wholesome emulation keeps up activity and assures progress. impelled not by desire for a reward, but only by the desire to do the best possible; by the satisfaction of performing a duty which is not burdensome, because it is proportioned to the strength of each. The scholars have not all the same article to make. In the first place, because they do not all begin at the same time, and then because certain pupils advance more rapidly than the others, on account of their greater attention or skill.

"The exercises having been finished, the boy presents his work to the Director, who examines it attentively, and judges whether it is worthy to be accepted or not. If it is well executed, the director compliments the pupil, who carries home the product of his work. The modest household of his parents will be enriched by a useful object, the commercial value of which is very slight, but which is highly appreciated, because it was made by the boy himself. It is his own work; no one has directly aided in it, and he is proud to show it. If, on the other hand, the model is badly produced, and if the mistakes cannot be corrected, the director, after having required the pupil himself to note his faults, breaks it, and has it made over again, for everyone must do his work in the best possible way. It is not the quantity of articles which is considered important, but their quality in point of correct execution.

"Herr Abrahamson founded in 1974 a primary school for girls. Its object was to give to young girls, from ten to sixteen years, at the same time with ordinary instruction, a sufficient skill in domestic labours belonging to females—such as spinning, weaving, sewing by hand and on the machine, housekeeping, preparation of food, &c., &c.—in a word, the pupils there are initiated into all the occupations which will be of constant use for the future mother of a family. In 1884, he introduced into this school a course of working in wood, to the extent of two and a half hours a week. The instructions continues ten months and a half each year, with eight hours of study and of work every day. The pupils are divided into two divisions. In the higher class twenty-four hours a week are devoted to ordinary studies, and ten to manual labour. In the lower class, twenty-one hours a week are given to lessons, and fifteen to domestic work.

"The normal school of manual work—Slöjdtärareseminazum, or a seminary for teachers of manual training. Slöjd is an expression purely Swedish, which it is impossible to translate into any other language, but which designates, in general, the manual labour proper to schools and to domestic work—is an institution unique of its kind. A complete study of its history, its organization, its experiments, the principles it has applied, its methods and its programme, will be, I believe, fruitful in suggestions of every kind, upon the important question of primary instruction in manual labour. This normal school was established in June, 1875, and five years later it was enlarged and installed in the building it now occupies.

"The main floor contains on the right two shops, one containing nineteen benches, the other twelve, a lathe, a grindstone, carpenter's tools, turning tools, and tools for wood-cutting, hung upon the wall in careful order. The left wing is occupied by two class-rooms, in which the ordinary instruction is given to the pupils of the primary school. The teachers who follow the courses gather there to listen to lessons in pedagogics, given by Mr. Otto Salomon, and to discuss questions relating to primary instruction in manual work. The desks of this room are in one place, and of a movable pattern, to be raised or lowered, according to the height of the pupils, an arrangement which seems to us an ingenious solution of this important question of school desks.

Beautiful geographical charts, cards representing animals and plants—Devrolles collection—ornament the walls. In glass cases are exposed collections of minerals and rocks, geometrical models and other objects, serving to give an insight into the subjects taught. Upon the wall facing the pupils are engravings of the Kings of Sweden and some great teachers. In a word, these class-rooms have a cheerful aspect. The laws of hygiene have been scrupulously observed in their construction, and the teaching apparatus proves that the instruction which is given there is according to the best modern conception of popular schools. The class-rooms are connected with the shops by a large corridor, in which pupils assemble at certain hours for lessons in singing, accompanied with instrumental music. The two wings of the buildings are separated by a grand hall, the museum, which contains models, serving for instruction in manual training, as well as a very large collection of objects of every kind, furniture, tools, toys, &c., which have served as models during the period of experiment.

"The method of Nääs is not, in fact, the product of pure theory; it is the fruit of a long and serious practical study. The investigations to which Mr. Salomon and his colleague, Mr. Johanson, devoted themselves in order to arrive at

the present system of instruction were pursued through many years with rare perseverance, and were crowned with success. . . . During the first years, from 1875 to 1880, the aim of the Normal School at Nääs was to instruct and to train men capable of teaching manual work in the schools, either independent or annexed to the primary school. The conditions of admission were as follows:—To be at least 18 years of age; to have sufficient physical strength to perform the duties for which the school is prepared; to have already some practice in manual work, and to know the subjects required in Sweden at the examination for leaving the primary schools.

"The instruction comprised two parts, one theoretical or general and the other practical. In the first was arithmetic, geometry, physics, mechanics, linear drawing, pedagogy, the science of methods; in the other the practice of trades, such as the execution of work designed to teach a knowledge of the various tools of the carpenter, the turner, the wood engraver, the blacksmith; familiarisation with the handling of these tools, the making and repairing of the simplest tools and utensils of an ordinary household, the making of shafts and wheels for carts and waggons, working with large tools, and working with the file.

"The course continued one year at the rate of fifty-four hours a week, of which thirty-six were employed in manual work, and eighteen in the scientific studies.

"Those who followed this course were practised in giving special instruction in manual labour by teaching pupils every day in the primary school, which forms the school of application—model school—and the examination for graduation included in three tests; one upon theoretical branches, one in linear drawing and the work of the shop, the third a teaching test in the school of application. A diploma was given to the candidates who successfully passed the examination.

"In 1880 this organisation was modified, the theoretical courses were suppressed, the instruction was concentrated in the exclusive study of manual training. Since that time the school no longer trains special professors, unless in exceptional cases. It receives by preference primary teachers, holding a diploma, who wish to acquire a practical knowledge necessary to teach the slöjd in the schools where they are employed. This change is the consequence of the purely pedagogical character of the method of Nääs.

"Manual labour not being considered as a direct preparation for specific trades, but as an educational agency, it does not form a special branch of the general programme, and the teacher gives lessons in that to his pupils as he teaches them to read, to write, to cipher, &c. Mr. Salomon thinks that the true mission of the primary school is the systematic cultivation of the faculties; that the different branches of the instruction should be considered as the means proper to attain this No one branch then can tend to specialisation; all must be grouped in a harmonious whole, and the fundamental condition for attaining this result is to require the same teacher to give the pupils of the same class instruction in the whole programme." The italics are mine. I wish this to be particularly noticed, as it is a salient principle of slöjd teaching. The Commission further state: -- "According to this conception there can be no question of applying to the primary school the principle of division of labour, since, in spite of the apparent diversity of subjects which are taught, primary education forms a single indivisible whole. The system of special teachers is in contradiction with the aim of the primary school.

"The consequence of this system is the necessity of preparing teachers to give instruction in manual training. It is this rôle that is assigned to the Normal School of Nääs. It is open to all teachers who desire to introduce this instruction into their schools. The courses and the lodgings are gratuitous. The teachers take their meals in a restaurant attached to the school, at the rate of one crown—about 1s. 3d.—a day. In general the Swedish teachers who follow the courses receive for their travelling expenses assistance from 'Economic Societies,' which are associations created to encourage all works having in view the moral and material well-being of the people.

"Within a few years this subject has made important progress in Sweden. There are to-day—1885—about 700 schools in which slöjd is taught. The teachers do not everywhere give these courses, their necessary preparation being defective; but the general tendency is towards this result. Although the official programme of the normal schools and the primary schools does not yet prescribe instruction in manual training, the Swedish Government is interesting itself in the subject, and many of the teachers of the country are moving voluntarily to introduce the instruction into their schools."

There is a temporary normal course in the summer which lasts six weeks, and a review course of five weeks in the following year. Generally these two courses are sufficient to exercise the student-teachers in the correct making of the hundred models of the series, if they continue to perfect themselves in the handling of tools during the year, which intervenes between the two courses. It will be seen from the following table how progressive the manual training principle is in Sweden:—

In 1879, nine teachers were prepared for instruction in the slöjd.

- ,, 1880, thirteen teachers.
- " 1881, eighteen teachers.
- ,, 1882, 102, in six temporary courses.
- ,, 1883, 114, in six temporary courses.
- ,, 1884, 113, in five temporary courses.

To these numbers may be added two teachers and sixty professors.

Since the period above mentioned a popular writer describes the routine of the school :- "Six hours daily are spent in the workshop under the supervision of Herr Salomon. The same gentleman, who is the Director of the seminary, lectured seven hours each week on the historical development and the manuals of manual training, and also presided twice weekly at assemblies of the students, held for the purpose of discussing the Nääs system in general and in its details. The result of these discussions were registered in a book kept for the purpose, and they accomplished diverse improvements in the details of the course. Throughout the course a religious service was held daily, which was opened and closed with prayer and sacred song. however, was compelled to attend this service. The programme of instruction included a daily lecture from 7 to 8 o'clock in the morning, slöjd exercises from 9.30 to 1.30 p.m., and from 2 to 6 p.m., excepting Saturdays, when the slöjd ended at noon, and the remainder of the day was devoted to school work and trial lessons. Two evenings weekly were given over to the discussions, and two more to lectures by Director Salomon. Herr Abrahamson was often seen in the work-rooms, and for every student he had a cheering word or a suggestion, and his personal influence was strongly felt among them. In his lectures, Director Salomon developed the ends which manual training is to subserve, with great ability and perspicuity. He distinguished these ends as formal and material. The former ends he showed were, (1) to arouse a desire for work and a pleasure in it; (2) to accustom pupils to independence and to fit them for it; (3) to instil the virtues of exactness, order, and accuracy; (4) to train the attention; and (5) to train pupils in habits of industry and perseverance. The material ends of manual training, Herr Salomon explained to be as follows:—(1) To win the interest of the children and, therefore, (2) to give them something useful to work at; (3) to require and promote orderliness and exactness; (4) to develop cleanliness and neatness; (5) to provide an opportunity to exercise and develop the sense of form; (6) to appeal to both the mental and physical powers of the child; (7) to strengthen the muscles; (8) to afford a relief from long continued sitting at school; (9) to train the pupil to methodical and accurate expression; and (10) to promote a general ability to do handwork."

To show with what rapidity the teaching of slöjd has advanced in Sweden, it is only necessary to state that while in 1876 only some eighty schools included this branch of instruction in their programme there are now nearly one thousand. In the outset the economic conception was generally adopted. Instruction in manual training was everywhere regarded as a means of giving the children of the people a way to earn their bread. But little by little the subject assumed its true aspect. It was recognised that manual training has a far more elevated purpose, far more useful even in the philosophical acceptation of that word. It was regarded as a pedagogical process, adopted to secure more completely the physical, moral, and intellectual development of the child. Thus was realised in Sweden the dream of those illustrious educators, Comenius, Rousseau, Pestalozzi, and Fræbel, of seeing in schools of primary instruction manual training closely joined with any subjects purely theoretical, in order to secure the integral training of all the faculties and all the aptitudes which constitute the complete man.

Herr Salomon in a speech on the subject says:—"The efforts made to effect the introduction of manual training into primary schools are a complete protest against that education which takes a false direction, and which results unquestionably in an instruction purely theoretical; such as is, unfortunately, still too generally given. Far be from me the suggestion that this protest has been raised in our little country alone, and that we have been the first to recognise the necessity of the reform which now engages us. Does not history teach us that the people being ripe for any reform of which the need is felt this suddenly appears, and most frequently at the same time in many countries? Surely then it is not befitting, either an individual or a people, to claim the privilege of having been first to possess that which is the common property of humanity.

"The truth being granted in respect to things relatively common, must all the more be admitted in respect to an extremely important idea like the one we are now considering, the extent of which cannot yet be measured, or the consequences fully understood. I desire, as far as my knowledge and my experience permit, to make you understand that the idea of employing manual training as a means of education is not a novelty and innovation; but that, on the contrary, its roots run back to the remotest time. In fact, we have seen that the authors of modern pedagogy have appreciated the highly educative value of the process. It is enough to say that in occupying ourselves seriously with manual training we are not giving our time and our strength to the service of a vain caprice or a fashionable notion."

The Philadelphian Commission state that: "If the name of method is given to a well-considered and systematic course, leading to a well-determined end, the School of Nääs constitutes a veritable method, and it has an unquestionable character of originality. Nothing in this system is left to chance. It is the result of experiments prosecuted for many years, with the constant desire of being able to give a practical and effective form to primary instruction in manual training."

Messrs. Sluys and van Kalken reported to the Belgian Minister of Public Instruction, as results of their observations in Sweden:—

- "1. Manual labour should make a part of the programme of the primary schools, in order to assure the integral and harmonious cultivation of all the faculties of the child by the progressive and methodical development of manual skill or of technical aptitude, which, in the existing school organisation, is not made the subject of special exercises.
- "2. The instruction in manual work should be based upon the same general pedagogic principles as instruction in any other branches of the programme. It has for its aim the systematic cultivation of the pupil, and not apprenticeship to specific trades.
- "3. In order to secure for instruction in manual work the pedagogic character which it ought to have, the regular teacher should be required to give it.
- "4. Those now actually employed in teaching can be prepared for this part of their work by means of temporary courses.
  - "The teachers for the future should be prepared for this instruction in the normal school.
- "5. The programme of instruction in manual work should include:—
  - "(A) For the first grade of the primary schools—pupils from six to eight years—occupations required by Fræbel's method, three hours a week.
  - "(B) For the second grade of the primary schools—pupils from eight to ten years—the same occupations, but more especially modelling and working with paper and cardboard, three hours a week.
  - "(c) For the third grade of the primary school, the superior primary school, the course preparatory to normal studies—pupils from ten to fourteen and sixteen years—wood-working according to the method of Herr Salomon, three to six hours a week.
  - "(D) For normal schools, the theoretical and practical instruction of the pupil-teachers in the subjects of the above programmes, a, b, and c.
- "6. The instruction in manual work should be closely connected with instruction in geometrical forms and drawing.
- "7. To secure a satisfactory teaching of manual work in the normal schools, a temporary course should be organised."

Messrs. Sluys and van Kalken also recommended the Belgian Minister of Public Instruction that it would be useful to send some teachers to Nääs to follow a complete course there.

The following is the *précis* of a description given by Herr Salomon, director of the Nääs Normal School, in English, the method and means are as follows:—

General Principles.—Attendance at slöjd. instruction should be voluntary on the part of the pupils. In order to do this the work must fulfil the following conditions:—(1) It must be useful; (2) It must not require fatiguing preparatory exercises in the use of the various tools; It must afford variety; (4) It must be capable of being carried out by the pupils themselves; (5) It must be real work not play; (6) It must not be so called nick-nacks, that is, articles of luxury; (7) It must become the property of the pupils; (8) It must correspond with the capabilities of the pupils; (9) It must be of a nature that it can be completed with exactness; (10) It must admit of neatness and cleanliness; (11) It must exercise the thinking powers, and not be purely mechanical; (12) It must strengthen and develop the bodily powers; (13) It must assist in developing the sense of form; (14) It must allow of the use of numerous manipulations and various tools.

The teacher.—(1) The instruction must be given by a trained teacher, if possible by the same teacher who instructs in intellectnal subjects; (2) The teacher should conduct, superintend, and control the work, but guarding against directly putting his hand to it.

The age of the pupil.—In order to follow with advantage the course of instruction, the pupil ought to have reached that stage of development usually attained at the age of eleven.

Branches of instruction.—The simultaneous employment of several different kinds of slöjd acts detrimentally for the following reasons:—(1) A sufficient number of subjects are already taught in the school, and every branch of slöjd is a subject in itself; (2) The time to be devoted to this work is short and limited; (3) By different kinds of work the interest of the pupils would be easily diverted.

For the above-mentioned standard of age, wood slöjd is the most suitable, it includes carpentry, turning, and wood carving. Slöjd carpentry differs from trade carpentry in the following respects:—(1) As to the character of the objects made in general, the objects are smaller; (2) The tools which are used, for instance, the knife, which is the most important tool in wood slöjd; (3) The method of working. In trade carpentry there is a division of labour, in slöjd none whatever. Turnery may be taken as a different branch of instruction, and, as such, be quite well separated from wood slöjd.

The number of pupils.—Individual instruction is generally advisable. This is especially the case with slöjd, which, on fundamental and practical grounds, cannot be taught as a class subject; therefore the number of pupils taught by one teacher must be limited.

The models.—In order to make the work as instructive as possible, models ought to be used in preference to drawings. The form should be sketched either directly by placing the model on a piece of wood, or by means of a diagram drawn with a ruler and compass on the wood. The models are to be simple, adapted to reproduction in wood, both hard and soft—turned and carved models are to be used as much as possible,—capable of developing the sense of form and beauty, and so arranged as to teach the use of the necessary tools, and to know and carry out all the most important manipulations connected with wood, in a series increasing in difficulty of execution, exactitude being demanded, not approximations to the correct form.

The

The Swedish course can be understood by a description of a slöjd school in England under an imported Swedish teacher. It was a normal course of twelve in number, among whom were two principals of boys' schools, a lady superintendent of a training college for female teachers, and a young lady who had won honors in Greek at Cambridge.

The indispensable tool used in slöjd work is the knife. This knife is immovably fixed in its handle, with a blade  $2\frac{1}{2}$  inches long, terminating in a long sharp point. This Swedish knife is of a different shape to the one I saw generally used in America, which I shall describe further on. Besides the knife, each pupil is provided with a pencil, a square, a saw, a pair of dividing compasses, a brad-awl, hammer and nails. For general use the work benches are of the Swedish pattern, not unlike those used in our best cabinet shops—with brace and bits, chiscle, gouges, and planes. work-bench and one set of tools suffice for four scholars. The following is a full list of the articles which are to be made by scholars as the result of a course of slöjd training:—(1) pointer; (2) flower stick: (3) penholder; (4) birds' pirch; (5) square flower-stick; (6) key label; (7) slate-pencil holder; (8) dibbler for planting flowers; (9) forked close-pins; (10) paper knife; (11) flower cross; (12) ruler; (13) knife handle; (14) pen tray; (15) first spoon; (16) hammer-handle; (17) second spoon; (18) bracket; (19) stocking stretcher; (20) trencher; (21) flower stand; (22) butter beater; (23) footstool; (24) corner bracket; (25) nail box; (26) sugar scoop; (27) boot-jack; (28) shoe brush-box; (29) stool; (30) knifebox; (31) salt-box; (32) teapot stand; (33) match-box.

These articles are carefully arranged in the above list in the order of their difficulty, and each article is made in a manner and by steps definitely prescribed by the teacher. So simple are the first tasks, and so exact the method, that it is not possible for one who follows it, to fall short of a certain standard of excellence. The wood used is at first a soft wood, like white pine; afterwards a harder wood is employed. Each worker keeps, in his own drawer, every article made by him or her, marking each with his own name, and receiving all at the end of the course for permanent preservation.

The great merits of the system appear to be,—(1) The moderate difficulty of the tasks proposed; (2) The methodical way in which pupils are instructed; (3) The position, subordinate to the intellectual portion of school work, in which the training is firmly held. The fact that the progress is methodical, does not imply that the rate of progress is the same for all. Tasks must be done in the same way by all, but each pupil may do as much, and go forward as rapidly as his ability permits him. It is a capital merit of the system that it does not profess to confer upon the pupil, any handicraft by which he can earn money, but, it is strictly disciplinary in its character. The articles which the pupils have made at the end of his course of study have little market value. They are simply wood utensils characteristic of a period, somewhat prior to the present age of machine products. The articles are not ornaments, and would not have a money value as such. Hence the learner of slöjd does not become in any sense a competitor of the mechanic or artisan; but the fact that he has learned to produce good work gives him an interest in all good work by whatever hand produced. This not only qualifies him intelligently to judge of all mechanical work, but gives him that sympathy with the mechanic, of which many persons, to their great loss, know nothing.

Manual

Manual training has now attained a definite form in many countries, but I must not omit stating that it is apparently to the Scandinavian peoples that the merit belongs of making it a public school subject. In Norway and Sweden, as well as in Finland, the manual training or slöjd is always woodwork, and the character of the work from the latter country is beautiful in the extreme with regard to the organisation and practice of teaching manual training the normal and model school,—or school of practice—at Nääs is a precious mine of information. The teaching is divided into logical series of excercises, established according to the experience of Messrs. Abrahamson and Salomon; experience entirely gained by experiment—and which has incontestably proved the need of reform in primary instruction. This reform must have for its foundation the intuitive method, the system of Fræbel will be enlarged and carried on into every class of education from the Kindergarten to the University.

# JAPAN.

The exhibits from Japan show the marvellous progress that nation has made in educational matters, and not in the exhibits only, but in the numbers of awards obtained. There were only six nations that received more awards than that of Japan. European and American models have been thoroughly studied and adapted until Japan has the ability to fairly compete with those nations whose systems she has adopted. Their exhibition measured by a European standard compared most favourably with those of the best character in Europe. They have founded kindergarten, primary and commercial schools of highest order, and are pushing forward the intuitive method in all. They evidently, from their exhibition, recognise, to the full, the vast importance of manual training, and technical instruction generally.

The State has its public schools, but it also gives permission to individuals to establish private schools, only the scholars of these latter, have to submit to be examined with those of the public schools, and if they fail three times successively they are compelled, by law, to leave the private and attend the public schools. The school age is from three to fourteen years, and the school year is forty-eight Their system is divided into kindergarten, primary, secondary, intermediate, and professional schools, and the University. The teachers certificate is only good for five or seven years, as the case may be. At the end of that period he has to undergo another examination in order that the authorities may know whether he has kept up his knowledge and progressed with the times. If he has done so, well and good, and the certificate is issued; but on the contrary, if he has fallen behind, and is not fully up to the mark, the certificate is withheld, and the teacher has to go back to the normal school until he is able to pass the examination. An expression of Mr. Wellman Parks, the American Commissioner, while comparing notes in this matter, said he "There is not much chance for teachers to fossilise under the The Government further insists, that all intermediate and Japanese system." professional schools, whether public or private, be supplied with complete physical and chemical laboratories and apparatus. In short, the Japanese authorities are determined that no empiricism shall exist either in teachers or schools. All must be open for inspection, all examined, and all certificated.

# THE ARGENTINE REPUBLIC AND MEXICO.

The Argentine Republic and Mexico were represented fully, and their exhibits showed the source from which the inspiration was drawn—and they could not have had a better. Their class-rooms are furnished in the complete manner adopted by the United States, and the same may generally be said of Mexico. The exhibit of the Argentine Republic was comparatively limited as regards primary instruction,

instruction, but in the higher education there were one hundred and sixty-nine exhibits, chiefly in works on law and science, including finance, medicine, and political economy, chiefly the work of their University and High-school professors. The undergraduates' work was somewhat insignificant. In both the elementary and superior classes Mexico exhibited fully. In the matter of awards, France took more than three times the number of all other nations combined, and according to the quantity and quality of the exhibits, their organisation and arrangement, they were fully entitled to them. The United States came second, Mexico third, the Argentine Republic fourth, Switzerland fifth, Belgium sixth, Japan seventh, and Brazil eighth.

It is necessary that I should be particular as to these matters, as they tend to demonstrate the relative positions of various nationalities as regards facilities for instruction, and when it is seen how comparatively high these South American Republics and Japan are placed by international judges of the highest attainments, it certainly behaves us to do the best we can for our youth, and not allow other countries to run away from us.

It can be well understood that these figures and deductions would be very much altered were England, Germany, and Russia in the competition, but, allowing for all this, it was with the greatest surprise that I recognised the position attained by the South American Republics and Japan. They seem to fully understand that the first initiation in manual work and in art should be an integral part of all elementary education, and that the child should be progressively exercised in manual as well as mental work. The work exhibited bears witness to this fact.

### THE UNITED STATES OF AMERICA.

The United States of America had an excellent exhibition, but the space accorded them was very inadequate. Had they ten times the space they occupied they could easily have covered it, and the quality of the school exhibits left little to be desired. Owing to this inadequate space, the second group was somewhat mixed up, as it contained books and other publications, stationery, photography, musical, surgical, optical, and other instruments, together with charts, maps, plans, and reproductions, which might have been regarded more or less commercial or industrial. The United States Commissioner himself informed me that "his exhibits were more than sufficient for ten times the space, and then give the impression they were crowded."

I visited the United States after the close of the Paris Exhibition and inspected the schools that had exhibited as well as others. My observations will therefore apply to American Schools, their methods, systems and organizations, and unless specially mentioned, without any reference to the exhibits that appeared in Paris.

Boston had a large collection and occupied a corner to itself. The other exhibits were so arranged that the kindergarten should be found at one end of the space, while the universities and polytechnics should be at the other. There was the collection of the Kindergarten Department of the Moline schools in Illinois, not a large city, but one distinguished in matters of educational interest and progress. The work consisted of the usual cardboard work, modelling, sewing, and paper folding. I mention this as a typical school of kindergarten work in the United States, and may here say that the work of this school and that of the other infant schools working under Fræbel's method, was quite equal to anything I saw in the European exhibits.

The primary schools were chiefly represented by those of Moline, Buffalo, Pittsburg, and Pandusky, as being of the latest class, having excellent furniture and apparatus, and if all the primary schools of the United States could do work up to the standard exhibited, then I can certainly say that in my opinion the United States occupied a very advanced position. The specimens of work comprised specimen papers in arithmetic, grammar, geography, and history, sheets of drawings, copy and In some schools I found a lack of system in teaching drawing, while in others the freehand drawings were very good. In most of the schools the geometrical and mechanical drawing studies were fairly executed, while in many the work was excellent. The work of the public or State schools was invariably of a better class than that done in private schools. The specimens of manual work from elementary schools were also very good. Elizabeth City, New Jersey, had an excellent exhibit, complete, although rather small. It gave all the statistics, charts of studies, administrative information, plans of the new buildings, and a collection of the pupils drawings. The Buffalo exhibit had a novelty in its way. specimen papers of all the pupils of the various classes were arranged in folios, on the covers of which were photographs in group of the individuals composing the These papers were very good, and a class, with their ages, weights, heights, &c. credit to all concerned.

The theory of education in the United States of America has been treated by me in previous reports, consequently I shall not say anything of it here. I shall therefore proceed to notice the work exhibited in manual training, and the class of school or institution for those unfortunates whose faculties are defective.

The Home for Feeble-minded Children of Santa Clara, California, was very good, and shows the possibility of doing a good deal for the education of this class of children. It is to be regretted that I shall only be able to mention a few of these institutions, as there is much to be learned from all.

Perkins' Institution for the Blind and its new kindergarten in Boston attracted a great deal of attention. The convenient form of the apparatus employed which enables the pupils to weave model, &c., excited much admiration, as the work compares very favourably with that done in schools where the pupils have the full use of their eyes. This institution has done a great deal of good since its organisation in 1829, and has exhibited its work many times in Europe and America, making its method and apparatus thoroughly known. At the present time there are thirty-two of these institutions in the United States, teaching 2,697 pupils, with a teaching staff of 587 masters, at a cost of about 290 dollars per scholar per year, a sum equal to about £58. These schools not only give instruction in literary, scientific, and mathematical subjects, but professional instruction as well. One of these subjects is piano tuning, an occupation obviously adapted for the blind.

Reformatory schools were also well represented. The school department of the New York House of Refuge, Randall's Island, New York, and the Sockanosset Reform School for boys of Howard, of Rhode Island, both of which are corrective institutions.

In all institutions of this class manual training is now taught and trade schools have been established by State authority, for the "reception of ungoverned, uncontrolled, and derelict youth under twenty years of age." Dr. Fetterholf, of Girard College, Philadelphia, says that in his opinion "about 40 per cent. of the pauperism, poverty, and depression, which rapidly sinks into pauperism, is due to

a lack of the resources and intelligence which results from a training which equips its recipients for all departments of mechanical work, without giving technical education in any of them. . . . The nearer we come to giving a generation a well-rounded education of the brain, the heart, and the hands, the better we shall prepare men handicapped from birth with poverty in an over-crowded labour market, to rise above the lowest ranks of unskilled and insufficiently paid labour, and more particularly will we put them in a way, not only of independence, but often of rescue from ruin. I attach great importance to the agency of industrial training, for the education which strengthens the body and elevates the mind intellectually and morally, and gives man broader views of natural laws, unquestionably fits him better to cope with the disadvantages and disabilities of his position. By far the larger part of the cases of poverty that came under my notice reveal a lack of character in some one particular, and, as John Stuart Mill says of those who are acquiring industrial education, 'they would acquire not only manual dexterity, but habits of order and regularity of the utmost use in after-life, and which has more to do with the formation of character than many persons are aware of."

Very much has been done in the United States during the last four years in furthering technical education, more especially in the introduction of manual training. The Legislature of the State of New York passed an Act in 1888, requiring the State normal and training schools to "include in their courses of instruction the principles underlying the manual or industrial arts, and also practical training in the same, to such an extent as the Superintendent of Public Instruction may prescribe, and to such further extent as the local boards respectively of said normal and training schools may prescribe."

For several years past the pupils of the State Normal School for females at Salem, Massachusetts, have been given instruction in the use of carpenters' tools. They only take one lesson a week, but much interest is shown in the work, and many articles are made by the young ladies for their own use, such as easels, book-cases, &c. The Principal of the school, Mr. Hagar, reports that the results are satisfactory.

The Maryland Normal School teaches woodwork, and the Prairie View Normal School in Texas began this last year. The schools at Whitewater and Milwaukee, in Wisconsin, have a workshop department, in which pupils, both male and female, are trained in the use and care of common tools, and the general principles relating to the construction of simple forms in woodwork, also in lathe and forge work. A large portion of the students are females from 16 to 25 years of age. They learn to handle the saw and plane, and even do work at the lathe and forge. They make articles of furniture and simple apparatus, and learn such exercises as involve the various forms of joints, mortises, tenons, &c., &c.

# ST. LOUIS MANUAL TRAINING SCHOOL.

To give information with reference to technical instruction in all the schools of the United States, which have become distinguished in this class of instruction, would fill a large volume. Nevertheless, it is necessary to furnish your Excellency with an array of facts, in order faithfully to show what this great and enlightened nation has done in the development of industrial education as a branch of the general education of the ordinary schools. I shall therefore describe such schools as may be considered types of their class, and shall commence with the establishment of the St. Louis Manual Training School, that having been the pioneer among special manual training schools. Moreover, Dr. C. M. Woodward, the distinguished

and able director, is a world-wide authority. This school was opened on the 6th September, 1880. Its object generally is instruction in mathematics, drawing, the English branches of a high-school course, and in the practice and use of tools.

The institution made a good display in Paris. In working drawings, shop-work, both in wood and iron, the machine-shop exercises in manual training, and, in short, everything made in the school relating thereto, was second to none. Of course I speak of that type of school which makes manual training a vehicle of culture, and not the learning of a trade.

The school motto is, "The cultured mind, the skilful hand," and I can certainly bear witness to the quality of the high-class work done by its students. The ordinance establishing the Washington University, with which this school is connected, states that "the tool instruction shall include carpentry, wood-turning, pattern-making, iron chipping and filing, forge work, brazing and soldering, the use of machine-shop tools, and such other instruction of a similar character as may be deemed advisable to the foregoing from time to time. The students will divide their working hours, as nearly as possible, equally between mental and manual exercises. Pupils are admitted on examination at not less than 14 years of age, and the course shall continue three years.

The prospectus stated that "The Manual Training School is not a mere workshop; the head is to be trained even more than the hand. Specific trades will not be taught. The tool education will be liberal, extending impartially through all the shops. It is not expected that every boy who attends the school will become a mechanic, but we have reason to believe that a boy's experience in the school will clearly indicate whether he is fit to become a mechanic or not." Professor Wood. ward distinctly says that, "All the shop work is disciplinary; special trades are not taught, nor are the articles manufactured for sale; as a rule the products of the shop have no value, except as exercises, illustrating typical forms and methods." So far the principle is similar to that laid down by Messrs. Abrahamson and Salomon, but a great difference exists in the manner in which it is carried out. Manual training at Nääs is limited to wood-work; the pupils are taught individually, and not in class, and the work is the making of small things for the use of the household. while in Professor Woodwards' system the pupils are taught in class; the exercises are both in wood and metal, and none of the class exercises have any pecuniary value; or, as the professor himself observes, "the most instructive tasks have no outcome except in the intelligence and skill of the student himself."

The scope of any trade is too narrow for educational purposes. Manual education should be as broad and liberal as intellectual. A shop which manufactures for the market, and expects a revenue from the sale of its products, is necessarily confined to saleable work, and a systematic and progressive series of lessons is impossible, except at great cost. If the object of the shop is education, a student should be allowed to discontinue any task or process the moment he has learned to do it well. If the shop were intended to make money the students would be kept at work on what they could do best, at the expense of breadth and versatility. In a factory intellectual life and activity are not aimed at; its sole object is the production of articles for the market. In a manual training school everything is for the benefit of the boy; he is the most important thing in the shop; he is the only article to be put upon the market.

Even

Even in manual education the chief object is mental development and culture. Manual dexterity is but the evidence of a certain kind of mental power, and this mental power, coupled with a familiarity with the tools the hand uses, is doubtless the only basis of that sound, practical judgment and ready mastery of material forces and problems which always characterises one well fitted for the duties of active industrial life. Hence the primary object is the acquirement of that mental clearness and intellectual acumen which is the natural outgrowth of logical processes fully comprehended and intelligently executed. This thoughtful activity results in skill in the use of tools and materials. The production of specific articles is a secondary and far inferior consideration. Moreover, the training must be general, and its possibly economic application may have the widest range. "We therefore abstract," says the prospectus, "all the mechanical processes and manual arts and typical tools of the trades and occupations of men, and arrange a systematic course of instruction in the same. Thus, without teaching any one trade, we teach the essential mechanical principles of all. Accordingly, the shop training is gained by regular and carefully graded lessons, designed to cover as much ground as possible, and to teach thoroughly the uses of ordinary tools. This does not imply the attainment of sufficient skill to produce either the fine work or exhibit the rapidity of the skilled mechanic.

"In a manual training school, properly socalled, no attempt is made to cultivate dexterity at the expense of thought; no mere slight of hand is aimed at, nor is muscular exercise, of itself, held to be of educational value. An exercise, whether with tools or with books, is valuable only in proportion to the demand it makes upon the mind for intelligent, thoughtful work. In the school shop the stage of mechanical habit is never reached. The only habit actually acquired is that of thinking. No blow is struck, no line drawn, no motion regulated, from muscular habit. The quality of every act springs from the conscious will, accompanied by a definite act of judgment. Such a limited training cannot, of course, produce a high degree of manual skill. We have distinctly stated that our pupils do not become skilled mechanics, nor do we teach them the full details of a single trade. The tools whose theory, care, and use we teach are representative, and the processes employed just far enough to make every step clear and experimentally understood, equally underlie a score of trades. By the words 'experimentally understood' is meant that it is not enough to know that a certain outline is to be produced, or a certain adaptation is to be secured, but one must know just the forces to be directed, the motions needed, and in their order, and all as the result of the closest attention and steady intellectual activity."

Thus is set forth the object of the school, and judging from the class of work exhibited it has been eminently successful, and has exerted much influence in the creation of similar schools throughout the Union. Moreover, it has now had an experience of ten years, and, in my opinion, has fully realised the aspirations of Professor Woodward. It has created a love of work, and the boy has acquired precision and method, and it has proved itself a thorough good form of secondary education.

Candidates for admission to the first-year class must be at least 14 years of age, and must pass a good examination in the following subjects:—

Arithmetic, including the fundamental rules; vulgar and decimal fractions; tables of weights; measures and their uses; percentage; interest and analysis of miscellaneous problems. Candidates will be examined orally in mental arithmetic, including fractions; mixed numbers; and the higher multiplication table.

- 2. Common school geography, including map drawing from memory.
- 3. Spelling and penmanship.
- 4. The writing of good, descriptive, and narrative English, with the correct use of capitals and punctuation.

Candidates for the second year class must be at least 15 years of age. All that is specified above will be required of them, and, in addition, the book studies for the first year class.

Similar requirements apply to those desiring to enter the third year class.

When candidates can present certificates of having completed a thorough course of study preparatory to a High School, or of having done satisfactory work in a High School, or school of equal grade, they may be admitted, either without examination or on one less formal in character.

The course of instruction covers three years, and embraces five parallel lines, three purely intellectual and two both intellectual and manual, as follows:—

- First.—A course of pure mathematics, including arithmetic, algebra, geometry, and plane trigonometry.
- Second.—A course in science and applied mathematics, including physical geography, botany, natural philosophy, chemistry, mensuration, and bookkeeping.
- Third.—A course in language and literature, including English grammar, spelling, rhetoric, composition, literature, history, and the elements of civic and political economy. Latin and French are introduced as electives, with English or science.
- Fourth.—A course in penmanship, freehand, and mechanical drawing.
- Fifth.—A course of tool instruction, including joinery, wood-turning, pattern-making, moulding, brazing, soldering, forging, and bench and machine work in metals.
  - Drawing.—The course of drawing embraces three general divisions:—
- 1. Freehand drawing, designed to educate the sense of form and proportion; to teach the eye to observe accurately, and to train the hand to rapidly delineate the forms either of existing objects, or of ideals in the mind.
- 2. Mechanical drawing, including the use of instruments; geometric constructions; the arrangement of projections, elevations, plans, and sections; also the various methods of representing shades and shadows with pen and brush.
- 3. Technical drawing, or drafting, illustrating conventional colours and designs; systems of architectural or shop drawings; the drawings required to familiarise the pupil with the proportions and details of the various classes of machines and structures.

Students have no option or election as to particular studies, except as regards Latin and French; each must conform to the course as laid down, and take every branch in its order.

The

The arrangement of studies and shop work by years is substantially as follows:—

#### FIRST YEAR.

Arithmetic, completed; algebra to equations; English language, its structure and use; study of selected pieces; history of the United States.

Latin grammar and reader may be taken in place of English.

Introduction to science, physical geography, botany.

Drawing, mechanical and freehand penmanship, carpentry and joinery, wood-carving, wood-turning.

#### SECOND YEAR.

Algebra, through quadratics. Geometry begun.

Natural philosophy.—Experimental work in the physical laboratory, in connection with which is a special workshop containing work-benches, hand tools, and lathes; principles of mechanics.

English composition and literature; rhetoric, English history.

Latin (Ceasar) may be taken in place of English and history.

Drawing.—Line tinting and shading, and the tinting of machine drawings. Development of surfaces, freehand detail drawing, isometric projections.

Shopwork.—Forging, drawing, upsetting, bending, punching, welding, tempering; pattern making, casting with plaster, soldering, and brazing.

#### THIRD YEAR.

Geometry continued through plane and solid. Mensuration.

English composition and literature. Civics and political economy

French or German may be taken in place of English and history, or in place of the science study.

Physiology.—Elements of chemistry. Students who have taken Latin, and who intend to enter the Polytechnic School after completing the course in this school, will take history in the place of physiology and chemistry.

Book-keeping.

Drawing.—Brush shading, machine and architectural drawing.

Work in the machine shop. Bench work and fitting, turning, drilling, planing, screw-cutting, &c. Execution of projects.

At least once a week in every class the literary work takes the form of reading and studying classic English or English composition, and the science study is omitted to give more time for such work. In the lower classes, penmanship takes the place of drawing occasionally, according to needs.

The shop instruction is given similarly to laboratory lectures. The instructor at the bench, machine, or anvil, fully explains the principles to be used or illustrated, and executes in the presence of the whole class the day's lesson, giving all needed information, and at times using the black-board. When it is possible the pupils make working drawings of the piece or model to be executed, and questions are asked and answered, that all obscurities may be removed. The class then proceeds to the execution of the task, leaving the instructor to give additional help to such as

need it. At a specified time the lesson ceases and the work is brought in, commented on and marked. It is not necessary that all the work assigned should be finished; the essential thing is, that it should be well begun and carried on with reasonable speed and accuracy.

Students who complete the course with credit in all its details receive the diploma of the school, and are entitled to certificates which will admit them to the freshman polytechnic class of the undergraduate department without examination, provided they have the required knowledge of French, German, or Latin, and history.

This school ever since its inauguration has been well patronised, and the Professor Woodward says, "the zeal and enrolment shows a steady increase. enthusiasm of the students have been developed to a most gratifying extent, extending into all departments of the work. The variety afforded by the daily programme has had the moral and intellectual effect expected, and an unusual degree of sober earnestness has been shown. The wholesome moral effect of a course of training which interests and stimulates the ardour of the student is most marked. observe the beneficial influence of occupation. The suggestions of the day fill the mind with healthy thoughts and appetites during the leisure hours. Success in drawing or shop-work has often had the effect of arousing the ambition in mathematics and history, and vice versa. Gradually the students acquire two most valuable habits which are certain to influence their whole lives, namely, precision and method. The school has served to demonstrate the entire feasibility of incorporating the elements of intellectual and manual training in such a way that each is the gainer thereby; and that there is a public demand for an education which shall insure the most valuable mental discipline, at the same time that it gives knowledge and skill of great intrinsic worth."

### THE PHILADELPHIA MANUAL TRAINING SCHOOL.

The Philadelphia Manual Training School is one of the latest model, having been opened towards the end of July, 1885. This school affords to pupils who have finished the grammar school course, the opportunity not only to pursue the usual high school course in literature, science, and mathematics, but also to receive a thorough course in drawing, and in the application of tools in the industrial arts.

The school is not a trade school but similarly to that of St. Louis the principles of all trades and occupations are taught, and also the school-time is about equally divided between manual and mental exercises. The course of study is for three years, the programme of which I append to this report. [See Appendix D.]

The daily session of the school begins at 9 a.m. and closes at 2.30 p.m., with an intermission of twenty-five minutes at 12.25.

The first consideration of the pupil is the work of the school, and it is expected parents will give their hearty co-operation and support, and not permit trifles to interfere with regular and prompt attendance.

The spirit of the school is that of earnest, faithful, and self-directed work. By avoiding cramming, class-ranks, and "markings," the school stimulates the student to do his best without appealing to his selfish interests.

Dr. James MacAlister the able superintendent of the Philadelphia Public Schools says, "The success which has attended the manual training school from the first

first is the best guarantee of the soundness of the principles upon which it is organised and conducted. Beginning a little over four years ago in a very humble way, it has steadily grown in public confidence and approval. It has more than justified every claim that was made in its behalf. Every valuable foot of space is now occupied, and it has now become impossible to admit all the pupils who apply for admission. The Board of Education has therefore been brought face to face with the question, whether the time has not come for opening another manual training school in such a quarter of the city as may be deemed most advantageous to the public interests. The original intention of the Board was to establish four or five of these schools as fast as a just regard for the other departments of the school system would permit, and the growing demand for the kind of education which this school represents will render the fulfilment of this purpose a necessity at no very remote date."

I will here give an extract from a paper by Mr. Superintendant MacAlister upon manual training in the Philadelphia schools wherein, after speaking of the generalities of education and culture, he says :-- "But there are more practical reasons for making manual training a part of the education given in the public schools. introduction would bring our education into closer harmony with the spirit and tendencies of the present age. No one will deny that it is the duty of the State to make the schools minister to the actual necessities of our civilisation. Herbert Spencer declares that the function which education has to discharge is to prepare us for complete living," a proposition which has withstood no small amount of adverse criticism; and Emerson in one of his wise sentences, says that, "the great object of education should be commensurate with the object of life." If we acted in the spirit of these maxims, we should hear less of the objection so often urged, that the education given in the schools is not sufficiently practical. I would not be understood as arguing for practical education simply as such, at the same time I believe that the education of a community should have direct reference to its social needs. This is eminently the age of industrialism. Science and its applications to the arts and industries of life reigns supreme. The wealth, power, and greatness of a nation depend to a very large extent upon its natural resources, and the quality and quantity of its skilled labour. As Carlyle says, "The proper epic of this world is not now the 'arms and the man,' as it is now 'tools and the man' that henceforth, to all time, is now our epic." It is impossible for the schools to ignore this condition It is not our business to train boys and girls to be mere bread-winners, but we must see to it that the education we give to them confers the power to hold their own in the struggle of life upon which they must sooner or latter enter. I have no sympathy with those who claim that the public school gives too much education to the masses of the people. It is impossible to over-educate any human being. The only question is as to the kind of education which should be furnished. must train our boys to believe in work; to respect work; to seek work. should be part of their education; and the way to do it, is not to teach them trades in the public schools, but to broaden the general culture which these schools give, in such ways that the young people shall begin their career in sympathy with the social conditions which surround them; will seek for success, independence, happiness, by striving, not against, but with the forces which compel success and its rewards.

"It is my sincere conviction that the best means of doing this is to put manual training into the curriculum of the common schools. As at present constituted, the schools are directed almost wholly towards a literary outcome. The traditions of

the past are still all-powerful in the common school as well as in the college. We need to make our education more real. In doing this we shall not make it less noble and refining, but we shall give to the children a wider vision and a braver heart, and we shall send them forth into the world better able to deal with the realities of life, and to discharge its duties fitly and successfully.

"There is another aspect in which the introduction of manual training may be The great question of the hour is the struggle between labour and wealth. This question cannot be put out of sight. We are gradually coming to see that one of the best ways to meet the difficulties which it raises is to clevate the worker himself. What the working man is seeking, is a larger participation in the fruits of his industry; but this can only be accomplished by the labourer putting more skill and intelligence into the work of his hands. The problem for every civilised nation to-day is how the largest amount of intellectual development can be given to its industrial population. There will be no peace between labour and capital until labour has recognised the necessity for intelligence, and capital has recognised the just rights of labour, enlightened and ennobled by knowledge. What is needed is to bring thought and labour together; to make every worker a thinker, and every thinker a worker; and there is no place where this can be done so well as in the school. It is here that enduring principles and habits can best be formed. We talk a good deal of the public schools as the nurseries of good citizenship. We shall have a better right to make this claim for them when they undertake to fit their pupils for the actual conditions of existence; for the world as they will find it—a world in which it is a privilege as well as a necessity to work; and in which work, animated and directed by the power which comes from a well-trained mind, cannot fail of its just appreciation and reward.

"There are many other advantages which would accrue from the introduction of manual training into the public schools. . . . . Not the least of these advantages would be the larger degree of confidence and support which the schools would receive from the general public. It is useless for us to conceal the growing dissatisfaction with many of the features of the public school system. Some of these objections are no doubt ill-founded; but there are others to which no valid answer can be made. What the people want is schools more in accordance with the real needs of society, and the principles which the advance of scientific methods of instruction demands. Nearly every city experiences difficulty in getting the appropriations which are necessary to keep pace with the growth of population and the improvement of the I believe a larger degree of sympathy and support for the public schools would be obtained if we could only make up our minds to set aside the antiquated and useless work that is required of pupils, and substitute in place of it more rational methods of development and training. I have no doubt also that the period of school attendance would be considerably prolonged by such a course. The lament in every large city is, that the mass of the children spend so little time in the schools. The tens of thousands are in the primary grades; the few thousands in the upper grades and high schools. The people, I think, would be quick to discover the advantages of giving their children more education, if this equivalent could be made better in quality, which is equivalent to saying more available for the practical uses of life. I am convinced that the introduction of manual education would do more to rid the schools of tasks upon which the time of the pupils now runs to waste, than anything we could do for them. The eight years of the common school course would certainly yield better results than are now obtained. A great deal that we persist in regarding as absolutely essential will sooner or later have to be discarded, and the modification of the course of instruction, in accordance with the general principles here indicated, will, I am sure, tend to hasten the coming of this better day."

These are the sentiments of the distinguished American, who from having had the most experience, is the most capable of forming a correct opinion, and moreover they are in strict accord with the opinions of all practical educationists who have given the system their best attention, and practised it.

The exhibits fully bore out the high character of the school. All the exercises both in wood and iron were shown, and altogether the display was as complete as possible, taking into consideration the smallness of the space into which it was crowded.

These two schools, the St. Louis Manual Training School and the Philadelphia Manual Training School, are a distinct type, as compared with most European schools, and I must certainly say that the system seems to me worthy of the most extensive imitation, while their method of tool instruction is excellent.

#### BOSTON PUBLIC SCHOOLS.

Manual training was introduced into the Boston public schools in 1884, when eleven classes containing in all, 220 boys—from ten grammar schools, had instruction in carpentry once a week. The lesson was two hours long, and boys were allowed to stay a part or the whole of a third hour if they desired. The boys were fourteen years of age, or over, and were drafted from the first and second classes of the grammar schools. The Superintendent of Public Schools reported on the progress of the work in 1885, as follows:-"A course of lessons drawn up at the beginning of the year by the teacher has been followed by some approach to uniformity; but here, as everywhere else, widely different degrees of native aptitude, as well as of attention to instruction, show themselves among the boys. There are some whose fingers are all thumbs'; and there are others who make square work, and good joints almost from the beginning. A very little observation among the boys is enough to show that a clear mind generally accompanies the skilful hand, that manual skill has its mental as well as its physical side, and that manual training is really a means of mental training.

"The interest, shown by the boys in their work, is very lively, such as I have seldom seen surpassed in any other kind of school work. Many boys come to the shop afternoons, and get the teacher's permission to work three hours instead of two. The experiment has already gone far enough to prove that work of this kind can be joined to the ordinary grammar school work with good effect. It culisted the sympathy, encouragement and support of the masters from the beginning; and to this cause the success already achieved is largely due. So long as there are nearly 3,000 boys in the grammar schools, 14, 15, or more years old, it will be desirable to give them good opportunities to discover and improve their mechanical aptitudes, and thus to gain a mental discipline which otherwise they would miss." In 1886, the Superintendent reported that the interest in manual work was unabated, and that the progress was most satisfactory. Further, that the course of lessons had been improved, by a better adaptation of exercises for giving the best training in the shortest time.

The lessons given in carpentry were as follows:-

Lesson I.—A board, 4 feet long and 12 inches wide, of undressed timber. By the use of chalk and line, strike off two or three spaces,  $\frac{3}{4}$  of an inch apart for the use of splitting saw. With the rule and pencil mark off five or six three-quarter inch spaces, and square across with the trying square, for the use of cutting off saw. After using these tools, what remains of the board is to be cut into pieces of the right dimensions for a box, 14 inches long, 6 inches wide, and 4 inches deep. The purpose of this lesson is to teach the use of the splitting and cutting off saws.

Lesson II.—This lesson brings into use the different bench planes. First, remove the iron from the plane, grind on the grindstone if necessary, set it on the oil-stone, and then adjust it for use. Taking the stuff cut for a box in the last lesson, plane one side and one edge of the board square; then gauge with the marking gauge and plane to 4 inches in width, squaring ends with the butt plane, and nail together.

Lesson III.—Get out stuff 2 inches wide and  $\frac{7}{8}$  of an inch thick, and put together a box, 12 inches long and 6 inches wide, by mitreing the ends, or cutting them at the angle of 45 degrees.

Lesson IV.—A mitre-box. Stock 18 inches long. Bottom planed to 4 inches wide. Take out of wind by the use of straight-edges; sides 5 inches wide and nailed to the bottom. Cut with a saw, across the two sides, at an angle of 45 degrees, to the right and to the left.

Lesson V.—Saw and plane a piece of stuff 3 inches wide, and put together a box by cutting the ends in a mitre-box. If correct the ends of the box will come together square.

Lesson VI.—Get out stuff 2 inches wide, with a rabbit cut for glass, and the two edges beaded, mitred, and dowelled together for a picture frame. This affords another test of the mitre-box.

Lesson VII.—Take two pieces of board, each 6 inches long and 5 inches wide, planed and squared, and put together by a common dove-tailed joint.

Lesson VIII.—Take two pieces of board, each 6 inches long and 5 inches wide, and put them together by blind dove-tailing.

Lesson IX.—A small cabinet, 9 inches square, halved together, with two drawers put together by blind dove-tailing. Crossbar between the two drawers dove-tailed in, made of black walnut or whitewood.

Lesson X.—A chest, 2 feet long, 12 inches wide, and 12 inches deep, dove-tailed and glued together, the bottom fitted inside. Base, 3 inches wide, chamfered on the upper edge and mitred together at the corners. Trimming around the top beaded, 2 inches wide, and mitred together at the corners.

Lesson XI.—Make a mortise and tenon, and fit them together. This is a preparation for the next lesson.

Lesson XII.—Cover for the chest (Lesson X.), put together with mortise and tenon, with a panel in the centre.

Lesson XIII.—A writing-desk, 12 inches long, 9 inches wide, 3 inches deep at back, and  $1\frac{1}{2}$  inches deep in front, with compartments for pens and ink. Cover put on with hinges.

Lesson

Lesson XIV.—Stuff 3 inches wide, 2 inches thick, and 6 inches long, framed together with a key-tenon.

Lesson XV.—Table with a drawer. Top 3 feet long, and 1 foot 8 inches wide, made of two boards glued together. Frame put together with mortice, tenon, and draw-box. Cross pieces 6 inches wide. Legs square and tapering.

The tools at each bench were:—Splitting saw, cutting-off saw, fore or jack-plane, trying-plane, smoothing-plane, butt-panel-plane, hammer, mallet, rule, trying-square, bevel, marking-gauge, mortise-gauge, five auger-bits and a brace, five firmer chisels, screw-driver, countersink, brad-awl, scratch-awl, nail-set, chalk line and reel, oil-stone, oil-can, bench-brush. A few other tools, when needed, are furnished to individuals, but, as a general rule, they are not often wanted.

This arrangement for the Boston public schools was entirely experimental, and all that could be done at the time, for want of workshops. Since then workshops have been built in connection with the schools in many parts of the city. Manual training has become general and, as a rule, is taught by the regular teacher.

I shall now describe several other of the United States schools that have been established within the last five years, so as to give information of a thoroughly practical and reliable character, as to the latest development in subjects and methods having in view the needs of the system of public instruction as now organised in this Colony.

# THE TOLEDO MANUAL TRAINING SCHOOL.

The Toledo Manual Training-school was established under the provisions of an ordinance unanimously adopted by the common council, and is maintained under the joint control of the Board of Education and the directors of the Toledo University. The new building was opened on December 5th, 1885.

In the workshops, and in freehand and mechanical drawing, instruction is furnished by the University Board, while the intellectual studies, which must go hand-in-hand with the development of manual training, are furnished in the prescribed grammar and high-school courses of the public schools.

The object of the Manual Training-school is to furnish instruction and practice in the use of tools, together with mathematics, drawing, and the ordinary English branches of a high-school course. The tool instruction includes carpentry, woodturning, pattern-making, iron chipping and filing, forge-work, brazing, and soldering, the use of machine, shop tools, and such other instruction of a similar character as may be deemed advisable to add to the foregoing from time to time. The working hours are divided, as nearly equal as possible, between the manual and mental exercises. This school clearly recognises the pre-eminent value and necessity of intellectual development and discipline, and exacts close and thoughtful study as well in the class-room as with the tools. It has lengthened the usual school-time by an hour, and has also abridged considerably the number of recitations. time thus gained is given to drawing and tool-work, thus securing more equally the liberal, intellectual, and physical development of the pupils. One of the great objects of the school is to foster a higher appreciation of the value and dignity of intelligent labour, and the worth and respectability of labouring men. A boy who sees nothing of manual labour but mere brute force, despises both the labour and the labourer. With the acquisition of skill in himself comes the ability and willingness to recognise skill in his fellow-men. When once he appreciates skill in handicraft, he regards the workmen with sympathy and respect.

All the shop work is disciplinary; special trades will not be taught, nor will articles be manufactured for sale. The Board were of opinion that the scope of a single trade is too narrow for educational purposes. Manual training should be as broad and liberal as it is intellectual. The desired end is the acquirement of skill in the use of tools at the same time the pupil is progressing in general knowledge.

The pupils of the Toledo public schools are not entitled to enter the Manual Training-school until they reach the senior grammar or junior high school grades, and pupils of private or parochial school are entitled to enter if they have pursued a course of study corresponding in grade to that specified in the grammar and high schools, and no pupils are admitted under 13 years of age.

All applicants who have not obtained admission as above, must pass a good examination in the following studies:—Spelling, writing, punctuation, penmanship, and the use of capitals; in grammar, as far as Syntax, and in correct forms of expression in writing; arithmetic, to equation of payments, tables and weights and measures, and their uses; common school geography, and the history of the United States.

The combined course of instruction covers four years, and the school work of the pupil is as follows:—

# FIRST YEAR.

Senior Grammar School-

- 1. Mathematics.—Arithmetic.
- 2. Science.—Physical geography.
- 3. Language.—Grammar, spelling, writing, English composition.

### Manual Training School-

- 4. Freehand drawing and mechanical lettering.
- 5. Shop work.—Carpentry, joinery, jig-sawing, proper care and use of tools.

## SECOND YEAR.

### Junior High School-

- 1. Mathematics.—Arithmetic, algebra.
- 2. Science.—Physiology and botany.
- 3. Language.—Grammar, rhetoric, writing.

### Manual Training School-

- 4. Drawing.—Freehand and mechanical; designs for wood-carving.
- 5. Shop work.—Wood-turning, pattern-making, wood-carving, clay modelling.

## THIRD YEAR.

# Middle High School-

- 1. Mathematics.—Geometry, arithmetic reviewed.
- 2. Science.—Physics.
- 3.—Language.—English composition, history.

### Manual Training School—

- 4. Drawing.—Freehand and architectural; designing from plant and leaf forms.
- Shop work.—Forging, welding, tempering, brazing and soldering, moulding and easting.
   FOURTH

# FOURTH YEAR.

Senior High School-

- 1. Mathematics.—Plane trigonometry, mechanics.
- 2. Science.—Chemistry, book-keeping, ethics; rights and duties; laws of right conduct.
- 3. Language.—Political economy, English literature and composition.

Manual Training School-

- 4. Drawing.—Machine and architectural details, decorative designing.
- 5. Machine shop work.—Chipping, filing, turning, drilling, planing, &c.; study of machinery, care of steam-engine and boilers; study of electrical machinery and gas-engines.

In the first year, German may be taken in place of physical geography; in the second year, in the place of rhetoric or physiology; in the third year, in the place of history; in the fourth year, in the place of English literature.

Three-quarters of an hour are daily given to drawing, and one hour and a half to shop work. The rest of the time is devoted to study and recitation. Each pupil has to recite three lessons daily, which have to be learned at home. The standard of the pupils is equal to that of the best high schools. The Directors of the Toledo University give a diploma on graduation, in addition to the regular diploma for high school work. Latin, French, and German are optional studies.

Drawing is taught in three general divisions:—Freehand, to teach the eye to observe accurately, and to train the hand to delineate. Mechanical drawing includes the use of instruments, and technical drawing illustrates conventional colouring; systems of architectural drawings, shop fronts, &c., together with proportions and details of machine work and construction.

The workshop instruction is given in the same way as laboratory lectures. The instructor shows practically how the work is done, using the black-board if required. The Board state, "The habit of working from drawings, and to nice measurements, has given the students a confidence in themselves altogether new. This is shown in the readiness with which they undertake the execution of small commissions on behalf of the school, and the handiness which they display at home."

There are evening classes also under the control of the Board of Education, and the Manual Training School Directors. Instruction is mainly confined to mathematics, physics, and drawing, as applied to the arts and manufactures, and is arranged so as to be of especial value to the various handicrafts. Brief lectures, accompanied by drawings and illustrations on the black-board, also are employed to impart instruction. The subjects have reference to construction, practical geometrical problems; how to use the T square, set square, and the usual drawing instruments; how to draw and indicate centre-lines, radial lines, and dimension lines, line-shading, and brush-shading, scale-drawing; how to construct scales; how to proportion and draw hexagon and square nuts, projections of plain objects, block letters, plain and oblique projection; how to indicate the section of different materials, freehand sketching, styles of architecture, the orders and details, perspective, sheet metal, and pattern work, &c., &c.

After studying the system thoroughly and carefully observing the school work for nearly a year, Mr. School Superintendent Dowd stated among other things that it was certainly true that the training in a manual training school lets in a flood of light upon a thousand things but imperfectly understood before.

This school has taken the initiative in giving the boys of the senior grammar grade the same programme of shop work and drawing as that given in the first year at the St. Louis Manual Training School. It is stated that the result has been very successful.

The Toledo school has also provision for giving manual training to girls. In separate classes girls are taught the same drawing as the boys, but also light woodwork and wood carving, together with cooking and its chemical aspect, needlework, cutting and fitting as applications of mechanical drawing.

The following is the course of combined study and training for girls:-

## DOMESTIC ECONOMY DEPARTMENT.

## FIRST YEAR.

- 1. Mathematics.—Arithmetic.
- 2. Science.—Physical geography.
- 3. Language.—Grammar, spelling, writing, English composition.
- 4. Drawing.—Freehand and mechanical, lettering.
- 5. Domestic Economy.—Light carpentering, wood-carving, care and use of tools.

#### SECOND YEAR.

- 1. Mathematics.—Arithmetic, algebra.
- 2. Science.—Physiology, botany.
- 3. Language.—Grammar, rhetoric, writing.
- 4. Drawing.—Freehold and mechanical designs for wood-carving.
- 5. Domestic Economy.—Clay modelling, wood turning, introduction to course in cooking or garment cutting and making.

### THIRD YEAR.

- 1. Mathematics.—Geometry, arithmetic reviewed.
- 2. Science.—Physics.
- 3. Language.—English composition, history.
- 4. Drawing.—Freehand and architectural, designing from plant and leaf forms.
- 5. Domestic Economy.—Instruction in preparing and cooking food, purchasing household supplies, care of the sick, &c.

#### FOURTH YEAR.

- 1. Mathematics.—Plain trigonometry, mechanics.
- 2. Science.—Chemistry, book-keeping, ethics, rights and duties, laws of right conduct.
- 3. Language.—Political economy, English literature and composition.
- 4. Drawing.—Machine and architectural details, decorative designing.
- 5 Domestic Economy.—Cutting, making, and fitting of garments, household decorations, typewriting.

  The

The catalogue states that the above course in domestic economy is arranged with special reference to giving young women such a liberal and practical education as will inspire them with a belief in the dignity and nobleness of an earnest womanhood, and incite them to a faithful performance of the every day duties of life; it is based upon the assumption that a pleasant home is an essential element of broad culture, and one of the surest safeguards of morality and virtue.

The design of this course is to furnish thorough instructions in applied house-keeping, and the sciences relating thereto; and students will receive practical drill in all branches of housework, in the purchase and care of family supplies, and in general household management, but will not be expected to perform more labour than is actually necessary for the desired instruction.

In cooking, practical illustrations will be given in the means employed in boiling, broiling, baking, frying, and mixing as follows:—

- Boiling.—Practical illustrations of boiling and steaming, and treatment of vegetables, meats, fish, and cereals, soup-making, &c.
- Broiling.—Lessons and practice in; meat, chicken, fish, oysters, &c.
- Bread-making.—Chemical and mechanical action of materials used; manipulations in bread-making in its various departments. Yeasts and their substitutes.
- Baking.—Heat in its action on different materials in the process of baking. Practical experiments in baking bread, pastry, puddings, cake, meats, fish, &c.
- Frying.—Chemical and mechanical principles involved and illustrated in the frying of vegetables, meats, fish, oysters, &c.
- Mixing.—The art of making combinations, as in soups, salads, puddings, pies, cakes, sauces, dressings, flavourings, condiments, &c.

Marketing and Economy.—The selection and purchase of household supplies. General instructions in systematising and economising household work and expenses. The anatomy of animals used as food, and how to choose and use the several parts. Lessons on the qualities of water and steam; the construction of stoves and ranges; the properties of different fuels.

The textile fabric work will cover instructions in garment cutting and making, the economical and tasteful use of materials, millinery, &c.

In a late report it is stated "that the interest in this school continues to increase, and that the classes increase in numbers—that other communities have been watching the example of Toledo with great interest. The letters of inquiry and personal visits from all sections of the country indicate the widespread interest in the manual training school movement. This is further evidenced by the attention which this topic has received in the leading magazines and newspapers during the last year. Many of our most conservative thinkers regard this practical instruction furnished to all the children of the State, and within the reach of all, as one of the most prominent factors in the solution of social problems."

# ALBANY HIGH SCHOOL.

In the State of New York manual training has been introduced into the public schools. The Albany High School was one of the first schools that organised classes

for this purpose. A special committee was appointed to inquire and report upon its advisability. The report was favourable, and the Board adopted the following resolutions in October, 1887:—

"That it is expedient and advisable that manual training be added as a part of the course of instruction in our public schools."

"That for the purpose of giving the new system a fair trial in the most economical manner possible, one of the rooms in the basement of the High School building be fitted up as a wood-working shop; that a competent instructor be employed to teach the boys in attendance at the High School in the proper use of wood-working tools for a period of one year, the total cost not exceeding 1,500 dollars—£300."

The Industrial Education Commission stated that "pursuant to these resolutions the appropriation was duly made, the workshop fitted up, and in January, 1888, the classes were organised, and the course opened."

The shop was furnished with twelve double work benches, giving ample space for classes, or divisions of twenty-four boys each. Twenty-four kits of tools were provided, each consisting of the following:—1 wooden jack-plane, 1 Bailey iron fine plane, 1 Bailey block-plane, 1 trying square, 1 back saw, 1 marking gauge, 1 mortise gauge, 1 sliding T level, 1 screw-driver, 1 pair winged dividers, 5 auger-bits, from  $\frac{1}{4}$  inch to  $\frac{7}{8}$  inch, 2 gauges  $1\frac{1}{4}$  inch and  $\frac{3}{4}$  inch, 5 socket chisels  $\frac{1}{4}$  to  $1\frac{1}{2}$  inch, 1 oil stone, 1 oil can, 1 hammer, 1 two-foot rule, 1 brace, 1 mallet, 1 cutter-board, 1 duster.

The following tools for general use were also furnished:—Counter-sink, bradawls, files, gimlets, bits, four cross-cut saws, four rip saws, one set of numbers and letters to mark and distinguish each pupil's work, one dozen iron hand clamps, brass stencil to mark aprons and hooks, six saw benches, a grind-stone, and a saw-clamp.

A lavatory of twelve basins and ample towels permits each division to wash and dry hands in a moment, while each pupil provides himself with a long work apron to protect his clothing while at the bench.

The cost of fitting and furnishing the shop was as follows:-

Twelve double work benches							\$156.00
Tools		,		***	•••	• • •	251.15
Materials					•••	•••	<b>1</b> 4·41
Lavatory		•••	111			•••	140:10
Carpenter	and	painting	bills	***	•••		23.00
_		=					_

\$584 66 or £117.

The special teachers were paid \$800 or £130 a year; materials, breakage, &c., costs about \$200—£40—so that the running expenses of this shop, giving instruction to 250 boys, will be about \$1,000, or £200 a year.

The shop was opened for class work in February. The boys of the first and second years were required to join in this work, but those of the two upper classes were permitted to volunteer. Much to the surprise of the teachers every boy in the school announced his desire to take the new course, and before many weeks had elapsed the senior boys, conscious that their time was limited to the few weeks of school, left before their graduation, formed a special class to take lessons after school hours, and on Saturdays, thus giving the strongest evidence of their high appreciation of the chance afforded them of getting even a brief course in manual training.

The

The course of instruction is as follows:—The drawing teacher exhibits an object to the class; the pupils make a working drawing from the object, carry the latter to the shop, and from it reproduce the object in wood. Of course this is preceded by a sufficient number of lessons in the use of tools to enable the pupils to work readily and intelligently. Principles of construction are taught as well as the most general use of tools. Nothing is made for use or for sale. Some specimens of work are kept to illustrate the work of the shop; the rest are either used over in the preliminary course in the use of tools, or are broken up and destroyed.

From our experience, says the general report, we believe that it is established that manual training is legitimate educational work in our schools, and the report of the Principal of the High School states: "The most signal departure of the year was the establishment of the manual training department on the 1st of February, the large well-lighted play-room of the boys' gymnasium was ready, with its twenty-four well-equipped benches to receive the first class in manual training. Work in this department was required of all the boys in the two lower classes, but was made voluntary in the two upper classes, in order that the experiment might not at the outset be complicated by any opposition or antagonism from those whom it was established to benefit. The result was that within one week almost every boy of the entire two hundred was enrolled in one of the manual divisions. By a careful adjustment of our programme of daily recitations, I was able to give to each boy two recitation hours per week at the bench without interference with other recitations. By this arrangement also every bench was occupied, almost every available hour of the week.

"I think more time could profitably be devoted to this branch than is now given, without detriment to other departments. Indeed few subjects taught in the school receive more than the equivalent of two hours per week during the entire four years. I believe the Board has adopted the true policy in this matter, not to turn our high school into a trades' school, but to add—what the term signifies—hand training to that of mind training. As certain lines of study have been found best fitted for mental training, so the line of work selected for this new department seems best fitted to develop manual skill. Of course the whole subject of manual training, as related to our public schools, is still in its infancy, but I hope to see it so far extended as to include instruction to the girls as well as to the boys. A beginning could certainly be made with very little expense. Should it be deemed advisable to add instruction in mental work to that in wood work for the boys, we have a room in the building that could easily be arranged for the purpose."

The following is a partial schedule of the work thus far laid out for this department:—

- 1. Hammer and planes.
- 2. Planing and sawing.
- 3. Housing.
- 4. Housing angles (1).
- 5. Housing angles (2).
- 6. Housing angles (3).
- 7. Boring square perpendicular and horizontal.
- 8. Boring angles.

- 9. Square butt-joint; nailing exercise.
- 10. Square butt-joint; toe-nailing exercise.
- 11. Square butt-joint, housed and glued.
- 12. Square butt boxed and glued.
- 13. Halving at corners, nailed and glued.
- 14. Halving at corners and glued.

- 15. Halving at centres and glued.
- 16. Slip mortise and tenon.
- 17. Half blind, slip mortise and tenon, glued.
- 18. Mortise and tenon.
- 19. Blind mortise and tenon.
- 20. Corner mortise and tenon.
- 21. Double slip mortise and tenon.
- 22. Double mortise and tenon.
- 23. Mitre, square, edge, nailed, and glued.
- 24. Mitre, square, flat, nailed, and glued.
- 25. Half mitre and half square.
- 26. Half mitre and half square, slip mortise and tenon.
- 27. Half dovetail corner.
- 28. Half dovetail centre.
- 29. Half dovetail and half square.
- 30. Dovetail, one tenon.

- 31. Dovetail, one tenon reverse.
- 32. Dovetail, butt-joint.
- 33. Dovetail, brace-joint.
- 34. Dovetail, two tenons.
- 35. Dovetail, three tenons.
- 36. Dovetail, three tenons and halved.
- 37. Dovetail, three tenons, half blind (1).
- 38. Dovetail, three tenons, half blind (2).
- 39. Double dovetailing, two tenons.
- 40. Double dovetailing, two tenons half blind.
- 41. Double dovetailing, two tenons blind.
- 42. Dowelling square butt.
- 43. Dowelling square butt, halved.
- 44. Dowelling square butt blind:
- 45. Kerfing and bending.
- 46. Splicing and scarfing.

It will be seen from the above list of exercises that the course is very simple, and also that it can be carried on most economically, and is, moreover, what it truly professes to be work that trains the hand while it instructs the eye, at the same time cultivating the mind through the senses of touch and perception. I append the Albany Report on Manual Training by a Special Committee appointed by Board of Public Instruction. [See Appendix E.]

#### ST. PAUL PUBLIC SCHOOLS.

In Minnesota the St. Paul Public Schools have adopted a system that is somewhat different in its details. The City Superintendent of Schools in his annual report gives a statement of the considerations which led to its adoption, and the cautious spirit in which operations were conceived and conducted. I give extracts from the report which illustrates the system. The beginning was in a small way, only 500 dollars—£100—being appropriated to fit up a small shop.

About the 1st October, 1887, a room in the basement of the high school building was fitted up with benches, tools, and other necessary appliances to accommodate forty-eight pupils in woodwork. On canvassing the high school it was found that about twice that number wished to avail themselves of the practice in this department, so that accommodation was made for ninety-six pupils. Eight classes of twelve each were formed, five of boys and three of girls. The pupils took hold of the work with much enthusiasm, and in most cases the interest continues unabated. The work in this department at present does not take the place of, or encroach upon the time of, any other department, but is really extra work which is done during the hours usually devoted to recreation. Only two of the classes practise during the regular school hours, the other six succeeding each other in the afternoon from 1:30 to 4:30. The boys classes each have two lessons of one and one and a half hours, and the girls of

one lesson of the same duration per week. Manual training is optional, but after a pupil has chosen it, he cannot leave off without presenting a note from his parents. The course of study pursued is as follows:—

- 1. Exercises in methods of holding and using the following tools:—1. Trying-square; 2, gauge; 3, dividers; 4, bevel; 5, saw; 6, mallet; 7, chisel; 8, plane.
- 2. Elementary frame work in pine from blue prints made by the instructor, using the abovenamed tools and making—1, a cross-lap joint; 2, tenon and mortise joint; 3, end tenon and mortise frame; 4, blind tenon and mortise brace frame.
- 3. Lathe work, comprising cylinders, spindles, handles, rosettes, &c., &c.
- 4. Advanced frame work in various kinds of woods, from drawings made by the pupils, including—1, mitre lap joint; 2, dovetail joint; 3, lap dovetail joint; 4, methods of scarfing; 5, keyed joints; 6, double-dovetail puzzle, &c., &c.
- 5. Small articles embracing—1, frame-work; 2, nail-driving; 3, turning; 4, jig-sawing, &c., &c.; making boot blacking-box; cannon on carriage; wind-mill, &c.
- 6. Cabinet work in hardwood, comprising—1, sawing; 2, turning; 3, framing; 4, carving; 5, panelling, &c. Making—1, brackets; 2, foot rests; 3, wall-pockets, &c.

Each boy is required to do every piece of work of Nos. 1, 2, and 3. In Nos. 4, 5, and 6, the pupils do not all do the same kind of work, but are given work which will suit their individual ability and taste to some extent. During the course the pupils take turns at the drafting-board, where they make working drawings from sketches previously brought in of objects to be afterwards worked out in wood. The work is by no means intended to take the place of the work in the drawing-room, but is intended to supplement it with work developing certain functions of the mind, and teaching certain practical methods which ordinary drawing work cannot do. A pupil is asked to make his sketch of his most approved pattern of a box on which to black his boots. This sets him thinking. After he has the idea it often puzzles him to put it on paper in good form. After an intelligible sketch he makes a working drawing to scale, and later the object in wood. He takes pride in the box, because it is his own design, and he will put his best work into it.

From time to time during the course, conversations, illustrated as far as possible, are given on subjects connected with, or suggested by the work, such as the uses and methods of obtaining and using shellac, glue, turpentine, rosin, &c., also the history of saws and other tools, with a glance at methods of obtaining iron and steel.

The course for the girls is made up of No. 1 of the above, with the exception of the use of the plane; a lesson in nail-driving, modelling of simple, ornamental forms, and carving the same in wood. Each pupil is given the opportunity of selecting some object to ornament with wood-carving. If approved by the instructor, the pupil is permitted to make a working drawing, and clay model of the ornamental parts, and then carve the same in wood. The High School buildings have been added to, and six large rooms opened for the new work. The Principal of the school goes on to say that, "regarding the attitude of the public towards the matter,

I think I can safely state that we have the hearty support of everyone that knows the scope of our work, and of many who do not. We are aware that our school differs from those of some of our western sisters and eastern cousins, but we have studied the matter quite carefully, and at last have taken a decided step." The Committee on Manual Training who reported to the Board in 1888, among other things, state, "Manual training, if introduced properly into our schools, must take the place of something less important and practical. One or two lessons per week in shop work, taken by pupils who are already pursuing an exacting course of study, will scarcely meet the end proposed by the friends of the new education. As to the ultimate future of the movement which is finding expression in many manual experiments in the school systems of our larger cities, it is believed that courses of study will be modified. Primary schools will train children to observe and express their notions in clay and with the pencil, as well as abstractedly in language. This will be the manual training of the primary grades. In schools between the primary and high school, there will be less drill in the technicalities of grammar, less memorising of the details of geography, less puzzling over abstractions and more teaching, which shall bring pupils into contact with material things and forces, and which shall give them ability, not only to express thought by language, but by the graphic and creative work of the hand. This will be the manual training of these intermediate grades. Then would come the manual training school, which would admit pupils from the eighth or even a lower grade, if experience should show it to be desirable, but at least at an age when they could profitably take up the work of the school. In this school, pupils who desire to advance on this line rather than to enter the high school would take a three years' course of study, including the studies of English, mathematies, and science, with two hours' shop work per day and one hour instruction in A report from the Committee on Manual Training presented to the Board of Education of St. Paul's, and adopted in 1888, is appended. [See Appendix F.]

## NEW HAVEN PUBLIC SCHOOLS.

In Connecticut the New Haven Public Schools will furnish the best example. At New Haven, under the shadow of Yale University, that venerable seat of learning founded in the day when Connecticut was an English colony, and George the III. was King, the matter of manual training has been thoroughly studied, and a systematic course of lessons determined upon, involving the use of the ordinary tools and practice in the various steps of carpentry and woodwork. Wood-carving has also been introduced as an optional class on Saturdays. Working drawings are made by the pupils and used to work to, and it will be sufficient for me to give the scheme of the lessons, and to state that each tool when it is first used is described, the different parts named, and the way to hold and use it explained. After the boy has learned how to use the tool he is instructed how to sharpen it on the oil-stone and to keep it in good order.

Lesson I. Hammer.—(1.) Exercises in striking a block of wood with hammer, to show wrist, elbow, and shoulder movements, and to learn to strike "square." (2.) Exercises in driving nails of different sizes perpendicularly, and in drawing them. (3.) Exercises in nailing two boards  $\frac{7}{8}$  inch thick together, with nails of different sizes driven obliquely, and in drawing them. Chiscl and Trying-square.—(4.) Take board 6 inches square, mark out the corners square with trying-square and lead pencil; cut them out perpendicularly with 1 inch firmer-chisel. (5.) Take board 6 inches square, round the corners with 1 inch firmer-chisel, cutting perpendicularly; prove with trying-square.

Lesson

Lesson II. Chisel to Line.—(1.) Take piece 12 inches long,  $1\frac{1}{2}$  inch wide,  $\frac{7}{8}$  inch thick, and mark with rule and compass a pointed arch at one end, and a round arch at the other end; shape out with 1 inch firmer-chisel, cutting with the grain from side to centre of arch. Halving.—(2.) Take two pieces 6 inches long,  $2\frac{1}{2}$  inches wide,  $\frac{7}{8}$  inch thick, and halve them together, using rule, trying-square, single gauge, scratch-awl, tenon-saw,  $1\frac{1}{4}$  inch firmer-chisel, and cutting-board. Always use cutting-board to save cutting the bench. Half Dovetail.—(3.) Make a half dovetail with one piece 5 inches long,  $1\frac{1}{4}$  inch wide, and  $\frac{7}{8}$  inch thick, and one 4 inches long,  $1\frac{1}{4}$  inch wide, and  $\frac{7}{8}$  inch thick, using the same tools as in (2), except  $\frac{1}{2}$  inch chisel instead of  $1\frac{1}{4}$  inch.

LESSON III. End Mortise and Tenon.—(1.) Take piece 5 inches long,  $1\frac{1}{4}$  inch square, and form mortise in one end; take piece same size and form tenon at one end; using rule, trying-square, scratch-awl, mortise gauge, tenon-saw,  $\frac{3}{8}$  inch chisel, and bench vice. Boring.—(2.) Take piece 3 inches long,  $1\frac{1}{4}$  inch square, centre the sides and ends with single gauge, put in the vice and bore half-way through with  $\frac{1}{4}$  inch bit; reverse thebore from theother end. (3.) Repeat the above, using  $\frac{3}{8}$  inch,  $\frac{1}{2}$  inch,  $\frac{5}{8}$  inch,  $\frac{3}{4}$  inch, and  $\frac{7}{8}$  inch bits.

LESSON IV. Sawing Square.—(1.) Take piece 12 inches long,  $1\frac{1}{4}$  inch wide,  $\frac{7}{8}$  inch thick, mark two sides 1 inch from end with trying-square and scratch-awl, and saw off evenly. (2.) Repeat the above, sawing off piece  $\frac{7}{8}$  inch,  $\frac{3}{4}$  inch,  $\frac{1}{2}$  inch,  $\frac{2}{8}$  inch,  $\frac{1}{4}$  inch, and  $\frac{1}{8}$  inch. Through Dovetail.—(3.) Take one piece 4 inches long,  $1\frac{1}{8}$  inch square, and make through dovetail, using  $\frac{1}{2}$  inch chisel for cutting.

Lesson V. Jack-plane.—(1.) Take piece 18 inches long, 12 inches wide,  $1\frac{1}{2}$  inch thick, place on bench, flat side down, end firmly against bench-hook, and plane off a few shavings with jack-plane as set. (2.) Take the plane apart, naming its parts; put it together and practice setting it, comparing the shavings, until it is set correctly. (3.) Take piece 6 inches square,  $\frac{7}{8}$  inch thick, mark off the corners, forming an octagon, using rule, compass, and scratch-awl; saw off corners, leaving line and smooth edges with block plane. Panel Saw.—(4.) Take board 8 feet long, 6 inches wide,  $\frac{7}{8}$  inch thick, lay off a line with trying-square and lead pencil 6 inches from the end, and saw off, leaving line. (5.) Repeat the above, sawing on the line.

Lesson VI. Grooving.—(1.) Take piece 3 inches long, 3 inches wide,  $\frac{7}{8}$  inch thick, and make a groove  $\frac{1}{2}$  inch wide,  $\frac{1}{2}$  inch deep, through the centre across the grain, using rule, mortise gauge, trying square, scratch-awl, tenon-saw, bench-hook,  $\frac{3}{8}$  inch firmer-chisel, bench vice and cutting-board. (2.) Take piece 4 inches long, 3 inches wide,  $\frac{7}{8}$  inch thick; cut a tenon on one end to fit groove, using same tools as in 1. (3.) Round the ends of both pieces with firmer-chisel, using trying-square to prove correctness of work. (4.) Put together and test with trying-square. Ripping Saw.—(5.) Take board 8 feet long, 12 inches wide,  $\frac{7}{8}$  inch thick; mark off with single gauge a strip 2 inches wide; put it on the horse and saw to line, then put the board in the bench vice, one end resting on the bench pin; plane with jackplane, and true-up with jointer, using trying-square to prove it. (6.) Repeat the above sawing on the line.

Lesson VII. Framing.—(1.) Saw from a board a strip 2 feet long, 1 inch wide, and  $\frac{7}{8}$  inch thick, using single gauge and ripping saw. (2.) Square up with foreplane, trying-plane, and trying-square. (3.) Saw off with tenon-saw piece 12 inches long for style, and one 5 inches long for rail. (4.) Form mortise in style, and tenon on rail, using bench vice, tenon-saw, bench-hook, 1 inch firmer-chisel,  $\frac{3}{8}$  inch mortise chisel and mallet.

LESSON VIII. Framing, completed.—(1.) Drive together the pieces prepared in the last lesson and smooth face with block plane. Halving.—(2.) Saw from a board piece 40 inches long, 1 inch wide,  $\frac{7}{8}$  inch thick, using ripping saw. (3.) Square it up with jack-plane, trying-plane, and trying-square gauging it to thickness and width. (4.) Cut-off two pieces 12 inches long and two 8 inches long, and halve corners to-gether, making a frame with ends projecting 1 inch.

LESSON IX. Halving, completed.—(1.) Round the ends of the pieces prepared in the previous lesson, using compasses, firmer-chisel, and wood-file. (2.) Put together and smooth up with block-plane. (3.) Sawing and Planing.—Saw from piece of stuff piece 12 inches long, 2 inches square. (4.) Square it and plane all sides. (5.) Cut from piece of board piece 4 inches long, 4 inches wide,  $\frac{7}{8}$  inch thick. (6.) Square it, and plane all sides.

Lesson X. Gauging.—(1.) Centre, with marking gauge, on all sides from end to end, the 12-inch piece prepared in last lesson. (2.) Square off a line all around,  $\frac{3}{4}$  inch from end, then on that line point off  $\frac{5}{8}$  inch on each side of centre, on all four sides; from the points thus obtained draw lines obliquely to the corners at the other end; then draw lines, from the said points, on the line squared off, to the centre of the top. Bevelling.—(3.) Bevel with a draw-knife, and plane true, using level to prove the work. Chamfering.—(4.) Chamfer the top to a point, as marked out.

Lesson XI. Dowelling.—(1.) Draw a line through the centre of the base of the column, made in the last lesson, point off  $\frac{3}{3}$  inch on each side of centre. Make centres with scratch-awl, to bore from, and bore holes perpendicularly 1 inch deep, with  $\frac{1}{4}$  inch twist bit. (2.) Glue in  $\frac{1}{4}$  inch dowels; ends to project  $\frac{5}{3}$  inch. (3.) Centre the piece 4 inches square, prepared in Lesson IX. (4.) Measure  $\frac{3}{3}$  inch on each side bore perpendicularly holes  $\frac{5}{3}$  inch deep. (5.) Set gauge  $\frac{3}{3}$  inch, and gauge round the top and sides, chamfer off, using 1 inch firmer-chisel, true up with block-plane and trying-square. (6.) Glue together, making column and plinth.

LESSON XII. Draw-knife, planing to line.—(1.) Saw from stuff strip 12 inches long 2 inches square. (2.) Square up sides and ends. (3.) Gauge off  $\frac{3}{8}$  inch from all the corners, put in bench vice, take off corners with draw-knife and plane to a line.

LESSON XIII. Mortising.—(1.) Saw from a piece of stuff two pieces 12 inches long,  $1\frac{1}{2}$  inch wide,  $\frac{7}{8}$  inch thick, for styles; and two pieces 8 inches long,  $1\frac{1}{2}$  inch wide,  $\frac{7}{8}$  inch thick for rails. (2.) Square them up. (3.) Form mortise in styles, and saw tenon in rails. (4.) Mortise to be two-thirds the thickness of the style, rails to enter styles  $\frac{3}{4}$  inch from the end, and tenons to project  $\frac{5}{8}$  inch.

Lesson XIV. Mortising completed.—(1.) Finish up and fit mortise and tenon commenced in last lesson with chisel. (2.) Round the ends of tenons. (3.) Drive together and plane off back and front.

Lesson XV. Glue joint.—(1.) Saw from stuff two pieces 3 feet long, 3 inches wide,  $\frac{7}{8}$  inch thick. (2.) Plane the edges square with jack-plane, trying-plane, and trying-square. (3.) Joint together.

Lesson XVI. Bevelling.—(1.) Saw from stuff two pieces 3 feet long, 3 inches wide,  $\frac{7}{8}$  inch thick. (2.) Square them up. (3.) Mark on edge with bevel (set to templet 45°) and plane to bevel with jack-plane, fore-plane, and trying-plane.

LESSON

LESSON XVII. Blind or mitre mortise.—(1.) Saw from stuff two pieces 6 inches long, 2 inches wide,  $\frac{7}{8}$  inch thick. (2.) Square them off. (3.) Make mitre mortise and tenon, using trying-square, scratch-awl, mortise gauge, tenon-saw,  $\frac{3}{8}$  inch mortise chisel, and bevel. (4.) Put the mortised piece in mitre-board and plane true.

LESSON XVIII. Blind or mitre mortise completed.—(1.) Drive together the pieces made in last lesson. (2.) Level off faces and ends with block-plane. (3.) Round the ends to finish.

LESSON XIX. Mitreing.—(1.) Saw from stuff strip 18 inches long, 3 inches wide,  $\frac{7}{8}$  inch thick. (2.) Smooth it up and square it. (3.) Out into four pieces 4 inches long. (4.) Mark corners of each piece on flat side with scratch-awl and bevel (set to templet 45°). (5.) Put in mitre-box and saw to line. (6.) Put in mitre-board and true up. (7.) Fit together and test with trying-square.

LESSON XX. Mitreing completed.—(1.) Glue together the pieces made in the last lesson and key it, making a frame. Dovetail.—(2.) Saw from stuff two pieces 4 inches long, 3 inches wide,  $\frac{7}{8}$  inch thick. (3.) Square them up. (4.) Mark for dovetail and saw out.

Lesson XXI. Dovetail completed.—(1.) Chisel out and fit the pieces made in last lesson. (2.) Drive them together and level off with block-plane. (3.) Round the ends.

LESSON XXII. Framing and wedging.—(1.) Saw from stuff one piece 6 inches long,  $1\frac{1}{4}$  inch square, and one piece 4 inches long and  $\frac{1}{4}$  inch square. (2.) Square them up. (3.) Form mortise  $\frac{3}{8}$  inch by  $1\frac{1}{4}$  inch in long piece, using mortise gauge and  $\frac{3}{8}$  inch mortise chisel. (4.) Form tenon on short piece to fit mortise and to project 1 inch. (5.) Cut hole in tenon, bevelled on one side for wedge, using  $\frac{1}{4}$  inch chisel. 6. Drive together and wedge.

Lesson XXIII. Squaring to sizes.—(1.) Saw strip  $1\frac{1}{2}$  inch wide, from  $1\frac{1}{2}$  inch plank. (2.) Gauge the size. (3.) Plane with jack-plane, and true up with jointer and trying-square.

LESSON XXIV. Planing to width.—(1.) Take  $\frac{1}{2}$  inch board, about 6 feet long, 8 to 10 inches wide, and saw off strip  $4\frac{1}{2}$  inches wide. (2.) Plane with jointer to  $4\frac{1}{4}$  inches. (3.) Saw off two pieces 8 inches long for sides, and two pieces  $4\frac{1}{2}$  inches long for ends of a box. (4.) Square edges and smooth faces with block plane.

LESSON XXV. Dovetail.—(1.) Set single gauge to  $\frac{9}{16}$  of an inch, and square around the ends of pieces prepared in last lesson. (2.) Mark for dovetails. (3.) Form dovetails, using  $\frac{1}{3}$  inch and  $\frac{1}{4}$  inch chisel, and cutting from both sides.

LESSON XXVI. Dovetail, completed.—(1.) Finish up and fit dovetails. (2.) Glue together and clamp with hand-screws, taking care to bring the joints up, and to keep the box square, using trying-square at every corner.

LESSON XXVII. Smoothing and Sand-papering.—(1.) Saw out two pieces  $5\frac{1}{2}$  inches by 9 inches for top and bottom of box. (2.) Square up edges and smooth faces. (3.) Smooth sides and ends of box with block-plane. (4.) Sand-paper clean and smooth. (5.) Level off top and bottom edges.

LESSON XXVIII. Nailing.—(1.) Nail on top and bottom pieces with  $1\frac{1}{4}$  inch No. 16 wire nails, being careful to drive the nails straight, and in the centre of thickness of sides and ends. Moulding.—(2.) Get piece 40 inches long,  $\frac{7}{8}$  inch square,

from

from a board in stock. (3.) Square to  $\frac{1}{8}$  inch, and quarter round with jack-plane; making a moulding for bottom of box. (4.) Get from stuff piece 40 inches long,  $\frac{1}{2}$  inch square. 5. Square to  $\frac{3}{8}$  inch, and quarter round; making a moulding for top of box.

Lesson XXIX. Mitreing.—Saw moulding made in last lesson, in lengths to fit box—mitreing the corners in mitre-box—and glue them on the box.

LESSON XXX. Bevelling.—(1.) Plane the edges of top and bottom of box with block-plane to an equal projection all round. (2.) Mark the top, with single gauge,  $1\frac{1}{4}$  inch down. (3.) Bevel with  $1\frac{1}{4}$  inch chisel and finish with block-plane, and sandpaper block.

LESSON XXXI. Chiselling.—Cut a hole exactly in centre of top,  $1\frac{3}{4}$  inch long,  $\frac{1}{3}$  inch wide, using  $\frac{1}{5}$  inch chisel.

Lesson XXXII.—Finish up the box with mouldings, &c., according to individual fancy.

The general results of this branch of training has been very good. Two hundred boys attended the Manual Training School regularly. Industrial drawing was introduced into the public schools in 1879. This was followed by handwork, such as clay modelling, paper design and construction, carving, sewing, embroidery, &c. In 1856 manual training was commenced in a central shop as before stated.

## THE WASHINGTON PUBLIC SCHOOLS.

The Washington Public Schools, District of Columbia, have introduced manual training. During the first eight years systematic and progressive instruction is given, beginning with the various Kindergarten exercises and continuing to more advanced work—moulding and drawing, both freehand and mechanical. In the seventh and eighth grades of the schools work is carried on in the shops as follows:—

#### FIRST YEAR.

Seventh and Eighth grades. Two hours a week throughout the year.

Bench Work.—The correct method of using wood tools, comprising planes, hand-saws, chisels, gauges, brace and bits, hammer, gauge, compasses, trying-square, &c., and the working of different kinds of woods.

The students are also taught this year to lay out the work with knife and pencil, the use of the trying-square, level, and dividers, and to work from drawings made by themselves. The making of plain and more complex mortise and tenon joints, dovetailing, and plain cabinet-making; articles of practical utility for the schools and shops; putting work together with brads, nails, screws, and glue; the care and sharpening of edge tools; the use of circular saws.

Lectures are also given on the various woods and other material used in the shops, showing where and in what condition each is found, and by what processes it is prepared for use or for market. Also, lectures on the manufacture of tools, &c.

#### SECOND YEAR.

Eighth Grade and High School. Two hours a week throughout the year.

Lathe Work.—The use of all the hand wood-turning tools, embracing plain and fancy turning in hard and soft wood, inside and outside; the use of chucks and face plates; pattern turning.

Moulding.—Bench moulding in sand and casting soft metal, comprising the use of rammers, trowels, riddles, risers, &c., using patterns made by the pupil himself.

Forging.—

Forging.—The forging of small articles of soft iron and steel, and steel tools, with instruction in the simpler methods of the manufacture of iron and steel. There is also practice in welding iron and in hardening and tempering steel, with lectures on metallurgy.

The Superintendent of Public Schools for the District of Columbia says that "the favourable estimate given to these manual training exercises by the various principals of public schools, given, as they were, after a year's observation and practical experience, and with all the disadvantages that such a training can possibly offer to a school system, is, to my mind, the strongest argument in favour of manual training that I have ever heard or read, and my investigation of this subject has been wide and thorough." There can be no doubt that the great demand throughout the United States and Canada is for the new education, or combined intellectual and manual training. In Illinois manual training is making exceedingly rapid progress. The lines of the St. Louis school are mainly followed. In the Chicago Manual Training School the full course of study, covering three years, is as follows:—

## JUNIOR YEAR.

- 1. Mathematics.—Algebra, geometry.
- 2. Science.—Physiology, physical geography.
- 3. Language.—English language and literature, or Latin.
- 4. Drawing.—Freehand, model and object, projection, machine perspective.
- 5. Shopwork.—Carpentry, joinery, wood-turning, pattern-making, proper care and use of tools.

# MIDDLE YEAR.

- 1. Mathematics.—Geometry, plane trigonometry.
- 2. Science.—Physics.
- 3. Language.—General history and English literature, or Latin.
- 4. Drawing.—Orthographic projection and shadows, line and brush shading. Isometric projection and shadows. Details and machinery, machines from measurements.
- $5.\ Shopwork. Moulding, casting, forging, welding, tempering, soldering, brazing.$

#### SENIOR YEAR.

- 1. Mathematics.—Mechanics, book-keeping.
- 2. Science.—Chemistry or descriptive geometry and higher algebra.
- 3. Language.—English literature, civil government political economy, or Latin or French.
- 4. Drawing.—Machine from measurement, building from measurement, architectural, perspective.
- 5. Machine Shop Work.—Chipping, filing, fitting, turning, drilling, planing, &c., study of machinery, management and care of steam-engines and boilers.

The student is not only taught the use of tools, but instruction is given each year in the production, properties, and uses of the materials used during the year, comprising wood, iron, steel, brass, &c. Throughout the course one hour each day is given to drawing and two hours each day to shopwork. In order to make clear the class of work done at this school, I shall append a list of the students' work done in 1888.

#### THE MOLINE SCHOOL.

The Moline school is somewhat different. It has an eight-year course, commencing with a class of work nearly akin to the Kindergarten exercises. The object, as set forth in the prospectus, is: 1, to teach the pupil another language—drawing and making—by means of which he may be led to appreciate thought in, and to interpret and express thought through form; 2, to develop the aesthetic nature of the pupil, and thereby to increase his capacity for enjoyment through an appreciation of the beautiful in art and nature; 3, to cultivate the industrial disposition by leading the pupil to do what to him is distinctly creative work.

The work of this course is not altogether new. With exception of a few subjects, it has been done and found wholly practicable under the conditions which make the ordinary school-room. It is not regarded as a perfect scheme, but a more definite plan for securing some of the results already recognised as desirable. The course provides work for both boys and girls. Much of the work may be given to the whole school at the same time; occasionally it will be found necessary to give boys one thing and the girls another thing to do at the same hour. Work planned and begun at school may be finished at home if the teacher thinks it desirable. Pupils should be led to see that drawing is the basis for most of the making. In the first and second years the pupil passes from the objects to their symbols; after this from symbols to objects.

Among the vast number of industrial and professional schools and institutions in the United States there are several in New York city that I must describe somewhat fully, not alone for their method and systems, but for the immense success that has attended their efforts in all matters pertaining to that technical education which they have so thoroughly taken in hand. These are the Cooper Union, the Pratt Institute, the Hebrew Technical Institute, and the New York Trade Schools.

# THE COOPER UNION.

The philanthropy of the late Mr. Peter Cooper in founding and endowing the Cooper Institute is well known throughout the civilised world, and this philanthrophy seems hereditary, for most certainly his mantle has descended upon his children. Mr. Edward Cooper and Mrs. Sarah A. Hewitt, his son and daughter, have lately expended \$300,000—£60,000—in reconstructing, enlarging, and beautifying the Institute, and in making good the original endowment which had been somewhat heavily drawn upon. To give an idea of the inestimable value of this institution it will be enough to say that in 1888–89 there were 394 female day scholars and 3,127 young men and lads attending the evening classes in science and art—or a total of 3,521 scholars, male and female.

A magnificent block of property of enormous value in the very centre of New York was devoted by Peter Cooper to found an institution for educational purposes, and an Act was passed in 1857 by the New York Legislature, entitled "An Act to enable Peter Cooper to found a scientific institution in the city of New York"; and on the 29th of April, 1859, he executed a deed in fee-simple of the whole of the property, buildings, furniture, &c., without reservation of any kind, to six trustees, upon the conditions specified in the Act, namely, "That the abovementioned and described premises, together with the appurtenances and the rents, issues, income, and profits thereof, shall be for ever devoted to the instruction and improvement of the inhabitants of the United States in practical science and art." The trustees laid down these principles:—First, that the details of the institution in all the departments should

should be arranged with special reference to the intellectual wants and improvement of the working classes; and, second, that as far as might be consistent with the first principle, all interference with the plan or objects of other existing institutions in this city should be avoided. Guided by these principles, the trustees arrived at the following broad scheme as best calculated to instruct, elevate, and improve the working classes of New York:—

- First.—Instruction in the branches of knowledge which are practically applied in their daily occupations, by which they support themselves and their families.
- Second.—Instruction in the laws by which health is preserved, and the sanitary condition of families improved; in other words, in personal hygiene.
- Third.—Instruction in social and political science, by virtue of which communities maintain themselves, and nations progress in virtue, wealth, and power.
- Fourth.—Instruction addressed to the eye and ear and the imagination, with a view to furnish a reasonable and healthy recreation to the working classes after the labours of the day. This general scheme necessarily included both sexes within its scope, and hence it was decided to extend all the privileges of the institution to men and women alike, and the development of the institution has followed in the line thus marked out.

There are regular courses of instruction at night, free to all who attend, under the general regulations of the trustees, on the application of science to the useful occupations of life, on social and political science, and such other branches of knowledge as, in the opinion of the Board, will tend to improve and elevate the working classes of the city of New York.

There is a school for the instruction of respectable females in the arts of design, and, in the discretion of the Trustees, to afford to females instruction in such other art or trade as will tend to furnish them suitable employment. (See Appendix G.)

There is also a free reading-room, and gallery of art, and scientific collections of models and apparatus, designed to instruct and improve those classes whose occupations are such as to be calculated to deprive them of proper recreation and instruction.

As may be well imagined, from the very outset, all the facilities of education offered by the institution were promptly taken advantage of, by the classes of the community for which they were designed. So much so, that last year I was informed the applications for admission were more than a year in advance, and that if the school were double the size it would promptly be filled by the applicants for admission. The average daily attendance at the reading-room amounts to 1,500 readers, and the Saturday evening lectures have attracted large audiences, often exceeding the capacity of the great hall. When this course of popular lectures was established they were the only ones of the class, while at the present time there are half a dozen similar free courses in New York every winter, but the Cooper Union course continues to hold the foremost rank among the multiplied agencies of free public instruction, and to command an attendance not surpassed, and probably not equalled. The subjects last year was distributed as follows:—Social science, 2; physical science, 5; biology, 2; literature, 1; art-sculpture and music, 2; archaeology, 2; travels, including description of scenery, &c., 4; special industries, 2.

The

The Director of Night Schools reports that the work for the term of 1888—89 closed on April the 18th—"That in the scientific department the number of pupils presenting themselves for examination was unusually large—in the first and fifth year classes larger than ever before. In the work of the Art School is exhibited a greater variety of drawings than in previous years, and their quality is very satisfactory. The highest class this year has contained twenty-four pupils, of whom twenty, having completed the prescribed course, are entitled to receive the Cooper medal and diploma. The full course in chemical analysis, which requires three years in the laboratory, has also been completed to the satisfaction of the instructor."

The Principal of the Woman's Art School, Mrs. Susan N. Carter, a lady eminently qualified for the position, reports that "It is encouraging to note the progress and usefulness of the school for the past year. This is indicated by the overflow of the classes into other parts of the building, necessitated by their increased size. It is also shown by the success of the pupils in the professions which they have adopted, and by the influence of the work, particularly that from the normal class from the public schools, more especially those in the western states. (Appendix H.)

"The study in the School has remained substantially the same as the year previous, except that there has been more life drawing--two models every fortnight, and one the alternate week. This affords constant life study to the most advanced class, and half time study, from the head, in the class next below it. In the afternoon Mr. J. A. Weir, N.A., has taught the largest class in painting we have ever had, and they work from models and still-life. Another change effected has been the addition of a small class of pupil teachers composed of the six best members of the life class. Its object is to furnish experienced teachers, drilled in the methods of study of the Cooper Union, and whose personal qualifications as instructors we know by experiment. Of late, in all demands for teachers, which we have received, the question has been asked as to whether the pupils have had experience. The young women who constitute this class of pupil teachers each instruct three or four scholars, and the result is most satisfactory. Working side by side with the regular teachers of the Art School, there has been constant opportunity for comparison in the progress of the pupils, and the standard of work is found equally good in all. I would remark that I have already sent one of these young women to take charge of the drawing class in a large seminary in Harrisburg, Pa., at a good salary, and as this arrangement was made in advance of the usual time for engaging teachers for the autumn, I expect to secure places for the others, and to start a new set of pupil teachers here in October, and to make the class a permanent one. In addition to these pupil teachers from the life-class, a number of scholars from the Normal Department have given gratuitous lessons in some of the charity schools in this city, with a similar object of gaining experience. An unusual number of encouraging facts about last year's graduates have been received; they, and the pupils at present in the school, report \$17,805-£3,561-as carned by them since May, 1888; but this amount is necessarily very partial. Of the 119 pupils whom we have heard as doing professional work, thirty-one are teaching in schools, or, are giving private lessons. One young woman, who teaches at Wellesley College, reports an excellent salary; another who is teaching at the Packer Institute, Brooklyn, reports a good income from that well-known school; a third is self-supporting from schools in Texas; another is teaching in a college in Arkansas; one writes: 'In Middleton I have six and in Port Jervis five buildings entirely under my supervision. In the former place I have about forty teachers and in the latter thirty-five! This number of teachers—seventyfive—must represent, at least, 5,000 children influenced by one of our late pupils. I would also mention that within a few days Messrs. Chency Brothers, have bought eight designs for their silk manufactory, and have asked to have more from our Normal School in Design. One young woman employed by Vantine in adapting the patterns of Oriental rugs for our market, and which are afterwards woven in the Oriental looms of Asia, has lately occupied her leisure time in orders for charts, &c., of animals, to show the classes for cooking in schools how the meat should be cut up."

Some estimate of the great use and diffusive intelligence of the reading-room of the Cooper Union from the following information:—The bound volumes of the library number 21,176; there are 189 magazines on file, and 393 newpsapers. The number of visitors to the reading-room during the past year has been 572,097. These readers have used 212,665 books, pamphlets, and magazines. A most useful branch of the Library is the complete set of the reports of the patent office from the beginning. These have been consulted by 1,173 visitors, who have examined 5,455 volumes of the reports.

A branch of the Cooper Union that struck me as being of the greatest value is that of the free school in phonography for women, where typewriting is taught in connection with phonography, but cannot be studied separately. The rules and regulations are as follows:—

- 1. School Term and Hours of Study.—There is only one term, which commences on the 1st October and ends on the 30th April. The school hours are from 9 a.m. to 1 p.m. There is no session on Saturday. Graduates of one term are qualified to take positions. Munson's system of phonography is taught.
- 2. Conditions of admission.—Applicants must be at least sixteen and not over thirty-five years of age. Residence in New York city is not a necessary condition of admission. If required a responsible written reference must be given as to character, a written guarantee must be furnished by some responsible person, not a member of the family, a clergyman or physician preferred, that the applicant is not able to pay for instruction, and will be obliged to earn her own living as soon as qualified. As only fifty can be admitted, and the number of applicants is very large, a careful selection is made of those of maturer age, those who have a definite promise of a position when they are qualified, and those whose circumstances render it necessary that they should immediately have some means of earning their own living.
- 3. How to apply for admission.—Application may be made in person or by mail. The form of application is to the effect that the applicant must fill in the blank form in her own handwriting, and give the name, residence, age, and occupation of parents, also the signature and address of the person guaranteeing situation for applicant after graduation—if any—and also that of the responsible person above alluded to who guarantees that the applicant is unable to pay for instruction, and will be obliged to earn her own living as soon as qualified. A careful selection will be made from the list of applicants. Those selected will be notified by post to present themselves for examination in penmanship, spelling, punctuation, grammar, and composition. This examination will be held during September. After October 1, no person can enter unless sufficiently advanced in phonography to go on with the class, and then only in case there should be a vacancy.

- 4. Diplomas will be awarded at the end of the term to such pupils as are qualified, but no pupil will receive a diploma who cannot properly compose and construct a letter, even though she may be proficient in phonography. The trustees do not procure situations for graduates.
- 5. Pupils must be particular to arrive in time, as they will not be admitted after the opening hour except with a sufficient excuse.
- 6. Any pupil absent three times without satisfactory excuse, forfeits her position in the school.
- 7. Pupils are not permitted to leave school while in session, except by permission of the teacher.
- 8. No calls upon the pupils are allowed at any time, except in cases of absolute necessity, and in such cases application must first be made to the assistant secretary.
- 9. Pupils wanting in diligence, those whose deportment is exceptionable, or those who do not make sufficient progress, will be dropped from the school lists. Neatness in person and habits is required.

There is no professional man in large practice, or mercantile house of any position, that does not keep a phonographer and typewriter, and many of them several. The amount of correspondence got through by the aid of this class of clerk is truly marvellous. Letters are replied to immediately on being read, the phonographer being present to take the requisite notes. Afterwards he writes them off at the typewriter, and takes them back to be signed. In all the offices and institutions I visited in the United States, I invariably found the phonographer and typewriter. It is necessary, therefore, that phonography and typewriting should go together.

There is also in the Cooper Union a free school in telegraphy, for women, the Trustees having made arrangements with the Western Union Telegraph Company to supply the necessary apparatus, and conduct the examination of the pupils for proficiency. The rules and regulations are similar in their character to those of the free school in phonography for women.

During the past three years a great number of young women have not only graduated in these classes, but have gone directly into situations at salaries varying from 10 dollars (£2) to 20 dollars (£4) weekly, and even higher. I cannot speak too highly in favour of these two branches of professional education. Mr. Edward Cooper, the son of the founder, and who nobly continues his father's good work, accompanied me over the institution at different times, and paid me every attention.

# THE PRATT INSTITUTE.

This grand institution was established by its founder, Mr. Charles Pratt, of Brooklyn, its object being to promote manual, industrial, and art education, and to inculcate habits of industry and thrift. Mr. Pratt gave me every facility for studying the institute, and to make myself familiar with the general arrangement of the building, together with the systems and methods adopted for giving instruction.

A circular of information sets forth "that as manual training is an important adjunct necessary to the education of the schools, and that mind and eye must together be trained in order to secure symmetrical development, manual training must aim at the broadest and most liberal education. While developing and strengthening

strengthening the physical powers, it also renders more active and acute the intellectual faculties, thus enabling the pupil to acquire with greater readiness, and to use more advantageously, the literary education, which should go hand in hand with the manual.

"The need of manual training as a developing power is scarcely less than that of industrial education—such education as shall best enable men and women to earn their own living by applied knowledge and the skilful use of their hands in the various productive industries. Accordingly, the institute seeks to provide facilities by which those wishing to engage in mechanical or artistic pursuits, may acquire a thorough, theoretic, and practical knowledge thereof, or may perfect themselves in that occupation in which they are already engaged.

"The twofold aim of the institute is based on an appreciation of the dignity as well as the value of intelligent handicraft and skilled manual labour. It endeavours to give opportunities for complete and harmonious education, seeking at the same time to establish a system of instruction whereby habits of thinking may be inculcated, to develop those qualities which produce a system of self-reliance, and to teach that personal character is of greater consequence than material productions.

"It offers its advantages to those only who propose to do their own part earnestly and well. Its aim is to aid those who are willing to aid themselves. Its classes, workshops, library, reading-room, and museum are for this purpose, and while tuition is required, yet it will be the endeavour to make possible, consistent with self-helpfulness and self-respect, the admission of every worthy applicant."

It is described by its founder as follows:--

The Pratt Institute occupies three large buildings—the Main Building, the Mechanic Arts Building, and the Trade School Building. Three additional floors with an area of 20,000 square feet were constructed last summer, and it is proposed to erect in the near future another building which shall contain large additional accommodation for students, as well as a large lecture hall and museum.

The Main Building, having an entrance to Ryerson-street, is 100 feet by 86 feet, and is six stories high. The Mechanic Arts Building, together with the extension to the Main Building, is 144 feet by 95 feet, the former being four and the latter five stories high. The one-storey Trade School Building is 103 feet by 95 feet. The buildings are of brick, with trimmings of stone and terra-cotta. They are heated by steam and lighted by electricity. The main building is provided with a passenger elevator which runs at all hours when classes are in session. Plans are also prepared for the construction of another building during the coming year. This will be situated on the west side of Ryerson-street immediately opposite the main building, with which it will be connected by sub-ways and bridges. This building will be 165 feet by 200 feet, and five stories high, and is designed for an Audience Hall, with a scating capacity of 1,200, for the Museum, and for the Departments of Domestic Science and of Music.

To fulfil the object of the institute the work is divided into departments, each of which is responsible for certain lines of development.

Instruction is given to both sexes by means of day and evening classes. The terms for day classes extend from September to July, and for the evening from October to April.

At

At the time I visited the school there numbered 1,643 pupils, 908 in the day classes, and 735 in the evening, while the library of over 20,000 volumes gives accommodation to an average of about 300 daily readers.

The organisation of the institute is under the control of a board of trustees, with a secretary as executive officer. The work of the institute is divided, as above stated, into departments; the heads of the various departments constituting the faculty, each member of which is directly responsible for the work of his department. Weekly meetings of the faculty are held, at which matters pertaining to the general interests of the institute are discussed and recommendations to the trustees are made. Department meetings are also held for the consideration of those subjects especially pertaining to the individual departments. In most of the departments, morning, afternoon, and evening classes are held. In all these the character of the work is similar, though, in the evening classes and in those classes not meeting every day, courses are of necessity abridged. Both sexes are admitted on equal footing to the privileges of the institute.

An important feature of the institute is its system of lecture courses. It is intended that these shall bear directly upon the work of the institute in all its phases, thus including practical instruction upon those matters which pertain to right modes of living, the problems of political and social life, domestic economy, sanitary science, literary culture, ethics, &c. While many of these courses may be given to pupils only as a part of the regular work of the institute, yet many others will be so arranged as to meet the wants of those not otherwise connected with the institute who wish the opportunity to obtain systematic instruction upon subjects of interest and importance.

The students who have completed a full course in any of the departments, and have passed satisfactory examinations upon the same, will receive the certificate of the institute. Special certificates for those completing courses in evening work will also be given.

There are six departments, viz.:—The technical high school, art, domestic, science, commerce, mechanic arts and music, besides the library, technical museum, and the thrift association.

## THE TECHNICAL HIGH SCHOOL

gives a three years' course for both sexes, and affords opportunity for such education as is given in the ordinary High School or Academy, and combines with this as an integral part of a symmetrical education systematic courses in drawing and in various The training here given is in harmony with recent progress forms of manual work. in educational thought, which, without ignoring or antagonising the education of the past, seeks to perfect this by supplying the elements heretofore disregarded. The new education does not endeavour to train a single set of faculties, but to develop harmoniously all the powers. It proceeds upon the supposition that the eye and hand should be educated no less than the brain, and that the training of the perceptive and imitative faculties is not only important but essential for true mental growth. This school has the same aim as other high schools—to fit boys and girls for their life-work, whether that is to be a business, industrial, or professional It does not endeavour nor wish to prepare for a particular occupation or class of occupations indistinction from all others, but it does try to make its course as broad and general as is consistent with the age of its pupils and the time spent

in its completion. Geometry and chemistry are introduced into the course, but not with the primary object of preparing teachers of mathematics or science; so manual work is made a feature, but not in order to train carpenters or machinists; on the contrary, the literary work and all forms of manual work are made parts of the course of instruction for one and the same reason—because of their disciplinary and educational value.

The school in which manual training is a feature has this decided advantage over others: that it gives students a better opportunity for discovering any aptitude they may have for a particular vocation, inasmuch as it provides for the development, not only of literary taste, but also of mechanical and artistic ability. The course of study has been planned to meet the requirements, as far as possible, of those students who are preparing for advanced, scientific, technical, or other schools, as well as of that larger class who expect to finish their school-room education with the high school. It is the same, as far as literary work is concerned, for both boys and girls; but the manual work is entirely different throughout the course, and the drawing after the winter term of the second year.

#### COURSE OF INSTRUCTION.

First Year :-

Language—English language, rhetoric.

Mathematics.—Algebra, geometry.

Science.—Physiology, physical geography.

Elocution—Vocal music.

Drawing.—Freehand and instrumental working drawings, freehand model and east drawing, clay modelling.

Manual Work.—For Boys: Bench work in wood, wood-turning, pattern-making, principles of moulding. For Girls: Sewing, hygiene and home nursing, wood-carving.

Second Year :-

Language or Latin, general history, and English history, essay writing.

Mathematics.—Geometry, trigonometry, bookkeeping.

Science.—Physics, with laboratory practice.

Elecution, vocal music.

Drawing.—Fall and Winter Terms: Perspective, architectural drawing, elements of design. Spring Term.—For Boys: Mechanical drawing. For Girls: Optional work in any of the art courses.

Manual Work.—For Boys: Foundry moulding, forging, tinsmithing. For Girls: Millinery, dressmaking, wood-carving.

Senior Year :-

Language, English literature, civil government, political science, French, essay writing.

Mathematics.—Principles of construction.

Science.—Chemistry and metallurgy, with laboratory practice.

Elecution, vocal music.

Drawing.—For Boys: Advanced mechanical drawing, problems in construction.

For Girls: Optional work in any of the art courses.

Manual Work.—For Boys: machine shop, bench work, machine tool work, construction. For Girls: Cooking, dressmaking.

The

The Technical High School use the shop during the day and a trade trainingclass in the evening. The courses cover both hand and tool work.

The Art Department occupies twelve rooms or studios—the Art Hall, on the sixth floor, one room on the third floor, and ten rooms on the fourth floor. The courses of study are arranged to meet the requirements of three divisions of pupils: those who can give five days each week, those who can give but two or three afternoons, and those who can only give three evenings. The morning classes are for students who pursue a regular course of two years or more in art or in decorative and applied design, architectural or mechanical drawing, wood carving, clay modelling, or manual instruction for the training of teachers. The work of the afternoon and the evening pupils is of a similar character; but owing to the limited time, the courses are necessarily abridged. Many pupils and teachers from the public schools are accommodated in the afternoon classes; and students who are otherwise engaged during the day are enrolled in the evening classes, in which, for six months, they devote three evenings each week to study and practice. Efforts are made to find in each student some quality or fitness for a specific work and then to open a way for its development.

The department is supplied with a large collection of casts of ornament and the antique; a number of sketches by the old masters, a set of original drawings for illustration by modern artists; a series of several hundred photographs arranged in chronological order, illustrating the historical development of art; photographs illustrating landscape composition; also large numbers of designs and charts for class use. Students have daily access to the collections of pottery, porcelain, bronzes, laces, embroideries, &c., in the Technical Museum, and also to the Institute Library, which contains a large and excellent selection of books on all subjects relating to art. The department provides drawing-boards, easels, wood-carving tools, and modelling clay; but paper, drawing materials, instruments, and wood for carving must be furnished by the student. These articles can be obtained at artist rates at the General Office of the Institute.

The Regular Art House is for those who wish thorough training in light and shade drawing, colour, perspective, &c., with work from the antique and from life. Examinations and test exercises are made from time to time to determine the progress made, and when a certain grade or subject has been satisfactorily completed students are allowed to proceed to the next. Throughout the course sketches have to be sent in weekly from each student for criticism. During the first year the study is directed principally to the choice of picturesque subjects, to perspective, broad effects of light and shade, and to the handling of simple mediums. On more advanced work sketching is considered in its relation to illustration and composition. Students of the advanced class also meet two afternoons weekly to sketch from a draped model. In connection also with the courses of study, lectures are given on perspective, design, harmony of colour, historic ornament, artistic anatomy, and the history of painting.

#### Course of Study.

- 1. Cast drawing in outline, and in masses of light and shade.
- 2. Cast drawing from ornament in values.
- 3. Freehand perspective, perspective problems and sketching.
- 4. Still life groups in light and shade.
- · 5. Cast drawing—masks and heads in outline, and in masses of light and shade.
- 6. Details of human figure.

- 7. Principles of design and decoration illustrated in colour.
- 8. History and application of ornament.
- 9. Heads shaded in values.
- 10. Instrumental perspective.
- 11. Painting in oil and water colour.
- 12. Study of artistic anatomy.
- 13. Study of the antique in outline, and light and shade.
- 14. Drawing from life—head and costumed figure.
- 15. Figure from life.
- 16. Clay modelling from the antique and from life (this is optional).

After this there is a Normal Art Course of two years, the aim of which is to give pupils such a training as will qualify them to fill positions as teachers and superintendents of drawing in public and private schools.

The course of study comprises the first ten subjects of the regular art course with the work in sketching and course of lectures, together with the following five subjects and work in normal methods:—Clay modelling, water colour drawing, elements of architectural and mechanical drawing, applied design, study of plant forms, and their adaptation to ornament and wood-carving. After this two years' course the students can—if they desire to do so—take an advanced special course, and become qualified as instructors in higher grades of work.

The extent to which modelling in clay is used in the arts determined the trustees to make it a special feature of the department. The subject is classed in four divisions: (1.) To supplement freehand drawing from the antique and from life, and to provide a training for those who wish to make a speciality of advanced work in clay. The pupils begin by modelling in the round, afterwards in relief, and as they advance they study directly from the life. (2.) The second is for pupils of the normal class who are instructed in the model of typical forms, fruit, &c., and are otherwise prepared to teach elementary clay work in connection with drawing in the public schools. The course includes modelling from casts and photographs, time sketches from plant forms and original designs for relief ornament. (3.) The course of the third division is planned to meet the requirements of pupils in the architectural and the wood-carving classes, and also those of the Technical High The students model from easts and from plant forms, and study concretely the principles of decorative design as applied to stone, wood, and metal work. The fourth division is designed for pupils of the evening classes, and the course is arranged to give artistic training which shall be especially adapted to meet the needs of artisans and designers in silver, brass, iron, stone, wood, and the numerous other branches of manufactured work to which modelled ornament is applicable. Students take a preliminary course in freehand drawing, design, and modelling from easts, and then advance to the particular line of ornamentation in which they desire special training. The course will include the principles of form and proportion involved in designs of various kinds and the adaptation of modelled ornament to different surfaces. Students of the evening classes, who can present work showing the necessary qualifications, may enter at once upon the study of the antique in clay. life class will be formed if applications warrant such organisation.

Wood-carving.—The course is five days in each week for two years. At the commencement the work is surface work from simple objects, and as the pupils advance the work is more difficult. Frames, panels, cabinet work and furniture are 138—N

first designed and then carved, the pupils invariably applying their own designs. Here also the afternoon and evening classes are especially designed to accommodate students of the normal class, and teachers and pupils from other schools, and those who cannot pursue so comprehensive a course as is planned for the morning classes. The course of study is as follows:—

- 1. Preliminary exercises; care and use of tools.
- 2. Plane and curved surface carving.
- 3. Diaper carving.
- 4. Horizontal and vertical lines of decoration.
- 5. Incised model carving—conventional and naturalistic treatment.
- 6. Low relief, half relief, high relief,—flat and curved surface,—conventional and naturalistic treatment.
- 7. Letters and inscriptions.
- 8. Cabinet work in some historic style.
- 9. Sculptured ornament—conventional and naturalistic treatment.
- 10. Use of oils, stains, and varnish in finishing woods.

Students will also pursue the parallel course of study-

- 1. Freehand and mechanical drawing.
- 2. Elements of ornament, lines, geometric lines, leaves and flowers, and their use in decoration, original designs for surface covering and borders.
- 3. Historic ornament and original design in historic styles.
- 4. Drawing from plant forms, and adaptation of plant and animal forms to ornament.
- 5. Clay modelling.

Applied Design.—This course provides thorough instruction in the principles of decorative design, and in the technical methods of practical application. Pupils having acquired proficiency in the underlying principles of all good design may make a specialty of any one subject. The course of study is:

- 1. Freehand drawing.
- 2. Elements of ornament.
- 3. Skeleton plans and pattern analysis.
- 4. Original designs in outline from given motives.
- 5. Preparation of colours, and harmony and contrast of colour in applied designs.
- 6. Original designs in colour for tiles, &c.
- 7. Original designs in historic styles, in colour.
- 8. Study of plant forms and their adaptation to ornament.
- 9. Foliage from nature in flat washes of colour.
- 10. Original designs in colour from plant forms.
- 11. Designs for prints, book covers, &c.
- 12. Designs for wall-papers.
- 13. Designs for carpets.
- 14. Decorative designs and schemes of colour for rooms.
- 15. Problems in decoration.

The course of study for the evening classes embraces as many of these subjects as is necessary to secure good drawing, and a proper understanding of the general and true principles of decoration.

\*\*Architectural\*\*

Architectural Drawing.—The course aims to give students that training in drawing and design, as well as the principles of building construction, as will fit them for work in an architect's office, or for an advanced course in architecture. The course is as follows:—

- 1. Geometric solids, plans and elevations.
- 2. Geometric problems, surface developments and intersection of solids.
- 3. Frame work, joints, &c.
- 4. Sections through partitions, doors and windows.
- 5. Plans and elevations of a cottage.
- 6. Framing plans of cottage.
- 7. Details of frame house.
- 8. Scale drawings of buildings from measurements and sketches.
- 9. Construction of foundations, chimney, &c.
- 10. Construction of arches, buttresses, &c.
- 11. Plans and elevations of brick or stone house.
- 12. Sections of house and details.
- 13. Staircase and details.
- 14. Fireplace and details.
- 15. Original designs for frame house—plans, elevations, and perspective.
- 16. Original designs for brick or stone house—plans and elevations.
- 17. Original designs for various details.
- 18. Problems in construction.
- 19. Problems in design and composition.
- 20. Problems, strength of materials, &c.

There is also a parallel course for the students in freehand drawing, perspective, history of architecture, &c., as follows:—

- 1. Freehand, perspective, light and shade drawing, pen and pencil sketching.
- 2. Instrumental perspective, projection of shadows, and isometric drawing.
- 3. Design and decoration.
- 4. Historic styles of architecture and ornament.
- 5. Clay modelling.

The evening classes are planned to meet the wants of those who wish to learn how to make and to read drawings relating to house construction.

Mechanical Drawing purposes to furnish a thorough training in all kinds of mechanical drawing and to afford instruction in the elementary principles of machine design. The course is for two years, and the time five mornings each week. The subjects are as follows:—

- 1. Principles of working drawings, simple projections, and use of instruments.
- 2. Geometric problems.
- 3. Machine details from models.
- 4. Machine details from sketches.
- 5. Screws, bolts, and nuts.
- 6. Freehand working drawings.

- 7. Development of surfaces and intersection of solids.
- 8. Pulleys.
- 9. Couplings.
- 10. Pillow-block and hanger.
- 11. Cams.
- 12. Gearing.
- 13. Crank.
- 14. Strap-end.
- 15. Eccentric.
- 16. Slide-valve action.
- 17. Assembly drawing.
- 18. Shop drawing.
- 19. Distribution of power.
- 20. Problems in construction, machine design.

The parallel course to be followed is:—

- 1. Freehand drawing and perspective.
- 2. Principles of design.
- 3. Metallurgy.
- 4. Elements of mechanism.
- 5. Properties of materials, &c.

I ascertained that the pupils following this course become very competent mechanical draftsmen, and the evening classes although less comprehensive, owing to the limited time, extends over two years, and turn out men capable of performing good honest work.

Although the great aim of the school is to make such course of study so thorough that pupils with aptitude and perseverance who successfully complete the work of any department, may possess such information in theory and practice as may be of practical use to them in the professions to which they attach themselves.

#### DOMESTIC SCIENCE.

The noblest task for a woman and one requiring the cultivation of all her powers is the right management of a house, therefore training in the domestic arts is that of all others the most beneficial. The purpose of this department of the institute is to afford girls and women opportunities for such training as will best supplement the education usually gained during their school life, and better prepare them to make house-keeping the high art it should be. This department gives courses of instruction in cookery, household economy, laundry work, hygiene and house nursing, plain sewing, millinery, and dressmaking. They have been so arranged as not only to insure a thorough knowledge of the subject, but to impress upon the pupils the value of order, accuracy, economy, and logical sequence. The methods of instruction are such as to lead the pupil to grasp the artistic and scientific principles underlying all good work, and encourage them to observe and judge for themselves so as to gain self-reliance.

The third and sixth floors of the main building are chiefly devoted to the work of this department. The rooms are large, sunny, well lighted and ventilated, and fully furnished with the apparatus essential for good work. The electric lights are so arranged as to allow work to be carried on with as much comfort and convenience

in the evening as during the day. In all the branches of instruction there are morning, afternoon, and evening classes; the latter for those whose duties prevent their attendance in the daytime. The number of pupils are limited, so that all may have an opportunity for practical work under the immediate direction of the teacher.

In cookery the kitchens are three in number, well ventilated by means of large swinging sashes and skylights. The tables have drawers furnished with the small utensils for the use of each pupil. The closets are well stored with the large utensils for cooking, and with china, silver, &c., for table service. The coal and gas stoves are most conveniently placed and arranged, and will permit twenty pupils to work at once. The first course of six months is as follows:—

- 1. Making and care of fire.
- 2. Dish-washing and care of kitchen.
- 3. Boiling meats, vegetables, and cereals.
- 4. Soups.
- 5. Stewing and Braising.
- 6. Warmed over dishes.
- 7. Simple invalid cookery.
- 8. Broiling.
- 9. Frying and sautéing.
- 10. Roasting meats and poultry.
- 11. Various ways of cooking fish and eggs.
- 12. Bread and breakfast cakes.
- 13. Pastry, cake, and plain deserts.

The main object of the course is to familiarise the pupils with the most healthy, attractive, and at the same time the most economical methods of preparing such articles of food as are found on a well-appointed home table. In connection with every lesson a brief talk is given by the instructress upon the chemical and nutritive properties of the materials used, the changes produced by cooking, &c., in order that the pupil may not only be able to prepare all varieties of wholesome and appetising dishes, but may also have a knowledge of the properties of the different food materials, and their values as nutritive agents, and thus be capable of choosing intelligently the several dishes for suitable menus. Once a term pupils are required to bring in a bill of fare for a week's breakfasts, luncheons, and dinners, which can be purchased at a minimum cost. There is also a practical lecture on "How to buy meat," which is illustrated by a butcher who cuts before the class sides of beef, mutton, and pork.

The second course of three months gives instruction in:—

- 1. Clear soups and bisques.
- 2. Soufflés and croquettes.
- 3. Salads—French and Mayonnaise dressing.
- 4. Entrées and sauces.
- 5. Roast game.
- 6. Fancy deserts and cakes.
- 7. Frozen creams.
- 8. A breakfast.
- 9. A luncheon.
- 10. A spring dinner.
- 11. A winter dinner.

In this course more complicated cooking is undertaken, combining and elaborating the principles taught in the first. Instruction in the preparation and cooking of richer soups, roast meats and game, with their accompanying gravies, sauces, and vegetables, also entrées, croquettes, and salads, which increase the varieties of food and utilise the materials often wasted. In addition to which several lessons are devoted to serving, in proper form, breakfasts, luncheons, and dinners.

Having completed the two courses satisfactorily and passed the written and practical examinations, the pupils receive a certificate. The practical examination consists of test dishes made at home and the cooking and serving a dinner of five courses.

There is also a normal course for the purpose of training teachers of cookery. This class is limited to twelve, and applicants for admission must have a practical knowledge of cooking, and must present a satisfactory statement or letter in regard to general scholarship. The course covers one year, five days each week, and includes, besides, a thorough course in cooking, instruction in physiology, chemistry of cooking, normal methods, and practice teaching; and as teachers of cookery who possess some knowledge of domestic science are in great demand, it has seemed wise to supplement the regular normal course by short courses in household economy and laundry work.

A course for invalid cooking, which has been approved by several leading physicians, is also given. This is especially designed for nurses and others desiring to learn how to cook for the sick. It includes meat extracts, broths, gruels, soups, beverages, dishes carefully prepared and served to convalescents in the most careful and approved manner. In all the courses there are evening classes for those who cannot attend during the day, which classes are especially adapted for cooks. There are also special classes formed during the year for working girls and the wives of labourers, in which are taught the methods of preparing the most economical and palatable dishes for the working-classes.

The Household Economy course comprises a course of twelve lectures intended to give instruction in practical housekeeping, and is designed to teach young girls and women how to manage homes of their own, or to take charge of other houses as professional housekeepers. As far as possible practical demonstrations are given in the various branches of the work. The course is as follows:—

- 1. Choosing a home, situation, ventilation, heating.
- 2. Care of cellar-stoops, sidewalks, and back yards.
- 3. Kitchenwork and care of utensils.
- 4. Laundry: arrangement of work and furnishing.
- 5. Dining-room and butler's pantry.
- 6. Drawing-room and halls.
- 7. Sleeping, guest, and sick rooms.
- 8. Store-room and linen closet.
- 9. House-cleaning.
- 10. Social side; courtesy and entertaining.
- 11. Household accounts.
- 12. Mistress and maid.

There are evening classes for maids and all working women interested in household management, and in economy of time, strength, and money.

There

There is also a course in laundry work, instruction being given in the simple chemistry of cleansing clothing and household linen, with methods of removing stains, the best sorts of soap and bleaching powders, sorting, soaking, washing, boiling, rinsing, bluing, wringing, bleaching, drying, dampening, folding and ironing. Starching and clear starching laundry shirts, collars, cuffs, body linen, dresses, fine baby linen, laces, and embroideries, coloured clothes, and flannels. Pupils must bring clothes to launder in class, and also to bring the articles prepared for ironing.

Hygiene and Home Nursing comprise three courses, each consisting of twelve lectures of one hour's duration. The aim is to teach women how to care for sudden illness or accident, and to enable them to perform intelligently the duties of a nurse where trained service is not employed. The subjects in the first course are as follows:—

Heart and circulation of the blood.

General direction of main arteries.

Various bleedings and ways of arresting them.

Immediate treatment of those suffering collapse from injury or fainting, and of those apparently drowned or otherwise suffocated.

Immediate treatment of burns, scalds, wounds, and bruises.

Observing and regarding pulse, respiration, temperature.

Furnishing, warming, and ventilating the sick room.

Bathing, dressing, and administering food and medicines to patients.

Practical bandaging, bed-making, lifting and propping helpless patients.

The second course comprises instruction in the—

Prevention and management of bed sores.

Treatment of fevers, bathing, sponging, diet, use of disinfectants.

Nursing special diseases, care of children, immediate treatment of fractures, sprains, unconsciousness, epilepsy, hysteria, poisonous bites, sunstroke, frost-bite, poisons and their antidotes.

Practical preparation and application of poultices, blisters, &c., packs and vapour baths.

Carrying the sick and injured.

The third course follows with a study of the—

Hygiene of infancy and childhood, growth, food, and artificial feeding, teething, clothing, exercise, &c.

Outlines of physiology and hygiene for adults, care of eyes, ears, skin, digestion and lungs, illustrated by a rough dissection of an animal's heart, lungs, and eye.

This course also gives information in house-sanitation and drainage.

Domestic Science also includes full and thorough instruction in sewing, dress-making, and millinery, in each of which subjects there are three courses. Every appliance is found in the workrooms, and if after carefully and perseveringly following these special courses girls cannot cut out and make their own clothes, it is not the fault of the institute or its teachers. Each pupil is obliged to make at least one dress for herself, and in order to afford larger opportunities for practice, orders are received from teachers and pupils, and the work executed in class.

COMMERCE.

#### COMMERCE.

This department comprises book-keeping, commercial law, geography, penmanship, and correspondence—phonography, typewriting, English, French, German, and Spanish language. Here, again, the dual subject of phonography and typewriting receive a large share of attention. The demand for amanuenses who are not only competent typewriters, but accomplished stenographers, is comparatively of recent date, and in order to furnish the supply a new profession has been created, and while the instruction for these two studies are totally different in character they are both absolutely necessary in order that the student may be capable of fulfilling the duties required of him, namely, those of a corresponding clerk and amanuensis.

I was informed by the teachers of these subjects, not only at the Pratt Institute, but at the Cooper Union and Packard Business College that with apt pupils the time required to become fairly proficient in phonography was about nine months. This varied considerably, and depended of course upon the ability and application of the student, and the same period also included the preparation for type-writing. In phonography the system taught at the Pratt Institute is known as the "Benn-Pitman," arranged for the work of the Institute in three grades—elementary, intermediate, and advanced—each covering a term of three months. Certificates are granted only to those who can write at the rate of 100 words a minute, for ten consecutive minutes, matter that has not previously been written by them, and to correctly copy new matter at the rate of forty words a minute for ten consecutive minutes, and the work performed must be neat and accurate.

The importance of book-keeping or accountantship, as the basis of all business, has led to the establishment of classes in which its principles and scientific application are thoroughly treated, and where the student is made familiar with all business terms and forms, together with actual transactions.

Applicants for courses in the Department of Commerce must be at least 17 years of age, and pass a satisfactory examination in arithmetic, penmanship, and spelling.

## MECHANIC ARTS.

The Department of Mechanic Arts in the Pratt Institute occupies in shops and laboratories the entire first floor of the Mechanic Arts Buildings, two rooms on the basement, two on the second floor, and two on the third floor, and the instruction deals with two classes of work, namely, that which is purely educational, and that which is professional. The first of these affords a manual training, which, with the subjects and studies of a High School course, will probably insure that harmony of mind and body which modern educators are so desirous to obtain. The general plan of instruction in the manual training is as follows:—The instructor first executes the lesson before the whole class; the proper method, and the principles involved, are carefully and clearly explained, and the applications of the exercise in practical work are pointed out. Each pupil then takes up the work, and the instructor gives individually what further advice or correction is necessary.

The first year includes wood-working, bench work, turning, and pattern-making. The second year, forge work, iron and brass moulding and casting, tinsmithing, brazing and soldering. Third year is devoted to the machine and fitting shops. I append to this report details of the work, from the catalogue of the Institute. (See Appendix.)

In the Trade School the aim of the instruction is to give a thorough grounding in the principles of a mechanical trade, and sufficient practice in its different operations to produce a fair amount of hand skill. The school does not pretend to turn out journeymen mechanics, but to afford such training which further practice in active work will complete. Thus, not only is ordinary detail work done, but a large model of a frame-house made, and the various methods of framing thoroughly illustrated. In the same practical way is the blacksmith's trade taught, the exercises representing actual useful work. Machine-shop work and fitting are here performed with the avowed object of learning a trade. Thus, in bricklaying, the men are first taught to handle the trowel, and spread mortar properly; and then they are put to work upon 9-inch walls, with square and blocked ends, and also with a returned corner. This practice is continued until the work can be carried up plumb, and the courses laid level. Then follows construction of arches, &c. The science underlying this work is given by means of lectures upon the properties and proportions of mortars and cements, the strength of walls, construction of arches, &c., &c.

As with carpentry and bricklayers, so with plastering, plumbing, stone-cutting, stone carving, house painting, and fresco work. Lectures bearing directly upon those various classes of labour give practical instruction upon sanitary science, and other subjects; in short, all who wish to obtain systematic instruction in the building trades have here the opportunity afforded them. (See Appendix I.)

#### Music.

In the Music Department the aim is to give the benefits of musical education to the masses, the founder fully believing, and stating, "that the influence of vocal music upon national life and character is very great," and he recognises it as one of the best means of moral, physical, and intellectual development. The tonic sol-fa system is chiefly used, and the musical training course is based upon the practical experience of the Tonic Sol-fa College, London. The course of study is—(1), vocal music; (2), theory of music; (3), voice culture; (4), nominal course, comprising art of teaching music, Kindergarten colour music; (5), Choral Society, which is in reality a philharmonic society, composed of the pupils of the music department. There is also a select choir, and a lecture course, in connection with this branch.

I must not finish with the Pratt Institute without mentioning the Technical Museum and the Thrift Association. The former of these is a collection of metals, minerals, &c., illustrating all those processes which produce artistic and useful objects, as well as examples of such completed work as may furnish special instruction to the students.

The Museum occupies the fifth floor of the main building, and is divided into two portions, the inorganic and the organic. The divisions are further subdivided according to the individual importance of certain materials. Thus the collections assume the following natural divisions:—

- (A.) Inorganic substances—iron, copper, silver, gold, nickel, &c.
- (B.) Ceramics.
- (c.) Glass.
- (b.) Building and decorative stones.
- (E.) Reproductive processes.
- (F.) Organic compounds—wood, leather, ivory, &c.
- (G.) Textile fabrics—silk, cotton, wool, linen, embroidery, laces, &c.

At the present time the Technical Museum contains about 7,000 specimens, and new articles are continually being added. The various instructors of the Institute take their classes to the Museum, for the purpose of demonstrating the subject upon which they have been working. Thus the collections are made directly useful as object lessons.

The Thrift Association has for its object the promotion of economy, and to inculcate habits of thrift, to promote prudence and wisdom in the use of time and money by offering young people a safe and simple method whereby they may make regular monthly payments for the purpose of saving money, or of accumulating a fund for buying or building their own homes. The trustees state "they fully recognise the responsibility of embarking in an enterprise which has to do with the handling of other people's money, but in the scheme of education undertaken by the Pratt Institute the value and importance of instructing the young in this subject of thrift has led the authorities of the Institute to do all in their power to encourage habits of saving. Experience has demonstrated that there must be some motive to impel persons to save money with regularity; therefore every effort will be made to encourage them to save their first dollar, and then to help them to make the one dollar, ten, then the ten, one hundred, and so on, by offering them a safe place for the deposit of their savings, at a liberal rate of interest. The firm of which Mr. Charles Pratt—the founder of the Institute—is the head, Messrs. Charles Pratt & Co. have executed a bond in the sum of \$500,000-£100,000-to indemnify and protect all persons having financial relations with the association. I append the full particulars of the Thrift Association, and its method of doing business. (See Appendix J.)

THE HEBREW TECHNICAL INSTITUTE.

The Hebrew Technical Institute for the preparation of Jewish youth for industrial callings was established in 1884. It is a manual training school, and applicants must be 12 years of age, and have attained to the fourth grade in the New York public schools. School hours are from 9 a.m. till 4 p.m. daily, with special instruction in wood-carving from 4 to 6 p.m. on Mondays and Thursdays.

The course of instruction is as follows:-

Arithmetic, from fractions to the completion of arithmetic.

Practical geometry; completing the ground in Hill's Geometry.

Physics and mechanics; history and geography; language lessons; composition and penmanship.

Materials used in arts and industries.

Instruction in physics—illustrated by experiments—the pupils have to make models illustrating the application of the mechanical powers. Instruction in this department takes two hours daily.

Freehand drawing, commencing with freehand measurement, then drawing of geometrical solids, sketching and drawing from the cast with charcoal. One hour daily.

Mechanical drawing-

- 1. Use of tools.
- 2. Developments of simple solids, which are cut out in the shop from these drawings.
- 3. Simple designs, which are cut out in thin wood with the hand bracket-saw.
- 4. Elements of working drawings.

- 5. Drawings of the principal joints, which are constructed in the shop.
- 6. Fifty problems in practical geometry.
- 7. Projection drawing.
- 8. Machine drawing to scale.
- 9. Elements of architectural drawing.
- 10. Tracing and blue printing.
- 11. Drawing trusses and patterns made in the shop.

#### Course in the Shop.

- 1. Work in pasteboard.
- 2. Bracket sawing.
- 3. Construction, in white holly, of some simple article for use.
- 4. A course of twenty lessons, bringing into use the principal tools, glue, and nails.
- 5. A course of construction work in which the previous course is applied.
- 6. A course of lengthening timbers, and its application to building.
- 7. Pattern making; series of twenty-one patterns, from which moulds and casts are made by pupils.
- 8. Castings made by the pupils to be finished up by them.
- 9. All work above mentioned to be made from drawings made by the pupil.

At the close of the first year in the shop, metal work is commenced.

The course in this branch includes vice work, clipping and filing, turning brass and iron, brass finishing, and the course in forge work.

In the shop pupils are taught the use, care, and nature of tools employed, and the various classes are periodically taken to leading manufacturing establishments of New York to witness the practical application of processes.

The following extract from the Director's report for 1888 says: "This is the difference between this school and a trade school. A trade school is one where some special branch is taught—a school where eigar-making, or plumbing, or some special industry is taught. Surely ill-fed boys of 12½ or 13, who never saw a hammer or chisel, are not fit to be set at these trades. And how many boys of 13 want to go to work at a trade? Let them, however, go to a school, not where a trade is taught, but where they are taught to use tools and to draw and to continue their ordinary education, and when they get to be 15 or so-and they are then not too old to enter life—what have they learned? They have learned to like tools and to want to be machinists, or electricians, or carpenters, and when they enter their fields they will become skilled mechanics. They have the foundation laid strong and deep; the foundations of intelligence and skill, for they know the principles, not of one trade, but the principles that underlie many trades. We dare not, indeed it is impossible, to take boys as young as we do, and from such sources as they come, and teach them trades from the first. We have to get them to love work and want work, then find out for what kind of work they are best fitted, and then assist them in that at which they will do best. Intelligence and skill are both needed, one as well as another. We have here the brain and the hand. We teach here that it is as honourable to be a greasy mechanic as the cleanly book-keeper; that the field of industry offers as broad and broader opportunities than those of commerce, that production is as honourable as distribution." . . . Summarising the course of instruction, it will be seen to fall under three heads: Shopwork in wood and iron; drawing, free-hand and

and mechanical; the English branches and physics. Each pupil attends during the six hours that form the school day, and receives instruction in all the departments. The longer he stays in the school the following facts become more apparent: First, whether he has any mechanical aptitude; second, whether he likes wood or iron work best, and this evidences itself by the work he does for special work. Thus, one boy will make a dynamo or an engine, while another will prefer to make a desk. It is the aim of the school, as far as possible, after a certain general course of instruction has been given, to furnish in the last portion of the pupils' instruction a special preparation.

### NEW YORK TRADE SCHOOLS.

I visited the New York trade schools, which were founded by Mr. R. T. Auchmuty eight years ago, and were designed "to teach thoroughly how work should be done, and leaving the quickness which is required of a first-class mechanic to be acquired at real work after leaving the school." They give young men instruction in certain trades, and also to enable those already in trade to improve themselves. The founder says: "In both the American and foreign schools, where trades are taught to beginners, the trade instruction is usually combined with a general instruction extending over several years. Although the results of this system of combining trade instruction with a general education are excellent, it does not meet the wants of young men who must support themselves or contribute to the family support. The system of trade instruction which seems best adapted to American wants is to leave the general education to the public schools, and confine the work of a trade school to the manual and scientific instruction necessary to make a mechanic."

There are day and evening classes giving instructions in-

- 1. Bricklaying.
- 2. Plastering.
- 3. Plumbing.
- 4. Carpentry.
- 5. House painting, including sign and fresco painting.
- C. Stone cutting.
- 7. Blacksmith's work.
- 8. Tailoring.

Here, then, we have a typical trade school in which skilled mechanics are employed as teachers whose duty is to show how good work is done, and to see that each individual pupil does it properly.

The requirements for admission are simple. The applicant must be between the ages of 17 and 21, and of a good character.

The buildings cover a plot of land 200 feet by 113 feet fronting on First Avenue, Sixty-seventh and Sixty-eight Streets. The buildings are all on the ground floor, except on Sixty-seventh where the slope of the land allows a basement floor. The main entrance is from First Avenue, and the front door opens into a hall, with the office on one side and the janitor's apartments on the other. A novel feature is at once apparent; the walls being hung with photographs of work done by former members, and views of buildings creeted by members of the bricklaying class, also photographic groups of classes and testimonials and diplomas awarded to the schools. The hall is handsomely finished with a timbered coiling. At the back of the hall is an open court communicating with the bricklaying room, the plumbing shop, and the tailoring shop. The carpenter's shop and the plastering room are entered

from the bricklaying room, and beyond the plumbing shop is the paint room. All these workshops have skylights as well as windows on each side, so there is no trouble as to ventilation. Fronting on Sixty-seventh-street is the reading room—spacious, lofty, well designed, with three large bay windows looking into Sixty-seventh-street, and one large one into the carpenter's shop. From this window you can see over 150 young men full of life and vigour, hard at work during the evenings. An inscription at the end of the room states that all the carpenter's work, including the open timbered roof, bay windows, &c., was done by students of the class 1887–8, under the supervision of the instructor, D. Vanderbeck. The decorations were done by the painting class of the same season.

In Appendix K will be found a detailed account of the classes, their respective work, fees, &c.

It is stated in the proprietor's programme "that journeymen object to having young men taught trades because there will be too many skilled workmen, and because they fear that the master mechanics would be able to do much work with boy labour that is now done by journeymen. \* \* \* At a trade school a young man learns his trade without competing with men in the workshop. The labour of a Trade School graduate is of considerable value, and it can easily be graded during the short term of practice required after leaving the school, so as not to allow him an unfair advantage over journeymen. Thus by the Trade School plan the competition of boy labour in the workshop, so much dreaded by the journeyman, is avoided.

The time has come for the trade unions to consider this apprentice question. Never before in any country have rules existed which prevented young men learning how to work so that they could share in the high wages any foreigner is free to earn. It is not possible that such rules will be tolerated much longer in this country. Were it not for the lads who learn their trades in country towns, where there are no unions to interfere with them, the number of skilled American workmen would be even smaller than it is now. It is estimated from figures given in the last census, that out of the enormous sum of \$23,000,000 paid annually to mechanics in the building trades in this city, less than \$6,000,000 goes to those born in New York." Apprentice rules drawn up by Mr. Auchmuty and recommended for adoption in the building trades will be found in Appendix K.

#### THE PACKARD BUSINESS COLLEGE.

As a commercial technical school I visited the Packard Business College at the corner of Fourth Avenue and Twenty-third-street, New York, as being a representative school of its kind.

The progress of business education in America, I was informed by Mr. Packard, during the past thirty years has had the effect of changing to a considerable extent the character of the preparatory schools. The demand of American life lie greatly in the direction of business, and to meet this demand schools must give every attention to the importance of practical studies. Even the classical schools have learned that it is unwise to put too much stress on Cicero and Xenophon, but that it is necessary to put much more on practical sciences and modern languages, as they now permit their graduates to substitute in a great degree living for dead languages and new methods and ideas for the old college curriculum. Mr. Packard says, "It has been the work of this institution to meet the requirements of business in a city which, in itself, is the embodiment of all that is best and most progressive. Nothing better and nothing truer can be said of its course of study than that it has been shaped

by the exactions of our best business houses. The study of book-keeping has always been, and remains, one of the important studies of the course; and the practices which enforce the science are taken from the daily customs of our commercial life. The arithmetical problems and methods are carefully adjusted to business demands, and embrace all that is newest and best in counting-house practice. The instruction in penmanship is in the hands of practical writers, and enforces the plainest and most business-like style, while securing the greatest freedom of movement."

Instruction is given in arithmetic, penmanship, language, phonography, type-writing, book-keeping, correspondence, commercial law, and business practice. In this last is exemplified the true technical character of the school.

Experience has shown that the average time of attendance of those who seek the business college for professional instruction to be about one year; therefore, to meet this requirement, it has been found necessary to condense as much useful information and practice as can be done within that time. This is done by simulating actual business and by going through the precise routine and operations of representative business houses, so we find in the school, banks, post-offices, transportation offices, wholesale and retail mercantile houses, and to represent through the daily manipulations all the peculiar features of traffic and exchange which make up the world of real business. To accomplish this in a strong and thorough way, it is necessary not merely to imagine but to know what these business procedures are; and the business school that is true to itself will leave nothing in doubt. The last three months or more of the course are given wholly to business practice, which as nearly represents business itself as can be done in a school. It is true there are no handling of bales, boxes, and barrels; no stores and warehouses filled with merchandise; no railroads or steamboats actually engaged in conveying goods bought and sold; but beyond this there is a semblance of business and a necessity for as complete a record of all transactions and movements as though these things existed. Every paper that would be required in real business has its place in the school work; every document which would be called for in the inception and completion of bargains and transfers is here demanded and made to fill its functions. There can be no reason why the daily routine of transactions such as occur in our large and small enterprises may not be enforced with perfect fidelity, and this is what is actually done. Avoiding all merely sensational devices, either in record or manipulation, the aim of the department is to throw the student upon himself, requiring at his hands the strict accountability for well-done work which he will experience in life. He goes through all the processes of buying, selling, receiving, and shipping merchandise of all sorts, remitting and receiving money through correspondence, dealing with banks from the outside, and attending to the details inside, beginning at the lowest round, and working up from messenger to manager, becoming familiar with the duties of each position in turn, and so at last, with the principles and theory of banking, as well as of business generally. It is scarcely necessary to say that while the semblance of real transactions is a main feature of this work, the fitting up of the offices, internally and externally, follows out this realistic idea, and the system in its entirety fulfils the best conception of teaching business through practice.

In the School for Shorthand the preparatory qualifications are a fair knowledge of the ordinary English branches of education. This is considered a sufficient preparation for the commercial course. Any deficiency in this respect, if not too radical, can be remedied in the regular departments of the school. The absolute require-

ments

ments for a position as amanuensis are: (1) a sufficient speed in shorthand to take from dictation—say, 100 to 125 words a minute; (2) unquestioned correctness in spelling; (3) a sufficient knowledge of the use of language to write letters without dictation; (4) general acceptableness in personal appearance, good temper, and common sense.

I was informed that, as a matter of fact, the Packard College had four times as many applications for young men and young women as clerks, amanuenses, &c., during last year as it could furnish. The demand has been especially strong for young men stenographers, and there were no efficient Packard graduates out of employment, who may desire employment, or is there any immediate prospect of such a contingency.

# THE INDUSTRIAL EDUCATION ASSOCIATION.

Matthew Arnold declared that "America holds the future;" and Miss Le Row says, "with equal truthfulness it may be said that the school teacher holds America." There are in the United States over 300,000 teachers, five times as many as there are clergymen, and four times the number of the lawyers. The necessity of training persons properly qualified for the work of teaching is at once apparent, and has been recognised for a long time; but although normal schools and training colleges exist in most of the states, it appears these educate only a minority of this vast teaching body. If you make inquiry as to the facility or difficulty of getting teachers of any college director, you will be informed that it is very easy to get teachers, but very difficult to get good teachers. However true this may be, it is a difficulty that can be overcome. My own experience leads me to believe that every school teacher, whether the school be public or private, primary or intermediate, should be certifi. cated from a normal high school or training college. Moreover, there should be a chair of pedagogy in the universities. It is known that the necessity for trained teachers exists, and also that it is impossible the number required can receive their professional training at universities. It is somewhat, if not altogether, phenomenal that a person should know how to teach without having systematically studied pedagogical methods; therefore special colleges for the training of teachers must be established, where the requisite normal training for the new education can be properly furnished.

The Industrial Education Association worked energetically in this direction, and its chief objects are as follows:—(1) To secure the introduction of manual training as an important factor in general education, and to promote the training of both sexes in such industries as shall enable those trained to become self-supporting; (2) to devise methods and systems of industrial training, and to put them into operation in schools and institutions of all grades; (3) to provide and train teachers for the work. The statement of principles which this association has promulgated is a most excellent pedagogic creed, and should be carefully perused by every teacher. Its substance is as follows:—

- 1. That the complete development of all the faculties can be reached only through a system of education which combines the training found in the usual course of study with the elements of manual training.
- 2. That the current system trains the memory too largely, the reasoning powers less, the eye and the hand too little.
- 3. That industrial training, to have its fullest value, must be an integral part of general education. While valuable in some measure alone, it is alone little better than manual training as leading to the value of trades.

- 4. That it is not the aim of the association to teach trades. That boys and girls will, if educated according to the system which it advocates, be better able to take up the study of any particular trade it recognises as one of the results of the system. It is the development of all the faculties which it holds to be the essential aim of the system.
- 5. That the fact is generally recognised among those best informed on the subject of education that the Kindergarten system produces the best results with young children. The Association claims that the system which combines industrial training with the usual and necessary branches is nothing more than a development of the Kindergarten theory—a system found wise for young children, modified and adapted to children of more mature growth.
- 6. That it holds the belief that, as children, wherever found, possess the same faculties and develop the same characteristics, this system should be introduced into all classes and grades of schools, the private as well as the public schools, and not alone in the primary public schools, but in those of more advanced grades.
- 7. It holds that this system tends to the development of certain moral qualities as well as to the development of the intellectual faculties.
- 8. That the various occupations which are by this system given to the children render study less irksome than any system can in which the exercise of the faculty of memory is alone involved.
- 9. That there exists in this country a wide-spread disinclination for manual labour which the present system seems powerless to overcome. There is a wide range of occupation, which our boys and girls might with advantage enter, were it not that they are prevented from doing so by a false view of the dignity of labour. That one of the results of this system of education will be to destroy a prejudice which in a measure arises from a want of familiarity with hand work.
- 10. That the first and last object of the Association, the main reason for its existence, is the creation of a public interest in this system, and a public belief in its value.

To carry out the objects of the Association, the methods employed were substantially as follows:—

- 1. By distributing writings and documents explanatory of the theories of industrial education, and also of the practical methods of engrafting industrial training upon the present school system as an integral part of a common school education. These documents are to be sent to all educational centres with a view to stimulate inquiry and interest.
- 2. By sending persons competent to lecture upon the same matters, to add personal influence to the documentary explanations, and to invite the interest of persons influential in educational matters.
- 3. By sending trained teachers to point out practical methods of engrafting manual training upon existing schools and institutions of learning, or, if need be, to establish independent schools of industrial training.
- 4. By sending teachers to work in schools wherever needed throughout the country.

To accomplish these objects there was established in University Place, New York City, a museum of articles illustrative of methods and results of industrial training and kindred topics. (2.) A library comprising all literature bearing upon these subjects. (3.) Courses of lectures on manual training and methods of teaching; and (4) Normal classes for the training of teachers and lecturers for the dissemination of this class of knowledge.

COLLEGE FOR THE TRAINING OF TEACHERS.

The Industrial Education Association having fulfilled its grand initiatory work, has been merged into that of the College for the Training of Teachers, which it founded at 9 University Place. This college received its charter from the Board of Regents of the University of the State of New York in January, 1889. It was issued upon the application of its promoters, stating that it was their desire to establish and conduct a purely professional school for the training of teachers; that the elements of a secondary education are not to be taught at the proposed college, but are to be required of candidates for admission; that the object of the college is to give instruction in the history, philosophy, and science of education in psychology, in the science and art of teaching, and also in manual training, and the methods of teaching the various subjects included under that head; that a school of practice and observation will be maintained in connection with the college; and that a course of instruction and practice of not less than two years is to be organised, the completion of which, to the satisfaction of the trustees and faculty of the said college, may entitle the candidate to the degree of Bachelor of Pedagogy.

The college for the training of teachers is a professional school, and not a normal school in the ordinary acceptance of that term. It is designed to prepare men and women students thoroughly for the profession of teaching, and the course of study is drawn up with that end distinctly in view. The trustees and faculty regard teaching as a profession which, in common with law or medicine, requires a careful preparation. They also maintain that manual training should absolutely be a part of every school curriculum, and that the ability to give instruction in it, and to thoroughly understand it, must be a part of the teacher's equipment. While students who desire to fit themselves as teachers of particular branches may pursue special courses for that purpose if they choose, yet it is strongly recommended that all pupils follow the general course first, and fit themselves for a speciality afterwards, should they so desire. This is in accordance with the policy adopted by the best schools of law and medicine.

The circular of information for 1889-90 states that "the full course of study leading to the degree of Bachelor of Pedagogy occupies two years. Students will only be admitted to an advanced standing on passing a satisfactory examination on the subjects already gone over by the class as well as the usual examination for admission,"

"The course of study includes psychology, the history and science of education, methods of teaching, observation and practice in the Model School, school organisation and administration in the United States, England, France, and Germany, the theory and practice of the Kindergarten, natural science including the construction of simple illustrative apparatus, history, and the subjects included under the term manual training. Special attention is given under the latter head, to form study and drawing, domestic economy, mechanical drawing and wood-working. all these departments the demand for trained teachers far exceeds the supply, and there is an excellent opening in all parts of the country for competent teachers. 138—P

Male

Male students are not required to attend any of the courses in domestic economy, although the lectures in that department are open to them should they choose to attend them. The course in wood-working is designed primarily for male students, but it is open to female students should they desire to attend it. The practical work of the course is not an undue tax upon their physical powers."

Students of both sexes are admitted on an equal footing, and, as a general rule, no student will be received in the junior class at its formation unless he shall have attained the age of 18 years; nor will any one be admitted to a more advanced standing without a corresponding increase of age.

Applicants for admission to the junior class are examined in the following subjects:—

Arithmetic.—Prime and composite numbers, greatest common divisor, least common multiple, denominate numbers, common and decimal fractions, per centage, simple and compound interest, discount, square root, and the metric system of weights and measures.

Plain Geometry.—As much as is contained in the first five books of Davies' Legendre.

History.—As much as is contained in Johnson's or Anderson's History of the United States.

Geography.—As much as is contained in Appleton's Higher Geography.

English.—Each candidate will be required to write a short English composition, correct in spelling, punctuation, grammar, expression, and divisions by paragraphs, the subjects to be taken from such authors or works as shall be announced from time to time.

In special cases a student who is deficient on the whole or any part of any of the above-named subjects, may be admitted conditionally. Students so admitted must satisfy their conditions before December 15th, unless excused by vote of the Faculty. Applicants for admission who have completed the course in the Model School, who have a degree from a university, a college of good standing, or a diploma from any academy or high school in the curriculum of which all the subjects of the entrance examination are included, may be admitted without examination on presentation of such degree or diploma. Every application for admission without examination is decided on its own merits; and every candidate must before examination present a certificate of good moral character from his last teacher, or from some citizen of good standing.

Another feature of this College is that special students are received at any time, and are permitted to select such courses as they may choose, and are, in the judgment of the President, qualified to enter upon. They are not required to pass the entrance examination, and the fees are also special and are fixed by the Dean of the Faculty. In order to obtain a certificate of proficiency in any department, a special student must take the course in the History and Institutes of Education, in addition to the studies of the department for which a certificate of proficiency is desired. Such certificate will be signed by the President, the Dean, and Professor in charge of the department.

The department of instruction are as follows:—

- 1. History and institutes of education.
- 2. Methods of teaching.
- 3. Kindergarten.
- 4. History.
- 5. Physical culture.

- 6. Natural science.
- 7. Domestic economy.
- 8. Form study and drawing.
- 9. Mechanical arts.
- 10. Vocal music.

The

The department of History and Institutes of Education includes psychology, the science of education, and the history of education. It occupies five periods a week throughout both junior and senior years. During the junior year psychology occupies three periods a week, and the science of education two periods. In the senior year the history of education occupies three periods a week, and the science of education two periods. In psychology the object is by lectures and the use of Murray's "Handbook of Psychology," supplemented by observation on the part of the students, to give a correct and full analysis of mental life and development, the laws which govern it and the various processes involved in the development of knowledge, feeling, and the well-continued application of the principles and facts discussed is made to the practical work of the school-room. The course begins with a discussion of the fundamental principles of education, and includes the citation and study of standard educational writers. It is designed to trace the development of educational institutions, organisation, and methods from the earliest times to the It concludes with a survey and comparison of contemporary educational systems both in Europe and America.

In methods of teaching two periods weekly is occupied during the junior year, and three periods weekly during the senior year. The methods are those of the usual English branches below the High School, number and arithmetic, language and reading, geography and history.

The aim of the instruction in this department is to give the students a general survey of the different methods in each branch and the relation of each to the growth of the child's mind. In addition, the most approved methods will be carefully studied in relation to the work of the various grades to the accompanying industrial and manual instruction and to general school management. These methods are also discussed in their relation to Kindergarten methods as the beginning, and the higher instruction as the definite end of school work.

Practice teaching occupies five periods a week during the senior year, and offers the students an opportunity for teaching and observation under the direction and criticism of the Professor of Methods and Teaching. In connection with this work, instruction is given in planning daily lessons, outlines of a term's work in the different branches, and in making programmes for the daily work in the various grades.

The special students in this department must, in order to obtain a certificate, attend courses in psychology, the theory of the Kindergarten, and elementary work in form study and drawing.

The general course of the Kindergarten occupies three periods a week during the junior year, during which an outline of the Kindergarten system is given by means of lectures, together with opportunities for observation and practice with children in the Kindergarten, in order to show how the theory is carried into practice.

Special courses have been instituted for those who wish to become practical Kindergartners—an elementary course occupying one year and complete in itself, which takes up, as fully as the time permits, all the subjects included in the advanced course, and to those who finish it satisfactorily a certificate will be given testifying to that fact. As, however, it is impossible in a year's course to fully study so many subjects as are found necessary, especially to thoroughly master Fræbel's philosophy, where the students must spend a considerable amount of time in practice teaching,

a second year's course has been provided for those who wish to enter upon Kindergarten work with the best possible equipment. In this course the subjects taken up during the first year will be more fully developed, and their bearings upon child-culture in the home, the school, and in the Kindergarten itself, will be more thoroughly and practically illustrated. Students taking the advanced Kindergarten course will also be required to attend the lectures on the science of education given to the senior class by the Professor of the History and Institutes of Education.

The admission to the special Kindergarten course must present a certificate of graduation from an approved high school or academy, or otherwise to pass the examination required for admission to the junior class.

In the Department of History the work occupies two periods a week during the senior year, and the place followed is that of personal investigation in connection with lectures upon topics which have a general bearing upon the development of civilisation. It is believed that right historical study is an aid to culture, breadth of view, and sympathy, and that it gives discipline in reasoning of the practical kind most needed in the affairs of life, that it trains the imagination, and is a special preparation for the worthy handling of the great questions relating to man and society, more especially as regards the duties and rights of mankind.

The Department of Physical Culture occupies three periods a week during the entire course, and students are urged to add as much more time to private practice as possible, the great aim being to secure for the students themselves the best health, strength, and endurance, and to place physical development before them in the place it should occupy; in the next place, to instruct them in such exercises as may be used to advantage in schools in the relation of physical habits to mental and moral growth, and to lead them to an understanding of gesture as a natural mode of expression and a guide to a better understanding of the child's mind. Each student, on entering, is tested as to his general strength and endurance, and special work given to meet the needs of the individual.

In the Natural Science Department the work of the regular course occupies six periods a week for one year, and the object of the work is to prepare the student to give experimental lessons in elementary science to pupils in primary and grammar grades. The topics dealt with are such phenomena as daily come under the observation of children, and such as they naturally desire to inquire into. A course of experiments is pursued which is calculated to develop the explanation of such simple phenomena, and the students are taught to construct and adapt their own illustrative apparatus. The members of the class, before coming up for their degree, are required to fit themselves in the subject-matter relative to these topics by reading prescribed portions of books of reference. No examination in science is required for admission to the College. It is found to be better that students should do their reading in connection with their experimental work. All candidates for a degree, however, must pass this examination in subject-matter at the end of their course. Persons who are prepared to pass examinations in zoology, physiology, botany, physics, and chemistry may, by spending one year in addition to the regular course in the study of laboratory methods and the construction of simple illustrative apparatus, receive a certificate signed by the President of the College and the Professor of Natural Science, stating that they are qualified to teach science in the high school grades.

Two courses of lectures with laboratory work have also been opened for teachers of New York City and vicinity during each year, for the purpose of teaching the construction of simple apparatus for illustrating the first principles of physiology, physics, and chemistry. These courses are specially adapted to teachers in grammar grades, but they may be readily applied to high school grades also.

The instruction in the Department of Domestic Economy includes cooking and sewing. The primary objects of the cooking course are to stimulate investigation, to develop the power of accurate observation, and to lead the pupils to put to practical use in the preparation of food their knowledge of the natural sciences. Throughout the entire course the students are instructed in the chemistry of cooking and food nutrition, by means of lectures illustrated by charts and a food museum. There is also a prescribed course of reading and lectures on domestic economy, including all matters relating to the care and hygiene of the household. There are no demonstration lessons, the work in the cooking laboratory being entirely practical. The course of study includes ten lessons on each of the following subjects:—The principles of cooking, with practical illustrations, plain cooking, preparation of fancy dishes, cooking for the sick, and a course of lessons intended to teach the most economical methods of choosing and preparing food. This course occupies four periods a week during the senior year.

The sewing system used in the College aims to give a thorough training in plain hand-sewing, to cultivate precision, and, through the medium of object lessons, to impart a knowledge of textile fabrics and their manufacture, and other articles used in sewing. The system embraces a primary course, which is designed for pupils in the primary grades, and follows as closely as possible the sewing, cutting, and weaving of the Kindergarten. The work of the grammar grades takes the pupils through all the stitches used in plain handwork, mending and the cutting out of simple garments. The high school work takes up useful household embroidery, and finishes with a course of lectures on textile fabrics. The course occupies three periods a week. Special courses are also offered by this department to teachers, nurses, or special students.

The Department of Form Study and Drawing occupies four periods a week throughout the junior and senior years, and includes the following subjects:—In the junior year the study of geometric models and type forms; detailed method of presentation to very young children, making objects in clay and paper; use of tablets and sticks; arrangement of simple designs; cutting the same in coloured paper and drawing; suggestions for the work of each day; arrangement and length of lessons; general primary work.

Construction. — Working drawings; freehand and instrumental drawings; paper models and objects based upon such models; the use of simple problems in constructive geometry.

Representation.—Freehand drawing from models, singly and in groups; rules of composition; arrangement and drawing of groups of natural objects; principles involved in illustrative drawing upon the blackboard.

Decoration.—Historic ornament; modelling of natural forms and ornament in clay; decorative design in pencil outline, and with combination of coloured papers; original designs about a centre, and over a surface; drawing done wholly by the pencil, and subject to thorough criticism.

Theory

Theory of colour.—Its application in the school-room; relief in clay; instruction in methods of teaching freehand drawing; the history of ornament.

In the senior year the work is adapted to the high school grades; relief in clay; historic ornament in water colour; light and shade; original design. Students desirous of becoming special teachers of form study and drawing should be able, on entering the college, to pass an examination in freehand drawing and light and shade.

Special classes for teachers and others are formed each year. One of these specially designed to meet the needs of teachers in the Public Schools is held on Saturdays at 10. The work of this class will be particularly beneficial to those teachers who look forward to introducing form study and drawing into their regular school work.

The Department of Mechanic Arts includes at present—chemical drawing, the Swedish system of Slöjd and wood-working. It is intended to extend the manual training so as to include metal working such as is suitable for pupils of High School age. Mechanical drawing occupies four periods a week during the junior year. The instruction aims to give the student a thorough knowledge of orthographic projections and working drawings. The drawings executed are afterwards used as the basis of constructive work in wood.

Slöjd, the system of wood-working devised by Professor Solomon, of Nääs, is adapted in the College to the powers and needs of pupils in the primary and grammar grades. This course occupies two periods weekly during the junior year. Woodworking is arranged to afford instruction and exercise in constructive work to the pupils of the upper grammar and High school grades. This course occupies two periods weekly during the senior year.

All of these courses are designed for pupils of either sex, and involve no undue strain on their physical powers. No attempt whatever is made to teach trades. Whatever tools are employed are used for the sake of the educational value of the processes which they involve.

There are special courses also for this department in which students may confine themselves solely to the manual training instruction; but in order to obtain a certificate special students must attend the lectures in psychology and in the science of education, which form part of the work in the junior class. An advanced class is also contemplated for the training of those who wish to qualify themselves specially to teach the mechanic arts. These will include advanced mechanical drawing and machine designing, wood-turning, and pattern-making, moulding, casting, forging, vice work, metal-turning, and planing. It will require the students' entire time for one year.

Vocal music has two periods weekly allotted to it throughout the junior year. The tonic-sol-fa method has been adopted, and the student is trained to teach music rationally as a part of the regular class-room work.

The model school of practice in connection with the College has its raison d'etre to afford students the opportunity for observation and practice, to demonstrate that manual training can be introduced into schools of primary and grammar grade with benefit to the pupils, and without interrupting their progress in other studies, and also to afford the opportunity to those intending to pursue the professional course at the College to receive thorough preparation for entrance. The school consists of four grades—Kindergarten, primary, grammar, and high school. The course

course of study is designed to last twelve years, though it may be completed in a shorter time. The aim of the instruction is to unite with the best methods of teaching the usual school studies, the best educational work in the industrial and mechanical arts, securing for the pupils such a training as will enable them to develop both their manual and mental powers, and fit them for the active duties of citizenship.

The Kindergarten is conducted by the professor of Kindergarten methods with competent assistance, and is designed to lay the foundations for all future education by the rational awakening of the child's mental powers. Under ordinary circumstances one year in the Kindergarten suffices to prepare a child of 5 or 6 years for the work of the first division of the primary grade, the work of which covers four years. The course of study in the English branches includes number, reading, spelling, penmanship, elementary geography, and language. The design is to acquaint the children with processes, and to give them a reasonable facility in their use. Every means is used to train the pupils to habits of precision, accuracy, and attention, and so far as possible to induce thought and expression to keep pace with each other.

Upon completing the four years in this grade, the child should enter upon more advanced work, unhampered by the inability to pronounce or spell ordinary words, able to use whole numbers and fractions in their written form or orally, acquainted in a general way with the people, the great industries of different parts of the world, and able to express his knowledge in simple but correct English, both orally and in writing. The foundation for systematic historical instruction is laid in this grade, by means of story-telling and illustrations.

The instruction in form study and drawing follows this outline: geometric solids by handling and making in clay; also objects based upon such solids, studied first as wholes, then in parts; exercises in arm movement; use of pasteboard tablets to show plain faces, and patterns of solids; arrangement with tablets of designs about a centre and simple borders; sticks as illustrative of lines; training the colour sense by presenting harmonious combinations in the paper, folding and cutting; using: first, tints and shades of primary colours, then tints and shades of secondary colours; folding and drawing simple objects in paper, cutting and pasting (such as boxes, &c.); drawing upon the blackboard and upon paper, the drawing to be very free and no erasing allowed. The object in this early work is to develop the observation and thought of the child, to teach him to express what he sees, to encourage habits of attention, neatness, and order, not expecting the correct execution which can only come with long training and practice. Provision is made for training the judgment, executive faculty, and power of expression by construction, by means of the Swedish Slöjd method. Beginning with objects of the simplest character, in the construction of which the knife is the only tool used, the pupil is laid on to the construction of more complex and elaborate objects which require for their completion the use of several simple tools. All of this constructive work is based upon drawing, and is pursued in connection with it.

Sewing is taught in this grade, and is designed to follow the Kindergarten, sewing, weaving, and cutting as closely as possible, and to prepare the child by easy steps for the more difficult stitches. The work includes running, stitching, folding hems, uniting corners, and the cutting of simple patterns.

Lessons

Lessons in elementary science are those outlined in Woohhull's "Simple Experiments for the School-room," together with kindred experiments in physics, chemistry, and physiology. The main objects sought in this instruction are two; first, to make pupils accurate observers, and second, to make them draw correct inferences from what they observe. The lessons are based entirely on experiments performed in the presence of the class.

The work of the grammar grade also covers four years, and is the extension of the work of the primary grade. In mathematics the instruction includes written arithmetic and constructive geometry. In reading, selections from the best authors are read and paraphrased, and attention is given during the entire course to articulation and vocalization. Physical geography is made the basis of political geography, and on finishing the work of the grade, pupils should know the general arrangement of the earth's slopes as grouped in the great continental river basins, together with the general outline of the continent; the heat-belts as determined by latitude and elevation; the belt of the trade winds, return trades and principle monsoons; the general distribution of rainfall; the divisions of the earth's surface into fertile and barren regions; the flora and fauna of the various regions, and the races which dwell in them; the mining districts; the world's centres of trade, principal capitals and historical cities, and also the great routes of commerce; the location of countries upon the great slopes, and the proper use of the Atlas and Gazetteer. Pupils are also led to develop a taste for good books of travel. language, the main object of the work is to enable the pupils to express themselves easily and correctly in speaking and writing; the facts of grammar and grammatical analysis are taught in connection with composition and letter-writing, together with such exercises in the use of words as will lead to an intelligent use of the dictionary. In history the systematic work includes the discovery, exploration, and colonisation of America, and the growth of the nation to the time of the rebellion. prominent statesmen, generals, discoverers, and inventors, and the literature of the different periods are read and discussed.

Form study and drawing in this grade includes the study of geometric forms with modelling in clay from vegetable and animal forms. The drawing is distinctly classified, and is divided into three parts. First, Construction, or the facts of form; working drawings, both freehand and instrumental; development of surface, or the patterns of solids; study of relative dimensions, &c. All this work has a direct bearing on the instruction in number, geometry, and the constructive work in wood. Second, Representation, or the appearance of form; picture drawing; models in different positions drawn singly in groups. The pupils are instructed to draw exactly what they see. Third, Design and Decoration; proper principles of designs illustrated by lessons on proper construction of objects; designs about a centre, over a surface, for borders. The imagination of the child is constantly stimulated to observe the beautiful in nature, and the proper and improper in the construction and decoration of objects.

Note:—Dr. French's form, study, and drawing system of the United States of America is furnished in *Appendix* L.

In manual training, the pupils pass from the Stöjd to wood-working with carpenters' tools. The instruction is connected closely with instruction in elementary science, and the pupil learns to prepare wood for use, and to construct with accuracy and precision the ordinary types of joints. Towards the close of the course the pupil undertakes some project which involves in its construction a combination of a number of the elementary steps with which he is already familiar.

Sewing

Sewing in the grammar grade includes object lessons on the different materials used, and embraces instruction and practice in all the stitches used in plain sewing and mending.

Cooking is begun in this grade, and includes some information regarding the chemical composition and relative nutritive power of various foods; combustion and the making of a fire; measuring materials and the elements of cookery; the application of this knowledge in the making of bread, soup, biscuits, tea, coffee, &c., and in the proper methods of preparing fish, meats, and vegetables for use as food.

In elementary science the work of the last grade is continued.

Instruction in the high school grade occupies three years, and includes:-

Mathematics.—Commercial arithmetic, elementary algebra, plain and solid geometry.

Geography.—Political, physical, and mathematical.

Language and Literature.—Higher English grammar and rhetoric; the reading and study of standard authors; essay writing.

History.—The outlines of the world's history, and the study of topics of contemporary interest; the government and institutions of the United States.

Latin.—Easy stories, Cæsar, Cicero, Virgil—Latin writing; Latin is taught as being the basis of all appreciative use of English, and as a means of gaining discipline and culture.

Form Study and Drawing.—Continuation of the work of the grammar grade; simple problems in constructive geometry; mechanical drawing; principles of orthographic projection; clay modelling from casts; historic ornament; decoration in water colours or distemper.

Constructive Work or Manual Training.—Construction of projects in wood; wood turning; moulding and pattern making; casting and forging; machine work in metal.

Domestic Economy is carried on in the cutting of simple garments; embroidery and application of the pupils' knowledge of colour and design; lectures in marketing, and the selection of foods; advanced cooking, and cooking for the sick.

Elementary Science.—Methodical study of the natural sciences for the purpose of acquiring a knowledge of their subject-matter. The students perform their own experiments in the laboratory, and their work is expected, first, to make them careful experimentors; second, to make them accurate observers; third, to teach them to draw correct and honest inferences; and fourth, to acquire scientific information. The corrollated facts of physics and chemistry are taken up in logical order, as are those of biographical science, including botany, zoology, and the study of the human body. Special attention is given to the construction of simple illustrative apparatus.

Systematic physical exercise, hygiene, and instruction in vocal music from part of the curriculum of every grade. No formal instruction in morals is attempted, though the formation of character and habits of truthfulness, honesty, and reverence is the chief aim of the course.

I have thus set forth, in detail, the methods and manner of teaching collected from the circular of information provided by the trustees, and also from a close personal

personal inspection, not only of the various departments, but of the classes of the model school of practice. I have been particular in thus fully describing the College for the Training of Teachers, as this institution does not take the form of the ordinary normal or training school, but to all intents and purposes is truly a professional It makes teachers in the same way that schools of law and medicine make lawyers and doctors, and is the latest outcome of work in this direction. children should be instructed in the public schools by thoroughly qualified teachers who have been methodically taught how to teach, and whose character and temperament fit them for the work, has been conceded and advocated by all who have had experience in the subject. These teachers must necessarily be certificated according to their skill, proficiency, and other qualifications, and it is clear that all responsibility rests with the Government as to providing teachers for public schools with these necessary qualifications. This has been recognised in New South Wales, and properly trained teachers are, I believe, always employed, and take the place of those who have been untrained, as vacancies occur or new schools are opened. I was struck with the extreme usefulness of this College, especially as to its wise provision in the institution of special classes on Saturdays, which teachers, who wished to improve themselves in their profession, had an opportunity of attending, without in any way interfering with their ordinary school duties. Thus, if uncertificated in any or every subject they could by application and energy rectify this drawback to their position. as the remedy is at their disposition, and entirely rests with themselves. to do this, they cannot be surprised should the Government supersede them, as its duty is clearly to get the best service possible.

Andrew S. Draper, the State Superintendent of Public Instruction, in writing his views upon determining the qualifications of teachers, states the following propositions, which, in his opinion, should govern the public, its officers and representatives, in determining who may teach in public schools:—

"First,—To the fullest extent possible it should be done through institutions established for training teachers, where applicants take a regular course of professional work, and have actual practice under the criticism and advice of experienced instructors. The completion of such a course, and the consequent certificate of such an institution, whose standing depends upon the character of its graduates, is more reliable for satisfactory results than any other. Second.—Training classes specially and properly organised for the purpose, should be preferred next to the institution exclusively devoted to it. The difference between them will depend, of course, in the difference between the plans of organisation, equipment, length of course, &c. Third.—Where persons desiring to teach cannot be induced, in sufficient numbers, to take a professional course of study and training, or where the facilities of such course do not meet their circumstances sufficiently to supply the schools, the question of qualifications must be left to an examination. Fourth.—Examinations for teachers' certificates should be held to be exclusively professional work, and be committed only to persons of established and acknowledged character and qualifications. Fifth.— But we must take circumstances as we find them. The law in cities and country alike, commonly commits the work to officers who may not, and in many cases are not, qualified for determining the qualifications of others. It would be best if the law were otherwise, but it is doubtful if it will be made so at an early day. Even qualified persons, however, will differ in degree of qualifications and in ideas, and individual standards will necessarily be variable, and certificates so granted will be of little or no value beyond the jurisdiction of the board or officer granting them, which

which is a hardship to qualified teachers. Moreover, qualified persons are subject to the influences and demands of interested persons. Near \$10,000,000 (£2,000,000) is annually expended in the State of New York alone for teachers' wages, and efforts to get it regardless of qualifications will never cease. Under our system of frequent elections and this strong unceasing pressure, even honest and qualified officers will temporise and be found wanting. Therefore, it is necessary that the State should supervise the examinations, determining their scope and extent, fixing the standards and sanctioning the results. The standards fixed by the State should be regarded only as the minimum standards of intellectual qualification. Local officers should be encouraged to extend the examination beyond that prescribed by the State, so far as they may be inclined, and to fix local standards as much above those fixed by the State as they may see fit, and to withhold certificates for any good reason; but no candidate should be certified who does not at least meet the requirements of the The examinations should be public and at stated times and places, they should be, in part at least, in writing, and the papers should be preserved for review in case of controversy over results. Abolish all special and private examinations. If an emergency arises a temporary permit might be issued without examination which would be good until after the next regular examination. Make a system which all can observe, which all officers can fall back upon for protection, and then require all to live up to it. Sixth: Grade the certificates. Let them clearly show the work performed by the holder. Let the certificates for low grades be for short terms—as the grades advance lengthen the term. Finally, give a certificate based upon a thoroughly substantial examination and successful experience, which shall be recognised as the professional certificate, and discontinue examinations altogether. Require teachers to advance beyond the lowest grade or experimental certificate, or cease teaching, by providing that this certificate shall never be issued to the same person more than a specified number of times. Make it to their interest to reach the highest grade. Seventh: Never permit the same authority which employs teachers to determine their qualifications, nor let the one authority be dependent upon the other. Employing officers need not employ unless satisfied with qualifications. That is sufficient. They should not be permitted both to license and employ. Eighth: Require that all officers authorised to issue certificates shall keep all examination papers, and a complete and public record of the standing of every candidate and of all certificates issued."

All this is very reasonable and impartial both to the teachers and the State. The teacher must progress with the times. He must advance beyond the lowest grade or cease teaching, for unless he can do this, it is clear he has mistaken his vocation. The whole future of the nation depends upon the school teachers, therefore it is not possible the Government can be satisfied with mediocrity. The profession of a teacher is a noble one, and counts among its members many of the truest and best of men and women, but they are not all of this class, and the chief cause is that the public have not yet come to realise the necessity of employing none but professionally trained teachers. In medicine, the law steps in and prevents an unlicensed man from practising, and it is the same with the law; but to teach children their duties as citizens, to educate them for the serious business of life, why is it that people think anything good enough? Once the great masses of the people become alive to the fact that professionally trained teachers are of infinitely more value than those who are untrained, whatever may be their respective attainments or accomplishments, the object will be gained, and steps would at once be taken to make the trained teacher as effective as possible by affording him every opportunity of thoroughly learning his profession. Education

Education is undergoing a gradual change, and teachers must not be taught. to regard education solely as the inculcation of facts. It is too much the fashion to think that if the brain be loaded with a mass of heterogenous facts and to continue this cramming during the whole school period is to provide a complete education, therefore "date is added to date, mountain height to mountain height, river length to river length, population to population, until time or finance fails." None of these things are of any use to the child, for if he had learned them fifty times they would be forgotten, and if at any future time the information were actually wanted it would be turned up at once from a book of reference. Of course the memory must be cultivated, but not in the way usually practised, where the whole of the school life, as a rule, consists of study and recitation—to commit the subject to memory and then recite it day after day, year after year, until the time comes to leave school. We know, however, that it is only applied knowledge that is power, therefore let us teach the application of knowledge, let us teach the use of the hands as well as the eyes. Sir William Hamilton said, "But as it is evident that the possession of truths and the development of the mind in which they are deposited are not identical, considered as ends and in relation to each other, the knowledge of truth is not supreme, but subordinate, to the knowing mind."

The discoveries which follow so fast upon each other necessitate a change, and the new education must include manual training. It will be impossible to do without it, if our children are to have equal chances with those of other countries that have adopted it. We must train their hands as well as their mind, and in doing so we may rest assured we are taking the best possible way to cultivate the mind. The great idea of the new education is to use the hands as well as the eyes, and where practicable, to make every lesson an object lesson. Says Charles Barnard, "I remember long ago a tear-stained book of tables of weights and measures, and a teacher's impatience with a stupid child who could not master the 'tables.' I have seen a school where the tables were written on a blackboard—thus: 'two pints are equal to one quart,' and on a stand in the school-room was a tin pint measure and a tin quart measure, and a box of dry sand. Every happy youngster had a chance to fill that pint with sand and pour the sand into the quart measure. Two pints filled it. He knew it. Did he not see it; did not every boy try it? Ah! now they knew what it all meant. It was as plain as day that two pints of sand were equal to one quart of sand; and with merry smiles those 6-year old philosophers learned the tables of measures; and they will never forget them. This is in brief what is meant by industrial education. To learn by using the hands—to study from things as well as from books. This is the new school; these are the new lessons. The children who can sew or design, or draw, or carve wood, or do joinering work, or cast metals, or work in clay and brass, are the best educated children, because they use their hands as well as their eyes and their brains—and yet you may say that, in such schools, all the boys will become mechanics, and all the girls become dressmakers. Some may, many will not, and yet whatever they do, be it preaching, keeping store, or singing in concerts, they will do their work better than those who only read in books. \* \* \* There may yet be shops in every schoolyard, and embroidery frames on every girl's desk. There will be books of course, and there also may be \* \* \* No more tears over unmeaning lessons, but everywhere pleasure and interest, because study is joined to work, and to learning is added industry."

I am fully aware that the adequate training of the teacher is not a new subject, and also that there have been many successful teachers who have never entered

entered a training college. As far as these latter are concerned, it must not be imagined that because they have not studied the science of education at school they have neglected the study at home, or that they do not see the vast advantages to be gained by such a thorough training as young men and women receive at the institution I have attempted to describe. Dr. Skinner, of New York City, speaking of the self-made successful teachers, says that: "These men and women have wrested success from adverse circumstances. They began their work with modest practice, carefully analyzed their experience, and thus reached wiser and wiser practice, almost unconsciously growing into a conscious possession of the truest kind of theory, that which is wedded to art. If we ask them what they think of the formal study of the history, the science, and the method of education, they invariably give a favourable response. These people, though lacking in early opportunity, have nevertheless been true disciples of Socrates, pioneers in the search for truth and mighty in their efforts to make the art of teaching worthy of being dignified as a Dr. Nicholas Murray Butler, the indefatigable and enthusiastic President of the New York College for the Training of Teachers, has given the most profound attention to the study of forming the high class professional teacher, and is of opinion that the German practice of giving far more practice work in the training colleges is superior both to English and American practice, and that he is further convinced that manual training should be an integral part of the common school course. He says, "The aim of the college is to equip teachers thoroughly for the work of elementary and secondary education, and to insist that in that education, and consequently in the equipment of the teacher, manual training must be permitted to occupy that place which history, philosophy, and science unite in saying is its due."

It will be noticed how closely the Americans follow the lines laid down by French educators, and this arises from the fact that the new system is the rational one. The true function of the school, from this point of view, is to prepare boys and girls for the active duties of life, and manual training brings out the character of the child, shows the direction his mind wishes to take; it therefore fits the child for the career in life adapted to his character, and teaches him the necessity of acquiring that education which will enable him to make an honest and honorable livelihood.

Francis N. Thorpe, an able writer on the subject of technical education, says:-"A manual training school trains boys in actual practice to become familiar with elementary notions, and to acquire a substantial knowledge of the nature of things, and of the rights and duties of men. The limits upon its provision for education can be set only by the actual wants of society as expressed in applications of all knowledge. It is a training school needed both by boys and girls, and is capable of modification suited to the wants of each. The school is a school of things, of principles, of human affairs, opened for the purpose of educating the young naturally, harmoniously, and ethically, in order to fit them to enter upon their work in the world without loss of time, without error in choice of activity, and with constant recognition of the gain both to society and to the individual: a manual training school is in the wisest sense a fitting school for life and for living. Our public schools upon a philosophic basis will quicken the life of society, and will aid, as they have never yet aided, in the solution of the industrial problems before the country. It may truly be said that the industrial factor in modern education is a permanent factor; that its early effects are already a revelation to educators of the hitherto unknown powers of boyhood, and that the manual training school is the nearest approach to the world of experience into which American boys have yet come. Whether in the city or the country, boys necd

need an education that is ethical in character. Experience will correct the early errors in the new movement, and the twentieth century may be well on its way before manual training is as characteristic of an academic course as literature or mathematics now are; but the economic forces in American society will work out a harmonious system of popular education."

I must not omit to give Dr. Butler's views as to the social and economic arguments in favour of manual training, as they fully bear out the sentiments I expressed in my last report, and more especially as to the dignity and the true position of labour. In addressing the members of the American Institute of Instruction. Dr. Butler said, "It is unquestionable that many of our social troubles originate in misunderstandings about labour, and in false judgments as to what labour really is. They originate, I take it, from the same misunderstanding that causes the average young man to think it more honourable to add columns of figures for \$3 a week than to lay bricks for \$3 a day. Some of us affect to despise manual labour. because we do not understand it. It must be apparent that if manual training is accorded its proper place in education, if we come to see that manual work has in it a valuable disciplinary and educational element, our eyes will be opened as to its real dignity, and men will cease to regard it as beneath them and their children. This is what I call the social argument for manual training. The economic argument is similar. It points out that the vast majority of our public school children must earn their living with their hands, and therefore if the school can aid them in using their hands it is putting just so much bread and butter into their Now, I have no sympathy with the purely utilitarian conception of the school, with what we may call the dollars and cents idea of education. On the contrary, I cordially endorse the pungent aphorism of Dr. Munger-'Education is to teach us how to live, not how to make a living.' But, while standing on that platform, I do say that if the best and most complete education happens to aid a boy in earning his living that is no reason why it should be supplanted by something less thorough and less complete. The movement which would place manual training in the school course has commended itself to the ablest and most thoughtful educators all over the world. I do not recall a single name of the first rank that is in opposition As might have been predicted, it meets with no little opposition and considerable misrepresentation. The forces of conservatism are arrayed against it as something new; and it is doubtless well that it is so, for education is altogether too important a matter to be swayed by any and every crude Any new movement to establish itself in education must run a gauntlet of opposition and criticism, the safe passage of which is a guarantee of excellence. This gauntlet manual training has successfully run, and it is to-day the newest phase of educational thought. In the first place, it is a deduction from our increasingly complete and exact knowledge of mind; and, in the second place, it meets the demands for a more practical education which our increased scientific knowledge points us to as the best, and is more practical, in the best sense of that much-abused word, than that which it supersedes."

There can be no doubt that it will take some time to get out of the old ruts. So many interests to oppose any innovation in school methods must retard the new system. It can, however, be only for a short time. The moment the masses wake up to the fact that the new system will save from two to four years of the school age, and enable the pupils to know far more, and more thoroughly in that period, besides being able to use their hands in useful work, to help their parents either at home or

in the shop, and to assist in providing the daily bread, they will insist that manual training be introduced into every school and every grade from the Kindergarten to the High School.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY.

Among the various and numerous technological institutions in the United States there is none more complete in its arrangements or more thorough in its methods of instruction than the Massachusetts Institute of Technology of Boston, under the able presidency of General Francis A. Walker. As a model institution of its kind, I must be permitted to speak of its objects and aims and the vast and varied scope of its work at some length; for everything I inspected was calculated to instruct in the acquisition of practical skill for subsequent definite use.

The Massachusetts Institute of Technology was founded in 1861 upon a report by Professor W. B. Rogers, entitled "Objects and plan of an Institute of Technology, including a society of arts, a museum of arts, and a school of industrial science." Its charter was granted by the Legislature of Massachusetts in an Act dated 10 April, 1861. The school of industrial science developed along the lines indicated at its foundation has become the prominent feature of the work of the Institute. The school was opened in 1865 with twenty-seven pupils. It is devoted to the teaching of applied science to the various engineering professions, viz., civil, mechanical, mining, electrical, chemical, and sanitary engineering, as well as to architecture, chemistry, metallurgy, physics, and natural history. Courses of a less technical nature, designed as a preparation for business callings, and a course preparatory to the professional study of medicine, are also given. A school, known as the Lowell School of Practical Design, is maintained by the corporation of the Institute. The Society of Arts held its first meeting in April, 1862.

The buildings cover a very large area. They are the Rogers' building on Boylston-street, devoted to instruction in mathematics, literature, history, political science, geology, mineralogy, and biology; the new building, corner of Boylston and Clarendon Streets, mainly devoted to the departments of chemistry, physics, electricity, and architecture, and to instruction in language; the engineering building, in Trinity Place, devoted to the engineering laboratorics and to instruction in mechanics and hydraulics, and in mechanical and civil engineering; workshops, in Garrison-street, with rooms devoted to the Lowell School of Design; a gymnasium and drill hall in Exeter-street.

In the annual report of the President for this year, he informs us that the schools continue to increase—that there has been a great gain in attendance even over the large number of previous years, so that we have now 900 scholars fully Those who have thus come to us from all parts of the country, and even from foreign lands, have been found better prepared than ever before to take up their work here with success. The instructing staff has been strengthened; a new building of the highest type has been creeted, giving us engineering laboratories of extraordinary extent and completeness; and additional apparatus and machinery have been supplied in the last twelve months, to an extent which might serve as the total equipment of many a school of applied science. The courses have been broadened, while opportunities for selection of studies and for a higher specialisation of technical work have been afforded in greater measure. The spirit of the school has risen alike among pupils and teachers; the sphere of its influence has widened; the prestige of its diploma is markedly increasing from year to year. So that it may safely be said that never did the Institute of Technology so fully justify its foundation and all the disinterested efforts which have been put forth for its maintenance and enlargement as to-day; nor were its means of usefulness ever so great. The

The new engineering laboratories referred to are called engineering, instead of applied mechanics and of mechanical engineering. This change is stated to be in consequence of the development of all the engineering departments of the school made plain by the following considerations: -First. -The subjects of mechanism, thermo-dynamics, and steam engineering, which were formerly regarded as exclusively mechanical engineering studies, now form an essential part of the courses of mechanical engineering, electrical engineering, chemical engineering, and of two of the options of mining engineering; while mechanism has also been introduced into the course of civil engineering. These subjects may, therefore, be said to be engineering Second.—The work in hydraulies and hydraulie motors, formerly given to the mechanical engineering students by instructors in their own department, is now to be conducted by the professor of the civil engineering department, this being a step in the line of the modern idea of specialisation, causing all work upon any one subject to be given by one and the same instructor to all students whatever their course. Third.—These laboratories are really an aggregation of the following, viz.:-(a) a laboratory for testing the strength of materials; (b) a steam laboratory; (c) an hydraulic laboratory; (d) a laboratory for a great variety of engineering tests and experiments, not yet sufficiently differentiated to be characterised and classified.

The floor space has been increased from 5,550 feet to about 13,900 square feet.

Some of the new apparatus is of the most advanced type. Thus there is a 150-h.p. triple expansion engine of the Reynolds-Corliss system, with cylinders of 9 in., 16 in., and 24 in., by a 30-in. stroke. This has been constructed especially for the Institute, and is the first triple expansion engine of a practical size that has ever been especially arranged and constructed for experimental purposes. It can be run either in a single, compound, or triple manner, and every arrangement necessary for experimental investigations in steam engineering.

There is also an hydraulic tank 27 feet high and 5 feet in diameter, and a stand pipe 85 feet high and 10 inches in diameter, with which experiments can be made upon the flow of water through orifices, mouth-pieces, and pipes. Complete sets of Westinghouse air brakes, water motors, and machines for testing the effect of repeated bendings upon the elasticity of iron and steel.

The Institute provides an extensive series of scientific and literary studies, and of practical exercises. The courses include the physical, chemical, and natural sciences, and their applications—pure and applied mathematics; drawing; English, French, German, and other modern languages; history; political science; and international and business law. Regular courses of study, each of four years' duration, and for proficiency in any one of them the degree of Bachelor of Science is conferred, have been established in the following subjects:—

- 1.—Civil and Topographical Engineering.
- 2.—Mechanical Engineering.
- 3.—Mining Engineering and Metallurgy.
- 4.—Architecture.
- 5.—Chemistry.
- 6.—Electrical Engineering.
- 7.—Biology.
- 8.—Physics.
- 9.—General Course.
- 10.—Chemical Engineering.
- 11.—Sanitary Engineering.

Within

Within each of these regular courses the student is given a considerable latitude in the selection of the branch of his intended profession to which he will specially devote his energies in the later years of his study. This is accomplished by means of options. Thus, in civil engineering, he may elect sanitary and hydraulic engineering, geodesy, or an advanced course in railway engineering and management; in mechanical engineering he may choose either marine engineering, locomotive construction, or mill engineering; and similarly for other courses.

In the regular courses, the schedules of prescribed and optional studies are as follows:—

#### FIRST YEAR.

Common to all regular courses.

First Term.—Solid geometry; algebra; general chemistry; chemical laboratory; history of the English language and English composition; French or German; mechanical drawing; freehand drawing; military drill.

Second Term.—Plane and spherical trigonometry; general chemistry; chemical laboratory; political history since 1815; French or German; mechanical drawing; freehand drawing; military drill.

#### SECOND' YEAR.

# I .- Civil Engineering.

First Term.—Surveying and plotting; topographical drawing; descriptive geometry, descriptive astronomy; analytic geometry: physics; political economy; German.

Second Term.—Surveying and plotting; differential calculus; physics; physical geography; English literature; German.

Options: Principles of mechanism, and mineralogy.

#### THIRD YEAR.

First Term.—Railway engineering, with field work and drawing; stereotomy; advanced surveying; integral calculus; general statics; physics: heat, physical laboratory; structural geology; German; English.

Second Term.—Railroad engineering, with field-work and drawing; advanced surveying; elements of construction; elementary design; spherical and practical astronomy; physical laboratory; historical geology; German; strength of materials, kinematics and dynamics.

#### FOURTH YEAR.

First Term.—Theory of structures; bridges and roofs; hydraulics; sanitary field-work and hydraulic measurements; strength of materials; theory of elasticity; metallurgy of iron. Options: (1) Sanitary engineering, bridge design, and railroad management; (2) railroad engineering, railroad management, and bridge design; (3) least squares, geodesy, physical laboratory.

Second Term.—Theory of structure; bridges and roofs; English; thesis work. Options: (1) Hydraulic engineering, machinery and motors; bridge and sanitary design, and bacteriology; (2) railway engineering, machinery and motors, bridge design, and hydraulic engineering; (3) geodesy and map projection, design, and differential equations.

This

This course is designed to give the student a sound training, both theoretical and practical, in the science and principles upon which the practice of civil engineering is based. Particular care is taken to enforce the practical application of the principles taught; and the student is made familiar with the instruments and the problems of general occurrence, while the fourth year is entirely devoted to professional work.

Engineering has assumed so vast a field that it is next to impossible for one person to study all its branches, consequently specialties are the order of the day. Students are, therefore, permitted a choice in the direction of their more advanced studies. It will be seen above what is the nature of these options. The more purely professional work is divided as follows:—The second year provides an extended course, elementary surveying, practice in the field, and plotting from the field book. This prepares the student for the subjects of typographical drawing and descriptive geometry. In the third year railway engineering, stereotomy, and advanced surveying are taught together with the elements of construction, design, and the strength of materials. During the fourth year the student completes the courses on bridges, hydraulies, sanitary engineering, design, and strength of material, as well as the advanced work in railways and geodesy. They also receive a certain amount of instruction in the principles of mechanism, and in machinery and motors.

In the summer vacation following the third year, students taking the geodetic option are required to devote several weeks to field work in geology, topography, and geodesy.

Instruction in civil engineering is given by means of lectures and recitations, and by practice in the field and in the drawing office. The use of the various instruments is taught by actual work in the field, and comprises the adjustment of instruments and all the principal operations involved in land, topographical, hydrographical, railroad, city, and underground surveying. The office work consists in representing upon paper the surveys made in the field, with practice in topograpical and map drawing. The course in roads and railroads, includes the survey, location, construction and equipment of railways, and the laying, building, and maintenance of town and country roads, and of city streets and pavements. In addition to the work in the class-room, an actual railway survey and location, several miles in length, is made each year upon such ground as shall best illustrate the problems occurring in practice; and the necessary maps and contours are prepared by the Advanced courses are given, in which are discussed the economics of railway location, and also the subjects of rolling stock, motive power, brakes, signals, yards, stations, &c., together with a course on railway administration and management.

The course in hydraulic engineering embraces—first, a detailed study of the principles of hydraulics, including the laws of hydrostatics, and of the flow of water through orifices, over weirs and through pipes. Second, practice in hydrometry, in which the student is instructed in the methods of gauging the flow of streams, with practice in the field, using instruments of various kinds. Third, practice in carrying out hydraulic experiments on the flow of water, and on the loss of head, under various conditions, with the aid of the tank and other apparatus in the hydraulic laboratory; as well as in the testing of motors, and other similar work. In mechanical engineering there is the same complete curriculum as also in sanitary, chemical, and electrical engineering. Indeed, all the courses are complete and well ordered.

In mining engineering and metallurgy, I must give the order of the work, as it turns out first-class men. I was surprised and gratified at the class of machinery, stamps, buddles, vanners, and amalgamators of all kinds, working models, the very machines themselves, actually doing the best of work. Moreover, there were reverbatory and blast furnaces, especially a good sized waterjacket furnace, working excellently, and which the students were allowed to work, under the supervision and There was nothing done by halves, but everything teaching of the instructor. thoroughly carried out in the same manner as would be employed at actual reducing works.

This subject being one that is of the most profound importance to this colony, for there is no class of professional men that is more needed than mining engineers and metallurgists. I shall give the schedules of the courses, and other information from the Institute Catalogue. They are as follows: In mining engineering the first year course is that which is common to all.

#### SECOND YEAR.

- First Term.—Physics; German; analytic geometry; surveying; blow-pipe, silver assay, political economy; descriptive geometry. Options: (1) Principles of mechanism; and, (2) topographical drawing.
- Second Term.—English literature; differential calculus; physics; German; determinative mineralogy. Options: (1) Mechanism, drawing and physical geography; (2) surveying and drawing and physical geography.

#### THIRD YEAR.

- First Term.—Integral calculus; general statics; geology; German; mining; physics: heat; physical laboratory. Options: (1) Steam engineering, thermo-dynamics, and drawing; (2) railway engineering, field work, and drawing.
- Second Term.—Strength of materials, kinematics and dynamics; physics; assaying; German; mining; geology. Options: (1) Steam engineering and engineering laboratory; (2) railway engineering, field work, and drawing.

#### FOURTH YEAR.

- First Term.—Ore dressing; metallurgy; mining laboratory; dynamo machinery; memoirs, English criticism. Options: Strength of materials, theory of elasticity, steam engineering, hydraulic engineering, and engineering laboratory; (2) strength of materials, friction, hydraulics, hydraulic measurements, and engineering construction.
- Second Term.—Metallurgy; mining laboratory; memoirs, and English criticism. Options: (1) Strength and stability of structures, theory of elasticity and engineering laboratory; (2) machinery and motors, electric railways and hydraulic engineering.

The two first options afford distinctively mining engineering courses, and contain respectively mechanical and engineering subjects. In the fourth year the first option trains the student with a view to the eventual management of mining industries, but the course for metallurgy is as follows:--

SECOND

#### SECOND YEAR.

- First Term.—Physics; German; analytic geometry; political economy; analytical chemistry. Options: Descriptive geometry, principles of mechanism, and blow-pipe silver assay; (4) theoretical chemistry and blow-pipe silver assay.
- Second Term.—Differential calculus; English literature; physics; German; determinative mineralogy. Options: (3) Mechanism, drawing, analytical chemistry; (4) analytical chemistry.

#### THIRD YEAR.

- First Term.—Analytical chemistry lectures and laboratory; German. Physics.—Heat, physical laboratory. Options: (3) Integral calculus, general statics, steam engineering, thermo-dynamics; drawing; (4) electricity, industrial chemistry, industrial laboratory; drawing; English.
- Second Term.—Analytical chemistry lectures and laboratory; assaying; German; physical laboratory. Options: (3) Strength of materials, kinematics and dynamics, steam engineering, engineering laboratory; (4) industrial laboratory, theoretical chemistry; English.

#### FOURTH YEAR.

- First Term.—Heat measurements; dynamo machinery; metallurgy; ore dressing; memoirs, English criticism. Options: (3) Strength of materials, friction, steam engineering, hydraulic engineering, engineering laboratory, mining and metallurgical laboratory; (4) analytical chemistry, electrometallurgy, drawing, metallurgical laboratory.
- Second Term.—Metallurgy; analytical chemistry; memoirs, English criticism; Options: (3) Technical machinery, engineering laboratory, metallurgical and mining laboratory; (4) metallurgical and mining laboratory.

The third option provides a course in metallurgical engineering. Chemistry is continued through the third year and a part of the fourth, and the amount of metallurgical work is greatly increased. The engineering subjects are the same as those of the first option—that is, branches of mechanical engineering related to metallurgical industries—except that applied mechanics is discontinued at the middle of the fourth year. The work in physics is the same as in the other schedules, except that special instruction in heat measurement is introduced into the fourth year. This course looks particularly towards superintendence in iron, lead, copper, and zine works.

The fourth option is devoted to metallurgical chemistry. In mining and metallurgical subjects it is identical with the third, but the engineering subjects are replaced by analytical, theoretical, and industrial chemistry. The study of physics is continued by electricity in the third, and by heat measurements—electro-metallurgy in the fourth year. The aim of this course is towards the position of chemist of works, and may lead to general management. The four schedules also contain nearly or quite the full amount of language, literature, history, and political economy, given in the other engineering courses.

I may say that the arrangements made in class-rooms and laboratories are excellent in the extreme sense of the word. The circular states that the aim of these laboratories

laboratories is to furnish students the means for studying, experimentally, various processes of ore dressing and smelting, and at the same time to enable them to gain an idea or what is required of a miner and metallurgist. To this end the apparatus has been chosen with a view of illustrating, as far as possible, the principles of the more important machines and furnaces which are used in mining and metallurgy. The metallurgy of lead, copper, gold, and silver has been chosen as the best suited for laboratory illustration. Production of iron and steel in quantity is precluded by the size of the plant requisite, and by the large amount of ores and fluxes necessary to put this into operation.

The work of the laboratory is carried on by the students under the immediate charge of an instructor. A sufficiently large quantity of ore is assigned to each student, who first examines it for its component minerals, sorts and samples it, and determines its character and value by analysis and assays, and makes such other preliminary examinations as serve to indicate the proper method of treatment. then treats the given quantity, makes a careful examination of the products at each step of the process, ascertains, wherever practicable, the amount of power, water, chemicals, fuel, and labour expended, and thus learns approximately the effectiveness and economy of the method adopted. He learns also the value of chemistry as a check upon metallurgical work. Each student is assisted in working his ore by his classmates, each of whom has an opportunity in turn to manage the machines and furnaces. "The Institute," says the catalogue, "does not claim that the instruction given in this laboratory is in any sense a substitute for the experience gained in large works. What is claimed is, that it prepares students to go into the works and profit by them. The spirit of investigation which is developed by the work, as well as the experience of comparing processes actually carried out, with the same processes as described in the books, is of great advantage to the student.

The mining laboratory consists of three parts—milling room, furnace room, and assay room; with supply room and ample storage vaults attached.

In order that the mining students may have a closer acquaintance with their profession, excursions are organised for visiting mines, mills, smelting-works, and geological fields—excursions have been made to Colorado, Lake Superior, Virginia, Vermont, Pennsylvania, Lake Champlain, New Brunswick, and Nova Scotia. Shorter excursions of a day or two at a time are sometimes made while the school is in session. During the summer of 1888 the excursion gave place to a summer school of mining of six weeks duration at Capeltown, Canada. The students surveyed, laid tracks, drilled and blasted below ground: they also sorted ore, assayed, and made a geological survey on the surface. In June, 1889, the summer course in metallurgy was given among the anthracite iron furnaces of the Lehigh Valley, and the coke furnaces of Lebanon, Steelton, and Baltimore. The construction and running of furnaces were studied, and also the rebuilding of furnaces after the flood in the Susquehanna River. The mining and metallurgical courses take place in alternate years.

In mechanical engineering, instruction is given by lectures and recitations, by practice in the drawing office and in the engineering laboratories. Visits are frequently made to machine shops and manufacturing establishments, to witness machinery in operation and manufacturing processes, in addition to those which can be seen at the Institute itself. The objects to be accomplished by these laboratories are: first, to give the students practice in such experimental work as they are called

upon to perform in the pursuit of their profession. Second, to give the students some experience in carrying on original investigations in engineering subjects with such care and accuracy as to render the results of real value to the engineering community. Third, by publishing from time to time the results of such investigations, to add gradually to the common stock of knowledge.

Practical instruction is given in the workshop upon the nature of materials used in construction and in the typical operations concerned in the arts. This is considered a valuable addition to the theoretical treatment of professional subjects. The workshops are extensive, and furnished with all the more important hand and machine tools, so that the student may acquire a direct knowledge of the nature of metals and woods, some manual skill in the use of tools, and a thorough knowledge of what can be accomplished with them. The shops are in Garrison-street, and are equipped as follows: -- The carpentry, wood-turning, and pattern-making department contain 40 carpenter's benches, two circular saw benches, a swing saw, two jig saws, a buzz planer, a mortising machine, 36 wood-lathes, a large pattern-maker's lathe, and 36 pattern-maker's benches. The foundry contains a cupola furnace for melting iron, two brass furnaces, and 32 moulder's benches. The forge shop contains 32 forges, vices, and hand-drills. The machine shop contains 23 engine lattles, and 16 hand lathes, of recent approved pattern, two machine drills, two planing machines, a shaping machine, a universal milling machine, a grinding-lathe, and 32 vicebenches, arranged for instruction in vice-work.

A course in electrical engineering has been established to meet the wants of young men desirous of entering upon the practice of any of the various application of electricity in the arts. Its leading studies are physics, especially theoretical and applied electricity, mechanical engineering, and mathematics. The president states that a broad training is obtained by the introduction of full mathematical courses and studies in history, literature, political economy, and French and German; the latter being of importance in obtaining at first hand a prompt acquaintance with the results of invention and discovery. Of the technical studies of the course, those in mechanical engineering run parallel with the electrical subjects, since in many branches of electrical engineering a sound knowledge of mechanics, motors, of measurements of power and its transmission, &c., is essential. Thus through the second year the students follow mathematics, mechanism, workshop instruction, and drawing to about the same extent as those of the mechanical engineering course. In the third year the pure and applied mathematics, mechanics and mechanical engineering, lecture and laboratory work are much the same in the two courses; and certain of these subjects are continued in the fourth year.

A full course of physics begins with the second year, and continues, by lectures, recitations, and laboratory work, to the end of the third year. A portion of this is devoted to electricity, and at the beginning of the third year special readings and recitations on this topic are begun, by which the study of the theory of electricity is continued until the end of the year. Work in the physical laboratory begins at the middle of the second year, and leads up to electrical measurements and testings. In the fourth year are given extended courses on the technical application of electricity to the telegraph, telephone, electric light, the electrical generation and transmission of power, &c. Electrical study and research occupy the principal position in the fourth year. A series of advanced mathematical topics form an important part of the work of this year. Accurate work is required throughout; and in connection with the use of instruments of precision—in common with all

physical experimental work—the student's attention is particularly directed to the study of possible sources of error, and to the discussion of the effects of these on the results obtained. As a foundation for subsequent work, thorough instruction is given in the theory of electricity. An extended course of lectures is devoted to the consideration of the various technical applications of electricity, to land and submarine telegraphy, &c. Instruction is given by lectures and laboratory exercises upon the processes of photometry, especially as applied to the measurement of electric lights. Advanced instruction in electrical measurements, including work with dynamo-electric machinery, together with a course on the electric testing of telegraph and telephone lines, is provided. The subjects of construction, specification, and contracts also receive attention. In the later part of the course each student prepares and reads before his class an essay on some electrical process, instrument, or system, or other professional topic. These essays are written after a study of recently published papers and memoirs, and often embody also the results of experimental work by the student. They are intended to familiarise the class with the topics presented, and to give experience in independent study, and in the preparation of original scientific papers.

Instruction is given to all the regular students in the principles of geometrical, mechanical, and freehand drawing, and a large amount of time is devoted to practice in the drawing department to enable them to acquire the necessary skill, and to prepare them for their future work.

The Kidder Laboratories of Chemistry, in connection with the Institute, afford accommodation for 550 students. I shall not give the schedule of the course, but may say it is chiefly designed to prepare students for actual work in connection with manufactures based on chemical principles. It is also adapted to the needs of those who intend to become teachers of chemistry. The student spends a large portion of the four years in the laboratories, the work being arranged as follows:-In the first year there is general laboratory practice, in which the student is taught the nature of chemical processes and the use of chemical apparatus, and is drilled in accurate habits of observation. Analytical chemistry—qualitative and quantitative—is begun in the second year, and continues throughout the course. Industrial, sanitary, and organic laboratory practice follow in the third and fourth years. • While there is a certain prescribed course of study and work in the separate departments of chemistry, which all regular students must pursue, there is allowed great latitude in the choice of subjects in the third and fourth years. Effort is made to develop self-reliance in the student, so that he may be fitted to make his way without assistance. To this end he is required to make investigations, involving original research and reference to the appropriate literature in English, French, and German.

In the laboratories above-mentioned, which are fourteen in number, besides two lecture-rooms, a reading-room and library, balance-room, offices, and supply rooms—in all, twenty-four in number. In connection with this department is the William Ripley Nichols Library of Chemistry, numbering more than 3,900 volumes and 2,000 pamphlets. This library contains complete sets of most of the important chemical periodicals. It is primarily designed to aid in the instruction of students, but is open to all persons who desire to consult it.

The special instruction in chemical engineering begins with an extended descriptive course of lectures, giving a general view of applied chemistry. The chemical questions connected with the various chemical industries are discussed, and the mechanical

mechanical appliances described, without entering into details of construction, which are specially dealt with in a subsequent course of instruction, designed to consider materials, methods of transportation, evaporation and distillation, refrigeration, furnace construction, and similar topics, with special reference to the needs of the chemical industries. These special topics will be, so far as possible, taught by persons practically connected with the industries of which they treat. The machinery and mechanical appliances used in manufacturing chemistry are also discussed at length from a purely engineering point of view. Thermo-chemistry and the chemistry of fuels are considered in separate courses of lectures. The laboratory instruction consists of practice in the preparation and application of chemicals in the laboratory of industrial chemistry, and in a special study of such machines as it may contain. Particular attention will be paid to comparative tests of various means and appliances used in chemical manufactures. Excursions are frequently made to various workshops and manufacturing establishments.

The Institute library consists of a large collection of books relating to the work of the school. It contains 15,000 volumes and several thousand pamphlets. It is divided into a general library, and nine departmental libraries. The students have also full use of the valuable library of the Boston Society of Natural History, of the extensive collections of the Boston Public Library, comprising more than 500,000 volumes in all departments of knowledge, and of the library of the American Statistical Association.

The Lowell Practical School of Design, established in 1872 by the Trustees of the Lowell Institute for the purpose of promoting industrial art in the United States was approved by the Corporation of the Massachusetts Institute of Technology. This body assumed the responsibility of conducting it, and in the same year the first pupils were admitted.

The Trustees of the Lowell Institute have established under the supervision of the Institute of Technology, courses of instruction, generally given in the evening, and open to students of either sex, free of charge. These courses are more or less varied from year to year by the omission or interchange of particular subjects, but include, in their entire scope, instruction in mathematics, mechanics, physics, drawing, chemistry, geology, natural history, biology, English, French, German, history, navigation, and nautical astronomy, architecture and engineering.

The object of these courses is to provide substantial teaching, rather than merely popular illustration of the subjects treated. It is therefore expected that all persons attending will come with a serious purpose of improvement, and will cheerfully comply with such rules as may be prescribed in regard to attendance and to order in the class. The conditions for admission to these gratuitous courses are as follows:—I. Candidates must have attained the age of 18 years; 2. Applications for admission must be made in writing, addressed to the Secretary of the Faculty, specifying the course or courses they desire to attend, mentioning their present or prospective occupations, and, when the course is of a nature demanding preparation, stating the extent of their preliminary training.

The expenses are entirely borne by the Lowell Institute, and tuition is free to all pupils. They are taught the art of making patterns for prints, ginghams, delaines, silks, lace, paper-hangings, carpets, oilcloths, &c. The course is of three years' duration, and embraces—(1) Technical manipulations; (2) Copying and variations of designs; (3) original designs or composition of patterns; (4) the making

making of working drawings, and finishing of designs. Instruction is given personally to each student over his work, much after the manner employed by Herr Jansen at Hamburgh, described in my report of 1887. There are also occasional general exercises. The students supply their own materials, which they can obtain at first cost from the Institution.

As the teaching of drawing is not the object of the school, but rather its application to industrial purposes, the applicants for admission must possess such a knowledge of drawing as will enable them advantageously to begin the work of composition and design. A considerable degree of skill in freehand drawing from nature, and also in the practice of colours are required beforehand in order to obtain admission to the school. If at the half-year examinations students are found seriously deficient in the qualifications necessary for a successful and advantageous pursuit of their studies they privately receive an intimation of the fact from the Director, with the approval of the President of the Institute, and are expected to withdraw from the school.

The degree given in the Institute of Technology is that of Bachelor of Science. It is given for the satisfactory completion of any regular course of study. In addition, however, to having passed satisfactory examinations and a final, or degree, examination he must prepare a thesis, or a dissertation on some subject included in his course of study. This thesis is submitted to the Faculty for approval. In the advanced courses the degree master of science is awarded for proficiency in complete advanced courses of study of at least one year's duration. The degrees, Doctor of Philosophy and Doctor of Science, are awarded for proficiency in complete advanced courses of study of at least two years' duration.

# THE SHEFFIELD SCIENTIFIC SCHOOL. (APPENDIX—YALE UNIVERSITY.)

The Sheffield Scientific School was built and endowed by Joseph S. Sheffield, Esq., of New Haven, Connecticut, and made one of the Departments of the Yale University, similarly to the law, medical, theological, and art schools, having its separate funds, buildings, teachers, and regulations, but governed by the Corporation of Yale College, which appoints the professors and confers the degrees. The Governing Board consists of the President of Yale University and the professors who are permanently attached to the school. There are several other instructors associated with them, a part of whom are connected with the other departments of the University.

Candidates for admission as under-graduate students must not be less than 15 years of age, and must bring satisfactory testimonials of moral character from their former instructors or other responsible persons. Courses of instruction occupying three years, are arranged to suit the requirements of the various classes of students. The first year's work is common to all the courses, and for the last two the instruction is chiefly arranged in special courses, of which those are chiefly—In chemistry; civil engineering; mechanical engineering; in agriculture; in natural history; in biology, preparatory to medical studies; in studies preparatory to mining and metallurgy; in select studies preparatory to other higher studies.

The aim and character of the instruction is as follows:-

Elementary chemistry.—Recitation from text-books and experiments made by the students in the laboratory, thus facilitating the study of the subject and training the students in observation and in the manipulation of chemical subjects. Analytical chemistry qualitative and quantitative.—This is used by the advanced student as a means of investigation in scientific or in technical researches. The most important part of the instruction is performed in the laboratory.

Physiological chemistry and experimental toxicology are taught by laboratory exercises, illustrative lectures, and recitations. Each student is provided with a suitable working place in the laboratory, well equipped with all the needed apparatus and material.

Comparative anatomy and elementary physiology.—The aim during the first year in the instruction in anatomy and physiology, as taught during the junior year, is the manual and mental training of the student in the methods of investigation by which the facts and principles of these sciences have been established, and at the same time to give him a sufficient knowledge of their elements to enable him to pursue with profit the special studies of the biological course as a preparation for medical studies. The student under the immediate supervision of the instructor, dissects specimens of a number of different animals, and is required to make careful sketches and records of his work. The elements of human physiology are taught by text-book, recitations, and demonstrations.

The course in geology includes recitations and oral instruction, extending through the entire year on alternate mornings. This part of the course includes physical, lithological, and dynamical geology. The subjects are illustrated by diagrams and specimens. During the first term each student is required to make a collection containing a specified number of the most important rocks and minerals, and to pass a thorough examination upon them at the end of the term. The last half of the year is devoted to historical geology and palæontology. Opportunities are also afforded for optional geological excursions during the warmer months.

Mineralogy is carried on by means of practical work in a laboratory especially fitted up for the purpose. The student is made familiar with the common minerals, attention being devoted especially to those which are of economic, geological, or scientific importance. The chemical and blow-pipe sections studied. In addition to laboratory work instruction is given in crystallography, illustrated by a collection of models and natural crystals.

Zoology and botany are also taught in a thoroughly practical manner. In agriculture the special instruction is given by recitations and lectures with such aids and appliances as are suited to the class-room. Besides agricultural chemistry it includes a discussion of the cultivation of the staple field crops of the country; theories of rural economy and systems of husbandry; the laws of heredity and principles of stockbreeding.

Sanitary science.—The lectures on this subject discuss the natural laws which govern the public health; their relations to the social habits and conditions of communities; instruction in the use of mortuary statistics; epidemics and postilences, with their relations to the prosperity of a community, and methods of control; the germ theory of disease and theory of disinfectants; the hygiene of private dwellings and public buildings; the relations of water supply to public health; sanitary engineering; legislation relating to public health and methods of official sanitary administration.

Mathematics, physics, military science and tactics have courses, in all of which lectures supplement the ordinary class-room exercises.

Civil, military, and mechanical engineering are taught so as to give a thorough preparation, first, in the principles of the various sciences involved, and afterwards, as extensive practice in the application of these principles as the time and ability of the students and the facilities and plants of the laboratorics will permit. A course of lectures on the theory of electricity and its applications are open to students in this department, and these lectures can be taken as a part of the preparation for a graduate course in the higher branches of electrical science.

Astronomy, and the study of the English, German, and French languages call for no further remark, than that they are well and ably taught, and the same may be said with reference to history and political economy. The degrees given are those of bachelor of philosophy—civil engineer and mechanical engineers and doctor of philosophy—and these are conferred by the President and Fellows of Yale College on Commencement Day. *Appendix*.

#### THE CORNELL UNIVERSITY.

One of the most useful institutions of learning in the United States is the Cornell University, situated at Ithaca, in the State of New York. Its existence is due to the liberality of the United States and of Esra Cornell, who said he "would found an institution where any person can find instruction in any study." In 1862 Congress passed an Act granting public lands to the several States which should "provide at least one college where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts." Thirty thousand acres for each senator and representative in Congress were apportioned to each State; and the share of the State of New York was 990,000 acres.

In 1865 the New York Legislature incorporated the "Cornell University," appropriating to it the income derived from the sale of this land scrip. The most important conditions were that Esra Cornell should give to the university \$500,000, that the university should give instruction in branches relating to agriculture, mechanic arts, and military tactics, and that it should receive, without charge for tuition, one student annually from each assembly district. Mr. Cornell fulfilled the first requirements of the charter, and made an additional gift of more than 200 acres of land, with buildings to be used for the general purposes of the university and for the department of agriculture.

In connection with the university the "Sibley College of Mechanical Engineering and the Mechanic Arts" was founded and endowed in 1870. The buildings of this college were erected and presented to the university by the Hon. Hiram Sibley, of Rochester, New York, who also gave the machinery and the greater part of the collections.

It is of this college I have a few words to say. It is divided into four departments, viz. :—Mechanical engineering, including a laboratory in which experimental work and investigations are conducted; a department of mechanical arts, or workshop instruction, a department of drawing and machine design, and a department of electrical engineering.

This college, founded as a college of mechanic arts, is intended by the trustees of the university to be made not only a school of arts and trades, but a college of mechanical engineering also, in which schools of the mechanic arts and the various branches of mechanical engineering shall be developed as rapidly and extensively as the means placed at the disposal of the trustees will allow.

Candidates

Candidates are admitted after examination in English; geography, political and physical; physiology and hygiene, arithmetic, plane geometry, algebra.

## DEPARTMENT OF MECHANICAL ENGINEERING.

The Department of Mechanical Engineering is divided into two principal sections; that of theoretical engineering and that of experimental engineering, or the mechanical laboratory.

In Theoretical Engineering, the lecture room course of instruction consists of the study, by text-book and lecture, of the materials used in mechanical engineering, the qualities of these materials being exhibited in the mechanical laboratory by the use of the various kinds of testing machines, as well as by examinations of specimens of all the most familiar grades, of which samples are seen in the cases of the museums and lecture rooms. The theory of the strength of materials is here applied, and the effects of modifying conditions—such as the variation of temperature, frequency and period of strain, method of the application of stress—are illustrated. The course of study is followed, or accompanied by instruction in the science of pure mechanism, or kinematics, which traces motions of connected parts, without reference to the causes of such motion, or to the work done, or the energy transmitted. This study is conducted largely in the drafting-rooms, where the successive portions of moving parts can be laid down on paper. It is illustrated in some directions by the set of kinematic models known as the Reuleaux models, which I have described in a former report, and of which a complete collection is found in the museums of the college.

The studies of machine design succeeds that of pure mechanism, just described. This study is also largely conducted in the drafting-rooms, and is directed by an instructor familiar practically, as well as theoretically, with the designs and proportions of machinery.

The closing work of the course consists of the study by text-book and lecture of the theory of the steam engine and other motors. The last term of the regular four-year course is devoted largely to the preparation of a graduating thesis, in which the student is expected to exhibit something of the working power and the knowledge gained during his course. A graduating piece of work is demanded also of each student, both in the drafting-room and the workshop, which shall show proficiency in these departments.

The section of experimental engineering, or mechanical laboratory instruction, is conducted by an instructor familiar with his apparatus, and with the best methods of work, and who will plan a systematic course of instruction, intended to give the student not only skill in the use of apparatus of exact measurement, but to teach him also the best methods of research, and to give him a good idea of the most effective methods of planning, and of prosecuting investigations, with a view to securing fruitfulness of result with minimum expenditure of time and money.

In the Department of Electrical Engineering the student may, if he chooses, at the end of the third year, substitute the special work in electrical engineering for the engineering of the regular course. Thus, it will be seen, the two courses are identical during the first three years, comprising drawing, mathematics, mechanics, mechanism, machine design, the elementary study of physics, and preliminary practice in the use of electrical and other physical instruments. The special work of the fourth year for electrical engineers, comprises the study, under the direction of the Professor of Electrical Engineering, of prime movers, the theory and construction of electrical machinery, the study of the problems involved in the distribution of the electric light, and the electrical transmission of power, besides practice

in every variety of electrical measurement and testing, as applied to the erection and maintenance of electric lighting and power plants, and telephone and telegraph lines and cables, and to the purposes of investigation; while work in the department of physics is continued with special reference to the needs of the practical electrician.

Graduates in the course of electrical engineering are given a degree as in the other regular courses, and a statement that the student has paid special attention to electrical work is introduced into his diploma. Electricians not familiar with engineering may secure special work.

Department of Mechanic Arts, or shopwork. The aim of the instruction in this, the department of practical mechanics and machine construction, is to make the student, as far as time will permit, acquainted with the most approved methods in the construction of machinery.

- (1.) Section of Wood-working and Pattern-making:—This course begins with a series of exercises in wood-working, each of which is intended to give the student familiarity with a certain application of a certain tool; and the course of exercises, as a whole, is expected to enable the conscientious and painstaking student easily and exactly to perform any ordinary operation familiar to the carpenter, the joiner, and the pattern-maker. Time permitting, these prescribed exercises are followed by practice in making numbers of structures, patterns, their core-boxes, and other constructions in wood. Particular attention will be paid to the details of pattern-making.
- (2.) Section of Forging, Moulding, and Foundry work:—These courses are expected not only to give the student a knowledge of the method of the blacksmith and the moulder, but to teach him also how to use the tools, and to give him that manual skill in the handling of tools which will permit him to enter the machine shop, and there quickly to acquire familiarity and skill in the manipulation of the metals, and in the management of both hand and machine tools as used in the working of such metals.
- (3.) Section of Ironworking:—The instruction in the machine shop, as in the foundry and the forge, is carried on in substantially the same manner as in the woodworking course, beginning by a series of graded exercises, which will give the student familiarity with the tools of the craft, and with the operations for the performance of which they are particularly designed, and concluding by practice in the construction of parts of machinery, and, time permitting, in the building of complete machines which may have a market value.

#### DEPARTMENT OF INDUSTRIAL DRAWING AND ART.

- (1.) Section of Freehand Drawing and Art:—Instruction in this department begins with freehand drawing, which is taught by means of general lectures from the blackboard, from flat copies, and from models. The work embraces a thorough training of the hand and eye in outline drawing, elementary perspective, model and object drawing, drawing from easts, and sketching from nature. The course in freehand drawing may be followed by instruction in industrial art, in designing for textiles and ceramics, in modelling, and in other advanced studies introductory to the study of fine art.
- (2.) Section of Mechanical Drawing.—The course of instruction in mechanical drawing is progressive, from machine sketching and geometrical drawing to the designing

designing of machinery and making complete working drawings. The course begins with freehand drawing as above; and in the latter part of this work considerable time is expected to be given to the sketching of parts of machines and trains of mechanism, and later on, working machinery. The use of drawing instruments is next taught, and, after the student has acquired some knowledge of descriptive geometry and the allied branches, the methods of work in the drafting-rooms of workshops and manufacturing establishments, line drawing, tracing, blue printing, the conventional colours, geometrical construction, projections, and other important details of the draftsman's work, are practised until the student has acquired proficiency.

The advanced instruction given to the upper classes, includes the tracing of curves and cams, the study of kinematics on the drawing boards, tracing the motions of detailed machinery, and the kinematic relations of connected parts. This part of the work is accompanied by lecture room instruction and the study of the text book, the instructors in the drafting-rooms being assisted by the lecture room instructor, who is a specialist in this branch. The concluding part of the course embraces a similar method of teaching machine design, the lecture room and drafting-room work being correlated in the same manner as in kinematics or mechanism. The course concludes, when time allows, by the designing of complete machines, as of the steam engine or other motor, or of some important special type of machine.

#### INDUSTRIAL ART.

A four years' course of instruction is arranged for students who may have a talent for original designs, and who may desire to devote their whole time to the subject. No degree is conferred, but a certificate of proficiency may be given at the end of the course. This course is given additional interest by occasional general and public lectures on the history of art and the work of great artists.

#### GRADUATE COURSES.

Electrical Engineering.—A graduate course is arranged for students in mechanical engineering who desire further instruction in electrical engineering, and for graduates in the course in electrical engineering.

Marine Engineering.—At the request of the University, an officer of the Engineer Corps of the United States Navy has been detailed for the purpose of giving instruction in mechanical and marine engineering. Special work in this subject may, therefore, be taken by such students as desire it. This instruction is usually given in a graduate or fifth year course, after the student shall have completed the regular course in mechanical engineering or obtained its equivalent elsewhere.

Chemical Engineering.—In all the great chemical industries, such as the manufacture of illuminating gas, sulphuric acid, soda making, refining of petroleum, distilling, &c., &c., the success of the business depends chiefly upon the correct arrangement of the mechanical details of the plant, and the skilful design and proportion of the machinery. The chemical reactions involved are generally simple. It is becoming a well recognised fact that there are few directions in which scientific work and a good preparation are more remunerative than in this field. Those of our leading manufacturers who have done most to build up the great industries of the country, very generally owe their success to their early training in engineering, quite as much, at least, as to their knowledge of chemistry. The Director of Sibley College and the Professor of Applied Chemistry, are at all times ready to give such advice

advice and assistance as may be asked by graduate students of this or other institutions who may be desirous of entering upon a course of study and work of this kind, uniting chemistry with engineering.

## MINING ENGINEERING.

Although Mining Engineering courses have not been formally established, the main instruction required by the Mining Engineer is now given as follows:—The Professor of Civil Engineering and his associates lecture on tunnelling, and on such constructions as are common to the professions of civil and mining engineering; the Professor of Mechanical Engineering and his associates offer instruction in mining machinery; the Professor of Chemistry give instruction in metallurgy, assaying, chemical analysis and cognate subjects; the professors of geology and palæontology give instruction in the theory and classification of ores, and in those branches relating to chemical geology.

Steam Engineering.—Special instruction in steam engineering is provided for advanced students and educated practising engineers. The course of construction is an extension of the work of the senior year in mechanical engineering, and includes the study of steam engines and boilers and their accessory apparatus, for the purpose of learning the theory of practice of engineering as applied to this class of motors.

Railroad Machinery.—This department is intended to prepare the same class of students for special work in railway shops, and especially in the division of the organisation of railways placed in charge of superintendents of motive power and of master mechanics.

"Special," or Artisan Course.—All special students are expected to follow as closely as possible a course of instruction in the mechanic arts planned with reference to the needs of such students, and of young men, not candidates for a degree, who are able to enter on the optional list, passing the necessary examinations.

Non-resident Lecturers.—A room for a lyceum is fitted up for the use of students enrolled in Sibley College in which debates may be carried on; and supplementing the regular course of instruction, lectures are delivered from time to time by the most distinguished men and the great specialists of the profession. Annual "inspection tours" are made to the great cities and manufacturing establishments during the spring vacation.

It will be seen from the above that the opportunities afforded by the Sibley College at the Cornell University are very large, and an inspection of the regular courses will show that the amount of instruction offered is greatly in excess of the amount which any person can avail himself of while an undergraduate student. Though all the courses are open to undergraduates who have prepared themselves by taking the necessary preliminary electives, a large number of courses are especially adapted to the wants of graduate students. No sharp line of demarcation, therefore, separates the two classes. Graduates and advanced undergraduates are taught together; but in all cases the necessary pre-requisite work must have been taken. In nearly, or quite, every branch of study, the advanced courses of lectures and the seminaries and laboratories afford abundant opportunities for carrying on profitable work of a high grade during two or three years after the baccalaureate degree has been taken. The facilities thus afforded commend themselves especially to graduates of those colleges which do not offer a large range of electives during the undergraduate course. Students are admitted to graduate study after having taken a baccalaureate degree in this university, or on presenting a diploma giving evidence that an equivalent degree has been taken elsewhere. Courses appropriate for graduate students

students and leading to advanced degrees are provided in the following departments:—Ancient classical languages and literatures, modern European languages and literatures, English literature, comparative philology, history and political science, philosophy, mathematics, chemistry and physics, natural history, the science and art of teaching, civil engineering, mechanical engineering, and agriculture.

I have described the courses of civil and mechanical engineering, and in the list of courses of instruction there will be found those designated as specially adapted to the wants of graduate students.

Among the special advantages offered to graduate students in this university may be mentioned—(1) The greater part of such work is carried on in laboratories and seminaries, in which the student, with the aid and under the intimate personal guidance and direction of the professor, is encouraged in the prosecution of original investigation of an advanced nature. In all the graduate work the aim is to surround the student with an atmosphere of earnest devotion to the cause of the advancement of knowledge and to excite a true scholarly spirit; (2) Graduate students who are not candidates for a degree, as well as those who are, are required to work under the general direction of a committee of the Faculty, appointed for the special purpose of supervising and directing their work. All graduate students are at liberty to attend any of the exercises of the university, but under the guidance of the appropriate committee every such student must take an amount of work not less than the minimum required of undergraduates during the senior year; (3) Graduate students have access to the alcoves of the library, as well as to the special collections in the seminary rooms, and thus have exceptional opportunities for prosecuting advanced work; (4) Eight fellowships, with stipends of 400 dollars each, are annually given to such graduate students as may be selected by the Faculty for the superiority of their scholarships; (5) Tuition is free to such graduate students as, having been duly admitted by the proper authorities as candidates for a second degree, are regularly pursuing the courses of study leading to such degree in accordance with the prescribed requirements of the proper faculty. The only payments required of such students by the university are those for materials actually consumed in the laboratories.

The museums and collections of this college are of exceptional extent, value, and interest. There are special museums for agriculture, archæology, architectural, botanical, chemical, conchology, special museums of the Civil Engineering Department, entomology and general invertebrate zoology, the museums and collections of the Sibley College of Mechanical Engineering and Mechanic Arts, Palæontology, Veterinary Science and General Zoology.

Of these the museum and collections of the Sibley College of Mechanical Engineering and Mechanic Arts are of exceptional value. The two principal rooms on the first floor of the main building are devoted to the purposes of a museum of illustrative apparatus, machinery, products of the manufacturing industrics, and collections exhibiting processes and methods of manufacture, new inventions, the growth of standard forms of motors, and other collections of value in the courses of technical instruction given in the college. In the west museum are placed the Reuleaux collection of models of kinematic devices and movements—the only complete collection in America. Besides these are the Schræder and other models, exhibiting the form and proportions of parts of machinery, the construction of steam engines and other machines, and methods of making connections. In the east museum are placed a large number of examples of machines constructed by the best makers,

makers, to illustrate their special forms and methods of manufacture. Among these are to be found several beautifully finished examples of steam pumps, "sectioned" to exhibit their internal construction and arrangement, steam boiler injectors similarly divided, governors for steam engines, water wheels and other motors, devices for lubrication, shafting and pulleys, couplings and other apparatus for the transmission of power, both by shafting and by wire-rope transmission. The lecture rooms of Sibley College, each being devoted to a specified line of instruction and list of subjects, are each supplied with a collection of materials, of drawings, and of models and machines, especially adapted to the wants of the lecturer in each subject. the lecture room of the instructor in "Materials of Engineering," contains a fine collection of samples of all the metals in common use in the arts, with samples of ores and of special intermediate products, exhibiting the processes of reduction and manufacture. Among these are specimens of copper-tin and copper-zinc alloys, and of the "kalchoids" produced by their mixture, such as were the subjects of investigations made by the Committee on Alloys of the United States Board, appointed by General Grant, by the authority of Congress, in the year 1875. The collection is supplemented by other alloys produced later by the Director, and is one which has no known superior, and is, perhaps, unequalled. The course in machine design is illustrated by the standard forms of parts of machinery. The course of instruction in mechanical engineering is illustrated by a fine collection of steam engines of various well-known types, gas and vapour engines, water-wheels, turbines, and other motors, models and drawings of every standard or historical form of prime mover, or parts of machines, and of completed machinery.

The collections of the Department of Drawing include a large variety of studies of natural and conventional forms, shaded and in outline, geometrical models, casts and illustrations of historical ornament.

The workshops are supplied with every needed kind of machine or tool, including lathes, of American and other make, with hand and bench tools sufficient to meet the wants of over 100 students of the first year in wood-working; in the foundry and forge all needed tools for a class of eighty in the second year; in the machine shop, lathes from the best makers and others made in the university shops, planers, drills, milling machines, and a great variety of special and hand tools, which are sufficient to work a class of sixty or seventy in the third year, and fifty or sixty seniors.

# THE DEPARTMENT OF EXPERIMENTAL ENGINEERING.

This Department possesses experimental engines and boilers, and other heat motors such as air and gas engines, and is well supplied with testing machines in considerable variety, as well as all the apparatus required, as indicators, dynamometers, &c., for determining the efficiency of engines. Each of the several rooms on the first floor of the Sibley College *Annexe* is a museum of apparatus.

The Special Museums of the Civil Engineering Department contain the following collections:—(1) the Muret collection of models in descriptive geometry and stonecutting; (2) the Delagrave general and special models in topography, geognosy, and engineering; (3) the Scroeder models in descriptive geometry and stereotomy, with over fifty brass and silk transformable models made in this department after the Olivier models; (4) the Grund collection of bridge and road details, roofs, trusses, and masonry, supplemented by similar models by Scroeder and other makers; (5) a model railway bridge of 25 feet span, the scale being one-fourth of the natural size; (6) the Digeon collection of working models in hydraulic engineering; (7)

working models of waterwheels; (8) several large collections of European and American photographs of engineering works during the process of construction, and many other photographs, blue prints, models, and diagrams; (9) an extensive collection of instruments of precision, such as a Troughton and Sims astronomical transit; a universal instrument by the same makers reading to single seconds; sextants, astronomical clocks, chronographs, a Negus chronometer, two equatorials, the larger having an objective by Alvan Clarke,  $4\frac{1}{2}$  inches in diameter, and other instruments, like pier collimators, &c., necessary to the complete equipment of a training observatory; (10) a Geodesic collection, consisting of a secondary base line apparatus made under the direction of the coast survey, and all the portable, astronomical, and field instruments needed for extensive triangulations, including sounding-machines, tachometers, deep-water thermometers, heliotropes, &c.; (11) among the usual field instruments there is nearly every variety of engineers' transits, theodolites, levels, solar and other compasses, with a large number of special instruments, such as planimeters, pantographs, elliptographs, arithmometers, computing machines, altazimuths, sextants, hypsometers, and meteorological instruments of all descriptions.

I have entered into the details of these two departments, to show how perfect in every way are the arrangements for providing the best materials and instruments, so that the professors and instructors may have nothing to desire in placing before the students in the most lucid manner the method of carrying out actual work in the most desirable way. In doing this, the instruction is altogether of a different character from that afforded simply by text-books, for, with the instruments at hand, the instruction takes the form of object lessons and sink deeper into the memory, is more permanent, and consequently infinitely more effective.

# COLUMBIA COLLEGE SCHOOL OF MINES.

There is another Technological Institute of learning which is perhaps the best of its type, and altogether worthy of imitation, and this is the Columbia College School of Mines, of New York City, where the teaching is most thorough, and whose graduates are much sought after as mining engineers and metallurgists, not only by mining and other companies in the United States, but elsewhere.

The system of instruction in this school includes seven parallel courses of study, viz.:—(1) Mining Engineering; (2) Civil Engineering; (3) Metallurgy; (4) Geology and Palæontology; (5) Analytical and Applied Chemistry; (6) Architecture; (7) Sanitary Engineering.

At the beginning of the first year each student must elect which of the seven courses he intends to pursue, and must thenceforth abide by his election, unless permitted by the Faculty to make a change, and no student is allowed to pursue more than one course at a time.

The plan of instruction includes lectures and recitations in the several departments of study; practice in the chemical, mineralogical, blow-pipe, and metallurgical laboratories; field and underground surveying; practice and study in mines, mills, machine shops, and foundries; projects, estimates, and drawings for the working of mines and for the construction of metallurgical, chemical, and other works; reports on mines, industrial establishments, and field geology.

The course of instruction occupies four years, and there are advanced courses for graduates.

The method of instruction is such that every pupil may acquire a thorough theoretical knowledge of each branch, of which he is required to give evidence, at

the close of the session, by written and oral examinations. At the commencement of the following year he is required to show, from reports of works visited, that he understands not only the theoretical principles of the subjects treated, but also their practical application, a point that is insisted on with great vigour.

Candidates for admission to the first class, at its formation, must be of the age of eighteen years complete, and for admission to advanced standing there will be required a corresponding increase of age; but this rule may be dispensed with when, in the opinion of the Faculty, there are sufficient reasons to justify its relaxation.

Candidates for the first class must pass a satisfactory examination in arithmetic, geometry, algebra, physics, chemistry, German, French, English grammar, composition and rhetoric, history, physical geography, frechand drawings and book-keeping.

I give the synopsis of studies in Appendix O. It will suffice here to say that it not only includes the theoretical studies necessary to the education of the engineer and metallurgist, but practical mining, which in the third year comprises:—(1) Boring, carth augers, driven wells, boring with rods and table tools, upward, inclined, and horizontal boring, diamond drill and its use in prospecting; (2) shaft-sinking, shaft timbering and lining, boring of shafts, sinking of iron and masonry linings, cribbing, walling, and tubbing; (3) drifting of adits and levels, timbering and walling-in levels and working places; (4) mining of coal and ores, coal-cutting machines, hand and machine drilling; (5) handling of coal and ores in working places; (6) tramming, cars, trucks, locomotives, wire-rope haulage, planes and gravity roads; (7) accidents to miners, causes and prevention; (8) organisation and administration; (9) time books, measurement of contracts, pay-roll, analysis and dissection of accounts and cost sheets, assaying and ore-testing lectures, recitations, and practical work.

In the fourth year of the course in metallurgy full instruction is given in ore-dressing, as follows:—(1) the theory of separation, hand and machine dressing, general principles governing crushing and sizing of ores of different character; (2) the theory of jigging, description of different forms of jigs and methods of working, air jigs; (3) sluice treatment, classification of sluices in troughs, spitz-kasten, &c., and treatment on buddles and tables; (4) description of crushing machinery, jaw crushers. rolls, stamps, mills, &c.; (5) sizing apparatus, screens, riddles, and buddles; (6) description of coal-washing plant, anthracite breaker; (7) description of American ore-dressing works; (8) foreign ore-dressing works.

The mechanical engineering of this course is also considerable, including practice in the management of engines and steam boilers, testing their efficiency, &c., pumps, hoisting engines, ventilating machinery, construction and management of hot air, gas, and petroleum engines, together with drawing, project and thesis work.

Assaying.—During the third year the student is admitted to the assaying laboratory, where he is provided with a suitable bench and a set of assay apparatus, and where he has access to the sampling and ore-testing machinery, crucible and muffle furnaces, and to volumetric apparatus for the assay of alloys. The course includes:—(1) Lectures and recitations; (2) practical work. The lectures treat of and describe the furnaces, fuels, apparatus, reagents, &c., employed, and explain the general principles, as well as the special methods of sampling and assaying, models and lantern views of the furnaces and apparatus are shown, and the ores of the various metals and the appropriate fluxes are exhibited and described. The recitations follow the lectures, and are held by the assistant instructor, the class being divided into small sections for that purpose.

The practical work includes the testing of reagents and small samples of ore, practice on methods, and special work to familiarise the student with sampling large lots of ore, and to give practice in mill and furnace assay. The student is supplied with the different ores, and is required to assay each under the immediate supervision of the instructor.

To facilitate the assay of ores of the precious metals, a system of weights has been introduced by which the weight of the silver or gold globule obtained, shows at once, without calculation, the number of troy ounces in a ton of ore.

To furnish necessary facilities for practical work the following plant has been provided:—

- 1. Arrangements for sampling large and small lots of ore. These consist of crushers, rolls, sizing sieves, Hendrie and Botthoff pulverizer, sampling and grinding plates.
- 2. Appliances for milling and amalgamation, such as small stamp mill, plates, steam-jacketed pan, settler, retorting apparatus for amalgam, &c.
- 3. Concentration appliances, both by hand and machine work, such as pans, jigs, Frue vanner, Golden Gate concentrator, &c.
- 4. Furnaces for roasting and smelting, with small plant for making leaching tests of chloridized ore.

The machinery is run by one 15-horse-power engine. In order to make the plant as practicable as possible, the arrangement, so far as space will permit, is the same as is used in milling and concentrating ores on a large scale. In following out the course of instruction, lots of 500 fb. of ore in lump are given out to the students, who are required to sample and assay the same, and then, from the assay and mineral characteristics of the ore, determine upon a method of treatment. If the ore is one that should be concentrated, the students to whom the sample is assigned will size it, concentrate by different methods, assay the concentrates, middlings, tailings, &c, and make up a clear statement as to the method and the results, giving an opinion, founded upon the facts observed, as to how the ore should be treated.

In mineralogy the studies, except for students in the course of civil engineering, continue throughout two years. During the first year the students are instructed in the use of the blow-pipe and in crystallography. The instruction in blow-pipe analysis lasts through the first half of the year. It consists in:

- 1. Preliminary tests on the purity and intensity of the oxidising and reducing flames, roasting, flaming, &c.
- 2. Characteristic tests upon the different oxides.
- 3. Analysis of compounds of varying complexity.

The students are taught how to examine mixtures, alloys, and natural compounds, so that they are able to determine, with ease, the constituents of a mixture containing a large number of simple substances. In order to do this, substances whose composition they know are given to them, upon which they are required to perform all the characteristic reactions which take place in the different flames with the different fluxes. After they are sufficiently familiar with the behaviour of substances, the composition of which they know, they are given substances, the composition of which they do not know, to determine.

The

The collection of blow-pipe substances consists of 300 compounds, exclusive of minerals. Students are taught to examine, qualitatively, the different commercial alloys and a large number of the natural combinations. The blow-pipe laboratory is a large, well ventilated room, to which the students have access at all hours of the day, and where each student has a drawer, with a lock, assigned to him, which he retains until the close of the term.

At the commencement of the second term the lectures on crystallography commence. They embrace the entire subject of crystallography, including the descriptions of both normal and distorted forms, for the study of which the students have access to a collection of over 300 models in wood, embracing all the theoretical forms. Besides this collection, they have the use of the collection of 150 models in glass, and also have access to the collection of minerals, most of the species of which are illustrated by models in wood, showing the perfect and distorted crystallographic forms. Conferences are also held during the term in which the students are required to determine models of the theoretical forms as well as those found in minerals.

At the commencement of the second year the students are taught theoretical mineralogy, including the optical and physical properties of minerals, the lectures being illustrated by a very complete set of apparatus, and a cabinet containing a large number of sections of minerals for lantern and instrumental use. For the study of sections the students are taught the use of Groth's polariscope, and of goniometers. They are required to determine minerals by the eye, aided by simple tests, or, when testing is not expedient, by asking questions with regard to those characteristics which cannot be determined without experiment. They are required to give the name, the composition, the crystalline form, and the prominent chemical and physical characteristics of the mineral they determine. To facilitate this work they have unrestricted access to a collection of over 3,000 carefully labelled specimens, on which they are allowed to make any experiments, and also, under the supervision of the instructors, are allowed to handle a collection of 2,500 finer specimens. They have besides constant access to the cabinet of minerals which contains about 30,000 specimens, arranged in table cases, to show the different characteristics of minerals, and about 3,000 specimens arranged in wall cases to show their associations. The crystals of minerals are arranged upon pedestals in such a way that they can be readily seen and examined by the students. They are also required to determine such minerals as they are likely to find in the field, by testing them with the blow-pipe and such reagents and instruments as they are likely to have in the outfit of an ordinary survey.

Other minerals of economic importance, such as the common ores, and the minerals used in the manufacture of paints, cements, &c., are described, and their applications in the arts briefly specified.

In metallurgy the lectures continue through two years, and discuss in detail the methods in use for working ores in the best establishments in this country and in Europe. They include:—(1) General metallurgy; (2) the metallurgy of iron; (3) the metallurgy of steel; (4) the metallurgy of copper, lead, silver, gold, zinc, tin, mercury, &c.

(A.) General metallurgy.—The lectures in general metallurgy embrace the subjects of combustion, refractory materials, furnaces; natural fuels—wood, peat, lignite, bituminous and anthracite coals, natural gas; artificial fuels—peat, charcoal, coke and combustible gases manufactured in producers; chimneys, the different kinds of blast engines, methods of heating blast, regulators, hot blast ovens and tuyeres.

(B.)

(B.) The metallurgy of iron consists in the discussion of the general properties of iron ores and slags; lifts, the theory of the blast-furnace process—the causes of variation in the working produced by the blast, by the fuels, by the variations in the charge, and by the form of the furnace, the effects of moisture. The methods of ascertaining the cost; the calculations of the heat developed and lost in the furnace; melting the iron in crucibles, cupolas, and reverberatory furnaces; moulding—the methods of making the moulds, the precautions required in casting, and the manufacture of malleable castiron. In the manufacture of wrought-iron from cast-iron there are discussed: the German process and its modifications; the English process, including fining; the dry and boiling processes in puddling, stationary and rotary furnaces; shears, hammers, squeezers, saws, rolls; reheating in ordinary and regenerator furnaces, two and three high trains; and the method of calculating cost of wrought-iron.

In the direct processes of manufacture of iron from the ore, the Catatan process and its derivatives are discussed.

- (c.) In the metallurgy of steel there are discussed the processes of the manufacture of the following:—Low furnace and puddled steel, cement steel, crucible steel, basic and acid Siemens-Martin steel, basic and acid Bessemer steel; the utilisation of scrap-iron, and the manufacture of sheet-iron, nails, wire, and rails.
- (p.) Copper.—The lectures on copper include the treatment of native copper, the treatment of pure sulphurous ores by the Swedish, German, and mixed methods in Europe and the United States; the treatment of rich pure ores, the treatment of impure ores in the Hartz Mountains and in the United States; the treatment of very poor ores by lixiviation, the treatment of rich and pure ores by the English methods in the reverberatory furnace in Europe and the United States, and the treatment of rich and impure ores in the same furnace; the treatment of oxidized ores in Europe and in the United States; the mixed methods in Europe and the United States; the treatment of oxides and the wet methods.

Lead.—The lectures on lead include the method of roasting reaction in France, England, and the United States; the method of roasting and reduction; method by precipitation in France, Germany, and the West; the mixed methods in France, Germany, and the West; the refining of lead; the extraction of silver by the Pattison method and by zinc, cupellation and condensation of volatile products.

Silver.—The lectures on silver includes the treatment of silver ores in furnaces in Germany and in the United States; water jacket furnaces and others; the separation of silver by Saxon, Mexican, or pan amalgamation; the treatment in the wet way by Augustin's method, Ziervogel's method, Von Petera's method, and Russell's method, and also the refining of silver.

Gold.—The lectures on gold include washing, sluicing, and hydraulic mining; Plattner's process parting gold and silver, stamping and amalgamation; the chlorinization process, &c.

Tin.—The lectures on tin include the treatment of tin in shaft furnaces and in reverberatory furnaces.

Zinc.—The lectures on zinc include the Silesian, Belgian, and English methods.

Mercury.

Mercury.—The lectures on mercury include the treatment of ores of mercury by precipitation and by roasting.

There are also discussed the treatments of ores of antimony, nickel and cobalt, and bismuth.

It is designed to make these lectures as practical as possible, and for this purpose the economic details of cost are given whenever they can be obtained from authentic sources. Special attention is given to American ores which are difficult to treat, to the solution of practical problems which may occur, and to changes which different economic relations are liable to cause in the treatment of the same ore in different localities.

In addition to the lectures by the head of the department the students in the course of metallurgy receive each week from one of the assistants a thorough review of work of the week. A certain number of hours are devoted to questioning the entire classes and further explaining points not thoroughly understood.

Students of the fourth year are required to hand to the Professor of Engineering at certain times memoirs on subjects studied in the summer school of practical mining, and students of this class are required to send in to the Professor of Metallurgy a *project* or written paper on a given subject, such as one of the three following:—

- 1. "An establishment to produce 300 tons of pig iron per day. The furnace will be located east of the Mississippi River. The ore will be composed of hematites and limonites, the hematites containing 60 per cent. of sesquioxide of iron, 0.055 of sulphur, and 0.065 of phosphorus. The limonite will yield 50 per cent. of sesquioxide and be equally pure. The fuel and fluxes will be such as can be had most readily in the district selected. The ore will be reheated by a regenerative system of ovens. The furnace to have a closed front and the charges to be made mechanically."
- 2. "An establishment to make from 350 to 400 tons of open hearth steel per week from purchased materials. The establishment to be located within 10 miles of New York City, with a water front and docks for water transportation, and a railway for inland transportation. All the materials used, as well as the fuel, will be purchased in open market. None of the metal produced will be sold in ingots, it will all be manufactured for the market, the rolling mills for the manufacture being included in the plant."
- 3. "An establishment to produce and desilverize 10,000 tons of lead bullion, containing on an average 150 ounces of silver and 2 ounces of gold to the ton. The establishment to be located in, or west of, the Rocky Mountains. The ore will be composed of earthy carbonates, with some galenite, anglesite, and cerussite, and will contain 25 per cent. of lead, 25 per cent. of silica, 25 per cent of sesquioxide of iron, and 1 per cent. of sulphur. The fuel and fluxes will be such as can be most readily had in the district selected."

One of these projects must be chosen and the specification and statement required furnished by the student accompanied by estimates, memoirs, and drawings. It can therefore be seen how eminently thorough and practical the work of the School of Mines has to be performed to enable students to carry out so high a class of work.

It

It is the same in all the other courses, the school work giving the students a thorough scientific training, and has doubtless contributed to raise the standard of secondary education in the complete manner it prepares young men for actual work and positions of responsibility.

The great English scientist, Professor John Tyndall, was, during his visit to America, so impressed with the high character of the school that he presented to the college \$10,800 or £2,160, for the encouragement of scientific research. The trustees accepted the gift, and therewith founded a fellowship entitled, "The John Tyndall Fellowship for the Encouragement of Research in Physics." This is to be held by some suitable person, who shall be either a graduate or a student in some department of Columbia College, but not necessarily a candidate for a degree. The appointment is made by the Board of Trustees, on the nomination of the President and Faculty of the School of Mines, and is held for one year only; but the fellow for the time being shall be eligible for reappointment from year to year upon the recommendation of the President and Faculty.

The cabinets and collections of specimens, together with models, are very extensive; they illustrate all the subjects taught in the school, and are accessible to all the students. They include:—Crystal models; natural crystals, pseudomorphs; ores and metallurgic products; models of furnaces; collection illustrating applied chemistry; fossils; economic minerals and rocks; models of mechanical movements; models of mining tools; models of mining machines, &c., &c.

The lectures on crystallography are illustrated by a collection of 150 models in glass, which show the axes of the crystals and the relation of the derived to the primitive form. This suite is completed by 400 models in wood, showing most of the actual and theoretical forms, and also by a collection of natural crystals showing the forms as they actually occur in the prominent mineral species.

The cabinet of minerals comprises about 30,300 specimens, arranged in cases. It includes a large suite of pseudomorphs, a collection illustrating the physical characters of minerals, and a collection illustrating crystallography by natural crystals, showing both their normal and distorted forms. There are also three separate student collections of average specimens, amounting in the aggregate to over 6,000 specimens.

There is also a most complete collection of ores and metallurgical products illustrating the different stages of the ordinary processes in use in the extraction of each metal in this country and in Europe which is accessible to the students.

An extensive collection of models of furnaces has been imported from the different countries in which they are used, and a very large number of drawings, plans, elevations, and sections of furnaces and machines used in the different mechanical and metallurgical processes.

The geological collection consists of over 100,000 specimens, forming the following groups:—

- 1. A systematic series of the rocks and fossils characteristic of each geological epoch, numbering over 70,000 specimens.
- 2. A collection of ores, coal, oils, clays, building materials, and other useful minerals, illustrative of the course of lectures on economic geology, and believed to give the fullest representation of our mineral resources of any collection yet made.

  (3.)

- 3. A collection of 5,000 specimens of rocks, and the minerals which form rocks, to illustrate the lectures on lithology.
- 4. A palæontological series, which includes collections of recent and fossil vertebrates, articulates, mollusks, radiates, and plants. In this series is to be found the largest collection of fossil plants in the country, including many remarkably large and fine specimens, and over 200 species of which representatives are not known to exist elsewhere. Also, the most extensive series of fossil fishes in America, including, among many new and remarkable forms, the only specimens known of the gigantic Dinichthys. There is also a suite of Ward's casts of extinct saurians and mammals, fine skeletons of the great Irish elk, the cave bear, the New Zealand moas, ichthyosaurus, teleosaurus, &c.

In each department there are equally complete collections arranged in the most convenient manner for the purposes of instruction.

The Library contains 91,000 selected volumes, and additions are being yearly made. It is open daily to all officers, students, and graduates of the College, both for borrowing and reference. More than 500 different serials, including the leading transactions of learned societies, are regularly received, together with all the periodicals.

Those students who complete the required course of studies will receive the degree of Engineer of Mines, Civil Engineer, Metallurgical Engineer, Sanitary Engineer, or Bachelor of Philosophy.

Graduates of the school who pursue, for not less than two academic years, a course of study prescribed by the Faculty, pass a satisfactory examination thereon, and present an acceptable dissertation embodying the results of such special study upon an approved subject, receive the degree of Doctor of Philosophy.

The Americans are in earnest, absolutely in earnest, with regard to making the education of the masses "a means to an end." To make education democratic the business of the school must be to instruct its pupils to earn a living. It is impossible that all the youth of a country can be clerks and book-keepers; but the business of the school has hitherto been simply to teach this business and nothing The higher class of democrat, however, believes in something far higher and He does not regard culture as the privilege of the few; it is absurd to think Are the masses too dull to be cultivated, and would a man be a worse artisan with a high culture than he would be were he profoundly ignorant? Certainly not. It stands to reason that the more intellectual the individual, if the intellect has been trained in accordance with the principles of the new education, the better must be the workman. When the eye and hand work in unison, and the hand is properly trained, we shall find that boys leaving school will be fully a couple of years in advance of those who have never had the advantage of learning the use of tools. Experience has shown that this is the case everywhere. Technical knowledge must make its mark, and manual training teaches a boy to think as well as to act, to understand and to rely upon his own powers.

## ENGLAND.

As I reported at some length in 1887 upon the tool instruction given in England, and having described the leading institutions and schools, such as South Kensington, the schools of the City and Guilds of London, and others, I shall limit my observations to those that in my opinion have progressed most in manual training; but I may say in a general way that it is not to Great Britain Australia

138—U must

must go for information and instruction as to model schools for manual training, or for the development of that technical education which takes the form of professional There can be no doubt that many excellent schools of technology and institutions for imparting instruction in applied science exist in England, but with few exceptions they do not seem to progress in the same rapid manner that similar institutions have done in the United States, and I can only attribute it to the banal influence of the South Kensington system of payment by results, and the halfhearted, hard and fast, unsympathetic rules and regulations that dominate the Department of Education. The present vested interests must be protected at any cost, and these seem to me diametrically opposed to those advocated by Rousseau, Pestalozzi, and Froebel, consequently progress will continue sluggish until the people wake up to the fact that other nations are going ahead faster than Great It must be conceded, however, that certain broad laws have a general application; and since the Royal Commissioner's Report on Technical Instruction the people begin to feel that Huxley was right when he said that "mere book learning in physical science is a sham and a delusion. What you teach, unless you wish to be impostors, that you must first know; and real knowledge in science means personal acquaintance with the facts, be they few or many. civilisation rests upon physical science; take away her gifts to our own country, and our position among the leading nations of the world is gone to-morrow, for it is physical science only that makes intelligence and moral energy stronger than brute force."

Science must be joined to practice in earnest, and last year the English Parliament passed a bill for making provision for aiding manual and technical instruction out of the public funds, which, while it does not go half far enough, a commencement may be made under its provisions.

The Technical Instruction Act was passed by the Parliament of the United Kingdom last year, and makes provision for aiding manual and technical instruction out of the public funds. It is hoped that, under its provisions, a fair beginning may be made. The National Association for the Promotion of Technical and Secondary Education has issued a circular explaining the Act, and the following is a *precis* which will serve to convey its chief provisions to your Excellency.

This Act gives power to local authorities—in municipal towns the town council, and elsewhere the county council or the urban sanitary authority—to give rate aid to technical and manual instruction in their districts.

By technical instruction is meant instruction in the principles of science and art applicable to industries. Instruction in special trades is excluded, for it is not intended to attempt the direct teaching of a trade. The definition includes all branches of science and art included in the directory of the Science and Art Department, and any other subjects, including modern languages and commercial and agricultural subjects, which may be sanctioned by that department on the representation of a local authority that such a form of instruction is suited to the needs of its district. Manual instruction is separately defined as instruction in the use of tools and processes of agriculture, and modelling in clay, wood, and other material. The Act gives power to the abovenamed local bodies to levy a rate, not exceeding 1d. in the £, for the purpose of aiding or supplying technical and manual instruction in their districts in the way they deem best. None of the rate raised under the Act may be used for scholars in elementary schools working in the standards.

It attempts to guard against the possibility of the local authority using its powers to set up rival schools, so as to crush out or injure existing institutions, or to discriminate unfairly between schools supplying equally efficient instruction. After

the local body has determined to levy a rate, the School Board or managers of any schools supplying efficient technical instruction may apply for a share, and if this be granted the rate must be distributed among them in proportion to the extent and efficiency of the instruction which they are supplying. In case of a dispute, the Science and Art Department is to be the umpire. In the case of all schools, except those under the School Board, the local authority is to be represented on the governing body to an extent corresponding as nearly as may be to the assistance given from the rates, or, more exactly, in proportion to the relation which such assistance bears to all the other sources of income other than public money utilised for manual and technical instruction. It is to be understood that both board and voluntary elementary schools may obtain rate aid for the purpose of giving technical instruction to children not working in the standards. The claim, however, is limited by three considerations:—(1) The schools applying for aid must be able to show that they are already supplying technical instruction to these children to the satisfaction of the Science and Art Department; and (2) voluntary, but not board, schools must be willing to accept representation of the rating authority on their board of managers; and, (3) they must render an account to the local authority of the mode of expenditure of the rate aid, and submit such account to a public audit. Rates may be used for any children not actually working in the standards, and not merely for ex-seventh The measure, however, as a whole, may be said to apply chiefly standard scholars. to secondary schools. For example, if a local authority which wishes to adopt the Act considers that instruction in, say, the principles of plumbing is suited to the needs of the district, it has only to make representation to that effect to the department, and, on receiving its sanction, it may organise the instruction in what manner it pleases, using the rates for the purpose, and receiving a share of any imperial grant which may be set aside in future estimates for the purpose of technical instruction. The Science and Art Department is the authority which (1) decides whether any particular form of instruction comes within the four corners of the Act; (2) lays down the conditions under which the Imperial grants shall be made in aid of technical instruction; (3) determines any point of difficulty which may arise between the rating authority and any institution receiving aid under the Act. All institutions receiving assistance under the Act must be open to all comers, that is, no religious test of any kind must be required of a scholar receiving technical or manual instruction under this Act, and no denominational teaching can be given to any scholar attending such a school solely for the purpose of receiving manual or technical instruction, and the times for prayer and religious worship, &c., must be conveniently arranged to allow of the withdrawal of such a scholar therefrom. of this clause arises from the fact that the benefits of the Act are not confined to special technical schools, that is, institutions where technical classes form the principal feature; but may extend also to general secondary schools where scientific and technical and manual instruction may be given. It is true that the latter part of the clause only applies to such scholars as are attending only for the purpose of technical instruction, but the more general part of the section applies to all scholars receiving technical instruction under the Act.

Nothing in the Act must be so construed as to interfere with any existing powers of School Boards with respect to the provision of technical or manual instruction.

The National Association says "it is hardly possible at this stage to make effective suggestions as to the kind of instruction best suited to various localities which now find themselves, for the first time, in the position to organise a system of technical

govern the shape which such a system will take. The textile districts, for example, will naturally lay stress on instruction bearing on design or dyeing; while courses on chemistry, metallurgy, the principles of mining, &c., will appeal rather to centres of the extractive industries and of chemical and colour manufacture. Each place will naturally and gradually discover the best way of supplying its needs, and, subject to the sanction of the Science and Art Department, will be able under the present Act to organise its system of instruction to suit those requirements. It is to be hoped that when the powers of delegation given to the local authority under the Act are used, the committee to whom power is entrusted will largely consist of practical men, and will contain representatives of the local working class organisations.

It will easily be seen from the above *precis* that the provisions of the Act only skirmish round the great question of manual training; nevertheless, it may afford an opening into which to insert the thin end of the wedge; then the true educational feature of manual training will be proved and appreciated, and handwork will take its legitimate place in the programme of primary instruction, which place should be the position of honour.

Of the schools I visited, I shall only instance the Manchester Technical or Manual Training School, the Sheffield Technical School in connection with Firth College, and the Bradford Technical College, and the Owens College, Victoria University, Manchester. The work at the Finsbury Schools and the City and London Guilds Institute, as well as South Kensington, was fully described and reported on in my last report.

### THE MANCHESTER TECHNICAL SCHOOL.

The Manchester Technical School is of the best class of English schools. It fulfils the functions of (1) a commercial and manual training school; (2) a technical school for persons about to enter upon industrial or commercial pursuits; and (3) as an evening continuation school for persons already engaged during the day in business or handicraft work who desire to develop and supplement the instruction of the day school, and the experience gained in the warehouse or workshop.

The syllabus states the objects for which the Manchester school is organised to be as follows:—

- 1. The intellectual, commercial, and manual training of boys of 13 years of age and upwards in the Department of the Manual Training School. Boys seeking admission to this department must pass an entrance examination at least equal to the sixth standard of an elementary school. The course of instruction comprises the usual English subjects of a higher grade school, viz., book-keeping, shorthand, fine and applied mathematics, elementary science, freehand, mechanical and geometrical drawing, chemistry, and the theory of and practice in the use of tools.
- 2. Daily instruction by means of lectures in the principles of engineering, chemistry, and the textile industries, along with systematic practice in well appointed workshops and laboratories. In connection therewith there is a complete course of instruction in mechanics, mathematics, drawing, and design. The scheme of study is arranged so as to enable youths not less than 14 years of age, whose education is sufficiently advanced, and who are destined to enter industrial occupations, to acquire a sound elementary knowledge of the principles and processes connected with engineering, chemical,

- chemical, and textile industries. No student will be admitted who cannot pass a satisfactory examination in English composition, the higher rules of arithmetic, and elementary algebra, including simple equations.
- 3. Instruction in evening classes for apprentices, journeymen, and foremen, in technical drawing and design, and in the scientific principles connected with the special industries in which they are employed, together with practice in the laboratories, and in the use of tools and textile machinery.
- 4. Instruction in evening classes in commercial correspondence and calculations, foreign languages, book-keeping, shorthand, and other subjects of value and importance to persons engaged in mercantile pursuits.
- 5. Staff of teachers of special knowledge and training in each of these departments is engaged.

The laboratories are suitably equipped for the practical study of chemistry, metallurgy, physics, and calico printing, dyeing and bleaching; and the engineering workshops are well furnished with all needful tools and appliances connected with mechanical engineering and building construction.

The Textile Industries Department is now established in a separate building in Peter-street. It is supplied with a complete range of spinning and preparation machinery, and with forty hand and power looms, for weaving the chief varieties of silk and cotton goods. It also includes a museum, in which is displayed a series of models illustrative of the development of the loom, and of the various appliances used in the manufacture of cotton goods, as well as specimens of the chief textile fibres, showing the processes of their conversion into yarns and cloths.

The students may thus gain in the workshops and laboratories a practical knowledge of the processes connected with the chief industries, which are the subject of the theoretical instruction imparted in the class-rooms.

The courses of instruction give every facility to students who are preparing for the examinations for Royal and local exhibitions, and national, Whitworth, and other scholarships, and the teachers are glad to aid with their advice and help any such students. The students have access to a scientific and technical library for reference and home study, as well as to a collection of raw and manufactured products, apparatus and models illustrative of the various subjects taught in the school, and every student is entitled to all the privileges and advantages of the school which include the use of reading-room, library, convenient lavatories, and a refreshment-room.

Drawing-boards, T squares, reagents and apparatus, with some exceptions, are supplied free by the school; but students must provide their own text-books, paper, note-books, pencils, rubber, pins, set-squares, and mathematical instruments, which may be purchased at the lowest possible price in the school.

All students of science, art, and technological classes are expressly required to make at least the qualifying number of attendances, and to present themselves for examination, and students can be exempted from these conditions by the payment of special fees only; and all students, whether day or evening, are required to conform to such disciplinary rules and regulations as the Council may make from time to time.

Term reports are issued upon the progress, position, and conduct of day students, and, whenever required by parents or guardians, a special report upon the attendance or progress of any evening student will be furnished.

The main purpose of the school is the harmonious development of a boy's whole faculties by means of a systematic and progressive course of intellectual instruction

instruction and manual training, which has for its express object the cultivation of the power of observation and the training of the judgment. It is not intended to teach a trade, but simply to provide for each boy a complete education for both head and hand, in the belief that in this way all his powers will be best developed, and he be best fitted to take his part in the world in any position to which he may be called. The course of study will also help to determine a boy's special aptitudes, and may thus guide his parents in the choice of his vocation.

The circular states that "The school has no narrow aims; languages and literature, mathematics, elementary science, drawing, and business training, receive due and proportionate attention, and the pupil is taught by the daily use of tools a real knowledge and experience of processes and materials which cannot but be of the greatest value to him.

"It is hoped that the school will create and foster a higher sense of the dignity of skilled labour and the worth of the skilled workman. It will certainly supply during school years the stimulus of a healthy occupation, and will cultivate in the pupil, through the constant practice of working to drawings and exact measurements, habits of precision, method, and painstaking effort."

The conditions of entrance are that boys seeking admission to the first year's course must be at least 13 years of age, and be able to pass a satisfactory examination in the fundamental rules of arithmetic, in vulgar and decimal fractions, and in English grammar and composition, fully equal to the sixth standard of the education code. The number of pupils who can be entered is limited, but pupils can be admitted at any time provided there is room, and that they are prepared to take up the class work.

The first year's course of instruction embraces language and literature, geography, and history, six hours per week; the higher rules of arithmetic and mathematics, five hours per week; writing, including book-keeping and phonography, freehand, geometrical, perspective, and mechanical drawing, five hours per week; elementary science, six hours per week; tool instruction in carpentry and wood turning, eight hours per week. The second year's course, in addition to the advanced studies in the subjects named, embraces manual training in the working of lead, iron, and other metals. The school year is divided into three terms of about fifteen weeks each, and the usual hours are from 9 a.m. until 4 p.m., with an interval for lunch of one hour.

The workshop occupies a spacious room, and is fitted with twenty-three benches and twenty lathes driven by power, and also a complete set of tools for each student. The laboratories and class-rooms are replete with every appliance necessary for the satisfactory illustration of all subjects.

The Manchester Technical School is now one of the institutes registered under the examination scheme of the Victoria University. Students in regular attendance upon courses of instruction in the school may obtain, on passing satisfactory examinations, university certificates in certain groups of subjects, viz.: Engineering, building, construction, electrical engineering, metallurgic science, applied chemistry, mining, higher mathematics, physics and chemistry, and commercial knowledge, including modern languages.

Each group of subjects has three subdivisions. A candidate may present himself in any one or more of the subdivisions of a group, but no certificate will be granted until all are passed.

The

The number of subjects taught at this school are great and varied. The day courses in the first group of subjects are: Mechanical, civil, and electrical engineering, pure and applied chemistry, metallurgy, bleaching, dyeing, and printing; spinning and weaving. Then the classes of art drawing and design, wood-carving; French, German, and Spanish for males; French and German for females, theoretical and practical dressmaking, millinery and needlework, teachers' training class for wood-carving.

Evening classes are in four sections: 1, commercial; 2, scientific; 3, technological; and 4, art.

The Commercial section includes correspondence, arithmetic, history, and geography, writing, book-keeping, shorthand, French, German, Spanish, Italian, Portuguese, and Typewriting. The lectures delivered in this section are combined with the examination and reporting on actual samples of the different products of commerce. This method of proceeding makes the lecture a collection of object lessons, rendering it far more interesting and instructive. In the historical part, attention is particularly directed to (1) a knowledge of the lessons to be learnt from a study of the country's commercial past; (2) the application of these lessons to the case of Britain in the present, with (3) the probable effect of such application in the future. The practical part gives, together with the examination of actual specimens, lectures on the geography and trade in the various products of countries specified. These lectures will have special reference to the sources of supply of these products, the countries supplying them, their nature, substances used in their adulteration, the home, colonial, and foreign markets, their geography, number, character, extent, population, requirements, and capacity for consumption, competition with other nations; methods of importation, cost and methods of transport, Custom duties, &c.

I must give the subjects of some of these lectures, to show their importance and character:—(a.) Lancashire and the laying the foundations of modern trade and commerce; (b.) the distribution of the raw materials of commerce generally, as determined by climate and its effects on the distribution of plant and animal life, its soil and its effect in localizing agricultural and other industries, and its geology as determining the products of mines and minerals; (c.) the commerce of clothing, cotton and cotton goods, cotton and the cotton plants, characteristics and qualities, sources of supply, quantity, the commercial handling of cotton previous to its reaching the spinner, plain, twilled, figured, and fancy cloths and their suitability for different markets, commercial handling in course of distribution to the consuming countries. the cotton trade, imports and exports, statistics, &c.; (d.) Great Britain and the rise and development of its commercial supremacy; (e.) the grain trade, sources of supply, domestic, colonial and foreign, qualities and characteristics of various grains, &c., statistics of production, import, &c.; (f.) our Indian and colonial Empire, its advantages from a commercial point of view, with a special study of Canada, Cape Colony, as sources of raw materials, markets for finished goods, or fields for emigration, &c.; (g.) wool trade, sources of supply, characteristics and qualities of various wools, various breeds of sheep, goats, and other hair-producing animals, influence of climate and soil on the breed and on the fleece, exports and imports; (h.) the geography of breadstuffs and the trade in grain; (i.) the geography of beverage and sugar-producing plants, with the trade, tea, coffee, sugar, &c. These lectures are fully illustrated by maps, plans, and diagrams, and with actual specimens of the materials of commerce, in their raw state, in the progress of manufacture, and as finished goods, all of which are open to inspection and practical study by the students after the lecture. The

The Phonography Classes are elementary, corresponding, junior reporting (40 to 70 words per minute), senior reporting (80 to 12) words per minute), in all of which the instruction is specially directed to make rapid and accurate shorthand-writers, to attain which the following facilities are offered:—(1.) Free reporting practice from experienced reader, reading at various speeds; (2.) examination and correction by the teacher of home-work, of which each pupil is expected to do a fair amount; (3.) students may attend two classes for the same fee; (4.) the leading shorthand publications are circulated among the students; and (5.) special attention is given to the advanced classes, to business correspondence and commercial requirements. There is a special class for women, arranged with a view to their special benefit and convenience, since shorthand is daily becoming more and more serviceable to them, and its acquisition is now a necessity to those engaged in or contemplating office and clerical work. Arrangements have also been made for instruction in the use of the Remington and Caligraph typewriters, as a practical knowledge of typewriting greatly enhances the value of a shorthand correspondent.

Sections II and III pertain to Science and Technology, and include:—(1) engineering; (2) builders' work; (3) electrical engineering and physics; (4) pure and applied chemistry; (5) textile fabrics; (6) letterpress and lithographic printing; (7) dressmaking; (8) natural science; (9) school of drawing and design. In Technology many of the classes are under the auspices of the City and Guilds of London Institute, and are intended to give workmen an opportunity of acquiring a knowledge of scientific principles and methods as applied to their special trades.

In Art Drawing and Design the course of instruction is progressive, and the courses of study are specially arranged so as to secure the gradual advancement of the student in the principles and practice, and also in their application to industrial purposes.

The Science subjects of the evening classes include: Practical geometry, machine construction, building construction, mathematics, theoretical mechanics, applied mechanics, sound, light and heat, magnetism and electricity, chemistry, geology, mineralogy, botany, physiology, metallurgy, steam, and physiography; while the Technical subjects comprise: Bread-making, brewing, oils, colours and varnishes, oils and fats, soap, iron and steel; bleaching, dying, and printing; wool and silk dying, coal tar colours, cotton manufacture, weaving and pattern designing, telegraphy; electric lighting and transmission of power, and electrical instrument making, metal plate work, plumber's work, metal working tools, mechanical engineering, road carriage building, rail carriage building, letterpress printing, lithographic printing, carpentry and joinery, brickwork and masonry, practical engineering, pattern-making, practical joinery, staircase making, quantity surveying, dressmaking, &c., millinery, surveying and levelling, elementary architecture, inking in colouring; while the Art subjects are: Art drawing and design, modelling in clay, and wood-carving.

In Mechanical Engineering the lectures are on the property of materials used, the behaviour of metals under strain, operations of welding, tempering, riveting, caulking, foundry work, moulding and pattern-making, shafting, gearing, and general machinery, hydraulic machinery, boilers, steam-engines, &c. The power of freehand sketching is an important requirement in this subject, as it is also in all the handicraft subjects.

There are four classes of persons for whom the use of the mechanical workshop is intended:—(1.) Youths who intend entering the various engineering professions;

(2.) Young men and others who, being already engaged in general and drawing offices of engineering firms, may wish to acquire a knowledge of and practice in the use of tools, appliances, and methods adopted in the works; (3.) Persons who, being already engaged in one or more branches of engineering work, may desire to become acquainted with any other department; and (4.) Persons who, having no trade interest, still desire instruction and practice in the use of tools.

The workshop course is arranged as follows:-

- Fitting.—Use of the hammer and chisel in the preparation of flat and other surfaces; the use of drifts for holes and mortises; the making of keyways for pulleys and shafts; use of the file; use of templates; use of the file and scraper in the preparation of true plane surfaces, i.e., straight edges and surface places; use of compasses, scriber, square, and other marking and dividing instruments.
- Turning.—Use of hand tools for various metals in cylindrical and surface work; striking and chasing screw threads with hand tools; use of slide lathe in turning and boring various kinds of work, cutting single, double, and multiple threaded screws, both internal and external, in the slide lathe; use of change wheels; cutting speeds for different materials. Students are also instructed as to the precautions necessary in the productions of accurate cylindrical work, as in the internal and external standard gauges, fixing work in lathe chucks, drilling and boring in the lathe.
- In machine tools students are taught the use of planing, slotting, shaping, and drilling machines; methods of fixing work of different forms; the cutting angle of tools used in different operations and metals.
- Foundry work, its elementary principles and practice; use of cores and core boxes; moulding and casting in green sand, dry sand, loam, &c.
- In the smithy the exercises are chiefly in upsetting, drawing, binding, welding, punching, tempering, and case-hardening.
- The pattern-making class is intended for the use of mechanics, draftsmen, and others who wish to acquire a practical knowledge of the use of woodworking tools, so as to be able to make any kind of simple pattern or template in a workmanlike manner. Students in the engineering classes will find the systematic course of practical instruction carried out in this class of great value to them.
- Builders' work comprise all the subjects of another group with classes for each of the handicrafts, and the application of geometrical drawing in the preparation of working drawings to scale, consisting of walls, floors, roofs, partitions, doors, windows, staircases, cornices, arches, groins, &c., from models, written descriptions, and sketches on the black-board; plans, elevations, and sections of buildings, or parts of buildings from measurement.
- There are separate classes in brickwork, stonework, leadwork, slater's work, ironwork, plasterer's work, and woodwork. The lessons are illustrated by models and diagrams, and by specimens of all the different kinds of timbers used in the building trade, the use and adaptability of which are fully described.

- In carpentry and joinery there are two courses—a drawing and lecture course and a practical course. In the first of these the course of instruction is as follows:—The nature and properties of the various kinds of timber used in the building trade.
- Mouldings.—Intersections at different angles, straight and circular, enlargment and diminution, determination of section of moulded bars and hip rafters in skylights and lanterns and of the true section when the given moulding is on the rake.
- Bevels.—For hip-rafters, jack-rafters, purlins, splayed linings, raking mouldings, and oblique work generally.
- Circular Work.—Method of bending boards or ribs round circular work by kerfing, grooving, steaming, moulds, and bevels for soffits in straight and circular walls.
- Stairs.—Newel and geometrical stairs, proportion of riser to tread, general planning of stairs to obtain proper head room.
- Hand-railing.—Proper height over flyers, winding-rails, and round landings, &c. Hinges.—Various kinds, modes of application.
  - Mechanical principles as applied to the framing of roof-trusses, timber partitions, trussed girders, bracing-doors, gates, &c., so as to show the comparative strain in the various members.
  - The practical course is established to meet the requirements of the City and Guilds of London Institute in the honours stage. In addition to the Drawing Examination each student must make in suitable material a piece of original work. The class is principally intended for those who have not the necessary practical skill, and will include such work as the following:

    —Tenoning, mortising, dovetailing (various kinds), and the making of some piece of useful work—as well as for the younger practical men, who wish to acquire a better knowledge of bevels as applied to splayed window casings, roofing, and oblique work generally.

In masonry the course of instruction includes:—

- 1. The application of geometry to practical masonry, for example: Setting out and mould making for all kinds of arches, tracery windows, tympanums, columns, bases, caps, pediment-heads, balustrades, louvre windows, turrets, towers, spires, pinnacles, abutments, buttresses, canopies, staircases, niches, embattlements, consoles, cornices, raking moulds for pediment-heads, octagonal or semi-circular bases, caps, and for moulding machinery.
- 2. Ground vaulting, flying buttresses.
- 3. The Technology of Stone.—Considerations as to use and properties; best methods of working.

The course is fully illustrated by specimens, plans, elevations, and sections, drawn to scale and full size, and by models or actual demonstration.

Bricklaying includes the application of geometry to brickwork and the methods of obtaining and applying moulds, templates, and levels, by setting out in detail elliptical and oblique arches, domes, niches, groins, raking mouldings; tunnel and sewer constructions; the nature and properties of bonding, foundations, walls, moulded cornices, chimneys, shafts; the nature and properties of limes, cement and bricks, and the uses for which each kind is specially adapted.

Practical

Practical Metallurgy is also here divided into the Elementary Stage and the Advanced Stage. The laboratory is open to students three days weekly—for an hour and a half on Tuesday and Friday, and two hours on Saturday. It is provided with gas, wind, and coke furnaces, crucibles, rolling mill, reagents, and all necessary appliances for the study of practical metallurgy and assaying.

In the Elementary stage, the course is so arranged as to thoroughly illustrate the corresponding lecture course, and the course on iron and steel, and the experiments performed will give a knowledge of the principles of the science. The course of instruction includes:—

Roasting.—Production of litharge, red lead, putty powder, &c.; the removal of sulphur from ores, roasting of sulphides to sulphates, &c.

Sulphurization.—The artificial production of lead and copper, antimony, and iron sulphides.

Reduction.—Production of silver, lead, antimony, copper, tin, and iron from their ores.

Production of steel by fusion of malleable and east iron.

Crucible-making.—Testing of the same for withstanding high temperatures and action of metallic oxides, brasquing crucibles, &c.

Alloys.—Making of common alloys, brass, bronze, gun-metal, bell-metal, speculum metal, pewter, type-metal, and solder, &c.

In the advanced stage each student has a separate bench, is provided with all necessary apparatus and reagents, but must supply himself with such gold and silver as may be required in the shape of old gold and silver or foreign coins.

The course includes:—

- 1. Fuel.—Valuation of coals. Determination of ash, sulphur, and water in fuels. Determination of calorific power by Thompson's calorimeter.
- 2. Clays.—Making clay crucibles for iron assay—Testing fire clays.
- 3. Extraction of Metals from their Ores.—(1), by roasting and reduction; (2), by amalgamation; (3), by liquation; (4), by cupellation.
- 4. Assay of Copper Ore and Products.—Dry assay, roasting of ores, production of coarse metal, blue and white metal, coarse copper and refined copper, policy of copper, fluxes used in the operations, wet assay of copper ores, production of copper slags.
- 5. Assays of Silver Ores and Alloys.—Making of bone ash cupels, scorification of silver ores, cupellation in muffle furnace, use of granulated and sheet lead, valuation of silver ores as to the amount of silver per ton of ore, wet assay of silver, amalgamation of silver with mercury and distillation of mercury.
- 6. Assay of Iron Ores.—The dry and wet assay of hematite, clay, ironstone, blackband, Northampton ore, tap cinder, ilmenite and spathic ores, production of iron slags.
- 7. Assay of Gold.—Cupellation, gold parting by nitric and sulphuric acids, amalgamation of gold, precipitation by Ferron's sulphate detection in minerals.
- 8. Assay of Tin Ores.--Reduction, fluxes used, liquation and refining.
- 9. Preparation of Alloys.—Bronze, coinage bronze, Muntz metal, Mosaic gold, stereo-metal, regulus of Venus, &c., also the assaying of zine, antimony, mercury, and lead ores.

In addition to this there is an honour's stage course which includes:—

- 1. Analysis of cast-iron and steel.
- 2. Eggertz method for estimating combined carbon.
- 3. Estimation of sulphur and phosphorous in iron and steel.
- 4. The dry and wet assay of nickel and cobalt.
- 5. Estimation of silver and gold in burnt pyrites.
- 6. Reduction of oxides by carbon and carbon monoxide.
- 7. Wet assay of silver, copper, and iron.
- 8. Preparation of chemically pure gold and silver, &c.

Thus students following the above courses may gain a sound knowledge of practical metallurgy and assaying. It, however, appears to me that the time given to these subjects is too short, and that, unless the students can work at home, the practice is much too limited.

There is a class devoted entirely to the iron and steel manufacture, of which the following subjects form the syllabus:—

- 1. Fuel: Calorific power and calorific intensity.
- 2. Varieties of fuel: Charcoal and charcoal burning.
- 3. Coal: Classification and valuation of coals.
- 4. Coke and coke ovens (Cox, Appolt, Siemens, &c.).
- 5. Gaseous fuel: Analysis of heating gas.
- 6. Refractory materials: Furnace lining and beds, &c.
- 7. Crucibles, &c.
- 8. Chemistry of iron.
- 9. Iron ores.
- 10. Preparation of ore: Calcination, &c.
- 11. The blast furnace: Furnace tops; Zuyerc's, &c., blowing engines.
- 12. The blast: Hot blast stoves.
- 13. Reactions of blast furnace: Slags; faults in working.
- 14. Pig-iron: Varieties; the foundry; influence of shape on strength of castings.
- 15. Malleable iron: Production direct from ore; Burmese and Catatan methods.
- 16. Production of malleable iron from cast-iron.
- 17. Refining: Puddling, dry and wet.
- 18. Improvements in puddling: Mechanical puddling; Dank's furnace, &c.
- 19. The forge and the mill.
- 20. Steel: Analysis of iron and steel.
- 21. Production of steel by carbonisation of malleable iron; case-hardening.
- 22. Production of steel by fusing cast-iron with malleable iron or iron ores (Siemens and Siemens', Martin processes).
- 23. Production of steel by decarbonisation of pig-iron.
- 24. Bessemer and Basic Bessemer processes; plant, &c.
- 25. Working of steel into ingots, plates, rails, &c.
- 26. Testing of iron and steel.
- 27. Tin plate: Galvanised iron.
- 28. Alloys of iron: Applications of iron and steel.
- 29. Statistics of iron trade.
- 30. Summary and conclusion.

These lectures are fully illustrated by specimens showing the different stages of the processes and diagrams of the plant used; facilities are also given for visiting works engaged in the industries of which the subjects treat.

I was well pleased with the manual training classes in connection with this institution, and can testify both to the enthusiasm of the pupils and ability of the teacher, who thoroughly understands his work. A commencement is made with the plane, showing its various parts and uses, how to sharpen it and to set it. Then follows how to plane a true surface, explaining the use of "winding strips." The next lesson is to true by planing two surfaces at right angles, introducing the use of the trying-square. The pupil is then taught to plane a long board, and to shoot its edge true and square. Then to make thereon a scale of inches. Afterwards as follows:-The use of the plane and gauge in combination, and planing a piece of stuff to gauge; the use of the tenon-saw, gauge, and scriber, and exercise in planing; the use of the saw, and sawing exercises at various angles; planing across the grain, introducing the smoothing plane; practice in this lesson, a frame for an inkstand; rabbeting and grooving, both with and across the grain with two practice lessons, namely, a simple bracket and a towel roller; joints, halving, with use of firmer chisel, with afterwards a practice lesson making an easel; mortise and tenon, with use of mortise gauge and mortising chisel, with a variety of examples; dovetails of all kinds, plain and secret; dovetails for hoppers, straight and splayed, their principles and numerous applications in practice; nail-box, office inkstand, tables, desk, stools, and various useful articles. The classes were well attended, and if the public schools would take up the method as practised at the Technical School it would not be long before the public would have an overwhelming demonstration of the immense value of manual training in the cultivation of the perceptive powers.

# THE SHEFFIELD TECHNICAL SCHOOL.

Another typical English institution for giving instruction in technology is the Sheffield Technical School in connection with the Firth College. The prospectus says: That the aim of Firth College is to provide for the people of Sheffield and the district the means of higher literary and scientific education by university methods of teaching. Its doors are open to all, without distinction of sex or class, who are over 17 years of age, though the limit of age may be lowered in exceptional cases. It forms one of the series of local university colleges which have been founded chiefly within the last decade, to spread the advantages of university education throughout all strata of the nation, and to attract and develop all the best intellects wherever they may happen to appear. Among their chief functions may be mentioned:—

- 1. The provision of higher education by university methods for students above ordinary school age in the large towns; such provision including laboratories and appliances for practical work in the experimental sciences.
- 2. The means of teaching the application of pure science to the technical operations carried on in their districts.
- 3. Placing the means of higher education within reach of all whose business or work would otherwise prevent it, through evening classes and laboratory work.
- To which may be added (4) the means of original research in science or its application.

The Sheffield Technical School fulfils the second of these functions. Its chief object is to give a thorough training in the applications of science to metallurgy and engineering, and in their operations as carried out commercially.

Firth Hall was founded in 1879 by Mr. Mark Firth. Originally intended as a hall and lecture rooms, in which the Cambridge extension lectures could be given,

its scope soon became enlarged so as to aim at filling the position of a local university college for Sheffield. The edifice of the college was given by the founder, at the cost of £20,000, including the site; and in addition to the building Mr. Firth gave a further endowment of about £10,000. An additional £12,000 was raised from other donors. The income partly depends upon contributions from annual subscribers. The funds are vested in a body of trustees, and the government in a council, including representatives of the different interests in the town.

The City and Guilds of London founded a professorship of mechanical engineering, with the proviso that a sufficient sum for maintenance and appliances were raised from local sources. It was not until February, 1886, that the scheme was in full operation, when the new buildings in St. George's Square was opened by Sir Frederick Bramwell.

It is stated that those students who have gone through a regular course of instruction for two or three years, as the case may be, have found no difficulty in getting admission into works immediately on leaving. There is no pretension to teach those things that can better be learned in the workshop itself, whilst the instruction is of a class to prove of the greatest importance to those who have the management of works as well as to the workmen themselves.

Intending students must obtain from the Principal a signed form of admission, on presenting which to the Registrar, and paying the fees, they will receive a card of admission to the several classes. No student will be at liberty to attend a lecture or class until this regulation has been complied with. A record of attendance is kept in each class, and students desiring leave of absence must obtain it from the professor. In cases of enforced absence a written explanation should be sent to the Principal, who will communicate with the professor. I mention this to show how necessary it is that attendance must be regular. Class-work cannot be successfully carried out unless the students are to be found in their places.

Certificates are awarded at the close of each session, upon the results of the examinations, to all those who pass in the first class, either in the day or the evening courses. Those engineering students, who in the same or different years obtain certificates in engineering and engineering drawing, together with certificates in two at least of the following subjects:—Mathematics, applied mathematics, theoretical physics, practical physics, theoretical and practical chemistry, will be entitled to a special certificate of honour.

There are also diplomas conferring the Associateship of the Technical School, and entitling the holder to free admission to all lectures, exclusive of workshops and laboratories. The use of the reference library, the reading-room, and the museums will be awarded in both the metallurgical and engineering departments to each student who attends the lectures and laboratory practice prescribed for the regular and complete courses, and who passes the annual examinations satisfactorily in each of the subjects.

Sheffield and its surrounding neighbourhood having been always famous for its steel, metallurgy is, of course, the favourite study. The metallurgic course is made up of three sections, and the first section comprises the following subjects:—

Refractory materials.—Influence of chemical composition, &c., upon the refractory character of fireclays, lime, magnesia, dolomite, silica, sand and stone firestones, graphites, &c.

Fire-bricks,

Fire-bricks, their manufacture and use; silica bricks; crucibles, their essential qualities; steel melting pots; selection, preparation, and mixtures of clays for the same; machine and hand-made pots.

General considerations of the phenomena of heat, combustion flame, smoke, &c.; nature and composition of the principal solid bodies; wood, peat, and coal used as fuel; coals and their classification; petroleum, oils, and other liquid fuels, their origin, characters, and methods of combustion.

Charcoal burning in piles, kilns, and ovens.

Coke, its varieties and composition; coking in piles, in beehive and rectangular ovens. The Coppec, Simon-Carvés, Appolt, and other special coking arrangements. Collection of waste or bye-products.

Gaseous fuel, its advantages, natural gas, water gas; blast furnace waste gases; the Siemens, Wilson, Casson, and other gas producers.

Calorific power of fuel and calculation of the same; calorific intensity or temperature of combustion; calorimetry or the experimental determination of the calorific power of fuel; economy in fuel, smoke prevention, &c.

The second section includes the following subjects:-

Furnace and crucible materials and construction; refractory rocks, clays, quartz, ganister, sand, dolomite, bauxite, firebricks, &c.; crucibles for laboratory, steel and other melting processes.

Iron Ores.—Their composition, general character, and distribution, calcination of iron ores, and the charges produced thereby.

Blast Furnace.—Construction and mode of working charcoal, coke and coal furnaces, charges and yields, slags and their uses, use of fluxes, hot and cold blast, their effects on the fuel, flux, quality, and yield of pig-iron, waste gases, and flue dust, hot blast stoves, hoists, shifts, blowing-engines, and furnace accessories.

Pig-iron.—Composition and classification, effects of different elements upon, production of Spiegeleisen, ferro-manganese, and highly phosphoric pig-iron.

Direct process for the production of malleable iron.—The Catalan and Bloomery forges process, Siemens' rotary furnace and process.

Indirect processes for the production of malleable iron.—In open hearth fineries, the Walloon process, the Swedish-Lancashire hearth, and the South Wales process, the treatment of pig-iron in reverberatory furnaces, the refinery and puddling process of South Wales and Yorkshire, pig boiling, modifications of puddling furnace, rotary-furnaces, hand and machine puddling, tap cinder, its composition and uses.

Machinery of the forge.—Manipulation of the puddled ball, shingling by hammers, helves, squeezers, &c., puddle and mill-bar rolls.

Convertion of malleable iron into steel.—Cementation process, blister and shear steel, crucible steel process in coke fires or gas furnaces, for remelting blister steel, or malleable iron bars with carbonaceous matters.

Production of steel in regenerative gas furnaces.—Siemen's method from pigiron and iron ore, the Siemens-Martin or scrap process, Basic process in Siemen's furnaces combined Bessemer and Siemens process, Pernot and other furnaces.

Manufacture of Bessemer steel.—Bessemer plant, English and American arrangements, lining for convertors, Holley's movable bottoms, cranes, ladles, &c., conduct

conduct of the blow, slag tests, spectroscopic examination of the Bessemer frame, pig iron for the Bessemer process, use of Spicgeleisen, gases from the converter, Clap and Griffiths' fixed converter, direct Bessemer process.

Basic Steel Process.—Conditions for the success of the process of dephosphorising pig-iron—basic process in the Bessemer converter and in the open air furnace—slags from the basic process—heat-producing elements in the process.

Unsoundness of steel ingots, use of silicon in producing homogeneous ingots. Methods of casting ingots, casting under hydraulic pressure (Whitworth's process), casting under steam and gaseous pressure.

Reheating and Welding.—The hollow fire, reheating or mill furnace, Siemens' regenerative furnace, Gyer's soaking pits, methods of piling malleable iron for merchant iron, rails, &c., faggoting for shear steel, plate and sheet rolling, mill furnace cinder and hammer scale.

Tests applied to steel.—Nature of the physical and chemical tests applied to iron and steel, effects of carbon, silicon, phosphorous, manganese, and the rarer metals on the quality of the steel, hardening, tampering, and welding qualities.

The third section treats of the metallurgy of copper, zinc, tin, nickel, cobalt, lead, silver, gold, aluminium, mercury, &c., and their alloys. The syllabus is as follows:—

- Copper.—Physical and chemical qualities of copper, composition and occurrence of copper ores, smelting of copper in reverberatory and blast furnaces, Bessemerizing of copper ores, wet methods of extracting copper from its ores, &c.
- Zinc.—Physical and chemical qualities of zinc, ores of zinc, extraction of zinc in the English, Belgian, Silesian and Corinthian furnaces, zinc fume, zinc oxide, alloys with copper, brass, Muntz metal, &c.
- Tin.—Physical and chemical qualities of tin, ores of tin, smelting and refining of tin, tin and term plates, alloys of tin (bronze, bell metal, pewter, &c.)
- Nickel and cobalt.—Physical and chemical qualities of nickel and cobalt, ores of nickel and cobalt, speiss, extraction of nickel, alloys of nickel, cobalt smalts, extraction of cobalt, &c.
- Lead.—Physical and chemical qualities of lead, lead ores, manufacture of red and white lead, smelting lead in reverberatory and blast furnaces, lead fume, softening of lead, extraction of silver from lead, Pattinson and zinc processes for desilverisation, cupellation, &c.
- Silver.—Physical and chemical qualities of silver, ores of silver, extraction of silver from its ores by amalgamation, methods pursued in Mexico, Nevada, Chili, Freiberg, &c.; wet methods of Augustin, Ziervogel, and Claudet; sulphuric acid process, English and German methods of cupellation, alloys of silver, coinage, &c.
- Gold.—Physical and chemical qualities of gold, occurrence of gold in nature, amalgamation and smelting processes for the extraction of gold from auriforous quartz, the chlorine process, gold parting by dry and wet methods, alloys with copper, silver, &c.
- Mercury.—Physical and chemical qualities of mercury, amalgams, ores of mercury, air reduction process for the extraction of mercury, methods of reduction with lime, iron, &c.; purification of mercury by dry and wet methods.

  Experimental

Experimental demonstrations are given in the laboratories illustrative:—
(1.) Of the various reactions occurring during roasting, calcination, amalgamation, liquation, cupellation, and the several smelting operations. (2.) The preparation of alloys, oxides, silicates, sulphides, and other metallurgical products. (3.) Analysis of fuels and the determination of their calorific powers, examination of fireclays, crucibles, and other refractory materials. (4.) Assay by dry and wet methods of ores, clays, alloys, and the metallurgical products of iron, copper, zinc, lead, gold, silver, &c., gold and silver parting. (5.) Complete analysis of iron and steel. (6.) Blow-pipe analysis, and the testing by mechanical means of the useful metals and their alloys.

Each student works quite independently, and his work will be specialised, as far as possible, to meet his particular requirements; but in all cases he is required to go through the course illustrative of the general principles of the calcination, roasting, reduction, and scorification processes; the preparation of metallic alloys and examination of their properties; also to make a series of quantitative determinations calculated to familiarise him with the use of the chemical balance.

# MECHANICAL ENGINEERING.

In this department the work consists of lectures, the work of the drawing office, laboratory demonstrations, and of practical work in the workshops. These last mentioned, although not intended to entirely supersede the practical training which the artisan or apprentice can only acquire in the engineering factory or workshop, will serve nevertheless to familiarise students, with the construction and use of tools, the principles upon which their use and construction depend, and with the ordinary workshop operations of mechanical engineering.

The course is thus designed to meet the requirements of students of mechanical engineering, architects, draftsmen, and others engaged in mechanical work, also those who, though engaged in other industries, may be desirous of acquiring some knowledge of the principles of machinery, and of the operations of the smith, moulder, pattern-maker, and machinist.

The complete course extends over three years in which period the more important branches of mechanical engineering are considered. The work of each year is independent of any other, and hence students can join the classes equally well at the commencement of any session. The subjects of the lectures are:—The strength of materials, the design of structures in wood and iron, steam and steam boilers, steam and gas engines, machine tools, shafting, workshop appliances and processes.

The 1889–90 course meets the requirements of students of all classes. Its syllabus is as follows:—

Descriptive lectures upon machine tools, vyces, wood and metal working machinery, the sliding, surfacing, and screw-cutting lathe; gap, break, and face lathes; drilling, milling, shaping, slotting, planing, punching, and shearing machines; riveting and hammering machinery, &c.

Details of the mechanism applied in machine tools, for the conversion of circular into reciprocating motion, cranks, eccentrics, slotted link, cams, reversing and quick return motions, linkwork. The conversion of reciprocating into circular motion, ratchet wheels, nipping levers, &c. The use of wheels in trains, screw-cutting, &c.

Proper

- Proper form of tools and cutting edges for cutting wood, &c.—metals, chisels, caulking tools, saws, planes, files, hand and machine turning tools; taps, dies, and screwing tackle; screw threads; planing, boring, and drilling tools; influence of speed on tools, chucks, drivers, rests, dividing apparatus, &c.
- Workshop operations, preparation of true plane surfaces, gauges, measuring machines, the practical operations of the workshop, such as pattern-making, moulding, forging, turning, screw-cutting, plaining, riveting, tempering of tools.
- Hydraulic machinery, hydraulic motors, pumps, accumulators, hydraulic shop tools, riveting machines, &c., hydraulic forging machinery.
- Transmission of power by wheels, cords and pulleys, belts and pulleys, speed pulleys, shafting and its supports, strength and speed of shafting, couplings, &c.
- In the practical work of the shops the professor is assisted by three practical foremen; one in each of the three departments. These embrace joiners and pattern-making shops; a fitting, turning, and erecting shop; smith's shop; foundry for east-iron &c.

The engine-house contains a 25-horse power duplex tubular steel boiler and steam-engine, designed to work either as a high pressure non-condensing engine, with or without compounding, or as a condensing engine, with or without compounding; also graduated tanks, pyrometers, draught gauges, and other arrangements and apparatus necessary for the education of the mechanical engineer.

The machine and fitting shops contain lathes arranged for all kinds of work. Planing machines driven by screw and steel gearing, powerful shaping machine, drilling machine, together with vice, Whitworth screwing tackle, gauges, surface plates, measuring machine, and all other shop and bench tools necessary to render the instruction complete and effective.

The wood-working shops are fitted with benches, and the usual bench tools, planes, chisels, saws, &c., besides a circular saw and treadle lathes.

The practical instruction is adapted to actual work, and efforts are made by the instructors to make the work as thorough and non-superficial as possible. Accordingly, all students will be required to attain a reasonable proficiency in the use of the several tools before they are allowed to proceed to any constructive work; thus students at the lathe will be required to turn a bar of iron to a fixed diameter, and fairly accurate to gauge; also to face an accurate plane surface, a 6-inch square cast-iron plate or other similar work, before he is allowed to attempt the construction of any part of a machine.

At the vice the student is required to chip over a 6-inch square surface of cast-iron, or 2 by 6 inches surface of wrought-iron ready for filing, and to file up fairly square and accurate to gauge, a  $1\frac{1}{2}$  inch cube or a hexagonal nut, before proceeding to any more important work.

At the carpenter's bench in like manner, before the construction of various points, carpentery or pattern making can be commenced, the student is required to possess sufficient skill to enable him to saw and plane up true square two pieces of timber 3 inches by 3 inches by 3 feet long, and to make a pair of parallel strips  $2\frac{1}{2}$  inches by  $\frac{5}{8}$  inches, and 2 feet 6 inches long.

During each season an effort is made to design, prepare patterns, and completely make and finish some single machine or piece of apparatus. In the last session a dynamo for the use of the schools has been thus designed, constructed, and finished.

The engineering laboratory contains Whitworth and other measuring apparatus, standard gauges, steam engine indicators, oil tester, pyrometer, dynamometer, &c., experimental engine and boiler.

I found the students themselves performing a course of experimental and practical work in connection with steam and the steam-engine. These consisted of determination of temperature and the velocity of gases through the chimney and furnaces, in connection with furnace and steam-engine economy; determinations of the effective heating surface in the steam boiler, and consumption of fuel under varied conditions; feed water for condensation purposes; expansive working of steam; the relative economy of different steam pressures, of varying degrees of expansion and of steam jackets; the use of the indicator, and calculations based thereon; testing of lubricants, dynamometers, brakes, &c. The work is conducted under supervision of the professor and his assistants.

Engineering drawing is thoroughly taught and supplemented by lectures on,—
(1) Geometry and its applications; (2) On the applications of the rules and formula used in the designing of machines, engines, and engineering structures; (3) Drawing office practice in machine drawing and design.

There are also classes of geology and mineralogy in connection with the engineering course. These treat of the origin, nature, and composition of locks. The effects of rain, rivers, glaciers, heat, &c., in the production of geological phenomena. The positions and relations of the rocks forming the earth's crust, characteristic fossils of the several geological formations, and their geographical distribution over the British Isles. The origin and nature of mineral veins, &c. The elements of crystallography, isomorphism, pseudomorphism, mineral physics, chemical composition and classification of minerals. Description of mineral species, stones, ores, native metals, fuels, &c. Use of blow-pipe in recognising minerals. (Appendix P.)

There are complete courses of study arranged for some of the examinations of the London University, and for the Associate Certificate of the Technical School. Students are allowed to join any of the classes without entering for the whole of either the engineering or metallurgical course; also students who are able, without attending the lectures, to pass the required examinations in any of the prescribed subjects, will be excused attendance upon such lectures, and the fees remitted. Any student desiring to enter for further instruction in any special section beyond that arranged for in the complete course, will be allowed to do so. The lectures upon mathematics, physics, and chemistry are delivered at Firth College by the respective professors. The engineering and metallurgical lectures, laboratories, and workshops are conducted at the Technical School.

The course for the Associate Certificate extends over three years, and there are both day and evening classes, while a junior diploma is granted to students who complete satisfactorily a two years' course.

I was much pleased with the energy and enthusiasm displayed at this school, both by the professors and their students. The earnest and methodical manner of the students clearly showed they had made up their minds to be successful, while the professors infused a spirit of energy and industry by their unremitting attention to the requirements of each individual student. The esprit de corps seemed perfect, and I attribute it entirely to the confidence inspired by the professors, added to their excellent and thorough manner of teaching.

Iron

Iron and steel, in all their various phases, being the staple industries of Sheffield, the school was developing in the direction of this production. At the time of my visit an open hearth, Siemens-Martin furnace, of fair working size was in course of erection, together with a series of pot furnaces for the production of caststeel. I was informed by the Principal that these were absolutely necessary in order to thoroughly teach the proper treatment of the different combinations of ores, metals, and fluxes required to produce the class of steel required for particular work. In the professor's opinion these furnaces would create almost a revolution in the method of instruction for making steel. In all the great works for the production of this article there exists so much jealously, and trade secrets are guarded with such care, that it is next to impossible for a young man to obtain experience in making the combination of materials above alluded to, and upon which, quite as much as in the furnace work, the success of the operation depends. The instruction which the Technical School will be in a position to impart after the erection of these furnaces will entirely remedy existing difficulties, and each individual student will have the opportunity afforded him of making a batch of steel for himself.

I have now described those institutions which in my opinion are of the class best worthy of imitation in the methods of imparting instruction in manual training and general technical education, and shall preface my recommendations with a few remarks upon these methods and the work that has already been accomplished under their influence and instrumentality.

While there have been many and varied opinions as to the methods to be employed, the great majority of the ablest and most thoughtful educators—indeed among the highest and most advanced authorities there is no exception-have concurred in recognising that manual training is based on some pedagogic principles, and that its teaching should be made general in all schools. It is only in the modus operandi of imparting it that theories differ. While some think it should be confined to the last two years of the boy's school age, others that it must be continued from the Kindergarten work, and throughout the school age be carried forward and adapted to the requirements of the children as they advance in age and intellect. The experiments made at Boston and St. Louis dealt only with boys of high-school age, consequently while proving that manual training was disciplinary and educational, the main question was not touched. Investigations had always dealt with schools of the higher grade, and it was not until the grand principle of Kindergarten work had been fully recognised as furnishing a system of educational training perfectly in accordance with the requirements of childhood, and that it contained the true principles of the genuine philosophy of education, that it was acknowledged these principles should be generally applied, at the present time this question has been fully answered, and, therefore, it will be only a work of time, that manual training must be introduced to schools of every grade.

Dr. Butler points out that for educational purposes the mental powers may be roughly divided into two classes, viz., the receptive and the expressive or active. "By means of the former," he says, "the child is put into possession of new facts, and by means of the second he makes these facts his own, and uses them in practical life." He also says: "As food will not nourish unless assimilated, so knowledge, or mental food, is not really knowledge, is not really possessed, until we have so gained control of it as to be able to express or use it. The power of expression is, therefore, a very important adjunct of the power of reception. Man can express his mental states or ideas by the use of language, by gesture, by delineation, and by construction.

Of all these modes, language is the most difficult, the most abstract, the latest acquired. When carried to any great degree of fluency and accuracy it is universally considered an accomplishment. Yet in the ordinary school-room it reigns supreme, and the other modes of expression are passed over as if they did not exist. The argument for manual training insists that each of these modes of expression must be considered, and that for the training of each a method must be devised." He goes on to point out that it is hardly more than half a century since Sir Charles Bell discovered that the nerves which carry impulses out from the brain to the muscles, are wholly distinct from those which carry stimuli into the brain. "For twenty-five years researches have been made in cerebral and nervous physiology that have revolutionised mental science. The dependence of mind on body, the relation of the various mental powers to each other, and the importance of the distinction between the in-taking and the out-going powers of the brain are now recognised as they never were before. Naturally we expect to see these scientific conclusions reflected in any course of study which is abreast of them."

It must be patent to all who will give the subject the thoughtful study it requires that both in the powers of reception and expression it is indispensable that the child deals with the actual object, and not only with what can be said or written about it. The pupil must see, touch, and handle for himself in order to receive the correct impression in the most direct manner. Herein lies the superiority and science of the object lesson, which has now become universally established. It must be the same with the expressive faculties, but we find in nine cases out of ten they are left to shift for themselves. The power of expression by delineation and construction are generally overlooked. It is only by reading and writing that expression is trained in the ordinary school, but these are wholly inadequate if we want to get the best results of the mental powers, consequently they must be supplemented in the other directions indicated. Dr. Butler again says: "The advocates of manual training come forward and demonstrate that their scheme of instruction will adequately and properly train the powers of expression. The powers of expression by delineation and construction are trained by the reciprocal instruction in drawing and in constructive work. It is proved that the boy who can draw a cube, or he who can carve or mould one in wood or clay, knows more, that is worth knowing about the cube, than he who can merely repeat its geometrical definition."

In England the new education has taken root, and will in the future become general. Manual training as a great educational element must take its proper position in the curriculum of every school whether public or private. I visited in company with Sir Philip Magnus—to whom I am much indebted for information—those London schools where the system has been inaugurated. Sir Philip has always been enthusiastic in his advocacy of manual training and technical instruction in all forms. I shall give his latest views on manual training in his own words: "Manual training is at length recognised as a part of the English system of public elementary education. When we remember the opposition with which the suggestion that workshops should be introduced into British schools was met, we have reason to be satisfied with the progress which the movement in favour of manual training has made during the last few years.

Sir Philip Magnus' views are as follows:—"It was in 1882 that the Royal Commissioners on Technical Instruction, impressed with the educational value of workshop training in the schools which they had visited in France, suggested in their preliminary report that by way of experiment manual instruction might be introduced

introduced into a few of the elementary schools of England. In 1884, after they had had opportunities of further considering the beneficial effect of workshop training, they recommended in their first report that instruction in the use of ordinary tools should form part of elementary education, and should be subsidised out of state funds by means of grants, much in the same way as is the teaching of cookery and needlework.

"The suggestion met with considerable opposition and some ridicule, owing mainly to the incorrect views which prevailed as to the advantages to be secured by workshop instruction. We were told that the trades-unions would object to the undue increase in the numbers of carpenters and joiners which would follow the encouragement proposed to be given to the teaching of woodwork in ordinary schools, that the school was not the proper place for teaching trades, that slipshod habits of work would be formed, and that the time devoted to literary instruction was already too short, and would be further curtailed by the introduction of a new subject into an overcrowded curriculum. Many, even, who favoured the movement did so on the erroneous ground that the children of the poor were being overeducated, and that it was a good thing that they should learn a trade at school; and it was suggested that the trade to be taught should be that practised in the in the district in which the school was situated. The removal of these incorrect views was no easy matter. In 1886 Sir John Lubbock wrote an interesting article on the subject in the Fortnightly Review, which was followed by a paper of my own in the Contemporary Review, embodying the views I had previously expressed at the Birmingham meeting of the British Association. In the following year, in order to give the experiment a fair trial, the City and Guilds of London Institute, with funds placed at their disposal by the Drapers' Company, offered to the School Board of London the sum of £1,000 for the establishment of centres of instruction in the use of wood-working tools. They had previously made arrangements by which teachers of elementary schools might undergo a systematic course of carpentry instruction at their central technical institution; and the number of teachers who applied for admission to the course was far greater than the workshops of the institution could accommodate. A joint committee was formed of members of the School Board and of the City Guilds Institute; and the organisation and direction of the instruction was left to this committee. The first question to be decided arose out of the selection of a teacher. There were some who urged that the most fitting person to teach carpentry was an experienced carpenter. Others pointed out that the object of the instruction was not to make carpenters, but to train the hand and eye, and that the best instructor would be a person skilled in the art of teaching and practically acquainted with the use of tools. The old battle had to be fought again between the advocates of manual training as a part of apprenticeship to a trade and between those who regarded it simply as an educational discipline and as a necessary part of the elementary instruction of all children. A very happy compromise was effected. Six centres were formed, three on the north and three on the south side of the Thames, and two very competent instructors were found—the one a skilled artisan who had distinguished himself as a science teacher in evening classes, and the other a trained elementary school teacher who had gone through a course of carpentry lessons at the Central Institute. The experiment has proved most successful. The opposition to manual training as a part of school education has practically ceased, and a new era of elementary school-teaching has been inaugurated. Ministers, statesmen, Government officials, and educationists have visited

visited the centres and have seen the children at work, and have expressed their satisfaction with the value of the training, not only as encouraging a taste for handicraft, and helping to inculcate the lesson of the dignity of manual labour, but as an intellectual exercise and educational discipline. The success of the experiment verified the theories of every progressive educationist from Locke to Huxley, and naturally assisted the National Association for the promotion of technical education in their endeavours to obtain the recognition by Parliament of manual training as a part of primary instruction. The battle is now won. The new code which Parliament issued this year, and which regulates the state-aided instruction throughout the country, recognises manual training as a part of public elementary education. It provides that manual instruction may be given in the school premises or elsewhere, and whether or not by the ordinary teachers of the school, and it suggests that manual instruction should be given in conjunction with drawing. The effect of this inclusion of manual instruction among the subjects recognised by the code, is that the cost of the instruction may be defrayed out of the ordinary school board Previously, no part of the general school fund could funds derived from the rates. be applied to the provision of manual instruction, that subject not being recognised as coming within the parliamentary definition of public elementary education. the circular which is issued as a guide to the inspectors in giving effect to the provisions of the code, occurs the following important paragraph on manual training: - The difficulty which has hitherto prevented the recognition of manual training, as part of the ordinary course of instruction, in a public elementary school, has been removed by the alteration in the terms of Article 12 (f). In some foreign schools manual exercises in continuation of the employments of the Kindergarten, and graduated in difficulty, are carried onward through all the classes of the school, and are found to be not without a useful reflex influence on all the ordinary school studies. Such exercises sometimes consist of modelling, the cutting, fixing, and inventing of paper patterns, the forming of geometrical solids in cardboard, and the use of tools and instruments. Although no special grant is made by this department for such instruction, you will watch with care the working of any experiment which is made in this direction, and will report upon it.' The use of the expression, 'this Department,' was thought to imply that the Department of the Committee of Council on Education which was the direction of scientific and technical instruction, and is known as the 'Science and Art Department,' might be enabled to make especial grants from the imperial funds in aid of manual training; and this exception has been fulfilled. The Science and Art Department in the Directory for 1890, offers, under certain conditions, a grant of six or seven shillings, according to the quality of work done, for every scholar in a public elementary school who is receiving manual instruction, provided that the instruction so aided is:-

- "(A.) In the use of ordinary tools used in handicraft in wood or iron.
- "(B.) Given out of school hours in a properly fitted workshop, and (c) connected with instruction in drawing; that is to say the work must be from drawings to a scale previously made by the scholars. A note to clause (b) explains that the expression 'out of school hours,' means only that the manual instruction shall be in addition to, and shall not be taken out of, the minimum of twenty hours per week to be given to the teaching of other subjects included in the code. It is however a condition for obtaining the grant from the imperial funds, that each scholar shall have passed the fourth standard and shall have received manual instruction for at least two hours a week for twenty-two weeks during the school year. "As

"As regards the advantages of associating manual instruction in drawing every one is agreed; but difference of opinion exists as to the advisability of insisting on a minimum of two hours instruction a week. In many places, notably in Liverpool, where manual instruction has been successfully given, it has been found that a lesson of one hour and a half once a week is sufficient, and efforts will be made to obtain a modification of the rule on this point.

"It will be seen that the legislation of this year enables the School Board rates to be employed in defraying the cost of manual instruction, and also provides grants from the imperial funds in aid of such instruction. The latter subvention is most important, for without it manual instruction might have been restricted to the Board Schools, in which less than one-half the children are educated. The voluntary or denominational schools receive no aid from the rates, but they, equally with the Board Schools, obtain grants from imperial funds. Not only therefore is manual instruction recognised by the new code as a part of elementary education, but the teaching is directly subsidised by the State."

I have given the matured views of Sir Philip Magnus on this most important question, from the fact that he is, of all English educators, the one who has most thoroughly studied the subject, and taking into consideration the opportunities he has had for so many years of forming a correct and reliable opinion his judgment must be everywhere respected. The opinions of the French, Belgian, and American authorities all point the same way, and I can positively say that since the date of my last report the movement in favour of manual training has made enormous progress. In France and in America especially is this advance shown in the most pronounced manner. In England Sir Philip Magnus, whom I have just quoted, says joyfully, "The battle is now won." At all events it has been commenced. The wedge has been inserted, whose force, when driven home by public opinion, will rive the gnarled and knotted old system from one end to the other, and the instruction given in public schools will be brought more into harmony with the present social conditions. England will never be content with an inferior system of manual training. It will in the course of a few years be made so clear that the new education is the true one that there will be no half-hearted measures. The work will be gone into enthusiastically throughout the length and breadth of the land, and the cultivation of the perceptive powers will take the position which has so long been denied them. Of these the tactual and visual are by far the most important, as they not only lead up to industrialism and the applications of science and the arts, but give that class of culture which our masses are hungering after, and which is exactly that class of education they require throughout their lives.

To a certain extent, England has arrived at that stage when the leaders of public opinion have been reached. Once they have been fully and thoroughly convinced the difficulties will rapidly disappear. The Science and Art Department will be remodelled, and that everlasting canker, known as "Payment by results," swept away. Departments of pedagogy will be established in all the universities and colleges, and their influence will reach everywhere and to every class. The coming men will be educated under their influence, all teachers will have graduated under their influence, and there will be no such thing as an untrained teacher in the United Kingdom. When these subjects have been definitely determined, and the new method carried universally into operation then, and not until then, will the battle be won, and the victory a decided one.

Drawing is one of the most powerful agencies in the education of the child, and I treated this subject fully in my last report. I, however, wish to show one of

the latest forms of teaching form-study and drawing in the United States. I append Dr. French's course of study, together with his syllabus of work to be followed by all teachers of drawing in all the teachers' institutes and normal schools of the State of New York. (See Appendix L.)

When it was decided to introduce form-study and drawing into the common schools of the State, Dr. French was solicited by the States Superintendent of Public Instruction to undertake the direction of the work in the teachers' institutes. Dr. French found that many changes were essential in order to make the work practicable, as the teachers from the normal schools appointed by the department to give instruction in the institutes, followed no uniform system or method. Dr. French was strongly of opinion that all the instructions in this subject under the control of the Department of Public Instruction should be uniform in character and method. He, therefore, suggested a conference of the normal school principals and teachers of drawing to consider the desirability and practicability of adopting a uniform course of elementary instruction, to be taught in the elementary classes in the normal schools and in the institutes, which should be made the basis for the examinations for certificates granted under the State system of uniform examinations. The suggestion was adopted, and the conference called in October, 1888.

The result, says Dr. French, was "that an elementary course in form-study and drawing, covering four years of time in the common schools, was unanimously Following upon this action the preparation of a syllabus based upon this course and consisting of outlines for six lessons to be followed by the instructors of drawing in the institutes, was agreed upon, and the preparation of this syllabus \* The tendency of the times is unmistakably \* \* \* \* placed in my hands. towards bringing more and more of the methods of the Kindergarten into all our primary education, while the social needs of our times are demanding that broader provision shall be made for general industrial education, or for manual training in connection with the instruction in our academies and high schools. drawing is the connecting link between these two branches of education, and I feel confident that the course of study now laid out has been prepared on so broad an educational and practical basis, that to whatever extent the State may be called upon in the future to promote instruction in the methods of the Kindergarten or in manual training, it will find that the instruction it is giving in form-study and drawing will be in entire harmony with sound instruction in either of these two branches."

The preparation of this course was Dr. French's last work. He died on the 23rd of December following. The course of study and syllabus have gone into very general use, but it became evident that for the ungraded rural schools a course of a more condensed and simplied form would have to be prepared. This was done and sent out under the form and title of the "Institute Course" which I also append. (See Appendix L.)

Domestic economy is now taught in almost every High School, and includes every subject that a good housewife should know in the management of a household. In describing the various schools, I have given the programmes of these studies. In France, and in the United States of America, I was particularly pleased with the scientific as well as the practical manner in which the various subjects were treated. More especially was I satisfied with the methods and system of the New York College for the Training of Teachers. The lessons should extend over three or four years, the longer time preferable. Mrs. Ellen H. Richards, the talented and accomplished instructor

instructor in sanitary chemistry at the Massachusetts Institute of Technology, has written an able paper on domestic economy as a factor in public education. I have appended it to this report, as it should be carefully studied by all the female teachers of our public schools, to whom I earnestly recommend its perusal. (See Appendix Q.)

The superior and complementary courses of domestic economy and hygiene taught in the primary communal schools under the municipal government of Paris, I also give, as well as the course of application, which is divided into two classes: (1.) The cooking class, and (2) the class of washing, ironing, dry cleaning, &c., &c. The cooking class includes the purchase of provisions, and three pupils in turn accompanying the teacher to market to make the purchases for the luncheon of the day. To this is added the method of keeping the note-book of expenses. Each operation is written out in full by the pupils in their memorandum books in such a manner that the receipts, &c., will always be available in the future, when the girls are housekeeping for themselves. (See Appendix R.)

Manual training exerts an immense force in the development of mental capacity, and its advocates rely upon the development of this force to bring out the pupils' powers of expression by means of drawing, delineation, and construction. As these powers expand, the executive faculty comes prominently forward and habits of precision and method are naturally engendered. Here, then, is established that culture which is of the most advantage to the masses, and both enlightenment and discipline are acquired while the boy is taught to work with his hands as well as his head.

In an educational point of view it is the opinion of all the most advanced educators that it is unwise to embrace too many kinds of work when the same pedagogic results can be obtained by restricting the work to one kind. Working in wood, therefore, is the class of work that has been most generally determined upon. It is not only the most convenient but that which gives the best results in manual training. Of the necessity of manual training there can be no doubt. All labourers of the present day have to use tools of some description or other, consequently they must benefit, more or less, by a course of manual training. The same reasoning applies to professional men and even to the most highly cultured of our wealthier classes. Who is there amongst us, no matter in what rank of life he may be placed, that is not proud of the work of his own hands? To be able to create, to construct, to make something that can be handled and admired, is, and always will be, a source of infinite gratification, and a proper pride to its maker. This innate principle, common to everyone, should consequently be made use of as an educational agency. It serves also to give a natural relish to school work and brings out many good qualities that otherwise would lie dormant.

It is the same with New South Wales as with England and America. Public opinion has been aroused, efforts are being made far and near to hasten forward the development of manual training in direct relation with the ordinary school studies. It is now within a measureable distance, almost within reach of us, and the old ideas and fixed customs will naturally weaken and fade away in the strong light of increased experience. We must follow the lead of the great nations in the methods I have described, and, moreover, we must take care that our foundation which has been laid upon the rock of sound principles shall carry a superstructure that will prove attractive, beneficial, and economical, or we may be hopelessly distanced in the race for hand skill before the present generation shall have passed away. The country produces

all kinds of excellent timber and cereals, and animal products in profusion, together with every metal or other mineral that is used in the arts and manufactures. It is clearly our province to take such steps as will enable us to utilise them to their fullest extent, in order that our country may speedily become populous, prosperous, and powerful.

In this we must have the firm support and active sympathy of all teachers. I feel confident that as soon as the teachers fully understand what is required of them, they will set themselves to work in carnest and speedily acquire that manual dexterity which will enable them to give the requisite instruction in manual training direct to their classes. These lessons will give a delight and zest for school work, such as hitherto has only been found in the Kindergarten.

I am certain your Excellency will feel with me, that a report of this nature is nothing except it is supported by exact circumstantial and impartial information. I have, therefore, endeavoured to supply a number of facts exactly as I found them, giving generally and in detail the methods employed in the various schools I visited. I have set down nothing I have not seen, or that I cannot vouch for, and if in places I have spoken strongly it has been for the reason that I have been firmly and sincerely convinced. I have also fortified my own statements by the opinions of the most distinguished technical educators. The measures I advocate can be made available for the whole country within a reasonable time, from the training college to the humblest house-to-house and evening school, and I feel confident the advantages to New South Wales will be serviceable, effective, and perpetual.

## RECOMMENDATIONS.

Much has been effected by the Minister of Public Instruction for New South Wales since the date of my last report, and I may here be permitted to state that the manner in which the subject has been handled by him, and by the officers of his department, has been worthy the thanks of the entire colony. For myself I am deeply grateful, and now express my thanks for the assistance and courtesy I have always received. I am also delighted to state that in every department of Technical Education a remarkable progress has been made, and a feeling manifested for its promotion in all districts. The number of students enrolled last year is over 5,000, as against 2,719 in the previous year. It is also gratifying to me in the highest degree that the broad lines laid down from the first by the late Board have been faithfully adhered to and energetically advanced. To begin in the right way is half the battle, and I may here place on record the fact that the leading Technical Educators in England, France, and America, have congratulated the colony, not only for its effectual action in thoroughly grasping the necessity of providing instruction in technical and scientific subjects, but in doing it.

I must here crave permission to quote the recommendations I made in my report of 1887, as those I have further to make follow entirely on the same lines. They were as follows:—

1. That, as no one can possibly doubt, the assistance given to Technical Education by the State can be more ably, judicially, and economically applied by a central authority, responsible directly to Parliament, I therefore recommend that a sub-department, under the Department of Education, be created, so that the administration of the vote may be made by the Minister directly responsible to Parliament.

2.

- 2. That the Minister be assisted by an Advisory Board, consisting of at least three but not more than five individuals, who could be called together periodically to advise with the Minister with regard to school matters, such as the arrangement of the programmes, &c., also to assist him in such decisions as may demand technical experience and knowledge in their consideration.
- 3. That a Technological Museum be at once formed in connection with the Technical College for the use of the teachers and students.
- 4. That a site be secured for the erection of an institution where technical instruction can be given in the approved manner now in use, and with the assistance of modern appliances. That such building include a technological museum, laboratories, lecture-theatres, workshops, and class-rooms, sufficiently extensive for a large metropolitan population, and provide accommodation for at least 3,000 students. That this institution be situated in a position convenient to the industrial classes, who chiefly reside in South Sydney, Balmain, Pyrmont, and around the terminal railway station, such a site as would be afforded at Ultimo, or in its neighbourhood.
- 5. That rudimentary drawing be incorporated with writing as a single elementary subject, and that instruction in elementary drawing be continued throughout the standards. That drawings from casts and models be required as part of the work, together with modelling in clay and wax.
- 6. That recognising the necessity that manual training should be an integral part of any system of general education, inasmuch as it contributes to develop activity, observation, and intuitive perception, I recommend that it be introduced into all the public, primary, or elementary schools as soon as possible.
- 7. That manual training be taught as an integral subject at the Fort-street Training School, and that in future all the training school students should be examined in manual training.
- 8. That in order to provide the necessary instruction for teachers in charge of schools, on the subject of manual training, a special course should be instituted at the existing training school during the vacations, of which the public school teachers could avail themselves in a manner similar to the method adopted by M. Solomon, at Näās, in Sweden. Further, that a normal course of manual training for teachers be instituted in connection with Technical College, the classes to be held in the evening.
- 9. That the teaching of art in Training Colleges should be inspected by the chief instructor in art, under the Department of Technical Education, and be made thoroughly efficient, and that arrangements be made for giving to selected students greater facilities for the study of art and science at the normal courses of the Technical College.

The Department of Public Instruction has adopted in their entirety Nos. 1, 3, 4, and 7, and as regards No. 5 every scholar in the public schools is now taught drawing. With reference to No. 6, manual training is taught at Fort-street and at West Maitland, and is about to be introduced into other schools, so that a commencement has been made. No. 9 has been adopted in spirit, the only difference being that the examination of the students is made by the Superintendent of Drawing under the Department of Public Instruction instead of the Chief Instructor

in Art of the Technical Education Department. The only recommendations not acted upon are those of Nos. 2 and 8—the one providing for an Advisory Board, and the other for special courses of manual training to be instituted at the training school during the holidays, and at the Technical College during evenings, for the special object of providing instruction for those school teachers in active employment and who cannot attend day classes except during the holidays.

I am still of opinion that an Advisory Board may at times be useful; but of course it can be dispensed with. I never intended such Board to interfere with the work of the officers of the department, as I know the necessity of preserving a proper esprit de corps; but in case the Minister wished advice on special technical subjects, that he should have something to fall back upon, to assist him in forming a correct opinion in the introduction or otherwise of new subjects or methods of teaching.

As regards No. 8 I am still of opinion these courses, or at least one of them, are required, therefore I shall again recommend them.

The recommendations I now make are as follows:-

1. Recognising the necessity that the valuable subjects of instruction included in the term manual training should be universally taught, and believing them to be absolutely essential to the national interests of this country, I recommend that provision be made at an early date to introduce and incorporate these subjects into the public school system of New South Wales.

Note.—This recommendation is in substance the same as No. 6 in my Report of 1887.

- 2. That in all new school buildings, or in making additions or alterations to existing school buildings, suitable provisions should be made for the erection or adaptation of a suitable room or rooms for the purposes of instruction in manual training.
- 3. That all public school teachers, male and female, whether actively employed in the public schools or students at the Training Schools, be required to study the subjects included in manual training. That a prescribed course of wood-work—similar to that of the New York College for the Training of Teachers—be instituted; to include such lessons in wood-working as may be accomplished in a course of twelve weeks, or in two short courses of six weeks each. And, as it will be necessary that the students make their own designs, a course of elementary mechanical drawing could be carried on at the same time, and in connection with the manual training.
  - NOTE.—It is a well established fact that the ordinary school teacher, when conversant with manual training, makes far and away the most successful instructor. As no trade is taught, artisans as instructors are not required.
- 4. That in order to provide facilities to teachers already employed in public or other schools for acquiring that training and instruction required to enable them to teach manual training, a short special normal course be instituted at the Training School or elsewhere during the summer vacation, and also that a special normal course in manual training for teachers be organised in connection with the Technical Education Branch, the classes to be held during the evenings. The instruction in both cases to be gratuitous.

Note.—This is the eighth recommendation of my 1887 report, and is the course adopted at Nääs by M. Solomon, and also in various states of America.

5.

- 5. That in outlying districts where half-time and house to house schools exist, the teacher should invariably be well-skilled in manual training, and where practicable, provision should be made to group schools of this class. As, however, in the majority of cases this would be inconvenient, the itinerary teacher's programme should be so arranged that the manual training be limited to the simplest subjects, and the instruction given in connection with the ordinary lessons.
- 6. That in the Central Technical School at Sydney and the branches at Bathurst, Goulburn, Newcastle, and Broken Hill, courses of mining and metallurgy be instituted of a thoroughly practical character, with mining and metallurgical laboratories equipped with modern machinery and apparatus, in a manner similar to those at the Massachusetts Institute of Technology at Boston, or other American institutions of a similar character.
  - Note.—(1.) As the mineral wealth of Australia has been proved to be equal to that of any nation in the world, then it is obviously irrefutable that we should provide for our young men that advanced instruction which other countries provide as to the most approved and skilful methods of mining and extracting the minerals, and in treating them practically in the most economical and effective manner in order to obtain the metals they contain. (2.) I have mentioned an American institution as a model because there are none of the same class in other countries. Even at the celebrated mining school at Freiberg, in Saxony, which I visited, the appliances are antiquated and obsolete when compared with those I visited and examined in the United States. Moreover, America has similar gold-fields and silvermines to our own, and its mining engineers and metallurgists have given the subject the most profound study. A description of the mining and metallurgical laboratories at the Massachusetts Institute of Technologycalled the Cummings Mining and Metallurgical Laboratories—is given in the body of the report. [See pp. 119, 138.]
- 7. That in the event of establishing such mining and metallurgical laboratories as above mentioned it would be advisable to engage graduates of the Columbia College School of Mines, New York, or, graduates of the Massachusetts Institute of Technology, Boston, Mass., as instructors in laboratory practice, and in teaching the methods actually employed in modern mining and metallurgy practice. Such teaching to include not only the ordinary stamping and amalgamating methods, but the chlorinization process for the extraction of gold from its ores, the use of the Frue Vanner, and the various buddles; Blake's crusher, crushing rolls, and automatic sizing screens—with the appliances for hydraulic mining and sluicing. Furnace work must include the construction and use of the Water Jacket Blast Furnace, with reverberatory copper and lead smelting furnaces, roasting furnaces, and a roasting kiln for desulphurising purposes, pot furnaces, melting kettles for Parkes', and Pattison's processes for desilvering lead. With assay room practice and the use of crucible furnaces and muffles.

Note.—My object in this recommendation is to get instructors who have not obtained their knowledge from text-books, but from actual work, not merely

merely from assaying but actual furnace work. The furnaces and machines at the Cumming's Mining and Metallurgical Laboratories are not models, but real furnaces and machines, such as are used at mining and reducing works, and the experimental work is carried out by the students under the immediate supervision of the instructor exactly as at actual works. Ore, sufficient for several furnace charges, is weighted out to the students who assay it, value it, and make such other examinations as will determine its character and indicate its proper treatment en grand. The bulk of the ore is then treated in the actual furnace, the students themselves charging, making the proper flux, tapping, &c., thus practically learning the effectiveness and economy of the method, and having previously accurately assayed fair samples of the ore, they understand the value of chemistry as a check upon their work. Instructors who have learnt their work in this manner are of real use to the country, while those who have only book knowledge are comparatively valueless.

8. That in order to increase the general efficiency of our technical teachers in a progressive manner, eight or more travelling scholarships be instituted for the special purpose of giving students who have distinguished themselves at their studies, and whose aim is to become professional teachers, facilities for continuing their studies at certain schools in the United States of America. That six of such scholarships should be open for males from the technical education classes and two for female students from the Hurlstone Training College. I would recommend that two males and two females, holding these scholarships, should enter, as students, the New York College for the Training of Teachers, and the remaining four males to continue their studies at the Columbia College School of Mines, New York City, or the Massachusetts Institute of Technology, Boston, Massachusetts; these institutions being, in my opinion, not only the very best of their class, but also more in accordance with the requirements of Australia than any others I visited either in Europe or elsewhere.

I may add that in selecting the examples I have given of schools and Technological Institutions, I have been guided solely by their great merits as vehicles of instruction, and as models worthy our imitation. It is not an easy undertaking to characterize fairly and fully the merits, or otherwise, of institutions and schools scattered far and wide over Europe and the United States, even after having inspected and studied them. This applies more forcibly when one has to do this work single-handed. In extenuation of shortcomings, and in justice to myself, I may state that the whole cost of this inquiry, and every expense incurred in the accomplishment of my mission, has been borne by myself.

I acquired, while in France, much valuable information with reference to their progress in Agricultural Education. I also took many notes and sketches of appliances and apparatus for wine-making, making myself thoroughly conversant with the best methods in use in the Bordeaux district. I propose to give the information I have collected, together with my own remarks thereon, in a separate report, which will take some time to prepare; but I shall lose no time in its preparation, or in submitting the report to your Excellency.

In conclusion, I beg to express my thanks to the officers of the Exhibition, and also to those of the British Embassy, for their assistance and co-operation in Paris while making this inquiry. Especially are my thanks due to M. Georges Berger, Director-General of the Exhibition; Mr. Egerton, Charge d'Affaires for Great Britain; M. Tisserand, Inspector-General of Agriculture; and M. Jacquemart, Inspector-General of Technical Education; and the Executive Commissioners in Charge for the United States of America, Belgium, Holland, Switzerland, and Sweden. In the United States of America I was rendered every assistance and personal consideration by Dr. Eliot, President of Harvard University; Dr. Dwight, President of Yale University; Mr. Edward Cooper; Mr. Platt; Professor C. Wellman Parks, the Commissioner in Charge of the U. S. Exhibition at Paris; Dr. N. Murray Butler, President of the N. Y. College for the Training of Teachers; Dr. R. Grimshaw, C.E; Mr. Packard, and Mr. Henry Sargent, for which I also wish to express my sincere thanks.

This inquiry was not completed until May last, and I returned to the colony in June. My great object has been to furnish facts, with the methods and systems of other countries, in whatever related to technical instruction, so that in placing before your Excellency the class of work now being carried out by European nations, and in the United States of America, our own authorities might be in a position to form a correct opinion as to how the work should be carried out in the colony, in order to best serve the interest and be most conducive to the progress and prosperity of New South Wales.

I have the honour to be,

Your Excellency's

Most obedient and humble servant,

EDWARD COMBES.

Sydney, January 31, 1891.

#### APPENDIX B.

THE FRENCH SYSTEM OF ELEMENTARY INSTRUCTION.

(As exemplified by the Schools of the City of Paris, by Edward Combes, C.M.G.)

THE progress of popular education has been unusually rapid since the Paris Universal Exhibition of 1878, and more especially so in France. The changes and modifications made since that time have been enormous, both in legislative enactments and in the programmes of primary education generally. The French system, as carried out in the City of Paris, is, in my opinion, the most complete and rational method of imparting elementary instruction that I have ever studied, and the results indubitably prove the efficiency of its character.

In order to explain the class of elementary instruction that is given, and the practice as carried out in Paris, in accordance with the French law, I here give a *précis* of the system, from the Maternal School to the Superior Primary School.

The staff of instructors, both for boys and girls, comprise three distinct grades of teachers, viz.:— Directors and Directresses—Directeurs and Directrices, Assistant Teachers—Instituteurs Adjoints and Institutrices Adjointes, and Supplementary Assistant Teachers—Instituteurs Suppléants and Institutrices Suppléantes.

The teachers are chosen and appointed as follows:—First, from among those students who have completed their three years of study at the Normal School of Teachers, and who have obtained first-class certificates; secondly, from among those candidates who have been prepared in Provincial Normal Schools; and thirdly, from those who, from other sources of tuition, in teachers' seminaries, &c., have been taught how to impart elementary instruction. These must all have obtained certificates at the public examinations.

### MATERNAL SCHOOL.

I commence with the Maternal School. This institution, Vécole maternelle, was, at its inception, simply a sort of charitable house, an asylum in fact for small children—Salle d'asile—where mothers, who were obliged to earn their living away from their own homes, could have their infants properly taken care of during work hours. These Salles d'asiles took their original form from a model asylum founded by M. Cochin, where normal instruction was given to special teachers. The course of study was directed by Madame Millet, and many elementary female teachers were taught the best methods of taking care of very young children. In 1837 a Royal Ordinance gave to these salles a legal existence. It was defined as follows:—That "Salles d'asiles are charitable establishments where infants of both sexes are admitted to receive maternal care and supervision, and such instruction as their age will permit." This instruction comprised the first principles of moral and religious teaching, ideas of reading, writing, and mental calculation, together with songs, needlework, and the various kinds of Manual and Kindergarten training. To these were afterwards added linear drawing and bodily exercises.

In 1881 the name was definitely changed to that of Maternal Schools (*Ecoles Maternolles*), and their organisation fixed in the following manner:—That the maternal schools, whether public or private, are educational establishments where infants of both sexes receive the care which their physical development requires, both intellectually and morally." Infants can be admitted at the age of 2 years, and remain until they are 7. Instruction in maternal schools comprises, (1) The first principles of a moral education, the knowledge of ordinary subjects, the first elements of drawing, reading and writing, the exercise of language, the notions of natural history and geography, with such recitations as come within the limited range of such young children. (2) Exercises in manual training. (3) Singing and graduated gymnastic movements.

These schools are to be exclusively directed and managed by women.

It was, therefore, in 1881 that in French legislation the Salle d'asile changed its form from the purely charitable character of an asylum to become, under the name of "Maternal School," a charitable institution of education, having its own particular programme and appropriate methods of teaching.

The great desideratum is not to weary, but constantly to find something to interest the attention and intelligence of the child, therefore the duration of exercises and periods of recreation must be arranged in such a way as to vary the object of instruction and make it pleasing. The exercises are graduated to suit the intellectual development of children of different ages. 1st, from 2 to 3½ years of age; 2nd, from 3½ to 5 years; and 3rd, from 5 to 7 years. The division into three sections form distinct classes, and this system is applied to all maternal schools.

138--2 B Each

Each group of 50 children are placed under the direction of a special mistress, and the school furniture is analogous to that in use in the primary schools, only of such dimensions as suit the size and requirements of the children. The walls of the class-rooms are hung with geographical pictures and objects of natural history. The objects made use of in the Kindergarten, and known as Froebel's Gifts, are everywhere employed together with slates, chalks, pencils, and books containing pictures of the objects employed in teaching. In short, the chief aim of the Maternal School is to accomplish the work of a tender, vigilant, and enlightened mother, and while the intellectual faculties of the child are developed, the care of its physical comfort is not neglected. The programme of Froebel is adhered to so far as the limited space of the playground will permit. An apparatus is also coming into use—invented by a M. Pichery—with which the child can exercise himself in various positions according to methodical rules, by means of cords and springs, to which convenient handles are attached.

The programme reserves as its most important object, the teaching of the principles of morality, and in order to carry this into effect it is necessary that the mistress should be inspired with the true principles of teaching, so as to give to each little lesson its proper moral. Thus, stories and poems adapted to infantile minds, furnish most attractive lessons, and are regarded by the children more in the character of a distraction than ordinary school work. It entirely rests with the mistress to make this class of teaching fascinating as well as instructive.

Exercises in language and object lessons, should be treated conjointly, the latter being the best medium for the former. To speak of the object necessitates some sort of a knowledge of it, and tends to give the child exact ideas. To exhibit the object to the children, to make them call it by its name, to induce them to talk about it as much as possible, serves in the first place, to make them understand how to form little sentences, it then awakens their curiosity and they recognise or guess the use of the object. The school programme indicates this as the proper way of teaching.

Instruction in drawing and manual exercises should proceed upon the same principle. To excite the child's curiosity, to awaken his ingenuity, to habituate him to observe accurately, and to bring the eye and hand together in unison, serve to bring about in the easiest and most judicious manner, that development which is the great aim of the teacher. Many of the children give proof of real ingenuity in drawing outlines on slates and paper ruled into squares, and in their exhibited work at the Paris Exhibition, there was much that was truly remarkable and highly interesting.

Reading and writing are taught as one subject. This is commenced by means of little blocks of wood, which are placed in position so as to form letters. The child is then taught to reproduce these forms upon a square slate, and it is not until the last year that he is allowed to trace the letters upon paper. Generally by the time the child is 6 or 7 years old he can read without hesitation, and write passably well. The subsequent work of the primary elementary school is therefore greatly facilitated.

The teaching of geography is upon the same lines that underlie all the teaching in the Maternal School. In this subject the child is taught to comprehend his immediate surroundings. He is instructed as to the situation of his parents' residence, the quarter of the town in which they reside. They are then led to understand the various aspects, which is the north, the east, south, and west. Then follows the shape of the world, the portion of it that embraces their own country. The map of France, upon which is indicated only the large towns, rivers, railways, mountains, and other remarkable places.

Calculation is also taught by means of objects consisting of balls, cubes, &c. These give the child the idea of numbers, and teaches him to count. Multiplication tables is not taught until the last year.

The only history taught is that which is comprised in great historical facts and these are invariably connected with the lives of eminent and distinguished persons. These lessons are given in the form of anecdotes, and here also the mistress should put the story in such a form as to make it attractive and amusing. In this way more progress is made, and the attention of the children kept alive by the manner in which the lesson is given.

In learning to sing, a collection of infantile songs has been compiled and set to ordinary and popular tunes. As a rule the children learn these with great cagerness. Thus an ear for music is formed and the teaching facilitated that comes at a later period.

The hours are necessarily very long as the children must be taken care of during the whole of the time of the mother's absence. The school opens at half-past 6 o'clock in summer and half-past 7 in winter. The children are received by a servant-teacher as they arrive and it is her duty to superintend them while they play in the court or playground until 9 o'clock. At this hour all the mistresses must be at their posts, and at a given signal from the Directress silence is observed and the children form themselves into their class groups.

The first half-hour is occupied by a thorough inspection chiefly as to cleanliness, and at half-past 9 they march into their singing class, which lasts untill half-past 10. If attention should flag, an amusing object lesson is introduced to vary the singing and marching. As a rule the hour passes very quickly and then there is a quarter of an hour's recreation. At a quarter to 11 class work recommences and the lessons vary each day. Sometimes the mistress begins with a moral story as a lesson in history, which she makes entertaining, sometimes she speaks of geography, mountains, waterfalls, and so on. At half-past 11 the children have their mid-day meal. They eat either what they have brought with them, or that which the canteen furnishes—for cheap and nutritious food is provided at the lowest possible charge—and afterwards they play until half-past 1. Class-work is then recommenced by exercises in reading and language. At 2 they sing and learn to count, and thus another half-hour is occupied. From half-past 2 until 3 the smaller children play, while the more advanced go through their gymnastic exercises. From 3 until half-past, they do their drawing and manual work, and these when well directed, operate as a real distraction and recreation, brightening their intellects and preparing them for the last half-hour which is given to natural history, the objects being animal, vegetable and mineral productions.

From 4 o'clock the children play, waiting until their parents come to fetch them. At 6 the last leaves, and the school closes. The children, both great and small, appear exceedingly happy, and certainly at the schools I visited under the Municipal authorities of Paris, they receive that tender, affectionate and careful supervision, which otherwise could only be provided by a kind mother, assisted by a Kindergarten governess.

The staff comprises Directresses, sub-Directresses, and supplementary teachers. These latter replace the mistresses who from illness, holidays, or other causes, are absent. Besides these, each school has one or more servants of a superior class, who are competent to supervise the children during play hours. This is in accordance with the importance of the institution, and the number of children. Teachers have to be certificated as having graduated at the Special Normal School foundered by the State in 1882.

## ELEMENTARY SCHOOLS FOR BOYS AND GIRLS.

It is with these schools that we have chiefly to do, for it is here that the real education of over 90 per cent. of the French children is begun and completed. It is here the future citizen and the mother of his family are formed, and here they gain that knowledge which teaches them their duties towards society, and how to exercise their own rights as citizens in a free country.

The institution I have described as the Maternal School supplies the place of a kind of intelligent mother to such children as are destitute, or to those whose mothers work in factories and other industrial establishments during the daytime. It serves, in point of fact, for a common teaching and recreation ground for a common family, a kind of intermediate between the family and the school. It inculcates habits of regularity and industry, and trains the child in such a way that discipline comes to him naturally; moreover, he receives such limited, but careful instruction as prepares him for the Elementary Primary School.

This school must, therefore, be so constituted that when a child is admitted without the knowledge acquired in the Maternal School, or an equivalent in home-teaching, he may be furnished with the instruction described as above. I was informed, as a matter of fact, that few children commence at the Primary Elementary School without some knowledge of simple subjects, either acquired from intelligent parents or from private tuition.

The Primary Elementary School is therefore the heart and soul of that education which serves to develop the child into an honest, sober, energetic, industrious, law-abiding citizen. It provides for this early teaching as well as what follows; and to that end is divided into four different sections, which take the form of separate courses. These are: 1st, the Infantine; 2nd, the Elementary; 3rd, the Middle; and 4th, the Superior Course.

Children are admitted at the age of 6 years, and the instruction at that age is, to all intents and purposes, similar to that given at the Maternal School during the last year, the teachers invariably paying especial regards to their morals, and |inculcating the principles of propriety, cleanliness, personal appearance, politeness, and benevolence. From 6 to 7 years of age the child is kept in the infantine class, unless from the knowledge obtained at home, or at the Maternal School, he is at once enabled to take his position in the Elementary Course, where the children usually range from 7 to 9 years.

In the Elementary Course the utmost importance is given to moral teaching. This is effected by means of familiar conversations, reading lessons, with explanations, and the recitation of great moral examples from memory. The character of each individual child must be studied, so that his faults may be corrected with gentleness, and his good qualities developed. Thus, by the application of an intelligent scholastic

scholastic discipline as a means of education, the teacher inspires his pupils with a scrupulous love of truth and equity, a horror of sneaking, lying, tale-bearing and hypocrisy. The teacher must always encourage the children to be out-spoken and patiently reply to all their questions and interest himself in their little grievances. In his endeavours to carry out this object he must constantly appeal to the sentiment of justice and fairness which is implanted in the child himself, and make him the judge of his own conduct. Children must be taught to justly estimate moral and intellectual efforts at home and abroad, to know when to speak and to be silent, and when they are acting rightly or wrongly. They must be made to feel keenly the sorrowful consequences of vice, of which they have constant examples before their eyes. Drunkenness, idleness, cruelty, &c., are exemplified, and while endeavouring to inspire them with compassion for the victims of these vices, to inculcate at the same time a horror for the vice itself.

In the same way and by means of examples furnished by reading lessons, and by appeals to their own immediate experiences moral emotions are initiated. Sentiments of admiration in the contemplation of some grand work of nature, the sentiment of charity in pointing out some particular misery to be assuaged and the manner to effect it with discretion; the sentiments of gratitude and sympathy, in pointing out acts of courage and devotion, and also in visiting some benevolent institution. These instances, and scores of others are indicated to the teachers on learning their vocation at the Normal Schools; where they are shown how to impart this instruction to the children, in the most rational and effective manner. Explanations are also given in a familiar way during the reading lessons which serve to convey rational ideas, and in which the words, citizen, soldier, army, country, nation, law, and justice frequently occur, and it is the duty of the teachers to enlarge upon patriotism, and to point out the duties a good citizen has to perform for the benefit of his country and the honor of himself.

The children now being able to read easily, the lessons are more advanced. They are always first read aloud by the teacher who directs the pupils' attention to the moral of the story, the chief actors and their object, and also explains the difficult words. After the lesson the teacher gives some little time to examine and interrogate the pupils upon these points to which he directed their attention. He then gives a task having for its object the proof that the pupils have thoroughly understood the lesson and the meanings of the difficult words. He also finds occasion to give interesting ideas upon the ordinary objects introduced in the lesson, especially having in view the inculcation of moral advice. Each pupil reads separately—in turn—so that each really obtains individual teaching.

Writing is practiced in large hand, round-text, and small hand. The copy for the writing lesson is always written by the master on the black-board, and at its commencement he recalls to the recollection of the pupils the proper position for their bodies, their copy-books and pens. He then passes round and examines the work of each pupil separately, giving advice and making corrections where needed. When the faults made by the pupils are more or less general, they are made the object of observations from the teacher's desk, accompanied with demonstrations upon the black-board. It has been found advantageous that the teacher should write the copy upon the black-board in the presence of the pupils, so that they may see how he does it.

In grammar the first notions are given orally upon the various parts of speech. These consist of questions and explanations, and are generally based upon the subject of the reading lesson. The pupils are interrogated upon the orthography and meaning of the words in the text. The difficult words are spelt, and the noun, adjective, verb, and pronoun in each sentence pointed out. The memory is exercised in learning selected pieces of poetry of an easy nature. Written exercises from dictation and grammatical exercises of various forms are reproduced upon slates and copy-books from the black-board. These ordinarily relate to some phrase in the reading lesson previously explained. The pupils are also exercised in the composition and study of simple sentences. Twice a week an interesting little story is read aloud and explained by the master. The pupils then read the story, and afterwards write an exercise upon its application. The teacher makes use of these exercises to correct any vulgar or incorrect expressions which may have been made use of by the pupils in their daily conversation. He also endeavours to show them how to converse in a manner more befitting respectable society.

Arithmetic is begun with the principles of numeration, both in questions and answers and in writing. Pupils learn by heart tables of addition and multiplication. The three first rules are worked fully, but division is limited to double figures for a divisor. Little problems are written on the blackboard and reproduced on the slates. These bear upon every day simple and familiar subjects, and always relate to the farm, the shop, or to local industries.

Simple lessons are given in geometry to teach how to design the most elementary regular figures, such as the square, the rectangle, the circle, and various other forms. Ideas of solids are given by means of models in relief. Frequent exercises are also given in measures of comparison, so that the eye may accustom itself to the principles of perspective, and approximately measure distances. Thus the children are familiarised with lines, angles, surfaces, and solids.

The

The history taught in this elementary course is confined to anecdotes and familiar conversations relating to distinguished personages, and the principal facts of French national history before the Hundred Years War. These lessons take the form of recitations and conversations. After the subject of the lesson has been duly treated by the teacher, he makes himself certain that he has been understood by numerous questions, and every time he speaks of any particular locality, he points it out on the map. This greatly assists the pupil in his geography, which is carried forward by means of object lessons. The cardinal points of the compass are learned in the play-ground, from the position of the sun. The children are taught to observe the seasons, atmospheric changes, and other phenomena. Geographical terms are learned and explained, and the pupils prepared to study geography both by the intuitive and descriptive methods. Local geography, showing the position of the house, street, village, and district. In general geography, the form, size, dimensions and subdivisions of the carth are learned and how to represent them on plans and maps. The terrestrial globe is explained and the continents and oceans considered. Conversations as to the pupil's birth-place, and the section of the country he knows, and making him fully understand the respective positions by actual demonstration. These preliminary studies having been gone through, the teacher instructs the child in matters relating to the Map of the World, and as to the position of his own country.

Short and simple lessons in physical science are given upon man and the various animals, vegetable and mineral products. He is taught that these natural products are transformed into manufactured products by various industrial methods, and explains objects such as food, tissues, paper, wood, stone, minerals, and metals. Little collections of these substances should be made by the pupils themselves, so that the instruction may take the form of object lessons.

This elementary course carries the child on to his ninth year, when he commences the middle course, which occupies another two years.

In this course the lessons on morality are thoroughly taught and carried progressively forward. They consist of the child's duty to his parents, including love, obedience, respect, recognition, &c. That it is his duty to assist them in their work, nurse them in sickness, and succour them in their old age. They are also taught their duties to their brothers and sisters, their friends, servants, teachers, and their comrades at school. They also learn that they must be assiduous, careful, docile, and industrious, and be cleanly, temperate, and well behaved in society. In external endowments they are taught to be econimical, to avoid getting into debt. The great evils attending gambling are pointed out, also those of prodigality and avarice. That it is an universal obligation to society that man should work, and the nobility of labour is thoroughly inculcated.

As regards the pupil's spiritual instruction he is made to understand the necessity of being veracious and sincere, never to lie, and always to preserve his proper dignity and self-respect; to be modest, and not to overlook his faults, to avoid pride, vanity, and frivolity, to have an abhorrence of ignorance and laziness; to be courageous in peril and misfortune, and to be patient in everything; to treat animals with kindness, and to be just and charitable towards everyone. In short, "to do unto others that which you would have them do unto you." To be good-natured, fraternal, and tolerant, and to respect the religious beliefs of all others.

The pupil is then instructed in the organisation of his country; the citizen, his rights, and obligations; his duty to the Municipality, the Mayor and Council, to the Department of State, the legislative and executive powers, and to the law of the land. All these matters are taught by examples and anecdotes, together with familiar conversations, the teacher always asking judicious questions to assure himself that the pupil fully understands what he is learning.

The reading lessons in this course resemble those in the former, excepting that they are more advanced, the teacher always reading the lesson aloud to the pupils. He remarks upon the proper inflexions of the voice, the stress upon certain words, and to see that proper attention is paid to the various stops. Object lessons naturally find their places in the development of the reading lessons.

Writing is carried on as in the former course; the teacher always recalling the pupils attention to the proper position of the body, &c. Phrases serving as copies should always be complete in themselves, having for precept some rule of conduct, or useful information.

In grammar the parts of speech are studied, the regular conjugation of verbs and the rules of syntax. The oral exercises consist of elocution and pronunciation, grammatical interrogations and recitation aloud of pieces read in class. The written exercises are dictations from classic authors, composition, construction of sentences, homonymous and synonymous words and parsing. The teacher also reads twice a week some extract from a classic French author, which he analyses critically and explains. This teaching

teaching has not only for its aim a knowledge of the language but the real culture of intelligence and the development of moral sentiment. The class dictations should relate to historical, geographical, agricultural, and commercial questions.

The arithmetic of this course includes, in the first place, a complete revision of what has been already learnt, then come Fractions, both vulgar and decimal, the Rule of Three, Simple Interest, &c. The legal system of weights and measures, with mental calculations, are applied to the rules abovementioned. All the problems and questions relate to operations in real life, or with facts associated with domestic, rural, or industrial economy.

In geometry, beside the simple geometric figures taught from the blackboard, the fundamental properties of the cube, prism, cylinder, and sphere are practically taught.

The Elementary History of France is thoroughly gone into, the teacher insisting upon all essential facts during the Hundred Years War. The method is as follows: He draws upon the blackboard a map of France as it existed during the period of which the lesson teaches. The towns, villages, and districts spoken of in the lesson are always shown upon these maps, and copied on the slates and copybooks of the pupils. The teacher also writes upon the blackboard the summary of the lesson, which is also copied, and the pupils interrogated thereon.

The geography of France and her colonies is taught during this course, together with its physical and political features, also close studies of the various departments and districts, with the products of the different regions. The lesson is always traced by the teacher on the map, before it is given on the board for the pupils to study. These are often exercised in tracing routes upon the blackboard, or upon paper. Voyages by water, journeys by railways and ordinary roads, all serve for real object lessons, both for oral exercises and for written descriptions.

In science the teaching in this course consists of the elementary principles of natural and physical science. The pupils have to study the different parts of the human body, its organisation, and to give oral and written descriptions of the principal functions of life. The division and classification of vertebrated animals; to describe a typical animal of each group; to study from certain chosen types the principal organs of plants, the great divisions of the animal kingdom, indicating the plants that are useful and those that are detrimental and poisonous. These lessons are usually given outside of the school during promenades on half holidays. The principles of air and water are also studied, with simple experimental demonstratious, also the elements of agriculture and horticulture. Instruction in these latter is also given during promenades, the teacher pointing out the different soils, the value of manures, and how the work is performed by the ordinary implements used by the farmer, such as the plough, harrow, roller, reaping, and mowing machines, &c., &c.

The child is thus brought up to his eleventh year, at which age he commences work in the Superior Course, which takes another two years. This will bring him to the limit of age fixed by law, viz.: 13 years, and closes the period during which he has to remain at the Primary Elementary School.

We find again in this course that the same importance is paid to moral teaching, reading lessons, and practical exercises, as in the former course, but the exercises are more extended and progressive. They comprise a regular series of lessons on morality generally, and more particularly on social morality, for example, the duties of parents to their children, the reciprocal duties of masters and servants. They also treat of society, its benefits and necessity. Justice is taught to be the first condition of all society, with joint responsibility and human frateroity. The pupils are instructed in the applications and developments of the principles of justice, the sacredness of human life and liberty; the respect in which the property of others is to be held, as well as their reputation and honor; they are to faithfully and honorably respect all given promises, as well as the opinions and belief of others. They are also taught the duties of recognition, charity, fraternity, and benevolence, tolerance, elemency, and devotion, and shown by examples, what takes place daily in common life.

In this course he has also to learn what he owes to his country in obedience to its laws, to the military service, to discipline, devotion, fidelity, and to the flag; his duties in the municipality, and his vote at elections. It should be proved to him that recording his vote is a moral obligation that he owes to society, also that in his opinions he should be free, conscientious, disinterested, and enlightened. The rights which correspond to these duties should be pointed out to him—such as individual liberty, liberty of conscience, liberty of labour, and liberty of association. The national sovereignty, the guarantee of the security of life and property, must be thoroughly explained, and the action of government made apparent.

In each of these subjects, regarding social morality, the teacher must explain to the pupil without entering into any metaphysical discussions—1st, the difference between duty and self-interest, even when they seem to be conflicting—that is to say, the imperative character and disinterestedness of duty; and 2nd., the distinction between the written and moral law, the one fixing a minimum of prescriptions which society imposes upon all its members under determinate penalties, the other, that which is imposed by one's own conscience, viz., those duties which need not be performed, but which, if left undone, one feels one's self morally guilty. These lessons must be followed by applications, examples to be given, and questions answered.

It is also during these two last years that the pupil completes his studies as to his duties of citizenship, and gets his ideas of political economy.

He has to study the Constitution of his country, the duties of the President of the Republic, the Senate, the Legislative Assembly, the laws and their administration, central, departmental, and commercial; the various authorities; civil and criminal justice; public instruction; the army, navy, &c., &c. He also receives elementary notions of taxation, the custom-house, the social state, property and successions, the probation of minors, the most common and usual form of contracts and agreements, leases, and bills of sale.

The conversation lessons relate to political economy, man and his necessities, society and its advantages; capital, labour, and association; the production and exchange of commodities, of insurance societies, mutual help, and other associations.

Reading is continued from books and manuscript pieces, both in prose and verse, together with anocdotes, descriptions, dialogues, &c., the pupils writing their ideas of the lesson from memory after the reading is finished.

In writing the pupils are exercised chiefly in running hand; ornamental writing is also taught, with the various forms of bills, invoices, agreements, leases, &c.

In grammar, syntax is continued; the functions of words and phrases are studied; the principal rules relative to their employment in accordance with time and etymology, both usual and derivative. Exercises in elecution, and in written accounts from memory of all reading lessons, promenades, and experiments. Each pupil has to recite the lesson in parsing that has been given to him, and which invariably consists of some grand historical fact. Dictation from classic authors, exercises in the derivation of words; and, also, on the application of the rules of syntax to composition. The teacher explains any difficulties that may be met with in parsing the reading lesson, making the pupils thoroughly understand the subject, and he takes many opportunities of reading aloud to them upon literary, dramatic, and historical subjects.

As this course finishes the education of the masses, there is a scarching review made of all the work done in arithmetic, in order to satisfy the teacher that the pupils thoroughly understand what they have been taught, and that they can calculate sufficiently well for the purpose of every-day life.

In geometry, besides the problems that particularly concern the surveyor, the boys are practically shown on the ground how to perform the simple operations of land surveying and levelling.

In history the work relates to a short historical summary of the periods of Ancient Egyptian, Jewish, Grecian, Roman, and that of the Middle Ages. Modern history is touched upon in the great events of France. All lessons to be followed by a task in the shape of questions and answers, or a recitation of some historical fact.

Geography is carried further forward, especially the development of the geography of France, together with a concise summary of that of the other parts of the world. Due importance is given to the French Colonies. The study of the physical and political geography of Europe is also continued.

A general review is made with reference to what has been previously taught in natural and physical science. The new work is a further study of physiology, chiefly as regards the functions of the human body, such as digestion, respiration, the circulation of the blood, the nervous system and the organs of sense. Added to these is practical advice by the teacher as to hygiene, the abuse of alcohol, tobacco, &c. The features of animal classification are taught, the principal groups and essential parts of plants; a summary of information upon geology, fossils, rocks, and soils. Examples are gathered during promenades and excursions, and collections are made by the pupils for the school museum.

Physical facts and principles are also taught, such as the lever, screw, and pulley, the equilibrium of liquids, atmospheric pressure, the barometer, thermometer, light, electricity, and magnetism. Various applications of science, the steam-engine lightning conductors, electric telegraph, the mariner's compass, &c.

Instruction is given in the elements of chemistry, simple and composite bodies, metals and the ordinary salts of commerce.

In agriculture and horticulture, the studies are more advanced and methodical. Drainage, artificial manures, implements, and farm machinery, domestic animals, and book-keeping for the farm. The pupil is shown the best methods of propagating plants and how to graft, bud, and generally how to cultivate fruit-trees, and manage gardens and orchards.

This finishes the work in the Primary Elementary School, but in addition to the subjects of general instruction I have described, there are also special subjects, with which, if the school is a large one, the master is usually assisted. These are drawing, singing, manual training, gymnastic, and military exercises. In the Paris Municipality these teachings have special organisations, and each is the object of a scheme of study having its own particular directorate.

The length of the school week is fixed at thirty-two and a half hours for the Elementary and Middle Courses, both for boys and girls, while for the Superior Course the boys have thirty-seven hours, and the girls, thirty-five.

In all schools of the Municipality of Paris, one teacher is alloted to fifty pupils in the elementary course, from forty to forty-five in the middle, and from thirty-five to forty in the Superior Course.

I have described as concisely as possible the manner of educating the masses in the Maternal and Primary Elementary schools in Paris, that being, as I before stated, in my opinion, the most complete and methodical system of imparting instruction to children up to school age limit.

As to the superior Primary School, it will be understood that the children who can afford to continue their studies at these establishments are very limited in numbers. The instruction of the masses is carried forward by means of evening classes in technical schools, where practical work—as well as the science which underlies it—is taught and applied.

With regard to the special subjects I have alluded to, drawing comes first. The eye mind and hand are complimentary to each other, and must be taught to work in unison. It is an incontrovertible fact that they work better under each other's guidance. Theoretical knowledge is in itself incomplete; it is the hand which makes experiments and tests practicability, that solves difficulties and completes the machine. One would be comparatively useless without the other, and it is as necessary that the eye and hand should work together, as that action should follow thought, and it is by learning to draw from the first that this object is effected in the easiest way. It is pleasing to see and learn that all civilised nations have awakened to the value of drawing and that it now takes its proper position in all State and public schools, it being thoroughly recognised that the ability of the workman to express his thoughts by the freehand use of the pencil is indispensably necessary before he can become a master of his craft.

A great number of drawings from Primary Elementary Schools were exhibited at the Paris Universal Exhibition, many of which were very good and highly interesting. Among others I noticed some floral menu cards for every month in the year. In the designing of these the method employed by the teacher is worthy of imitation. The pupil is given a natural flower, a lily, for example; it is first studied in detail in all its various parts, accurate drawings are made of the stem, leaf, bud, and flower; then the entire flower is drawn singly and in groups, and, lastly, an ornamental design for the vignette of the menu card is arrived at. These have been done in a large way for reproduction, fully 18 inches by 12, and are strongly and boldly drawn. Honeysuckles, poppies, daffodils, lilies, possion-flowers, and pansies were thus treated. One can easily understand how invaluable as a means of culture, as well as learning to draw, is this close study of nature. They are, inded, object lessons of the greatest importance.

How different this from the art teaching in England. Until very lately the course there pursued was all wrong and the work feeble and niggling in the extreme. It is true a better order of things is now obtaining, and if the Principal of the Art Department at South Kensington were not cramped and fettered by the red-tapeism that exists there, the results would be much more pronounced than they are. The work would be progressive and carried out in accordance with nature, common sense, and the requirements of manufacturers, where art is a great factor in the production of their goods. As an example, one may see what has been done at the Doulton Ceramic Manufactory at Lambeth. The characteristics of the ordinary British drawing-master are prettiness and pettiness. What he calls finish is a lot of finnicking unnecessary detail. The unfortunate students become stunted in mind and cramped in their handwork. They find this out as soon as they go to work in a manufactory where full-sized drawings are required. Then they discover that they must go back almost to the beginning in order to arrive at that freedom of hand with which they should have commenced. In France, Germany, Belgium, and the United States of America, a child begins by reproducing lines on as large a scale as his little arm will allow, and, instead of using a finely-pointed lead pencil, he is given a piece of chalk and a blackboard.

After this he is advanced to charcoal, with brown paper and white chalk for the lights, and so on. In ordinary schools no special teaching is required for drawing. It must be taught every day in the same way as reading and writing by the same master, and I have stated in my previous reports, already referred to, that in my opinion reading, writing, and drawing can all be taught as one subject.

Drawing must be universally taught. There is no profession or handicraft in which it is not of the greatest service. Not only is it useful in mechanical construction, but it enables the artisan to give beauty to his designs; in short, it unites artistic effect with a proper proportion of the parts in constructive design.

It is the same with manual training. All nations have, within the last half a dozen years, become convinced of the inestimable value of technical education towards the culture of the mind as well as the training of the hand. Scientific discoveries floating vaguely in the minds of inventors become real through the skilful manipulation of the artisan. The late M. Salieis, who effected such important reforms in technical teaching, and whose work at the Ecole de la Rue Tournefort has been a model to all nations, told me that in his experience he had invariably found manual training served to strengthen the ordinary primary instruction, and that in his opinion if the time given to primary instruction were reduced one half, far better results would be obtained than at present. Much weeding would have to be done in the subjects taught, but as in thinning a forest, the best trees would thereby be strengthened. It would be precisely the same in the schools. By instilling such ideas to children, they can be readily assimilated, and the result is better in the present, and far more useful in the future. He says: "Given a child's nature, nothing else is needed in order to develop there the pre-existent germ which stimulates him to realisation; he can then be roused to a taste for work. This is the inevitable outcome of manual training, the underlying skill, disclosure of tendencies, and love of work naturally follow."

M. Salicis early recognised the great want of a Special Normal School for manual training, and he did his utmost to bring it about. He managed to set in motion M. Jules Ferry, the Minister of Public Instruction in 1882, and was also assisted by M. Buisson, Director of Primary Instruction. An institution of this class was inaugurated, and admission given to school teachers by competitive examination. These at first numbered forty-eight, all of whom were graduates of the *Université de France*. They were taught for one year. The following subjects having been chosen:—

- 1. Experimental physics and chemistry as illustrated in simple phenomena, i.e., such experiments as might be repeated in elementary schools.
- 2. Natural history treated in the same way.
- 3. Plain trigonometry, algebra, and elementary mechanics.
- 4. Descriptive geometry, with direct applications to perspective and to stereotomy.
- 5. Drawing, modelling, moulding, and graphic designs.
- 6. Treatment of wood at bench and turning lathe.
- 7. Treatment of iron in the smithy, smithy in the forge, vice, and turning lathe.
- 8. As subordinate studies, choral, music, French literature, fencing and fire, military, and brigade exercises.

This programme was to be completed at a later period by a scientific study of various fertilisers in their relation to the nature of the soil, and to special productions.

Up to last year the Special School had graduated seventy-two professors of manual training, and these had been added to by a few expert scholars from the St. Cloud Normal School. It is now a fact, that in strict compliance with the law, each of the French Normal Schools, numbering ninety, including Corsica and Algeria, is provided with a competent professor of manual training.

These schools graduate every year about 1,500 teachers all of whom are fairly fitted to teach manual training in Primary or Superior Schools. M. Salicis calculates "that in fifteen years, 2,750,000 boys, of the French working classes, will be provided with such instruction as will completely fit them for the future they have in store."

My reports on Technical Education for 1887 and 1890 treat the subject of manual training, its present position in Europe and in the United States of America very fully, and to these I would refer all school teachers and others who may be interested in the new education.

Singing is generally acknowledged to be a most important part of a child's education. It assists in the proper devolopment of the vocal organs, and corrects bad habits in the tone and quality of the voice. A child may be a fluent reader, but he never would attain, in a general way, to perfect reading, 138—2 C much

much less to high-class elecution, without voice culture. Singing serves to strengthen the lungs, and of all artistic recreations, it is the most conducive to health. It has thoroughly established itself, as a branch subject in all schools in countries where education is compulsory. It operates as a recreation between exercises, and trespasses little on the school time. The kindergarten action songs act most beneficially and charmingly. They are made very instructive, and the children never become weary of them, for naturally music delights; therefore it serves the purpose of the teacher in a remarkably happy manner.

Gymnastics and military drill are now generally taught all over the continent, and at all the higher schools of Great Britain. The mind cannot act with the best results unless sustained by a healthy body. Where we have so large an expenditure for public education we should be indeed much to blame if we continue to yoke together active brains and inert bodies; to increase the load and neglect the means of carrying it. There is no need to lose health in the pursuit of knowledge, and where a thorough system of physical education is carried out, the pupils are almost invariably healthy. They must be made to maintain regular habits of reasonable recreation. Physical training should be made a part of the usual school work.

The superior or higher Primary School carries on and extends the work of the Primary Elementary School. In case the district is not large enough to support a high school, classes are attached to the Primary Elementary School, where advanced instruction is given. There were in France, at the end of 1888, 256 schools and 431 classes of this kind, with 22,000 scholars in the schools and 10,000 in the classes taught by 3,300 teachers. In these higher schools and classes a two years' course is followed. The new work comprises algebra and geometry, commercial arithmetic and book-keeping, physical science applied to industry, agricultural and hygiene, geometrical and ornamental drawing, modelling, notions of law and political economy, the principal epochs of general history, commercial and industrial geography and modern languages. These higher schools and classes are only open to scholars who have passed the examination for the certificate of primary elementary studies.

According to French law a child is not allowed to work more than six hours per day before the age of 15, unless he can produce a certificate that he has passed this examination. If, however, he can obtain this certificate before he is 13 years old he is then permitted to work six hours a day.

Each department in France is bound by law to provide itself with a normal school or training college, in which the training is gratuitous. Students are admitted by a competitive examination. Should a sufficient number of candidates fail to make application, a second examination is held. The course of training lasts three years. Studies for males occupies thirty-five hours weekly, and include: psychology, morals, and pedagogy, two hours; French language and literature, four hours; history and civics, three hours; geography, one hour; handwriting, two hours; modern languages, two hours; mathematics, three to four hours; physics and chemistry, two to three hours; natural science and hygiene, one hour; drawing and modelling, four hours; theoretical agriculture, one hour; manual training and practical agriculture, five hours; gymnastics and military exercises, three hours; singing and music, two hours.

My object in thus setting forth the manner of teaching, as well as the subjects taught in French schools, is to point out to all Australian teachers not only the advisability, but the necessity, of giving the highest class instruction to children of every age, as regards their moral and civic duties. I am thoroughly convinced that these subjects must be taught daily and in no half-hearted or lukewarm manner. It is not only necessary to cultivate the mind but also to elevate the soul. Let us therefore teach our children to know their duties to their fellow creatures and to society, and not only to know them but to practice them.

What I have described will be sufficient to indicate to teachers particularly, and to the public generally, what the French people have found it necessary to do in order to preserve the character and manners of their citizens, and I cannot too strongly advocate the imperative necessity of following their example. They must not only teach reading, writing, and arithmetic, but morality, rights, and duties.

## APPENDIX C.

## MANUAL TRAINING IN FRANCE.

By A. Salicis, Late Inspector-General of Manual Training.

Nature wishes that those who work should first be esteemed and rewarded by the measure of their salary.—Confucius.

I have always noticed that among workmen, good apprentices make good citizens.—B. Franklin (Codicit to his testament).

We have been created to act and produce.—Channing.

The aim of education should be to prepare us for complete life; therefore education should furnish the individual with the means of providing for his existence.—Herbert Spencer.

THERE is nothing at all new in the idea of completing man and doubling his value by teaching him at an carly age to make use of his hands. We have reason to be astonished at not finding a greater number of manual instructors, and also that no country has thought best to introduce into its public school the use of the hand, the simplest, cheapest, most universal, most obedient and most marvellous tool in our

If we stop to think of the sum of the countless efforts of all kinds that have been spent since the formation of society solely on the unfolding of brain powers, it might prove interesting to consider what would be the present state of the world if the millionth part of this outlay in mind and money had been appropriated to create and make fruitful in successive generations a love for concrete work in all its forms—a love such as would be called forth, fostered and promoted by bringing about an appreciative

co-operation between the taste and the judgment, the eye and the hand.

In this connection the following quotation from Channing is generally known, in the United States at least: "Manual training is a school where men are put to acquire energy of purpose and of character, a conquest which is far more valuable than all the knowledge of the schools."

Not less familiar are the opinions of Pestalozzi, Condorcet, Rousseau, Locke, and Montaigne, all of whom would surely agree with the English philosopher in saying, "since it cannot be hoped that a child will have time and strength to learn everything, the result is that he should be taught especially those branches of which he is most in need, and which will be of greatest and most frequent use to him in the world."

Already in his day Seneca complains that this was not the case: and this inconsistency must be strikingly apparent, for Détrouve himself, whose mind was radically different from that of the Seneca,

has thought it his duty to say in his Salyricon:-

"Those who are in charge of the studies of young people do not devote sufficient care to make them familiar with what is most intimately connected with every-day life; thus it happens that when they do breathe the atmosphere of the surroundings among which their destiny calls them, they believe they have been wafted into a different world."

For many centuries there has been no great change in the education of those classes whose liveli-For many centuries there has been no great change in the education of those classes whose livelihood depends on the daily work of their hands. It would seem as though the book or the paper were the only things they would have to handle, and as though the pen were the sole tool they would have to make use of. Book, pen, and paper are put into the hands of children from their fifth to their thirteenth year, and they submit during all this time with passive indifference to being saturated with the one taste for literary things. Then, when they have been carefully perverted both intellectually and physically with respect to the future which awaits them and when the gate of life finally stands wide open before them, they are calmly expected to enter it not only unarmed but wholly unprepared.

Does this mean that the actual primary instruction should be slashed to pieces, and that one excess should be substituted for another? What rash voice could formulate such an idea? By no means, for every nation has its main roots buried in the mass of elementary knowledge. If it be in the nature of things that we children of the same country are called upon to follow different paths, we may at least have the same language, write it in the same way, and share the same history. However, if the introduction

have the same language, write it in the same way, and share the same history. However, if the introduction of manual labour become general, let no one scorn the tools, the needles, the scissors, which we all shall have learned to handle. On the contrary let each one esteem modesty and courage in their attempts to

lead a creditable and useful life.

Far then from wishing to weaken primary instruction, I believe it can be conceived of as strengthened, but different: it would be reduced perhaps by half as a time for study, but in return a double harvest would be reaped by thinning out the requirements, very much in the same way as a forest is cleared in order to strengthen its trees. The new departure would consist chiefly in introducing into the new system concrete methods of instruction, revealing such principles as can be assimilated on the spot, and yielding such results as will be useful later on.

This is in part the aim sought by the Academy of Medicine in the active war it is waging against intellectual over-pressure. This is moreover the tendency, clearly defined nowadays in France, as well among the guardians of public instruction as in the legislative halls and in the general enlightened

opinion of the country.

It was in March, 1882, that the Chamber of Deputies voted in favour of making manual training obligatory for the different grades of primary instruction. Thus was realised in a much larger sense the scheme which Condorcet laid before the Convention nearly a century ago, and which the strong heads of the time naturally dubbed Utopia; it was spoken of as Condorcet's Utopia! Very happily this is the way with a goodly number of Utopias; to-day they are follies in the sight of barren scepticism, and

to-morrow they are fruitfully fulfilled.

Up to 1882, manual training was not altogether wanting in France; but where it did exist, it was chiefly in the form of apprenticeship, or rather of undivided preparation for one special calling. The institutions offering this training bore the characteristic names of apprentice's schools, industrial schools, tacknical schools, schools, and trades and so an Allege institutions were private cornerations. technical schools, schools of arts and trades, and so on. These institutions were private corporations; their number was very limited and they could not give to their pupils the general stamp which is inherent in a nationally ordered instruction. Beginning.

Beginning at the very foundation, and in keeping with the spirit of the law, the State has organised and is still busied in organising, institutions which are primary above all; just as are those whose fundamental principles are the book and the pen. The State should no more aim to turn out accomplished workmen after a course in simple manual training, than it claims to graduate thirteen-year old literati and historians on a pen and book instruction. But just as it ought to provide the pupils as far as possible with the knowledge necessary to spell their language correctly and also with the elements of a tolerable style, just so in manual courses it can spread a knowledge of the correct use of the principal tools and of the ordinary operations with them.

Given a child's nature, nothing clse is needed in order to develop there the pre-existent germ which stimulates him to realisation; he can then be roused to a taste for work, and this is the inevitable outcome of training an underlying skill. The whole secret is here: underlying skill, disclosure of tendencies, taste for work.

Far from being well under way in 1882, with this worthy end in view, all preparations for the journey had still to be made; methods, buildings, stock of tools, body of instructors,—all this coupled to the great obstacle that on making the new studies obligatory, it had been forgotten to make any appropriation for them.

Thanks however to the stand taken by M. Jules Ferry, Minister of Public Instruction, and by M. Buisson, Director of Primary Instruction, a Special Normal School for Manual Training was decided on and was straightway created. Admission by competition was granted to forty-eight young school-teachers, graduates of the University de France. They were taught there for one year the following

1. Experimental physics and chemistry as illustrated in simple phenomena, i.e., such experiments as might be repeated in elementary schools; the instruction was collective but the students had the privilege of individual manipulation.

- Natural history, treated in the same way.
   Plane trigonometry, algebra, and elementary mechanics.
   Descriptive geometry with direct applications to perspective and to stereotomy.

5. Drawing, modelling, moulding, and graphic designing.

6. Treatment of wood at bench and turning-lathe.7. Treatment of iron in the smithery, with vice and turning-lathe.

8. As subordinate studies; choral music, French literature, fencing, and fire practice.

This programme was to be completed at a later period by a scientific study of various fertilisers in their relation to the nature of the soil and to special productions. Repeated questions, competitive reviews, and practical trials kept these young teachers always on the alert. Although the programme was overcrowded for immediate needs, it was thoroughly carried out, and was satisfactorily assimilated in all its parts.

From an essentially manual point of view it covered about the following ground:

Stereotomy-Design and construction of a soffit, of a full centre, of a segmental arch, of a stilted arch, of a rampant arch; development of the same; stringer of a staircase.

Drawing and Modelling—Rendering of twelve models selected from the collection of the National School of Fine Arts. No modelling was done, unless preceded or followed by a design of the object.

Joinery—Besides preliminaries, twenty exercises in joinery and ten summaries.

Smithery-Introductory details, fire-building, striking in presence of one, two, and three smiths, welding, rolling, measuring the calibre, tempering.

Millwright's work-Practice in flat and half-round files, mortise-chisel, graver, saw.

Wood-turning lathe-Railings of different styles, Medicis vase.

Metal turning-lathe-Slide cylinder.

Every object made was to be a material rendering of an off-hand sketch. A memorandum of each sketch was entered in a special workshop note-book, along with the teacher's private explanations and estimates.

The close of the year witnessed the establishment of a certificate of proficiency for such as were fit to teach manual work in the normal schools and in the higher primary schools. On examination this certificate was awarded to most of the students in the first promotion: the few backward ones obtained this distinction in the following year, along with twenty-four new students of the second promotion.

The Special School has thus graduated seventy-two professors of manual training; since then, the Normal School in St. Cloud has swalled the list by a few adopts, and some independent teachers have shown themselves so well versed in the several requirements as to pass satisfactory examinations in the same. Thus it is that now, in strict compliance with the law, each one of our ninety normal schools, including Corsica and Algeria, is provided with a competent professor of manual training. On the other hand these schools are fully equipped with laboratories, workshops, and tools: with respect to the new branches, the programme is identical with the one adopted by the Special Normal School, minus the above-mentioned 3rd, 4th, and the latter part of 8th. The course is completed within three years at the rate of four hours per week a rate which scores years inadequate. rate of four hours per week, a rate which seems very inadequate.

Still these normal schools are beginning now to graduate every year something like 1,500 teachers, who are pretty well fitted to introduce the new studies in the numerous continuation schools. The outlook for the elementary schools is also bright, and it may be hoped that they will delay no longer in incorporating special teachers in their body of instructors. Summer schools are even being opened gradually in the normal schools to those teachers in each department who will pledge themselves to regular attendance. These voluntary teachers carry back to their schools a manual knowledge which is sufficient inasmuch as it is primary: their own works are their models and their note-book is their guide. The remainder of their equipment, which in the beginning need be only slight in the way of buildings and tools, will depend altogether on the General Councils and on the Municipalities.

In fifteen years from now, nearly all our primary high schools and most of our 40,000 elementary schools for boys ought to provide our 2,750,000 male children of the working-classes with the instruction which will fit them completely for the future they have in store.\*

This period of expectation would have been shortened, and the standard of manual training would surely have been raised, if the Special Normal School for Manual Training, founded by M. J. Ferry, had been developed instead of supressed by his second successor; unfortunately, ministers have this point in common with the days,-they follow upon one another without being alike.

It is a fact that everywhere, without exception, where the equipment is decent and the professor suitable, manual training is as much of an attraction to the pupils of various ages as to the student-teachers of the normal schools. The recent convention of academical rectors and of general inspectors of primary instruction, presided over by the Minister, was unanimous in favour of the new departure: such was the interest manifested by the students of the normal schools, that at times it had even been nocessary to restrict their enthusiasm in workshop matters. We wish it to be always well borne in mind that we are dealing here only with the question of primary manual training, such as is generally given by the State.

Inasmuch as the variety of private enterprises is as great as the number of individual callings, it is not to be expected that their soul and mechanism should emanate from the government. In this case, it is a matter as we have already stated of regions, departments, cities, industrial syndicates or private concerns. These special and varied demands have for some time been met in France by a large number of private establishments. The last few years have seen them well started towards rapid enlargement, and the organisation of syndicates can only hasten their development.

Heretofore the State was satisfied with providing a few important typical institutions, such as the National Schools of Arts and Trades which were founded long ago in Châlons, Aix, and Angers. The experiment is to be completed by trial district schools in Vierzon, Voiron, and Armentières. These schools, like the former ones, will receive boarders and will give instruction from the primary department up to a well-defined idea of the industrial occupations of the country.

The rapid spread of general manual training is greatly hampered by the lack of space available in primary schools, and moreover by a temporary scarcity of the department and communal funds. Great sacrifices have been required and made in view of building local railroads, town-halls and school-houses, and, as is always the case, noble impulses have been followed to the detriment of future welfare. Nevertheless, besides these primary high schools which are being equipped day by day, there is a very large number of elementary schools which have now introduced manual training in various stages. At all events the difficulties have been diminished, in a measure, by the programmes adopted by the High Council of Public Instruction, small classes being assigned such work as requires neither workshop nor special equipment. special equipment.

For the time being and awaiting further reforms, manual work enters under the head of physical education. A synopsis of the same is as follows:

5—7 Years.	7-0 Years.	9—11 Years.	11—13 Years.		
Basy exercises in plaiting, folding, and weaving. Cutting out pieces of coloured paper and uniting them in geometric designs. Basy basket work. Combinations of coloured worsteds on canvas or on paper.	Construction of geometric solids out of paste-board.  Basket-work, combinations of many coloured twigs.  Modelling.  Reproduction of geometric	painted pictures and col- oured paper.  Eusy wire-work; trellis-work.  Combination of wire and wood- work; cages.  Modelling simple architectural	Combined exercises in drawing and modelling. Objects sketched on a giver scale and vice-versa—objects reproduced from a sketch or a given scale. Chief tools used in wood-work Graduated exercises. Planing, sawing wood, simple joinery. Boxes, nailed or put together without joints. Turning-lable. Turning very simple objects. Chief tools used in iron-work File exercises, paring or polish ing rough iron and cast-iron		

GIRLS.									
5—7 Years.	7—9 Years.	9—11 Years.	1113 Years.						
Casy Froebel exercises. Plaiting, folding, weaving. Knitting small articles.	Meshes on the right and wrong sides. Ribbed work, increasing, diminishing. Making stitch, on canvas. Elements of sewing. Homs and overcastings.	stitches.  Marking on canvas, forward stitch, side stitch, back stitch.  Overcasting-stitch.  Plain seam, hem; double seam.  Overcastings on selvidge.  Overcastings on turned in folds.	Stitching, gathers, buttonholes. Mending garments, darning. Elements of cutting and making up very simple garments. Elements of domestic economy in its relation to the kitchen, to washing clothes and keep- ing them in repair, to the toilet, to household duties.						

<sup>\*</sup> If we do not speak of the girls, it is because they have already to a certain extent a suitable primary manual training, consisting of needlework, cutting out, and dressmaking.

Such is nowadays in France the part which manual training plays in elementary schools. This programme may be altered to meet the wants of any and every school, and in such a way that each school can select a part of the whole in keeping with its means. In any case the Council of every department is vested with a certain authority in matters of changes such as it may seem wise to brirg about in local applications of manual training.

A committee has recently been formed with the mission of studying up the question of agricultural training in normal schools, primary high schools, and elementary schools.

Personally we do not think that the type of programme shown above should be maintained as a whole, at least as far as the boys are concerned.

It seems to us that up to the eleventh year there is not a sufficient demand made upon individual thought and judgment, or upon the complete subjection of the hand to an instantaneous decision of eye and will. Moreover, physical strength meets with no means or incentive to develop. Weaving, basketwork, plaiting,—all this is quiet work, where the fingers are trained to move evenly and mechanically, without any intellectual exertion. The proof of this lies in the fact that this kind of work is introduced with greatest ease in the asylums for the blind and weak-minded. We believe that the true aim of manual training should be to accustom a child at an early age to work standing, and as far as possible, to bring all parts of his body into play. Does he not do this anyway, if left to himself? Is it not a source of continual wonder to see the youngest children stand from morning to night: they are on such a constant go that it is impossible for their parents to keep up with them. And then, thanks to this healthful weariness, when night comes on they fall into a sound sleep from which they arise at early dawn refreshed and ready to begin all over again.

The needs of a child are made evident by his love for hoops, tops, ball-playing in all its phases, and so on. A child must dig ditches, build dams, climb trees, and experiment with the power of his lungs: he must do all this and in the same day. He will even skip his meals, if he has a chance.

It is very true that all this cannot be done in a school: still the natural inclinations of a child should not be tampered with, but this overflow of vital energy should be controlled in such a way as to direct the main course into a channel of future usefulness.

Thanks to the freedom of scope and means which the Municipal Council of Paris has given us, it is on these lines that we seek to promote manual training in the public school of Rue Tournefort. We lay special stress upon our methods, because this institution realises a type whose tendency is to spread as a whole or in part.

There all children from the ages of six and seven years have a part in active manual work. As soon as they enter school they begin modelling, and they keep up the study during their entire school course. They are also taught to treat soft wood with the saw, the rasp, the chisel, and the mortise-chisel. They are then advanced to the plane, the turning-lathe, and the iron-work including furnace duty.

At a very early age they begin to sketch on a given scale, all draughting being recorded in a notebook which is never to leave them. These memoranda are chaotic at first, but they assume rapidly a definite shape: the accounts of daily work are tabulated as regards the nature of the work, its material, and the time spent on it.

The school is made up of five classes, the highest being intended for special or post-graduate work.

12-14 years Special Class devotes 21 hours a week to manual work. 81 10-12 1st ,, ,, 22 5 9-11 2nd,, " 8-10 3rd4 33 37 23 ;; ,, 3 7-94th " ,, ,, ,,

No attempt is made to specialise before the Special Class. Once there students are given successively fluishing touches in a complete general training, but desides that, they have access to such special branches as will foster more especially an avowed bent.

The new instruction involves an additional expense of 15,000 francs a year; the school receives 260 children, and were it not for its small quarters it could take in 300 without its outlay being increased other than by the expenditure of raw material.

This institution has been in operation now for nearly sixteen years, and the experiment may be considered a success from the triple point of view of hygiene, general instruction, and practical results. The children thrive notwithstanding the fact that their attendance in school is longer by two hours than usual regulations provide. Their occupations are so varied, in accordance with their mental and physical aptitudes, that there is no sign of weariness after their exertions of mind and body. Ardour pervades them in a characteristic way: their heaviest punishment is to be debarred from the workshop.

As regards instruction, the annual examination ordeal for the certificate of proficiency in primary studies is a sufficient relative criterion: it proves that the scholars from the Rue Tournefort are among the best off, as far as scholastic knowledge is concerned. Thus, in addition to what their comrades in other schools know, they are indebted to the new instruction for all the manual training they have acquired. The practical results are made manifest in the facilities for finding good apprenticeships, for reducing their length, and for being sconer compensated.

Besides choice workmen devoted to their calling, this school has graduated expert accountants, teachers, professors even of higher branches, and artists: one of these famous when twenty years old for his water-colours, is now much sought after by New York publishing houses.

Of the two hundred boys' schools in the city of Paris, about one-half are equipped with benches and turning lathes, at which the older scholars do manuel work. The Municipal Council and the Board of Instruction are both endowed with the very best will, and still they have not dared to settle definitely the amount of importance to be attached to primary manuel training. As a consequence, this instruction is somewhat subordinate, and up to the present time the results attained are not in proportion to the

eacrifices

sacrifices made. Another cause of delay is the lack of teachers well qualified in point of methods and statements. As a matter of necessity workmen are called in: they are good practical men as far as their own work goes; but when it comes to imparting knowledge, their teaching is decidedly empirical.

This state of affairs has very happily reached a climax and a sweeping change will take place: the teachers will now be recruited from the ranks of Normal School graduates of the department of the Seine.

We have stated above that nowadays all normal schools give manual instruction: the school at Autouil especially (Siene department), has been thoroughly equipped for the past three years and graduates every year some thirty teachers who are well able to fill to some advantage the places of present workmen.

The case will be the same in other departments in proportion to their population.

At all events the extension of manual knowledge can only be hastened still more by the decisions of the Higher Council of Public Instruction. Ministerial resolutions, and if need be, speaial decrees insure to these decisions a legal sanction.

In accordance with them all, every primary high school must be provided with a workshop, and there shall be awarded certificates of proficiency in higher primary studies, including manual work. These two, three, and four year schools are urgently demanded by the departments and cities: they apply to a part of the studying population that has already received the certificate for elementary primary instruction, and that is not compelled to seek directly an apprenticeship.

Now it happens that the committee intrusted with the revision of the programme desires to retain a general course of study during the first year only in the high schools: this year should be a sort of review. Then from the second year on the studies are to become more and more professional, and are to be based chiefly on the main industries of the country. Manual training will be obligatory four hours a week during the first year, five hours in the second year, and six hours throughout the third and fourth years.

If we take into account that the prime elements of this training have had full chance to become assimilated in the elementary school during a minimum period of six years, they will surely bear fruit after an average apprenticeship of four years, or after an additional special training in the high schools.

The outlook should be a bright one for future generations, inasmuch as being better prepared to battle with life they will show greater love for work, and will be all the more happy and honored ou that account.

#### APPENDIX D.

# THE PHILADELPHIA MANUAL TRAINING SCHOOL-PROGRAMME OF STUDIES.

This school affords to pupils who have finished the Grammar School Course the opportunity not only to pursue the usual High School Course in Literature, Science and Mathematics, but also to receive a thorough course in Drawing, and in the use and application of tools in the Industrial Arts.

The object of the School is the education of all the faculties. "The whole boy is put to school." He is trained mentally, physically, ethically, and is fitted to enter upon his life work without loss of time, and without error in the choice of occupation.

The Manual Training School is not a trade school, but it is a school wherein the principles of all trades and occupations are taught. Its purpose is not to make mechanics, but to train boys for manhood. It is a fitting school for life and for living.

It fosters a high appreciation of the value and dignity of intelligent labour. Its moral influence is immediate and wholesome.

Its organisation embodies suitable provisions for such purposes as practical education demands. These find expression in the following

#### COURSE OF STUDY.

The combined Course of Study covers three years, and the school-time of the pupils is about equally divided between mental and manual exercises. One hour per day is given to drawing, two hours to shop-work and three hours to the usual academic studies.

The Course of Study embraces five parallel lines, as follows:-

First.-A Course in Language and Literature, including the Structure and Use of English; Composition, Literature, History, Economics, and German.

Second.—A Course in Science and Applied Mathematics, including Geology, Physics, Chemistry, Physiology, Economic Botany, Mechanics, Steam and Electrical Engineering, Mensuration, Book-keeping, and Surveying.

Third .- A Course in Pure Mathematics, including Arithmetic, Geometry, Algebra and Plane Trigonometry.

Fourth.-A Course in Free Hand, Mechanical and Architectural Drawing, Designing and Modeling.

Fifth.—A Course of Tool instruction, including joinery, pattern-making, wood-turning, wood-carving, modelling, forging, soldering, brazing, moulding and casting, vice work and mechanical construction.

# FIRST.- COURSE IN LANGUAGE AND LITERATURE.

## OBJECTS AND METHODS OF STUDY.

The object of the work in English is to secure for each student an easy and idiomatic use of his mother tongue, and to awaken in him an appreciation and an understanding and a love for wholesome literature. Special attention is given to the subject of "Books and Reading" by suggestions concerning the selection of books and courses of reading.

# ENGLISH LANGUAGE AND LITERATURE-(First Year.)

- RHETORIC.—The mother tongue taught by

  (a) Conversations.—Subjects from daily life, occupations of men, travel, inventions, general information.

(b) Use of Texts.—English and American Classics.
Synonyms, prefixes, suffixes, roots, word-building, analysis of thought.

- (c) Writing .- Dictations; punctuation and composition; analysis, order, form.
- (d) Short Essays-Outlines set by the instructor; descriptions; the concrete before the abstract.

## SELECTED ENGLISH AND AMBRICAN CLASSICS .- (Second Year.)

Complete works from Addison, Chaucer, Tennyson, Scott, Whittier, Longfellow, Bryant, Lowell, Coleridge and others.

The Classic selected is made the basis of instruction in the history and social life of the times. Essays by the student.

## GENERAL COURSE IN ENGLISH LITERATURE—(Third Year.)

Shakespeare .- Macbeth, Casar, Henry V., King John, The Tempest, etc. Selection from any of the series. Lectures, criticisms, classical readings, comparisons, style.

Essays by the student.

In the study of literature, numerous charts are constructed, each student selecting his own method of presentation of the subject. Biography, the growth of opinions, characteristics of periods of time, and causes and consequences of literary activity are among the themes illustrated. These charts also serve to harmonise the industrial and the literary studies of the school.

HISTORY.

## HISTORY.

History is taught in its principles and in its applications. Special attention is given to the development of free governments, the progress of civilisation, the westward course of empire, industries and inventions, the origin of American laws and customs, the recognition of human rights, the empire of religion and morality, and the relations of man and men.

In American History, the Nation is the chief theme. By text book and by standard authorities, by library and by newspaper, by lectures, and by political and industrial maps, the pupil studies the Nation. The object of the instruction is to acquaint the pupil with the nature of the institutions, laws and customs of his native land, and to inculcate sound views of his duty as a citizen.

#### GENERAL HISTORY .- (Second Year.)

Special study of the History of Greece, Rome, England, France and Germany. Readings in the class from authorities. Construction of historical maps in crayon or in water color.

#### AMERICAN HISTORY—(Third Year.)

Construction by the student of industrial and economic maps, showing movements of populations; the rise of political parties; the growth of canals and railroads; the acquisition of the public domain; the progress of the country in business, commerce, agriculture, education; the changes in State and in Federal Government during the nineteenth

century.

The Course of Instruction also includes the study of Civil Government in America; the origin of our State and of our National Government; the functions of the State; the Executive, the Judiciary, the Legislative; Municipal Government, with special reference to Philadelphia; the citizen; immigration; land laws; duties of public officers; citizenship, its duties and responsibilities.

#### ECONOMICS.

In the study of Economics, the student becomes acquainted with some fundamental, economic and political truths. His attention is carefully directed to the affairs of men in the production, the distribution, and the exchange of commodities. The nature and the duties of a man in society are briefly outlined. The study of Economics is made a general introduction to the world into which the student must soon enter.

#### THE ELEMENTS OF POLITICAL ECONOMY-(Third Year.)

Production—Labour, capital, co-operation, land.

Distribution—Property; the status of persons; wages, profits, rent.

Exchange—Demand and supply, values, money, international trade, interest, competition.

Society—Industry, education, population, values, prices, the functions of the State, the laws of a Iministration, the Nation. Essays by the student.

#### SECOND COURSE IN SCIENCE.

In the Science Course, those discoveries and facts which have a direct bearing upon the industries and upon the every-day affairs of life are made the objects of special study. The end sought is to give the students an intelligent notion of their environment, and to diffuse among them the spirit of scientific investigation.

#### GEOLOGY.

In Geology, the study is valued rather as a means of inducing sound thinking about Nature than as an opportunity to impart a mass of information.

Besides the general ground covered by physical geography the course includes the elements of crystallography, studied constructively; an experimental study of the chief metals and metalloids forming the crust of the earth or important in the arts; the determination of the more common minerals and rocks. While the educative value of the science is predominant, particular attention is given to such practical questions as the physical and chemical properties affecting the strength of building-stones, and methods of determining whether a particular specimen is suitable or not for the use proposed.

## (First Year.)

Experimental Courses in elementary crystallography, chemistry, mineralogy and lithology; the study of earth, air, fire and water; the mineral resources of Pennsylvania and of the United States; the construction of models and of maps in relief and in the flat; geological excursions.

#### PHYSICS.

In Physics the object of the instruction is to convey as much practical information as possible concerning the recent applications of the principles of physical science, and particularly to induce in the student sound habits of thought. The principals underlying the science, the Conservation of Matter and the Conservation of Energy, are constantly kept in view. A physical laboratory has recently been fitted up, and each student is expected to do a certain amount of practical work.

#### (Second Year.)

Proporties of matter; the principles of mechanism; hydraulies; heat and thermo-dynamics; electricity and magnetism; sound; light; transformation and transmission of energy; lectures with experiments; recitations from text and note-books; conversations on subjects relating to the physical sciences, and by practical work in the physical laboratory. Volunteer work is also encouraged in the making of apparatus, the construction of diagrams, and the solution of problems in every-day life.

138-2 D CHEMISTRY

#### CHEMISTRY.

The chief object of the Course in Chemistry is to lay a broad foundation of chemical knowledge which will ensure sound thinking in regard to the constitution of matter and which may afterwards serve as a basis for more special work. Particular attention is given to the metallurgy of iron and steel on account of the great importance of these compounds as constructive materials. In the laboratory a course of qualitative analysis is worked out. Chemical manipulation and the use of the blow-pipe are taught.

#### (Third Year.)

Inorganic Chemistry.—The main facts concerning the chief metals and metalloids; their place in nature, their extraction and their application in the arts.

Organic Chemistry.—An outline of the principal hydro-carbons of industrial importance, with brief sketches of the industries dependent upon them.

Metallurgy.—The production, working and properties of iron and steel receive particular attention. Excursions made for the inspection of operations carried out in the blast furnace and Bessemer converter, the foundry and rolling-mill.

#### MECHANICAL ENGINEERING.

The Course in Mechanical Engineering is designed to give the students a practical knowledge of the elementary mechanics of engineering and their applications, and of heat, its effect upon liquids and gases, its agency in the utilisation of latent energy and the methods employed therein. In the Dynamical Laboratory the classes construct apparatus and carry on experiments familiarising them with the various topics, and make various tests of steam-engines and boilers. Students are detailed to take care of the boiler and engine during the day.

# MECHANICS-(Second Year)

Force, motion, work, energy, power—their units and measurement; momentum and inertia; centrifugal force; equilibrium of forces; moments; friction; principles of mechanism; pulleys and belts; teeth of wheels, etc.; machines; dynamometers; clasticity and strength of materials; shapes of beams, girders and columns; graphical statics; arches, bridge and roof trusses; springs, periodic motion, impact, etc.

#### STEAM ENGINEERING-(Third Year.)

Combustion and Fuels; Generation of steam; steam-boilers; grate surface and heating surface; boiler testing.

Motive Power from Steam; expansion and heat of steam; parts of engine; cylinder; piston, valve gears, etc. Details of construction and proportioning of parts.

Work of Steam-Indicator diagrams, calculation of horse-power, etc.

Varieties of Engines; stationary, rotary, locomotive and marine engines.

Management and Care of steam-engines and boilers; visits of inspection to machine shops, etc.

## ELECTRICAL ENGINEERING.

The Course in Electrical Engineering is intended to familiarise the student with the elementary principles of electricity, and the practical applications and measurement of electrical energy, as well as the principles and construction of batteries and electrical machines. In the laboratory, opportunities are given for experimental work in measuring electric currents, and for testing and managing dynamos, lamps, storage batteries and lines. During the Course the students are required to design and construct various electrical instruments and machines, such as galvanometers, rheostats, batteries, dynamos, motors, etc.

#### ELECTRICAL UNITS AND MEASUREMENTS.

Electro-motive force, quantity, resistance, current, etc. Measurement and testing. Cable testing, location of faults, etc.

## GENERATION OF ELECTRICAL CURRENTS.

Chemical—Primary and secondary batteries. Principles, construction, E. M. F., internal resistance, duration, etc.

Mechanical—Dynamo-electric machinery; principles, calculation and construction; automatic regulation; testing; characteristic curves, efficiency, etc.; care and management; motors and the transmission of power.

#### APPLICATIONS.

Electric Lighting - Heating effects of currents; incandescent and are lighting; circuits for electric lighting; care and management of lamps and plants; cost of maintenance.

Electro-Plating-Copper, silver, nickel, brass, etc., ; plating of non-conductors, (stone, wood, etc.)

Telegraphy and Telephone-Principles, and constructions of instruments; use of instruments; running circuits.

Electric Bells and Gas Lighting-Design and construction; annunciators; railway signals, etc.

Electric Welding.

# Physiology.

In Physiology, attention is given to those facts of anatomy and physiology which are essential to the proper understanding of the laws of hygieno. The pupil is made to understand that the principal object of the instruction in Physiology is to teach him how to keep that complex machine, the human body, in sound running order. The instruction aims to present the laws of life in such a practical way that they may become a guide to healthful living. The pernicious effect of alcohol and narcotics upon the individual and upon society is especially emphasised.

## First Year.

The function of the organs of the human body, and the relation these sustain to the conditions of health and disease; food and digestion; assimilation; secretion and exerction; circulation of the blood; nervous system; special senses; hygiene of food, air, exercise and clothing; temperature of rooms; ventilation, etc. Anatomy of the skeleton, muscles, heart, lungs, stomach, etc., illustrated by models, charts, diagrams, and by the dissection of the organs of animals; use of the miscroscope.

Economic

#### ECONOMIC BOTANY.

The Course in Economic Botany is designed to show the use and application of wood in the Industrial Arts.

#### First Year.

(a) Structure and Growth of Wood-Cells and cell growth; woody fibre; tissues and their growth; exogens and endo-(a) Structure and growth; white cent growth; wondy here; tissues and their growth; exogens and entire growth; exogens, structure and growth.
(b) Elements of Forestry—Soil, varieties and formation; effect of trees on climate and soil; preservation of forests; distribution of timber in United States.
(c) Treatment of Timber—Cutting and seasoning; preservation; shrinkage; defects of timber; cause and remedies.
(d) Value of Timber—Cutting to the best advantage; selection of sound timber.
(e) Classification of Trees—Their specific properties; fuel value; strength; use in the arts.

#### THIRD.—COURSE IN MATHEMATICS.

The course includes :-

FIRST.—A review in Arithmetic and Mensuration.

#### First Year-First half.

Numerical calculations of the amount and cost of materials used in construction; the percentage of waste in the making of shop exercises; calculation of surfaces and volumes of the same, and the amount of wood or metal required in their construction; business forms and calculations; cube root; the metric system.

Second.—A Course in Algebra.

#### First Year.

Fundamental operations; fractions; equations of the firstde gree; equations of more than one unknown quantity.

#### Second Year.

Involution; evolution; inequalities; radical quantities; quadratic equations; ratio and proportion; progressions binomial theorem; series. Constant attention given to the use of algebraic formulæ as instruments of investigation in physics, chemistry, engineering, and mechanics.

Third .- A Course in Geometry.

#### First Year-Last half.

Definitions; perpendicular and oblique lines; parallel lines; triangles; quadrilaterals; polygons; circles; measurement of angles; constructions.

#### Second Year.

Theory of proportions; proportional lines; similar polygons; comparison and measurement of polygons; regular polygons and circles; constructions.

#### Third Year-First half.

Plane and solid angles; polyhedrons; spherical geometry; conic sections.

Throughout the course the applications of Geometry to drawing, construction, engineering, mechanics, and architecture, as a means of bringing the pupil to see clearly the true relation of principles and things, make this study an invaluable preparation for the varied duties and labours of life.

Fourth.—A Course in Trigonometry and Surveying.

## Third Year-Last half.

1. Trigonometry.—Fundamental formulæ; relation of Geometry to Trigonometry; angular magnitude in general; uses of tables of natural and logarithmic values; solution and area of right and oblique triangles.

2. Surveying.—Use and adjustment of instruments.

Area of triangular, polygonal, and irregular fields; interior and exterior stations; dividing land; establishment of meridian; triangulation.

#### BOOKKEEPING-Third Year.

The subjects of single and double entry are thoroughly explained and illustrated. Each pupil is required to write several sets, including, beside the principal books, auxiliary books and business papers.

The object is to present the subject in as simple and practical form as possible, so that each student can roadily apply it to his own affairs.

## FOURTH.—COURSE IN DRAWING.

The importance of Drawing in its application to Manual Training cannot be over-estimated. It is, in fact, the first step in manual training. Without drawing, the use of tools becomes a mere mechanical imitation, and has little value as an educational factor. From the conception of the idea to its expression in the concrete material, the drawing is the medium through which the mechanical processes are logically developed, and brought to a definite and practical form.

From the beginning, therefore, the pupil is taught to interpret working drawings, and to reproduce from them the indicated forms. He must understand the language in which they are described, and acquire by education and experience the ability to obey it.

While drawing underlies all industrial work, its application is not limited to mechanical action. Throughout all the departments, drawing is the common language used in explaining construction. facts, ideas, and principles. By means of historical, botanical, and topographical maps, literary and economic charts, geometrical and electrical diagrams, anatomical and geological sketches, the pupil graphically expresses the lessons taught in the class-room.

The Course in Drawing has three general divisions:-

First-Constructive drawing, as the basis of all industrial pursuits.

Second-Representative drawing, designed to educate the sense of form and proportion, to teach the eye to observe accurately and to train the hand to delineate rapidly the forms of objects.

Third-

Third—Decorative drawing, used as a means of cultivating the taste, and developing an appreciation and love of the beautiful

First Year.

- Constructive Drawing. (Mechanical)—Proper care and use of instruments; class study of the geometric facts of shape and size in typical solids; the method of representing and describing such facts applied in the preparation of free-hand dimension sketches of the exercises which are afterwards made in the shops; finished working drawings made to scale from them; orthographic projections; sections and intersections, and surface developments; lettering; conventional methods and technicalities in accordance with the best modern practice of the draughting-room.
- Representative Drawing. (Free hand.)—The analysis of forms singly and in groups, prepared for their accurate representation on paper, or the blackboard. Much practice is given in making drawings of various objects seen out of school, yet based upon the simple geometric solids, casts, and natural forms upon which the pupil has received instruction and practice in the school-room.
- Decorative Drawing. (Design.)—Elementary geometric design; straight lines, curved lines, and their combinations; geometric figures; elementary conventional design.

#### (Second Year.)

- structive Drawing. (Mechanical.)—Preparation of finished working drawings from free-hand dimension sketches, from blackboard drawings, and from dedicated directions; drawings of patterns and forge work to be used in shops. Shop tools and machine details—such as calipers, wrenches, pipe fittings, pulleys, details of engineering structures; parts of lathe; steam-engine, &c.; development of surfaces applied in preparing working drawings for tin smithing exercises. Constructive Drawing.
- Representative Drawing. (Free hand.) -Representation of the appearance of the rectangular and circular objects, with shades and shadows. Free hand drawing from simple casts and natural forms.
- Decorative Drawing. (Designing.)—Typical historic forms, and simple natural forms conventionalised; design to fill given space; borders and surface covering; principles of arrangement; repetition; alternation; cumulation; radiation ; symmetry.

#### (Third Year.)

- Constructive Drawing. (Draughting.)—Machine drawings, tracings, and blue prints made from blackboard and note-book sketches; drawings of steam-engine and electric motor to be used in the "projects" in the shops; isometric drawing; ornamental coloring and India ink shading with pen and brush; designing of screw threads, gear wheels and parts of machinery, from specifications; plotting of irregular mechanical movements.
- Representative Drawing. (Free hand.)—Advanced free hand drawing from models, casts, natural and historic forms; light and shade; coloring. Elements of linear perspective and the perspective of shades and shadows.
- Decorative Drawing. (Designing.)—Geometric, historic and conventional forms in design; analysis and conventionalisation of natural forms; designing of repeated pattern and repeated forms; planning of ornament. Applied design; analysis of colored designs; original designs in color and in relief.

## BUILDING CONSTRUCTION AND ARCHITECTURE.

#### (Third Year.)

The object of this Course is to familiarise the pupil with the typical forms, processes and principles of building construction, the elements of planning and design, and sanitary conditions; to present the subject of architecture from an historical standpoint, and combine therewith the comparative study of structural and ornamental features; and to cultivate the sense of and a taste for the beautiful in art and

Illustrated lectures, study of notes, drawings, charts, photographs, ornamental forms, reference books.

Study of existing buildings and structures, and the typical forms found therein, with special reference to the application of the principles of construction in stone, brick, wood, iron, etc.

Examination of buildings in course of erection for methods and processes; building materials.

Architectural Sketches and Drawings; blackboard illustrations; typical forms seen in buildings—structural and ornamental—figured sketches of the building selected by the pupil for set of architectural drawings—foundation and floor plans, elevation, vertical section, perspective view and details; study of historic ornament.

## Modelling in Clay.

## (Third Year)

Clay Modelling accompanies the more advanced work in drawing from casts and natural forms, and design in low and high relief. In modeling in clay, as well as in the carving in wood, it is the aim to give a better conception of form and proportion than is attainable on the flat surface.

Simple studies of ornamental forms from casts and carvings; modeling of single plant forms from nature; original designs

Modeling from designs, drawings, photographs, carvings, casts and nature.

## FIFTH.—COURSE IN TOOL INSTRUCTION.

In this department—which is the distinctive feature of the school—each exercise involves a mechanical principle, and the chief object of the instruction is the development of this principle, rather than a finished piece of work. The exercise has value only as it has rendered educational service during its construction. In the changing conditions of the thing in hand during its construction, there is a constant necessity for creating new means to meet new requirements, and the directive skill thus evolved makes manual training rise to the level of scientific or mathematical studies as a means of intellectual

Other values of a specific nature—accuracy of measurement, precision of adjustment, delicacy of manipulation, exactness in every particular-must be taken into account in estimating the educational value of manual work.

All the articles made in the shops are required to be of precise forms and dimensions given in a drawing made by the pupil himself previous to taking up the exercise. The aim is to teach the pupil to express his thought in a concrete form with the least waste of material, in the most workmanlike manner and in accordance with the most approved methods.

## (First Year.)

In the wood shop in the first year the pupil begins by laying out his work on a piece of rough board; he then proceeds with various exercises in sawing, planing, squaring, chiscling, mortising, mitring, nailing and dovotailing—receiving in the meantime lessons in the design, structure, and use of tools.

Running parallel with the work in joinery, and occupying the same length of time, is a course of vise-work, which includes chipping, filing, and fitting of plane and curved surfaces.

#### (Second Year.)

In the second year the course in wood-work is continued in a series of exercises in pattern-making, which are afterwards used in the foundry in moulding and casting. In connection with pattern-making, the pupils are taught wood-turning.

In the manipulation of wood and cold iron, the material will wait for the pupil to exercise his judgment as to the best method of doing the work. In the forge shop, however, where hot iron is to be manipulated, quickness is an essential requisite, the necessity of "striking while the iron is hot" being imperative. As a preliminary step, the processes involved in forging are first worked out in lead. The operations are then performed in hot iron in a series of exercises in drawing out, upsetting, shaping, bending and in the making of rings, bolts, chains and tongs. Welding and the tempering of steel follow; and, at the end of the second year, each pupil is required to make the chisels and a set of turning tools for his third year's work in the machine shop. A short course of tinsmithing and brazing is also taken up the second year.

## (Third Year.)

In the third year, the principles taught the first and second years are practically applied to mechanical construction. In the wood shop, each pupil is required to make one or more models, such as planes, pulleys, parts of machines, etc. In the machine shop is a course of vise-work involving the chipping, filing, and fitting of curved and plane surfaces used in machinery,—and also a course of iron turning. As a final exercise, the class will be required to make from their own drawings and measurements, as a "project," a steam-engine, a dynamo, or some other machine.

A course in wood-carving forms a part of the work of the third year.

#### TEXT BOOKS.

Rhetorio—Kellogg.
English Classic Scries—Clark & Maynard.
Shakespeare—(Rolfe's edition).
American History—Scudder.
General History—Barnes.
American Politics—Johnston.
Social Science—Steele.
Government of the People of the United states—Thorpe.
Physical Geography—Houston.

Elements of Physics—Gags.
Chemistry—Remsen.
Physiology—Dunglinson.
Arithmetic—Graded Problems.
Geometry—Wentworth.
Algebra—Loomis.
Trigonometry—Wentworth.
Book-keeping—Meservey.

## EQUIPMENTS.—SCIENCE DEPARTMENT.

## CHEMICAL LABORATORY.

Apparatus and reagents for the experimental illustration of general Chemistry. A laboratory equipped with the customary apparatus and chemicals for qualitative analysis for 17 students.

#### PHYSICAL LABORATORY.

Working table, with gas, pneumatic trough, etc. Apparatus for the illustration of the principles of pneumatics, hydrostatics, acoustics, optics and electricity, including air-pump, syphons, vacuum fountain, bellows, blast furnace, sonometer, tuning forks, organ pipes, lenses, porte-lumière, prisms, batteries, magnets, electro-motors, galvanometer, telegraphic instruments, frictional apparatus, etc.

#### GEOLOGY.

A collection of the more common minerals, rocks and ores. Globe and charts.

## ELECTRICAL LABORATORY.

The apparatus in the Electrical Laboratory includes one Maxim and one Hochhausen dynamo; one Tabor steam indicator; one Prony friction dynamometer; four Julien storage batteries; fourteen Brush storage batteries; other secondary and primary batteries of various kinds; ammeters and voltmeters; tangent and other galvanometers; rheostats for large and small currents; voltameters and standard batteries; one Troemner balance; electro-plating, telephone and telegraph apparatus; incandescent and arc lamps of various kinds; switch-boards, fusible plugs, and cut-outs; electric bells, annunciators and gas-lighting apparatus; wire, tools, and necessary fixtures for carrying on the practical work of the Course.

## DRAWING ROOM.

Drawing desks for 50 pupils. Drawing boards, T squares and triangles for 325 pupils. Models of fundamental geometric solids,—cylinders, cones, cubes, prisms, etc. Blue-print frame, papier-mache casts charts of typical forms and styles, etc.

# Modelling Room.

Tables and modelling tools for 17 students. .Two troughs for clay.

MECHANICAL

## MECHANICAL DEPARTMENT.

Wood Shor.

Sixty cabinetmaker's benches, 8 speed lathes, 2 grindstones; bench, lathe, and general tools for 60 pupils; carving tools for 17 pupils.

FORGE SHOP.

Twelve forges, 12 anvils; tongs, bammers, etc., for 12 pupils.

TINSMITHING COURSE.

Five Bec't-horn anvils, 1 furnace, shears; soldering tools for 5 pupils.

FOUNDRY.

Trough, flasks, sieves, trowels; moulding tools for 5 pupils.

METAL SHOP

Forty-three vises, 3 iron turning lathes (one with screw-cutting gearing); lathe and vise-tools for 43 pupils; grind-stone, surface-plates.

Power is supplied by an 8 horse-power engine, with 12 horse-power boiler.

The recitation rooms are furnished with the usual appliances.

## RULES FOR ADMISSION.

1. Promotions to the Manual Training School shall be made at the close of the June term from the Twelfth Grade of the Boys' Grammar, Consolidated, and Combined Schools; but no boy shall be promoted who is under 13 years of age.

The Committee on the Manual Training School shall designate the time of holding the examinations for promotion, and make all necessary arrangements for the same.

- 2. It shall be the duty of the Principals of the several Boys' Grammar, Consolidated, and Combined Schools, to certify to the Superintendent of Schools the names of all boys of the proper age who have finished the Course of Study in the Twelfth Grade, and are desirous of promotion to the Manual Training School.
- 3. The examination for promotion to the Manual Training School shall be under the direction of the Superintendent of Schools, who shall be assisted by a sufficient number of Principals of Boys' Grammar, Consolidated, and Combined Schools, to be designated by the Committee on the Manual Training School.
  - 4. The examination for promotion shall include: -

READING.
SPELLING.
LANGUAGE.
WRITING.
ARITHMETIC.

GEOGRAPHY.
UNITED STATES HISTORY AND CIVIL
GOVERNMENT.
SCIENCE LESSONS.
Drawing.

A minimum average of 50 per cent, shall be required in Reading, Language and Arithmetic; and a general average of 65 per cent, in all the branches.

5. The number of pupils to be admitted from any school shall be the pro rata of the number from that school who pass the required examination to the whole number who can be received into the Manual Training School. Schools having more pupils who have passed the examination than can be received, shall have their respective surplus number of pupils admitted pro rata to the aggregate number of vacancies in the Manual Training School, as the same may occur.

The pupils of each school shall be admitted in the order of their averages.

# RULES FOR THE GOVERNMENT OF THE SCHOOL.

The daily session of the school begins at 9 a.m. and closes at 2.30 a.m., with an intermission of twenty-five minutes at 12.25.

The school year is divided into three terms, ending respectively about Christmas, Easter, and Commencement. The results of examinations, held during the term or at its close, combined with the instructors' knowledge of the character of the daily recitations, determine the advancement of the pupils. Regular quarterly reports of the proficiency of the pupils in each branch are made to the parents.

The first consideration of the pupil is the work of the school, and it is expected parents will give their hearty ec-operation and support, and not permit trifles to interfere with regular and prompt attendance.

The spirit of the school is that of carnest, faithful and self-directed work. By avoiding cramming, class-ranks and "markings," the school stimulates the student to do his best without appealing to his selfish interests.

Pupils whose influence is found to be injurious will be dismissed from the school, and those who fail to make good progress in their work after reasonable trial, will be required to withdraw.

Pupils are required to furnish their own drawing instruments and aprons, the expense of which will average about 5 dollars to each pupil. The Drawing Instruments are to be of a uniform kind, prescribed by the Committee on the School. Books, paper, shop-tools, and all other materials are furnished by the School. Losses and damages are charged to the pupils when they are the result of carelessness.

## APPENDIX E.

## MANUAL TRAINING-THE ALBANY REPORT ON MANUAL TRAINING.

The following report is that presented on October 3rd, 1887, to the Board of Public Instruction of Albany, N.Y., by a special committee—of which the Superintendent of Schools was a member—appointed to investigate and report as to the advisability of introducing manual training into the public schools of that city:—

To the Board of Public Instruction,-

Your committee, to which was referred the resolution to investigate and report as to the advisability of introducing manual training in the public schools, beg leave to submit the following report:—

No subject is receiving greater or more serious consideration in the educational world at the present time than that of manual training. Those who have the interest of our common school system at heart are giving their attention to a subject which it is believed is destined to have a marked effect on the future of our schools and the industrial relations of our country. The manual feature in education is old in theory, but new in application. Success has attended its introduction in the schools of Europe and this country, and your committee feel that they are not treading on uncertain ground, and that the conclusion which they have reached is fortified by the experience of other places.

## WHAT IS MANUAL TRAINING?

A mistaken idea is prevalent as to the meaning of manual training, it being confounded with the trade schools of the country, and much of the opposition which has been expressed to the system has been upon the theory that it was designed to teach trades. Not so. It is not intended or desired to give instruction in any particular trade to the exclusion of others. Trade schools are confined to particular branches; manual training is more comprehensive, and takes in all. The prime object is the education of the mind, and of the hand as the agent of the mind, and to impart knowledge of such working tools and materials as are found in the great industrial pursuits of the world. To lay the foundation for mechanical pursuits, the same as our present literary system lays the foundation for professional and literary pursuits, and to be an important adjunct in all mercantile callings, so that when our boys graduate they will not be obliged to live by their wits alone, but will have the benefit of a dexterous hand directed by an intelligent brain. Instruction in the use of the common working-tools does not necessarily teach them to become mechanics any more than instruction in Latin and Greek teaches them to become lawyers or physicians. Its work is preparatory, not final. If it is desired to become a skilled artisan in any trade other avenues must be entered; manual training is but the beginning. To use a much-quoted expression, it is "putting the whole boy at school," and educating him on all sides, giving him a better mental and physical preparation for life's work.

## THE HISTORY OF MANUAL TRAINING.

The fundamental principles of manual training were first enunciated by Pestalozzi and Froebel a century ago, when they first suggested object teaching, but it has not been until within the last twenty years that any decided attempt has been made to bring the manual and intellectual into intimate relation. The Imperial Technical School at Moscow had the honor of being the pioneer in this field in 1868. The great benefits derived from such a course of instruction were soon seen, and manual training schools quickly sprang up in many of the other countries of Europe. In 1876, at the Centennial Exposition in Philadelphia, the exhibit of the Moscow school attracted the attention of Professor John D. Runkle, of Boston, who soon after adopted the main features of the Moscow system in the Boston School of Technology. This was quickly followed by the opening of training-schools in St. Louis and Chicago, and so rapid has been its growth that to-day it is taught in a greater or less degree in two-thirds of the States of the Union.

# ITS ADVANTAGES.

# 1. A wider field of occupation to choose from.

Our present system of teaching is entirely subjective. Our boys are taught the theory, but not the practice; their heads are crammed with a mass of facts and figures which they find difficult to apply; they know how a thing should be done, but cannot do it, and when called upon to decide upon their future course they find themselves at a loss. One side only has been educated; the brain acts, but the hand is powerless. They can write an excellent essay; they are well grounded in classical and English literature; they understand the principles of science, but they have not the power to give form and expression to their knowledge, and they are often diverted into avenues of employment where failure alone awaits them, whereas, if the opportunity had been afforded of applying the theory, and a wider scope had been given to exhibit their natural aptitude, the problem of the future would have been solved, and they would have sought the paths of success.

Our schools every year graduate those who turn from the workshop and the bench and go to swell the multitude of poorly-paid scriveners and professional men, while the more lucrative positions by the bench and the forge are filled by those from other countries. What else can be expected when our young men themselves do not know their own capabilities, and their parents know even less? It is our duty to develop the whole boy, and to give the opportunity of displaying the natural capabilities of our pupils, so that when they leave our schools to enter upon the active duties of life their choice of occupation shall be certain and unerring.

## 2. A sounder judgment of men and things.

The poor judgment of literary men in the practical matters of life is well known. They live in an ideal world, surrounded by books, and when they are brought face to face with the common every-day affairs their judgment is at fault, and they seem to be wanting in plain, practical common-sense. The application of the abstract to the concrete, of the lessons in the book to material objects, develops the 138—2 F

perceptive faculties. The heated iron must be bent in shape by quick, vigorous blows, and the black-smith must use his judgment to tell when it is in proper shape; the stoneworker must exercise his judgment as to the force to put in his blows; the carpenter, in the fitting of a joint, must use his eye, hand, and judgment. Mental science may teach what judgment is in the abstract, but the hammer, chisel, and plane will give practical expression of the faculty. The boy that can exercise good judgment in material work will soon learn to exercise it in all practical problems involving the animate and inanimate.

## 3. A better intellectual development.

The argument has been sometimes advanced that by making manual training a part of the course of study the literary part is slighted. This is an erroneous impression, and one which has not been borne out by the experience of cities where such a system has been adopted. On the contrary, it has been incontrovertibly proven that the combining of the manual with the intellectual does not lower the literary standard of the school. It affords a pleasant relief to the routine of class-room work and the constant exercise of the memory in abstract problems. Three or four hours a week in the shop will produce marked results, and will keep up the boy's interest in his books by this pleasant change. Intellectual development is not to be measured by the length of time passed in the class-room. One hour of active interest in the work is worth more than five hours of indifference. If the interest is only kept up by a change from the class-room to the shop, one great point in a boy's rapid intellectual development has been gained. But the workshop is not a place of unthinking work. It is there the boy is giving tangible expression to his class-room knowledge. As he uses the hammer, the chisel, and the plane, he must study cause and effect. The finished work is the end to be gained, and as he fashions and moulds the rough piece his judgment and reason act in unison with his hands. As has been very beautifully expressed by one writer, "The body and mind act and react upon each other, and any act is a thought expressed, and the application of the hand and eye to systematic and artistic pursuits produces a reflex benefit to the mind of the worker."

### 4. The Elevation of Labour.

Our counting-houses and offices are overrun with an army of copyists, who have graduated from our schools, and who have avoided the factory and shop. The wide field of mechanical pursuits has not been entered by our American boys, but has been left to those from other countries, and a very large majority of the lucrative positions in our manufacturing establishments are filled by comparatively recent arrivals from foreign shores. Is not our educational system at fault? Are we not to blame for the surplus on one side and the void on the other? Have we not rather educated our boys for the so-called genteel employments of life and neglected the more practical? The dignity of labour cannot be impressed upon our young men by essays alone; example, also, is needed. If tools were placed in our schools, and our boys perceived the necessity of intellectual effort to properly use them, the smoke-begrimed mechanic with his dinner-pail in his hand, returning from his day's work, would be something more to them than the embodiment of brute strength. By being brought into daily contact with the implements of toil, and a participation in their use, they would beget a respect for the dignity of labour, which, it is feared, is not entertained now. An eminent French statesman lately said, "Caste ideas would vanish when tools were found in schools alongside of maps and books, and the nobleness of manual labour would be perceived and concord would be spread."

## The necessity of Manual Training.

Great advances have been made in different kinds of machinery and in applied science in the last quarter of a century. On all sides various improvements have been developed; new fields of employment have opened up; the various uses to which electricity alone has been put has called for a large class of skilled mechanics, yet the old subjective style of education has been pursued as caimly and evenly as if there was no such thing as an electric wire. That our present system needs strengthening, and that greater opportunities should be given for the development of our boys and girls, is evidenced by the interest which the Press of our city has taken in this subject during the past year, and the articles which have appeared from time to time. The great exponents of popular sentiment have been knocking at our doors, and urging us to adopt some method by which our boys and girls will be better fitted to engage in life's work. We have been slow to respond, but your committee believe that the time has come when the experiment should be tried. They do not desire to be understood as in any degree belittleing the present system of education, but believe that in this age of progress, when there have been such immense strides made in the modes of travel, when the invention of new machinery has revolutionised the methods of manufacture, an equal advance should be made in the methods of education and a broader field should be cultivated, and that an effort should be made to direct the attention and interest of our boys in our important industrial concerns has turned the public eye upon our schools for a remedy. The apprenticeship law still exists upon the statute book, but investigations, by those in a position to learn, show that it is practically a dead letter. Under the old system, when a boy was apprenticed, he was taken into the family of his master, sheltered by the same roof, fed at the same table, was present at all the business transactions of the master, and was taught every branch of a trade; under the present sys

Statements from other public men have been to the same effect, and it seems to be the general opinion that our public schools shall find the solution of our present labour troubles. The Commissioner of Labour Statistics last year sent out circulars to trades unions throughout this and other States, and to all the principal schools in this State, seeking information on the subject of manual training, and it is gratifying to know that a decided majority were in favour of adopting the new system.

gratifying to know that a decided majority were in favour of adopting the new system.

Twelve years ago the Legislature of this State took an important step in the direction of manual training by passing an Act making industrial drawing a required study. The wisdom of such a course has

been demonstrated by the steady improvement which has been made in this art in our schools; and as drawing is the basis of manual training, we are, in a measure, prepared to take the additional step and

give shop instruction.

In most of the cities where the manual feature has been introduced in the schools, the kitchen and the sewing-room for the girls have held an equal place with the bench and forge for the boys; but your committee, influenced by the conservative spirit which has always governed the action of this Board, have deemed it wise to express their conclusion affecting but one branch of the subject until the experiment has been tried and its success established.

Your committee, therefore, recommend the adoption of the following resolutions:—

Resolved, That it is expedient and advisable that manual training be added as a part of the course of instruction in our public schools.

Resolved, That for the purpose of giving the new system a fair trial, in the most economical manner possible, one of the rooms in the basement of the High School building be fitted up as a woodworking shop; that a competent instructor be employed to teach the boys in attendance at the High School in the proper use of wood-working tools for a period of one year, the total cost not exceeding 1,500 dollars.

Resolved, That the foregoing resolutions be adopted as the sense of this Board.

## APPENDIX EA.

# PROGRESS OF MANUAL TRAINING AT ALBANY, N.Y.\* BY SUPERINTENDENT CHAS. W. COLE.

The rapid strides made by the new element in public education called by common consent, manual training, are shown by the fact, lately ascertained by an educational journal, that forty-four of the leading cities of the country have introduced it in some form. The presence of manual training in these schools is justified by its most intelligent promoters on educational grounds only. The distinction between manual training and technical education is sharply drawn. The latter seeks to impart that special skill manual training and technical education is sharply drawn. The latter seeks to impart that special skill that results in the acquirement of a trade, and has no justifiable place in a scheme of instruction at public expense. The object of the former is "to add to the pupil's power of expression by verbal description, the powers of expression by delineation and by construction." The indirect social and economic benefits derived from turning the attention of pupils towards mechanical pursuits and from the fostering of a higher appreciation of the value and dignity of labour, may be properly and forcefully dwelt upon, but they do not alone vindicate the adoption of manual training in a public school system. As has been truly said: "The schools are not established for the purpose of teaching scholars how to make a living, but to teach them how to live. They are not to teach trades, but to educate." but to teach them how to live. They are not to teach trades, but to educate."

Having accepted these conclusions as a basis of action, your special committee recommended and the Board adopted the following resolutions in October last:

Resolved, That it is expedient and advisable that manual training be added as a part of the course of instruction in our

public schools.

Resolved, That, for the purpose of giving the new system a fair trial in the most conomical manner possible, one of the rooms in the basement of the High School building be fitted up as a wood-working shop; that a competent instructor be employed to teach the boys in attendance at the High School in the proper use of wood-working tools for a period of one year, the total cost not exceeding \$1,500.

Pursuant to these resolutions the appropriation was duly made, the workshop fitted up, and in January last the classes were organised and the course opened.

The shop was furnished with twelve double work-benches, giving ample space for classes, or divisions, of twenty-four boys each. Twenty-four kits of tools were provided, each consisting of the following :-

I wooden jack-plane,	1 Bailey iron fore-plain,	1 Bailey block-plane,
1 try-square,	1 back faw.	2 gauges, ½ and ¾ in.,
5 socket chisels, \frac{1}{4} to 1\frac{1}{2} in.	1 oil stone,	1 oil can,
1 hammer,	1 marking gauge,	1 mortise gauge,
1 sliding T level,	1 screw-driver,	1 pr. winged dividers,
5 augur bits, 1 to 7 in.,	1 2-foot rule,	1 brace,
1 mallet,	1 cutter board,	1 duster.

The following tools for general use were also furnished: - Counter-sink, brad-awls, files, gimlet bits, four cross-cut saws, four rip saws, one set of numbers and letters to mark and distinguish each pupil's work, one dozen iron hand clamps, brass stencil to mark aprons and hooks, six saw benches, a grind-stone and a saw clamp.

A lavatory of twelve basins and ample toweling permits each division to wash and dry hands in a moment, while each pupil provides himself with a long work-apron to protect his clothing while at the bench.

The cost of fitting and furnishing the shop was as follows:-

Twelve double	work-bene	ches			***	1.,	101	146		***		\$156	00
Tools Materials	***	٠,	•••	***	***					***		251	15
T 1.		• •	***	***	***	1+1	141	***	***	***	***	14	
Carpenter and	 Maintina 1	 .:11	• • •	***	***	• • •	***	1-8	***			140	
our perioes and	banting p	itria	***	•••	***	• • •	***	***	4+4	***		23	00
											•	\$584	66

We pay the special teacher \$800 a year. We estimate that materials, tools, and supplies of all kinds will not cost more than \$200 a year, so that the running expenses of this shop, giving instruction to 250 boys, will be about \$1,000 a year. It is a noteworthy fact that in five months the breakage amounted to just 24 cents. A more extended plant reaching out into metal working, forging, lathe-work, moulding, and similar lines will require additional expenditure. It is hoped that the Board may soon be able to make the necessary appropriation.

The shop was opened for class work in February. The boys of the First and Second years were required to join in this work, but those of the two upper classes were permitted to volunteer. Much to the surprise of the teachers, every boy in the school announced his desire to take the new course, and before many weeks had elapsed the senior boys, conscious that their time was limited to the few weeks of the left before their graduation formed a special class to take largery after school beyon and on school left before their graduation, formed a special class to take lessons after school hours and on Saturdays, thus giving the strongest evidence of their high appreciation of the chance offered them of getting even a brief course in manual training.

Our course of procedure in instruction is briefly this: The drawing teacher exhibits an object to the class; the pupils make a working drawing from the object, carry the latter to the shop, and from it reproduce the object in wood. Of course, this is preceded by a sufficient number of lessons in the use of tools to enable the pupils to work readily and intelligently. Principles of construction are taught, as well as the most general use of tools. Nothing is made for use or for sale. Some specimens of work are kept to illustrate the work of the shop; the rest are either used over in the preliminary course in the use of tools, or are broken up and destroyed. From

From our brief experience we believe that it is established that manual training is legitimate educational work in our schools; that the tendency is to keep boys longer in school; that its effect is to round out the development of the pupil; that it promotes good order and discipline; that it has a moral force; and that it dignifies manual labour by removing false notions of degradation.

Having reached these conclusions from our short trial with the boys, it remains to decide what plan should be adopted to give the same training to the girls.

Believing that this line of work is strictly educational—that it develops the judgment and executive faculty better than any plan hitherto used—the logic of the situation requires that a similar line of opportunity should be opened to the girls.

While in a few places the girls are put in the shops, and given the course so successful with the boys, and while much that is forcible could be said in favour of such a plan, the general practice has been to limit the course for girls to sewing and cookery.

It seems to me that if sewing were introduced, it would be best to use it in the Grammar schools. To do this systematically and completely, two or more special teachers would be needed to give as little as one lesson a week in all the grammar grades. The High School pupils are of an age and from surroundings such that would make instruction in ordinary sewing generally superfluous.

With my present light I am not prepared to advise the introduction of any specialised form of manual training in the Primary and Grammar schools. We have drawing in all grades, and with a few modifications this, the foundation of manual training, will accomplish its office of preparation. In the lowest primaries we have Kindergarten methods, with constant instruction in form, color, modeling in clay and sand, etc., which need only to be extended on the same lines, as the complements of drawing, to form a good preparatory course for shop work in the High School grades, at which point the pupils have attained a physical and mental maturity that will enable them to handle real tools with effect.

I would prefer a line of work with cutting tools, for instance, modeling and designing followed by wood-carving, for the girls; but a more complete preparation in the Primary and Grammar schools than we have now, should precede any attempt to place such a course in the High School where alone it can be well managed.

The special line of manual training for girls that has met with the greatest favour thus far is scientific cooking. Conducted entirely upon an educational plan, illustrating important principles of physiology, hygiene, chemistry and biology, as well as the incidental instruction in domestic economy, I feel that this course is really the only one open to girls at present. The presentation of the physiological facts of the constant waste and the need of as constant repair of the tissues of the body, the investigation of the elements that best conduce to that repair, their proper preparation, the chemical changes effected in cooking, the selection of healthful and wholesome foods, the skilful manipulation of utensils, the acquirement of deftness in deciding proportions, all may be made to lead to the development of well-grounded, intelligent women. They will not be trained cooks, though well prepared to become such; they will be instructed "how to live, not how to make a living."

## APPENDIX F.

#### THE ST. PAUL REPORT ON MANUAL TRAINING.

The following report from the Committee on Manual Training was presented to the Board of Education of St. Paul, Minnesota, on February 6, 1888, and adopted by the Board:-

To the Board of Education:

Gentlemen: Your Committee on Manual Training, after a careful consideration of the work begun and now going on under its charge, desires to report its views of it, and also of the ends to be attained in the progress and extension of the present experiment. This report does not assume to be a dogmatic answer to the many difficult questions which attend the introduction of manual training into courses of study for public schools—indeed the various and conflicting opinions of members of the committee limit the extent of the common ground upon which they could agree. Its design is to direct public attention to what the Board purposes to do in this department in the future, and to elicit public discussion from

which good may come.

In the beginning it is assumed that there is entire unanimity as to the desirability of making the instruction of the schools practical, and that there is a strong public sentiment in favour of manual training as a part of the course of study, although differences of opinion may exist as to the best means for co-ordinating the new with the old and traditional training now in vogue. The thought for some time seems to have been prevalent that our schools have too much to do with words and the memorizing of symbols and too little to do with things: that the education of our youth should include a training to symbols, and too little to do with things; that the education of our youth should include a training to express thought by the labour of the hand as well as well as to express it by language. Coinciding in these views, the committee gave little thought to the question of the desirability of giving our pupils an opportunity for manual training—indeed the work already in progress had decided that question for our city—but passed at once to the consideration of the best means to accomplish the end decided to be desirable.

We find that at present a room in the basement of the high school has been fitted up with benches, tools, and necessary appliances to accommodate pupils in wood-work. That pupils of the high school five classes of boys and three of girls, numbering twelve pupils each—are admitted, the boys taking two lessons of one and one-half hours each and the girls one lesson of the same duration per week. The committee were unanimously of the opinion that two mistakes had been made in the experiment commenced last September. One in attaching it to the high school as a department where, before, courses of study were full, and thus making work here additional to that which in the judgment of some was already too heavy. Manual training, if introduced properly into our schools, must take the place of something less important and practical. One or two lessons per week in shop-work taken by pupils who are already pursuing an exacting course of study will scarcely meet the end proposed by the friends of the new education. As now in operation, the manual experiment has little opportunity for future development or increased usefulness.

It seemed, too, that the appropriate training for the girls was in the line of household duties, the art of cooking, and the use of woman's 'universal implement,' the needle, rather than the tools of the

carpenter's bench.

As to the ultimate future of the movement which is finding expression in many manual experiments in the school systems of our larger cities, it is believed that courses of study will be modified, that much that is unnatural will give place to rational training. Primary schools will train children to observe and express their notions in clay and with the pencil, as well as abstractly in language. This will be the manual training of the primary grades. In schools between the primary and the high school there will be less drill in the technicalities of grammar, less memorizing of the details of geography, less puzzling over abstractions and more teaching which shall bring pupils into contact with material things and forces, and which shall give them ability not only to express thought by language, but by the graphic and creative work of the hand. This will be the manual training of these intermediate grades. Then would come the manual training school, which would and pupils from the eighth or even a lower grade if experience should show it to be desirable, but at least at an age when they could profitably take up the work of the school. In this school pupils who desire to advance on this line rather than to enter the high school would take a three years' course of study, including the studies of English, mathematics, and science, with two hours' shop-work per day and one hour instruction in drawing.

The foregoing is an outline of what, in the judgment of the writer of this report, should ultimately grow out of our experiment in manual training for the benefit of the boys, although upon all points the members of the Committee were not in accord. It is not a scheme which would turn our public schools into trade schools. It would not revolutionise our school system. It does not establish a work-shop in each school building, but economically gathers from all the schools those of a proper advancement who desire to complete the course in one school where mental and manual training go on together. It answers those who ask: Should not manual training be a part of a good education, whether that education be restricted to the common school, or carried to the highest discipline of technical schools and universities, by pointing to the manual work in drawing, and applied kindergarten training of the primary schools, to the original designs and the constructive work in different materials of the intermediate grades? It recognises the importance of carrying forward manual training simultaneously with all other educational processes, but provides suitable training for different grades, reserving shop-work and the use of

wood and machine tools for pupils who have completed or nearly completed the grammar school course.

In accordance with the idea thus presented there would be no necessity of large expenditures.

The present facilities, with those that will be furnished by the addition to the high school, now in process of erection, will answer for the present, and the ideal manual training school will be a natural growth and

development of the work now in progress, if it be properly fostered.

Having presented a possible though somewhat distant future of the work under the charge of the Committee, we desire to present our recommendations effecting its more immediate outlook. For the remainder of the present school year we recommend the continuance of the present order of things. recommend that this Committee be authorised to prepare and submit a course of study covering a period of three years, to include the studies of English, mathematics, science, drawing, and shop-work.

at the end of the present school year pupils who have finished the work of the grammar schools may be admitted to either the high school or the manual training school. That the manual training school for the present be located in the basement of the high school building, its pupils reciting in English, mathematics, and science, in the same classes and to the same teachers as the pupils of the high school.

It seems important to the writer of this report that there should be no organic connection between the high school and the manual training school. Such a connection would hamper the latter in its development. If experience should show that it would be best to admit pupils to the manual training school from lower grades than those of the grammar schools, the change could then be made without disturbing the gradation of the high school.

With regard to special training for girls, awaiting definite results from cities where expensive experiments are in progress, the Committee recommends that for the present the Board rests the matter with the general training given to all the pupils, both boys and girls of the grade schools.

Respectfully submitted,

B. F. WRIGHT,

Chairman.

Chairman.

### APPENDIX G.

COOPER UNION, FOR THE ADVANCEMENT OF SCIENCE AND ART, NEW YORK CITY.

Rules and Regulations of the Free Night Schools of Science and Art, Cooper Union.

President-Edward Cooper; Secretary-Abram S. Hewitt; Trustees-Edward Cooper, Abram S. Hewitt, Wilson G. Hunt, John E. Parsons, Daniel F. Ticmann; Director—Geo. W. Plympton, A.M., C.E.

1. The Night Schools of the Cooper Union are organised in two sections, called respectively the Scientific Department and the Art School.

The term for the Scientific Department commences on the 1st of October, and ends on the 15th of

The corresponding dates for the Art Department are three days later.

2. Application for admission may be made in person or by mail, at the office of the Cooper Union, from 8:30 a.m., until 5 p.m., beginning June 15th, not before. Old students wishing to continue the course, may be registered before the close of the term, upon recommendation of their teacher. Applications do not hold good from one term to the next, and those failing to be admitted, must renew their application the first week in June, for the following term. Such applicants will receive the preference over newcomers.

3. After the commencement of the term, applications may also be made to the Director in his own

room, on the fifth floor, on Monday and Tuesday evenings, from 8:30 to 9:30.

4. Each applicant for admission must be at least 15 years of age. Residence in New York City is not a necessary condition of admission. A letter of recommendation from his employer is regarded as desirable.

5. Ladies are admitted to any of the classes in the Scientific Department for which they are fitted, but to none of those in the Art School, except the class in perspective drawing.

6. As the number of applications for admission to the elementary classes of the Art School is largely in excess of the number that can be admitted at once, it becomes necessary for the later applicants to wait until vacancies occur. They are then admitted strictly in the order of their applications. Pupils who obtain an admission ticket to a class for which they are not fitted, are referred back to the Director by the instructor of the class. They are then entered as applicants for the lower class, if they so desire, but are subjected to the same conditions as new applicants of the same date.

7. Any pupil absent three times without a satisfactory excuse, forfeits his position in the school.

Pupils absent for sufficient cause, and who wish to retain their position, should report to the Director,

either in person or by writing, before three absences have been recorded.

- 8. No pupil can leave the school while his class is in session, except with the permission of his instructor.
- 9. For any breach of good behaviour, or violation of the regulations of the school, a pupil will be immediately suspended, and reported to the Trustees for dismissal. Cleanliness in person and habits is

strictly required.

10. Pupils are enabled to purchase at the school all the text-books and drawing materials they require, at prices lower than the retail rates.

#### SCIENTIFIC DEPARTMENT.

11. The regular course of study requires five terms for its completion, and to those who have successfully completed it, the Cooper medal and diploma are awarded. The following is

#### The Regular Course of Study.

Class E, first year: - Algebra, geometry, natural philosophy, and elementary chemistry.

Class D, second year:—Algebra, geometry, elementary chemistry, and astronomy.

Class C, third year:—Trigonometry, descriptive geometry, analytical geometry, mechanics, and geology.

Class B, fourth year:—Analytical geometry, differential and integral calculus, and mechanical drawing.

Class A, fifth year:—Applied mechanics.

Chemical analysis is an optional study for members of class A. There is a charge of 10 dollars for

chemicals used, and 5 dollars deposit for breakage.

12. Applicants for admission to algebra, class E, must have a thorough knowledge of arithmetic. To enter class D, applicants must have studied as far as quadratic equations in algebra, and as far as the fourth book in geometry. To enter class C, B, or A, applicants must give satisfactory evidence of proficiency in the preparatory studies. Pupils are permitted to select any single subject for which they are prepared, and to omit all the others, if they desire.

13. The subjects of chemistry, natural philosophy, astronomy and geology, are presented during the first part of the term in the form of lectures, to which visitors are admitted without tickets, provided they

enter at the appointed time, to remain till the close of the hour.

14. The following text books are now used in the school:

Davies' University Algebra. Davies' Legendre's Geometry and Trigonometry. Dana's Mechanics. Avery's Natural Philosophy. Avery's Chemistry. Wentworth's Analytical Geometry. Taylor's Calculus. Dana's Geology. Fresenius' Analysis. Kiddle's Astronomy Twisden's Applied Mechanics.

15. The evening session begins at 7.25 and ends at 9.30. An intermission from 8.25 to 8.30 affords

an opportunity for change of classes, and for pupils to enter or leave the class rooms.

16. Examinations of the scientific classes are held during the second week in April. Those students who have been regular in attendance, and pass the examination creditably, receive a certificate of proficiency

17. Pupils who have not pursued the regular course, but have successfully completed a single study will receive a certificate thereof.

The following are the studies pursued in the Scientific Department:—

Algebra, Analytical geometry, Geometry, Natural philosophy, Elementary mechanics, Trigonometry,

Chemistry, Differential and integral calculus, Applied mechanics, Astronomy,

Geology, Descriptive geometry, Analytical chemistry, Mechanical drawing, Electrical Measurements.

## ART SCHOOL.

(The conditions of admission and membership are specified in sections 1 to 10 of the foregoing rules and regulations.)

18. Each of the art classes is in session from 7:30 to 9:30, and, with the exception of the cast, perspective and elementary mechanical drawing classes, each is divided into three sections.

The sessions of the first section are Mondays and Thursdays.

The sessions of the second section are Tuesdays and Fridays. The sessions of the third section are Wednesdays and Saturdays.

The cast class is in two sections only, the first meeting Monday, Wednesday, and Friday; the second meeting Tuesday, Thursday, and Saturday.

The perspective class is in two sections, one meeting on Wednesday and the other on Saturday. One section of beginners in mechanical drawing forms a class, meeting on Wednesday and Saturday.

19. At 7:30 the gate on the third floor is closed, and pupils are not admitted until 8:25, unless pro-

vided with a pass from the Director. At 8:30 the gate is again closed, and remains closed until 9:30.

20. During the last week in May, the reception of the pupils of the School of Art is given, for which they are required to deliver during the term to their instructors, any drawing which the latter may deem worthy of exhibition. The drawings, however, are in all cases the property of the pupils, and will be returned to them at the close of the reception. The trustees reserve the right to retain at least one drawing from each pupil if they so desire.

The several classes of the Art School are as follow:--

## Rudimental Drawing.

This is the class for beginners in freehand drawing from copy or simple models. The lower divisions of the class copy simple ornamental designs, and the more advanced are engaged in figure drawing, copying lithographs of human heads.

## Ornamental Drawing.

Pupils require the preparation of at least one term in the rudimental class or its equivalent before entering this class. The work consists in drawing with pen or pencil the more intricate ornamental forms employed in decoration.

# Decorative Designing.

This class is intended to aid a large class of young artisans whose work requires the frequent invention of ornamental forms. The class are specially instructed in combining simple figures to form ornamental patterns. The practice involves some geometrical drawing and some colouring. A term in the rudimental class is a desirable preparation for this class, though not indispensable.

## Form Drawing.

The pupils in this class draw from plaster models, mostly relief ornaments of moderate size. Two terms of freehand drawing from copy are regarded as a necessary preparation for this class.

## Cast Drawing.

The work of this class consists in drawing from models of antique statuary. Only those who have acquired a good degree of proficiency in freehand drawing are encouraged to enter this class.

#### Mechanical Drawing.

Pupils in this class draw from the first with instruments. A complete three years' course is provided for, beginning with simple geometrical problems, and ending with the finished shaded drawings of complex machines. The class is in four sections, and under two different instructors.

## Architectural Drawing.

There are five sections of this class under charge of three different instructors. Two different objects are attained in the course: 1st, the ability to draw ornamental architectural designs according to conventional rules; and, 2nd, skill in the preparation of working drawings from given dimensions.

# Modelling in Clay.

This is for workers in terra cotta, stucco, marble-cutters, and all whose work is relief decoration.

#### Perspective Drawing.

To enter this class some knowledge of geometry is necessary. Ladies are admitted.

#### LECTURES.

The following subjects are presented in the form of lectures to the scientific students: Chemistry, Natural Philosophy, Astronomy, and Geology.

The programme for each week from 1st October to 1st March, is:-

Monday, 8:30—Chemistry.
Tuesday, 8:30—Chemistry.
Wednesday, 7:30—Chemistry.
8:30—Natural Philosophy.
Thursday, 8:30—Astronomy.
Friday, 8:30—Geology until January, then Electricity.

The public is invited, it being understood that visitors enter the lecture-room at the beginning of the hour and remain to the close. No tickets of admission are required.

A course of six lectures on Architecture is given on Thursday evenings, beginning the first Thursday

in February.

The lecture-rooms are on the fifth floor.

The number of applicants that can be admitted to the school is as follows:-

Elementary mechanics, 60. Astronomy, 260. Applied mechanics, 20. Analytical geometry, 45. Dif. and int. calculus, 45. Trigonometry, 60. Geometry, 180.
Algebra, 180.
Natural philosophy, 300.
Geology, 250.
Elemeda philosophy, 200. Elem. chemistry, 300. Chemical analysis, 25.

Arch. drawing, 200. Elem. arch. drawing, 100. Descrip. geometry, 50. Mech. drawing, 200. Elem. mech. drawing, 50. Drawing from copy, 400.
Decorative designing, 180.
Drawing from cast, 75.
Drawing from form, 100.
Perspective, 80 Perspective, 80. Modelling in clay, 120.

## APPENDIX H.

COOPER UNION, FOR THE ADVANCEMENT OF SCIENCE AND ART, NEW YORK CITY.

#### WOMAN'S ART SCHOOL.

This Department of the Cooper Union was established by the Trustees in accordance with the provisions of the Trust Deed. It is for the purpose of affording instruction in the Arts of Design to women, who, having natural taste and capacity, but being unable to pay for instruction, are obliged to apply the knowledge acquired in the institution to their support, either by teaching or pursuing art as a profession.

## Rules and Regulations.

1. Conditions of Admission.—Applicants must be at least 16 and not over 35 years of age. Residence in New York City is not necessary for admission. A responsible written reference must be given as to character, and a written guarantee furnished that the applicant is not able to pay for instruction and is obliged to earn her own living. Pupils are not admitted into the school for less than one year and can remain only three years, unless the Principal may otherwise determine. If compelled by illness or other cause to leave sooner, or to be absent for any length of time, they are required in all cases to communicate with the Principal.

Pupils can take only one professional branch besides drawing.

Pupils can take only one professional branch besides drawing.

In the wood engraving class, pupils must engage to remain for at least three years.

2. How to apply for Admission.—During the term, application must be made at the school, on the fourth floor, and during the vacation, at the Office of the Cooper Union, on the first floor. No registry can be made between January 1st and March 14th. The books are opened March 1st for old pupils desiring to re-enter. March 14th (not before that date) they are opened for new applicants, and the latter are advised to register as early as possible, owing to the pressure for places. All eligible persons will be admitted strictly in the order of their application. Persons admitted will receive notice thereof, and no applicant need present herself unless she has received such a notice. The school lists are always full for the ensuing October before the close of the term in May. Applicants do not hold good from one season to the next, and those failing to be admitted one year must notify the Principal the following season to the next, and those failing to be admitted one year must notify the Principal the following March if they still wish to enter the school, in which case they will receive the preference over new

3. School term and hours of study.—The term commences on the 1st of October, and ends the last week in May. The hours of study are from 9 a.m. to 1 p.m. Pupils may remain for practice until 4 p.m., but no later. There is no session on Saturday. The pupils must provide at their own expense all necessary materials, such as paper, pencils, crayons, colours, brushes, and instruments. Easels and models are

furnished by the trustees.

4. Pupils must not come later than 9 o'clock in the morning, nor absent themselves without the consent of the Principal, as three absences not excused will forfeit the place of the pupil so absenting herself. Places will not be retained for those who may desire to defer their attendance, to the exclusion of others who are prepared to attend at once, but the Principal is authorised to grant leave of absence when the circumstances of the case may render it proper.

5. The drawings will be the property of the students, with the exception of such as may be retained

by the Principal.

6. The annual exhibition will take place during the last week in May, when certificates and medals will be awarded to deserving students.

7. In the wood engraving class, orders are received for engraving, and will be executed by the pupils to whom they may be assigned by the teacher, and the money thus carned is paid to the pupils.

8. Complaints may be addressed in writing to the Secretary of the Trustees or to the Advisory

9. In order that the advantages offered by the school may be properly bestowed, all pupils who, at the end of the first two months after the opening of the term, do not show sufficient talent or energy in the pursuit of their studies, will be dropped from the school and their places filled from the list of applicants, and at the end of each month thereafter the Principal will request the withdrawal of such pupils as in her judgment prove in any way incompetent. This rule applies to the old as well as to the

10. Visitors to the school, not to the scholars, will be received only on Fridays from 10 a.m. to 12:30 p.m. No calls upon the pupils are allowed at any time, except in cases of absolute necessity.

12. Classes in the Morning School. ( Elementary drawing from objects. Cast drawing. Non-Professional Classes ? Life drawing. Oil painting (for graduates of the drawing class only). Normal drawing class. Designing class. Retouching of negatives. Professional Classes Retouching of positives in oil colours. Photographs in water-colours, crayons, and India ink. Porcelain photograph painting. Engraving on wood.

#### SUPPLEMENTARY AFTERNOON CLASSES.

Owing to the pressure of pupils who are obliged to make drawing, &c., a means of livelihood, the free morning school is reserved exclusively for them. To meet the wants of persons who wish to study as an accomplishment, afternoon pay classes have been organised under the charge of competent teachers and of the clerk of the school, and the general superintendence of the Principal. These classes can be entered at any time during the school year. Applicants for the afternoon classes must give responsible written reference for character. Payments in advance, and no deduction is made for absence. Pupils have the privilege of working in the class-rooms every day except Saturday and Sunday, from 9 a.m. to 4 p.m., when the school-rooms are closed, and all are expected to leave promptly.

The following branches are taught, viz.:-

Elementary drawing from objects.

Cast drawing.
Life drawing.
Oil painting.
Engraving on wood.
Designing.
Normal drawing.

#### Drawing Class.

Lessons of two hours in length are given three times a week in this class, on Monday, Wednesday, and Friday, from 2 to 4. Terms, 15 dollars for thirty lessons.

## Oil Painting Class.

Two lessons a week are given in this class, on Tuesday and Thursday, from 2 to 4. Terms, 20 dollars for twenty lessons.

## Wood Engraving Class.

Lessons in this class are given on Monday, Wednesday, and Friday, from 2 to 4. Terms, 15 dollars for thirty lessons.

## Designing Class.

Lessons in this class are given once a week, from 2 to 4. Terms, 24 dollars for twenty-four lessons.

#### Normal Drawing Class.

Lessons are given in this class once a week, from 2 to 4. Terms, 24 dollars for twenty-four lessons

## LECTURES.

Lectures on perspective are given to the whole school, both morning and afternoon classes, and such other lectures on art as may be provided by the trustees.

## APPENDIX I.

#### PRATT INSTITUTE BROOKLYN, N.Y.--ANNOUNCEMENT FOR 1889-90.

#### CALENDAR.

Day Classes: First term—24th September—26th December. Second term—2nd January—26th March. Third term—2nd April—20th June.

Evening Classes: First term—30th September—20th December. Second term—2nd January—26th March.

## Holidays:

Thanksgiving Day and the following day. Election Day. Washington's Birthday. Good Friday. Memorial Day.

## TECHNICAL HIGH SCHOOL DEPARTMENT .- A THREE YEARS' COURSE, FOR BOTH SEXES.

Turs department aims to give a thorough academic education, combining with the usual studies of such a course enough free-hand and mechanical drawing and manual work to secure a symmetrical development by the training of eye, hand and mind.

It does not aim to fit pupils for any particular occupation or class of occupations, but to give them the best preparation possible, within the limits of a three years' course, for higher institutions of learning—cspecially advanced scientific schools—for business or for any other pursuit.

The studies of the department are in general the same as those pursued in the best academies and

high schools, viz. :-

Second term-

Algebra,

English,

First Year. First term-Algebra, English, Physiology.

Physical Geography.

Second Year. First term-Geometry, General History or Latin, Physics.

Second term-Geometry, General History or Latin, Physics.

Third term-Third term-Geometry. Rhetoric Physical Geography.

Trigonometry, English History or Latin, Book-keeping, Physics.

Third Year. First term-English Literature, Civil Government,

Chemistry, Principles of Construction, Second term-

English Literature, Political Science, Chemistry, French. Third term-

English Literature, Political Science, Chemistry and Metallurgy, French.

In both physics and chemistry, laboratory practice forms a part of the regular work. Special instruction is given in penmanship during the first year, and in elecution and vocal music throughout the course.

The hours of session are from 9 a.m. to 3 p.m., with an intermission of one half-hour for lunch.

The school day is divided into seven periods, of which three are devoted to recitations, one to study,

one to free-hand or mechanical drawing, and two to manual work.

The manual work for boys consists of regularly graded courses in joinery, turning, pattern-making, moulding, forging, bench and machine work in metals, &c.

The same amount of time which is spent in the shops by the boys is devoted by the girls to courses

in modelling, wood-carving, sewing, dress-making, cooking, &c.

Applicants for admission to this department must, except in special cases, be at least 14 years of age, and must pass a satisfactory examination in arithmetic (entire), algebra, as far as to simple equations, geography, spelling, United States history, grammar and composition.

Denote an admitted at the hoginary of the fall town in Sentember.

Pupils are admitted at the beginning of the fall term in September.

Examinations for entrance will be held on Saturday and Monday, 21st and 23rd June, and on Wednesday and Thursday, 17th and 18th September, 1890. Candidates are expected to be present on both of the appointed days, either in June or in September.

## ART DEPARTMENT.

Additions made to the Institute buildings give the Art Department five more large rooms. One is used for wood-carving, one for clay-modelling, one affords additional studio room, and the others are used for mechanical and architectural drawing.

Arrangements are being made for more complete and extensive lines of work than have hitherto been carried out. Practical designing, clay-modelling, and wood-carving are features which will receive

especial attention in both day and evening classes.

Applicants for admission to the Regular Art Course, Normal Class and the Class in Design are required to pass a simple examination in outline drawing, and those desiring to enter the Normal Class

must, in addition, present a satisfactory statement, letter, or certificate in regard to general scholarship.

Lectures on perspective, architecture and historic ornament, design, color, anatomy, mythology,

&c., are given in connection with the various courses of study as the progress of pupils demands.

Applications for admission to the classes beginning in September must be filed at the General Office on or before 18th September, and to the January class on or before 20th December.

Morning

Morning classes meet at 9 o'clock, afternoon classes at 3:30, evening classes from 7:30 to 9:30 o'clock.

Tuition.—For all morning classes \$8. 00 a term.

Afternoon classes 5. 00 ,,

Evening classes 5. 00 ,,

## Morning Classes.

Regular Art Course—Five days each week; three years. Pupils will be admitted at the opening of the fall term and a limited number will be received in

January.

Students advance through a regular course of study from cast and model drawing, still life groups
to study from the antique, to oil or water-colour painting and in light and shade, harmony of colour, &c., to study from the antique, to oil or water-colour painting and to work from life.

The course of study is divided into grades; the first grade embracing a variety of subjects in order that students may discover any aptitude they may have for work in a special direction, while pursuing at the same time a thorough and systematic course of study fundamental to all art work.

The advanced grade of this course is especially planned for those who wish to make direct use of drawing in illustration or in other forms of art work, or, in connection with the Normal Course, to fit students to teach drawing in the higher schools, public or private.

Normal Class-Five days each week; two years.

Pupils are admitted in September.

This course is especially designed to train students as teachers and supervisors of drawing in public schools. It embraces a part of the regular art course, including cast and model drawing, light and shade, study of colour and work from the antique.

The course also includes work in design, historic ornament, modelling, instrumental and free-hand perspective and elementary mechanical drawing, together with regular normal instruction in methods and practice teaching.

Design-Five days each week; three years.

It is intended that the work in practical applied design shall become a prominent feature in the work of the Art Department. Much work in free-hand drawing, historic ornament, &c., is required.

The course of study is planned to give students thorough instruction in the principles which govern decorative design, and also in the technicalities of the processes involved in the manufacture of tentile febrical well paper. textile fabrics, wall paper, &c.

Machinery will be added in the Mechanics Art Department, from time to time, that students may understand the practical demands of the work.

Wood-carving—Five days each week; two years. Study of free-hand drawing, clay modelling, historic ornament and design is embraced in the woodarving course.

Students will advance from simple designs for frames, panels, &c., to more elaborate designs for cabinets, clock frames and small articles of furniture. It is intended that the principles of wood-carving

shall be from the first embodied in artistic designs and in objects which can be used when completed.

Normal students, and others who find it impossible to attend at the specified hours of morning or

Normal students, and others who find it impossible to attend at the specified hours of morning or evening work, may join a class which meets on Tuesday and Thursday afternoons at 3 o'clock.

A course in light carpentry may be taken up in connection with the wood-carving in order that pupils may understand the construction of simple objects.

Clay-modelling.—Clay-modelling is taught in connection with wood-carving and the normal work.

A separate course will be established for pupils who wish to make a more exhaustive study of the subject either in sculpture or in decorative relief-work in wood, metal, and stone. A special evening course in clay-modelling is preliminary to the courses in decorative stone carving and metal work during clay-modelling is preliminary to the courses in decorative stone-carving and metal work design.

Architectural and Mechanical Drawing.—Five days each week; two years.

The school is not designed to give a thorough course in architecture with all the kindred subjects which would be included in a course covering several years in an institute of technology. The courses in architectural and mechanical drawing are especially prepared to fit students to become draftsmen. Pupils of the architectural class are required to work out complete sets of drawings illustrating every detail of frame, brick and stone houses, with measurements. Instruction is also given in the most approved methods of construction, in the properties of materials, in free-hand and perspective drawing

and the history of architecture and ornament. The course in mechanical drawing is similar to that in architecture in its practical aims, but relates to the drafting of machinery and to the study of the elements of mechanism.

# Afternoon Classes.

Classes in free-hand drawing meet at 3.30 o'clock on two afternoons of each week for instruction and practice, and on one afternoon for practice alone. Classes meeting Monday and Thursday are for second year students, those meeting Tuesday and Friday are for first year students. Pupils of all afternoon classes may practice in the studios on Wednesday and on other class days, beginning at 2 o'clock.

The course of study is similar to that of the morning classes, and as much of the Regular Art

Course will be covered as the limited time will permit.

Special classes for teachers from the public schools will be formed if applications are received. The afternoon class in wood-carving meets at 3 o'clock on Tuesday and Thursday.

## Evening Classes,

# THREE EVENINGS EACH WEEK; MONDAY, WEDNESDAY AND FRIDAY.

Classes in free-hand drawing,—including cast, model and light and shade drawing,—mechanical and architectural drawing, decorative and applied design, clay-modelling and wood-carving, meet three evenings each week, beginning 30th September, and continuing through two terms. A limited number of students may be admitted at the beginning of the second term. The courses of study are of the same character as those above described for day work, but of necessity abridged.

Applications for evening work must be filed at the General Office on or before September 23 for the first term, and on or before 20th December for the second term. DEPARTMENT

## DEPARTMENT OF DOMESTIC SCIENCE.

Classes are formed at the beginning of each term of the school year and receive one or two lessons a week. Lessons omitted on account of legal holidays will not be made up. In all branches there are morning, afternoon and evening classes. Evening classes are reserved for self-supporting women, while day classes are open to all.

Applicants are required to present their application blanks before the beginning of the term for which they wish to enter.

The number of pupils in each class is limited, that all may have opportunity for practical work under the direction of the teacher.

In the cooking classes, materials are supplied to the pupils free of charge; but in the sewing, dress-making, millinery and embroidery classes pupils furnish their own materials.

Cookery.—The regular course in cooking consists of two graded courses, the first covering a period of six months. In this course the principles and simple chemistry of cooking are taught and recipes for such articles of food as are found on a well-appointed home table are worked out in class.

The second course covers three months and is devoted to advanced cooking. All members of the regular cooking classes must attend and take examination on the course of lectures which will be given on marketing and the chemistry and economy of foods. Pupils must satisfactorily complete the first course before entering the second. Those who have satisfactorily completed both courses and passed the final examination with credit are entitled to a certificate.

There will be a supplementary course of twelve lessons in cooking for invalids; also a special class in fancy cooking for which no examinations are required and no certificate will be given.

Tuition.—For course of six months, one lesson a week: \*-

Day classes, first course	\$10.00 5.00
For course of three months, one lesson a week:-	
Day classes, second course  Evening classes, second course  Day classes, cooking for invalids  Evening classes, cooking for invalids  Special class in fancy cooking  This comprises the first and second courses of last year.	8.00 5.00 5.00 3.00 2.500

Sewing.—The complete course includes a term of three months devoted to instruction in all kinds of hand-sewing, from simple over-handing to button-holes, hem-stitching and feather-stitching; also a term of three months devoted to machine-sewing and the cutting and making of plain garments and cambric dresses.

Tuition.—For course of six months:-

Day classes, two lessons a week	
Evening classes, one lesson a week	
Day classes, for children, one lesson a week.	3.00

Dress-making.—The complete course consists of three graded courses, each covering a period of three months. Applicants for the first course must be at least sixteen years of age and must submit samples of their own work which satisfactorily prove their knowledge of hand and machine-sewing and their ability to make simple garments and cambric dresses from pattern. After learning in this course to cut and make dresses from pattern, pupils are prepared to enter the second course, in which they are taught to draft from measure and to cut and fit a dress. Following this is the third course, which includes instruction in drafting and fitting polonaise and princess dresses, children's dresses, &c. In each course there will be lectures on hygiene, also upon the selection of fabrics, and harmony of colour and form in dress, that the pupil may gain a knowledge of design and the ability to originate and make tasteful garments.

Tuition.—For course of three months, two lessons a week (forming one lesson a week):-

		,	-	-	,
Day classes, first	course			 	\$12.00
Evening classes,					5.00
Day classes, secon	d and thire	l courses, eacl	1	 	
Evening classes.	second and	third courses.	each	 	9.00*

\* This price includes the chart, tracer, and measure,

Millinery.-Three graded courses, each covering a term of three months, are given. The first course includes instruction in covering, facing, binding, and trimming square or stiff-crowned hats. The second course is devoted to making and trimming soft and fancy-crowned toques and bonnets, and the

third to making fancy hats of good materials.

Applicants must be at least 16 years of age, must have a knowledge of hand-sewing, and must satisfactorily complete the first course before entering the advanced classes. A series of talks will be given, in connection with each course on the suitability of materials, combination of colours, and character of lines and form as essential to artistic millinery.

Tuition.—For course of three months, two lessons a week (formerly one lesson a week):— Day classes, first, second, and third courses, each \$10.00 Evening classes, first, second and third courses, each 4.00

Art Needlework.-The course of instruction is divided into two regular courses. The first comprises three terms of three months each, two lessons a week. Applicants must submit work which proves their knewledge of hand-sewing. The course aims to instruct the student in the various stitches of art needlework and to apply these to some special piece of work. At least four such pieces, besides the sampler, must be completed during the term. Free-hand drawing of ornament from cast and from plants forms a part of this course. The first course of studies includes:—

First Term.—Laid work, drawn work, German stitches, Roman work.
Second Term.—Damask and tapestry stitches, Kensington work, appliqué and tapestry staining.
Third Term.—Gold thread, ecclesiastical work, flowers embroidered freely, advanced tapestry painting.

The second, or advanced course, embraces a thorough study of design and its application to art needlework as used in interior decoration, including also:-

Drawing of ornament from the cast. Study of plants for purposes of design.

Study of historic ornament and the harmonious arrangement of colour and materials,

Application of an original design to a suitable piece of needlework.

This course extends over the entire school year, and pupils are expected to spend five mornings a week in the class-room, unless special arrangements are made for study at home.

Applicants must be at least 17 years of age, and must submit samples of work which satisfactorily

prove sufficient knowledge of embroidery.

Tuition .- For each term of three months :-

Advanced course, five lessons a week:-

Day classes .....

Hygiene and Home Nursing.—Courses consist of twelve lectures each, with practical demonstrations from the living model, on the following subjects:—Outlines of anatomy, physiology, and hygiene; immediate aid in emergencies—the treatment of wounds, broken bones, sunstroke, cases of poisoning, &c., home-nursing, including care of the sick room, administration of foods and medicines, &c., &c.

\$5.00

Laundry.—The course covers three months, and includes instruction in the simple chemistry of cleansing clothing and household linen and the practical application of these principles in washing, removing stains, starching, and ironing.

Tuition.—For term of three months, one lesson a week :-

Day classes
Evening classes 2.00

Household Economy.—The course will include instruction in the purchase and care of family supplies, home sanitation, and applied house-keeping, with general instruction in systematising and economising household work and expenses. Classes will be formed as early in the fall as is found practicable.

#### Department of Mechanic Arts.

## Afternoon Classes.

Shop Work and Drawing.—Classes in shop work and drawing, for pupils of public and private schools, meet three times a week, from 3:30 to 5 o'clock. Applicants must be at least fourteen years of age.

## Evening Classes.

Shop Work and Drawing.—These classes meet Monday, Wednesday, and Friday of cach week, from 7:30 to 9:30 o'clock. This course takes up mechanical drawing and geometry the first year, and the shop branches the second year.

Carpentry.—Instruction is given in the care and use of tools, methods of laying out work, the proportions of the various joints and framing details, and their application in cabinet making, joinery, and 

Turning and Pattern-making.-Plain and ornamental turning on the speed lathe and making of patterns and core boxes.

Forging.—Practice in drawing, bending, upsetting, punching, welding, tempering, and the making of steel tools. The processes of making iron and steel and the properties of the commercial product will be illustrated by lecture.

Machine Work.—This course takes up the use of the chipping chisel, file and hand scraper, dies, taps and reamer, practice on the engine lathe, drill, planer, and milling machine and the theory of cutting tools.

Tuition, first term \$10.00 ,, second term 12.00

Modelling and Carving for Metal Casting.—

First year.-Free-hand drawing and modelling.

Metal Chasing.-

Electrical

Electrical Construction.—Lectures and laboratory work. Theory and practice of dynamo-electric machinery, motors, wiring, lamp construction, testing, &c. A six months course.

Tuition, first term, electrical theory ....... second term, electrical practice .....

# DEPARTMENT OF BUILDING TRADES.

Evening classes in this department meet Monday, Wednesday, and Friday of every week, from 7.30 to 9.30 o'clock, beginning 2nd October.

Applicants for admission must be between 16 and 25 years of age.

Brick-laying .- The instruction will take up the building of walls and piers and the construction of arches, flues, fire-places, &c. Care will be taken to make clear the principles involved in the work.

Plastering.—Instruction is given in scratch coating, brown coating, and hard finishing, also practice in running arches and cornices.

Plumbing.—The course will include the making of lead seams, all kinds of wiped joints and sand bends, the working of sheet lead, erection of sewer pipes, &c., together with frequent lectures upon the scientific principles of drainage, sewerage, and ventilation.

Modelling, Casting, and Carving.—The aim of this course is architectural stone and wood carving. Considerable attention is given to principles of design and to modelling in clay.

Practice in free-hand drawing and in clay modelling, such as is given in the Art Department, is necessary for admission.

Stone-cutting.—Plain and ornamental cutting in brown-stone.

## DEPARTMENT OF PHONOGRAPHY AND TYPEWRITING.

Applicants for admission must be at least 16 years af age, and must pass a satisfactory examination in English language and spelling. Examinations for the classes beginning 2nd January, 1890, will be held Monday evening, 23rd December, 1889, at 7:30 o'clock. Examinations for the third term classes will be

held Thursday evening, 27th March, 1890, at 7 30 o'clock.

Phonography.—Elementary Course.—This course, consisting of two lessons a week for a term of three months, is sufficient for the acquirement of a thorough knowledge of the principles of shorthand, so

that practice alone is necessary to gain proficiency.

Advanced Courses.—Graded classes, also meeting twice a week for a period of three months, have been established for those who pass a satisfactory examination in the above course, and who desire to

acquire speed and to secure regular and systematic practice in commercial correspondence, &c.

Typewriting.—The course in typewriting covers a period of three months, but as personal instruction is given, each pupil advances as rapidly as his ability permits. Morning and afternoon classes meet every day except Saturday. Evening classes meet Monday, Wednesday, and Friday evenings of every week.

Tuition: Phonography.—Day classes	\$8.00
Evening classes	6.00
Typewriting,—Day classes, morning or afternoon	5.00
Evening classes	3.00

## VOCAL MUSIC DEPARTMENT.

DAY and evening classes in vocal music, on the Tonic Sol-fa system, and in the staff notation as supplementary to Tonic Sol-fa, have been established as follows :-

4. Normal training.

1. Tonic Sol-fa.
2. Staff notation.

5. Kindergarten colour system.

3. Theory of music.

6. Choral Society.

The Tonic Sol-fa classes, in accordance with the requirements of the Tonic Sol-fa College, are divided into these grades:—Junior, elementary, intermediate, matriculation, and advanced. Students who pass the examination of the respective grades receive the certificates of the American Tonic Sol-fa

Association and College of Music.

The object of the normal classes is to train teachers of vocal music for public and private schools

and for musical societies.

The Choral Society will meet weekly from the first of October till the first of May with the object of affording its members higher instruction in sight-reading, voice and ear training, part-singing and musical theory, and with the purpose of stimulating a love for the best choral music. Candidates for admission to the Choral Society will be required to pass the elementary examination.

Lectures will be given from time to time on important musical subjects.

Tuition.—Term of three months:—	
Sol-fa or musical theory, preparatory, and first or elementary grades	\$2.00
Staff notation, first grade	3.00
Staff notation, first grade	3.00
Term of six months:-	
Normal training, first grade	\$6.00
Kindergarten colour music	6.00
Annual dues of Choral Society	2.00

Students in any department of the Institute are admitted to one of the music classes, either day or evening, except the Choral Society, on payment of one-half the regular fee. 138-2H

KINDERGARTEN

#### KINDERGARTEN DEPARTMENT.

244, Vanderbilt Avenue, a few doors north of DeKalb Avenue.

A REGULAR two years' course has been arranged, and pupils who have had the preparatory work of the first year will be admitted to the advanced class

Children from 3 to 5 years of age will be received. Application may be made at the General Office of the Institute.

The school year is divided into three terms. Sessions from 9 a.m. to 12 m.

## TECHNICAL MUSEUM.

The technical museum is designed to illustrate, by means of specimens properly classified and labelled, the consecutive stages through which materials of various kinds pass in their transition from the crude state to the finished article. In connection with this it also shows some of the artistic forms into which the art of man is able to mould even the commonest substances; and by presenting examples of the highest grades of work in each class, it sets standards towards which the efforts of the student or experimentar should be directed. experimenter should be directed.

The collection contains sets of rocks and minerals representing the materials of which the earth is composed and from which almost all inorganic substances used in the arts are obtained. The use of clays and kaolin is shown by a number of specimens of pottery and porcelain from the celebrated factories

of the world, while one entire case is devoted to the various kinds of glass.

In an adjoining room is placed a collection of textile fabrics, including cloths of all kinds, and

embroideries and laces from different countries.

All the specimens are intended to be used in illustrating the lectures and class work in the various departments of the Institute, and are at other times displayed in the museum.

A small library of special reference books is placed in the office of the museum, and is open to the public during the same hours as the museum.

Museum open to the students and public:—

 Monday and Friday
 7:30 to 9:30 p.m.

 Wednesday
 3 to 5 p.m.

## LIBRARY AND READING-ROOM.

The Library contains at present about 17,000 volumes, covering all the general departments of literature, while in the Reading-room are to be found about 150 of the leading American and English periodicals. The use of both Library and Reading-room is free to all residents of Brooklyn over 14 years of age who have filled out the prescribed blank, obtaining thereto the signature of some responsible person as guarantor. The blanks are kept on file one week, at the end of which time applicants are expected to call for membership cards and to sign the register.

## Library and Reading-room Hours.

Library.—Every day except Sunday, from 9 a.m. till 6 p.m., and on Wednesday and Saturday till 9:30 p.m. Reading-room.—Every day except Sunday, from 9 a.m. till 9:30 p.m.

# THRIFT ASSOCIATION.

THE aim of the Association is to encourage its members to habits of thrift; to help them to become prudent and wise in the use of money and time, by offering them a safe and simple method whereby they may make regular monthly payments for the purpose of accumulating a fund for buying or building their own homes; also to loan to such persons as want to borrow for this purpose, and to do any and all such things as experience shall prove essential to the accomplishment of these objects.

Any person, whether he be an attendant at the Institute or not, may become a member of the

Association upon complying with the regulations.

The office of "The Thrift" will be open on Monday, Wednesday, and Friday evenings, from 7:30 to 9'30 o'clock, and on Wednesday and Friday afternoons, from 2 to 4 o'clock.

## LUNCH-ROOM.

In the basement of the main building is a commodious lunch-room, where simple meals, well served, are furnished noon and evening, at moderate prices.

#### GENERAL REMARKS.

THE authorities of the Institute reserve to themselves the right to increase the rates of tuition given above, if it shall be found advisable, but efforts will be made to render possible by some means consistent with self-helpfulness and self-respect, the admission of every worthy applicant.

Applicants for admission to any department are expected to leave their application blanks at the general office, or mail them to the Secretary, before the beginning of the term for which they wish to enter. If the application prove satisfactory, due notice will be sent to the applicant.

All necessary information may be obtained upon application in person or by letter at the office of the Institute, Ryerson-street, between DeKalb and Willoughby Avenues.

Office Hours.

F. B. PRATT, Secretary.

## APPENDIX J.

## PRATT INSTITUTE THRIFT ASSOCIATION, BROOKLYN, N.Y.

President: - Charles Pratt.

Advisory Council:—Charles Pratt, 232, Clinton Ave., Brooklyn; Charles M. Pratt, 270, Clinton Ave., Brooklyn; H. A. Pratt, 26, Brooklyn; New York; F. B. Pratt, 232, Clinton Ave., Brooklyn; John Gibb, 218, Gates Ave., Brooklyn; Hayden W. Wheeler, 274, Washington Ave., Brooklyn; Frank L. Babbott, 149, Lincoln Place, Brooklyn.

Solicitors and Counselors: —Carter and Ledyard, 54, Wall-street, New York; S. C. T. Dodd, 26, Broadway, New York.

Manager: -F. B. Pratt, Pratt Institute, Brooklyn, New York.

THE object of the Association is to promote habits of thrift; to help people, especially the young, to become prudent and wise in the use of money and time, by offering them a safe and simple method whereby they may make regular monthly payments for the purpose of saving money, or of accumulating a fund for buying or building their own homes; also, to loan to such persons as may want to borrow for this purpose; and to do all such things as experience shall prove to be essential to the accomplishment

The responsibility of embarking in an enterprise which has to do with the handling of other people's noney has not been assumed without much hesitation. But in the scheme of education undertaken by Pratt Institute, the value and importance of instructing the young in this subject of thrift, leads us to do all we can to encourage them in habits of saving. Experience has demonstrated that there must be some motive to impel persons to save money with regularity; therefore our effort will be to encourage them to save their first dollar, and then to help them to make the 1 dollar, 10, then the 10, 100, and so

on, by offering them a safe place for the deposit of their savings, at a liberal rate of interest.

One says: "If I receive 500 dollars per year, how much can I save?" We cannot answer. It is wise to provide something for the contingency of sickness and loss of employment, which may make you a non-producer. Every honest man is bound to live within his income. Another says: "If I receive only 4 dollars or 5 dollars per week, how much can I save?" Save 10, 25, or 50 cents a week, but save something. The amount is of less importance than that you put a part of your earnings aside, at regular something. The amount is of less importance than that you put a part of your earnings aside, at regular intervals. The first 100 dollars earned and saved has started many a mechanic and merchant on the road to wealth. Therefore, begin to save to-day, and never stop until you are obliged to. Your money will be safe if deposited with "The Thrift," and the habit of self-denial will be formed. The boy who learned to save 50 cents per week while he was getting 5 dollars, can easily save 3 dollars per week when he gets 10 dollars, or 7 dollars per week when he gets 20 dollars; but it will not be so easy for a man who has been spending his full income of 20 dollars per week to reduce his expenses to 13 dollars per week.

Estimate your wealth not by the number of dollars you have in bank, but by your power to live a

contented life on some sum less than your income. If your wants are simple, you will find it easier to supply them. It is right for one to increase his expenses to a degree consistent with his increase of income. Consequently, be just to yourself and to your family, and "Neither a spendthrift nor a miser be."

"The Thrift" is designed to aid in the work carried on at Pratt Institute, but it is not conducted by the Institute, nor is the Institute in any way responsible for it. The names of persons financially responsible for "The Thrift" will be furnished to those doing business with it on request.

#### BENEFITS

1. Any person, whether connected with Pratt Institute or not, is entitled to the benefits of the Association upon complying with the regulations, with the understanding, however, that the management at any time will have full power to close an account without giving notice or reason, by refunding the money with interest.

2. The work of the Association divides itself into two branches, the "Investment Branch," and the "Loan Branch."

#### INVESTMENT BRANCH.

3. The first practical step must be to afford opportunities for persons to save and deposit their money, and we wish to offer the best possible inducements consistent with safety, to secure method and regularity in the manner of saving. The intention is to allow small deposits, so that no one need be

debarred from sharing in this plan.

4. The investing shares of the Association, to which no hability attaches, are 150 dollars, payable at the rate of 1 dollar per month for ten years. The monthly payments on each share amount in ten years to 120 dollars, and the accumulated interest at the rate of 5 per cent. per annum to 30 dollars, making 150 dollars in all; in addition to which, provided the instalments are regularly paid, each share at the end of ten years will be entitled to a premium of 10 dollars per share more. In other words, a monthly payment of 1 dollar will amount, with interest and premium, to 160 dollars at the end of ten years, or about 6 per cent. per annum on the subscription paid to the Association.

5. Payments draw interest from the first day of the month following the date of deposit. Payments may be made in advance from time to time or the number of shares may be increased if decired

ments may be made in advance from time to time, or the number of shares may be increased if desired.

A fine of 2 cents a share per month will be charged on overdue payments.

6. Application for investment must be made on a blank form furnished by the Association. The

investment fee is 50 cents, payable with the application.

7. It is not intended to offer a high rate of interest so as to induce the deposit here of funds already invested in savings banks or elsewhere, but rather to encourage, in young and old, the habit of regular, systematic economy and saving in small amounts.

8. 150 dollars in one sum pays up a share in full, and when this payment has been made, the interest is payable half-yearly, at the rate of 4 per cent. per annum, the holder being entitled, at the end of ten years to the same premium as that receivable by persons who pay for their shares by instalments.

9 Shares can be withdrawn at any time; and although the Association may, under its rules, require one month's notice, it hopes to be able to repay subscriptions on demand, and without notice. No interest will, however, be allowed on shares payable by instalments if they be withdrawn within two years of their issue.

10. Shares may be held by minors, and by trustees and guardians on behalf of others; and by married women in their own names, and for their separate use, and they may sign receipts for interest and principal.

Table showing how money may be accumulated.

11. One share at 1 dollar per month, involving a saving of 4 cents per day for 300 days, amounts, with interest and premium, at the end of ten years, to 160 dollars.

By steady perseverance in saving, therefore, every person, however limited his income, may make some provision for the future, by investing in "The Thrift." In addition to this, that which we estimate to be of more value than the money, is the growth of character which is developed by the self-denial and

personal sacrifice required in making this saving.

12. The foregoing explains the manner of saving money by deposits in the "Investment Branch." Now the question is, how can we use this movey safely so as to produce a rate of interest that will be encouraging to those who save it? It is proposed to loan it to persons for the purchase of homes, and to have the loans so made that they can be paid in small monthly instalments in place of rent, so that after a term of years the home will belong to the member taking the loan.

This part of the enterprise will be termed the

#### LOAN BRANCH.

13. Sums of any amount will be loaned for the purchase of private houses, shops, and other real property in Brooklyn, but it is the special object of the Association to encourage the purchase of dwelling-houses by persons for their own occupation; and all applications for advances, with this object in view, will be dealt with in the most liberal manner consistent with security.

14. The Association will not purchase or build houses, but simply make advances for this purpose. The amount which will be advanced will be regulated according to the valuation of the property by the Association's officials; and of this value, a tenth part at least must be provided in advance by the one

wishing to obtain a loan.

15. In order to cover the cost of doing the business—such as general office expenses, searching records, guaranteeing titles, &c., and to keep the rate of interest low, as well as to establish a permanent security fund, a commission of 1 per cent. per annum on the sum advanced will be charged, which sum, if desired, can be added to the loan. This is based on the experience of the best English societies, though we shall modify these charges from time to time as our own experience shall justify.

16. The option will always remain with the borrower to pay the loan in full, at any time, if he shall

prefer to do so.

17. Loans will be re-payable by monthly instalments, commencing on the first day of the month following the date of the mortgage, or in any other manner that may be arranged, so that the re-payments shall not extend over twenty-one years.

18. The monthly instalments are to totally extinguish principal and interest, and when they are

all paid the house will become the property of the borrower.

19. So long as the instalments are paid regularly, the loan cannot be disturbed; but the borrower can at any time make additional payments on account of the advance, and thus either shorten the period during which the instalments are payable, or reduce their future amount, or the mortgage may be cancelled at any time by paying the present value of the future instalments.

Table showing the monthly payments required, cost of loan,  $\delta c$ ., for a loan of 1,000 dollars, for a period of ten years.

	Interest on loan at-		
-	5 per cent.	6) per cent.	6 per cent.
fonthly dues Cotal dues, ten years Cotal cost for ten years Cotal cost for ten years Cotal cost of loan	dollars. 10.90 1,308.00 100.00 1,408.00 1,000.00 408.00 40.80 4	dollars. 11.10 1,332.00 100.00 1,432.00 1,000.00 432.00 43.20 4-3.0	dollars. 11.40 1,368.00 100.00 1,468.00 1,000.00 468.00 46.80

20. As an illustration of the working of "The Thrift," the case may be taken of a person occupying a house in Brooklyn, for which he pays a rental of 300 dollars per year. The price is 3,000 dollars, of which amount he pays, perhaps, 400 dollars, and obtains 2,600 dollars from "The Thrift." If the advance be granted for fourteen years at 6 per cent. interest, the payments to the Association will be about 30 dollars per month, or about 360 dollars per year, inclusive of city, county, and water taxes, insurance, and commission. By selecting a longer period for the redemption of the advance, these payments can be reduced. At the end of fourteen years, if the instalments be regularly paid, he becomes the absolute owner of the house, while as a tenant he would have paid his landlord during the same period almost the same amount of money without becoming the owner of a single brick.

21. In the event of borrowers, from adverse circumstances, being unable to keep up their subscriptions, the Association has power, after three years' instalments have been paid, to suspend, without fines, all further payments for twelve months.

22. Through the aid of the Association, therefore, any person may become the owner of the dwelling-house he occupies as a tenant, by an annual payment, for a limited period, very little in excess

of the regular rent.

23. How to obtain an advance.—The first step to be taken, after a person has selected a house, and ascertained the price, is to obtain from the office a form of proposal, which must be filled out according to the instructions contained therein. The property is then examined, and a report made to the managers,

by whom the amount which can be wisely advanced is determined.

24. As every application for an advance is considered on its own merits, it is impossible to state the amount which will be leaned, or to fix the rate of interest, until the property has been inspected by the Association's official; but in all cases, applicants will be dealt with on the most liberal terms consistent with consults.

sistent with security.

25. The firm of Charles Pratt & Co. have executed a bond in the sum of 500,000 dollars, to

indemnify and protect all persons having financial relations with the Association.

26. Rules for the conduct of the business will be adopted and modified from time to time as

experience suggests.

The office of the Association will be open on Monday, Wednesday, and Friday, from 2 to 4, and from 7:30 to 9:30 p.m., and at such other times as may be determined.

Additional information will be furnished by mail or upon application at the office.

Address:--"THE THRIFT," Pratt Institute. 215 Ryerson-street, Brooklyn, N.Y.

Notice.—For the convenience of residents of the eastern district, a representative of the Association will be, until further notice, at the reading room of "The Austral," 184, Franklin-street, every Saturday evening after 1st January, 1890, from 7:30 to 9 o'clock.

## APPENDIX K.

#### NEW YORK TRADE SCHOOLS.

First Avenue, 67th and 68th Streets, New York.

Evening instruction in Bricklaying, Plastering, Plumbing, Carpentry, House and Sign Painting, Fresco Painting, Stone-cutting, and Blacksmith's Work.

Day classes in Plumbing, House and Sign Painting, Bricklaying, and Tailoring.

The charges for instruction include the use of tools and materials.

THE New York Trade Schools cover a plot of land measuring 200 x 113 feet, fronting on First Avenue Sixty-seventh and Sixty-eight Streets. The buildings are one storey in height, except on Sixty-seventh street, where the slope of the land allows a basement floor.

The main entrance to the schools is on First Avenue. The front doors opens into a broad hall, with the office on one side and the janitor's apartments on the other. This hall is handsomely finished and has a timbered ceiling. The walls, which are of a dark colour, are hung with photographic groups of young men who have attended the Schools, with views of buildings erected by members of the bricklaying class, and with testimonials and diplomas presented to the schools. All the wood-work in this hall was

class, and with testimonials and diplomas presented to the schools. All the wood-work in this hall was done by members of the carpentry class of 1886-7.

At the rear of the hall is a small court which is filled with flowers during the summer months. This court communicates with the plumbing shop, the tailoring shop, and the bricklaying room. The carpenters' shop and the plastering room are entered from the bricklaying room, and beyond the plumbing shop is the paint room. All these workshops are open to the roof and have windows on three sides, which secures good ventilation. The walls of the plastering room were built by the first bricklaying class, and those of the bricklaying room by the class of 1883-4. All work done by graduates of the school was paid for, precisely as if done by outside parties.

Fronting on Sixty-seventh-street is the reading-room, a spacious, lofty room with three bay windows looking on Sixty-seventh-street, and one into the carpenters' shop. An inscription states, that all the carpenters' work of this room with its open, timbered roof, bay windows, &c., was done by H. B. Rogers, G. J. Beck, J. Fielding, and J. E. Timmons, class of 1887-8, under the supervision of D. Vanderbeek, instructor.

In the evening the brilliantly lighted carpenters' shop and the bricklaying shed beyond, with over 150 young men at work, presents from the bay window in the reading-room a beautiful and animated sight, which few of those who see it are likely to forget. The brickwork of the reading-room was laid by members of the bricklaying class 1887-8. An inscription on the chimney breast of Philadelphia facebrick states that it was built by Thomas Carcy and Philip Martin, graduates of the New York Trade School. The decorations were done by the painting-class of last season.

This reading-room, which is well supplied with trade papers and magazines, is open to members of the schools every evening from six to seven o'clock, so that those who come from a distance, or who come before the workshops are open, may have a comfortable place to wait. During the day and after seven in the evening, the room is reserved for the use of the young men of the day classes.

Owing to the number of young men who have attended the New York trade schools during the past two seasons from all parts of the United States, the proprietor is now building a house within a few injustes walk of the schools, where comfortable, well-furnished rooms will be rented to young men. This building, which will be finished in the autumn, is being constructed on the most approved principles in regard to sanitary requirements, the staircases will be fire-proof, and the halls and the passages will be steam-heated. The building will be in charge of a respectable family. Single rooms will be rented at two dollars per week, and double rooms, with two beds, at three dollars per week, including lights and attendance. Meals can be had at neighbouring houses and at restaurants at 3 dollars and 3.50 dollars per week. The house will accommodate fifty-six young men. Rooms can be engaged when the entrance fees to the schools are paid.

The proprietor of the New York Trade Schools does not assume any control over the young men after they leave the workshops. Those who are strangers are warned what to avoid and thus far have conducted themselves like earnest young men who come to New York to learn a trade and not to amuse themselves. This house, and the reading-room at the schools, which is reserved for the day classes the greater part of the time, give strangers every comfort that can reasonably be expected.

greater part of the time, give strangers every comfort that can reasonably be expected.

Young men who desire to do so can deposit the money they bring with them at the office of the schools, and can draw it out at any time and in such sums as may be convenient.

# BRICKLAYING-DAY AND EVENING CLASSES.

THE classes in bricklaying and plastering will be under the supervision of Mr. Erskine Van Houten.

The manual instruction will be in building eight, twelve, and sixteen inch walls; in turning corners and building walls intersecting at different angles; in building piers, arches, flues, fire-places; in setting sills, and lintels; in corbelling, &c.

The scientific instruction will be upon the strength of walls, construction of flues, thrust of arches, mixing and properties of mortar, cement, &c. The scientific instruction is given by means of lectures illustrated by avaniments, and by corofully proposed manuals.

illustrated by experiments, and by carefully prepared manuals.

In the bricklaying classes the young men are taught first how to handle the trowel, and how to spread mortar. After this they are practiced on 8 and 12-inch walls. When these can be carried up plumb, and the courses laid level, the class is put upon walls returned at right angles, piers, arches, fireplaces and flues. Great care is exercised that each brick is properly laid, and that the joints are neatly pointed. No attempt is made to work fast until towards the close of the course, when an hour is given at stated intervals, to ascertain how many brick each member of the class can lay in that time in a workman-like manner on a straight wall. The brick work is carried up as high as the young men can conveniently work.

work; it is then forn down, and the bricks cleaned, to be used again. Before an exercise is commenced, the instructors show how it should be done. The young men are then required to practice under the constant supervision of the instructors until they can do the work well.

#### EVENING CLASSES IN BRICKLAYING.

There will be two evening classes in bricklaying, limited to seventy-five young men each. Instruction will be given to class No. 1 on Monday, Wednesday, and Friday evenings, and to class No. 2 on Tuesday, Thursday, and Saturday evenings, from 7 to 9:30 o'clock, commencing on 23rd October, and ending on 12th April. Class No. 2 will not be commenced until class No. 1 is full. The instruction will be the same in both classes.

During the last two weeks of the course, instruction will be given every day from 8 a.m. to 5 p.m., instead of in the evening.

Terms :- Eighteen dollars for the course, to be paid when name is entered.

This class is reserved for young men between 17 and 22 years of age.

This course of instruction of three evenings each week for five months, followed by two weeks of day instruction, has enabled those who are regular in attendance to do from one-third to one-half a day's work on leaving the schools, and to do a full day's work after a few months' practice at real work. Some members of this class have got full wages each year on leaving the schools, but they are exceptional cases. It is believed, however, that it is better not to attempt to do so, but to seek for steady employment at

moderate wages, until a sufficient experience has been gained to warrant journeyman's wages.

Members of the class of 1883-84, after finishing their course of instruction were employed by the proprietor of the New York Trade Schools to build three stores on 125th-street near Fifth Avenue.

Many members of the class of 1884-85 and of 1885-86 were employed by the proprietor of the schools to build the large apartment house on the corner of Ninty-third-street and Ninth Avenue.

The members of the class of 1885 and should found to be the corner of the street and Ninth Avenue. schools to build the large apartment house on the corner of Ninty-third-street and Ninth Avenue. The members of the class of 1885-86 also built four houses on Sixty-eighth-street, between First and Second Avenues. The young men of the class of 1886-87 built the Ninth Avenue section of the Ninty-third-street apartment house. The additions to the New York Trade Schools, and five houses on Sixty-eighth-street, were built by members of the class of 1887-88. A calculation is made of the number of brick laid each fortnight, and the young men's wages are graded accordingly. Nearly all the brick of these buildings, except the face brick, were laid by young men who could not handle a trowel when they joined the schools six months before being employed. Much of the face brickwork on the buildings erected the last two seasons was done by former graduates of the schools brickwork on the buildings erected the last two seasons was done by former graduates of the schools. Several houses are now being built by members of the class of 1888-89. These buildings have attracted great attention from mechanics and those interested in training the young men of this country in the mechanic arts. It would be difficult to find more thorough or better work. The lines are true, each joint is straight and neatly struck. The work looks as though the builders had "put their hearts in it." The Philadelphia Builders' Exchange sent a committee last year to inspect these buildings, and the work on exhibition at the New York Trade Schools. So favourable a report was made that it was decided to establish the Mechanical Trade Schools of the Philadelphia Builders' Exchange.

To strong active young men old enough to do a day's work this brighlaving class offers an exper-

To strong, active young men, old enough to do a day's work, this bricklaying class offers an opportunity to acquire speedily and at a small cost, one of the most profitable trades in the United States.

# DAY CLASS IN BRICKLAYING AND PLASTERING.

A three-month course of instruction in bricklaying and plastering will be commenced on 6th January, 1890. The instruction in bricklaying will be given every day from 8 a.m. to 5 p.m., except on Saturdays, when the schools close at 2:30 p.m. The instruction in plastering will be given on Monday, Wednesday, and Friday evenings, from 7 to 9:30 o'clock.

Terms :- Forty dollars, paid one-half on entry of name, balance on or before 2nd January. As

this class is limited to twenty five young men an early application is desirable.

The day course of instruction is intended for young men old enough and strong enough to do a full day's work. It is believed that those who take this course will be able to work as well and as rapidly as the average journeyman, and with a short term at real work will be first-class workmen. They will also have a knowledge of the trade few journeymen possess, which will fit them to be foremen and master builders in the future. Besides the regular course of instruction now given the bricklaying classes, the day class will be taught the use of plans, the laying out of buildings, getting levels, putting in stone and concrete foundations, &c. The instruction in plastering will be the same as that followed in the evening class.

This three-month day class is reserved for strong, active young men between 19 and 23 years of age, and none others need apply.

PLASTERING.

Instruction in scratch coating, brown coating, and hard finishing, also in running and mitring plain cornices, will be given on Monday, Wednesday, and Friday evenings from 7 to 9 30 o'clock commencing December 2 and ending March 8.

December 2 and ending March 8.

Terms:—Sixteen dollars for the course, paid in advance.

The Plastering Room is divided into compartments measuring 8 by 10 feet and 9 feet high, the walls and ceilings being lathed in the usual manner. Two young men work in each compartment. They are taught first how to apply the "scratch coat" on the walls and ceilings. This coat is taken off by labourers after each evening's work, leaving the laths ready for the young men on the following evening. The class is exercised on this work until it can be done neatly and rapidly. The "scratch coat" is then allowed to harden and the young men are shown how to apply the "brown coat." This coat is also removed after the work is finished. Then follows hard finishing and the running of plain cornices. The illustration shows the arrangement of the Plastering Room and the method of instruction. One spectator shown in the photo-engraving is ex-President Rutherford B. Haves, who visited the school as President of shown in the photo-engraving is ex-President Rutherford B. Hayes, who visited the school as President of the Slater Fund for the industrial education of coloured young men in the South.

The skill that can be acquired in the Plastering Class can be seen by the plaster work now on

exhibition at the Schools, but the best proof of what is learned in this class is the success that has attended its members; full wages being frequently earned on leaving the Schools. Young men now in the bricklaying trade would do well to take this course in plastering, as the trades are combined in country towns.

#### PLUMBING.—DAY AND EVENING CLASSES.

THE plumbing classes are under the supervision of the Trade School Committee of the Master Plumbers' Association of New York, consisting of Messrs. George D. Scott, Frank Reynolds, Edward Murphy, T. J. Tuomey and W. R. Bracken.

Manager appointed by the Trade School Committee-Mr. William H. Dewar.

Manager appointed by the Trade School Committee—Mr. William H. Dewar.

The manual instruction will be as follows:—1, lead scams; 2, overcast joints; 3, cup joints; 4, S traps; 5, horizontal wipe joints; 6, horizontal branch joints; 7, upright wipe joints, and joints on pipe placed at various angles; 8, upright branch joints; 9, wiping on a stop-cock; 10, wiping a flange on a two-inch pipe; 11, wiping on a ferule; 12, caulking; 13, putting an overflow pipe in a safe waste. At the conclusion of this course, miscellaneous and fancy work, sand bends, &c.

The scientific instruction will be upon the proper arrangement of service and waste pipes and upon

drainage and ventilation, as follows:—1, soil and drain pipes; 2, trapping and ventilation of soil and drain pipes; 3, supply pipes; 4, boilers; 5, tanks; 6, fixtures; 7, trapping and ventilation of fixtures; 8, mistakes in plumbing; 9, pumps.

At the termination of the course of instruction, the Trade School Committee of the Master Plumbers' Association will examine the members of the plumbing classes to ascertain their manual skill

Plumbers' Association will examine the members of the plumbing classes to ascertain their manual skill and scientific knowledge. Certificates will be given to those entitled to receive them, which will be found valuable in seeking for work. The possession of a certificate will reduce the term for which "helpers" are usually employed in New York by one year.

The plumbing classes at the New York Trade Schools have earned a high reputation. The system on which they are conducted has been followed in the plumbing schools now established in various parts of the United States and at the plumbing school in Montreal. The plumbing shop at the New York Trade Schools is 30 feet wide by 70 feet long, and is fitted up with all the appliances of a first-class shop. Each young man is furnished with a set of tools and has his allotted place at the work bench. The instructors, who are skilled mechanics, follow a regular course. Each member of the class is shown how his work should be done, and it is the duty of the instructor to see that it is done neatly and in a workmanlike manner. The solder is melted by means of Bunsen burners, supplied with gas. This avoids the heat and unwholesome gases of charcoal, or the danger which might arise from a great number of the heat and unwholesome gases of charcoal, or the danger which might arise from a great number of gasoline furnaces. Each member of the class is advanced as rapidly as his proficiency will allow. He is provided with a separate compartment, in which the specimens of his work are kept after being approved of by the instructor. These specimens can be taken away at the end of the course by paying for the cost of the material used. Great care has been bestowed on the scientific course of instruction. For each of the subjects, printed forms are furnished containing questions with blanks left for the answers. The lecturer reads a question and writes the answer to it on the blackboard. This answer is copied by the young men in the blank space in the printed forms. The lecturer then proceeds to explain fully what is meant, to illustrate his meaning by diagrams, and to answer questions put by members of the class. The printed forms, after being filled up, are kept by the young men for future reference. Diagrams are also given the members of the class of improperly arranged plumbing, many of them taken from faulty work that has actually been done in this city, which they are required to correct. By this course of manual and theoretical instruction, a knowledge of the trade is acquired to which it would be difficult to obtain in any

other way. Young men in the trade, and those who propose to enter it, should remember that the plumber, if he is to succeed, must know far more than was required of him a few years ago.

The skill that can be acquired in both the day and evening classes can best be determined by examining the specimens of work now on exhibition at the Schools, some of which were done by "helpers' and some by young men who had no knowledge of the trade when they joined the plumbing class.

# EVENING CLASSES IN PLUMBING.

There will be two evening classes in plumbing, limited to seventy young men in each. Manual instruction will be given to class No. 1 on Monday and Friday evenings and to class No. 2 on Tuesday and Thursday evenings from 7 until 9:30 o'clock, the course of instruction being the same in both classes. Scientific instruction will be given to both classes every Wednesday evening, from 7:30 to 9:30 o'clock.

Instruction will commence on October 23 and terminate on April 2. The examination will then

be held and the certificates will be given on April 9.

Terms:—Twelve dollars for the course; to be paid when name is entered.

These classes are reserved for young men between sixteen and twenty-one years of age.

The success of the evening plumbing classes established the reputation of the plumbing department at the New York Trade Schools. Although there is not time to make such claborate specimens for examination as members of the day class prepare, the workmanship of the evening classes is fully as good. The evening classes have been more largely attended than any of the classes in the Schools. Although the majority of the young men are in the trade, many are beginners and excellent examinations are passed by them, both in workmanship and in the science of the trade.

The day class will be given instruction in lead burning for an extra charge of five dollars.

#### DAY CLASS IN PLUMBING.

A. Three Months' day course of instruction in plumbing and gas-fitting, designed particularly for young men in country shops, and for such young men as have time to attend, will commence on December 3. The instruction is given every day from 8 a.m. and 4 p.m., except on Saturdays, when work is

stopped at 2.30 p.m.

Terms:—Thirty-five dollars for the course, paid in advance. Good board can be obtained in private

families at five dollars per week.

This class is reserved for young men between 18 and 22 years of age.

The day class in plumbing has been in operation five winters. It has been attended by young men from Vermont, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Iowa, Missouri, California, Tennessee, Alabama, Georgia, Florida, Virginia, Michigan, Ohio, District of Columbia and from Canada. The majority of the young men who join the day plumbing class have no previous knowledge of the trade. In giving them their certificates in March, 1888, the President of the Master Plumbers' Association of New York said that their work was "simply marvellous." The Trade School

School Committee reported to the Master Plumbers' Association that the work of the day class of 1888-9 "was as good as could be done by many journeymon," and that the examination which had been passed by

"was as good as could be done by many journeymon," and that the examination which had been passed by fifty out of fifty-two young men was a most trying one.

Besides the regular course of instruction given to both day and evening plumbing classes, the members of the day class will be instructed in the best method of keeping plumbers' books, and in mechanical drawing. The young men will be taken over different buildings, and the system of plumbing followed in New York explained to them. They will also be required to fill up specifications for an ordinary city house according to the rules of the Board of Health of the City of New York.

## CARPENTRY.

There will be two classes in carpentry and joiners' work, limited to forty young men each men. Instruction will be given to class No. 1 on Monday, Wednesday, and Friday evenings, and to class No. 2 on Tuesday, Thursday, and Saturday evenings, from 7 to 930 o'clock, commencing on October 23 and ending on April 2. Class No. 2 will not be commenced until class No. 1 is full. The course of instruction will

The class in carpentry will be under the supervision of Mr. D. Vanderbeek. Terms:—Sixteen dollars for the course, to be paid when name is entered. This class is reserved for young men between 16 and 21 years of ago.

The young men in the carpentry class are shown the use of the various tools commonly used in the trade, great care being taken that each is used in a workmanlike manner. After this has been acquired and boards can be sawed to a line and neatly planed, mortising and tenoning are taught. Then panels are framed, mouldings are put on, and later doors and shutters are made. Partitions are also set, floors and partitions are bridged, and flooring laid. A small frame house is also framed, sheathed, shingled, &c.

This course of instruction gives each member of the class a varied amount of work.

The scientific instruction includes the meaning of the terms used in carpentry, laying out a building

from a plan, the framing of partitions and roof trusses, strength of girders, &c.

A visit to the New York trade schools will show what excellent work can be done by young men after one season's instruction who had no knowledge of the trade when they came to the schools. The ornamental woodwork of the Entrance Hall was executed by members of the class of 1886-7, and all the carpenters' work, including the open timber roof, bay windows, &c., of the new Reading-room was done by members of the class of 1887-8. The young men who have attended this class have found no difficulty

Owing to a demand for instruction in carpenters' and joiners' work from country towns and from young men able to attend during the day, a three months' day class will be opened on January 6, provided a sufficient number of names are entered by December 10. The charge for the day class will be thirty-

five dollars, paid in advance. Good board can be had at five dollars per week.

# House, Sign, and Fresco Painting,-Day and Evening Classes.

The Painting Classes will hereafter be under the supervision of the Trade School Committee of the Master Painters' and Decorators' Society of New York, consisting of Messrs. Walter Reid, John Beattie, H. D. Moeller, Theodore C. Johansmeyer, T. L. Taylor, and Joseph Scott.

At the termination of the course of instruction the Trade School Committee of the Master Painters' and Decorators' Society of New York will examine the members of the Painting Classes to ascertain their manual skill and their knowledge of the science of the trade, and will give certificates to those entitled to receive them.

Mr. William O. Allisson, the proprietor of the Painters' Magazine, will give a medal to the most deserving members of the Painting Classes to be known as the Painters' Magazine medal.

Young members of the rainting chasses to be known as the rainters renganthe metal.

Young men by this course of instruction in painting can prepare themselves to enter an excellent trade, and one for which there are openings for those who know how to work, in every town in the United States. The courses of instruction, which combine both the science and practice of the trade, are arranged for those who are now employed in shops or who desire to enter the trade. The Committee of the Master Painters' and Decorators' Association recommend these classes to well educated young men who are old enough to know for what sort of work they are fitted, as the instruction should enable them to make their labour of value, and in a reasonable time after leaving the schools to become

There is a large wall surface in the school buildings on which the young men are practised and wooden screens fitted with doors, windows, box slutters, &c., are used for instruction in fine work. Some of the compartments shown in the photo-engravings contain specimens of fancy painting, lining, gilding, graining, work in flat colours and polish white, executed by young men who had no previous knowledge of the trade when they came to the schools, which would do credit to any journeyman.

# DAY CLASS IN HOUSE PAINTING.

A Turee months' day course of instruction in house and sign painting will be commenced on 3rd December. The instruction will be given every day from 8 a.m. to 4 p.m., except on Saturdays, when

Terms :- Thirty-five dollars for the course, paid in advance. Good board can be obtained at five dollars per week.

This class is reserved for young men between 18 and 22 years of ago.

This class is reserved for young men between 18 and 22 years of ago.

The members of this class can take the evening instruction in sign painting without extra charge. The manual instruction commences with preparing the surface for painting, mixing paints, care of brushes and paint pots, plain painting, &c. When the pupil can cover a plain surface whether of wood, brick, or tin, in a satisfactory manner and can explain where to begin his work, he is exercised in painting in colours, in flatting, polish white, stippling, gilding, and glazing.

The scientific instruction includes the harmony of colours, mixing of colours, properties of oils and dryers, and the various materials used in painting, &c., &c. Lectures are given by Mr. Joseph Scott, the young men being required to illustrate the subjects discussed by actual experiments.

# EVENING CLASS IN HOUSE PAINTING.

Instruction will be given on Monday, Wednesday and Friday evenings from 7 to 9:30 o'clock, commencing on 23rd October and ending on 2nd April, in fancy painting, graining, lining, gilding, flatting, polish white, &c., to young men who have some knowledge of the trade. Each member of this class will be advanced as rapidly as his proficiency will allow, it being required that each exercise shall be well done before proceeding to the next. Instruction will also be given in the harmony of colours, mixing of colours are side and drawns. of colours, properties of oils and dryers.

Terms:-Twelve dollars for the course, to be paid when the name is entered.

This evening instruction in house painting meets a want long felt, of some means by which young men now in workshops can gain a knowledge of the trode not to be obtained in a shop. Ambitious young men who wish to become first-class workmen, should visit the schools and see what progress can be made by working during three evenings each week for a few months, under the supervision of a capable instructor.

The paint shop used by the evening class at the New York Trade Schools, can only accommodate thirty-five pupils. It is therefore desirable for those who wish to join this class to make early application.

## FRESCO PAINTING.

Instruction in fresco painting will be given on Monday, Wednesday and Friday evenings, from 7 to 9:30 o'clock, commencing 23rd October and ending 2nd April.

Terms:—Twelve dollars for the course, paid in advance.
The instruction consists in preparing walls and ceilings for kalsomine; in lining; in laying out

work; in making pounce and steneil and applying same; in putting on flat and shaded ornaments, &c.

Fresco painting was one of the first trades taught at the New York Trade Schools, and excellent work has been done by those who have attended this class. The instruction is given by a practical fresco painter; the pupil, as in the other classes in the schools, being made to follow a systematic course. Towards the end of the season elaborate designs have been painted, which have been exhibited and received favourable comment at the Fair of the American Institute and at the rooms of the Master Painters' Association of New York Painters' Association of New York.

Attention is called to the moorish room and a portion of the renaissance room shown in the photo-engraving, and which, with much other work, can be seen by a visit to the schools. These rooms were decorated by members of the fresco class of 1888-9, from the preparation of the walls and making the steneils, to the finest work, without being touched up by the instructors. The design on the walls of the moorish room was enlarged by the young men from Owen Jones' "Grammar of Ornament."

## SIGN PAINTING.

Instruction will be given on Tuesday and Thursday evenings from 7 to 9.30 o'clock, in sign painting, commencing on 3rd December and ending 11th March.

Terms :- Ten dollars for the course, to be paid when name is entered.

The instruction commences with preparing the wood. Then spacing and plain lettering is taught.

The instruction commences with preparing the wood. Then spacing and plain lettering is taught. The class then practise fancy lettering in colours and gold, also painting on glass and metal.

Instruction in sign painting was given at the New York Trade Schools last winter for the first time. Rapid progress was made by the members of this class, as can be seen by the collection of signs with plain and ornamental lettering, which are now on exhibition at the schools. A knowledge of sign paintaing is gained by this course of instruction, given by a first-class sign painter, which could only be obtained with difficulty even in the best shops. The course of instruction is arranged both for beginners and for those who have a knowledge of the trade. Skill in sign painting is particularly valuable to mechanics who find work in country towns.

## STONE-CUTTING.

Instruction in plain and ornamental stone-cutting in brown stone, will be given on Monday, Wednesday, and Friday evenings, from 7 to 9:30 o'clock, commencing October 23, and ending on April 2.

The stone-cutting class will be under the supervision of the Trade School Committee of the Master Freestone Cutters' Association of New York, consisting of Messrs. B. A. Williams, James Hughes, and Wm. Light,

The class will be instructed by Mr. James Hughes, of the firm of Hughes and Scanlon.

Terms :-Twelve dollars for the course, to be paid when name is entered.

Terms:—Twelve dollars for the course, to be paid when name is entered.

This class is reserved for young men between 18 and 28 years of age.

The stone-cutting shop in the New York Trade Schools has attracted considerable attention from both masters and journeymen, on account of the rapid progress made by the young men who enter it. It is difficult to realise how much more thoroughly such a trade as stone-cutting can be learned with a skilled mechanic to show how each piece of work should be done, and to explain why it should be done in a particular way, than by leaving the trade to be acquired by observation and by chance.

The course of instruction commences with squaring an irregular block of stone. The pupil is then shown how to finish the surface in various ways, such as rubbed, tooled, bush hammered, random pointed, tooth chiseled, &c. He is then taught to cut chamfers, simple mouldings, return mouldings, raised and sunken panels. The superb exhibit of cut-stone in the stone-cutting shop at the schools (a photo-engraving of which is given) all of which was done by young men after one season's instruction, is photo-engraving of which is given) all of which was done by young men after one season's instruction, is a sufficient guarantee of what can be learned. The mantle-shelf in the reading-room was cut by a young man after four months' instruction, who had no previous knowledge of the trade when he came to the

schools. Active young men have, in this class, an opportunity to enter one of the best and steadiest trades in a short time and at a small cost. They can also ascertain if they have any capability for the work; if not the instructor will so advise them.

BLACKSMITH'S

#### BLACKSMITH'S WORK.

Instruction will be given in forging, filing and chipping, on Monday, Wednesday, and Friday evenings, from 7 to 9.30 o'clock, commencing on October 23, and ending on April 2.

The instruction in forging will be in the management of the fires, in drawing down, bending, shortening, welding, splitting, punching, chamfering, rivering, &c. In vise work, the instruction will be in filing to line, fitting towards and groves shipping hands granting river work.

in filing to line, fitting tongues and groves, chipping bevels, scraping, ring work, &c.

Terms:—Twelve dollars for the course; to be paid when name is entered.

The Blacksmith's Shop is large, well lighted and well ventilated. It is in charge of a practical mechanic and it is fitted up with forges and the tools and appliances of a first-class shop. The instruction is based on the course followed at the Massachusetts Institute of Technology in Boston. The plan being to give the young men such instruction as will enable them both to comprehend clearly the principles of their work and to gain a knowledge of the kinds of tools used in their trade and the various ways of using them. In each exercise some useful piece of work is executed. Instruction is also given in building and the management of forge fires, upon which much depends in forging. The growing demand for wrought iron work makes the instruction given at the New York Trade Schools particularly valuable. The work now on exhibition at the schools shows what neat and beautiful work can be done after one season's instruction.

The work required of the young men is hard, but the hours of instruction are not too long to render the practice more than good exercise. The members of this class are advised to keep a flannel shirt and a suit of clothes at the schools to work in, so that their clothing can be dry when they leave.

#### TAILORING.

A free course of instruction in tailoring has been opened by the Merchant Tailors' Society of the City of New York, at the New York Trade Schools.

The instruction is given throughout the year from 8 a.m. to 5 p.m., with one hour's intermission at noon.

The object of the Merchant Tailors' Society of New York in establishing a Tailoring School is to teach the trade thoroughly in all its parts.

The Tailoring School is under the supervision of a first-class teacher, with an assistant, both of

whom are thoroughly practical tailors, and understand every detail of the trade.

At the expiration of six months, or sooner, those pupils who are proficient will be paid one dollar

The first few months of the course of instruction are spent in learning to sew upon different kinds of woollen and textile fabrics. At the expiration of this period the pupils are put upon actual work, assisting those who are more advanced in making vests. When a vest can be put together and good button-holes can be made, the pupil assists one still more advanced in making trousers.

The Mcrchant Tailors' Society of New York has also established a back shop at No. 11 West, Twenty-seventh-street, to which the pupils will be admitted after they have spent two years at the school.

It is proposed at this back shop that each lad shall be under the charge of a good journeyman, who will teach him the balance of his trade, and with whom he will be expected to remain for two years. During these two years the numit will be paid according to his ability to earn: the amount to be arranged

During these two years the pupil will be paid according to his ability to earn; the amount to be arranged between the journeyman and the pupil, subject to the approval of the Society.

When the pupil has finished his course of instruction, and has passed his examination, he will receive the certificate of the Merchant Tailors' Society of New York, which will entitle him to be recognised as a journeyman by every Merchant Tailors' Society in the United States, and to receive journeyman's wages.

The Merchant Tailors' Society of New York has also under consideration the giving of a full course of instruction in cutting to the graduate who shall receive the greatest number of marks for the best work and for the faithful performance of his duties, during the four years of his instruction.

None but respectable lads who can read and write will be admitted, and those who are found to be objectionable or incompetent will be dropped.

Application for admission can be made at the New York Trade Schools, or to Mr. Andrew Patterson, 25 and 27 West Twenty-sixth street, New York.

To young men.—Skilled labour all over the United States commands the highest wages. The demand far exceeds the supply and is constantly increasing. In the large cities, owing to the difficulties young men thus far have had in finding an opportunity to learn a trade, this demand for skilled labour is chiefly supplied from abroad. A thorough knowledge of a trade yields its possessor, even if he works but 200 days in the year, an income equal to that received from \$20,000 invested in Government bonds.

Architecture roung men have new the experiment at the New York Trade Schools to acquire in a short Ambitious young men have now the opportunity at the New York Trade Schools to acquire in a short time, and at a small expense, the knowledge of a trade which will be valuable to them all their lives.

"Can we get work after we leave the schools?" is a question often asked. The reply is that although

organised labour unwisely endeavours to keep American young men out of the trades, many friendly hands are stretched out to help them. Two thousand young men have attended the New York Trade Schools since their establishment, the majority of whom have come on the recommendation of brothers or friends who have preceded them. Hundreds of these young men have written, or called at the schools, to say that the instruction they received was the making of them. Most of those who have been heard from, were getting high wages, and some are now master mechanics.

## To Journeymen.

Journeymen object to having young men taught trades because they believe there will be too many skilled workmen, and because they fear that the master mechanics would be able to do too much work with "boy labour" that is now done by journeymen.

As soon as skilled labour was organised, rules were made in many of the trades forbidding master mechanics to employ more than a limited number of lade werelly from two to four with a town of committee to the state of the state

mechanics to employ more than a limited number of lads, usually from two to four, with a term of service

of four years.

This rule only allows a master mechanic to graduate one journeymen each year, or one in two years-a number insufficient to fill the vacancies, much less to meet the ever increasing demand for skilled labour

labour in growing communities. Thus mechanics are induced to come here from Europe, not only to make this country their home, but as "harvesters," to work here during the busy season and return home with their savings when it is over. Union apprentice rules, therefore, do not reduce the number of journeymen, they merely cause the high wages our own people should earn to be paid to strangers.

At a Trade School a young man learns his trade without competing with men in the workshop. The labour of a Trade School graduate is of considerable value, and it can easily be graded during the short term of practice required after leaving school so as not to allow him an unfair advantage over journeymen. Thus by the Trade School plan the competition of "boy labour" in the workshop, so much

dreaded by journeymen, is avoided.

Although Union men, and even the officers of the Unions, send their sons to the New York Trade Schools, yet the Trades Unions have been hostile and shown their ill will in many ways. The New York Trade Schools were not established in the interests of, nor in the opposition to, any organisation, whether of masters or journeymen. The schools were established solely to aid young men to learn how to make an honest living, and while doing so care has been taken not to injure the trades. There is a great demand for admission to the schools from men who wish to learn a portion of a trade, and money far in excess of the regular fees has been offered by such men for admission. Instructing men in part of a trade would not be making good mechanics, it would be depriving skilled workmen of much of the jobbing work, tend to lower wages, and it would be distasteful to the journeymen. Except in some unusual case it has not been done, although at times the temptation has been great to retaliate in this way for injuries done the schools by the Unions.

The time has come for the Trades Unions to consider this apprentice question. Never before, in any country, have rules existed which prevented young men learning how to work so that they could share in the high wages any foreigner is free to earn. It is not possible that such rules will be tolerated much longer in this country. Were it not for the lads who learn their trades in country towns, where there are no Unions to interfere with them, the number of American skilled workmen would be even smaller than it is now. It is estimated from figures given in the last census that out of the enormous sum of 23,000,000 dollars paid annually to mechanics in the building trades in this city, less than 6,000,000

goes to those born in New York.

The National Association of Builders has recommended for adoption in the building trades apprentice rules in which it is provided: That a young man who wishes to be a mechanic shall first go to a trade school to learn how to work, and shall remain there until able to pass an examination. Then he shall serve in a workshop as a "junior," either for a specified term, or until "old enough, strong enough, and competent," to do a full day's work. He is then to apply for a second examination, which, if passed, entitles him to be considered a journeymen. These rules are so just to the journeymen, to the master mechanics, and to the young men that there can be no opposition to them which does not arise from a desire to exclude American young men from the trades.

Trades Unions are necessary for the protection of mechanics. They are, however, unpopular, and they often meet with hostility where they should receive support, because of their persecution of the youth of this country. Workmen of foreign birth, who largely control the Unions, are apt to undervalue the importance to an organisation of having public opinion on its side. "With public opinion on our side," said Abraham Lincoln, "nothing can fail; without it nothing can succeed."

APPRENTICE RULES recommended for adoption in the building trades by the National Association of Builders of the United States.

1st. The serving of a regular course of instruction in a Mechanical Trade School, and graduating

therefrom with a certificate of proficiency granted by the same, under rules and regulations approved by a committee of master mechanics, who may unite in the management of the said school.

2nd. The preliminary training in the Trade School to be followed by a term of practice with an employer on actual work, this term to be at least one year less than the usual term of apprenticeship by virtue of the holding of a certificate of proficiency, granted by a Mechanical Trade School. During this term of service the young man to be known as a "junior."

3rd. Finally, completion of the education of the mechanic to be acknowledged after a proper examination has been passed before a Board of Examiners appointed for the purpose by the Association

examination has been passed before a Board of Examiners appointed for the purpose by the Association of Builders, to which the employer may belong, or to whom the "junior" may apply for examination, by the issue of a certificate by the said Association, which shall state that the holder has passed through the prescribed course at the Trade School, and the term of practice with an employer (name and location given) with satisfaction and credit, and is entitled to be received by all builders as a journeyman.

Any young man who has received the "certificate of proficiency" from the Trade School, may apply for the second examination before the Board of Examiners, and if adjudged by them to be old enough, strong enough, and competent, he may receive a special certificate, which shall state the facts in the case.

## APPENDIX L.

# FORM, STUDY, AND DRAWING IN THE UNITED STATES OF AMERICA.

A course of study for four years in Form-Study and Drawing, adopted at Buffalo, New York, 17th October, 1888, by the Principals and Teachers of Drawing in the Normal Schools of the State of New York and the State Director of Drawing in the Teachers' Institutes; with a syllabus of work to be followed by all Teachers of Drawing in all the Teachers' Institutes and Normal Schools of the State. Prepared by the late John H. French, LL. D., State Director of Drawing in the Teachers' Institutes, and approved by Andrew S. Draper, State Superintendent of Public Instruction.

#### I. INTRODUCTION.

The term Drawing very inadequately expresses the nature of the study it is desirable to have taught in the schools under the name. When the study was first introduced into the schools, it was very properly called Drawing, inasmuch as the work of pupils consisted principally of drawing from printed copies, and the instruction was devoted mainly to the training of the hand and eye in copying. As the study has developed, however, under the influence of educational methods, the character of the instruction and the work of pupils have entirely changed.

The study of form as observed in models of type-forms and in objects, has taken the place of the stu ty of printed copies, and the instruction has been broadened so as to include the cultivation of the observing powers by the study of things on the one hand, and the expressive powers through making, drawing, and language on the other,-drawing, however, beyond the elementary work, being the principal

means used in expressing form knowledge and its applications.

Thus it will be seen that drawing is only a feature in the important study of form, while in the applieations of form knowledge, both in education and in practical life, it becomes the principal means for expressing thought. Hence, the proper title for the study that is now desired in the schools is form,

study and drawing, and not drawing alone.

The following syllabus has been arranged in accordance with this idea of the study; and is divided into two parts. The first or elementary part is devoted to gaining a knowledge of the properties of forms from models of type-forms, and from objects based on them. In this division it is intended that the aim of the instruction shall be to develop the pupils' powers of observation, and to give training in the means of expressing thought in regard to form, through making, drawing and language.

In the second division the study of form in chiefts is still certified but it is now the sim of the

In the second division the study of form in objects is still continued, but it is now the aim of the instruction to give expression to this form knowledge, and to make applications of it mainly through drawing. In this division the course of study prepares broadly for general education and for practical

Persons who expect to qualify themselves to pass examination in the study and representation of form merely by studying some text-book on drawing for a few days or weeks, need to be reminded of the following facts:-

1. In the near future drawing is to be taught in all the public schools of this State.

2. A knowledge that will enable a person to successfully pass an examination in this subject, must be such a knowledge as will enable him to teach the subject properly.

3. A person properly qualified to teach the subject must be familiar with the terms, characters and materials used, with the results to be secured, with the development and training of the mental and physical powers concerned in the work, with the proper synthetic order of arrangement of the parts of the subject with a logical method of proporting instruction and conducting the work; and appropriate here. the subject, with a logical method of presenting instruction and conducting the work; and must also have the manual skill which can be acquired only by considerable practice in all the details of observation, con-

struction, representation and ornamentation.

The subjects with which all candidates should be theoretically and practically familiar to enable them to give that kind of instruction of the greatest value to the children of the State, are included in

the following:

## II. COURSE OF STUDY. I. TYPE-SOLIDS.

## First Year-

- 1. Sphere 2. Cube.
- 3. Cylinder.
- Second Year-
  - 1. Ellipsoid.
  - Ovoid.
     Equilateral Triangular Prism.
- 4. Hemisphere. 5. Square Prism.
- 6. Right-Angled Triangular Prism.
- 4. Cone. 5. Pyramid.
- 6. Vase Form.
- (a). The first half of the first year the work is to be mainly the study of the six type-forms, with some attempts at representation by stick and tablet-laying. No drawing as a regular exercise is to be required this half year.

(b). In the second half of the first year simple exercises in paper-folding and paper-cutting are required. Drawing is to begin in this half year.

Method of Study:

- By sight.
   By touch.
- 3. By arrangement.

- Order of Study:
  - 1. As wholes.
  - 2. As to surface.
  - 3. As to faces.
  - As to edges and corners.

Ways

Ways of expressing: 3. By drawing. 2. By making. 1. By language. Plane figures to be taught: Circle.
 Square. 4. Right-Angled Triangle. 5. Equilateral Triangle. 6. Isosceles Triangle. 3. Oblong. LINES ARE TO BE TAUGHT. As to directness: 1. Straight. 2. Curved. As to relation: As to position: 1. Horizontal. Parallel.
 Perpendicular. 2. Vertical. 3. Converging and Diverging. 3. Oblique. Third and fourth years:- Continued study of the twelve type-solids; and
 Study of natural formes based upon them.
 Teach reversed curves, symmetry and proportion.
 Drill in position, pencil-holding, pencil-movements and quality of line. III. SYLLABUS. I. WORK FOR THE FIRST AND SECOND YEARS. I. TYPE-SOLIDS. First Year Sphere, cube, cylinder, homisphere, square prism, right-angled triangular prism. Second Year Ellipsoid, ovoid, equilateral triangular prism, cone, square pyramid, vase-form. Method of study:

1. By sight—by observing appearances of models in different positions.

2. By touch—by grasping, by handling, by moving, by placing models. 3. By pleasing arrangement of models in rows, or by building. General order of study of a type-solid: 1. As a whole; how it feels, how it moves, how it looks, its name. As to surface; round, rounding, plain, curved.
 As to edges; straight, curved. 4. As to corners; square, sharp, blunt.

The surface is the whole outside of a thing. A face is a limited part of a surface.

A sphere has one round face; a cylinder has one curved and two plane faces. A cube has six plane faces. A hemisphere has one rounding and one plane face. An ellipsoid has one rounding face. Ways of expressing : By making—clay modeling, paper cutting, and pasting.
 By drawing, with free arm movement. 3. By language, using the proper terms in complete sentences. Terms to be learned by the use of the solids: 1. Terms of location, to be learned by placing the models at the left side, right side, top, bottom, near, far, above, below, middle, front. 2. Terms of direction, to be learned by movement in the air and on the surface of the model, the blackboard and the desk; round and round, from left to right, from top to bottom, from corner to corner. 3. Terms of position, to be learned by placing the models, -upright, standing, vertical; level, lying, horizontal; standing, leaning, oblique. II. PLANE FIGURES. Plane figures are derived from type-forms, and are to be studied from the faces of solids and objects, and from tablets. First Year Circle, square, oblong, semicircle, right-angled triangle. Ellipse, oval, equilateral triangle, isosceles triangle. Method of study and plane figures:

1. By sight—by observing and comparing.

2. By touch—by handling and placing.

3. By use in arrangements to represent objects, and for borders and arrangements around a centre. Order of study: 1. As to shape and name. 2. As to edges or sides; number, quality, relation. 3. As to corners or angles; number, kind. Ways of expressing: 1. By folding, cutting, mounting figures, borders and arrangements around a centre made of coloured paper—by stick laying. By drawing—proper pencil-holding, free movement, broad lines.
 By language.

Terms

Terms to be learned:

1. Directness-straight, curved.

2. Location of faces, edges, corners, figures, angles, and lines—as upper, lower, left, right, back, front.

3. Position of faces, edges, and lines—as vertical, horizontal, oblique.

4. Relation of faces, edges, and lines—as parallel, perpendicular, converging, diverging.

5. Angles—right, acute, obtuse.
6. Details of faces—as diameter of a circle; diameter, diagonal of a square; vertex, base, altitude of a triangle.

These terms are to be learned by the use of tablets, sticks, and other materials, with regard to

faces, edges, corners, figures, angles, and lines.

Develop from the type-forms the drawing of lines and angles. Teachers should exercise their own taste and judgment in the use made of the drawing of objects as wholes. Teachers may either teach surfaces, angles, and lines from the use of these objects severally, by requiring pupils to find and draw the objects in connection with the terms; or they may teach the surfaces, angles and lines in connection with the type-forms.

Edges apply to objects; lines, in drawing, are pictures of edges.

Borders should have marginal lines; arrangements around a centre should have a central figure to

hold the parts together. Two colours should not be combined in making an arrangement of figures from coloured paper; two shades of one colour may be used however.

II. WORK FOR THE THIRD AND FOURTH YEARS.

Third and Fourth Years-

Review type-solids; study objects based upon them. The three kinds of work suggested below, should be carried on at the same time.

I. Study and draw Solids as they are.

- Geometric views; names of the different views, placing the different views.
   Patterns of developments of surface.

3. Making type-forms from patterns.

Terms to be learned:

Top view.

Left side or end view, Front view, Right side or end view.

Bottom view.

The proper placing of these views is shown by the arrangement above.

II. Study and draw Objects and Natural Forms as they appear.1. Opposite the eye.2. Below the eye.

Terms to be learned:

Proportion, Outline, Reversed Curves.

No attempt should be made at this stage to introduce theoretical perspective. Study the simple appearance of objects opposite the eye, and of natural forms, fruit, etc., below the eye.

III. Study Ornamental Arrangement.

Seek for beauty. Beauty is the harmony of differences. Study and draw from nature and from ornament;

1. Simple leaves.

- 2. Simple ornamental figures.
- 3. Original arrangement.

Steps in arrangement:

- 1. Arrange tablets and sticks for single figures, borders, rosettes, etc.
- 2. Cut, arrange, and mount units of coloured paper.

3. Draw the arrangements made.

Principles of arrangement:

- Symmetry secured by balance.
   Proportion learned from the study of pleasing forms.
- 3. Rhythm secured by repetition.

Terms to be learned:

Bisect, trisect, axis, trefoil, quatrefoil, border, rosette.

IV. Some Important Facts and Definitions.

1. Drawing is the graphic expression of form.

2. Industrial drawing is drawing applied to the industries of life. It is both free-hand and instrumental.

3. The basis of industrial drawing is geometric form.

- 4. Balanced curves are pairs of curves that bend equally—but in opposite directions in every part.
- 5. A working drawing is a drawing that gives all the facts of the form, size and structure of an object. It is a drawing by which a workman can manufacture an object.

  6. A geometric view shows two dimensions only.

7. An elevation is a drawing that shows a vertical side of an object.

V. General Suggestions.

1. As to materials:

Good and cheap paper, scissors, rulers or straight-edges, pencils, erasers.

Pencils---

Grasping; movements in free-hand and mechanical work.

Erasing-

Pupils make no erasures the first year without the direction of the teacher.

Every pupil should be provided with a set of type-forms for the year in which he is working.

2. As to length and frequency of exercises:

Daily, of about the same length as other class exercises. No attention to other work when this is going on.

3. Length of time required for the course:

With the same proportionate amount of attention that is given to other subjects of equal importance, this course can be completed in four years; but with the attention that most pupils would be glad to give it, five years can be profitably devoted to it. If, however, this course is to be supplemented by an advanced art course of two years, not more than four years should be given to the elementary course.

4. How to introduce the subject into the schools:

- (a.) An exercise of fifteen minutes in the study of a type-form will arouse interest in the pupils.
- (b.) A sheet of good light manilla paper, 36 x 54 inches, cut into oblong pieces of about 4 x 6 inches will supply a class of forty pupils with all the paper they will need for two weeks. Give these to the pupils and set them to work, more for amusement than as a requirement. Allow no scribbling, crumpling, or waste of paper in any way. Require the pupils to return to the teachers all pieces of paper unused at the close of every exercise, whether they be large or small.

The Institute course of form, study, and drawing, as abridged from Dr. J. H. French's Syllabus, and approved by Andrew S. Draper, State Superintendent of Public Instruction.

# INSTITUTE COURSE—FIRST PERIOD—FORM-STUDY.

Form knowledge is best derived from a study of solid models of type-forms and of objects of similar forms. Form-Study by handling and by seeing, is for the cultivation of the observing powers and for the development of form ideas in the mind, to be expressed by making, drawing and language. The method is illustrated by the study of the sphere, cube, cylinder, square and right triangular prisms. These solids are studied as wholes, and also as to their details.

As wholes—Their resemblances and differences.

Sphere and Cube—In each of these two models the three dimensions the same, (height, width from left to right, width from front to back). The sphere is round, the cube has corners

Cylinder and Square Prism-In each of these models but two dimensions the same, (width from left to right, width from front to back.) The third dimension may vary. The cylinder is round one way and has curved edges, while the prism has corners and straight edges.

Right Triangular Prism-No two dimensions the same.

No position of the sphere or cube can be designated as horizontal or vertical, as their three dimensions are the same.

The cylinder and prisms may be placed in a horizontal or a vertical position, as two of their three dimensions differ; therefore, there is a greater variety in the different appearances of these models than in those of the sphere and cube.

As to Surfaces-The outside of an object. Surface of sphere is round; of cylinder is curved and plane; of the cube and prisms is plane.

As to Faces-Face a limited part of a surface.

Character of Faces-Round, as on the sphere; curved and plane, as on the cylinder; plane as on the cube and prism.

Shapes of Faces—Circular, as on the sphere; square, as on the cube and square prism; oblong as on the cylinder and prisms; triangular, as on the right triangular prism.

Position of Faces—Vertical; horizontal; oblique.

Relation of Faces—Parallel; perpendicular; oblique to each other.

As to Edges and Profiles—An edge is formed by the meeting of two faces. A profile is the limit of the visible part of a round or curved face.

Edges are both curved (on the cylinder) and straight (on the cube and prisms).

Profiles are both curved (on sphere) and straight (on cylinder).

Position of Edges—Vertical; horizontal; oblique.

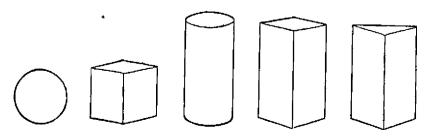

Relation of Edges—Parallel; perpendicular; oblique to each other.

Edges and profiles limit and give the shapes of faces and parts of faces visible.

As to Corners or Angles-Corners or angles are formed by the meeting of two or more edges. Observe right angles on cube and prisms, acute angles on triangular prism, obtuse angles obtained by placing square and triangular prisms together.

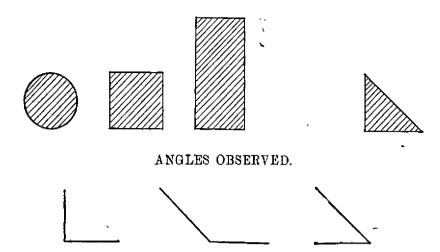

The study of faces, edges and corners should be by observation in regard to their position, location, direction and relation.

#### MODELS STUDIED.

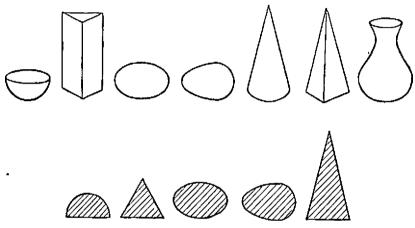

FACES

#### FACES OBSERVED.

As the work develops, the models to be studied in addition to the above, are the henisphere, equilateral triangular prism, ellipsoid, evoid, cone, square pyramid, vase form, together with the geometric faces or figures derived from them, as shown in the following illustrations;

It is not expected that in the upper classes, Form-Study with all the details here indicated should be presented. It is important, however, that in all classes the work should begin with the study of the solid model or object, and the nature and extent of the Form-Study should depend upon the extent to which the observing powers of the pupils have been developed.

The study of objects like these type-forms should be a feature in the whole work.

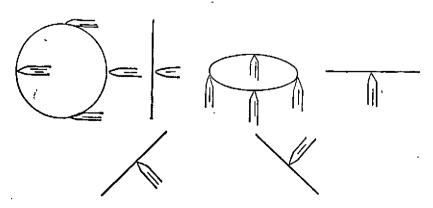

## SECOND PERIOD-DRAWING.

Skill in drawing should be developed as an accurate and ready means of expressing form ideas. There should be drill in pencil-holding and in the free drawing of circles, ellipses, curved and straight lines.

This drill practice should be given in connection with the drawing of the form ideas derived from the study of the models and objects.

Pencil Rolding—The pencil should be held lightly about four inches from the point, at an angle of about 30° to the paper.

In drawing a circle or vertical line, the pencil should point to the left. In drawing a horizontal ellipse, or a horizontal line the pencil should point toward the top of the paper.

The general rule in drawing straight lines is, that the pencil should point in a direction at right argles to that of the line to be drawn.

Drawing—

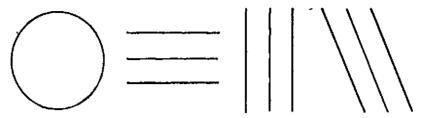

138—2 K

Drawing-Free work should be obtained in drawing by the whole arm movement from the shoulder.

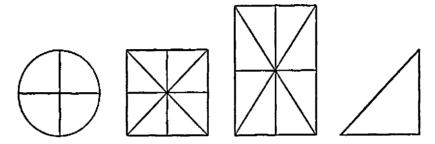

Draw circles and ellipses with a continuous movement, beginning at the lowest point and moving up to the left and around to the starting point.

Much practice should be given in drawing long, straight lines,—vertical, horizontal, and oblique.

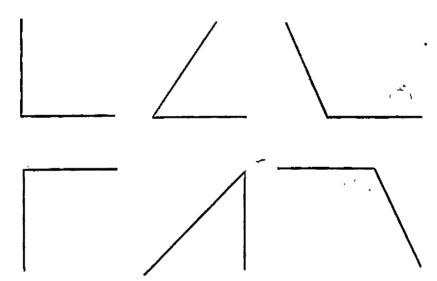

Character of Lines—The line should be a light grey line. Avoid heavy, black lines. Pencils should be of medium grade, and the lead should have a round point, not a sharp point.

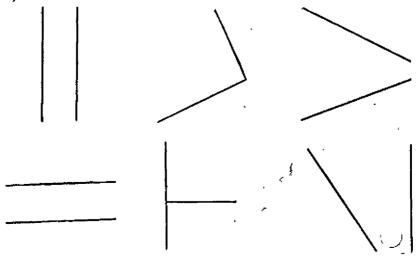

From the faces of the solids studied, we get the circle, square, oblong, and right-angled triangle. Draw these figures. Draw diameters of circle, square, oblong. Draw diagonals of square and oblong. The figures should be from three to four inches high.

Draw angles, right, acute, obtuse,—each angle in two different positions.

Draw lines in relation to each other, as parallel, perpendicular, oblique to each other. (Two examples of each.)

Teachers

Teachers will find the laying of tablets and sticks to represent the faces of solids and objects, an important aid in teaching these details of form to little children, and of great value in fixing ideas of form for drawing.

The diameters and diagonals of different figures can be easily and pleasantly taught to little

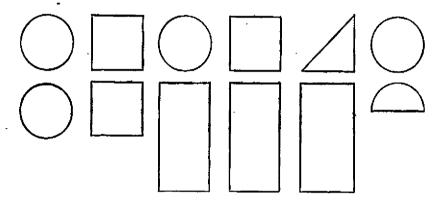

children by paper-folding.

Paper cutting, especially that of coloured paper, is also a valuable accessory in form and figure study in primary work.

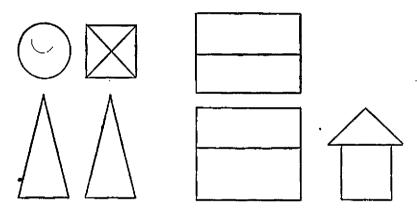

## THIRD PERIOD—CONSTRUCTION.

In Industrial Construction, the accurate presentation of the facts of objects is necessary, and drawing is used to convey ideas in regard to the facts of objects.

The sphere, cube, cylinder, square and triangular prisms are studied for a knowledge of all the facts of their forms as presented in the necessary geometric views. This knowledge is to be expressed by drawing the different geometric views in their relation to one another.

MODELS STUDIED AS TO THEIR FACTS AND THEIR RELATIONS.

The applications of form knowledge in Industrial Construction are of the utmost importance. The work here given in observing the facts of the models studied and in expressing by drawing what has been observed, only needs the addition to the drawings, of what are known as "Conventions," such as centre lines, working lines, dimension lines, etc., to be complete working-drawings.

In this course it has been deemed advisable to omit the presentation of these conventions,

Making patterns or the development of surfaces is an important feature in Constructive drawing; but this feature is also omitted in this course.

## FOURTH PERIOD—REPRESENTATION.

This subject deals with the general appearance of objects as wholes under the various conditions in which they may be placed with regard to the eye of the spectator.

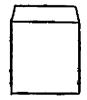

In this course the solids, sphere, cube, cylinder, and square prism are studied as to their appearance as wholes in one position only, i.e., when viewed in front of and below the eye.

For this work care should be taken not to place the models or objects too far below the eye.

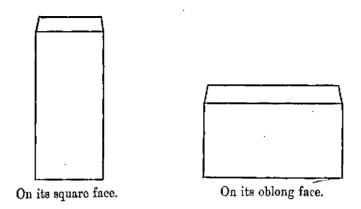

Sphere—There is no change in the appearance of the shape of the sphere, no matter how it may be viewed. The representation of the appearance of the sphere is always a circle.

Cube-Whenever a cube is placed below the eye, resting on one of its faces, so that two faces only are visible, the top face appears foreshortened, and appears narrower than the front face.

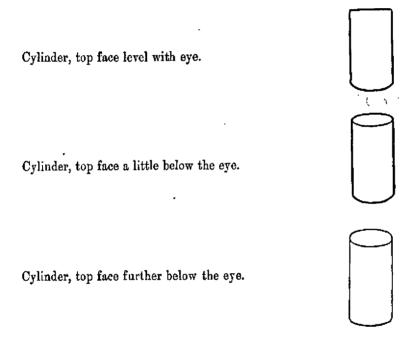

The further edge of the top face appears shorter than the front edge, and the side edges appear to converge away from the front edge; thus-

Square Prism—Whenever a square prism is placed below the eye, resting on one of its faces, so that two faces only are visible, the top face also is foreshortened, and the appearance of the solid is as follows:

Cylinder—When a cylinder is so placed that the edge of the top face is on a level with the eye, no part of the top face is seen and the curved edge appears as a straight line. When a cylinder is placed below the eye, resting on one of its plane faces, the circular face of the top is fore shortened and appears as an ellipse, and the breadth of the ellipse depends upon the degree in which it is below the level of the eye.

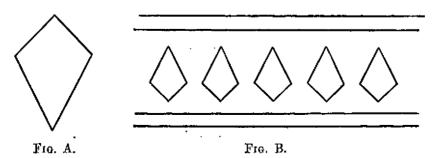

Note the change in the appearance of the lower curved edge as the distance below the eye increases.

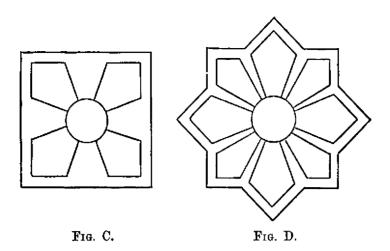

## FIFTH PERIOD-DECORATION.

This subject deals with the application of form knowledge to the enrichment of industrial articles by beautifying their surfaces.

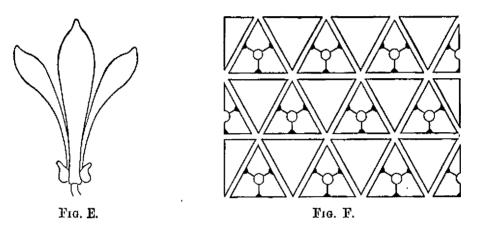

The ornamentation of an object must always be subordinate to the use of the object.

The elementary principles of arrangement for decorative purposes are symmetry, Figs. A, E; repetition, Figs. B, C, and alternation, Figs. D, F.

The modes of arrangement are, bi-symmetric figures, Figs, A and E; borders, Fig. B; rosetles Figs. C, D, G; surface-covering, Fig. F.

The sources from which materials for design decorative can be obtained are:

Geometric figures,

Natural forms conventionalised,

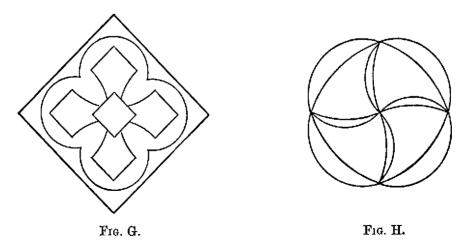

Historic ornament.

Decorative designs should express strength, stability and repose.

In a rosette or central arrangement, the units should be held together by a central figure. The central figure should overlap the units, to express a firm union. Figs. C, D, G.

Units should not be joined by points as such a union expresses weakness. Figs. I, J.

A whirling effect should be avoided in a decorative design, as repose is thereby violated. Fig. H.

A decorative design should cover about two-thirds of the surface to be ornamented. If more space is covered, the design looks crowded; if less space is covered, the design looks insufficient.

All elementary designs should be simple; a multiplicity of lines and small figures is wearisome. The following figures are given as illustrations of very bad arrangements: Figs. I and J.

Fig. J.

Colored paper may be used to great advantage in making decorative designs; but as the harmony of color requires much study, it is better not to attempt any combination of two or more positive colors in one design. Two tints of a color or two shades of a color may be used with good effect.

## SIXTH PERIOD-REVIEW. .

## GENERAL ORSERVATIONS.

Drawing is a language for the definite expression of form ideas for various purposes. The development of form ideas and a knowledge of the elementary principles of their practical applications, are the main points in the instruction. These form ideas are to be derived from the study of type-forms and objects. Their applications should always be observed in objects.

Drill in drawing is for the training of the hand to express clearly form ideas in their applications.

In this course there has been a study of only a few of the type-forms for the purpose of giving the general method to be pursued in gaining a knowledge of form. This form knowledge has been shown to have applications in three directions:

- 1st. In Industrial Construction, a subject which deals entirely with the facts of form in objects, and requires these facts to be clearly and accurately presented in their relation to one another.
- 2nd. In Pictorial Representation, a subject which deals with the appearance of objects as wholes, when viewed in different positions; this leads to general pictorial representation. This subject requires keen powers of observation, for the facts of objects undergo great modifications in appearance when viewed in different positions.
- 3rd. In Decoration, a subject which relates to the enriching and beautifying of objects by the proper arrangement of forms and figures on their surfaces.

Only very elementary principals have been given in these three subjects; while in drawing the instruction has necessarily been limited to a few details as to the method and character of work.

The aim has been to indicate to teachers the general character of work desired in the schools, and on which the Examinations will be based, with the exception that teachers will pursue the study further and in accordance with the general syllabus.

In the selection of objects to study, great care should be used to select only those that have beauty of form. In the study of Decoration great care should also be taken to point out what is good and what is bad decoration. Teachers should endeavour to have their schools supplied with suitable models.

# DEFINITIONS AND IMPORTANT FACTS.

Diameter—A straight line passing through the centre of a figure and terminating in opposite sides, and dividing the figure into two equal parts. The diameter of a square must be parallel to two of its sides.

Diagonal-A straight line connecting opposite angles of a figure.

Vertex—The point of convergence toward which faces, edges or lines tend. The point in a figure furthest from the base.

Base—That part of a figure or form upon which it is assumed to rest.

Altitude—The distance from the base to the point furthest from the base measured by a line perpendicular from that point to the base.

Working Drawing—A drawing that gives all the facts of the form, size and structure of an object. It is a drawing by which a workman can manufacture an object.

Facts of Form-All details of form in their actual proportions and dimensions.

Geometric View—Such a view of an object as will show the facts of that portion visible to the observer. For a geometric view the eye of the observer is supposed to be directly opposite each point of the object that is visible in the view obtained.

. Front View—A front view is that obtained when the object is directly in front of the observer on a level with the eye.

Side View—A side view is that obtained from a direction at right angles to that from which the front view is obtained. The object must be on a level with the eye. The right side view is the side view obtained from a position to the right of the observer's position for front view. A left side view, the side view obtained from a position to the left of the observer's position for front view.

Bottom

Bottom View-The view obtained of an object when it is directly above the eye.

Top View-The view obtained when an object is directly beneath the eye.

Appearance of Form—The aspect of that portion of an object visible to the observer at any one time. The appearance of an object varies with its position and its location in relation to the observer, and with its distance from him.

Proportion of Form—The relative dimensions of the different portions of an object.

Outline—The apparent limitations of an object. The line that could be drawn around an object as it appears.

Symmetry—The regular disposition of parts of an object or figure about a centre or about a straight line passing through the centre called an axis of symmetry.

Rhythm—The effect produced by the regular repetition at pleasing intervals of units in a decorative arrangement.

Axis—A straight line passing through the centre of a figure or object and dividing it into two parts that balance each other.

Rosette-A decorative arrangement made by a regular repetition of units about a centre.

Trefoil—A figure containing equal portions of three circles regularly disposed about a centre.

Quatrefoil—A figure containing equal portions of four circles regularly disposed about a centre.

## I.—CIVIL ENGINEERING.

This course is designed to give the student a sound training, both theoretical and practical, in the sciences and principles upon which the practice of civil engineering is based. Particular care is taken to enforce the practical application of the principles taught, and the student is made familiar with the instruments and the problems of general occurrence. The fourth year is devoted to purely professional work.

The rapid specialization now going on in the various departments of civil engineering renders it desirable that students should be allowed some choice in the direction of their more advanced studies. The course therefore offers, principally in the fourth year, a selection among three options or lines of study, - namely, a general course in civil engineering; a course in which more than usual attention is devoted to roads, railroads, and railroad management; and a course giving special attention to geodesy,

geology, and topography.

The more purely professional work is divided as follows: In the second year an extended course in elementary surveying, with practice in the field and work in the drawing-room, prepares the student for the more advanced work to follow; the subjects of typographical drawing and descriptive geometry are the more advanced work to follow; the subjects of typographical drawing and descriptive geometry are also completed. In the third yearthe subjects of railroad engineering, stereotomy, and advanced surveying, together with the elements of construction, design, and the strength of materials, are taken up. In the fourth year the student completes the courses on bridges, hydraulics, sanitary engineering, design, and strength of materials, as well as the advanced courses in railroads and geodesy. Students in this course strength of materials, as well as the advanced courses in railroads and geodesy. Students in this course also receive a certain amount of instruction in the principles of mechanism, and in machinery and motors.

In the summer vacation following the third year, students taking the geodetic option are required to devete several weeks to field-work in geology, topography, and geodesy.

First Year, common to all Classes.

# II.—MECHANICAL ENGINEERING.

The course aims to equip the student with such training in pure and applied mathematics as shall qualify him to deal with the engineering problems of his profession from the most favourable standpoint. It attempts by instruction, both theoretical and practical, to acquain him with engineering practice, and to give him a proper groundwork upon which to base a professional career. The more strictly professional work of the course may be classified as follows:—

Mathematics, physics, and applied mechanics, given outside the department—the last including the study of and practice in testing the strength of materials.

Recitation-room work of the department proper, beginning with a study of the principles of mechanism, the construction of gear-teeth, &c., and continued by courses on machine-tools and cotton machinery. Courses are given on the slide-valve and link-motion, thermodynamics, theory of the steamengine, and steam-boilers. The fourth-year instruction includes such mechanical engineering subjects as dynamometers, governors, fly-wheels, springs, effect of reciprocating parts of engines, injectors, steampumps, cylinder condensation, hydraulics, and hydraulic motors, &c. The option is given of courses in marine engineering, locomotive construction, and mill engineering.

Drawing-room work.—The students in the second year make working drawings from measurements, and the drawings necessary in connection with the course in mechanism and gear construction. In the third year they make detail and assembly drawings from machinery, and this is followed by mechanism designs and boiler drawings. In the fourth year a course in machine design is given.

Shop-work, including carpentry, pattern-making, forging, chipping, filing, and machine-tool work.

Engineering laboratory work.—This begins with drill in steam-engine tests in the second term of the third year, and is continued throughout the fourth year, including tests of boilers, pumps, power, &c., and a large amount of investigation.

## III .- MINING ENGINEERING AND METALLURGY.

The mining and metallurgical professions formerly demanded of their members an especially wide range of attainments, so that the student was obliged to acquaint himself with many different branches of civil and mechanical engineering, as well as chemistry, metallurgy, and geology. With the gradual disappearance of this more primitive condition, the demand seems now plainly to indicate that, instead of endeavoring to fit himself in all possible directions, the student should select at the outset the line which he will follow, and should devote himself to this with correspondingly greater thoroughness. The schedules here for the first time presented in the Institute catalogue are arranged in accordance with this view; and each is thus enabled to afford an increase in subjects of direct technical importance.

The first two options afford distinctively mining engineering courses, and contain, respectively, mechanical engineering and civil engineering subjects; the last two options form metallurgical courses, characterised, respectively, by mechanical engineering and chemistry. Throughout the first three schedules, mathematics is prominent, continuing four years. In the fourth, the special characteristic is chemistry, with no mathematics beyond the second year.

The first option trains the student with a view to the eventual management of mining industries. It therefore contains mineralogy, geology, assaying, mining, ore-dressing, and metallurgy,—the last to a less extent than options 3 and 4,—but with a large amount of mechanical engineering, namely, mechanism, thermo-dynamics of steam, applied mechanics, mechanical engineering laboratory, &c., with particular reference to applications in mining engineering. Pure mathematics is necessarily continued into the third year, and its applications extend through the fourth year. The full course in physics is included, and a brief course on dynamo-electric machines is given.

The second option differs from the first mainly in that the engineering subjects are of civil rather than mechanical engineering; namely, surveying, drawing, railroad engineering, with field-work, and drawing, engineering construction, hydraulics, electric railroads, with the full course in applied mechanics. This course is designed for students who wish to become mine-surveyors, engineers, or superintendents. In both of these options pure chemistry terminates with the first year, all subsequent chemical work being only such as is included in the instruction in metallurgy, assaying, mineralogy, &c.

The third option provides a course in metallurgical engineering. Chemistry is continued through the third year and a part of the fourth, and the amount of metallurgical work is greatly increased. The engineering subjects are the same as those of the first option—that is, branches of mechanical engineering related to metallurgical industries,—except that applied mechanics is discontinued at the middle of the fourth year. The work in physics is the same as in the other schedules, except that special instruction in heat measurements is introduced into the fourth year. This course looks particularly towards superintendence in iron, lead, copper, and zinc works.

The fourth option is devoted to metallurgical chemistry. In mining and metallurgical subjects it is identical with the third, but the engineering subjects are replaced by analytical, theoretical, and industrial chemistry. The study of physics is continued by electricity in the third, and by heat measurements and electro-metallurgy in the fourth year. The aim of this course is towards the position of chemist of works, and may lead to general management. The four schedules also contain nearly or quite the full amount of language, literature, history, and political economy given in the other engineering courses.

#### IV.—Architecture.

Throughout this, as in the engineering courses, extends a full course in mathematics, pure and applied, to serve as a basis for professional work.

The more strictly professional work begins in the second year, with the study of the five orders and their applications, and of architectural history. The student is made familiar with the materials and principles of construction, by lectures, problems, and visits to buildings. The subject of specifications and contracts is thoroughly discussed. Practice in architectural design is continued throughout the course. Instruction is given in sketching in black and white and in water-colour, and in drawing both from the cast and from life. Regular students pursue, in addition to this work, courses in German, French, English, and Physics. and Physics.

All special students in Architecture are required to take in full, as a minimum, the following twoyears' course:

## V.—CHEMISTRY.

The course in Chemistry is primarily designed to prepare students for actual work in connection with manufactures based on chemical principles. It is also adapted to the needs of those who intend to become teachers of chemistry.

The class-room work consists of a full course of lectures on general chemistry, and lectures on theoretical, analytical, industrial, and organic chemistry. The non-chemical studies, such as mathematics, physics, mineralogy, English, history, political economy, and language, are selected with reference to their bearing on chemical work or for their educational value.

The student spends a large part of the four years in the laboratories, the work being arranged as follows:—In the first year there is general laboratory practice, in which the student is taught the nature of chemical processes and the use of chemical apparatus, and is drilled in accurate habits of observation. Analytical chemistry—qualitative and quantitative—is begun in the second year, and continues throughout the course. Industrial, sanitary, and organic laboratory practice follow in the third and fourth years.

While there is a certain prescribed course of study and work in the separate departments of chemistry, which all regular students must pursue, there is allowed great latitude in the choice of subjects in the third and fourth years.

jects in the third and fourth years.

Effort is made to develop self-reliance in the student, so that he may be fitted to make his way without assistance. To this end he is required to make investigations, involving original research and reference to the appropriate literature of English, French, and German.

## VI.—Electrical Engineering.

This course has been established in order to meet the wants of young men desirous of entering upon the practice of any of the various applications of electricity in the arts. Its leading studies are physics, especially theoretical and applied electricity, mechanical engineering, and mathematics.

A broad training is obtained by the introduction of full mathematical courses, and studies in history, literature, political economy, and French and German, the latter being of importance in obtaining at first hand a prompt acquaintance with the results of invention and discovery. Of the technical studies of the course, those in mechanical engineering run parallel with the electrical subjects, since in many branches of electrical engineering a sound knowledge of mechanics motors of measurements of power and branches of electrical engineering a sound knowledge of mechanics, motors, of measurements of power and its transmission, &c. is essential. Thus, through the second year the students follow mathematics, mechanism, shopwork, and drawing, to about the same extent as those of the mechanical engineering course. In the third year the pure and applied mathematics, mechanics, and mechanical engineering (lecture and laboratory work) are much the same in the two courses, and certain of these subjects are continued in the fourth year.

A full course in physics begins with the second year, and continues, by lectures, recitations, and laboratory work, to the end of the third year. A portion of this is devoted to electricity; and at the beginning of the third year special readings and recitations on this topic are begun, by which the study of the theory of electricity is continued until the end of that year. Work in the physical laboratory begins at the middle of the second year, and leads up to electrical measurements and testing. In the fourth year are given extended courses on the technical application of electricity to the telegraph, telephone, electric light, the electrical generation and transmission of power, &c. Electrical study and research occupy the principal position in the fourth year. A series of advanced mathematical topics forms an important part of the work of this year.

#### VII .- Bronogy.'

The object of this course is first, to afford a general education in the natural sciences, - physiology zoölogy, mineralogy, geology, botany, &c.,—and, second, professional training in biology, with special reference to medical studies and sanitary science. It is intended for those who wish to become biologists; for those who are preparing for medical studies; for those who wish to fit themselves for teachers of, or desire a general education in, the natural sciences.

Beginning with a substantial foundation of chemistry, physics, drawing, and the modern languages, the subjects peculiar to the course are early introduced, while history, political economy, and literature receive throughout due emphasis as essentials to a broad training, or as auxiliaries to the scientific studies.

The intimate relations existing between physics, chemistry, and biology on the one hand, and the medical and sanitary sciences—physiology, pathology, hygiene, &c.—on the other, make a course like this peculiarly valuable as a preparation for the scientific or professional study of medicine. To this end the student of biology is made familiar, not only with the essentials of physics, chemistry, and microscopy, but also with the comparative anatomy and physiology of the lower animals, especially vertebates, and with sanitary bacteriology.

Abundant opportunities are provided for practical laboratory studies in the biological, geological, and mineralogical laboratories (see page ); while advantages somewhat unusual are offered by the library and museum of the Boston Society of Natural History.

For field-work in zoölogy, botany, mineralogy, and geology, the vicinity of boston affords rich opportunities in its long and accessible shore-line, varied geological features, and well-explored botanical fields.

#### VIII.—Physics.

As distinguished from the professional or technical courses in Engineering, Architecture, &c., there are offered by the Institute certain courses of a purely scientific nature. The course in Physics contains a series of studies adapted to the needs of those who wish to become teachers of physics, or who desire to enter upon a course in pure science, whether with a view to its further continuance, or wholly as a matter of training. A strong line of mathematical topics and the continuous study of physics are its leading features. General, theoretical, analytical, and organic chemistry occupy a position next in prominence to mathematics, but of hardly less importance. Options are so arranged that choice may be made between the pursuit of more advanced mathematical and chemical topics; also between shopwork instruc-

between the pursuit of more advanced mathematical and chemical topics; also between shopwork instruction in the use of tools, and work in the biological laboratory.

Historical and other allied subjects and the modern languages continue throughout the first three years; and the latter, which are of great importance, may be further prolonged if desired. Chemistry may be continued up to the middle of the last year, and mathematics, pure and applied, is required throughout the whole four years. Physics begins with the second year, and by lectures, readings, recitations, and laboratory exercises extends to the close of the course. A large amount of experimental

The course in Biology takes the place of the former course in Natural History A course in Geology, corresponding to the geological option of the latter, is now in preparation, and will be presented in the next catalogue. A descriptive circular will be sent on application.

work is performed, and an experimental investigation is undertaken during the fourth year in connection with the preparation of the thesis. At all times it is sought to encourage the spirit of original research, and to impart an understanding of the principles upon which scientific investigation, especially in quantitative measurement, should be conducted.

The advantages offered by the Rogers Laboratory of Physics, notably in the direction of electricity, acoustics, and heat, by the large equipment of apparatus, are somewhat unusual. The study of special topics is greatly facilitated by many valuable libraries, to which, by right or courtesy, the students

have admission.

# IX.—GENERAL STUDIES.

This course is designed to meet, as far as possible, the needs of an increasing class of students who desire a general scientific education, or are looking forward to engaging in some branch of commerce, in the administration of public or private trusts, in banking, in journalism, in manufacturing or other business enterprises. It is accordingly somewhat less technical in its studies than the other courses of the school, though not less exacting in its requirements or less thorough in its educational discipline.

It will be noticed that natural science makes a considerable demand upon the time and attention of the student. He is required to study chemistry one year; physics, one year; structural and historical geology, one year; zoölogy, one year; and each of the following subjects one half-year, viz.: Physical geography, climatology, descriptive astronomy, the history of the natural sciences, anthropology, and sanitary science. Optional courses permit the student to devote additional time to these subjects. In brief, the studies of this course have been arranged with a view to securing an education primarily through scientific study and experiment, yet with a larger amount of philosophical study in history, economics, language, and literature than is possible with the technical requirements of the other courses.

The special opportunities offered by the department of General Studies are: the more extended study of French and German; a continuous course of historical study, directed especially towards the political and social history of England and the United States; a more thorough acquaintance with English literature and with the models of style; economics, including its theory and history, with courses in industrial and commercial history and geography, finance and statistics; social and political science, directing special attention to the origin and development of institutions. It will be noticed that natural science makes a considerable demand upon the time and attention of

directing special attention to the origin and development of institutions.

#### X .- CHEMICAL ENGINEERING.

This course is arranged to meet the needs of students who desire a general training in mechanical engineering, and who wish to devote a portion of their time to the study of the applications of chemistry to the arts, especially to those engineering problems which relate to the use and manufacture of chemical products. The instruction in the fourth year has been so arranged that the student can exercise a certain choice as to the special topics to which he wishes to devote his greatest attention. A student can receive instruction in textile colouring in case he expects to find employment in the textile industries, in heat measurements and metallurgy, to fit him especially for operations involving the use of furnaces, or in organic chemistry, if he intends to engage in the manufacture of organic products. It is expected that the graduates in this course will find employment as engineers, having to deal with problems of construction and administration in connection with dye-works and bleacheries, oil-refineries, gas works, sugar-refineries, soap-works, paper and pulp mills, chemical-works, and various other branches of industry where such special training is demanded, and also that they will acquire sufficient knowledge to be able to work intelligently in carrying out the processes used in these establishments.

The general engineering studies in the course in chemical engineering coincide for the most part with the work of the students in mechanical engineering. A special course of instruction is given to the students of the fourth year, devoted to a discussion of the appliances used in manufacturing and applied chemistry considered from an engineering point of view.

The instruction in industrial and applied chemistry is arranged with reference to the needs of this course, and special attention is directed to the methods of conducting the mechanical operations in the various manufacturing processes. At the same time, the chemical principles upon which operations test are thoroughly taught. 138—2 M

# XI.-Sanitary Engineering.

This course is essentially one in Civil Engineering, but is designed for students who wish to pay particular attention to those engineering branches which are concerned with problems of the public health, and who, therefore, desire to gain a better knowledge of the subjects of chemistry and biology and of their relations to engineering problems, than can be obtained in the course in Civil Engineering.

The line of study offered differs from the regular course in Civil Engineering, page 24, in the following particulars:—

There is a reduction in the time devoted to Railroads and Bridges, and an entire omission of the mechanical engineering subjects of Mechanism and Machinery and Motors, and of the subjects of Astronomy, Metallurgy of Iron, and Historical Geology.

The time thus gained is devoted principally to courses in Chemistry and Biology. In these it is designed to give the students such training as shall fit them properly to interpret the results of sanitary chemistry and sanitary biology, and to co-operate with chemists and biologists in professional work. In the fourth year a course of instruction is also given in Heating and Ventilation.

The entire instruction in Sanitary and Hydraulic Engineering now given in the course of Civil Engineering, a portion of which is there optional with other studies, is required in the course in Sanitary Engineering.

## FIVE-YEARS REGULAR COURSES.

The foregoing schedules of the regular courses are arranged for the completion of the work in four years. It may occasionally happen that considerations of health, lack of opportunities for thorough preparation, or other causes, render it advisable for a student to extend the work over five, instead of four years. To meet such cases the Faculty have arranged, in certain departments, five-years courses which contain precisely the same subjects and amounts of study as the corresponding four-years courses, and differ from them only in the time over which the work is distributed, and, to a slight extent, in the sequence of some studies. They lead respectively to the same degree of the Institute. The standard of scholarship required of the student will be in every way the same, and be will be classed as a regular student so long as he maintains his standing in the course which he is pursuing. A five-years course student may, with the permission of the Faculty, pursue additional or more extended lines of study. He thus has the opportunity of accomplishing more than the equivalent of the four-years course.

Further information may be had upon application to the Secretary of the Institute.

#### ADVANCED COURSES.

The degree, Master of Science, is awarded for proficiency in complete advanced courses of study of at least one year's duration.

The degrees, Doctor of Philosophy and Doctor of Science, are awarded for proficiency in complete

advanced courses of study of at least two-years' duration.

The particular courses of study which candidates for these degrees wish to pursue must be submitted in writing to the Faculty, and must meet ther approval. Occasional short absences, when the time is spent upon professional work by advice of the Faculty, will not be considered as interruptions of the student's residence.

Advanced courses in chosen lines of study, and without reference to the degrees, may be pursued by graduates of the Institute without preliminary examination, or by Bachelors of other institutions, who shall satisfy the Faculty, by examination or otherwise, that they are qualified to take with advantage the course proposed.

## SPECIAL COURSES.

In general, no schedule for special courses of study is laid down; but any special course selected by the student or applicant, and receiving the approval of the Faculty, may be pursued. Applicants should consult the Schedule of Topics, pages 95 and 116. Special opportunity for the pursuit of laboratory and lecture courses is afforded to teachers, and to persons of mature years engaged in technical pursuits. All special students in Architecture are required to take in full, as a minimum, the course of two years, duration for admission to plaid the full entering are required. Special students two years' duration, for admission to which the full entrance examinations are required. Special students in Chemistry must also pass the regular entrance examinations.

## REQUIREMENTS FOR GRADUATION.

The degree, Bachelor of Science, in the course pursued, is given for the satisfactory completion of

any regular course of study.

To be entitled to a degree, the student must have passed satisfactory examinations in all the prescribed studies and exercises, and, in addition, a final or degree examination, embracing all the subjects which particularly relate to his course. He must, moreover, prepare a dissertation on some subject included in his course of study; or an account of some research made by himself; or an original report upon some machine, work of engineering, industrial works, mine or mineral survey; or an original architectual design, occompanied oy an explanatory memoir. This thesis or design must be submitted to the Faculty for approval three days before the first degree examination unless the thesis or design be design by design b approval three days before the first degree examination, unless the thesis or design be dependent on laboratory work, in which case it must be presented two days after the close of the respective laboratories.

No degree can be conferred until all dues to the Institute are discharged.

Students leaving the school before graduation are entitled to receive an honourable dismission, if

their record for conduct, attention to studies, and scholarship is satisfactory to the Faculty

REQUIREMENTS

#### REQUIREMENTS FOR ADMISSION.

Time of Examination for Admission.—A first examination for admission to the first-year class will be held in the Rogers Building, 187 Boylston-street, beginning at 9 a.m., on the first Thursday after May 29, and continuing two days. A second examination for admission, and for applicants conditioned at the first examinations, will begin at 9 a m., on the first Tuesday after September 17, and will continue two days. Attendance on both days of one examination or the other is required.

Entrance examinations were held in May, 1889, in New York, Philadelphia, Chicago, Cincinnati, St. Louis, Washington, San Francisco, St. Paul, Pittsburgh, and Kansas City. Arrangements will probably be made for examining applicants in June, 1890, in the same cities.

Candidates who intend to be examined in any other place than Boston are required to send their names to the Scaratary in time for him to receive them by May 18th.

names to the Secretary in time for him to receive them by May 15th. A fee of five dollars is to be paid in advance by every candidate who is examined at any place other than Boston. The whole fee of a candidate who proposes to divide his examination between two years is payable in the year when he begins his examination. The fee should be sent by check, postal order, or registered letter, to Albert M. Knight, Bursar, at the same time that the candidate sends his name to the Secretary.

For detailed information, address the Secretary.

Applicants for advanced standing—that is, for admission to classes above the first year—must pass the entrance examinations, exception being made of applicants from other colleges (see page 58), and must present themselves for further examination at 9 a.m., on the Thursday following the second entrance examination.

Applications for admission at other times than the above will be received only when illness or some other equally good cause has prevented attendance on the days prescribed. A fee of five dollars, to be paid to the Bursar, will be charged for all such examinations held at other times than those above specified. Women are admitted to any of the courses of the school.

# Admission to the Regular Courses.

First Year.—To be admitted as a regular student in the first-year's class, the applicant must have attained the age of seventeen years, and must pass a satisfactory examination in Arithmetic, Algebra, Plane Geometry, French, English Language and Literature, History, and Geography.

The requirements in the various subjects are as follows:-

1. Arithmetic.—Prime and composite numbers; greatest common divisor and least common multiple; ratio and proportion; common and decimal fractions; percentage; simple and compound interest; compound numbers; metric system of weights and measures; square root. A satisfactory treatment of these subjects may be found in either Scaver and Walton's, Wentworth and Hill's, or Greenleaf's Complete Arithmetic.

2. Algebra. - Fundamental operations; use of parentheses; factoring; highest common factor; 2. Algebra.—Fundamental operations; use of parentheses; factoring; highest common factor; lowest common multiple; fractions, simple and complex; simple equations, with one or more unknown quantities; involution of monomials and polynomials; evolution of monomials and polynomials and the cube root of numbers; the theory of exponents, with applications; radicals, including rationalization, imaginary quantities, properties of quadratic surds, square root of a binomial surd, and solution of equations containing radicals; quadratic equations; equations in the quadratic form; simultaneous quadratic equations; theory of quadratic equations; ratio and proportion; arithmetical progression; geometrical progression; binomial theorem, with proof for a positive integral exponent. A satisfactory treatment of the topics in Algebra may be found in any of the following text-books: Wells's Academic, Wentworth's Elementary, or Todhunter's Algebra for Beginners.

3. Plane Geometry.—As much as is contained in the first five books of Wells's Chanvenet's or

3. Plane Geometry.—As much as is contained in the first five books of Wells's, Chauvenet's, or Wentworth's Geometry. The examination will be based on the first-named work. Much importance will

be attached to the applicant's ability to demonstrate original exercises.

Note. Solid Geometry.—Caudidates will be allowed an examination, in September, in Solid Geometry, and, if successful, will be excused from studying that subject after admission.

4. French.—Elements of grammar, and some practice in translation. The requisite amount of preparation is represented by at least a year of careful work upon Part I. of Otto's Grammar, and fifty or sixty pages of easy reading. Practical exercises, both oral and written, are essential.

Note. German.—Candidates not prepared in French may substitute an equivalent in German. Otis's Elementary in represents the required amount. In this case the German will be continued and finished during the first year, and German represents the required amount. In this of the following two years will be devoted to French.

For 1891 and subsequent years the requirements in Modern Languages will be:—

French.—(1) Proficiency in elementary grammar, to be tested by translation of easy English into French, or by direct questioning on the following topics: Inflection of nouns and adjectives for gender and number, excepting unusual cases; "pronominal adjectives"; the forms and position of pronouns, especially the personals; the partitive constructions; the inflection os the regular and of the more usual irregular verbs, such as dire, faire, and of the classes represented by ouvrir, sentir, venir, paraître, conduire, and craindre.

(2) Ability to translate simple prose at sight, to be acquired by the reading of not less than two hundred duodecimo pages from at least two dissimilar works.

German .-- Candidates not prepared in French may substitute an equivalent in German, for which the requirements will be:

(1) Proficiency, to be tested as for French, in the following topics of elementary grammar: declension of readily classified nouns, of adjectives and of pronouns; conjugation of the weak and of the more

usual strong verbs; simple cases of word order.

(2) The candidate must have read not less than one hundred and fifty duodecimo pages of easy German (of which one hundred and twenty-five must be prose), from not less than two dissimilar works.

Note.—Although a correct pronunciation in modern languages is not, for the present, one of the requirements for entrance examinations, it is desired that teachers will give this important subject all due attention. Candidates capable of presenting both French and German at the entrance examination will find this advantageous for their subsequent labors at the Institute.

5. English Language and Literature.—The requirements in English are included within the limits of those prescribed for entrance into the New England colleges.

The candidate will be required to correct specimens of defective English set for him at the time of

the examination.

He will also be required to write a short English composition, correct in spelling, punctuation, grammar, division by paragraphs, and expression, upon one of the several subjects to be announced at the time of the examination. These subjects will be drawn from one or more of the following works, and the applicant is expected to be familiar with all the books in this list.\*

For 1890: Shakspeare's Julius Cæsar, Longfellow's Evangeline, Macaulay's Essay on Lord Clive, Thackeray's English Humorists, Webster's First Bunker Hill Oration, Scott's Quentin Durward, George

Eliot's Silas Marner.

For 1891: Shakspeare's Julius Casar, Longfellow's Evangeline, Macaulay's Essay on Lord Clive, Webster's First Bunker Hill Oration, Irving's Alhambra, Scott's Old Mortality, George Eliot's Silas

For 1892: Shakespeare's Julius Casar, Scott's Marmion, Longfellow's Courtship of Miles Standish, Addison's Sir Roger de Coverley Papers, Macaulay's second Essay on the Earl of Chatham, Webster's First Bunker Hill Oration, Irving's Alhambra, Scott's Talisman.

Note.—In 1890, the applicant will be allowed to take his choice between an examination upon the above-mentioned requirements and an examination upon previous requirements for entrance, as by the catalogue of 1888-1889, viz. —

"The applicant will be required to write a short English composition, correct in spelling, punctuation, grammar, division by paragraphs, and expression, upon one of several subjects to be announced at the time of examination.

"He will be required to be acquainted with the essentials of English grammar, and to correct specimens of defective English set for him at the time of the examination.

"In literature the applicant must have a knowledge of the life and best works of the principal English authors.

"Rev. Stopford Brooke's Primer of English Literature is recommended, but is not prescribed."

6. History.—Preparation in either United States History or Ancient History may be offered. In the former subject, a thorough acquaintance with the history of the thirteen Colonies and of the United States down to the present time is required. In the latter subject, the requirement covers the history of the early world down to the fall of the Roman Empire in the West.

If single text-books are used, Alexander Johnston's History of the United States, or P. V. N. Myers' Outlines of Ancient History† (latest edition), are recommended, though not prescribed.

7. Geography.—The text-books in common use fairly represent the amount of preparation required. A knowledge of the geography of the United States and Europe is especially important. To have been familiar with geography at some previous time is not sufficient, but a systematic review of the whole is an essential part of an adequate preparation for certain studies which are included in all the Institute courses. Practice in freehand map-drawing from memory is strongly recommended.

DIVIDED ENTRANCE EXAMINATIONS.—Candidates for admission will be allowed, at their option, to divide their Intribute Entrance examinations between two successive years. The first divided examination will be held only in June; the second, in either June or September of the following year, at the dates named on page 51. For the first divided examination the candidate will be allowed the choice of any of the following nine subjects, but he must take at least six. No credit will be allowed on any of these unless at least five of the six taken are satisfactorily passed. At the second examination, all subjects not passed at the first must be taken.

To be admitted to the first divided examination, the candidate must be at least sixteen years of age, and must have notified the Secretary of the Faculty, at least two weeks before the date fixed for the examination, of his intention to apply. This notification must be accompanied by a list of the six subjects in which he will submit himself, and by a certificate from his teacher stating that he is qualified in them.

I. Arithmetic (without Metric System).

11. Metric System.

III. Algebra (to Quadratics).
IV. Advanced Algebra.
V. Plane Geometry.

VI. French (or German)
VII. English Language and Literature.
VIII. History.
IX. Geography.

In general, the training given in the best high schools and academies will afford suitable preparation. To the student the importance of thorough preparation is great; since the character and amount of instruction given in the school from the outset leave little opportunity for one imperfectly fitted to make up deficiencies, and render it impossible for him to derive the full benefit from his course, or perhaps even to maintain his standing.

Students will find their progress in Physics and Chemistry promoted by making themselves thoroughly familiar with so much of Physics as is contained in Balfour Stewart's Primer.

A knowledge of the Latin language is not required for admission; but the study of Latin is strongly recommended to persons who purpose to enter this school, as it gives a better understanding of the various terms used in science, and greatly facilitates the acquisition of the modern languages. Those who intend to take the course in Natural History will find it advantageous to acquire also the elements of Greek. Some proficiency in Freehand Drawing will be found advantageous, particularly for applicants to the partial course in Architecture.

It should also be borne in mind by pupils purposing to enter the Institute that the broader the intellectual training of the student in any direction, and the more extensive his general acquirements, the greater the advantages he may expect to gain in his future course.

Admission

<sup>\*</sup>These books may all be had in an inexpensive form. A list of publishers and net prices will be sent upon application to the Secretary. † Or Myers and Allen's Outlines of Ancient History, soon to be published.

practice in mechanical drawing.

#### Admission to Advanced Standing.

To be admitted as a regular student in the second, third, or fourth year, the applicant must have attained the proper age (eighteen, nineteen, or twenty years respectively), must in general pass satisfactorily the examination for admission to the first-year's class, and examinations on all of the subjects given in the earlier years of the course which he desires to enter. The examinations for advanced standing are held at the time appointed, and applicants should present themselves at that time

are held at the time appointed, and applicants should present themselves at that time.

Graduates of colleges are admitted to the Institute without examination, and will be permitted to enter any of the courses at suth a point as their previous range of studies will allow. If prepared to enter upon most of the studies of the third year, they will be afforded opportunity to make up any studies of the earlier years in which they are deficient; they will, in general, be credited with all subjects in earlier or later years in which they can show, by examination or otherwise, a standing satisfactory to the Faculty, and will be received provisionally as regular students. The attention of such applicants is particularly called to the schedules of courses, and to the schdule of topics given and numbered in the decimal catalogue. It is highly desirable that students contemplating professional courses after graduation from college shall arrange their college electives to cover the earlier subjects of the chosen course, in order that the number of deficiencies to be made up may be as small as possible; and such students are advised to communicate with the Secretary of the Faculty, from whom detailed information may be obtained as to the requirements for entering any particular year of any course. In order to enter any of the engineering courses in the third year, it will be essential for the applicant to be familiar with Differential Calculus. It is exceedingly important that students applying for advanced standing in these courses should have had considerable

Admission to Special Courses.

To be admitted as a student in any one or more selected subjects in any of the regular courses, except that in Architecture, that is, to partial or special courses, the applicant must have attained the age of at least seventeen years, and must pass satisfactorily such examinations as shall prove him to be qualified to pursue to advantage the subjects chosen.

By means of the schedule of topics and requirements, the applicant may ascertain what the various subjects of study are, how and by whom they are given, by what regular courses and when they are taken, the subjects required in preparation for each, and the time occupied by it. In general, no student will be allowed to take any one of these topics until he has passed a suitable examination in all other topics required as preparation for that applied for.

Special students in Architecture must pass the regular entrance examination to the first-year class, and are required to take as a minimum the full two-years partial course given on page 32, but may, with the consent of the Faculty, substitute equivalent studies, or take such additional ones as they may desire. All special students desiring to take Chemistry of the first year must pass the full entrance examinations, except that an equivalent in some other subject may be substituted for Plane Geometry. Communications in regard to such substitution should be addressed to the Secretary.

# APPENDIX N.

# SHEFFIELD SCIENTIFIC SCHOOL OF YALE COLLEGE, CONNECTICUT, UNITED STATES OF AMERICA.

Courses of Instruction and Programme of Studies.

Courses of instruction, occupying three years, are arranged to suit the requirements of various classes of students. The first year's work is the same for all; for the last two years the instruction is chiefly arranged in special courses. The special courses most distinctly marked out are the following:—

In chemistry,

(a.) In chemistry,(b.) In civil Engineering,

(c.) In mechanical engineering, (d.) In agriculture,

(e.) In natural history,

(f.) In biology preparatory to medical studies,

(g.) In studies preparatory to mining and metallurgy,
(h.) In select studies preparatory to other higher studies.

The arrangement of studies is indicated in the annexed scheme. A fuller statement of the methods and character of the instruction will be found below (p. 38). Unless otherwise specified, the number of hours given means hours per week.

# FRESHMAN YEAR.—INTRODUCTORY TO ALL THE COURSES.

First Term.—German—Whitney's Grammar and Reader, three hours. English—Lounsbury's History of the English Language, one hour. Mathematics—The derivatives of algebraic functions;

fundamental properties of equations; plane analytical geometry, three hours. Physics—Recitations, two hours, with experimental lectures, two hours. Chemistry—Mixter's; recitations, two hours; laboratory practice, two hours. Elementary Drawing—Practical lessons in the Art School, three hours.

Second Term.—Language, Physics, and Chemistry—as stated above. Mathematics—Plane analytical geometry (continued), three hours. Physical Geography—Eight lectures during the term. Botany—Gray's Lessons, three hours. Drawing—Principles of orthographic projection; isometric drawing with application to drawing from models and structures, and isometric construction of objects from their orthographic projections; projections of shadows: shading and tinting; sections developments from their orthographic projections; projections of shadows; shading and tinting; sections; developments and intersections of surfaces, four hours.

For the senior and junior years the students select for themselves one of the following courses:-

#### (a.) IN CHEMISTRY.

## Junior year.

First term.—Organic Chemistry—Lectures and recitations, two hours. Qualitative Analysis-Recitations, two hours; laboratory practice, twenty hours; blowpipe practice and determinative mineralogy, four hours. German—Three hours. French—Three hours.

Second Term.—Organic Chemistry—Lectures and recitations, two hours. Quantitative Analysis—

Laboratory practice, twenty hours; recitations, two hours. Mineralogy—Blowpipe analysis and determination of species, four hours; lectures in crystalography and descriptive mineralogy, two hours. German—Three hours.

#### Senior year.

First Term.—Organic and Theoretical Chemistry—Recitations and lectures, two hours. Agricultural Chemistry—Recitations (optional), two hours. Quantitative Analysis—continued, six weeks, twenty hours. Organic Chemistry—Experimental work during the remainder of the term, twenty hours. Geology—Dana's; recitations, three hours. Zoology—Lectures, two hours. French—Three hours. Second Term.—Theoretical Chemistry—continued, two hours. Zoology—continued, two hours. Agricultural Chemistry—(Optional) two hours. Analytical Chemistry—Analysis of minerals and technical products, twenty hours. Assaying—(Optional.) Metallurgy—Lectures (optional). Geology—Dana's, three hours. Mineralogy—(Optional.) French—Three hours, during winter half-term.

The laboratory practice of the second term of the senior year may be devoted to such special branches of analytical or organic chemistry as the student may desire, or to original investigations in connection with theses.

with theses.

## (b.) In Civil Engineering.

#### Junior year.

First Term.—Mathematics—Analytical geometry of three dimensions; elements of the theory of functions; differential calculus, with applications to geometry and analysis; solution of numerical equations, six hours. Surveying—Field work, sixteen hours, till November. Drawing—Descriptive geometry, six hours, from November. German—Three hours. French—Three hours.

Second Term.—Mathematics—Integral calculus with applications to geometry; rational mechanics, six hours. Drawing—Descriptive geometry (concluded); typographical; practice in working drawings, six hours. Surveying—Topographical and railroad curves, sixteen hours. German—Three hours.

six hours. Surveying French—Three hours.

#### Scnior year.

First Term.—Field Engineering—Location of line of railroad, setting out slope stakes, calculation of earthwork; lectures on economic location; office work; Henck's Field-book, twenty hours, till November. Civil Engineering—Mechanics applied to engineering; resistance of materials; bridges and roofs; stonecutting, with graphical problems; eight hours. Geology—Dana's, three hours. Mineralogy—Blowpipe analysis and determinative mineralogy, eight hours. French—Three hours.

Second

Second Term.—Civil Engineering-Bridges and roofs; building materials; stability of arches and walls; foundations; six hours. Dynamics—Principles of mechanism; thermodynamics; steam-engine; six hours. Hydraulics—Hydraulics and hydraulic motors, three hours. Drawing—Designing; practical problems; specifications and estimates; twelve hours. Spherical Trigonometry and Astronomy—Practical astronomy, with field work, six hours. Geology—Three hours. French—Three hours, during winter half-term.

#### (c.) In Mechanical Engineering.

## Junior year.

First Term.—Mathematics—Analytical geometry of three dimensions; elements of the theory of functions; differential calculus, with applications to geometry and analysis; solution of numerical equations, six hours. Surveying—Theory and practice, three hours until 1st November. Principles of Mechanism—Kinematics, one hour. Shop visiting—Study of machine details and tools, three hours, beginning when surveying ends. Drawing—Descriptive geometry, three hours. German—Three hours. French—Three hours.

Second Term.—Mathematics—Integral calculus, with applications to geometry; rational mechanics, six hours. Principles of Mechanism—Applied kinematics; forms of teeth of wheels; cams; parallel motions; transmission of power by belts and gearing, &c., one hour until spring recess. then two hours. Shop-visiting—Continued, three hours, until spring recess. Study of the Steamengine—Two hours after spring recess. Drawing—Perspective and shadows; Machine Elements, three hours. German—Three hours. French—Three hours.

#### Senior year.

First Term.—Applied Mechanics—Friction; moment of inertia; centrifugal force; elasticity and strength of materials; theory of flexure and torsion; strains in structures; construction of roofs and bridges; equilibrium and pressure of fluids; theory of flotation; flows of fluids in pipes and channels; resistance of ships, nine hours. Machine-designing—Practical exercises in designing machine details and simple machines, twelve hours. Study of the Steam-engine—continued, two hours. Electricity (optional)—Laboratory work, three hours. Visits of Inspection—Examination of machinery in operation; reports of visits. French—Three hours.

Second Term.—Applied Mechanics—continued; hydrodynamics; theory of water-wheels and turbines, six hours. Thermodynamics—Three hours. Study of the Steam-boiler—Two hours, Electricity (optional)—Laboratory work—Three hours. Lectures—Two hours. Machine-designing—continued; advanced exercises in preparing designs and working drawings for machinery; estimates of weight and cost of machinery, twelve hours. French—Three hours during winter half-term. Thesis. Visits of inspection and reports.

Visits of inspection and reports.

#### · (d.) In Agricuture.

## Junior year.

The course is identical with that in chemistry, except that in the second term lectures in crystal-lography and descriptive mineralogy are omitted, and in the spring half-term botany is substituted for determinative mineralogy.

## Senior year.

First Term.—Agriculture—Recitations—Two hours. Agricultural Chemistry—Recitations, two hours. Geology—Recitations, three hours. Zoology—Lectures, two hours. Meteorology—Lectures, two hours. Botany—Laboratory practice, five hours. French—Recitations, three hours.

Second Term.—Agriculture—Recitations or lectures, two hours. Agricultural Chemistry—Recitations, two hours. Physiology—Recitations or lectures, two hours. Geology—Recitations, three hours. Zoology—continued, two hours. Heredity and Stock-breeding—Lectures, two hours during winter half-term. Sanitary Science and Public Health—Lectures, two hours during spring half-term. French-Three hours during winter half-term.

## (e.) IN NATURAL HISTORY.

Either mineralogy, zoology, or botany may be made the principal laboratory study, some attention in each case being directed to the other branches of natural history.

#### Junior year.

First Term.—Organic Chemistry—Lectures and recitations. Qualitative Analysis—Fresenius's; laboratory practice; recitations. Mineralogy—Blowpipe analysis and determinative mineralogy, four hours. Botany—Gray's manual, three hours; laboratory practice, three hours. German—Three hours. French-Three hours.

Second Term.—Zoology—Laboratory practice, six to twelve hours; recitations; excursions (land and marine). Botany—Lectures; laboratory practice in the identification of phaenogamous plants, two hours. Physiology—Huxley's. Embryology—Lectures. Mineralogy—Blowpipe analysis and determinative mineralogy, four hours. Lectures in crystallography and descriptive mineralogy, two hours. Physical Geography. German—Three hours. French—Three hours.

#### Senior year.

First Term:—Geology—Dana's, three hours; excursions. Zoology—Laboratory practice, eight to twelve hours; lectures, two hours; recitations, two hours; excursions. Botany—Laboratory practice in the preparation and examination of microscopical specimens, illustrative of stem-structure and of the anatomy of the higher cryptogamous plants, five hours; excursions. Meteorology—Lectures, two hours. French—Three hours.

Second Term.—Geology-Dana's, three hours. Anatomy of Vertebrates-Huxley's, two hours. Zoology—Laboratory practice, eight to twelve hours; recitations, two hours; lectures, two hours. Botany—Herbarium studies, especially in the cryptogamous orders; botanical literature; essays in descriptive botany. Sanitary science, laws of horedity and principles of breeding—lectures. French—Three bours during winter half-term.

Besides

Besides the regular course of recitations and lectures on structural and systematic zoology and botany, and on special subjects, students are taught in the laboratories to prepare, arrange, and identify collections, to make dissections, to pursue investigations, and when sufficiently advanced, to describe genera and species in the language of science. For these purposes, large collections in zoology belonging to the college are available, as are also the private botanical collections of Professor Eaton.

#### (f) In Biology Preparatory to Medical Studies.

#### Junior year.

First Term.—Organic chemistry—Lectures and recitations, two hours. Qualitative analysis—Frosenius's; laboratory practice, twenty hours; recitations, two hours. Mineralogy—Blowpipe analysis and determinative mineralogy, four hours. German—Three hours. French—Three hours.

Second Term.—Comparative anatomy and histology—Laboratory practice, eighteen hours; lectures and recitations, one hour. Physiology—Huxley's; recitations, two hours. Embryology—Eight lectures during the term. Organic chemistry—continued, two hours. Mineralogy—continued, through winter half-term, four hours. Botany—Lectures; laboratory practice in the identification of Phaenogamous plants, five hours during spring half-term; excursions. French—Three hours. German—Three hours.

## Senior year.

First Term.—Physiological chemistry—Recitations and lectures, three hours; laboratory practice, thirteen hours. Organic and theoretical chemistry—Lectures and recitations, two hours. Zoology—Lectures, two hours. Botany—Laboratory practice in the preparation and examination of microscopical

specimens, illustrative of stem-structure and of the anatomy of the higher cryptogamous plants, five hours. Geology—Dana's, three hours. French—Three hours.

Second Term.—Physiological chemistry and experimental toxicology—Illustrative lectures, recitations, and laboratory practice, twenty-seven hours. Geology—Dana's, three hours. Zoology—(continued), two hours. Sanitary science—Lectures, two hours during spring half-term. Laws of heredity and principles of breeding—Lectures, two hours during winter half-term. French—Three hours during winter half-term. winter half-term.

## (g.) In Studies Preparatory to Mining and Metallurgy.

Young men desiring to become mining engineers can pursue the regular course in civil or mechanical engineering, and at its close can spend a fourth year in the study of metallurgical chemistry, mineralogy, &c.

# (h.) IN THE SELECT STUDIES PREPARATORY TO OTHER HIGHER STUDIES.

## Junior year.

First Term.—Mineralogy—Blowpipe analysis and determinative mineralogy, eight hours. Astronomy—Recitations, four hours. English—Early English, two hours. History—Green's Short History of the English People, two hours. French—Three hours. German—Three hours.

Second Term.—Mineralogy—Lectures; laboratory work, eight hours during winter half-term. Botany—Lectures; laboratory practice in the identification of phaenogamous plants, two hours during spring half-term. Physical geography—Four hours during winter half-term; recitations from Guyot and lectures. English—Chaucer, Bacon, Shakspere, two hours during winter half-term, three hours during spring half-term. History—Green's History—continued, two hours during winter half-term, four hours during spring half-term. German—Three hours. French—Three hours.

## Senior year.

First Torm.—Geology—Recitations, three hours; excursions.
English—Shakesperc, two hours. Meteorology—Lectures, two hours.
French—Three hours.

Second Term.—Geology—continued, three hours. Zoology—continued, two hours during winter half-term. Meteorology—Lectures, two hours during winter half-term. Sanitary science—Lectures, two hours during winter half-term. Political economy—Recitations, exercises, and lectures, four hours. English—Shakspere, Milton, Dryden, Pope, Gray, and later authors, three hours. French— Three hours during winter half-term.

Exercises in English composition are required during the entire course from all the students. The preparation of graduating theses is among the duties of the senior year.

Lectures and instruction in military science are annually given to the senior class by the Professor of Military Science and Tactics.

The following account of the various subjects specified in the above scheme will explain the character and aim of the instruction.

Elementary Chemistry.—The exercises in elementary chemistry consist in recitations from a textbook, and experiments by the students in the laboratory to illustrate statements in the book. The object of the laboratory work is to facilitate the study of the subject, and to train the students in manipulation and in the observation of chemical phenomena. Notes are required and students are questioned on the experiments. As the class is divided according to scholarship at the end of the fall term, opportunity is

experiments. As the class is divided according to scholarship at the end of the fall term, opportunity is given to those who are most proficient to make rapid progress.

Analytical Chemistry—Qualitative and Quantitative.—This study is intended to serve two purposes. Analytical chemistry is used by the advanced student as a means of investigation in scientific or technical researches. The beginner, however, derives from its study advantages of another kind. The knowledge of the properties of chemical compounds, the familiarity with chemical reactions gained by experience in the laboratory, and the development of the reasoning faculties by the application of this knowledge in analytical processes, enable the student to generalize and classify chemical phenomena and aid him to understand the more abstract theories of chemical philosophy. The method of instruction adopted is conformed to this view of the uses of the study. Text-books are used and recitations are required, but the more important part of both study and instruction is performed in the laboratory. In order to solve the more important part of both study and instruction is performed in the laboratory. In order to solve the problems which are there constantly presented, the student, aided by books and instructors, must learn both principles and their applications. The student, throughout his course in analytical chemistry,

spends PIGG DAS spends four consecutive hours in laboratory work during five days of the week. The laboratory, however, is kept open seven hour daily for the benefit of graduate students and others who desire to devote more time to this study.

Qualitative analysis forms a part of the courses in chemistry, biology, agriculture and natural history. Quantitative analysis is one of the more important studies of the senior year in the chemical course. It is also included to some extent in the agricultural course.

Organic Chemistry is taught by informal lectures and experimental illustrations, as well as by text book drill, a lesson from Richter's Organic Chemistry being given out for each instruction-hour. The class has two exercises weekly throughout three terms. The course is adapted to give a fairly complete outline of the subject and some familiarity with the more important bodies and classes of bodies.

In addition to this, the senior students in the chemical course are required to spend twenty hours per week during the latter half of the first term in experimental work in organic chemistry. This is intended to supplement the preceding course, and at the same time to serve as a preliminary training for such students as desire to make a special study of organic chemistry.

as desire to make a special study of organic chemistry.

Opportunity is also afforded for the carrying on of original investigations in this subject, either in connection with theses or as a part of the regular work in the case of advanced students.

Physiological Chemistry and Experimental Toxicology.—Physiological chemistry is taught by laboratory exercises, illustrative lectures, and recitations. Each student is provided with a suitable working-place in the laboratory, well equipped with all needed apparatus and material. The regular course of work, designed especially for senior students in the biological course, extends throughout one year, and embraces a thorough study of the chemical composition of the various tissues and fluide of the body, together with a study of the chemical and physiological processes of respiration, digestion, secretion, excretion, and nutrition in general.

Beginning with a study of the albuminous bodies, the experimental work extends through the epithelial, connective, contractile, and nerve tissues. Proceeding then to digestion, the various digestive fluids are studied, artificial digestions are mades, and the several products of digestive action isolated and studied. The blood and urine are next considered, and students are taught to make both qualitative and quantitative analyses of the latter and to identify abnormal constituents. A portion of one term is also devoted to a study of the chemical reactions of the more important mineral and organic poisons, and their physiological action is determined experimentally. Students are also taught how to separate poisons from organic tissues and fluids, and to identify them, both by chemical and physiological reaction. During the latter half of the second term, senior year, opportunity is afforded for the erreying on of original investigations on some selected subject in either physiological chemistry or toxicology, in connection with the preparation of graduating theses. The course of work is particularly recommended to students intending to enter upon a course of medical studies.

Comparative Anatomy and Elementary Physiology.—The object sought in the instruction in anatomy and physiology, as taught during junior year, is the manual and mental training of the student in the methods of investigation by which the facts and principles of these sciences have been established, and at the same time to give him a sufficient knowledge of their elements to enable him to pursue with profit the special studies of the biological course as a preparation for medical studies. With this end in view, five forenoons each week are given to laboratory work in anatomy and histology. The student, under the immediate supervision of the instructor, dissects specimens of a number of different animals, and is required to make careful sketches and records of his work; he also examines the different animal tissues with the microscope, makes microscopical preparations, and is taught the methods of anatomical and histological investigation. This work is reviewed each week by means of text-book and recitation, or by lecture and examination. The elements of human physiology are faught by text-book, recitations, and demonstrations. The physiology of digestion and nutrition is taught during senior year in connection with physiological chemistry. During the last part of the term there is a short course of lectures on embryology, with special reference to human morphology.

Geology.—The course in geology includes recitations and oral instruction, extending through the entire year on alternate mornings. During the first half-year the recitations are attended by the entire senior class, except those in the course in mechanical engineering. This part of the course includes physical, lithological, and dynamical geology. These subjects are illustrated by diagrams and specimens. During the first term, each student is required to make a collection containing a specified number of the most important rocks and minerals, and to pass a thorough examination upon them at the end of the term; the object is to compel every student to become personally familiar with the appearance, as well as with the composition and other characters, of the rocks and minerals that are of the most importance in geology, as well as in the arts.

The last half of the year is devoted to historical geology and paleontology. This part of the course is pursued by all the seniors except those in the courses in mechanical and civil engineering. Suitable collections of fossils are used to illustrate the subject.

Opportunities are afforded for optional geological excursions during the warmer months.

Mineralogy.—The instruction in mineralogy is carried on by means of practical work in a laboratory especially fitted up for the purpose, and is intended to familiarise the student with the common minerals, attention being devoted especially to those which are of economic, geological, or scientific importance. To understand better the chemistry of the subject, the student is first made familiar with the simple chemical and blowpipe reactions useful in testing minerals, and applies this knowledge later to the determination of unknown species. The students have access to a labelled collection where they can study the properties of the minerals and make comparisons, and also to extensive unlabelled collections arranged especially to give them practice and facility in the correct identification of minerals. In addition to the laboratory work, instruction is given in crystallography, illustrated by a collection of models and natural crystals. The lectures in descriptive mineralogy to the more advanced students are illustrated by means of the extensive private collection of Professor Brush. The laboratory is provided with apparatus for the thorough chemical and physical investigation of minerals, and with an extensive library to which the students have access. The laboratory is open seven hours each day to accommodate any who desire to devote more time and attention to the subject than is laid out in any of the prescribed courses.

Zoology.-

Zoology.—The instruction in zoology includes a course of lectures on systematic zoology, morphology, and embryology, which are attended by all the seniors except those in the courses in mechanical and civil engineering. These lectures are generally given twice a week, and continue during about half

the year. The students are required to keep careful notes of the lectures.

Students in the natural history course are also required to pursue a course of laboratory instruction the second term of the junior and all of the senior year. This generally occupies from two to four during the second term of the junior and all of the senior year. This generally occupies from two to four hours a day on four days of each week. It includes dissections of various classes and orders of animals, with microscopic studies of the finer structures and of minute animal forms, as well as work in systematic

Special courses of recitations or lectures on particular subjects are also given when desirable.

Bolany.—The scheme of instruction provides for three successive courses of study, as either ending the study for the ordinary student, or introducing it for one who desires to become a professional botanist.

The first or elementary course, which is required of all the freshmen, is designed to teach the nature of the visible organs of flowering plants, tracing the life-history of vegetation from seed, through stem and root, leaves, branches, buds, blossoms, and fruit to seed again. The method consists mainly in the use of some casy text-book, like Gray's Lessons, with whatever illustrations and explanations may be needed to secure the student's attention. The second course, coming the next year, is restricted to the sections in biology, natural history, agriculture, and selected studies, and is intended to enable the student to recognise the chief natural orders of native plants, with the ability to identify the common species. The class meets two or three times a week in spring and summer, and is practised in identifying plants, using Gray's Manual as a standard, and employing the ordinary simple dissecting microscope. At this point the instruction for the select course ceases; in the next fall term the work for the courses. in biology, natural history, and agriculture is entirely practical, books being used only for reference. Students begin with cutting thin sections of some common woody and herbaceous stems, and are shown how to prepare such sections for examination and for permanent preservation as microscopic objects. After acquiring some facility in microscopic manipulation, various parts of flowering plants are brought in for dissection and examination, and towards the close of the term some attention is given to ferns, mosses, and algae. This finishes the course for ordinary students; for those who may desire to prosecute the science professionally, the work is arranged to suit individual requirements, whether it be in the direction of histology, or of systemstic botany as applied to flowering plants, or to ferns, mosses,

hepatics, or algae.

Agriculture.—The special instruction in the science of agriculture is by recitations and lectures, with such aids and appliances as are suited to the class-room. Besides agricultural chemistry, it includes a discussion of the cultivation of the staple field crops of the country; theories of rural economy and systems of husbandry; the laws of heredity and principles of stock-breeding.

Sanitary Science.—The lectures on this subject discuss the natural laws which govern the public health; their relation to the social habits and condition of communities; instruction in the use of mortuary statistics; opidemics and pestilences, with their relations to the prosperity of a community, and methods of control; the germ-theory of disease and theory of disinfectants; the hygiene of private dwellings and public buildings; the relations of the water supply to public health; sanitary engineering;

legislation relating to public health and methods of official sanitary administration.

Mathematics.—The mathematical studies of the freshman year are pursued by all members of the class; those of the junior year by students in the course of engineering and properly qualified special students who may choose them. During the latter year, in connection with the instruction briefly indicated in the subspace for 201 briefly indicated in the scheme above [p. 29], a course of familiar lectures is given to supplement the

ordinary class-room exercises.

Physics.—The object of the experimental lectures is not only to elucidate the subjects treated in the text-book employed, but also to extend the treatment of such subjects, and to introduce others where thought desirable. A considerable portion of the work of the year is the preparation for recitation on matter thus presented.

At the end of the fall term, the freshman class is redivided into three sections, according to the grade of scholarship shown in their studies. After this, although the experimental lectures are attended as before by the class as a whole, the higher divisions are able to pursue the studies more thoroughly.

The facilities of the physical laboratory are extended to such graduate students and seniors as may desire them.

Course in advanced physics.—A course of two lectures per week, beginning in January, is suppled by laboratory work. The earlier portion of the time is devoted to the theory of observation and thod of least squares. The course is optional to all who have a command of the calculus. mented by laboratory work. the method of least squares.

Military science and tactics. - Instruction in this course is obligatory upon the whole senior class in all departments. To secure familiarity with definitions and fundamental principles, a concise text-book is used for recitations and reference. The work is carried on chiefly by lectures, upon which satisfactory notes must be submitted. Such topics as the following are discussed: military accordingly the American military problem; organisation and reorganisation; modern war on field and map; statistics and logistics; the combined use of "the three arms"; strategy and campaigning; orders of battle and grand tactics; special operations of war and field service; minor tactics and the art of war; use of cavalry in campaign and battle; use of artillery and the Franco-Prussian war; use of infantry and the Turco-Russian war; and finally a summary of "the Eastern Question." The course will terminate with an examination, and a special military certificate is awarded, by the Regular Army Officer in charge of the department, to such students as attain a sufficient degree of proficiency, and give evidence of military aptitude. In

connection with this course a brief original paper is required.

Civil engineering.—The object of this course is to give a thorough preparation, first of all, in the principles of the various sciences involved, and afterwards, as extensive practice in the application of these principles are the time of all of the various sciences.

principles as the time at disposal, the ability of the students, and the facilities and plant permit

Under the first head are included such subjects as mathematics, physics, mechanics, thermodynamics, astronomy, geology, mineralogy, chemistry, and botany; and under the second head, drawing, surveying, strength, and properties of materials, and design and construction of various kinds, such as bridges, roofs, foundations, arches, retaining walls, dams, water-works, railroads, improvement of rivers and harbours, sewerage and drainage, water motors, etc.

The first division includes civil engineering as a science, the other civil engineering as an art. The ground covered by the first is definite, and the instruction is made as thorough as possible. ground covered by the second is of almost indefinite extent. Here, by a careful selection of practical examples, such as occur in engineering practice, the application of principles is illustrated, and, together with the analytical or algebraic methods, the student is also instructed in practical graphic solutions, wherever such solutions present a special value. Much time is devoted to geodetic operations and to surveying in the field. Instruction is given in the practical operations connected with the reconnaissance, location, and surveys of roads, canals, and railroads, such as setting out, cross-sectioning, setting grade stakes, calculation of earth work, etc. Thorough instruction is given in drawing and design, the construction of working drawings, and principles of designing as applied to bridges, roofs, etc.

The instruction is by means of practical exercises, lectures, and recitations, so combined as to develop as for an acceptable the mental payons of the student. Visits of inspection are made at suitable

develop as far as possible the mental powers of the student. Visits of inspection are made at suitable

intervals to private and public works of engineering interest.

The entire course requires five years, three years of undergraduate and two of graduate instruction; and a thesis of merit upon some approved subject, accompanied by designs and estimates, is required upon the completion of the course, as also at the end of the first three years. Examinations are also held at the end of every term and year.

In what follows, such details are given as may be of interest to those who contemplate taking the

Mathematics.—6 hours weekly, junior year, both terms. See synopsis of course. French and German.—Students in this course take in the junior year the regular studies of the junior class in both German and French, 3 hours each. In the senior year French is continued, 3 hours

during the winter half-term.

Drawing and descriptive geometry.—Drawing is begun at once in the first term of freshman year, under the charge of the professor of drawing in the art school, and includes practice in free hand drawing. In the second term, under the instructor in instrumental drawing, the students take isometric drawing with application to drawing from models and structures by measurement, shading, tinting, conventional use of colours, principles of orthographic projections, and practice in making simple working drawings, 4 hours both terms.

The drawing of junior year, 3 hours both terms, includes descriptive geometry, the drawing of structures from measurement, and elements of design for simple structures. The instruction is by recitations, lectures, practical exercises and models, and is under the charge of the instructor in instrumental drawing and the professor and instructor in civil engineering. Included in the work of this year is also the mapping of surveying field notes.

In the senior year, the drawing consists of the mapping of the surveys of that year, and the designing of structures and finished drawings, designs and estimates, under the charge of the professor

and instructor in civil engineering, 6 hours both terms.

Surveying and field engineering.—The instruction in the field occupies about 20 hours for six or more weeks in both terms of junior and senior year. The exercises at these times are so arranged as to secure as much consecutive time as possible in the field. The work of the junior year includes the use and adjustments of instruments; practice surveys; recitations and lectures upon surveying operations and methods of keeping field notes. Levels are run, surveys made, plotted, and checked; blue print copies of drawings made, the use of compass, level, and transit acquired. In the second term of junior year, land and topographical surveys are made and railroad curves run.

In the first term of senior year, a line of railroad is located and set out from a contour map previously obtained, grades and curves established and set out, and computations made. The theory of the economic location is taught by lectures and recitations in connection with the field work. The work is arranged so that each student has sufficient practice in all the various operations. The text-books used are Gillespie and Johnson's works, Henck's Field Book, Gore's Elements of Geodesy, and Merriman's Theory of Least Squares. The course is under the charge of the professor and instructor in civil

engineering, aided by several assistants.

Mechanics of engineering.—Senior year, 6 to 8 hours, both terms. The text-books of Weisbach, 1st and 2d volumes, are used in connection with lectures and solution of practical problems in illustration of the various topics. The course includes thorough instruction in the strength of materials, the stability of foundations, retaining walls, dams and embankments, and masonry arches, by lectures and graphic methods. Questions of hydraulics, water supply, and measurement of discharge, receive attention, and the theory and construction of water motors. A course in thermodynamics, with application to air and steam engine, is also included.

Construction and design.—Senior year, six hours both terms. A thorough course is given in the determination of stresses and the detailed design of roofs, bridges, &c., with working drawings, specifitions, and estimates. Visits of inspection are made, and recitations and lectures held in connection with

the work in the drawing-room.

Astronomy.—A course is given under the charge of the professor of astronomy, six hours, second term of senior year, including practical work and the use of the sextant and transit in determining time, latitude, and azimuth.

Geology.—This course occupies three hours up to the middle of the second term of senior year. Mineralogy.—This course, under the professor of mineralogy, occupies three hours up to the middle of the second term in senior year.

A course of lectures on the theory of electricity and its applications, by the professor of physics, is open to students of this department, and can be taken as a part of the preparation for a graduate

course in the higher branches of electrical science.

Military Engineering.—The object aimed at is to disseminate military information, and to awaken interest in the application of the arts of peace to those of possible war. In connection with the courses of civil engineering and military science, lectures will be given upon such topics as systems of fortifications. cations, sea-coast defences, hasty intrenchments, passage of rivers and military bridges, military reconnaissance and instruments, battlefield telemetry and methods, sea-coast range-finding and shiptracking devices, gun-powder and ballistic machines, high explosives and demolitions; gun metals, modern ordnance, and gunnery; armour plates, turrets, projectiles, and fuses; torpedoes, submarine mines, military electric installation and countermining.

Mechanical Mechanical Engineering.—The objects aimed at in the plan of instruction in this course are to give to the student a thorough training in elementary and advanced mathemathics and physics, and their application to the science of construction; to make him familiar with the general principles of engineering and with the prescioul details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of mathematical details of the details of and with the practical details of mechanical construction through which these principles are made useful; and to enable him ultimately, in beginning the work of his profession to bring to bear upon it a well balanced store of theoretical and practical knowledge, and a mind trained in correct habits of thought and work.

The complete course covers five years, three of which are spent in undergraduate study, and two in a graduate course, a portion of which may be spent in actual practical work. The subjects and

methods of instruction in the undergraduate course are as follows :-

Mathematics.—See synopsis, page 30.

French and German.—Students take in the junior year the regular studies of the junior class in both.

France and German. In the senior year French is continued during the winter half-term.

Surveying.—A short course in surveying comprises lectures on methods of surveying and the construction and use of instruments, also practice in field work in the use of the level and transit, city surveying, establishing grades and laying out buildings.

Shop-visiting divides the time equally with drawing in the junior year until the spring recess.

The student accompanied by the instructor is employed in studying machinery in use and in process. The student, accompanied by the instructor, is employed in studying machinery in use and in process of construction in different machine shops in the city. He is required to make satisfactory carefully dimensioned sketches, from measurements taken by himself, of the complete machines and their parts, and to describe the tools and mechanical operations used in producing the simpler pieces.

Drawing.—Descriptive geometry is taught in the drawing room by lectures and recitations, and by exercises at the drawing board, where the problems are solved graphically by the student. Instruction in drawing machine elements is given in the junior year. Models and cartoons showing examples of approved practice are used by the instructor, who also gives personal attention to each student's work at the heard as it progresses.

the board as it progresses.

Principles of mechanism.—This is a course in theoretical and applied kinematics. Instruction is by text-books and lectures illustrated by diagrams and models, an extensive collection of which belongs to

the school, and is accessible to the student.

Steam engine.—Recitations and lectures in this subject begin in the junior year, after the spring recess. They relate to the structural details of engines and to the mechanical principles involved in their working. The subject is continued in the first term of senior year, when particular attention is directed to various kinds of valve gear, the governor, the fly-wheel, balancing, and the effect of the weight of the reciprocating parts. In the second term of senior year, the study of steam-boilers takes the place of that

Indicator Practice.—In the senior year, the student is afforded opportunities to apply the indicator to various engines in operation, and has practice in reading indicator cards and measuring them by

the planimeter. He is taught to detect such defects in the engine as are shown by the cards.

Applied mechanics.—In this course lectures, recitations, and exercises in the solution of practical problems, relate to the topics specified under this head in scheme on page 31.

Thermodynamics.-Recitations and lectures on the mechanical theory of heat and its application

to hot-air engines, gas engines, and the steam-engine.

Machine design.—The course in this subject consists chiefly in practical exercises at the drawing board, and partly in lectures on the functions of machines and the mechanical principles which are applied in determining the proportions of machinery. The student under the guidance of an experienced instructor, is employed in making complete working drawings of machines, many examples of which are in the drawing rooms and the basements of the school. He does not copy the examples, but is required to change the dimensions and in many cases to alter the design, and is ultimately taught to make partly new designs of important machinery, such as cranes, yacht engines, machine tools, boilers, etc. The discipline the student receives is such as he would obtain in the drawing-office of an engineering establishment, while he is also carefully instructed in the theory of the subjects he deals with, and in the practical bearing of all his work.

In the senior year, several excursions are made by the class, accompanied by one or more instructors, to neighbouring manufacturing and engineering centres, where large manufactories, pumping works, ocean steamers, etc., are visited. Full notes must be taken, and a satisfactory written report upon the machinery examined is required of the student.

Thesis.—Before graduating, the student must present a satisfactory thesis on some subject approved by the professor in charge of the department of mechanical engineering.

A course of lectures on the theory of electricity and its applications is open to students in this department, and these lectures can be taken as a part of the preparation for a graduate course in the higher branches of electrical science.

Astronomy.—Students in the select course receive instruction in astronomy during junior year, first term, four hours per week.

Students of civil engineering during the second term of their senior year have six recitations per week, and also practical experience in the determinations of time, azimuths, latitude, longitude, etc.

English.—The course is designed to give the student acquaintance with the great representative writers of the various epochs. A history of the language is one of the studies of the freshman year; and after that year the study of the language is made entirely subordinate to that of the literature. During first term of junior year, however, extracts from early English authors are read, and early English grammar studied, so as to familiarise the student with the inflections then in use and the distinctions existing between the leading dialects. It is the aim of this term's work to give such knowledge of forms, and to some extent of words that the student will be able to read at sight any Early English of forms, and to some extent of words, that the student will be able to read at sight any Early English author whose writings do not involve special difficulties of language or vocabulary.

With the second term, the regular study of English literature proper begins with Chaucer; and for the rest of the course till the end of senior year the following authors are read: Bacon, Shakspere, Milton, Dryden, Pope, Gray, Goldsmith, and later writers. Those mentioned in the lists are always studied, but other authors not named are also taken up, the course varying somewhat in different years.

In all cases, complete works of a writer are studied, not extracts; as, for instance, several of Chaucer's Tales, and several of the plays of Shakspere. The authors are taken up in chronological order, and the literary history of the time is likewise carried on in connection with the great representative writers of each period.

German.—The aim in this department is to give such a knowledge of facts and principles as shall qualify the student as rapidly as possible to use the language for such various purposes as his special needs may require, and particularly to facilitate the use of German treatises in his later special studies. To accomplish this, the course consists of the combination of the study of systematic German grammar with a complementary and progressive course of oral translation from English into German, the latter being designed for the double purpose of increasing the command of grammatical principles, and through the establishment of a habit of ready and accurate expression, of laying the foundation for future colloquial use of the language. In connection with the foregoing, it is attempted to introduce the student to as many different styles and as many forms of composition as the time allows. For this purpose the reading matter is in general selected from readers and collections prepared for the use of schools in Germany, and characterised by the number and variety of their extracts, thus enabling the instructor to select pieces that illustrate one another and to avoid similar lines of reading with successive classes. Constant attention is paid during a portion of the course to English affinities, to analogies in the formation of English and German abstract terms, to the commoner rhetorical resemblances and differences, to the details of arrangement in German sentences, and the development of secondary from primary significations of words.

In view of the shortness of the course there is no attempt to secure any considerable acquaintance with German literature. A body of representative pieces of lyric peotry, however, is made the basis of careful literary study, with special attention to poetic diction and variety of metrical form. Memorising German poems is practiced to some extent as class exercise, as also retranslation of dictated literal versions of simple pieces into German verse, in accordance with prescribed rythm and sequence of rhyme.

Occasionally, when the proficiency of a class allows it, an advanced division is organised, which is thus enabled to read a much larger amount of matter and to pursue more critical methods. The attention of such a division is sometimes given for a few months to extracts treating of leading events in German history, with a collateral course of German historical poetry, the selections being made so as to be mutually illustrative. Historical poems not contained in the text-books are often furnished by dictation.

During the last few weeks of the course, there is an attempt to initiate the student into the art of rapid and intelligent, though uncritical reading, dispensing largely with dictionary and grammar, and aiming to form independent habits of observation and induction. For this purpose recourse is had to entertaining novels.

In general, it is the endeavour, while aiming primarily and constantly at acquiring a working know-ledge of contemporary German, to combine habitually scientific and empirical methods, to enforce correct notions as to the nature of language, to secure incidentally some of the most important disciplinary results of elementary linguistic study, and to give some conception, by suggestive questions and occasional statements, of the various special directions which a more extended and advanced course would necessarily take.

The time allotted to the subject is three hours a week during the freshman and junior years.

Regular text-books: Whiney's German Grammar, Whitney's German Dictionary, Ahn's Exercises, or Eysenbach's German Exercises.

French.—To avoid repetition, it will suffice to state that much the same course is pursued in French as is above detailed for the German, and on like principles. The three weekly exercises extend through the entire junior, and most of the senior year, based on a systematic review of the essential elements. In the junior year, a wide extent of reading is insisted on, beginning with the simpler novels, such as "Le Conscrit," "L'Ami-Fritz," "La Petite Fadette," &c., through a scale of deversified vocabulary, by which at last sight-reading of such matter as is more appropriate to the department may be profitably entertained. The practical or conversational course runs along parallel with the more systematic study of the language.

In the second year, the aim is to familiarize the student with practical terms and expressions of a scientific cast, rather than with the purely literary language. Hence practical works, such as books of travel and scientific treatises, have seemed best adapted to the general object in view.

History.—The greater part of the work is carried on by means of recitations, Green's Short History of the English People being used as a text-book. The students are also required to look up special topics, and to give the results of their studies to the class; the books used for this purpose are drawn from a small historical library in the class-room. The location of places is enforced by the use of outline maps which the students are required to fill in. Particular attention is given to the history of institutions and to the constitutional and economic growth of the country.

Political Economy.—In the beginning of the course, an effort is made to familiarise the students with the fundamental principles of economics, and more particularly to train them in economic reasoning. More difficult problems are then taken up and discussed, and special topics are assigned to the class for investigation. A small library, containing a number of copies of each of the principal authorities, has been provided, in order that the students may be able to familiarise themselves somewhat with the literature of the subject, without expense to themselves.

### TUITION CHARGES.

The charge for tuition for undergraduate students is 150 dollars per year, payable 55 dollars at the beginning of the first and second terms, and 40 dollars at the middle of the second term. An additional charge of 5 dollars a year is made to each student for the use of the college reading-room and gymnasium, which is payable at the beginning of the first term, making the total charge for that term 60 dollars. The student in the chemical course has an additional charge of 60 dollars per annum for chemicals and use of apparatus. He also supplies himself at his own expense with flasks, crucibles, &c., the cost of which should not exceed 10 dollars per term. A fee of 5 dollars is charged members of the freshman class for chemicals and materials used in their laboratory practice, and the same fee is required from all (except

chemical students) who take practical exercises in blowpipe analysis and determinative mineralogy. fee of 5 dollars a term is also charged to students in the zoological and anatomical laboratories, for materials and use of instruments.

For graduate students the charge for tuition is 100 dollars per year.

#### CHURCH SITTINGS.

Free sittings for students in this department of Yale University are provided as follows:—In the Centre Church and North Church (Congregational), in the Trinity (Episcopal), and in the First Methodist Church.

Those who prefer to pay for a sitting for one year, more or less, in the churches above-mentioned, or in any other church of any denomination, will be aided on application to the Secretary of the School.

Sittings in the gallery of the College chapel are free as heretofore to the students of this department.

Students of this department, on the recommendation of the Governing Board, are admitted by the Corporation of Yale College to the following degrees. They are thus conferred:—

1. Bachelor of philosophy.—On those who complete any of the three years courses of study, passing all the examinations in a satisfactory manner, and presenting a graduation thesis.

The fee for graduation as Bachelor of Philosophy, including the fee for triennial catalogues, commencement dinners, &c., is 10 dollars, unless the person taking the degree is also an academical graduate, when it is but five dollars.

2. Civil engineer and mechanical engineer.—The requirements of these degrees are stated on

pages 22-25.

Doctor of philosophy.—The requirement of this degree are stated on page 21 of the School Calendar.

#### TERMS AND VACATIONS.

The next academic year begins Thursday, 18th September, 1890. The first term begins twelve weeks from commencement day, and continues thirteen weeks; the second term begins ordinarily on the first Tuesday in January and continues until commencement day, with a spring recess—usually of eight days including Easter.

### ANNOUNCEMENT IN RESPECT TO STATE STUDENTS.

The scholarships established in this school in consequence of the bestowal upon it of the Congressional grants are designed to aid young men who are in need of pecuniary assistance in fitting themselves for agricultural and mechanical pursuits of life. All applicants must be citizens of Connecticut. In case there are more applicants than vacancies, candidates will be preferred who have lost a parent in the military or naval service of the United States, and next to these such as are most in need of pecuniary assistance; and the appointments will be distributed as far as practicable among the several counties in proportion to their population. The appointing Board for the current year, consisting of the Board of Visitors for the State and the Secretary of the school, will meet on 24th June, 1890, and at or about the same time in the year 1891, due notice of which will be given by publication in every county in the State. All applications should be made previous to that time. Blank forms for application will be sent, when requested, by Professor George J. Brush, Secretary of the Appointing Board.

### APPENDIX O.

### COLUMBIA COLLEGE SCHOOL OF MINES, NEW YORK CITY—SYNOPSIS OF STUDIES.

I.—Course in Mining Engineering.

First Year.

First Session.

Trigonometry and mensuration, as contained in Davies' Legendre.

Trigonometry and mensuration, as contained in Davies' Legendre.

Physics—Magnetism; electricity, static and dynamic, thermo-electricity, induction, magneto-electricity, the electric telegraph. Optics—lectures, and Atkinson's Ganot's Physics.

Botany—Lectures, and Bastin's Elements of Botany.

Chemistry—The metals. Lectures and recitations; Fownes' Manual of Chemistry.

Qualitative analysis—Lectures, and Valentin's Manual of Qualitative Analysis.

Blowpipe analysis—Qualitative; lectures, conferences, and Plattner's Blowpipe Analysis.

Drawing—Free-hand and sketching; lettering, instrumental drawing; projections, intersections, and developments. Text-book: Binn's Orthographic Projection.

Second Session.

Geometrical conic sections—Text-book: Peck's Conic Sections.

Algebra—Text-book: Peck's Manual of Algebra.

Graphical algebra—Text-book: Phillips and Beebe's Graphic Algebra.

Graphics—Descriptive geometry. Text-book: Church's Descriptive Geometry. Physics—Doctrines of heat, viz., expansion, conduction, radiation, thermometry, latent heat, tension of vapours, steam, specific heat. Sound—Lectures, and Atkinson's Ganot's Physics.

Botany—Lectures, and Bastin's Elements of Botany.

Qualitative analysis—Lectures, and Valentin's Manual of Qualitative Analysis. Crystallography—Lectures, conferences, and Egleston's Diagrams of Crystals.

Drawing—Same as first session.

Summer Vacation.

Surveying-Lectures, recitations, and field work; pacing; compass and chain surveys; topographical work; use of solar compass in land and mineral surveys; adjustments and use of transit and wye level for triangulation; traversing, city surveying, and levelling; use of plane table; stratigraphical and magnetic surveys.

Summer class in surveying.

Memoir.

Second Year.

First Session.

Analytical geometry—Text-book: Peck's Analytical Geometry.

Graphics-Shades and shadows, perspective, isometrical drawing. Text-book: Church's Shades and Shadows.

Engineering—Exercises in mathematical problems.

Practical mining—Excavation, quarrying, drilling and blasting, tunnelling.

Zoology—Lectures, and Nicholson's Manual of Zoology.

Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics; lectures and laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-air, water, artificial

illumination, photography.

Mineralogy—Lectures, conferences, laboratory work, and Egleston's Lectures and Tables of Mineralogy.

Drawing—Topographical drawing; tinting and grading; problems in graphics; scale-construction drawing.

Second Session.

Differential and integral calculus-Text-book: Peck's Practical Calculus.

Engineering—Exercises in mathematical problems.

Practical mining—Excavation, quarrying, drilling and blasting, tunnelling.

Zoology—Lectures, and Nicholson's Manual of Zoology.

Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics; lectures and laborators practice. laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-limes, mortars, and cements; building stones; decay and preservation; timber and its preservation; pigments, paints, essential oils, varnishes; glass and ceramics; explosives—gunpower, gun-cotton, nitro-glycerine; electro-metallurgy, &c.

Mineralogy-Same as first session.

Drawing—Construction drawing; mine maps; mine sections.

Summer Vacation.

Optional class in machine shops. Surveying-Continued from first year.

Summer class in surveying.

Third Year.

First Session.

Mechanics of solids, including forces, moments, equilibrium, stability, &c., and elementary machines; dynamics, including uniform, varied, rectilineal, and curvilinear motion, rotation, vibration, impact, work done, &c.

Physics-Mechanical theory of heat.

Engineering--General principles relating to materials and structures, physically and mechanically considered.

1. Materials—Stone, cements, brick, metals, timber, treated in regard to strength, durability, mode of preparation, defects, tests of quality, and fitness for special uses.

2. Structures—Earthwork, execution of earthwork, foundations and supports, superstructure, joints; stability, strength, and stiffness of parts; special rules of construction for masonry of public buildings, bridges, retaining walls, arches, railroads, common roads, and canals.

Physical properties of materials.—Pig-iron—castings, chilled and malleable; wrought iron—bar, shapes, plate, tube, and wire; steel—ingot motal, castings, shapes, and plate; other metals and alloys.

Practical mining:

1. Boring, earth augers, driven wells, boring with rods and cable tools; upward, inclined, and horizontal boring; diamond drill and its use in prospecting.

2. Shaft sinking, shaft timbering and spilling, boring of shafts, sinking of iron and masonry linings, cribbing, walling, and tubbing.

3. Drifting of adits and levels, timbering and walling in levels and working places.
4. Mining of coal and ores, coal-cutting machines, hand and machine drilling.

5. Handling of coal and ores in working places.

6. Tramming, cars, tracks, locomotive and wire-rope haulage, planes and gravity roads.

7. Accidents to miners, cause, and prevention.8. Organisations and administration.

9. Time-books, measurement of contracts, pay-roll, analysis, and dissection of accounts and cost sheets. Assaying and ore testing.—Lectures, recitations, and practical work. Metallurgy.—General metallurgy; fuel, furnaces, &c. Geology, lithological.—Rocks and rock masses.

Drawing.—General engineering construction; machine construction.

#### Second Session.

Mechanics of fluids, including pressure, buoyancy, and specific gravities, motion in pipes and channels, undulation, capillarity, tension and clasticity of gases, the atmosphere, the barometer, barometric formulæ, and hypsometry.

Physics.—Electricity, physical optics, and the undulatory theory of light (last two optional). Engineering.—Theory of strains and strength of materials—clasticity, mechanical laws, application of principles of mechanics to beams, girders, and roof trusses under various conditions of loading and

Physical properties of materials.—Continued from first session.

Practical mining.—Continued from first session.

Metallurgy.—Iron and steel.

Geology.—Ristorical, including paleontology, or a systematic review of recent and fossil forms of life. Drawing.—General engineering construction, machine construction.

### Summer Vacation.

Summer class in practical mining-Memoir.

### Fourth year.

(Without distinction of sessions.)

Mining engineering:

. Considered in its widest sense as a course of study.

2. Considered in reference to the application of general principles of engineering to the development and working of mines.

3. Classification and nomenclature of mineral deposits, descriptions of lodes or veins, beds, masses, and irregular deposits, with illustrations of the disturbances to which they are subjected, as affecting the work of mining.

Graphical representation of deposits, with examples showing modes of occurrence and disturbances.

5. Prospecting or searching for mineral deposits.

6 Exploratory workings.

Establishing seats of extraction.

8. Description of typical methods of exploitation as applied to wide veins or lodes, to narrow veins, masses, to beds of various thicknesses and degrees of inclination.

9. General principles relating to subterranean transportation.

10. Methods and machinery employed for extracting minerals from the pits, and for facilitating ascent and descent of workmen.

11. Drainage of mines, theory of infiltrations of water, methods and machinery for draining or freeing mines from water.

12. Ventilation of mines, causes of vitiation of the air of mines, quantities of fresh air required under various circumstances, natural ventilation, mechanical ventilation by fires and by ventilating machinery, distribution of air through galleries and workings.

13. Graphical illustrations of exploratory workings; methods of exploitation; machinery for hoisting, pumping, ventilation, and transportation, including the use of steam-engines and pumps, air compressors, air engines, pumping engines, winding engines, centrifugal and other ventilating machines.

Engineering.—Theory of strains and strength of materials continued; graphical methods of determining strains, deflection of beams and girders; quantity of material in braced girders under various conditions of loading and supports; angle of economy for bracing; torsion of shafts; crushing and tensile strength of materials; working strains and working load; mode of estimating cost of girder

Hydraulic engineering.-Application of principles of mechanics of fluids to determining the discharge of water over weirs or dams; the dimensions of conduit pipes; discharge of canals and rivers; the effect of varying forms and sections of channels and of obstructions to flow; the gauging of streams; retaining walls for reservoirs. Ore

138--2 O

Ore dressing-

1. Introduction, theory of separation, hand and machine dressing, general principles governing crushing and sizing of ores of different character.

2. Jigging.—Theory of, description of different forms of jigs and methods of working, air jigs.

3. Slime treatment, classification of slimes in troughs, spitz kasten, &c., and treatment on buddles and tables.

4. Description of crushing machinery, jaw crushers, rolls, stamps, mills, &c.

5. Sizing apparatus, screens, riddles, and trommels. 6. Description of coal-washing plant; anthracite breaker.

7. Description of American ore dressing works.

8. Foreign ore-dressing works.

Machinery and millwork-

General theory of motion.
 Uniform and varied motion.

3. Composition of motions.

4. Instantaneous centre and centroids.

5. Transmissions by rolling and sliding contact, by belting, ropes and chain, by shafting and linkages, by fluids.

6. Engaging and disengaging and reversing gears, and quick-return motions.

Dynamics of machinery.—Forces of nature employed or acting in all machines; dynamical laws, mathematical theorems, measure of forces, work of forces; elementary machines and their combinations; matical theorems, measure of forces, work of forces; elementary intenders and their combinations; theory of efficiency; theory of fly-wheels, governors, and brakes; strength and proportions of parts of machines; dynamometers; prime movers, as driven by animal power, water power, steam power, compressed or heated air, wind power comprising the theory of animal power, theory of water-wheels, overshot wheels, undershot wheels, breast wheels, turbines, reaction wheels, centrifugal pumps; properties and laws of heat as applied to the generation of steam and the construction of boilers; properties of steam and hair in their relation to prime movers; mechanical theory of heat applied to steam-engines, hot-air engines, compressed-air engines; general description of heat engines of various forms; description and theory of ventilating fans or blowers.

Mechanical engineering—

1. Steam-boilers—Construction, wear and tear, fittings, setting, testing, care and management, firing, feeding, injectors, pumps, &c.

2. Mechanism of engines.—Valve gearing, link motions, governors, &c.

3. Management of engines.—Erecting, emergencies, special types of engines, &c.

4. Proportions of engines, &c.

5. Testing efficiency of engines and boilers, &c.

6. Pumps, hoisting engines, ventilating machinery, construction and management of hot-air, gas, and petroleum engines, &c.

7. Machine tools.

Graphical statics.

Surveying.—Railroad surveying—Reconnaissance, location of line, calculation of cuttings and embank-

Quantitative analysis.

Metallurgy.—Copper, lead, silver, gold, zinc, tin, mercury, &c.

Economic geology—Theory of mineral veins, ores, deposits, and distribution of iron, copper, lead, gold silver, mercury, and other metals; graphite, coal, lignite, peat, asphalt, petroleum, salt, clay, lime-stone, cements, building and ornamental stones, &c.

Project in metallurgy, or thesis in mining engineering or economic geology.

### II.-COURSE IN CIVIL ENGINEERING.

### First Year.

### Second Session.

Trignometry and mensuration, as contained in Davies' Legendre.

Physics—Magnetism; electricity, static and dynamic, thermo-electricity, induction, magneto-electricity, the electric telegraph. Optics—Lectures, and Atkinson's Ganot's Physics.

Botany—Lectures, and Bastin's Elements of Botany.

Chemistry—The metals. Lectures and recitations; Fownes' Manual of Chemistry.

Drawing—Freehand and sketching; lettering, instrumental drawing; projections, intersections, and developments. Text-book: Binn's Orthographic Projection.

### Second Session.

Geometrical conic sections—Text-book: Peck's Conic Sections. Algebra—Text-book: Peck's Manual of Algebra.

Graphical algebra—Text-book: Phillips and Beebe's Graphic Algebra.
Graphics—Descriptive geometry (text-book): Church's Descriptive Geometry.

Physics—Doctrines of heat, viz., expansion, conduction, radiation, thermometry, latent heat, tension of vapours, steam, specific heat. Optics—Lectures, and Atkinson's Ganot's Physics.

Botany-Lectures, and Bastin's Elements of Botany.

Drawing—Same as first session.

### Summer Vacation.

Surveying—Lectures, recitations, and field work; pacing; compass and chain surveys; topographical work; use of solar compass in land surveys; adjustments and uso of transit and wye level for triangulation; traversing, city surveying, and levelling; use of plane table; hydrographic surveys.

Summer class in surveying-Memoir.

Second Year.

First Session.

Analytical geometry-Text-book: Peck's Analytical Geometry. Graphics—Shades and shadows, perspective, isometrical drawing. Stereotomy—Text-book: Mahan's Stone-cutting. Engineering—Exercises in mathematical problems.

Sanitary engineering—Drainage of buildings and house lots; water supply of buildings.
Practical mining—Excavation, quarrying, drilling and blasting, tunnelling.
Zoology—Lectures, and Nicholson's Manual of Zoology.
Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics; lectures and laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-air, water, artificial illumination, photography.

Mineralogy—Lectures, conferences, blowpipe analysis and crystallography.

Drawing—Topographical drawing; tinting and grading; problems in graphics; scale-construction drawing.

#### Second Session.

Differential and integral calculus—Text-book: Peck's Practical Calculus.

Engineering—Exercises in mathematical problems.

Roads and pavements.

Sanitary engineering—Drainage of buildings and house lots; water supply of buildings.

Practical mining—Excavation, quarrying, drilling and blasting, tunnelling.

Zoology—Lectures, and Nicholson's Manual of Zoology.

Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics; lectures and

laboratory practice.

Applied chemistry—Lectures and recitations; Wagner's Chemische Technologie—limes, mortars, and cements; building-stones; decay and preservation; timber and preservation; pigments, paints, essential oils, varnishes; glass and ceramics; explosives; gunpowder, gun-cotton, and nitro-glycerine; electro-metallurgy, &c.

Mineralogy—Lectures, conferences, and laboratory work on rock-forming minerals, common ores, and minerals used in the manufacture of cements, paints, &c.

Drawing-Problems in graphics; construction drawing; stone-cutting.

Summer Vacation.

Option class in machine shops. Surveying-Continued from first year.

Summer class in surveying.

### Third Year.

First Session.

Mechanics of solids, including forces, moments, equilibrium, stability, &c., and elementary machines; dynamics, including uniform, varied, rectilineal, and curvilinear motion, rotation, vibration, impact work done, &c.

Physics-Mechanical theory of heat.

Practical astronomy and general principles of geodesy.

Engineering—General principles relating to materials and structures, physically and mechanically considered.

1. Materials--Stone, coment, brick, metals, timber, treated in regard to strength, durability, mode of

preparation, defects, tests of quality, and fitness for special uses.

2. Structures—Earthwork, execution of earthwork, foundations and supports, superstructure, joints; strength and stiffness of parts; special rules of construction for masonry of public buildings,

bridges, retaining walls, arches, railroads, common roads, and canals.

Physical properties of materials—Pig-iron: castings, chilled and malleable; wrought iron: bar, shapes, plate, tube, and wire; steel: ingot metal, castings, shapes, and plate; other metals and alloys.

Metallurgy—General metallurgy; fuels, furnaces, &c.

Geology—Lithological, cosmical, and physiographic.

Drawing—General engineering construction; machine construction.

### Second Session.

Mechanics of fluids, including pressure, buoyancy, and specific gravities; motion in pipes and channels, undulation, capillarity, tension and elasticity of gases, the atmosphere, the barometer, barometric

rindulation, capitality, tension and ensitivity of gases, the atmosphere, the barometer, barometer formulæ, and hypsometry.

Physics—Electric (required); physical optics, and the undulatory theory of light (optional).

Practical astronomy and general principles of geodesy.

Engineering—Theory of trains and strength of materials; clasticity, mechanical laws, application of principles of mechanism to beams, girdors, and roof trusses under various conditions of loading and supports.

Physical properties of materials—Continued from first session.

Metallurgy—Iron and steel.
Geology—Historical, including palæontology.
Drawing—General engineering construction; machine construction.

Summer Vacation.

Summer class in practical geodesy.

Memoir.

#### Fourth Year.

(Without distinction of sessions.)

Civil engineering-Hydraulic and sanitary engineering, embracing water supply for cities and towns, for the purposes of irrigation and improvement of lands; quantity and quality of water required; rainfall, flows of streams, storage of water, capacity of water-sheds, impurities of water; practical construction of water-works, pumping machinery; clarification of water; systems of water supply.

Works of sewerage—Rainfall and sewers; influence of geological and topographical features of the sites of towns and districts; discharge of sewers; intercepting sewers, forms, modes of construction, and materials used; flushing of sewers and ventilation; terms outfalls, tide values, cubesil and conference.

materials used; flushing of sewers and ventilation; traps, outfalls, tide-valves; subsoil and surface drainage of towns; house drainage; water-closets; ventilation of houses in connection with sanitary measures.

Improvements of Rivers and Harbours—Action of tides and currents in forming and removing deposits;

methods of protecting and deepening harbours and channels.

Engineering—Theory of strains and strength of materials continued; graphical methods of determining strains; deflection of beams and girders; quantity of material in braced girders under various conditions of loading and supports; angle of economy for bracing; torsion of shafts; crushing and tensile strength of materials; working strains and working load; mode of estimating cost of girder work.

Hydraulic engineering—Application of principles of mechanics of fluids to determining the discharge of water over weirs or dams; the dimensions of conduit pipes; discharge of canals and rivers; the effects of varying forms and sections of channels and of obstructions to flow; the gauging of streams; retaining-walls for reservoirs.

Machinery and mill-work-

1. General theory of motion.

2. Uniform and varied motion.

3. Composition of motions.

4. Instantaneous centre and centroids.

5. Transmissions by rolling and sliding contact, by belting, ropes and chain, by shafting and linkages,

6. Engaging gears, reversing and quick-return motions.

Dynamics of machinery-Forces of nature employed or acting in all machines; dynamical laws, mathematical theorems, measure of forces, work of forces; elementary machines and their combinations; theory of efficiency; theory of fly-wheels, governors, and brakes; strength and proportions of parts of machines; dynamometers; prime movers as driven by animal-power, water-power, steam-power, compressed or heated air, wind-power, comprising the theory of animal-power, theory of water-wheels, overshot wheels, undershot wheels, breast wheels, turbines, reaction wheels, centrifugal pumps; properties and laws of heat as applied to the generation of steam in steam-boilers; properties of steam and air in their relation to prime movers; mechanical theory of heat, applied to steamengines, hot-air engines, compressed-air engines; general description of heat engines of various forms; description and theory of ventilating fans or blowers.

Mechanical engineering-

1. Steam-boilers: construction, wear and tear, fittings, setting, testing, care and management, firing, feeding, injectors, pumps, &c.

2. Mechanism of engines: valve gearing, link motions, governors, &c.

3. Management of engines: erecting, emergencies, special types of engines, &c.

4. Proportions of engines, &c.

5. Testing efficiency of engines and boilers.

6. Pumps, hoisting engines, ventilating machinery.

7. Construction and management of hot-air, gas, and petroleum engines, &c.

Machine tools.

Graphical statics. Engineering design.

Railroad engineering—The locomotive engine, construction and design of various types; limitations of alignment by the motive power and operating expenses; economic location; specifications for construction; maintenance of way; switches and signals; operating systems; administration; rolling stock, &c.

Principles of sanitary engineering as regards necessity of sanitary measures, different systems of removing refuse and decomposing matters, warming and ventilation.

Geodesy continued, with lectures on figure of the earth, astronomical determinations of time, latitude,

longitude, and azimuth of a direction.

Surveying—Railroad surveying: reconnaissance, location, and survey of line, with curves and slope stakes, calculations of cuttings and embankments; railroad construction.

Drawing-Engineering designing.

Project.

### III .- Course in Metallurgy.

### First Year.

### First Session.

Trigonometry and mensuration, as contained in Davies' Legendre.

Physics—Magnetism; electricity, static and dynamic; thermo-electricity, induction, magneto-electricity, the electric telegraph. Optics—Lectures, and Atkinson's Ganot's Physics.

Botany-Lectures, and Bastin's Elements of Botany.

Chemistry—The metals; lectures and recitations; Fownes' Manual of Chemistry.

Qualitative analysis—Lectures, and Valentin's Manual of Qualitative Analysis.

Blow-pipe analysis—Qualitative; lectures, conferences, and Plattner's Blow-pipe Analysis.

Drawing—Freehand and sketching; lottering, instrumental drawing; projections, intersections, and developments. Text-book: Binn's Orthographic Projection.

#### Second Session.

Geometrical conic sections—Text-book: Peck's Conic Sections.
Algebra—Text-book: Peck's Manual of Algebra.
Graphical algebra—Text-book: Phillips and Beebe's Graphic Algebra.

Graphics—Descriptive geometry. Text-book: Church's Descriptive Geometry.

Physics—Descriptive geometry. Text-book: Church's Descriptive Geometry.

Physics—Doctrines of heat, viz., expansion, conduction, radiation, thermometry, latent heat, tension of vapours, steam, specific heat. Optics—Lectures, and Atkinson's Ganot's Physics.

Botany—Lectures, and Bastin's Elements of Botany.

Qualitative analysis—Lectures, and Valentin's Manual of Qualitative Analysis.

Crystallography—Lectures conferences and Egleston's Diagrams of Crystals

Crystallography—Lectures, conferences, and Egleston's Diagrams of Crystals.

Drawing-Same as first session.

### Summer Vacation.

Surveying—Lectures, recitations, and field-work; pacing; compass and chain surveys; topographical work; use of solar compass in land and mineral surveys; adjustments and use of transit and wyo level for triangulation; traversing, city surveying, and levelling; use of plane table; stratigraphical and magnetic surveys.

Summer class in surveying.

Memoir.

Second Year.

First Session.

Analytical geometry—Text-book: Peck's Analytical Geometry. Graphics—Shades and shadows, perspective, isometrical drawing. Stereotomy—Text-book; Mahan's Stone-cutting.

Practical mining—Excavation, quarrying, drilling and blasting, tunnelling.

Zoologye—Lectures, and Nicholson's Manual of Zoology.

Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics, lectures and laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-air, water, artificial illumination, photography.
Quantitative analysis—I ectures, and Cairn's Quantitative Analysis.

Mineralogy-Lectures, conferences, laboratory work, and Egleston's Lectures and Tables of Mineralogy. Drawing-Tinting and g ading; topographical drawing; construction drawing.

### Second Session.

Differential and integral calculus-Text-book; Peck's Practical Calculus.

Practical mining—Excavation, quarrying, drilling and blasting, tunnelling.

Zoology—Lectures, and Nicholson's Manual of Zoology.

Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics, lectures and laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-limes, mortars, and cements; building stones; decay and preservation; timber and its preservation; pigments, paints, essential oils, varnishes; glass and ceramics; explosives—gun-powder, gun-cotton, nitro-glycerine; electro-metallurgy, &c.

Quantitative analysis—Lectures, and Cairns' Quantitative Analysis.

Mineralogy—Same as first session.

Drawing—Construction drawing: plans of mill buildings, furnaces, &c.

### Summer Vacation.

Optional class in machine shops. Surveying—continued from first year. Summer class in surveying.

Third year.

First session.

Mechanics of Solids, including forces, moments, equilibrium, stability, &c., and elementary machines; dynamics, including uniform, varied, rectilineal, and curvilinear motion, rotation, vibration, impact, work done, &c.

Physics-Mechanical theory of heat.

-General principles relating to materials and structures, physically and mechanically con-Engineeringsidered.

1. Materials-Stone, cements, brick, metals, timber, treated in regard to strength, durability, mode of preparation, defects, tests of quality, and fitness for special uses.

2. Structures - Earthwork, execution of earthwork, foundations and supports, superstructure, joints; stability, strength, and stiffness of parts; special rules of construction for masonry of public buildings, bridges, retaining walls, arches, railroads, common roads, and canals.

Physical Properties of Materials—Pig-iron; castings, chilled and malleable; wrought-iron: bar, shapes, plate, tube, and wire; steel: ingot metal, castings, shapes, and plate; other metals and alloys.

Practical Mining-

- 1. Boring, earth augers, driven wells, boring with rods and cable tools; upward, inclined, and hori-
- zontal boring; diamond drill and its use in prospecting.

  2. Shaft sinking, shaft timbering and spiling, boring of shafts, sinking of iron and masonry linings, cribbing, walling, and tubbing.

  3. Drifting of adits and levels, timbering and walling in levels and working places.

  4. Mining of coal and ores, coal-cutting machines, hand and machine drilling.

5. Handling of coal and ores in working places.
6. Tramming, cars, tracks, locomotive and wire-rope haulage, planes and gravity roads.

7. Accidents to miners, cause and prevention.

8. Organization and administration.

9. Time-books, measurement of contracts, pay-roll, analysis and dissection of accounts, and costsheets

Quantitative analysis.

Metallurgy-General metallurgy, fuels, furnaces, &c.

-Lithological, rocks and rock masses.

Drawing-Constructions; machines, furnaces, plans, &c.

### Second Session.

Mechanics of fluids, including pressure, buoyancy, and specific gravities, motion in pipes and channels, undulation, capillarity, tension and elasticity of gases, the atmosphere, the barometer, barometric formulæ, and hypsometry.

Physics—Electricity; physical optics and the undulatory theory of light (the last two optional).

Engineering—Theory of strains and strength of materials continued—graphical methods of determining strains, deflection of beams and girders; quantity of material in braced girders under various conditions of loading and supports; angle of economy for bracing; torsion of shafts; crushing and tensile strength of materials; working strains and working load; mode of estimating cost of girder work.

Dynamics of machinery-Forces of nature employed or acting in all machines; dynamical laws, mathematical theorems, measure of forces, work of forces; elementary machines and their combinations; theory of efficiency; theory of fly-wheels, governors, and brakes; strength and proportions of parts of machines; dynamometers.

Physical Properties of Materials—Continued from first session. Practical mining—Continued from first session.

Assaying and Ore Testing—Lectures, recitations, and practical work; sampling and testing large and small lots of ores, slags, mattes, alloys, amalgams, &c.; special practice on lead, antimony, gold, silver, and copper ores.

Metallurgy-Iron and steel.

Geology—Historical, including palæontology.

Drawing-Constructions; machines, furnaces, plans, &c.

Summer Vacation. Summer class in practical mining.

Fourth year. (Without distinction of sessions.)

Mining engineering-

Considered in its widest sense as a course of study.

2. Considered in reference to the application of general principles of engineering to the development and working of mines.

3. Classification and nomenclature of mineral deposits; descriptions of lodes or veins, beds, masses, and irregular deposits, with illustrations of the disturbances to which they are subjected, as affecting the work of mining.

4. Graphical representations of deposits, with examples showing modes of occurrence and disturbances.

5. Prospecting or searching for mineral deposits.6. Exploratory workings.

7. Establishing seats of extraction.

8. Description of typical methods of exploitation as applied to wide veins or lodes, to narrow veins, masses, to beds of various thicknesses and degrees of inclination.

9. General principles relating to subterranean transportation.

10. Methods and machinery employed for extracting minerals from the pits, and for facilitating ascent and descent of workmen

11. Drainage of mines; theory of infiltrations of water, methods and machinery for draining or freeing mines from water.

12. Ventilation of mines; causes of vitiation of the air of mines; quantities of fresh air required under various circumstances; natural ventilation; mechanical ventilation by fires and by ventilating machinery; distribution of air through galleries and workings.

13. Graphical illustrations of exploratory workings: methods of exploitation; machinery for hoisting, pumping, ventilation, and transportation, including the use of steam-engines, and pumps, air compressors, air engines, pumping engines, winding engines, centrifugal and other ventilating machines.

Engineering—Theory of strains and strength of materials continued—Graphical methods of determining strains; deflection of beams and girders; quantity of material in braced girders under various conditions of loading and supports; angle of economy for bracing; torsion of shafts; crushing and targets attempts of materials attempts of materials attempts of materials. tensile strength of materials; working strains and working load; mode of estimating cost of girder work.

Hydraulic engineering-Application of principles of mechanics of fluids to determining the discharge of water over weirs or dams; the dimensions of conduit pipes; discharge of canals and rivers; the effect of varying forms and sections of channels and of obstructions to flow; the gauging of streams;

retaining walls for reservoirs.

Dynamics of machinery—Forces of nature employed or acting in all machines; dynamical laws, mathematical theorems, measure of forces, work of forces; elementary machines and their combinations; theory of efficiency; theory of fly-wheels, governors, and brakes; strength and proportions of parts of machines; dynamometers; prime movers, as driven by animal power, water power, steam power, compressed or heated air, wind power, comprising the theory of animal power, theory of water-wheels, overshot wheels, undershot wheels, breast wheels, turbines, reaction wheels, centrifugal pumps; properties and laws of heat as applied to the generation of steam and the construction of boilers; properties of steam and air in their relation to prime movers; mechanical theory of heat applied to steam-engines, hot-air engines, compressed-air engines; general description of heat engines of various forms. description and theory of ventilating fans or blowers. forms; description and theory of ventilating fans or blowers.

Ore dressing-

1. Introduction, theory of separation, hand and machine dressing, general principles governing crushing and sizing of ores of different character.

Jigging-Theory of, description of different forms of jigs and methods of working, air jigs.

3. Slime treatment, classifications of slimes in troughs, spitz kasten, &c., and treatment on buddles and tables.

4. Description of crushing machinery, jaw crushers, rolls, stamps, mills, &c.

5. Sizing apparatus, screens, riddles, and trommels.

6. Description of coal-washing plant; anthracite breaker.

7. Description of American ore-dressing works.

8. Foreign ore-dressing works.

Mechanical engineering—
1. Steam-boilers; construction, wear and tear, fittings, setting, testing, care and management, firing, feeding, injectors, pumps, &c.

2. Mechanism of engines: valve gearing, link motions, governors, &c.

3. Management of engines: creeting, emergencies, special types of engines, &c.

4. Proportions of engines, &c.

5. Testing efficiency of engines and boilers, &c.

6. Pumps, hoisting engines, ventilating machinery, construction and management of hot-air, gas, and petroleum engines, &c.

7. Machine tools.

Graphical statics.

Metallurgy-Copper, lead, silver, gold, zinc, tin, mercury, &c.

Economic geology—Theory of mineral veins, ores, deposits, and distribution of iron, copper, lead, gold, silver, mercury, and other metals; graphite, coal, lignite, peat, asphalt, petroleum, salt, clay, limestone, cements building and ornamental stones, &c. Drawing—Project and thesis work.

Project.

IV .- Course in Geology and Palæontology.

First Year.

First Session.

Trigonometry and mensuration, as contained in Davies' Legendre.
Physics—Magnetism; electricity—Static and dynamic, thermo-electricity, induction, magneto-electricity, the electric telegraph. Optics-Lectures, and Atkinson's Ganot's Physics.

Botany—Lectures, and Bastin's Elements of Botany.

Chemistry—The metals. Lectures and recitations; Fownes' Manual of Chemistry.

Qualitative analysis—Lectures and Valentine's Manual of Qualitative Analysis.

Blow-pipe analysis—Qualitative; lectures, conferences, and Plattner's Blow-pipe Analysis.

Drawing—Free-hand and sketching; lettering, instrumental drawing; projections, intersections, and developments. Text-book: Binn's Orthographic Projection.

Second Session.

Geometrical conic sections-Text-book: Peck's Conic Sections.

Algebra—Text-book: Peck's Manual of Algebra. Graphical algebra—Text-book: Phillips & Beebe's Graphic Algebra.

Graphics—Descriptive geometry; text-book: Church's Descriptive Geometry.

Physics—Dectrines of heat, viz., expansion, conduction, radiation, thermometry, latent heat, tension of vapours, steam, specific heat. Optics—Lectures, and Atkinson's Gauot's Physics.

Botany—Lectures, and Bastin's Elements of Botany.

Qualitative analysis -- Lectures, and Valentin's Manual of Qualitative Analysis. Crystallography—Lectures, conferences and Egleston's Diagrams of Crystals.

Drawing-Same as first session.

Summer Vacation.

Surveying—Lectures, recitations, and field work; pacing; compass and chain surveys; topographical work; use of solar compass in land and mineral surveys; adjustments and use of transit and wye level for triangulation; traversing, city surveying, and levelling; use of plane table; stratigraphical and magnetic surveys.

Summer class in surveying.—Memoir.

Second Year.

First Session.

Graphics-Shades and shadows, perspective and isometrical drawing.

Practical mining—Excavation, quarrying, drilling and blasting, tunnelling.

Botany—Histology.

Zoology—Lectures, histology, and Nicholson's Manual of Zoology.

Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics; lectures and laboratory practice.

Applied chemistry—Lectures and recitations; Wagner's Chemische Technologie—air, water, artificial illumination, photography.

Mineralogy—Lectures, conferences, laboratory work, and Egleston's Lectures and Tables of Mineralogy. The microscope and its practical applications—Lectures and laboratory practice.

Drawing—Topographical drawing; tinting and grading; problems in graphics; sketches of geological out-

crops, fossils, &c.

Second Session.

Practical mining—Excavation, quarrying, drilling and blasting, tunnelling.

Botany-Protophyta, thallophyta, bryophyta.

Zoology-Lectures, and Nicholson's Manual of Zoology; and practical study of protozoa, recent and fossil. Hygiene-Causes of disease, methods of investigation and of prevention, vital statistics; lectures and laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-limes, mortars, and cements; building stones; decay and preservation; timber and its preservation; pigments, paints, essential oils, varnishes; glass and ceramics; explosives, gun-powder, gun-cotton, nitro-glycerine; electro-metallurgy, &c.

Mineralogy-Same as first session.

The microscope and its practical application-Lectures and laboratory practice.

Drawing-Geological sections, plain and coloured; fossil drawing.

Summer Vacation.

Surveying—Continued from first year.

Summer class in surveying.

Third Year. First Session.

Physics-Mechanical theory of heat. Botany—Pterinophyta, phanerogamia. Zoology—Radiata, recent and fossil. Practical mining-

1. Boring, earth augers, driven wells, boring with rods and cable tools; upward, inclined and hori-

zontal boring; diamond drill and its use in prospecting.

2. Shaft sinking; shaft timbering and spiling, boring of shafts, sinking of iron and masonry linings, cribbing, walling, and tubing.

3. Drifting of adits and levels, timbering and walling in levels and working places.
4. Mining of coals and ores, coal-cutting machines, hand and machine drilling.

5. Handling of coal and ores in working places.6. Trauming, cars, tracks, locomotive and wire-rope haulage, planes and gravity roads.

7. Accidents to miners, cause and prevention.

8. Organisation and administration.

9. Time-books, measurement of contracts, pay-roll, analysis, and dissection of accounts and cost sheets.

Assaying and ore test—Lectures, recitations, and practical work.

Metallurgy—General metallurgy, fuels, furnaces, &c. Geology—Lithological, cosmical, physiographic. Biology—Laboratory practice.

Drawing-Geological drawings.

Second Session.

Physics—Electricity, physical, optics, and the undulatory, theory of light (last two optional). Botany—Palæontological. Zoology—Mollusca, recent and fossil.

Lithology—Macroscopic.
Practical mining—Continued from first session.

Metallurgy—Iron and steel.

Geology—Historical, including palmontology. Biology—Laboratory practice. Drawing—Geological drawings.

Summer vacation-Memoir.

Fourth Year.

(Without distinction of sessions.)

Palæontology.

Botany—Palmontological and economic. Zoology—Articulata and vertebrata, recent and fossil.

Lithology-Microscopic.

Ore dressing.

Surveying—Principles of geodesy, railroad surveying, reconnoissance, location of line, calculations of cuttings and embankments.

Metallurgy—Copper, lead, silver, gold, zinc, tin, mercury, &c.

Economic goology—Theory of mineral veins, ores, deposits and distribution of iron, copper, lead, gold, silver, mercury, and other metals; graphite, coal, lignite, peat, asphalt, petroleum, salt, clay, limestone, cements, building and ornamental stones, &c; economic mineralogy.

Drawing-Dissertation and thesis work.

Thesis.

V .- Course in Analytical and Applied Chemistry.

First Year.

First Session.

Trigonometry and mensuration as contained in Davies' Legendre.

Physics-Magnetism; electricity, static and dynamic, thermo-electricity, induction, magneto-electricity, the electric telegraph. Optics—Lectures, and Atkinson's Ganot's Physics. Botany—Lectures, and Bastin's Elements of Botany.

Chemistry—The metals. Lectures and recitations; Fownes' Manual of Chemistry. Qualitative analysis—Lectures, and Valentin's Manual of Qualitative Analysis.

Blowpipe analysis—Qualitative; lectures, conferences, and Plattner's Blowpipe Analysis.

Drawing—Free-hand and sketching; lettering, instrumental drawing; projections, intersections, and developments. Text-book: Binn's Orthographic Projection.

Second Session.

Geometrical conic sections—Text-book: Peck's Conic Sections. Algebra—Text-book: Peck's Manual of Algebra.

Graphical algebra—Text-book: Phillips and Beebe's Grapic Algebra.

Physics—Doctrines of heat, viz.; expansion, conduction, radiation, thermometry, latent heat, tension of vapours, steam, specific heat. Optics—Lectures, and Atkinson's Ganot's Physics.

Botany-Lectures, and Bastin's Elements of Botany.

Chemistry-Organic; lectures and recitations; Fownes' Manual of Chemistry. Chemical physics—Lectures and recitations; Cooke's Chemical Physics.

Qualitative analysis—Lectures, and Valentin's Manual of Qualitative Analysis. Crystallography—Lectures, conferences, and Egleston's Diagrams of Crystals. Drawing—Same as first session.

Summer Vacation.-Memoir.

Second Year.

First Session.

Zoology—Lectures, and Nicholson's Manual of Zoology. Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics, lectures, and laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-air, water, artificial Appned chemistry—Lectures and recitations; wagners considered the illumination, photography.

Chemical philosophy—Lectures and recitations; Cooke's Chemical Philosophy.

Quantitative analysis—Lectures, and Cairn's Quantitative Analysis.

Mineralogy—Lectures, conferences, laboratory work, and Egleston's Lectures and Tables of Mineralogy.

The microscope and its practical applications—Lectures and laboratory practice.

Second Session.

Zoology—Lectures and Nicholson's Manual of Zoology. Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics, lectures, and

laboratory practice.

Applied chemistry--Lectures and recitations; Wagner's Chemische Technologie-limes, mortars, and cements; building stones: decay and preservation; timber and its preservation; pigments, paints, essential oils, varnishes; glass and ceramics; explosives; gunpowder, gun-cotton, nitro-glycerine; electro-metallurgy, &c.
Chemical philosophy—Lectures and recitations; Cooke's Chemical Philosophy.
Quantitative analysis—Lectures, and Cairns Quantitative Analysis.

Mineralogy—Same as first session.

The microscope and its practical applications—Lectures and laboratory practice.

Summer Vacation.—Memoir.

Third Year.

First Session.

Physics-Mechanical theory of heat.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie.

Chemistry—Lectures and recitations; Wagner's Chemisene Technologie.

Chemical manufactures: acids, alkalics, and salts. (1) Sulphur, sulphurous acid, hyposulphites, sulphuric acid, bisulphide of carbon, &c. (2) Common salt, soda ash, hydrochloric acid, chlorine, binoxide of manganese, bleaching powder, chlorates, chlorimetry, &c. (3) Carbonate of potash, caustic potash, alkalimetry, acidimetry, &c. (4) Nitric acid and nitrates. (5) Iodine, bromine, &c. (6) Sodium, aluminium, magnesium. (7) Phosphorus, matches, &c. (8) Ammonia salts. (9) Cyanides. (10) Alum, copperas, blue vitriol, salts of magnesia, baryta, strontia, &c. (11) Borates, stannates, tungstates, chromates, &c. (12) Salts of mercury and silver. (13) Oils, fats, soans glycerine. fats, soaps, glycerine.

Quantitative analysis.

Metallurgy—General metallurgy, fuels, furnaces, &c. Geology—Lithological, cosmical, and physiographic.

Biology—Lectures and laboratory practice.

Second Session.

Physics—Electricity, physical optics, and the undulatory theory of light (last two optional). Applied chemistry—Lectures and recitations; Wagner's Chemische Technologie.

Food and drink: milk, cereals, starch, bread, meat, tea, coffee, sugar, fermentation, wine, beer, spirits, vinegar, preservation of food, tobacco, &c.

Assaying-Lectures, recitations, and practical work; ores of lead, antimony, tin, bismuth, copper, nickel, iron, morcury, gold, and silver; alloys of lead, gold, and silver.

Metallurgy-fron and steel,

Geology—Historical, including paleontolog Biology—Lectures and laboratory practice. -Historical, including palæontology.

Summer Vacation.-Memoir.

Fourth Year.

(Without distinction of sessions.)

Organic chemistry—Lectures and laboratory practice.

Applied chemistry—Lectures and recitations; Wagner's Chemische Technologic.

Clothing: Textile fabrics, bleaching, dyeing, calico printing, paper, tanning, glue, india-rubber, guttapercha, &c. Fertilizers: Guano, superphosphates, poudrettes, &c.

Metallurgy

Metallurgy—Copper, lead, silver, gold, zinc, tin, mercury, &c. Economic geology—Theory of mineral veins; ores; deposits and distribution of iron, copper, lead, gold, silver, mercury, and other motals; graphite, coal, lignite, peat, asphalt, petroleum, salt, clay, limestone, cements, building and ornamental stones, &c. Thesis.

#### VI.—Course in Architecture.

First Year.

First Session.

Trigonometry and mensuration, as contained in Davies' Legendre.

Physics-Magnetism; electricity, static and dynamic, thermo-electricity, induction, magneto-electricity, the electric telegraph. Optics—lectures, and Atkinson's Ganot's Physics. Architectural history—Text-book; Collignon's Archéologie Grecque.

Botany—Lectures, and Bastin's Elements of Botany.

Chemistry—The metals. Lectures and recitations; Fownes' Manual of Chemistry.

Drawing—Freehand and sketching; tracing; lettering; instrumental drawing; projections, intersections, and developments.

#### Second Session.

Geometrical conic sections—Text-book; Peck's Conic Sections.
Algebra—Text-book; Peck's Manual of Algebra.
Graphical algebra—Text-book; Phillips and Beebe's Graphic Algebra.
Graphics—Descriptive Geometry; problems.
Physics—Descriptive of beet viz. expansion conduction additional description.

Physics—Descriptive Geometry, problems.

Physics—Doctrines of heat, viz., expansion, conduction, radiation, thermometry, latent heat, tension of vapours, steam, specific heat. Optics—Lectures, and Atkinson's Ganot's Physics.

Architectural history—Text-book: Collignon's Archéologie Greeque.

Botany-Lectures, and Bastin's Elements of Botany.

Drawing—Brush work; plans and elevations; ornament; shades and shadows; perspective.

### Summer Vacation.—Memoir.

#### Second Year.

First Session.

Graphical geometry—The construction of curves.

Graphics — Shades and shadows; perspective; problems.

Stereotomy—Text-book: Mahan's Stone Cutting.

The elements of architecture—The forms and proportions of the five orders, and of balustrades, steps,

doors, windows, arches, vaults, domes, roofs, spires, &c. Ancient architectural history—Text-book: Reber's History of Ancient Art, Kroker's Katechismus der Archæologie.

Hygicne-Causes of disease, methods of investigation and of prevention, vital statistics; lectures and laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-air, water, artificia illumination, photography.

Drawing and tracing—Free-hand and ornamental; ornament; plans, sections, and elevations.

### Second Session.

Graphical geometry—continued.
The elements of architecture—continued.

Ancient architectural history—continued. Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics; lectures and laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-limes, mortars, and cements; building stones; decay and preservation; timber and its preservation; pigments, paints, oils, and varnishes; glass and ceramics; explosives; gunpowder, gun-cotton, nitro-glycerine; electro-metallurgy, &c.

Drawing—Ornament from casts; details; perspective drawings.

### Summer Vacation.

### Surveying-optional.-Memoir.

### Third Year.

### First Session.

Mechanics of solids, including forces, moments, equilibrium, stability, &c., and elementary machines. Engineering-General principles relating to materials and structures, physically and mechanically considered.

1. Materials—Stone, cements, brick, metal, timber, treated in regard to strength, durability, mode of

preparation, defects, tests of quality, and fitness for special uses.

2. Structures—Earthwork, execution of earthwork, foundations and supports, superstructure, joints; stability, strength, and stiffness of parts; special rules of construction for masonry of public buildings, bridges, retaining walls, arches.

Sanitary engineering-drainage of buildings and house lots; plumbing and water supply of buildings.

\* Mediæval architectural history.

\* The history of ornament, ancient and oriental—Lectures and exercises; reports.

\* The theory of architecture-The theory of form, conventionalism.

\* Specifications and working drawings—excavations, foundations, piling, stonework, brickwork, plastering, and stucco-work; lectures; shop-work.

Architectural design—Design by dictation; problems.

Geology—Descriptive.

Drawing from the cast-Ornament and the human figure.

### Second Session.

Mechanics.

Engineering-Theory of strains and strength of materials-elasticity, mechanical laws, application of principles of mechanics to beams, girders, and roof trusses under various conditions of loading and supports.

Sanitary exgineering - Drainage of buildings and house lots; plumbing and water supply of buildings.

\* Medieval architectural history.

\* The history of ornament-continued.

\*The decorative arts—Stained glass, pottery, &c.; lectures.

\*Business relations; office papers; competitions; legal obligations; superintendence.

Architectural design-Alterations and restorations; problems.

Geology—Historical.
Drawing—Historical examples.

#### Summer Vacation.—Memoir.

### Fourth Year.

#### (Without distinction of sessions.)

Civil engineering—Theory of strains and strength of materials continued—graphical methods of determining strains; deflection of beams and girders; quantity of material in braced girders under various conditions of loading and supports; angle of economy for bracing; torsion of shafts; crushing and tensile strength of materials; working strains and working load; mode of estimating cost of girder work.

Graphical statics.

Engineering design.

Sanitary engineering-Ventilation and warming of buildings.

† Specifications and working drawings-Carpentry, painting, glazing, plumbing; iron, lead, and copperwork; tinning and slating; lectures.
† Estimates—Quantity, weight, time, labour, cost; squaring.
† Modern architectural history.

†The history of painting and sculpture.

† The decorative arts—Mosaic, fresco, metal works, inlays; lectures.
† The theory of architecture—The theory of colour, the theory of composition.
† The history of ornament, Mediaval and modern—Lectures and exercises; reports.

Economic geology—Clay, limestones, cements, building and ornamen tal stones. Agricultural design—Problems.

Drawing-From the cast and from historical examples.

Project.

### VII.—Course in Sanitary Engineering.

### First Year.

### First Session.

Trigonometery and mensuration, af contained in Davies' Legendre.

Physics-Magnetism; electricity, static and dynamic, thermo-electricity, induction, magneto-electricity,

the electric telegraph. Optics—lectures, and Atkinson's Ganot's Physics.

Botany—Lectures, and Bastin's Elements of Botany.

Chemistry—The metals. Lectures and recitations; Fownes' Manual of Chemistry.

Qualitative analysis—Lectures, and Valentin's Manual of Qualitative Analysis.

Drawing—Freehand and sketching; lettering, instrumental drawing; projections, intersections, and developments. Text-book: Binn's Orthographic Projection.

### Second Session.

Geometrical conic sections—Text-book: Peck's conic sections.

Algebra—Text-book: Peck's Manual of Algebra.

Graphical algebra-Text-book: Phillips and Beebe's Graphic Algebra.

Graphics algebra.—Texterook: Inhips and Beebe's Graphic Algebra.

Graphics—Descriptive geometry (text-book): Church's Descriptive Geometry.

Physics—Descriptive geometry (text-book): Church's Descriptive Geometry.

Physics—Descriptive Geometry, latent heat, tension of vapours, steam, specific heat. Optics—Lectures, and Atkinson's Ganot's Physics.

Botany—Lectures, and Bastin's Elements of Botany.

Chemistry—Organic; lectures and recitations; Fownes' Manual of Chemistry. Qualitative analysis—Lectures, and Valentin's Manual of Qualitative Analysis.

Drawing-Same as first session.

Summer

<sup>\*</sup> For convenience these subjects are given in alternate years, the third-and-fourth-year students taking them together. In 1887-88 both classes take the work here set down for the fourth year; in 1888-89, that set down for the third year. † For convenience these subjects are given in alternate years, the third-and-fourth-year students taking them together.

### Summer Vacation.

Surveying—Lectures, recitations, and field work; pacing; compass and chains surveys; topographical work; use of solar compass in land surveys; adjustments and use of transit and wye level for triangulation; transversing, city surveying, and levelling; use of plane table; hydrographic surveys. Summer class in surveying-Memoir.

Second Year.

First Session.

Analytical geometry-Text-book: Peck's Analytical Geometry. Graphics—Shades and shadows; perspective, isometrical drawing. Stereotomy—Text-books: Mahan's Stone-cutting.

Practical mining-Excavation, quarrying, drilling and blasting, tunnelling.

The elements of architecture.

Zoology—Lectures, and Nicholson's Manual of Zoology.

Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics; lectures and laboratory practice.

Applied chemistry-Lectures and recitations; Wagner's Chemische Technologie-air, water, artificial

Applied chemistry—Lectures and rectangle, illumination, photography.

Quantitative analysis—Lectures, and Cairns' Quantitative Analysis.

The microscope and its practical application—Lectures and laboratory practice. Drawing-Topographical drawing; tinting and grading; problems in graphics.

Differential and integral calculus—Text-book: Peck's Practical Calculus. Practical mining—Excavation, quarrying, drilling and blasting, tunnelling.
The elements of architecture—Continued.
Zoology—Lectures, and Nicholson's Manual of Zoology.

Hygiene—Causes of disease, methods of investigation and of prevention, vital statistics; lectures and

laboratory practice.

Applied chemistry—Lectures and recitations; Wagner's Chemische Technologie—limes, mortars, and cements; building stones; decay and preservation; timber and its preservation; pigments, paints, essential oils, varnishes; glass and ceramics; explosives; gunpowder, gun-cotton, nitro-glycerine; electro-metallurgy, &c.

Quantitative analysis—Lectures, and Cairns' Quantitative Analysis.

The microscope and its practical applications—Lectures and laboratory practice.

Drawing-Construction drawing; mapping; problems in graphics.

Summer Vacation.

Surveying—Continued from first year.

Summer class in surveying.

Third Year.

First Session.

Mechanics of solids, including forces, moments, equilibrium, stability, &c., and elementary machines; dynamics, including uniform, varied, rectilineal, and curvilinear motion, rotation, vibration, impact, work done, &c.

Physics—Mechanical theory of heat.

Engineering—general principles relating to materials and structures, physically and mechanically con-

Materials—Stone, coments, brick, metals, timber, treated in regard to strength, durability, mode of preparation, defects, test of quality, and fitness for special uses.
 Structures—Earthwork, execution of earthwork, foundations and supports, superstructure, joints;

stability, strength, and stiffness of parts; special rules of construction for masonry of public buildings, bridges, retaining walls, arches, railroads, common roads, and canals.

Physical properties of materials-Pig-iron: castings, chilled and malleable; wrought iron: bar, shapes, plate, tube, and wire; steel: ingot metal, castings, shapes, and plate; other metals and alloys, especially those used in house-drainage and plumbing.

Sanitary engineering—Drainage of building and house lots; water supply of buildings.

Quantitative analysis.

Geology—Lithological, cosmical, and physiographic. Drawing—General engineering construction.

### Second Session.

Mechanics of fluids, including pressure, buoyancy, and specific gravities, motion in pipes and channels, undulation, capillarity, tension and elasticity of gases, the atmosphere, the barometer, barometric formulæ, and hypsometry.

Physics—Electricity, physical optics, and the undulatory theory of light (last two optional). Engineering—Theory of strains and strength of materials—elasticity, mechanical laws, application of principles of mechanism to beams, girders, and roof trusses under various conditions of loading and supports.

Physical properties of materials, continued from first session.

Sanitary engineering-Drainage of buildings and house lots; water supply of buildings

Geology-Historical, including palæontology, or a systematic review of recent and fossil forms of life.

Drawing—General engineering construction; machine construction.

Summer Vacation-Memoir.

Fourth

#### Fourth Year.

### (Without distinction of sessions.)

Civil engineering—Hydraulic and sanitary engineering, embracing water supply for cities and towns, for the purpose of irrigation and improvement of lands; quantity and quality of water required; rainfall, flows of streams, storage of water, capacity of water-sheds, impurities of water; practical construction of water-works, pumping machinery; clarification of water; systems of water supply. Disposal of refuse and waste products; garbage and offal sewage, &c.; sewage farming, earth filtration, chemical purification.

Hydraulic engineering-Application of principles of mechanics of fluids to determining the discharge of water over weirs or dams; the dimensions of conduit pipes; discharge of canals and rivers; the effects of varying forms and sections of channels and of obstruction to flow; the gauging of streams;

retaining walls for reservoirs.

Machinery and millwork-1. General theory of motion.

2. Uniform and varied motion. 3. Composition of motions.

Instantaneous centre and centroids.

5. Transmissions by rolling and sliding contract, by belting, ropes and chain, by shafting and linkages,

6. Engaging gears, reversing and quick-return motions.

Dynamics of machinery—Prime movers as driven by animal power, water power, steam power, compressed or heated air, wind power, comprising the theory of animal power, theory of water-wheels, overshot wheels, undershot wheels, breast wheels, turbines, reaction wheels, centrifugal pumps; properties and laws of heat as applied to the generation of steam in steam boilers, and to heating and ventilation; properties of steam and air in their relation to prime movers; mechanical theory of heat, applied to steam-engines, hot-air engines, compressed-air engines; general description of heat engines of various forms; description and theory of ventilating fans or blowers.

Mechanical engineering-

1. Steam boilers; construction, wear and tear, fittings, setting, testing, care and management, firing, feeding, injectors, pumps, &c.

2. Mechanism of engines: valve gearing, link motions, governors, &c.

Management of engines: erecting, emergencies, special types of engines, &c.

4. Proportions of engines, &c.

5. Testing efficiency of engines and boilers.

6. Pumps, hoisting engines, ventilating machinery.7. Construction and management of hot-air, gas, and petroloum engines, &c.

S. Machine Tools.

Graphical statics. Engineering Design-

Works of sewcrago-Rainfall and sewers; influence of geological and topographical features of the sites of towns and districts; discharge of sewers; intercepting sewers; forms, modes of construction, and materials used; flushing of sewers and ventilation; traps, outfalls, tide-valves; subsoil and surface drainage of towns; house drainage; the drainage of malarial districts of country; the surface and subsoil drainage of the sites of cities and towns; the construction and management of street pavements; the general principles of heating and ventilation of dwelling-houses, halls of assembly, schools, public buildings, &c., in connection with sanitary and architectural arrangements.

The practical designing of house drainage, and of heating and ventilating apparatus for dwelling-houses, public buildings, hospitals, schools, &c., the methods of computation and investigation for deter-

public buildings, hospitals, schools, &c.; the methods of computation and investigation for determining the magnitude of heating furnaces, quantity of heating surface, size of blowers or fans for ventilating purposes; size of ventilating air-ducts or conduits and passages, and the general arrange-

ments of the sanitary apparatus in public and private buildings.

### APPENDIX P.

SHEFFIELD TECHNICAL SCHOOL, ST. GEORGE'S SQUARE, SHEFFIELD, ENGLAND—PROGRAMME OF CLASSES FROM THE PROSPECTUS FOR 1889-80.

Subjects and Times of Lectures-Sheffield Technical School, St. George's Square.

#### DAY CLASSES.

MICHARIMAS Term begins Wednesday, 1st October, and ends Saturday, 14th December. Lent Term begins Wednesday, 15th January, and ends 25th March. Easter Term begins Tuesday, 9th April, and ends Monday, 30th June. Annual Examination begins 24th June.

Professor—William H. Greenwood, M. Inst. C.E., F.C.S., Assoc. R.S.M., &c. McWilliam, Assoc. R.S.M. Demonstrator-Andrew

Note.—The lectures will be delivered in three sections, which, taken together, make up the Mctallurgical Course, but students will be allowed to take either one, two, or three sections in one

The sessional fee for the first section is £111s. 6d.; for the second section, £116s. 6d.; for the third section, £1 16s. 6d.; or £3 13s. 6d. for the three sections together.

A reduction of 20 per cent, will be made to students taking together any two sections.

Examinations will be held in each class at the end of each term.

Upon the results of the examination at the end of the session, certificates will be awarded to students who pass in the first class.

#### First Section.

Fuel, refractory materials, firebricks, crucibles, &c.

### Syllabus.

Refractory materials; influence of chemical composition, &c., upon the refractory character of; fire-clays; lime; magnesia; dolomite; silica sand and stone; firestones; graphites, &c.

Firebricks, their manufacture and use; silica bricks.

Crucibles, essential qualities of; steel melting pots; selection, preparation, and mixtures of clays for the same; machine and hand-made pots.

General considerations of the phenomena of heat, combustion, flame, smoke, &c.; nature and composition of the principal solid bodies, wood, peat, and coals, used as fuel; coals and their classification.

Petroleum, oils, and other liquid fuels, their origin, characters, and methods of combustion.

Charcoal burning in piles, kilns, and ovens.

Coke, varieties and composition of; coking in piles, in bechive and rectangular ovens; the Coppee, Simon-Carvés, Appolt, and other special coking arrangements; collection of waste or by-products.

Gaseous fuel, advantages of; natural gas; water gas; blast-furnace waste gases; Siemens, Wilson,

Casson, and other gas producers.

Calorific power of fuel and calculation of the same; calorific intensity or temperature of combustion; calorimetry or the experimental determination of the calorific power of fuel; economy in fuel, smoke prevention, &c.

Lecture Hour—Monday 4-5 p.m., during the Michaelmas and Lent terms only. Sessional Fee—£1 11s. 6d., or £1 1s. each term.

Text Book—Greenwood's Manual of Metallurgy, vol. I. (Collins).

### Second Section.

The metallurgy of Iron and Steel.

### Syllabus.

Furnace and Crucible Materials, and Construction.-Refractory rocks, clays, quartz, ganister, sand, dolomite, bauxite, firebricks, &c.; crucibles for laboratory, steel and other melting processes.

Iron Ores.—Their composition, general character, and distribution; calcination of iron ores, and

the changes produced thereby.

Blast Furnace.—Construction and mode of working charcoal, coke, and coal furnaces; charges and yield; slags and their uses; use of fluxes; hot and cold blast, their effects on the fuel, flux, quality, and yield of pig-iron; waste gases and flue dust; hot blast stoves; hoists, lifts, blowing engines, and furnace accessories.

Pig-iron.—Composition and classification; effects of different elements upon; production of

spiegeleisen, ferromanganese, and highly phosphoric pig-iron.

Direct Processes for the Production of Malleable Iron.—The Catalan and Bloomery forges; chenot

process; Siemen's rotary furnace and process.

Indirect Processes for the Production of Malleable Iron.—In open hearth fineries, the Walloon process, the Swedish Lancashire hearth and the South Wales process; the treatment of pig-iron in reverberatory furnaces; the refinery and puddling process of South Wales and Yorkshire; pig boiling; modifications of puddling furnace; rotary furnaces; hand and machine puddling; tap cinder, its composition and uses.

Machinery of the Forge.-Manipulation of the puddled ball; shingling by hammers, helves, squeezers, &c.; puddle and mill bar rolls.

Conversion of Malleable Iron into Steel.—Cementation process; blister and shear steel; crucible steel process in coke fires or gas furnaces, for re-melting blister steel or malleable iron bars with car-

Production of Steel in Regenerative Gas Furnaces.—Siemens' method from pig-iron and iron ore; the Siemens'-Martin or scrap process; basic process in Siemens' furnace; combined bessemer and Siemens' process; pernot and other furnaces.

Manufacture

Manufacture of Bessemer Steel.—Bessemer plant; English and American arrangements; linings for converters; Holley's movable bottoms, cranes, ladles, &c.; conduct of the blow; slag tests; spectroscopic examination of the bessemer flame; pig-iron for the bessemer process; use of spiegeleisen; gases from the converter; Clapp and Griffiths' fixed converter; direct bessemer process.

Basic Steel Process.—Conditions for success of the process of dephosphorising pig-iron; basic process in the Bessemer converter and in the open-hearth furnace; slags from the basic process; heat-

producing elements in the process.

Unsoundness of Steel Ingots.—Use of silicon in producing homogenous ingots; methods of casting ingots; casting under hydraulic pressure (Whitworth's process); casting under steam and gaseous pressure.

Reheating and Welding.—The hollow fire; reheating or mill furnace; Siemens' regenerative furnace; Gjers soaking pits; methods of piling malleable iron for merchant iron, rails, &c.; faggoting for shear steel; plate and sheet rolling; mill furnace cinder and hammer scale.

Tests Applied to Steel.—Nature of the physical and chemical tests applied to iron and steel; effects of carbon, silicon, phosphorus, manganese, and the rarer metals on the quality of the steel; hardening, tempering, and welding qualities.

Text Book—Greenwood's "Steel and Iron." (Cassell's).

Lecture Hour—Thursday, 4-5 p.m.

Sossional Fee—£1 16s. 6d., or 15s. per term.

Third Section.

The metallurgy of copper, zinc, tin, nickel, cobalt, lead, silver, gold, aluminium mercury, and their alloys. Syllabus.

Copper.—Physical and chemical qualities of copper; composition and occurrence of copper ores; smelting of copper in reverberatory and blast furnaces; bessemerising of copper ores; wet methods of

extracting copper from its ores, &c.

Zinc.—Physical and chemical qualities of zinc; ores of zinc; extraction of zinc in the English, Belgian, silesian, and Carinthian furnaces; zinc fume; zinc oxide; alloys with copper (brass, muntz-

metal, &c.)

Tin.—Physical and chemical qualities of tin; ores of tin; smelting and refining of tin; tin and

terne-plates; alloys of tin (bronze, bell-metal, pewter, &c.)

Nickel and Cobalt.—Physical and chemical qualities of nickel and cobalt; ores of nickel and cobalt;

speise; extraction of nickel; alloys of nickel; cobalt smalts, safflor; extraction of cobalt, &c.

Lead.—Physical and chemical qualities of lead; lead ores; manufacture of red and white lead; smelting of lead in reverberatory and blast furnaces; lead fume; softening of lead; extraction of silver

from lead; pattinson and zinc processes for desilverisation, cupellation, &c.

Silver.—Physical and chemical qualities of silver; ores of silver; extraction of silver from its ores by amalgamation; methods pursued in Mexico, Nevada, Chili, Freiberg, &c.; wet methods of Augustin, Ziervogel, and Claudet; sulphuric acid process; English and German methods of cupellation;

alloys of silver, coinage, &c.

Gold.—Physical and chemical qualities of gold; occurrence of gold in nature; amalgamation and smelting process for the extraction of gold from auriferous quartz; the chlorine process; gold parting by wet and dry methods; alloys with copper, silver, &c.

Manual Physical and showing analysis of mercury; amalgama; orce of mercury; air reduction

Mercury.—Physical and chemical qualities of mercury; amalgams; orcs of mercury; air reduction process for the extraction of mercury; methods of reduction with lime, iron, &c.; purification of mercury by dry and wet methods.

Text Book - Greenwood's Manual of Metallurgy, vols. I, II (Collins).

Lecture Hour—Wednesday, 4-5 p.m. Sessional Fee—£1 16s. 6d., or 15s. per term.

Metallurgical Laboratories.

In the Metallurgical Laboratories, experimental demonstrations will be given, illustrative:-

1. Of the various reactions occurring during roasting, calcination, amalgamation, liquation, cupellation, and the several smelting operations.

2. The preparation of alloys, oxides, silicates, sulphides, and other metallurgical products.

3. Analysis of fuels and the determination of their calorific powers, examination of fire-clays,

crucibles, and other refractory materials.

4. Assay by wet and dry methods of ores, clays, alloys, and the metallurgical products of iron, copper, zinc, lead, gold, silver, &c., gold and silver parting.

5. Complete analysis of iron and steel.

6. Blow-pipe analysis and the testing by mechanical means of the useful metals and their alloys. Working Hours—The Laboratories will be open each week-day, except Saturday, from 10 a.m. to 4 p.m.

Students may enter for one day or upwards per week, and the hours of attendance will be arranged to suit the students' convenience. One Term

											One re		NC	COLUI.	
											£ 8.	d.	£	8.	d.
Fee	s-6 hou	rs per	week								$2  ext{ } 5$	0	5	0	0

Fees for		eriods	-For						week				3	3	0
2 000 200			For	two	months	, work	ing 18	hours r	er week	.,			4	10	0

Note I.—The above fees include the use of separate working table, cupboard, and apparatus of an expensive character, &c., fuel, water, gas, re-agents, crucibles, and ordinary minerals, but the students will be required to provide their own specimens of the precious metals, gold, silver, and platinum.

Nore

Note II.—A deposit of 2s. 6d. will be required from each student on the receipt of the key of his ag table. This will be refunded if the key is returned at the end of the session.

working table.

Note III. - Each student works quite independently, and his work will be specialised as far as possible to meet his particular requirements; but in all cases he will be first required to go through the course illustrative of the general principles of the calcination, reasting, reduction, and scorification processes; the preparation of metallic alloys, and examination of their properties; also to make a series of quantitative determinations calculated to familiarise him with the use of the chemical balance.

### Science Teachers.

An arrangement has been entered into with the Science and Art Department, South Kensington, which will enable Science Teachers to take the Practical Course on payment of one quarter of the usual fee, the department being willing to pay the remainder under certain conditions, of which full information may be obtained on application to the Registrar or to the Principal.

### Geology.

### Lecturer-A. McWilliam, Assoc., R.S.M.

Syllabus.

Configuration of the earth's surface; distribution of land and water; external and internal effects of the action of the forces of nature upon the earth's crust; earthquakes: volcanoes; origin of mountain chains and Coral Islands.

Mechanical and chemical action of air, water, snow, ice, winds, waves, &c., in disintegrating rocks and altering the surface configuration of this and other countries.

Nature, origin, composition, and classification of rocks; metamorphism; contortion; cleavage; stratification; bedding; unconformability; faults; origin of veins, lodes, metallic ores, &c.

Chronological classification of rocks; plant and animal life at these periods, as shown by their characteristic fossil remains; successive appearance of the fish, reptile, bird, and mammal; geographical distribution of the geological formations of the British Isles.

Note.—The Lectures will be illustrated by specimens, diagrams, and lantern slides.

Lecture Hours-Monday and Thursday, 12:15-1:15 p.m. Sessional Fee-2 2s. or £1 1s. per term.

Text Books-Page's School Text Book of Geology. Gcikie's Outlines of Geology.

### Mineralogy.

### Lecturer-A. McWilliam, Assoc. R.S.M.

Syllabus.

Elements of crystollography, ismorphism; dimorphism; pseudo-morphism, &c.; physical properties of minerals; density, hardness, colour, cleavage, &c.; chemical composition and properties of minerals; description of the more important mineral species and rock masses; blow-pipe and other tests by which minerals are recognised in the field.

Leisure Hours-Tuesday and Friday, 11-12 noon.

Sessional Fee—£2 2s. or £1 1s. per term.

Text Books—Collins' Advanced Mineralogy, 2 vols. Rutley's Mineralogy.

### MECHANICAL ENGINEERING.

### Professor-W. H. Greenwood, M. Inst. C.E., M.I.M.E.

Assistant Professor—William Ripper, M.I.M.E.

Note I .- In this department the work will consist of lectures, the work of the drawing office, laboratory demonstrations, and of practical work in the workshops. The last mentioned, although not intended to entirely supersede the practical training which the artisan or apprentice can only acquire in the engineering factory or workshop, will serve, nevertheless, to familiarise students with the construction and use of tools, the principles upon which their use and construction depend, and with the ordinary workshop energing of makespiral engineering. workshop operations of mechanical engineering.

The course is thus designed to meet the requirements of students of mechanical engineering, architects, draftsmen, and others engaged in mechanical work, also those who, though engaged in other industries, may be desirous of acquiring some knowledge of the principles of machinery, and of the

operations of the smith, moulder, pattern-maker, and machinist.

Note II.—The complete engineering course extends over three years, in which period the more important branches of mechanical engineering are considered. The work of each year is independent of any other, and hence students can join the classes equally well at the commencement of any session.

Examinations will be held in the several classes at the end of each term.

Upon the result of the examination at the end of the session, certificates will be awarded to students who pass in the first class.

### Engineering Lectures.

The subjects studied in the Engineering Lectures are :- The strength of materials; the design of structures in wood and iron; steam, and steam boilers; steam and gas engines; machine tools; shafting; workshop appliances and processes.

The subjects of this section will be treated in the following order:-

1889-90-Hydraulic and machine tools; the mechanics of machinery; workshop appliances and processes. 1890-91—Steam; steam boilers; gas and air engines. 1890-91—The strength of materials, and the design of structures in wood and iron.

Engineering Lectures—1889-90.

The Mechanics of Machinery, Workshop Tools, Appliances and Processes, Shafting and Transmission of Power by Gearing, Belting, Hydraulic Machinery, &c.

This course is designed to meet the requirements of students of mechanical engineering, draftsmen, and others engaged in mechanical work, also those who, though engaged in other industries, may be desirant of acquiring some knowledge of the principles of mechanical and of the appreciant of the smith. desirous of acquiring some knowledge of the principles of machinery, and of the operations of the smith, moulder, pattern-maker, and machinist.

Syllabus.

### Syllabus.

Descriptive Lectures on Machine Tools.—Vices; wood and metal working machinery; the sliding, surfacing, and screw-cutting lathe; gap, break, and face lathes; drilling, milling, shaping, slotting, planing, punching, and shearing machines; riveting and hammering machines, &c.

Details of the Mechanism applied to Machine Tools, for the conversion of Circular into reciprocating motion.—Cranks; eccentrics; slotted link; cams; reversing and quick return motions; linkwork. The conversion of reciprocating into circular motion—ratchet wheels, nipping levers, &c.; the use of wheels in trains, account authing the

the use of wheels in trains; screw cutting, &c.

Proper form of Tools and Cutting Edges for Cutting Wood and Metals.—Chisels, caulking tools, saws, planes, files, hand and machine turning tools; taps, dies, and screwing tackle; screw threads; planing, boring, and drilling tools; influence of speed on tools; chucks, drivers, rests, dividing apparatus, &c.

Workshop Operations.—Preparation of true plane surfaces; gauges; measuring machines. The practical operations of the workshop, such as pattern making, moulding, forging, turning, screw-cutting, planing, riveting, tempering of tools.

Hydraulic Machinery.—Hydraulic motors; pumps; accumulators; hydraulic shop tools, riveting

machines, &c.; hydraulic forging machinery.

Transmission of Power by Wheels.—Cords and pulleys; belts and pulleys; speed pulleys; shafting

and its supports; strength and speed of shafting, couplings, &c.

Text Book—Shelly, Workshop Appliances, &c.; Goodeve, Elements of Mechanism; Rankine, Mills and Millwork; Kennedy, Mechanics of Machinery.

Lecture Hours—Monday and Thursday, 12-1 p.m.

Sessional Fee—£2 12s. 6d.

### Engineering Workshops.

In the practical conduct of the workshops, the Professor is assisted by a skilled practical Foreman in each of the three departments.

The workshops embrace joiner's and pattern-making shops; a fitting, turning, and creeting shop;

smith's shop; foundry for cast-iron, &c.

Engine-house—In the engine-house are a 25-h.p. duplex tubular steel boiler and a steam-engine, designed to work either as a high-pressure non-condensing engine, or a compound engine, or as a condensing engine, with or without compounding; also graduated tanks, pyrometers, draft-gauges, and other arrangements necessary for the education of the mechanical engineer.

Machine and Fitting Shops-The machine shop contains lathes, each arranged for sliding, surfacing, and screw cutting; planing-machine, driven by screw and steel gearing; powerful shaping machine, drilling-machine, together with vices, Whitworth screwing tackle, gauges, surface-plates, measuring-machine, and all other shop and bench tools necessary to render the instruction complete and effective.

Wood Working—This department is likewise fitted up with benches, and all planes, chiscls, saws, and necessary bench tools, besides a 36-in. circular saw, and a 6-in. treadle lathe.

The practical instruction will be adapted to the requirements of persons who propose to become mechanical or electrical engineers, and will include carpentry, pattern-making, fitting, turning, moulding, and founding, smith's work, tempering of tools, &c., with the use of all the ordinary engineers' tools.

Efforts will be made to make the work as thorough and non-superficial as possible. Accordingly all students will be required to attain a reasonable proficiency in the use of the several tools before they are allowed to proceed to any constructive work: thus students at the lathe will be required to turn a bar to a fixed diameter, and fairly accurate to gauge; also to face to an accurate plane surface a 6-inch square cast-iron plate or other similar work before he is allowed to attempt the construction of any part of a machine.

At the vice the student will be required to chip over a 6" square surface of cast-iron, or 2" x 6" surface of wrought-iron ready for filing; and to file up fairly square and accurate to gauge a 13"-in. cube or

a hexagonal nut before before proceeding to any more important work.

At the bench, in like manner, before the construction of various joints, carpentry, or pattern-making can be commenced, the student will be required to possess sufficient skill to enable him to saw and plane up true and square two pieces of timber 3" x 3" x 3' 0", and to make a pair of parallel strips, each 2½" x 5" x 2' 6".

During each Session also an effort is made to design, prepare patterns, and make complete some single machine or piece of apparatus. During the past Session a dynamo for the use of the schools has been thus constructed and finished.

The workshops will be open daily, except on Saturdays, from 9 a.m. to 1 p.m., and from 2 p.m. to 5 p.m., or 7 hours per day. Students may enter for 7, 14, 21, 28, or 35 hours per week.

The fees, including cost of materials and use of all tools, are as follows :-

					The Sessi October t		For a Single Term.		
1 d	ay, o	r 7 hoi	urs per we		£ s 4 10		£ s. d. 2 0 0		
2 đ	ays, o	r 14	<b>)</b> 1	***************************************	8 0	0	3 10 0		
3	"	21	37	***************************************	11 5	0	4 10 0		
4	,,	28	<b>)</b> )	************	11 0	0	5 10 0		
5	11	34	,,		16 10	0	6 10 0		

Students who have acquired a fair degree of competency in the use of tools will be allowed, under certain conditions, to take away any work which they may have done, on payment of the cost only of the materials employed.

138 - 2 Q

### Engineering Laboratory.

The Engineering Laboratory contains Whitworth and other measuring apparatus, standard gauges,

steam-engine indicators, oil tester, pyrometer, dynamometer, &c., and the experimental engine and boiler.

During the present Session the students will themselves perform a course of experiments and practical work in connection with steam and the steam-engine; defermination of the temperature of, and velocity of gases through the chimney and furnaces in connection with furnace and steam-engine economy; determinations of the effective heating surface in the steam boiler, and consumption of fuel under different conditions; feed water for condensation purposes; expansive working of steam; the relative economy of different steam pressures, of varying degrees of expansion, and of steam jackets; the use of the indicator and calculations based thereon; testing of lubricants, dynamometers, brakes, &c.

The student's work will be conducted under the supervision of the Professor and his assistants.

Laboratory Hours-Monday and Thursday, 2-5 p.m., and other hours to be arranged with the

Sessional Fee-£5 5s., or £2 12s. 6d. per term for 6 hours per week, or £8 8s. or £4 per term for 12 hours per week.

ENGINEERING DRAWING.

The Engineering Drawing Course includes-

... One hour per week. 1. Lectures on Geometry and its applications .

2. Lectures on the application of the rules and formulæ used in the designing

... One hour per week. of machines, engines, and engineering structures ... ... ...

••• ... Four hours per week. ... Six Machine Drawing ... . . . ... . . .

#### Syllabus.

### Geometrical Drawing.

Proportional division of lines; scales; areas of plane figures; problems on the circle, eclipse, parabola, hyperbola, cycloid, and spiral; points, lines, and planes; projection of solids; development of surfaces; interpenetration of solids; tangent planes to curved surfaces; projection of shadows; isometric projection; horizontal projection; perspective; graphical arithmetic and statics.

### Machine Drawing and Design.

Plans, sections, and elevations; drawing to scale of the details of engine and machine tools, and general machinery, from dimensioned sketches and from actual examples; wheel-gearing; spur, bevel, and skew wheels; cycloidal teeth, involute teeth, worm and wheel; cams.

Preparation of general drawings from details, and of coloured finished drawings.

Designs from given data for engine and machine details, including engine slide valves, expansion valves, link motions; valve diagrams, illustrating points of admission, cut-off, &c.

Advanced students work out during the session a complete design for a typical engine, machine, or framework structure, to fulfil given requirements. In this the special requirements of each student are met as far as possible.

Exercises on the proportions and strength of machine details, e.g.:—Bars; Simpler forms of beams; bolt and nut fastenings; pins, keys and cotters; rivetted joints; shafts, axles, and couplings; toothed-wheel, gearing; belt gearing, &c.

Lecture Hours—Geometry Lecture, Thursday, 10:15-11:15 a.m. Machine Design Lecture, Saturday, 10:15-11:15 a.m. Drawing Office Practice.—The Drawing office will be open each day from 9

a.m. to 1 p.m., and students may arrange their attendance to suit their convenience.

Sessional Fee—£2 12s. 6d. the full course, or £1 1s. per term.

Books recommended—Unwin's Machine Design, 6s.; Angel's Geometry, Text, 4s.; Plates, 6s.

For reference, Ripper's Machine Drawing and Design.

### Practical Plane and Solid Geometry.

A special class for teachers will be held each Saturday morning during the session, from 9:30 to 12:30.

Fee for the course-10s. 6d.

### EVENING CLASSES.

Michaelmas Term begins on Monday, 7th October, and ends on Saturday, 14th December. Lent Term begins on Wednesday, 15th January, and ends on Tuesday, 25th March. The Sessional Examinations will be held during the week, 9th-16th April.

Note.—Examinations will be held in each of the several classes at the end of each term.

Upon the results of the examinations at the end of the session certificates will be awarded to students who pass in the First Class.

Students are prepared for the Technological Examinations of the City and Guilds of London, and of the Department of Science and Art. (For further particulars and previous successes, see p.p. 62-63.)

Two exhibitions of 25s. each in the Metallurgical and Engineering Sections respectively, are offered

for competition at the Sessional examination.

### METALLURGICAL DEPARTMENT.

Professor—William H. Greenwood, M. Inst., C.E., F.C.S., Assoc. R.S.M., &c. Demonstrator—Andrew McWilliam, Assoc. R.S.M.

Note.—The evening course of study in Metallurgy will extend over three years, and the subjects treated upon in the lectures of each year will vary accordingly.

The Lectures will be delivered as follows:

1889-90.—" Fuel, Refractory Materials, Fire-bricks, Crucibles," &c. 1890-91.—" Metallurgy of Iron and Steel."

1891-92.—" Metallurgy of Copper, Lead, Zinc, Silver, Gold, &c., and their Alloys."

Any student who passes the Sessional Examinations in the First Class during each of the three consecutive sessions into which the complete course is divided will receive a special certificate recording such successes, provided that the student also holds First Class Certificates in Metallurgical Laboratory Practice, and a First Class Certificate from the Firth College in Theoretical Chemistry. Subject for 1889-90.—"Fuel, Refractory Materials, Firebricks, Crucibles," &c.

Syllabus.

General considerations of the phenomena of heat, combustion, flame, smoke, &c. Nature and composition of the principal solid bodies used as fuel. Coals and their classification.

Charcoal burning in piles, kilns, and ovens.

Coke, varieties and composition of-Coking in piles, in beehive and rectangular ovens. Coppee, Simon-Carvés, Appolt, and other special coking arrangements. Collection of waste or by-products.

Gaseous fuel, advantages of—Natural gas—water gas—blast-furnace waste gases—Siemens,
Wilson, Casson, and other gas producers.

Liquid fuels—Petroleum, oils, &c., their special characteristics and methods of combustion.

Calorific power of fuel and calculation of the same—Calorific intensity or temperature of combus--Calorimetry or the experimental determination of the calorific power of fuel-economy in fuel, &c. Refractory materials—Influence of chemical composition, &c., upon the refractory character of—Fire-clays, lime, magnesia, dolomite, silica sand and stone, fire-stones, graphites, &c.

Fire-bricks, their manufacture and use—Silica bricks.

Crucibles, essential qualities of—Steel melting pots—selection, preparation, and mixture of clays for the same—machine and hand-made pots.

Lecture hour-Monday, 7:30-S:30 p.m. Fee-7s. 6d. per session, or 5s. each term.

Text book—Greenwood's Manual of Metallurgy, Vol. I. (Collins.)

Metallurgical Laboratory.

The Laboratories will be open during one evening of each week, when instruction will be given and the students will perform experiments illustrative of metallurgical reactions and the methods of assaying, &c., following, as far as time permits, the outlines of the course given in the day classes.

Special attention will be directed to the assaying, &c., of iron ores, iron determinations, analysis of iron and steel, &c., but all students will be required to commence with a series of preliminary determinations as laid down for the day courses, p. 69.

Working hours—Wednesday, 6:30-9 p.m.

Sessional fee—£2 2s., and £1 5s. per term.

The fees include the use of separate working table and furnace, with fuel, water, gas, chemicals, crucibles, and ordinary minerals; but each student must provide his own specimens of the precious metals, gold, silver, and platinum, if required.

A deposit of 2s. 6d. will be required from each student on receiving the key of his working bench.

This will be refunded if the key is returned at the end of the session.

Geology.

Lecturer-A. McWilliam, Assoc. R.S.M.

Syllabus.

The origin, nature, and composition of rocks. The effects of rain, rivers, glaciers, heat, &c., in the production of geological phenomena. The positions and relations of the rocks forming the earth's crust. Characteristic fossils of the several geological formations, and their geographical distribution over the British Isles. The origin and nature of mineral veins, &c.

The lectures are illustrated by specimens, diagrams, and lantern slides.

Lecture hour—Friday, 7-8 p.m. Sessional fee-5s., or 3s. per term.

Mineralogy.

Lecturer-A. McWilliam, Assoc. R.S.M.

Syllabus.

Elements of crystallography, isomorphism, pseudomorphism. Mineral physics. Chemical composition and classification of minerals. Description of mineral species, stones, ores, native metals, fuels, &c., &c. Use of blowpipe in recognising minerals.

The lectures are illustrated by models, specimens, and experiments.

Lecture hour-Friday, 8-9 p.m. Sessional fee-5s., or 3s. per term.

MECHANICAL ENGINEERING DEPARTMENT.

Professor—W. H. Greenwood, M. Inst. C.E., M.I.M.E.
Assistant Professor—William Ripper, M.I.M.E.

Note.—The evening course of study in engineering will extend over three years, and the subjects treated upon will comprise steam and the steam boiler; steam, gas, and air engines; and the mechanics of machinery respectively, so as to include in the three years all the more important branches of

mechanical engineering.

Any student who passes the sessional examination in the first class, during each of the three

auch auccesses

The subject will be treated in the following order:-

1889-90 "Steam and Gas Engines." 1890-91 "The Mechanics of Machinery."

1891-92 "Steam and Steam Boilers."

- Subject, 1889-90 .- Steam and Gas Engines.

Syllabus.

The steam engine—the mechanism of the engine—types of engines—engine details—cylinders, pistons, piston rods, connecting rods, eranks, bearings, fly wheel, governors—condensers, pumps—valves, and valve gearing—link motions—expansion valves—valve diagrams—effects of lap, lead, clearance, compression, wire drawing, jacketing, cylinder condensation—efficiency of the engine—indicator diagrams—dynamometers dynamometers. Gas

Gas engines—thermodynamics of the gas engine—combustion and explosion—types of gas engines, details of their construction and their efficiency.

Lecture hour—Friday, 8-9 p.m.

Sessional fee-5s.

Text book—Ripper's steam engine, 2s. 6d. (Longmans); or Holmes' steam engine, 6s. (Longmans)

### Principles of Mechanics.

Syllabus.

Properties of matter; parallelogram of forces; levers, parallel forces, couples. Centre of gravity; stable and unstable equilibrium; the principle of work; laws of friction; the simple machines; the laws of falling bodies; energy; motion in a circle; the pendulum.

The mechanics of liquids and gases; fluid pressure; specific gravity; barometor; syphon; Boyle's law; force pumps; air pumps; hydraulic press.

Lecture hour—Friday, 7-8 p.m.

Sessional fee-5s.

Text book recommended—Goodeve's manual of mechanics, 2s. 6d. (Longmans).

### Engineering Workshops.

The joiners' and pattern-making shops; fitting, turning, and erecting shop; smith's shop, foundry, &c., fitted up as described p. 73, will be open to evening students during two evenings of the week, under the superintendence of the professor and three practical foremen.

The instruction will be carried out, as far as time will permit, according to the programme laid

down for the guidance of day students.

All students will be required to show a reasonable proficiency in the use of the several tools before they are allowed to proceed to any constructive work; thus students at the lathe will be required to turn a bar to a fixed diameter, and fairly accurate to gauge; also to face to an accurate plane surface a 6-inch square cast-iron plate or other similar work, before they are allowed to attempt the construction of any part of a machine.

At the vice, the student will be required to chip over a 6 in. square surface of cast-iron, or a 2" x 6" surface of wrought-iron ready for filing; and to file up fairly square and accurate to gauge a  $1\frac{1}{2}$  in. cube, or a hexagonal nut, before proceeding to any more important work.

				Session.	-	Single term
Foor	One evening per week Two evenings "	 	• • • •	£l 1s.	 	 £0 12s. 6d.
T 603	Two evenings	 		$1\ 15s.$	 	 1 1s. 0d.

Note.—The above fees include the cost of all materials, wood, or metal, with a separate bench or bench vice to each student, and the use of all machine or bench tools, except the small pocket instruments of the mechanic, such as small squares, punches, &c.

### Engineering Drawing.

The Engineering drawing course includes : -

(1.) Lectures on the application of the rules and formulæ used in designing machinery.

(2.) Drawing office practice.

### Syllabus.

### Geometrical Drawing.

Proportional division of lines; scales; areas of plane figures; problems on the circle, ellipse, cycloid, points, lines, and planes; projection of solids; development of surfaces; interpenetration of solids; tangent planes to curved surfaces; projection of shadows; isometric projection; horizontal projection are planes to curved surfaces; projection of shadows; isometric projection; horizontal projection. jection; perspective; graphic arithmetic and statics.

### Machine Drawing and Design.

Plans, sections, and elevations; drawing to scale of the details of engines and general machinery, from dimensions, sketches, and from actual examples.

Wheel gearing; spur, bevel, and skew wheels; cycloidal teeth, involute teeth; worm and wheel;

Proparation of general drawings from details, and of coloured finished drawings.

The more advanced students are assisted to work out, during the session, a complete design for a

typical engine or machine, to fulfil given requirements.

Exercises on the proportions and strength of machine details, e.g.: -Bars; simpler forms of beams; bolt and nut fastenings; pins, keys, and cotters; rivetted joints; shafts, axles, and couplings; toothed wheel graring; belt gearing, &c.

Class hours—Tuesday and Thursday, 6:30-7 p.m.

Fee-7s. 6d. for the full course, or 55s. per term.

For Reference-Ripper's machine drawing and design. Text Books-Unwin's machine design, 6s.; Angel's geometry, 1s. 6d., for elementary students; Angel's geometry, text, 4s., plates, 6s., for advanced students.

### APPENDIX Q.

## DOMESTIC ECONOMY AS A FACTOR IN PUBLIC EDUCATION.

BY MRS. ELLEN H. RICHARDS, INSTRUCTOR IN SANITARY CHEMISTRY, MASSACHUSETTS INSTITUTE OF TECHNOLOGY.

THE Public School of the American Commonwealth is a somewhat unique development in the educational institutions of the human race. Founded for all the children of the community, supported by the public funds in order to secure a constant succession of good citizens, that the state might be sure of being sustained, the school taught those subjects which were thought to best prepare for citizenship-the schoolmaster was to supplement not supplant home training. With this common aim, the children of those who ploughed in the field were sent to sit at the same desk as the children of those who were the intellectual leaders of the community. The equality of mind thus recognized was typical of the spirit of the carly commonwealth. At a time when every man could lead a gun, build a log house or a palisade, and every woman could spin and weave the cloth from which she fashioned the garments of her family, there was little need of manual training or domestic economy. It was the highest ambition to have the children furnished with the intellectual weapons which would enable them to take, in due time, a leading place in the community. Thus the public school was a factor, next to the "moeting," in the clevation of the people. Grown men and women used the few woeks of winter, when work was less pressing, for an intellectual advancement which was always recognized as fitting them for public duties giving to them intellectual advancement which was always recognized as fitting them for public duties, giving to them better language for the town meetings, more skill in debate, a reputation for quickness at figures. This was the condition of affairs only forty years ago, in the home of the public school, the commonwealth of Massachusetts. But the first act of the General Court in 1642, not only enjoined upon the municipal authorities the duty of scaing that every child was educated so as to read and write, but also that "all authorities the duty of seeing that every child was educated so as to read and write, but also that parents and masters do bring up their children and apprentices in some honest, lawful calling, labour, or employment, either in husbandry or some other trade profitable for themselves and the commonwealth." As Horace Mann so well stated the bearing of this early law: "Thus were recognised and embodied in a public statute the highest principles of political economy and of social well-being—the universal education of children and the prevention of drones or non-producers among men."

The aim of education is now what it was then-to make good citizens; and those subjects which will best conduce to this end should be taught in the public school.

Times change and methods must change with circumstances. People no longer travel by stagecoach: Why should children be taught in the school just what their stage-coach travelling grandfathers were taught? The citizens of the future are now in the schools. They are in just that stage of development in which they can most readily imbibe higher ideals of life and be influenced to better ways of living: shall the best thought of the time be withheld from them for fear that they shall know more than their fathers or that they shall become too revolutionary in their homes?

In no branch of knowledge has there been greater advance in the last fifty years than in that of public health. In no department of science can so much be accomplished for the general good with so little expenditure as in teaching the elements of sanitary science.

It is no longer considered as necessary for a child to have measles and scarlet fever as to cut its teeth. It is no longer considered an essential part of life to have at least twenty or thirty days of illness in the year; but the community is beginning to learn that health and happiness are within reach of all who know and obey the laws of right living. Health and happiness mean competence and peace in the community. Good house-keeping and good cooking have the greatest influence on these factors in a nation's prosperity.

The necessity of teaching something of sanitary law is recognized in the wide spread endeavour to introduce lessons on hygiene and temperance into public schools; but the attempt to teach topics insulated from their proper connections is oftentimes not only futile but disastrous. In these lessons harm instead of good not infrequently results from ignorance of the real bearing of science as well as from overzealous partizanship. Hygiene and temperance, with a good ground connection in a course in domestic economy, may safely receive the shock given by the most enthusiastic teacher.

The elementary science lessons now given in so many schools form an admirable and sufficient ground work for the consideration of the effect of foul air and dust on health.

The present plea is for a connected and systematic course in general science which should be given

to both boys and girls as a preparation for the practice work or manual training which is now so generally conceded to be an essential concomitant of an education, as is shown by the establishment of schools where boys may gain control of all their faculties and thus become well balanced men. It is quite time to consider what can best affect the same result in the same degree for girls.

The subject chosen must be broadly educational and at the same time capable of manual demonstration. It must be universally applicable to all conditions of life. The writer has no hesitation in saying that the science of domestic economy rightly interpreted fulfils all of these conditions. And here, as in

all manual training, the science, or educational element should be distinguished from the art.

While sympathizing heartily in the work of the cooking schools so successfully established, the writer sees the same element of danger lest they should be considered as an end instead of a means, as has been the case in the schools of carpentry. In a word, they should "not teach how to make a living but how to live." To do this effectually the foundation should be broadened; just as the course in carrent best developed into the manual training and the schools of the school pentry has developed into the manual training school, so should the eminently successful cooking school develop into a course in domestic economy. All the work of the school should be in harmony, and the cooking should no longer be considered an outside affair—an interloper, a crowder out of more important studies; but all the teachers should cooperate to make most effective the practical lessons.

The topics required are all taught in some fashion in most schools; so that this plea is not for the introduction of new subject matter, but for the simplifying and correlation of what is now attempted, so that the result may be a valuable educational development, mentally and morally, instead of a useless hodge-podge of isolated facts with no effect in the after lives of the pupils.

The attempt to introduce new subjects into an existing curriculum is often like setting up with great labour disconnected posts which enclose nothing and support nothing, instead of building upon a foundation a complete and useful structure. In education, each step should follow closely upon the previous one, and the connection between all the branches of a subject should be clearly apparent to the pupil's mind."

What then is a feasible plan for a course in Domestic Economy applicable to public school work? The teacher must bear in mind that the word economy as here used is not synonymous with parsimony. Better living, better health in consequence of better cooking, means economy to the state in the general

capacity of its citizens-brain workers quite as much as day labourers.

The lessons in Domestic Economy should extend over four years, from the ages of ten to fourteen or from twelve to sixteeen. The writer prefers the younger limit. First year:

Observations on the growth of plants and animals, in the school-room.

Sewing and knitting.
Two hours a week of elementary science lessons.
The study of oxygen, hydrogen, and carbon, and their relation to the life of plants and animals. Second year :-

Continued observation of plants and animals.
Collection of seeds, and fibres and woods, in connection with geographical study.

Sewing, cutting, and fitting.

Two hours a week of elementary science lessons.

Simple mechanism.

Oxygen and carbon in their relation to fire and heat.

Elementary physiology.

Third year:-

Completion of the museum of materials used in the house, with reading lessons and geographical classification.

One hour a week of elementary science, composition of food, starch, sugar, &c.

Two hours a week in the school kitchen. Practical lessons in the care of the fire and the cleaning and cooking of natural products, seeds, roots, and fruits. Simple applications of the laws of heat which have been learned before. Especial attention is to be given at this point to cleanliness, to orderly and systematic arrangement.

One hour a week at this point should be given lessons on personal hygiene, temperance in

eating as well as in drinking.

Fourth year:

Collection of materials used in cleaning and repairing; soaps; substances used in taking out spots and stains; sewing materials—examples of skilled repairing.

One hour a week of science lessons on the composition and cost of food materials, and the pre-

paration of dictaries for different seasons of the year.

Two hours a week in the school kitchen, beginning with the natural products prepared by the younger class; the lessons should be devoted to combining them into the more complicated dishes. The cooking of meats, preparation of soups and stews, the making of bread and

breakfast and tea cakes; made over dishes. Suitable combination, seasonable marketing with appetising serving, should follow.

One hour a week, family bygiene and the care of the house.

The course here outlined will in all require only one-fifth of the school time, and surely it is of onefifth the value of the sum total of education.

The plan proposed is no visionary one, but lest some reader should still be sceptical about the desirability of the manual or practice work and the introduction of so much science into the school

kitchen, we will consider the question more in detail.

The use of tools is acknowledged to be almost a distinguishing attribute of civilised man, that thing which distinguishes him from the savage, and the advocates of manual training often say that there is no reason why girls should not use tools as well as boys. But as a rule the needle is still held to be the tool of the woman as it was in days of bead ornamentation and tapestry working. The use of tools is also recommended, because of its value in developing the muscles, in making a part of physical

Will any one venture to recommend the position of the seamstress at her work as hygienic? as calculated to develop all parts of the body? as tending to an erect carriage or a firm step? However valuable the use of the needle may be as an art, it cannot claim to be ranked very high as a factor in

education.

The preparation for needlework, the science of cutting and fitting, is properly a branch of drawing and geometrical application, and as such is rightly considered within the scope of the school; but even that

is of limited value in increasing physical and mental growth.

The workshop, as arranged in the best schools for manual training, leaves little to be desired in the way of the best exercise for all the muscles. Watch a boy at the bench and see how, in the progress of his work, every muscle from head to foot is called into play and with this advantage over the gymnasium, that it is all unconsciously done, the boy's mind being on his work. The mental stimulus which the boy receives from the workshop has been abundantly proven receives from the workshop has been abundantly proven.

What can take the place of the workshop in the education of girls?

Educators are everywhere clamouring for physical education for girls as a necessity, and yet no general effort has been made to give the girls a chance at the work-bench, although some schools have done so. It is an additional expense for one thing and since, after all, the school is utilitarian to a certain extent, that subject which is useful

as well as educational will find a readier foothold.

But along with the use of tools in the development of civilised man came another advance, as marked, and not less important, i.e., the cooking of food. In all the march of civilisation the two have gone hand in hand. The sayage woman built the house as well as cooked the food. Man has taken the

building off her hands, but the cooking still remains her province. What training does she receive for this most important office—an office not less important to the welfare of the community than the use of tools?

Can cooking, the use of kitchen tools, be placed on a level with the workshop tools, as a means of mental and physical training? Let the sceptic go into one of the school kitchens and see the girls standing at their benches, with the measuring cup and scales, instead of a foot rule, with the moulding board and rolling pin instead of the plane, the dough for a loaf of bread instead of a piece of pine board, their hands the most effective tool of all. Let them watch their graceful unstudied motions as they tidy up the desk while the prepared dish is cooking; let him note their bright faces as the soup is tasted, and then tell whether there is no value in the work as a physical development and a mental exercise in judgment, exactness and neatness, if the "executive faculty, the most important of all our powers in the practical work of life" is not called into play by the bringing of the preparation of materials and cooking within the specified time? within the specified time?

As, in the case of the workshop, after the fundamental principles are learned, the pupil has the satisfaction of making a table or a chest of drawers, in order that he may more clearly see the bearing of each separate process, so the girl prepares a set of dishes, as a tangible evidence that she has understood the principles involved, not merely for the sake of making the dish.

Consider for a moment the scientific principles which are called into play in the preparation of so simple a dish as a steamed pudding. First a fire is built. The kindling point of coal is at so high a temperature that the heat of a match is not sufficient to ignite it, therefore some wood is first set on fire. But this cannot be lighted by the heat of a match unless it is in shavings or fine splinters which will in their turn give heat enough to set on fire the larger pieces, and this will heat the coal so that it will burn. None of these substances will burn unless they have sufficient oxygen to combine with the carbon and hydrogen which they contain. If they do not burn there will be no heat, hence the amount of air which passes through the wood and coal must be regulated by the drafts of the receptacle in which the combustion is going on, i.e., the stove. Too much air will carry the heat produced by the union of the oxygen and carbon and hydrogen up the chimney. After a fire is well started, steam to cook the pudding is required. A pan of water is set over the fire, and by means of the conducting power of the metal of which the pan is made the water is heated. First little bubbles of air are so expanded by the heat as to rise to the surface and escape; then some of the water nearest the metal is so heated that it becomes gascous and rises in large bubbles to the top where the bubbles are cooled to water again, and seen to disappear. Soon, however, the top becomes heated by these bubbles of steam so that they escape as steam, carrying with them the heat which was required to form them; this heat is given up to any cooler substance with which the steam comes in contact and so it becomes heated. While the water is coming to this temperature, the dough is to be prepared. Wheat flour is used, because it contains all the substances which are needed for the nutrition of the human body. Starch and some fat to be combined with oxygen in the tissues to furnish the heat needed to keep the body from ten to one hundred degrees warmer than the outside air, according to the season, and to furnish some of the tissues with food which they need. Flour also contains gluten and some other nitrogenous substances which not only enable the cakes made from flour to become light, i.e., porous, because of its glutinous character, but also to furnish nitrogenous material for the repair of the muscular tissues and probably to fulfil some other as yet unknown office in the economy of the human body.

The flour being good for food in itself must be made digestible and palatable, the three requisites in any food. Flour being dry must be moistened, therefore water is added in just such quantity as will be taken up by the starch grains and swell them but not allow them to become pasty. But the saliva must penetrate every particle of starch with its change-producing ferment, and while savage man ate parched grain, chewing it a long time, civilized man prefers a quicker method and so makes the mass of cooked flour porous with the aid of carbonic acid gas introduced either by the use of a ferment yeast, or more quickly by a chemical preparation of baking powder. When the batter is heated all through to the boiling point of water, 212° F., the gluten is stiffened so that the mass is elastic, the starch has taken up the water and become dry. The pudding has now to be taken out and served with some flavored saure.

The school-girl who has had the elements of chemistry and physics which are too often taught as abstract subjects, summed up and applied to the making of a simple dish has had her mind awakened to

abstract subjects, summed up and applied to the making of a simple dish, has had her mind awakened to

the relations and inter-dependence of things, as no other training now given can awaken it.

The objector may say that a pudding made by practiced hands is just as good as one made by the hands which are actuated by all this brain knowledge. It is quite true, but the advocates of manual training as a factor in education turn their eyes first of all and chiefly to the effect on the child (not to the results as shown in the work accomplished, for the sake of results only) for the proof that the training

has been successful in that which it aimed to accomplish, namely, a result on the mind of the child.

Often the most effective lessons are those which are indirectly learned. Thus, not the least of the many values of the training in the cooking school is the indirect one of neatness, cleanliness, and

promptness.

This effect cannot be better expressed than it has been by a master in science: "A fact discovered by a child for himself through his own direct observation becomes a part of his being, and is infinitely more to him than the same fact learned by hearsay or acquired from a lesson book. The idea of discovery should be encouraged in every way among children. We should remember that to them the whole of nature is an unknown world into which their young souls, timidly or adventurously, as the case may be, advance. If we can help them to push forward boldly and see things for themselves we do them an inestinable service, not only adding to the joy of their childhood but kindling for them a light that will illumine them all their future life."

The training has been so far tried in two different places in the curriculum—in the grammar school and in the high school. At present, I am unhesitatingly in favour of beginning at the earlier date. The age of ten or twelve is my own proference, for several reasons.

First:—The child of ten or twelve is still observant, even if she has been so unfortunate as to miss the early training of the kindergarten. She is still retentive in memory, without effort, especially in regard to things which she sees and handles herself.

Second:—The experience so far gained has shown that, as a rule, the younger children (twelve to fourteen years of age) very readily appreciate and very deftly perform the house-keeping part of the lesson. They wash the dishes and put them in place with a zest which is wanting in the case of the older girls.

Third:—At twelve she needs pleasant bodily occupation rather than prolonged mental work.

Fourth :- She needs a mental distraction, an interest outside herself, and interest in things and an illustration of the power of mind over matter; a control of the forces of nature. An inquiry into the reasons of things is of great benefit to the growing girl. At an age when dolls begin to be thrown aside, let the child begin her preparation for womanhood by practicing that most fascinating of all rainy day

plays, playing cook, but under the eyes of the judicious teacher.

The work to be laid out in the school kitchen corresponds very well with the course in the

workshop.

First the preparation and the clearing away: the care of the fire, the tidy ways of the kitchen—in short, the house-keeping part. Then the construction of single parts, simple boiling, broiling, and baking. Finally the preparation of a whole and its orderly arrangement, mixing, flavouring, and combining of dishes. Whether these three parts shall be all combined into one course, or whether there shall be two or three soparate courses, extending over as many years at less frequent intervals, depends upon circumstances. For the elementary instruction in the grammar school two years at least are needed for the best development of the science. It would then seem wiser to follow the natural order and arrange for the younger children to take that most essential part of the lessons, the housekeeping part, either as a morning lesson, preparing the materials for the afternoon class to combine into dishes, or a certain number of them to serve at the same time that the other lesson is taking place.

The first plan would seem to be preferable, since all confusion should be avoided and all distraction of the mind from the work of the hand. Also there should always be time allowed for the full performance of the work, for, as in all science teaching, the child should never be told what is to happen. She should

see for herself what will take place under given conditions.

When, however, one teacher has to oversee two sets of workers, a loss of power is unavoidable. Two teachers, one for each class of workers, would of course solve the difficulty. In any case, care must be taken not to crowd too much into a single lesson, and especial care must be taken to have each lesson a preparation for the next, that there may be a clear and orderly progression from beginning to end. There is a limit to the absorbing powers of a child's mind.

If, however, the lessons on domestic economy are delayed until the pupils are in the high school, the first endeavour must be to bring into line whatever of science training they have had; their interest must be awakened in the applications of the laws they have learned in their school laboratories. For them the school kitchen is only another kind of chemical laboratory. They should be already familiar with the use of the thermometer and with the properties of starch and sugar, so that they may at once begin the preparation of food and the study of its composition. In case of a possibility of a three years course in the high school, the third year should give an opportunity for the class to combine the foods prepared by the other classes into a suitable dinner with the refinements of service, and with careful calculations as to cost of materials and of preparation.

So little attention has been paid to the science of cooking, there is a wide field here for original

In all this discussion the reader will bear in mind that the standpoint is that of the public school, and the aim is an educational one throughout, just as much as if the topic under consideration were the teaching of arithmetic or geometry. It is the development of the child in character, in mental ability, in more strength, by means of the training advocated. "It is not the production of a skilled class of workers in one line.

This distinction should be borne in mind constantly, because there are trade schools in cookery just as there are trade schools in carpentry and mental working. Both are admirable for certain purposes, such as giving free instructions to the children of the poor or affording an opportunity to those who wish to make a better living; or offering advantages to grown people to improve their condition, or opportunities

to acquire useful knowledge.

It has been very difficult to prevent the two forces of philanthropy and education from collision over this matter, and at the risk of being tedious the writer must emphasise the distinction again as a reason for the comprehensiveness of the course on domestic economy which at first sight may seem to be absurdly extended so as to cover all the sciences. But where do all the sciences meet if not in the home, the centre of all activity, the pivot about which revolves comfort, health, and happiness, or sickness, poverty, and heartache? Upon the education of the American school girl depends the future of the American hon.c.

The science of home life should keep pace with the improvements in outside affairs. At a time when all the food products of the world may be found in the markets of any city, and when electric lighting and steam heating are common in dwellings, the housekeeper needs a correspondingly broadened education.

At present it will be difficult to find teachers fully equipped for carrying out the ideal course in

domestic economy; but the demand will bring the supply.

Colleges and scientific schools are waking up to the needs of the time, and courses in physiology, hygiene, and sanitary science are being established with reference to the requirements of such teaching.

### APPENDIX R.

#### DOMESTIC ECONOMY AND HYGIENE AS TAUGHT BY THE MUNICIPAL GOVERN-MENT OF THE CITY OF PARIS.

#### COURS SUPERIEUR.

Une leçon de trois quarts d'heure par semaine pendant laquelle les élèves pourront, tout en écontant le professeur, se livrer à des travaux de couture.

#### PREMIER TRIMESTRE.

Economic Domestique.

Définition de l'économie domestique. Devoirs d'une maîtresse de maison.

Qualités d'une bonne ménagère; ordre, économie, propreté, vigilance, etc.

Comptabilité du ménage: carnet journalier, balance, équilibre du budget.

Invêntaire du mobilier.

Loyer, Impôts. Engagement de location; bail, congé.

Hygiène.

Définition de l'hygiène. Hygiène de l'habitation.

Choix de l'habitation; exposition, salubrité.

Ventilation, aération.

Entretien de l'habitation et du mobilier au point de vue sanitaire.

DEUXIEME TRIMESTRE.

Mobilier de l'appartement; choix et entretien. Distribution du travail de la ménagère.

Travaux d'entretien par jour, par semaine, par saison, etc.

Conseils sur la manière de faire un lit, de balayer, d'épousseter, etc.

Meubles et ustensiles de cuisine, différentes espèces de fourneaux.

Allumage des feux.

Entretien et allumage des lampes.

Entretien des ustensiles de cuisine, de la vaisselle,

Combustible.—Donner les indications économiques sur les différentes sortes de combustibles, sur leur emploi.

De la Cave.—Exposition, aménagement, soins à donner au vin, conservation.

Chauffage et éclairage au point de vue de l'hygiène. Aération des locaux pourvus d'un appareil de chauf-

Dangers des poêles dans les chambres à coucher,

précautions à prendre. Propriétés des différentes espèces de combustibles, de leur influence sur l'appareil respiratoire.

Divers modes d'éclairage.

Des précautions à prendre dans l'emploi des lampes à essences minérales, des appareils à gaz, etc.

Influence de l'éclairage sur la vuc. Hygiène de la

### TROISIEME TRIMESTRE.

Choix et entretien du linge et des vêtements.

Matériel nécessaire aux travaux de couture.

Emploi de la machine à coudre.

Confection du linge et des vêtements.

Raccommodages divers : reprisage, rapiéçage, etc. Blanchissage.—Matériel nécessaire au blanchissage et au repassage. Des différents modes de

blanchissage, lessive, savonnage.

Conseils pour laver le linge, le plier, le repasser.

Des différentes sortes de taches et de la manière de

Hygiène du vêtement. Propriétés diverses des tissus: soie, laine, coton, toile, etc.

Couleurs des vêtements, leur influence.

De la forme des vêtements au point de vuc de l'hygiène.

Proproté du linge et des vêtements, son influence sur la santé.

les enlever. Le professeur rendra aisément cette leçon attrayante : elle doit reposer l'élève des études plus difficiles et plus abstraites qui exigent un effort soutenu de l'esprit. L'économie domestique est en quelque sorte la relation journalière des occupations de la femme dans son ménage. Presque toutes les jeunes filles reconnaîtront dans ces leçons les principes qu'elles voient appliquer chaque jour dans leur famille; mais sur lesquels il faut insister pour les leur faire observer. Rien n'est nouveau, par conséquent rien ne sera difficile pour elles dans cette science toute féminine qui paraît si naturelle à la femme qu'on s'étonnerait presque de devoir la lui enseigner.

Nous conseillons au professeur d'accompagner ses leçons d'exemples pris dans la vie usuelle et de parler aux yeux des élèves au moyen de dessins exécutés sur le tableau noir.

### COURS COMPLEMENTAIRES.

Une leçon de une heure et demic par semaine.

### PREMIER TRIMESTRE.

### Economic Domestique.

Hygiène.

Révision des matières étudiées pendant l'année précédente au cours supérieur.

Révision des matières étudiées pendant l'année précédente au cours supérieur.

### DEUXIEME TRIMESTRE.

Alimentation.

Viandes de Boucherie.

Volaille, gibier, poisson, lait, Choix et qualité.

beurre, œufs.

Boissons.—Vin, bière, cidre, eau potable

Principes élémentaires de la cuisine. Pot-au-feu, rôti, sauces et assaisonnements, cuisson des légumes.

Provisions du ménage.

Beurre, œufs, huiles, etc; confitures et conserves.

Conservation des légumes et des fruits.

Hygiène de l'alimentation.

Propriétés nutritives des aliments, leur digestibilité. Boissons; alcools.—De la sobriété.

De l'usage des fruits. Précautions à prendre en cas d'épidémie.

Danger des fruits verts. Falsification des aliments.

TROTSIEME

#### TROISIEME TRIMESTRE.

Du jardinage. Son utilité et son agrément.

De l'utilité des engrais.

Distribution du jardin. Culture des arbres, des

légumes et des fleurs. Le Jardin medicinal.

Savoir vivre. Des lettres officielles, pétitions, etc.

Conseils pour quelques cérémonies.

Hygiène du corps.-Ablutions, bains, soins de propreté.

Sommerl, exercice, repos.

Préparation de tisanes et de quelques médicaments.

Petite pharmacie du ménage.

Précautions à prendre en cas d'épidémies.

Vaccination et revaccination.

Maladies et accidents.

Soins à donner aux malades et aux convalescents.

Dans ces leçons théoriques d'économic domestique, le professeur devra faire intervenir les élèves qui sont exercées à tour de rôle à l'enseignment pratique du ménage (chaque jeudi, par série de dix pour la cuisine, et dix pour le blanchissage et repassage). Il leur demandera d'expliquer à haute voix, à leurs compagnes, les opérations de cuisine et de blanchissage auxquelles elles auront pris part dans la leçon précédente. Cet exercice aura le double but d'habituer les élèves à s'expliquer clairement sur des questions simples et faciles en même temps qu'il les forcera à prêter plus d'attention à des opérations qu'elles s'attendront à décrire devant toute une classe.

### COURS D'APPLICATION.

### Cuisine-Nettoyage-Blanchissage.

Ces cours ont pour but de compléter par des exercices pratiques les notions théoriques données aux jeunes filles dans le cours d'économie domestique, de leur en montrer l'application et de leur donner le goût, sinon la science complète du ménage, si nécessaire à toutes les femmes. A l'aide de ces leçons et des principes qu'elles y auront puisés, elles pourront rendre des services dans leur famille et perfec-

tionner par l'expérience et par la pratique les premières connaissances qu'elles auront acquises.

Les cours d'application ont lieu le jeudi, de huit heures et demie à deux heures, du 1<sup>er</sup> octobre au 1<sup>er</sup> juin dans toutes les écoles qui possèdent un cours complémentaire.

Division en Deux Cours.—Ils se divisent en deux cours: 1° Le cours de cuisine, confié à une maîtresse cuisinère; 2° Le cours de blanchissage, repassage, nottoyage, etc., confié à une maîtresse blanchissage. chisseuse.

Ces deux cours sont dirigés et surveillés par deux des adjointes chargées du cours complémentaire.

Durée de Chaque Série de Cours.—Chacun de ces cours sera suivi par dix élèves environ et com-prendra huit leçons. Sa durée est donc de deux mois par série de vingt élèves.

Les élèves des cours de cuisine passeront au cours de blanchissage au bout des deux mois de cours et réciproquement, de façon à prendre part, en quatre mois à tous les exercises du cours de cuisine et du cours de blanchissage. Du 1er octobre au 1er juin, quarante élèves environ devront donc recevoir l'enseignement ménager.

Local.—Le cours de blanchissage et de repassage pourra avoir lieu dans le préau couvert. aménagera des tables sur des tréteaux, des planches à repasser, des fourneaux à gaz pour chauffer les Le matériel volant sera fers, des baquets pour laver le linge, une armoire pour renfermer l'outillage.

enlevé après chaque leçon.

Il serait à désirer qu'une pièce spéciale fût affectée à l'enseignement de la cuisine. A défaut de cette pièce, il faudra se contenter de la cantine de l'école, à condition que cette cantine soit assez vaste, bien ácrée, bien éclairée et en dehors du logement de la concierge. Il sera nécessaire de ménager dans cette cantine un espace spécialement réservé aux ustensiles de la cuisine du jeudi, qui ne doivent en aucun cas servir à la cantinière, et d'y placer une armoire fermant à clef pour y serrer la vaisselle et les provisions de ménage.

Cours de Cuisine.—Le cours de cuisine comprendra l'achat des provisions necessaires au déjouner et dont la liste est fixée d'avance par le menu du jour<sup>1</sup>, la tenue du carnet de dépenses, la préparation et la cuisson des aliments, la mise du couvert. Toutes ces opérations devront être décrites au fur et à mesure de leur exécution. Cette première partie de la leçon durera de huit heures et demie à midi. Les élèves, ainsi que la maîtresse, déjeuneront ensuite et jugeront elles-mêmes de la qualité des mets confectionnés (Elles apporteront de chez elles leur pain et leur vin.)2 par elles.

Après le déjeuner, tout devra être remis en ordre, la vaisselle lavée, les ustensiles de cuisine nettoyés. Les deux maîtresses adjointes feront chacune pour la section qu'elle aura surveillée un resumé oral des opérations du jour pendant lequel les élèves prendront des notes, qu'elles auront à rédiger pour la leçon suivante en les accompagnant du compte de la dépense et du prix de revient de chaque plat par

On trouvera plus loin huit menus d'été et huit menus d'hiver. On y vera désignés des accommodements de viandes froides tels que: miroton, hachis, croquettes, etc. Ces accommodements des restes de la veille sont si nécessaires dans un ménage que l'on ne devra pas s'arrêter à la difficulté qu'ils présentent nécessairement dans un cours qui n'a lieu qu'une fois par semaine. Un pot-au-feu, fait le mercredi à la cantine de l'école, permettra de conserve pour le lendemain un morceau de bœuf bouilli qui sera accommodé par les élèves de la classe de cuisine.

Cours de Blanchissage et de Nettoyage.-L'emploi du temps des cours de blanchissage et de nettoyage, est également réglé pour chaque leçon. La directrice de l'école comprendra la nécessité de procurer aux élèves quelques objets mobiliers à nettoyer. Le matériel de l'école en fournira d'ailleurs un

certain nombre.

Chaque élève de ce cours apportera les quelques objets de linge qu'elle devra laver et repasser.

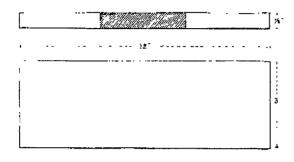

<sup>1</sup> Trois élèves accompagnées de la maîtresse quisinière et sous la surveillance d'une maîtresse adjointe iront chaque jeudi faire les provisions ·lu jour. <sup>2</sup> Les dix élères du cours de blanchissage devront apporter leur déjouner.

#### APPENDIX.

### PENNSYLVANIA STATE COLLEGE.

THE following Series of Plates, showing the carefully arranged course of shop work in wood and iron working, from the Pennsylvania State College, is the best available illustration of a progressive series of exercises for a course in mechanic arts:—

### FIRST LESSON.

#### PLANING

The student is given a rough one inch pine board, from which he is to saw a piece 12 inches long and 4 inches wide. The difference between a ripping and cross-cut saw is here explained to him. He planes one side smooth, using the proper planes, and from this face the edges and other side are worked, making the edges at right angles and face parallel to the working face. No effort is made in this exercise to work to dimensions.

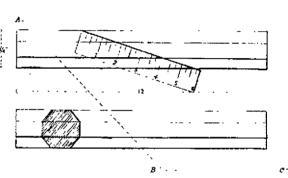

### SECOND LESSON.

### PLANING SQUARE PRISM.

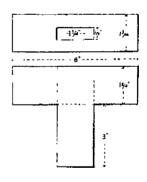

In this exercise, the material is 14 inches long and 2 inches square section. Two adjacent sides are first smoothed, care being taken to keep them at right angles to each other. With a gauge, it is then marked to 13 inches square, and carefully worked to these lines. One end is then dressed with block plane, and the piece sawed off and dressed to a length of exactly 12 inches.

### THIRD LESSON.

The finished piece of the last exercise is now taken, and by method illustrated in accompanying cut, is marked so as to be planed to a regular octagon. The bevel is put at angle A B C =  $135^{\circ}$ , so that the work can be tested as it proceeds.

### FOURTH LESSON.

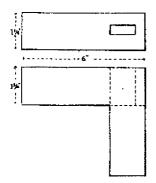

THROUGH MORTISE AND TENON.

In this, as in the two following, the piece is gotten out 12 inches long, and squared as in No. 2. It is then sawed in two pieces,  $5\frac{1}{2}$  and  $6\frac{1}{2}$  inches in length. Mortise is laid off on  $6\frac{1}{2}$ -inch piece, and tenon on  $5\frac{1}{2}$ -inch piece, marking being done with knife, except when mortise gauge is used. The tenon is cut with the back saw, and the mortise bered and chiselled out. The ends are then cut to proper dimensions.

(138-25)

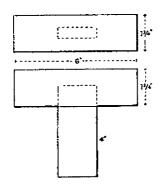

### FIFTH LESSON.

POLISHED MORTISE AND TENON.

This piece is merely another form of No. 4, involving the same operations, with a few modifications, as can be seen in the drawing.

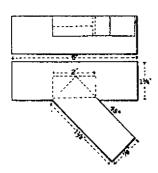

### SIXTH LESSON.

Double Mortise and Tenon.

The same as previous lessons, except there are two mortises and tenons instead of one.

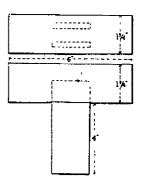

### SEVENTH LESSON.

BRACE MORTISE AND TENON.

The brace is put at an angle of 45°, and made of material  $1\frac{1}{2} \times \frac{7}{8}$  inch. Tenon is flush with one side of brace, and a shoulder cut on end. The whole brace is slightly dropped into mortise piece.

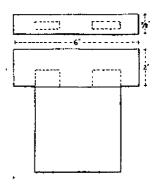

### EIGHTH LESSON.

CONCEALED MORTISE AND TENON.

This differs from the preceding only that the mortise does not pass through the piece.

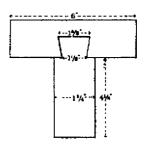

### NINTH LESSON.

DOUBLE MORTISE AND TENON.

Another form of double mortise and tenon, made from inch material; differing slightly in detail, and being somewhat more difficult to fit.

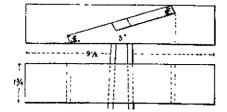

### TENTH LESSON.

OPEN DOVE-TAIL JOINT.

The most elementary form of a dove-tail joint, affording exercise in laying off, and cutting the mortise and tenons at oblique angles.

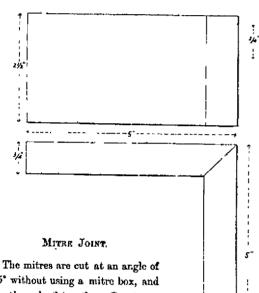

### ELEVENTH LESSON.

KEYED SCARF JOINT.

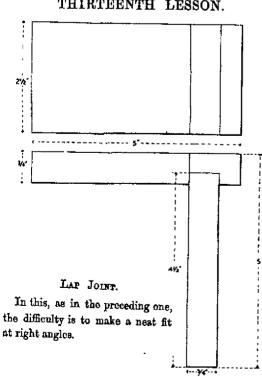

This, on account of its oblique faces and splayed ends, is somewhat difficult to fit. The key forces the pieces into position, and securely holds them there.

### TWELFTH LESSON.

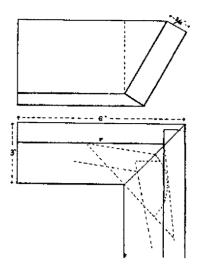

45° without using a mitre box, and are then glued together. Great cere is required to make the glued pieces form a right angle.

### THIRTEENTH LESSON.

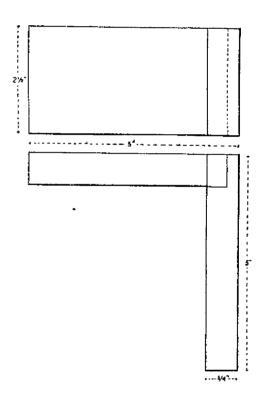

### FOURTEENTH LESSON.

Hopper Lap Joint.

In the drawing but one angle of the hopper is shown, but the student makes the complete hopper. The method of laying off the work, which is somewhat complicated, is fully explained to him, and in no case is he permitted to proceed until it is laid out with precision.

### FIFTEENTH LESSON.

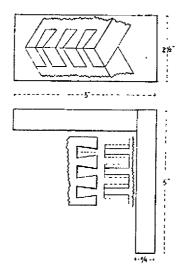

GAINED JOINT.

The inner surface of the gain must be flat and true, in order to produce the proper angle. The joint is glued.

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE, SYDNEY, NEW SOUTH WALES.

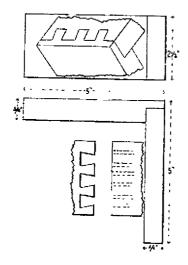

## SIXTEENTH LESSON.

LAP DOVE-TAIL JOINT.

A more difficult form to lay off, cut, and dress.

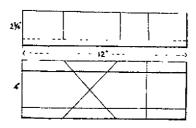

## SEVENTEENTH LESSON.

THROUGH DOVE-TAIL JOINT.

The simplest form of a dove-tail joint at right angles, affording practice in laying off, cutting, and dressing the corresponding parts to exact form and dimensions.

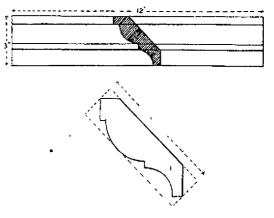

# EIGHTEENTH LESSON.

MITRE BOX.

The box is for subsequent use in sawing mitres, and must be made with great precision, angles, and right angles, and bottoms of uniform width.

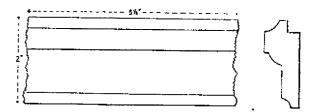

## NINETEENTH LESSON.

Moulding.

In this the work is laid off from an oblique section, as indicated in drawing, but of full size. The drawing of the oblique section is laid upon the material at the proper angle and pricked through, thus marking the lines at which the surfaces change direction. The proper tools are now taken, and the material worked to the desired form. The hollow and rounding planes are used here for the first time.

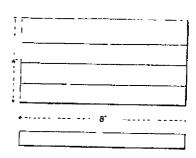

## TWENTIETH LESSON.

Another Form of Moulding.

Much as the former, except here a right section is taken from which to lay off the work, and the marking is done on the end of the piece.

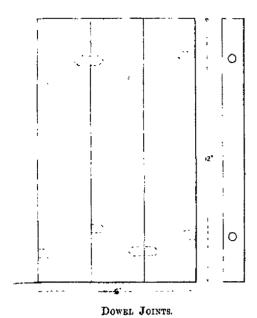

## TWENTY-FIRST LESSON.

GLUE JOINTS.

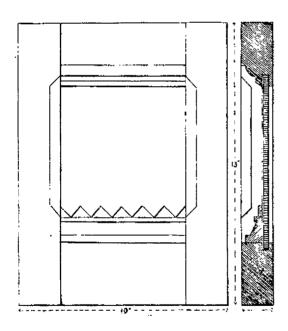

This is made from alternate Cherry and Walnut strips, so that the quality of the work can be seen at a glance.

#### TWENTY-SECOND LESSON.

In this also two kinds of wood are used alternately. The drawing shows the nature of the work.

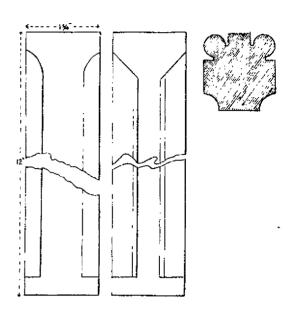

## TWENTY-THIRD LESSON.

## GOTHIC PANEL.

This exercise affords a variety of work. The inner edges of stiles are chamfered, the upper rail has moulding worked upon it, and the bottom of panel is veneered along the top of a piece of moulding placed above the lower rail. The panel and veneer are made of fancy woods, thus presenting a handsome appearance when completed.

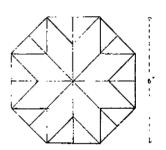

#### TWENTY-FOURTH LESSON.

#### WOOD CARVING.

The work is laid off with gauge, after the stick is dressed equare. Templates are made from curves in full size sectional drawings. The cutting is done with chisels and carving tools, the templates being frequently applied in order to keep the moulding of proper shape and uniform size.

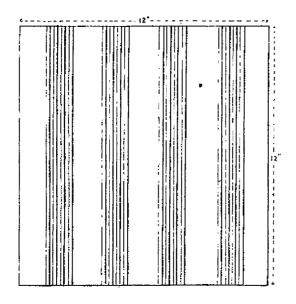

## TWENTY-FIFTH LESSON.

#### ORNAMENTAL VENEERING.

The different pieces of vencer are made of different kinds of wood, thus producing a beautiful effect. It requires considerable care to bring the lines of divisions as indicated in the drawing.

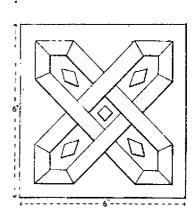

#### TWENTY-SIXTH LESSON.

ORNAMENTAL INLAYING.

Seven narrow strips of different kinds of veneer are glued together, so as to form a piece  $\frac{3}{4}$  inch wide. That is then inlaid in a solid piece of hard wood, as shown in the drawing, a number of them being placed at regular distances apart.

## TWENTY-SEVENTH LESSON.

MARQUETRY.

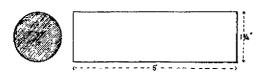

The narrow strips and diamond-shaped pieces are inlaid, and made of different wood from the block into which they are put.

## MACHINE WORK IN WOOD.

The appliances for this work are as follows:--Six wood-turning lathes, strained scroll saw, planer, and circular sawing machine. With each lathe is a set of six turning chisels, a set of six gouges, a parting tool, a pair of calipers, a pair of compasses, a try-square, a two-foot rule, and an oil can.

In this course, not only the use of tools is necessary, but the eye must be carefully trained, as many of the varied forms which arise in wood-turning are tedious and difficult to measure. A skilled workman should, therefore, be able to produce work without measuring the smaller details that shall conform substantially to the drawing.

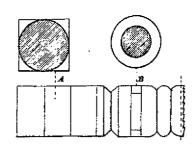

## FIRST LESSON.

#### A CYLINDER.

A piece 9 inches long and 2 inches square is taken. The corners are turned off, and it is worked down to nearly the desired size with the gouge. The chisel is then used to work it to the given dimensions, which is determined by frequent application of the calipers.

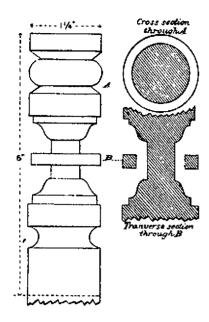

#### SECOND LESSON.

COMMON OUTS IN TURNING.

The drawing represents half the length, the remaining half being a repetition of what is shown. In this the cutting lines are marked, and the depth is gauged by the use of calipers, but the forms of the curves in middle of the piece are determined entirely by the eye.

#### THIRD LESSON.

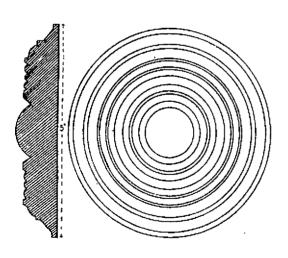

#### ORNAMENTAL TURNING.

In this we have a variety of curves, besides a loose ring to be turned upon the small cylinder, as shown in the transverse section in the drawing. The parts are all worked to given dimensions.

. These pieces represent the elementary part of the work, and the student is kept upon these until he can produce them accurately, and with rapidity.

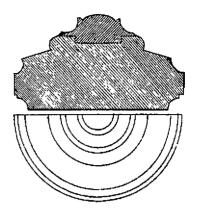

## FOURTH LESSON.

FACE PLATE TURNING.

A piece, 6 inches square, is fastened upon the face plate, from which the rosette, as indicated in the drawing, is to be turned.

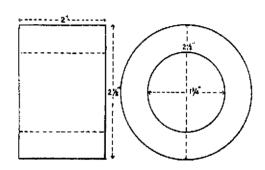

## FIFTH LESSON.

NEWEL POST CAP.

The main part of the cap is made of Walnut. The central resette, which is turned to fit into it, is of Cherry.

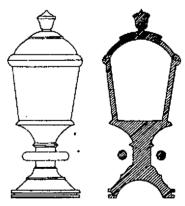

## SIXTH LESSON.

A CYLINDRICAL RING.

This piece is turned, both inside and outside, and consequently requires two chuckings. It is made of either Cherry or Walnut.

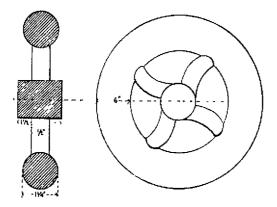

## SEVENTH LESSON.

ORNAMENTAL VASE.

As can be seen in section, the vase is made with a lid which fits neatly upon it. The vase is turned both inside and outside, as in case of the ring, but here the chucking is more difficult, and fitting the lid requires very careful work. There is a loose ring turned on the stem.

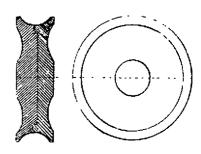

#### EIGHTH LESSON.

HAND WHEEL

The rim and hub are turned. The spokes are cut out with saw and chisel.

## NINTH LESSON.

GROOVED WHEEL.

It is made in two pieces, each of which is turned separately on an arbour. The inner part of one is turned the reverse of the other. When worked to nearly the given dimensions, they are both put upon the same arbour, driven tightly together, and finished in this position.

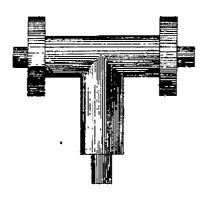

## PATTERN-MAKING.

The student is now ready for pattern-making, in which he will apply the knowledge and skill acquired in both carpentry and wood-turning.

As the applications for patterns extend into nearly every industry, a great variety of forms is required, and from these many courses of equal value might be arranged. In this course, with a few exceptions, we have, therefore, no fixed exercises for each class. After a few preliminary ones, the students are required to make patterns from drawings, previously made, of some machine or part of a machine, which they are to construct later in their course.

The fact that the patterns are to be actually used is an incentive to good work. During the construction the student is shown how the grain should lie in the different pieces forming the pattern; where and what allowance is to be made for warping, shrinking, &c., and in what manner the different forms should be constructed to draw properly from the sand. The following plates are only preparatory to this course:—

## FIRST LESSON.

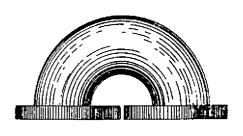

T PIPE.

The pattern is made in halves.

The body and flanges are first completed, the branch is then made and fitted to the body. Care must be taken that the branch is of such length that the fitting will bring to the size desired.

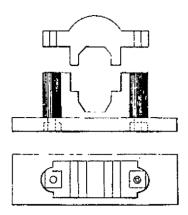

#### SECOND LESSON.

RETURN BEND.

A ring, semi-circular in section, is first turned of such a radius as desired for the bend. As much of this is then taken as required for the pattern. The half flanges are fastened by screws passing through the centre of the pattern into the flange.

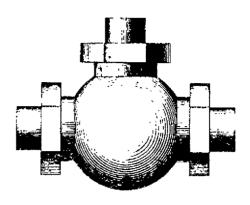

#### THIRD LESSON.

PILLOW BLOCK.

A piece is first prepared for the base of the desired size, allowing for the contraction of the casting in cooling. The pattern is built up from this, as indicated in cut. The student is also required to make the core box.

#### FOURTH LESSON.

GLOBE VALVE.

In this the two pieces of wood are taken of sufficient size, so that when pegged together the ball or body of the pattern can be taken out of them. The branch is then made and fitted to the ball.

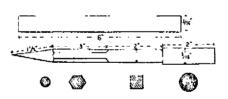

## FORGING.

. For this work there are eight Sturtevant forges, each supplied with blast by a power blower, each provided with an anvil, tongs, punches, heading tools, hot and cold chisels, hammer, and a 2-foot square. There are also in this room four complete sets of swedging tools, set hammers, flatters, fullers, sledges, two large box vices, and a self-feed post drill. A drawing, laid out to the working dimensions, is placed in the forge-room for reference during the exercise. The piece is then forged in detail by the instructor before the class, calling attention to the important points as he proceeds with the work. The student himself is then required to forge the piece, the instructor giving assistance only in case of necessity.

#### THE FIRST LESSON

COMPRISES the building and keeping of forge fires in proper condition, upon which, in forging, so much depends. The student is also shown what degree of heat is necessary, and how to determine when that degree is obtained for the successful working of the various forms.

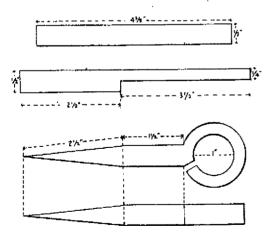

## THIRD LESSON.

DRAWING AND FORMING.

As seen in the cross sections of the finished piece, a portion is round, another is square, another octagonal and the one end tapered to a round point. The student is here shown that a welding heat is necessary in drawing common iron, otherwise its parts are likely to separate lengthwise.

## SECOND LESSON.

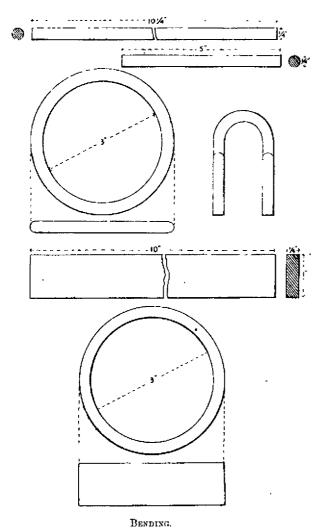

DRAWING, FORMING, AND BENDING.

The successive steps of the exercise are fully explained by the drawing.

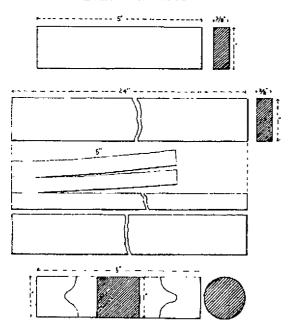

(138-2 T.)

## FOURTH LESSON.

One har each of round and flat iron are bent in circular form and welded. In forming the staples, drawing as well as bending is involved. Whenever possible, useful forms are invariably selected, but the introduction of principles is considered of the first importance, and frequently much time can be saved by taking plain forms.

## FIFTH LESSON.

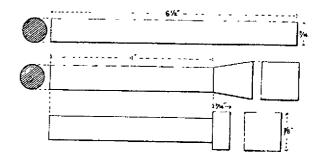

#### FIFTH LESSON :- Continued

#### FAGOT WELDING.

The one piece is two feet long, for the purpose of holding it while welding upon it two 4-inch pipes. In welding and rounding the ends, it is drawn out 1 inch. It is then cut off, and the ends dressed, making the finished piece 5 inches long.

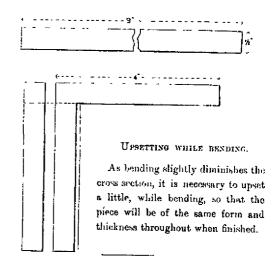

## SIXTH LESSON.

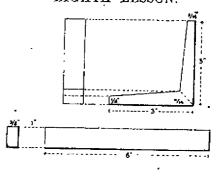

UPSETTING AND BOLTMAKING,

The material is 6 inches long. By upsetting it is diminished in length, while the part upset is increased in cross section, and squared in preparation for the head of the bolt of the finished piece.

#### SEVENTH LESSON.

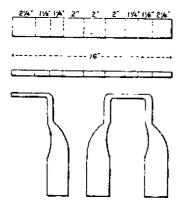

## EIGHTH LESSON.

Upsetting before bending.

This piece is made heavy at the middle, and bent of that point. It makes a much stronger angle than the preceding one.

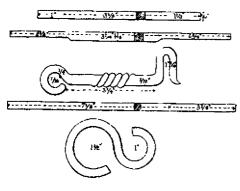

## NINTH LESSON.

BENDING AND TWISTING.

The bar is bent without upsetting. It is a post floor hanger, and is twisted to bring it to the proper shape to receive the timber.

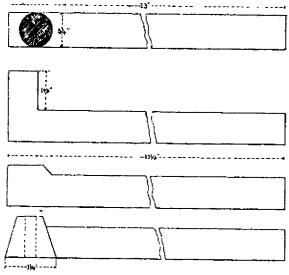

## TENTH LESSON.

DRAWING, BENDING, AND TWISTING.

The ends are drawn out for hook and eye, and made round. The twist in central part is ornamental. The S hook is to accustom the student to forming graceful curves with iron.

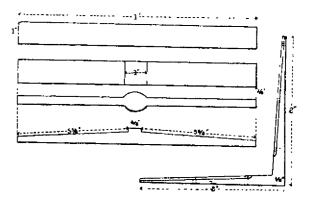

# ELEVENTH LESSON.

Upsetting, Welding, Forming, and Punching.

A tool for making the heads of bolts, &c., called a heading-tool.

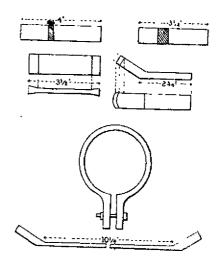

## TWELFTH LESSON.

BRACKET.

This involves upsetting, drawing, bending, chamfering, and punching.

## THIRTEENTH LESSON.

Rixc

The ring is made from 3 pieces welded together. The main part being made of lighter material than the ends and angles.

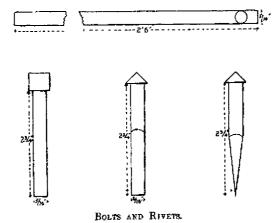

## FOURTEENTH LESSON.

BUTT OR JUMP WELD.

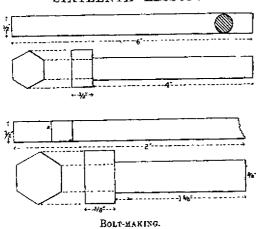

The ends are upset and made square, after which they are welded by butting them together. Instruction is given as to how the weld should be dressed to preserve its strength.

## FIFTEENTH LESSON.

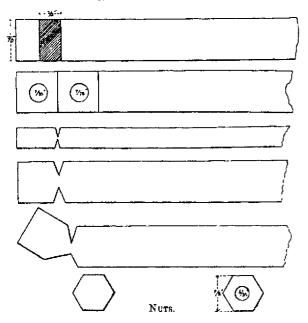

These are formed with the heading-tool made in Lesson Eleven. The principal feature in this exercise is to keep the stem in the centre of the head.

## SIXTEENTH LESSON.

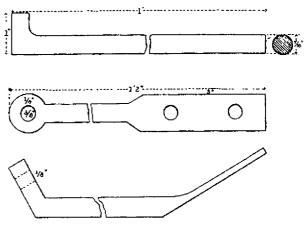

The stock is upset, as in a previous lesson, but in this the head is made hexagonal, instead of square. Great care is necessary to make the head regular, and, as in the lesson above, to keep the body of piece in centre of head.

## SEVENTEENTH LESSON.

The drawing explains the method of making hexagonal and square nuts.

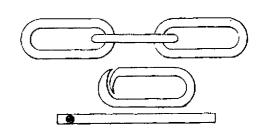

#### EIGHTEENTH LESSON.

EYE STAY OR BRACE.

The two ends are bent so as to be at right angles, to each other while making different angles with the bar. The eye is formed from the hody of the piece, while the tang is formed separately and welded on.

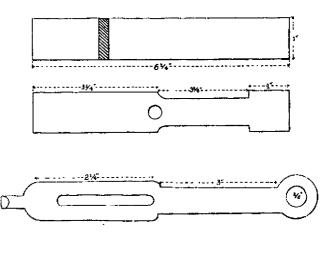

#### NINETEENTH LESSON.

WELDING LINKS.

In this the scarf is somewhat different from that in the ordinary weld. The links are twisted in the finished chain.

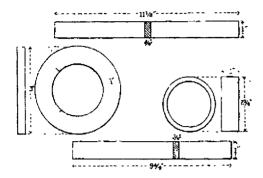

## TWENTIETH LESSON.

HASP.

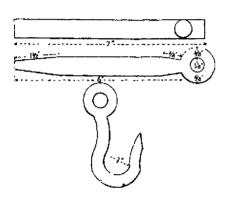

This brings in splitting, in connection with what has been given before.

#### TWENTY-FIRST LESSON.

Same as in a preceding lesson, except one piece is bent on its edge. The two are put together to show difference in the scarfing.

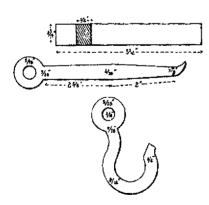

## TWENTY-SECOND LESSON.

Ворв Ноок.

The eye is formed by turning and welding it in such a manner as to give it the appearance of being punched.

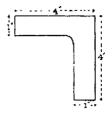

## TWENTY-THIRD LESSON.

CHAIN HOOK.

In this the eye is punched, and the greatest care is taken to give it the maximum strength with the material used.

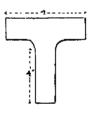

## TWENTY-FOURTH LESSON.

WELDED CORNER.

Two pieces welded at right angles, illustrating the kind of scarf necessary for this weld.

#### TWENTY-FIFTH LESSON.

T WELD.

In this the pieces are welded in the form of a T. The scarf is somewhat different, and the weld is more difficult to make.

## TWENTY-SIXTH LESSON.

## BLACKSMITH TONGS.

The jaws are made from  $\frac{2}{8}$ -inch square iron, and welded to lighter pieces for the handles. This exercise combines nearly all the principles that have been gone over in former lessons, and closes the course in iron forging.

## STEEL FORGING.

The student has now acquired considerable skill in producing forms, as well as regulating heat in the working of iron. In working steel slight variations are necessary, but he soon becomes familiar with these and is ready to take up hardening, tempering, and annealing, which are of supreme importance in the making of tools, &c.

#### TWENTY-SEVENTH LESSON.

WELDING.

Steel to iron and steel to steel by lap weld.

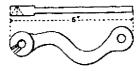

## TWENTY-EIGHTH LESSON.

IRON AND STEEL WELDING.

Steel welded to iron by split scarfing.

## TWENTY-NINTH LESSON.

WRENCH.

This is formed here, to be finished in the fling course which follows. The student here finds the difference between working iron and steel.

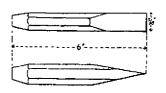

## THIRTIETH LESSON.

BLACKSWITH'S PUNCH.

After forging it is hardened and tempered.

## THIRTY-FIRST LESSON.

FLAT COLD CHISEL.

The forging is a sample form, but it gives practice in tempering.

## THIRTY-SECOND LESSON.

CAPE CHISEL.

Forming and tempering.

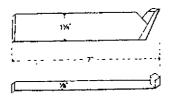

## THIRTY-THIRD LESSON.

DRILL.

Here the form is somewhat more difficult to produce, and is tempered to a dark straw colour, instead of a brown, as in the two preceding lessons.

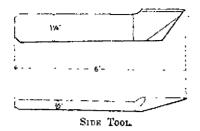

## THIRTY-FOURTH LESSON.

LATHE TOOL.

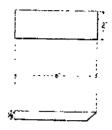

Forged as indicated and properly tempered.

## THIRTY-FIFTH LESSON.

These tools are comparatively easy to form, after the course in iron forging, but close attention is necessary to properly temper them.

#### THIRTY-SIXTH LESSON.

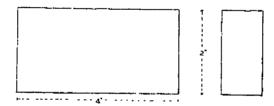

THAN INDA

In the preceding lessons on tempering, the pieces have been hardened on or near the cutting edge, while in this the whole piece is tempered.

## VICE WORK.

For this work the shop is provided with eight swivel vices, and a supply of small tools, as follows — Cold chisels of different forms, chipping hammers, an assortment of files, file cards, try-squares, calipers, scratch gauges, hand vices, &c., &c. This course is intended to give practice in the use of different hand tools for metal, and also to teach the student how to keep them in order. Each lesson is varied in such a manner as to insure the introduction of the different-shaped files. The castings are planed, not true, to remove the rough scales which are so injurious to files.

## FIRST AND SECOND LESSONS.

FILING TO LINE.

- I. A plain block of east iron is taken, and one face is filed true. The student is taught how to hold the file and move the arms to produce a true surface.
- 11. An edge and end are filed square with true surface, using a try-square to test the accuracy of the work.

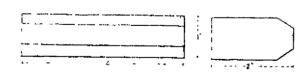

## FOURTH LESSON.

#### RACK-TRETH

This piece shows the different files used to form sharp angles of this kind.

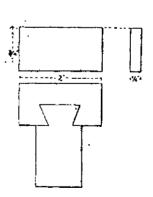

## THIRD LESSON.

#### FILING HALF HEXAGON.

The same casting is used as in Lessons One and Two. The student lays out a half hexagon on the end of the piece, lines it, and then files it to the lines as indicated in the figure.

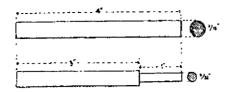

## FIFTH LESSON.

#### DOVE-TAILING.

The piece being of wrought iron, showing the difference of working the two metals. It introduces drilling, sawing, and filing.

#### SIXTH LESSON.

SCREW BLANK.

This is reduced in size its entire length; then a portion is reduced more than the other, forming a shoulder, the reduced portion being kept round in section, and in the centre of the stock.

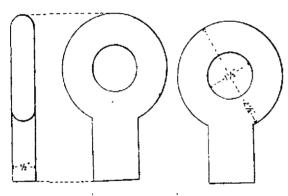

## SEVENTH LESSON.

WRENCH.

The wrench made in the forging course. It introduces inside and outside curves, and a square hole to be filed from a round one.

## EIGHTH LESSON.

RING WORK.

The material for this exercise is on the right in the drawing, and two projections of the finished piece are on the left. The object is to make the ring circular in section from the casting, which is square in section, and to make all the surfaces of the tang straight, and at right angles to each other.

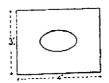

## NINTH LESSON.

CHIPPING BEVEL.

The casting is lined by the student the proper distance from the edge which is to be bevelled. It is cut down to the line, using a hammer and flat cold chisel.

## TENTH LESSON.

OVAL FILING.

A flat piece of cast iron upon which an oval shape is marked out. It is drilled out as near to the marks as possible, and then chipped and filed to the line.

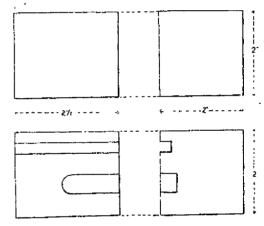

## ELEVENTH LESSON.

THREAD CUTTING

A line representing the thread is marked off twelve times around the piece, the pitch being kept the same throughout. The filing is done by using the half-round and three-cornered files.

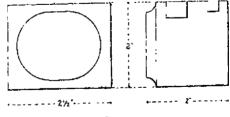

## TWELFTH LESSON.

CHIPPING (WROUGHT IRON).

A rectangular groove,  $\frac{1}{4} \times \frac{1}{4}$  inch, is chipped entirely across the face of the piece, and another groove,  $\frac{1}{2} \times \frac{3}{6}$ -inch, three-eighths of the distance across

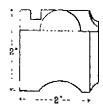

## THIRTEENTH LESSON.

CHIPPING.

Same block is used. An oval is cut upon one side, introducing concave chipping, as is shown in the right-hand projection.

## FOURTEENTH LESSON.

CONVEX CHIPPING.

Here, on same block, is introduced convex chipping, in the form of a half cylinder part way across the face of the piece. Also, more concave cutting.

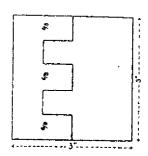

## FIFTEENTH LESSON.

HAND VICE FILING.

A round piece of steel is reduced in diameter its entire length, and filed at one end to a tapering joint.

## SIXTEENTH LESSON.

## PARALLEL FITTING.

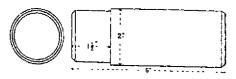

The exciting is lined by the student, and fitted as shown in the plate. The practice which he has acquired is here called into use, as one misstroke of the file may necessitate his beginning a new piece.

## MACHINE WORK IN IRON.

In this course, after a few elementary pieces, the student is required to build some machine. If it is too large for one to complete during his course, more students are put upon it, and in this way a working piece of mechanism is produced, the result of their combined efforts. We hope, by this method, to add to our equipment special machines designed and built by our own students in mechanical engineering. Some little work has already been done by special students. Below will be found a few of the elementary lessons required by all students who enter upon this work.

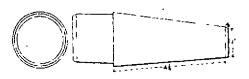

#### SECOND LESSON.

#### THIRD LESSON.

#### PLAIN TURNING.

The piece is centred, put upon the lathe and ends faced up, making it exactly 6 inches in length. It is then turned down its entire length to 2 inches in diameter. A portion of it is then cut down to a smaller diameter, loaving a square shoulder  $1\frac{1}{2}$  inches from the end. The ends are then chamfered. The exercise gives practice in selecting, grinding, and setting the proper cutting tools.

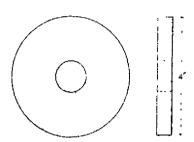

#### TAPER TURNING.

The finished piece of last exercise is taken for the stock of this. The object of this lesson is to show how, by moving the toil stock to the front or rear, any desired taper may be turned.

(138-2U.)

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE. SYDNEY, NEW SOUTH WALES

## FOURTH LESSON.

#### CHECKING AND BORING

The solid blank is centred, and then bored out by placing the drill in the slot of tool posts and using toil stock to force drill through.

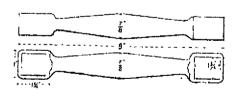

## FIFTH LESSON.

## A HANDER

This lesson gives practice in using the cross feed by hand to produce a given curve, while the longitudinal feed is operated by the lathe.

## SIXTH LESSON.

## CONNECTING ROD.

This involves about all the principles of the preceding lessons, besides some planer work.

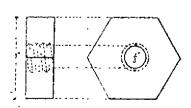

## SEVENTH LESSON

SCREW CUTTING.

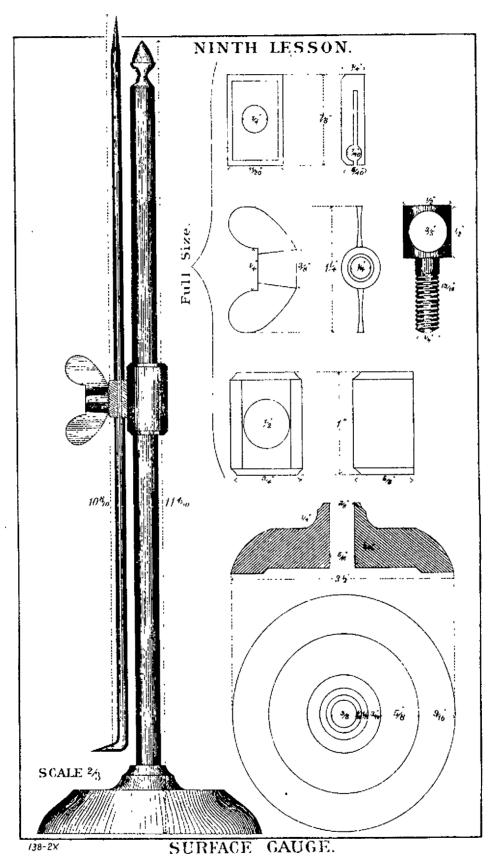

The student is shown how to arrange the gearing for cutting threads of different pitch. He then cuts 12 threads to the inch upon the bolt given him

## EIGHTH LESSON.

INSIDE SCREW COTTING.

The thread is cut for the bolt in the preceding lesson.

MADE BY STUDENTS IN THE PENNSYLVANIA STATE COLLEGE.

# SYDNEY GRAMMAR SCHOOL.

(REPORT FOR 1890.)

Presented to Parliament, in accordance with the provisions of section 16 of Act 18 Vic., 1854.

The Chairman of Board of Trustees to The Minister of Public Instruction.

Sir,

Sydney Grammar School, 6 July, 1891.

I have the honor to submit the following Report of the Proceedings of the Trustees, and of the progress of the school, during the year 1890, in order that the same may be laid before His Excellency the Governor and the Executive Council, in accordance with the provisions of the "Sydney Grammar School Act."

The Trustees are pleased to be able to report satisfactorily upon the working of the school during the past year.

Several changes have taken place in the teaching staff, mainly necessitated by the reorganisation of the school referred to, in the last Annual Report.

There has not been any falling off in the attendance of the pupils throughout the year, which has been maintained at the high average of 426.

The results of the School and University Examinations have shown that the confidence of the public in the masters and management of the school has been fully justified.

The usual examinations of the pupils by gentlemen not connected with the school took place in December.

The reports of these gentlemen—Messrs, G. F. Vaughan, M.A., E. Trechmann, B.A., Ph.D., and J. W. Jonson—are annexed hereto.

Much success has attended the establishment of a commercial side in the school.

The proportion of boys who have entered these classes being large, and their progress so far being satisfactory.

The new science class-room was completed towards the end of the year, and the necessary apparatus has been procured, with the sum appropriated by Parliament for that purpose.

Mr. G. E. Blanch, M.A., Oxford, B.Sc., London, whose testimonials were of a high order, having been appointed to the post of Mathematical Master and Teacher of Natural Science, a regular course of instruction in the science branch has now been instituted.

With the object of making the school play-ground available to its fullest extent, for the boys' recreation, some further improvements are being made, and the Board propose at an early date to commence the erection of a gymnasium.

There have not been any changes in the Board during the year.

Mr. Justice Windeyer and Mr. A. J. Cape continued to occupy the post of Chairman and Vice-Chairman respectively.

The "Salting Scholarship" at the University, which was available on the 1st January, 1891, has been awarded to Mr. A. H. Garnsey, who was head of the school at the December examination.

A statement of the income and expenditure of the school for the past year is forwarded herewith.

W. C. WINDEYER, Chairman.

Submitted.—C.S., 7/7/91. Submit to Executive.—J.H.C., 8/7/91. Ex. Min. prepared.—H.W., 13/7/91.

#### SYDNEY GRAMMAR SCHOOL, DECEMBER, 1890.

Reports of the Examiners.

Report by Mr. G. F. Vaughan, M.A., late Scholar St. John's College, Oxford, Formerly Headmaster, Maryborough Grammar School, Queensland.

Gentlemen,

I have the honor to submit to you my Report upon the work of the Commercial Side of the Sydney Grammar School and upon the English and Latin of the Lower School.

In both Schools papers were set for each Form in its own subjects, and in both alike the industry and interest of the boys in their work was shown by the large number of papers given in as well as by the care with which they had been done.

been done.

In the Commercial School the only exception to the general excellence of the papers was in Euclid II, and, to a less extent, in Algebra II, in both cases, as I think, too much has been attempted, with the result that only the best boys in the class have been successful. Apart from these, the work done was, in all respects, eminently satisfactory: the papers were well written, the answers were well arranged, and the knowledge shown was, as far as it went, thorough and accurate. In Division III however, and, perhaps, to some extent, in Division II, there seemed to be a tendency to allow verbal accuracy in repeating rules to take the place of an intelligent understanding of them, and this detracted a little from the value of some of the papers.

As each class had its own papers they cannot easily be compared together. On the same papers I should expect to find that Divisions II and III, and to a much less extent, Division I, overlap one another more than is desirable; a further subdivision of the classes seems to be called for so as to form a new class that would include the lower part of the Second and the upper part of the Third Division. Division IV is evidently a difficult class to deal with, and cannot, I think, be better arranged than at present.

The whole arrangement and organisation of this School is, as I understand, the work of the past year, so that you

The whole arrangement and organisation of this School is, as I understand, the work of the past year, so that you The whole arrangement and organisation of this School is, as I understand, the work of the past year, so that you are, in my opinion, much to be congratulated, both upon the real excellence of the work that has been done in it, and upon the systematic thoroughness with which it has been arranged. It has in it the promise of much usefulness, but everything will depend upon the spirit in which its further organisation is carried out. For the School has, as I take it, raison d'être in your system unless the spirit of a wider and more liberal education is infused into the mechanical routine which is involved in the notion of Commercial teaching. As a means of ensuring this I think the ground occupied by the School at present must be enlarged: new subjects must be taken up and the present subjects taught in a more liberal spirit; nor should the mechanical accuracy of knowledge that is useful in the lower forms be made the characteristic feature of the highest classes. If I am not much mistaken the general excellence of the work done, especially in the First Class, shows better than anything else that the School is capable of higher work, and this should all be in the direction of general education. English Composition and Literature and French Composition, if not Literature too, are undoubtedly well within the reach of the highest class, and these have a real practical as well as an educational value: whilst Physical Science seems a suitable study to be included in a system of practically useful education, and would be a relief from the monotony of the other work; nor should I omit to add that a wider reading in History ought to take the place of the present text book, and that it should not be confined to English History. If in addition to some such extension of your curriculum the sub-division of classes could be made as I have suggested, you have all the elements of success ready to your hands. your hands.

your hands.

In the Lower School the papers done for me were very satisfactory: they were noticeable for the sound and accurate knowledge they showed of most of the work done. The only comparative failure was in the Latin Composition paper of III B. and in some of the English questions of III A. and B. A very large amount of work was shown up, and all the questions on each paper were well attacked; there was little mere blundering; the answers, for the most part, clear and to the point.

The classes seem well arranged, so as to correspond with real differences in the attainments of the boys composing them, and those, in the different classes, seem to be well together. I was unable to take the forms orally, but, judging from their papers, I think that the amount of work set out, for the higher class at least, is rather small; whether it could be increased without impairing the general efficiency of the form I am hardly in a position to judge; in the English work however, there can be no question, I think, that time should be found for English Composition and Essay writing, and that more attention should be given to the subject matter of the poetry taken in repetition. Spelling, too, seems weak in both forms, but this has already been well looked after.

Mr. E. Trechmann, B.A., Ph.D., Lecturer in Modern Languages at the University of Sydney, reports on French and German as follows:—

Centlemen. have the honor to report to you for the second time on my examination of the Sydney Grammar School in French and German.

French and German.

In consequence of the changes which have taken place since my last report in the arrangement of the French and German classes, I cannot compare the work all through the School with that of 1889; as far as I can judge, however, I think I may say that, in French at least, there is a distinct improvement.

In the first French Division both the translation and prose composition are good, and the boys show an intelligent interest in the subject matter of the prescribed books and their authors. In the Second Division the papers which I set were rather easy, and the average of marks obtained is in consequence high. In the translation from the set books there is a want of exactness; thus out of the fourteen boys nine passed over in silence a little word in the first line of the first piece. Most of the errors are due to carclessness rather than ignorance. Another point which I should like to notice is one which I mentioned in my last report. A very large number of words in the English vocabulary came from the French; of these many have in the course of centuries developed a different meaning or a different shade of meaning in one language or the other, or in both languages. The majority of these words, however, cover one another. Where such changes have taken place it should be the duty of the teacher to point out the difference in meaning. Where no differences exist, it is unnecessary to vary the expression, as many boys systematically try to do, usually for the worse. To them translation must appear more difficult than it is. In rendering modern French prose a plain, straightforward translation is the best; in poetry and plays, especially of the classical age, a little freedom may be permitted.

Amongst the remaining French Divisions the fourth may be commended for uniformly good work. Quality has not been sacrificed to quantity, as so frequently happens when too much is attempted.

The number of boys who learn German is unfortunately very small; in the Upper Division only six. In the Junior Divis

To the Head Master, Sydney Grammar School.

Sir,

I have the honor to submit my Report on the result of the Shorthand Examination in connection with your School. Sixty-three boys presented themselves for examination: thirty-one in the First Division, fourteen in the Second Division, and eighteen in the Third Division. Of these, nine in the First Division, five in the Second Division, and three in the Third Division, pass a rather low standard. The test words given being all taken from the Phonographic Teacher (the instruction-book used), and only one-half of the possible number of marks being taken as sufficient for a pass, I think it will be admitted that the Examiner has not erred on the side of severity; but bearing in mind the fact that Phonography has only recently been introduced into the school as a regular subject of study, and that it would very probably be regarded by many of the boys with disfavour, the result may be considered very satisfactory. A year or two hence, when the study of Phonography has come to be looked upon by the pupils of the "Commercial Side" as a matter of course, the number of passes may reasonably be expected to be considerably greater.

With reference to the number of marks allowed, perhaps I had better explain that I have given one mark for each test-word correctly written, twelve for the vowels correctly pronounced, and one for every five grammalogues.

Enclosed you will find a list of the students, with the number of marks gained by each. To the Head Master, Sydney Grammar School.

I am, &c., T. W. JONSON.

APPENDIX

# $\Lambda_{\tt PPENDEX}$ giving full details of the Examination Work.

I.—CLASSICAL SCHOOL.

VI. Latin, 17 boys.	Subjects,	Average.	1	esults I	Name to
VI.	Subjects,	smgc.	ję,	ī —	Name who
		γĸ	Highest.	Lowest.	Remarks.
, , , , , ,	Latin Unprepared Translation.	54	95	32	Two papers excellent, seven good. The style of the translations was generally good, though sometimes too florid. Most boys would have done better to consider more carefully the grammatical construction of the Latin; adverbs and conjunctions were generally omitted or wrongly
	Latin Prose	44	73	20	Two papers excellent, four good. There was considerable accuracy shown in this paper, but some want of power. Co-ordinate constructions were
Greek, 14 boys.	Greek Unprepared Trans- lation.	40	88	11	too generally employed.  One paper excellent, two good. The paper set was too difficult for the lower boys in the form; it was, however, well attempted in many cases, and the work was much more close and accurate than in the
	Greek Prose	40	77	6	corresponding Latin paper.  One paper excellent, five good. Less accuracy shown than in the Latin
	Critical Paper	51	76	32	prose, but more style.  Two papers excellent, five good. There was a want of clearness in the arrangement of some of the answers, and a slight tendency to fill up with irrelevant details.
]	Latin and Greek History	52	77	40	One excellent paper, and three others not much inferior; the rest of the class was well together, and their answers show a very fair knowledge of the subject.
V. 18 boys.	Latin Unseen Translation	59	87	24	The class generally weak in dates, and too apt to give general answers to particular questions.  The meaning was generally apprehended, and in many instances the spirit of the original was reproduced. The Form, as a whole, has a respectable knowledge of vocabulary, a good comprehension of structure supplemented in some cases by good style, and in a few cases, by an
7 boys. 16 boys.	Greek History Greek Unseen Translation	50·5 53	80 78	28 14	appreciation of the distinction between the style of poetry and prose.  Insufficient knowledge of facts.  The work shows, in a few cases, originality, in most cases a very fair knowledge of vocabulary, and a good knowledge of syntax. Four of
	Greek ProseLatin Prose	62 53	90 84	32 44	the papers were bad.  Some excellent work. Four papers very bad, not included in the average.  A great deal of the work is spoilt by far too much inaccuracy, and the
LOWER V. 28 boys.	Sallust—Catiline's Con-	52	1		juncture of the sentence is not noticed.  Translation with only one or two exceptions very well done; though from a certain similarity in the answers, and for other reasons it was
	Composition and Unseen	90	56		apparent that the translation was produced by rote rather than by in- telligence on the part of the boys. Thus much better answers were got for a question of reproduction than for the questions in the meaning of particular words and phrases and peculiar constructions. I think that twenty-four out of the twenty-seven examined could pass the Matriculation Examination in this nather.
ıv.	Translation.	20	,,,		Composition not at all satisfactory; with liberal marking only five boys got more than half marks; false concords abounded; the form failed throughout to translate the English perfect active participle. Unseen translation: the piece set was evidently too difficult for even the best boys, only three grasped the trend of the passage. I consider that not more than ten of these boys are up to Matriculation standard in
	Latin Translation—Ovid Metamorphoses.	68	86	35	composition.  The papers, with one exception, were all thoroughly satisfactory. Three were excellent. The translations showed much careful and accurate work, several boys rising above the ordinary "school-boy" style.
18 boys.	Greek Translation—Xen, Agesilaus.	61	100	31	A very difficult paper; but the way in which it was treated by the form shows that they have thoroughly mastered the subject. Form papers were excellent, one boy obtaining full marks. The reproduction of the English into Greek was good, considering the fact that the form has had so little practice in that line. The parsing was the only part
22 boys.	Latin Prose	63.4	87	33	of the paper that was not well done.  The form, as a whole, is in a highly efficient state. Three excellent papers. In a few cases the inflections were weak, but accuracy was the paper of the contract of th
17 boys.	Greek Prose	51	77	26	the main characteristic. The results show very level teaching.  One excellent paper; six were good. The form, as a whole, display an accurate knowledge of the inflections of the verbs and nouns, and show careful training in the way in which there is no the verbs and nouns, and
UPPER REMOVE.			<u> </u>		show careful training in the way in which they set about their work.  The form is in a thoroughly healthy condition, and great credit is due to
29 boys.	Latin, Composition, and Author.	52	81	17	Composition: Satisfactory. A few very good. A few bad. Result not even. Averge 48 per cent.  Translation: Fair. Structure of sentences as a rule not grasped. Author too difficult. Average 54 per cent.
_	English Author	63·3	84	25	Parsing: Fair. Marks lost through want of thoroughness. Average 54 per cent.  General result spoilt by the presence of five boys who seem to be unfit for the work, and who reduce the general average by nearly 6 per cent. Excluding them, the result of the work was good.  General result good. The repetition was well known, though more attention is required in the matter of punctuation. The parsing was particularly good. Meaning of words and context good. Allusions were not so well done and derivations were inaccurate or incomplete.
Division I. 16 boys.	Greek, Grammar, Transla- tion and Composition.	52·3	81	38	Analysis should have been better. Composition fair.  Result as regards Div. I very satisfactory. Four papers were decidedly good.

<del></del>	Perc	ental I	Result	Hs				
Form,	Subject.	Алегаде.	Highest	Lowest.	Remarks .			
Division II. 8 boys.	Grammar	37	60	21	Div. II was uneven. The form throughout failed in the verbs and inflections of some of the pronouns. Translation was pretty good.			
•	Translation, Grammar, and Composition.	53	   71-	   26 	Composition: Five papers very satisfactory, remainder indifferent to bad. Vocabulary at fault.  Translation: Very well done by the whole form, only one boy getting less than half marks.  Grammar satisfactory; parts of verbs good; parsing good; prepositions			
HIGHER MATHEMATICS. Division I. 14 boys.		40	78	16	The papers included questions on Algebra to Binomial Theorem, Trigonometry to solution of Triangles. One boy took up Analytical Conics			
ARITHMETIC. Division I, It boys.	An	683	   <sub>94</sub> 	41	and Differential Calculus. The standard was not very high; the result however is creditable. One paper was excellent and one very good. A noticeable absence of great gaps in the marks.  A creditable result. The most noticeable faults were inaccuracy, especially in the question on simple interest, too many failures in a simple stock sum, too frequent use of Algebra in elementary questions and a lack of intelligible explanation to connect the steps in the working. Three excellent papers, one being almost perfect. Two weak			
Division II. 18 boys.	All	513	86	36	ones.  A mediocre result. All the Mathematical papers of this division show that it is far from being homogeneous. As in the division above there is a lack of intelligible explanations of the working and too free a use of Algebra, but the lower division is the more accurate. Failed in the			
Division III. 24 boys.	   To Stocks	41	74	8	profit and loss question. Four papers excellent; one good.  The division is sound on the principles involved in elementary questions, weak in profit and loss and stocks, and inaccurate where long working is required. One paper excellent, one good, four bad, one total			
Division IV. 24 boys.	To Profit and Loss	62	89 	   39 	failure.  A very even result. With few exceptions, the work was thorough and careful. The paper was, however, an easy one for this division, and the failure in the questions on mensuration and discount was therefore			
Division V. 27 boys.	To Discount and Profit and Loss.	56	79	<sub>32</sub> . 	somewhat remarkable. Four papers excellent, eleven good. Elementary work and fractions very sound throughout. The general style of work much better than in algebra. The question on mensuration was consistently avoided, and their ideas on discount appear			
Division VI. 29 boys.	To Proportion	43	76	12	either hazy or non-existent. Four papers excellent, eleven good.  Three papers excellent, four good. One third of the division very weak.  A great lack of uniformity of method in the mechanical work, and,			
<ul> <li>Attebra, Division I, 14 boys.</li> </ul>	Progressions	59	93	32	consequently, much inaccuracy through cumbersome and unnecessarily long reductions.  With two exceptions fairly level for the top division. Very little work that was wrong, but too much that was clumsy. The simultaneous			
Division II. 18 boys.	Upper, Progressions Lower, Indices.	50	89	15	quadratic very poorly answered, seeing that it at once resolved itself into one of the commonest types. The only problem of moderate difficulty attempted by only four boys. The book work on surds very indifferently known. Two excellent papers and six good ones. There are practically two divisions, the lower of which would probably have done better in the division below. A distinct weakness in symbolical expression and an inclination to use algebraical artifices rather than straightforward working. One excellent paper and five			
Division III. 24 boys.	Simultaneous Quadratics	31 ½	86	6	good ones.  This division was unfortunate in being grouped with Div. I and II: the paper was evidently beyond their reach. The papers showed distinct weakness in symbolical expression and in fractions. Four, if not seven boys, are quite unfit for the division. One excellent paper, which			
Division IV. 24 boys.	Simultaneous Quadratics, not including problems	49	83	29	would have ranked second in the division above.  The elementary work of this division was very thorough, as is shown by the consistent results for the first half of the paper. It was only when rather more originality was required that any failure was perceptible. On the whole the result is creditable alike to the division and its master. Two excellent papers, three good, the noticeable			
Division V. Upper, 12 boys. Lower, 16 boys.	Harder Fractions Easy Fractions	48 39	92 54	16 15	point being the absence of any total failures.  This division has been necessarily divided into two, thereby naturally increasing the difficulty of instruction. There also appear to be some six boys whose proper place would have been in a lower division. A good deal of inaccuracy appeared in the elementary work, and a general			
Division VI. 30 boys. * EUCLID.	Simple simultaneous equations.	36	100	14	want of fairlity in manipulating factors and fractions. Two papers were excellent and one good.  Work very inaccurate and unsound. The result, with one exception, unsatisfactory.			
Division I. 14 boys. Division II. 18 boys.	Books I-VI		89 75	34 13	Bookwork good. Deductions fair, though very few attempted the one on Book VI. Three excellent papers and four good ones.  Bookwork fair in the upper half of the division. Deductions weak.			
Division III. 24 boys. Division IV. 24 boys.	Books I-III, 25	56 <u>1</u> 57	78 89	25   4	Three excellent papers, four good, two bad.  Bookwork decidedly good. Deductions very weak. Two excellent papers, ten good, one bad.  Bookwork well and intelligently done. The deductions, all but one,			
Division V. Upper, 12 boys. Lower, 15 boys,	Book I	47	81 63	26 26	weak. Four excellent papers, seven good, two very bad.  Bookwork good, deductions weak. One paper excellent, one good, three bad.  Definitions very good; the rest of the bookwork satisfactory. No deduc-			
]	Book I, 26	1	80	10	Definitions very good; the rost of the bookwork satisfactory. No deductions attempted. Two pages good, three bad.  Definitions and propositions good. Failed in the question on the methods of proof employed by Euclid. Six papers excellent, two bad.

1891. (SECOND SESSION.)

#### NEW SOUTH WALES.

# SYDNEY FREE PUBLIC LIBRARY.

(REPORT FROM TRUSTEES FOR 1890.)

Presented to Parliament by Command.

The Trustees of the Free Public Library to The Minister of Public Instruction.

Sir, Sydney, 11th March, 1891. I have the honor to transmit to you the Twentieth Annual Report of the Trustees of the Free Public Library, for the year 1890.

- 2. On 1st May the new Library in Macquarie-street, which was completed at the end of the previous year, was opened to the public, and the overcrowding, which had previously caused much inconvenience to readers, has been thereby, for the present, entirely put an end to.
- 3. It is with deep regret that the Trustees have to place upon record the death of Professor William John Stephens, M.A., F.G.S., who was Chairman of the Board from 27th March, 1885, until the date of his death, which took place on 22nd November.
- 4. In recognition of the valuable services which, for twenty-one years, the late Professor Stephens had rendered to the Library, the Trustees, at a meeting held on 10th December, passed a resolution,—"That this Board desires to record its sense of the great loss which has been sustained by the Free Public Library, Sydney, and the Colony at large, in the decease of its Chairman, Professor William John Stephens, M.A., F.G.S., &c. (one of the first-appointed Trustees of the Library), and to express the same to the surviving members of his family."
- 5. At the same meeting the Hon. James Norton, LL.D., M.L.C., &c., was unanimously elected President of the Board, as successor to the late Professor Stephens.
- 6. During the year, 3,190 volumes have been added to the Reference Library, 1,189 to the Lending Branch, and 294 to Country Library boxes, making a total number of 4,653. The books worn out, lost, or withdrawn and deducted from the stock numbered twenty-six for the Reference Library and thirty-eight for the Lending Branch, leaving 86,284 as the total number of volumes in the Library, as detailed in Appendix  $\Lambda$ .
- 7. Appendix H contains a list of 756 volumes acquired by donations and 125 volumes supplied under the Copyright Act. The Trustees desire specially to record the handsome gifts from Mr. Drummond Gilchrist, Woollahra, of R. Holinshed's Chronicles of England, Scotland, and Ireland (black letter edition), imp. 8vo., Lond., 1577; with a copy of Plutarch's Lives, translated out of Greek into French by J. Amiot, and out of French into English by Sir T. North, Knt. Fol. Cambridge, 1676. From Mr. Alexander Oliver (Trustee), a special collection of 284 volumes of works relating to the Drink Question, for which a special compartment has been 17-A

reserved in the Library. From Mr. James Barnet, late Colonial Architect, a copper-plate inscription and a glass bottle containing documents, coins, &c., discovered on 28th September, 1887, in the foundation-stone of the old Library building, and placed there in the year 1843. Also, from Mr. Richard Tangye, of Birmingham, a rare and curious illustrated poem in MS., relating to Australasia, by "Stormy Jack." 12mo. (n.p.), 1815-44.

- 8. In consequence of the increased accommodation and conveniences provided for readers, the number of visits to the Library increased to 155,822, being 23,839 in excess of the number recorded for the year 1889.
- 9. The Reference Library has been kept open during the year 358 days, including Sundays, and the Lending Branch 341 days, also including Sundays.
- 10. One hundred and thirty-seven boxes, containing 10,070 volumes, have been lent to Country Libraries, and have travelled a distance of 47,737 miles, while the demand for boxes is still in excess of supply. A detailed statement of the Institutions to which the books have been lent will be found in Appendix E. The excess over last year's issue being forty-two boxes issued, 3,951 books lent, and 10,832 miles travelled.
- 11. In the Appendices A to I will be found statistics giving full information as to the working of the Library for the past year, and shows highly satisfactory results as to the benefits conferred upon the students and readers who frequent the Library.

I have, &c.,

JAMES NORTON,

President.

#### APPENDIX G.

## AMENDED REGULATIONS.

Conditions upon which books in boxes, each containing lots of about 60 volumes, will be lent by the Trustees of the Free Public Library, Sydney, to Libraries in Country Districts of New South Wales :-

1. Books will be lent only to Trustees or Committees of Free Libraries, Schools of Arts, Mechanics' Institutes, or Libraries of Municipalities, that may be beyond the boundaries of the City of

Sydney.

2. All books authorized to be lent under these conditions shall be bound in good strong binding, placed in boxes constructed of nearly uniform size, and numbered from one upwards. Each box shall

contain about 60 volumes, according to its catalogue, in which no alteration can be made.

3. Printed catalogue slips of the contents of each box, stating the value of each book, together with forms of application for loans, will be forwarded, free of charge, on application being made to the Principal Librarian.

4. Trustees or Committees of Country Libraries, &c., wishing to obtain books on loan, must make application in writing, stating which particular box of books they desire to borrow; and their application must be accompanied by an undertaking in the form approved by the Trustees of the Free

application must be accompanied by an undertaking in the form approved by the Trustees of the Free Public Library, Sydney, to indemnify them against loss.

5. Borrowers, in their applications, must give a full description of the Library, room, or building in or from which it is proposed to deposit or lend the books, and must specify the time for which they desire to retain the use of the books. They must also submit, for the approval of the Trustees, the conditions or regulations under which it is proposed to lend any books so obtained from the Trustees, who reserve to themselves the right of refusing any application without assigning any reason therefor.

6. No charge will be made for the loan of any box of books to cover the cost of freight, packing, and collating; but no receipt will be given for any books returned until they have been collated, and an adjustment made for any loss or damage that may be discovered.

adjustment made for any loss or damage that may be discovered.

#### APPLICATION TO BORROW BOOKS.

Sir, 188 We are desirous of borrowing the books enumerated in your catalogue slip No. on behalf of which the names of the\* of the

It is proposed to retain the books for months from the date of their despatch from Sydney, and to keep them (while not lent under the conditions mentioned below) in the building of which a full description is attached, in order that you may effect an insurance on the said books to cover risk against fire so long as they remain in the said building.

Enclosed herewith is a copy of the regulations under which we propose to lend the books, and we agree to sign an undertaking in the form required by the Trustees of the Free Public Library, Sydney.

We have the bases to be Sir.

We have the honor to be, Sir,

Your most obedient servants.

The Principal Librarian, Free Public Library, Sydney.

\* Trustees or Committee.

Undertaking to be signed by Borrowers of Books from the Free Public Library, Sydney, for use of Libraries, &c., in Country Districts.

In consideration of the books enumerated in the Catalogue hereunto arnexed, together with the box containing the same, having this day been delivered to us by Robert Cooper Walker, the Principal Librarian of the said Free Public Library, Sydney, for the use of the situate at we, the undersigned, undertake and agree with the said Robert Cooper Walker, and also with the Trustees of the said Free Public Library, Sydney, and each and any two or more of them as follows:—

them, as follows:

1. The books will be kept in a suitable apartment of the said

1. The books will be kept in a suitable apartment of the said

1. The books will be kept in a suitable apartment of the said

1. The books will be kept in a suitable apartment of the said

1. The books will be kept in a suitable apartment of the said

1. The said Free Public Library, Sydney, and the public will be permitted to use the same during such hours only as shall be determined by the Trustees (or Committee, as the case may be), but may be lent by such of the said Trustees (or Committee, as the case may be) under the same Regulations as shall apply to books belonging to the said institution.

2. The said books and box shall be returned to the said Robert Cooper Walker, or other Principal Librarian for the date of despatch from Sydney, in good condition, allowance being made for reasonable wear.

3. We undertake to pay to the said Robert Cooper Walker, or other Principal Librarian for the time being of the Free Public Library:—

(1.) The value of every book not returned

(1.) The value of every book not returned.

- (2.) The estimated value of the injury done to any volume, work, set, or series, or box, of which value the Trustees for the time being of the Free Public Library, or any two of them, shall be the sole judges.
- (3.) The value of the whole work, set, or series, in case any volume or part thereof shall not be returned within the time above mentioned.
- 4. In case default shall be made in the observance or performance of any of the conditions aforesaid, we will pay to the said Robert Cooper Walker, or other Principal Librarian of the said Free Public Library. Sydney, for the time being, the sum of £50 (fifty pounds) as liquidated damages. day of 18

## NEW SOUTH WALES.

# SYDNEY FREE PUBLIC LIBRARY.

(REPORT FROM TRUSTEES FOR 1891.)

Presented to Parliament by Command.

The Trustees of the Free Public Library to The Minister of Public Instruction.

STR

Sydney, 9 March, 1892.

I have the honor to transmit to you the Twenty-first Annual Report of the Trustees of the Free Public Library for the year 1891.

- 2. The vacancy in the Board, caused by the death of Professor W. J. Stephens in November, 1890, has been filled up by the appointment of Professor Mungo W. MacCallum, M.A., which was gazetted on 28th January following.
- 3. The Trustees, with deep regret, have to report the death of the Hon. Sir William Macleay, Knt., M.L.C., F.L.S., which took place on Monday, 7th December. At a meeting of the Board held on 9th December, it was resolved,—"That this Board desires to record its sense of the great loss which has been sustained by the Free Public Library, Sydney, and the Colony at large, in the decease of the Hon. Sir William Macleay, Knt., M.L.C., F.L.S. (the last survivor of the first ten appointed Trustees of the Library), and to express the same to the surviving members of his family."
- 4. In April last negotiations were entered into with the executrix of the will of the late Professor Stephens for the purchase of the whole of his library, the result of which was that the Board obtained a collection consisting of 1,431 volumes of choice books and 194 pamphlets for the small sum of £450.
- 5. An Australasian Bibliography, being a catalogue of books in the Free Public Library, Sydney, up to the end of the year 1888, relating to or published in Australasia, has been completed, and special authority of the Colonial Treasurer was obtained, through your Department, for printing the same, but owing to the great pressure of Parliamentary and other work, the Government Printer was unable to make a commencement until 1st October last. The volume will contain about 1,000 pages, and will be published in three parts—Part I being a general list of authors, editors, &c., with full titles. Part II books arranged under authors' names separately for each Colony, viz.:—No. 1, New South Wales; No. 2, Victoria; No. 3, South Australia; No. 4, Queensland; No. 5, Western Australia; No. 6, New Zealand; No. 7, Tasmania; No. 8, Polynesia; and No. 9, New Guinea. Part III will be arranged under subjects and titles, with a general index. It is expected that the work will be ready for issue about the end of the year 1892, and that the very large demand for the same will soon cover the whole cost of printing.
- 6. A new catalogue of the Lending Branch having also been prepared, the last sheets are now being printed, and it will be ready for issue in a few weeks. The printing of this work has been delayed for more than two years, owing to the quantity

of official printing in the hands of the Government Printer and to the Trustees not having sufficient funds at their disposal to defray the cost of printing the work at a private establishment.

- 7. For the Reference Library, at present numbering over 65,000 volumes, a new catalogue is in course of preparation upon a complete and concise plan, but the labour of bringing out a work of this character is very heavy, and it could not be fairly commenced until the re-arrangement of the books in the new Library in Macquarie-street, which was completed on 1st May, 1890. It is expected that this catalogue will be ready for issue before the end of the year 1893, but in the meantime the manuscript is available for readers and students.
- 8. The number of volumes added to the Library during the year, as shown in Appendix A is—For the Reference Library, 4,645; Lending Branch, 771; Country Libraries, 245; total, 5,661; and during the year the number of books transferred, worn out, or lost, was 64 for the Reference Library and 81 for the Lending Branch. The total number of volumes in the Library on 31st December was 91,945.
- 9. In the return comprised in Appendix B, the past year shows an excess of 4,520 visits to the Library beyond the highest number for any previous year since the opening of the Institution in 1869; a result which satisfactorily shows that the advantages offered to readers and students are more highly appreciated than ever.
- 10. During the year 133 Country Libraries were supplied, under the special regulations of the Free Public Library, with 19,350 volumes, and the boxes containing these volumes travelled a distance of 45,670 miles. A list of the borrowing Institutions is given in Appendix E, which shows such a highly satisfactory result that the Trustees have ordered sufficient books to fill ten additional boxes, most of which will be ready and put into circulation during the year 1892, the demand for loans of boxes being still greatly in excess of the supply.
- 11. The Reference Library has been kept open during the year on 358 days including Sundays, and the Lending Branch, also including Sundays, on 348 days.
- 12. The Trustees desire to record their thanks to various donors during the year for 556 volumes presented to the Library, a list of which is given in Appendix H. Among these gifts may be specially mentioned "The Jeypore Portfolio of Architectural Details," presented by H.R.H. the Maharaja of Jeypore; and the original Commission, signed by Governor Phillip, appointing Philip Gidley King, Superintendent and Commandant of Norfolk Island, dated February, 1788, which was purchased specially for this Library by Messrs. R. and G. Tangye, of Birmingham, England, and presented by them free of cost. Under the Copyright Act, the Trustees received 130 volumes of books published in the Colony.
- 13. The statistics comprised in Appendices A to I give full information as to the working of the Library, the results of which are quite as satisfactory as those of previous years.

I have, &c.,
JAMES NORTON,
President.

APPENDIX A.

Number of Volumes in the Free Public Library on the 31st December, 1891.

APPENDIX G.

#### APPENDIX G.

#### AMENDED REGULATIONS,

Conditions upon which books in boxes, each containing lots of about 60 volumes, will be lent by the Trustees of the Free Public Library, Sydney, to Libraries in Country Districts of New South

1. Books will be lent only to Trustees or Committees of Free Libraries, Schools of Arts, Mechanics Institutes, or Libraries of Municipalities, that may be beyond the boundaries of the City of

Sydney.

2. All books authorized to be lent under these conditions shall be bound in good strong binding.

Each box shall

placed in boxes constructed of nearly uniform size, and numbered from one upwards. Each box shall contain about 60 volumes, according to its catalogue, in which no alteration can be made.

3. Printed catalogue slips of the contents of each box, stating the value of each book, together with forms of application for loans, will be forwarded, free of charge, on application being made to the Principal Librarian.

4. Trustees or Committees of Country Libraries, &c., wishing to obtain books on loan, must make application in writing, stating which particular box of books they desire to borrow; and their application must be accompanied by an undertaking in the form approved by the Trustees of the Free Public Library, Sydney, to indemnify them against loss.

5. Borrowers, in their applications, must give a full description of the Library, room, or building in or from which it is proposed to deposit or lend the books, and must specify the time for which they desire to retain the use of the books. They must also submit, for the approval of the Trustees, the conditions or regulations under which it is proposed to lend any books so obtained from the Trustees, who reserve to the mealing the right of referring continuous interval and the reserve to the mealing the right of referring continuous interval. who reserve to themselves the right of refusing any application without assigning any reason therefor.

6. No charge will be made for the loan of any box of books to cover the cost of freight, packing,

and collating; but no receipt will be given for any books returned until they have been collated, and an adjustment made for any loss or damage that may be discovered.

## APPLICATION TO BORROW BOOKS.

Sir. We are desirous of borrowing the books enumerated in your catalogue slip No. of which the names of the\* on behalf of the

It is proposed to retain the books for months from the date of their despatch from Sydney, and to keep them (while not lent under the conditions mentioned below) in the building, of which a full description is attached, in order that you may effect an insurance on the said books to cover risk against fire so long as they remain in the said building.

Enclosed herewith is a copy of the regulations under which we propose to lend the books, and we agree to sign an undertaking in the form required by the Trustees of the Free Public Library, Sydney.

We have the honor to be, Sir,

Your most obedient servants.

The Principal Librarian, Free Public Library, Sydney.

\* Trustees or Committee.

Undertaking to be signed by Borrowers of Books from the Free Public Library, Sydney, for use of Libraries, &c., in Country Districts.

In consideration of the books enumerated in the Catalogue hereunto annexed, together with the box containing the same, having this day been delivered to us by Robert Cooper Walker, the Principal Librarian of the said Free Public Library, Sydney, for the use of the

we, the undersigned, undertake and agree with the said Robert Cooper Walker, and also with the Trustees of the said Free Public Library, Sydney, and each and any two or more of

them, as follows:—

1. The books will be kept in a suitable apartment of the said to be approved of by the Trustees of the said Free Public Library, Sydney, and the public will be permitted to use the same during such hours only as shall be determined by the Trustees (or Committee, as the case may be), but may be lent by such of the said Trustees (or Committee, as the case may be) under the same Regulations as shall apply to books belonging to the said institution.

2. The said books and box shall be returned to the said Robert Cooper Walker, or other Principal Librarian for the time being of the said Eree Public Library. Sydney, at the expiration of months

Librarian for the time being of the said Free Public Library, Sydney, at the expiration of months from the date of despatch from Sydney, in good condition, allowance being made for reasonable wear.

3. We undertake to pay to the said Robert Cooper Walker, or other Principal Librarian for the

time being of the Free Public Library:

(1.) The value of every book not returned.

- (2.) The estimated value of the injury done to any volume, work, set, or series, or box, of which value the Trustees for the time being of the Free Public Library, or any two of them, shall be the sole judges.
- (3.) The value of the whole work, set, or series, in case any volume or part thereof shall not be returned within the time above mentioned.
- 4. In case default shall be made in the observance or performance of any of the conditions aforesaid, we will pay to the said Robert Cooper Walker, or other Principal Librarian of the said Free Public Library, Sydney, for the time being, the sum of £50 (fifty pounds) as liquidated damages.

  Dated at this day of 18 this

## NEW SOUTH WALES.

# AUSTRALIAN MUSEUM.

(REPORT OF TRUSTEES FOR THE YEAR 1890.)

Presented to Parliament, pursuant to Act 17 Vic. Ho. 2, sec, 9.

TO HIS EXCELLENCY THE GOVERNOR AND EXECUTIVE COUNCIL,-

The Trustees of the Australian Museum, incorporated by the Act 17 Victoria No. 2, have the honour to submit to Your Excellency in Council, in accordance with the 9th section of that Act, this their thirty-seventh Annual Report.

- 1. The hours during which the Museum was open to the public were as in previous years, from 10 a.m. till 5 p.m., but in summer till 6 p.m.; except on Sundays, when they were from 2 p.m. to 5 p.m.; and on Mondays, when the Museum was closed for cleaning. The number of visitors in 1890 was 123,724, being a decrease of 14,766. The largest attendance on one day was on Monday, 13th October—1,589. The largest Sunday attendance was on 22nd June—1,239. The average for the year was 331 on week-days, and 688 on Sundays. No schools have taken advantage of the privilege accorded by the Trustees of using the Museum on Monday afternoons for teaching purposes; but as the Trustees consider it desirable to interest Schools and Country Museums in the study of Natural History, efforts have been continued to induce them to forward specimens for identification and correct nomenclature, and some School Museums have been supplied with named specimens from the duplicates in this Museum.
- 2. The collections are still being steadily increased, although on account of the temperary disarrangement of part of the Museum for building purposes, the Trustees have, to some extent, limited the acquisition of specimens. The principal purchases during the year have been:—

Casts of remains of large extinct American animals.

Skins and skeletons of large foreign animals.

A series of skins and skeletons of Australian animals for exchanges.

Ethnological specimens from New Caledonia, New Hebrides, New Guinea, &c.

The most important acquisitions, by exchange, have been :-

Some vory valuable specimens, including a nearly perfect skeleton of the Great Auk, from the United States National Museum.

A collection of Mediterranean Fishes from the Royal Zoological Museum, Florence.

A collection of Fishes from the British Museum.

A collection of Corals, &c., from the Technological Museum, Sydney.

The only collecting expedition of any importance during the year was sent to the River Darling (Mr. R. Helms, Collector) in order to take advantage of the exceptional facilities afforded by the late floods, and resulted in the acquisition of an extensive collection of Insects and other specimens.

3. The Trustees are glad to report that the proposed much needed enlargement of the Museum has been commenced. The work undertaken is the erection of a third story on the original building or "old wing" of the Museum, so as to raise it to the same height as the newer portion. Unfortunately great delay in the building operations was caused by the long continuance of unusually wet weather, and by the discovery, during the progress of the work, of the necessity for various alterations and repairs not provided for in the first specification. Some unavoidable inconvenience and difficulty in carrying on the work of the Museum has been caused by the necessary temporary removal of Library, Board Room, and Curator's and Secretary's Rooms to a galvanized iron building erected in the grounds, and the Trustees have been obliged to withdraw the Geological, Palæontological, and Foreign Mammalian Collections from 50—A exhibition

exhibition and to store them until the completion of the alterations. It was also found necessary to close the upper floor of the Museum, where the collections of Birds, Shells, Insects, &c., are exhibited, for the purpose of repairing the walls and ceiling; but this having been satisfactorily completed, a contract has been signed for the erection of additional wall-cases for the display of portions of the Australian and Foreign Collection of Birds.

- 4. Committees of Trustees having been appointed for the investigation of the Duties and Salaries of the whole of the officers and employees of the Museum, and for the revision of the Standing Rules and By-laws, have devoted a large amount of time to the performance of the duties entrusted to them, and it is hoped that the results of their labours will simplify and facilitate the work of the Institution.
  - 5. The following publications have been issued during the year:-

Catalogue of Australian Birds in the Australian Museum, by E. P. Ramsay, supplement to Part 1 Accipitres, and Part 2 Striges.

Catalogue of Echinodermata in the Australian Museum, by E. P. Ramsay, Part 1 Echini, new edition. Descriptive Catalogue of the Nests and Eggs of Australian Birds, by A. J. North.

Australian Lepidoptera and their tranformations, by the late A. W. Scott, edited and revised by A. S. Olliff and Mrs. H. Forde, vol. II, part 1.

Guide to the Contents of the Australian Museum.

Hints for the Preservation of Specimens of Natural History, by E. P. Ramsay.

Records of the Australian Museum, Nos. 1 to 5.

The following works are in preparation:-

Catalogue of Australian Birds, Parts 3, 4, 5, by Dr. Ramsay. [Part 3 early in 1891.]

Catalogue of Shells, by Mr. Brazier.

Catalogue of Tunicata, by Professor Herdman, Liverpool, England.

Records of the Australian Museum, Nos. 6 and continuation. [No. 6 early in 1891.]

History and Description of the Skeleton of a New Sperm Whale, by W. S. Wall, 1851. Reprint, 1891. [Early in 1891].

Catalogue of Australian Mammals, by Mr. Ogilby.

Catalogue of Reptiles and Batrachians, by Mr. Ogilby.

Australian Lepidoptera, &c., vol. 11, Parts 2 and 3. [Part 2 early in 1891.]

- 6. The appointment of Dr. J. C. Cox as Crown Trustee having caused a vacancy on the Board tho same was filled by the election of Professor T. P. Anderson Stuart.
- 7. It is with feelings of deep regret that the Trustees have to record the death of Professor Stephens, another of the Elective Trustees, who occupied a seat on the Board from 1862 to 1879, and again from 1883 to the time of his death in November, 1890. The vacancy has been filled by the election of Professor W. A. Haswell.
- 8. The offices of Surveyor-General and Colonial Architect having been abolished, the number of Official Trustees has been reduced to seven.

The following Appendices are attached to this Report :-

I .-- Annual Balance Sheet.

II .-- Attendance of Visitors.

III.—Attendance of the Trustees.

IV .-- Summary of Specimens acquired.

V .- Donations.

VI.—Exchanges.

VII.—Departmental Reports by the Curator.

VIII.-Additions to the Library.

1X.—Publications of the Australian Museum.

The Common Seal of the Museum was hereunto affixed by order of the Board this 7th day of July, 1891.

(Signed)
S. SINCLAIR,

(L.S.)

(Signed)
JAMES C. COX, M.D.,

Secretary.

```

#### APPENDIX VII.

DEPARTMENTAL REPORTS BY THE CURATOR.

To the Trustees of the Australian Museum,-

Gentlemen,

I have the honour to submit herewith Reports of the different Departments for the year 1890; and in doing so, I desire to record my thanks for leave of absence granted to me during the year for medical treatment, and specially during the months of May, June, and July, when Mr. R. Etheridge, junr., by your appointment, performed the duties of Curator:—

Mammals.—Owing to the alterations and additions to the Museum, a large portion of the collections has been withdrawn from public exhibition, and has been housed in temporary buildings in the grounds. This has rendered it injudicious to greatly increase the collection, except in cases where valuable or unique specimens have been offered. Some of the most interesting acquisitions are:—Northern scals, Cystophora cristata; twenty-four skulls of natives of New Britain; a number of specimens of Macropus rufus; stuffed specimens of Epyarus melampus and Cerous pardus; a skeleton of the pronghorn antelope.

Birds.—

Birds.—The collections of birds have been increased by 235 specimens, the most worthy of notice being a nearly perfect skeleton of the great auk, from the U. S. National Museum, and a rare bird of Paradise, Dyphyllodes guglielmi iii, from New Guniea, and fine adult. The upper floor of the Museum in which the bird collections are exhibited was closed for about four months for repairs to walls and ceiling. It has now been reopened, and a contract has been made for the erection of additional wall cases. Work has been continued at the "Catalogue of Australian Birds," the part containing the Psittaci\* being now ready for the press.

REPTILES, BATRACHIANS, AND EISHES.-Mr. J. Douglas Ogilby, Assistant in Zoology in these Departments, severed his official connection with the Museum towards the end of 1890, and a successor has not yet been appointed. He left the collections under his charge in good order, and he has since been employed by contract in writing and completing catalogues.

In the present condition of the Museum buildings, already referred to, not much new work has been attempted during the year, but the collections have been gone over, as usual, and carefully attended to.

Some of the most interesting acquisitions have been of lizards—Lygosoma monotropis, Blg., and Lygosoma atrogulare, sp. nov.; Batrachians, Hyla macgregori, sp. nov., from New Guinea; of snakes—Acanthophis axis from New Guinea; two large Indian pythons (Python reticulatus); and ever 400 specimens collected during the late floods at the Darling River.

The work of arranging, describing, naming, and labelling the fishes was steadily continued during the year, but want of space has prevented several large collections being placed on view. A few interesting exchanges have been made with other Museums, and we have received, among others, valuable collections of Brazilian fishes, by exchange from the Museum of Comparative Zoology, Harvard College, Cambridge, Mass., and of North American fishes from the U.S. National Museum. Some of the more important single specimens acquired are Tetrodon aurantius, sp. nov.; Polynemus verekeri, sp. nov.; Harpodon translucens, sp. nov.; a Sword fish (Histiophorus brevirostris); and a large Murray River Cod (Oligorus macquariensis), which has been mounted as a skeleton.

Mollusca.—(Mr. John Brazier, Conchologist.) During the year 343 specimens of land and fresh water mollusca were collected on the Darling River, N.S.W. 111 species of marine mollusca were obtained by the Museum staff during a dredging excursion in the Harbour. Two small collections of shells have

been purchased.

Show cases are much required for the effective display of the marine, land, and fresh-water shells in the Museum.

Mr. Brazier has been occupied during a great part of his time determining, naming, and cataloguing. A portion of the catalogue will be ready for publication early in 1891.

INSECTS.—Mr. A. S. Olliff, formerly Assistant in this department, resigned his position, and Mr.

F. A. A. Skuse was appointed his successor.

The total number of acquisitions in this department during the year amounts to about 22,000 specimens, chiefly Micro-colcoptera. Of these, about 20,000 specimens (comprising more than 200 species) were collected in May and June during the latter part of the Darling River floods at Bourke and Wilcannia, containing a large number of rare and new forms. A miscellaneous collection, principally consisting of Micro-lepidoptera, from Benalla, Victoria, and numbering 482 specimens, was purchased, and 294 specimens have been received from various other sources. It is to be regretted that only one exchange was effected, namely, in the acquisition of sixteen specimens of Victorian Lepidoptera (chiefly Heterocera).

Mr. Skuse, since his appointment, has been busy examining, cleaning, arranging, and making himself acquainted with the collections preparatory to their being placed on view in the new gallery after

building operations are completed.

MARINE INVERTEBRATA-(Mr. T. Whitelegge).-The registrations amount to 445 specimens, representing 193 species, of which 31 species and 51 specimens are donations, the remainder having been acquired by purchase and exchange.

The different sub-kingdoms are represented as follow: -

			Species.	Specimens.
 	 		 6	6
 	 	4 - 1	 14	20
 	 		 19	27
 	 		 20	128
 			134	264
•••	 		 	14 19 20

The most important addition made in the year 1890 was a series of Corals, Echinoderms, and Polyzoa, which originally formed part of the collection of the late Rev. J. E. Tenison-Woods. specimens were obtained by exchange, and are mostly from the Great Barrier Reef. There are, however, some from Port Jackson and other parts of the coast of New South Wales. Amongst them are several type specimens and many rare species new to the Museum collection.

During the year about three-fourths of the very large duplicate collection of spirit specimens have been examined with a view to reducing the size and the number of bottles, in order to economise the

space, and arrange them in systematic order, so as to render the specimens more easy of access.

Minerals.—Not very much new work has been attempted in this department during the past year, principally because of the necessity to close the part of the Museum where the mineral collections were displayed and to store away the specimens, and also because of the death in the early part of the year of Mr. F. Ratte, late Assistant in Mineralogy, whose place has not yet been filled up.

The collections have been increased by about 200 specimens received as donations, 90 specimens

as exchanges, and a few specimens purchased.

Palæonfology—(Mr. R. Etheridge, junr., Palæontologist).—The specimens registered during 1890 number 1,068, comprising as follows:-

Presented				 		***	30S
Exchanged	***		• • •	 	***		301
Purchased		***	***	 ***	1.4	4++	213
Museum collect	ing			 ***		• • •	237
Old collections				 			9
				•			1,068

Tho

The chief presentations were made by Professor A. Liversidge, F.R.S., and the Rev. Dr. Jeffreys, already acknowledged in last year's report. The former gave a very good set of miscellaneous British secondary and tertiary fossils, including some rare forms. The exchanges represent permo-carboniferous fossils from the Jamberoo District, from Mr. Engelhardt, Public School, Jamberoo; and similar organism from Mulbring, near Maitland, forwarded by Mr. S. Dodds. The chief purchases include additional remains of Meiolania, from Lord Howe Island; Pleioscene fruits, from the deep gold leads of Haddon, Victoria; Wenlock fossils, from Lilydale, Victoria; and casts of Phenacodus primævus and Hyracotherium ventricatum, from America. The specimens obtained by Museum collecting are from the Shoalhaven District and from Lilydale, Victoria, collected by Mr. A. J. North.

As already noticed, Mr. Etheridge filled the post of Acting Curator for three months, when his attention had to be given to the removal of specimens from a portion of the Museum to a store to make room for building operations. This work required special attention, and, with the general oversight of the Museum which devolved on him, delayed for a short time the work of his own department.

The following official papers were published during 1890:-

- 1. General Notes made during a visit to Mount Sassafras, Shoalhaven.
- 2. Descriptions of Upper Silurian Fossils from the Lilydale Limestone, Upper Yarra District, Victoria.—Records Australian Museum, 1890, I, pt. 1, p. 27; pt. 3, p. 60.

Ethnological Collections.—(Mr. J. Brazier). During the year 320 specimens have been purchased, the most important being a fine lot of greenstone axes and old clay cooking-pots from New Caledonia; fine-made mats, baskets, hats, native hair lines and fishing hooks, from Gilbert and Kingsmill Group; necklaces, drums, and otherrare articles of native dress, from British New Guinea; clubs, spears, cava-bowls, and food-baskets, from Viti or Fiji; stone-headed spears, from Bathurst Island. Torres Straits. By exchange seventy-four specimens have been acquired, the most important of which is a valuable collection of Neolithic worked flints from the Chalk Hills, South Downs, England; worked flints, from the River Thames; Paleolithic worked flints, from the river gravels, near London; polished basalt celts, from Iroland; celt socket, formed of the base of the red deer, from Swiss Lake dwellings; old English flint and steel, from Yorkshire; modern French peasant's pipe-lighter, flint, and steel; iron lamp, or "cruzie," in use since Roman times in Scotland: brass lamp, being a modification of the "cruzie," from Antwerp; cornelian arrow-tips, from Arabia; photographs of Hindoo pipes; illustrated art derived from natural objects, from Mr. E. Lovett, Croydon, England.

The following is a summary of the Ethnological specimens, registered in 1890:-

NUMISMATICAL AND HISTORICAL SPECIMENS (Mr. J. Brazier).—In this department, show cases are required to display the large collections of coins, medals, and tokens that are put aside in boxes. During the year the presentations have been 1 silver four-penny, Charles II, 1677; 1 penny token, Walsall, England, 1811; 1 penny token, Day and Mieville, merchants, Dunedin, New Zealand, 1857; 1 penny token, S. Hague Smith, merchant, Auckland, New Zealand, 1861; 2 Roman coins, 2 Turkish, 1 Russian, 2 kopecks

Five historical presentations have been received, viz.:—A copy of the New Testament in French, printed in France, 1664; the Hobart Town Gazette, Van Dieman's Land, 25 April, 1829, with duty stamp of 1827; General Advertiser, March 4, 1803, printed in Philadelphia, United States of America; "The Almost Christian discovered, or the false Professor tryed and cast," being the substance of seven sermons preached at Sepulchers, London, 1661, printed for John Tims, at the "Cross Koys," in St. Paul's Churchyard, 1662; a block of East Indian teak wood of the ship "Endeavour," East Indiaman, beached at Duskey Bay, New Zealand, in 1775.

I have, &c , E. P. RAMSAY, Curator

## NEW SOUTH WALES.

# AUSTRALIAN MUSEUM.

(BY-LAWS AND GENERAL RULES.)

Presented to Parliament by Command.

Department of Public Instruction, Sydney, 30th December, 1891.

## AUSTRALIAN MUSEUM.-BY-LAWS AND GENERAL BULES.

The following By-laws, Rules, and Regulations, made by the Trustees of the Australian Museum, for the management of that Institution, having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the 8th section of the Act 17 Victoria No. 2.

F. B. SUTTOR.

#### BY-LAWS OF THE AUSTRALIAN MUSEUM.

#### MBETING OF THE TRUSTEES.

T.

The ordinary meetings of the Trustees shall be held at least once in each month, on such day of the week, and at such hour, as shall be agreed upon by the Board.

Special meetings may be called on a requisition to the Sceretary, signed by three Trustees, stating the object of the meeting; and at such meeting no other business than that specified in the notice shall be transacted.

Every meeting may be adjourned from time to time, at the pleasure of the majority of members present.

In the month of December in each year, one of the Trustoes shall be elected President for the ensuing year, and shall, when present, preside at all meetings of the Trustees; but if he shall be absent, or shall vacate the chair at any meeting, one of the Trustees present may be elected Chairman of that meeting. If the office of President shall become vacant, another President may be elected for the residue of the current year. may be elected for the residue of the current year.

### OFFICE OF ELECTIVE TRUSTEE.

V.

The office of any Elective Trustee shall become vacant by his absence from the meetings of the Board without leave during six consecutive months.

### VI.

Whenever the office of an Elective Trustee shall have been declared vacant by the President or Chairman, any two Trustees may nominate in writing some other person to fill the vacancy, and at the next ordinary meeting after such nomination a bellot for the election of a new Trustee shall be held.

#### HONOBARY CORRESPONDENTS.

Persons who have rendered any service to the Museum or to the general cause of Science, may, at any ordinary meeting, be proposed in writing by two Trustees as Honorary Corres-pondents, and may be elected by hallot at the next or any subsequent ordinary meeting, and, if elected, shall be entitled to receive a Diploma under the Common Seal of the Museum.

#### ADMINISTRATION OF FINANCE.

All moneys of the Museum shall be kept at such bank or banks in Sydney as the Board may from time to time direct.

#### IX.

A Finance Committee shall be appointed, consisting of three Trustees, of whom two shall form a quorum. One member of such Committee shall retire in turn at the end of each year, and such Committee shall retire in turn at the end of each year, and shall not be eligible for re-election for twelve months; his successor shall be appointed at the first ordinary meeting of the Board in December, or as soon thereafter as may be possible; and every vacancy during a current year may be filled up by the Board by appointment of another Trustees to hold office until the end of that year.

### THE COMMON SEAL.

X.

The Common Scal of the Museum, the Deed of Grant of the property, the By-laws approved by the Governor, and such other things as the Board shall direct, shall be kept in a safe having three locks with duplicate keys, of which two shall be in the custody of each of two Trustees appointed by the Board and the other two shall be kept by the Secretary, so that any two possessors of keys may open the box.

Every document to which the Common Scal is affixed shall be signed by the President and countersigned by the Secretary, and such scal shall not be used except at a Board meeting or by order of the Board.

#### RULES FOR THE FINANCE COMMITTEE.

1. Previously to the first ordinary meeting of the Board in each month the Finance Committee shall aunit the accounts for the past month, and shall examine all claims to be submitted for

payment.

2. The accounts, when audited by the Finance Committee shall be reported to the Board, and (with the cash-book, chequebook, petty cash-book, and bankers' pass-books) laid on the table. The list of claims, when approved by the Board, shall be signed by the President or Chairman, after which cheques for the same shall be signed by two Trustees.

for the same shall be signed by two Trustees.

3. Cheques for salaries, wages, and other urgent claims, required to be paid before the next ordinary meeting may, on the requisition of the Curator, be signed by two members of the Finance Committee; but otherwise all cheques shall be signed only at the ordinary meetings of the Proof.

the Finance Committee; but otherwise all cheques shall be signed only at the ordinary meetings of the Board.

4. All cheques signed between the ordinary meetings shall be reported to the Board at the next meeting.

5. Unless otherwise requested all cheques shall be crossed, and, when signed by the trustees, shall be handed to the fectorary, who shall countersign the same on paying them away, but not sooner; and at the next ordinary meeting of the Board vouchers for all payments made shall be produced after having been submitted to the Finance Committee, and all cheques not handed over to the persons entitled to them shall be also prohanded over to the persons entitled to them shall be also pro-

. 6. The Finance Committee shall audit the annual balance-sheet, and report the result of their examination to the Board.

#### GENERAL RULES.

1. Officers-From 9:30 a.m. to 4:30 p.m. on every working day except Saturdays; and from 9:30 a.m. to 12:30 p.m. on

Skilled Workmen-From 9 a.m. to 5 p.m. on every working day except Saturdays; and from 9 am. to 12 30 p.m. on

Saturdays.

Labourers and Unskilled Workmen-From 8 a.m to 5 p.m. on every working day except Saturdays; and from 8 a.m.

to 1 pm. on Saturdays.

Attendants—From 8 am. to 5 p.m. on every working day except Mondays, from 1st April to 30th September, and from 8 am. to 6 p.m. from 1st October to 31st March, and from 8 am. to noon on Mondays.

One hour delle at times arounded by the Curator will be

One hour daily, at times arranged by the Curator, will be allowed for lunch.

2. Every officer and servant of the Trustees shall sign his name in an attendance book, to be kept in the entrance hall, and record the time of his arrival and departure; and a and record the time of the attendances shall be prepared and laid before the Board et every ordinary meeting; such book to be removed to the Curator's office at 9 15 a.m. and 9 45 a.m.

3. No officer or servant shall be absent during working hours without the permission of the Curator, and all absences shall be recorded in the attendance book. Should an officer have again to learn his room health!

occasion to leave his room, he shell leave a memorandum stating

the fact, and when he will return.

4. No officer or servant of the Trusters shall lend money to any other employé, nor shall the Secretary make any advances in account of salary or wages, nor recognise any order to pay money on account of any employé, nor accept any receipt for salary or wages from the country or wages. salary or wages except from the person to whom the money is actually due, without the authority of the Board.

5. Leave of absence on full pay may be granted yearly to the members of the Staff, as follows:-

Officers, three weeks, or such other time as may be agreed to by the Board. Skilled workmen and

On the recommendation of the Curator and approval of the Board. Attendante, two weeks.

But no claim for accumulation of leave from year to year will be recognised.

6. The Officers and Servants of the Museum shall receive

instructions as to their respective duties from the Curator, and they shall be responsible to him for the due performance of the same. Any communication they may wish to make to the Trustees shall be forwarded through the Curator. The Secretary shall receive his instructions in all matters pertaining to his Department from the Trustees and shall be responsible. to his Department from the Trustees, and shall be responsible to them for the due performance of his duties.

# Duties of the Curator.

- 1. To attend at the Museum on Sundays as well as on other days when it is open, unless specially exempted by resolution of the Board or relieved by one of the Officers of the Museum.
- 2 To direct the general working of the establishment, to superintend the staff, and to make the less use of the collections as a source of interest and information to the public.
- 3. To report in writing to the Board upon all specimens offered to the Trustees for purchase or exchange.
- 4 To be responsible for the naming, labelling, classification, safe custody, and preservation of the collections, books, and other property of the Trustees.
- 5. To sign all letters on scientific subjects, and in connection with the acquisition and disposal of specimens.
- 6. To cause lists of specimens acquired by donation up to the last day of each mouth to be prepared and laif before the Board at the next monthly meeting, and to forward monthly lists of donations to the press.

7. To report monthly on the state of the Museum and collections, and the nature and particulars of the work done by each assistant, taxidermist, and collector during the month; and to submit such statement to the Board at its first ordinary meeting in the following month.

8. To be responsible for the preparation of letters of thanks

to donors of specimens.

9. To be responsible for the preparation of a register of specimens received, embodying—

Number in consecutive arrangement.

Name and habitat of specimen as nearly as possible.

Name of donor or vendor.

Date of acquisition.

Disposal of same.

Remarks in relation to the same.

10. To superintend the packing of all cases despatched from the Museum, and the preparation of lists of contents.

11. To be responsible for the preparation of an Exchange Register according to forms approved of by the Board.

12. To certify to the correctness of all accounts submitted to the Regard for parameter.

the Board for payment.

18. To deliver to the Secretary all reports and requisitions on the day before the meeting at which they are to be

14. To act as editor of all publications issued by the Trustees, except when they shall otherwise determine.
15. To see that the precautions against fire are strictly

carried out. 16. To sign all requisitions laid before the Board.

17. To have charge of the keys of all cases, offices and doors of workrooms and other rooms.

#### Duties of the Secretary.

1. To prepare and issue notices of all meetings of the Trustees, and whonever any elective Trustee has been absent from the meetings of the Board, without leave, for four consecutive months, to send him notice to that effect.

2. To prepare business papers for all Board meetings, to attend such meetings, and to prepare minutes of the proceed-

- ings at the same.

  3. To take charge of all correspondence; to register all official letters; to write and sign all letters according to instructions; to prepare monthly returns of the number of persons visiting the Museum; to make lists of all publications acquired by purchase, exchange, or donation; to prepare such other returns and reports as may be required; to keep copies of all lotters and returns written or made by the Board or by its authority; and to perform all clerical work appertaining to the business of the Museum.
- 4. To commence all communications which he may have occasion to make with the words "on behalf of the Trustees," and to use the words "by direction of the Trustees" only when so instructed.
- 5. To keep all necessary books of account; to countersign and pay away all cheques, and to prepare monthly and yearly balance sheets for submission to the Board, and half-yearly statements for the Auditor-General.

statements for the Auditor-General.

6. To keep separate accounts of the expenditure of the different grants of money voted by Parliament.

7. To compare all accounts with the Order Book, initial them if correct, and submit the same to the Board, on Government forms in duplicate.

8. To act as Librarian, and keep a register of all books in the Library, and enter them in the Library Catalogue.

9 To stamp all books in the Library on the tule page, at intervals of about 100 pages, and on the fronts of the plates

and other illustrations.

10. To keep in the Library a register in which every book removed from the shelves shall be entered, with the date of such removal.

11. To attend in the Library at stated times for the purpose of issuing and receiving books, to examine once a month or oftener the register of books issued and the cards left in the Library by borrowers, and to obtain the return of all books at the expiration of the time for which they were borrowed.

12. To attend to the shipment of all goods sent abroad, and obtain delivery of all goods consigned to the Museum.

13. To furnish each Trustee prior to the mosting at which

any estimates intended to be submitted to Parliament are to be considered, with a copy of such estimates.

14. To have charge of the keys of the office safes and strong

15. To prepare and sign letters of thanks to donors of books

15. To prepare and sign letters of thanks to donors of books to the Museum Library.

16. To take charge of all stores and equipments, and to issue the same only on requisitions signed by the Curator.

17. To keep a Store Book showing the receipt, issue, and condition of all stores, and to produce the same to the Finance Committee whenever required by them.

18. To receive all stores and equipments arriving for the Museum, and to enter the same in the Store Book.

19. To take charge of the Museum during the temporary absence of the Curator in office hours.

absence of the Curator in office hours.

D.

#### Duties of the Scientific Assistants.

1. To assist the Curator in the work of their respective departments; to name, classify, register, and take charge of such specimons as he may hand to them for that purpose; to prepare for publication descriptions of specimens; also to prepare official catalogues and guides; and to perform such other duties as the Curator may require.

2. To enter daily in a diary particulars of all work done by them, and to hand such diary to the Curator once a week, or oftener if required, for inspection by himself or production to

the Board.

3. To take charge of the Musuem in turn, according to seniority of appointment, during the absence of the Curator on Saturday afternoons and public holidays, and on week days from 4.30 p.m., to closing time.

4. To proceed on collecting tours if required by the Board, and to furnish reports on the same.

#### Duties of Skilled Workmen.

1. To preserve or deal with such specimens as may be supplied to them by the Curator in such manner as he may direct.

2. To carry out the instructions of the Curator for the care of the collections, and to obey all such other orders as he may

at any time give them.

3. To enter daily in a diary particulars of all work done by them, and hand such diary to the Curator once a week or oftener if required, for inspection by himself or production to the Board.

#### Duties of Attendants.

1. To clean and dust the Museum and its contents; attend to the doors, and maintain order among visitors; to assist the Scientific Assistants and the Taxidermists when required by the Curator, and to act generally under the instructions of the

2. All attendants shall be sworn in as special constables for

duty in the Museum.

3. To clean and attend to the closets and lavatories for visitors.

Duties of Collectors.

1. During the period of their engagement collectors shall be under the superintendence of the Curator, and shall devote their time entirely to collecting for the Museum, and shall not collect for themselves or any other institution or individual. All specimens of which they may become possessed during any collecting trip shall immediately become the property of the Trustees

2. They shall, on the last Friday of every month, and at such other times as the Curator may require, forward to him a report of their movements, with a statement showing the number and nature of specimens collected, and particulars of

all expenses incurred.

3. These regulations shall apply to any members of the Staff while collecting, as well as to specially engaged collectors.

#### LIBRARY RULES.

1. Excepting as hereinafter provided for, every Trustee shall be entitled from time to time to borrow four volumes at a time for a period not exceeding fourteen days.

2. Any member of the Scientific Staff may be allowed to take

from the Library to his workroom such books as he may require in connection with the work upon which he is engaged in the Museum; but the Librarian shall at all times have access to the books in the workrooms and shall be responsible for their

teturn without unnecessary delay.

3. Members of the Museum Staff, with the approval of the Curator, may borrow books to be taken out of the Museum, in which case they shall also enter the books in the Register, with their eignatures attached, and the date of removal. Books must be extravel to the Library at the experience of feminal and the statement of the st be returned to the Library at the expiration of fourteen days,

but may be re-issued. 4. Visitors will not be permitted to take books out of the Library; but upon the approval of a Trustee or the Curator, may be allowed to consult any book between the hours of 10

a.m. and 3 p.m.
5. No book shall be removed from the shelves in the Library

except in the presence of the Librarian

6. Every borrower on obtaining a book shall leave in its place a card with the title of the book thereon signed with his name, and he shall be responsible for such book so long as his

7. Books returned to the Library must be left on the table for the inspection of the officer in charge, who will replace them on

the shelves.

8. Books difficult to replace shall be specially marked, and shall not be permitted to go out of the Museum without the senction of the Board. Any breach of this rule must be reported to the Board.

#### FIRE BRIGADE REGULATIONS.

#### FIRE BUCKETS.

Fire Buckets are stationed at the following places :-

- 1. One Bucket in each Workroom or Office.
- Two buckets in Library.
   One bucket in Board Room.
- 4. Two buckets in Vestibule.
  5. Two buckets in Storeroom.
- 6. Eight buckets in Cellars and Passages in Basement.
- 7. Two buckets in Spirit Room.

They are to be kept full of water, which is to be changed once a week, and are not to be used for ordinary purposes under any consideration whatever.

#### HOSE AND HYDRANTS.

Hydrants and Hose are stationed at the following places :-Inside Building.

- Geological Hall.
   Control Hall, Ground Floor.
   Staircase, First Landing.
   Staircase, Upper Landing.

Outside Building.

- 1. East side Main Building.
- 2. Cellar Door.
- 3. On Lawn, opposite Private Door.

All hose to be kept coupled to the hydrants. In each case where there are two or more lengths of hose supplied to any one hydrant the whole is to be kept coupled together, and the branch nozzle is to be kept attached. In case any hose has to be uncoupled that the hydrant may be used for other purposes, it must be replaced as soon as the other work is finished.

All hadrents are to be kept closed down tight to present the

All hydrants are to be kept closed down tight, to prevent the hose caupled on from gettting wet.

Each hydrant will be tried quarterly, to test whether the water supply is correct, by the Foreman of Public Buildings.

All rubbish of any kind liable to spontaneous ignition must be taken outside the workshops each day before closing. Smoking is not allowed in the Workshops, the Spirit Room, or the Cellars, nor in any part of the Museum Buildings.

#### IN CASE OF FIRE.

In Case of Fire.

Ring up the Telephone Exchange, get on with No. 211
Metropolitan Fire Brigade, and report fire either in the Museum
or in the immediate vicinity. Engines will promptly attend.

Any person discovering a fire in the Museum is to give the
alarm, and immediately run out the hose to as near the seat of
fire as possible. After the hose has been run out the wheel of
the hydrant is to be turned to the left until it cannot be turned
any more. If this is done quickly there will be time to get back
to the nozzle again and direct it before the water reaches it.

When the alarm is heard do not rush indiscriminately to the
seat of the fire—but first pass the signal on to others—then get
your own hose out and ready for use in case it should be
nerded, await instructions, and be ready to act as may be
required. If visitors are in the building attendants must not
leave their posts unnecessarily, as extra vigilance will be required
to prevent panic or damage to the specimens by frightened and
mischievous people.

Any person using the hydrants must be very careful not to

Any person using the hydrants must be very careful not to do unnecessary damage by water.

Directly the Metropolitan Fire Brigade arrives all directions must be taken from officers in charge of same.

The preceding By-laws, General Rules, and Regulations having been passed by the Trustees of the Australian Museum, the Common Scal of the Corporation is hereto affixed by me as Crown Trustee and Chairman, this twelfth day of November, 1891.

#### Secretary and Treasurer:

W. P. WARTON.

### Report to The Minister for Public Instruction.

The additions made to the national collection by purchase during the year 1890 have been both numerous and important, and the Colony is indebted to the donors for a number of valuable and interesting presentations.

The Trustees have purchased thirty-three oil paintings, at a cost of £5,816 19s.; eight water-colour drawings, costing £459 15s. 6d.; one drawing in black and white, costing £2 2s.; one piece of statuary, costing £250; and one medal, costing £1 10s.; making a total of forty-four works of art purchased during the year, at a cost of £6,530 6s. 6d., of which the following is a detailed list:—

#### Oil Paintings.

British.

Festa: By S. Melton Fisher.

Oyster-fishers, Essex: By E. Waterlow, A.R.A.
Their Ever-shifting Home: By S. A. Forbes.
On Bideford Sands: By F. Bourdillon.
Streatley on the Thames: By A. Glendinning.

Stealing the Keys: By Marcus Stone, R.A.
Interior of St. Peter's, Rome: By David Roberts, R.A.
Edinburgh: By David Roberts, R.A.
Home: By S. E. Waller.

The Lizard, the Lion, and the Stags: By John Brett, R A.

Foreign.

Le Bataillon Carrée: By J. Le Blant.

Meditation: By Heilbuth, Napoleon at Waterloo: By F. Flameng.

The Snake-charmer: By Dinet.

Meditation: By Oliver Rhys. Outside the Fortifications of Paris: By H. Thompson.

Penitents in Spain: By Melida.

Study (young girl): By M. Courtois. La Seine at Vetheuil: By Dufour. Chateau de Loches: By Lansyer.

Vintage in Provence: By Montenard. The Marsh: By Marie des Landelles. Psyche: By Carl Smidt.

Procession in Seville: By F. Bossuet.

#### Australian.

After the Shower: By L. Lister.

A Token of Friendship: By A Collingridge.

Apples: By Madame Roth. The Dry Season: By L. Jones.

Still Glides the Stream: By A. Streeton.

An Old Woman: By G. P. Nerli.

Portrait of Sir Henry Parkes: By J. R. Ashton, P.A.S.

Scandal: By L. J. Cowen.

Nearing the Camping-ground: By J. Ford Paterson.

Water-colour

Water-colour Drawings.

British.

Silver Birches: By T. F. Grace.

Arriving from the Ferry: By R. W. Allen.

Mossman's Bay: By J. Mather.

Black and White.

Orpheus and Eurydice (Photogravure).

Marble.

Copy of Canova's Venus.

Medal.

Tho "West" Medal.

The Trustees have again much pleasure in recording the very marked advance in the works of local artists, as evinced in the last Exhibition of the Art Society, which justified them in making purchases to the full amount set apart for that purpose.

The following works have been presented to the Gallery during the year :-

Oils.

Daybreak off the old town Hastings (by T. R. Miles): Presented by Mrs. Eben Atherton. Study (a figure by G. Guido): Presented by Mrs. Eben Atherton. Copy of Raphael's Madonna della Seggiola: Presented by Josiah Mullens, Esq.

Water-colour.

The 'Prentice Hand (by T. W. Couldery): Presented by R. T. Hall, Esq.

Black and White.

Limburg on the Lahn: Presented by Josiah Mullens, Esq.
Two Pencil Sketches by Lalanne, and one Etching by Donor: Presented by E. L. Montefiore, Esq.,

The Reproduction of the Ghiberti Gates, Florence: Presented by J. R. Fairfax, Esq. French Assignat, dated 1792: By J. A. Parrot, Esq.

The total number of visitors during the year was 211,544, the average on Sundays being 1,596, and

on week-days 413.

With a view to the further encouragement of Art Students and Amateurs, the Trustees again offered an amount (about £67) as prizes for the best and second best pictures in various branches of painting and drawing, with the result that about 450 works were sent in for competition, being nearly double the number sent in the year previously. Many of these were of considerable merit, and the most meritorious were exhibited in the Gallery during January, 1891.

The number of students who have been permitted to copy in the Gallery was increased during the

year by 14, making the total 95, and there has been a very fair average attendance.

It is with extreme regret the Trustees have to report the resignation of Sir Oswald Brierly as a member of the London Selection Committee, through ill-health. The Trustees, however, congratulate

themselves on the acceptance of the position thus made vacant by the Right Hon. the Earl of Carlisle.

The Trustees have also to report the appointment of a Selection Committee in Paris to act in conjunction with the London Selection Committee, consisting of E. L. Montefiore, Esq., MM. Charles Efrussi and Phillip Burty; the latter gentleman has, however, since died, and his place is not yet filled No further progress has been made as regards the completion of the building, the plans submitted by Mr. Horbury Hunt not having met with the approval of the Minister or the Trustees.

The Trustees report that the Hon, the Minister for Public Instruction has approved of an improved water supply being made to the Gallery.

water supply being made to the Gallery.

For the convenience of visitors and students, the Trustees decided on allotting distinct courts for oil paintings by British, Foreign, and Colonial artists, water-colour drawings, and drawings in black and white, necessitating an entire re-arrangement of the Gallery, which was accomplished without closing the

Gallery to the public for a single day.

With the view to the gradual formation of a collection of water-colour drawings, illustrating what is most picturesque in the scenery of New South Wales, especially in the remoter districts of the Colony, the Trustees have invited competitive drawings, to be exhibited in the Gallery in November, 1891, from which they propose to select a certain number if considered of sufficient merit to be be permanently placed in the

Gallery.

With the approval of the Minister, the Trustees gave the Secretary eleven months' leave of absence, in consequence of ill-health; during his absence Mr. G. E. Layton was appointed Acting Secretary, and his duties to their entire satisfaction.

Sydney: George Stephen Chapman, Acting Government Printer .-- 1891.

#### 1891-2.

#### LEGISLATIVE ASSEMBLY.

## SOUTH WALES.

# SYDNEY MECHANICS SCHOOL OF ARTS.

(CORRESPONDENCE RESPECTING THE USE OF, FOR THEATRICAL PURPOSES.)

Ordered by the Legislative Assembly to be printed, 1 April, 1892.

#### DEPUTATION.

Sydney Mechanics' School of Arts.—Objections of certain theatrical managers to the use of the large hall as a Music Hall. Deputation to the Minister of Public Instruction, 16th February, 1892, Messrs. W. H. Traill, M.L.A., Frank Smith, H. Barrington, L. Foley, and George Perry.

Mr. Traill said: We want to bring under your notice the impropriety of an Institution subsidised by the Government, for educational purposes, competing with private enterprise, by giving in its hall entertainments which are decidedly not of an educational character. The Sydney School of Arts is, I understand, giving in its hall entertainments not at all of an educational character. These gentlemen will be able to bring the matter more fully under your notice on they are better acquainted with the question be able to bring the matter more fully under your notice, as they are better acquainted with the question

Mr. Perry said: What I object to is that any Institution drawing a Government subsidy should have shows of this kind. No Institution subsidised by the Government has any right to allow any part have shows of this kind. No Institution subsidised by the Government has any right to allow any part of the building to be put into competition with private enterprise. The main hall of the Sydney School of Arts has been open as a variety hall for about two years. It is said to be leased by Mr. Tracey. Mr. Tracey is not real lessec. I understand. The show is run by Mr. Haviland, the Secretary of the School of Arts. One of the artistes told me so. I say it is wrong that any Institution subsidised by the Government should compete with us. It is wrong all through. We cannot compete with them. We are taxed to pay the subsidy that helps them, it is simply taking the bread out of our mouths. I have lost £300 last year through them. I have to pay my way, and pay my artistes. I run concerts. I have to run my show without any subsidy. When I get good artistes, they leave because the School of Arts can give them more. I have no objections to the character of this show, but it is not right that I should be made to help to pay this subsidy, and then for them to use their hall to compete with me. Morally they are wrong. I know that you will side with me that they have no right, as a Government Institution, to compete with us. compete with us.

Mr. Suttor: What is the nature of the entertainment?

Mr. Perry: It is a variety and minstrel entertainment,—burlesque business. There is the usual first part—the chairs, then different acts and a burlesque. In fact, it is a minstrel and variety entertainment of the usual type. (Mr. Perry and Mr. Foley here apologised for the absence of Messrs. Hiscocks and Goodman.)

Mr. Smith said: There is another thing. Each member of the School of Arts goes into the show at half-price. The price is said to be 2s., but he goes in for 1s. because he is a member of the School of Arts. Then a member can go and buy five tickets during the day-time at half-price, that is a thing that is against us altogether. I have a lot of people in my employment. There are sixty men in my employ, and I have been told that Tracey does not pay the salaries at the School of Arts. When Tracey went there he had no money. He is none the worse for that, but it shows that it is not likely that he could run the show. Mr. Fanning, an artiste, told Mr. Barrington that Mr. Haviland payed them with his own cheque. [Mr. Barrington here said that Mr. Fanning told him so.] Tracey does not pay them at all. Mr. Foley has got a fine theatre vacant. It would not be vacant if this hall was not occupied, inasmuch as they have been there to ask him about the rent. Then, as to the show, you can see by the bills what it is. You can see the pictures as you go by. I am not saying anything against the character of the show. I have nothing to say against the show as a show, but if you take a drive past there, and then call it a Mechanics' School of Arts, I think it is coming pretty low down. It is very injurious to us.

Mr. Foley said that Mr. Goodman and all the other theatrical managers were in favour of the object of the deputation. He had lost £6,000 over the Royal Standard Theatre.

Mr. Smith said he had lost £6,000 over the Royal Standard Theatre.

Mr. Foley said the show was just a variety show and nothing else. Mr. Smith said: There is another thing. Each member of the School of Arts goes into the show at

Mr. Foley said the show was just a variety show and nothing else.

Mr. Smith said they objected to the principle of the thing.

Mr. Suttor said that he understood that they objected to the principle, not to the show.

Mr. Foley said the show could not be tougher than it was. It was the usual leg business. They had a lot of little girls at 12s. a week to show off their figures. It was a leg show. They had a crowd who went in for 6d.

Mr. Traill said that no doubt in country places there was need for the occasional use of the hall for travelling shows. It was sometimes the only hall to be obtained; but in the Metropolis it was right, he thought, that the hall of the School of Arts should be used for educational purposes. He considered such a hall should be used for lectures by professors; for lectures such as those given by the late Mr. Proctor. He did not think that it was confemplated, when the Government subsidised such an Institution,

that its hall would be used for the purposes which had been mentioned.

Mr. Smith said that the hall was so used formerly. He had attended lectures there.

Mr. Suttor said that there was no doubt that it was a legitimate construction that these halls should be used for educational purposes. In country Schools of Arts the halls were, he understood, countried temporarily by shows. He did not see any objection to the temporary was of halls in country. occupied temporarily by shows. He did not see any objection to the temporary use of halls in country

Several members of the deputation expressed assent.

Mr. Suttor said that he thought that there was a very great distinction between a temporary occupation and a permanent one. One statement had been made unmistakably, and that was that the Sccretary of the School of Arts is running this show.

Mr. Perry said he was told so.

Mr. Suttor said that was a matter which should be considered by the School of Arts. Certainly he did not think it allowable that a person occupying the position of Secretary of the School of Arts should be running a show such as this. The deputation could not expect him to give them a definite There had been no previous complaints, and there were no papers. Now that a complaint had been made, it was his duty to see if there was anything to be done. He would cause inquiry to be made. There was no doubt that these halls were built for educational purposes.

Mr. Folcy said: Supposing they deny that Haviland runs the show, supposing they said that Tracey

has the place; will that make any difference?

Mr. Suttor said they got a subsidy. The Government could make conditions. He did not think it was right that a lease should be given for a show such as had been described. He would give the matter consideration.

Mr. Traill thanked Mr. Suttor on behalf of the deputation.

16/2/91.

Submitted.—E.J., 17/2/91.

A copy of the statements made by members of the deputation may be forwarded to the Committee of the School of Arts, with a request that they will furnish me with any explanation they have to make upon the matters complained of.—F.B.S., 25/2/92.

Letter to Mr. Teece, President of Mechanics' School of Arts, 29/2/92.

#### The President, Sydney Mechanics' School of Arts, to The Under Sccretary for Public Instruction.

School of Arts, Sydney. 4 March. 1892. Sir, I have the honor to acknowledge receipt of your favour, No. 1192-1,821, of 29th ultimo, and to thank the Minister of Public Instruction for the opportunity which he has afforded me of repelling a

number of calumnies that might, if uncontradicted, scriously prejudice the reputation of the School of Arts.

I prefer to think that the gentlemen comprising the deputation referred to in your letter spoke from an imperfect knowledge of the facts. Since I should not like to believe that even the jealousy engendered by business competition could have led them designedly to frame a series of such gross misre-

presentations as are contained in the remarks attributed to them.

At an interview which the Minister recently granted to a deputation from the Committee of the School of Arts I had the honor to explain the pecuniary embarrassment which the unexpected withdrawal of the Technical College from the School of Arts premises had entailed upon the Committee: I need not, therefore, make any further reference to that aspect of the question, but shall at once proceed to deal with the statements made by the members of the deputation. The facts of the case are that the hall attached to the institution is leased to Mr. Dan. Tracey for a period of three years, only a few months of which have expired. The lease drawn by the solicitors of the Institution is made direct from the Committee in its corporate capacity to Mr. Tracev, the sole responsibility for payment of rent and salaries of artistes rests on Mr. Tracey, who receives the entire proceeds; the secretary of the Institution, either in his official or his private capacity, has no connection of any kind with Mr. Tracey in the conduct of his business, and none of the artistes are paid by his cheque. The whole of the statements made by the members of the deputation to the contrary are entirely without foundation. I believe it is a fact that since Tracey's occupancy of our hall, the attendance at sparring and boxing contests and music hall entertainments has fallen off. I attribute this to the fact that Traccy's entertainment is of a more refined and elevating character. I believe it is a fact that Mr. Foley offered Mr. Traccy the Guiety Theatre at a lower reutal than is being paid for the School of Arts hall; I am also given to understand that Tracey pays his artistes higher salaries than are paid by music hall proprietors. Seeing that Tracey that Tracey pays his artistes higher salaries than are paid by music hall proprietors. Seeing that Tracey receives no assistance from the School of Arts, these facts should be sufficient to show that the public prefers his entertainments to those given by the members of the deputation. It is not true that Tracey employs a number of "little girls at 12s. a week to show off their figures." The costumes of Tracey's artistes are similar to those worn in the performances of Gilbert and Sullivan's operas and burlesques. The Minister may inform himself on these points by means of a report from the Inspector of Theatres. The members of the Committee frequently visit the hall during the progress of the entertainments, and can vouch for the care taken by Tracey in their conduct, and the good order and decorum which always prevail. I have shown that every statement made by the members of the deputation thus far is untrue, and at this point I might allow the matter to rest, but I think I should fail in my duty if I did not point out to the Minister that the hall is not subsidised by the Government. The School of Arts, in common with other institutions of a kindred character throughout the Colony, is subsidised by the

Government to the extent of 10s for each £1 of private subscription paid by the members; no subsidy is given in respect of the receipts from the hall or from any sources beyond the subscriptions. It is quite a customary thing in country towns for balls and dramatic and musical entertainments to be given in the halls attached to the Schools of Arts, but it has never occurred to any Government to refuse, for this reason, a subsidy to which these institutions become entitled by virtue of other qualifications. The receipts from the hall enable the Committee to increase for the use of the members the supply of books, magazines, &c., and thus to augment the purchasing power of the annual subscriptions of such members. If the hall were allowed to remain vacant, the facilities for intellectual improvement afforded to the members would be much curtailed without producing any reduction in the subsidy contributed by the Government. The dog-in-the-manger policy suggested by the deputation would not relieve the Government of any payment, while it would seriously curtail the advantages enjoyed by the members of the Institution.

I think it right that I should add that when the Technical College abandoned the hall the Committee undertook a series of lectures of an educational character, but as the receipts from these did not repay the cost they were discontinued. The Committee is fully sensible of the responsibility resting on it to employ the resources of the Institution in such a manner as to confer the greatest possible benefit on these classes of the community for which Schools of Arts are primarily intended. To this end it is now elaborating a scheme for the establishment of evening classes in the subjects usually comprised in a curriculum of primary education. Such classes to be attractive must be accessible at a small cost, and the Committee does not anticipate that the receipts therefrom will be much more than sufficient to pay the salaries of teachers. The rent of the hall will be of material aid to the Committee in making these classes successful. If such rent is not forthcoming the Committee may be compelled to abandon the scheme, and to let the rooms intended to be occupied in carrying it out for such purposes as will secure a sentel sufficient to provide a fair interest on the sentel sufficient to provide a sentel sufficient to provide a sentel sufficient to provide a sentel sufficient to provide a sentel sufficient to provide a sentel sufficient to provide a sentel sufficient to provide a sentel sufficient to provide a sentel sufficient to provide a sentel sufficient to provide a sentel sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient to sufficient rental sufficient to provide a fair interest on the capital represented by them.

I trust that this explanation will be sufficient to convince the Minister that he has been entirely misinformed on this subject, and that the deputation has failed to adduce any reason to warrant the Government in withholding from the School of Arts the generous support which has enabled it to provide valuable intellectual recreation at a reasonable cost to 5,000 members of the community.

I have, &c RÍCHARD TEECE,

President.

# Minute by The Minister of Public Instruction.

31 March, 1892.

I HAVE carefully read and considered the letter submitted to me by the President of the School of Arts, in reply to statements made by members of a deputation that waited upon me, complaining that the hall connected with the Institution had been leased for a long term, and was being used entirely for theatrical performances.

Although other statements were made, and replies given to them, I do not consider them essential,

and will deal only with the one and chief complaint

It is admitted by the President that the hall is leased to Mr. Dan. Tracey for a period of three It is not denied, in fact it is admitted, that the hall is used for theatrical purposes, and it is years. It is not denied, in fact it is admitted, that the hall is used for theatrical purposes, and it is claimed that the entertainment is of a more refined and elevating character than sparring and boxing contests. This even being so, I contend that the entertainments are not educational, nor are they of a kind that should be given in an Institution such as this—I admit that in small country towns where there are no other halls suitable, occasional performances of a theatrical character may be excusable; but to permanently lease a School of Arts' hall for such purposes, as has been done in this case in the Metropolis, is indefensible, and so long as the lease continues, and these entertainments are given, I do not think that I shall be justified in granting a Government subsidy to the Institution.

The statement made by the President that the hall is not subsidised by the Government, is quite beside the question. No particular portion of these buildings is subsidised directly; the Government contribution is given upon subscriptions paid by the members, and it is fair to claim that the money so raised is expended in the general maintenance of the Institution.

F.B.S.

1891. (SECOND SESSION.)

### NEW SOUTH WALES.

# NAUTICAL SCHOOL-SHIP "VERNON."

(REPORT FOR THE YEAR ENDING 30 APRIL, 1891.)

#### Presented to Parliament by Command.

The Superintendent, N.S.S. "Vernon," to The Under Secretary of Public Instruction.

Nautical School-ship "Vernon," Sydney, 31 July, 1891. I have the honor to submit my Annual Report upon the "Vernon," for the year ended the

I have the honor to submit my Annual Report apon the former, and make the honor to submit my Annual Report apon the former, and what illness there was, was chiefly confined to boys arriving on board with skin complaints, sore eyes, want of proper food, and so forth. Over 2.000 boys have been on the vessel during the last fifteen years, and only three have died. In all three cases the deaths occurred from the chronic complaints with which the boys suffered when admitted. At the present time there is a clean bill of health.

3. The lads' behaviour has been highly satisfactory throughout. There has been less misconduct than in any former year, and the new comers have, as usual, been responsible for most of the offences. This is very natural, considering the class from which the ship is recruited. Boys are sent here, for the most part as a last resource, and when other means of dealing with them have failed. Of the new

most part, as a last resource, and when other means of dealing with them have failed. Of the new comers, 50 per cent, had been more than once before the police courts; and 19 per cent, had proved failures under the various charitable systems. These things should not be forgotten when the "Vernon' work is being considered or compared with that of other institutions. Under these circumstances, it is pleasant for ine to be able to report favourably concerning the boys' conduct.

4. The greatest number ever on board at one time was attained on the 21st March last, namely, For the year a daily average of 219 was reached, and, altogether, 353 boys were dealt with on the The apprentices averaged about 430, thus making a total daily average of 700 under my control, ashore and afloat. The cost to the State, including salaries, supervision of apprentices, schooling, training and board, clothing, and lodging of the ship boys, amounted to about £6,500, or  $6\frac{1}{2}$ d. each per diem. Included in this sum is a number of items which might fairly be spread over a term of years, such as

formation of drill ground, repairs to ship, and so on.

5. The reports concerning the boys in the second stage of the system, who are apprenticed, have been numerous and favourable. Over 90 per cent. received good characters, and of those unfavourably commented upon the majority were returned to the ship for a further disciplinary training. The apprentices had been away from the ship for various periods, ranging from nearly six years downwards. During the year I received upwards of 3,000 letters concerning them, provided from the boys the received. During the year I received upwards of 3,000 letters concerning them, principally from the boys themselves. Every apprentice has been visited by a responsible person on my behalf, and in many cases I have personally inspected the lads at their masters' residences. The Inspector-General, Mr. Fosbery, and the police continue to take the greatest interest in the "Vernon" apprentices, and much of the success attained is attributable to them.

6. The demand for our lads has been unusually numerous, and not more than one application out of three has been complied with, owing to the boys not being available. This is practical proof that the "Vernon" lads, as a rule, give satisfaction to their employers. Great care is taken in selecting situations. Every person must, in addition to being well recommended, furnish certificates from a clergyman and a magistrate, resident near the proposed master, that they will visit the boy, and see that all the conditions under which he is apprenticed are being observed.

7. The system of allowing boys to be apprenticed, after only a short probationary period in the Institution, is an admirable one, at once economical to the country and benevolent to the boys. Instead of shutting the lads up for a long weary period until they attain the age of 18, the vast majority become virtually free after a comparatively short stay on board, and learn upon stations, farms, and elsewhere pursuits which enable them to gain an honourable living. In addition, they earn a fair sum during their apprenticeship, which gives them, at the age of 18, amounts to their credit ranging from £25 to £50. The satisfactory way in which this plan has worked (and it has been over twenty-four years under trial) has enabled the "Vernon" to deal with a large number of boys—a number such as elsewhere has employed soveral large establishments to deal with. It is obvious that, if the system had not worked well, several more institutions of a reformatory character would be required to house the boys—some hundreds in number—who are now serving apprenticeship from the "Vernon."

8. Visits and letters from "old" boys (those who have passed out from the apprenticeship stage, and who are quite free from control) continue to be numerous. It would take up too much space to

219-Aenumerate

enumerate all these, but they form gratifying incidents in the history of the ship. One young man, who left the ship in 1868, has held his present situation for nearly twenty years, and receives closely upon £3(0) per annum. Another, whom I frequently see, and who left here many years ago, is earning nearly the same amount, and holds a responsible situation in the Government service. Another, who was apprenticed in August, 1875, in the northern district, still remains with his old employer. He is a steady fellow, with a well stocked place of some 2,000 acres. When he visited the ship recently, after nearly fifteen years absence, he expressed his gratitude for his rescue from the life he was leading prior to being sent to the ship, and for the start in life he received from the "Vernon." And ever so many more instances are available. Looking back to the history of these men before they came to the ship, shows the work done in a reformative direction. From amongst hundreds of cases I take the following, as bearing upon the practical value of the "Vernon's" labours:—J. S., committed to the ship 21st October, 1882. The precis of evidence furnished by the committing magistrate, Mr. O'Malley Clarke, S.M., showed that the boy was unable to read or write, that his father had described him, and that his mother was a prostitute and a drunkard, who lived with the boy in a brothel kept by her, which was frequented by thieves, prostitutes, and vagrants. She was, at the time of the boy's being sent here, in gaol. The lad had himself been more than once before the Court. He stayed on the "Vernon" for one year and a few days, and was then apprenticed on the 14th November, 1883, to a gentleman living some considerable distance from his old haunts and associations. Not one complaint was ever made of him; and he finished his apprenticeship, about three years ago, having close upon £50 to his credit. He still remains with his old master, who wrote last week concerning him, after upwards of eight years experience, to the Principal Under Sceretary:—"I have had great pleasure in always speaking of his meritorious behaviour while in my service. He is still in my employ earning when dearing for weekly and found and when shearing He is still in my employ, earning, when droving, £2 weekly and found, and, when shearing, y. I now beg to apply for another boy. —(Sd.) W.C."

15s. daily. I now beg to apply for another boy.—(Sd.) W.C."

9. The Institution is the longest established of its class in Australasia, and has now entered upon its twenty-fifth year. Sufficient time has therefore elapsed to judge the result of its work. To the 30th Of these, 224 remained on board, 11 died on the ship or in hospital, and 2,253 left apprenticed or discharged. Some of these latter turned out badly, and have been in and out of gaol almost continually. Their cases come more prominently under notice than those where ex-inmates turn out well. In England a return is yearly published, showing the reconvictions after detention in reformatories during the year. For 1889 (the last period yet reported upon) these amounted to 632 males for England and Scotland, or a percentage of 1.8 of the number who had passed through the institutions. The Comptroller-General of Prisons in New South Wales reported a few days ago that during the twelve months ended last April, twenty-eight ex-inmates of the "Vernon" had been convicted. This gives the low average of 1.2. The proportion of the total convictions to the entire male population of the Colony is about 1.8

population of the Colony is about 1.8.

10. The foregoing statistics appear to afford the most reliable means whereby to arrive at a fair understanding as to the nature of the work done by the "Vernon." Even better results would have been accomplished if some of the boys had been sent aboard at an earlier period of their career. In another way, no doubt good has been accomplished. The fact of the "Vernon's" existence has in itself

proved a deterrent to many lads of wayward proclivities.

11. Religious instruction has been conducted on board by the Revs. W. Charlton, Hanly, E. Corcoran, and J. Hagarty; the Sisters of St. Joseph; and by Mrs. Ford. The boys have much benefited by the numerous visits paid to the ship by these ladies and gentlemen, who are entitled to our warmest thanks for their earnest and successful labours. When fine, the boys landed and marched to their respective places of worship in Balmain. In inclement weather, Divine Service was held aboard, in addition to the usual religious exercises, conducted under the supervision of the ship's officers. Several of the Church of England boys were confirmed by the Bishop of Sydney, who also visited the ship; and a number of the Roman Catholics were confirmed by Cardinal Moran.

12. Fair work has been done in school, and with the changes now imported into the school management, better results will be obtained in the future. Table K gives details of the school work.

13. The scholastic routine occupies nearly six hours daily; and every boy attends during half that time, according to his division. A great deal of other work is done however. Yarious drills and exercises are systematically taught. Besides these, the following is a summary of the industrial work done during the past year, and its estimated monetary value :-

	£	В.	ø.
Sailmaker's work—Awning making	12	0	0
Making and fitting mast-coats	1.	15	0
Covering fire-hose	1.	10	0
Making 6 hatch covers	6	0	0
, 4 tarpaulins	3	0	0

Musician's Department—Work in connection with keeping instruments in order; value of services rendered by band when engaged out of	£	8.	d.
Laundry—Washing and mangling clothes. Each boy washes his own	100	0	0
clothing (about 8 pieces) weekly, and a hammock every fortnight.  In addition to these, bed-ticks, towels (2 to each hov), collars.			
blankers, serge clothing are washed; 142,000 pieces @ 2d General work—Cleaning decks, rifles, ship's side, dormitory, baths, play-	930	0	0
ground, aviaties, sheds, landing, and whitewashing	200	0	0
Total value of industrial labour, apart from school, drill, and other training £	2,251	0	0

It will be seen that the boys are kept fairly employed.

14. Recreation plays an important part in the system of the ship. A large proportion of the recruits arrive ignorant of rational recreation. It is a difficult task, for some time, to get these to take part in any games, or to show interest in what is being done for their amusement. I have observed that an inclination to join in with the recreation marks, in many cases, the commencement of reformation. Much attention is therefore given to this subject, and during the past year considerable additions and improvements have taken place, with the approval of the Minister of Public Instruction, the Hon. J. H. improvements have taken place, with the approval of the Minister of Public Instruction, the Hon. J. H. Carruthers. A large playground has been levelled and nicely grassed. A very complete gymnasium, with roomy asphalted court, swings, climbing poles, horses, giant's stride and parallel bars constructed, and a spacious swimming bath, made with sandy bottom, trapezes, and other appliances. The Library on the ship has been added to, and now comprises over 1,000 volumes, while the daily papers are accessible to the lads who wish to read them. There are three clubs in healthy condition, viz:—(1) Athletic and Swimming Club; (2) The Vernon Cricket Club; (3) The Vernon Liedertafel. These are managed each by its own committee, and candidates for admission are proposed and balloted for in the usual way, the only condition for eligibility being that intending members must be in a high class for conduct. Much interest is shown in chess, and there are some very fair players amongst the inwates: and draughts Much interest is shown in chess, and there are some very fair players amongst the inmates; and draughts and other indoor games are indulged in. On two occasions the boys attended at the theatres, by the kind permission of Messrs. Williamson and Rignold; and Dr. Carver entertained them at the Wild West Show, Moore Park.

15. Some time ago the experiment was tried of keeping birds, dogs, and other pots on board. This has proved successful, and not one case of cruelty has occurred on the part of the lads, who have undoubtedly gained in gentleness and kindliness of disposition by the care and presence of these creatures. All the boys in the first four classes, who wish to do so, now keep pets, and pigeons, doves, dogs, guinea pigs, &c., go about the ship with their liberty uncurtailed. This kindly disposition has been encouraged by the proprietors of the "Band of Mercy," who distribute many copies of every issue amongst the boys, and who have also kindly awarded prizes to the writers of the best essays on the subject of kindness to animals.

16. An important event in the history of the ship was the inspection of the institution by His Excellency the Governor, on the 17th February, when he was accompanied by the Minister of Public Instruction, who is the head of the establishment. On arrival and departure seventeen guns were fired, yards were manned, and a guard of honour with colours and band were drawn up under arms on the quarter deck. The Governor made a thorough inspection, and afterwards addressed the boys, giving them kindly advice. At a later date Lord and Lady Jersey entertained the boys and officers at Govern-

ment House, where a most enjoyable day was spent.

17. The Hon. Sir Henry Parkes, G.C.M.G., the Prime Minister of New South Wales, and Lady Parkes again entertained the lads at their house in celebration of the Queen's Birthday. These annual festivals are looked forward to with considerable anticipation, and their occurrence is greatly appreciated by the lads, whose enjoyment is always carefully provided for by their benevolent and sympathetic

entertainers.

18. Lectures on various subjects, illustrated by the ship's oxyhydrogen lantern, have been given by Messrs. Haviland (3), Courtney Smith, J. Ritchie, and A. Dakin, and the St. George's Philharmonic Society contributed a musical evening on board. The proprietors of the Town and Country Journal and Illustrated Sydney News have given us their papers, and several persons have contributed books to the Library. A tame emu, presented by Mr. Crick, M.P., runs about the grounds, and is a great acquisition

to our stock of pets.

19. I have dwelt at greater length than usual upon the work and system of the Institution, as this will probably be the last Annual Report upon the present vessel. A new vessel, nearly three times as large as the "Vernon," has been purchased, and the boys will shortly be shifted to their new quarters. The large as the "Vernon," has been purchased, and the boys will shortly be shifted to their new quarters. The work of the ship has been for years steadily increasing, so much so as at one time to seriously overcrowed it, and although the spacious dormitory on Cockatoo Island at present relieves the vessel of this strain, yet it has been for some time evident that much more room is necessary. Added to this, is the decay of the ship by age and wear and tear. The "Vernon" has been employed in its present duty for a term approaching a quarter of a century, during which time it has housed some 2,500 boys. This means a great deal of work, and the condition of the ship itself may be described as worn out. A larger institution will afford more sleeping accommodation, roomier space for exercise, drill, and school, while offering opportunities for improvements and additions to the training, which experience teaches would be opportunities for improvements and additions to the training, which experience teaches would be advantageous. Here it will not be out of place to once more invite your attention to the hearty assistance given by the officers of the ship. They have worked well. In the larger vessel they will have scope for extended work, although success will, in the largest measure, materially depend upon the manner in which it is fitted up. Apart from decay and lack of accommodation, the "Vernon's" internal arrangements offer great facilities for complete supervision and training, but these have only been gradually achieved as the result of long practical experience and constant observation. It is with some regret that I leave the old ship after eighteen years residence on board.

EREDERICK W NEITENSTEIN FREDERICK W. NEITENSTEIN,

Commander and Superintendent.

Sydney: George Stephen Chapman, Acting Government Printer. -- 1891.

Nautical School Ship "Vernon."

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

# PURCHASE OF THE SHIP "SOBRAON."

(CORRESPONDENCE RESPECTING.)

Ordered by the Legislative Assembly to be printed, 18 November, 1891.

RETURN to an Order made by the Honorable the Legislative Assembly of New South Wales, dated 14th September, 1891, That there be laid upon the Table of this House,-

"Copies of all papers in connection with the purchase of the Ship "Sobraon."

(Mr. Murphy.)

### Alfred Lamb, Esq., to The Minister of Public Instruction.

Sydney, 31 December, 1839. The "Sobraon" ship is now in Melbourne, so if anything is likely to come out of my suggestion that she will make a suitable training-ship, will you let me know? There is no hurry for a few days, as I am getting matters into shape to say more plainly to you that she is for sale, and the price.

I know the vessel is in splendid order—just been coppered afresh, which is a big outlay. Her size is 2,131 tons, built in 1866. Then classed for seventeen years, and since, in 1883, reclassed for eleven years as A1. Length, 272 feet; breadth, 40 feet; depth 27 feet. I will communicate again with you in a few days.

Yours, &c

ALFRED LAMB.

Acknowledge, and say I will be glad to get particulars as to price.

The Under Secretary of Public Instruction to Alfred Lamb, Esq.

B 90-146.

Department of Public Instruction, Sydney, 7 January, 1890. Sir, In acknowledging the receipt of your letter of the 31st ultimo, respecting your suggestion that the ship "Sobraon" would be suitable for the purpose of a training ship to supersede the N.S.S. "Vernon," I am directed to acquaint you that the Minister of Public Instruction would be glad to receive particulars as to the price of the vessel referred to.

> G. MILLER (For Under Secretary).

### Alfred Lamb, Esq., to The Minister of Public Instruction.

Sydney, 14 January, 1890. In reply to your letter, B 90-146, I have the honor to inform you that after exchanging various cables with the owners of the "Sobraon," they have declined to sell the ship. Several of the owners I know were desirous of making a sale, which caused me to bring the matter under your notice, but by a majority the decision is the reverse.

368-A

[870 copies—Approximate Cost of Printing (labour and material), £10 0s. 6d.]

I have been instructed from London to offer you a fine iron ship for £12,000, and now in New Zealand. The offer is, however, subject to certain arrangements being made for cancelling the ship's present engagement. Should you, therefore, entertain the purchase of the ship in any way, I shall be glad to know soon, so that I may ascertain before going further into the matter that she is actually available.

The ship is a very fine built vessel, 1,458 tons, 230 ft. x 38 ft. x 23 ft., and built in 1868.

I have, &c., ALFRED LAMB.

Refer to Captain Neitenstein.—J.H.C., 16/1/90. The Superintendent, Nautical Training Ship "Vernon."—E.J., B.C., 20/1/90.

The Under Secretary of Public Instruction,—As I have not seen the ship referred to in Mr. Lamb's letter, I am unable to express an opinion respecting her. The price seems high. I regret that there is no prospect of obtaining the "Sobraon," as she could have been made suitable for this work.—F.W.N., B.C., 22/1/90.

Inform Mr. Lamb that the "Sobraon" is a suitable for this work.—

Inform Mr. Lamb that the "Sobraon" is the only vessel of those offered by him suitable, and we

are prepared to treat for her if offered.—J.H.C., 28/1/90.

### Alfred Lamb, Esq., to The Minister of Public Instruction.

Re Training Ship.

Sir,

Sydney, 21 January, 1890.

Since addressing you on the 14th instant, I have a cable from London, authorising me to offer to you a composite vessel of 1,014 tens register, 198 feet long x 31.5 beam x 22.0 deep, built in 1867, by Hall, of Aberdeen, with seven years yet to run as A1, price £5,000. My cable does not make it quite clear as to whether this is for delivery here, or in Glasgow; but if you entertain the vessel at all at the price—and it appears a very reasonable one—I will be happy to cable to London, and be in a position to furnish you with further particulars to furnish you with further particulars. I have, &c.,

ALFRED LAMB.

Superintendent N. S. "Vernon," for report.—E.J., B.C., 21/1/90.

The Under Secretary of Public Instruction,—This ship would not afford much more space than does the "Vernon." Composite or iron old ships are not the most suitable vessels for our purpose. Wooden ships are the best.—F.W.N., B.C., 23/1/90.

Inform Mr. Lamb that this vessel is unsuitable.—J.H.C., 28/1/90.

### Alfred Lamb, Esq., to The Minister of Public Instruction.

Re Proposed New Training Ship.

Sir

Sydney, 22 January, 1890.

Referring to my interview with you to-day, I have again the honor to bring under your notice the following suggestion as to the "Sobraon."

I feel so satisfied that by searching the world you are not likely to come across a more suitable vessel in every respect; and I suggest that you should send some one now, that may be hereafter responsible to you for the securing of a suitable ship, to inspect the vessel, as she lies in Melbourne. Should you then be satisfied that this is a suitable vessel, I have little doubt but that I could arrange for the sale of the ship to be delivered here within nine months.

> I have, &c., ALFRED LAMB.

Unless a vessel is under firm offer I cannot agree to an inspection.—J.H.C., 28/1/90.

### The Under Secretary of Public Instruction to Alfred Lamb, Esq.

Department of Public Instruction, Sydney, 28 January, 1890. Sir,

I am directed to acquaint you that the Minister of Public Instruction has had under notice your letters, dated respectively the 14th, 21st, and 22nd instant, submitting for consideration the names of vessels thought by you to be suitable to replace the N.S.S. "Vernon."

2. In reply I am to state that, having consulted the Superintendent of the "Vernon," Mr. Carruthers is of opinion that of the ships named in your letters the "Sobraon" is the only one suitable for the purposes of an industrial school ship. He cannot, however, agree to send an officer, as suggested by you, to inspect her as she lies in Melbourne, unless she is placed under direct offer to this Department. If the owners will make a definite offer of her, Mr. Carruthers will be prepared to treat for the purchase. I have, &c., E. JOHNSON, the purchase.

Under Secretary.

### Captain J. A. Elmslie to The Colonial Secretary.

Dear Sir Henry,

I send you with this a short outline of the ship's history and condition, and hope that you may decide to accept her for the purpose you require a vessel for, subject to price, which I have no doubt could easily be arranged with your Agent-General in London. She is admirably suited for the work, and it would be a great gratification to me, after my long and successful connection with the ship, to see I have, &c., JAS. A. ELMSLIE. her placed in such honourable and useful retirement.
