<b>POINTS OF ORDER (continued) :—</b>		
<b>RULINGS OF SPEAKER (continued) :—</b>		
That motion in respect to expenditure from Revenue and Loan Account was irregular in form as submitted, as some of the Resolutions were inconsistent with each other, 143.		
That Motion of Adjournment in reference to payment of legal expenses of Sergeant McKee without the consent of Parliament, should not be discussed, as the item could be discussed in Supply, 193.		
That Hon. Member was in Order in Committee of the Whole in discussing <i>Hansard</i> reports of Speeches made in past Sessions, provided they were relevant to subject under discussion, 250.		
That the matter of referring the Central Railway Station, Devonshire-street, to the Public Works Committee, instead of submitting to Parliament the Hyde Park scheme recommended, was in Order; also, that the explanation of the Minister as to the probable revenue to be derived from the work was clearly that no revenue would result, 265.		
That motion for adjournment in reference to prosecution of Kate Burns, at Bourke, was not in Order, as matter could be discussed in Committee of Supply. (Mr. Speaker also referred to previous rulings), 282.		
That Member was not in Order in discussing any particular item in Committee on the Appropriation Bill which had been passed by Committee of Supply, 307.		
That Member was not in Order in moving in Committee the omission of an item in the Appropriation Bill, 307.		
That the proposed amendment on the Motion to refer the matter of the Extension of the Railway into the City was in accordance with the terms of the Public Works Act, 315.		
<b>POLICE :—</b>

Lays papers on Table, 5, 18 <sup>(e)</sup> , 69, 259.		
Commission of Deputy, to Administer Oath of Allegiance, 14.		
Announces return of Writs, 119 <sup>(o)</sup> .		
Reports resignation of Member, 119.		
Intimates his intention to consider Points of Order, 106.		
Clerk informs House of unavoidable absence of, and Deputy-Speaker takes Chair, 151, 215, 253.		
Clerk adjourns House in the absence of the Speaker and Deputy-Speaker at time appointed for meeting, 251; Standing Order amended in reference to absence of Speaker and Chairman of Committees, 265; Assent reported, 271.		
Submits Nomination to fill vacancy on Public Works Committee separately, 328.		
Reports letter from Governor enclosing Despatch in reference to Address on Federal Constitution Bill, 201.		
<b>RULINGS OF :—</b>		
That a motion for adjournment of the House could not be moved before the Address in Reply to the Governor's Opening Speech had been dealt with, 4.		
That motion for adjournment in reference to Australian Jockey Club Trust was out of order as it was not definite, and introduced another subject for discussion, 84.		
That amendment on motion to declare the Member for Paddington, Mr. Neild's, seat vacant, to refer matter to the Elections and Qualifications Committee was in order, 88.		
That an amendment on a proposed amendment on the Motion of Censure against the Government was relevant to the proposed amendment, 107.		
That an amendment on a proposed amendment on the Motion of Censure was relevant to the original motion, 107-108.		
That after the mover of a motion, on which an amendment has been proposed, had replied, an Hon. Member could only address the House on the amendment, 136.		
That amendment, on motion for removal of Green Rocks, in connection with Hunter River Flood Mitigation Scheme, to refer matter to the Public Works Committee, was in order, 142.		

REFERENCES TO THE VOTES AND PROCEEDINGS, VOL. I—18TH PARLIAMENT—THIRD SESSION, 1899.	PAPERS ORDERED TO BE PRINTED.	
	VOL.	PAGE.
<b>S</b>		
<b>SPEAKER (continued) :—</b>		
<b>RULINGS OF (continued) :—</b>		
That motion in respect to expenditure from Revenue and Loan Account was irregular in form as submitted, as some of the Resolutions were inconsistent with each other, 143.		
That motion of adjournment in reference to payment of legal expenses of Sergeant McKee without the consent of Parliament, should not be discussed, as the item could be discussed in Supply, 193.		
That Hon. Member was in Order in Committee of the Whole in discussing <i>Hansard</i> reports of Speeches made in past Sessions, provided they were relevant to subject under discussion, 250.		
That the matter of referring the Central Railway Station, Devonshire-street, to the Public Works Committee, instead of submitting to Parliament the Hyde Park scheme recommended, was in Order; also, that the explanation of the Minister as to the probable revenue to be derived from the work was clearly that no revenue would result, 265.		
That motion for adjournment in reference to prosecution of Kate Burns, at Bourke, was not in Order, as matter could be discussed in Committee of Supply (Mr. Speaker also referred to previous rulings), 282.		
That Member was not in Order in discussing any particular item in Committee on the Appropriation Bill which had been passed by Committee of Supply, 307.		
That Member was not in Order in moving in Committee the omission of an item in the Appropriation Bill, 307.		
That the proposed amendment on the motion to refer the matter of the Extension of the Railway into the City was in accordance with the terms of the Public Works Act, 315.		
That an amendment to alter the route on the motion to carry out the Extension of the Railway into the City, as recommended by the Public Works Committee, was an evasion of the Public Works Act, 315.		
<b>SPECIAL ADJOURNMENT (See "ADJOURNMENT").</b>		
<b>STAGE CARRIAGES BILL :—</b>		
Received from the Legislative Council, and on motion ( <i>Mr. Reid</i> ) read 1 <sup>o</sup> , 39; read 2 <sup>o</sup> ( <i>Mr. Wise</i> ), committed, reported without amendment, report adopted, 171; read 3 <sup>o</sup> , passed, and returned to Council, 198; Assent reported, 232.		
<b>STAMP DUTIES (AMENDMENT) BILL :—</b>		
Message from Governor, 294; Standing Orders suspended, 305; Ordered ( <i>Mr. Lyne</i> ), founded on Resolution of Ways and Means (No. 11), Bill presented and read 1 <sup>o</sup> , 314; read 2 <sup>o</sup> , committed, reported with amendments, Report adopted, 321; read 3 <sup>o</sup> , passed, and sent to Council, 325.		
<b>STANDING ORDERS :—</b>		
Suspended to pass Bill through all stages in one day, 17, 118, 148, 235, 305 <sup>(6)</sup> .

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## LOCKS AND WEIRS ON THE RIVER DARLING, BETWEEN BOURKE AND MENINDIE.

### REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, and the Public Works Acts Further Amendment Act of 1897, 61 Vic. No. 6, to whom was referred the duty of considering and reporting upon "the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie," have, after due inquiry, resolved that it is not expedient the proposed works should be constructed; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

#### GENERAL REMARKS.

1. The question of making certain sections of the river Darling permanently navigable, the Committee are officially informed, has been before the Government of New South Wales for a number of years. In 1855 an examination of the river between Bourke and Wilcannia was made by the Department of Public Works, and in 1888 a sum of £20,000 was passed by Parliament for improving the navigation, and afterwards set aside for the construction of an experimental lock and weir. Up to the end of 1894 the question was dealt with solely in the interests of navigation, but at that time the papers in the matter were obtained by the Mines Department to ascertain whether the locking of the river could be profitably carried out in connection with water conservation and irrigation. In 1895, a contract was let for the construction of an experimental lock and weir at a point about 4 miles below the town of Bourke, a work which was completed about the middle of 1897.

In 1896, the expediency of canalising the river between Bourke and Berrarrina was referred to the Parliamentary Standing Committee on Public Works, who reported against the proposal on the grounds that the work "could only be regarded as an initial step in rendering the whole length of the river navigable, the benefits resulting from which would principally accrue to Victoria and South Australia, and that the Committee were of opinion that it would be unwise to engage in such outlay until the matter could be comprehensively dealt with by a Federal Parliament."

On the 22nd December, 1898, the present inquiry was authorised by the Legislative Assembly, and the Minister for Works, in submitting the proposal, urged its consideration in the interests of water conservation and navigation, and also as a possible means of benefiting the railway system of the Colony.

THE

## THE LOCKS AND WEIRS AS PROPOSED.

2. The Departmental proposal is to render the river permanently navigable between Bourke and Menindie, a distance by water of about 570 miles, by a system of seventeen locks and fixed weirs, constructed of rubble concrete and iron, and placed at intervals of distance varying from 17 to 58 miles. The sites for the weirs, except in three instances, it is officially stated, are at parts of the river where a natural rock bar provides a satisfactory foundation; where a rocky bar does not exist, and a weir is necessary, a foundation would be made on a bottom of stiff clay and sand. A survey of the river has shown that many suitable rock bars occur where the stream is abnormally wide with very sloping banks, conditions regarded as very suitable for the proposed works. The locks, which it is intended should, as far as possible, be placed in the river channel in positions where the river runs a straight course, would be 200 feet in length between the gates, and 37 feet in width; the lifts varying from 6 to 10 feet. This length would admit of the passage together of a steamer and barge, and the width is sufficient, the Committee are informed, for all but one of the steamers now navigating the river, and that one could easily be so altered as to be able to use the lock with the same facility as others. The weirs, would be constructed at the lower end of the locks, as far from the entrance as possible, in order to obviate the risk in time of flood of steamers being taken by the current either over or against the weir, instead of into the lock; an additional precaution against this to be a line of piles placed above each lock, to which vessels might be tied when necessary. The height of the weirs would be from 13 to 16 feet, according to the lifts provided for at the various sites, and the drop of the water behind the weirs to supply the locks, from 6 to 10 feet.

In the locks the minimum depth of water provided for is 6 feet; at the lower ends, with the water from the weir, from 12 to 16 feet. No apprehension of an insufficiency of water in the river to meet requirements is felt by the Engineer-in-Chief for Public Works. In his opinion, based upon observation and inquiry, there would always be water enough to allow for losses by lockage, evaporation, soakage, or any other cause. The average depth of the river throughout would be 8 ft. 6 in. Floods are not expected to prove injurious to settlers in the neighbourhood of the river banks by reason of the weirs, as they would be well below the top of the banks, and should a flood cause the water to rise 8 or 9 feet over a weir the flood-level would still be within the banks. What risk of erosion there might be near the weirs would be met by building into the banks until solid ground is reached, and then throwing out long concrete wings or abutments from 9 to 11 feet above the tops of the weirs; and also by facing the banks with stone.

## ESTIMATED COST.

3. The estimated cost of the works is £530,000, or £930 per mile, which amount is made up as follows:—

7 locks and weirs complete at £28,000 =	...	...	£196,000
10 " " " 26,000 =	...	...	260,000
17 lock-keepers' cottages at 300 =	...	...	5,100
300 miles telephone line at 20 =	...	...	6,000
Wharf and cranes ... ..	...	...	10,000
Maintenance steamer, fitted with small sand-pump	...	...	10,000
Contingencies ... ..	...	...	42,900
			£530,000

The estimated interest and cost of maintenance are given as follows:—

	Annual charge.
First cost, £530,000 at 3 per cent. ... ..	£15,900
Seventeen lock-keepers at £100 ... ..	1,700
Crew of steamer, stores, and up-keep ... ..	2,000
Stone and material for repairs ... ..	2,400
	£22,000

This, it is pointed out, is equal to £36 13s. 4d. per mile per annum.

WORKING

### WORKING THE LOCKS.

4. It is proposed that those in charge of the vessels navigating the river should open and shut the lock-gates, under the direction of the lock-keepers or watchmen. In time, it is thought these watchmen may be done away with, and the working of the locks left entirely to the crews of the steamers and barges, as in England. For the time being, however, the watchmen would assist in opening and closing the lock-gates, and by means of telephonic communication from lock to lock report, when necessary, anything going wrong. The steamer included in the estimate of cost would be used in connection with repairs, for which purpose it would be manned by a good crew, fitted with a small sand-pump, and furnished with a blacksmith's forge. Passing from point to point of the river, repairs, when required, could by these means be attended to without much delay, and any accumulation of silt in front of the locks, after a flood, easily removed.

### THE COMMITTEE'S INQUIRY.

5. In the course of their inquiry the Committee have had before them, for their information, the various official reports which, from time to time, have been made in connection with the improvement of the Darling, and on the subject of irrigation in the western districts, together with reports relating to water conservation and irrigation in other places; they have taken evidence in Sydney, and at Bourke, Louth, Wilcannia, Menindie, and other places on the Darling; and, accompanied by an officer of the Department of Public Works, they travelled the whole length of the river from Bourke to Menindie, and inspected the sites for the proposed locks and weirs. The witnesses examined in Sydney included the Under Secretary and Commissioner for Roads, Department of Public Works; the Engineer-in-Chief for Public Works; the Principal Assistant Engineer of the Water Conservation Branch of the Public Works Department; the Government Fruit Expert; the Chief Railway Traffic Manager; the Chief Draftsman, Department of Lands; the Government Astronomer; the Superintendent of Public Watering Places and Artesian Boring; the representative of a firm of carriers doing an extensive business on the Darling; and the surveyor who carried out the survey of the Darling for the purpose of fixing the lock and weir sites.

On the Darling those who gave evidence comprised pastoralists, carriers, and others interested in the river trade, the manager of the Government experimental farm at Pera Bore, farming lessees at the Pera Bore irrigation settlement, settlers who have cultivated by means of irrigation from the river, and the caretaker of the lock and weir at Bourke.

In the consideration which the Committee have given to the proposal before them they have inquired into the three-fold aspect of the question—the permanent navigation of the river, irrigation and increased settlement along and in the neighbourhood of the river banks, and the prospects from an improved waterway of additional traffic to the railways.

### THE LOCK AND WEIR SITES.

6. The inspection of the sites for the proposed locks and weirs showed most of them to be in suitable positions. In two or three cases the conditions were regarded by the Committee as not quite what is desired, but the depth of the stream and the nature of the river-bed, in places which otherwise would meet requirements, have rendered it necessary to choose situations not in every respect as suitable as could be wished.

Site No. 1 is  $38\frac{1}{2}$  miles below the lock and weir at Bourke, and near Yanda station. The approach to it down the river is at a bend in the stream, where it did not appear to the Committee to be desirable to construct the lock and weir, as a bank on one side was evidently "making" in a manner which suggested a possible repetition of a mistake noticed in connection with the lock and weir at Bourke. Round the bend there is a straight run in the river for a considerable distance, and as rocks extend some distance from the point of the turn, it seemed to the Committee quite possible to place the lock and weir in a position where the approach either way would be easy, and the risk of the lock silting up very small.

Site

Site No. 2, which is at Toorale landing, 71 miles from the Bourke lock and weir, is situated near a slight bend in the stream, but in a fairly long reach, and in such a position as should prevent any silting up as at Bourke.

Site No. 3, at Singleton's Crossing, 97½ miles from the Bourke lock and weir, was found to be situated at a short and somewhat awkward turn of the river, apparently as difficult as the site of the lock and weir at Bourke. The river at this point winds very sharply, and certainly does not in its present state offer a suitable approach; but it was explained by the Departmental surveyor accompanying the Committee that one of the sand points would be removed so as to provide a straighter run. A short distance beyond this site, and just past the point to be cut away, is a fine long reach, which should form an admirable position for the lock and weir, but the necessary foundation, it is said, cannot be obtained, there being rocks on one side only of the river, and the bottom of the stream being soft mud. About a mile beyond the site, however, and at some rocks known locally as "Charley Mathews' Rocks," it appeared practicable to find a site superior to that chosen.

Site No. 4, at Louth, and 115 miles from the lock and weir at Bourke, was found to be in a straight run of the river, and apparently very suitable for the purpose in view. It is situated just before turning round the bend in the stream from Bourke to the punt-crossing at Louth township.

Site No. 5, or Dunlop site, is about 2 miles below Dunlop station, and 133 miles from the Bourke lock and weir. The approach to it from the Bourke side is circuitous, the river winding considerably, and the turns short; but on rounding into the straight run, where the pegs denoting the position for the lock and weir are placed, it can be seen that the site is well down the reach, and should be satisfactory. The choice of some of these sites, it was explained, is due to the difficulty of finding in their vicinity positions where the water is shallow, and the bottom hard enough to admit of a good foundation and the required height of walls.

Site No. 6 is at the Curranyalpa Rocks, 187 miles from the Bourke lock and weir. Here, again, the approach from Bourke is tortuous, the stream broken by several small islands, the water shallow, and the navigation so difficult that the steamer by which the Committee were travelling bumped heavily several times and grounded. The rocks at this part of the river extend along the stream for a considerable distance, and practically form the key to the river, as the risk of steamers touching the rocks or grounding is greater here than in any other part, and the fall is considerable. After passing the small islands, the stream bends round into a short straight run, and then turns into a very fine long reach, about midway in which is the site for the lock and weir. It appears to have been wisely selected, and should prove satisfactory.

Site No. 7, near Tilpa, and 211 miles 60 chains below the lock and weir at Bourke, has not yet been surveyed, but the position is a good one, in the centre of a reach.

Site No. 8, at Ryan's Island, and 253 miles from the Bourke lock and weir, also has not been surveyed. The lock, the Committee were informed, may be constructed on one side of the island and the weir on the other.

Site No. 9 is just below Talyawalka Creek, and in the vicinity of a small island, near a bend in the river, which forms the approach to a long reach. The stream is broad, and the site, apparently, suitable. The island may be removed, or the lock and weir placed as indicated in the case of site No. 8.

Site No. 10, near Mount Murchison station, is in a long, straight run of the river, where the stream is of good width.

Site No. 11 is near Murtee station, and 358 miles from the Bourke lock and weir.

Site No. 12, which is 18 miles 27 chains from Wilcannia, and 393 miles 27 chains below the lock and weir at Bourke, is situated at an awkward turn in the river, which will make a somewhat difficult approach up or down stream to the lock. Just past the bend there is a long reach, but apparently the water there is too deep for the foundations of the proposed works, or it may be otherwise unsuitable.

Site No. 13, or Culpaulin site, was also found to be near a bend in the stream, but in a fairly good straight run when, going down stream, the bend is rounded. It is

is not as good as might be desired, but at the same time is not objectionable, and has been selected because its position is where some rocks offer a suitable foundation. It is situated about 5 miles by water below Culpaulin homestead, and 418 miles 65 chains from the lock and weir at Bourke.

Site No. 14, or Mulyenery site, is fairly good, but in a situation where the river twists about a great deal. The position is 451 miles 50 chains from the Bourke lock and weir.

Site No. 15, at Christmas Rocks, is 477 miles 15 chains from the Bourke lock and weir, and, like most of the other sites, near a bend in the stream, but, notwithstanding, may prove fairly easy and good.

Site No. 16, or Henley site, is in a long straight run of the river, where there is a bottom of hard clay and nodular limestone, and is very suitable. It is near Henley station, and 510 miles 70 chains from the lock and weir at Bourke.

Site No. 17 is about 8 miles beyond Menindie and 569 miles 50 chains from the Bourke lock and weir. It was somewhat difficult to ascertain its exact position, but the part of the river in which it should be appeared suitable for the purpose.

#### SNAGGING.

7. The snagging of the river is a necessary work, and has been proceeded with for some time. Up to date, £97,000 has been expended between Walgett and Wentworth. Of the length of the river proposed to be locked, it is said, a little more than 200 miles has been cleared; but in their journey down stream it appeared to the Committee that it was only below Wilcannia, and in one or two places above it, that operations were being carried on with any system. For most of the distance between Bourke and Menindie, the river banks presented to the view numbers of instances of trees with roots denuded of soil, from the effects of flood-water, and certain, sooner or later, to fall into the stream; and something must be done before long to remove them. The snags which have been dealt with lately, the Committee are informed, were the accumulation of years.

#### PECULIAR CHARACTER OF THE DARLING.

8. In some respects the river Darling is unlike most other rivers. Very little of the sparse rainfall on much of its catchment area finds its way into it. The country through which it runs is so absorbent that most of the rain sinks rapidly into the ground, and much of that which goes into the river seems to disappear in its gravel beds. Streams which, as tributaries, should feed the main channel disappear in the soil before the river is reached. At times the flow of water practically ceases, and generally the conditions differ from those of rivers elsewhere. In English, European, and American instances the rivers have either low banks with a small fall or high banks with a quick fall; but the Darling has high banks and a small fall—the fall averaging only 3 inches to the mile. During a dry season most of it is a series of pools at different levels; but in time of flood the water rises to a great height. For more than half the period since 1882 the river has been closed to navigation, and trade, as a consequence, greatly hampered.

#### NAVIGATION OF THE RIVER.

9. With the carrying out of the proposed works, all uncertainty in regard to navigation between Bourke and Menindie will, it is confidently stated by the Engineer-in-Chief, cease. The effect of the Bourke lock and weir with a fresh in the river, and the shutters closed, is said to be noticeable for a distance above the weir of 50 miles; but, with a low river, so much water escapes through the interstices of the shutters that the weir becomes ineffective, and, therefore, it is proposed to convert it into one of a fixed description, similar to those designed for the river below Bourke, at an additional cost of about £4,000. At the time of the Committee's visit to Bourke there was a fresh in the river, but, according to the Engineer-in-Chief for Public Works, before the fresh came there was nearly enough water above the Bourke lock and weir to keep the trade of the river going. With the

the additional locks, the number of steamers would probably increase, but no doubt is felt as to a sufficiency of water under any circumstances which up to the present have been experienced. The absence of locks and weirs between Menindie and Wentworth would, in periods when the Darling is low, interfere with the navigation of the river for its whole length; but in view of the elaborate and expensive nature of the works in the present proposal it is unlikely that the locking would be allowed for long to terminate at Menindie.

#### IRRIGATION.

10. Irrigation along the banks of the Darling the Committee found to be possible in small patches, but the uncertainty of the water supply seems to preclude the practicability of large areas being treated. With a locked river fairly extensive areas could, no doubt, be used for fruit culture. In one instance, a paddock of 23 acres was seen in which fodder crops, fruit-trees, and grape-vines were growing successfully; but in other cases met with, cultivation extended no further than fruit and garden produce for station use, and fodder crops for feeding valuable stock in times of drought. The station managers from whom evidence on this subject was obtained, were practically unanimous in their opinion that cultivation of fodder crops by irrigation was only possible to a limited extent. As with the large station properties, so it is with the smaller areas occupied by homestead lessees and others—cultivation, wherever attempted, has only been carried out on a small scale. Wool is the product of the holdings, and the only one which it is considered will yield a satisfactory return. Even if it were practicable to cultivate fodder extensively, the produce so grown could not, it is said, compete successfully with that imported by way of the river.

At Yanda, about 38 miles below Bourke, there have been grown, by means of water from the river, various kinds of fruits with very good results; but the land on the Darling between Yanda and Bourke is liable to flood as far as for 12 miles back, and the flood of 1890 destroyed all the stone fruits at Yanda. At Dunlop, near Louth, a small irrigated paddock has been sown with lucerne, with the result that a fair crop has been grown, and, at the time of the Committee's visit, another paddock, of 4 acres, was being graded and otherwise prepared on the bank of the river, also for lucerne. Murtee station, near Wilcannia, was found to have a small patch of cultivation near the homestead, and a vegetable and flower garden. Similar conditions were found at Tintinallogy station. At Kallara, near Tilpa, a 12-acre paddock, sown with wheat, oats, and lucerne, and a fruit and vegetable garden, were seen; and at Gundabooka station cultivation has been carried on with river water, apparently with successful results. At various points along the river banks, several small market gardens were observed, irrigated and worked by Chinese; and at Winbar station, the Committee were informed, a comparatively large area was under irrigation and successful crops. The Committee, however, were unanimously of the opinion that to grow crops for sustaining large flocks was impracticable.

Opinions differ as to the best soil for cultivation purposes on the banks of the Darling, some favouring the red, and others the black or grey, soil. The latter is that of which the 23-acre paddock mentioned consists, and there, undoubtedly, crops of wheat and lucerne mixed with trefoil, and grown for hay, looked very well; but equally good results are to be seen on small patches of red soil, and it is probable that each description of soil has its advantages. According to the evidence of the Engineer-in-Chief, there would not be sufficient water conserved by the locks and weirs for both irrigation and navigation, and in view of this the Committee endeavoured to ascertain whether it were possible to promote irrigation by raising the height of the weirs. Such a course, the Engineer-in-Chief stated, would add considerably to the cost of the work, and anything above 1 foot of extra height would render the adjoining country liable to damage from flood; but local witnesses in the inquiry were of opinion that no such damage would occur, and that if the increased height of the weirs resulted in the water overflowing the adjoining land at times when the river was in high flood the land would be benefited thereby instead of injured. This latter view seems to the Committee to be the correct one, as, if the weirs were raised, the extra height of the flood waters over the immense floodable area would be inappreciable.

The

The Committee during their visit took every opportunity, by inspection and inquiry, of examining the Darling country, both as regards the character of the soil and the contour of the land, and it was self-evident that the mere damming back the waters of the river to a few extra feet in height, would not, as many people imagine, enable the residents to convert these at present barren wastes into large tracts of cultivation, nor would it change the present condition of severe hardship of the residents into one of corresponding prosperity. If such would be the early advantages, the Committee's observation of the great difficulties with which the western settlers are now contending, would induce them to at once recommend the scheme. But both observation and the evidence prove that there are many great difficulties in the way, and in view of the fact that irrigation is possible only to a limited extent, and is, in this instance, dependent on the adoption of a primary scheme providing for navigation at a cost of half a million of money, the Committee regret that they cannot advise the expenditure.

Before any extensive scheme of irrigation is undertaken on or near the banks of the river Darling, it appears to the Committee that it will be necessary that full inquiry be made as to suitable areas, levels, quality of soil, and other matters associated with such a large and expensive work.

Some inquiry was made by the Committee with respect to irrigation by means of artesian water, and at the Pera Bore settlement it was found that the cultivation carried on there is fairly successful.

#### EFFECT OF THE LOCKING UPON ANA BRANCHES.

11. The level of the Talyawalka and other creeks is above what will be that of the ordinary locked river, and hence the construction of the weirs would not, with the river at the locked-level, result in the backing up of the water so as to feed these ana branches; but as every fresh would, after the construction of the weirs, have a permanently higher river to start with, these creeks and billabongs would certainly be more frequently filled. During the Committee's run from Menindie to the position of the last lock-site it was found that the locking of the river would result in the filling of Tandure, Pamamaroo, and Menindie Creeks, but that the water would not flow into Menindie Lake. It did not, however, appear on inquiry that the permanent filling of this lake with water would be of any special advantage. The water is not required permanently as its presence prevents the land forming the lake-bed from being used for depasturing stock. It is a limited supply of water, quickly disappearing, that is of any value, for then it promotes the growth of herbage specially useful for feeding and fattening purposes.

#### FIXED, AS COMPARED WITH MOVABLE, WEIRS.

12. The question has arisen whether fixed weirs are preferable for use in the river Darling to those which are movable. The weir constructed below Bourke is a movable one, on the Chanoine or shutter system, and was proposed and carried out in the belief that during ordinary seasons it would impound sufficient water for navigation, and, in flood time, be capable of manipulation which would practically remove it as an obstruction. It has, however, been found that when the Darling is low the weir will not hold water, and, in the opinion of the Engineer-in-Chief for Public Works, it is not suitable for a river where, at times, the flow practically ceases, and where it is not possible to erect an overhead bridge from which to work the shutters. The Chanoine weir has been used very successfully in France, where it was first introduced, and it is to be found in America, but the conditions in French and American rivers must be suited to both its construction and working.

When at Bourke the Committee made a careful examination of the lock and the shutter-weir, and at the first glance it was evident to them that the site was ill-selected and the weir ineffective. The site is in a bend of the river which affords every facility for the accumulation of silt, the result being that close to the upper side of the lock entrance, a large bank of sand has formed, and the approach to the lock is so much interfered with as to make entrance by a vessel impracticable. This obstruction,

obstruction, which would never have occurred if reasonable forethought had been exercised in the selection of the site, will have to be removed at considerable expense. The working of the shutters was watched on each of two occasions upon which the lock and weir were visited, and a most unfavourable impression was formed of their manipulation. With an easy river and moderate flow, the process of raising and lowering some of them was observed, and found to be primitive, unreliable, and productive of great delay. When the shutters were up, the quantity of water that escaped through the interstices was so great as to show conclusively that it was not possible for the weir as constructed to be satisfactory. The photo-reproduction published with this Report shows unmistakably its uselessness as a means of holding back the water with a low river. The opinion formed by the Committee of the working of this shutter-weir was most unfavourable, and they cannot too strongly urge the undesirableness of its being again used.

#### TOLLS ON THE RIVER.

13. The imposition of a toll on the river, when locked, could be made to contribute towards interest on the money expended, and, perhaps, prevent some of the trade from leaving New South Wales; but it may be contended that as the roads of the Colony are free, notwithstanding the large annual expenditure upon them, the rivers should be in a similar position, and it is not by any means certain that the imposition of an effective toll would be approved. To pay interest upon the capital expenditure, and to provide for cost of maintenance, would take a little over 4 per cent. on the total sum, or £22,000 per annum.

#### RAILWAY TRAFFIC QUESTION.

14. On the railway traffic question the conclusion is unavoidable that the locking of the river will be a serious disadvantage to the New South Wales Railways. Wool coming down-stream from above Bourke reaches, under present circumstances, the railway at Bourke, and possibly some of this would continue to be sent through Bourke to Sydney, notwithstanding the carrying out of the proposed works; but the tenor of the evidence collected from pastoralists and others, along and in the neighbourhood of the Darling below Bourke, is that with a navigable river the bulk of the trade, if not the whole of it, will go to Adelaide or Melbourne.

Most, if not all, of the station properties in the Darling district below Bourke are, more or less, in the hands of South Australians or Victorians, whose business relations and sympathies are naturally with South Australia or Victoria, and those colonies are regarded as having the first claim on the trade. If cheaper transit by rail to Sydney, as compared with the cost of carriage by river to Adelaide or Echuca, could be obtained, the New South Wales Railways might secure some of the wool; but it is very doubtful whether the Railway Commissioners could offer sufficient inducement to draw trade from the river, and whether, if they could, a Federal Parliament and an Inter-State Commission would permit it to be done.

The evidence of the Chief Traffic Manager of the Department of Railways on this question of the trade and its relation to the railways is very emphatic. In his opinion, and that of the Railway Commissioners, a locked river, instead of being a feeder to the railway system, will act as a "sucker." The competition between the Colonies for traffic is now very keen, and to improve the river in the direction of rival ports or centres of exchange, is regarded by the railway authorities as increasing the disposition of trade to go in that direction.

#### DECISION ARRIVED AT.

15. From the evidence before them, and what they saw during their visit of inspection, the Committee are of opinion that the permanent navigation of the Darling, at least between Bourke and Menindie, would by the construction of the proposed works probably be assured, though it is doubtful whether the advantages from this long stretch of navigable water—570 miles—would not be greatly discounted by the absence of locks and weirs below Menindie. Irrigation and increased settlement in the vicinity of the river banks are not impossible, but, in view of difficulties disclosed

by

by the inquiry into this branch of the subject, are most unlikely on an extensive scale. It does not seem probable that the proposed works would benefit the railways. Further, it must be borne in mind that the river Darling is an important waterway in which three, if not four, of the Australian colonies are interested, and that being the case so large and costly a proposal as the expenditure of over half a million of money for its improvement is peculiarly one for Federal action, and can very justifiably be left over for the consideration of the Federal Parliament. To carry out the proposed works now would be to saddle New South Wales with the whole cost of a project which, in view of the early completion of Australian federation, should remain in abeyance until the federated colonies together can deal with it comprehensively, and in a manner and on terms fair to all.

The Committee, therefore, have resolved that it is not expedient the proposed works should be carried out, for the reasons—

- (1) That though the construction of the locks and weirs proposed would probably secure permanent navigation on the Darling River between Bourke and Menindie, no benefit would accrue to the trade of New South Wales in connection with its railways.
- (2) That irrigation on a large scale by means of water retained in the river by the locks and weirs is impracticable.
- (3) That a proposal for any such large expenditure upon the River Darling, as is involved in the present inquiry, is a matter which may be fairly left for the consideration of the Federal Parliament.

The following extract from the Committee's Minutes of Proceedings of 1st November, 1899, shows the resolution adopted :—

Mr. Dick moved,—“That, in the opinion of the Committee, it is not expedient the proposed Locks and Weirs on the river Darling, between Bourke and Menindie, as referred to the Committee by the Legislative Assembly, be carried out.”

The motion was seconded by Dr. Garran, and passed.

W. J. TRICKETT,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 21 November, 1899.

---

- R. R. P. Hickson.  
15 Mar., 1899.
6. Has it been used to any extent? I do not think so.
7. *Mr. Trickett.*] Has it not been a success, so far as the backing up of the water to the town of Bourke is concerned? Yes. It is of no use, of course, having 4 or 5 miles of a river navigable and the rest unnavigable.
8. You say :  
The canalising of this length of river should only be regarded as an initial step in rendering the whole length of the river navigable.  
? That is the report of a former Public Works Committee.
9. The statement continues :  
The benefits resulting from which would, principally, accrue to Victoria and South Australia.  
Has anything occurred to alter that opinion? Not to my mind.
10. You think that the benefits would principally accrue to the other Colonies? I think so.
11. The statement continues :  
The Committee were of opinion that it would be unwise to engage in such outlay until the matter could be comprehensively dealt with by a Federal Parliament.  
I suppose your Department think differently from that? We have submitted a scheme for the Committee to decide what they think about it.
12. Is this scheme in any way connected with possible irrigation? Yes.
13. Did you work along with Colonel Holme when he was here? No; but he was attached to the Department. Mr. McKinney accompanied him into the country.
14. Have you considered his reports? They passed through my hands. I had not anything to say in connection with them.
15. Did you consider them sufficiently to enable you to say whether you endorsed his views or not? No.
16. *Mr. Shepherd.*] Was the survey of the river carried out under your directions? Under Mr. Darley's directions.
17. Are the proposed locks equi-distant from each other? No.
18. Is the bed of the river, generally speaking, rocky? No; there are rock bars, but a good deal is sand.
19. I suppose the navigation of the river has been the chief object in view? That is the main object in view; but, of course, the matter is closely mixed up with water conservation.
20. Do you know if regard has been had to the formation of the country in various places with a view of ascertaining whether the water can be run back to the billabongs? No; that cannot be done. If the river is used for water conservation, it will have to be pumped. The water would only run into the billabongs when the river was very high.
21. Is the country between the points where it is proposed to construct the locks comparatively level? Yes.
22. So that really, in flood-time, the water could be conveyed beyond the banks of the river by cutting small canals? Yes.
23. *Dr. Garran.*] What was the cost of the lock which has been made at Bourke? £23,000.
24. Have you any one in charge of it? Yes; one man.
25. Has there been any kind of revenue from irrigation, or the use of the locks? No.
26. You state that the Mines Department applied for the papers with the view of taking up the locking of the river in the interests of water conservation, hoping to show that in this way the work would pay;—has there been any attempt to make it pay? Not as far as I am aware.
27. Do you know whether the lakes in the neighbourhood of the river are fresh water? Some years ago the lakes were dammed across the entrance and filled up.
28. I believe that one of the Menindie lakes is fed from the river;—could any of the others be fed from the river? In flood time they could.
29. Do they dry up? Yes.
30. I suppose you could not find any of them there now? I am not sure about the big one—the large Menindie Lake. There is a dam across it.
31. I suppose you do not know whether the others are in existence? I suppose they are almost dry now.
32. When was the survey of the levels of the river made? It has only just been finished.
33. Do you think you have the levels pretty accurate? Yes; up to date.
34. In every case you could lock back the water up to the lock above it? The section shows that in each case the lock holds the water back to the lock above it.
35. And leaves enough for the navigation of small barges? Yes.
36. What are they supposed to draw? From 2 to 4 feet when they are fully laden.
37. To make the river navigable, you would want at least 4 feet of water? You would want about 5 feet.
38. Below every lock? Yes.
39. And you provide for 5 or 6 feet of water below every lock? Yes; 5 feet, I think it is.
40. Would there be any need to lock the river between Menindie and Wentworth, so as to make the river continuously navigable? I think it ought to be locked the whole of the way.
41. If you lock the river as far as Menindie you will still be stuck up, and unable to travel between Wentworth and Menindie? There is a better river, and for a longer period, from Menindie down, but there are times when the navigation is bad there too.
42. Could you, a week or two ago, before the fresh which is coming down now, navigate to Menindie? I do not think so.
43. Could you navigate to Morgan on the South Australian Railway terminus? I think you could always get a river from Morgan to Wentworth.
44. That is to say, that the Murray is always navigable and the Darling is not? Yes.
45. The navigation stops at Wentworth in a bad season? A short distance above it.
46. To make a complete scheme of navigation for the Darling we should have to go to Wentworth? Yes, close to it.
47. Has that part been surveyed? Not yet.
48. Then the scheme before us is not an absolutely complete scheme for making the whole of the Darling navigable? No, it only goes as far as Menindie.

49. Would it require another £100,000 to do the rest of the work? I could not say.

50. *Mr. Watson.*] With regard to going no further than Menindie with the lock, was there not some idea that by going that distance we might be able to compete with a railway at Wilcannia;—for instance, traffic would go up the river for a reasonable distance to a railway, if it were navigable to it and not navigable below? Yes; that would be one reason for going as far as Menindie only.

51. Do you know whether any attempt has been made to put weirs at the entrances of the ana branches? Not in connection with the ana branches. The only attempt has been made at Menindie Lake.

R. B. P.  
Hickson.  
15 Mar., 1899.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

52. *Chairman.*] Have the plans in connection with the proposal under the consideration of the Committee been prepared under your direction? Yes. C. W. Darley.

53. Will you explain the details? The proposal before the Committee is to construct a series of locks from Bourke as far as Menindie. The distance by river is about 600 miles. The average fall in the river very closely approximates 3 inches to the mile. Were it not necessary to take into consideration the nature of the foundation, we should decide on the height of lift to adopt, and divide it into equal distances; but it was necessary, in fixing the sites of the weirs, to take into consideration the best spots in which to place them. Hence we select natural rock bars, but in about three cases, where we cannot get a rocky bar upon which to construct, we must make a foundation on the natural bottom, which is composed of very stiff clay and sand. Of course we have to take the ordinary precautions to obtain a good foundation under such circumstances. In most cases we can get a fairly good rocky bottom; we call it rocky, but most of it is composed of beds of rock mixed with stiff clay. The height of lift in every case has to vary on account of the distance between the locks varying so much. The distance between the locks varies from 17 miles to 58 miles. The two closest are at a point near Louth. There is a considerable fall there for a long distance, and it is greater at that particular point to which I have referred, so that we had to put two locks close together. The form of weir I propose is what is known as the "fixed weir." It is a fixed rubble concrete weir, with a lock in the river. In fixing the height of lift and depth of water, I, at all times, kept a minimum of 6 feet of water over the lower sill of the lock. That is the depth of water held back by the locks below. In all cases it holds up to 6 feet on the lower sill of the lock. I find that is quite sufficient for navigation. The deepest boat on the river, when laden, does not run to more than 5 feet 6 inches. The lifts vary from 6 feet to 10 feet near Carranyalpa; there are two places where I was obliged to put in 10-foot lifts to get up. With respect to the class of lock adopted, I wish to point out that the first report on the locking of the Darling was by Mr. Gordon. His report was ordered to be printed by Parliament on the 7th December, 1890. In that report he recommended a series of locks in the river, occupying a portion of the river with the weir—that is, with the locks and weir in the river. The matter was sent to the Public Works Department to be dealt with, and it was put in the hands of Mr. Williams, assistant engineer, who looked after works of this kind. The proposal then was to construct a lock near Wentworth. He proposed putting the lock across a bend of the river, and putting the weir on the main course of the river. You can easily understand that in many cases it would be quite possible, under those conditions, to save 3 and 4 miles of navigation by a short cut along a loop. I recommended and supported that suggestion. At that time I had never been on the river. Mr. Williams reported that the bed of the river was of a good stiff clay formation, and, on the strength of that, I supported the view that the locks should be kept away from the weir. When I was giving evidence before a previous Public Works Committee, I held to the view that the weirs and locks ought to be kept separate, if possible, because there must be a certain amount of draw upon a weir, and unless proper care is exercised there may be a certain amount of risk in approaching the lock, if the weir is alongside it. As I have stated, I advocated the proposal which emanated from Mr. Williams, to put the lock in a bend of the river. An estimate was subsequently prepared for locking the Darling, and the matter stopped at that point, the Minister stating that he could not see his way to do anything, as the cost was so great, nor could he see anything sufficient to warrant the matter being placed before Parliament at that time. The papers were then applied for by the Mines Department, the Minister for Mines stating that he thought that he could show that he could make the locking of the Darling pay in the light of irrigation. With that view, he took up the question of the locking of the Darling. Of course the question of the navigation of the river naturally came under the Works Department; but when the question came to be one of irrigation, the Minister for Works allowed it to be transferred to the Minister for Mines who had the question of irrigation in his hands at that time. In the light of an irrigation proposal the matter was then placed before the Public Works Committee, and, after a long inquiry, they reported against it. It was not shown then, I think, that irrigation was going to benefit by locking the Darling. Personally, I could not see how locking the Darling could benefit irrigation. Mr. McKinney prepared a design on behalf of the Mines Department for a lock and weir on what is known as the Chanoine system, with folding shutters, and authority was given to construct it at Bourke. It was in course of construction at the time the inquiry on the construction of locks and weirs on the Darling was last held. When I was under examination at that time, I pointed out that, whilst in many cases the system was an excellent one, and very suitable for many rivers, I did not think it was suitable for the Darling, where the water practically ceased to run, therefore we could not afford any leakage or loss of water through the shutters. The position I then took up has been pretty well upheld, for we have seen that, when the Darling went low, the weir had practically no water behind it. The whole of the discharge of the river passed easily through the space underneath and between the shutters. Therefore no water was held up. Practically, then the weir is of no utility, except when there is a moderate amount of fresh passing down the river; but for a low river it is of no use. When making an inspection of the river some time ago, I personally examined the place, and saw that the difference in level above and below the weir was only a matter of a few inches. I then quite satisfied myself—as I was satisfied before—that it would not be suitable; and I assert now that if the Darling is to be locked, it cannot be locked on that system. The system has been a great success in America and Europe, but the rivers of those countries have always a large body of water passing down them. There is always a good stream passing down the rivers where shutters have been used, and they can

15 Mar., 1899.

C. W. Darley. can afford the leakage—that is, the quantity of water passing between the shutters is of no moment, and they can afford a considerable space between the shutters. Although, when I visited Bourke, the shutters were down, and well constructed, and were temporarily caulked with rope, yet practically no water was held up by them. I therefore came to the conclusion that the scheme before the Coommittee would be of no use if we adopted shutters, because I was certain they could not be tight and act automatically. I determined then to go in for fixed weirs. I have so far departed from the recommendation I previously made in my report that I am following the lines of Mr. Gordon, and so far following the lines of Mr. McKinney, in recommending that the locks be placed in the river with the weirs beside them. Of course, when I reported on a former occasion, I had not been on the river, but was guided by the information I obtained from my officers. I have seen, however, that the country is, to a large extent, of an alluvial and soft sandy nature, and although you might get a suitable bend in which to put a lock, it might be a very unsuitable place, so far as the formation of the country is concerned, for a weir. The matter really came back to this state of things: That it was imperative that we should make use of the natural facilities offered by the rock bars to construct the locks and weirs upon them. I have so far departed from my previous recommendation, that I think now that it is necessary to adhere to the natural features of the country—the rock bars in the river. It so happens that, in the case of nearly every rock bar we have surveyed up to the present, the river is wider than it is in its normal condition. The normal condition of the river shows fairly steep slopes. In many instances when I went up and down them, I was glad to hold on by the root of a tree. The abnormal state occurs where there is a rock bar, and then you find that the slopes on one side at least, if not on both, are very flat. So far that falls in with our requirements, and enables us to obtain a wider breadth of river where we can put the locks and weirs. All the rocks I examined were of that formation—one, if not both, banks were on easy slopes, with a wide river. It is in these places, where nature has left the rock bars, that it is now proposed to construct these locks. There are three instances of lock sites which will be a little more costly in putting in the weirs, but I have averaged for them in my estimate. The system of weir now constructed on the Darling was known as the Chanoine system. It has been very successful indeed in France, where it originated. On the Seine a number have been constructed, and also a number in America. At the same time, there is a considerable difference of opinion amongst English engineers as to its advantages and disadvantages. The general opinion is that they do not like any form of fold-gear unless you can have an overhead bridge from which to operate it. In the case of the Darling, of course, it is impossible to have an overhead bridge unless it is erected at a great height to pass navigation underneath. In the case of the Seine and large American rivers there is no great rise of flood. The floods only rise a few feet, so that you can get an overhead bridge from which to operate the shutters. There are a great many other forms of weir, but this is a very good one, and the engineers recommend that they should not be put up unless you have an overhead bridge from which to operate them. As I have stated, we cannot erect an overhead bridge, because we need free navigation.

54. Have you abandoned that idea altogether? I propose to abandon it for, as I have already stated, if the river is to be locked, it cannot be done on this principle, because it will not hold up the water when the river is low. For the last three months a row-boat could hardly approach the lock.

55. *Dr. Garran.*] Then we have spent £23,000 to find that that sort of weir is not suitable for the Darling? Not suitable for the Darling in dry weather.

56. *Mr. Watson.*] Do you think that all that money is wasted on the weir;—could it not be converted into a fixed weir? Of course the greater portion of the money is in the lock, and it could be utilised if we determined to make it a fixed weir. The foundations are in, and it would not be a costly matter at all. If the lock is proceeded with, it will have to be altered into a fixed weir—that is my opinion.

57. *Chairman.*] Experience has proved that the shutter system on the Darling is a failure? In my opinion it is not suitable for the Darling. It is not suitable for a river where the flow practically ceases. We cannot afford to lose any water. For over two months the Darling, to all intents and purposes, ceased to flow. Therefore we cannot afford any loss of water. What we call the lockage water—filling and emptying the locks to let vessels up and down—is the maximum we can afford to lose. The conditions of the Darling River are, I think, unique. I can find no record in any part of the world of any other river with the same conditions. The invariable conditions of English, American, and European rivers are either low banks, with a small fall, or high banks with quick fall, whereas the Darling has high banks and a small fall. The floods also rise to a considerable height, and prevent any form of bridge being constructed over the weir from which to operate it. The system has this advantage: When the river rises to the condition required, the weir can be put out of the way, and the boats go to and fro over the locks; but with a fixed weir they must, except in the case of a flood, always pass through the lock. As soon as the water is 8 or 9 feet deep on the weir, you will practically lose sight of it, and the boats can pass freely over it. That, however, will only occur when there is a good fresh in the river. For the greater portion of the year all vessels will have to pass through the locks. Navigation can always be secured to the shipping, but they will have to pass through the locks, excepting when there is a flood 9 feet deep over the weir.

58. *Dr. Garran.*] How long will one of these floods last running over the weirs? In wet years, like 1890 and 1891, there would be clear navigation for more than half a year, and boats would have been able to go clear over the weirs.

59. Do the floods increase the velocity of the Darling very much? Yes; up to a maximum of about  $1\frac{1}{2}$  mile an hour.

60. *Mr. Trickett.*] In connection with a former inquiry I asked Mr. McKinney the question:

Might it not happen that more water was running through the interstices than was coming into the river?

He replied:

That could be regulated. First of all the side bays could be gradually closed, and then, if necessary, some of the spaces between the shutters could be closed by sliding down boards in front of the weir.

? When I saw it the other day the water was passing underneath. It was boiling up between the bottom of the gate and the sill. In other words, there was such a small quantity of water going down that, unless there was something very solid there, you could not prevent it leaking through. No doubt the Chanoine system is an admirable one where there is a good flow in the river.

61. *Chairman.*] If the shutters were down, would there be any danger of a big deposit of silt upon them? No doubt there would be some, but nothing serious. They are below the level of the sill, and any water passing over the sill would, no doubt, scour them.

62. *Dr. Garran.*] Is there any risk of the river making a new channel for itself, and going around at the end of one of the weirs? There is always a risk in work of this kind; but we must put up a strong abutment, and a good connection with the dyke, to try and obviate it. C. W. Darley.  
15 Mar., 1899.

63. We have had one instance of a weir being made, in connection with which the river made a new course for itself? In that case which occurred on the Macquarie, not far from Warren the weir was not finished. It was only in course of construction.

64. *Mr. Levien.*] I suppose the weirs will be erected where there will be no chance of the river cutting through and taking another course? Yes; we shall avoid places of that kind. We shall erect them where we can get a straight reach of the river.

65. *Mr. Shepherd.*] I suppose the chief object in view is navigation? Yes.

66. And I suppose the river is seldom brought up to a level with the banks? Only in a big flood.

67. Would it be difficult to convey water from the river into any of the dry lakes or billabongs? Water goes in now naturally, and no doubt will continue to do so. I would call the attention of the Committee to the period of navigation for a number of years back.

Year.	River closed.	River open.	Year.	River closed.	River open.
1882.....	40 weeks	12 weeks	1891.....	1 week	51 weeks
1883.....	46 "	6 "	1892.....	12 weeks	40 "
1884.....	49 "	3 "	1893.....	1 week	51 "
1885.....	52 "	.....	1894.....	12 weeks	40 "
1886.....	22 "	30 weeks	1895.....	44 "	8 "
1887.....	14 "	38 "	1896.....	35 "	17 "
1888.....	41 "	11 "	1897.....	27 "	25 "
1889.....	28 "	24 "	1898.....	38 "	14 "
1890.....	2 "	50 "			

Since the year 1882 the river has been closed for 464 weeks, and it has been open 420 weeks. Thus for over half that period the steam-boat proprietors have had their boats lying idle, and of course they really suffer more than when they are at work. I do not think they can complain of the little extra trouble to which they would be put in having occasional delays in passing through a lock, especially if they secured permanent navigation. From Bourke to Menindie they would have to pass through seventeen locks, and I do not think they would consider that anything of a hardship if it secured them permanent navigation. With respect to the working of the weirs, one point to which I called attention when I was giving evidence on a former occasion was that, in my opinion, the Chanoine weir was hardly suitable to construct in out-of-the-way places, such as we have on the Darling, out of the reach of repairs, with no town within 50 or 60 miles, and without even a blacksmith handy. Under such circumstances, if anything went out of repair, navigation might be closed for some time. That is one reason why I am in favour of fixed weirs. There is also the question of the cost of attending to the weirs. On a previous occasion I found it very difficult indeed to obtain any information as to the number of men required to attend to a weir. I have since obtained information from America, where the weirs are larger than ours. There they require a considerable staff of men to attend to a weir—six or seven, and sometimes more. Of course on the Darling we could not get more men when they are required, and it would be necessary to have at least three men stationed at every lock to attend to the folding shutters—that is, if the Chanoine system were adopted. Under the fixed system, I provide for one man for each weir, and I think he need not be more than an elderly watchman. I provide in the estimate for telephones from lock to lock, along the whole of the river, thus bringing the full distance into telephonic communication. Of course we want a man to attend to them, and report if anything is going wrong, and that can be done by the men in charge of the locks. Those in charge of the vessels navigating the river must open and shut the gates, as is done in the old country. Those who have gone along the English canals know that there is no person whatever in charge of the locks. I know of 6 miles of canal in Wales where there are fifteen locks without one man to be seen in charge. The canal men there, of course, are licensed boatmen, and provision should be made here for licensing the masters of boats; they should open the locks and pass through, leaving the locks ready for the next boat to enter. I hold that the crews of the boats should open and shut the gates, under the direction, for the time being, of the watchman. I think it is quite possible that in time the seventeen watchmen for whom I provide might be done away with altogether. In order to provide for repairs, I propose to put a good steamer on the river. I have estimated £10,000 for a really good steamer, and I propose to put a good crew on board, and also to have a blacksmith's forge on board for repairs. These men would pass from point to point of the river, attending any locks out of repair. If they found that any place was scoured out they could attend to it. They could have a punt, upon which they could load stone and fill in any washaways which occurred. That means that instead of scattering the men along the river they will be concentrated where they are wanted. I would also put on board the steamer a small sand-pump, because I think it is likely that after a flood we may find a certain amount of silting up in front of the locks. It would be of a very light nature, and easily removed. The existing lock at Bourke is very much silted up. Unfortunately, however, the lock is not in the most suitable position. It is under a bend of the river, where silting must necessarily take place. In selecting lock sites in the future, we shall have to be careful to always get our locks on the concave banks, where you obtain a scour rather than a deposit. In the estimate before the Committee I provide £6,000 for a telephone line and £10,000 for a maintenance steamer fitted with a small sand-pump. The estimated cost of interest and maintenance would be as follows:—

First cost, £530,000 at 3 per cent. ....	Annual charge.
Seventeen lock-keepers at £100... ..	£15,900
Crew of steamer, stores, and up-keep ...	1,700
Stone and material for repairs ... ..	2,000
	2,400
	£22,000

Equal to £36 13s. 4d. per mile; or, omitting interest, the maintenance would cost £6,100 per annum—say, £10 per mile. Thus £22,000 a year would practically be the cost of locking the Darling. That comes to £36 13s. 4d. per mile, or less than it costs to maintain a road.

- C. W. Darley. 68. *Mr. Watson.*] When you say per mile, you mean, of course, per river mile? Yes. Of course some of the main roads of the Colony cost as much as £50 per mile per annum without paying interest on the cost of bridges. Therefore, this would really be an extremely cheap piece of navigation—the cheapest in the world, I should say.
- 15 Mar., 1899. 69. With reference to the possible dispensing with the services of the lock-keepers, is there any provision for making the gates of the locks independent, as far as the shutting and closing is concerned? You cannot open them both together.
70. Would it not be possible for careless people to leave the sluices open, and thus allow a sluice of water to run through? It would require to be wilfully done.
71. That is what I allude to? The boatmen, of course, would require to be licensed. You would then be able to trace who did it, and suspend his license. That would make it worth his while to attend to his duty.
72. Would there be any means of locking the levers? Yes.

FRIDAY, 24 MARCH, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

- C. W. Darley. 73. *Mr. Dick.*] If the proposed scheme is carried out, what will be the general effect upon the trade of the river? The first effect will be to open permanent instead of intermittent navigation. If the river is only locked as far as Menindie the tendency will be to act as a feeder to the railway at Bourke.
- 24 Mar., 1899. 74. Have you any statistics as to the number of months in a year the river is navigable below Menindie? Not below Menindie. The table I gave in my evidence the other day pretty well holds good. Soon after the navigation ceases above, it ceases below.
75. Will the construction of the locks have little or no effect on the water in the lower part of the river? No; it will not affect the lower part of the river at all.
76. In nearly all cases it is, I believe, proposed to place the weirs on the rock bars of the river? Yes; we have selected them as sites where they are available.
77. Would there be any necessity to remove those parts of the rock bars which are not utilised for weir construction? No, because the rising of the water will put navigation above the obstructions. There are a few rocks projecting into the river which may have to be removed. We have removed some rocks during the progress of snagging the river. At Yanda last month some dangerous rocks were blasted away. Of course, if there are any rocks over which there would be less than the minimum depth of water we require for navigation, they will be removed.
78. Do you know of any case in which there are two rock bars in close proximity to each other, one of which is utilised for a weir;—in cases of that kind, would it be necessary to move the rock bar below the weir in order to give permanent navigation? No; we have so selected the lock sites that the weirs will raise water over any bars above them.
79. What depth of water will you get on the average over the rock bars? The minimum depth would be 6 feet. In some cases, of course, the depth will be from 12 to 16 feet.
80. Do you know the Curranyalpa bar? Yes.
81. According to the official report, which has been placed before you, that bar extends a long distance, and it will be necessary to remove it? I get over that by two 10-foot lifts.
82. What position does the Curranyalpa bar occupy on the river? It is 187 miles below Bourke—just above Tilpa.
83. Will a weir be placed on that bar? There will be one on the bar, and another at Tilpa, which will throw the water back over the lower portions of the rocks.
84. Mr. Halligan, in an official report, states that the accumulation of snags on rock bars forms a far more dangerous obstruction to navigation than the bars themselves;—will the same difficulty be found in the construction of these works? No, because we are removing the snags. We have removed the snags from more than one-third of the river.
- 84½. Mr. Halligan states that every flood reproduces the difficulty of the accumulation of snags on the rock bars? Once they are out of the river, as we are clearing them now, they will not be seen again.
85. Do not the floods bring a large amount of snags into the river? A certain number come from the banks, but we have been burning off trees which are likely to fall in. That is a matter which is provided for in the ordinary maintenance of the river.
86. Mr. Gordon also makes some strong remarks about the instability of the watercourse at the bed of the river; he states that the course of the river is continually changing, and that new courses are being formed and old ones departed from;—is that likely to form any serious impediment in the way of the permanent maintenance of the weirs? No. There is no evidence really of any serious alteration in the course of the river. No doubt it has, in its past history, gone round some of the billabongs; but really the river may now be regarded as having a very stable bed. There is no evidence of a change taking place to any appreciable extent.
87. This is what Mr. Gordon says:

The present condition of the river is not stable; it is in a state of gradual, constant change. The banks on the hollow side of the numerous bends are increasing in their convexity. The process going on for long periods of time occasions the formation of the narrow necks between reaches of river separated by miles of distance if measured along its course, and eventually

eventually a breakage through these necks. As the process of the lengthening of the bend by this action is counteracted by the occasional breaking through of the necks, it is probable that the length of the course of the river is not materially altered, and that its régime may be considered generally permanent though locally unstable.

C. W. Darley.  
24 Mar., 1899.

Has full value been given to that statement? Yes. We have avoided all cases of putting locks near sharp bends. Compared with the Hunter I call the river a stable one. The changes in the river are very slow indeed. In any case we avoid putting any work near sharp bends.

88. Will the permanent increase in the height of the water tend to bring about an increase in these changes in the course of the river? No.

89. Would it be necessary to protect any of the weirs by means of long sided embankments, in order to prevent the water in times of flood forming a new course round them? That is provided for in the estimate. Of course it is necessary to protect the slopes.

90. But will there be any long protecting arms facing up the river? No.

91. Is it the practice to make arms of that kind in canalising rivers in India? I do not know of any parallel case.

92. I believe that a couple of dams have already been made along the course of the river? One lock has been constructed.

93. Have any dams been constructed? No.

94. Have any dams leading from the river into the lagoons been constructed? A dam was constructed at Menindie across the entrance to the lake, but not on the river.

95. Is it a fact that any dams which you know of as having been constructed along the river are now standing in a dry watercourse, the river having taken another course? I do not know of any case of a dam constructed in the river. I may point out that the dam at Menindie Lake was constructed under exceptional circumstances by tumbling sand bags into the channel during flood time. It was an emergency labour relief job. The work itself has stood. The idea was, in a rough way, to impound water in the lake. The water made another channel and got away.

96. Has an estimate been made of the loss of water by lockage, soakage, and evaporation? No.

97. Do you think that the water supply will be sufficient to make up for any loss in these directions? Yes, so long as there is no other leakage but that. Even during the late drought the river did not actually cease to flow. There was enough water passing down at the end of December to balance the lockage. If you divide the lockage over the area of the river above each lock you will find that it will take a great many lockages to lower the water half an inch.

98. Is it proposed to make any of the weirs oblique? No.

99. Is the practice of constructing oblique weirs unsatisfactory? There is nothing to be gained by making them oblique. They are more costly, longer, and more likely to cause erosion of the banks.

100. I find that Mr. Russell states that the evaporation in that part of the Colony cannot be taken at less than  $7\frac{1}{2}$  feet per annum in a dry season. The average seems to be about  $5\frac{1}{2}$  feet;—is that a matter to be seriously considered in connection with this scheme? I do not think so, because that evaporation was going on during the dry season, and although the river was very low, it did not actually stop running. It shows that there was sufficient water to allow for evaporation, soakage, and all the other losses which must take place.

101. Mr. Halligan, in his report, says:

In designing any large works for the improvement of the inland rivers it will, of course, be absolutely necessary to have information of the amount of evaporation and absorption taking place, and as the matter is not as simple as is generally supposed, and can only be obtained by some such proposal as Mr. Russell's—

Do you agree in the main with that, or do you think that the matter has been sufficiently investigated by your Department? Of course the more information one can get on every point the more valuable it is. But there is really no necessity to anticipate any trouble on account of evaporation.

102. What is the average lift of the locks? They run from 6 feet to 10 feet.

103. Mr. Gordon, in his report, states:

The weirs should offer as little obstruction as possible so that their effect on a flood should disappear as soon as may be. I have, therefore, fixed the lift of the locks generally at from 4 feet to 6 feet 6 inches only, both with the object just mentioned, and also in order to reduce the cost of the weirs which would increase in a greater ratio than their height.

? Of course, that increases the number very largely and creates this difficulty: that in some places you would be forced to put a lock on a difficult site—perhaps in a long pool with a bad bottom. That is why in one instance I have been forced to provide for two 10-foot lifts.

104. You find it necessary to increase the height of the lift in order to provide for sufficient water over the shallow bars? Yes.

105. Apart from that, would the increase in the number of weirs increase the total cost of the work? Yes.

106. Although they are much smaller? The difference between the high lift and the low lift is not very great.

107. Has the size of the locks been fixed in view of the dimensions of the vessels now trading on the river? Yes.

108. Would it materially decrease the cost of these works if they were made smaller? Not to any great extent. The locks have been kept large enough to pass all the steamers trading on the river, except one. There is only one paddle-boat which is a little too wide, and it can be easily altered to enable it to pass through.

109. Will the carrying out of this work raise the height of the floods to which the Darling will be subjected? Not to any appreciable extent. When a flood rises 8 or 9 feet over the weirs the weirs really do not raise the water any longer. Above that height you would not see the weirs; they would be drowned and lost sight of.

110. At what do you estimate the cost of the work per mile? £930 per mile.

111. In 1890 you reported an estimate of £1,200 per mile? Yes.

112. Is the difference due to a fall in the rate of charges and cost of material? No. We are working on a different principle; that was a very preliminary estimate. We had no surveys then, and that scheme was for putting the locks in bends, which means an immense amount of excavation.

113. Have you given any attention to the subject of irrigation as a subsidiary object of this scheme? No, I do not think there would be any large benefit to irrigation; in fact there is not enough water for it. The scheme will help the residents living along the river, who will not have quite so far to lift their water for domestic uses. Lately the water has become very bad. It is a marvel the people have not been poisoned in using it.

C. W. Darley. 114. In 1890 you stated that the weirs were to assist in conserving water for irrigation, which, in the near future, must be turned to profitable account all along our western rivers? The water can be used for homestead settlements. I do not think people will go to the expense of pumping water for the purposes of broad irrigation. It will help irrigation on a small scale of course.

24 Mar., 1899.

115. In what way is it proposed that the annual charge on the taxpayers for carrying out the work shall be met;—is it proposed to impose dues? That is a matter of policy.

116. Has the experience gained in the construction and subsequent use of the lock and weir at Bourke been of benefit to the Department? Yes.

117. I think you have stated that you would not, in the future, adopt the system in existence there? Yes; that experiment settles the question that the folding shutters are not suitable for the Darling.

118. In all cases, will the locks and weirs be separate from each other? In each case we shall keep them together. There will be fixed weirs instead of folding weirs. They are not to be constructed on the cut-off bend.

119. Will that form of construction result in lower cost? Yes; it cheapens the cost.

120. Mr. McKinney, in his report in 1893, states:

In 1874 a dam was made at a cost of £1,600 on the Tallywarka which runs through the Killara run; but when the flood of 1879 occurred a new channel, deeper than the old one, was cut by the water in one day and the water flowed past the dam. The other instance is that of a dam which was constructed some years ago to retain flood water in Menindie Lake. The dam is still standing in good condition, but a new channel at least as deep as the old one has been cut round one end of the dam.

? It was a little distance from it. There were a number of blind feeders from the river, and it was one of those which was cut through.

121. I suppose there is no danger of that kind to be apprehended from the construction of these weirs? No.

122. You have abandoned all idea of the so-called navigation or movable gates in these weirs? Yes; they are not satisfactory in a river like the Darling.

123. *Mr. Shepherd.*] Has the river been thoroughly snagged already? Some years ago part of it was snagged, but I do not think it was so thoroughly done as we have been doing it of late.

124. Is an estimate for snagging included in the cost of this work? No; there was a separate vote by Parliament passed some time ago for the snagging.

125. Would it be possible to raise any of the weirs sufficiently high to bring the water almost on a level with the banks? No.

126. I believe the river in some parts is very tortuous? Yes.

127. Has the desirability of cutting canals where the river is very tortuous been taken into consideration? No, not further than the original proposal to cut across some of the bends, so as to place locks in them.

128. It would be utterly impossible, under those circumstances, to think of irrigating the country naturally from the river? Quite impossible.

129. I suppose a rocky bottom is more favourable than a clayey bottom for the construction of weirs? Yes. But there are not many instances in which there is really good rock. It is a mixture of rock and clay, and will make a safe foundation to build upon.

130. I suppose the distance between the weirs varies on account of the nature of the river? Yes. Although the river has an average slope of 3 inches to the mile, the fall really takes place at the different bars.

131. Does the river vary very much in its fall? In one instance there are 58 miles between two locks, in another instance 54 miles, and in another 51 miles. Therefore, it is practically a level pool. During the dry season the river has been a series of level horizontal pools with no appreciable gradient. Then there is a sudden fall over the rocks, sometimes of 2 feet.

132. *Mr. Watson.*] Is there any proposal for the protection of the banks against erosion immediately above the weirs;—do you purpose protecting them by means of a fascine? Only where we anticipate erosion, and then we use stone.

133. Do you anticipate that there will be any considerable amount of erosion? Not above the weirs. There may be some below. We have provided for protection below. In my estimate for maintenance, I have put down a sum of money for extra stone.

134. Have you any knowledge of the means taken to prevent erosion in the Wimmera district of Victoria? I do not know of the work personally, but of course a great deal depends on the velocity of the river. The Darling happens to be of unusually low velocity. There are few rivers of such a length with such a small fall. Therefore the erosion will be very little.

135. You do not apprehend any great danger from it? No.

136. I believe you purpose making the locks 200 feet by 37 feet? Yes.

137. I notice that in 1890 you reported that there was an objection to a large-sized lock, because of the undesirability of losing water by lockage; you recommended that the locks be not more than 130 feet long by 33 feet? If we make them 200 feet long, they are long enough to take in a steamer attached to a barge.

138. I suppose they would go in end on? Yes.

139. Was the object of increasing the size to provide for two vessels coming in at one time? Yes. Another reason is that the existing lock is 200 feet by 37 feet, and it is desirable to have them all uniform.

140. If the loss of water by lockage is so great, would it not be wise to try and economise in that direction? You do not economise, because if the locks were smaller, you would require two lockings. It is better to have one locking 200 ft. long than two of 120 ft. long.

141. Then in view of the fact that a steamer is generally accompanied by a barge, you think it wise to increase the size of the lockage so that both can come in together? Yes.

142. If a steamer goes through without a barge, you will lose the same amount of water as you would if she were attached to a barge? Yes; but as a rule they have a barge with them.

143. In another paragraph of your report in 1890 you give reasons why it would be unwise to have a lock and weir together; one of those reasons states that if the river should be at all fresh it would be hardly safe for a vessel to approach the locks owing to the risk of being drawn against or over the weirs; do you think the danger you apprehend then exists now? Of course, there is a certain amount of danger where there is carelessness; but, in the design, I am keeping the weirs at the lower end of the locks instead of at the upper end, as far from the entrance as possible. I am also providing for a line of piles above the locks, so that the vessels can be tied to them.

144. Do you think the danger of vessels going against the weirs has been overcome by bringing the upper entrance to the locks above the weirs? The upper entrance to the locks will be 200 ft. above the weirs. C. W. Darley.
145. I suppose that even with a reasonable fresh the current would not be so strong that a steamer could not make back-way against it? No; and I have provided a line of mooring-piles so that steamers may be tied up when necessary. 24 Mar., 1899.
146. Do you think the benefit accruing to vessels from the construction of the locks would be sufficient to justify the imposition of tolls? I think so. In 1890 I expressed the opinion that toll should be levied on all downward traffic, not on upward traffic.
147. Why differentiate? To try and keep the trade in our own Colony to some extent.
148. When making that suggestion, did you attempt to estimate the amount which would probably be derived from a reasonable toll? No; it is a matter of policy. If we adopt the same policy with regard to our rivers as with regard to our roads there will be no toll. We spend £300,000 or £900,000 on the roads of the Colony without imposing any tolls, and it is a question whether we should not spend money on the rivers without imposing tolls.
149. It must be recognised that this is a road which leads away from a road? It was that which induced me to make the suggestion of a downward toll. I thought it would have a tendency to draw the trade to us rather than to send it away.
150. I suppose it would have to be a toll on freight rather than on the tonnage of a steamer, because, as she would pass one way as much as the other, that would practically become a half toll on each separate voyage? I take it that it would have to be a toll on the freight.
151. Do you think it would be possible to raise the height of the weirs sufficiently to impound water so as to allow a large quantity to be used for irrigation? No.
152. The water is available in flood time, if it can be conserved? Yes.
153. Do you think it would be possible to raise the weirs so as to provide for the impounding of water? I could not recommend that course.
154. What is the objection to it? If you raised the weirs that height, you would have to raise all the locks as well, which would make the work very costly.
155. I suppose there is no danger of the weirs, when raised to that extent, being carried away? Of course if you raise them the strength must be increased.
156. If you have a weir which keeps back water for a distance, say, of 40 miles, I should imagine a comparatively small increase in height would be sufficient to impound a very large body of water? Yes; but for irrigation purposes it would all have to be pumped, and I am inclined to think the people would not go to the expense of pumping, excepting for ordinary domestic purposes.
157. Is it not a fact that there are at present some irrigation schemes which depend on pumping—for instance, there is one at Wentworth? Yes; that is carried out by the Government, but you will not have them carried out by private people to any extent.
158. What about Mildura? The water is pumped there.
159. What height have they to raise the water there? I do not think more than 10 or 12 feet; but even that has not been very successful.
160. Do you take any interest in irrigation works apart from their engineering aspect? No.
161. What would be the cost of raising, say, 200,000 gallons of water an hour, 30 or 40 feet, assuming that you would not have to raise it far above the bank? It will cost about £2 to raise 1,000,000 gallons 100 feet.
162. Do you think we should be justified in considering this scheme from the standpoint of irrigation? I am afraid we have not got enough water in the river to encourage a very large amount of irrigation. There is no doubt that irrigation and navigation are so far antagonistic that you cannot store enough water in the river to go in for irrigation on a large scale.
163. There is no doubt that more than sufficient water comes down occasionally to fill large dams? Certainly, in flood time.
164. Supposing you increased the height of the weirs all round by 1 foot, do you think the loss by lockage would be such as to do away with the benefit of the river for irrigation purposes? During the late dry season there was not more than sufficient water to make sure of keeping up navigation.
165. I suppose that if you raised the weirs another foot, the loss by evaporation during a dry season would be no greater? It would only be increased by the increased area; but a foot of water is very little, indeed, for the purposes of irrigation.
166. The loss by lockage would be no greater? No.
167. So that, practically speaking, for every foot you raised the weirs, you would have that amount of water impounded for irrigation purposes? Yes, but it would not irrigate a very large area.
168. Assuming that weirs from 7 feet to 10 feet high are sufficient for the purposes of navigation, to what further height would it be safe to carry them? Two or 3 feet more. There is no reason why you should not make all the weirs 10-foot lifts, if necessary.
169. Would that increase the cost proportionately? It would certainly increase it.
170. Would it to any material extent increase the liability to flood of the people above the level? No.
171. It seems to me that a foot or two of water impounded there, when spread over miles of country, would mean but a fraction of an inch to that country? It would not appreciably effect the floods. When the water rose to such a height as to drown the weir, the flood-level would still be within the banks. So long as you drown your weir before the water is at the top of the banks, you are perfectly safe from doing harm.
172. It seems then that the only thing against the wisdom of utilising some of the water for irrigation is the improbability of people taking advantage of it? All that is taken will not be missed. There would not be enough for irrigation on a large scale.
173. Assuming it were possible to get people to take advantage of water conserved for irrigation purposes, would it be much more costly at a later stage to raise the weirs, and consequently the locks? They could be raised a little without incurring serious cost.
174. Could they be raised a few feet? Yes. Of course you would have to raise the lock-walls and gates as well.
175. Would not that entail the widening of the beds of the weirs? You would, very likely, have to increase the thickness of weirs.

C. W. Darley. 176. Could that be done without incurring a cost which would be out of proportion to the height to which the locks would be raised? It would be a rather troublesome thing to do once navigation was commenced. You could not get at the foundations very well.

24 Mar., 1899.

177. You have stated that there are one or two boats which are too wide to use the locks you propose to put in? There is only one too wide.

178. I presume that, with the certainty of water to a given depth, it will be possible for that boat now using paddles to use screws? The owner could take a little off the paddle-boxes or convert it into a stern-wheeler.

179. That means loss of power, does it not? No; many of the boats on the river are stern-wheelers.

180. I should imagine it would be much safer with a locked river to use screws? It is quite feasible with the depth of water which will be there to use screws.

181. I understand that you have stated that the shutter-weir at Bourke is a failure for the purposes of the Darling River? I do not say it is a failure; but it is not suitable for a river with such a small flow.

182. What expenditure would be required to change it into a fixed weir? It would not cost very much. Of course it would be necessary to raise the walls of the lock, and to put in new lock-gates. The foundations of the weir are in, and there would only be the upper portions to build.

183. Then it would not cost a very large amount to transform it into a fixed weir? I should say £4,000 would do it.

184. *Mr. Trickett.*] I think you explained on a former occasion that it would be more expensive to work movable than fixed weirs? Yes.

185. Would you require four or five men to look after them? It takes at least three men to operate them. I do not think it has been done with less than four men.

186. What is the general experience with regard to irrigation by pumping;—is it satisfactory? It is satisfactory where a number of people join together. I daresay it would work out well at Wentworth. Private individuals, however, will not, as a rule, go in for any large expense in pumping. I may mention that there are some windmills and some small steam pumps on the river now.

187. I suppose they are only for operating in a small way? Yes.

188. I suppose you know that Colonel Home gave it as his opinion that the river Darling was not a suitable one for irrigation operations? Yes.

189. Did he not say that it was impossible to get irrigation near the banks of the Darling excepting by pumping? Yes.

190. Did he not also express the opinion that the character of the soil there was not suitable for large tracts of irrigation? Yes.

191. Colonel Home states in his report on the river Darling:

The soil is described as light sandy loam, but it was noticed that wherever the top soil had been swept off by wind a hard red clay, with limestone nodules in places, was exposed to view, which would, of course, be very ill-suited to irrigation. A careful examination of the subsoil would, therefore, be necessary before the tract could be accepted as one on which an irrigation colony could be settled.

Do you agree with that opinion? Yes. From what I saw of the country it is patchy. You get very considerable variation in the soil and subsoil. There are, no doubt, patches where irrigation might be suitable, but a good deal of the land is very poor.

192. I believe that observation of that country shows that the after effect of saturating the soil with water is to cake it? Yes.

193. You appear to think that navigation and irrigation are hardly reconcilable in connection with a river which has so small a constant supply of water as the Darling? That is so.

194. I suppose you consider that the first use of such a river is for the purposes of trade? Yes.

195. I believe that legally the first claim on a river is for navigation purposes? Yes.

196. Therefore, in dealing with the question of irrigation, we should have to be very careful not to deprive the river of water to such an extent as to render it unnavigable? You would have to cease drawing for irrigation the moment you commenced to interfere with navigation.

197. To what height will the construction of the proposed locks raise the river above its ordinary level? The average rise right through the river will be about 8 feet 6 inches.

198. Will that be suitable for all purposes of navigation? Yes.

199. I notice that Mr. Hickson stated:

The locks, which will be placed in the river channel, will be 200 feet in length between the gates by 37 feet in width, the lifts varying from 7 to 10 feet; this will admit of the passage together of an average steamer and barge, and will be sufficiently wide to pass all but a very small percentage of the steamers now navigating this river.

Why are these large-steamers excluded by the scheme? Of the steamers actually trading on the river, there is only one which could not pass through the locks. Of course, if there was free navigation there, some of the larger boats running on the Murray might be excluded, but up to the present they have never come up the Darling.

200. We may take it from that that it is not likely there will be larger steamers running on the river? If it is intimated that the Government are going to put locks there, it will be at the owners risk if he builds steamers which will not go through them.

201. Has it been considered whether, in view of the growth of the trade, which will possibly follow on the river being made permanently navigable, larger steamers will not be required? Steamers of the size at present in use will do all the work required there for a very long time.

202. What is the tonnage of the boats running there now? Up to about 200 tons.

203. If it is likely that larger steamers will be required for the purposes of trade, it appears to be almost unwise to make the locks so narrow? Thirty-seven feet is not narrow for a lock. It will admit of a large steamer. The locks will be 200 feet long, and very few of the vessels at present in use are more than 100 feet.

204. You said on a former occasion that there was some danger in having the locks close to the weirs, because the current might set a vessel across a weir? Yes; the proposal of Mr. Gordon was to have the weirs at the top end of the locks. I propose to keep the weirs as far from the entrance to the locks as possible. They will be at least 200 feet from the entrance.

205. I suppose that in entering a lock, it is advisable to have as straight a run-in as possible? Yes, we obtain that by trying to keep all the locks in the straight portions of the river.

206.

206. Was not something said about putting them in bends? That was the original scheme. When C. W. Darley. Mr. Williams went up about 1890 he recommended that the locks should be put across bends of the river. He reported that the soil would be perfectly sound for excavation purposes. There are instances in which we should save 2 or 3 miles of navigation by following out that system. When I came to examine the river closely, however, I found there were not many instances in which we should get suitable places for the construction of the weirs in bends. We could not take advantage of the rock bars; and whilst we might have had suitable places in the bends of the river in which to put the locks, there would be no suitable places around the bends for the construction of the weirs. Therefore, I was forced to stick to the rock bars. 24 Mar., 1899.
207. I suppose the weirs will be below the top of the river banks? Yes, well below. Sixteen feet will be the maximum height to the top of any weir. At those places the banks are about 40 feet high.
208. How will you fit the weirs into the pliable banks so as to prevent erosion;—will the side structure have to go a long way into the banks? We shall go in until we get to solid ground, and then a long concrete wing will be thrown out.
209. Seeing that the weirs will be a considerable distance below the tops of the river banks, would not the wings have to be carried up very high? The top of the wing walls would only be from 9 to 11 feet over the top of the weirs. When the water rises to the top of that, it will pass over, and will make the ordinary bank of the river unobstructed, as it is now.
210. Do you not think that the cost of snagging the river is an item which should be included in dealing with an undertaking for making the river navigable. Is it not likely to be a considerable amount? Once the snagging now in hand is finished, the ordinary maintenance men will keep the river clear. The snagging is being done apart from the locking. It is in progress now, and will probably be finished before the locking starts.
211. Is it a very expensive item? About £97,000 has been spent to date on snagging the river between Walgett and Wentworth.
212. If the work is carried out, will trees and snags get into the river? Not to any serious extent; the banks are now pretty well cleared of timber. The snags which have been dealt with lately have been the accumulation of years.
213. What is the practice in other countries with regard to charging tolls on rivers? There are many large water-ways which are free from tolls. The canals in England are mostly held by private companies who keep them in order to move what is called slow freight. I do not think any charge is made in America, where the canals have been formed by the State.
214. If this work is carried out, will not a great deal of the trade of New South Wales go down the river to South Australia? It does now when the river is up. But if the work is only carried out as far as Menindie, there is no doubt that the trade will largely work up to Bourke.
215. What will happen if the river is made navigable right down? The trade will largely go round to Adelaide and Echuca.
216. Do you not think that under such circumstances we should charge something in the way of tolls? If it were my property I certainly should make a charge.
217. How does the cost of irrigation by pumping from a river compare with the cost of irrigation by gravitation or from one of the bores in existence in the colony? It would be very much greater.
218. Is the Darling River of such a continuous height that a movable weir is of as great advantage as a fixed one? Less than half its time the river is open for navigation. To obtain permanent and constant navigation the steamboat owners cannot object to go through the locks; by so doing they will keep their boats in constant use.
219. Although in some rivers a movable weir may be of great advantage, the river Darling does not commend itself as one of those rivers? No.
220. I suppose a fixed weir in the absence of any unusual damage will last a long time? It will be a permanent work. A weir itself would last practically for ever. It is only the erosion of the banks which has to be watched.
221. *Dr. Garran.*] How much water do you estimate is retained in each lock when it is full? In a 10-foot weir you will lose 10 feet of lockage. The amount retained will amount to 74,000 cubic feet.
222. Every time a boat passes that amount of water falls in level from one lock to the other? Yes.
223. Every level is really supplied from the level above it? Yes.
224. Therefore, the ultimate storage for the whole scheme is the water above the first lock? Yes.
225. At present is there enough water above the lock at Bourke to keep trade going up and down the river? At present there is a fresh passing down the river. Before the fresh came, there was, I think, nearly enough to keep the trade going.
226. The moment the new system is established, you will have more steamers on the river than you have now? Yes.
227. So that there will be a pretty active trade going on and a steady descent of the water? The worst that would happen would be in a long dry season, when the river would be lowered a few inches.
228. Would the upper portions be lowered first? No, it would be lowered all over proportionately.
229. Still the upper portion would get dry first? Yes.
230. Supposing the scheme had been completed and in work during the last four dry years, do you think the navigation would have been kept up under such circumstances? I do. We have had two or three small freshes down the river even this year which would have set the river going again. It is only during the last two months that the river has gone down to an abnormally low level.
231. In any case, at the worst, the navigation in the lower reaches of the river would have been maintained? Yes. I saw the river at its worst, and I think navigation would have been maintained the whole time.
232. We should have been able to get up as far as Wilcannia in any case? I think in the late drought you could have kept the river open to Bourke.
233. What is the greatest length between any two locks? Fifty-eight miles. The shortest is 17 miles.
234. How deep do you propose to sink the weirs into the rock? It depends on the quality of the rock.
235. How deep was the one that has been built sunk into the rock? One portion got off the rock altogether. I think it is 9 feet below the bed.
236. Is that enough to prevent water getting underneath? Yes.
237. Is stone abundant on the side of the river? Not abundant; but on an average we can get it within 10 miles of every lock.

- C. W. Darley. 238. It is mostly sandstone? It is a species of altered sandstone.  
 239. Metamorphic sandstone? Yes.  
 24 Mar., 1899. 240. If we want to make this a remunerative work, I suppose we ought to obtain enough to pay interest on the loan, and the cost of up-keep? Yes.  
 241. I suppose that would take fully 4 per cent.? A little over.  
 242. Four per cent. on £500,000 would be £20,000? I have taken it as £22,000.  
 243. Do you think the present traffic could bear a charge of £22,000 a year? The present traffic is very small.  
 244. Could we, by licensing steamers, raise such a revenue as that? Not for some time to come.  
 245. I have seen it stated that in a good year the trade of the river is worth to South Australia over £1,000,000 sterling;—do you think a trade of that character would bear a charge of £22,000 a year? It would, certainly.  
 246. So that if that amount is not an over-estimate, it would be possible to raise a revenue which would pay the cost of this large undertaking? Yes.  
 247. Did you, during your visit, see Chinamen's gardens, for which water was raised from the river? Yes.  
 248. Was it raised by windmill? Some people raise the water by windmill, and some by means of small Tangye pumps. Different homesteads and stations have a little irrigation around them.  
 249. Are there many windmill pumps on the banks? A good many, as well as small steam pumps.  
 250. I gather that you think gardens and orchards might be irrigated? Yes.  
 251. And perhaps a lucerne paddock or two? Yes.  
 252. But not large grazing areas? No.  
 253. If any attempt were made to carry out irrigation on a large scale, would navigation suffer? Yes.  
 254. And in a dry year we want the water most for trading purposes? Yes.  
 255. There would not be enough for the double demand on the water in a bad season? No.  
 256. So that either irrigation or navigation must go to the wall? Yes.  
 257. If we have large irrigation colonies there, they will have to be closed if the river is to be kept open for navigation? Yes.  
 258. If the irrigation colonies are to be served, the steamers, I suppose, could not run? That is so.  
 259. I suppose the reasonable use of the water of the river for the purposes of navigation would be to keep your locks always full? Yes.  
 260. And the reasonable use of water for irrigation purposes would be to keep the farms always healthy and in good condition? Yes.  
 261. You think there would not be enough in a dry year to do both? Not if irrigation were carried on on a large scale. It would be impossible to grow cereals in large crops by means of irrigation from the river.

TUESDAY, 2 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.  
 WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

- C. W. Darley. 262. *Chairman.*] Have you prepared a model of the proposed lock and weir? Yes. I have a model prepared for the Committee illustrating the type of lock which I propose. [*The witness described in detail the model of lock and the mode of working.*]  
 2 May, 1899. 263. *Dr. Garran.*] Is there any river liable to floods which gives an exact example of what you propose to construct here? I know of no canalized river in which there is so high a flood as in ours.  
 264. Even with lower floods, are there several rivers where, in flood-time, the water would cover all the works? Yes.  
 265. Do the works in those rivers stand the floods? Yes.  
 266. Do they leave no silt? In some cases in America there is a large amount of silt as in the Mississippi and Ohio. The water is very highly charged with silt, and to an extent unknown in this country.  
 267. Then, practically, the works on those American rivers have stood every test which the works here are likely to be subjected to? I think so.  
 268. What protection is there against the river going a mile out of its course in a high flood, and giving the go-by altogether to these works? The river does not deviate from its course, except in one or two cases, and then it is only the top water-level which escapes. The whole river is not diverted, and it does not leave its bed. At Talyawalka the flood-water finds an escape, and does not return to the river for a good many miles. It passes through the back country, but that is only the top of the high flood.  
 269. *Mr. Watson.*] Does the main body of the water still continue in the river-bed? Yes; the main river does not alter its course.  
 270. Have there been no instances within our knowledge where the main river has changed its course? I have no knowledge of any instances; there may be small places where a cut-off has taken place.  
 271. I have read that in America the rivers occasionally change their course? I know there are some cases in the Darling where a short bend has been cut off, and what are now known as islands have been formed.  
 272. Do you think you have provided against that in the selection of long reaches? I have selected only straight reaches for the locks. I have kept them away from the sharp bends.  
 273. *Mr. Trickett.*] How much higher is the weir than the sill at the upper end of the lock? The minimum depth of water is 6 feet. According to the drop which takes place at the weir, which varies from 6 feet to 10 feet, there will be that extra depth at the lower end of the lock—that is, there will be from 12 to 16 feet of water at the lower end. 274.

274. So that a vessel coming in at the upper end of the lock will have a minimum depth of 6 feet of water to float in, and the water at the lower end of the sill will vary, according to the height of the drop, from 12 to 16 feet? Yes. C. W. Darley.  
2 May, 1899.

275. So that once a vessel is in the lock, and the lower gates are open, the water will subside, and she will float out at the level of the river at the lower end? Yes.

276. When a vessel is coming up the stream will the process be reversed, so that directly she enters the lock at the lower end the water will rise to a sufficient height to take her over the sill, and enable her to pass into the stream? Yes. On the last occasion you asked me to collect some information with respect to similar work on rivers in other countries, and as to tolls and charges. I will now read some information which I have collected on the subject. It is as follows:—

EXTRACTS from a Report by Mr. L. F. Vernon Harcourt, M.A., M. Inst. C.E., on the benefits to be derived from the improvement of water-ways and ship canals, for the World's Columbian Water Commerce Congress, 1893.

THE greatest opportunities for inland navigation occur in the interior of large continents, where the sea-board is distant, and small in proportion to the area of the country, and where often the rivers are large, and more or less navigable for long distances inland. The Rhine, the Danube, and the Volga are instances of such rivers in Europe, and the St. Lawrence, the Mississippi, the Amazon, and La Plata in America. These rivers, owing to the vast areas which they drain, possess not merely a larger channel, but also a more regular discharge; and consequently a moderate amount of improvement in places suffices to render them navigable for very great distances, and they form natural highways for the trade of the country. The economy, moreover, of transporting goods in bulk by water in such cases is fully realised on account of the long distances that can be traversed.

A remarkable instance of the benefits to be gained by even a small increase in depth of a river navigation, at a long distance from the sea-coast, is afforded by the canalization of the river Main from its junction with the Rhine up to Frankfort. Till these works were carried out, in 1883-86, the navigable depth of the river in dry weather was liable to fall below 3 feet; and the traffic by water up to Frankfort did not exceed 12,000 tons in the year. As soon, however, as the minimum navigable depth was increased by canalization and dredging to 6½ feet, enabling vessels of from 700 to 1,000 tons to get up to Frankfort, the traffic rose to 300,000 tons. The traffic last year reached 709,000 tons.

The moderate minimum depth of 6½ feet has been adopted as the standard depth along the main lines of inland navigation in France, and has proved capable of accommodating a large traffic; whilst on the Rhine, a similar depth has enabled Mainz, Frankfort, and Mannheim to acquire the importance of seaports, though situated inland, at a long distance from the ocean.

The conditions favourable to the development of inland navigation are a large area of country at a distance from the sea-coast, a considerable traffic in bulky goods, the existence of large rivers stretching far into the interior, and large inland lakes or seas, capable of connection by water with the ocean. All these conditions are found in North America; and if France, with her extensive sea-board on the north, west, and south, has found it expedient, notwithstanding her network of railways, to improve, extend, and throw open her waterways, it is evident that a similar policy is far more important for America, where the distances from the ocean are so vast, the rivers so large, and the inland lakes so extensive.

In France inland navigation is encouraged and developed by the State, and made free of tolls like the roads.

Moreover, whilst the construction of an extensive system of artificial water-ways at the public expense may be open to question, there can be no doubt that river navigation, in a country like America, should be carried as far into the interior as practicable, especially as in large rivers moderate local improvements often open up a considerable length of navigation. Whilst the construction of local canals might be sometimes left to private enterprise, the improvement of the main water-ways should be effected by the State; for the Government can more easily raise the necessary funds, it alone can undertake a comprehensive scheme of improvement, extending over long distances, and occupying a considerable period in execution, it looks to the interests of the community at large, and not to local advantages, and it alone derives the indirect benefits resulting from a general development of the resources of the country.

Conclusions.—The value of water-ways for traffic in bulky goods, especially in the interior of vast continents, has been fully established, and the care of the main water-ways should devolve on the State, which alone can undertake a comprehensive scheme, and which alone reaps the indirect benefits of the increase in the trade of the country. Only the main lines of inland navigation should be improved at the public expense.

Works for connecting river navigations, or for extending them further into the interior, and the development of main lines of inland navigation, are specially incumbent upon the State as constituting national benefits.

#### EXTRACTS FROM "WATERWAYS AND WATER TRANSPORT."

By J. Stephen Jeans, M.R.I.F.S.S., 1890.

##### English Canal System.

About the middle of the last century, the cost of goods by road, between Manchester and Liverpool, was 40s. per ton; whilst, by the Mersey and Irwell route, the water-rate was 12s. per ton. After the opening of the Bridgewater Canal the cost was reduced to 6s. per ton, and a better service was given than either of the previous routes had afforded. (Fol. 40.)

So far as mere mileage is concerned, the waterways of England, including canals and canalized rivers, are really of very considerable, if not sufficient extent, as the following figures show:—

Owned by public trusts.....	927½ miles.
Independent canals.....	1,445½ "
Guaranteed and owned by railways.....	1,333 "
Derelict.....	118½ "
Ownership not known.....	36½ " (Fol. 54.)

##### Waterways of France.

According to an interesting statement issued by the French Minister of Public Works in 1880, the length of the canals then constructed in France was 2,882 miles, of which 2,248 miles were described as principal lines, and cost about £10,300 per mile, while 634 miles were secondary lines, and cost £7,200 per mile. The total amount expended on canals of both categories was about 33 millions sterling.

There were, besides, 4,598 miles of rivers which had been adapted, by canalization or otherwise, for purposes of navigation, at a total cost of about 11½ millions sterling—£2,500 per mile.

On both canals and rivers the total amount expended had been over 44 millions sterling. (Fols. 97-98.)

##### Waterways of Germany.

It is the practice in Germany for the Government to maintain the inland navigations, charging only 6s. for lockage. This allows of very cheap transport, so much so, indeed, that it is stated that between Hamburg and Berlin, notwithstanding that the railway rates are extremely low, all heavy traffic is carried by barges or steamers. (Fol. 132.)

In the year 1878, it was announced that over 1,045 miles of new canal navigation had been ordered throughout Germany, in addition to the 1,289 miles then open, and the 4,925 miles of navigable rivers available. This fact sufficiently indicates the great importance that is attached in Germany to adequate water communication, and it is all the more notable that very few countries are possessed of equally cheap railway transport. (Fol. 133.)

Waterways

C. W. Darley.

*Waterways of Belgium.*

2 May, 1899.

The total length of the waterways of Belgium in 1885 was 1,634 kilometres, or 1,013 miles. (Fol. 134.)

Up to the year 1863, the Dutch Government levied a tax upon all vessels using the Scheldt. This tax was found to be so onerous, that treaties were entered into in that year by which, in consideration of certain specific payments made by the various countries concerned in the navigation of the river, the King of Holland renounced his right to levy such duties.\* Since then the trade of Antwerp has advanced by "leaps and bounds."

\* The sum total of these amounts was 17,141,640 francs or £685,666,—of which more than one-half was paid by Great Britain, and fully one-sixth by the United States. (Fol. 142.)

*Waterways of Canada.*

It has been found necessary in Canada with a view to meeting the competition on the Erie Canal route, to reduce the canal tolls and harbour dues. Prior to 1884, the rate of tolls on the grain shipped by way of the Welland Canal was 20 cents per ton, which allowed a vessel to pass through the St. Lawrence Canal without additional payment; but, as the tolls on the Erie Canal were abolished in 1883, it became increasingly difficult for the Montreal route to compete with that *via* the enfranchised Erie Canal to New York. A remission of one-half of the tolls on grain has, therefore, since 1884 been allowed on the Welland Canal, so that the present rate is only 10 cents, or 5d. per ton. Other concessions have been made in the interval, until now the rate is only 2 cents per ton on grain passing eastwards to Canadian parts. This had the effect of greatly stimulating the canal traffic. (Fol. 223.)

*Cost of Water and Land Transport.*

Mr. Conder has pointed out that a feature of prime importance in which the economy of transport by canal differs from that by railway, is the incidence of the expenses of maintenance. The cost of railway maintenance, as soon as anything like an adequate amount of traffic is brought on a line, is remarkably steady, rising and falling, to a certain extent, with the increase or diminution of the volume of transport. On canals, the fixed expenses demand, in any case, a certain cost, and this cost is very little increased by a large increase of traffic. The annual cost of maintenance in the Suez Canal, was actually less from 1876 to 1881 than it has been from 1871 to 1876. But the traffic had considerably more than doubled, so that the cost of maintenance per ton, per mile, fell from 0.35d. to 0.134d.—Fol. 389.)

Among the many current questions relative to transport, none is more urgent than that of how far the waterways of a country can be profitably and conveniently utilised in competition with railways. In continental countries—and especially in France, Germany, Belgium, and Holland—the greatest possible importance is attached to having the command of cheap and adequate water transport. The fact is that the cost of water transport, under the most suitable conditions, is almost ridiculously low. It has been proved in Belgium, in France, and in Germany, to be under one-tenth of a penny per ton, per mile, whereas the cost of railway transport is seldom less than double that amount. But, of course, much necessarily depends upon the local conditions, and upon the means of transport employed. (Fol. 472).

## EXTRACTS FROM "CANALS AND IRRIGATION IN FOREIGN COUNTRIES."

(Report from the Consuls of the United States, in answer to Circulars from the Department of State, dated 1891.)

*Canals in Canada.**Welland and St. Lawrence Canals.*

The canals are built, repaired and controlled by the Government, which by its system of tolls encourages vessels to use the entire water route from the lake to the ocean. Vessels going down through the Welland Canal receive a receipt for the toll paid, which is taken up by the Government, and 90 per cent. of the money returned to the vessel upon satisfactory evidence being furnished that the grain upon which the toll was paid has passed through the St. Lawrence Canal, and out of the country. If the grain leaves the water route for consumption or transportation the vessel loses the advantage of the return of the toll. (Fol. 16).

*Canals in Belgium.*

## Length and Ownership.

In 1885 the total length of all the canals in Belgium was 1,651 kilometres, 600 metres. Part of them being the property of the Government, which has built and maintains them; on these canals navigation is generally free. Some others belong to the province or to the commune and the rest to large companies. In every case these companies are chartered by the Government, which also gives subsidies for the construction and maintaining of them. (Fol. 82.)

It seems almost necessary to remark . . . that Belgium takes the lead on the Continent of Europe in establishing these artificial waterways, and that to that fact is owing, in a great measure, her commercial prosperity. Nothing contributes so much to the commerce of any country as rapid, easy, and cheap means of communication, and the experience of the Belgians has been like that of the United States, that canals have done more than anything else in the last fifty years to cheapen transportation. (Fol. 83.)

*Canals in Germany.*

All the canals in the Prussian Kingdom belong to the Government, and are managed by the Ministry of Public Works. They were constructed entirely for the benefit of the people, and have never been an object of speculation. The traffic is immense; the rates of transportation very low. The canals are administered with great care, and with the best possible pecuniary advantage to the Government. (Fols. 133-134.)

277. *Dr. Garran.*] Do you know the largest sized ships which go through the locks on the Manchester Canal? I do not recollect, but they are large ocean-going steamers.

278. All the extracts you have read point to the familiar statement that water carriage is immensely cheaper than railroad carriage? Yes.

279. Have you seen the recent statement that the Erie Canal Company has admitted that it cannot compete with the present railway freights from the Hudson to Buffalo? I cannot reconcile that statement, because there is no charge on the Erie Canal.

280. It was stated in the American letter in the *Sydney Morning Herald*, three or four weeks ago, that the alternative before the Canal Company now was either to admit defeat by the railways, or to spend something like £20,000,000 in reconstructing the canal, so as to enable ocean-going ships to pass from the Hudson to the Lakes without breaking bulk? I have not seen the statement, but I think I can understand why that is so. The railways take up the grain in the country close to the farms, and convey it to the ships on the seaboard. If the grain is carried by the canal it has to be transhipped into the vessels in the canal, and it is afterwards transferred to ocean-going vessels.

281. If that statement be correct, is it not the first remarkable instance in which a canal has been beaten by a railway? It is the only case I know of.

282. The saving of time by a railway would also be part of the gain? Of course it would save at least one handling.

283. Is there any such possible competition between the river and a railway in the case of the Darling? It is not a case of competition at all. The river would be a feeder to our railways.

284. Supposing the Government were to make a railway down the valley of the Darling from Bourke to C. W. Darley. Wentworth, would it be possible to carry wool as cheaply by a railway made at very low cost as it would be to carry it down the river if locked? It would be quite impossible to carry it so cheaply by railway. 2 May, 1899.

285. So that if we construct these locks we know that we cannot possibly be outdone by a railway hereafter? Certainly not in the carriage of wool. The river would carry it cheaper.

286. Of course, a railway could be made very cheaply down that valley? It would cost two or three times more than opening up the navigation. The latter would cost only £930 a mile, whereas a railway could not be made under £2,000 per mile.

287. And the working expenses of the railway would be greater? Yes.

288. Therefore, as far as we can see, there is no such thing as serious competition possible? No.

289. The railway would be much shorter than the river navigation? Yes.

290. The river mileage would be ten times more than the railway mileage? About two and a quarter times; but the cost of working the railway would be very much more than working the river.

291. Would there not be a saving of time by using the railway? That is not much of a consideration in the case of wool. It is not of sufficient importance to cover the extra charge.

292. Are canals in England looking up as against the competition of the railways? Generally speaking, canals in England are improving properties.

293. Were not a great many canals bought up by the railway companies? Yes; the London and North-Western bought up a long series of canals and worked them. Heavy goods, such as crockery from Staffordshire, with respect to which there is no hurry to get to market, are moved by water at a lower rate than by railway.

294. *Chairman.*] In the *Contemporary Review*, April, 1883, General Hamley, who is an authority on these subjects, wrote:—

Fifteen years ago it would scarcely have been disputed that canals must give way to railways. The teaching of to-day is, however, quite different. There is a widespread belief that inland water-carriage may compete successfully with railways, and a very general desire to bring the former mode of transit into more extensive use.

Has a further experience of fifteen years since that date borne out the opinions then expressed? Yes.

295. So that the question of railways competing with water carriage has been satisfactorily settled in favour of water carriage? Yes; except in the case mentioned by Dr. Garran, which I did not see before. But I think there are special reasons for that.

296. In connection with these canals, we can understand that a canal can compete with a railway running alongside it;—in your opinion, will the locking of the Darling take away from the traffic of our railways or add to it? That is very much a traffic question as to how the trade will flow. We know that in the special case of the Darling very large interests in many of the stations along the river are held in Melbourne, and those people naturally like the goods to be brought down there. When they can, I think they will take the goods down to Echuca away from our railways; but no doubt a great quantity of goods will go to Bourke, or to any other point where we have a railway touching the river. If we had a railway touching the river lower down it would very likely take most of the traffic. Permanent navigation to Bourke would no doubt bring a large quantity of traffic to Bourke which now goes down the river.

297. Is this scheme more for navigation than in the interests of irrigation? I look upon it entirely as a matter of navigation. Irrigation is very secondary to that.

298. A former Committee which sat in 1896 and which considered this question of locking the Darling reported as follows:—

Before any general scheme for locking the Darling is adopted, ample time should be afforded to test the effect of the construction of the Bourke weir upon the river channel both above and below, and to ascertain if movable shutters become unworkable after long submersion.

Has the effect of the weir already erected been carefully watched? Yes.

299. I asked the question because, in view of an inspection of the locality, we have made inquiries, and I have here a telegram from a gentleman in the district, which says:

Cannot quote price, river being unnavigable for anything larger than a canoe. Not 3 inches water over sill of weir. Lock partially sanded up.

What does that prove, in your opinion? The shutters are down now, and I left orders that they should be kept down. I was anxious that the Committee should see the process of putting them up. When the Committee goes up to Bourke, I propose to ask them to go to the lock and see the work of putting them up. It will not be done under such favourable circumstances now as if there were a little more water in the river. However, the Committee can see the process. With regard to the silting up of the lock, I anticipated that that would take place. The lock, unfortunately, is situated close below a sharp bend in the river. The lock is put on the convex bank instead of the concave bank, and there is an eddy in front of the lock, and there will always be trouble from silt in that case. It would have been better if the lock had been placed on the other bank, where it would have had the advantage of a scour. Where it is situated at present there will always be trouble from silting up.

300. Colonel Home in his report, said:

The experimental weir and lock lately completed at Bourke has stood the test of a flood well, and has proved that such works can be constructed at a reasonable cost.

It would appear from that that he had an idea that the work was a success? He saw it under most favourable circumstances, when there was a good flow of water, and when the water was passing over the shutters. He did not see it when it was very dry. Everything was then satisfactory, but, since, we have had the experience of a very great drought, and we see the other side of the picture.

301. Then your Department, having seen it under conditions of flood and drought, have come to the conclusion that a movable weir would be simply waste of money? I do not think it is suitable for a river where the circumstances are so extreme as in the Darling.

302. *Mr. Watson.*] With reference to the Lake Erie Canal, do you know whether that has to compete with canals which connect with the St. Lawrence? Yes; I read about that just now. That is an American-owned canal. The Canadian canals have lowered the rates to compete with it, so as to induce grain to pass through Canada and out through the St. Lawrence.

303. Do ocean-going vessels navigate the canals upon the St. Lawrence? Ocean-going ships do go up to the lakes.

- C: W. Darley. 304. Vessels that will take cargoes to Liverpool direct? Yes.
- 2 May, 1899. 305. Are there whale-backed vessels which carry wheat in bulk right from Chicago to Liverpool? Yes; they pass through the lakes to Montreal, and out through the St. Lawrence.
306. Is it possible that the failure of the Erie Canal is due to the fact that ocean-going vessels can take another route and get to the ocean? No doubt that must tend to injure the interests of the Erie Canal.
307. In the American letter of the *Sydney Morning Herald*, to which Dr. Garran has referred, I saw a statement to the effect that, while the traffic on the Erie Canal had actually declined during the last ten years, the traffic on the railways running in competition with the canal had increased by about 90 per cent;—does not that look as if the railways were successfully competing against a shallow inland canal? Yes; it is a canal connecting the lakes with the ocean, and it now really does not serve the purpose. It requires a deeper canal to compete with the railways, so as to carry ocean-going vessels into the lakes.
308. You do not think it necessary to make any such provision here? No, the case is very different. First of all, ocean-going vessels cannot use the Darling.
309. Is it not possible for us to do the same with the railways as the Americans have done? Yes.
310. So that it might be possible for railways here to compete against a shallow canal? It is only possible under the very special circumstances which exist there.
311. There is one feature in America which we shall not have here—they have such a large volume of traffic that they can carry goods by railway much cheaper than we can? There is an immense volume of grain traffic there.
312. We are not likely to have that? No, our heaviest traffic will be wool and provisions.
313. Commercial men in America place very great value upon getting to market quickly, so as to save interest on capital, &c., and they thus prefer railway carriage, even at a greater cost;—might that motive operate here? I do not think so. It is a most remote possibility that a railway will ever be made down the Darling, especially if there is any navigation open. The river would then really be competing simply with very slow road traffic, and it would be a feeder to the railways. At present wool is slowly brought by teams to the railway. Owing to the late dry season I am told that last year's clip is still in some of the stations. From Momba Station, near Wilcannia, they are sending a little wool down to Broken Hill by camel teams, but it would take them some years to get the whole of it carried in that way. If they had water-carriage they would have the wool in England by this time.
314. Taking wool as against wheat or ores, bulk for bulk, wool is more valuable;—would there not be greater inducement to take advantage of quick transit for wool than for the other articles? Everything else being equal, it would, but it would only be the difference of a few days in bringing it to the railway.
315. Would there not be another handling; the barges which would take wool down the Darling would discharge at Echuca or Morgan;—would not that mean another handling, as compared with the railway, in getting to market? Yes.
316. *Mr. Trickett.*] Colonel Home, I believe, did not take a very favourable view of the proposal to deal with the Darling River in this way;—were not the two rivers which he recommended for treatment the Murray and the Murrumbidgee? That was for irrigation.
317. Does he not also point out in his report—

As a means of cheap carriage through a sparsely-populated country where a railway would not pay, it has its value, but this is discounted by the frequent stoppages of navigation which are caused by a want of water in the river, and at times last for long periods. The experimental weir and lock lately completed at Bourke has stood the test of a flood well, and has proved that such works can be constructed at a reasonable cost, but the difficulty is to get any return for the outlay in a country so thinly populated.

;—do you share that view? Yes.

318. I see by your evidence that you contemplated making a charge by way of tolls for this work? I think I said it might be done, but that it was a matter of policy for the Government to consider.

319. Do you still think it would be a fair thing to carry out that proposal? Yes; it is my personal view that it would be desirable to put on a toll to recoup the outlay. There is no doubt that the river would be a feeder to the other colonies.

320. The construction of this work, instead of improving the carriage on our railways, would in all probability take the trade to other colonies to a large extent? I think it will help our railways to some extent. Of course, it will enable goods to be carried up easily to Bourke, and no doubt some wool will go up to Bourke. I do not think our railways will lose any trade, but by putting on a downward toll we might catch more of the trade. The wool is simply held by the stations until there is water enough to run it down the river.

321. If the river were always navigable, owing to locks and weirs, they would not keep the wool on the station; they would send it away at once? Yes.

322. Therefore, does not that show that if we are going to incur an enormous expenditure of this kind to improve the river to take our trade away, we should put on some charge by way of self-defence? We should be benefiting our own citizens by increasing the outlet for their goods, and we should increase the value of our own property. We should get better rents for the land.

323. Would it not also benefit the other colonies by sending goods for shipment from their ports? It will give them more constant access to their ports, but the traffic goes that way already. Our people have to wait, and suffer the loss of interest on their money by holding their wool until the river is open.

324. Have not most of the canal works to which you have referred been works which have been constructed as a means of transit from one important centre to another in the country which constructed the works? Yes.

325. There have not been the various conflicting interests which, unfortunately, exist in the case of a work of this kind in this Colony? In the case of the Rhine, the trade passes from Germany into Holland. It is taken to Amsterdam and Rotterdam. That is a somewhat similar case to ours, yet the Germans have spent enormous sums in improving the Rhine and its tributaries, so that the trade may pass into another country.

326. Have you made any estimate as to the possible revenue which could be raised from a toll on the river? No; I have left that to merchants and others who use the river. Firms like Rich & Co. could give more valuable information.

327. Some years ago when this question was considered, Mr. Kirkcaldie, one of the present Railway Commissioners, seemed to think that it would produce a very large revenue? That is a point on which those who have considered the question of traffic could give better opinions than I could give.

328. Is this scheme submitted simply as a canal scheme, or as one likely to be of a profitable character to the country;—is it merely devised as a means of convenience rather than as a means of profit? As a means of profit more or less indirect. It would be a benefit to the State generally. C. W. Darley.  
2 May, 1899.
329. The figures which you have quoted seem to show that the estimated cost of this work is much smaller in proportion than the cost of similar works carried out in other countries? Yes; I cannot find any record of navigation being opened over such a length of river at such a low cost as in this case.
330. What is the cause of that? The low fall in the river, and there are so few locks in proportion to the length. For 570 miles there are comparatively few locks,—the fall of the river only averaging 3 inches to the mile. The case is unique in that respect.
331. I suppose that the river being so low generally favours the construction of locks and weirs? That enables us to carry out the work much cheaper. There is very little trouble in dealing with the water in the dry seasons.
332. During the construction of the weir below Bourke, had it to stand any severe tests? One or two floods passed over the works during construction, but there was no harm done of any consequence.
333. That is not likely to be a serious item? No; but if you pick a very flooded season, it might cause long delay. If you picked a season like the present one, you could carry out the work at a very cheap rate.
334. From your experience of the work already constructed would you carry out almost identically the same one, except with regard to the fixed weir? Yes; the work would be practically the same. The foundation for the shutter-weir is quite as heavy as for the fixed weir.
335. Have you the weir there at the upper end or the lower end of the lock? The upper end.
336. Has it had the effect of drawing the vessels in towards the weir? It has never been worked.
337. Owing to these shutters there has never been an effective weir to use? The water might be sufficient behind the weir, but the river has been so low below that vessels could not go in. One lock is of no use for navigation, but it will help to keep the water in front of Bourke.
338. With regard to the navigation above the lock, has the effect been sufficiently far-reaching? No.
339. So that as a means of improving the navigation it has been of no practical effect? It was never expected that one lock would do much good. It holds up the water a little in front of Bourke, but that is all the benefit.
340. I suppose the making of these weirs effective is simply a matter of levelling and backing up the water, and there is no difficulty about it? Yes; there is no difficulty.
341. Have you any doubt that if the work were carried out in the way suggested, it would have the effect of making the river navigable for vessels of the draught of water you have named? I have no doubt that it would be a success.
342. *Mr. Shepherd.*] Is the snagging of the river still being carried out? Yes.
343. Has any estimate been made as to the cost of snagging? I have made an estimate of the cost.
344. How many miles are required to complete the whole of the snagging between the two points where it is proposed to lock the river? I have not that before me. Of the length which we propose to lock there is rather more than one-third done. There is a little more than 200 miles done.
345. Have the banks been thoroughly cleared of timber, so that there is no fear of snags being washed in again? There may be a few occasionally, but all the immediately dangerous snags have been removed.
346. Is the snagging carried out much more effectually when the water is low, so that the present time is favourable? It makes the work easy in one way, but there are other difficulties created by the dry season. There is a difficulty in getting food to the men, or in getting the men there at all. A great many men have suffered from typhoid fever, so that the work has been surrounded with great difficulty, although otherwise the season has been favorable.
347. Are these locks very liable to silt up? No; as long as the sites are carefully selected.
348. I see among the annual charges a sum of £2,000 put down for a steamer and sand-pumps;—do you think that will be ample? I propose to provide a steamer with a small sand-pump.
349. Will the expense of snagging be entirely in addition to the estimated cost of locking? Yes; that is being done in any case.
350. Are there no means of getting an estimate of the cost of snagging? We can only estimate on the cost per mile now.
351. Have you any idea what it has cost per mile? I cannot say from memory, but we have had it all worked out.
352. *Mr. Dick.*] You have stated that it is provided that there should be a minimum depth of 6 feet of water on the sill of the upper portion of the lock for vessels passing down;—how much lower is the sill of the upper end of the lock than the top of the weir? The upper weir is 6 feet below the top of the water.
353. Then how can we get 15 feet of water at the lower end of the lock? According to the height of the drop each way. It is 9 feet in this particular case. There are two locks with a minimum of 6 feet, and there are two with a maximum drop of 10 feet. The others are between that.
354. Do you excavate the bank of the river at each of the places where you construct a lock? We widen out the river.
355. Does the excavation of the material add to the cost of each lock? Yes.
356. Is there any great necessity for that additional cost? It is only necessary in some cases. In a great many cases the river is already sufficiently wide, because in nearly all cases where there are bars the river is wider than it is in the normal section. Where there are bars we generally find the river is wider. In the normal section, both banks slope down 1 in 1—they are very steep. But when you come to a rocky bar you find that there is one easy slope, which you can drive down. In the normal section the river is quite narrow, and there are two straight banks.
357. What do you mean when you speak of the river being wide enough? It is wide enough to hold the lock and weir.
358. In nearly every case where you have hard rock, the river will be wide enough? Yes; it is only in some cases where much further widening will have to be done.
359. *Mr. Watson.*] In what way is it important that the river at the weir should necessarily be as wide as the river above the weir and lock? So as not to retard the free discharge of the river. It would raise the floods if you checked the river. We want to interrupt the river as little as possible.

FRIDAY, 5 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. ANDREW GARRAN, LL.D.  
 The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.  
 ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Hugh Giffen McKinney, Principal Assistant Engineer, Water Conservation Branch, Department of Public Works, sworn, and examined:—

H. G.  
 McKinney.  
 5 May, 1899.

360. *Chairman.*] Have you prepared any evidence for the Committee in the shape of a statement? I have not prepared a regular statement, but I have made a number of notes with regard to irrigation, which I thought might be interesting to the Committee. In the report on the locking of the Darling above Bourke a good deal of evidence was taken as to the relative cost of irrigation from artesian bores and of irrigation by pumping. Upon that subject I think the Committee which then sat were a good deal misled. I think they were under a misapprehension upon some points, and it is chiefly with regard to those points which I made note.

361. Did you prepare a report some two years ago? Yes. That was in connection with the locking of the Darling above Bourke.

362. *Mr. Trickett.*] Have you any special credentials with regard to irrigation works? Yes; I think I am specially fortunate with regard to the training I have had as to irrigation works. I passed a competitive examination for the Indian Public Works Department at the India Office in 1868, and from the beginning of 1869 up to about the end of 1879 I was in the Irrigation Department in the North-west Provinces and in the Punjab. During the first seven years of that time I was on the Baree Doab Canal. During those seven years I was employed on every branch of irrigation works, from the setting out of canals to the distribution of the water, and for the last duty I had to pass an examination in canal law. For the remaining three years of my service—about three and three-quarter years—I was on the Upper and Lower Ganges Canals in the North-west Provinces, and also on the Eastern Jumna Canal. That was up to the end of 1879. In 1880 I became Resident Engineer for the Sydney Water Supply Works, which were then just started. I had nothing to do with the Prospect Reservoir, but I was employed on the canal and tunnel works. From that I was transferred to the Royal Commission on the Conservation of Water, in October, 1884.

363. Have you remained in the Government Service from that time until now? Yes.

364. Were the works on which you were engaged in India in any way similar to the works contemplated for the improvement of the Darling? In some respects there was similarity, but there was a great deal of difference. For instance, I had charge of the construction of locks on the Lower Ganges Canal. They were really similar in principle to the locks here, but the style of the works generally was totally different, because there was a very large supply of water there, while here there is only a small supply. I was first employed on the Ravee River, afterwards on the Ganges, and then on the Jumna.

365. Are they not very much larger rivers than the Darling? Yes.

366. Were you treating the rivers or branches of them? The main canals were taken from the rivers themselves. I can show the Committee a map of the whole of the canal system of the north-western provinces.

367. I suppose that the volume of water which you treated in India was of enormous extent, as compared with the water available in the Darling? Yes; it was greater beyond comparison.

368. How do the banks of those rivers compare with the banks of the Darling as to elevation and formation? The water was taken out just close to the foot of the hills, so that the conditions were quite different to those of the Darling. The supply was taken out there from the rivers, and we had nothing to do with the rivers lower down. We diverted the water almost at its source at the foot of the hills where the rivers ran into the plains.

369. Then the flow for irrigation was by gravitation? Yes, entirely.

370. So that, unfortunately, those works will not be of much advantage to us in considering this proposal? No.

371. Have you been engaged in any other work that was of a somewhat similar character to the one we are now dealing with, and the proposal to use the water for irrigation by pumping it up? There were certain cases in India where the water was pumped up by the primitive native appliances. That was exceptional, and we sought to avoid it as far as possible.

372. The main scheme you had to deal with was by means of water taken from near the source of the river? Yes. The scheme which I hope to see before the Committee in some months' time with regard to the Murrumbidgee is very similar to the Indian works; but the River Darling scheme is certainly different.

373. A weir and lock have been already constructed 3 or 4 miles below Bourke? Yes.

374. Was that estimated to cost £20,000? A little under.

375. What has it cost? I think about £21,000.

376. It has not cost anything excessively over the estimated amount? No. In regard to that case, there were special difficulties raised through the contractor throwing up the work.

377. But, as against that, you might put the fact that they were very favourable seasons? Yes; the seasons were fairly favourable, but the work was interrupted.

378. But there were no very severe floods? No.

379. That work having been constructed, what is your opinion of it as an engineering work? It has quite come up to my expectations.

380. It has been forcibly brought under our notice by Mr. Darley that you recommended this system of movable shutter-weir? Yes.

381. What do you say about those weirs? I may say that I have not gone any further into the question since then, and there may have been something proposed between Bourke and Wilcannia which would obviate the difficulties which I anticipated with regard to the construction of fixed weirs of any kind. I may say, with regard to the design now before you, that I have had nothing whatever to do with it. I had

had to do with the shutter-weir at Bourke, but I have had nothing to do with the designs of the weirs below Bourke on to Menindie.

382. We want, as we go along, to get the advantages or otherwise of what has been already done. I want you to say whether you think the shutter-weir, which was erected at your suggestion, has been a success, and whether it is suitable for a slow-running river like the Darling? I know that the chief objection Mr. Darley has to weirs of that kind is that they allow a considerable quantity of water to leak through the shutters. Of course, the question of the practicability of preventing that leakage is a matter I really have not had an opportunity of going into since.

383. This is Mr. Darley's evidence, given on the 15th March:

Mr. McKinney prepared a design on behalf of the Mines Department for a lock and weir on what is known as the Chanoine system, with folding shutters, and authority was given to construct it at Bourke. It was in course of construction at the time the inquiry on the construction of locks and weirs on the Darling was last held. When I was under examination at that time, I pointed out that, whilst in many cases the system was an excellent one, and very suitable for many rivers, I did not think it was suitable for the Darling, where the water practically ceased to run, therefore we could not afford any leakage or loss of water through the shutters. The position I then took up has been pretty well upheld, for we have seen that, when the Darling went low, the weir had practically no water behind it. The whole of the discharge of the river passed easily through the space underneath and between the shutters. Therefore no water was held up. Practically; then; the weir is of no utility.

That is rather severe criticism on a public work. We are now considering a further scheme lower down the river, and we would like you to say whether, in the face of that, you would recommend any more such constructions as this lock and weir already erected? With regard to that, as I have said, I have not had an opportunity of going into the question of the practicability of stopping that leakage. When I proposed these weirs, I considered that there would not be any material difficulty in stopping the leakage; in fact, I knew that in such weirs in France, when the rivers fall, they simply slip a piece of board between the shutters, leaving it lying against them, where it is kept by the pressure of the water. I have not gone into it in detail since.

384. In the face of actual experience of that kind, which cannot be gainsaid, because it has been gained by the practical observation of Mr. Darley, would you recommend the construction of any more weirs of that kind? I have not yet seen any reason to change my mind about that. I have not seen enough to convince me that it is not practicable to stop the leakage, so that I cannot say that I would not recommend them.

385. Have you seen the working of this weir? Yes.

386. When? Not when the river was at its very lowest, but I was up there several times when the shutters were raised and lowered.

387. When the shutters were up, did you not notice that a considerable amount of water was running between the gates and also bubbling up below the shutter-weir? Yes; that was always intended.

388. With a river like the Darling, which we know gets down to such a low state, do you contend now that it is desirable we should allow a lot of the water to run to waste? As I have said, I have not gone into the question as to what means should be adopted, or whether it is practicable to stop the leakage entirely. I never contemplated that a great quantity of water would be running off, and I am certain a great deal of it could be stopped.

389. Who has had the supervision of the weir? The Works Department.

390. Has this weir been under your supervision or care? Yes.

391. Have you had any regular reports from time to time as to whether the water was running away? Yes; we let the water go away purposely on occasions when people said it was wanted down below. On one occasion there was a boat carried down by dropping part of the shutters of the weir.

392. I can understand that happening on certain occasions, but it seems to be very strange to have a weir which is not a weir;—I could quite understand what you say occurring when there is abundance of water; but when you have continuously dry weather for two or three years it is a different matter;—here is a weir which has been erected, and which, according to the report of a former committee, was to be taken as a guide for the future;—that the water should be allowed to run away continuously is a matter which calls for explanation;—do you not say that it should be remedied? I do not know that there is any object to be gained by stopping all the water. The people below wanted the water.

393. The object of the weir was to raise the height of the water above the weir, so that when it reached a certain height it would flow over. You would thus gain a double object by backing the water up above and having a surplus to run down below; otherwise, what is the use of going to so much expense? Of course, a work of that kind does not come into operation until the whole series of works has been carried out, so that really there was nothing to be gained. Of course, as far as keeping it up was concerned, if we had complete means of stopping up the flows, once we had the shutters up we probably could have held it up.

394. I will put this question directly: In the erection of future weirs on the River Darling, do you recommend a continuance of these shutter-weirs, or do you recommend the erection of fixed ones? Speaking broadly, and as a matter of preference, without saying shutter-weirs, I would prefer movable weirs to fixed weirs.

395. What kind of movable weirs? There are several kinds. This kind seemed to me to be the least expensive.

396. Expense is not altogether the object, the great thing is effectiveness? I do not think it has been proved that the leakage at that weir could not be stopped.

397. Then I understand that if you were carrying out the work lower down, you would have these shutter-weirs again? I do not say that kind, because I have not tried the experiment on this one.

398. There is the experiment and the result? No, the experiment has not been tried, it certainly has not been fully tried.

399. How do you mean that it has not been tried? What I mean to say is that the best means of stopping that leakage has not been tried; in fact there has not been any means tried to any great extent to stop the leakage.

400. You will admit then that these shutter-weirs are not effective to act automatically? No.

401. To pull them up by the process which you described before, by a man in a punt with boat-hooks, so as to get these shutters up to their proper height to make them water-tight, what would you have to do so as to keep the water back? There would have to be something packed in the joints. The simplest course is to put weighted boards over each of the places between the shutters.

H.G.  
McKinney.  
5 May, 1899.

402. But that would leave the gap at the bottom? There was a suggestion made by Mr. Wade, the resident engineer in charge, which I considered a very good one; that was, that pieces of rope should be used instead of boards. Hempen rope would find its way between the crevices, and I believe would stop the leakage.
403. Honestly, do you suggest, for a weir with wooden shutters, in a river of this kind, that the interstices should be stopped up with rope;—is that worthy of the magnitude of the scheme? They consider it worthy of much greater rivers.
404. Just so—larger rivers—where they can afford to waste the water; here we want to preserve the water;—do you still maintain that this peculiar style of weir is desirable? I am quite prepared to admit that objection could be found to almost any kind of weir, and it seemed to me that that was the kind to which there was the least objection.
405. What is your objection to a fixed weir? The danger of scouring away the banks of the river, and raising the flood-level.
406. Have you any reason, by experience, to expect that that would happen on the river Darling, with a fixed weir? I think the river Darling is a pretty good lesson with regard to things of that kind. For instance, there is a natural barrier at Brewarrina. We find there are large outflows from the river above that. In nearly every place where there is an outflow from the river, you will find a hard bar not far below. There would be a tendency, where there is any barrier, to divert the river into other channels.
407. Has that taken place anywhere, on the Lachlan for instance? The conditions on the Lachlan are very different.
408. Has anything of that kind taken place on the Lachlan? Yes, it has not only taken place, but we have been taking advantage of it to distribute the water.
409. What has taken place, and what have you done? On the Lachlan the Willandra weir has been erected, where there has been a natural outflow of that kind towards the Darling. I believe that natural outflow is due to an obstacle in the river some distance further down; at least it is largely due to that.
410. It is not due to the weir? No; there was a channel there—a very poor channel—before we built the weir. What we have done, since we built the weir, has been to improve the channel. We have simply been improving on what we found.
411. What has happened there with regard to your weir? Nothing at all. We have been diverting the water into the back country, when there was any water to divert. The Willandra weir turns the water for about 350 miles when there is any considerable rise in the Lachlan. In 1894 it did do that.
412. You are getting away from the subject; you said just now that your objection to a fixed weir was the scouring of the banks, and the danger of the water getting away from the weir. I followed that up by asking if anything of the kind had happened on the Lachlan, and I understood you to say at first that it had happened there;—I want to know if your opinion as to the danger of fixed weirs is based only on what you anticipate, or if it is based on anything that has actually happened? It is based on general experience. It is a matter which you can easily see that if you contract the waterway, you necessarily raise the flood-level.
413. Has that already happened on any work undertaken, where a weir has been left standing, and the water has got away from it and formed another channel? Yes, there is a case; but that has not anything to do with the raising of the flood-level. I understood your question to refer to raising the flood-level.
414. No; my question referred to your own answer, that you feared something would happen;—I ask is that based upon actual experience, and if so, tell us the instance and the locality? I do not know of any instance on our rivers where it has happened. There is a case where we were constructing a weir on the Macquarie, and, owing to negligence, the water was allowed to flow over the unfinished ends of the weir, and it cut away the bank behind the weir, and formed a new channel.
415. But that occurred during the construction of the weir? Yes; and it was owing to a piece of negligence. That is not a thing which need necessarily happen.
416. Is there a case where anything of that kind happened after a weir had been completed? I do not know of any.
417. The model before the Committee represents the construction of a weir and lock; the banks on the model are not as high as they are in reality; the weir shown in the model is a great many feet below the height of the surrounding banks;—as the weir is so much below the height of the protecting stone-work, and that stone-work is to be extended a considerable way on either side, what probability is there that the water will spread over such a large space? All that I said was that any permanent obstacle, such as a weir, diminishes the waterway and necessarily increases the velocity.
418. Is not that an objection to any form of weir? It is not an objection to a movable weir.
419. A movable weir has the advantage that it can be lowered, and we get the whole of the bed of the river for the outflow? Yes; I may say that the whole question of a preference for fixed or movable weirs is very much a matter of opinion. It has been very much debated, and I concluded that the weight of evidence seemed to be in favour of the movable weirs; but I know that many very eminent engineers are in favour of fixed weirs.
420. Is there any hard-and-fast rule? No.
421. Do you not think that the weight of evidence is in favour of movable weirs where a river is of such magnitude that you could afford to lose water? There is no doubt that they have natural advantages.
422. Have you had any experience of the American method of locking rivers and improving the navigation? That very arrangement for working these shutters is really derived from American precedents.
423. There, do they not, very often, where they want water only for irrigation, put up at frequent intervals weirs constructed with timber, so that if a flood comes it will wash away one or some of them, and it is therefore advisable to avoid going to the great expense of these fixed weirs? They sometimes do put up timber weirs and timber locks, but, as far as I have seen, the best authorities lately are beginning to go against them altogether.
424. You must recognise that in this question there is some difficulty, because I understand that you want to connect the two things, navigation and irrigation;—is not that your idea? Yes.
425. Which do you look upon as of chief importance in dealing with the river, navigation or irrigation? I regard irrigation on the river as really the more vital of the two; but I must say that in the interval which has elapsed since the matter first came to be inquired into I have been very much disappointed at the small progress made on the Darling in pumping water for irrigation purposes.

426. Do you look upon irrigation as secondary to navigation in dealing with a river of this kind? I do not in this case. I think it is the more vital of the two, because, without a certain amount of irrigation, that country will be hardly fit to hold.

H. G.  
McKinney.

427. Is the soil on the banks of the Darling for a considerable distance what is known as black soil? Yes; there is a good deal of it.

5 May, 1899.

428. How do you regard that as a subject for irrigation? It is not very good soil for irrigation.

429. When you get away from that black soil do you get into a different kind of soil, which is more suitable for irrigation? Yes; as a rule there is better soil at a distance than there is near the river.

430. So that we are confronted with a difficulty there—where the water can be most easily got to the soil the soil is not exactly suitable for irrigation? Yes, there is something in that. But still, under any circumstances, I do not expect that irrigation will be carried on there except in patches at intervals.

431. You accompanied Colonel Home in his investigation, and he pays a very nice tribute to your assistance and ability in that inquiry; but you remember that at page 17 of his report he states there that it is very doubtful whether this clay soil is suitable for irrigation? I know that he had not a very high opinion of much of that western country as far as irrigation is concerned.

432. Would you amplify what you said that you did not expect irrigation to be carried on to any great extent? My idea of the function of irrigation there is that it should be carried out on patches of country, say 20, 40, or 100 acres in order to raise fodder crops for horses and cattle and for stud flocks, so as to carry them through a drought.

433. Will you concede this, generally, that you cannot carry on irrigation from the Darling over large grazing areas? I do not think that would be desirable. The best use of the available water would be to irrigate patches at intervals.

434. Are you of opinion that irrigation over large tracts of grazing land is not desirable or practicable in the western country? Yes.

435. Then you look upon it that graziers and others having holdings within convenient distances of the river would only avail themselves of irrigation for the use of home stock and valuable animals? Yes, chiefly as an insurance against drought.

436. Is such a large system of irrigation as you saw and helped to bring about in India practicable here? No.

437. To utilise water for such purposes as you indicate would necessitate individual effort in the way of pumping? Yes.

438. There would be no combination, as far as you can see, which would enable the people to club together and get water laid on to their land, and it would have to be taken in hand at various points? That would be the general rule; there might be cases where a number of people could combine together, say near a town, for fruit growing or something of that kind.

439. Would a pumping process of that kind be very expensive? No. That is a matter which was brought before the previous Committee which inquired into the question of navigation; that was for the part above Bourke. The impression that seemed to be created was that irrigation from artesian bores was cheaper than any other kind of irrigation.

440. I would like you to finish your evidence with regard to people clubbing together? Where people could club together advantageously for irrigation on the Darling would be exceptional, but there would be cases in which it could be done advantageously, and particularly for fruit-growing. Fruit-growing can always be better done by a community.

441. To carry out your idea of irrigation by individual effort, and occasionally by combined effort, have you calculated whether that would seriously diminish the flow of the river, so as to interfere with navigation? I am sorry to say that, at the present rate of progress, it would be a very long time indeed before it would have any effect upon it.

442. As far as your observation has gone, have the people availed themselves of the opportunity of pumping water from the river to help themselves in time of drought? No. On the whole length of the Darling we have only had six applications for licenses to pump water for irrigation. On the Murrumbidgee we have had twenty-six applications. The progress has certainly been very disappointing to me.

443. As far as you see, is there any way of irrigating the land on either side of the Darling, except by pumping? No.

444. You might now give us the comparative figures with regard to irrigation by pumping and irrigation from artesian bores? In a return given to the Committee which previously inquired into the locking of the Darling above Bourke, it is stated, at page 99 of the Appendix, that the cost of artesian bores which have been put down by the Government was £119,155 5s. 1d., and the quantity of artesian water obtained by that expenditure was 20,267,000 gallons per day. The detailed expenditure is given, but the details of the water are not given. Working that out to units, it comes to £3,175 for every cubic foot per second of flow.

445. *Dr. Garran.*] That means the total yield of all the bores? That is the average cost of the water, that is, taking the cost as reported. I know there are preliminary expenses which could be fairly debited to the bores, but which are not put in.

446. You mean the capital expenditure for every cubic foot per second is £3,175? That is the amount of money spent in obtaining every cubic foot per second of flow. I do not think it would be right to take the interest and depreciation at less than 6 per cent. That would give the annual cost of a flow of a cubic foot per second, interest and depreciation, of £190 10s. Now for pumping lifts up to 25 feet, I gave instances in my evidence of cost varying from £50 to £80 for every cubic foot per second. But in this case you might take about 40 feet for the lift. I shall give an instance from Mr. George Gordon, who went into this matter very carefully, and he estimated the cost of raising water to a height of 39½ feet by modern pumps at 83 of a penny for every 1,000 cubic feet. That works out to a cost of £109 1s. 2d. per annum for every cubic foot per second.

447. That compares with £190 10s. for artesian water? Yes.

448. You make your calculation on the basis of a continuous flow in both cases? Yes; it is only right for me to point out that there is one particular case of an artesian bore which gives a remarkably cheap supply, that is the Euroka bore. But it does not seem a fair thing to take one artesian bore which gives a very favourable result, and at the same time ignore all the others. In this calculation I have simply taken them all as they came.

- H. G. McKinney.  
5 May, 1899.
449. *Mr. Trickett.*] Have you placed this comparative calculation upon the height to which the water would have to be pumped out of the river Darling—that is, about 40 feet? Yes; that last one, in which the cost of a cubic foot per second comes out at £109 1s. 2d.
450. Have the applications for leave to pump water for irrigation out of the Darling been made by the large graziers? Yes, as a general rule; there is one who is a small landowner at Menindie.
451. Can you state the nature of the plant which is proposed to be used by extensive holders? I have not the particulars with me.
452. You do not know what the cost of the plant would be? No; I simply made out a list of the applications on the different rivers.
453. Will you look at Question 1441 of the evidence which you gave before the previous Committee on this subject, and will you quote what you stated there as an extract from a paper by Mr. Gordon? Yes; it is as follows:—

In a paper published by Mr. George Gordon, member of the Institution of Civil Engineers, he gave a statement of results of experiments and calculations which he had made to determine the cost of pumping 1,000 cubic feet of water. The results arrived at were as follows:—For a 6 feet-lift, 0·19d. per 1,000 cubic feet; for a 24-feet lift, 0·32d.; for a 25-feet lift, 0·42d.; for a 39½-feet lift, 0·83d.; and for a 100-feet lift, 12½d. These figures are in substantial agreement with those I obtained. In the 39½-feet lift, Mr. Gordon's are equivalent to a cost of £109 per annum for a flow of 1 cubic foot per second, while my estimate of the average cost of this quantity for the 31-feet lift was £70 per annum. Mr. Gordon's result for a 24-feet lift is equivalent to an annual charge of £42 per annum, as compared to my estimate of £50 per annum for a 23-feet lift. Mr. Gordon's result for a 25-feet lift is £55 per annum for 1 cubic foot per second. I may add that in my estimates in the two cases referred to I concluded that the annual cost of a cubic foot per second in Mr. Wills Allen's case was likely to vary from £60 to £80, and in Mr. Gatenby's case from £45 to £70. Making ample allowance for defects in working, a flow of 1 cubic foot per second should irrigate 60 acres of lucerne, and produce on suitable land five or six fair crops in a year.

I have allowed in my calculations for interest upon plant and working expenses, and made an annual charge.

454. Have you also allowed for depreciation? Yes; I have allowed 6 per cent. for interest and depreciation. I may say that in regard to the calculations as to pumping, I allowed 8 per cent. for interest and depreciation, but in the calculation with regard to the artesian bores, I have only allowed 6 per cent.
455. Do you still remain of the opinion that to put these calculations in a practical form you think £1 per acre per annum would be a fair allowance for irrigating such lands as are on the bank of the Darling? Yes; I believe it would cost about that.
456. I suppose that would be after the land had been prepared and levelled and piped? I am assuming that a place would be selected which would require very little preparing. You can get such places. If we had to make special preparations that would be in addition.
457. In that amount of £1 per acre, do you include what the Government would charge for water? No, but supposing only the fees were charged; they are only nominal at present.
458. I suppose that unless the water were availed of much more than it is at present, the people would only have to pay the fees? Yes; it would be a mere nothing.
459. If the Government carried out this work at great expense, is it probable that a charge would be imposed for the use of the water? It would be perfectly fair to do so; but, at the same time, a very large proportion of the land there is Crown land, and it might be said that the indirect benefits to the Crown were sufficient to justify the Government in not making any charge.
460. Might they not increase the rent? Yes.
461. Have you anything to guide you to say that if this work were carried out the people there would go in more for irrigation than they do now? I think they would, because they would have the water at a slightly higher level, and it would be kept more uniform for them.
462. They could then arrange their pumping plant and have a reliable supply? Yes.
463. Therefore you think they would be more likely to avail themselves of it? Yes; I think it would encourage them.
464. What is the average rate of flow of the Darling? The velocity of the river, even when pretty high, is not more than 2 or 2½ miles an hour, and when it is very low you can scarcely see the water moving. The velocity is then only the fraction of a mile per hour.
465. Is the fall very slight? The average is 3 inches to the mile. It is smaller than in any of the other rivers.
466. Is that a feature favourable to the construction of weirs and locks? It is particularly favourable to navigation.
467. Have you been consulted about this proposed work? No; Mr. Darley took the matter of the design altogether into his own hands. I have been assisting in getting up general information, and in matters connected with the surveys.
468. Have you been consulted as to the design which has been submitted to the Committee? No.
469. Have you considered the question sufficiently to be able to say whether the scheme is a good one as regards the number of locks and weirs, their position, their distances apart, and so on? I have not gone into that in detail. I started the surveys, and selected some of the sites, but the designing of the weirs had to settle the question as to the sites, because upon the height of the weir depended pretty nearly all the other points.
470. What do you consider the best position in which to construct these locks and weirs on a river like the Darling? It is very desirable to have a good hard foundation—rock if possible. It is very desirable to have the banks high near the place. It is also desirable to have the site not near any place where there is an outflow, at least any outflow on the upper side near the works.
471. So as to get a certain passage over the weir into the lock? Yes; and so that there will be no risk of changing the course of the water by diverting it into a billabong, or anything of that kind.
472. Therefore you agree with the proposal that these locks and weirs should not be erected at certain intervals, but that advantage must be taken of the natural suitable localities? Quite so.
473. Mr. Darley proposes to erect the weir at the lower end of the lock;—do you think that is a good thing? I think it is the best way in adopting this style.
474. In the case of a fixed weir, is that done so as to avoid the possibility of a vessel being drawn in to the weir by the set of the current? Yes. I think that is best in a fixed weir.

475. In the case of a movable weir, does that matter? It does not matter much, but in many cases it would be well to have the weir at the lower end, even with a movable weir, though it does not matter so much in the case of a movable weir.

H. G.  
McKinney.  
5 May, 1899.

476. Do you agree with the arrangement in this case? Yes.

477. Have you considered what sized vessel it is desirable to provide for in the future requirements of navigation in this river? I think a lock of the size of the one at Bourke is sufficient for all ordinary purposes, that is 200 feet long inside, by about 38 feet wide.

478. Would that take in the largest vessel trading there at present? There is only one vessel trading there at present which could not come into the lock, and she is exceptionally broad over the paddle-boxes. As far as the length is concerned, it will take any one.

479. Would it do for any vessel likely to trade up and down? Yes; it will take an ordinary steamer and a barge at the same time.

480. With regard to the canals which you had to do with in India, was any charge made for the use of the rivers? Yes, there was a charge for irrigation. There was a double charge for what is called the owner's right, and the occupier's right. Those works were all carried out by the Government, and the charge was collected in the same way as the land revenue. The canal officers made up the return. Then the returns were made over to the district authorities to collect. It was charged by measurement of the area irrigated, and also by the nature of the crops.

481. Can we take it as a general rule that there are charges for the water used for irrigation where extra accommodation is provided by the Government or companies? Yes, it is the general rule in all Government works in India and Egypt.

482. What is the tendency with regard to navigation? It is to make the charges very low—in fact to remove them altogether.

483. What is the reason? I am not quite certain about it, but I understand it is considered that navigable rivers and canals should be treated simply as highways, that they tend so much to the development of the country that it is worth while to let the people have the use of them for nothing.

484. Are they looked upon in the same way as ordinary roads? Yes.

485. If this scheme were carried out by the Government, what would you recommend as to charges with regard to navigation and irrigation? In this case it is a very complicated question, as far as making a charge for navigation is concerned, because it is not altogether a highway for this Colony; and the question is, whether this Colony would be right in treating it as a highway for another colony.

486. If the colonies remained as they are, would it be a question whether we should not charge for goods going down the river, while we should make it free for goods coming up? There would be a great deal to be said in favour of such a proposition.

487. As regards irrigation there is no doubt that that would be an absolutely fair charge? It would be perfectly fair.

488. *Dr. Garran.*] Did you draw the designs for this shutter-weir? Yes, it was my design.

489. Was it carried out under your superintendence? Yes. The contractors stopped work, and made claims against the Government, and we had some litigation.

490. Was it all done under your superintendence? Yes.

491. So that you were responsible for the construction of the weir, and no one else? I am quite prepared to take the responsibility. I had a very efficient officer in immediate charge as resident engineer—Mr. Wade.

492. Its success or failure was due to you? Yes, I am quite prepared to take the responsibility.

493. Did you intend that the water should come between these shutters? Yes.

494. Did you always allow for a certain proportion to go away? Yes; certainly. There is another reason, though, for having a certain space between the shutters, that is such space as is required for the working of them. The shutters would not work if too close. With long shutters like those, very little movement one way or the other would make them jar against each other. These are closer than they are in the habit of making them in France. The spaces are generally larger than we allow.

495. Did you allow for water going underneath? I thought they would fit in closer, and I did not think that would be so important a factor.

496. Is that due to the want of water above the weir not pressing against the bottom? With timber and concrete it is impossible to make a tight joint. I fancy it could be made tight at the bottom with another arrangement.

497. Supposing there were 6 feet of water above the weir, would that press the bottom of the shutter against the sill better? Yes.

498. Sufficiently so? I should not like to say that, because the shutters are particularly strong and heavy, and would give very little. It would press against it, but any inequalities in the timber would not fit closely with the concrete. There would be always little spaces through which water would go.

499. In a very dry year like this—the fourth successive dry year—is not water very precious in the Darling, both for navigation and irrigation? Yes.

500. Do you want to waste any of the water above the weir? No; none should be wasted.

501. Would it not be a good thing under such circumstances to make the weir as water-tight as you can? Yes; I believe it would.

502. Did you provide any method for making it water-tight? We did not; but I regarded that as a matter scarcely likely to arise. The Darling has been lower lately than it has been since 1885. If we had had ordinary seasons since the work was finished, that question with regard to the shutters would never have cropped up.

503. That is because in an ordinary season you would have had water to waste? It is hardly right to call it waste, because it could be allowed to flow on.

504. In a very dry season do you not want to keep every bucket of water you can? Yes.

505. Is it not true that, as all the traffic will perpetually lose a lock-full of water, you want to keep a reservoir somewhere to make up for that waste? Yes.

506. Is there any reservoir except that stored above the highest lock? With regard to that, there is a feature which does not crop up in this case, but it is right to mention it. It is this fact that, although the water is not always running below Bourke, it is always running at Brewarrina. The idea I had was that if the river had been locked above Bourke, the small quantity of water which is always running at Brewarrina

H. G.  
McKinney.  
5 May, 1899.

- Brewarrina would be about sufficient to balance the loss by evaporation, so that there would not have been so much danger of a shortage for locking.
507. You are getting away from the point that in all systems of canals you want a reservoir somewhere to feed them? Yes; to keep up the flow.
508. They want some storage to work upon? Yes; it may be called storage. They require something to keep up the supply.
509. Here the only storage is the natural storage above the highest weir? Yes.
510. Then, in a case where the stored quantity is scarce, is it not extremely important that the storage reservoir should be effective? Yes.
511. To make it effective you must not let the water run away through your lock uselessly? Yes.
512. Therefore your shutters ought to be tight in a dry season? Yes.
513. Have they been tight this season? No.
514. So that no reservoir has been kept at the lock? Yes.
515. Supposing we had several locks below, there would have been no storage for supplying the lockage waste? No. As a matter of fact, it would have been insufficient this year.
516. Do you consider that this specimen lock of yours has had a fair trial? I do not.
517. Do you think it is premature to condemn it? I think it is, although at the same time I admit that it is a point against it to have this trouble in keeping it water-tight in a very dry season.
518. Suppose we got a rainfall that gave us a good flow, and that we could keep permanently 6 feet of water above that lock? It is more than 6 feet; but there would be 6 feet difference above and below.
519. Supposing we had a permanent pressure of 6 feet against that shutter, would that answer? I believe it would. It was answering very well so long as there was a good supply in the river.
520. How long was that? There was a period of six or eight months when we had a good supply. We have some photographs showing the water up to the top of the shutters, and flowing between them.
521. At that time, did much water come underneath? I do not think so. That flow underneath would be lessened when there was any considerable quantity of water below the shutters. When the river is very low, and when there is scarcely anything on the down-stream side of the shutters, there is no back pressure to stop the flow.
522. Supposing there had been a lock below, would there have been a back pressure? Yes.
523. Would that have checked the quantity of water between the shutters, and going underneath? Yes.
524. So that the waste would be much less if we had a system of locks in full swing? Yes.
525. If we had twenty locks of the shutter kind, would they all act better than a single one? Yes.
526. It is scarcely a fair test to have this one by itself? Yes.
527. To test it properly you should have another lock below it? Yes.
528. In drawing this design, did you copy anything exactly in America or France, or did you make variations? When I got out that design first I went into the matter as carefully as I could, and I adopted the Chanoine shutter, which is worked generally from one end of the weir. There is a long bar that passes along the bed of the river, and there are cogs which pull the bars out in succession. The shutters would drop one after the other. That was the best thing which I could recommend at the time, although I did not care about the principle, because it had several disadvantages. One was that, if the gear got damaged, it would mean that the whole weir would have been unworkable. While the work was going on I got a description of an arrangement which was patented by a French engineer, named Pasqueau, and which was adopted in the United States, as well as in one or two cases in France. It seemed to me to be a very superior arrangement as compared with the previous one. When the contractor broke down in the work I had an opportunity of making the alteration.
529. Then you altered your design during the progress of the work? Yes; simply in that respect of the working of the shutters. The alteration made this difference, that, instead of the shutters being all worked on the one plan, they are now worked independently. If any damage occurs to one shutter it does not affect the others.
530. How many separate shutters would there have been in the first plan? The number of shutters is just the same; I think it is thirty-three.
531. Is this a French invention, which the Americans have improved upon? It is a French invention which the Americans took up more quickly than the French.
532. Has it been applied to any rivers in France? I am not certain whether it was first used on the Seine or the Loire. I believe it was used on the Seine above Paris. There are weirs with Chanoine shutters used in France at the present time.
533. Have they been subjected to heavy floods? I understand that the French rivers are subject to heavy floods.
534. Have you seen any report of a failure? No. On the great Kanawha River in Virginia they are worked with success.
535. Have the Americans made a great success of them? Yes; the reports I have seen are the reports of the United States Engineers, who correspond with our Royal Engineers.
536. Do you think that, with a fixed cement weir, there would be danger of the Darling silting up? It is a very doubtful point, but I scarcely think there would be any danger.
537. Why not? As a rule the silt is so fine that I think it is carried off in suspension.
538. Does the river during non-flood times deposit much silt? No.
539. Would it be possible, with a concrete weir, to make a pipe or valve in the middle of the weir to let the water underneath, and sluice the sand away? I do not think there would be any difficulty in that.
540. Would it diminish the strength of the dam? I do not think it would materially.
541. If you had such a valve, would it not scour the sand away? Yes.
542. Could you work such a valve from the banks? I do not think there would be any difficulty about it. It would have to be left in such a position that it would be covered over in flood time. If the valve were of such a nature that the screw would not be damaged, I do not think there would be any difficulty.
543. Would there be any risk of your not being able to close the valve through sand getting in? In many other rivers there would be a difficulty, but the movements on the Darling are so slow in rising and falling that I think any difficulties of that kind could be easily surmounted.
544. Supposing sand did accumulate, could we get it out from the banks by simple appliances such as sand-pumps? I think so, but I have not seen them used in such a case. I do not see why they should not act.

545. At any rate, you do not anticipate any difficulty from sand? No; it seems to be the general rule in the Darling that where there is an obstruction—for instance, at Brewarrina—the tendency is to scour out the river above it.

546. Do you think that is a difficulty which we can leave to the future? I think so. I do not think that the question of the accumulation of sand above the weir would give any trouble.

547. *Chairman.*] Is there not a probability that, as there would be practically still water between the weir and the lock, it would serve as a trap for catching a great deal of silt in flood time? That would be the case, but in the whole of the Darling basin the alluvial deposits are very fine, and any increase in the velocity at which it is deposited tends to remove it. I think the probability is that the silt would pass over the top of the weir and lock.

548. Would not the water near the surface be freer from silt than the water below? Yes; there would be a tendency to deposit silt there, as it would be comparatively still water; but when there are 3 or 4 feet of water over the top of the weir I think the draw will be sufficient to wash out nearly all that silt again.

549. If silt did accumulate against the weir, do you think that the first flood coming down would clear it out? I think so; there might be a little left in, but I scarcely think it would be worth speaking about.

550. *Mr. Watson.*] Is there any danger of the silting up of the lock entrance? No.

551. The worst that could happen from silt immediately above the weir would be a slight reduction of the area available for the retention of water? Yes; I scarcely think that there would be any serious danger from the accumulation of silt. Of course, we have not much to go upon in the case of the Darling; but judging from the natural obstacles, and especially at Brewarrina, the conclusion one is led to is that the tendency is to scour out rather than to deposit silt.

H. G.  
McKinney.  
5 May, 1899.

TUESDAY, 9 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.

The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Hugh Giffen McKinney, Principal Assistant Engineer, Water Conservation Branch, Department of Public Works, sworn, and further examined:—

552. *Mr. Trickett.*] When the Committee considered the question of locks and weirs on the Darling in 1896, the portion of the river to be dealt with was from Bourke upwards? Yes.

553. Now it is proposed to make them downwards;—I suppose one of the reasons for abandoning the upper portion is that a railway has been authorised to Brewarrina? It was not authorised at that time, but I understand that a majority of the people preferred the railway.

554. What portion of the river do you think would be the best to deal with as regards an irrigation experiment, above Bourke or below it? It is difficult to answer that question right off, because the conditions differ very considerably. Below Bourke irrigation is more wanted, because as you go towards Wilcannia the rainfall diminishes.

555. Looking at the country above Bourke, when the scheme was submitted to the Committee in 1896, you went carefully into figures, and worked out a possible estimate of return in the shape of irrigation dues of about £50,000 per annum? That was what I anticipated it would come to ultimately; but, as I have already stated, the signs of progress in that direction on the River Darling are very disappointing.

556. Therefore you feel that that estimate is not so likely to be realised as you then thought? It would not be realised in the near future.

557. The other day you intimated that it would be the duty of each holder to pump the water he required for his holding, except where there were centres? Yes.

558. When you were examined before upon that project you spoke differently;—at Question 1952 you will see this:

*Mr. Trickett.*] You do not think that every farmer would have to erect his own pumping plant? No; it pays much better to have a large pumping plant, making an equitable charge for the distribution of the water.

Is not your statement to-day different? That assumes farming. I certainly did not refer there to the distribution of water on any large scale. I never thought it practicable.

559. I asked you if you thought every farmer would have to erect his own pumping plant, and you answered that it would be far better to have a large pumping plant;—unless they were close to each other, would that be practicable? No; but I do not think there would be much farming, except near the centres, at any rate for a long time to come—that is, assuming that the farms would be of a large size.

560. Then that answer fits in with your other one, inasmuch as it applies to where farmers would congregate? Yes.

561. You do not mean, then, that the Government should go in for a wholesale system of pumping all along the river? No.

562. In 1891 you brought up a report in which you spoke of the patches over which water conservation on the Darling is provided; one of them has been irrigated by direct flow through natural or artificial channels from the river;—seeing that you stated the other day that the only way in which we could get irrigation would be from the river, how could we get irrigation by direct flow from only artificial channels? There is none of that in the upper part of the river, as far as I know, but there could be irrigation with flood-water down towards Menindie, and there was a proposal there some time ago to irrigate an extensive lake. The arrangement was to construct a dam across the mouth of the channel which led into the lake. The intention was to put some kind of sluice-gate in that, and let the water in as required.

563. That provision would only apply to occasional low-lying land, below the flow of the river? Yes.

H. G.  
McKinney.  
9 May, 1899.

H. G.  
McKinney.  
May, 1899.

564. What I want to arrive at is, that there is really no difference between that recommendation and what you stated at our last sitting—that irrigation by gravitation is impracticable, except in the case where you can get a bit of low-lying land, below the flow of the river, where you could put in a siding and divert the water? Yes.

565. Looking at this proposed scheme from a financial point of view, as experience has shown that farmers and others have not availed themselves of the privileges of pumping water for irrigating their lands, and as the present tendency seems to be not to charge tolls for navigation purposes, this scheme must be looked upon as remunerative only in a very small degree, if at all? Yes; as far as can be seen, the direct return would be little, if anything.

566. Have you made any calculation here, such as you made in the Bourke to Brewarrina inquiry, as to the land which would be benefited, and as to what extent irrigation water would be available? No.

567. In the former inquiry a statement was handed in by the Department in which your name is used, and in which the following paragraph occurs :

It would be unwise to construct weirs which would interfere with or obstruct the waterway, and it would be very expensive, as well as unsafe, to carry the works to above flood-level.

You endorsed that opinion in the evidence, and also in the report referred to? Yes.

568. Do you still maintain that opinion? I still think it is not advisable? Speaking generally, I have not seen any reason to modify that opinion.

569. Was Mr. Gordon also of that opinion? Yes. I know he also advocated movable weirs for the Darling. I may say that that statement had special reference to the case of Bourke, where anything that would interfere with the flood-level would have led to serious consequences.

570. In what way do you think it would be unsafe to construct a permanent weir? I think I mentioned before that the idea I had was that all that country along the Darling has been deposited by the river, or nearly all, that the deposit is of a very fine character, and that if you by any means raise the velocity above the velocity at which that material was deposited it will tend to carry it away again, even though the increase may be very slight.

571. You might, by doing that, make holes in the side of the waterway which would gradually make away and form another channel? Yes; or change the channel at flood-time. I came to that conclusion after going down the river by steamer from Walgett to Wentworth in flood-time. I then had an opportunity of seeing the river in many places flowing in three or four different channels. I also had an opportunity of seeing what they call breakaways in every stage of formation, from the first small flow until the last, when it was becoming the river.

572. Will you explain how that would be averted by the use of movable weirs? The principle of working a movable weir is that when the river rises to the ordinary navigation level the movable weir is shut down to the bed of the river, and there is no obstacle left for the passage of the flood-water. In the case of the Bourke lock and weir, with the lengthening of the weir on one side and the building out of the lock wall in another, the waterway is slightly better than it was before the lock and weir were built.

573. *Mr. Levien.*] Supposing all the timber came down between the two locks and weirs, what would you do? When there is any floating timber it comes down in flood-time. At that time the gates of the lock are both open, and the weir is lying in the bed of the river, so that there is no obstacle in its way.

574. Would not the timber catch between the two, and could vessels go through in those circumstances? The flood river moves right over the top, and is unobstructed; any floating timber would be carried over.

575. I have lived on the Hunter, and I know something about what occurs there? The circumstances are very different. The velocity in the Hunter would be double or treble what it is in the Darling.

576. What is the velocity of the Darling? I just looked up my notes, and I see that the greatest velocity I obtained there on the surface was only a little over 3 feet per second, which is a little over 2 miles per hour—that is much lower than it would be in the Hunter.

577. *Mr. Trickett.*] When your weirs are up, would there not be a danger then also of the banks being interfered with by the water? No; because the weir is put up only when the natural flow in the river is small. For instance, at Bourke, as far as I recollect, the natural level at which the river becomes navigable is about 9 feet on the gauge. At that time the flow in the river is comparatively very small, and it is only below that that we would have the shutters up. At the only time when there could be danger from debris there is no obstacle in the way, and it will run right through over the top of it.

578. Are you quite sure that there would be very little fear of the river silting up in the locality either of a fixed or a movable weir? I do not think there is much danger of that, although I would like to modify an answer I gave to Mr. Watson. He asked if there was any danger of silting up above the upper lock-gates with a fixed weir. There is considerably more risk with that than with a movable weir. I said I did not think there would be, but I think there would be a doubt about that.

579. *Mr. Watson.*] Do you think that there is a risk of silting extending to the upper part of the lock—that is, 200 feet from the weir? I think so. I should not like to be very decided about it, but certainly there would be more danger than in the case of a movable weir.

580. Why would that be the case? At the weir itself there is a considerable draw; the water is being drawn up over the weir, and there is a tendency on the part of the silt to scour out for some distance. Further back that influence is not felt, and it would not be felt in any appreciable degree in the part immediately above the lock.

581. Would not your lock be in the same position with a movable weir? Yes; but with a movable weir the lock-gates are not nearly so high. The movable shutters would be put down when the river is about 9 feet at Bourke; but with a fixed weir the navigation passes through the lock only when it falls to (say) 13 or 14 feet. There would be a difference of 4 or 5 feet. In this case the steamers have to pass over the top of the weir.

582. Will there not be a certain amount of scour every time that the lock is used, and a vessel is sent through? Yes.

583. Would that not operate in keeping clear of silt the part above the lock? Yes; but then the lock-gates are very much higher with a fixed weir than they are with a movable weir. These lock-gates are much higher than the lock-gates in the other case. I consider that the greater depth of water at the head of the lock would tend to silting up.

584. Assuming that there is a certain amount of silt deposited immediately above the weir, would not that form a shelving bank right back for several feet above the weir, leaving the water an opportunity of gradually

H. G.  
McKinney,  
9 May, 1899.

gradually running right over it, and carrying the deposit with it? I believe the form the deposit would take would be that of a slope down towards the bottom of the weir. It would be scoured out for a distance back, perhaps, 60 or 100 feet. It would slope upwards from the bottom of the weir. Then I believe the silt above that will lie to a certain extent. Perhaps at some distance back it would be almost as high as the crest of the weir, and then I think there would be a chance of its accumulating close to the lock-gates.

585. Above the lock-gates is the only portion where there would probably be any deposit, and that would be 200 feet back from the weir, because that is the only place where there is any dead water? Yes; but it is a most likely place.

586. Would not that be counteracted by opening the lock-gates? Yes; but I believe that during floods there would be an accumulation of silt behind them.

587. Do you not think that with the next locking the water would take that away? There would be great trouble in opening those gates; but that may be obviated by having sluice-gates.

588. *Mr. Trickett.*] With regard to the possible silting-up, I suppose you will admit that this river is somewhat peculiar with regard to the fineness of the silt which flows away? Yes.

589. Is it not a fact that where the water strikes against an obstruction in the river, instead of silting-up, it really forms a hole alongside the obstruction? Yes.

590. Does not that indicate that everything would go away down this weir-space? Yes; I certainly do not think there would be any accumulation behind the weir.

591. Or back from it? There could not be any great quantity. There might be some away back from the weir, but not close to it.

592. It is a slow-flowing river in flood-time, and the stuff is so fine that it mostly gets away? Yes, the flood carries the silt; in fact the whole of the country down to Wentworth is made up of it.

593. What do you estimate is the annual cost of working the movable weirs? At Bourke one man has been sufficient to work the weir.

594. Has that weir been properly worked at all? Yes; the shutters have been up and down many times.

595. In your last estimate you stated that £250 a year would be sufficient? That was really an over-estimate; that was allowing for any necessary repairs.

596. What is your opinion now about the estimate of £250 a year that you gave before? That is a very ample estimate so far as we have seen.

597. For seventeen weirs, would you put down the expenditure at £200 a year for each weir? Yes; that would be a safe estimate.

598. Would that amount to £3,400 a year for maintenance? Yes.

599. Would not that be a very considerable item? Yes; but still it is small if we compare it with the cost of maintaining a road of the same length.

600. But is it not costly compared with the working of a fixed weir, according to Mr. Darley's estimate? I am not prepared to say as to that.

601. Can you state, from your experience, what the cost of one would be, as compared with the other? I cannot say from experience.

602. Is there a Water Rights Act in force with regard to these rivers, for the purpose of enabling licenses to be given? Yes; that is what I referred to when I mentioned that only six applications for licenses had been received from the river Darling.

603. Has this question of locking the river Darling occupied public attention for many years? Yes; it has been brought up repeatedly.

604. Has there been a changing idea from time to time as to where the work should begin? Yes.

605. Was it first proposed to begin as low as Wentworth and then did we get a proposal from Bourke to Brewarrina, and are we now going down-stream again? Yes; in fact there was a proposal at one time to begin at Wilcannia, and go up to Bourke.

606. Was there a proposal to charge river dues on the Darling at one time, in consequence of the large sum of money that this Colony has expended in snagging the Darling? Yes.

607. With regard to the irrigation schemes which have been established at Mildura and Renmark, what has been the experience financially? I know that the general public have suffered very considerably. I know also that a large number of the people who went to those places were greatly disappointed. They did not by any means come up to the description they had received.

608. Was that a pumping scheme? Yes; both Mildura and Renmark were pumping schemes, and the pumping had to be done to a great height. The average lift at Mildura was 70 to 80 feet, nearly twice as much as in the case of the river Darling.

609. What were the people there charged for water? At first they were charged nothing, then they began with a charge of 6s. per acre per annum, then they raised it to 12s. per acre per annum, and next to £1 per annum. I know there was an intention of raising it to 24s. or 25s., but I am not quite sure whether they did so.

610. Were the people there able to bear the strain? Some of them in the more favoured positions were.

611. Those who had money at their back? Yes, and some of them who were very good orchardists, and who were convenient to the township; but the majority of the people found that it was too heavy, especially as the very least they paid for their land was £20 an acre.

612. Are those concerns going now? Yes, but not very satisfactorily.

613. In what way are they unsatisfactory? The people are complaining greatly about the irregularity of the water supply and the expense. A large number of the settlers paid as much as £40 per acre for their land, and those close to the town paid £80 per acre. That is much too high a price.

614. Were those irrigation settlements started on the American principle? Yes. They were really started much more as land speculations than as irrigation settlements.

615. Are you able to say whether the failure of those settlements is due to the water failing or to the people having given too much for the land? In the first place, the people gave far too much for the land, and in the second place the arrangements for distributing the water were bad.

616. *Mr. Shepherd.*] Was not the greatest difficulty the distance from market? That was a great difficulty; but, with regard to raisins and other fruit, I understand the people did not complain so much of that as they did of the other difficulties.

617. Was not that the chief cause of failure? I have talked with a number of the settlers there, and what

H. G.  
McKinney.

9 May, 1899.

what they attributed the failure chiefly to was that the charges were far too high, and that there was a great deal of injudicious settlement. People went far away from the town, where they found the water supply very irregular.

618. *Mr. Trickett.*] As far as you know, if the people had got the land at a reasonable rate, and if they had been charged 5s. or 6s. an acre per annum for the use of the water, do you think that the settlements would have been a success? Yes; if they were properly managed.

619. Was it a success with regard to fruit-growing? Yes; I have been told that Lord Ranfurly's place, close to Mildura, has been doing very well almost from the start.

620. So that, looking upon that as an experiment, and if the settlers had been given a fair show, has it been a success? It would be too much to say that it has been a success, but it has shown pretty well that they could grow fruit by irrigation very successfully; but it also shows that a settlement like that can be too much handicapped.

621. Have you been there? Yes; several times. I went through there when everything was booming, and I went through when everything was the reverse.

622. At the present time, are both places at very low water? Yes.

623. Has not irrigation on a large scale been undertaken in Victoria, in the shape of trusts? Yes; on a considerable scale.

624. Have not large sums of money been spent in conserving water for irrigation? Yes.

625. Has that been a financial success? I do not know that any of them have been. Where irrigation has been carried on by private enterprise alone it has done very well. I have seen several instances of that; but a great deal of the expenditure was premature. For instance, the principal work was the Goulburn weir and canal. That was extremely costly, the weir alone costing about £210,000.

626. *Mr. Levien.*] How many years ago was that carried out? It was finished about 1889 or 1890.

627. *Mr. Trickett.*] Is it not a fact that the great irrigation schemes which have been undertaken in Victoria by the Government, to induce farmers and others to take up land and irrigate it, have been absolute failures? I do not know that we could put the matter so strongly as that, but the report of the Royal Commission which inquired into these works showed that it would have been very remarkable if they had not been financial failures.

628. Did it produce a large number of farms? Of that I am not certain, I have not been able to get any very recent information; but last year, and the year before, the area irrigated had increased a great deal. 629. *Dr. Garran.*] You said on Friday that the irrigation of large areas on the Darling was out of the question, and that your idea was that there would be patches or moderate areas at intervals all down the river which would be irrigated;—what sized areas did you contemplate? Forty, 50 or 100 acres.

630. How many of these would there be between Bourke and Menindie? It would be impossible to say at present.

631. What do you think would be the area that would be placed under irrigation between Bourke and Menindie? I do not think it would be possible to give any fair estimate under present circumstances. The idea I had was that in every holding on each side of the river there would be a patch of irrigation by way of insurance where they would provide fodder for the best of their stock. The condition of affairs with regard to that will go on changing as the subdivision of the lands extends by the taking up of land in homestead leases, so that it will be quite impossible to say anything even as to the approximate area to be irrigated.

632. Are you speaking of pastoral settlers? Yes.

633. Are there not others, such as market gardeners, and orchardists? They would be confined almost to the neighbourhood of towns like Wilcannia and Menindie.

634. How much water per acre do you think these little settlements would require? If the water were properly distributed, I should think a cubic foot per second would irrigate 60 acres of lucerne. That is a crop that might be cut six times in a year.

635. Will lucerne take as much water as anything else? It will take more than any other crop.

636. Would you want to be pumping water day and night on a bit of land? It would depend upon whether a man wanted to get the utmost value out of his pump.

637. Would he have to keep the land saturated? No; he would irrigate constantly in turn. He would irrigate every patch once in about three weeks. He would start at one place, and flood an acre or two, he would then go on to the next patch and keep going on until he got back to the first one.

638. Your estimate of cost was based on the engine going night and day. To irrigate 100 acres, would you require the engine to go night and day? Yes; 60 acres of lucerne would require 1 cubic foot per second.

639. What engine-power would 60 acres keep going constantly? I have not the figures, but I could work them out. You would get better value from an engine raising 3 or 4 cubic feet per second than from a smaller one.

640. If you kept the engine going night and day what sized engine would you require for 60 acres? That is a matter which I will have to work out.

641. With the smaller area, say of 40 acres, would a man require a smaller engine, or else not pump night and day? Yes.

642. If the pumping were intermittent, would not the cost per cubic foot increase? Yes.

643. So that your estimate is a somewhat supposititious case that the area to be irrigated will exactly use up the power of the engine going night and day? Yes.

644. If the engine is not going night and day the cost would be increased? Not so very greatly, because the cost of night-work is generally more than day-work.

645. Are there some engines on the river bank now pumping? Yes.

646. Of what power are they generally? I do not know. Generally speaking, they are portable engines.

647. Have you ascertained from any other people who have already pumped water what it costs them? Yes; I think it was given to the Committee which inquired into the question before. One of the pastoralists gave a statement as to what the water cost him, and how much his hay cost him per ton. I think it was the owner of Winbar station. He stated that the hay cost him 23s. per ton.

648. Does he give the cost of pumping? No; he has not worked that out.

649. Can you compare that with your estimate? He stated the area irrigated, and I have a note in the margin to the effect that with the pump he had and with a 12-horse power engine he ought to have done far more irrigation.

H. G.  
McKinney.  
9 May, 1899.

650. Your estimate was a theoretical one? No; it was not theoretical, except as to the highest lift. With regard to lifts up to 24, 25, and 28 feet, I accepted the actual cost of Mr. Wills-Allan's pumping plant at Namoi, and Mr. Gatenby's at the Lachlan. For a 39½-feet lift that was calculated out. It was really accepting Mr. Gordon's figures, but the others were not.
651. What I wanted to get was the total quantity of water which you proposed to take from the Darling, and I wanted to ask you if you thought that quantity could be spared? I should estimate that the quantity of water that could be taken from the Darling would be much greater if there were a system of weirs than at the present time, because the loss of water would then be much diminished.
652. Supposing there had been 200 miles of irrigation, gardens, and patches between Bourke and Menindie this year, could you have stored water to do justice to those irrigation blocks? Not continuously. With regard to that, I may state that in the licenses for pumping in a river like the Darling there is a condition put in that the pumping is liable to be regulated by the Minister for Public Works, when the supply in the river falls below a certain figure. In the case of the part between Bourke and Wilcannia, the figure we have taken is 250 cubic feet of water, per second, in the river. That condition means that when the river falls below that, the Minister can arrange that the pumping shall be done in rotation, so that one man could pump for two days in the week, and then another man could pump for two days, and so on.
653. If you have an irrigation farm in that dry country, is its success dependent on a constant supply of water? Yes.
654. If you have a farm where you are liable to have the water shut off for a week, a fortnight, or a month, will you not be ruined? Yes, if it is anything like an orchard or a vegetable garden; but with regard to pastoral properties, where I think the bulk of the irrigation would be done, it would simply mean that they would have a smaller stock of hay in that season than in another season.
655. But in the case of vegetables or fruit-trees, would not the whole crop be lost, and the trees and plants destroyed? There would be a danger of that.
656. So that it would be a very hazardous thing to carry on an irrigation farm if the Government or any other power could shut off the water? Yes.
657. According to you that is the condition on which every irrigation farm on the Darling must be held? Not necessarily so.
658. In a year like this, do you think the Minister, if he wanted to keep the navigation open, would allow all these people to draw on the water? Yes; but I think that in a season like this the navigation ought to suffer rather than the irrigation.
659. You, as an irrigationist, hold that irrigation should prevail over navigation? Yes.
660. But would not the people with farms on the river be interested in navigation? Yes; but I have no doubt as to what would be their preference.
661. Their greater interest would be to save their farms? Yes.
662. As you propose only small farms, I presume you do not look for an export of produce? No.
663. You think nothing more will be produced except what is wanted for local consumption? Yes.
664. Are the banks of the Darling a little higher than the ground immediately behind? Not always. The Darling is different from the Murrumbidgee.
665. Have not most of our rivers high banks? Yes.
666. Has not the Darling? In places, but not in others.
667. When the floods are out are those high banks covered with water? The banks are covered in many places for long distances, but there are patches of high lands at intervals which are above the highest floods.
668. Are most of the pumping plants out of the reach of floods? Yes. In some cases the pumping plants have been fixed on slides, and can be pulled up in time of flood. These are the smaller ones.
669. Looking at the number of irrigable areas, would there be high ground for all of the people to put their plant on? I think so. Even if there were not, there are places where the land is so little under flood that it would be easy to make up a small place which would be high enough for the engines. There are people who would take the risk of irrigating land which would be under a flood like that of 1890.
670. Even supposing we kept the engine out of water, would not the farm itself be under water in time of flood? Yes, in many cases. While there is a large proportion of country along the river liable to flood, still the areas which are out of the range of flood are very large—larger than can be irrigated.
671. There has been given in evidence the statement that stone fruit will not bear being flooded? Yes; I had evidence of that when I passed down the river.
672. Then wherever the flood is likely to reach, it would be useless to plant fruit-trees of that kind? Yes; it would be rather too risky; but it is only the flood of 1890 that reached those stone fruits. I saw the orchard which was particularly referred to in that evidence, and all the citrus fruit-trees lived through the flood of 1890, while the stone fruit-trees were all killed.
673. How far back from the river do you propose to irrigate? That would be a matter to suit individuals.
674. Is there not a natural line beyond which you could not go conveniently? Practically there is not, as far as the levels are concerned; but, at the same time, no man would want to take the water any great distance away who knew the quantity he would lose thereby; in fact, that is one of the great sources of failure at Mildura. There they sold land to settlers 5 or 6 miles away from the place where the pumping establishment was. They found that before the water reached those settlers the greater part was lost.
675. How far did those floods go back? In some cases 20 or 30 miles. On the Lower Talywalka there is a long stretch of country which is under flood. In fact the flood-water goes further back, and right down to the lakes; but there are large areas out of flood.
676. What is the floodable area on each side of the river? I cannot exactly say; I know there are many places where, in flood-time, the river is as much as 20 or 30 miles wide.
677. What I gather from your explanation is that in big floods those farms will be under water? Not necessarily. There are plenty of places along the river that are quite above flood-level.
678. Large enough for farms? Yes; plenty of places.
679. They would stand out as islands in floods? Yes.
680. Would that be above 40 feet? Yes; in some cases.
681. Would that high land be as good as the land on the lower levels? In some cases it is better for irrigation. Generally speaking, that land is reddish loam, and a large number of irrigationists prefer that.
682. Is it self-drained? Yes; and it is less clayey than the lower land.
683. Is there enough land close to the bank out of flood reach to serve for the farms you speak of? I do

H. G.  
McKinney.  
9 May, 1899.

- do not mean that there would be any considerable number of farms, I merely referred to land under pastoral occupation. There is plenty of that land, far more, in fact, than there is water to irrigate.
684. With regard to a farm near an irrigation bore, is not the water supply there pretty constant? Yes; although there have been a number of complaints lately about the supply diminishing.
685. Would not a man be better off getting water from a constantly flowing bore than from a doubtfully flowing river? Yes; but I think it would be very likely that the bore would be quite as risky as the river with regard to giving a constant flow.
686. That is a thing of the future? There have been several cases of complaint already about the supplies in bores diminishing. There is one case I know of where a bore was stopped through the material at the bottom getting scooped out, and the casing dropping down.
687. These are risks that apply specially to bores, but as far as the back country is concerned, are not the bores more useful to settlers than the rivers would be? Yes.
688. These scattered bores will be so many oases in this dry country, so that they will have their special function apart from the Darling River? Yes. What I meant in referring to the two was that artesian bores would not, under any circumstances, supersede the function of the river itself.
689. Do you think that a pastoralist who has successfully sunk an artesian bore is just as well off as a man who has pumping machinery on the bank of the river? Yes; but a man who sinks a bore runs a great risk. He may have to put down two or three before he gets a successful bore.
690. But these bores have been running during the drougthy season, while river water was scarce, so that the bores have some advantages over the river? Yes, they have advantages, just as the river sometimes has advantages over them.
691. But you would never get your farm flooded when drawing your water from a bore? No.
692. You can apply the water much or little, just as you like? Yes; but you can do that by pumping.
693. You said yesterday that the Willandra Billabong carries the water for 350 miles? Yes; but that is as the channel goes, and not in the direct line. It is over 100 miles in a direct line.
694. What is that dam on the Lachlan made of? Crib-work.
695. Does the water go over the top of the dam? Yes; the crib-work is filled with stone. It cost a little over £5,000.
696. Was it constructed under your superintendence? Yes.
697. How high does it bank up the water? Twelve feet.
698. Does that send the water to the end of the Willandra Billabong? Yes.
699. When you get to 100 miles, is there rising ground between that and the Darling? Yes; the billabong turns southward there, and there is a slight rise.
700. Could you cut a canal right through from there to Teryawynia Creek, and so make a direct communication with the Darling? I believe the thing would be possible, but the circumstances would not justify the cost.
701. Does your survey show the elevation of the ground behind the water? Yes. The fall of the Willandra Billabong from where it leaves the Lachlan is something like 120 to 130 feet.
702. Has the water been sent right into that lake? Yes; in 1894 it went into it, but not since. There has never been such a dry period known in the case of the Lachlan as there has been since 1894.
703. How often do you get the Lachlan high enough to send the water down the billabong? Previous to 1895 it went down every year. The weir was finished about the time of the flood in 1890. After that it ran through the Willandra Billabong every year until 1894. Since then it has never gone down more than 30 or 40 miles from the head in a direct line; there was not sufficient water.
704. Was there water enough in the billabong in ordinary years for the stations? Yes.
705. Was there enough for irrigation farms? No.
706. In dry years it has been deficient? Yes.
707. So that the stations have had to fall back on other resources? The stations near the head have had enough to last them right through, but those far down have had to fall back on other sources of supply.
708. You say that your regulations at present put all those who use the water under the control of the Minister? Yes.
709. Does not that imply that the law as it is administered puts irrigation second, and the water supply in the river first? I do not think so.
710. Is not that the case if the Minister can stop the irrigation water whenever he thinks proper? Yes, but that is not the purpose of his having that authority. The idea is simply to distribute the available supply of water equally between those irrigating.
711. Is it merely to arrange between the different persons drawing the water, and not as between irrigation and navigation? Yes; it is merely to arrange a rotation in the use of the water.
712. Can you give us any definite idea as to the quantity of water which you could set aside from the Darling between Menindie and Bourke, even in a dry year? In an extremely dry year, if the whole river had locks and weirs, I should say that the quantity of water which should be taken should be simply measured by the quantity of water conserved by the weirs. That is all that should be drawn upon.
713. If you have a system of locks and weirs, you will have no more water than you will actually want for navigation? Yes; but in an extreme case like the present year, I think navigation should be suspended if the water were wanted for irrigation on the river.
714. Supposing that all these locks were in existence, and every one was full, if you draw water for irrigation purposes must you not replace it from the uppermost reservoir;—therefore we want to know how much water you want to take? That is really a question which only arises in a year like the present.
715. Precisely;—but is not that the testing year? Yes. In a case like the present year, supposing the whole series of locks and weirs were complete, I should say the proper course would be that if the requirements of irrigation demanded it we should stop navigation.
716. Then you would have a whole string of people dependent upon getting their stores up and their produce down the river who would have the river closed against traffic? Yes; but it would only be for a month or two; whereas, under present circumstances, the navigation is stopped for eighteen months.
717. But now we are told that the storekeepers lay in supplies for six or twelve months, whereas when they get the locks and weirs they will live from hand to mouth? I do not think they will be justified in doing so. They would always want to be prepared on a river like the Darling for an extreme drought.
718. Speaking generally, you do not see your way to give the country a direct financial return from the money

H. G.  
McKinney.  
9 May, 1899.

money spent on canalization or locks, or from the money to be spent on irrigation? In the case of navigation, certainly the whole tendency at present is not to apply rates. But in the case of the river Darling I think there are strong reasons for putting on rates; that is, however, purely a matter of policy. In the case of irrigation that is a matter practically settled by the Water Rights Act.

719. Do you think the river should be treated like a road? Speaking as a general rule, it should be.

720. In other words, the Government should make a present of £500,000 to the district, and ask for nothing in return? I do not say so.

721. Will not that be the case if we get nothing back in the way of lockage rates? It is a matter of policy on which I cannot give an opinion.

722. If irrigation is likely to pay with locks and weirs, why should it not pay now before the locks and weirs are made? As I have said, the people in that part of the country certainly take to irrigation more slowly than I expected. But the evidence given at the previous inquiry shows that irrigation, wherever it has been conducted in a proper way, does pay.

723. Do not the people there like to make money? I believe they do.

724. Have they not had this river flowing past their stations year by year? Yes; but unfortunately very few seem to know how to use it.

725. Have not the newspapers been teaching them for twenty years? A great many of our people think that they can strike out a course of their own; and I know that in many cases where people took to irrigation there was no chance of its paying.

726. As a matter of fact, the irrigation on the Darling has not hitherto been a very paying thing for those who tried it? Possibly it is so; but I think that at the previous inquiry those who tried it expressed themselves very highly satisfied.

727. If it paid some people, why did not others imitate them? I cannot say; it may have been want of enterprise. In some cases it may have been want of capital. It means a considerable expense to buy pumping plant in a place like the Darling.

728. Have not the pastoralists on the Darling, in many cases, had large capital at their disposal? I think that many of those who had large capital at their disposal adopted irrigation.

729. Have you seen the Pera Bore? Yes.

730. As far as you saw, was the irrigation there as successful as on the river? In some respects it was, and in others it was not. There was an appearance of salty deposit in some places; I do not know exactly whether it came from the water or from the soil.

731. Had it injured the vegetation in any way? No.

732. Then there was no cause of failure from that? No.

733. Was it as much a success as on the Darling? It could not be compared with it. On the Darling it is irrigation for fodder crops; at the Pera Bore it was irrigation for fruit. It was totally different, and could not be compared.

734. *Mr. Watson.*] The other day, in reply to Mr. Trickett, you indicated that there were other kinds of movable shutter-weirs in use in some parts of the world;—can you describe them? There is one common kind called needle weirs. They are formed with a series of pieces of timber generally about 3 inches or 4 inches in section, and about 8 or 10 feet in length, and they are laid with a slope up-stream. They have a beam of some kind to abut against at a height of 8 or 9 feet above the river-bed, perhaps less. They are just set in place sloping up-stream, and have to be lifted out of place to open the weir.

735. Would not that kind be open to the same objection as the shutter weir—that is, that it would lose water? Yes.

736. Are there any others? There are several varieties of movable weirs; there are five or six kinds. The only kind I have actually seen are shutter weirs and needle weirs.

737. Is there not one kind where they have a gate raised or lowered or opened? That is the Stoney patent. They are huge iron gates, which have to be raised up out of the river entirely. They have used them on the Manchester Ship Canal, and in a number of other places.

738. Would it be costly to erect them? Yes, in the case of the Darling, because the difference between extreme low water and extreme high water in the Darling is very great. If you have any arrangement which involves the lifting of a weir right out of the water it is very costly.

739. *Mr. Levien.*] In the case of the Manchester Canal, is there not a tidal river? Yes.

740. So that there would be a great difference between the Manchester Canal and the Darling? Yes.

741. *Mr. Watson.*] You say that the difference between the ordinary height and the flood-level of the Darling is so great that you would require to raise the gates too high for the system to be economical? Yes; it would be very expensive to build works of such a height as would enable you to use such gates.

742. So that you still prefer the shutter weir? Yes.

743. It has been stated here that whilst these shutters were in position some time ago at Bourke, and therefore presumably in a proper position to hold the water back, the height of the water above the shutters was only an inch or two above the water below the shutters? That was when there was a very small flow in the river.

744. Unless we can guarantee a good flow, it would seem that the shutter is not a suitable kind of weir? Yes; unless they are made more tight at the joints.

745. Would not that mean a large amount of labour in making them watertight? I do not think it would involve very much labour. The men in charge could easily do all that is wanted.

746. Would you have to close the joints every time the lock was used? No; it might not have to be done more than once in five or six years. This year is an exceptionally dry year. The river has been lower than ever since 1885.

747. We have had it in evidence that the river has been closed to navigation half the time during the last seventeen years? It does not follow from that that the flow was so low as at present.

748. Do you think that in ordinary years there would be sufficient flow of water to make good the loss occasioned by the shutters? Yes; as far as I can recollect there has been no year from 1885 up to 1898 when there would not have been sufficient.

749. Assuming that the flow of water is sufficient to make good the loss which would accrue through the openings in the shutters, will the flow be sufficient to make good what you would take out for irrigation? Yes.

750. Then there is the loss by lockage when vessels go through the lock? That is really not a loss; it is really a small flow. It is only a loss to the first lock.

751.

- H. G. McKinney.  
9 May, 1899.
751. Do you think the flow of water in ordinary seasons is sufficient to make good the loss by leakage through the shutters, and the loss by lockage, and at the same time give a reasonable supply for irrigation? Yes, except in extremely dry years.
752. Do you think people would be encouraged to go in for any large expenditure of capital in the way of irrigation, planting and laying out land, and the arranging of trade dependent upon secure navigation, unless they were certain that even in the worst years there would be sufficient provision made for them? I think they would, in cases where they were going to irrigate for fodder.
753. You do not contemplate irrigation settlements for fruit-growing? Not on an extensive scale.
754. *Mr. Levien.*] You speak of fodder being grown on stations to feed stock, when you speak only of irrigating patches of 40 and 100 acres;—what would be the good of that? *Mr. Gatenby*, on the Lachlan, would be able to answer that question better than I can.
755. Did you not say, in answer to *Mr. Trickett*, that 40 or 100 acres would be all that they would irrigate. What I said was that, as to the good of doing that for feeding stock, some men who irrigate would be better able to answer that question.
756. *Mr. Watson.*] I presume you mean that a number of pastoralists would irrigate to get fodder for their working stock? Yes; I said for their horses, draught cattle, and stud sheep.
757. In any case, you do not contemplate supplying water for irrigating fruit-growing settlements, and so on? I think that would probably be adopted on a moderate scale, but I do not think there is any chance of its being adopted on a very large scale.
758. What are your main objections to fixed weirs, of which we have a model before us? The conclusion I came to was that any fixed weir would be chiefly objectionable on account of its obstruction to the flow of the flood-water, and the risk of making the river change its course in flood-time. What I wanted to explain a little time ago was that there will be a 9-foot obstruction. Supposing you have a 9-foot fixed weir, there is that obstruction constantly. The river will have to be flowing 4 or 5 feet over the top of that weir to make it navigable at all without using the lock. In the case of the movable weir, 9 feet of ordinary flow in the river would be sufficient to make the river navigable.
759. But you start with 9 feet permanently in the river, and an additional 5 feet gives you navigation over the lock with the fixed weir? There are some points in connection with navigation over the top of a fixed weir which seem to me very dubious, but I cannot state the whole case, because I have not gone into the matter fully.

WEDNESDAY, 10 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Hugh Giffen McKinney, Principal Assistant Engineer, Water Conservation Branch, Department of Public Works, sworn, and further examined:—

- H. G. McKinney.  
10 May, 1899.
760. *Mr. Watson.*] Yesterday you stated that your principal objection to a fixed weir was on the score of erosion of the banks, consequent on the increased velocity in flood-time given to the water through a certain amount being dammed up? Yes; the raising of the flood-level for an inch or a portion of an inch on the weir would cause an increase in velocity. A very slight increase above the weir would cause increased velocity below it. It would cause a draw over it. Any obstacle in the way of the flow of the stream causes increased velocity, on the principle that the velocity is in inverse proportion to the waterway.
761. But that increased velocity, consequent on the water meeting an obstacle would be confined to the part immediately below the weir where the fall takes place? It causes a draw for a certain distance above the weir, but not far. It depends on the extent of the draw. Supposing there was a drop in the surface of the stream of 1 foot or 18 inches on the weir, that would affect the velocity to a very considerable distance, perhaps a quarter or half a mile.
762. In the scheme proposed, the lifts vary from 7 to 10 feet;—how far do you think the increased velocity would extend above the weir in that case? Very little; in flood-time it would be scarcely perceptible. At other than flood-times there would be a draw when the water was falling over the weir.
763. Still the ordinary velocity of the river would be very little just then;—with a small amount of water available at the in-take there would be very little going over? Yes; but the time at which the action of the weir would be greatest in affecting the velocity would be when there was a depth of 3 feet or so on the crest of the weir.
764. We will assume a weir 10 feet high, with water to the depth of 10 feet flowing over the crest of it, what would be the velocity above the normal rate 200 feet back from the weir? It would be increased.
765. Would it be materially increased? Certainly to such an extent that it would carry on any ordinary silt.
766. Would it be sufficiently increased to cause erosion of the banks? Yes; but that is a matter easily provided for. I presume the banks would be protected near the weir.
767. In this proposal it is intended to protect the banks below the weir, but not above? Of course there is much more necessity below the weir than above, because it is only at times when there is a great draw over the weir that there will be a need for protection above. When the river has very little water it will fall in a thin sheet over the weir; it will not have much effect either way. But when the weir is completely drowned—that is, a depth of 5 feet or 6 feet over the top, and just ready to start navigation over the top of the weir—the effect would be very slight. It is between the two that the effect will be greatest.
768. Do you think it would be necessary, in order to prevent serious erosion of the banks above the weir, to protect them with fascines, or some other kind of contrivances? That is really a matter that no rule could

could be laid down about, because the erosion which will take place above the weir will only be at certain times, and even then it will not be nearly so great as below; so that, supposing that there is a growth of gum saplings on the banks, that will be ample protection.

769. Would it be possible to provide that cheaply? Yes; in many cases it would be natural.

770. I think you stated that some tests made by yourself when the river was fairly high the highest velocity was 3 miles an hour? Yes; about that.

771. How high was the river then at any given point? I forget exactly what it was. At Bourke it was something like 27 to 30 feet.

772. Would it have been the same height at Wilcannia? It would have been lower at Wilcannia.

773. How much would it mean on an average in the bed of the river? Generally from 20 to 25 feet.

774. Would that be a little more than half the height of the banks, and would the velocity be 2 miles an hour? Yes.

775. Starting with the river having no obstruction, the flood got to a height of 25 feet and the velocity is 2 miles an hour;—suppose there were weirs damming the water back to a height varying from 10 to 6 feet, how much higher would that raise a flood of that description? It would be very small.

776. If it only raised it to a small degree, how much extra velocity would it impart to the water? A small fraction of a mile per hour.

777. Therefore, the increased velocity given to the water in an ordinary fresh would not be appreciable;—do you think it would be sufficiently appreciable to cause erosion of any character? I should say such erosion would occur only in places that were very susceptible of erosion. For instance, at a place where there was an overflow of the river. If there were a low bank and an outflow into a billabong, the bank of the billabong might be eroded to some extent. I am going on the broad principle that the probability is that there would be some erosion when the velocity of the stream went above what the material was deposited at.

778. What we want to get at is the reason for a tangible, definite objection to fixed weirs;—unless the erosion spoken of is one likely to be of a serious character, owing to the increase of velocity, we are hardly justified in taking that objection into account? I do not think there would be any erosion that could not be provided against.

779. Will there be any probable erosion that could not be provided against at a reasonable cost? I believe not.

780. So that that objection to fixed weirs would largely disappear? Yes.

781. The only other objection raised to a fixed weir is the delay in navigation? Yes; that is one objection.

782. What time would it take for a steamer and barge to go through one of the locks? I should not think it would take more than half an hour.

783. Do you think that would constitute a serious objection to the people engaged in navigation compared with the possibility of getting a permanent waterway? I do not; only the general rule is that people complain about very little matters, although it would be really no serious objection; at the same time, they might make it the subject of complaints.

784. There are seventeen locks;—so that it would take about nine hours' delay between Bourke and Menindie with fixed weirs? Yes.

785. Is such a delay a very expensive thing to a vessel? No; and the time they would be able to make would be much better, on an average, than at present. Going down they would not, but going up they would make better time. If the water was very low they would have good water and no current.

786. In any case, it would be a distinct advantage to be able to go right ahead with the certainty of water being there? Yes.

787. So that delay in navigation is not a very important factor? No.

788. Are there any other objections to a fixed weir which engineers hold? I do not think so.

789. So that at the most it amounts to a slight delay in navigation, and a possibility of erosion which would probably entail some protection to the banks at a reasonable cost? Yes. Of course the fixed weirs entail the making of the lock walls and the lock gates higher, and therefore it is a little more expensive.

790. Then, against these disadvantages, we have the advantage that it absolutely retains all the water possible? Yes.

791. I understood you to say that one reason why no experiment was tried with regard to the weir at Bourke was that there has been an agitation by people below the lock to have the water let down? Yes.

792. Why did they object to the retention of the water? I think their principal reason was not that they were in want of the water, but in certain places a quantity of mud collected, in which their stock were likely to get bogged. I understand that is a considerable source of loss when the river is low. They thought that by opening this they would have a fair supply of water which would prevent the stock from wanting to get into the channel.

793. Did they want a body of water for scouring purposes? No, merely for filling up, so that the stock would not have to leave the foot of the banks to get a drink.

794. So that there was no attempt to retain the water by the weir for any length of time? After that question was raised there was really no attempt made to make the gates tight.

795. Do you think that there is larger importance to be placed upon the irrigation part of this scheme than the navigation aspect? Yes; but that is in a great measure looking to the future.

796. If you were planning the scheme, you would do so with a view to providing for irrigation? Yes.

797. We have it in evidence from Mr. Darley that the amount of water retained by his proposed weirs will be practically about sufficient for navigation? There is a return which shows that the uppermost pool of these weirs will hold a sufficient quantity of water to fill one lock 4580 times.

798. What is the holding capacity of any of the pools, or of the upper pool of these series of locks? The capacity of the upper pool is 1,905,150,000 gallons.

799. That is the capacity of the pool available for lockage? Yes.

800. Have you calculated how many lockages that will permit of? Yes, that amount is 4,580 times the capacity of a lock.

801. In that have you made any allowance for evaporation? That does not take the evaporation into account. The evaporation would have to be deducted.

802. Mr. Darley, in his evidence, said he anticipated that even in the worst period there would be a sufficient flow in the river to make good the evaporation;—do you think that would be so? Yes.

- H. G. McKinney.  
10 May, 1899.
803. Do you think there would be enough to make good 60 inches per year, even in the worst time? In the worst time the river below Bourke has been known to stop flowing.
804. How long at one time? I am not quite certain; but I think it was two or three months—it might have been more.
805. During those two or three months, would not evaporation make serious inroads on the water stored? Yes; it might be  $1\frac{1}{4}$  feet.
806. Would not that make a considerable reduction in the quantity available? Yes; but even then the quantity remaining would be very large. That is only the capacity of one pool.
807. What is the depth available for lockage: say, first, above the weir; second, at the head of that particular pool? This is allowing for 6 feet.
808. At the head of the pool? The top part of the pool, 6 feet in depth, measured from the top of the weir downwards. That leaves all the dead water behind the weir under that 6 feet.
809. What is the decrease in the height of the water at the head of the pool with a certain number of lockages? To cause a decrease of one-eighth of an inch in the depth of the water, six lockages would be sufficient; 51 lockages would reduce the level by 1 inch; 152 lockages would reduce it by 3 inches; 305 lockages would reduce it by 6 inches; and 610 lockages would reduce it by a foot.
810. Mr. Darley said in his evidence that in his opinion the amount of water retained by this series of weirs would be sufficient, but not much more than sufficient, for navigation purposes? That is in very dry seasons.
811. Have you had any opportunity of going into the probable cost of erecting these weirs? No; I did not go into the question of the designs at all, so that anything I say with regard to the designs is said on the spur of the moment.
812. Will the raising of the weirs 1, 2, or 3 feet, and a proportionate raising of the other works, involve any extraordinary increase in the expense, and if so, in what approximate proportion? I cannot say as to the probable increase in the expense. If the weirs were raised to any considerable height, of course it would necessitate rather unwieldy lock gates.
813. What would be the highest practicable lock gate in conjunction with a weir of proportionate height? I cannot say. Nowadays they are building lock gates of tremendous height in some places in connection with ship canals. I would not like to say whether the circumstances would warrant the cost of such lock gates on the Darling. It is a matter I have not gone into.
814. Can you offer an opinion as to whether the increase in the height of the weir by 1 foot would materially increase the cost of the work? No, I do not think it should involve any very great increase; but I should not like to say what the increase would be.
815. Have you any data to estimate the quantity of water which would be held within the river banks up to any given height between Bourke and Menindie? Yes; I have got the quantity made out approximately.
816. At what height? I have got it made out to 1, 2, and 3 feet. I took the same width of the river in each case. Of course we do not know exactly what are the slopes of the banks without trying each case, and to get an average would entail more work than the circumstances would warrant, so that I have taken the same width all along.
817. Have you a statement showing how much additional water would be held if the weirs were raised 1, 2, or 3 feet? Yes; the additional quantity of water that would be held up if all the weirs in this scheme were raised by 1 foot, would be 3,762,000,000 gallons. As I took the same depth I did not allow for the slope of the banks. I took 2 feet double, and 3 feet treble. For 2 feet, 7,524,000,000 gallons; for 3 feet, 11,286,000,000 gallons.
818. If the first is correct, the two latter will be slightly greater owing to the receding of the banks? Yes.
819. Why I wanted you to prepare that estimate was with reference to irrigation prospects;—assuming that Mr. Darley is correct in saying that approximately the scheme under consideration will be sufficient only for navigation, do you think that the raising of the weirs 1, 2, or 3 feet would be of material advantage from an irrigation standpoint? Undoubtedly it would.
820. Can you give any idea roughly as to what area of land that quantity of water would serve per year if properly applied? If the weirs were raised 1 foot all along that quantity of water that I have mentioned would be equal to a depth of 1 foot for an area of 13,818 acres.
821. That would not be sufficient for irrigation? It would not for certain things; it would be better to allow more than that. At the same time, with what little rain they get, an occasional flooding is as much as they would want.
822. Supposing we had 10 inches of rain there on an average, and 12 inches of irrigation, would that be sufficient for an ordinary crop? Yes; if the rain came in a seasonable time. If you had to depend on that water altogether, and allow for all the losses in distributing it, instead of taking 13,000 acres, you would want to take 7,000 or 8,000 acres.
823. Making all allowances, you think the raising of the weirs 1 foot would allow of the retention of sufficient water to properly irrigate 7,000 acres? Yes.
824. What would be the increased cost of raising the weirs to that height? That is a matter which I have not gone into.
825. Do you think that the raising of the weirs and the other works to that height would make any appreciable difference in the resistance to the current, or that it would increase the flood-level;—would there be any objection, from an engineering standpoint, to the increase of height apart from cost? It would to some extent increase the risk from erosion, but I think that could be provided against at no great expense.
826. The risk of erosion would not be very great, owing to the low rate of velocity? Yes; that is one great point in favour of the Darling. It lends itself particularly to canalising.<sup>1</sup>
827. Do you think raising the weirs and locks by 3 feet would make any appreciable difference with regard to obstruction and raising the flood-level? It would necessitate the protection of the banks for some further distance. Below the locks, particularly, and inside the banks, there would be a considerable rush with 3 or 4 feet of water passing over the weirs, but I do not see any reason why it should not be practicable to provide against that.
828. Have you gone into any calculations to see whether the scheme as proposed at the present time will allow of any margin that could be used for irrigation purposes? Not in connection with this scheme.

H. G.  
McKinney.

10 May, 1899.

829. Had you some scheme in hand previously with regard to the locking of the Darling? Yes, above Bourke.

830. You never went into a detailed survey below? No; I had a number of sites surveyed for weirs.

831. Therefore, from the irrigation standpoint, you are not certain that this would provide for it? I know, from the discharge of the river, that in any fair season there is a fair quantity available for irrigation. Of course, in a bad season like this, the quantity is very small, but this is not an average season.

832. Is not the chief thing to be provided for in an irrigation scheme permanency and efficiency in all possibilities of drought? Yes; but, on the other hand, in the case of people who irrigate for fodder for their stock, they can afford to have a bad season just as well as people who depend upon ordinary seasons.

833. But could you get any great development of irrigation unless you could give a guarantee of water? I do not think so; but for ordinary fodder crops they could irrigate in five seasons out of six on a moderate scale.

834. Do you think that irrigation development from a future standpoint would be sufficient to justify this large expenditure? No. As to the financial aspect, I have already said I do not see any prospect of getting a large direct return.

835. When your Department was considering the desirability of providing facilities for irrigation on the Darling, did they test the soil to see if it was suitable for irrigation? I do not think the Department has, but we know there are patches of irrigation at intervals all along, and I do not think there would be any difficulty in finding much more land suitable for irrigation than there would be water to irrigate with.

836. The only reference I can find in Colonel Home's report touching on the Darling basin with regard to the quality of the soil is where he speaks of the class of soil proposed to be irrigated at Menindie, and there his opinion is distinctly unfavourable? There is very little of that kind of soil on the Darling.

837. Does it not seem a proper thing that when the Department is investigating irrigation possibilities they should look to the soil first to see what it will do if water be applied to it? We have instances right along the Darling, almost from the Queensland border to the Murray, where irrigation has been carried on successfully.

838. But is that a guarantee that there would be miles more available, unless your officers went over the country to find out? No, but there was no intention of the Government taking up irrigation.

839. But if they provide the water, should they not first know whether there would be a possibility of some one settling on suitable land in order to use the water;—has not the question of providing water been before the public and the Department for a long time? This question of locking the Darling has been before them repeatedly.

840. As far as you are aware, has there been any attempt on the part of the Departments to find out the character of the soil which would be contiguous to these proposed locks? I do not think so. Of course it is a matter for the Agricultural Department to take up.

841. I should think the Minister should be satisfied as to the quality of the soil before he considered the possibility of locking the river from an irrigation standpoint? We know the productiveness of the land at intervals all along, and we know the way it responds to rainfall, and there is no reason to suppose that it would not respond to the use of river water just as well.

842. From what I can learn irrigation is of no value on land which has not got a free subsoil; you cannot put on water from an irrigation channel in the same delicate and masterly manner as the rain of Heaven falls? It cannot be put on so evenly.

843. *Mr. Trickett.*] Does not Colonel Home in his report say that the land at Menindie is very unsuitable? Yes; it is hard clay with nodular limestone. That land near Menindie is really high scrub country. I do not recollect seeing any land along the Darling like it—certainly the high red land near Bourke is not like it. That is really a chocolate loam.

844. *Mr. Watson.*] Is the land near Menindie and Wilcannia not like the land at Bourke? There is very little land resembling it. That patch at West Bourke is red soil.

845. *Dr. Garran.*] Has the Department ever sunk a pit along the banks of the river to test the soil? The Public Works Department has never tested the soil.

846. Has your Irrigation branch made any investigation as to the suitability of the soil between Bourke and Menindie for irrigation, or have you ever sunk a pit? No; but we consider the evidence of actual experience showed that there was no doubt about the subject.

847. *Mr. Watson.*] The evidence, seeing that it only relates to patches, would not prove that any large portion of the land was of value for irrigation;—it would only amount to an assumption on your part? The case is simply this: Under any circumstances, with regard to the land within a moderate distance of the Darling, I do not see any prospect of more than 1 acre in 500 ever being irrigated for a very long time. That being so, there is a great deal of choice as to what should be irrigated.

848. Has not the Department simply gone on the law of probabilities? The view which the Department took was simply that, as rainwater will make crops and grass grow very favourably, the river water ought to do the same.

849. Is it not a fact that some land which will grow fair crops with a medium rainfall will not grow similarly good crops with irrigation? I never heard of any instances of the kind.

850. I am informed that some land, through having a clay subsoil, will not do well with irrigation, whereas the same land, with a light regular rainfall, would do well? That is a case where the fault lies with the man. I know a man who laid out a large sum of money for an irrigation plant, and he started irrigating clay soil which had no subsoil drainage, and which had no get-away for the water on the surface. He grew crops of rushes, and he proclaimed to his neighbours that irrigation in New South Wales was a failure.

851. Would it not be more expensive to irrigate land of that character? Land of that character should never have been irrigated.

852. Does not that seem an additional reason why the Department should ascertain what proportion of land along the banks of the river was suitable? It would have been a very expensive matter, and outside the functions of the Department. I consider it is sufficiently certain that there is a very large area of land there suitable for irrigation, and that the people actually on the land can be safely left to decide what those portions are. It is their special business.

853. But when you were in the Department of Mines and Agriculture and that Department had the matter of irrigation in its hands, I should imagine that it would have dealt with the question of the suitability

H. G.  
McKinney.  
10 May, 1899.

suitability of the land, because that is a matter of policy which the Minister would have to consider? It would have been a good thing for the information of the public, no doubt, to have sent an officer of the Agricultural Department, who knew soils well, to report. The only place where I know of that having been done was at Wentworth.

854. What was the idea of erecting the Bourke weir singly? There were several points. There had been an agitation for a good while on the general subject of the locking of the Darling. One point that weighed was to have one constructed tentatively. In fact, under almost similar circumstances, the construction of a lock was undertaken many years ago near Wentworth. The money was actually voted for it. I think the construction of the lock was almost ready to be started when something occurred to stop it. In that case, too, one great consideration that weighed was the matter of having one lock constructed as a beginning. Then Bourke was selected because of several reasons. One idea which the Railway Commissioners favoured was that if one lock were constructed there, and was satisfactory, the river should be locked above Bourke to bring the traffic down to the western railway. Another reason was, that the river there falls very low, and that it would be an advantage to the town to have a better depth of water.

855. Was it largely in the nature of an experiment? Yes; that was a point which certainly weighed in the decision in favour of it.

856. Was there any mention made of the possibility of a portion of the water retained by that weir being used for irrigation purposes? Yes, there was that idea. In fact, the place I have mentioned at West Bourke is very favourable for irrigation. It is one of the best places on the river.

857. Has any application been made to the Department to secure water for irrigation from the weir? No.

858. How far do you think the Bourke weir has proved the practicability of locking generally? I think it is a success. Of course there is that point against it of the leakage between the shutters.

859. Apart from that, can you inform the Committee how far the water was backed up by that weir? It was backed up almost to the top of the shutters, or just exactly to the top of them.

860. How many miles did it throw the water back? About 38 or 40 miles. It made it navigable to about 25 miles above Bourke.

861. Was there any considerable quantity of water going through the weir at the time it was holding it back? Yes; there was a pretty fair flow.

862. Latterly I understand that the shutters have been simply lying down? I think the water has been allowed to flow off.

863. There was no encouragement given to the people to expect the use of the water behind the weir owing to the shutters being down? We received no application for the use of the water near Bourke.

864. Do you remember the period when the shutters were put down with a view of letting the water run? I do not remember the exact time.

865. Was the river below the weir low then? Yes.

866. How much water was retained by the shutters before the water was let go? I cannot really say. We have got records, but I cannot say exactly as to that point.

867. Was the weir, just prior to putting them down, holding the water to any extent? Yes.

868. What height of water do you think would be behind the shutters when they were let go? Judging from a diagram which I have, there was 2 or 3 feet difference between the two. That was at the extreme low point.

869. What is the height of that portion of the shutters where the opening is made? The space between the shutters at the upper part is 2 inches.

870. The shutter was designed to hold water at a height of about 4 feet above the sill? No; we expected the quantity of water flowing down would always be sufficient in a time of low river to stand level with the top of the shutters. So it did until this extremely low river came.

871. *Chairman.*] Did you expect the natural flow above would compensate for the leakage? Yes; for the quantity that passed through the spaces.

872. *Mr. Watson.*] So that the shutter should back up for the whole of its height? Yes; and so it did until the river fell so very low.

873. At some period the river fell so low that the water coming in did not compensate for the leakage, and therefore the water retained went down to the level of 3 feet? Yes; the river fell lower than it had been for thirteen years. There is one point I should like to explain with regard to what Mr. Watson asked yesterday, it was about the question of silt accumulating at the upper end of the lock. I had not looked into the action of weirs of this kind at the time, and I could not come at the point I wished to explain. The best way I can state what I meant is this: In the case of movable weirs, assuming an unlocked river, it would have taken a height of 9 feet at Bourke, before the shutters would have been put down and the river would have been open. On the other hand, in the case of fixed weirs, it would take a height of 14 or 15 feet at Bourke before the navigation would commence to go over the top of the fixed weir. It appeared to me that small freshets coming down in that interval between the height of 9 feet and 14 or 15 feet would be likely to collect silt at the upper end of the lock in connection with a fixed weir. But on looking into the matter—and I looked carefully into the question last night—I see no reason to doubt that the sluices in the lock gates would be sufficient to carry off any silt that might accumulate in the weir.

874. You do not think there is a probability of the accumulation of silt? No. I think that with the aid of the sluices in the lock gates where there is a fixed weir that silt could be scoured away so as to prevent it causing any trouble. There was a point in reply to a question put by Dr. Garran as to whether the Government or any persons had the power to shut off water for a time, and whether that would not ruin any irrigation scheme. I do not think I made my meaning clear about that matter of the Minister retaining power to limit irrigation in a case like that of the river Darling. The idea is really to establish a rotation that would enable every one who had the right to irrigate to irrigate to a certain amount—that is, to limit the amount of irrigation, but it need not necessarily ruin it or stop it. A man might have the right to pump for two days in the week, and during that two days he might be able to irrigate a considerable area. He could irrigate one patch the first week, and he could irrigate a second patch the second week, and a third patch the third week. In the fourth week he could go back to the first patch again, and so keep his land properly irrigated by using the water only two days a week. That is the way in which all irrigation canals are managed.

875. *Mr. Trickett.*] There is one point I cannot understand, although Mr. McKinney has explained it more than once. He says that when there was a body of water flowing down it went over the weir, and the leakage did not matter. Seeing that this was an experimental weir, I cannot understand why directly the water became lower than the top of the movable weir it was not made into a weir which would keep the water back? I may say that I would not have been disposed to comply with the request which was made to let off the water, because the people were really no worse off than they would have been if there had been no weir at all.

H. G.  
McKinney.  
10 May, 1899.

876. *Mr. Watson.*] Still, the Minister thought it was wise to let the water go? It was decided to let the water go. There is another point which, perhaps, I had better mention in connection with a question asked by Dr. Garran. I think part of my answer was not heard. The question was, whether I thought nothing would be produced by irrigation except what was wanted for local consumption. The answer is simply "Yes." I made a qualification that, to a certain extent, there might be export, in a small way, of fruit, either fresh or dry. For this reason, that there are certain kinds of fruit which can be produced at Bourke several weeks earlier than on the coast districts. Another item would be dried fruits. That is looking a great deal into the future. There was another question I was asked about—the fall in the Willandra Billabong. I stated from memory that I thought it was from 120 to 130 feet. I find, on looking up the matter, that it is nearly 180 feet. I found that it would be possible to take the water of the Lachlan to the Darling, as far as the fall of the country is concerned, but it would not be practicable, on account of ridgy country intervening.

877. *Dr. Garran.*] I wanted to know the height between the two? I know there are ridges that run up to 30 or 40 feet above the slope which would have to be cut through.

John Harper, Chief Traffic Manager, Department of Railways, sworn, and examined:—

878. *Chairman.*] The proposal before us is to construct locks and weirs on the Darling, south of Bourke;— can you give the Committee any idea as to how the Railway Commissioners view the proposal from a railway standpoint? Their opinion is that it would not be any advantage to the railways; on the other hand, it would be a disadvantage.

J. Harper.  
10 May, 1899.

879. Is the idea of its being a feeder to the railway erroneous? Yes, in their estimation.

880. Would it be a sucker? Yes.

881. I think, before a former Committee, you stated that, by constructing a weir at Bourke, you would secure the whole of the traffic above Bourke for the Bourke railway? I did not say that we should secure the whole of the traffic, but that it would tend to give it to us.

882. You stated that, as far as you could ascertain, none of the traffic passed Bourke? No; not under existing circumstances. How far the existence of the weir at Bourke has contributed to that I cannot say. I do not think it has, personally.

883. Was that evidence given before the lock was constructed? Yes.

884. Is it your opinion that if you construct locks and weirs on the Darling, the goods, once they are on board the steamer, will continue to be carried all the way down the Darling even if a railway is constructed from Cobar to Wilcannia? Yes.

885. They will not be transhipped, and therefore your railways will lose by the construction of these locks and weirs? Yes.

886. Have you gone pretty closely into this matter? No; I only speak as a matter of experience as the river stands. My opinion is that if the river is improved in the direction of what we may regard as rival ports or centres of exchange, the disposition to go in that direction must also increase.

887. Therefore any river-borne traffic will go out of the Colony? Yes; my impression is that with the whole course of that river locked, and with permanent navigation provided, we should get very little traffic at Bourke.

888. Is the competition pretty keen for traffic in the other colonies? Yes; exceedingly keen.

889. Have the other colonies a system of rebates? Yes.

890. Can you give the Committee an idea as to how far that system extends into our territory? Over the whole of the Murrumbidgee. It extends throughout the whole of western New South Wales and south-western New South Wales. Its actual operations are confined to about 200 miles above Wilcannia and to the Murrumbidgee, and of course the Murray.

891. Does the whole of the traffic on the Darling find its way into South Australia, and on the Murrumbidgee and the Murray into Victoria? The Darling traffic chiefly finds its way to South Australia.

892. Does that always occur when the river is navigable? Yes.

893. So that if we lock the Darling we shall permanently lose the traffic? Yes.

894. Is that your firm opinion? Yes.

895. At the present time when the river is navigable, are you aware of any case where goods are sent round from Sydney to Adelaide and on to Bourke? Yes; large consignments of beer have been sent to Bourke from Adelaide through Sydney. We have had to make special quotations to secure that business at Bourke.

896. So that when the river is navigable it has occurred within recent years, and it is sure to become permanent if these locks and weirs are constructed? Undoubtedly.

897. Was it always your opinion that that would occur? Yes, it has always been my personal opinion—that is, anywhere south of Bourke.

898. Then, you do not think that, in the interests of your Department it would be desirable to construct these locks and weirs? I do not.

899. At page 12 of the report of a former Committee on the construction of locks and weirs, I find the following question and answer:—

Are you authorised by the Commissioners to make any definite statement to the Committee that it appears to them that there should be some sort of auxiliary like this to enable them to command the traffic? No; I am authorised to say that they regard any improvement of the internal waters in the direction proposed as a very desirable thing.

What do you say to that? The direction then proposed was above Bourke. I am still prepared to say that that is an improvement.

J. Harper. 900. What I want to get at is this: If you put a lock at Bourke, it is a desirable thing in the interests of the Bourke railway traffic;—would not the same thing occur if you had locks and weirs below Bourke, in order to secure the traffic at Wilcannia, if a railway is made there? No, because at the time of the previous inquiry, it was a question of providing a means of access to the railway for the people about Walgett and Brewarrina; and it was really a question whether those districts would be better served by locking the river and making it permanently navigable to reach a constructed line, than to build other lengths of railway line. That is how that that question came to be answered.

10 May, 1899.

901. Would the same explanation fit in with Question 258—

I presume you would not advocate the locking of the river below Bourke? That question has not entered into consideration. The Railway Department have advocated the locking of the river as far as Wilcannia.

? That was not my opinion personally, as I have said.

902. Was it the opinion of the Department at that time, that if the river were locked to Wilcannia, the railway would take all the traffic? That is when we first opened the railway to Bourke, and we had rather indefinite ideas as to what would happen.

903. This proposal is to erect locks as far down as Menindie, and we have evidence to the effect that that would not render the stream navigable except between Bourke and Menindie. Below Menindie there would still be obstruction. What I want to get at is this: Supposing we locked the Darling to Menindie, and there are points below Menindie where navigation would be obstructed, would the traffic be diverted to Sydney? I could not conceive such an intolerable condition of affairs as that the locking should cease to exist below Menindie.

904. That is the proposal? As to the nature of the proposal I have nothing to say. But if the existing highway on the lower reaches of the river is to continue, it does not seem to me to be a fair thing to the people using it that they should be obstructed below Menindie. I fancy that the Federal aspect of the question would come in there.

905. Do you think that might effect it? I think it would.

906. How would that affect the railway traffic? I have not studied that.

907. Suppose the Colony of New South Wales constructed these locks and weirs within a short time, then the Federal Government would take the matter up, if we had a Federal Government? That is another question I cannot answer. That is still in the throes of the future.

908. I think that when Mr. Kirkcaldie held your position, he seemed to favour this scheme of locking the Darling? I do not think he did below Wilcannia; and his impression of locking the Darling to Wilcannia was formed when the railway was first opened to Bourke; in fact, I think before we reached Bourke.

909. Then in the light of the experience gained by the Commissioners, are you distinctly of opinion that in the interests of the railways, the locking of the Darling would be a mistake? Yes; south of Bourke.

910. *Mr. Watson.*] Even north of Bourke, with the Brewarrina railway? Yes; when the railway is constructed.

911. *Dr. Garran.*] I have some recollection of evidence, either by you or Mr. Kirkcaldie, to the effect that one year wool from a station of Mr. Wentworth, above Bourke, went down the river instead of by railway? Yes; a station out on the Paroo. But there were circumstances connected with that which were absolutely special. It arose out of pique rather than anything else. We have to adopt a certain dividing line, where two rates are established for the purpose of competition. This station was situated in a unique position. It was divided by this river, and they asked to have the concession given to them which was given to the stations lying wholly west of that line. The Commissioners of the day could not see that it would be consistent to concede to that particular station what was not conceded to other stations which had all their country to the east of that line.

912. Has the same thing happened since? No; we get all the wool now.

913. At the present time you do not lose anything above Bourke? No.

914. When the river is in flow do you consider that you get half the trade for the railway? Above Bourke we get the whole traffic. By giving specially low rates we get 75 per cent. of the merchandise.

915. It was given in evidence the other day that, supposing a railway from Cobar to Wilcannia were made, and the river were navigable, the railway would get half the trade from Wilcannia;—do you think it would? It would be absolutely impossible.

916. Your line to Wilcannia would be a longer line than to Bourke, therefore your mileage rates would be higher? Yes.

917. Therefore, practically speaking, your freight would be higher, but the transit down the river to Wilcannia would be less than from Bourke;—therefore the river freight would be a little cheaper from Wilcannia than from Bourke? Yes.

918. Therefore, you would be competing with steamers, which would be carrying at lower rates than you are carrying from Bourke, and you would have a longer line, and therefore the competition would be severe, and against you? Yes.

919. So that your experience gained at Bourke leads you to think that, to get an equal proportion of river trade at Wilcannia, you would have to cut lower still? Decidedly.

920. You do not think you would get anything like half the trade? No.

921. Supposing the river to be navigable six months in the year, during the unnavigable time you must trade at your lowest possible rates? We cannot vary our rates.

922. Could you have summer rates and winter rates? No.

923. Then whatever competition compels you to go down to, you would have to maintain it permanently? Yes.

924. Therefore, even if you had a monopoly of the trade during three years drought, you would still be running at rates fixed by the severest competition? Yes.

925. Would you have more chance of getting up-river trade in stores than the down-river trade in wool at Wilcannia? Certainly not.

926. It makes no difference as far as you are concerned? No, the one would be the corollary of the other. So far as the goods up-stream are concerned, the steamers can carry them practically for nothing, in order to get the freight on wool.

927. But do not storekeepers like to get their stores several times in the year? With perishable goods that is immaterial. But in the case of galvanised iron, wire, and station supplies, it is quite usual to hold a large stock

- stock at Bourke, even with the railway there to-day. You could get interesting evidence from Rich & Co., J. Harper, as to the stock they carry at Bourke.
928. You cannot vary your rates for up trade or down trade, because you have the same competition to deal with? Yes. 10 May, 1899.
929. You say you get all the trade from above Bourke;—if there were a line to Wilcannia, would you get all the trade above Wilcannia? No; at Wilcannia the competition by river would be keener, and the circumstances would probably differ altogether. At Bourke we have been able, until recently, to obtain the whole of the southern Queensland trade at that point. Lately, by the imposition of border duties, it has fallen off, and our circumstances even at Bourke will not be so favourable for competition as they have been.
930. Supposing the idea which the Commissioners first favoured of completing the railway to Broken Hill had been carried through, would there be any risk of the trade going by way of Port Pirie? No; it would go by river.
931. If the river were closed and a storekeeper at Wilcannia had to decide as to whether he would get galvanised iron from Port Pirie or from Sydney, do you think that Port Pirie would have the choice? It would never come from Port Pirie by railway; it would come by Murray Bridge, Echuca, or Morgan.
932. Supposing the river were not navigable, and there were a through line from Sydney to Port Pirie, which railway would have the better chance of supplying Wilcannia? The goods would go by the shorter mileage, undoubtedly.
933. You think Port Pirie would have the advantage? Yes.
934. With a through line of railway from Sydney to Port Pirie, would the effect be to send the Wilcannia trade to Port Pirie rather than bring it to Sydney? Yes; the advantage would be in favour of the shorter distance, subject to such small variations as might arise from a difference in port charges.
935. What extent of mileage do you think the break of gauge would be equivalent to? I cannot say.
936. Could you say whether it is equal to 50 miles? No.
937. It has never been decided? No.
938. Even the break of gauge at Albury is a little in favour of our railways? Yes.
939. You do not know how much? No.
940. Supposing even on national grounds if it might be desirable to make a railway through to Broken Hill or lock the Darling, in neither case would it benefit the treasury of our railways? No.
941. Not even the indirect advantage from increased settlement? No. I cannot see how we can promote settlement with a railway to a point so distant from a port as against river competition.
942. The traffic is bound to take the shortest and cheapest route? That is our experience.
943. You have a great range of mountains to climb, which is all against you? Yes.
944. Looking at it exclusively from a financial point of view, you are not very hot to see this river locked? No, not from a railway point of view. From a national point of view, I have not studied the question. It might have advantages in the form of irrigation that I do not know about.
945. If you do not catch the Wilcannia trade, do you get at Bourke any of the north-west trade from Milparinka and Mount Browne? No; it does not come to Bourke.
946. Is there not a regular stock route with wells sunk from Bourke to Mount Browne? I cannot say; there is from Wilcannia to Mount Browne.
947. How far north-west of Bourke does your trade come in? We have the trade of the stations with a frontage to the Paroo down to about 50 miles south of a line from Bourke? West of that we get nothing.
948. West of the Paroo you do not get much trade? No.
949. *Mr. Trickett.*] Have you been making any special inquiries with regard to this investigation? No.
950. *Chairman.*] At the time the construction of locks and weirs on the Darling was before a former Committee, had the railway extension from Byrock to Brewarrina been sanctioned? No.
951. You then preferred taking over the cost of the lock and weir upon the river, to taking over the loss that would be incurred by constructing that line? Yes, that was my opinion, and so it is still.
952. Since the lock has been constructed at Bourke, has the river above Bourke been made use of extensively by the steamers? I cannot say.
953. Do you know how the traffic reaches Bourke, whether by teams or by the river? That depends upon the seasons. The weir has not had the effect of making the river navigable to Brewarrina.
954. Has the weir had any effect upon navigation, so far? I cannot conceive how it can; it did not throw enough water back.
955. So that from that standpoint it has been a failure? I should imagine so. As a matter of reason, I should say it has not had the effect of improving the navigation between Bourke and Brewarrina. I am confident it has not made the river navigable, when it would have been otherwise unnavigable.
956. *Mr. Shepherd.*] With reference to the effect that the extension of the railway from Cobar to Wilcannia will have, I should imagine from what you have said that it will still further rob the railway of traffic? Yes, that is my impression.
957. That is, it would draw traffic to the river which now goes by the railway from Cobar? Yes; either it would do that, or we should have to make prohibitory rates. I do not know what rates we could make.
958. You have already, in previous evidence, shown the advantage of the river over the railway, as far as rates are concerned;—if the river were locked and made permanently navigable, would the river inflict a still greater injury on the railways? Yes. There would be another element; there would be a greater certainty of transit, and the steamers would be able to make the trip in a shorter time.
959. We have also had it in evidence that insurance on the river is much greater than by the railway, and that that would cause the preference to be given to the railway;—do you think there is anything in that? No, absolutely nothing. The insurance is not more than 25s. per £100. That expressed in railway freight amounts to nothing.
960. So that that would make no appreciable difference as far as the railway is concerned? No; the insurances are a varying quantity. Insurances are sometimes made from the wool on the sheep's back to London.
961. *Chairman.*] If the river is rendered permanently navigable, have you no hope of successfully competing with it? No. Whatever insurance is paid would then necessarily become lower.
962. Would it be impossible for the railway to compete with the river traffic? Yes.

- J. Harper. 963. Do you think you would lose the Bourke traffic if the river were made permanently navigable? We should either have to lose it, or so reduce our rates that they would be absolutely ruinous.
- 10 May, 1899. 964. *Mr. Shepherd.*] If the river were properly snagged and made navigable, would the insurance be so great? No; the insurance is greater now on account of the danger from snags.
965. *Chairman.*] Before there could be any chance of your competing with the river traffic, would there have to be almost prohibitive river dues? Yes.

THURSDAY, 11 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Charles Louis Shainwald, Inspector of Branches. Messrs. E. Rich & Co. (Ltd.), Sydney and Bourke, sworn, and examined:—

- C. L. Shainwald. 966. *Chairman.*] How long were you residing in the Darling district? Since 1882.
- 11 May, 1899. 967. Have you had an opportunity of observing the flow of the river? Yes.
968. Have you had any opportunity of observing the effect of the lock already constructed at Bourke? No; I cannot speak with any degree of confidence about it.
969. Has it had any effect upon the volume of trade coming into Bourke? I do not think that this particular lock has had any material result on trade, because the immediate effect of the one lock is only to conserve the water for a distance of about 25 miles.
970. So that the one lock would not enable you to judge of the effect of locking the river? Not the trade effect of it.
971. Was it anticipated that by locking the Darling at Bourke pretty well the whole of the trade above Bourke would be water-borne? I do not think so. I think it was anticipated that if the river were locked over the whole distance the trade would flow to Bourke.
972. If the river is locked, say, to Wilcannia, would the trade flow to Bourke from as far south as Wilcannia? Only at such times as the river was not navigable below Wilcannia.
973. In your opinion, would it be wise to lock the river from Menindie upwards, and to leave the portion below Menindie without locks? The locking of the river from Menindie to Bourke would induce that trade to go to Bourke and to the railway line ending at Bourke, while the river below Menindie is not locked, or while the river below Menindie is not navigable. The effect of locking the Darling from Menindie upwards would be like closing a gate to the flow of the river from Menindie downwards.
974. Suppose the river were tapped by a railway below Bourke, and the river were locked, what would happen, say, at Wilcannia? The trade would then find its cheapest channel. It would then be a matter of freight.
975. Is there any quantity of goods going round from Sydney when the river is navigable for Bourke or other stations on the Darling? A certain amount; but I have not the papers before me at present.
976. If it was contemplated to put tolls on the river, can you give us any idea what would have to be put on to enable the railways to compete for the trade? I cannot give that opinion unless I know what the railway is going to charge.
977. The railway people say that they are now charging as low as they can? I understand you to mean, that if the railway were at Wilcannia, what rate would it be necessary to impose on the river in the shape of tolls so as to enable the railway to compete with the river.
978. Suppose the river is locked throughout and made permanently navigable, would the trade then go down the river? I think it is unquestionable that the trade will go to South Australia.
979. Do you think the Railway Commissioners could not reduce the rates so as to compete with the steamers? Not in my opinion.
980. With reference to another aspect of the case which is not contemplated just now;—this proposal deals more with navigation than with irrigation;—suppose that a sufficient quantity of water were stored to irrigate, is there much land about there which could be profitably cultivated? Immediately along the banks the soil is of black alkali. As far as my meagre knowledge of agriculture goes, I do not think that the bulk of the land is suitable for agriculture. There are sections of the river composed of red, loamy soil which is very good; but immediately on the river banks the land is black soil in many places.
981. Has any cultivation been attempted there? Yes; there has been cultivation at Louth, Winbar Station, and close to Wilcannia, at Murtee.
982. Did not the Government select some red soil as an experiment? Not on the river, but close to Bourke at the Pera bore.
983. With what result? As far as results have been reached, it is rather difficult to form an opinion. The first results appeared to be very good, but I understand that at present they do not look very bright.
984. Is that owing to something in the water? There is a great difference of opinion amongst the people. Some consider it is due to a shortage in the supply, owing to some trouble with the bore. Others consider that it is essentially due to the nature of the water.
985. Has any analysis been made of the soils there? I think so.
986. Was the red soil chosen in preference to the black for an experiment? I cannot say for a certainty, but I should think so.
987. Have you mixed with any people at Bourke who have a knowledge of agriculture? I think there are very few practical men there of large experience.
988. Is it a fact that they generally select the red soil in preference to the black for agriculture? Yes.
989. *Mr. Dick.*] I suppose you know the general outline of this scheme? Yes. 990.

990. Can you give the Committee an opinion as to the effect upon trade of the unreliability of the Darling as a natural highway? The effect of the uncertainty of the river in its natural state is to make the living of the inhabitants there very difficult and expensive. They cannot tell from one month to another when they will get a river. Consequently they have to provide as far as they can in advance; but all experience has proved that even that provision is not sufficient. The merchants in Wilcannia have endeavoured, as far as possible, to provide by putting in very heavy stocks when there is a river; but their precautions have not been nearly sufficient. During the last three years, I do not think the river at any one time has been navigable throughout its length for any certainty for two months at a stretch. That is an unusual experience. In the evidence which I gave before about the locking of the Darling from Bourke to Brewarrina, I prepared a return which showed that, taking the average for fourteen years, the river was navigable for just half the time. But that average is very misleading, because I showed that in 1890 the river was navigable for 360 days out of 365, while in 1884 it was navigable for only twenty days out of 365. There is no dependency on the river for traffic purposes.

C. L.  
Shainwald.  
11 May, 1899.

991. One result of that would be that the price of goods in some years is very much increased? Yes.
992. Is the insurance on river-borne goods rather high? Compared to ocean rates it is very high.
993. We have been informed that it is the practice in the case of wool to insure from the sheep's back to the market;—does that prevail in the district? As far as I am aware the practice of insuring from the sheep's back to the market does not cover the river risk. That is a special charge.
994. What is the general charge for insurance upon river-borne wool say from Wilcannia to the ocean port? I think the rate at present is 25s., less 20 per cent. At the present price of wool that would make it pretty high. At present it would be worth, scoured, £175 per ton.
995. Would that be a matter to be seriously considered in the question of rival routes by river or rail? Yes; that would be entirely absent in the case of a railway.
996. Supposing the river were locked from Bourke to Wilcannia, how much of the trade, say in wool and stores and machinery in the district lying between Bourke and Wilcannia, would be directed towards Bourke? You would have to take other conditions with it. It might be assumed that at the time the river is not navigable from Wilcannia below in its natural way, and that the river is locked from Bourke to Wilcannia. In that case the whole of it would go to Bourke. If the river is navigable from Wilcannia below, certainly no more trade than that from Tilpa would go to Bourke. That is about half-way, 115 or 120 miles to Bourke by road, and  $2\frac{1}{2}$  times over that by river.
997. Then the amount of trade to be obtained at Bourke from this proposal would be a varying quantity? Yes.
998. Would it depend upon the state of the river below Wilcannia? Yes.
999. If the average is six months in the year during which the river is navigable below Wilcannia, what proportion of the trade from year to year would be attracted to Bourke;—do you think it would 50 per cent.? I think it would be more for this reason, that if the river is permanently navigable by means of locks from Bourke to Wilcannia, the merchants and other residents of the Wilcannia district would not depend so largely on intermittent navigation, with the result that they would order, even if it cost them a little more, by river from Bourke when they could make a certainty of it.
1000. The certainty of free navigation the whole distance up to Bourke would bring about a certain stability of the trade? Yes.
1001. If a railway line were constructed to Wilcannia from Cobar, do you think that between the railway at Bourke and the one at Wilcannia, with permanent navigation provided by locks and weirs, the whole, or the greater part of that trade, would naturally flow to those two centres? No; I think that the river would be availed of at any time when delivery would be fairly sure, because the river rates would always be lower than the railway.
1002. Does the matter of delay as seriously affect wool as it does ordinary stores, food, and so on? It is not so serious a living factor, but it is a very serious matter to the resident who has his wool there, and who has to pay for an overdraft, which is not unusual in that section.
1003. Is it a fact that the greater number of the stations up there are owned in Victoria? I think the major part of the stations in the Wilcannia district are owned in South Australia and Victoria.
1004. Would that militate against setting up a constant trade between Wilcannia and Bourke? I do not think so to a material extent. Business men in New South Wales or anywhere else will go wherever they can get their things cheapest.
1005. Have you considered the question of irrigation in connection with this scheme? To some extent.
1006. Do you think that any fairly large system of irrigation could be carried on? Not with navigation.
1007. Do you think the two are antagonistic? Yes; because you have not the volume of water to depend upon.
1008. Would there be any beneficial effect other than the certainty of transit brought about by the construction of such works? A moderate amount of irrigation could be accomplished.
1009. Apart from that, would there be any increased prosperity besides that brought about by the certainty of transit? I think you would get increased population within a reasonable distance of the river frontage.
1010. Are the river frontages alienated? As far as I know a good deal of it is not alienated; a good deal of it is under lease.
1011. Then it would be some time before we could expect increase of population in the way of settlement? I should say so.
1012. What has been the effect upon trade north of Bourke of the construction of the weir near Bourke? There has been no effect. I understand that was only put up experimentally to prove its value or otherwise.
1013. As an experiment, do you think it could be advantageously repeated further on? Yes, personally, though as I have some interest in seeing the river locked northward from Bourke, I may be prejudiced favourably.
1014. Has that been an effective lock? Yes.
1015. Has it kept the water back? Yes.
1016. We had some evidence that there was only 3 inches of difference between the height of the water at the top side of the lock and at the bottom? Probably that was when the weir was open. But when the weir was locked for some months, I think the difference between the height of the water on each side of the lock was about 7 or 8 feet.

C. L.  
Shainwald.  
11 May, 1899.

1017. Is it not a fact that since the dry weather came on, the whole of the impounded water trickled through the spaces between the shutters? I think that was done intentionally. They can make the weirs absolutely water-tight. I am informed that they did not make them water-tight, because they feared that some objection might be taken by stock-owners further down the river.

1018. But they allowed the water to trickle through the shutters? That was done purposely.

1019. Would not that always be the case with such a weir? There would be a certain amount of leakage, but from what I have seen, I think the shutters could be made fairly water-tight; they are only 30 inches wide each, with iron bands at the face ends.

1020. Have you had an opportunity of examining the model of a fixed weir in this room? I see it now.

1021. Do you think a fixed weir like this would be preferable to the experimental one at Bourke? I am not competent to speak of it from an expert point of view, but I should think that this weir would be preferable.

1022. Did the weir at Bourke have any effect on navigation from Bourke to Brewarrina? It only impounded the water for 25 miles back. I should think it had no effect one way or the other. It certainly did some good on one occasion, in assisting the Wilcannia residents. There were a couple of boats loaded with cargo at Bourke, and they had not the slightest hope of getting to Wilcannia unless the weir were opened, so that they could go to Wilcannia on the top of the rise. The Department very kindly permitted that when it was pointed out that unless it was done the Wilcannia residents would practically starve. The lock gates were opened thirty-six hours after the vessel passed through, and the vessel floated down to Wilcannia successfully.

1023. Do your company own a good many of the river steamers? Yes.

1024. What is their average draught when loaded? About 6 feet.

1025. What is the heaviest draught you have? Fully loaded, about 7 feet 6 inches.

1026. Would a system of locks and weirs providing a minimum depth of 6 feet be sufficient for the majority of your vessels? Yes.

1027. You think that if these weirs were constructed a system of tolls might be imposed on the river traffic out of the Colony? I do not see why a system of tolls should not be imposed if the Government provides accommodation.

1028. We have some evidence that Sydney merchants are in the habit of sending goods round by steamer to Adelaide, and then from Adelaide to Wilcannia, and even as far as Bourke;—do you think that the imposition of tolls would prevent that sort of thing, or, in other words, that suppliers in Sydney would be compelled to use the railway to Bourke and the river over the locked distances? It could be done in the same way as our so-called friendly neighbours in Queensland have put a tax on every bale of wool that leaves for Bourke and Bourke only. You could put on a tax on every bale of merchandise which comes in from South Australia.

1029. Would that deprive the people of the benefit to be derived from a locked river? Yes.

1030. *Dr. Garran.*] During the last three years I understand the river has been of very little use? Yes.

1031. So that you have been practically compelled to get all your goods or produce by railway both at Bourke and Wilcannia? No; the two matters are distinct. To Bourke we always have the railway; but at Wilcannia, during the last three years, through the non-navigability of the river, the bulk of the produce found its outlet at Broken Hill by road, and in a great many instances the produce was held for intermittent opportunities of getting it away.

1032. What have you had to pay for cartage from Broken Hill to Wilcannia? About £6 to £7 per ton.

1033. What is the ordinary freight by river when it is navigable? You would want to take Adelaide as the starting-point, and take the railway freight from Adelaide to Broken Hill. There would be two routes—Goolwa, Murray Bridge, and Morgan—or you could take the other route by Broken Hill, and then by road to Wilcannia. Taking third-class traffic, the rate from Adelaide to Wilcannia by Broken Hill would be £14 per ton right through. Then from Adelaide by way of Murray Bridge, and then by river to Wilcannia, including insurance, the ordinary rate for moderate parcels would be £4 per ton, as against £14 per ton the other way. This is the position at the present time.

1034. What makes Murray Bridge a better route than Morgan? The rates are lower from Adelaide to Murray Bridge than they are to Morgan. I think it is the shorter distance.

1035. Do you send wool down to Port Victor? Yes.

1036. Do you get goods up from there? No; the ships only go there to take away wool.

1037. Is that a cheaper method of getting the wool away? Yes. Wool going to Port Adelaide is landed at Goolwa, and wool going to Port Victor is landed at Morgan. The railway rate from Morgan is much higher than it is from Goolwa to Port Victor.

1038. Is insurance specially heavy at Port Victor? I do not think so.

1039. Does much wool go down to Port Victor? Yes.

1040. If the river were running now in the ordinary style for six months in the year from Bourke to Encounter Bay, or any other place, would you be getting most of your goods up by rail or by river? We should get the bulk—all the heavy goods—by river.

1041. In value would that be half? More than half.

1042. If that is true of Bourke, would it be still more true of Wilcannia, if we had a railway to Wilcannia? Yes.

1043. A railway from Sydney to Wilcannia would be somewhat longer than the railway to Bourke, and the mileage would be higher? Yes.

1044. And the freight from Wilcannia to the ocean would be less than from Bourke? Yes.

1045. Therefore the railway people would have severer competition at Wilcannia than at Bourke? Yes.

1046. Do you think they would get half the trade with a six months river? No; not a quarter of it.

1047. Could they face the cheaper carriage by water? No.

1048. Would it be a passenger railway principally? Yes; and for starving stock.

1049. During the last twenty years have you had six months navigation? Yes; on an average. In one year we had only twenty days, while in another year we had 320 days.

1050. Supposing we had the river locked, and permanent navigation as far as Wentworth all the year round, so that goods could be got up with as much certainty by river as by railway, would the railway get one-quarter of the traffic? No; not a penny; because the Murray is a certainty always; it rises every year.

1051. Has the river ever been stopped between Morgan and Wentworth? Yes; every year, but only for a short time.

1052. When the snow has all melted in the mountains the Murray shrinks? Yes; it is a very broad, shallow river past Wentworth. C. L. Shainwald.
1053. For how many months in the year does the Murray fail? I have not the figures; but year in and year out, I would put it at from three to four months. In April or May the Murray rises. 11 May, 1899.
1054. Could the storekeepers always adapt themselves to it? Yes.
1055. It would not interfere with the wool going down? No, because the Murray is navigable at the time when the wool is ready for market, at the latter end of the year.
1056. It would pretty well compel the squatters to get what they wanted to carry them over three months? Yes.
1057. Compared with what they have to do now would that be a trifle? Yes.
1058. Have they now got to secure a supply of some things for one or two years in advance? I think they take their chances.
1059. Taking the last three or four years, have you run out of heavy things, such as galvanised wire? Yes, absolutely. We have not a coil of wire in Wilcannia. We have run out of flour, and certain storekeepers at Wilcannia have been getting flour and baking-powder by parcels post.
1060. Have you run out of tea? Very close.
1061. Has this been the most trying time you have known on that river? Yes.
1062. You have had to bring goods across from Broken Hill? Yes.
1063. Have the teams from there had to carry feed with them? Yes, to a certain extent. At present the cartage is being done by camels. There is a fair water supply on the road by means of Government tanks and wells, but not a blade of grass.
1064. What feed do they take for the camels? They eat the trees; anything at all.
1065. Practically, have you been shut up to this land-carriage to Broken Hill? Yes, we have practically kept ourselves supplied from Broken Hill.
1066. We have it in evidence that the sheep in the Wilcannia district altogether have fallen from 4,000,000 to 2,000,000? I should not think that that is an exaggeration.
1067. How have they managed even to keep 2,000,000 sheep alive? By cutting the scrub and feeding the valuable sheep on grain.
1068. Has any fodder been brought from Broken Hill? Yes; a great deal.
1069. For stud stock? Yes, and for the station horses.
1070. You were asked whether the locking of the river would probably increase the number of small settlers;—have you ever been at Wilcannia when there has been a great flood? No.
1071. What is the biggest you have seen? In 1893-4.
1072. Did the water then go over the banks? At Bourke it went to within 18 inches of the level of 1890. It did not go over the highest banks.
1073. If the land on the banks is liable to inundation, is it the sort of country which small farmers are likely to take up? I think the land which would be available is not liable to inundation. There are a great many high banks along the river. You can hardly take Bourke as an example, because it is lower than the land elsewhere.
1074. Do you think there is high land enough along the river to give a sufficiency of farms to supply green stuff, vegetables, and orchard stuff for the population up and down the river? I think so.
1075. If we came to irrigation, would it be principally on the high ground that there would be those irrigation farms? Yes; and there it is red soil. It is very deep, rich soil. The subsoil is calcareous.
1076. Do you think the land subject to floods is likely to be taken up? It might be in places, because they could easily run that risk, considering that they only get such a flood probably once in twenty years.
1077. Would an orchardist who has to wait three or four years for a return, be likely to plant his trees where they might be flooded at any time? No; it would be discouraging.
1078. Is it not a fact that so much land is subject to inundation, that it would seriously diminish the area likely to be settled by small cultivators? Yes.
1079. So that the irrigable area on the banks of the Darling has a natural limit? Yes.
1080. And there is only a limited quantity of water for irrigation? Yes.
1081. During this last year, do you think any water could have been spared for irrigation? No. To a large extent the two schemes must be antagonistic.
1082. You have seen this weir at Bourke at its best, throwing the water back 20 miles? Yes.
1083. Had we had a series of locks and weirs below that, it would have been the reservoir for supplying the rest? Yes.
1084. Do you think that what you saw stored there would have been sufficient to make good the waste in navigation? No; a great deal would depend on the volume of the traffic. I do not think the storage of water would have provided for the possible traffic.
1085. Would it have kept the whole thing going during three years of drought? No.
1086. Then the first lock would have dried up? No, because there is a constant small stream, and it is constantly being fed from above.
1087. Is it being fed now? Yes.
1088. To an appreciable extent? Yes. If we put up this lock at Bourke now and made it hermetically tight, it would fill up within a couple of months.
1089. Can you row a boat above the lock now? Yes.
1090. How far? I have not visited the river lately; but I think you could row a boat from the lock 5 or 6 miles up.
1091. There is still a little running? Yes; I think the river report to-day gives a height of 2 feet.
1092. Bourke has not wanted drinking-water? No; and in that respect the lock has been of value, because it has given good drinking-water.
1093. Is the town supplied from the natural river? Yes. At Wilcannia I believe there is a dam, but it is only of a temporary character.
1094. Are you clear from your experience, that given a navigable river, it will beat the railway hand over fist? Yes, in the matter of cost of carriage.
1095. Whatever national reasons there may be for making the river thoroughly navigable, do you think it will not conduce to the prosperity of our railway system? I do not see that it can to any material extent, unless there are other avenues ascertained in the way of mining.

C. L.  
Shainwald.  
11 May, 1899.

1096. You have seen the effect of the railway to Bourke;—is it a great convenience to the residents? Yes, and it has developed the district. I do not know that there has been a large increase of population; but the existence of the railway has largely increased the volume of trade.
1097. Has more pastoral country been taken up than when the railway did not go beyond Dubbo? Yes, very much more under the new homestead leases system.
1098. But was not that land under occupation before? Yes; but it has been taken up in smaller blocks.
1099. There has been closer pastoral occupation? Yes; and there is farming close to Bourke.
1100. You find that the homestead lessees keep more sheep to the acre than the squatter? They make the attempt, but I do not know whether they succeed.
1101. Has it been a trying time, and therefore not a fair test? Yes.
1102. Do you get any of the trade from Tibooburra and Milparinka down to Bourke? Only intermittently. It goes to South Australia or to Wilcannia.
1103. Have you a well-watered route from Bourke to those places? Yes; a very good route for teams.
1104. Have they had to carry feed this year? In the early part of the year they did.
1105. They have not relied on Bourke for supplies? No; it is quite as easy to get there from Wilcannia as from Bourke.
1106. It is easier for them to get to the Broken Hill railway than to the Bourke railway? It is not easier, but the traffic has been slightly in their favour with regard to the rates.
1107. You do not see much in their money? No.
1108. Would a railway to Wilcannia make any difference in attracting the trade as against Broken Hill? It would affect a certain section coming in towards Wilcannia. The reason of the trade finding its way to Broken Hill is because they can make certain of sending it away there.
1109. Supposing there were a railway to Wilcannia, would the railway to Wilcannia compete favourably with the railway at Broken Hill? I think not, for the reason that it is a longer haul to Sydney from Wilcannia than from Adelaide to Broken Hill.
1110. If a railway to Wilcannia were made right through to Broken Hill, would there be any tendency to send the trade by way of Port Pirie? I cannot say.
1111. Trade usually follows the shorter route, and it is a much shorter route, notwithstanding the break of gauge, to Port Pirie than to Sydney? Yes.
1112. Would there be some risk of the trade going from Wilcannia to Port Pirie? If they stood on an equal footing with regard to mileage rates there would.
1113. Making a railway from Sydney to Wilcannia and right through to Broken Hill would by no means strengthen the hold of Sydney over the Wilcannia trade? No; not on the mileage basis.
1114. Would it not rather weaken it than otherwise? Taking the mileage basis, there would be a tendency to go in the other direction.
1115. Let us suppose the river not locked, and a drought, with a railway right through to Broken Hill from Sydney, in a drought season would the Wilcannia storekeepers be more tempted to get their goods by Port Pirie than from Sydney? Sydney would have the advantage, because Port Pirie is only a shipping port. You would have to count the freight from Adelaide or Sydney to Port Pirie, or the railage from Adelaide to Broken Hill.
1116. Would it be an even thing? No; I think it would be slightly in favour of Sydney as the better buying place.
1117. That advantage would neutralise to some extent the greater amount of railway carriage? Yes.
1118. Would it be a matter of calculation as to railway charges? Yes; goods take the cheaper route.
1119. Do you get the Paroo trade at Bourke? Yes; it comes almost wholly to Bourke.
1120. *Mr. Shepherd.*] Do the people generally on the river seem to take an interest in the proposed locking of the Darling? I visit the district about four times a year, and as far as I can see the townspeople prefer the railway to the river. I do not blame them, because it gives them greater facilities for reaching the port, and for the removal of stock, and obtaining food and feed supplies, than by the river, because the distance from Bourke to Wilcannia is too great for stock or food or feed to be moved as compared with the railway. We could not move stock all the way from Wilcannia to Bourke, and truck them from there down to the port. If it is one of the main objects of constructing the railway to provide means for getting away starving stock in times of drought, the river is of no value for that purpose.
1121. Do they seem anxious that the river should be locked? I think they are taking an interest in both schemes; they would be glad of either, but they have a leaning for the railway scheme.
1122. Even if the river were locked, do you think they would still largely use the railway to Bourke? Yes.
1123. If a railway were constructed from Cobar to Wilcannia do you think they would largely use that as well? I think so. If the river were locked, they would give the railway preference for passengers and stock, but not with regard to merchandise.
1124. The railway would never compete with the river as far as freight is concerned? I do not think so.
1125. The freight for general goods by railway from Sydney to Wilcannia would be £10 13s. 6d. per ton. Could it not be carried for very much less by the river? Yes, even under the present severe conditions they can get their general goods from Adelaide to Wilcannia by railway and road for £14 per ton—that is only £4 more than they would have to pay by the railway.
1126. Is the land in the immediate vicinity of the river generally black? Yes, most of it.
1127. Is it a stiff, clay soil? Yes.
1128. Are you acquainted with the country for a considerable distance back from the river? Yes.
1129. What is it like 10 or 15 miles from the river? It is very much the same. Perhaps 30 miles out from Wilcannia and north towards Bourke it is nearly all red; 40 miles beyond that it is all black; around Wilcannia it is all red.
1130. What is the character of the cultivation which is taking place along there? They grow hay and vegetables. They grow wheat for hay and lucerne.
1131. Have they made any attempt at irrigating on a small scale for garden purposes? Yes; on several of the stations, notably Murtee and Winbar. The manager at Winbar not long ago told me they were extending their cultivation area. They use a pumping engine.
1132. Are they always able to get a supply from the river? Yes.
1133. Is there sufficient water in the river now to irrigate to any extent? Only to a limited extent.
1134. Are the banks of the river very deep? Yes.

C. L.  
Shainwald.  
11 May, 1899.

1135. Would they have to pump in every instance? If they lock the river, I understand it will give a permanent, navigable height of something like 7 or 8 feet. It would not then require so much pumping.
1136. The weir as proposed here is quite unfitted to supply water for irrigation and navigation as well? I think the two are antagonistic.
1137. For irrigation, would the weirs have to be very much higher? Yes.
1138. That would, of course, largely increase the supply? Yes.
1139. On an average, taking one year with another, is the Darling navigable for nearly half the time? Yes, about 49 per cent.
1140. During that time can supplies be got with comparative ease? Yes, and at small expense. I may say, with regard to the average which I have mentioned, if I made it up within the last four years the average would not come out so high.
1141. In the event of the railway being continued to Wilcannia, do you think it would induce the steamers to reduce their charges for freight? I do not think they would allow the traffic to be taken away from them without a fight, although I must say candidly that the rates now are hardly paying. I do not think they could afford to reduce them very much.
1142. *Dr. Garran.*] Is that due to competition amongst themselves? Yes.
1143. *Mr. Trickett.*] Where do Rich & Co. get their goods from at Bourke? We get them chiefly by rail from Sydney.
1144. When you were examined before on the proposals to make locks and weirs on the Darling was it proposed to erect them north of Bourke? Yes.
1145. Would that be a greater advantage to you than the present proposal? I do not think so. From the point of view of my firm either scheme would be an advantage.
1146. I understood that your business for your steamers was generally from Bourke northwards? Not necessarily.
1147. And between Bourke and Wilcannia you have no very great trade? No; only at times, when the river has been so intermittently navigable.
1148. When you were examined before you stated that your chief trade was from Bourke northwards, and from Wilcannia southwards? Yes.
1149. Now the great gap we are going to deal with is from Bourke to Menindie;—looking at it from a trade point of view with regard to your steamers, how is that going to benefit you or anybody else, seeing that there is not very much trade between those two points? The advantage to us in locking the river would be that we should secure a good deal of that trade which we do not get now. If we had permanent navigation we should be able to secure a lot of the trade for the steamers.
1150. How is it you do not get so much trade between Wilcannia and Bourke as you do on the other sides? Circumstances are different now to what they were when I gave my evidence. The present proposal is to lock the river from Bourke to Menindie, which means permanent navigation. The result will be that at such times as the river is not navigable below Menindie the bulk of the trade will gravitate to Bourke, and the trade of Bourke will be increased.
1151. Therefore, from that point of view, it would be an advantage to your firm? Yes.
1152. You said just now that the people seemed to prefer railway connection with Wilcannia, to the river;—would you, as a person having great experience of the district, say what you think would be the best for the general benefit? I consider that for the general benefit the railway is the better of the two. Looking at it apart from any selfish point of view, and purely from the point of view of the residents, the railway is far preferable for a number of reasons. The chief reasons are that they could get stock removed, it would bring a larger population, it would promote mining development, and in several directions it would facilitate the populating of the country, which the river could not do. I am talking of the Wilcannia district.
1153. That is a straightforward answer, because, personally, it would suit you to have the river? Yes; I state my opinion as unprejudicedly as I can.
1154. Is there much trade from Bourke down the river to Wilcannia and Menindie? It is very intermittent.
1155. Has that trade increased or decreased of late years? It has slightly increased on account of the intermittency.
1156. Is there much competition between the colonies at those points? Yes; the competition still goes on. I could explain in another way how the trade has increased on account of the intermittency of the river. A pastoralist or other resident of the Wilcannia district if he knows there is a good river coming down would not look at Bourke, but if he sees there is no chance of a river he will send his order to Bourke. These difficulties may not arise again for some time.
1157. How far above Wentworth does competition reach from the other colonies? A little above Wilcannia.
1158. How many miles is that? About 300.
1159. If you were asked which you considered was of greater importance in dealing with this river to make a navigable channel or one fit for irrigation, which would you favour? That is a home thrust. I am a steamboat proprietor—I could not say.
1160. Looking at the experience of that great country of America, of which you are a native, is not irrigation there regarded as an advantage in the dry districts? Of course. In dry districts there they have gone in more for artesian boring by artesian companies, which lease land out in small sections and guarantee so much water to every holder per acre.
1161. Do you look upon the locking of the river as being of as much importance as you did when we were considering the question of locking the river from Bourke to Brewarrina, seeing that a railway is now being authorised from Byrock to Brewarrina? I still consider that the locking of the river is a national scheme, and a great one. It may be called a Federal scheme.
1162. What is the largest tonnage of the steamers which you employ? Each vessel is provided with one or two barges, and the steamer does not carry much cargo. She tows two barges. Taking the combined tonnage capacity in that way of any one plant, it is about 250 or 300 tons.
1163. The length of this lock is 200 feet, with a width of 37 feet;—do you think that would be sufficient length to accommodate any vessel that would be employed in the river for many years? Yes; as far as I recollect the dimensions are the same as the lock at Bourke. That I think would be quite sufficient. A boat and a barge could go in at one time.

C. L.  
Shainwald:  
11 May, 1899.

1164. *Chairman.*] Have you now got the figures which you referred to? Yes; I have taken an average of fourteen years from the 1st January, 1882, to the 21st May, 1896. The average per annum during which the river was open was 49 per cent. The lowest number of days was in 1884. It was then open twenty-one days out of 365; the longest time the river was open was in 1890, when it was open 354 days. I have also the following tables:—

SUMMARY of Wool Inwards and Merchandise Outwards between Wilcannia and Bourke, 1892 to 1898.

Year.	Days river was navigable.	Wool inwards.	Merchandise outwards.	Year.	Days river was navigable.	Wool inwards.	Merchandise outwards.
		Bales.	Tons.			Bales.	Tons.
1892	247	9,750	1,760	1896	64	2,238	680

RETURN showing the value of Imports and Exports at Wilcannia during the years 1895-6.

Year.	Imports.	Exports.
1895 .....	£23,137	£145
1896 .....	£60,694	£176

1165. Has any special effort been made by the Railway Commissioners to get the traffic from Wilcannia towards Bourke? Yes; there is a special rate offered for a portion of it.

1166. *Dr. Garran.*] Has that been affected by the low river below Wilcannia? I do not think so. They have preferred to hold their wool at Wilcannia, on the chance of getting the boats to take it away. They have sometimes kept it stored for months.

1167. *Chairman.*] Is there much traffic by road from Bourke to Wilcannia? Practically none.

1168. Is there any road-borne wool? Yes; but not below Tilpa.

1169. *Dr. Garran.*] Have you any return of what has come overland from Broken Hill to Wilcannia during the last twelve months? No; but it might be ascertained partly through the Custom-house in Broken Hill.

1170. *Mr. Watson.*] How many steamers are engaged on the Darling River, usually? Approximately, the registered tonnage, including barges, is about 10,000.

1171. With reference to the possibility of imposing tolls with a view of recouping the State for the expense, what do you think would be the most equitable way of imposing a toll? I think the most equitable way would be the same as wharfage charges; that would be on the package or on the ton. The goods could be classified.

1172. In view of the increase of trade resulting from a permanent river, what amount do you think the steamboat proprietors could afford to give in the way of tolls on the registered tonnage of 10,000? I do not know. It seems to me that a steamboat proprietor would do what any other middleman does—that is, he would pass on the charge to the consumer. It would pay him for the reason that on account of the permanent traffic he could afford to carry for less money.

1173. The up-keep of the system of locks and weirs will be £22,000 a year, including interest and everything;—what proportion of that could we reasonably expect to get back by the imposition of tolls without unduly handicapping the people? It is very difficult to arrive at the figures. It is very difficult to say what saving there would be to the steamboat proprietor in having permanent navigation. There would be a great many items to be considered. For instance, during the last twenty-four hours an incident has occurred showing the uncertainty of the calculation. We sent a vessel down to South Australia, and the crew were engaged at Bourke under the same articles as on an ocean-going vessel—that is, we are bound to return the crew to Bourke. The vessel has become stranded, and we have to bring back the crew. We shall have to rail them to Port Adelaide, and provide them with a passage by sea to Sydney, and then rail them back to Bourke. All that would be saved to a steamboat owner if there were permanent navigation.

1174. *Mr. Levien.*] I suppose that does not occur very often? Yes; we engage men sometimes in South Australia, and we have had to bring them back in the same way. We have engaged them at Bourke, they have got stranded at Wilcannia, and we have had to bring them back to Bourke by road.

1175. *Mr. Watson.*] Do you think it would pay the steamboat proprietors if a license fee were imposed of £1 per registered ton per annum;—taking everything into consideration in the way of increased trade from population, could they afford to pay that amount? I think that would be an exceptionally good idea; and I do not think a fee of £1 would be excessive.

1176. If they could afford to do that, practically half the annual cost would be recouped? Yes; if my estimate is correct that the gross tonnage is 10,000, you could obtain half the maintenance cost from that source. It would be more than worth the license fee.

1177.

1177. It would be worth your while to pay £200 per annum per plant and have a free passage? Yes, unquestionably.
1178. You would assume, of course, a river to Wentworth and not to Wilcannia? I do not say Wentworth necessarily. I refer to the scheme under consideration.
1179. You think it would be worth while to pay a license fee as far as Menindie? Yes.
1180. With regard to the question asked by Dr. Garran concerning the present flow of water at Bourke, I understood you to say that there was a certain amount of water coming down the river now;—do you know what that means on the gauge? I think the gauge at Bourke to-day shows a little over 2 feet above what they call summer level.
1181. Does summer level mean flowing? I do not think so. It is a very deceptive thing. The levels are not the same at the different telegraph stations.
1182. At Bourke and Wilcannia we have diagrams showing different levels? Yes; they are not reliable for navigation purposes.
1183. You say that there is 2 feet of water shown on the gauge;—what would that represent on the next ensuing bar or shallow? It would be flowing the whole length.
1184. Two feet at Bourke would mean 2 feet right down the river? Yes.
1185. Do you think it is 2 feet at the present time? Yes.
1186. Is that the lowest? No; I have seen it not flowing at all.
1187. How long has such a state of things existed? I do not recollect it since 1884.
1188. Did that obtain over any length of time then? Two or three months.
1189. Was there one occasion on which there was no flow? Yes; you could walk across the river.
1190. We could not always rely upon the river making good the waste of lockage water, and the evaporation in the upper pool? No, but if it were fairly conserved, I think, for all practical purposes you could rely upon it.
1191. We were told yesterday by one of the engineers that 610 lockages would reduce the level of the water in the uppermost pool by one foot. We also have it in evidence that, the evaporation in that district amounts to about 5 feet per annum. So you would have to allow, say, during the three months that no river was running for 15 inches of evaporation, and 610 lockages, would bring you down another foot? In making that estimate I would take into consideration another factor, that is, that evaporation is greater in certain seasons than in others. The evaporation would occur during the warm weather, and the chances of having a good river are better during January and February, which are the hottest months. It is very seldom that we lose the navigation during that time.
1192. Is that on account of the tropical rains on the Queensland side? Yes, if you estimate the evaporation at 5 feet you should take into consideration the time at which it occurs.
1193. Your experience is that the evaporation would be least during the period when the flow would be least? Yes.
1194. Do the tropical rains keep up the river? Yes.
1195. So that you would leave out evaporation as far as the upper river is concerned? I would not set much store by it.
1196. The worst aspect would be what would be lost by lockage in an exceedingly dry time? Yes.
1197. What do you think during any three months would be the greatest number of lockages, and do you think they would average 610 during that three months? I do not think they would.
1198. Then even during the worst periods of the year you do not think there would be a reduction of one foot over the whole area? No.
1199. So that from a navigation standpoint, you think the depth proposed to be ensured would be quite sufficient even during the worst period of the river? Yes.
1200. Do you know whether any steamers have had occasion to use the lock since it was put up? Yes.
1201. What time did it take to go through? Only a few minutes. We put the first boat in there when the lock was open, and they emptied and filled the lock in less than four minutes.
1202. There would not be any great loss of time in passing through the locks? No.
1203. Half an hour has been mentioned as the probable maximum? I should not think it would take any longer.
1204. Did you put a barge through with that vessel? Yes.
1205. Did that involve any great additional trouble? No. There is sufficient length in the lock.
1206. *Mr. Levien.*] Supposing vessels were going up to Wilcannia from Wentworth, at what rate do they travel? About 4 or 5 miles an hour. In a locked weir they would have still water and no current.
1207. Supposing the river is in flood, and without any locks, at what rate does the stream run down? At least 3 or 4 miles an hour.
1208. So that the steamer could still go up-stream? Yes. It is only in turning the corners that there would be any trouble. They then get into eddies.
1209. *Chairman.*] Are there any obstructions in the river below Menindie? Yes; it is a very bad river there. More accidents occur below there than anywhere else, on account of snags and rocks.

FRIDAY, 12 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD,  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

1210. *Chairman.*] Have you prepared a map showing the tenure of the land within 3 miles on each side of the Darling River, from Bourke to Menindie? Yes; 15 miles wide is shown between Bourke and Wilcannia.

C. L.  
Shainwald.  
11 May, 1899.

C. E. Rennie.  
12 May, 1899.

C. E. Rennie. Wilcannia. I first of all prepared a map from Bourke to Wilcannia, showing a distance of 15 miles on each side, but I was afterwards asked to prepare a map showing 3 miles. That accounts for the different widths.  
 12 May, 1899. 1211. Have you a statement showing how these lands were held between Bourke and Menindie? Yes. It is as follows:—

## BOURKE TO MENINDIE.

Proposed locking of the Darling River 3 miles on each side of River.

Alienated land .....	52,100 acres
Homestead leases, &c., &c. (Includes settlement leases, 3,480 acres ; improvement leases, 6,980 acres ; special leases, 1,250 acres) .....	478,000 ,,
Reserves ..	402,750 ,,
Crown land .....	366,200 ,,

## Tenure of Crown Land.

Leasehold area (expiring in 1918) .....	354,400 acres
Held under occupation license.....	11,100 ,,
Untenanted .....	700 ,,

1212. Is there anything in the Department by which we could obtain a statement of the proportion of agricultural and pastoral lands? I do not think so. Probably it could be obtained approximately from the local district survey office.

1213. Suppose this country is made fit for smaller settlement, could some of the expenditure be recouped by an increase of the rents;—is that the practice in the Department? Such land as is suitable for closer settlement is set apart for that purpose. For instance, if any area along the river is fit for settlement leases, it would be reported upon, and set apart in small areas, and the surveyor's report would state the value of the land, the rental that should be charged, and the improvements upon it. The rent in that case would be higher than the rent of the adjoining pastoral holding. That is probable, as it would be the best part of the holding, of course. Most of the available resumed areas along the river have been taken up under homestead leases. The blue hatchings show the resumed areas along the river which have been taken up as homestead leases or improvement or settlement leases. The brown-coloured portions are the leasehold areas which are not available.

1214. When will the leasehold areas be available? In 1918—that is, provided no further extension is granted.

1215. Is the portion of the map coloured dark blue freehold land? Alienated land; and the green shows the reserves. The great bulk of the blue hatching is homestead leases.

1216. Can you give the same information with regard to the 15-mile area? On the 15 miles on each side of the river from Bourke to Wilcannia, the figures are as follows:—Alienated land, 136,800 acres; homestead leases and other leases, 1,193,900 acres; reserves, 590,700 acres; Crown lands, 2,482,600 acres. Crown land made up as follows:—Leases expiring in 1918, 2,110,500 acres; held under occupation licenses, 370,700 acres; unoccupied, 1,400 acres.

1217. *Dr. Garran.*] Have you the number of different settlers, the homestead lessees, and so on? No; it cannot be given satisfactorily, because homestead leases may not be occupied, although they may be held in individual names.

1218. You cannot give an idea as to how many *bonâ fide* settlers there may be? It would not be reliable. Of course the improvement leases do not require residence. There is not a very large proportion of improvement leases.

1219. *Chairman.*] As the leases of the pastoral holdings fall in, are they eagerly sought for by small settlers? Yes, as a rule in the Central Division. They have not expired in the Western Division.

1220. In the past have there not been a number of withdrawals from leases? No, except in one or two cases around townships. The withdrawals are limited to 10 miles from the boundaries of towns of not less than fifty inhabitants. The resumed areas have been taken up pretty freely in parts of the Western Division.

1221. Were the resumed areas eagerly taken up? I cannot speak for the whole district; but I know that here and there they have been very freely taken up, for instance, along this river.

1222. Judging from the past, would it be naturally supposed that when the leases fall in, they will be taken up in a greater number of holdings? Yes, especially along river frontages.

1223. Is there any difference in the carrying capacity of the land in homestead leases and pastoral holdings? I do not know from local knowledge; but I suppose the character of the land does not vary very much.

1224. I suppose the original holder would see that the best part of the country was not resumed? No doubt he would do the best for himself; it is natural to suppose so.

1225. *Mr. Dick.*] Was there ever a reserve 3 miles wide proclaimed along the banks of the Darling? I do not think so? but there is a stock route along the river.

1226. Of what width? On an average a mile wide.

1227. Does that extend along the whole length of the banks? There is a stock route going down from Bourke to Wilcannia. It is mostly on the western side, and also partly on the eastern side. Throughout a good part of the distance, it is on both sides.

1228. Is that route exempted from any kind of selection? No; it may be included in homestead leases or settlement leases.

1229. *Mr. Watson.*] Are not stock routes reserved from occupation? Yes; but they are not absolutely excluded from homestead or settlement leases.

1230. They pay a rental for it, but they have to give passage for travelling stock? Yes.

1231. *Chairman.*] Then, practically, there is a stock route reserved on both sides of the river? Yes, practically, for a great part of the way.

1232. *Mr. Dick.*] If it were thought desirable to allow the stock route to be selected, what course would have to be taken? It would have to be reported on, and we should have to get the consent of the Mines Department (the Stock Branch) to its alienation. It would have to be inspected, set apart, and measured up.

1233. What provision would be made for the drovers? We should not cancel the route if it were absolutely wanted.

1234. *Mr. Watson.*] The bank of the river may become valuable because of its proximity to the river for irrigation purposes, and to that end it may be wise to throw open the stock route for very small settlement,

settlement, say, for homestead selections; and therefore an exchange of a portion of the land along the banks of the river might be made for land further back for a stock route? Yes, the stock route might be deviated further back. I do not mean that the stock route absolutely follows the banks of the river. It is along the river, but it does not absorb the frontage. C. E. Rennie.  
12 May, 1899.

1235. *Mr. Levien.*] Would not a large area be wanted in that country? Yes, you could not have settlement on very small areas unless it were close to the townships.

1236. *Mr. Dick.*] Under the terms of the pastoral leases in that district, is the Department allowed to subtract from the areas, for the purpose of creating stock routes under the conditions we have been discussing? Yes, the Department has power to take stock routes through the leasehold areas.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

1237. *Chairman.*] Can you give the Committee a statement of the extent of country which supplies the catchment area of the Darling River in the upper part? In New South Wales the area is 73,400 square miles, and the corresponding area in Queensland is 49,000 square miles. That is the area draining into the river. H. C. Russell,  
C.M.G.  
12 May, 1899.

1238. *Dr. Garran.*] Does that include the Castlereagh and the Macquarie? Yes, the whole of the branches of the river spreading out above Bourke. It does not include the area below Bourke, although that does yield a considerable percentage of the water coming into the river at certain times.

1239. Is the proportion coming from Queensland compared with the proportion coming in from our own tributaries relative to the two areas you have mentioned? I cannot answer the question definitely, because I have not the rainfall exactly in Queensland. The water coming from Queensland, although the area is smaller, is quite as large as that from New South Wales, because the rainfall there is heavier.

1240. Then the water at Bourke is as much Queensland as it is New South Wales water? Yes.

1241. *Chairman.*] Can you give the average rainfall over the New South Wales area? The average rainfall varies very much from year to year in New South Wales; generally it is 20 to 22 inches. In 1897, it was only 17·75 inches. In other years when there were heavier rains it has been as much as 25 inches. I do not take into consideration what is below Bourke, because the general impression is that no rainwater of any consequence gets into the river there. The Warrego or the Culgoa waters seldom or never reach the river. There is one instance on record in which a very heavy rain-storm passed over Wilcannia as a centre, and it caused a rise in the river of 27 feet at Wilcannia, although the rain only lasted thirty-six hours.

1242. Have you the record of the rainfall for the past three or four years? Yes.

1243. Have you a record of the rainfall above Bourke which supplied the Darling? Last year it was 17½ inches, and the average was about 24 inches over the area of the catchment of the Darling.

1243½. That is the effective catchment of the Darling in New South Wales? Yes.

1244. What percentage of that rainfall actually finds its way into the Darling? It differs very much according to the seasons.

1245. During a very dry period, does very little of it find its way into the river? Yes; the river sometimes does not run for six or seven months, but that is an extreme case. The flood that is now in the Darling affecting the navigation there arises, not from any general fall over the catchment of the Darling, but from a heavy rain on the main range north of Tamworth up to Tenterfield, including perhaps 60 or 70 miles to the westward. The rain was very heavy, and that gave rise to the present floods. The character of the rain varies so very much from year to year that in order to convey an exact idea of the state of matters, one would require to supply a table showing the quantities.

1246. Have you gone into that question? Yes; I have the quantities here for a number of years. Taking nineteen years, the average rainfall has been 24·16 over the catchment of the river. The percentage of that rainfall which passes Bourke amounts to 1·35 per cent—that is about 1½ per cent. The greatest quantity that passed Bourke in any year was in 1893, and that amounted to 2·85 per cent. The rainfall was 26 inches over the area in that year.

1247. Has the water passing down the Darling been gauged at various points? Yes; but those records going back for some years are not so accurate as they are now, since the Water Conservation Branch has looked after the rivers better. In older times the records were simply kept by some telegraph master, who might sometimes guess at them. Now, I believe, they are correct.

1248. Have you a correct return for the last three years? Yes. For 1891 the percentage was 2·31; 1892, 1·60; 1893, 2·85; 1894, 2·09; 1895, 0·52; 1896, 0·78. In 1897 the river gauge was shifted, and the record was incomplete.

1249. Can you give us the volume of water passing down? No; I have not got it worked out. It is a very small percentage of the water which falls. Take the Murray, for instance, the average percentage of rain passing down that river amounts to nearly 25 per cent. It seems very remarkable that the Darling catchment area should adjoin the catchment area of the Murray, and that the Darling should only carry away about 1½ per cent., while the Murray carries away about 24 or 25 per cent.

1250. Is the Murray affected a great deal by snow water? Yes; a great deal. There are no means at present of ascertaining how far it does affect the river, but it can be observed that the river begins to rise when the snow begins to melt.

1251. Have you any opportunity of ascertaining what amount of loss is caused by evaporation and absorption? It is very difficult to answer the question, because the evaporation at Bourke from a water surface is about 5 feet in the year, and the rainfall is 18 inches. That looks like a flat contradiction, but it must be remembered that evaporation does not go on all over the surface. When the ground gets dry evaporation ceases. I find by weighing a portion of the surface of the earth regularly every day, the evaporation is more rapid from an earth surface than it is from a water surface alongside of it, until the ground becomes baked on the surface. When it is baked for an inch from the surface evaporation stops. That must be the case in Bourke. After the wet surface has disappeared, practically the evaporation ceases.

1252. *Mr. Levien.*] Has that been tested up there? For many years I have had a proper instrument for recording evaporation at Bourke. I have had it there since 1885, another at Wilcannia, another at Walgett, another at Dubbo, and at a few other places about the country.

- H. C. Russell,  
C.M.G.  
12 May, 1899.
1253. *Chairman.*] Does a great deal of the water that falls as rain find its way into the subterranean supply? Yes; I think that is what becomes of it. The sides of the hills are very absorbent, and the rain does not get into the rivers, and even when it does get into the rivers, it seems to sink into the gravel beds.
1254. *Mr. Shepherd.*] Does the depth of the water affect the evaporation? I think not. If you put out a very shallow surface of water, the sun's rays would go through and heat the bottom. But in the case of an ordinary depth of a foot or 2 feet that would not be appreciable. It is the wind chiefly which causes evaporation, and not the heat so much.
1255. Would not the sun have more effect on shallow water than on deep water? Yes.
1256. Consequently evaporation would be greater in that case? Yes.
1257. *Mr. Levien.*] What wind has the greatest effect in evaporation? The north-westerly—the hot winds. Before I made the experiment, I was under the impression that 2 or 3 inches of water would evaporate in a single day. I have had a positive statement made to me that a much larger quantity would disappear in a day, but I find the greatest record at any of these places in the country extending over thirteen years shows that the greatest evaporation in one day is a little under 1 inch.
1258. Where was that? At Walgett. The vessel there is 4 feet in diameter, and the water is 2 feet 6 inches deep, so as to represent as fairly as possible an artificial reservoir.
1259. *Mr. Shepherd.*] Have you found that the growth of timber in the immediate vicinity of water assists evaporation? We have no means of ascertaining that. Of course, trees do evaporate enormously. A number of experiments have been made in Europe, and it is found that a comparatively small-sized tree with abundant foliage evaporates in summer as much as 16 gallons of water per day.
1260. Of course, some varieties of timbers take up a great deal more moisture than others? Yes; but there are not many Australian trees which have large foliage. The tree I spoke of was a chestnut tree in the Old Country with a very full foliage. I have always felt that it is hardly fair to measure the percolation in Sydney, and to suppose that it represents the country, but I cannot get any one in the country to do it.
1261. It is supposed by a good many that the Hobart blue-gum (*eucalyptus globulus*) is the greatest absorber of water? I do not know about that, but very likely it is. There are many cases in this country where the forests have been cut away suddenly and springs have burst out as the result, showing that the trees must have got rid of a good deal of water before.
1262. *Chairman.*] The other day you gave it as your opinion that the creation of large areas of water in that district would have little or no effect upon the climate;—are we to take it that you meant there would be no appreciable difference in the rainfall in the immediate vicinity, or that there would be no influence whatever on the rainfall some distance away? I have come to that conclusion from experience. I think I mentioned the experience in Italy, where a large area of Northern Italy was placed under irrigation, and it was expected that there would be increased rainfall, but it was not so. In this Colony, at Menindie, and in that district, there are some very large lakes after heavy floods; but it does not appear that the rainfall is improved thereby, because that is the driest part of the country. There is less rainfall about Menindie than anywhere else. I heard of a scheme the other day as being broached in Victoria, where one of the engineers proposes that the overflow of the Murray in flood-time should be carried into a part of the Wimmera district, so that a very large lake would be formed there. One of the strong points made by the engineer is the probability of a greater rainfall, and an improvement in the climatic conditions, so that there would be an improved growth of cereals. As far as I have been able to ascertain here and in other countries there is no result of that kind. The atmosphere is drifting to the eastward at the rate of 450 to 500 miles a day, and any mass of water evaporation which rises up and mixes with the air above, must go away probably to the sea. We do not get much rain from the west.
1263. Is it possible that the rainfall would be increased between the Darling and the coast? I do not think so; it would go too fast to fall. Suppose all these water areas were evaporated, and the water they contain distributed over the large intervening space between there and the sea, you would not be able to see it—it would be a microscopic quantity. The areas of those lakes are utterly insignificant compared with the general area of the Colony to the eastward.
1264. We should not have to consider the lakes there now; they would be considerably increased in size;—do you think they would not be sufficient to make any difference in that? I do not think so.
1265. *Mr. Shepherd.*] Is it not reasonable to suppose that where there is an enormous conservation of water, and that water is evaporated, the rain would be given off somewhere near the point rather than it would be carried away hundreds of miles to the sea? I do not think so; but to a large extent that opinion is based upon my own idea of the matter and what has been done in other countries. I am not aware of any definite experiment being carried on on a large scale. The water in Lake Torrens is a very large area, but it does not appear that there is an excessive rainfall there above that of the surrounding districts; in fact, the rainfall there is very poor.
1266. Then it is just a matter of chance as to what rain will be brought there? Yes. The bulk of our rain comes along with weather changes from the west and north-west. All the useful rain inland comes in that way.
1267. Have not the hills some effect in breaking the rain-clouds? Yes. If a rain-cloud is made to rise up a little it immediately drops rain. The winds from the west and north-west, which bring rain to us, pass over a stretch of ocean 6,000 miles wide. Heavy winds there generally break up the surface of the water, and tend to load the atmosphere with moisture. When it comes on to the shore there is a probability of getting a deposition from it; but you cannot compare any artificial water conservation with the Indian Ocean, and that is where our supply comes from.
1268. *Dr. Garran.*] Do you get in your office returns the number of days on which the Darling is navigable? Yes; we get the height of the river every day, and it is plotted in each book. The record of the river at each station is shown in a diagram. The salient points—the highest and lowest and the average—are given in a table.
1269. Can you say how many days during the last four years the river has been navigable? I cannot give the figures for the last three or four years, but the average duration of available water for navigation is about four months in the year.
1270. During the last four years would it have been less? Yes. What I have stated is the average of fifteen or twenty years. Sometimes there has been no navigation for a year. I remember that once when

I was at Bourke the hotelkeeper told me he had been waiting for two years for a load of timber from Adelaide. That was in a very dry time—in 1885. H. C. Russell,  
C.M.G.

1271. *Mr. Levien.*] Would not that depend upon the draught of the vessel? Yes.

1272. *Dr. Garran.*] Has it ever been navigable for a whole year? I am not certain, but I think it has been. 12 May, 1899.

1273. *Mr. Trickett.*] If these weirs are erected it is contemplated to utilise the waters of the Darling for irrigation;—have you studied the point as to the capacity of the river for such a purpose? I have not studied it so as to give an answer that would be worth much, but I have looked at it. I do not think the question has been determined as to how much water would be necessary. In Egypt one flooding of the agricultural area requires about 17 inches. I think there is a smaller flooding after that.

1274. *Mr. Watson.*] Is it the practice here to put such an immense body of water on the land where irrigation is carried out? I do not know what is done in the Colony. The crops are somewhat different, I think.

1275. *Mr. Trickett.*] Could we not get information on that point by a record of the water which passes down the river at any given point at a certain time? It would be possible to get at it. We have all the records of the heights of the water, and approximately the quantity that runs down. But then you want the other side of the question, as to how much is necessary for irrigation.

1276. We have had some evidence in that direction from Mr. McKinney;—if we knew what amount of water runs away, and could be conserved, it might be of some use? Mr. McKinney has a better opportunity of knowing how much goes away than I have, because in many cases he has his own officers to keep the records. As to the amount required for irrigation, that will have to be proved by actual experiment.

1277. When you gave evidence before, you stated the estimated quantity of water passing Bourke—Question 830—you say that the volume of water passing down the Darling at Bourke is 2,350,000,000 tons of water, equalling three-tenths of an inch of rain over the catchment area per annum—how did you arrive at that quantity? By calculating the discharge of the river from the average height.

1278. Does that give the volume that goes down the river? Yes; it means that three-tenths of an inch over the catchment area would represent that quantity if it all went into the river.

1279. But it does not get into the river? There is the difficulty that it is impossible to say what goes into the river. We have a rainfall of 24 or 25 inches, but only about 1·35 per cent. of that goes down the river.

1280. *Mr. Watson.*] How do you arrive at what percentage goes down the river, unless by measuring the flow at some particular point? We know the velocity of the river at Bourke, and the size of the river.

1281. Then you must have data to go upon to know how much goes down the river? That is all in my annual report. Taking it at Bourke it amounts to 1·35 per cent. of the rainfall. The rainfall amounts to 24 inches.

1282. Over how many square miles? 122,000 square miles.

1283. To get the amount that goes down the river, you have to use as a factor in the calculation the drainage area? Yes.

1284. You know the drainage area? Yes.

1285. You must have some records of the quantity of water going down at Bourke? Yes.

1286. Otherwise you could not arrive at that conclusion? This statement, made by me in 1896, refers to three-tenths of an inch. That means ordinarily 1½ per cent. of the rainfall; the rainfall is 24 inches.

1287. *Mr. Levien.*] Would not the quantity in the river at different points vary very much, owing to the water coming in from springs and other streams? Yes. My own impression is that the water goes underground, and that that accounts for the artesian water.

1288. *Mr. Trickett.*] Out of the 24 inches of rainfall, only three-tenths of an inch passes Bourke? Yes. It is wonderful how there is such a difference in the discharge of the Darling and the Murray. In the Murray, at Euston, 24 to 25 per cent. of the rainfall passes down. That is about one hundred times as much as in the Darling.

1289. How do you account for that? I cannot. The only way in which I can account for it to my own satisfaction, but it may not convince anyone else, is that the water sinks into the ground, especially on the high lands. Lake George is a remarkable sheet of water, from 12 to 15 miles long. I found there that although the hills were very rocky, with no soil on the greater part of them, a mere fraction of the rain goes into the lake,—just about the same proportion as passes Bourke. The hills must be full of cracks.

1290. *Mr. Shepherd.*] On the Lachlan it may rain for a month, and yet not set the river running? Yes. If the rain falls at a certain speed it runs off the surface, but if it falls slowly it all runs in.

1291. *Chairman.*] Does it go to form the subterranean waters? Yes.

1292. *Mr. Trickett.*] Have you said that a very small portion of the water goes away in evaporation? About 5 feet of it goes away on the water surface; but that is one difficulty in computing the discharge of the rivers, that we cannot tell what the evaporation is on the surface of the rivers. You have to take the whole surface of evaporation, and that is not known.

1293. On the Darling does the ground cake when the rain falls upon it? Yes. Nearly all the floods that come into the Darling are floods that are derived from the steep uplands on the western slopes of the mountains. It is not local rain.

1294. Is that kind of country which cakes on the surface good for irrigation? I cannot give an opinion on that.

1295. With regard to irrigation in that part of the country, do you think it is safer to look to the water supply from artesian bores rather than to a river supply? I should certainly think it is safer, because you could depend upon it every year, while you cannot depend upon the river.

1296. As far as experiments have gone, has the boring been very successful? Yes, and the discharge is fairly even.

1297. Do you think there is an immense quantity of artesian water in that part of the country? Yes; that is the only way in which I can account for the small quantity going down the river. I believe it is the opinion of geologists that the present surface there has been filled up by deposition from floods, and that underneath there are an abundance of old river beds occupied by gravel and such things which enable the water to get away.

1298. Then that points to the conclusion that the great storage capacity of that western country is underneath rather than in the few streams which are running there? Yes.

1299.

H. C. Russell, 1299. The country absorbs nearly the whole of the moisture? Yes. Of course, the question now is how much the artesian water is going to appear on the surface. At present we are getting about as much out of the artesian wells as we are getting out of the Darling. I think the probability is that we shall ultimately get ten or twelve times as much. But you cannot tell whether or not it is running away through some subterranean channel to the ocean.

C.M.G.  
12 May, 1899.

1300. *Mr. Shepherd.*] Is the artesian water, as a rule, suitable for irrigation? It depends upon the amount of soluble matter which it contains and the character of it.

1301. Does the quality of the water vary very much in the various wells? I believe it does, but I have no personal knowledge of it.

1302. *Mr. Watson.*] Do I understand you to say that, from experiments of your own, you are of opinion that when the soil cakes on top there is practically no evaporation? Yes.

1303. That would seem to be at variance with the experience of the statements of some of the Government officials engaged in teaching agriculture. The principal of the Hawkesbury College states that the more broken you keep the surface the less evaporation there is; he states that, with the caking, capillary attraction is set up, and that attraction can only be destroyed by breaking the surface? I know they hold that opinion, but my opinion is based on actual experiments going on over many years at the Observatory. We ascertain every day by weighing the soil how much it has lost. We find that when the surface becomes hard the evaporation does not absolutely stop; but it practically stops—the quantity becomes very small.

1304. Do you think that the safest way to retain moisture in the subsoil would be to allow the surface to cake? That is my experience. I know the agricultural authorities say that the way they keep the soil moist is to pulverise the surface; but it does not seem a reasonable proposition. My own experience has been altogether the other way.

TUESDAY, 16 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GABRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Hon. Edward Davis Millen, M.L.C., sworn, and examined:—

Hon.  
E. D. Millen,  
M.L.C.  
16 May, 1899.

1305. *Chairman.*] You are familiar with the proposal into which the Committee is inquiring? I have a general knowledge of it.

1306. You have taken a special interest in this matter, have you not? I have given some time and attention to it.

1307. Will you give the Committee your opinion upon the proposal generally? Certainly. To my mind the consideration of this question resolves itself under the two headings—navigation and irrigation—and I will deal with the navigation aspect of the proposal first. The point which, in my opinion, commends this work is the necessity of providing more certain and cheaper carriage for produce in the district under consideration than the people there enjoy at present. The value of the produce raised there is so small that it is unable to stand a very high rate of carriage, and experience teaches me that one of the great obstacles to profitable squatting in that part of the Colony is the very heavy charges involved in the conveyance of wool to a market. Those charges are necessarily highest when those who have to incur them are least able to bear them—that is, in times of drought, when the incomes of the pastoralists are smaller than they are in good seasons. The proposal to lock the river I regard as alternative to railway construction. If it is desired to give an impetus to the development of that part of the country, either the river must be locked or a railway constructed.

1308. *Mr. Watson.*] A railway to what point? A railway to tap the Lower Darling. The question which presents itself is, which would be the more economical means of providing the required facilities—the construction of a railway or the locking of the river? I have no knowledge of the figures submitted to you as to the cost of the proposed scheme; but I would point out that if you construct a railway you incur a large expenditure, and are able to deal with only half the traffic of the district, because in a good season the river will invariably take a very large portion of the traffic, even after a railway is constructed; but if you lock the river, although the expenditure you incur is large, you deal with all the traffic. That the work would be directly reproductive is matter for very grave doubt, but I would point out that the State owns practically all the land from which comes all the traffic which would be affected by the construction of the proposed work, and as the rentals derived from that land are reappraised every seven years, if the river were made navigable the State would receive additional revenue per medium of the Lands Department, on account of the advantages conferred upon its tenants. During a previous inquiry on a similar project, the view which I have just advanced was disputed by many of the Crown tenants; but, as the Land Act distinctly provides that, in assessing rentals, the Local Land Boards shall take into consideration the cost of carriage, and as they invariably take that matter into consideration, I think it cannot seriously be argued that the State would not receive higher rentals if the proposed work were carried out. It would also be possible to collect fees in connection with the navigation of the river, if such a thing were thought desirable; but I do not advocate such a course, because of the indirect benefits which would be obtained from the expenditure in the way I have described, and because I regard the work as very much of the same nature as the undertakings which have been carried out to improve the navigation of the northern rivers of the Colony, and the various harbours along the coast.

The

The expenditure upon those undertakings is not expected to return any direct revenue. I am inclined to think that the effect of the locking of the Darling upon the railway traffic of the Colony, and upon the trade of the metropolis, has been very much over-estimated. At the present time some portion of the traffic of the western district always finds its way by river to the sea-board, and that portion of it which comes to our railways is by no means profitable, because, in order to secure it, the Railway Commissioners have to make very considerable rebates upon their ordinary rates. For all traffic other than wool, the river, if locked, would, I think, act very considerably as a feeder to, and a distributor from the railways. Owing to the saving of time which would result, a very large portion of the general merchandise going to the districts concerned,—at least, for a very considerable distance below Bourke—would always be obtained from Sydney. But even if such were not found to be the case, I think that Sydney interests should not be given undue weight. If the traffic of the district found its way by river to ports other than Sydney, it would show that the people in the districts affected found it more profitable to use those ports. But if it is feared that the locking of the river would too severely prejudice the trade of the metropolis, I would suggest that the danger might be got rid of to a great extent by locking the river only between Bourke and Wilcannia. If that were done, I think that the railway traffic would not be affected to any appreciable extent.

Hon.  
E. D. Millen,  
M.L.C.  
16 May, 1899.

1309. You do not think that the volume of the railway traffic would be reduced appreciably if that were done? No.

1310. *Chairman.*] If the river were locked as far as Wilcannia? It would then become only a feeder to the railways. I now propose to turn to the irrigation aspect of the proposal, and I shall endeavour to show later on that there is no opposition between such irrigation as is possible out there and navigation. In my opinion, all talk about comprehensive schemes is so much nonsense. The general discussion of irrigation matters seems to assume big schemes which will water whole districts, whereby enormous regions will be transformed from naturally poor pastoral country into rich agricultural country. But such a thing has not taken place in any country in the world. The area which it has been found possible to irrigate in any country has been found to be absolutely and relatively very small. In the United States, where they have enormous mountain supplies of water, and great numbers of artesian wells, the total area under irrigation to-day is 8,000,000 acres. This seems a large area, but it represents only '35 per cent. of the total area of that country. Applying the same ratio to New South Wales, we get only 650,000 acres. The Director of the United States Geological Survey Department, Major Powell, states, after devoting some years to a consideration of the subject, that the area of the arid region is 1,340,000 square miles, of which, as an outside estimate, some 3 per cent. may be irrigated. His estimate of the area in Utah, capable of being irrigated—though all of it is not yet irrigated—is 2·8 per cent.; in India, a country of extremely large schemes, only 3 per cent. of the land is irrigated; in France and Spain,  $\frac{1}{2}$  per cent.; and in Italy, where the conditions are peculiarly favourable, and notwithstanding the modern character of the works there, only 5 per cent. These figures, I think, prove that under the most favourable circumstances irrigation is confined to very limited areas. I put the figures before the Committee, because I consider that one of the most serious difficulties which we have to overcome is the getting of the people to be practical in this matter.

1311. *Mr. Watson.*] Are the percentages which you have given percentages of the total areas of the countries named? They give the percentages of the land which can be irrigated in comparison with the whole areas of the countries named.

1312. The figures include, presumably, the areas which will be benefited by irrigation? Yes. There are, of course, very large areas which require irrigation, but which cannot be irrigated, either because of the absence of available water or because of other conditions. The figures I have given perhaps destroy to a great extent the ambitious schemes of many engineers, and, I might say, of most platform orators on the subject; but they bring the idea of irrigation within such practical limits that I hardly think anyone will say that it is beyond the resources of New South Wales. While these figures may be disappointing, it must be remembered that irrigation settlements, considered both as a means of producing wealth and as a means for providing occupation, are out of all proportion beyond ordinary agricultural settlements. In support of this contention I might instance the irrigation colony of Riverside, where 8,000 people live upon 12,000 acres of land, and the annual value of their production is returned at £500,000. In our own colony, at Pera, twenty settlers are in occupation of 400 acres of land.

1313. *Chairman.*] At Pera the water used for irrigation is supplied from artesian bores? Yes. The area of ground necessary for the support of a family is, with irrigation, so much smaller than that required under ordinary circumstances, that the best way of considering an irrigation proposal is not with regard to the area of land which it will affect, but with regard to the number of people which it will profitably provide for. We must in this Colony regard irrigation as an entirely new thing, and I think it is therefore advisable to make a start in connection with it upon a comparatively small scale. It is to be remembered that very few people in the Colony are familiar with irrigation, very few indeed have any knowledge of small husbandry, and a still smaller proportion have any faith at all in irrigation. The absence of a suitable population is, in my opinion, the greatest obstacle to be overcome. In reducing our ideas upon irrigation to practice, there are two methods of irrigation which suggest themselves. The first of these is what I may term the regional method. By the regional method, I mean schemes by which water is conveyed to settlers who are spread out over a whole district. The second method is the colony method, by which I mean the irrigation of a comparatively small selected area of land upon which population is concentrated. I know of no country less suited for the first method of irrigation than New South Wales. In all the districts of the Colony in which irrigation is desirable, settlement is sparse and the holdings are of various sizes, generally very large. But if irrigation is to be economically followed, the line of distributing canal must be as short as possible. To supply the wants of the scattered population which is to be found in one of our pastoral, or semi-pastoral semi-agricultural districts, a canal several miles in length would be required. We know, too, that the cultivation of a holding is generally in inverse ratio to its area. In most of the districts where irrigation is required the land is held in large blocks, and the proportion cultivated is necessarily very small. It would be an enormous undertaking for any individual landholder to irrigate, say, 2,000 acres. But that area would represent but a very small percentage of the total area of many of the holdings through which, in any regional scheme, it would be necessary to carry an irrigation canal. That area of 2,000 acres having been watered, the canal would have to run for probably half a mile before coming to the next irrigable area, and then  
on

Hon.  
E. D. Millen,  
M.L.C.  
16 May, 1899.

on again through more unirrigated land. But where those who desire to irrigate are concentrated, it is possible to irrigate successfully at much less expense. An illustration in support of this contention is the case of a town water supply. We have many little towns, with 2,000 or 3,000 inhabitants, who are able to obtain a comparatively cheap water supply, but it would be impossible to supply the same number of people with water at anything like the same rate if the population, instead of being concentrated, were scattered over a large district. The neglect to note this fact has, I think, resulted in the failure of the Victorian irrigation scheme. There large sums have been expended in carrying out schemes for the irrigation of whole districts, in which only a percentage of the people were prepared to irrigate, and they could irrigate only small portions of their holdings. I think that a regional scheme is out of the question under our present conditions of settlement. But, on the other hand, I regard New South Wales as enjoying ideal conditions for the adoption of the colony system of irrigation. In the first place, in most districts the land and the water both belong to the Crown. This is an extremely important point, because in many countries great difficulties have arisen through the ownership of the land being in one set of hands and the ownership of the water in another, and all authorities agree that the two should be associated. The advantages of the colony system are these:—The area required for irrigation being small, it is possible to select a site where the great proportion of the land will be suitable for irrigation. This, too, permits of the economical distribution of water, and ensures that the land for the irrigation of which the water is provided will be used. Where the irrigated area is small, no one will select unless he is prepared to irrigate, because only by irrigation can a sufficient living be made on a small area of land. The question of economical distribution is extremely important, too. It has been estimated that in connection with several irrigation schemes in America at least 50 per cent. of the water is lost by soakage before the stream reaches the land which it is intended to irrigate. On that part of the Darling affected by the proposal under the consideration of the Committee, it would be possible to select several comparatively small areas which would be suitable for irrigation, and which are situated immediately upon the banks of the river. There would, consequently, be no waste of water, and the cost of conveying it to various points of distribution would be the minimum. Then, too, under the colony system it is possible to get what is regarded as one of the essentials of successful irrigation—a dense population. It is generally assumed that close population is necessary in any country adopting irrigation; but that is only a partial statement of the truth. What is required is, that there shall be close population, not necessarily in the whole country, but on the particular areas which are irrigated. Where there are successful irrigation schemes in India and in other countries, such close population exists, and a colony on the Darling would represent one of these large schemes in miniature. Another advantage in the colony method when compared with the regional method is that, because of the close association of the settlers, it is easy to make provision for the profitable handling and marketing of produce. The effect of such co-operation is seen in many of our dairying districts, where the farmers are able to handle their produce much more profitably than if they were isolated. Going back to the district immediately affected by the proposal before the Committee, I should like to point out that the work, if carried out, and if followed by irrigation, would have a distinctly beneficial social influence. Small settlement in the western districts is absolutely impossible, unless in conjunction with irrigation. Homestead leasing has been an absolute failure west of the Culgoa. But our land laws make no provision for any other form of small tenure. Consequently, although out west there are thousands of station employees and other labourers, these people have absolutely no prospect of ever acquiring homes for themselves, or—except in rare cases—of improving their positions. The gap between the position of a shearer and that of a squatter is far too great for any ordinary man to bridge, and even homestead leasing requires too large a capital for an ordinary labouring man to obtain, even if the results were not altogether forbidding. But suitably-selected irrigation colonies would provide means by which men of the class to which I refer, whose capital is chiefly their labour, could make homes for themselves, and could ultimately, as they improved their holdings, win from the soil a modest competence. I do not for a moment pretend that it is possible to settle an enormous population along the entire course of the river within a reasonable period. We have not a sufficiently large number of people in the Colony for such an undertaking, and, even if we had, it might be doubted whether, with our limited knowledge of irrigation, it would be advisable to settle a very great number of people upon the soil in that way all at once. I am convinced, however, that if only limited areas were dealt with, and made available for settlement under the conditions to which I have referred, the land would be gradually taken up by men who at present have absolutely no chance of acquiring homes of their own. It may be asked why no settlement of this kind has yet taken place. The answer is that there must be a beginning to everything. At the present time our land laws entirely prevent anyone from acquiring small portions of land for such a purpose, and even if it were otherwise an individual irrigator working alone could hardly hope to succeed. Irrigation requires some form of joint effort, and the cost to an individual irrigator of raising his own water supply would be much greater than the cost of providing a joint supply where a number of people were closely settled. Before settlement of this kind can take place, the State, as the owner of both land and water, must provide the necessary facilities, and make them sufficiently attractive to induce people to avail themselves of them. Such settlements as I refer to, if situated at convenient points along the river, would not materially interfere with the present pastoral lessees, because the area required for an irrigation colony is, comparatively, so small, that its withdrawal from an ordinary pastoral lease would be of very little moment. If this work were carried out, and irrigation colonies created along the river, the present holders of land there would be tempted to irrigate to a much larger extent than they are irrigating now, because they would be assured of a permanent water supply, and, the river being maintained at a permanently higher level, the cost of raising water from it would be reduced. A great deal of agriculture is being done in a small way in the districts under consideration, and whereas a few years ago it was quite a rare thing to see any cultivation around a homestead, it is to-day quite unusual to see a homestead without cultivation. The first problem which the pastoralists had offered to them for solution was how to obtain sufficient water. I can remember a time when it was confidently affirmed that it would be impossible to provide water upon many large areas of that country; but to-day I consider that the water problem has been solved, and the question that now presents itself to the graziers there is how to obtain an adequate a food supply for their stocks as they have obtained a water supply. They are beginning to turn their attention to that question; and, although their efforts have been timid, I know of no case in which those responsible have failed to continue them. Every year sees a larger area brought under cultivation,

cultivation, and although it is a common thing to hear the lessees declare that it does not pay to grow fodder, they continue to grow it, and most of them are steadily extending their operations. Wherever irrigation has been tried there has been but one result, and that an extremely satisfactory one. The figures showing the amount of produce obtained from irrigated land are so phenomenal as to often excite doubt. At Toorale, Mr. McCaughey's property, I have seen a heavy crop of lucerne cut within three weeks of the previous cutting, and Mr. McCaughey has informed me that in the year 1888 he took eight crops off a lucerne patch which was irrigated, and also fed some stud sheep upon it. That is only one of many instances which I could give as showing the profitable results of irrigation. What has deterred many men from engaging in irrigation is the knowledge that when water is most required it is least available. In an ordinary good season, when the river is running at a tolerably high level, little or no irrigation is required. It is in times of drought, when the river is often reduced to a miserable trickle, that the water is most required. And if, by the locking of the river, the people near it were assured of a permanent supply of water, I feel confident that they would steadily engage in irrigation. I will now deal with the placing of the water upon the land. The only way in which this can be done in the Darling River district is by pumping. There is, of course, no difficulty in lifting the water the height which it has to be elevated there, except the difficulty of meeting the expense, and the question to be considered is—Can the water be placed upon the land at such an expense as would render the use of it profitable? I understand that the engineer's estimate for placing the water on the land is from 20s. to 25s. per acre per annum. That is the information which was given during a previous inquiry; I do not know if the same estimate has been put forward on this occasion. Now, most land-occupiers, if asked if they could pay 25s. per acre for a water supply, would unhesitatingly reply in the negative. They would reply in the negative, because they consider only the returns which they are getting from their land at the present time. To a grazier who pays a rental of 1d. per acre per annum, and gets about 6d. worth of wool to the acre, a charge of 25s. per acre for water seems quite prohibitive; but that charge must be considered in relation to the value of the produce which the water would enable one to raise. The only way which I can discover for determining whether such a charge would be prohibitive in this country, is to compare it with the charges paid in other countries where irrigation is employed. There is absolutely no such thing as cheap water; because, wherever water has been made available for irrigationists at a cheap rate, the owner of the land which is irrigated has been able to obtain a higher rental for the land, or if he sells it, a higher price. Where a water right is held apart from the land, that right is sold much as mining shares are sold, quite regardless of what it cost to obtain the water supply. The share, or "right," as it is termed, is sold for a much higher price than the proportion of the cost which it represents, so that to the actual user of the water it makes very little difference whether the irrigation scheme has been carried out for much or for little money. Having made that general statement, I propose to give a few figures which show what is really paid for water in other countries, and I would draw the attention of the Members of the Committee to the fact that the charge for water is not the only charge which has to be met. The cost of irrigation to the farmer is what he has to pay for water plus what he pays for his land, and plus what he pays in general rates and taxes. It is very necessary to remember that fact, because most of the figures I am about to quote are for the supply of water only. As in the Darling River district the value of the land is nil—we may regard it as nil when it can be rented at 1d. per acre per annum—the cost of irrigation to the irrigator would be practically only what he has to pay for the water he uses. In other countries where they are paying perhaps less for water than it is estimated it would cost here, they are paying a great deal more for land. In no case, with which I am acquainted, are they getting their land and water for such a low price as it will be possible to let people have both in this colony if the official estimate of 25s. per acre for water be correct. There is some little difficulty in ascertaining exactly what is paid for water in connection with many of the irrigation schemes of India and other places, because the charge is not so much per annum, but so much per crop, and a summer crop is charged for at one rate, while a winter crop is charged for at another rate. In connection with many schemes, too, the charges vary according to the nature of the crop. For instance, sugar-cane requires a great deal of water, and the charge for that crop is greater than the charge for other crops.

1314. Are they likely to grow sugar-cane out on the Darling? No. I think they can grow something even more profitable than sugar-cane out there. In connection with the schemes for which water is drawn from the Ganges, the price ranges from 6s. to 8s. per acre per crop. Most of this land is cropped twice in the year, so that to obtain the charge per annum it is necessary to double these figures. In Bengal the Government has expended £6,000,000 in providing for the irrigation of 550,000 acres. That means a charge of 11s. per acre for interest alone, while the expense of maintenance would be a considerable addition. In the Surhind canal scheme £4,700,000 were expended to provide for the irrigation of 640,000 acres. Taking the cost of maintenance in this case as equal to that in the other case—that figures out to 3'66 per cent.—and allowing interest at a trifle over 4 per cent. we have a total charge of 8 per cent. which means that the scheme requires an annual charge of 12s. per acre to meet the expenditure. In giving these figures I may explain that in one case I was able to obtain the rate of interest provided for, and in the other the cost of maintenance, and I have applied the figures in one case to the other, and *vice versa*. In another Government scheme—the Tanjore scheme—the State receives 16 rupees per acre per annum.

1315. *Mr. Watson.*] What is the rupee worth—1s. 2d.? I have taken it as worth 1s. 2d. In the Bombay district, where a great deal of the water is supplied from reservoirs, the charge at Ekruk is 20s. per acre for water, which is only half the rate charged in connection with the Krishna canal supply, and is about the lowest rate in the district, 16s. per acre being the minimum. In connection with another scheme in the Bombay district—the Khadakvasla scheme—the average charge is 18s. per acre. I draw attention to the word "average" because the actual charge is per crop, and as the charges for many crops range as low as 10s., the charges for many other crops must be correspondingly high.

1316. *Chairman.*] Do those charges include the cost of distribution? They do and they do not. One of the difficulties in the way of an understanding of the cost to the irrigator in India is that many of these canals merely supply water into a reservoir, and the irrigator has to lift it from the reservoir. A very small proportion of the land irrigated derives its water direct from the canals, and in some places there is a very severe penalty inflicted upon those who attempt to take water direct from the canals. At Nera the charge is 8s. per acre for the four hot months of the year, and 16s. per acre for the whole year. In connection with the Sone canal the charge from April to June is 8s. per acre, and there are lower charges

charges for the succeeding winter months. For a crop of sugar-cane 12s. per acre is charged during the months when it requires watering. At the Sidna settlement, where the land is extremely uninviting, and where an irrigation scheme has been carried out avowedly for the purpose of attracting settlement in a rather lawless district, and without very close regard to financial considerations, the following charges prevail:—Rent, 1s. 4d. per acre; spring watering, 4s. 6d. per acre, and autumn watering 5s. per acre—a total charge of 10s. 10d. per acre. To this is to be added 3d. in the 1s. to meet rates and fees to local officials, making altogether 13s. 7d. per acre. Of course, to the charges which I have enumerated in connection with other schemes must be added the rent of the land to which the water is applied. I can get no definite information as to what that charge is, but I will present certain figures to the Committee which will enable members to form an approximate idea of it. My information is some ten or twelve years old, but it is the latest I could find in my hurried search. The Indian land revenue at the time my information speaks of was £25,000,000, so that it will be evident that, in addition to the charges for water, irrigators there have to pay a very considerable amount for their land.

1317. *Mr. Watson.*] Is the land revenue you speak of obtained from taxes? No. In India the Government is nominally the owner of the land—in some districts absolutely, though in other districts there is an intermediary holder. This personage was originally the local head man, who used to collect the taxes for the older governments. When the present Government was established, it to some extent recognised him, and used him to collect a stated sum per annum. Of course, he screws as much more as he can get from the unfortunate occupants of the land. That system prevails in two presidencies, and it is therefore difficult to know exactly what rent the occupants of the land pay; but £25,000,000 is the aggregate land revenue received by the Government of India, a fact which evidences that the occupants of land pay very heavy charges for it. Some idea may be gained as to what is paid for irrigated land from the fact that the average rent for the whole district of Bombay, including the area which pays no rent, is 1s. 11d. per acre. It may be taken for granted that the irrigated land pays a much higher rental than the unirrigated land, and therefore, as a good deal of land pays no rent at all, the charge upon the irrigated land must be pretty high. In the Madras district, the average rental is 4s. 2d. per acre, and the same remarks apply. In Italy, a country frequently referred to as one in which water is cheap, the rent of irrigated land is £6 per acre, and the water charge ranges from 8s. to 12s. per acre. In the western states of America the charge for water ranges from 10s. to 25s. per acre per annum, and in France and Spain from 20s. to 28s. per acre per annum. With regard to Spain, the charge for water is to be considered in conjunction with a rent of £5 per acre; similar land, not watered, being rented for 5s. per acre. In Egypt—another country supposed to have a particularly cheap water supply—there were ten years ago, and the number has since increased, 476 steam pumps, 107,000 Persian wheels, 150,000 men, and 60,000 animals engaged in connection with the lifting of water as distinct from the cultivation of the land. This entailed a charge of 4s. per acre per annum for water, to which must be added a land tax of £1 12s. per acre per annum. This land tax is probably a form of rent. The total charge to the irrigator is, therefore, £1 16s. per acre. Mr. Deakin, in one of his works written after his trip to America, expressed the opinion that wheat could be grown in Australia if a charge of from 20s. to 25s. per acre had to be paid for water, and from 5s. to 10s. per acre for land. In considering the various Indian schemes which I have mentioned, it must be remembered that those who have to pay for water and for land have also to pay a large amount for the employment of labour. The construction of many of their distributing canals is carried out upon a kind of communist system, so much labour being required for the occupants of each village. That system necessarily lessens the cost at which the Government can supply the water. I have given these figures to the Committee in order to show that the cost of pumping is not, as it is generally supposed to be, prohibitive. I want now to show that the notion that irrigation to be successful must necessarily be by gravitation is a mistaken one. In India there are thousands of wells and rain-fed tanks, and they water a very much larger area than is watered by canals. In the Bombay district 118,000 acres are watered by canals, and 720,000 acres from other sources of supply. A very large proportion of the water obtained from these other sources has to be lifted by some method or other. It is generally lifted by very crude appliances, worked either by hand or by bullocks. Even where the water is delivered from canals, the expenditure of some labour is necessitated in lifting it for purposes of distribution. If allowance is made for the cost that this must entail, it will be seen that the cost at which water could be pumped from such a river as the Darling would, owing to the cheap price of our land, bear favourable comparison. In the United States of America, and particularly in Colorado, a very large area in the aggregate is irrigated in the way I speak of; but by means of much better appliances. A pumping scheme has one great advantage over the correspondingly expensive gravitation scheme, inasmuch as in a good season it permits of a considerable saving being made, because, the pumps being idle, there is a reduction in working expenses, whereas with a gravitation scheme there is no saving, but, on the contrary, the expense is often considerably increased, because of the risk of damage by flood. In regard to pumping schemes, I should like to quote a short sentence in reference to the Balranald scheme, which appears in Colonel Home's report:—

The lift would have been moderate, the water would have been easily distributed over the land—which is said to be suitable to irrigation—while the mean rainfall is only 13 inches. There was, therefore, a fair chance of success if the works had been properly carried out. Small schemes of this kind in the neighbourhood of townships where the supply of water is assured and other conditions are favourable would be of considerable use in spreading the practice of irrigation, and in gradually turning out men who have had experience in this class of agriculture.

The value of that statement is, I think, very considerably increased by the knowledge of the fact that, generally, Colonel Home's report was of a most depressing character. If I may be permitted to say so, he was, evidently, so familiar with the gigantic schemes of India that he was hardly able to recognise the possibility of more modest efforts succeeding. Practically, Colonel Home's report resolves itself into the statement that we cannot adopt Indian methods in Australia. I have endeavoured to show why I favour the establishment of irrigation colonies rather than large district schemes. It may be said that for irrigation colonies artesian supplies offer most attraction; but I would point out that artesian water in our experience is probably the most expensive. The Mines Department has prepared a table showing the total amount expended in boring and the volume of water obtained, and it has applied the charge for boring to the volume of water obtained. That, I think, is a perfectly fair thing to do, seeing that the object of obtaining this water was primarily to give a supply to the stock routes of the Colony; but it hardly states the case accurately from the standpoint of irrigation. Much of the water obtained

obtained from artesian bores is unsuited for irrigation, and it would therefore be fair to charge the cost of bores from which unsuitable water is obtained upon the cost of obtaining suitable water in order to ascertain exactly what suitable artesian water costs. It can never be known with certainty whether suitable water will be obtained from a bore, and if the cost of obtaining suitable water is calculated in the way I suggest, it will be shown to be extremely high, and, I think, higher than the cost of pumping water. Then, too, there are other drawbacks to the adoption of an artesian supply for irrigation purposes. One of these is the difficulty of getting a sufficient supply within a given area. Very few bores give a sufficiently large supply to irrigate an area upon which an entirely successful irrigation colony could be established. In New South Wales the average supply of a bore is probably not more than 500,000 gallons per day. What amount would be required for irrigation under the conditions prevailing in this country is not quite certain; but it would probably not differ greatly from that required under apparently similar conditions in the western states of America. Upon that comparison it would not be safe to look to any bore to irrigate more than 200 to 250 acres. Upon such an area it might be possible to establish small settlements like the Pera settlement, growing high-price products; but such settlements must be extremely limited, because the produce would have to be of a character such as is readily salcable in the neighbourhood of towns. It might be contended that if the supply from one bore were not large enough other bores could be put down. But there is a considerable risk in following out that practice, because of the mutual interference of bores which are put down in the same neighbourhood. This interference is not merely the creation of theory, it is established by actual experience in America, where, when bores have been multiplied in a locality, after a certain point has been reached the aggregate flow has not increased, and occasionally some of the earlier bores have altogether ceased to flow. I should like to read in this connection an extract from a statement made by Major Powell, who is chief of the United States Geological Survey. He says:—

Hon.  
E. D. Millen,  
M.L.C.  
16 May, 1899.

Something can be obtained from artesian wells, but not a very great amount. The experience from artesian wells fully warrants what I am stating now. They have been bored at different places in the world, and used for irrigation wherever they could be used; and it bears out the statement I make, that the supply from artesian sources is always limited; is always comparatively small; and that no great area can be irrigated thereby. If all the artesian wells in the world, which are used for irrigation, were assembled in one county, in Dakota, they would not irrigate that county. . . . We see an artesian well in the arid country with a bore of 4 to 6 inches, pouring out a fine stream of water; and it looks a large stream, and strikes the eye with a good deal of force; but when you actually compute the amount of water it supplies you find that amount is small.

As to the possibility of the interference of one artesian bore with another, Major Powell states:—

If a series of neighbouring wells be bored at the same level, the individual discharge of all the wells is progressively diminished, and the total discharge is at first progressively increased, but the limit of discharge for the locality is finally reached, and then the boring of additional wells gives no advantage. If two wells in the same vicinity head at different levels, the one at the lower level discharges more water than the other, and the flow of the well, or of a group of wells, may be entirely destroyed by the sinking of new wells at a lower level. The same effect is produced by pumping water from these wells, which is equivalent to a discharge at lower level.

In view of that statement it is evident that there is a very considerable risk in multiplying bores in the neighbourhood of each other. It also bears out my contention that we cannot have anything more than small irrigation settlements in connection with artesian supplies. I do not wish it to be in any way supposed that I am at all opposed to the use of artesian water for irrigation purposes. On the contrary, I have endeavoured, so far as I could, to direct attention to what may be done in that direction. But, because of the limited supply and the location of these bores, they are chiefly suited to individual efforts at irrigation for the growing of fodder in connection with grazing pursuits. It is hardly possible to look to them to provide a supply for irrigation settlements of the character I have referred to. I should like now to say a word or two as to the value of irrigation, not merely in providing an insurance against drought, but also in providing a fertiliser. In considering the cost of irrigation, it is not fair or accurate to consider that cost as against the value of an ordinary crop. The effect of irrigation is not merely to make a crop certain; irrigation increases a crop to a phenomenal extent. It is stated on the authority of "Mulhall" that in France irrigated land yields produce valued at £3 per acre more than the produce of unirrigated land. In Cyprus irrigated land yields crops three times heavier than the crops obtained from unirrigated land. In one of the most useful American publications that I know of, it is stated by Mr. Hinton, one of the best authorities on this subject, that—

Evidence taken before the Senate Special Committee on Irrigation in 1889 shows that the production of grain can be doubled by means of irrigation within the arid region over equal areas within humid States; but the production of root crops and garden vegetables can be increased from five to tenfold over the same crops elsewhere, and that in the production of special products over large areas where the climatic conditions are favourable to them; aridity aside, the section possessing constant sunshine, and soils laden with mineral elements, will have thorough irrigation, an advantage and security no other region on the continent can possess.

Bearing upon that statement, I may mention that at Wilmoringle, a station upon the Culgoa River, 103 tons of hay—nearly 3 tons per acre—were taken from 35 acres of irrigated land. The total crop was heavier than that, but a large quantity was consumed by the horses used in conveying the hay from the land upon which it was grown to the homestead, a distance of some 18 miles, and that quantity was not included. An ordinary farmer would consider 1½ ton to the acre a fairly good crop, so that irrigation may fairly be held responsible for the other 1½ ton, and it will be seen that the extra crop very much more than paid for the cost of the water used. I should like to draw the attention of the Members of the Committee to a fact that is recognised as the action of stock upon the catchment area of the Darling. Owing to the consolidation of the soil there by the tramping of stock, and the tracks made by the stock in going to water acting as small gutters, a larger percentage of the rainfall now finds its way to the watercourse than formerly did so. The fact is generally recognised; but its effect upon the navigability of the river, and also upon irrigation, has not, I think, been sufficiently considered. It will be noted that over each successive period of years for some time past the Darling has continued navigable for longer stretches. From 1879 to 1886, a period of seven years, the mean height of the river at Bourke averaged 7 feet 7½ inches. During the next eight years, it averaged 14 feet 2 inches. The percentage of water falling within the catchment area that passed Bourke in the years between 1879 and 1886 was 1.12, while during the next seven years it was increased to 1.80, and if the consolidation of the surface continues to take place, it may have a very important bearing upon the question of the supposed conflict between irrigation and navigation. I contend that so long as the river is running irrigation will have absolutely no effect upon its navigability; while the navigation of the river certainly has no effect upon the quality

Hon. E. D. Millen, M.L.C.  
16 May, 1899.

or quantity of the water, because the water is just as suitable for irrigation after a steamer has gone over it as it was before. The only question is whether at any particular time the supply may become so low that navigation may be threatened. During my seventeen years' knowledge of the Darling, I have only known it to stop running once; and I am of opinion that all the irrigation which is likely to take place, even under a distinctly enterprising public policy, would not for very many years to come, take from the river the quantity of water which now passes down it and enters the ocean. If it is correct that more and more water is finding its way to the river, it follows that the chances of the river stopping are becoming less and less every year, and so long as care is taken to prevent more water being drawn from the river than now goes to waste, there can be no interference with navigation by irrigation. It will indeed be very many years before even a very small portion of the water which now runs to waste is used for irrigation, and a very much larger population than we now have will be required to use it. Colonel Home, at pages 16 and 17 of his report, speaking of the Menindie Lakes, points out that upon existing levels no replenishment of the lakes worth mentioning could have taken place during the years 1880 and 1885; but he curiously omitted from his calculation the very important difference which would be represented if, instead of having the river in its natural condition, it were permanently locked. Assuming that a weir were placed somewhere below the in-take of the Menindie Lakes, those lakes would be replenished by a rise of 12 feet less than that upon which Colonel Home bases his calculation. One important effect of having the river locked upon schemes such as the projected Menindie scheme would be that comparatively small freshes, which to-day are lost in the waterholes on the higher stretches of the river, would travel right down, and as a consequence the supply to the "down river" frontages, instead of being in any way diminished, would be very materially increased.

1318. *Chairman.*] How long has the Bourke weir been in existence? I think it was completed about two years ago.

1319. Has advantage been taken of the water there for irrigation purposes? There is no one to take advantage of it. There is any amount of water, and any amount of land, but no one can get hold of the land. One of the finest pieces of land for irrigation purposes is situated at North Bourke, 2 or 3 miles from the township, but it is locked up in reserves and in other ways. Twenty-acre blocks have been offered along the river, and some of them have been taken up by dairymen and others, who, with their puny pumps, do a little irrigation; but before any scheme of irrigation can succeed it will be necessary to have big pumps.

1320. Do you think that advantage would be taken of the water if the State erected pumping machinery? I think that if the State erected pumping machinery and threw open the land in blocks of from 10 to 100 acres, it would all be taken up within twelve months. Carriers who now have to make one trip after another, merely to maintain their homes in the town, and to pay forage bills, would grow their own fodder if they could obtain small farms.

1321. Have you any idea as to the total area of land suitable for irrigation in the Bourke district? No; I do not think that the question is quite material just now.

1322. If you have not suitable land —? You have more land there suitable for irrigation than you have people to till it. At North Bourke there is a patch of land running right on to the river, and containing at least 8,000 acres, where you could commence to irrigate within 100 yards of the banks. That patch was above the level of the big flood in 1890, and was the site of the encampment at which the people of Bourke took refuge. There are several other places down the river equally good. With regard to the character of the weirs which it is proposed to construct, although it may seem presumptuous for a layman to attempt to criticise the opinion of a professional man, I feel that a very serious difficulty will be encountered if fixed weirs are constructed. We have several instances which illustrate what would happen if such weirs were made. The river is intersected at various points by rocky bars, and wherever these bars exist it has cut a fresh channel for itself. The Fisheries, at Brewarrina, is a very good instance. Above that point the river has cut the Cato on the one side and the Tarrion on the other. If movable weirs, such as that at Bourke, are constructed, the river will in flood-time keep to its natural channel.

1323. I think it is contemplated to take advantage of the rocky bars as sites for the weirs? Yes; but I know that wherever these bars occur the river cuts a new channel. Colonel Home's testimony upon the point is that the Bourke weir is answering well, and indicates how, at a very small cost, the river may be permanently locked.

TUESDAY, 23 MAY, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.	WILLIAM THOMAS DICK, Esq.
The Hon. ANDREW GARRAN, LL.D.	JOHN CHRISTIAN WATSON, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Hon. Edward Davis Millen, M.L.C., sworn, and further examined:—

Hon. E. D. Millen, M.L.C.  
23 May, 1899.

1324. *Chairman.*] Have you had an opportunity of reading the evidence which you gave last week? Yes.

1325. Do you wish to make any alteration or additions to it? I have no alterations to make; but, if the Committee wish for further information, and will ask me questions, I think they will in that way more readily get at what they want than if I make a second statement.

1326. *Dr. Garran.*] I understand that you resided for some time at Bourke? Yes.

1327. You are pretty well acquainted with the traffic which concentrates in Bourke? Yes.

1328. And, I presume, with the opinions and views of the residents of the districts? Yes.

1329. You were examined before a previous Committee with reference to a proposal to lock the Darling above Bourke? Yes.

1330. I gather from a perusal of that evidence that you then preferred that public money should be expended in locking the river than in making a railway to Brewarrina? Yes. 1331.

Hon.  
E. D. Millen,  
M.L.C.

23 May, 1899.

1331. Now that it has been decided that the railway shall be made to Brewarrina, would you still recommend the locking of the river from Bourke upwards? That is not the proposal now before the Committee.

1332. No; but if that proposal were before us, would you still recommend it? Not if the locking of the river were to stop at Bourke; but, if the river were locked below Bourke, it would be a distinct advantage to have it locked above Bourke also, because the conservation of water above Bourke would make a more perfect work. But I could not ask the State to lock the river above Bourke merely that water-carriage between Bourke and Brewarrina might enter into competition with the railway that is being constructed.

1333. That is to say, you would not, for navigation reasons, lock the river above Bourke, but for irrigation reasons you would? Yes.

1334. The project that we are now considering is the locking of the river below Bourke; I presume that it differs from the former project in its effects both upon the trade of Bourke and of the railway? Only in question of degree.

1335. If the river were locked above Bourke the traffic would be down stream to Bourke? And up stream from Bourke.

1336. If this proposal is carried out, the desire will be to bring the traffic up stream? The traffic comes that way now to some extent, when the river is navigable.

1337. How far up the river do you think the traffic would come to Bourke, supposing the proposed scheme were carried out? I regard Bourke as the centre of a district the south-west boundary of which is 150 miles below Bourke.

1338. How far would that go;—would it take in Tilpa? Yes; it would be somewhere in the region of Tilpa.

1339. You think that traffic would come from Tilpa to Bourke if the river were locked? Yes; in normal seasons.

1340. But not from places so far south as Wilcannia? No.

1341. Do you think that if we locked the river as far as Tilpa we should add to the trade of Bourke? I do not know that you would; but you would furnish the people of the district with a cheaper and more certain means of reaching Bourke. They already send produce there; but in a season like the present they have to pay enormous sums in order to do so.

1342. Such a work would prevent the people of Louth and Tilpa from ever suffering in times of drought from want of access to Bourke? Yes.

1343. They would always have a cheaper means of getting to market, and could never be cut from provisions? Yes.

1344. You are aware how completely Wilcannia has been cut off from supplies this season? Yes.

1345. If the river were locked as far as Wilcannia that town would never again be so completely isolated as it is now? No.

1346. But the people who sent produce from there would have to pay more than they do at present;—not only would they have to pay the railway charges, but they would also have to pay the river freight? Now they pay the railway charges, and the charges made by teamsters.

1347. Do they not get their supplies from Broken Hill now, using camels for their transport? That system has lasted for a few months only. It will always be dearer to take produce goods to Wilcannia by railway to Bourke, and thence by a road, than by railway and thence by river.

1348. Have you known goods to be sent to Wilcannia from Bourke by teams? Yes.

1349. What would be the cost of transporting such goods from Sydney? I could not give figures which would be of any value to the Committee. The charges upon different commodities vary so, that it requires a person acquainted with the particular business to give answers of anything more than a general value.

1350. Have the storekeepers at Wilcannia preferred that route to the route from Broken Hill by team? It sometimes happens that one road may be fairly good for teams, while another road, although perhaps a little shorter, is not in good condition. All circumstances of that kind influence a storekeeper in determining which route he shall choose.

1351. You said the other day that you do not advocate the levying of tolls on the river, because you would put the proposed improvement upon the same footing as the improvement of a coastal harbour, or the making of a road? Yes.

1352. The proposal before us—to lock the river from Bourke to Menindie—will cost £500,000 to carry out? Yes.

1353. And we have been told by a witness who seems to know the river very well that the very worst part is that between Menindie and Wentworth? That is only half stating the case. In one sense the portion of the river between Menindie and Wentworth is the worst; but that is because of the obstructions to navigation there. The further you are down the river, the longer do you find the period for which the river is naturally navigable.

1354. Mr. Shainwald, who is the agent for a firm of steamer-owners on the river, told us that more accidents occurred between Menindie and Wentworth than on any other part of the river, that boat-owners suffer more loss on that part of the river than anywhere else. Therefore, to make the river navigable all the year round, we should lock it right down as far as Wentworth? The accidents to which Mr. Shainwald refers are not due to the absence of water.

1355. Are they due to snags? To snags, to rocky obstructions, and to other local difficulties.

1356. Do you think that if we locked the river as far as Menindie we should practically make the river navigable for nine months in the year? For at least nine months. My impression is—though it is one that can be confirmed or disposed of only by experience—that if the river were locked as far as Menindie, the holding back of so much water would tend to keep the lower portions navigable without any further works.

1357. The proposed weirs would not hold back any water that would be available for improving the navigation lower down than Menindie? The river rarely stops now.

1358. But all the water that now comes down the river would go over the weirs? I do not think it would travel as fast as it does now, supposing the river were locked. Station-holders, although they cannot retain the water altogether, now hold it back for a long time by means of tailing dams, and my opinion is, that a succession of locks would keep the river navigable below the last lock for a longer period than that for which it is navigable at the present time.

1359.

Hon.  
E. D. Millen,  
M.L.C.  
23 May, 1899.

1359. But when the weirs had held back all the water they could the conditions would be the same as they are now? If the river were locked a small fresh would run right down, without apparent loss, but now, when the river is empty, it will not run 50 miles. These small freshes are continually occurring. I have seen many a fresh pass Walgett and not get below Boorooma, which is halfway to Brewarrina. If the river were half-full, however, such a fresh would run right through.

1360. But if the locks are all full, and the river up to the tops of the weirs, whatever is coming down over the uppermost weir will continue right down the stream? Yes; but now a great deal of the water does not go right down the stream. The advantage that you would get from all the water passing right down the stream would be that this water would tend to keep navigable the portion of the river below the last lock for a longer period than it keeps navigable now.

1361. Why does not the water go right down now? When the river is empty a great deal of water escapes into various waterholes and by soakage. If the river were kept half-full there would not be so many waterholes to fill and no soakage.

1362. That is to say, that if we kept the banks covered with water up to a height of 6 feet, and all the ana-branches and pools full up to that level, any water coming down would come right down without loss from further soakage, and be available for navigation in the lower reaches? Yes. Under such conditions nearly all the water coming into the river would pass right down it. Of course, a small portion must be lost in any case.

1363. Your opinion goes to prove that it would be sufficient to lock the river only down as far as Menindie? Yes; until we can see what effect that will have. If Nature will do something for us, we may as well let her.

1364. We have it in evidence that the river is not navigable from Wentworth to Morgan for two months in the year? Well, a break of that length of time is not serious out there.

1365. I presume you know something about the interests of Wilcannia in this matter? Yes. My knowledge of the Darling extends from below Wilcannia to above Walgett.

1366. Speaking in your own person, do you think that the interests of Wilcannia lie more in the construction of a railway from Cobar, or in having the river locked from Bourke to Wilcannia? I am certain that the interests of Wilcannia will be better served by the locking of the river, but I should like to add that I believe that the inclination of the Wilcannia people is more towards a railway—that being due to the fact that in this country people have very little knowledge of the advantages of water-carriage, and are, to a certain extent, prejudiced against it.

1367. You think that their preference is a preference of ignorance? Yes.

1368. When you say that the interests of Wilcannia lie in the locking of the river, you mean the interests of all whose trade centres in the river? I mean the interests of the district, rather than the interests of the town.

1369. If it would take £500,000 to make a railway from Cobar to Wilcannia, and about the same sum to lock the river from Bourke to Menindie, you think that the money would be better spent in locking the river? Personally, I would rather see £2 spent on the river than £1 on the railway.

1370. But you think that the residents upon the river would not take the same view of the case? The river residents would naturally prefer the locking of the river, just as the landholders through whose runs a railway would pass would prefer the construction of a railway; but, taking the townspeople of Wilcannia and a section of the residents of the district, I believe that their votes would be cast for a railway as against the locking of the river.

1371. Comparing the conflicting claims of irrigation and navigation, which interest do you think ought to carry the day when there is a conflict? I do not regard them as coming into conflict.

1372. But suppose they did? I cannot see that they would.

1373. Well, take the circumstances existing at the present time when there is not a bucket of water to be spared at Bourke; do you think that the first chance of a fresh should be for the advantage of navigation or for the advantage of irrigation? I cannot take existing circumstances and compare them with the state of things which would exist if the river were permanently locked.

1374. Suppose that the river were permanently locked, and that the water coming down at Bourke was not sufficient to supply the leakage at the locks, so that every bucket taken for irrigation weakened the chances of navigation? In supposing that I should suppose something which would not happen. If the river were permanently locked, enough water would be going down to satisfy both interests.

1375. Every steamer that comes up or goes down the river wastes a whole lock full of water? The steamers would not waste as much water as we allow to flow to waste now. There is a very large amount of water flowing past Bourke at the present time, though the quantity in the river-bed appears to be very small. If you started to pump it out, you would find that the quantity of water available was very large. The only limit that you could put upon the use of water for irrigation would be by ascertaining what quantity of water passes to waste. So long as the irrigation works did not take from the river more water than was flowing to waste, they could in no sense impair the navigability of the stream.

1376. Suppose your view should turn out to be incorrect? In that case I would say that ever since the country was settled, river navigation has been called upon to submit to periods of intermittence, and that it would not hurt the steamers to have to tie up for a month or two.

1377. At the present time the people out in that district are always facing the risk of a stoppage of navigation, and lay in their stores accordingly; but if the river is regarded as permanent, and they commence to live hand to mouth, a stoppage of navigation would be a very different thing? They would not in any case be living hand to mouth when a stoppage of navigation occurred, because they would know some months ahead that it was likely.

1378. At any rate in such an event you would vote for irrigation? I should be prepared to put a stop to navigation. I would point out that the proposal before the Committee has been designed to accommodate the boats which are now on the river; but if the river were permanently locked we should probably have a speedier and more handy class of boats. The present boats were built with the knowledge that occasionally they might have to be tied up in a waterhole for many months at a stretch.

1379. But if the river were permanently locked, there would be no need to suspend navigation altogether; it would be only the upper reaches that would be unnavigable; a drought would have to be very severe to render the lower reaches unnavigable? As I have known the river to stop running only once in nineteen years, I say that there would always be a flow of some kind. Therefore, I do not anticipate that the river would stop running if it were permanently locked.

1380.

1380. While, in a very dry year, steamers might not be able to get up to Bourke, they would be able to get to within at least a lock or two of Bourke. The whole river would not be dried up? No.
1381. If we desired to obtain revenue from the expenditure of £500,000 in locking the river, do you think it would be possible to obtain by any kind of tax anything like interest upon the sum expended? If you want a direct return it could be collected; but, as I pointed out, such a return would make no difference to the Consolidated Revenue, though it made a difference to the returns of a particular Department. If to-day it costs a runholder £5 a ton to take his wool to Bourke, and he were enabled by reason of the proposed river improvements to take it there for £2 a ton, the Local Land Board would take from him the saving of £3 a ton by imposing upon him additional rent equivalent to that amount. If, on the other hand, you levied such river tolls as would bring his freight charges up to £4 a ton, the Local Land Board would only increase his rental by an amount equivalent to £1 a ton.
1382. If you levy a charge for the work by increasing the rental of land in the district, you levy a tax upon only one class of settlers there? Yes; but as that class has to pay for the maintenance of the towns and the industries there, the evil would work its own cure.
1383. But if, on the other hand, you levied a charge upon the steamboat proprietors, the storekeepers and their customers would have to pay part of it? The customers of the storekeepers are the men whose land is assessed by the Lands Department.
1384. And the men whom the runholders employ? It would come back to them in any case.
1385. If the well-sinkers and other employees in the district had to pay a little more for the goods they consume, would it in the long run affect the squatters? I doubt if the difference of £1 a ton in the carriage of ordinary commodities, such as the men of whom you are speaking consume, would have any effect upon the price of those commodities.
1386. Do you think that the storekeepers would pay the charge, and not ask more for their goods? I do not think that they would. A difference of £1 a ton upon a freight of clothes, we will say, could not be apportioned out among the various articles, so as to affect the price of, say, a pair of trousers.
1387. But do not storekeepers always fix their prices so as to cover freights? Yes; but there are some articles upon which a difference of freight would be so infinitesimal that the storekeeper cannot allow for it in connection with them. In such a case they must make up the difference in connection with their bulk goods, 99 per cent. of which go to the squatters.
1388. Then you think that the man who, in any case will have to pay the tax, will be the squatter? Yes—the homestead lessees and the pastoral tenants. They will have to pay the bulk of it.
1389. I suppose that very little besides wool goes down the river now? Nothing worth speaking of. Possibly there are some bales of skins, and some casks of tallow carried occasionally; but wool is the main item.
1390. With regard to the using of the water for irrigation, I see that you entirely abandon all idea of
1391. You take the view that Colonel Home takes, that we should begin modestly, with experimental areas? Colonel Home's opinion seems to be that we should not attempt irrigation at all, because we cannot attempt it upon a large scale. My idea is, that we can do what Southern California has done—take gigantic and comprehensive schemes? I never entertained such schemes.
1392. We have it in evidence by some witnesses that if we had any quantity of water to be used, there is only a portion of the land on the banks of the Darling really suitable for irrigation;—do you agree with that? Yes; but the portion which is suitable is sufficiently large to take all the water that we could spare, and to provide for all the people who are likely to settle there for many years to come.
1393. We are told that the land now subject to inundation would not be suitable for cultivation, because the floods would kill any growing crops; and because where there is such land there is generally clay underneath? Well, there are certain crops which would grow on such land—an annual crop, such as wheat for instance. There is no reason why you should not grow wheat on such land, seeing that a great deal of that land is flooded only once in twenty-five years. I have seen lucerne grown upon land subject to flood—land flooded only once every five or six years.
1394. But the crop would be destroyed by a flood, so that you would have to re-sow? Well, the loss would be very small in such a case.
1395. We are told that the land suitable for irrigation is the land above the flooded area, and that all the way down the river there are large patches of such land. There is said to be one very suitable patch north of Bourke, a patch containing 8,000 acres, and seemingly marked out by nature for an irrigation farm? In my opinion the spot that you speak of is an ideal one for the purpose.
1396. Then have we not, as it is, an opportunity to establish an irrigation colony? We have the opportunity, subject to one or two drawbacks.
1397. What are they? One is that the river being only partially locked you have no guarantee that the freshes to which I have referred will come right down.
1398. Supposing we were to make the Bourke weir watertight, the water above it would be of full value for irrigation though not of much service for navigation? Even in that case a fresh coming in at, say, Walgett, might be exhausted before it got half way down to Brewarrina, so that it would never reach the locked portion of the river at all. With one lock you cannot have the advantages which you would have if the river were locked throughout.
1399. I understood you to say that there is always enough water coming down the river to keep the locks supplied;—if that is so, there would be enough water to keep that one stretch of river supplied;—there would be enough in that 8 miles for the irrigation of the 8,000-acre block to which I have referred? I think you missed the force of my previous remarks when I said that if the river were locked over a large portion of its course you would receive contributions right down it which you do not get now.
1400. But, apart from that, there would be water enough in this artificial lake that I speak of to allow of the irrigation of the 8,000-acre block at North Bourke? Yes.
1401. That being so, all we have to do to establish an experimental colony is to make the Bourke lock watertight, and to put up adequate pumping appliances. Therefore, without any new locks at all, we could carry out these experiments at Bourke? Yes.
1402. I have gathered from your evidence that the produce of 8,000 acres would be just as much as Bourke could manage to consume? Bourke would probably not attempt to consume so much produce as that.
1403. Then a difficulty would arise in there not being an immediate market for the produce? I do not think

Hon.  
E. D. Millen,  
M.L.C.  
23 May, 1899.

Hon.  
E. D. Millen,  
M.L.C.  
23 May, 1899.

think there would be any difficulty of that kind. When people can grow stuff in America, as they are doing, and can pay train freights, shipping freights to England, the breaking of bulk in England, and the charge of reshipping to Sydney, I do not see why similar produce grown much nearer the point of consumption should not find a market.

1404. American conditions are very different from our own; we have it in evidence that it now pays better to import greenstuff and produce of that kind from Dubbo than to grow it on an irrigation farm at Bourke;—do you agree with that statement? I have not the slightest faith in it.

1405. Do you think that a farmer could sell produce grown 3 miles out of Bourke more cheaply than the price at which produce brought from Dubbo could be sold? It is not fair to limit me to a single commodity.

1406. Well, take milk or garden stuff? I will take that popular commodity for which there is the biggest market at Bourke—lucerne, chaff, and other produce. The proof that you can produce it more cheaply at Bourke than the price at which you can import it lies in the fact that those who have once started to grow produce have never gone back upon the attempt, but have continued their operations.

1407. It is stated in previous evidence that the squatters have tried to grow hay, but that finding that it did not pay they have abandoned it? I have heard men repeat that statement, but I know of no station out there where, having once attempted to grow produce, they have abandoned the attempt, and have not, on the contrary, extended their operations. They always begin with a number of blunders, because they are not agriculturists, and, although they continue, they will tell you that it does not pay. The squatter was always prejudiced against the plough, and I am inclined to think that it is their prejudice that is talking.

1408. If we started our experiment in agriculture at Bourke, it is not to be supposed that the whole 8,000 acres would be snapped up at once? No; because we have not a sufficiently large population familiar with irrigation to draw upon.

1409. A few men would begin, others would follow, and in course of time, if there was a market for the produce, the whole of the land would be taken up? Yes.

1410. I suppose it would not be worth while to multiply these farms until the first farm established itself as a success? I should feel more inclined to start three or four farms on a small scale than one large one. At Bourke our great difficulty is to get people who are familiar with the particular kind of industry required. You might have a few people of the class near Wilcannia who would be ready to take up the work there, but who would not go up to Bourke to make a start.

1411. At Bourke you have a railway terminus, you have land within 3 or 4 miles of the township, you have a large number of teamsters (the very class of men likely to go on to the land)—everything in favour of the success of such a scheme; but if you scatter your resources you are more likely to have three blunders than one success? I have no objection to the carrying out of the North Bourke scheme—on the contrary, I would advocate it; but if I owned all that western country and wished to develop it, I should establish three or four irrigation farms at convenient spots, rather than one big farm. At the same time, I agree that if we could concentrate the people one large colony would be more economical and more profitable than three small colonies.

1412. Your opinion is that the Government, being the owner of this land, should set up the necessary pumping machinery, and charge for the water used? Yes; or an arrangement might be made similar to that which obtains in connection with the supply of water for country towns. The irrigation settlement might be made a sort of municipality and allowed to provide itself with water, the necessary machinery being erected by the Government, the municipality paying the Government an annual charge for interest and refund.

1413. You would not attach the irrigation settlement to the Bourke municipality? No; I would make it a separate municipal area.

1414. That could not be done until a large portion of the land was occupied? No.

1415. And the Government would have to take all the risks of the experiment? Yes; as many landholders do in private life.

1416. As pumping on a large scale is cheaper than on a small scale, it would be necessary to put up a pump sufficiently large to supply the whole area with water? I do not think it would be necessary to at once put up a pump sufficiently large to irrigate the whole area. I understand from engineers that what could be done, and would probably be done by private people acting in the same way, would be to provide boiler power sufficient for the working of double pumps, but to put up only one pump at first. Under such an arrangement the overcharge would not be so heavy as if what you suggest were carried out.

1417. You would arrange for two smaller pumps? Yes.

1418. Probably that arrangement would have advantages in case of accident? Yes.

1419. Can you say whether for the distribution of the water it would be cheaper in the long run, remembering especially the waste which would occur from seepage, to provide pipes or to make ditches? That question would be determined only by a closer examination of the land than I have made, and by a calculation of the comparative costs.

1420. Have you not in your reading come across any American experience? Yes; but many of their larger pipes are made of wood, on the same principle as casks are made. They have a great quantity of cheap soft wood at their disposal there; but as we have not such wood, I do not know that we can take their experience.

1421. But we could make three-sided wooden flumes? Not so cheaply as they can. Such flumes are not very lasting; but as the material for them can be obtained so cheaply in America, it pays the people there to use them. I should be inclined to think—though the question is one which must be determined after a close attention to every detail—that for the main distributing channel iron pipes would possibly be the best things we could use.

1422. If the three farms you speak of produced more than the district wants, could a market be found for the overplus by sending it down the river? The district is an ever-widening one for the consumption of locally-grown produce. As an instance of what the market there is, I may say that one year I obtained particulars from the Railway Commissioners as to the value of farm produce taken into Bourke by rail, and which could have been produced locally, and I found that it amounted to £70,000 for the twelve months. That consumption takes a good deal of catching.

1423. Then you do not distress yourself about the overplus? Not in the slightest, any more than I would about the disposal of the wool grown there.

1424.

Hon.  
E. D. Millen,  
M.L.C.  
23 May, 1899.

1424. If an outside market had to be looked for, would not the people at Renmark and lower down the Murray have easier access to that market? To which market.
1425. To the markets of the world? Well, if the river were made permanently navigable they would all have water carriage alike.
1426. But lower down the river their water carriage would be less? On the other hand, the land near Bourke would be cheaper. People taking up land there would not have to pay the Government £20 an acre for it.
1427. But there would be no advantage in being at Bourke rather than lower down the Murray if you wanted to supply the markets of the world? No advantage, except that you would have cheaper land.
1428. You say that homestead leasing has been an absolute failure in the Bourke district? Yes, west of the Culgoa.
1429. Why? It would take a long time to answer that question. The conditions out there do not lend themselves to the profitable occupation of the land under the restrictions created by law to govern that class of settlement.
1430. That is to say, there can be no intermediate holding between that of the squatter and that of the irrigation farmer;—the land must either be under pastoral occupation or under intense cultivation? It must either be under pastoral occupation upon a comparatively large scale or it must be held upon a small scale for agricultural pursuits with intense cultivation.
1431. At the present time there is no room for an intermediate holding? I see no possibility of any intermediate holding.
1432. If a man holds only 10,000 acres, will he not, as a rule, carry more sheep than a squatter having a large holding would carry on the same area? In certain districts, such as Brewarrina, he would; but taking all the homestead leases west of the Culgoa, I doubt if to-day they are carrying more sheep than they did when the squatters had the land. Some of them do, but others are falling back.
1433. Have the small settlers kept up the breed of sheep and the quality of the wool as well as the large squatters do? I am certain that the return of wool has not been increased by them.
1434. Do they send to market a more mongrel kind of wool? They raise inferior sheep and inferior wool. If you take the homestead leases which are capable of carrying 2,500 sheep and producing not the best class of wool, you will find that their returns are not sufficient for the capital invested.
1435. Wool-growing is not a business for a small man? Not out there. The capital required is out of all proportion to the return you can get from a small block. Besides, very few of the homestead lessees had sufficient capital when they went on to their land.
1436. If irrigation is of more importance on the Darling than is navigation, and if we must proceed gradually in this matter, our wisest course would be, instead of locking the whole river, to make use of the one lock that we have? Looking at the matter entirely from an irrigation standpoint, I would answer "Yes."
1437. If irrigation is to override navigation, that is what we should do? Well; I do not like to state my opinion in that way. A matter that has not been mentioned is the value of conserving a large body of water in the river quite apart from its use for irrigation purposes.
1438. It has been suggested that it might be possible to raise all the weirs another foot, and thus store up a foot of water more than is required for the purposes of navigation, in order that that spare foot may be available for purposes of irrigation;—do you think that scheme a feasible one? There is a great deal to recommend it, though I cannot speak of its possibility from an engineering point of view. Every foot that you can add to your weirs, having due regard to cost, adds immensely to the value of the work from an irrigation standpoint.
1439. If, while we are about it, it will not cost very much more to raise the weirs another foot, and we should thus have a foot to spare for the purposes of irrigation, do you not think that that would reconcile the conflicting interests? Very much indeed. I consider that if the river-level were raised 6 feet, that would leave a margin for irrigation; but, with another foot, you have a still bigger margin.
1440. If the present proposal is considered by the navigationists as providing only as much water as they want, so that they cannot allow any interloper to take away any considerable quantity, can we reconcile their claim with the claim of the irrigationists by adding another foot to the weirs? That would go a long way to get over the difficulty that you speak of, if it exists.
1441. I am assuming that it does exist;—we have the evidence of Mr. Darley that in a year like this there is no water to spare? Well, that opinion is open to a very serious objection. Mr. Darley stated, in one portion of his evidence, that the Bourke weir had not held back any water. Although he was head of the Department, he appeared not to know that upon one occasion his officers received instructions to let the weir fall flat, in order that the water it was impounding might go through.
1442. You stated in one portion of your evidence that the water problem in connection with the western station properties, had now been practically solved;—has the experience of the last few years of drought shaken your opinion on that point? There is no such thing as a water problem there now.
1443. Do you say that no station out there has been abandoned for want of water? Yes. When I first went on to the Darling there were stretches of country there in which people said that water could not be impounded. Some of it was loose, ashy country, and in other places it was impossible to make tanks of any depth. In saying that the water problem had been solved, I did not mean that there is no want of water there now. What I meant is that they now know how to conserve the water there under any set of conditions, and that it is only a matter of enterprise and capital to fill up the few blank spaces for the supplying of water to which provision has not been made.
1444. There is not a station west of the Darling upon which, with adequate capital, sufficient water could not be provided to see a squatter through any drought? That is so. Further than that, they have carried themselves, so far as water is concerned, through the most trying times the district has ever experienced.
1445. So far as the supply of water is concerned, the men in the back blocks are now as well off as many of the men on the frontages? In some cases they are better off. The river, when it is low, is sometimes a death-trap to sheep.
1446. I have heard squatters say that there is often not a blade of grass for 6 miles back from the river banks, and that very often a two days' journey has to be made in order to water stock at the river; but that on the back stations the water is better distributed? Yes. When the river is low, the approach to the

Hon.  
E. D. Millen,  
M.L.C.  
23 May, 1899.

the water is often very boggy, and it is difficult for the sheep to get out. But, where stock is watered by means of artesian wells, places can be prepared to give a safe approach. A mileage fee might be charged to the account of station owners, because of the advantage which a permanent river would give them in fencing-off their property. At the present time every station having a river frontage has now and again to incur a heavy expense in putting up brush fences to keep the sheep out of boggy places. I am certain that if the squatters there were asked whether they should be made to pay to the Government the cost of these fences, or pay for the improvement given them by a permanent river, they would choose the latter.

1447. But, notwithstanding the advantage you mention, there would still be an absence of grass on the country within a few miles of the river? That is so.

1448. If the water problem has been solved in the back country, there still remains the food problem;—in England the farmers have to provide winter food for their animals; but here the problem is how to provide summer food; or, at any rate, how to provide food during very dry weather;—what has hindered the squatters from having made more headway in the solution of that problem? There are two principal difficulties in the way of its solution. The first of these is, that squatters have taken a prejudice against agriculture. Speaking of them as a class, they regard cultivation with the plough as somewhat beneath them. I remember that, when Mr. Mack started to cultivate at a place near Dubbo, his neighbours half seriously and half rebukingly would say to him, "So you are a cockey now!" However, he is one of the few men who have made wheat-growing pay, and he is doing handsomely out of it.

1449. Supposing that prejudice to exist, why could not men who were in a smaller way grow hay? There is a prejudice against cultivation on the part of the squatter; he does not believe in it. The smaller men, on the other hand, have not sufficient capital to cultivate much. The operations of the large graziers are so extensive that they are almost appalled at the magnitude of the task of providing hay for their sheep.

1450. Would it not pay the squatters to lease land to men who would grow hay? In isolated cases men are doing well by agriculture out there; but in most cases where the men have faith in it they have not sufficient capital.

1451. Cannot natural hay be easily procured in that district? Yes; but you do not know what year you can get it.

1452. But when you could get it, you might store up sufficient hay to carry the stud sheep at least through a couple of years of drought? Well, necessity is forcing them to do that.

1453. The solution of the food problem is proceeding more slowly than the solution of the water problem? The water problem was the first to present itself. No class of men proceeds to solve a problem until it bumps up against it in an uncomfortable fashion. At first there was back from the rivers a large stretch of country which provided feed in a good season, although there was no water on it. This feed the squatters could then use as a sort of reserve, but when the whole of the country was stocked, the reserve was destroyed. Now the difficulty of preserving sufficient feed presents itself to men who are practically bankrupt.

1454. Supposing a smaller class of settlers, leaving the squatters to their glorious, patriarchic life, took up the work of growing hay, would the agricultural products resulting from the employment of irrigation on the banks of the Darling be sent out back? Irrigation settlers there would devote a large part of their land to the growing of fodder to be consumed in the district.

1455. You think that that would be one of the most profitable things they could do? I do not say that it would be the most profitable, but that industry would be one of the quickest to give a return.

1456. If there were a succession of good seasons, the growers would have to keep their produce on hand for two or three years? That is what they do at Orange and other places now. There they have to abide by the rises and fallings of the value of farm produce, according as the seasons are good or bad.

1457. Do you know men who have kept hay by them for two or three years? Yes, and all the time they have been keeping it, they have been pointing to it as of no use. Then comes the drought, and they would not sell their hay for £10 a ton.

1458. You think there is a future for irrigation on the Darling simply for the growing of fodder, if for nothing else? Yes; of course I am not saying that the growing of fodder is the best purpose to which you could devote an irrigation settlement; but it seems to me that the possibility of growing fodder under irrigation is one of the advantages of irrigation which will force itself to the front most readily.

1459. But I suppose no farmer would concentrate all his energies on one crop; a farmer would probably grow a little fruit, a few vegetables, and a little hay? Yes; out there hay is a winter crop; but it occupies the ground for a shorter period than it would in other districts, so that the farmer has ample opportunity to get a second crop from the land if it is necessary for him to do so.

1460. Is it principally wheaten hay that is grown? Yes.

1461. How long a period is there between the time of sowing and the time of cutting? I have known a crop to be put in late in June, and to be taken off at a time that would be considered early for an ordinary farming district.

1462. In what month would they cut it? There you can cut hay in September, if you get a warm, dry summer.

1463. Could a farmer do anything with his ground between that time and the time for the next sowing for hay crop? He could immediately plough it up and put in corn.

1464. And could he get the corn crop off again before he had to put in his hay crop? Yes; but most farmers would let the land lie fallow. We are not so tied up for land there as to make it necessary to put in two crops.

1465. You think that there is a large market for fodder in the Darling district? Yes.

1466. And that it may be that the solution of the food problem is the growing of fodder for the squatters by intermediate men? I do not say that that is the solution of the problem. A great deal can be done in that way; but, if I were a squatter, I should try to grow my own hay, as many people are doing now, though in a timid way.

1467. The question would be: how far back from the river could they afford to carry the produce? In a time like the present the squatters there have been paying freight for hay from farming districts, such as Orange, and then carting the produce 120 or 150 miles out back.

1468. It has been better to do that than to lose their stock? It was absolutely necessary for them to do that for their working stock, unless they were prepared to abandon their station.

1469. But you think it would have paid them better to have grown hay on their own runs? On Sir Samuel Wilson's run they have been growing it upon rather a large scale—200 acres is rather a large patch there—but at the particular time when they wanted it the crop failed. That land is not irrigated.

1470. I gather from your evidence that all idea of irrigation by gravitation on the Darling is out of the question? Except in small cases that need not be referred to. There may be one or two places where a man could grow such a crop as hay by irrigating from the river by gravitation, supposing the river were locked; but the area is so small that it need not be taken into consideration.

1471. But water coming from an artesian bore could not be used for irrigation by means of gravitation unless the bore were placed upon a slight eminence? You could flume the water on to an eminence, and distribute it from there by gravitation.

1472. Up to the present time the artesian bores have been put down without any idea of distributing the water by gravitation? The first artesian bores were put down in the lowest places that could be found, a mistake easily to be understood. Now, however, they put them on the highest places they can find.

1473. Of course, if we want to irrigate by gravitation, we must irrigate from an eminence? Yes. In using the water of the Darling you would irrigate by gravitation in the same sense as you irrigate by gravitation from a bore.

1474. If you pumped it into a tank first? Yes. You let the bores throw the water into tanks.

1475. I suppose the small pumps in use on the Darling discharge the water they raise into tanks? Yes, all of them. They never deliver directly into a channel.

1476. You still think that river irrigation will always beat artesian irrigation? Unquestionably. Our bores are too far out and too scattered to be of much use for irrigation. The water that comes from many of them is not suitable for irrigation. Besides, you could not place a decent-sized settlement near any one of them.

1477. But is it not an advantage that they should be scattered, because in this way they cover a large district, and thus might save carriage? That would be an advantage if you only intended to grow fodder for isolated settlers.

1478. Or garden stuff, or soft fruits;—what would you do with the produce raised? The bores, on the Wanaaring Road, for instance, are, some of them, 30 or 40 miles from the nearest house.

1479. The teamsters would consume a certain amount of produce? In a small way they would be consumers, but I do not think anyone would be tempted to cater only for their requirements.

1480. Coming back to the project immediately before us, do you think it would be wiser to carry out the whole scheme, or simply to feel our way down the river? A great point would be gained in the direction of economy by carrying out the whole work, because when the river was low you could take advantage of a favourable opportunity to push on with it.

1481. But we are making an experiment? It might be necessary to experiment with one lock and weir, but, having done that, and having determined that it was or was not suitable, I do not see that there would be any necessity to feel the way.

1482. The lock and weir at Bourke have not proved anything? To my mind they have.

1483. The weir has not held back the water continuously? I cannot accept that statement. The water that has gone through the weir would, in my opinion, have got away anyhow, either over the top of the weir or through the lock. The fact that there is no water there now is not the fault of the weir. When they first pulled the weir into position the water was low, and the erection of the weir caused such a stoppage below Bourke that many of the holders of the frontages there wrote to me, as I was at the time Member for the district, and pointed out to me that the proper time for pulling the weir into position was when a fresh was coming down. I represented the matter to the Minister, and he ordered the weir to be thrown down again.

1484. Would not the difficulties of the frontage holders lower down have ceased directly the water rose level with the top of the weir? Yes; but as the river was then flowing very slowly, the stoppage would have meant a great deal to them had it continued. For instance, it would have created such a large area of boggy ground that there would have been heavy losses of stock.

1485. Has there not been a fresh down since? Several; but on the last occasion, when they had the weir fixed, and it was holding water, the people of Wilcannia were in such straits that they wired down to Sydney, asking that the weir might be dropped to allow of a steamer going down on the flood. Their request was granted and a steamer was thus enabled to carry provisions to Wilcannia. Mr. Darley, in giving evidence, has ignored what has been done by his Department.

1486. But a weir that has to be pulled down first for one settler and then for another cannot be of very much use? Had the weir been a fixed one, the Minister could not have ordered it to be pulled down, but he would have ordered the lock gates to be opened.

1487. You do not see the wisdom of carrying out this project gradually? I do not see that anything would be gained by doing that. If you are convinced that there is an advantage to be gained from having the river locked, and that the type of weirs designed is suitable, I cannot see why the work should be carried out piecemeal. I can, however, see a great disadvantage likely to arise if you carry it out piecemeal, because of the long series of stoppages that would be occasioned by freshes during good seasons.

1488. Would not those stoppages occur in any case? Once you had a suitable season you might push on with the whole of the weirs.

1489. We might begin all the weirs when the river was low and a rise might put us into difficulties in connection with every one of them? Yes, but when the fresh had gone down again you could get on with the work. If we put the weirs up separately that experience might be constantly repeated.

1490. *Mr. Trickett.*] I suppose we are to take it that as an object lesson the weir below Bourke has really been of no use at all? I think it has been of very great use indeed. It has shown the difference between the river locked and the river not locked.

1491. The evidence of Mr. Darley is that water runs away under the weir and through the interstices? It is an astonishing fact that the gentleman in charge of this Department should have made the statement that for three months a rowing boat could hardly approach the weir, without explaining why that happened. Taken in conjunction with the fact that Mr. Darley has all along objected to the type of weir constructed, his statement seems more than significant.

1492. Mr. Darley said that these shutter weirs were very suitable for swift-running rivers where the supply of water was ample and a little leakage did not matter? I do not object to Mr. Darley's opinion; but

Hon.  
E. D. Millen,  
M.L.C.  
23 May, 1899.

Hon.  
E. D. Millen,  
M.L.C.  
23 May, 1899.

but Mr. Darley must have been in possession of the information which I have given you as to the throwing down of the weir, and yet he appears not to have told the Committee of the facts which I have related. Of course it goes without saying that, other things being equal, a weir that holds back all the water is better than a weir which allows a certain quantity of water to go free.

1493. Do you think it would be dangerous to erect fixed weirs in the Darling? I think there would be a danger. The soil there is extremely fine silt, and is so easily disturbed by the action of water that I fancy a permanent weir would offer a temptation to the river to cut another channel—I do not mean to say that this raises an insurmountable difficulty; but a permanent weir would have to be watched, and might entail expenditure which is not provided for in the estimate for this work.

1494. It would entail expense in the construction of very long side walls leading to the weir? Not more than I imagine a movable weir would cost in that way. The effect which an obstruction to the water has upon the river channel is seen in two ways. Mr. Darley referred to one. He stated that wherever there was a rocky bar across the river bed, the channel was wider there than elsewhere. The other effect is that above these rocky bars we find that the river has either cut itself another channel, or is now doing so. I do not know that these channels are altogether a disadvantage, because they serve to distribute the water more extensively. At the same time they would have to be watched.

1495. You do not think that there is any fear of the river silting up in front of the weirs? None at all on the top side. Wherever there are these rocky bars, to which I have referred, and they are natural weirs, there is generally a hole on the top side. At Brewarrina there is a hole 19 or 20 feet deep above the bar there. That hole has been made, I think, by the water hitting the bar with some force, and stirring up the soil, and then carrying it away in suspension. Wherever there are these rocky bars, there is a hole upon the top side of them.

1496. When you say that you favour the construction of movable weirs, I suppose you mean weirs of such a kind as would hold back the water absolutely if, in times of drought, that were required? No weirs, whether they be movable or fixed, absolutely hold back all the water. The weir I favour is a weir which would hold back more water than the Bourke weir has been allowed to hold back. I have had an opportunity of looking into the matter more closely since I spoke before. Another reason why I advocated the construction of movable rather than of fixed weirs was because of the saving in cost they allowed. I see, however, that Mr. Darley has now so materially reduced his estimate for fixed weirs that that objection has gone.

1497. Mr. Darley advocates the construction of a fixed weir in preference to a movable weir, because of the great saving in expense and in maintenance? Yes. Originally his estimate for fixed weirs was very much higher than it is to-day, and it then seemed to me that movable weirs being a cheaper construction they might be put up when it was not thought advisable to expend the larger sum which Mr. Darley's original proposition would have entailed.

1498. The cost of managing and maintaining a movable weir is very great indeed. There must be permanent employees engaged in connection with it? I do not think that is necessary. Freshes do not occur simultaneously at all the weirs, and I should imagine that a maintenance steamer, such as you would have whether the weirs were movable or fixed, might travel down the river and pull down, or pull up the various movable weirs as circumstances required. A steamer could travel faster than a fresh could travel. While on the question of expense, I might draw your attention to the fact that £600 has been put down as the cost of putting up 300 miles of telephone wire; but as the telegraph now runs all along the river, I should think it would not cost another £20 a mile to fix the telephone wire on to the same poles. What is probably intended is to put up a separate set of poles for the telephone wire.

1499. Does the Government undertake irrigation in America? No, but the Government there does what public opinion will not allow our Government to do, it grants facilities for carrying out work of this kind by private enterprise. Most of the American irrigation schemes are carried out by some private corporation or syndicate which has obtained a concession of water-rights, and has purchased or acquired in some other way the necessary land.

1500. But irrigation has not been very successful in this Colony? Whenever we have attempted anything of that kind objections have been raised in Parliament to the granting of any concessions.

1501. Is it not strange that in the western districts where, in favourable seasons, the pasturage grows so rapidly and to such a height that it can be easily cut, the squatters and the homestead lessees have not used it for hay, or by putting it in silos, to tide over bad seasons? That is only another instance which shows how communities will go along a beaten track for a long while, until it is demonstrated to them that something else will be better. Then they say, "Why did we not think of that before?"

1502. Do you think it is practicable upon a large holding to go in for the growing of fodder to such an extent as to provide for the stock in dry seasons? I think a great deal can be done in that way. I think that if they were to spend upon fodder the money that they now spend in cutting down scrub, or that they lose by the death of stock in dry seasons, in preserving and laying up fodder for stock, they would find the investment a better one.

1503. You look upon this scheme of irrigation as one to provide produce for local consumption;—does it seem feasible to you that agriculturists should go to this dry district and incur the expense of pumping water and irrigating crops or fruit trees there when they can get land which is nearer to Sydney, and in a much more favourable climate? I do not know any district near Sydney where the climate for fruit-growing is more favourable than the Darling climate. When you compare one district with another, you must take all the circumstances into consideration, the cost of pumping would be far more than counter-balanced by the high prices paid for land nearer Sydney.

1504. But what about the freight to market? The freight for a great deal of what they would produce is in their favour. An Orange farmer selling hay at Bourke for £4 a ton would lose £2 of that in freight; whereas a man growing produce at Bourke would get the whole price, and, under irrigation, would obtain much larger crops than could be obtained elsewhere without irrigation.

1505. Do you think that agriculturists would go up there? I do not say that the wheat-growers at Narromine would sell their farms and go up there. The great difficulty is to get into existence a population with faith in the profits of small husbandry combined with irrigation.

1506. I suppose the irrigation colonies you have spoken of would be upon a very limited scale to begin with? They would not have to be on too small a scale; they would have to be sufficiently large to allow of economy in the distribution of the water.

1507. Mr. McKinney, when he was here the other day, expressed great disappointment because the community had not sufficiently availed themselves of the advantages given by the Water Rights Act? I share that disappointment; but the people out west have trodden in the beaten track a very long time, and they are not very receptive of new ideas. It is the same in other countries when you make a new departure. The managing partner of Dunlop Station told me the other day that some sheep he had—I think 20,000—had cost him 5s. a head to maintain, because of the drought. They were a particularly good class of ewes, and it would have taken many years to breed up the flock again. From that it will be seen that the expense of keeping stock alive in a dry time is very great indeed. I received a letter to-day from Mr. J. Mackay, in which he told me that he was sending teams along a road to distribute food so as to enable him to travel some good ewes from one station to another. The pastoralists there face a very heavy expenditure when they are pressed by the drought; but they will not pay similarly in providing against drought.

Hon.  
E. D. Millen,  
M.L.C.  
23 May, 1899.

1508. Time alone will bring about the making of proper provision? Time and a few good object lessons.

1509. I suppose you admit that to irrigate large grazing areas is almost impracticable? Yes; I do not think that that is ever likely to be practicable—at any rate out on the Darling.

1510. You have instanced India as a place where irrigation is extensively carried on, and where crops are largely grown by irrigation;—do you think that their experience can guide us, seeing what an enormous population they have there to consume the produce which they grow? I did not instance India as an illustration of what can be done by irrigation; but merely to show how small a proportion of any country can be irrigated. I did that with a view to disposing of the idea that large irrigation schemes were necessary, and, further, to show that the expense which irrigators there have to face. India holds out this encouragement to us, that the essential condition of success there is close population; and, within the limits of an irrigation colony, we can get close population here.

1511. Colonel Home, in his report, seems to indicate that a great deal of the land near the river is black-soil country, and unfit for irrigation;—do you agree with him there? A large part of that land is not the country one need select or bother about, seeing that the land which is suitable is more than sufficient.

1512. You think that there is an ample area of red soil country there? Yes, more than will satisfy the requirements of this generation. The black soil country must not be condemned entirely; there are certain crops which will grow upon it, though it is not the soil which you would choose where constant cultivation is required. For such a crop as wheat, which does not require cultivation after sowing, it would do very well. The black soil would produce better crops of wheat, and for a longer period, than the red soil.

1513. *Mr. Dick.*] You can irrigate the black soil? Yes, where you are growing a crop like wheat. But where you are growing fruit-trees, and it is necessary after each irrigation to run the plough down between the trees, black soil is too heavy; but there is not that difficulty with red soil. I have grown remarkably heavy wheat crops upon black soil, and without any difficulty at all.

1514. *Mr. Trickett.*] You stated that the greater the production the greater the demand for the produce; but if the prices are not remunerative what becomes of the producer? A man would not continue to produce if it did not pay him. What I meant is, that whereas to-day a ton of hay might cost £5, if it could be purchased at £2, as it can be at Orange, there would be a much larger consumption of hay.

1515. The agricultural production of that part of the country must be chiefly for local consumption? Yes; the fodder raised would be for local consumption.

1516. What things do you think could be grown there for export? There are very many high-class products which might be grown there. Certain kinds of fruits might be grown there, and profitably marketed throughout the Colony. There are many fruits, such as those which they are now shipping from Mildura to England in pulp, which might be sent from the Darling in the same way.

1517. The difficulty at Mildura has been caused, you say, by the high prices which have had to be paid for the land there? Yes; and because the scheme was very badly designed.

1518. And because of the high charge for water? Yes.

1519. The people there were over-weighted? Yes. The people went there at a boom time, and many of them purchased land at fabulous prices. They bought more than they could ever pay for, and when the instalments became due, they were in difficulties. I saw some evidence placed before the Committee as to the water lift at Mildura being 16 or 17 feet, but in one place there is a lift of 80 feet.

1520. When you gave evidence before, you said that you attached considerable importance to the Pera settlement as an object lesson;—what has your observation of it taught you? It has entirely confirmed my opinion both as to the possibility and the profitableness of growing fruit out there. I do not know if the Committee noticed the remarks which Mr. Carruthers made about it as reported in this morning's newspapers. The trouble which has occurred at Pera, and which has, to a certain extent, threatened the very existence of the settlement, has been occasioned by the failure of the water supply. When I gave evidence before, I referred to that as one of the dangers incidental to irrigation by means of artesian bores.

1521. But you say that the production of the soil has shown the place to be a success? Everything has confirmed the opinion I held of the place. A great difficulty in connection with it is to get the right type of men. One of the men who went there had been a grocer, and he had no agricultural knowledge at all; another man had been a Bank clerk, who left the Bank to take up a block at Pera. You cannot expect men to be successful in business of which they have no previous knowledge.

1522. You said that prejudice prevented the squatter from growing fodder for his sheep, but prejudice does not generally stand in the way of self-interest; if it had been to the interest of the squatters to go in for siloing or haymaking, would they not have done so? That would seem natural were it not that we have so much evidence to the contrary everywhere through life. A gentleman whom I mentioned just now—Mr. Wilson—has always protested that cultivation would not pay, but he recently got a manager—Mr. Robertson—who believes in cultivation, and he is going in for it, notwithstanding the mild protest of the owner of the station. Mr. Robertson is a younger man, who has seen other districts, and he has the largest single patch of cultivation out in the district now.

1523. Do you regard the proposed scheme as likely to be directly remunerative? By that you mean will it furnish a return direct to the Treasury.

1524. Yes? I understand that it would require a return of £22,000 a year to make the scheme pay, and I think it is very probable that it will not for a number of years return that amount. But we have constructed

- Hon.  
E. D. Millen,  
M.L.C.  
23 May, 1899.
- constructed many roads and public works which do not pay, incurring expense in connection with them in order to develop and assist the districts in which they are situated. For instance, a very large amount has been spent to enable the coal of Newcastle to reach the markets of the world. I view the proposed expenditure as similar in its object to the expenditure on the public works to which I refer.
1525. I suppose you consider that, where a large outlay of public money is made in a thinly-populated district, to get a return must be the work of years? It takes time; but I can see that work of this kind must tend to increase settlement. I cannot, however, see that a railway would increase settlement at all.
1526. You look upon the proposed work more as a work to develop the district in the future? As a work of immediate development. Apart from the indirect benefits which would accrue from it, the direct benefits might have to be waited for for some time.
1527. Do you look upon the work as likely to be of special benefit to this Colony? If you regard the people of the western district as entitled to call themselves part of the Colony, I do.
1528. Will its construction not lead to the taking away of a great deal of trade from this Colony? If any trade is taken away, it must be to the benefit of the men out there; otherwise they would send it to Sydney. But if you regard them as part of the Colony, and they are benefited, the Colony must be benefited. The question is whether you are to consider the interests of Sydney before their interests. I am not advocating the construction of this work in the interests of Sydney.
1529. You advocate it in the interests of the district? Yes.
1530. You said something in your evidence about the rebates given by the Railway Commissioners in order to secure the traffic? I said that any trade lost to the railway would not mean a serious loss of revenue, because the traffic that might be lost is now carried at such low rates that the Commissioners have very little profit out of it.
1531. Owing to the competitive rates of the other colonies? Yes.
1532. *Mr. Shepherd.*] I think you said that there are very few people in the neighbourhood of the Darling who are familiar with irrigation? Very few.
1533. Have any of the experts who have visited the district attempted to give lectures upon irrigation or to instruct people in any way regarding it? I do not think we have had any irrigation experts up there. One or two gentlemen connected with the Department have been up there, but they have been men like Mr. McKinney—engineers rather than irrigation experts.
1534. I understand that Mr. McKinney has had very great experience in other parts of the world? Yes; but you must distinguish between men who, as engineers, have had experience in the work of carrying out irrigation schemes, and men who, as irrigationists, have used water for the purpose of improving their crops. Mr. McKinney, like Colonel Home, is an engineer.
1535. I should think that the application of the water to the land is a very simple matter? There is a great art in it.
1536. Chiefly in laying it on? Yes; and in judging as to the quantity to be taken and the time at which it should be applied. Close attention to details is required.
1537. I should think that any agriculturist ought to know when his soil would require watering? I admit that, but still there are a great many people in this country who, although they are engaged in farming pursuits, are not agriculturists.
1538. I should think that practical men could very easily be instructed in the manner of applying the water, once there was a supply at their disposal? I do not think there is any great difficulty in the matter, but in teaching people to become irrigationists you have to combat their desire to use the water extravagantly. They will always use a great deal more water than is necessary.
1539. And too much water is almost as bad as too little? By over-watering they do harm to their crops and to their land.
1540. Is the black soil you speak of a tenacious clay? Yes.
1541. Such soil is, of course, unsuitable for irrigation? Yes; but I have used it myself for such a crop as hay.
1542. Flooding the land? Yes.
1543. The more friable and open the soil, the better for irrigation;—I think you said that there had been some remarkable lucerne crops grown in the district;—you stated that you had known a paddock of lucerne to be cut eight times in one year? Yes.
1544. That would exceed the production of the Hunter district? Yes; but the greater heat in the western district makes the growth more rapid than it is on the Hunter. With us the crops will grow in the winter months, when, upon the Hunter, they would almost have ceased to grow. In summer, too, the growth with us is more rapid than it would be on the Hunter.
1545. Do you know at what depth water is to be found under the land upon which this lucerne is grown? No.
1546. Do you think that its roots got down to the water? Nothing would have grown there but for the water applied on the surface of the ground.
1547. The great secret in lucerne-growing is to cultivate where the roots of the plant can get down to water? Well, in this case the water was going down to the roots.
1548. I believe that some excellent results have been obtained by irrigation from the Pera bore? Yes.
1549. But irrigation has been carried on there only upon a small scale? I may say that I myself designed and plotted out that settlement. I submitted the proposal to the Minister with the idea that it might ultimately become a fruit-growing place, or a place for growing vegetables for the supply of Bourke. The blocks there only contain 20 acres each.
1550. I imagine that cereal crops would not pay upon the Darling, except for local consumption? I should not like to say that. I believe that with cheap water-carriage you could grow grain there by means of irrigation; but I do not think it would be attempted at first. People, at first, would naturally grow produce for which there was a market at their own doors.
1551. Have you any idea what the local consumption would amount to? The price of produce greatly determines the amount of the consumption there. At the present time fodder is extremely dear there, and the supply is limited; but as I have already mentioned, in one year £70,000 worth of produce went into the Bourke Railway Station for distribution from that centre.
1552. That fodder would be sold at a very high price? Yes, and during a very dry time.
1553. Are the mining industries in the neighbourhood of the Darling at all active now? The mines at and near Broken Hill, and at White Cliffs are active; but both those places are too far away from the river to be affected by it, except as a trade route.
- 1554.

1554. Would not the produce from White Cliffs come to the river? Yes, the trade from that centre would drain to the river.

Hon.  
E. D. Millen,  
M.L.C.

1555. You say that you have known the river to cease running only once in nineteen years;—do you mean to cease running all the way down to the junction with the Murray? No; I spoke only of that portion of the river with which I am familiar, and more particularly in regard to the river between Walgett and Bourke. I believe that below Bourke the river has stopped running once or twice for a limited period, or has become so small a trickle that you could step over it.

23 May, 1899.

1556. Some of these rivers often run near the head, and seem to disappear altogether lower down;—I know that that is the case with the Lachlan very often? Yes.

1557. As a rule, I think the rainfall in the Darling district does not come at a period when it is likely to assist cereal crops very much? There is generally not very much rain at all. The first three months of the year show the best average rainfall, and each succeeding three months the rainfall becomes less. It is to be remembered, however, that our average rainfall is very much better than that of many places where irrigation is practised. Consequently we should not require to irrigate as much as they have to irrigate in those places.

1558. Where irrigation is carried out the less rainfall the better, because without rain you can regulate your supply of water better;—heavy rainfall coming after irrigation may do more harm than good? Yes.

1559. Do you think that sufficient water could be spared from the Darling to irrigate a considerable area of land? Yes.

1560. Irrigation has already been carried out there to some extent? One can hardly say "to some extent"; but sufficient has been done to show what is possible by means of it.

1561. Does there appear to be any disposition to increase the area under irrigation? All the efforts made in that direction out there have been extremely timid and half-hearted. People have very little faith in it, and know very little about it. The one or two people who have attempted to irrigate have made such serious mistakes that they have disheartened others.

1562. It is generally very hard to get people here to help themselves? When you will not allow other people to help them.

1563. *Mr. Dick.*] I gather from your evidence that you think that because of the want of men qualified to take up the work of irrigating, and for certain other reasons, we should go slow in this matter? Do you mean go slow in the matter of irrigation.

1564. Yes? Yes; but not go slow in the matter of locking the river.

1565. You look upon the locking of the river, then, mainly from the point of view of navigation? Its immediate effect would undoubtedly be to give facilities for navigation. The other advantages of the scheme would require time for development.

1566. You look upon the expenditure of £500,000 upon this work as justifiable in the interests of the Colony? Yes; if I had the money I should not hesitate to spend it.

1567. Presuming that it is necessary for the State to be recouped this expenditure, how can it be recouped? As I stated before, I regard this as one of those works from which the State need not look for a direct return. There are many works of the kind in this Colony which it is never expected will make a direct return.

1568. I do not regard the return as necessarily immediate? Well, such works as those on the northern rivers or at Port Kembla are not intended to give any direct return to the State.

1569. What about Port Kembla? It has been suggested that there will be a return in the shape of wharfage dues, but it has never been pretended that that return will be adequate to the expenditure. Expenditure upon roads comes within the same category. A water highway is the only road you can give the people out in the west.

1570. If we lock the Darling we set up a competitor with our own railway system? You mean to say that you may take some of the trade of the district from Sydney.

1571. We may take some trade from the railway which has been built to cater for that trade? What trade.

1572. The trade of the western district, of which Bourke is the centre? Supposing that that is so, are you, because you have constructed a railway to Bourke, going to refuse for all time to allow the people of the western district a cheaper and more natural means of carriage.

1573. The view I take is that to lock the river will be to bring it into competition with the railway? The railway is paying handsomely now. Last year the profits of the Bourke to Nevertire section were £30,000. But suppose there were a loss to the railway or to Sydney of £100,000, and the people out there made £150,000, which interest should stand first, looking at the matter from a national standpoint.

1574. Do you think it is quite fair that the majority of the taxpayers of the Colony should suffer a loss of £100,000 in order that the few people in the western district might gain £150,000? I think it is a monstrously unfair thing that the people out there should be directly taxed for the benefit of the people of Sydney.

1575. In what way would the people out there be taxed under present conditions to support the people of Sydney? If you force their trade to come here when they could send it more cheaply elsewhere you are taxing them unfairly.

1576. The people in that district were very anxious to get the railway? Yes.

1577. Then is it not fair that they should pay for it? Yes; but they have also to help to support other lines, such as the Hay line, which has been built merely to bring traffic to Sydney.

1578. Do you think that if the river were locked the trade between Tilpa and Bourke, which now centres in Bourke, and is brought to Sydney, would continue to be dealt with in that way? I do not think that between Tilpa and Bourke much more traffic would be taken away from the railways than is taken from them now in good seasons. I think that the traffic that would be taken is traffic which is now carried, if not at a loss, not a profit, merely to bring that to Sydney.

1579. Is it not the competition of water carriage that compels the Commissioners to reduce their rates? You cannot get away from that competition.

1580. You want to make it greater? Naturally, so that the people there may get to market more cheaply.

1581. Is it not rather late to consider that? What about the people on the Lower Darling.

- Hon. E. D. Millen, M.L.C.  
23 May, 1899.
1582. I am referring to the traffic of the district of which Bourke is the centre? The proposed scheme will not affect the people near Bourke very much; it is the people on the Lower Darling who will be affected.
1583. Have you gone into details as to the cost of necessary mechanical appliances for the small irrigation colonies of which you have spoken;—can you give the Committee any idea as to what the cost of these would be? The only way in which I could give you that information is by telling you the cost per acre of supplying water.
1584. How can you arrive at that cost unless you know the cost of the necessary plant? Not being familiar with mechanical appliances, I have got engineers to work out the figures for me, giving them the quantity of water required per acre and the lifts. The estimates I have obtained from different engineers have not exceeded 25s. per acre, and some have been as low as 17s. 6d. per acre.
1585. What would be the size of the colonies for which such a charge would apply;—you must have had in your mind colonies of a certain area? I have always taken 3,500 acres as the minimum, and 5,000 acres as the probable maximum for an initial, experimental scheme.
1586. You think that 5,000 acres could be successfully irrigated at a maximum cost of 25s. per acre? Yes.
1587. How many individuals would that area support? It depends upon the purpose to which you put the ground. If you are going to grow hay only, that area would not support very many people; but if you grow higher-priced produce it might support a soul to the acre.
1588. That would depend upon their getting an immediate market for their high-priced products? What do you mean by an immediate market.
1589. Not a Sydney market, for instance? The people of Sydney are now buying their dried fruits, which could be sun-dried at Bourke, from America, and places on the Mediterranean, and the fruit that is brought from those places is no better than could be brought from Bourke.
1590. Is it not a fact that the area suitable for fruit-growing there is outside the flooded area? It is above the reach of flood-water, but it is within 100 yards of the banks of the river.
1591. Is there much good land close to the river so as to be at once irrigable and beyond the reach of floods? I know of several patches within a reasonable distance of the river. There is a particularly good piece of land at Redbank. That land is, perhaps, better than the land at North Bourke, but not quite so close to the town.
1592. What do you think the North Bourke land would be suitable for? Almost anything you could grow out in that district.
1593. Is it as good as the Pera bore land? Yes; it is better than that land. It is a little more friable and richer.
1594. I think you said that with irrigation people could grow heavier fodder crops out in that district than in any other part of the Colony;—could they get a crop of mangold wurzels of 80 tons to the acre? My brother got 80 bushels of corn to the acre, and it was planted anyhow. It received no proper cultivation, and was treated in a way that would shock a North Coast farmer.
1595. *Chairman.*] Can you inform the Committee whether, if the river level were raised 8 or 10 feet, the water would pass down the various anabranches unless some provision were made to stop it;—are the entrances to the anabranches higher than the bed of the river? Yes, in most cases.
1596. If the river level were raised to the height of 10 feet, would not the water make its way down these anabranches, unless precautions were taken to stop it? The anabranches proper run back into the river again.
1597. Yes; but a great many miles below where they leave the river? Not always. However, that would not greatly affect the supply of water. The most numerous depressions out there are the billabongs, and they do not come back to the river. One effect of blocking the river would be that, whereas these billabongs are filled now only once in two or three years, they would then always contain a permanent supply of water.
1598. The Acres Billabong is of considerable length, and so too is the Talyawalka;—would there not be a danger of the river leaving its present channel and using some of these anabranches? I think it would be a very fine thing if the locking of the Darling did cause these additional rivers to be made. An additional lock would conserve all the water that ran into an anabranch.
1599. Would you lock these places? Yes; if necessary.
1600. The estimate before us contains no provision for that work? Probably the levels are such that no such provision would be made at this stage. I should like to ask the Committee to take into consideration before it closes this inquiry the possibility of running a line from Menindie to Broken Hill, and the advantage such an irrigation settlement at Menindie would have in supplying Broken Hill. I am satisfied that an irrigation settlement at Menindie and a railway to Broken Hill would be self-supporting, and I think that a great deal of the traffic of Broken Hill would come to the Darling, some of which might be brought up to Bourke.
1601. I suppose the people out in the western district do not particularly want to trade with Sydney;—if they can get a market at Broken Hill or other places it will suit them just as well? An irrigation settlement at Menindie, even without a railway, would find its best market at Broken Hill.
1602. *Dr. Garran.*] Would the produce grown at Menindie stand the land-carriage to Broken Hill? Yes; the distance between the two places is only about 60 miles, and at Broken Hill there is a population of about 25,000 people. Broken Hill is situated in a very dry district, and the freights through from Adelaide, are comparatively high.
1603. Have you ever travelled from Menindie to Broken Hill? No. I know Broken Hill, and I have been within a few miles of Menindie, but I have never been from Menindie to Broken Hill.

TUESDAY, 13 JUNE, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Robert R. P. Hickson, Under Secretary and Commissioner for Roads, Department of Public Works, sworn, and further examined:—

1604. *Vice-Chairman.*] Under section 12 of the Public Works Act, the Committee have to take into consideration in any inquiry of this kind whether the work is to be regarded as of a reproductive or revenue-producing character; and we have recalled you to ask you if it is the intention of your Department, as far as you know, to impose any tolls or other charges in respect of these locks and weirs on the river Darling? I am instructed by the Minister (Mr. Young) to say that this matter has not yet been considered by him, or submitted to the Cabinet.

R. R. P.  
Hickson.  
13 June, 1899.

1605. No determination has been come to? None.

1606. So that at present we shall have to regard it, then, as if no charges were to be imposed? Yes; no charges having been determined.

1607. Although nothing has been determined, could you tell the Committee whether the question has been gone into at all in your Department of what revenue could be obtained from a large service of this kind? It has not.

1608. Or what freight would be obtained, or what charges could be made for using the locks? No.

1609. That has not been gone into, so as to give the Minister an estimate? No.

1610. He has not called for any inquiry of that kind? No.

1611. *Dr. Garran.*] Have you formed any opinion as to what will be the best way of levying a toll—whether by a licensing system, or by a charge on the freight? I cannot say that I have.

1612. Do you know of any experience in other parts of the world as to the way in which these things are made to pay? As a rule it is a tonnage rate.

1613. Do you mean a rate on the tonnage of the steamer, or on the tonnage of the freight carried? On the tonnage of the steamer.

1614. Irrespective of what they carry? Yes. There are a great many ways in England in which the tolls are levied. They are sometimes per foot of water drawn by the barge, sometimes on the gross tonnage carried, and sometimes on the gross tonnage of the vessel carrying cargo; but as a rule, I think, it is the tonnage of the vessel carrying cargo which is charged on.

1615. What is the case on canals in England? I am speaking of canals now.

1616. Do you know what it is in America? No.

1617. Or in France? I could not say.

1618. You have not yourself given any consideration to the question? No.

1619. *Chairman.*] In France, in some cases, they are regarded as highways, and no charge is made? It may be so in France. I do not think there is any case of the kind in England, for the simple reason that they all belong to private companies, and they must get a revenue from them.

1620. *Dr. Garran.*] In France there are Government canals? Yes.

1621. They are not charged for? I could not say.

1622. *Vice-Chairman.*] You are not able to say whether there is a tendency towards granting the free use of these waterways? No; for the simple reason that the only ones I am at all conversant with are all English ones, and they all belong to private companies.

1623. *Mr. Shepherd.*] Have you any objection to say whether, in your opinion, a large amount should be spent for the benefit of the people in these localities without getting any return? I think there ought to be a return.

1624. You think that tolls would be quite justifiable under the circumstances? I think so; I do not see why they should not be.

WEDNESDAY, 14 JUNE, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

James William Boulton, Superintendent of Public Watering Places and Artesian Boring, Department of Mines and Agriculture, sworn, and examined:—

1625. *Mr. Shepherd.*] You are thoroughly acquainted with all the bores in operation? Yes; there may be an odd one I have not seen.

J. W.  
Boulton.  
14 June, 1899.

1626. How many bores are there in operation? We have forty-eight flowing bores, sixteen pumping wells, eight failures, eleven bores for which contracts have been let, but which have not yet been commenced, and

J. W.  
Boulton.  
14 June, 1899.

and nine bores for which contracts have been let, and which are in progress. That gives a total of ninety-two for which provision has been made. The progress has been considerable since the last occasion I appeared before the Committee.

1627. Is any cultivation carried on at any of the bores? A small amount is done at nearly every one of them. The largest cultivation we have is at Pera, then at the Native Dog, and then at Enngonia, Belalie, and Barrington.

1628. What revenue does the Government derive from these bores? During 1898 we had sixteen bores unleased; they were under caretakers, and they produced a total revenue of £790.

1629. Will you state the names of the different bores, the districts in which they are situated, what amount they cost, and what revenue they produce? I have prepared this information in the shape of a return, which reads as follows:—

RETURN re Artesian Bores, New South Wales, sunk by Government.

Under Lessees.

\* These should not properly be classed as failures ; there is a small pumping supply available.

## SUMMARY—Artesian Boring.

1. Number of flowing wells .....	48
2. Number of pumping wells .....	16
3. Number of failures.....	8
4. Number let, but not commenced .....	11
5. Number in progress .....	9
Total .....	92

6. Total depth bored to date .....	134,815 feet.
7. Total cost of 72 bores completed .....	£220,192 7s. 4d.
8. Total depth of bores completed.....	123,315 feet.
9. Average cost per foot of bores completed .....	£1 15s. 9d.
10. Average depth of bores completed .....	1,712 feet.
11. Total cost of 48 flowing bores .....	£154,260 16s.
12. Total depth bored of flowing wells .....	84,029 feet.
13. Average cost per foot of flowing bores .....	£1 16s. 8d.
14. Average depth bored of flowing bores.....	1,750 feet.
15. Total cost of 16 pumping bores.....	£43,654 16s. 3d.
16. Total depth bored of pumping bores .....	25,379 feet.
17. Average cost per foot of pumping wells .....	£1 14s. 4d.
18. Average depth of pumping wells .....	1,586 feet.
19. Estimated supply from 48 flowing wells .....	29,491,340 gallons per day.
20. Estimated supply from 16 pumping wells .....	741,000 gallons per day.
21. Estimated supply from 64 wells .....	30,232,340 gallons per day.

There are 125 private wells in the country, the output from which is about 43,000,000 gallons, while the output from the 64 Government wells is 30,232,340. Other bores are in progress at the present time.

1630. Have the lessees sole right to use the water from these bores? They have, subject to a limitation. They have to supply all travelling stock, and to carry out a certain amount of cultivation for the Department if they are called upon to do so; and they are authorised to make a certain regulation charge, viz., 10s. per 1,000 for sheep, 1d. per head for horses and bullocks,  $\frac{1}{4}$ d. per head for camels and goats.

1631. Is there much cultivation carried on at the bores? Not a great deal.

1632. What is the charge to private consumers? The charge for water which is carried away for domestic purposes is 6d. per 100 gallons. During this last exceedingly dry season a great deal of water has been supplied free of charge. Wherever we have had caretakers, any person who has asked for free water has been allowed to have a supply.

1633. *Dr. Garran.*] You could not interfere with the lessees, I suppose? No; we have in some cases, but we have made a small monetary compensation to them for the concessions they made to the public.

1634. *Mr. Watson.*] Many lessees charged lower than the standard rates? A great many of them do. The standard rate we charge is the price which they may not exceed.

1635. *Mr. Shepherd.*] Is there a disposition generally amongst residents to use this water for irrigation purposes? I cannot say that there is. It is growing very considerably. I had a letter some little time ago from Mr. Mullen, who is doing our surveys under the Artesian Wells Act, in which he told me that he

J. W.  
Boulton.  
14 June, 1899.

had more work in laying out small irrigation farms for stations at the bores than he could complete before the end of the year. He said there was a distinct advance all along the line in the direction of putting in small areas for cultivation and the irrigation of the land just for station requirements. There is nothing done in a large and extended way.

1636. Have you any return to show the progress made in irrigation during the last three years? No.

1637. In the amount of acreage? No.

1638. There is an increase? Yes.

1639. Does there seem to be a desire on the part of people to acquire a knowledge as to how to apply the water? I think so, decidedly. The number of visitors at the Pera settlement are very many, and they are very anxious to get information from our farm manager as to the methods of applying the water and the results he gets, and they criticise his methods very freely.

1640. Has there been any attempt made to instruct the people as to the proper way of using this water for irrigation purposes? In no other way than by the actual experiments at Pera.

1641. The Pera bore seems to be about as successful as any? There is no question that it has got beyond the range of experiment. We should have been much further ahead had it not been for this unfortunate falling off in the supply of water at the present juncture.

1642. Have you remarked a falling off in the supply at any of the bores? We did at Pera.

1643. But not at any other? At the Native Dog and at Osaca we have noticed it, but that is explicable. We put that result down to imperfect casing. At both those places and at Pera we think the flow is getting away and losing itself underground before it reaches the surface. I think that is the only feasible explanation of it.

1644. Do you think it is attributable to the exhaustion of the supply, or perhaps to one bore robbing another? I do not like to admit that there is any possibility of the exhaustion of the supply. Perhaps I might be permitted to read to you what the best authorities we have say with regard to the exhaustion of the supply. Mr. Jack, the Government Geologist of Queensland, Mr. Pittman, our own Government Geologist, and Professor David have all gone into this matter to a more or less extent, and what I propose to read are simply some extracts from a paper which Mr. Jack read before the Science Congress in Brisbane. I think when you hear what he has to say, and what Mr. Pittman has to say, you will see that any permanent or serious diminution of the flow is not a possibility in our generation. Of course, the whole thing is speculative to a greater or less extent, but still there is such a strong presumption of correctness in what they say that you cannot help but be impressed by their views.

In Queensland the examination of the intake beds of the artesian water system was deemed of sufficient national importance to warrant the Government Geologist and his colleague, Mr. Assistant-Geologist Maitland, now Government Geologist of Western Australia, being detailed on a special mission to that end. When Mr. Jack commenced his observations it was currently believed that the area of the intake beds was extremely limited.

At the time they commenced to make that examination the intake bed was supposed to be very limited in extent. I think, roughly speaking, it was supposed to be one-eighth of a mile wide and about a couple of hundred miles long.

The subsequent examination demonstrated that area to be forty times larger than was supposed, and in referring to this matter he stated: "The outcrop of the porous strata, massed together under the name of the Blythesdale Braystones (which are not the only porous beds of the lower cretaceous), having been ascertained to be at least 5 miles wide over 1,000 miles of country, proved to be less than forty times greater than the total width (one-eighth of a mile) of the various porous beds assumed by Mr. J. S. Henderson, hydraulic engineer, which I thought a liberal estimate."

Mr. Jack goes on to say:—

"The idea that water entering the porous beds ultimately finds its way to the sea by underground channels, or by percolations, through the intervening portions of the earth's crust, has been for a long time a matter of vague speculation on the part of theorists, who did not take into account, or who were ignorant of, the essential element of the geological structure of the region in question. That such a communication could only take place through the medium of the intake beds themselves may be said to have been the common knowledge of geologists for a long time, but so far as I am aware, as regards the Australian area, this was distinctly pointed out in 1893 by Prof. David, who discussed the probability of the continuity of the porous beds of the lower cretaceous formation to the Gulf of Carpentaria in the north and to Lake Eyre on the Coorong coast on the south."

1645. *Dr Garran.*] Where are the intakes situated in Queensland? They run up the west of the foothills of the coastal range. The writer of this paper continues as follows:—

This idea has been further dealt with, and it was insisted upon that the loss of water by such rivers as the Darling, and presumably by the Queensland rivers crossing the outcrop of the Blythesdale Braystone, amounted to a proof of the circulation of water through the Braystone itself to the sea, inasmuch as the comparatively trifling amount discharged by the bores now in existence would not make a void in the porous strata anything like sufficient to absorb the annual loss of water by the rivers, and no other outlet than the sea was conceivable. The conclusion was drawn that the water-bearing strata must run into the sea, and that unless the strata were periodically replenished, the sea level would ultimately become the level to which the water of the bores would rise. "A drought," Mr. Jack says, "sufficiently long to bring about this result would, no doubt, have for a prior result the destruction of the greater part of the land fauna of this part of Australia, including the genus homo." Far short of this, however, he cannot conceive of the temporary diminution or cessation of the flow of some at least of our artesian wells. "Finally, as the leakage into the sea is so vast and so entirely beyond human control, the draught upon our ground supply made by artesian wells is not worth controlling."

1646. After that paper was written, Mr. Pittman's investigation showed that the intake beds could be enormously added to by the inclusion of an immense area of Trias Jura formation which was lying to the eastward of all this known intake bed as mapped by Mr. Jack, perhaps adding about 20,000 miles.

He considers there is an area of about 200 miles in width lying to the east of the outcrop of the Blythesdale Braystone which, though hitherto unprospected, possesses all the conditions which are regarded as necessary to the occurrence of artesian water, and he expresses the opinion that the probabilities of artesian water being obtained in large quantities to the east of the outcrop of the Blythesdale Braystones are very strong indeed, and concludes by saying: "I would even go so far as to suggest that the porous strata of the Trias Jura formation may constitute the chief storage beds of the artesian water supply of Australia."

That adds a very large area, in addition to that mapped out by Mr. Jack. Professor David, in a paper read before the Royal Society upon this subject some years ago, gave an interesting and speculative calculation, showing the vastness of the storage capacity of the artesian basin in New South Wales. From memory, the calculation is somewhat as follows:—

If the area of the porous beds of the cretaceous be estimated at 40,000 square miles (the superficial area of the cretaceous is 62,000 square miles), and the imbibing capacity of the porous beds is  $2\frac{1}{2}$  gallons per cubic foot (that of the upper green sand of Europe is 3 gallons per cubic foot), and if the beds average 20 feet thick, the quantity of water in them would maintain the present outflow from the artesian wells in New South Wales (say 41,000,000 gallons daily) for 3,726 years, provided, of course, the pressure is maintained by additions of rain-water at the intake.

It

It is mainly on these three statements I rely when I say that I do not think that any serious or permanent diminution can take place in our time, or at any rate until the wells are so multiplied that they actually interfere with one another. Probably one hundred times more than we have at present.

J. W.  
Boulton.  
14 June, 1899.

1647. Is it found as a rule that the water is absorbed into the soil, or does it find its way to some water-course? It runs for miles. There is a certain amount of absorption; but where the water is helped, as it is on some of the stations;—I could quote places—the water runs fully 60 miles from the bores.

1648. And, ultimately, it falls into a watercourse? Yes, they utilise the watercourse, ease the bars down, and help it along. That is a very wasteful way of handling the water, but still it is economical.

1649. Is it found that the quality of the water varies very much at the different bores? Not generally. On the road from Bourke to Wanaaring, when you get on the other side of the Warrego, there is a very marked difference in the quality of the water; it is very much inferior to the quality of the water at the other bores. That is, inferior as far as its contents of the alkaline-carbonates are concerned. I think very nearly all of them, with one exception, are potable by human beings.

1650. And they are largely used for domestic purposes? Very largely.

1651. You are inclined to think, on the whole, that the application for areas for irrigation purposes will be largely increased? I think as the people get experience, and we get population, there is no question that it will.

1652. As a rule, irrigation water seems to facilitate the growth of the crops very much? It does enormously in that hot district. The soil gets very hot, and with the application of water it is like a hot-bed.

1653. It comes out of the bore heated to a certain extent? It is; but we do not supply it in its heated state. We prefer to cool the water and aerate it before it is used. It is very heavily charged with sulphuretted hydrogen when it first comes up. That is volatile, and goes off upon exposure to the air.

1654. Have you had experience in artesian-boring in other parts of the world? None whatever, except in Australia, and from reading what other countries are doing.

1655. *Vice-Chairman.*] Taking the particular district to which this inquiry relates, which is the most important and the most successful of the bores? The Pera, which is within 7 miles of Bourke if you cross by the punt, and within 15 miles of Bourke if you go by the bridge.

1656. What is the nature of the soil at the Pera bore? It is a red chocolate soil—a gidgee forest soil.

1657. What are its ingredients?

#### ANALYSES OF SOILS.

Sample marked "A."

Locality of soil—Pera Bore.  
Nature and depth of soil—Sand.  
Reaction of soil—Very slightly alkaline.  
Capacity for water—27·66 per cent.  
Absolute weight per acre, 6 inches deep—3,457,091 lb.

#### Mechanical analysis.

Root fibres.....	·00 per cent.
Stones over $\frac{1}{4}$ inch diameter .....	·00 "
Coarse gravel, more than $\frac{1}{16}$ inch diameter .....	·00 "
Fine gravel, more than $\frac{1}{32}$ inch diameter .....	·93 "
Fine soil—99·07 per cent. { Sand .....	86·16 "
{ Impalpable matter, chiefly clay .....	12·91 "

#### Analysis of fine soil.

Moisture .....	2·159 per cent.
Volatile and combustible matter, principally organic .....	2·329 "

#### Fertilising substances soluble in hot hydrochloric acid of 1·1 specific gravity.

##### General value.

Lime (CaO) ·165 per cent. Satisfactory—equivalent to 5,610 lb. (a) in an acre of soil 6 inches deep.  
Potash (K<sub>2</sub>O) ·223 per cent. Satisfactory—equivalent to 7,582 lb. (b) in an acre of soil 6 inches deep.  
Phosphoric acid (P<sub>2</sub>O<sub>5</sub>) ·087 per cent. Fair—equivalent to 2,958 lb. (c) in an acre of soil 6 inches deep.  
Nitrogen ·100 per cent. Fair—equivalent to 2,788 lb. (d) in an acre of soil 6 inches deep.  
Ferrous Oxide (FeO) ·144 per cent.

NOTE.—(a) This amount of lime would be supplied in 6,233 lb. of quicklime, or 8,415 lb. of slaked lime, or 11,220 lb. of chalk.

(b) This amount of potash would be supplied in 15,164 lb. of commercial sulphate of potash, or 63,153 lb. of kainit.

(c) This amount of phosphoric acid would be supplied in 11,832 lb. of commercial bone-dust, or 17,748 lb. of superphosphate.

(d) This amount of nitrogen would be supplied in 13,940 lb. of sulphate of ammonia, or 16,728 lb. of nitrate of soda.

Sample marked "B."

Locality of soil—Pera Bore.  
Nature and depth of soil—Sand.  
Reaction of soil—Very slightly alkaline.  
Capacity for water—30·33 per cent.  
Absolute weight per acre, 6 inches deep—3,357,092 lb.

#### Mechanical analysis.

Root fibres.....	·00 per cent.
Stones over $\frac{1}{4}$ inch diameter .....	·00 "

(c) This amount of phosphoric acid would be supplied in 39,808 lb. of commercial bone-dust, or 59,712 lb. of superphosphate.  
(d) This amount of nitrogen would be supplied in 10,720 lb. of sulphate of ammonia, or 12,864 lb. of nitrate of soda.

The

The lime found corresponds to 18·15 per cent. calcium carbonate. The subsoil is remarkably rich in plant-food, and the general values assigned to each ingredient are those that would be attached to a surface soil. The alkalinity is very slight, being only about 0·1 per cent. The freedom of the subsoil from alkali is a very encouraging sign, as it is obvious that if the conditions are favourable leaching out the alkali from the surface the subsoil is not saturated to such an extent as to render further absorption of alkali by it impossible. The soil is itself a rich one, and as long as the water used circulates freely there should not be much danger.

J. W.  
Boulton.  
14 June, 1899.

That is only the first analyses of the soil; we had a very long series of analyses of the soils made, subsequently, after three years irrigation, which I could hand in if desired. We had six analyses made of the soil from the land under irrigation.

1658. They are of much the same character? Very much the same. They were taken when we commenced the work, and those analyses made subsequently show that the increase of alkaline matter in them is infinitesimal.

1659. *Mr. Watson.*] Although it was anticipated that the application of water would increase the proportion? Yes. In one instance there is even less alkali now than when we made the first analysis.

1660. *Dr. Garran.*] Was that analysis of soil made since the bores have been put down? Previously.

1661. Before the site was selected? No, afterwards.

1662. Is there any examination of the soil before a bore is put down? No chemical examination; we get the water before we attempt anything at all.

1663. Is the selection of the site of the bore made under any superintendence by a general engineer in the Department, or is it left to the local managers? It is decided by the Government Geologist and myself. The primary object of these bores was the watering of the stock routes. We consult the Chief Inspector of Stock, and select a position where it is most required and most useful for travelling stock, and then we ask the Government Geologist if he considers that there is a probability of the occurrence of artesian water on the spot; and it is by his report we are guided generally; the actual fixing of the exact spot is left to the local officer—that is immaterial.

1664. The general purport of all this is to open up country for stock traffic and teamsters? Yes.

1665. And the idea of agriculture was quite subordinate to that consideration? Entirely; it simply arose out of the enormous volume of water which was there in excess of requirements.

1666. In fact, it was the Pera bore which first gave the idea of having agricultural settlements attached to a bore? No; the Native Dog was the first one. It is 45 miles from Bourke, on the Barrington Road. The Minister went out to see the results on a small area of 16 acres, at the Native Dog bore. He was accompanied by Mr. Thompson, the Director of the Hawkesbury College, and after he came back to Bourke he visited the Pera bore, which was then completed as a stock bore. In view of the distance which the Native Dog was from Bourke, he thought that Pera would be a more convenient position for such an experiment, and accordingly he gave directions that it was to be carried out at Pera, and that we should lease the Native Dog.

1667. If you are now going to consider irrigation as well as the supply of stock, you always have to consider before you put down a bore whether you are fixing your bore on a site from which you can deliver the water eventually by gravitation? That is a point we have never lost sight of. We have always selected the handiest spot for the bore.

1668. We have had some evidence, I think, to the effect that the question of gravitation has not been considered, and that there are some bores in places where you could not use the water for irrigation without lifting it? I hardly think that in those cases this Department is responsible for the selection of the sites of the bores.

1669. Still it is so? It is so. In most cases it is not so.

1670. I suppose in these out-of-the-way places there would be no market for irrigation produce, even if you made some few farms there? There would be no market, perhaps, for vegetable products; but there is a good market up there for dried fruit and products of that description, and for fodder crops there will always be a market.

1671. I suppose for fodder crops more than for dried fruits? Yes.

1672. Dried fruit requires some skill and manipulation? Dried fruit is enormously more profitable than the fodder.

1673. But it is not every plain farmer who can produce dried fruit? No.

1674. Any plain farmer can produce a lucerne crop? Yes.

1675. Even to irrigate simply an acre or two for fodder you require gravitation? Yes.

1676. Therefore, it is of no use to put your bore down in a hollow? Not at all.

1677. Is the Pera bore well situated for gravitation? Yes; the country there is as nearly level as you can get it. I do not think there is a fall of about a foot in the mile. Of course, under a system such as we have there that is immaterial, because we can give a fall to the flume.

1678. How high does the water rise above the surface of the ground? About 9 feet; it is delivered into an irrigating tank, and from there it travels in a flume, which I think has a fall of 4 feet to the mile.

1679. Do you catch the water? The water comes up from the bottom of the tank, and it sprays into the tank.

1680. You catch the water at a sufficient height to command the ground? Yes.

1681. What proportion of available land at Pera has been taken up? The whole of the blocks are taken.

1682. Have any of the cultivators there been sufficiently long at work to fairly test the profitability of it? Yes. Two men named Munro and Hersey are making a living. The others are a different stamp of men, and are not so used to the steady, patient labour which is required to produce the results there obtained.

1683. Have these men, who have been at work, gathered sufficient experience now to be a guide to the newcomers? I should hardly like to say that. Both Munro and Hersey were at this thing long before they came to Pera—Munro came from the Clarence, where he had had a lot of experience in cultivation.

1684. They are experts to a certain extent, and men of intelligence? Yes; they are good, respectable, hard-working men.

1685. You do not want to irrigate much on the Clarence? No; Munro had had absolutely no experience of irrigation until he came to Bourke, but he had had good agricultural experience.

1686. We are almost uniformly told that the first thing which irrigators have to learn is not to place too much faith in water? Exactly. The tendency up there—and it is very hard to knock it out of them—is simply to drown everything. They do not cultivate enough. Munro and Hersey are the only men there who are really alive to the benefit of cultivating.

1687.

J. W.  
Boulton.  
14 June, 1899.

1687. As regards the bulk of the other men, what stamp of men are they? They are all labouring men except one, who, I think, was a clerk in a bank.
1688. They have not been practical agriculturists? Not at all.
1689. They have everything to learn? They have everything to learn as they go along.
1690. Have any pains been taken by your Department to teach them? Yes; the manager of the farm instructs them, especially in pruning, cultivation, and all that sort of thing.
1691. In the application of the water? They see exactly how it is applied on the Government farm. It is constantly dinned into their ears not to put too much water on, but they do not see why they should not. They think that the moment the surface gets hard and dry it wants water.
1692. Is the water conveyed in little ditches or in pipes? It is conveyed in a semi-circular iron flume, which is open at the top.
1693. Is that a main channel or a local distributing channel? It is a main channel.
1694. Every man puts it over his own land as he likes? Yes; we deliver the water in three places on each block.
1695. With regard to fruit-trees, do they have little channels round the trees? Mostly between the trees.
1696. With regard to lucerne paddocks, how do they distribute the water? The flooding system is used for lucerne. The land is divided into checks and each is flooded in rotation.
1697. It is a thirsty soil? Yes. It is so thirsty that we have not attempted to provide any system of subsoil drainage at Pera.
1698. It drains itself? Yes.
1699. Is this fluming expensive? It costs the Government about 1s. 4d. a foot.
1700. The Government provides the fluming and takes the water to the edge of each man's land? Yes.
1701. What charge are you making for the water? We charge £5 a year for 20 acres of land and the water they use.
1702. You leave them to determine how much water they will take? They are limited really to 21,000 gallons per day per block.
1703. How do you measure it—in open flume? It is measured on time.
1704. It is allowed to run for so many hours? Yes; we know exactly how long it takes to supply the quantity of water. In America they have a system which they call horary rotation, and that is practically what we do at Pera.
1705. A man would want more water for his lucerne than for his fruit-trees? Yes.
1706. The question is brought forward as to which is the better method of irrigating—by pumping from the river or by using water from a bore; and it has been pointed out to the Committee that close to Bourke, on the other side of the Darling River, there is a magnificent site for irrigating from the river;—if there were an irrigation farm on the North Bourke site, would that cut out the Pera bore? I do not think it would. It would put those who took up land at the North Bourke site on a better footing than the Pera men, because they would be nearer to town; but still I do not think it would interfere with the sale of Pera products, because there is a market at Bourke which is quite sufficient for the products of two or three Peras.
1707. Your farmers at the bore have 8 miles of carting, while the farmers at North Bourke would have 3 miles? Yes.
1708. Is the soil at North Bourke equally as good as that at Pera? It is of a more sandy nature than the soil at Pera. It is purely red sand. From West Bourke until you get out to Fort Bourke station boundary you have nothing but a series of undulating sand-hills.
1709. That is a fertile soil? It is very good for cereals.
1710. Is it quickly exhausted? I should think it would be. I have never seen it or heard of it being under any cultivation for a series of years. I think the intense cultivation and the smaller products which bring the high prices are the things to be considered. I do not think anyone who irrigates in that district will be able to compete with people in other localities, who are growing without irrigation.
1711. It is for fodder and fruit and garden stuff? Yes; and such produce as millet, sorghum, and Kaffir corn.
1712. Especially what you can sow in drills? Yes; maize, too, grows beautifully up there.
1713. Would the experience you have gained at Pera be in favour of an irrigation farm at North Bourke? Certainly.
1714. You think that is a good position? It is a good position, but I should prefer to go further than North Bourke; I should go away from the river. I should not attempt to use the river water for irrigation. I should put down another bore at the junction of the Wanaaring and Hungerford Road, about 2 miles away.
1715. The advantage of the Bourke site is that the water only wants pumping up, and you have the river and the railway as get-aways for the produce? Yes; but under the bore system you have the water always running—always delivered on your ground without any annual charge for pumping.
1716. You have the interest on your outlay to pay, and we have to compare the two;—have you any knowledge of what a pump would cost to lift the water at Bourke? No; it would depend upon what the lift would be.
1717. It would not be less than 40 feet? I should think it would be about 35 feet.
1718. I would like to get a fair estimate of what is represented by the annual cost of lifting water 40 feet and the annual cost of a bore? I have not gone into that question.
1719. I suppose all your bores have been made with borrowed money? Yes.
1720. None of them have been paid for out of revenue? None.
1721. And at present the receipts do not anything like pay the interest on the loans? Not directly. The State must necessarily derive very large indirect benefits from the expenditure.
1722. The foreign bond-holder is not content with indirect benefits? As a direct return we do not get the interest on the money.
1723. No attempt has been made to apply the land revenue towards the cost of these improvements? No.
1724. Mr. McKinney has said that it would be decidedly cheaper to get water by pumping from the river;—do you know any officer in your Department who is equally prepared to prove that it will be more economical to get the water from the bore? No; I am the only officer there is in the Department dealing with the question.

J. W.  
Boulton.

14 June, 1899.

1725. I suppose if you were to put a bore down close to the Darling you would be pretty sure to get water? There is no question of that.
1726. You have not tested that, simply because you have not wanted the water for stock route purposes? Exactly.
1727. At what intervals do you put down the bores for the stock routes? At intervals of from 12 to 16 miles, and in some cases at intervals of 20 miles. The stock routes are not watered entirely by bores; they are watered by tanks and wells as well.
1728. Every one of these bores, I suppose, is on some station or other? Yes; they are all upon, or adjacent to, the stock route and have been taken out of either a pastoral lease or a homestead lease.
1729. Does the pastoral tenant get the benefit of the water which is not used by travelling stock? In some cases he does, but he pays for it. We close the bores; the waters are not always running.
1730. When you re-open the tap it will always flow afresh? Yes.
1731. You have never found that you have shut a bore down for good? No.
1732. There is no dirt or silt accumulating in the bore? Shale accumulates, but that is forced out with the flow. The shutting of the Pera bore caused this shale to drop back, and it filled up nearly 300 feet.
1733. *Mr. Watson.*] How did you get that shale out? With a sand-pump.
1734. *Dr. Garran.*] Then the squatter cannot take advantage of this water simply because it is on his run? No.
1735. If he wants water he has to pay for it the same price as anyone else? We do not charge him so much a head. Haddon Rigg station got the run of the water from the Tenandra bore for three weeks at £10 a week.
1736. If the squatter wanted water to water a lucerne paddock you would let him have the water by time? Yes.
1737. Every squatter who likes can have a lucerne paddock close to the bore? Yes. Where they have their own bores a great number of them have small cultivation paddocks.
1738. Have the squatters generally utilised the water? No; they take very little advantage of it from the Government bores.
1739. They do not show any enterprise in the matter? No. Where they have, we have allowed them to have the water, but they are very few.
1740. In all these dry seasons which we have had continuously, have not these men tried to grow lucerne or hay? I do not think so, except at their own places.
1741. Would it not pay them to do so? Yes.
1742. Why did they not do so? That is a matter to which I do not think they have given sufficient attention.
1743. Perhaps they do not know why, themselves? I do not think they do. It is an aspect of the question which they have never properly considered. I am rather laughed at for saying that it will pay to grow fodder for stock as an insurance against the dry times.
1744. Are not many of them carting hay from Bourke? They are spending large sums in that way. In this last season some stations have spent sufficient money on horse-feed to have laid down the most perfect irrigation farm you could possibly imagine. There is no question of their being able to grow fodder.
1745. The climate and soil will grow anything, with water? Yes.
1746. Even in a good season it will pay them to grow hay? Yes, and some of them do. They have very small paddocks.
1747. Will the natural grass make good hay up there? It just depends upon what grass you get. If you get Mitchell-grass or blue-grass it will make beautiful hay.
1748. Is it nearly all kangaroo-grass there? There is, in the Moree district. That is a wonderful grass country.
1749. Will the kangaroo-grass make good hay? I do not think kangaroo-grass or wiry-grass would.
1750. There is no artificial grass which grows up there at present? No. The kangaroo-grass is rather too wiry for making good hay, unless you get it cut very green, and salt it.
1751. It is a favourite grass with stock? Yes, especially with cattle.
1752. Suppose the Darling weir were locked, and an abundant supply of water were offered for all irrigation farms likely to be established on its banks, they would grow the produce for the district on the riverside farms as against the back country? Yes.
1753. If we have to look to irrigation in the future in that district, we must rather look to it along the river than in these back country bores? For a time we might.
1754. These bores will be merely isolated places like oases in the desert? Yes.
1755. Have you bores all the way to Tibooburra? Right along from Bourke.
1756. Is there any attempt at farming anywhere in the neighbourhood of Mount Browne or Tibooburra? Nothing.
1757. Is the soil good there? No; it is a little too stony for that class of work.
1758. There is no place between Pera and Tibooburra where there is any attempt at cultivation? There a little between Pera and the Warrego, and Mr. Davies, of Kerribree Creek, has a very good farm of his own.
1759. Are there any dams on the Warrego to store water? There are some dams, but I do not think you can consider them permanent.
1760. No attempt at irrigating there? None, except at Mr. McCaughey's place; but there, I fancy, they get short of water, and it is not what you would call a permanent thing. I do not know whether any effort has been made to increase the capacity of the dams, but when I was there last, about seven or eight years ago, I think they had about 40 acres under cultivation.
1761. Does the Warrego run in a well-defined channel, or does it spread itself over the country? On the other side of the border it has a very well defined channel. As it comes over on to our side it has a very small channel, but a fairly wide watercourse.
1762. In flood-time it would be a marsh? It covers a very large extent of country.
1763. *Vice-Chairman.*] You gave evidence before this Committee three years ago at a similar inquiry, and you stated that these bores were being worked then at a general loss, but you seemed to be hopeful then that things would improve? I did.

J. W.  
Boulton.  
14 June, 1899.

1764. Has your hope been realised? I cannot say that it has; still I do not lose sight of the large benefit which the country has derived indirectly from the bores. Of course the direct revenue is not so good as one would like it to be.

1765. Do the people appreciate this advantage in an increasing degree? I think so.

1766. Are far larger and more numerous holdings taken up for the purpose of agriculture by the aid of artesian water as years go on? I do not think so.

1767. Is not that the chief test of its value? Yes; but you must remember that the expense of getting artesian water debars so many, and the Artesian Wells Act was designed rather to meet that condition, and help the people.

1768. But it has not done so? It has not had time yet. We have only two bores commenced under that Act; they are not completed. There are about thirty applications for bores under the Act being dealt with.

1769. With regard to artesian bores which are available for the purpose of assisting agriculturists, are they availed of to their full extent? No.

1770. If agriculture is so much facilitated as you say by the aid of artesian water, and people think they can make a do of it, why do they not do so? As I said three years ago, the people do not realise what it means to them. They agree with an abstract proposition that artesian water is a magnificent thing for them—that it saves them in a time of drought, and all that sort of thing; but there it ends. They have not had the experience of artesian water to induce them to take full advantage of it.

1771. Now, as a practical man, can you suggest any way in which the people can be induced to avail themselves of these advantages? Only by letting them see what we are actually doing, and what the results are, as we shall show them at Pera in the coming season. The first fruit will ripen there in this coming season.

1772. *Mr. Watson.*] You have had no returns for fruit, so far? None whatever.

1773. *Vice-Chairman.*] Your experience, in regard to artesian water, agrees exactly with the experience of Mr. McKinney in regard to river water which is made available by that same Act—that although the people have all the advantages of it, they do not seem to avail themselves of it? No. You have a population here who are used to stock-raising. The agricultural population is in an enormous minority. The people who are used to stock-raising lead comparatively a very lazy sort of life. Their work is not very hard, and they cannot understand the steady, patient labour which is required to bring to fruition any one of these enterprises. They have a poor conception of it.

1774. Is this the general experience through the country, that a man starts as a small farmer, and as he gets on, instead of extending his farming operations, he likes to buy a few sheep and live on them? Yes.

1775. I suppose that time, and an increase in population, are the only things which could remedy that? I look to an increased population to help us.

1776. Is all that land at the Pera bore taken up? The whole of the blocks are taken up.

1777. Have any persons abandoned their holdings at Pera? A young fellow named Dwyer went away simply because he had bad eyes. He has not abandoned his holding permanently. Time has been given to Bull and Dalton.

1778. Do the remaining men on the holdings get their living entirely by the results of their farming operations, or is it a mixed occupation which they follow? Some of them get their living absolutely by their farming, and others do a little outside work. Some of them do small contracts for us, such as clearing and that sort of thing. We prefer to give the contracts to settlers if they tender.

1779. Are there any instances where persons who have taken up 20 acres have cultivated the land and are now making a living on the holding? Yes, and doing well. Munro told our Examiner of Accounts that last season his gross return was over £200 from 20 acres. I tried to find out what Hersey had made, but he was very chary about saying what it was.

1780. What does Munro grow? Citrus fruits and stone fruits. He has 18 acres under cultivation, of which 7 acres are under fruit, and the rest under lucerne, green fodder crops, vegetables, melons, and pumpkins. He told me that he cleared £20 off a quarter of an acre patch with melons one season.

1781. Is his market chiefly a local one? Bourke and Cobar. When I was up there the other day, I saw a load of stuff which was being sent to Cobar by another settler named Stanbury.

1782. *Dr. Garran.*] Can a farmer at Pera send produce all the way to Cobar as against people who send produce from Dubbo? I understand so. I think they get a special rate from the Railway Commissioners.

1783. It has been stated in evidence that a great deal of fodder and other things have been sent to Bourke this year from Dubbo? There is no doubt that a great deal has been sent up.

1784. Yet, side by side with that, you get produce sent down from Bourke to Nyngan and Cobar? Yes.

1785. What sort of produce goes to Cobar? Vegetables.

1786. Any hay or fruit? No; they sell all their hay crop in Bourke when it is green.

1787. Have the people at Pera any advantage in growing vegetables over people at Dubbo and Narramine, who have a river flowing past their doors? I fancy they have, because it is not done to any extent at Narramine. It may be done at Dubbo, but then I think it is mostly done by Chisamen.

1788. *Mr. Watson.*] The people at Pera have remarkably cheaply-watered land? Yes.

1789. *Dr. Garran.*] The people at Dubbo would have to pay the ordinary free-selecting price for their land? Yes.

1790. But nothing for the water? No.

1791. They can put a pump on the side of the river, and pump up all the water they want? Yes.

1792. The carriage from Dubbo to Cobar, and from Pera to Cobar would be about the same? No; I fancy they get a special rate from Bourke. I do not know what the rate is; but I know that they can send a 6-ton lot very cheaply to Cobar.

1793. Would they not charge the same price on a 6-ton lot from Dubbo? I fancy the rates downwards are higher than the rates upwards. There is a very large market in Bourke. One man at Pera makes his living by taking milk and butter in every morning to Bourke. He feeds his cows on lucerne.

1794. What excites my curiosity is that, in fighting for the trade of Cobar, Pera people should be able to compete with Dubbo people? The orders go up, I understand, from Cobar to Pera.

1795. *Vice-Chairman.*] You charge £5 a year for 20 acres, or at the rate of 5s. an acre, including the water? Yes.

1796. What would the land be worth a year to the Crown without water? The rental would be nominal.

1797. Therefore you may say that the settlers are now paying for the water £5 a year? Yes. 1798.

1798. Mr. McKinney, in his prior evidence, stated in reply to Questions 560 and 563, that 5s. an acre would be a fair charge to make for a license to pump the water from the Darling to the farms; so that your arrangement to give them 20 acres at a rental of 5s. per acre per annum would be cheaper, because the man on the river would have to erect his own pumping plant? He would have to pump. If you take the price which they had to pay at Mildura for their land, and the annual charge they had there for pumping, and compare their results with the results you get from one of these bores, you will see that there is a great difference.

J. W.  
Boulton.  
14 June, 1899.

1799. That is hardly a fair test, because the charges at Mildura were on an increasing scale? Owing to its being a speculative business, the charges were higher than the Government would be likely to charge. I do not know how it would compare with the Wentworth and the Hay irrigation scheme.

1800. Besides melons, what other products do they grow on these Pera farms? Broom millet is fairly productive; but they do not care to go on with it. We grew it for one season. I have just sold a ton and a half from the Moongulla bore for over £30 a ton, and that is the produce of an acre. The price of broom millet varies. It is very scarce now, because the American crop failed this year.

1801. *Mr. Watson.*] Was it unremunerative when it was grown at Pera? No; they got a return of from £9 to £15 an acre.

1802. It did not pay them to grow it? They did not care about it, as there is a lot of labour required in turning it down.

1803. *Vice-Chairman.*] As regards the growth of cabbages, potatoes, beans, and peas, we must recognise that the market will be a limited one as Pera is so far away from Sydney? Yes.

1804. It is of no use to start this system of irrigation for the purpose of establishing a few gardens to supply Bourke with vegetables? No.

1805. Do you mind stating what your own views are as to its being a real, producing industry for the benefit of the country generally? It is in the production of dried fruits and citrus fruits. For sultanas, currants, grapes of the raisin variety, oranges and lemons, there will be a permanent and steady market. When a start was made in America, twenty-eight years ago, to irrigate from artesian bores, the people were in practically the same condition and under the same disability as we are at the present time. With the permission of the Committee I will read an extract showing what was done in regard to Riverside, which is, I think, the best fruit ranch in Southern California. Colonel Hinton states:—

At that time the site of Riverside was occupied by an Indian village. Without artificial conservation and distribution of water, Riverside, like other prosperous settlements of San Bernardino County, would have had no real value for farm purposes. It would have taken 800 acres of its area to support a ranchman or hunter, and 25 to poorly feed one broad-horned steer. About 6,000 people now live with the greatest comfort, even luxuriously, upon 6,000 acres of land. Within the range of cultivated land in America there will be found no settlement more closely worked or subjected to more intensive farming, returning a larger result for labour, skill, and enterprise, than this cultivated area, 3,000 acres of which are under oranges, the trees varying in age from one to fifteen years. As at Fresno, the yield shows steady annual increase. In 1880, 1,480 car-loads of oranges and lemons were forwarded to market as the product of the 3,000 acres referred to. Taken at a value of 800 dollars per car-load, which is the official value given, the shipment gave a return of 1,184,000 dollars, and a net return of 395 dollars per acre. Since 1880, additions referred to later on, through the inception of the Gage system of artesian wells, have been made to the cultivated area, which, upon Riverside proper, is now some 12,000 acres, which supports a population of 8,000 souls. Besides the citrus fruits, the raisin grapes, the muscat of Alexandria, and the Gordo Blanco are largely cultivated, and the return given for 1891 for this product alone amounted to 700,000 dollars, while the annual average value of fruit of all descriptions shipped from Riverside is stated to be 2,200,000 dollars.

Of Fresno, which is really the centre of the raisin-grape industry in America, it says in this paper:—

In 1871, 500 emigrants from the East settled there and secured some 5,000 acres of land, which was divided into small vineyards for the cultivation of the raisin grape; the progress made has been phenomenal, and Fresno stands as one of the most prosperous settlements in California, and a striking example of what intense culture upon small areas means. The land originally cost 2.50 dollars per acre. The population within twenty years reached 100,000 souls, and Fresno city is to-day a well laid out town, with all modern improvements, of some 25,000 inhabitants, surrounded by an area of 20,000 acres of vineyards. The condition of this land at the time of the inception of the settlement is described as follows:—

“The entire area of which would be worthless except for occasional croppings of wheat and sparse feeding of cattle, without the system of irrigation in vogue.” The cultivation area is now stated to have a capital value of 30,000,000 dollars, and had it been sold twenty years ago for 1,000,000 dollars that would have been considered a high price. When once the vines commenced to bear in 1873, the return began to come in, and has increased yearly; in that year 6,000 boxes of raisins (20 lb. each) were shipped; in 1883 the yield was 140,000 boxes, or 2,800,000 lb.; in 1890, 900,000 boxes, or 18,000,000 lb.

The writer goes on to show the tremendous increase in land value which arose from the use of artesian water. When they started there, twenty-eight years ago, they were under just the same difficulties as we had in regard to the proper class of people. They had everything to learn. They had a long distance to transport their produce, and they were just as far from the railway as we are—further in fact. I do not suppose you could find two more prosperous places in America than Fresno and Riverside. The success of these places has given rise to a good many other colonies of the same nature, such as Lake View.

1806. These places are watered from the river? Twelve thousand acres of Riverside are watered by artesian wells. They are a group of thirty-seven wells, on about 700 acres of land, and the water is all flumed down to the land to be irrigated. That is known as the Gage system, and the success of that place started several others. There is one called the Whittier system, in the upper St. Gabriel Valley.

1807. Do you regard the Mildura settlement as a success? It is not a financial success; but from the orchardist point of view, it has been a success, I contend. When the defects in the channels and other disabilities are remedied it will be different.

1808. Is it still a going place? I have not heard to the contrary, and I think some of the men on the place are making money. Mr. Allen, the Fruit Expert in the Mines Department, can give direct evidence as to the Mildura settlement.

1809. Has the water from the Pera bore to be treated in any way before it can be used for watering purposes? No; the only thing we do is to aerate it.

1810. It cannot run from the flumes on to the ground without being aerated? It is not absolutely necessary to aerate the water. For a long period we used the water without aeration, but aeration is really a very great advantage.

1811. How is it sprayed? As it comes up through the bottom of the tank it is forced through an enormous rose which has 27,000 holes. In this way it is all broken up; it falls back into the tank, and then it goes down the flume.

1812. The agriculturist has to provide his own fluming? He provides everything on his own block.

1813. The men do not use fluming, but they make channels in the ground? Yes.

- J. W. Boulton. 1814. Is the Pera bore used to its ultimate limit? Yes; it was barely adequate for requirements this season.
- 14 June, 1899. 1815. It has never had to be shut down? Yes; it is shut down in the winter months for some time. The water is not always used; it is not always required. We have not been allowing the water to run to waste.
1816. Is the water from that bore used as well for watering stock? Yes. The water is run away in a pipe to the troughing.
1817. There is no quantity of the water kept in a dam? No; the trough holds about 3,000 gallons.
1818. Do the sheep drink out of the troughs? Yes.
1819. Does the water, if exposed, deteriorate or become decomposed? I do not think so; I have never noticed that it does. If it is put into an excavation in the ground there is great waste; sheep trample about in it, and the water gets filthy and they will not drink. The trough is 300 feet long at every public watering-place in the Colony.
1820. Do very large mobs of sheep come down by Pera? As many as 10,000 will come in a mob, but they do not take in more than 500 or 600, or perhaps 1,000 at a time. If we took them in a mob, half the sheep would not get a drink.
1821. You consider that one of the indirect benefits of these bores and watering-places is that it establishes new stock routes? No; I have not noticed that. It simply opens up the existing stock routes, and enables you to get your stock in and out in the season when otherwise you could not move them.
1822. As regards any stations near the Queensland border, would it not induce sheep to travel in the direction of the railway if the stock routes were well watered? The idea underlying all we have done was to encourage the traffic towards our rail centres. Take the roads running into Bourke from the border: I can remember the time—and it is within eight or nine years—when, to get a load out to the border, you would have to send a team with water to water the horses which were carrying your loading out.
1823. It would have the effect of making passable a route which was not passable? Yes. The road from Wanaaring to Milparinka is a road which for many years was absolutely impassable. It follows the telegraph line, and is in one straight line. When you get beyond the Urisino homestead I do not think you would find a drop of water on it which would wet a mosquito, until we put the bores down. I have travelled that road, and ridden 90 miles without a drink for myself and horse, and had to spend a night out too; but now we have the bores running right along the route. Last year the effect of this policy was to bring both stock and wool in towards Bourke, and for some 300 or 400 tons of station stores and loading to be sent out by that road. As the seasons come on, and the road gets better, we shall get all the more. The whole of that traffic would otherwise go down to Cockburn, in South Australia.
1824. What are the other indirect advantages of the water supply you spoke of a little while ago? Where you can draw the traffic to the railways it must increase the railway traffic to some extent, and it enables the pastoral people to get their wool in when they otherwise would not, perhaps, be able to get it in. I have known wool to be stuck on the Darling for four years. Since we opened up the roads that has all been done away with. There is no difficulty whatever in getting the produce in. There is no more living on weevilly flour on the back stations as we used to do when we had to get 20 tons in at a time.
1825. Do you think that water in sufficient quantities can be got by a system of boring to supply the agriculturists in that district for a long time to come without going to the river? I do not think you ought to put the two things on the same basis, because the river frontages, if the land is suitable for irrigation, must have an advantage by reason of the proximity of the waterway and the carriage, and they, for many years to come, must necessarily supply the back country. I do not look to see any enormous development for the irrigation of cereals or products of that description from the bores. What I think we shall see will be the nucleus of small settlements at the bores where they are accessible, and where, perhaps, an accommodation house will spring up, and so on. The place will grow insensibly. I do not think there is much fear of the boring in the actual back country competing with any large scheme on the river frontage for some years to come.
1826. People, you think, will be attracted to the river if they can get suitable soil for utilising water? I think they would, because the carriage is the thing which handicaps the people.
1827. Is it not rather a feature of this soil along the banks of the river that it is not so well suited for agricultural purposes as the soil away from the river? I could not tell you that exactly. With my experience of what we have done by irrigating from the bores, I should certainly give the preference to the black soil. You get far heavier crops out of the black soil than out of the other.
1828. *Mr. Watson.*] You are speaking now of black, loamy soil? Yes. I have some corn in my office which has come from one of those black-soil bore places, Woolabra, and I do not suppose you would see finer corn anywhere.
1829. It must be very loamy soil? Yes.
1830. *Vice-Chairman.*] How would you compare the two soils in the district? I would sooner have the red soil than the black clays of the river flats. There is no comparison to my mind between the red soil and the black, loamy soil.
1831. I suppose you recognise that in that part of the Colony the irrigation of large areas for promoting the growth of natural grass is out of the question? Yes. I do not think it is possible. In America they irrigate natural grass, but I fancy it must be under a system of cultivation. They have a thirty-mile canal in South California which is used entirely for the irrigation of natural grass.
1832. With regard to the large holdings in that district, do you find that irrigation for the purpose of an assistant to carrying on the station is on the increase? Unquestionably. At one station called Weilmoringle they had 40 acres under irrigation, and they have put in 100 acres additional, and at Belalie they had nearly 200 acres under cultivation. Every one who has a bore on his station is utilising the water to some extent for growing hay for horse-feed and lucerne for stud rams. With the permission of the Committee I will read a copy of the letter received from Mr. Mullen, the licensed surveyor, who did some levelling work for us at Pera:—

I have just returned to Bourke after a trip of eight weeks through my district. I feel I must draw your attention to the fact that the Pera Experimental Farm has been the means of giving a great start to irrigation works on large and small scales throughout the Bourke district. I have now more irrigation farms to design and lay out within 100 miles from Bourke than I can cope with this year, unless I give my whole attention to that business alone, and that I cannot do, as my hands are fairly full of Government work, which must be first attended to. About ten weeks ago I was engaged at Weilmoringle, adding to their present irrigation area of 40 acres; all this was under a very heavy wheat crop when

when I was there at work, and for two years running they have taken over 1,000 tons each year off this small area. Their water supply is a bore of one and three-quarter million gallons per diem. The scheme was designed and levelled by me some three years ago. It is now intended to increase the area to 100 acres, and I am engaged upon the plans for that scheme. They have carried their bore water for miles, north, east, south, and west, in drains, to water their sheep in many different paddocks. At Kerribree I have instructions from the lessees to lay out 40 miles of drains and an irrigation farm, and I hope to be able to tackle it this year. Nearly every station, and, where they have the means, many small holders, practically recognise the value of home-grown fodder in times of drought, and it is a pleasing relief to the eye to see the green patches on the banks of all the rivers in the districts of Bourke and Brewarrina, and nearly every station has its irrigated vegetable garden. It is only within the last four years that crops have been irrigated with bore water.

J. W.  
Boulton.  
14 June, 1899.

1833. *Mr. Shepherd.*] Do you experience much difficulty in shutting down the bores? There is no difficulty in doing it; but I do not like doing it.

1834. Has it not been found in some cases that the water bursts off at some distance? It is a risk.

1835. Cannot that difficulty be obviated by inserting a tube down to the solid rock? We do that. It is the pressure of the water which is eroding the rock, and the flow gets behind the casing. That is how we lose it.

1836. In France, I understand, they have the whole of the bores under thorough control? Yes; we have a valve at every bore which is put down for the Government, and we can shut it down; but I do not like it. When you consider what the surface pressure is, and just think for a moment how enormous the pressure must be down below, you will see that it is taking too many chances to shut it down.

1837. Has any attempt being made to irrigate the natural grass? No; not designedly. Where it has so happened that you have had to let the water flow, then the patch wherever the water has spread has been irrigated, and it has grown up wonderfully.

1838. What are considered the best natural grasses in the Bourke district? I think the Mitchell-grass and the blue-grass. A grass we used to know on the West Darling is the star-grass; I do not know what it is called in the Bourke district. I think they are the best fodder grasses you can get.

1839. Do the whole of these bores throw the water to the surface without any pumping? Yes; I think some of them shoot 80 feet high. It just depends upon the orifice you have and the pressure.

THURSDAY, 15 JUNE, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

James William Boulton, Superintendent of Public Watering Places and Artesian Boring, Department of Mines and Agriculture, sworn, and further examined:—

1840. *Mr. Watson.*] The charge for water from the Pera bore is 5s. per acre per annum? Yes.

1841. What quantity of water is allowed to the men? They are allowed a miner's inch—that is, 22,000 gallons a day per block.

1842. What depth of water would it average per acre? It would be very considerable—perhaps 30 inches.

1843. Is that reckoned to be a fair quantity, or more, or less, than is usually given? It is the mean, you may say. The average quantity of water which is used per acre is a cubic foot—that is, 548,000 gallons. They reckon that 548,000 gallons a day is sufficient to irrigate 250 acres.

1844. It varies with the nature of the soil and the character of the crop? Yes.

1845. Five hundred and forty-eight thousand gallons per diem would irrigate 250 acres? Yes.

1846. That is the general average as far as your experience of irrigation has gone? Yes.

1847. And it might be taken as a fair thing? Yes. In India, on the Eastern Jumna canal, they allow 306 acres; on the Western Jumna canal, 240 acres; the Ganges canal, 232 acres; the Swat River canal 216 acres; and the Bari Doab canal, 227 acres; the Spanish canals, from 240 acres up to 2,200 acres; the French canals, from 140 acres up to 350 acres; the Egyptian canals about 350 acres; and the American canals, from 100 acres up to 500 acres.

1848. I daresay in a warm climate there would be a demand for a greater quantity of water, and the possibility of raising a greater quantity of water efficiently, because of the greater number of crops you could get off the land in a year? Exactly.

1849. To which country do you think our western land would more nearly approximate—to Egypt? I really could not say. In point of aridity there is no doubt it would. It would nearly approximate to the upper table-lands of South California as far as one can judge from a comparison of the analyses of soil—what they call the Mesa land. In Southern California I think the rainfall averages from 6 to 12 inches. I should think, perhaps, it was a drier country than ours.

1850. Where your experiments with irrigation patches have been attempted the rainfall has been greater than that? A little better. About Bourke I think it is 14 or 15 inches. I think Southern California would approximate to Bourke.

1851. What did you say was the allowance there? I have not got it definitely. It is given at from 100 to 500. The Pomona canal in South California gives 500, and the Cache-le-Poudre canal in Colorado gives 193.

1852. Will you state what the general, broad results of the Pera bore have been to the Government irrespective of the commercial side of the question? It has demonstrated without any question of a doubt the complete suitability of that western soil for citrus fruits—the orange, the lemon, and fruits of that class.

1853. Do apricots do well there? They do exceptionally well there.

1854. Are they in any way fibrous? The few that were on the trees last season were not allowed to mature. There is some reference made to this subject and the superiority of the western land for fruit-culture is pointed out in one of Mr. Coghlan's books. He has gone into the statistics of the question, and shows that the yield is very much better.

1855.

J. W.  
Boulton.  
15 June, 1899.

J. W.  
Boulton.  
15 June, 1899.

1855. On whose data is that report founded? I could not tell you how that information has been derived.
1856. As I understand, the actual experiment at Pera has not been long enough in operation to allow of any proper results being arrived at? Not as far as fruit is concerned. Maize, cotton, sorghum, Kaffir corn, planter's friend, and broom millet have grown very luxuriantly. The plants which have been put in the nursery grow from pips—young apricots and all those things—advanced far and away ahead of the imported trees we put in.
1857. Is it certain that it is a healthy growth;—you may unduly stimulate a tree? I do not think so. They have not had any more attention than in the bulk of the orchards. I think anything which is matured in that climate from the seed will be far finer than anything you could bring from any other part and put in there.
1858. You have a practical orchardist in charge of that portion of the experiment? A very capable man.
1859. Does he entertain any doubt as to the quality and flavour of the fruits? No; he has the highest opinion of them.
1860. I suppose in the next few years he will be in a better position to give an opinion? Next year we expect to get our first harvest from the fruit-trees.
1861. It has been said it would pay people, given reasonable access to market, to give £1 an acre per annum for the use of the water alone;—do you think that would be an out-of-the-way charge, or too great a charge, to enable a man to make a profit? You would have to take into consideration the distance from market, and the rate you would have to pay for the transport of the produce.
1862. You know that the water-rate at Mildura is about £1 an acre? I know it is very high.
1863. And the settlers at Mildura are under the additional disability of having paid a very large amount for the freehold of the land, and of being a considerable distance from market? Yes.
1864. Do you think the Pera settlers would be as far from a big market as the Mildura settlers—that is, as regards accessibility to market? I think the Bourke people would be equally as favourably situated as the Mildura people, because if the navigation is improved you have that waterway of the Darling open to Adelaide for about 8s. to 10s. a ton.
1865. Eight shillings or 10s. a ton? The information I gave at the previous inquiry I got from Messrs. Rich & Co. I said in reply to Question No. 1303, by Mr. Black, "You could get water-carriage from Bourke to Adelaide for about 10s. a ton when the river is up." If the Committee wish, I will make inquiry again from Messrs. Rich & Co.
1866. You think the people at Bourke would not be in any worse position than the people at Mildura, so far as access to a general market is concerned? I do not think so. If you can send down a sufficient quantity you would get a very great concession, both from the railway and from the river steamers.
1867. In either case they would be within a reasonable distance of market for dried fruits and any products of that description? Yes.
1868. For fresh fruits the railway would be considerably preferable on account of the quick transit? Yes.
1869. Were the blocks at Pera submitted to competition, or were the rentals assessed beforehand? The rentals were assessed beforehand.
1870. You have no means of ascertaining what the value of the rentals was? No.
1871. Do you know if any settlers have since transferred at a premium on the Government price? I have no idea what the price was. Mr. E. C. Millen has transferred. I fancy some arrangement has been made of late.
1872. You do not know whether in the case of that transfer a premium was given? I have no idea.
1873. I wish to ascertain what would be the greatest rental we might expect for land, including proper water facilities? After these men have been resident for five years their rental is doubled under the provisions of the Act.
1874. They are under similar conditions to the homestead selectors? Exactly; they are homestead selectors.
1875. And the rental is 10s. an acre after five years? Yes.
1876. Have you had any experience in the Department of the erection of weirs over creeks in that country? No; of course we have done ordinary dams for the public watering-places.
1877. Of what description is the dam? It is an excavation and a dam combined.
1878. On the creeks? On the smaller watercourses.
1879. Not on the larger ones? No.
1880. I suppose, in each case, you have provided by-washes? Yes, unless there is a natural by-wash available; we prefer to have a natural by-wash to cutting one.
1881. You would see that there was one, either artificial or natural? Yes.
1882. Would you care to offer an opinion on the effect which a weir has on the possible siting up of the river? No; it is trenching rather on professional ground.
1883. I thought that during your residence in the west you might have had some experience of the Darling and other large rivers? No. My experience of the rapid-running creeks is that it is better to leave them alone. For many years I was manager for Messrs. Quin, Currie, and Company, and the property, which comprised 700,000 acres, had running through it one of the largest watercourses in that part of the Colony. I suppose we put 100,000 or 120,000 yards of dams on that Bunker Creek, and to-day there is not one of them worth a snap of the finger; they have simply filled up.
1884. *Dr. Garrun.*] What sort of soil is it? It is a red, gravelly soil; it is rather a hard soil.
1885. Is it in any way similar to the soil on the banks of the Darling? No; it is quite a different class of soil; it is a hard, red clay—it is Pleistocene deposit—pebbles and everything mixed up together.
1886. Do you think that would be more likely to be carried down than a finer silt, held almost in solution by the waters of a bigger river? I should think a creek such as the Bunker Creek, a rapid-running creek, in flood would be far more liable to silt, because it carries the stuff such a distance.
1887. The evidence is that the velocity of the Darling, in a fairly large flood, does not exceed more than 2·8 miles an hour? I should not fear much in the matter of silt there, unless, perhaps, there were a permanent obstruction, and then it might gather silt.
1888. Would that term apply to a weir? Not to such a weir as they have there at present.
1889. With banks 40 feet high, and a fixed weir to the extent of 10 to 13 feet, do you think that would offer such an obstruction as would lead to a large deposit of silt? I do not think you would find that it would be serious, because the river does not carry, even in flood, such a body of silt as you see coming down

down in the smaller creeks. When it is in flood, there is a great settlement of stuff on the bank. You can see a film on the banks after the flood has gone down; it is not exactly of the nature of silt; it is more of a clay deposit.

J. W.  
Boulton.

15 June, 1899.

1890. You do not think that there would be much trouble from that source? I should not anticipate much trouble from it.

1891. *Mr. Dick.*] Can you state the cost of supplying the water per acre from the Pera bore? The cost of supplying the water comes to about 5s. 1d. an acre per annum. It is hardly fair to consider a bore which was put down originally for stock purposes, as a bore purely for irrigation. Probably if we were to provide a bore for irrigation solely and wholly, we should choose a position where the boring would be shallower, and where, perhaps, we should get a larger volume of water. Take, for instance, such a place as Tenandra. The depth of the bore is between 800 and 1,000 feet, and we get over 1,000,000 gallons a day at a very low cost. If you can get these conditions, then, of course, the cost of supplying water per acre is very much lessened. Taking the whole of our bores, I think Colonel Home worked out the cost of supplying water to the land they would serve at about 8s. 5d. per acre.

1892. That is the failures with the successes? Yes.

1893. What are the elements in your calculation that the water from the Pera bore costs 5s. 1d. per acre? I simply take the interest on the capital cost of the bore at 5 per cent. It costs £1,487, and the interest on that sum, at 5 per cent., is £70 a year. The bore gives a flow of  $1\frac{1}{16}$  cubic feet per second, which is equal to 275 acres, so that it comes to about 5s. 1d. per acre.

1894. Does that include attendance on the bore? No; it simply includes the interest on the cost of the bore.

1895. Does that bore require much attending? We have to have a man there constantly.

1896. How much per acre does his salary represent? He gets £100 a year. I am not giving you the cost of the fluming, and buildings. I am simply giving the interest on the cost of the bore.

1897. You do not regard that as a fair sample to take of the effect of an irrigation scheme supplied by water from bores? No. We could work out a scheme which would be far less expensive if we went into the Warren district, where the boring is shallow and the soil is better, and where it is nearer the market.

1898. Is the Pera bore what you call a small bore? It is a medium bore.

1899. Was it put down simply to water stock? Yes.

1900. The irrigation scheme was an after-thought? It was entirely an after-thought.

1901. If at Warren a man had 500 acres of irrigable land, do you think it would pay him to put down a bore and irrigate his land? There is no doubt about it. Buttabone station and Haddon Rigg have done that. Haddon Rigg is now putting down its No. 2 bore. Buttabone has completed two, and intends to put down two more. They get splendid flows of about 1,000,000 gallons a day at about 780 feet.

1902. Do you know whether they have any intention of irrigating? I understand from Mr. Hill that he has; I think they have the land under plough now.

1903. Do you know of any case where the squatter has, as a speculation, put down a bore and leased the land around? No; they want it themselves too badly.

1904. You think that under more favourable circumstances as regards irrigation, the charge of 5s. per acre may be materially reduced? I think so. Of course, the cost depends to a large extent on the volume of water which a bore is yielding, and the depth you go down.

1905. Mr. McKinney has stated that it would cost about £109 per annum for a 40-foot pump lift to deliver 1 cubic foot per second. Do you think you could get 1 cubic foot per second in a bore situated in the western district at a lower, equal, or higher price? I think you could get it at a lower price.

1906. You think the expense of maintaining the pump and plant would be higher than the interest on the cost of constructing and maintaining a bore? I think so; because you must have a skilled man and incur a large expense in firewood annually with a pump which is quite absent in the case of a bore.

1907. You recognise that in Mr. McKinney's statement, they go on the assumption that the water is there conserved by locks of some kind for their purposes, and that the estimate of £109 does not include any part of the cost of the weirs or of conserving the water? Quite so.

1908. He says, in one portion of his evidence, that it would cost from 10s. to 12s. an acre to supply water from the Darling; but you think that it may be done, under favourable conditions, or even under ordinary conditions, with a bore, for less than 5s. an acre? Yes.

1909. Do you think there would be any possibility of successfully irrigating land from conserved water in the river at any distance from its banks—that is, successfully from a financial point of view? It would depend upon the expense you went to for your channels. Probably you would be able to carry water out a very long way from the river; but whether you could do it successfully from a financial point of view is a question I have not gone into. The great trouble they had at Mildura was with the state of the channels.

1910. From your knowledge of the soil there, do you think an ordinary drain would suffice to carry the water any distance? I think it would, so long as you keep on the black soil; but when you get into the red soil it is no use to you for drains. Colonel Home, when he visited Pera, said the soil was useless for the purpose. We had found that out previously to his visit.

1911. When a drain reaches the red soil it would want lining in some shape or form? Yes.

1912. Is the soil at Mildura much superior to that at Pera? No; at Mildura I think it is mostly mallee land, which is of a lighter character than the Pera soil. It is lighter in colour, and lighter in substance; there is not so much clay in it.

1913. *Dr. Garran.*] Is it somewhat like the land near Bourke? No. It is a peculiar land which you see in this mallee country.

1914. Is the soil at Mildura lighter and thinner than the soil close to the Darling River? Very much. On the eastern bank of the river they have black soil out for about 13 miles, and on the northern side the red soil almost comes into the river.

1915. Is that block near Bourke which we spoke of red soil? Yes.

1916. Mildura is not at all red soil? Mildura is of the nature of red soil; it is a sandy soil, and lighter in colour.

1917. Is it alluvial deposit? Yes; but more of a sandy nature.

1918. Which has been brought down by the river at different times? I should hardly think so; there is such an enormous stretch of it on both sides of the river.

- J. W. Boultbee.  
15 June, 1899.
1919. Is it similar to that scrub through which the railway goes from Melbourne to Adelaide? It is very much of the same character.
1920. With that stunted growth in it? Yes.
1921. You say you do not think it is alluvial brought down by the river? No.
1922. The river floods do not at all improve it in any way? I do not think so.
1923. It is no better than the land the railway goes through? I do not think so.
1924. It simply has the advantage of water? That is all. I have never visited Mildura, and therefore I am only speaking from hearsay.
1925. *Mr. Dick.*] Can you state the cost of the Euroka bore, and the cost of delivering a cubic foot of water per second? The bore is 1,543 feet deep; it cost £2,428; and the flow is put down approximately at 3,000,000 gallons. The flow would be a little over 5 cubic feet per second.
1926. Taking the interest on the capital cost at 5 per cent., you have a flow of 5 cubic feet per second at Euroka for about £120 per annum as against a flow of  $1\frac{1}{2}$  cubic foot per second at Pera for £70 per annum? Yes.
1927. Had you such a bore at Pera as you have at Euroka you would be able to irrigate nearly five times as large an area and at a far smaller cost? At a less cost.
1928. Will you be able to put down many such bores as the Euroka in that dry district? You could pick places where you would get large flows I think, still it is very hard to say. For instance, at the Lilah Springs station they have a flow which is put down at about 2,000,000 gallons a day. Yet, on another part of that station, and not very far away, they have another bore down for a good many hundred feet deeper which gives a flow of only about 70,000 gallons a day.
1929. Is the land around Euroka fit for irrigation? It is black soil, with little chocolate ridges in it.
1930. Would that be suitable for irrigation? We are intending to do that; the caretaker is doing a little at it already. We have got in a few fruit-trees—oranges, lemons, peaches, apricots, apples, nectarines, cherries, prunes, plums, gordo blanco vines, and sultanas.
1931. About how many acres do you think you can irrigate with that flow of water—1,500 acres? A cubic foot is equal to 250 acres, so that it would be about 1,200 acres.
1932. Practically at a capital cost of £2 per acre? Yes.
1933. *Mr. Shepherd.*] Have you brought any return showing the yield of the various crops per acre? I have brought the following statement:—

*Results of experiments, Pera Bore.*

- Millet.*—Yielded 17 cwt. threshed fibre to the acre; yield of seed large, and sold in Bourke for 3s. 3d. per bushel. Controller-General of Stores reported that standard sample of millet was superior to the average millet found in open market, and that brooms manufactured therefrom were more valuable in every respect, the millet being of good colour, free from seed, and tough in fibre.
- Lucerne.*—Yielded 1 ton to acre for each cutting, and found ready sale in Bourke at £4 per ton.
- Cotton.*—Has been grown of good marketable value. Everything in favour of this product—climate, soil, water, and practically an unlimited market. Five varieties tested.
- Wheat.*— $3\frac{1}{2}$  acres unirrigated yielded 1 ton per acre;  $3\frac{1}{2}$  acres irrigated yielded over 2 tons per acre, allowing for waste. Both plots grown under same conditions on virgin soil, and with exception of irrigation, received similar attention.
- Kaffir corn and tares.*—Yielded large crops. Sorghum saccharatum, one cutting yielded 2 tons 16 cwt. 76 lb. from  $\frac{1}{2}$  acre, or at rate of 5 tons 13 cwt. 40 lb. per acre.
- Cow-pea.*—Makes luxuriant growth.
- Potatoes.*—Yielded 4 tons 2 cwt. per acre (varieties tested Cambridge Kidney and Wyatt's Early Ashleaf).
- Maize.*—Twenty-six distinct varieties tested with good results.
- Sugar beets.*—Average weight 2 lb.  $3\frac{1}{2}$  oz. Average percentage of cane sugar in piece, 11.33 per cent. Specimens submitted for analysis rather large for acceptance.
- Tobacco.*—Varieties tested—White burley, Big Frederick Crescent, Orinoco, Virginia, and Kirbasina; no report as to results to hand.
- Melons, Pumpkins, Squashes, Marrows, &c.*—With very good results.
- Orchard.*—Fruit-trees have made excellent growth. Citrus as well as most of the deciduous trees have done well. Experiments are being carried out mostly with a view to determining the best fruit that can be grown in district for drying and preserving purposes.
- Bourke Show, 1898.*—National prizes were awarded to four of the settlers for produce, &c., while a prize was awarded to another settler for twenty varieties of vegetables.
- Ensilage.*—First made in district at Pera, was an excellent sample and highly commended, consisting of Kaffir corn, maize, lucerne, reed dhouri, and early amber cane. Better results are, however, anticipated from an improved silt.
1934. *Mr. Watson.*] Did he report what was the rainfall during the time the unirrigated wheat was in? 1.84.
1935. Is that above or below the average for that season of the year? I should think it was above the mean.
1936. *Mr. Shepherd.*] Would that yield of  $4\frac{1}{2}$  tons of lucerne hay from 5 acres be for the year? No, for the one cutting. A local produce merchant offered me £4 a ton for the hay, but, of course, we use it for our own stock. We turned in 700 sheep on those 10 acres of lucerne for the benefit of the manure.
1937. Is it shown in your reports how often the lucerne was cut during the year? No. This report I read is the report after the first cutting.
1938. Has there been any attempt at making ensilage at the Pera bore? There was an attempt made, but it was very badly carried out by the previous manager; it was surface ensilage—compression. He did not attend to it properly, and it got spoiled. The stuff he put in was the amber cane and the sorghum; he had not enough pressure.
1939. *Mr. Watson.*] I think you stated that you thought it would be possible by means of bores to get water for irrigation purposes at less than £109 per cubic foot per annum? Yes.
1940. I also understood you to say that the Pera bore delivered  $1\frac{1}{2}$ th cubic foot per second, and that although the interest on the capital cost was only £70, yet when the wages were added the cost came up to £174 per year? Yes.
1941. It costs £174 to deliver  $1\frac{1}{2}$ th cubic foot per second? Yes; but, as I said, I would not take that place particularly as an example of what can be done financially.
1942. You think that better results can be obtained? There is no question about that.
1943. *Vice-Chairman.*] Have you had an opportunity of comparing the difference between crops produced on land naturally watered and crops produced on land irrigated, quite irrespective of locality? I have not.
1944. You could not say which land is the more productive? The irrigated land would give the greater yield, but I have not seen the two growing side by side.

1945. I am not speaking of two blocks which are side by side;—take a good agricultural district such as the Camden district with natural rainfall and good soil, and take the good soil up in the Bourke district with facilities for irrigation, which soil would yield the more productive crop? I think the irrigated land would, but whether the farmers would get the same return from it up there as a farmer at Camden would is another question.

J. W.  
Boutbee.  
15 June, 1899.

1946. Is not the sun a great factor? Yes; it ripens.

1947. A hot sun with a good water supply would be a great forcer? Yes.

1948. Would the soil up there be a lasting soil if used for crops, or would it impoverish? It would impoverish; it would have to be rested and manured. It is a peculiar soil. It is almost devoid of what chemists call humus—that is mould, and to supply that deficiency we grew these luxuriant, rank-growing, green crops and ploughed them in.

1949. *Mr. Watson.*] Were there any trees growing on the land originally? Yes; it was a gidgee forest.

1950. *Vice-Chairman.*] Can you supply an analysis of the water from the Pera bore? Yes, I will do so.

1951. Are any of these ingredients present to a sufficient extent to prejudicially affect the vegetation? If the carbonates of soda exceed 35 grains per gallon, they would want to be used with a very great deal of caution. The Pera water is just on the margin of the limit of safety put by the chemists who are very cautious in expressing an opinion.

1952. Have the crops suffered there at all? No; there is no sign of any suffering.

1953. You are quite sure of that? Quite sure.

1954. I have often heard it stated that where the water from these bores is used for irrigating the amount of salt in the water is very prejudicial to the vegetation, and that sometimes you see almost a coating of salt over the surface of the ground? Yes.

1955. Why does that exist? You can see that surrounding almost any bore where the land is not properly looked after and cultivated, and where evaporation takes place. A good deal depends upon whether there are any of the alkali salts in the soil, whether the soil is too much saturated with water and the salts are drawn to the surface by evaporation. The American soils have a very much larger percentage of alkaline carbonates than ours. Ours taken right through are almost free from alkaline carbonates. In America they have the difficulty to deal with which you have suggested, and they get over it by a mixture of lime which neutralises the effect of the alkali, and it can also be avoided by a proper system of tillage and drainage. Where we have so little of these alkaline carbonates in the soil, we have quite a different condition to meet from what they have in America, because it is one thing to bring the salts to the surface by evaporation and another thing to deposit them by filtration.

1956. If any injury does happen to these farms from the salts in the water it is due, you think, to an imperfect system of farming? Yes; unquestionably.

1957. Do you know of any holdings which have been injured in that way and which have become failures? Yes; I have seen Mr. Tobin's bore at Lila. They had a large amount of land under cultivation close to the bore, and they made no attempt at cultivation. They put a crop in and let the land dry and bake like a brick, and then they wondered at the crops dying. That was after two or three seasons. Of course they moved further round and opened fresh ground and got the same beautiful crops which they had got at the start. The failure is simply due to want of cultivation and no system of drainage at all. The water is spread over the land, it is simply allowed to lie and evaporate, concentrating all the salts it contains just on the surface.

1958. Does the salt in the water operate more prejudicially in the case of red soil than in the case of black soil? I should think it would be more prejudicial in the case of black soil; it is a stiffer soil.

1959. It is apt to cake and get a smooth surface? Yes; the red soil is better for irrigation because it affords a better get away. If you do not go in for artificial drainage it is a looser soil than the black soil.

1960. You are speaking about the advantage of irrigation over naturally-watered land;—is that largely due to the water being supplied at regular intervals and at the proper time? Yes; at the time when the plant most requires it.

1961. Looking at the question generally, and seeing that irrigation involves a considerable extra expense to the farmer, do you think the increased return in the way of crops would be sufficient to compensate him for the increased expenditure? I think the way in which the money would be made, would be by the growing of these crops which are high in value, and would require intense cultivation. I do not say that it would pay you to grow wheat against farmers near Sydney; but I say it would pay the pastoralists on the river bank that suffer these frightful losses periodically, if they would ensure themselves by irrigating and storing fodder against times of drought. The money which has been spent this season in buying lucerne to feed stock is something fabulous.

1962. Given a farm within easy distance of Sydney, and with good soil, and a fair average rainfall, and given a farm at Bourke with good soil, and the cost of the water for irrigation, and the extra freight to the centre of the population;—do you think the one farmer could compete with the other? I think the advantage would be with the farmer on the irrigated land.

1963. I mean could the one compete with the other in the growth of fruits and such products? Unquestionably. At Bourke the farmer is in a climate where he can grow almost anything, and he is free from disease; the fruit is absolutely clean.

1964. With a supply of water there would be nothing to damage your crops? No.

1965. You would have a kind of forcing-house? Yes.

1966. Would not the heat at times be injurious? The hot winds do cause the leaves to wither, but it does not happen very often that such a thing occurs. We had one at Pera some time ago which did a lot of harm.

1967. As regards the market for dried fruits, have you any information as to the amount of imports into the Colony? For the year 1894, the imports of fruits, vegetables, currants, raisins, preserves, pickles, salad oil, linseed oil, onions, and such things, amounted to £727,270, and the total value of dried fruit, currants, raisins, and jams, handled by one firm in Bourke in that year was £3,145.

1968. Does the American farmer get any special facilities in the way of reduced railway freights? I think the railway freights are lower there than here. You can get a bushel of wheat carried from San Francisco to New York, and a fast freight guaranteed for 5½d., whereas it costs 7½d. to bring a bushel of wheat from Bourke to Sydney. In America there is great competition, and the rates are cut enormously. I do not suppose they are carrying at a profit at that rate.

1969.

- J. W. Boulton. 1969. *Mr. Watson.*] Is your information of a recent date? I am speaking of the rate which was charged four years ago.
- 15 June, 1899. 1970. *Vice-Chairman.*] But seeing that the Government make a specially low rate for the carriage of wheat from newly-established wheat centres, I suppose you recognise that it would also be fair for them to do something of the same kind in regard to fruit? They will do that; in fact they have done it for us in the case of some stuff which was brought down from Bourke.
1971. Can you state the quantity of water which is available from the bores in use, and the quantity of water which the public avail themselves of? I can give the quantity of water at each bore, but what proportion of that quantity has not been properly utilised, I cannot say.
1972. Can you state generally whether the water available from these bores is being fully asked for by the public? In some districts it has been; in others it has not. In the Moree district this season the bore water has been simply the salvation of the country. I believe there were 60,000 sheep watered at one bore.
1973. Moree is an instance where the advantages of artesian water have been supreme? There is no question about that; it is very bad country for surface water. There are no waterholes and no other sources of supply available. One lot of settlers has been absolutely dependent on the Dolgelly bore for watering their stock. We did not make any charge because it was such a terrible time.
1974. Independent of the Pera bore, where the Government have started an object lesson for the settlers, are there any places where the bores have been availed of for agricultural purposes to any extent? Yes, and the bores are mentioned in the return I read yesterday.

Cecil West Darley, Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

- C. W. Darley. 1975. *Vice-Chairman.*] I think you promised to supply some information in regard to the cost of raising the height of the weirs, and also the details of the expenditure on the scheme? I was asked to supply a detailed statement, similar to that supplied in regard to locks and weirs between Bourke and Brewarrina, as published on page 6 of the Committee's Report on that proposal, and the cost of increasing the height of the weirs and other works connected with them 1 foot, 2 feet, and 3 feet.
- 15 June, 1899. 1976. Have you prepared a detailed statement of the cost, made out on the same basis as the cost of the weirs between Bourke and Brewarrina? Yes; it is as follows:—

TOTAL Estimate of Cost of seventeen Locks and Weirs on Darling River, £530,000.

Excavation in soft material	...	...	...	...	...	...	...	...	...	£36,375
"    rock	...	...	...	...	...	...	...	...	...	13,275
Concrete	...	...	...	...	...	...	...	...	...	329,090
Iron gates for locks (complete)	...	...	...	...	...	...	...	...	...	17,840
Timber in sheet piling	...	...	...	...	...	...	...	...	...	9,350
"    fenders, &c.	...	...	...	...	...	...	...	...	...	1,870
Pitching	...	...	...	...	...	...	...	...	...	17,850
Winches at lock gates	...	...	...	...	...	...	...	...	...	850
Coffer-dams and pumping	...	...	...	...	...	...	...	...	...	30,000
Lock-keepers' cottages	...	...	...	...	...	...	...	...	...	5,100
Telephone lines and instruments	...	...	...	...	...	...	...	...	...	6,000
Maintenance steamer, fitted with sand-pump	...	...	...	...	...	...	...	...	...	10,000
Wharfs and cranes	...	...	...	...	...	...	...	...	...	10,000
										£487,100
Supervision and contingencies	...	...	...	...	...	...	...	...	...	42,900
										£530,000

1977. Have you prepared an estimate of the cost of raising the height of the works by 1 foot? It is as follows:—

TOTAL Estimate of Cost of seventeen Locks and Weirs on Darling River.—1 foot of water available for Irrigation purposes.

Excavation in soft material	...	...	...	...	...	...	...	...	...	£38,011
"    rock	...	...	...	...	...	...	...	...	...	13,606
Concrete	...	...	...	...	...	...	...	...	...	344,985
Iron gates for locks (complete)	...	...	...	...	...	...	...	...	...	17,760
Timber in sheet piling	...	...	...	...	...	...	...	...	...	9,350
"    fenders, &c.	...	...	...	...	...	...	...	...	...	1,870
Pitching	...	...	...	...	...	...	...	...	...	18,218
Winches at gates	...	...	...	...	...	...	...	...	...	850
Coffer-dams and pumping	...	...	...	...	...	...	...	...	...	30,000
Lock-keepers' cottages	...	...	...	...	...	...	...	...	...	5,100
Telephone line and instruments	...	...	...	...	...	...	...	...	...	6,000
Maintenance steamer fitted with sand-pump	...	...	...	...	...	...	...	...	...	10,000
Wharfs and cranes	...	...	...	...	...	...	...	...	...	10,000
										£505,750
Supervision and contingencies, 8·8 per cent.	...	...	...	...	...	...	...	...	...	44,506
										£550,256
Total increased cost for 1 foot	...	...	...	...	...	...	...	...	...	£20,256
Increase per Lock and Weir	...	...	...	...	...	...	...	...	...	1,191 10s. 7d.

1978. Have you prepared an estimate of the cost of raising the height of the works by 2 feet? It is as C. W. Darley follows:—

TOTAL Estimate of Cost of Seventeen Locks and Weirs, on Darling River.—2 feet of water available <sup>15 June, 1899.</sup> for Irrigation purposes:—

Excavation in soft material	...	...	...	...	...	...	...	£39,721
"    rock	...	...	...	...	...	...	...	13,946
Concrete	...	...	...	...	...	...	...	362,055
Iron gates at locks (complete)	...	...	...	...	...	...	...	18,180
Timber in sheet piling	...	...	...	...	...	...	...	9,350
"    fenders, &c	...	...	...	...	...	...	...	1,870
Pitching	...	...	...	...	...	...	...	18,585
Winches at gates	...	...	...	...	...	...	...	850
Coffer-dams and pumping	...	...	...	...	...	...	...	30,000
Lock-keepers' cottages	...	...	...	...	...	...	...	5,100
Telephone line and instruments	...	...	...	...	...	...	...	6,000
Maintenance steamer, fitted with sand-pump	...	...	...	...	...	...	...	10,000
Wharfs and cranes	...	...	...	...	...	...	...	10,000
								£525,657
Supervision and contingencies, 8·8 per cent.	...	...	...	...	...	...	...	46,257
								Grand total ... .. £571,914
								Total increase for 2 feet ... .. £41,914
								Increase per Lock and Weir ... .. 2,465 10s. 7d.

1979. Have you prepared an estimate of the cost of raising the height of the works by 3 feet? It is as follows:—

TOTAL Estimate of Cost of Seventeen Locks and Weirs, on Darling River.—3 feet of water available for Irrigation purposes:—

Excavation in soft material	...	...	...	...	...	...	...	£41,508
"    rock	...	...	...	...	...	...	...	14,294
Concrete	...	...	...	...	...	...	...	382,398
Iron gates at locks (complete)	...	...	...	...	...	...	...	19,200
Timber in sheet piling	...	...	...	...	...	...	...	9,350
"    fenders	...	...	...	...	...	...	...	1,870
Pitching	...	...	...	...	...	...	...	19,514
Winches at gates	...	...	...	...	...	...	...	850
Coffer-dams and pumping	...	...	...	...	...	...	...	30,000
Lock-keepers' cottages	...	...	...	...	...	...	...	5,100
Telephone line and instruments	...	...	...	...	...	...	...	6,000
Maintenance steamer, fitted with sand-pump	...	...	...	...	...	...	...	10,000
Wharfs and cranes	...	...	...	...	...	...	...	10,000
								£550,084
Supervision and contingencies, 8·8 per cent.	...	...	...	...	...	...	...	48,407
								Grand total ... .. £598,491
								Total increased cost for 3 feet ... .. £68,491
								Increase per Lock and Weir ... .. 4,028 17s. 7d.

I have given this information to the Committee, but I do not recommend that the height of the weir should be increased by more than 1 foot. If you increase the height of the weirs, the floods will go all over the country and possibly do damage. That question I considered very carefully in fixing the height of the locks originally. I could not possibly recommend increasing them by more than 1 foot. I should be very sorry to recommend that they be increased by 2 feet.

1980. *Mr. Watson.*] At your previous examination this evidence was given to the Committee?

168. Assuming that weirs from 7 feet to 10 feet high are sufficient for the purposes of navigation, to what further height would it be safe to carry them? Two or three feet more. There is no reason why you should not make all the weirs 10-foot lifts, if necessary.

169. Would that increase the cost proportionately? It would certainly increase it.

170. Would it to any material extent increase the liability to flood of the people above the level? No.

I think I must have misunderstood the question. There are some of the locks which might be raised, but the 10-foot ones could not be raised. Those which are 6 feet high might be raised, but the 10-foot ones could not be raised 3 feet safely.

1981. In answer to the next question, you proceeded to explain as follows:—"It would not appreciably effect the floods. When the water rose to such a height as to drown the weir, the flood-level would still be within the banks. So long as you drown your weir before the water is at the top of the banks, you are perfectly safe from doing harm." The evidence is, I understand, that practically all along the line the banks are between 30 feet and 40 feet high, so that you drown a 13-foot weir long before you reach that height? Of course.

1982. Your evidence is to the effect that as long as you drown your weir before the water is at the top of the banks, the appreciable difference in the flood-level would not be very great? I have been looking into the matter again, and I do not think it would be safe to raise the 10-foot weirs to 13 feet.

1983. Can you state how many of the weirs have a 10-foot lift, and how many a 6-foot, so as to ascertain how many of them it would be possible to raise in height? There are 2 10-foot weirs, 5 9-foot weirs, 4 8-foot weirs, 4 7-foot weirs, and 2 6-foot weirs.

1984. You advise that it would not be wise to go beyond a height of 10 feet? It would not be wise to put more than a foot on a 10-foot weir.

C. W. Darley. 1985 You do not think it would be wise to go above 11 feet? I do not think it would.

15 June, 1899. 1986. Suppose you had an 11-foot weir, and that you proposed to increase its height by 2 feet, with a bank averaging 35 feet high, would the additional 2 feet on the weir mean an appreciable raising of the flood-level above the bank; because once you get above your bank the water spreads over an enormous area? Yes; I do not suppose you would raise it seriously above the bank, but I think it would be enough to bring in claims; it would always lead to trouble.

1987. About how wide apart are the banks where a weir is to be placed? The width varies between 200 feet and 300 feet.

1988. The amount of water which would be raised would be a multiple of, say, 250 feet by 2 feet by the length of the lock? The pool held back by the weir.

1989. That would be the amount of water which, in the case of a very high flood, would be extra distributed over the land above the banks? No; it might be a very great width over the whole country.

1990. If the weirs are raised 2 feet, so as to bring them up to a height of 13 feet, the extra amount of water which would thus be forced, in the case of a very high flood, over the banks would be just so much as would be contained by the weirs being 2 feet higher than they were, would it not? No; it might be a very large quantity. You are checking back the whole flow of the river; you are checking the whole flood. It is a very complex question to answer.

1991. It means that your flood level commences slightly earlier than it otherwise would do, does it not? The river is not so deep in a great many places. There are many places where the banks are not more than 15 or 18 feet deep. It decreases as you go down the river. Down at Wentworth, I do not think the banks are more than 15 feet high.

1992. *Dr. Garran.*] Are the banks lower where these anabranches take off? There is a low gulch there.

1993. Is there a cut through the bank where it takes off? There is.

1994. At what height above the top of your sill do these anabranches go off? The only important one we have to deal with is Talyawalka, but I have not seen that. I know that when the river rises a certain height the water begins to flow off.

1995. How high does it rise before it runs into the anabranch? I am not quite sure.

1996. You propose to raise your dams only high enough to secure your navigation? That is all I have dealt with at present.

1997. These questions which are asked you now are due to the fact that it has been suggested that if you raise the dam a little higher than you want to do, the extra water will be available for irrigation? Yes.

1998. The finance of the question will depend upon whether the extra quantity of water so stored could be sold at a price to pay for the cost of the storage; say the water is banked up 20 miles and we raise a weir by 1 foot, we raise the water in that artificial canal by 1 foot all along its length at a cost of £1,100;—if we could sell the water to pay good interest on that £1,100 it would be a good financial operation? I think the weir could be raised from 1 foot to 2 feet.

1999. Suppose we can raise the weir 1 foot, and make it pay by selling the water, it would not injure your canal at all? Instead of raising all, I should say a better scheme would be to store water higher up the river.

2000. In lateral lakes? At the Brewarrina Rocks.

2001. We want the water where we can do irrigation? You would have it then to let down to replenish the lock. In ordinary seasons you would have abundance of water if you had a storage above the Brewarrina Rocks. Above these rocks there is a very long pool where the water could be thrown back by a weir for a very great distance, and that water could be let down to make up for the loss of water used by irrigation to maintain navigation.

2002. Your idea is that instead of storing more between each lock we should make one big storage up at the top, and let the water down as we consume it? I think it would be better than raising the weirs too much. You might put a foot on all through, and then have the main storage near Brewarrina.

2003. We have got one weir, with the shutter arrangement, which is so far unsatisfactory that it is not keeping the water back,—is it not so? That is so.

2004. Suppose we were to make another weir above that, with a sluice to let the water out through the weir, to let the silt out in case it should be wanted, we should have a second experiment? Yes.

2005. And if there were no important deposit of silt, and we found that sluice was not wanted, it would be a good argument for making solid concrete dams would it not? If you want to let the water out you must have a sluice; but I do not quite follow you.

2006. The objection made against your solid concrete dams by several witnesses is that silt will collect against them;—could you not get rid of that difficulty by having a sluice in the solid rock? To some extent; but I do not think there is much risk of silt collecting, and, even if it did, it would cost very little to put a sluice in. We could put a sluice into them all without increasing the cost very much.

2007. Not after they are built? No; as they are being built. I gave consideration to that matter, but I did not entertain the idea of putting them in. There is no evidence to show that there will be trouble with silt collected there.

2008. Suppose it does collect, we should have to get it away? At Brewarrina there is a rock across the river and for miles above that point there is a deep pool in which there is no silt at all. If the silt is travelling down the river why does it not fill that pool to commence with.

2009. You think that if the silt were brought down it would fill up these pools? It would fill up that pool first.

2010. Suppose we kept one steamer in the river with a sand pump, would that be sufficient to clear the river? Quite enough.

2011. With that precaution you do not think there is any need to make sluices? I do not think so.

2012. *Vice-Chairman.*] Since your last appearance before the Committee we have examined Mr. Millen. We drew his attention to the question of these fixed or movable weirs, and he gave this evidence:—

1493. Do you think it would be dangerous to erect fixed weirs in the Darling? I think there would be a danger. The soil there is extremely fine silt, and is so easily disturbed by the action of water that I fancy a permanent weir would offer a temptation to the river to cut another channel. I do not mean to say that this raises an insurmountable difficulty; but a permanent weir would have to be watched, and might entail expenditure which is not provided for in the estimate for this work.

1494. It would entail expense in the construction of very long side walls leading to the weir? Not more than I imagine a movable weir would cost in that way. The effect which an obstruction to the water has upon the river channel is seen in

two ways. Mr. Darley referred to one. He stated that wherever there was a rocky bar across the river bed, the channel was wider there than elsewhere. The other effect is that above these rocky bars we find that the river has either cut itself another channel, or is now doing so. I do not know that these channels are altogether a disadvantage, because they serve to distribute the water more extensively. At the same time they would have to be watched. C. W. Darley.  
15 June, 1899.

Do you think there is any force in these objections, that above these fixed weirs the water may get away to the sides, and form the side channels he speaks of;—do you think there will be any fear of that taking place? I do not think so; I do not think there is much tendency to silt up.

2013. You are prepared to advise the Committee to recommend the construction of these fixed weirs, having these difficulties in view? Yes. I think with a sand-pump dredge you can overcome any difficulty which may arise from an accumulation of sand.

2014. Without any fear of the weirs being surrounded and destroyed? Yes.

2015. *Mr. Shepherd.*] In the event of these weirs being raised in height, it would throw the water much higher than it is proposed to do by the present weirs,—would it not be possible to reduce the number of them? Then you come back to the same position you were in before; it would all be required for navigation.

2016. The water would be much higher than is proposed by the present weirs? No; if you reduce the weirs in number you throw the water back further, and you come to the same minimum depth again.

2017. It could be brought to the old point, and yet you could reduce some of the weirs I should think? You cannot reduce the number. If you reduce the number you come back to where you were.

2018. *Vice-Chairman.*] You wish to hand in a diagram showing the number of times the uppermost lock will have to be opened to cause a decrease of 1 foot in the pool? I hand in a diagram upon which there is a table showing that six lockings would lower the pool by one-eighth of an inch, fifty-one lockings by 1 inch, 152 lockings by 3 inches, 305 lockings by 6 inches, and 610 lockings by 12 inches. You could use the locks 610 times before you lowered the pool by 1 foot.

THURSDAY, 7 SEPTEMBER, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.

The Hon. WILLIAM JOSEPH TRICKETT.  
WILLIAM THOMAS DICK, Esq.

JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Hugh Giffen McKinney, Principal Assistant Engineer, Water Conservation Branch, Department of Public Works, sworn, and further examined:—

2019. *Chairman.*] You were asked to get the Committee some information in reference to the Hay Irrigation Settlement and other irrigation settlements in the Colony? Yes. Under the Hay Irrigation Act the Municipal Council of Hay was constituted an irrigation trust, and the temporary common was granted to them to use as an irrigation settlement. After they had that common under their control for some time they came to the conclusion that if a scheme were prepared by the Government for them they could carry it out themselves, and they applied that I should be sent up to advise as to what scheme should be adopted. Accordingly, I proceeded to Hay, and went over the ground. I selected a place for a pumping-station on the northern side of the river, where they wished to start their irrigation first. As they had land on the southern side too, I also selected a pumping-station there; but they applied afterwards, that, in addition to that, I should have levels taken, and plans of the ground, showing the levels and also the best lines for irrigation channels marked out. That was sanctioned too, and I had the survey carried out and the levels taken, and everything practically ready for starting work when the Council, that is, the Irrigation Trust, stated that they would be able to raise the capital themselves and carry out the work. They did make a start, but at the very outset they departed in a vital point from the scheme I proposed. Instead of adopting the site I had chosen for the pumping-station, they took a place on much lower ground, considerably nearer the town of Hay, and instead of getting a new pumping-plant with a centrifugal pump, they bought an old pump in one place and boilers in another, and they ran themselves into a large amount of expense in getting these fitted up. Another thing which I did not advise, and never should have advised, was the construction of a reservoir which they took in hand. When I found that out I called the attention of the Government to it, and pointed out that the Council had departed in very material points from what I had recommended. However, as they had arranged then to carry out the works themselves nothing could be done; they were allowed to proceed, in fact, they could not have been interfered with. After they had gone on for some time it was found out that the works were going to cost very much more than they estimated, and their way of getting over the difficulty of the low ground proved to be a complete failure. They erected a flume which, when a heavy storm occurred some time afterwards, was blown across the plain. That, and several other things they did, brought them into financial difficulties, and they then applied to the Government to take up the matter. I was asked to report on it again, and I advised that the pumping-plant, which they had got, should be devoted to the town's use, as they stated they were wanting a new pumping-engine, and that a new pump should be got, and put up at the station first adopted. The trust objected to that, and the matter was allowed to rest until Colonel Home came out. In the meantime they had got their pumping-engine set up, but they had not sufficient funds to complete the work in order to start operations. Colonel Home reported on the works. He stated that if well managed he thought there was still a chance of their paying the interest on the outlay—that is, on the larger outlay, including what they wanted to get from the Government. He also stated in his report that if they had followed out the lines recommended in my report they would have had a better scheme at a cost of from £2,000 to £3,000 less. After Colonel Home had submitted his report a grant was made by the Government to enable the work to be completed. The works were completed, and then an amending Act was passed putting the works under a different kind of trust. It

H. G.  
McKinney.  
7 Sept., 1899.

repealed

H. G.  
McKinney.  
7 Sept., 1899.

repealed the part of the first Act relating to the trust, and appointed a trust differently composed. The works have been under that trust up to the present time, but I see that lately a petition has been sent in asking for a dissolution of the trust.

2020. Have there been any results at all at the Hay irrigation works? 700 acres of land were taken up, and some of the irrigation was very satisfactory. The pump, I may say, is not suitable for that class of work, and they had a very heavy expense in getting over that difficulty of the pumping-plant being on low ground. It proved to be necessary to lay a pipe a distance of about a third of a mile up to the rising ground, and to force the water up to that from the pump. However, in spite of these disadvantages, 700 acres were taken up, and a considerable part of the area was put under irrigation, and I was told that the crops of sorghum, maize, and some things of that kind, proved exceedingly good. But I understand that people complained of the cost of the water. On the other hand, it was stated that they have not got a suitable class of settlers.

2021. Are they cropping their land now? I understand that they are. I have not visited the place lately, but I understand that there is a certain amount of irrigation still going on.

2022. It has not been a success so far? No.

2023. And the reason you give is that the machinery is not suitable? There is a variety of reasons. One reason is that the machinery is not suitable, and another is that the works cost too much. The initial cost was too great. There was no necessity for such expenditure if they had adopted a suitable design for the works. That pipe, which extends on to the high ground, if I recollect aright, cost from £1,500 to £2,000 at least. That expenditure would have been avoided entirely if they had adopted the site which I recommended for pumping.

2024. *Dr. Garran.*] You have referred to some preliminary expenses that the Government undertook before the local authorities took over the works;—do you know whether those expenses were charged to Revenue or to Loan Account? I am not quite sure; I know that all the preliminary expenses of preparing the plans, doing the survey, and taking the levels and everything of that kind amounted to about £150. I am not quite certain, but I think it was charged to Loan Account.

2025. It has not been debited to the capital account on the trust? No; there was an understanding that it was to have been returned by the trust, but as far as I know it was not. I cannot state exactly what happened afterwards.

2026. The Government has borne the preliminary expenses? Yes.

2027. Is that the whole of the preliminary expenses before the local trust began operations? That is all the Government undertook.

2028. That covered all your business? It covered everything.

2029. There has been no subsidy to the trust since then? Yes. After the trust petitioned for assistance there was a grant made to cover not only what they had expended, but what further expenditure was required. I think it was a grant of £10,000.

2030. Was it revenue or loan money? I understand that it was loan money.

2031. Was the engine which the trust first bought the old Botany engine? No; it was the old Crown-street engine.

2032. Was not the Botany engine bought for some irrigation purpose? I did not hear.

2033. Did your plan involve any reservoir on high ground? No; none. I did not consider that there was any necessity for a reservoir.

2034. To what height were you going to lift the water? The average lift, I reckoned, would be from 22 to 25 feet.

2035. You simply lift the water in the pipes? Yes.

2036. You do not require any stationary reservoir? No reservoir.

2037. Did you select a site on the bank of the river for your pumping-station? Yes: and one on the south side of the river also.

2038. On the south side of the common you mean? No, on the south side of the Murrumbidgee. The first grant of temporary common which was given to the original trust included a large area on the south side of the river as well as on the north side.

2039. Practically, there would be two farms? Yes.

2040. Have any attempts been made to settle both the farms, or has it all been concentrated on one? Only on the north side. By the amending Act all the area on the south side was taken away from the trust.

2041. Was any money spent on the south side? No.

2042. Then all the money spent is still to the good, so far, on the north side? Yes.

2043. Do you think the reservoir which they have built is of any service in distributing the water? Not the slightest; there were some serious objections to it. For one thing, the water which would have been absorbed in a large shallow reservoir like that would have been sufficient to have kept the pump going a considerable portion of every day in order to balance absorption and evaporation.

2044. You think the absorption in that reservoir would have been considerable? Certainly; besides, as the river is permanent, there was really no necessity for a reservoir.

2045. Supposing the river had fallen, how much would the reservoir have held;—would it have been a week's supply for their irrigation purposes? If anything like the whole of the present area had been under irrigation, it would have been a week's supply.

2046. Along for 700 acres, that would be comparatively useless, if we are going to have a drought so often? It would have been quite useless. I never could see any sufficient reason for having such a reservoir at all.

2047. Is the river ever empty at Hay—dried up? Never.

2048. There is always water enough in the river to irrigate the common? Always sufficient.

2049. What kind of soil is that common? It is a greyish soil, something between black soil and red soil. Part of it is red soil; but the greater part of it is greyish soil.

2050. Is there clay underneath? There is clay underneath part of it. I forget whether it runs through the whole of it or not; but there is clay underneath a part of it, I know.

2051. Did you, before you recommended it as an irrigation site, sink any pits, or bore at all? We had a number sunk, and we had it inspected by experts from the Agricultural Department.

2052. Do you remember what their report was? I know that Mr. Thompson, of the Agricultural Department, reported favourably on it.

H. G.  
McKinney.  
7 Sept., 1899.

2053. What is the area which they have brought under cultivation? I have not heard exactly. It passed to the new trust; it passed from under our control. They were not in any way bound to supply us with any information. I could not say exactly the area which was under cultivation. I know that about 700 acres is about the area which they have let; but how much of it is under cultivation I cannot say.
2054. Is the Committee to understand that your responsibilities ceased after your preliminary advice was given? Yes. When I heard of the changes made by the trust, I wrote in, pointing out that the trust had taken the matter entirely into their own hands, and that I certainly could not be responsible for the effect of the changes they made.
2055. Has your advice been asked since by the trust? The advice of the Department was sought, and I reported; but the matter was left over, I think, partly at their request, if I remember aright, until Colonel Home would have an opportunity to report on it.
2056. Have you had access to any of the figures which would show the cost of lifting the water by the apparatus they have? No; they have not sent us any returns.
2057. You cannot tell the Committee what is the cost of lifting the water? No.
2058. Have you any reason for thinking that a centrifugal pump would have lifted the water much more cheaply than the pump they have? I certainly think it would.
2059. How much more cheaply? I should say probably it might have been as much as 15 or 20 per cent. cheaper.
2060. They are wasting that much additional? It may be called waste; probably they would say that their pump is more durable, or something of that kind, or that they got it more cheaply at the start. They did get it very cheaply, I understand.
2061. More cheaply than they could have got a centrifugal pump? I think so.
2062. The pump at Crown-street was for lifting the water up to Waverley or Paddington—a greater height than they want to lift their water? Much greater.
2063. You only want a pump to lift a large volume, and a very slight height? Quite so.
2064. That is a different kind of pump from one which is required to lift to a high elevation? Quite so.
2065. Will it work more cheaply per gallon? Yes; it would certainly be considerably cheaper.
2066. Taking all the experience of this Hay irrigation farm into consideration, do you consider that the result is encouraging or discouraging? It certainly is not encouraging. But then, on the other hand, it was handicapped by not getting a fair trial.
2067. Taking off a discount for the want of a fair trial, and supposing they had carried out your plan, which I suppose you still think the best, do you think there would have been an encouraging result then? I think it is quite doubtful, because it has been shown that there is a great difficulty in getting a class of settlers who understand irrigation, or who will make themselves acquainted with it in a short time. The greatest difficulty of all seems to be to get settlers who understand irrigation.
2068. Did they have any difficulty at Mildura in getting settlers who would buckle to and understand it? They had not; but they spent very many thousands of pounds in advertising in pretty nearly every town and colony in the British dominions.
2069. Does it happen because you advertise that the people who answer the advertisements are fit people? No; a great number of those who came to Mildura were not fit people. But still, taking them altogether, they got a very good class of settler there. They got a very large number who were quite unsuitable; but, on the other hand, they got a large number of very good settlers.
2070. If they got a large number of good settlers at Mildura, why should we not get a fair proportion of good settlers at Hay? If it were deemed that anything like the same expenditure were warranted in advertising I think we could get them.
2071. Do you know how many settlers there are at Hay? They are nearly all local men. There are very few that are outsiders. They are nearly all people who either are or were residents in Hay. Some of them have built houses on the irrigation area. I think the majority of them have not.
2072. Do they live in their own houses? Yes. The settlement is only about 2 miles from the town, and I think that the majority of the settlers live in their own houses in the town.
2073. They walk to the farm in the morning, and walk home again at night? Walk, ride, or drive. A few of them, I know, have built houses; and one or two of them have built very good houses.
2074. Have you been up there at all? Not recently.
2075. Does the Department get any reports down from the trust? It has not been getting any reports recently; in fact, the last Bill which was passed was taken in hand by the Minister for Lands.
2076. Did that stipulate for reports? Not to us.
2077. Did not the Department require reports showing what was done? The Lands Department, I should fancy, expects to get reports, because the District Surveyor was made a member of the trust.
2078. The Government has had a leg in the trust? Yes; there has been one Government officer always in the trust, and two Government officers part of the time.
2079. Then the local people have had the assistance of a Government official? Yes; at the meetings of the trust they had the advice and assistance of a Government official in that way.
2080. It does not necessarily follow that the District Surveyor is a good expert in irrigation? No.
2081. Only that he is a trustworthy man to report to the Government exactly what has been done, and nothing more than that? Quite so.
2082. It does not follow that he is a good adviser? Not by any means.
2083. How much land is under irrigation? 700 acres.
2084. What crops have they been growing? They have planted a number of fruit-trees I know; but the only crops I saw were crops of sorghum. I was not even close up to the crops; but I understand that sorghum was the crop which gave most satisfaction. Of course it gives a quick return.
2085. Was all the water distributed from this reservoir? The reservoir was abandoned altogether. It really never came into use.
2086. Do the trust convey the water in pipes or in channels? In open channels, after they reach the highest ground; it has to be carried in pipes up to the highest part of the ground, and then it passes into a trench there.
2087. From that main trench it is diverted in sub-trenches, I suppose, to the different properties? Yes.
2088. There is no piping after it has once reached the height? No.
2089. The only piping is just to lift the water? Yes.

H. G.  
McKinney.  
7 Sept., 1899.

2090. Do you know whether they distribute the water over the ground in channels, or do they attempt to make surface irrigation? It is surface irrigation, I understand. I have not seen the details of the distribution; but, I understand, that what they have been doing is to make openings at intervals along the minor channels, which are simply small earth channels. They make openings at intervals, and allow the water to flow over the surface of the particular plots which they wish to irrigate.

2091. Do you know whether they grow fodder crops—like lucerne or hay crops? I am not quite certain. I think I heard that they were growing some lucerne; but I have not any particulars about that.

2092. I have asked all these questions because I want light on a point which has been very much before this Committee—namely, as to the possibility of a successful irrigation farm on the land to the north of Bourke;—you know that land very well? Yes.

2093. Do you know that it has been recommended by some witnesses—one in particular—as an ideal site for an irrigation farm? Yes; it has several important advantages.

2094. I want to find out whether this Hay irrigation farm, of which we have had a little experience, throws any light on the probability of our having a successful irrigation farm at Bourke? If the right sort of settlers were obtainable for that proposed irrigation farm near Bourke, I think it ought to be a success; but it appears to me that that is really the greatest difficulty.

2095. We are told that at Bourke it will be necessary to lift the water about 30 feet;—what is your lift at Hay? I think their lift now is about 7 to 8 feet more than it would have been in the place I selected. I think altogether it is about 32 or 33 feet.

2096. Practically, the lift would be about the same? About the same.

2097. So that the cost at Hay will be a fair guide to the cost at Bourke? It would.

2098. Providing that the cost of the plant and fitting-up is not heavier at Bourke than it was at Hay? Yes.

2099. I suppose there is no reason why it should be? No.

2100. One of the reasons given to us for locking this river is to supply water for irrigation, and I think you yourself have pressed that point? Yes, I did.

2101. For not only navigation but irrigation? Yes.

2102. I think you have given greater importance to irrigation over navigation, if they should ever clash? Yes; I think it would be of the greater ultimate importance.

2103. That being so, you see the immense importance of the questions I am putting; before we can suggest or recommend locking the river for the sake of irrigation, we ought to get all the available evidence as to whether an irrigation farm with a lift of 30 feet is a remunerative business or not? Quite so.

2104. I want you to say, if you think the Hay experiment, as far as you can see, would be encouraging or discouraging for such an experiment at Bourke? I should say that on the whole it is discouraging.

2105. I want to get your opinion, as the Committee are sure to look at this piece of ground, and naturally it will interest them very much to see whether the locking of the river would be likely to have any result in developing local production and so on? Yes; on the whole it certainly has been discouraging; but then on the other hand they certainly do not manage to get settlers here anything like as good on the average as those who have remained at Mildura.

2106. I understood you to say that all down the river here and there, the squatters have made small experiments at irrigation? Yes.

2107. They have had to find funds to do that, I suppose? Yes; in most places where they have irrigated on squatting stations, it has been for the production of fodder crops.

2108. They have grown hay and lucerne and sorghum? Quite so.

2109. Is that a simpler thing to do than to irrigate in channels over orchards and vegetable gardens? I do not think it is really. In vegetable gardens and orchards there is a greater amount of labour involved, but I do not think there is very much difference, otherwise, between the two.

2110. You pass the water through in defined channels? Yes.

2111. That is easier than distributing the water equally all over the surface? It is.

2112. *Mr. Watson.*] A person might put too much water on an orchard? Quite so.

2113. He would not be likely to do as much harm by putting a little more water on a fodder crop, as he would on an orchard? No. One of the most successful irrigationists up country ruined a considerable area of grass by over-irrigating when he first began his experiments. By irrigating in hot weather the grass became scalded and was killed.

2114. *Dr. Garra.*] You think there is not so much danger in regard to fodder crops as there is in regard to orchards? No. Speaking generally, an orchard is well worked up, and the ground is absorbent, and people can manage to have an orchard on a place which is naturally drained. So, as far as that risk under similar circumstances is concerned, I do not think there is much to choose.

2115. In your earlier evidence, if I remember aright, you looked forward to the possibility, if the river were locked, of suitable selected sites being made irrigation farms all down the river from Bourke to Menindie? Yes.

2116. But if I understand you aright now, there will be no chance of there being a success unless we can get the right sort of people? I think that is so.

2117. You are implying that there is a difficulty in getting the right sort of people? There is a difficulty, but I am not sure that I am not misunderstood about that. I may mention that I expected that there would be patches of irrigation at intervals all down the whole length of the river. But I expected that in the majority of these cases, the irrigation would be for the production of fodder crops, and I anticipated that the close settlement, at all events for a long time to come, would be in the neighbourhood of the towns; for instance at Wilcannia and Menindie, and possibly at Louth and Tilpa. My anticipation was that the general rule would be that the irrigation which would be practised at intervals along the Darling would be for the production of fodder crops.

2118. Still, for the production of fodder crops, you would require just as much skill as for the production of fruits? For the distribution of the water, practically you do.

2119. It requires a different class of skill for the cultivation of the plants, on pure irrigation farms? For irrigation, I think, there is just about as much skill wanted in one case as the other.

2120. So that we cannot get rid of the need of skill by assuming that we are going to get a fodder crop;—what I want to point out is, that your scheme for its completion requires not only the locking of the river, but the discovery of suitable people? That is as far as close settlement is concerned, not so far as the production of fodder crops is concerned.

H. G.  
McKinney.  
7 Sept., 1899.

2121. You said just now that to irrigate a fodder crop requires just as much skill as to irrigate an orchard? Yes; but there is an important difference between the two cases. The irrigation of fodder crops would be started by people who could afford failures.
2122. Who could afford to learn by experience? Who could afford to pay for their experience; but with close settlement, the people who could take up small areas could not afford to buy their experience in that way.
2123. You mean that a man who will work for a squatter can learn at his expense, but the man who is on his own little farm will learn to his ruin if he cannot learn in time? Yes.
2124. The cheaper plan is for a man to learn at the squatter's expense? It undoubtedly is. In fact, on many of the squatting stations where irrigation has been practised, it has been practised in a very wasteful way indeed, and I have no doubt that many people have gained very much valuable experience there. I know many places where they ought to be irrigating three or four times as much as they are doing.
2125. Since you were here before, there has been enough rain in Queensland to make a fresh in the river? There has.
2126. So that navigation is just beginning again? Yes; in fact, one fresh went down, and there is another coming now. The Namoi has been flowing in, and there is a considerable quantity there.
2127. We have heard that the weir which you built, having been let down for some time, has been raised? It is not up now.
2128. Had it been raised? It was down, and it was raised.
2129. Did a request come to the Minister to have it put down? A request did come; but, as a matter of fact, it was down some time before that request came.
2130. At the present time it is not storing water? No; the river is now above navigation level, so that there is no necessity for storing water.
2131. Not for navigation purposes? No.
2132. All the water is going down the river? Yes.
2133. On the Darling, I suppose, you call anything over the banks a flood? Yes.
2134. You do not call it a flood until it is over the banks? No; it can fairly be called a flood before it is over the banks at Bourke, because the banks there are very high. It is a very high river indeed, when it comes within 5 or 6 feet of the top of the banks at Bourke.
2135. It gets over the top of your weir long before it gets over the banks? Yes.
2136. You would not call it a flood when it is merely over the top of your weir? No.
2137. When it is over the top of your weir and at that level, are there places where the water would go into side channels instead of flowing down the main river? It does go into side channels at that height, and in a number of places; but they are all side channels, which are connected with the river; they are not side channels, which flow away from the river.
2138. They are parallel channels? They are either parallel or horseshoe-shaped.
2139. Ana-branches, in fact? Yes.
2140. If the water is up to the top of your weir, is that water enough for all purposes down below the river if it is running over? Yes.
2141. Anything more than that in the Darling goes to waste? It does really.
2142. I suppose, practically, all our floods in the Darling have gone to waste? They have gone to waste, except in this way: on the lower part of the Darling there are considerable areas of low land, and all those polygonum and other things which are useful in times of drought to stock, get water by these floods, so that a flood is not altogether wasted; it waters a certain area of low land which is useful afterwards.
2143. You mean that there is a kind of natural irrigation which goes on on certain low flats? Yes.
2144. If we were to try to utilise all this water that goes to waste, could we make channels at right angles or otherwise to the river, and carry that water back into the dry country without taking away water which was really required down below? The water could be spared perfectly well, but, unfortunately, the country as a rule is very ill adapted to that.
2145. It is not well adapted to carrying the water back from the river? No.
2146. How far back is it ill-adapted? There is not a general fall in the ground away from the Darling River as there is in the case of the Murrumbidgee. In that case the banks are the highest land in the neighbourhood, and the country falls away, so that, once the water is out, you can take it away quite naturally.
2147. In the case of that dam you built on the Willandra billabong, the water runs, I suppose, right away to that lake? Yes, that is a natural outflow channel.
2148. And there is no such natural outflow as that off the Darling? There is one at the Talyawalka—the one which supplies these lakes.
2149. How far is that lake which seems to be the end of the Talyawalka ana-branch from the Darling? It must be over 50 miles.
2150. How far is the lake at the end of the Willandra billabong from the point where it takes the water off? It is about 100 miles in a direct line.
2151. That is the longest natural channel we have which takes water off the river? If you take the Edward River from the Murray, I believe it would be longer than that; that is really a natural channel.
2152. That is an ana-branch? Yes.
2153. I am talking of channels which begin in the river and end in the desert? I think the Willandra billabong is the longest. I do not think we have one equal to that.
2154. If nature could make a channel 150 miles long, and take water from the river, cannot art make a channel 150 miles long, and take the water to the back country too? Yes; the channel could be made; but the question of cost would be a very serious matter.
2155. I am wanting to know whether there will be any difficult ridges to cut through, or whether the fall of land would allow the high floods in the Darling to be sent back 50, 60, 70, or 100 miles? The only case I can recollect where that can be done is on the lower part near this Talyawalka ana-branch. The great ana-branch might be somewhat improved, but not very much, because the fall in the country there is so slight in the direction in which the ana-branch runs. It is not capable of very great improvement.
2156. In the Upper Darling, between Bourke and Wilcannia, the land on either side is a little too high for water to be sent into the back country? Yes; and as a rule it does not fall away from the river; the slope is not away from the river.
2157. Not even the waters of the highest flood could be economically carried into the interior? No; they could not be taken to any great distance.
2158. The inference from that is that the flood waters must continue to be wasted? Yes, I am afraid they

- H. G. McKinney.
- 7 Sept., 1899.
- they must. The only chance of saving them is in some of the large lakes in the lower part of the river. A quantity could be conserved in the lakes near Menindie.
2159. Nowhere else that you know of? I do not not know of any good site, except in these large lakes in the lower part of the river; and in most cases there are considerable objections to utilising them.
2160. We could improve the Talyawalka billabong a little bit? Yes, it can be somewhat improved. When I was first instructed to look into the question of locking the river Darling, my idea was that a weir ought to be constructed in such a way that it would divert water into the Talyawalka billabong. But I found that it would have to be such a height that there would be the risk of diverting the course of the river altogether in flood time.
2161. Before this water ran into the Talyawalka billabong, it would have to be much higher than the top of your lock? Yes; we would have to adopt a different style altogether.
2162. None of these ana-branches take the water off at the low level at all? None.
2163. How much, generally, do the waters have to rise before they will get into an ana-branch off the Darling? If I recollect rightly there is a channel into that Talyawalka billabong at from 18 to 20 feet above the river bed.
2164. You see on that wall-map the lake at the end of the Talyawalka billabong and the lake at the end of the Willandra billabong, and between those two points there is a little bit of rising ground, I suppose a kind of watershed;—would it be 100 miles from the end of one to the end of the other? Forty-five miles.
2165. And that is slightly elevated ground, I suppose? It is slightly undulating. There is one distinct undulation. I remember, because I was looking-out to try to locate the position of the watershed.
2166. Would it be possible, if we could take the water into the Talyawalka billabong from the Darling in a flood, to force that water further along, and put it in a lake at the head of the Willandra billabong? I think not, as far as my recollection goes. The lake at the end of the Willandra billabong, is higher than the lake at the lower end of the Talyawalka billabong; speaking from memory I believe it is higher.
2167. Because sometimes the Darling is in flood owing to Queensland rains when the Lachlan is low? Certainly.
2168. And it would be a great thing if you could divert Queensland water, which is going to be wasted, into that Willandra billabong? It would certainly. I will look up the difference between the two, but to the best of my recollection the lake at the end of the Willandra billabong is more elevated than the lake at the end of the Talyawalka billabong.
2169. If your surveys give the figures, I should like to know the elevation of the lakes at the head of the Talyawalka billabong, the elevation of the lake at the end of the Willandra billabong, and the height of the intervening ridge? I have got the height of the ridge, at all events, from the railway levels, if I have not got it in my own surveys. I know that I have the elevation of the lakes. I will furnish the information to the Committee.\*
2170. Will you now relate the history of the Wentworth irrigation farm? The Wentworth Municipal Council was constituted an irrigation trust in the same way as the Hay Council was, and there was a special Act passed, in which this was decided on, known as the Wentworth Irrigation Act. That Act gave the Wentworth Council the control of 10,000 acres of temporary common to use as an irrigation area. The Wentworth Irrigation Trust decided, like the Hay Trust, that they would raise the necessary funds and carry out the work themselves. They appointed a Victorian gentleman as engineer and manager, and he set about getting out a scheme for them. In the course of time, I think it was about 1892, they were not satisfied with the length of time which was being taken in the preparation of the scheme, and, also, they were not satisfied with the amount which was being expended on it. They asked their engineer and manager to at once submit what he had and to give as close an estimate as he could of the cost of the scheme he would recommend. He did this, and the scheme which he recommended was to cost between £18,000 and 19,000. One serious drawback to the scheme was that the place where it was proposed to pump the water was outside the irrigation area; it was on Crown land. This report was forwarded by the trust to the Public Works Department for information. The question of the merit of the scheme was made over to me, while the question of the legality of the pumping outside the irrigation area was looked into by the Crown law officers, who, I may say, decided that the trust could not lawfully pump from outside the irrigation area. I had to go into the merits of the scheme independently of that point, and the conclusion I came to was that it was too expensive for them to start with; that they ought to start with a smaller scheme, and that it would be advisable to start nearer Wentworth. Then the Wentworth Council asked that I should be sent there to advise as to what should be done. I went there and reported on a scheme which I estimated to cost about £5,000, within about 4 miles of the town of Wentworth, whereas the other scheme was about 9 miles away. When this report was received the council unanimously decided to adopt it, and they still intended to go on with the scheme, and raise the funds themselves. But just about that time, the financial crisis of 1893 came, and they found themselves saddled with an overdraft of £1,000, which they had raised on the personal security of the members of the trust, and, in addition to that, they found they could raise no funds to proceed with the work. After the matter had stood over for a considerable length of time, they decided to ask that the Government should carry out the work for them. In order to do that, the trust had to be dissolved, and the Government had to take over the liabilities of the trust as well, and to take back all the area of land which had been dedicated, and eventually the works were put in hand. All the necessary preliminaries were gone through, and the works were carried out, but there was considerable delay, after they were carried out, in getting regulations under which the irrigation was to be managed. That delay, as it proved afterwards, was a very serious drawback, because a number of people who had come from Mildura and other places, to take up blocks, had waited for some months for the regulations to come out, and, owing to the delay, they decided not to remain. Eventually the regulations did come out, and the areas were thrown open eight months ago, but only 55 acres were taken up. That is the position of affairs now. Some complaints were made lately about that matter; in fact, I think Sir Joseph Abbott called attention to the insufficiency of the advertising which had been done, and, on account of that, there is a whole statement coming out in the next number of the *Agricultural Gazette* showing the position of affairs at Wentworth and describing the land and the advantages of the settlement.

2171.

\* NOTE (on revision):—The bed of Lake Moomanyah, which is supplied from the Willandra billabong, is 66 feet higher than that of Sayer's Lake, which is fed from the Talyawalka. The distance between these lakes is 45 miles, and this is the shortest distance between the limits of the Lachlan and Darling flood-waters. On this line, at 6 miles from Lake Moomanyah, the ground level is 44 feet above the bed of the lake, and at 28 miles the ground is 92 feet above the same level.

2171. Can you say how much money the Government has now embarked in this concern? About £1,100, which had been expended by the people, had to be made good by the Government, chiefly in the preliminary work. Generally speaking, Government work is credited with being more expensive than private work. In that case the preliminary work done privately cost fully £900, while the preliminary work done by the Government cost considerably under £200.

H. G.  
McKinney.  
7 Sept., 1899.

2172. *Mr. Watson.*] Was it done in the one place? Not in the one place. There were some levels which were taken from those places by the Victorian engineer. We connected our work with them; but they were really of no use to us. We only used them as a check.

2173. *Dr. Garran.*] I understand that the Government had to pay about £1,100 to take over this work;—how much has it spent since? As far as I can recollect, about £4,000, in addition to the £1,100. I know it is not much over my original estimates for the scheme.

2174. Since the Government has taken it over, has it been under your supervision? Yes; there is an engineer and manager down on the place.

2175. Then we have spent £5,000 of public money and secured 55 acres of cultivation? Yes; but I need scarcely say that it has not had time to have a trial yet.

2176. How long have these regulations been out? I think about nine or ten months.

2177. There has been a Government officer on the spot all the time; we have been paying his salary all the time, and we have only 55 acres of cultivation to show? Yes; that is all that has been taken up yet. It has all been taken up by local people.

2178. Do you know whether this £5,000 has been charged to revenue or to loan account? To loan account, I believe.

2179. Is this area of 55 acres in the hands of one man? No; there are seven blocks at least.

2180. They must be very small blocks? The blocks run from 5 up to 25 acres.

2181. Are they taken for vegetable gardens or orchards? The cultivation which they have started on them is to a large extent for fodder crops. They have wheat, lucerne, potatoes, and some acres of vines.

2182. The market, I suppose, is a local market? Yes, for anything which they have now.

2183. They would have the same advantages for getting products away from there as they would have at Mildura? They would be able to get them away by river, or by river and rail combined.

2184. How do they get them away from Mildura? Speaking generally, down the river, but very often they send goods up the river to Swan Hill.

2185. That is some considerable distance? It is; but there is a regular line of steamers which runs there.

2186. They do not attempt land carriage? I think not. I have never heard of any attempt at land carriage.

2187. So far as the experiment at Wentworth goes, there is nothing more encouraging in that one than there is in the Hay one? There is just the same difficulty about getting the right class of settlers. Of course, the Hay settlement has been very much longer in the field. The Wentworth one has not had time yet to show what can be done; in fact this is the first real attempt which has been taken to bring it very largely into prominence. This article, which will appear in the *Agricultural Gazette* next month, ought to be of considerable use; I will be much disappointed if it has not some effect.

2188. At any rate there is nothing in the experiment, either at Hay or at Wentworth, to justify the Government in taking immediate steps to start a third farm at Bourke? There is not at present. In fact, the Balranald trust is in the same position as the Wentworth trust came to be in, that is, before the Government took it up. They wanted it to be dissolved, and the Government to take it up; but it was decided that any action there should await developments at Wentworth.

2189. Is there any irrigation going on at Balranald? There are some gardens, and things of that kind; but there is no irrigation on any considerable scale. There was a trust formed at Balranald in exactly the same way as at Hay and at Wentworth.

2190. Was it started privately? No; Parliament passed the Balranald Irrigation Act, constituting the municipal council an irrigation trust, as at Hay and Wentworth.

2191. Has the council put any people on the land at Balranald? There were some pieces of land taken up on lease, but they had not the capital to arrange about irrigation. There has been no pumping-plant bought, but the council had a survey made and some levels taken.

2192. Is the lift of water at Wentworth the same as at Hay? It is very similar. The average will be slightly less. The Murray is a more regular river, and the average will be less at Wentworth.

2193. What is the lift supposed to be at Mildura? I think the average lift for the pump is about 70 feet, and the highest lift is about 90 feet. At Wentworth the average lift will not be more than 18 or 20 feet.

2194. There is no very high ground on Wentworth Common? There is very little high ground.

2195. A lift of 20 feet will command nearly the whole of the common? It will command a large proportion of it. One reason why you may expect that we shall have a fair success at Wentworth is that the terms we offer are really a little less than half what it costs the settlers to go on the land at Mildura, at least less than half what it did cost them. There is no payment for the land; it is let on lease for thirty years, and the land and the water rate, combined, at Wentworth, are just about the same as the water-rate alone at Mildura.

2196. You have no promoters' interests to pay money on at Wentworth? Quite so.

2197. Is the character of the soil at Wentworth as good as the character of the soil at Mildura? It is for some things. The light reddish soil was very much advocated by the Chaffeys, and up to the present time there is a number of people who think that there is no soil at all like it for crops of almost any kind.

2198. What is the kind of soil at Wentworth? It is very similar to what it is at Hay. Most of it is a greyish soil, or a reddish soil.

2199. Is that more fitted for particular kinds of cultivation than the red? I believe it is. I do not profess to be an authority on soil, but I know I have tried things which have grown on this soil. For instance, I have tasted better peaches grown on this soil than I have ever tasted in Sydney.

2200. Better than they can get at Mildura? I do not think I tried any of the Mildura peaches; but I know that I never got peaches in Sydney as good as I have tasted at Wentworth, and they grow beautiful oranges there too.

2201. You have not had experience enough at Wentworth to determine what crops can be most advantageously grown there? No. This is really the first season for crops at Wentworth.

2202. *Mr. Shepherd.*] Have you been to the Darling since you were examined here in May last? No.

- H. G. McKinney.  
7 Sept., 1899.
2203. You have been there frequently? Yes; I went along the Darling in a steamer from Walgett to Wentworth.
2204. The Committee were anxious to get all the particulars they could as to the suitability of the Darling for irrigation purposes, and for locking, and you have given the matter, no doubt, every consideration? Yes. I looked into the matter as much as I had an opportunity to do.
2205. And you think it is possible to efficiently irrigate the country in the immediate vicinity of the Darling? Only in patches, not in great areas.
2206. Not extensively? Not in extensive areas; but in many patches it is quite practicable, and could be done, I believe, advantageously.
2207. What do you think would be the most feasible way of proceeding to secure a sufficient flow of water for irrigation purposes? As far as obtaining a sufficient supply is concerned, in a flooded year, there is enough water in the river for a very considerable amount of irrigation. In the period from 1889 to 1894 I think there hardly ever was a year in which there could not have been a large amount of irrigation done simply from the natural flow. Of course, we have had some very low years since then, and the only way in which irrigation could be done to any great extent in such years would be by storing the water in the river, and also in any locks or reservoirs which were available.
2208. Would you throw it into these locks or billabongs by damming the river a sufficient height to throw it into them, or how is it to be done? I am sorry to say that there are only a few places where these billabongs or lakes can be availed of to any great extent in that way. Menindie Lake would be easily availed of, and so would Pamamaroo Lake; but they are among the very few lakes which could be utilised without much trouble. It would be a simple matter to divert water into either of those lakes.
2209. Do you think the plan proposed for locking the river would give a sufficient supply for irrigation? Only for irrigation on a comparatively moderate scale. It would not give a supply for any great irrigation scheme.
2210. You are aware that nearly all these lakes and billabongs are supplied from the overflow from the river, as a rule, and that as the river recedes the water is drained away from the lakes? Yes.
2211. So that to conserve that water it will be necessary to dam the channel between the lake and the river? Yes; it would be necessary to have floodgates.
2212. The great difficulty is that the time when irrigation is most required is when the river is at its lowest—that is, in these very dry seasons? Speaking generally, that is so, although not always, because with us, the river sometimes in very dry seasons comes very high, from Queensland water. That has been known to occur repeatedly.
2213. And the rains in Queensland, I think, generally come at a season when we have very little in New South Wales? I believe they do. I do not know the conditions there very well.
2214. In the summer they generally have the heaviest rainfall in Queensland? I think they have.
2215. What is the difference in irrigating undulating country and flat country? In irrigating undulating country your only chance of distributing water at any moderate cost is to manage to get the water along the tops of the ridges and let it pass down on each side from there. Of course, with flat country you can take your distributory, and make openings at intervals so as to flood the ground. I may mention that in India the regulations compel the people to divide their land into areas not exceeding a certain size, on account of the waste of water if they try to flood too large an area.
2216. They fill these drains and allow the water to soak into the areas enclosed, I suppose? They keep a constant flow in these channels; but the whole of the land is divided up like a chessboard, and the size is generally a square chain, sometimes even considerably smaller. A square chain is about a tenth part of an acre. As far as I can recollect, that is about the outside size for these small divisions. They have their distributory running along a line of these divisions, and they open the side of their small distributory at a particular spot, and as soon as a small area is filled that is blocked, and they open it for the next one, and so on.
2217. So that the irrigation goes on gradually? Yes; and the part which is nearest to the distributory channel is not much over-irrigated. The tendency is to greatly over-irrigate the part near an opening, and, perhaps, to under-irrigate the part furthest away.
2218. Is it not a fact that in the Victorian irrigation settlement a great deal of water was lost through crab-holes being found to exist in the open drains? That is what they said; but I think the crabs were a good deal maligned. I know that the channels were very badly designed at the start, and when they did not carry water, as was expected, the whole blame was thrown on to these poor unfortunate crabs.
2219. From its nature, I fancy the country on the Darling would not be so liable to a fault of that kind as the land in the Victorian irrigation settlement? I do not think it would. What I mean to say is that you cannot depend on these statements which were made about the great damage which was done by the cray-fish. From all I can gather, it was very much exaggerated. I know that the flow of water going so badly in the channels could, in most cases, at any rate, have been accounted for by the rate of fall being insufficient for the class of channels they made. They made very broad shallow channels, and they gave them a fall of only 6 inches in a mile, which was not enough. When water did not flow in the channels properly they put it down to cray-fish.
2220. Do you approve of irrigating by open drains in preference to flooding on flat country? The drains are wanted in any case to distribute the water properly. If you try to flood too large an area, it will simply mean that the place near the entrance to the water will be a great deal over-irrigated, and the place furthest away from that point will be under-irrigated.
2221. So that if you want to economise your water, and have uniform irrigation, you require to have these channels at pretty frequent intervals? Yes; then you can irrigate any particular portion as you require it.
2222. In flooding the part you cannot do that? No, and you have your irrigation more uniform.
2223. Has irrigation been carried out to any extent on the Darling, or has it been carried out there at all? No; I am surprised to find to what a small extent it has been carried out. I will take the number of applications we have received for pumping-plants throughout the Colony under the Water Rights Act. We have received altogether sixty-six applications, and of these only six have come from the whole length of the Darling.
2224. Do you think it will be possible to arrange to carry on irrigation there by gravitation instead of by pumping? I do not think so.

2225. Of course gravitation will be very much cheaper? It will be much cheaper; but the only places in which that can be done are a few places where there is a stretch of low-lying land beside the river, which will get precarious irrigation from floods.

2226. And where there is a constant flow? There is no place that I can remember on the whole course of the Darling where they could irrigate, except in high river, by gravitation.

2227. *Mr. Dick.*] In the report of the Victorian Royal Commission on Water Supply, at page 108, I find this statement:—

It is no longer a speculation to assert that cultivation within the dry valleys and plains of Central and Southern California is having the effect of drawing upwards by capillary attraction the subterrene supplies of water, and to a distinct and marked degree lessening the need of surface application. How much, if any, effect this increased humidity of the surface soil may have on the atmospheric humidity is not yet known. The increase of evaporation by means of cultivation, both of trees and plants, must ultimately produce a beneficial change in this regard.

Would you care to offer the Committee any opinion on a statement of that kind with respect to irrigation along the river Darling? I do not think that irrigation there would be practicable on such a scale as to have any appreciable effect in that way. There might be a certain amount of local effect perceptible, but there certainly would not be any widespread effect from any cause of that kind.

2228. In this case, the effect is ascribed to irrigation over an area practically about 5 per cent. of the State? I cannot help thinking that the statement of there being any perceptible effect is exaggerated. I should not think there was any perceptible effect.

2229. Have any searching investigations been made as to the various sites along the course of the Darling as regards their suitability for irrigation settlements? No; there has been no very close examination of that kind. When I was going along the river by steamer I took notes in regard to the position of the high red land, and also the position of any extensive flats, but it appeared to me that irrigation along there would be, comparatively speaking, on such a small scale, that is, small in proportion to the length of the river, that I did not think the circumstances would warrant me in taking time to go into it in detail.

2230. Do you think that irrigation would be on rather a small scale there? It would be on a small scale on any one place.

2231. At each particular spot where irrigation is to be carried out, it would be necessary to have a complete irrigating plant? I think so.

2232. Under these circumstances, seeing that a 30-foot lift is necessary, and that there is little or no population along there, do you think that there are likely to be any developments at all in the way of irrigation along the river Darling? I would go so far as to say that it is disgraceful to the enterprise of the pastoralists that there is not more done in that way. A number of years ago, when vessels were stuck in the river, there was a case of horses being kept alive on flour for some time, and this on land which will produce lucerne that would feed twenty-two sheep to the acre. All they wanted to do was to pump sufficient water from the river to supply themselves with enough fodder to carry their horses and the most valuable part of their stock through a bad season.

2233. Have you any idea what is the average number of bad seasons, say, in ten years, in that district? I think, speaking generally, the bad seasons are in a considerable majority. There is nearly always a scarcity of rain there. I do not recollect any season in which the people there expressed themselves satisfied with the quantity of rain they had.

2234. Still we find that sheep-raising has been successfully prosecuted along the river Darling? It has; but as a matter of fact there have been very few of the pastoral holdings there which have been satisfactory to their owners; it has been the exception, for the risk is too great.

2235. Taking an average sized pastoral holding there, with a frontage to the river, as most of them have, what area of irrigable land would there be in an average holding? You can find a number of single holdings which would have several thousands of acres of irrigable land, that is to say, land that could be irrigated in that way by pumping.

2236. Would the irrigation of several thousand acres be an expensive undertaking? Yes. You asked me to state the area of irrigable land. I think every large station there should have 100 or 200 acres under cultivation.

2237. You stated that 200 acres of irrigated land under fodder crops could support practically twenty sheep to the acre;—that would give as a maximum 4,000 sheep which they could depasture in a bad season on their irrigation area? Yes; but I should never expect their irrigation area to carry their stock of sheep through a bad season. The most I should expect the irrigation to do on these large properties would be to carry their horses and working bullocks, if they had any, and, perhaps, their stud rams.

2238. You do not look upon it then as an insurance against the loss of the general stock? Not for the whole stock. What I said about the number of sheep that could be carried by 1 acre of land is mentioned as the result of an experiment which was made on the Tapio run near Wentworth. When Messrs. Brooks Brothers had that station they tried irrigating a plot of, I think, 15 or 20 acres of lucerne. They cut that lucerne carefully time after time, they fed a number of sheep on it, and they tried how many sheep it carried to the acre, and as far as my recollection serves me it was twenty-two or twenty-three.

2239. If a pastoralist situated up there irrigated a few hundred acres, would he be able, thereby, not to feed the whole of his flock, through a prolonged period, but to tide over a considerable portion of his flock during the worst period of the drought? That is really what I should think he would do. There is another point in connection with the irrigation of that area of 200 acres. In a good year the produce of that area would be wanted only to a very limited extent; they could go on storing hay from year to year, and if a very bad season came, they could have an extensive stock of hay to fall back upon.

2240. Is there anything in the present state of the law which prohibits a pastoralist from irrigating a small area like that? No; in fact in some places they are doing it on a very considerable scale.

2241. Where? Along the Murrumbidgee. There is scarcely a station now which has not a considerable patch of irrigation.

2242. Along the Darling? There are very few along the Darling, and that is the surprising part of the business.

2243. In spite of the fact that it offers a fairly effective insurance against loss, and many other manifest advantages, and that it would not cost a very large sum, pastoralists in that district still refuse to go in for irrigation? I believe the great majority of the pastoral properties on the Darling are held by financial

H. G.  
McKinney.  
7 Sept., 1899.

financial companies. I do not think these companies take a very broad view of an enterprise like that, which they think will very likely be mismanaged, and merely lead to useless expense. I know one case in the western part of the Colony—it is not on the Darling—where a station manager, who was working under a pastoral company, had the greatest trouble to get permission to cultivate a large patch of land in a good season for producing hay. He managed to get their sanction with great difficulty, and the result was that when a bad season came—in fact, it was last year, and the hay his neighbours were importing was costing them about £6 a ton—he had his hay at a gross cost of about 25s. a ton. Yet that station manager had great trouble in persuading the company he represented to spend the money on that cultivation.

2244. May we take it that on account of the limited area which would be placed under irrigation, the conflict between navigation and irrigation would undoubtedly not arise at all? It would not arise in the near future.

2245. And what would tend to bring that about later on? The people coming to understand irrigation better, and adopting it on a larger scale.

2246. You think that with the increase of population, and with the extension of knowledge in that district, there is likely to be an increase in the area put under cultivation? I do.

2247. We have had two or three practically Government schemes of irrigation in places fairly favourably situated, and we have also one or two to compare with them instituted by private enterprise;—could you institute any sort of comparison between the results of Government initiation and the results of schemes started by private enterprise? The only comparison of that kind I know of would be between Wentworth and Mildura.

2248. I mean as far as results are concerned? We have not gone far enough to be able to say anything about results; we could not make a comparison at this stage.

2249. Do you know what the charges are at Mildura and at Wentworth for watering land? The water-rate at Wentworth is £1 an acre; I am not quite sure what it is at Mildura. I know there was a proposal that it should be 25s.; but, if it is £1, I know they are constantly in trouble about the insufficiency of water, and they are wanting the Government to assist them in the cost of pumping.

2250. *Mr. Watson.*] When you were last examined, you stated, in reply to me, that if each lock were raised by 1 foot the quantity of extra water available above the requirements of navigation would be sufficient to properly irrigate about 8,000 acres—that is after making allowance for evaporation, loss, and so on? Yes.

2251. You also stated, in reply to question 820:—

If the weirs were raised 1 foot all along, that quantity of water that I have mentioned would be equal to a depth of 1 foot for an area of 13,818 acres? Yes.

And later on, in view of the rainfall and so on, you said, in reply to question 822:—

If you had to depend on that water altogether and allow for all the losses in distributing it instead of taking 13,000 acres, you would want to take 7,000 or 8,000 acres.

? Yes.

2252. We may take that as your estimate of what area these weirs would allow of being watered? I really have forgotten the figures; I made them out at the time.

2253. You were also asked at the time whether you could give an estimate of the cost of raising the weirs so as to get the greatest results; but since then Mr. Darley has been examined and given an estimate of the increased cost; he states that to raise each one of the seventeen weirs by 3 feet, which is regarded as the maximum height to which they might be raised with safety, would mean an additional expenditure of £68,491;—if the weirs were 3 feet higher, on your basis of calculation, you could irrigate 24,000 acres? Yes.

2254. Assuming that the cost of storing sufficient water to irrigate 24,000 acres to be £70,000, and allowing for the cost of raising that water for the purpose of irrigation and distributing it, do you think there is a sufficient margin between the additional cost and the probable results from the rentals of irrigation colonies to justify the extra expenditure? I scarcely think there is at the present time, but I think it is a matter which could be done afterwards. If I am not mistaken, such arrangements could be made by degrees, as irrigation developed, as would admit of the raising of the weirs.

2255. But that would mean a certain amount or preliminary expense in the broadening of the base and both weirs and locks? No; in the case of the locks it would simply mean adding on to the walls.

2256. And the gates? It would certainly mean adding to the gates. That would be a greater difficulty, for it would practically mean new gates.

2257. On a total expenditure of over £500,000, if it is worth while to provide for irrigation at all, I should imagine that an expenditure of £70,000 would be justifiable? I have not looked into that question in all its bearings. I am not quite certain to what extent it would interfere with the river.

MONDAY, 11 SEPTEMBER, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
The Hon. ANDREW GARRAN, LL.D.  
The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.  
ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

John James Phelps, grazier, Albemarle station, near Menindie, sworn, and examined:—

J. J. Phelps. 2258. *Mr. Trickett.*] You are a grazier, residing on Albemarle station, near Menindie? Yes; it is 17 miles up the river from Menindie.

11 Sept., 1899. 2259 How long have you been there? Twenty-three years.

2260. Therefore, you are pretty well conversant with the history of the Darling River during that period? Yes. 2261.

J. J. Phelps.

11 Sept., 1899.

2261. How many miles is Menindie from Bourke? It is about 320 miles by land.
2262. And by water? About  $2\frac{1}{2}$  miles of river to 1 mile of land.
2263. It is little more than double the distance by water? Yes.
2264. Do you know what the fall of the river is in that length? I do not, but I have been told that between Menindie and Wentworth the fall is 2 inches to the mile.
2265. What has been your experience of the navigability of the river during that time? During the first few years it used to go dry very frequently, up to 1889. Since 1889 we had a continuous river as far as the place I come from, for seven years.
2266. Continuous right away? No, only continuous to us. It broke once or twice to Wilcannia, but only for a short time. Since then we have had very small rises, but no continuous river.
2267. At Albemarle station, how do you get your goods brought up, and your wool sent away? We get the goods either from Adelaide or Melbourne by river, and send the wool away by river to one place or the other.
2268. You deal with Adelaide? With Adelaide or Melbourne, as the river offers.
2269. Is there any choice between the two ports, all things being equal? I prefer to send the wool to Melbourne and to get the stores from Adelaide.
2270. For any particular reasons? The stores are cheaper in Adelaide.
2271. And there are better wool sales in Melbourne? We do not sell the wool in Melbourne as a rule. With very few exceptions it is always shipped to England.
2272. Have you recently come from Menindie? Yes; I left there about the middle of July.
2273. You have not been home since? No.
2274. What was the state of the river when you left? It was very low; it was not navigable.
2275. And Lake Menindie. It was quite dry. I think it has been dry since 1894. In two lakes on the east bank of the river there is water yet.
2276. Have you given any attention to the subject of locking the Darling? No, not much.
2277. Are you able to state whether you think it is a river that could be dealt with by locks and weirs, and that it would improve its navigability, and also whether it would be possible in the dry country to go in for using the river water for irrigation purposes? I could not say anything about the practicability of locking the river, because I am not an expert.
2278. As regards its advantages, what would you say? I should say that it would be a certain advantage if it could be done; but as for going in for irrigation there, I think all irrigation farms would be likely to be destroyed periodically by those very big floods which cover the whole country.
2279. They do not come very often, do they? No; the excessively high floods do not come very often.
2280. How often has the river been over the banks, to your knowledge, since you have been at Albermarle? If you will allow me to refer to the lakes in the back country, I can tell you the number of times they were full; and it takes a high flood to fill them. The first time I knew them to be filled by back water was in 1879; then again in 1886 and 1887; and then from 1890 to 1893 it was almost in a continual state of flood.
2281. Do these flood-waters cover the whole of the face of the country? No, they do not cover the whole of it; but the whole of the frontage on the east side of the river for an average of 12 miles out is rendered useless; and although there are islands—sand-hills—which are not covered,—yet you cannot get stock to them.
2282. As a pastoralist, which would you prefer for the carriage of your goods,—water carriage or rail carriage? Water carriage.
2283. With a regular river you would prefer to send your wool by barges rather than by rail? Yes.
2284. Why? On account of the cheapness of carriage. Being right on the bank of the river we have special facilities for shipping by water.
2285. So that we could take it pretty well as a broad fact, that with an available river, you would always use the river, even if you had a railway to your door? Yes, always.
2286. I suppose you agree with the general view that river carriage is always cheaper than railway carriage? Yes, undoubtedly.
2287. Rail carriage cannot compete with river carriage? No.
2288. What is the freight now for wool from Menindie to Adelaide and Melbourne? I got a quotation for this year's clip to Melbourne at 40s. 6d. a ton for greasy, and 48s. for scoured wool. That is the rate from the station to Melbourne, including carriage over Victorian lines. I cannot say that I have known it to be any lower than that.
2289. That is a very cheap rate? It is, very cheap.
2290. For what distance? By river and rail, about 800 miles.
2291. Would not a railway from Menindie to Broken Hill suit you people very well? I do not think it would do us any good at all.
2292. Not a railway from Menindie to Broken Hill and thence to Adelaide? I do not think so.
2293. It would be too costly? Yes. We did send one clip of wool by that way. We carted it to Broken Hill. It cost us about £7 10s. a ton to Adelaide.
2294. Menindie is only about 70 miles from Broken Hill? Yes.
2295. *Mr. Watson.*] It was in a dry season I suppose? It was a fair season, but as the river was low we could not send it away by water.
2296. It was a fair season for teamsters? It was a fair season for teamsters, or they would not have been able to travel.
2297. *Mr. Trickett.*] The people of Menindie have often urged that a railway to Broken Hill is the only thing they require to put them in touch with the main railway system, that it would be a great outlet for the people from Broken Hill who wished to go to the river and enjoy themselves? Very few people do come from Broken Hill.
2298. You do not seem to agree with that idea? I do not see any money in it at all for the Government.
2299. You think that if people had money to spend, and wanted to take a holiday, they would not go to the river at Menindie? No; they would go south.
2300. I suppose the country about Menindie now is in a very bad state? It is in a very bad state.
2301. Is there much loss of stock there? Speaking for the station I represent, we have 55,000 sheep less than we had last year.
2302. You could not even send those sheep to the boiling-down works? No.

2303.

- J. J. Phelps. 2303. What extent of country does Albemarle station comprise? About 730,000 acres.
- 11 Sept., 1899. 2304. Carrying in an ordinary season about 100,000 sheep? It would average about 80,000. We are expecting to shear about 20,000 this year.
2305. I suppose this is about the worst drought you remember? It is the worst. We have had four years of drought now.
2306. So far as your knowledge of that district goes, do you think it is likely to remain a pastoral region, or is it likely to develop into a country where there will be a considerable population settled on small holdings? I see nothing for it but a pastoral future. I do not see any other possible chance for the district, as the rainfall is too low.
2307. What is the general character of the herbage for feed purposes? It is very good. The bulk of the grass there is the spear grass; but there are several other sorts of grass and herbage which are equally good—better, in fact.
2308. Is there any salt-bush? On the east bank of the river it has pretty nearly disappeared, from long stocking and rabbits; but on the west bank, out from the river a bit, there is still a considerable quantity of salt-bush.
2309. Then we can look upon it that it is not likely to be a very thickly-populated part of the country? Not in the immediate future.
2310. This proposal to construct locks and weirs is a very costly project;—can you give us any prospect of getting revenue to any large extent from that part of the river? The only chance of getting revenue that I can see is by putting a toll on the river.
2311. The toll would only be paid once a year, namely, at shearing time? Yes.
2312. And the revenue collected from a toll on goods and supplies would not be very large? No; it would not be very heavy.
2313. Do you know any place, either in your own locality or any part of the river Darling, where irrigation is carried on? On no large scale. Every station has its small fruit garden and vegetable garden, and some of them have small lucerne patches; but I know of no patch of more than 4 or 5 acres.
2314. I suppose in that dry part of the country the idea of attempting to grow produce to a large extent for the purpose of saving stock in a dry season is a mere idea? It is altogether out of the question.
2315. It would be a lamentable failure from a pecuniary point of view, if attempted? Altogether. We do plant a certain amount of wheat for the working horses; but that is altogether dependent on the rainfall. We do not irrigate.
2316. I suppose in continuous, dry seasons such as we are experiencing now, there is no help for the pasture? There is no way of saving the pasture at all.
2317. Do you know anything of the river between Brewarrina and Bourke? No.
2318. A Government official who has been examined here seems to think that between Brewarrina and Bourke, and possibly lower down, a little agricultural settlement might take place,—being worked possibly on the co-operative system as regards pumping water from the river on to the farm;—anywhere up near your place do you think any project of that kind would be likely to be started? I really do not see that it would. Broken Hill would be the only market for anyone.
2319. And to Broken Hill they have 70 miles of carriage over a very dry, rough road? It would be a very dry road for a great part of the time.
2320. So that, as regards its establishing any population about Menindie, that is not likely to be realised? I fancy it is out of the question.
2321. You stated that possibly we might put tolls on the river, have you thought out what rate of tolls? No.
2322. If we put these weirs across the river, and side locks, do you think there would be a possibility, or a probability, of the side of an approach being washed away in case of a heavy flood, and the river clearing away from this obstruction which would have to be erected;—we have been told that the soil is so extremely fine that it washes away very easily:—do you think, if this obstruction to the free course of the river were put up, the locks and weirs are likely to be left standing and the river to go away to one side? I think there is every danger of that. I have had experience in putting up dams of our own. We find that if water once gets running on flat ground it will make a creek in a very short time; it will cut away into a well-defined creek.
2323. Therefore the approaches to these locks and weirs, if constructed, would have to be very well protected to prevent the possibility of any danger of that kind? Very well protected indeed. The tendency now in big floods is for the river to cut across bends. I know one or two places where small islands have been formed by the river cutting across a narrow bend.
2324. And leaving its ordinary course? Yes.
2325. Would it be at a rocky corner that that occurs, or would it be cutting off a soft corner? It would be cutting off a soft corner. Rocks are very scarce in the river down about where I am. I only know one rock bar across the river about there.
2326. Were the dams which you constructed, and which suffered damage, made in the river or in creeks? In flooded creeks.
2327. Were they fairly well built, or were they rather primitive? They are all earth dams; but we have sluice-gates in one or two of them.
2328. Will you describe what takes place? As regards the last one we put up, we put a sluice-gate in the dam which had been standing for some years, and after we let the water through on a little blind creek, it cut out a creek about 8 feet deep, right up to the dam. Then we had to shut the gate and employ a sort of shoot to carry the water away from the foot of the dam.
2329. Is this soil washed right away, or does it accumulate a little further on? A good deal of it accumulates a little further on. It is very noticeable in places where the river cuts round a sharp bend. At the point of the bend an island is very apt to form; silt deposits itself there.
2330. What soil have you at Menindie—red soil or black soil? Both. The black soil is the flooded ground, that is the ground which the water goes over. The red soil is the red sand on the sand hills; that is not flooded ground.
2331. Is the soil of the same rich character as the soil which we find in the greater part of our western country, that with water it is very productive, and grows well? It must be rich, although it does not look rich. If rain falls it throws up very good feed.

2332. In this little holding which you say the squatters irrigate, do they grow crops successfully? Yes; J. J. Phelps. but as a rule they are on flooded country—on the clay country.
2333. The manager of the meat-works at Menindie has rather a good bit of cultivation? Yes; his garden is on a sandhill, and that is one of the few places where the sand comes in close to the river. 11 Sept., 1899.
2334. Does he irrigate that? He used to do it.
2335. Did he have a pump? He had only a small pump, with a two-inch pipe.
2336. Your evidence does not seem to offer any inducement for damming the river up towards Menindie? No.
2337. Can you give us any information about the river up towards Bourke? I have never been to Bourke; but up as far as Tilpa it is very similar country to the country I come from. A great deal of this lignum-flat country is all liable to be flooded. I think, moreover, if the river were to be locked it ought to be started at the lower end, instead of at the top end. We find that the Bourke lock has interfered with us to a small extent, cutting off the tail-end of the small floods.
2338. *Mr. Watson.*] If you started a flood with your lock full, at the other end of the river, you would be just as well off? I daresay.
2339. *Mr. Trickett.*] That appears to have been a mistake;—the weir was erected at Bourke in order that it should be a kind of object-lesson, and the flood-gates were kept up to a certain extent, and then they were let go;—if the gates had been kept up the people below would still have had the same flow as they are getting now? Yes.
2340. Have you suffered very great inconvenience at times by reason of not getting your wool away by the river? No. I only know one year where it was stuck for any considerable time. The clip of 1888, which we carted to Broken Hill, was stuck for about nine months.
2341. *Mr. Watson.*] What is the distance by river from Menindie to Wentworth? It is about 200 miles by land, and between 400 and 500 miles by river.
2342. The estimated cost of locking the river from Bourke to Menindie is £530,000, and at the rate of £930 a mile, which that distance averages, it would cost £400,000 to lock the river from Menindie to Wentworth; the annual charge on that expenditure of £530,000, together with the cost of maintenance, is £22,000 a year, and the annual charge on the additional expenditure of £400,000 between Wentworth and Menindie would be about £20,000;—from what you know of the river between Menindie and Wentworth, and the traffic, do you think you are likely to get £20,000 out of tolls and other charges? No, I do not see how you could, unless the tolls were made exorbitantly heavy.
2343. If the tolls were made too heavy, what would happen? They would have to go to the railways then.
2344. Do you think a work of that character ought to be expected to be altogether self-supporting? I do not think it should.
2345. Do you think we can expect to get one-half of that sum from the traffic at any time? I do not think so. I should say £5,000 would be nearer the mark, and that, of course, would depend on what the tolls were.
2346. You think that would be as large an amount as you would be likely to get from a reasonable toll? Yes.
2347. Do you think there would be any large increase in the value of land along the river frontages, consequent upon the locking of the river? I do not think so; the river now is open so much more than it used to be.
2348. That is hardly likely to be a permanent condition? It is not likely to be permanently navigable, but it may be navigable for three or four years on end. That I attribute to the extra stocking of the country up the river, so that more water runs in.
2349. The ground, I suppose, is beaten down with stock, and the grass cleared to a large extent, so that there is a better chance for the water to run into the river? Instead of soaking into the ground, a great part of the water runs off.
2350. That is likely to be a permanent condition? Yes, that would be getting better every day.
2351. So that there is likely to be a greater proportion of the rainfall within the drainage area going down the river, in the future, than did in the early days? Yes.
2352. But still, you would not expect that that would make so material a difference as to leave one dependent on the river? I think it would pay a station better to depend on it. It might not pay the people in the townships. Even at the risk of having to hold a clip for twelve months, I believe it would be better.
2353. Do the stations usually get their stores in large quantities at times? As a rule.
2354. Do they generally get several months' supplies? Yes.
2355. Suppose you had a clip river-bound, if I may use the term, and kept from the market for, say, six months, what charge do you usually have to pay the Bank against that clip—7, 8, or 9 per cent.? It depends a good deal upon the money market. I suppose, with a special arrangement, you could get an advance at 6 or 7 per cent. now.
2356. Assuming a man to have capital enough to try the experiment, which do you think would pay him the better—to pay 7 per cent. on an advance against the clip, and wait until it was marketed, or to pay the toll charge which it would be necessary to impose if works of this character were constructed, thereby getting a quicker return? I should say the toll charge.
2357. A quick return is better for pastoralists in common with others engaged in industries? Yes.
2358. Still what you have said to-day does not encourage us to expect a great deal from the construction of these works? No.
2359. The trade from Wilcannia, right on as far as Louth, I suppose, goes up by Menindie when the river is up? Up as far as Wilcannia, at any rate; the bulk of it comes up through Adelaide and Melbourne.
2360. That rate which you stated had been quoted for the carriage of wool from your station to Melbourne might be termed a cut rate, so far as the railway carriage is concerned? I think so. I think the Victorian Commissioners are cutting against South Australia.
2361. I suppose our own Commissioners are taking a hand in that game too? I have had no experience with them; but there is no doubt that they are in Lower Riverina.
2362. You are too far away from their lines to be tempted with offers. Altogether too far.
2363. Taking the tract of country about where you are, there is a competition between Victoria and South Australia? Yes.
2364. I suppose you do not anticipate getting the rates down quite so low after the Inter-State Commission

- J. J. Phelps. is created by the Federal Parliament? No; but then again we shall not have to pay a shilling a head duty on stock going out of the Colony, so that it might even things up a bit in that way.
- 11 Sept., 1899. 2365. The probability is that you will have to pay a little more on your wool carriage? I am sure that we shall have to do that.
2366. Had you any experience of sending wool by rail prior to the introduction of the cutting system? No.
2367. I suppose they started cutting as soon as they extended their branch lines sufficiently far out? Yes.
2368. I want to know if you could state what the original prices were? I do not mean to state that £2 a ton is the regular rate; it is a low rate. We have had to pay as high as £5 or £6 by the same track. Last year we had to pay about £5 10s. a ton to Adelaide for some wool. We had to pay about £4 10s. to Melbourne for other wool.
2369. One would fancy that if the river were navigable the wool could go, and that if it were not navigable it could not go;—therefore how does the state of the river affect the actual price of the carriage of wool? Because sometimes on a big river boats have no trouble. On a low river they sometimes stick and have to haul over. Sometimes they have to take off some of the wool, run down a few miles, empty out what they have on board, and come back for the rest. That is what causes the extra charge; they lose a lot of time in doing this.
2370. Last year you said it went up as high as £4 10s. a ton? £4 10s. a ton to Morgan, and I think it cost £1 a ton by rail from Morgan to Adelaide.
2371. The proposal before the Committee is to construct locks and weirs, starting at Bourke, and going down the river towards Menindie, and the underlying idea is that in certain seasons the country, anyhow down as far as Menindie, would be a feeder to the present railway terminus at Bourke, or to a railway station at Wilcannia if a railway were constructed to that point;—what do you think of that proposal? I think that if there were a line to Wilcannia you might do something, but certainly not to Bourke.
2372. You think, if a line were constructed from Cobar to Wilcannia, it would attract some traffic from both up and down the river? I think it would to a limited extent.
2373. Of course the trainage between Sydney and Wilcannia would be a little longer, if anything, than the trainage between Bourke and Sydney, so that the river carriage is so much shorter so far as Menindie is concerned? Yes.
2374. Why do you think it would be more likely to attract trade at Wilcannia than at Bourke? On account of its being nearer. There would be a difference of between 100 miles and over 300 miles by land.
2375. You stated that nearly all the stations have small patches of cultivation, and that a few of them have fruit gardens and vegetable gardens;—do many of the station-owners down there go in for irrigating a piece of land? On a very small scale. I only know of one station about there which irrigates about 4 or 5 acres.
2376. How do they raise the water? With a centrifugal pump from the river.
2377. Has their experience been successful? No. I was speaking to the man who had this plot, in Adelaide, and he told me that it was costing him too much.
2378. Did he mention what it was costing him to raise fodder? It was lucerne. He said it was costing between £3 and £4 a week. He told me it took three men all the time. He was complaining about it.
2379. Do you know whether his pumping gear was employed on the plot of 4 or 5 acres to its fullest capacity, or could he have irrigated a larger area? I think he could have irrigated a larger area with the same machinery.
2380. That would add to the expense of irrigating the small plot? Yes.
2381. He did not seem at all satisfied with his experience? No, he was not at all satisfied. Lucerne is not a good crop to grow on a station; there is not much sustenance in it for working horses, or anything of that sort.
2382. You do not know whether he has tried to grow any other fodder—maize, oats, wheat, or hay? I tried, on a small scale, some sugar-cane once, and that was a good heavy crop for horses.
2383. Were you satisfied with the experiment? I do not think it would do to feed them altogether on sugar-cane; it would be too rich for them.
2384. Was that crop raised by means of irrigation? Yes; but only on a very small scale.
2385. What height did the pastoralist with the patch of 4 or 5 acres lift the water to irrigate his patch? That altogether depends on the height of the river. When it is at its lowest, I suppose he would be lifting the water 30 feet.
2386. Do you think the land he was experimenting on was suitable for irrigation? Very suitable land, I think.
2387. If it pays people to irrigate at Mildura, where the water is pumped as high as 90 feet, one would think it would pay a man to grow fodder by irrigation where he has to pump only 30 feet, if the land is suitable? You would think so.
2388. Even allowing that the Mildura people have a larger market, still for a man's own consumption, that would not be of any importance to him? No; he would only want enough to keep his horses from year's end to year's end. Chaff and horse-feed, as a rule, are very cheap on the Darling when the river is open.
2389. The only time a man would need to provide against would be the time when the river was down? Yes.
2390. You do not know any other cases where irrigation has been tried on the Darling to any extent by station-owners? There is one station—up near Wilcannia—which tried it.
2391. Have you heard anything of their experience? No; I have not heard much, as it is rather too far away.
2392. What is the name of the station? Murtee.

TUESDAY, 12 SEPTEMBER, 1899.

Present:—

JOHN PERRY, Esq. (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD.  
 The Hon. ANDREW GARRAN, LL.D.  
 The Hon. WILLIAM JOSEPH TRICKETT.

WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.  
 ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

John James Phelps, grazier, Albermarle station, near Menindie, sworn, and further examined:—

2393. *Dr. Garran.*] Mr. Russell, the Government Astronomer, tells us that Menindie, which is your township, is about the driest place on the Darling;—is that your experience? I believe it is, on the river. J. J. Phelps.
2394. And that the last three years have been the driest that you have ever had? The last four. 12 Sept., 1899.
2395. How far back from the river do you go? About 80 miles.
2396. How do you water your stock in that back country? About 50 miles from the river we have a natural system of lakes, an overflow from the Darling, which we have improved by means of a dam. Beyond that it is altogether watered by tanks.
2397. You have no wells? You cannot get wells out there.
2398. Have you sunk wells? We have sunk a great number of trial shafts in that country, but we have had no successful wells.
2399. Do you mean that you got no fresh water, or no water at all? We got no fresh water. We got all salt water beyond those lakes.
2400. What was the last time these lakes were full? In 1893.
2401. Have these lakes held water for six years? No; they are all dry now, except one lake on Albermarle.
2402. And how deep are they? When they are full I suppose the deepest lake would be 30 feet.
2403. Have you deepened them at all? No; they are too big.
2404. Is there a continuous channel from the river to these lakes? Yes.
2405. And in a time of flood do you dam up the exit of the water again to prevent it from flowing back? As far as my experience goes, the water does not flow back. We have no necessity to dam it.
2406. It fills all the lakes? Yes.
2407. What is the longest time that these lakes will hold out? The only lake on Albermarle which contains water now will be dry, I think, at the end of this coming summer. The water last got into this lake in 1893.
2408. Speaking generally, you may say that these lakes will hold water from three to four years? Yes.
2409. And that it neither evaporates altogether, nor soaks in altogether? No; I tried the evaporation one year, and I proved it to be 5 feet for the year.
2410. A station like yours, if it happened to be well supplied with lakes, would be well supplied with water for three years after a flood? Yes.
2411. Would it be very costly to make an artificial lake, big enough to hold water, in any part of your run? Very costly.
2412. All the flood-water of the Darling seems to run to waste—to do no good to anybody? That which immediately comes down the river does.
2413. Nobody makes any use of that water? No.
2414. And the sides of the Darling are so comparatively level that the question naturally arises, whether by artificial channels you could not imitate nature, and carry this water back into artificial lakes, could you? No.
2415. Why not? It would be too expensive altogether for private people to undertake, and I do not think the country would justify public action.
2416. It would not pay? I do not think so.
2417. Then, practically, you are still in a state of nature as far as water supply goes? Yes.
2418. You have not seen your way to create an artificial supply of water which would be remunerative? Nothing beyond tanks and wells. We make drains into the tanks.
2419. Do you dam up the outlet, if there is any outlet? No; there is no necessity, because most of our tanks are in swamps, and the water does not run out of the swamp.
2420. The water in these dams is shallow? I suppose 15 feet would be the greatest depth we have.
2421. How long would it take to evaporate or use up 15 feet of water? We have no tank there which will last twelve months.
2422. Then your artificial supply will not last you through twelve months? No.
2423. Nature's lakes will last you through three years? Yes; but in some of the creeks we have made dams, and by the help of dams we can make the water last for two and a half years.
2424. Some of the natural creeks which you have dammed? Yes.
2425. What natural creeks other than Talyawalka have you on your run? That is the only one we have dammed.
2426. At intervals? We have dammed that creek in two places.
2427. When a flood rises in the Darling the Talyawalka is full, I suppose, from the time it takes out of the Darling to the time it goes back again? Yes.
2428. Is the country on the south of the Talyawalka flooded too? On the west side of the Talyawalka, that is between the Talyawalka and the Darling, it is pretty well all covered. After you get outside the Talyawalka there is a fringe of flooded country, and then you get into the high, safe country.
2429. There is no place where you could tap that Talyawalka Creek, and carry that water back into your run? There is no place where it would pay you to do it.
2430. The water in your series of lakes comes from the Talyawalka, I suppose? Yes; and from the river in the first place.
2431. You get it directly from the Talyawalka? Yes.

- J. J. Phelps. 2432. How far from the Talyawalka is it to the nearest lake on Albemarle? About 14 miles, I suppose.  
 2433. How long will it take the water to run from the Talyawalka to that lake? It depends upon the height of the flood considerably.  
 12 Sept., 1899. 2434. It is not a fast-flowing stream? No. I will give you an instance which occurred in one flood. The water got to Terryawinnia Lake, the first lake in the chain, in June, and it did not get to the last lake in the chain until February. The last lake very seldom gets water into it at all.  
 2435. Then a flood has to be up a considerable time to reach the last lake? A very long time.  
 2436. It has to be a very high flood to get to your last lake? Yes; we always consider that 30 feet at Bourke is the lowest river which will send water out into the back country.  
 2437. Have you deepened these channels to the lakes? No.  
 2438. If beyond the furthest lakes you are dependent merely on dams, and your dams will give out in twelve months, your back block become useless to you after twelve months of drought? That is the case.  
 2439. Then you are forced to bring your sheep into the neighbourhood of the lakes? Yes.  
 2440. Your feed gets shorter then for them, though? Yes.  
 2441. In the course of this inquiry we have had a great deal of evidence about sending starving stock to the highlands, and it has been represented by some witnesses, that if we extend our railway system from Cobar or elsewhere to the Darling, the squatters along the Darling will be able to send their starving stock eastward to the highlands, and save their lives;—do you think that is a practicable project? I do not, from my country.  
 2442. You have lost a large number of sheep? Yes.  
 2443. If you had had a railway from Menindie to the Lachlan, would it have paid you to send the 40,000 sheep which you have lost, eastward for food? We should have been sending them into the same sort of country—into starvation.  
 2444. I mean on to the highlands of New England, or the Australian Alps? It would never have paid us.  
 2445. You think that could not be done? Yes.  
 2446. You think it would cost more than the sheep would be worth? Yes.  
 2447. If it would not have paid you to send the sheep to the food, supposing there had been a railway to Menindie, would it have paid you to bring feed to your stock; could you have kept the whole of your stock alive by bringing fodder from the east? No.  
 2448. That would have cost a lot? Yes.  
 2449. Supposing your run to be as it is, pretty well, or was three or four months ago, nearly foodless, how much a week would it take you to keep a sheep by fodder brought by railway? That is a matter I have never gone into.  
 2450. I want to know what it would cost per annum to feed a sheep by fodder brought by rail to the Darling country in a dry season, and no river? That is a question I have never gone into, as far as sheep are concerned.  
 2451. Would it cost 10s. per annum? It would cost, I should say, 1s. a week.  
 2452. That would be 50s. per annum;—what would be the value of a sheep at the end of the year? It would be represented by a minus number I think.  
 2453. We have had it stated in evidence that beyond Dubbo they have been feeding sheep at a cost of a farthing per day;—would it have paid you to have sent that food by railway to feed your sheep; that is seven farthings' worth per week? I think it would be worth chancing.  
 2454. Taking the problem as a whole, we are said to have lost from 15,000,000 to 20,000,000 of sheep during the last four years of drought;—do you think it possible that on natural feed these 15,000,000 or 20,000,000 of sheep would have been saved? No.  
 2455. You do not think it would have paid the squatters to bring fodder to feed these 15,000,000 sheep where they were? No; there is a third question which arises.  
 2456. You say that all the squatters on the Darling have a small cultivation area? Yes; if you call a fruit garden and a vegetable garden a cultivation area.  
 2457. You have one, too, I suppose? Yes.  
 2458. Have you attentively extended that cultivation from time to time? No.  
 2459. Do you do anything to keep your choicest stock, your rams, safe from starvation? If we had any very choice ones we should feed them on ordinary hay, oats, and chaff.  
 2460. Where do you get that feed from? We buy it. In some seasons we grow hay. We always put in some hay.  
 2461. But it would not pay you to grow hay to feed the whole of your stock? No, we are too dependent on the rainfall.  
 2462. You mean that you might not be able to grow hay? Yes. The last two seasons we practically missed with hay.  
 2463. If you do grow hay is it better to keep it in haystacks or silos? I have had no experience of silos; we always keep ours in stacks.  
 2464. Is not that much exposed to fire? I am sorry to say that it is. We lost 160 tons of hay through fire in 1894.  
 2465. A moderate bush-fire would sweep away the whole lot of it? That is a thing we are seldom troubled with up there. This fire must have been an accident.  
 2466. There is too little grass to burn up there? It is a very rare thing to see a bush-fire of any extent.  
 2467. There are only three methods possible to keep the sheep alive;—one is to grow the feed; the second is to take them to the feed; and the third is to bring the feed to them; and I understand you to say that all these three plans are impracticable? They are—certainly from my point of view.  
 2468. Supposing the river to be in flood, could you send your stock away in barges down the river? No.  
 2469. When the country is so bare of feed you cannot even drive them? Not if we left them too long.  
 2470. If you want to get them away on their own legs you must do it early? Yes.  
 2471. If you venture to wait and wait for rain, and it does not come, you are boxed? Yes.  
 2472. Locking the river would not be of any service to you as far as feeding your flock goes? No; it would be of no use at all.  
 2473. It is only of use for the carriage of produce and stores? Yes.  
 2474. You do not think it would be of very much use for irrigation? I do not think so up there.  
 2475. Some witnesses have suggested that, in order to get a return on the cost of the locking, the proper thing

thing would be to tax the squattages all along the banks of the river;—do you think that that would be a fair thing to do? I do not think it would be fair to tax them on the whole cost of the work.

J. J. Phelps.  
12 Sept., 1899.

2476. We want to get a revenue of £22,000 from this work to make it self-supporting;—do you think the squatters within a reasonable reach of the river Darling could afford to pay £22,000 a year in consideration that they get the money's worth back—that is, between Bourke and Menindie;—do you think they would get £22,000 back? I do not think so.

2477. They would get cheaper stores? I doubt that very much.

2478. Consider what prices things have been fetching at Wilcannia during the last twelve months? Yes; but if people looked a little bit ahead, and laid in twelve months' stock, it would be different.

2479. They would have wanted to lay in four years' stock to tide over this drought? The river has not been dry all that time. There have been floods in the river. I am looking at the matter from the squatters' point of view, not from the storekeepers' point of view.

2480. During this year how long were you at Menindie without a steamer coming up with supplies? From March to August, I think. We sent our last shipment of wool in March, and the steamer which arrived with stores got up some time in August.

2481. Then Menindie has not remained unsupplied for twelve months at a stretch? Not since 1885-6.

2482. During this period of non-supply did you get anything overland from Broken Hill? One ton of sugar was all we got, and just as that arrived the river came down. We always keep a very large stock of rations, though.

2483. Do you know anything of the western side of the river, opposite to Albermarle? I do, between Menindie and Broken Hill.

2484. Does Stephen's Creek run down into the Menindie Lake in wet weather? Never.

2485. Do you know that a Broken Hill company has dammed Stephen's Creek to supply water to that town? Yes; I have seen the dam.

2486. It holds the water back pretty well? Yes.

2487. Would it be possible to dam the same creek lower down in the same way? I do not think so, because the banks are too flat.

2488. The site they have got is in a more favourable position? Yes; their site is just where the creek leaves the hills, and lower down there are no hills at all. The banks are not more than 6 or 7 feet high.

2489. It would not be possible to repeat that experiment south of Broken Hill? I do not think so.

2490. The water all loses itself? It runs into a large swamp, I believe. That dam at Broken Hill has made a very great difference to the running of the creek. It does not run nearly so often now as it used to do.

2491. Do the squatters below complain of that? No; the creek never held water.

2492. According to your evidence, if this river is to be dammed and locked, it must be done at the public expense, without anything more than can be got from a mere toll on the steamers? That is as far as I can see.

2493. £2,000 or £3,000 would be very poor interest on an expenditure of £500,000? Very small.

2494. And even that expenditure would not go below Menindie? No.

2495. If we locked the river right down to South Australia we should want £1,000,000? Yes.

2496. We are told that the most dangerous part of the river for steamers is the part between Menindie and Wentworth; that more accidents have happened there than anywhere else? Yes; on account of the snags and rocks.

2497. Do you know of any steamer being lost on that bar? I know that three steamers met with accidents on the river.

2498. *Mr. Levien.*] The steamers were not lost altogether? I know one steamer which was stuck there in 1890, and she is there yet. It was a steamer called the "Cumberoona."

2499. How old was that steamer? She was a very old boat.

2500. *Dr. Garran.*] On your run has the salt-bush pretty well disappeared? Pretty well.

2501. Have the edible bushes gone too? There is a good deal of edible scrub yet.

2502. Do you have to cut that down, or do the sheep eat it as wanted? As a rule, we have to cut it down. It is eaten too high up now for the sheep to get at.

2503. That has been the principal food they have had? In places.

2504. And at the present time, until the last rain came, the whole of your large run was fully stocked with 25,000 sheep? It is fully stocked now with 20,000 sheep, which we expect to shear.

2505. In very bad weather that is the most you can carry? Yes.

2506. Do you think you have been tempted to overstock your run in good seasons? The last time it was overstocked was in 1884. At that time we had about 130,000 sheep on 730,000 acres; that is under 6 acres to a sheep.

2507. You think it would be a mistake ever to stock it up again as fully as that? We never could do it.

2508. What do you consider now to be the average carrying capacity of the run after this experience? About 80,000 at the outside.

2509. You think it would be unsafe to go beyond that number? Yes.

2510. I gather from your answers to some of the other gentlemen that if a railway were made from Wyalong to Menindie it would not carry any of the commerce away from the river? I do not think so.

2511. You think the river would be the cheaper method of getting anything to market, and of getting back stores? Yes.

2512. A passenger or two might go down, and a few light goods, but the heavy commerce to the stations would always take the river? Invariably.

2513. *Mr. Shepherd.*] You do not think the lakes lose anything by the reaction when the river goes down? Our lakes which are on the east of the Darling lose nothing.

2514. But nearer the Darling you think they do? On the western side, Lake Menindie and Lake Pamamaroo fall as soon as the river falls.

2515. Do you not think it would be possible to prevent these lakes from returning all the water, by damming the channels? I think it is quite possible. It was tried once at Menindie Lake, but it was not tried successfully.

2516. The banks of the Darling, as a rule, are pretty high? Yes.

2517. It is only in the case of a very high flood that the lakes are filled from the river? It is only in the case

case

- J. J. Phelps. case of a very high flood that the lakes on the eastern side are filled. As regards the lakes on the western side, which are close to the river, the water runs into these lakes after the river is up a few feet; but it does not stop in them. The bottom of the channel is about on the same level as the bottom of the river.
- 12Sept., 1899. 2518. So that really there is no supply in the lakes at all as the river goes down? No; the water follows the river.
2519. And the supply is entirely exhausted? Yes.
2520. You stated that there has been some cultivation on the stations near the banks of the river;—which soil do you find the more productive? I prefer the red soil to the black soil.
2521. I suppose both soils have been tried there? Yes.
2522. Does not the black soil retain the moisture longer than the red? For fruit-trees it retains it rather too long. My experience is that the water stagnates about the roots of the trees; but for vegetables the black soil is just as good as the red soil.
2523. Is there any extent of cultivation at all, or is it only small plots which are cultivated? Small plots.
2524. No large planting for market, or anything of that kind? I believe that lower down the river, about Pooncarie, some homestead lessees are going in for wheat-growing on a fairly large scale—up to 400 acres; but I have not been down there myself since they started.
2525. They have not been long at work, I suppose? They have sold chaff and hay at times, so I presume that occasionally they get a crop.
2526. Does this spear grass, which you mentioned, grow in tussocks, or is it one regular mass? It grows in tussocks; but you might know it better under the name of cork-screw grass. It is the grass whose seed damages the lamb in good seasons. The seed gets into the flesh, and the end of it curls up like a cork-screw.
2527. To what height does it grow? In a good season I have seen it grow to 3 feet high; but that is almost too rank.
2528. Would it be possible, in a good season, to paddock certain portions of a run, or to cultivate for the purpose of making ensilage? In a really good season, up there, there is a great deal of stuff which, I think, would make ensilage—luxuriant-growing herbage. I have had no experience of ensilage myself.
2529. It is so simple now to manufacture ensilage that I should have thought it would have paid squatters to make an attempt? I have never seen it tried.
2530. Have you got the bamboo grass growing in your locality? No.
2531. It is a grass 3 or 4 feet high, which sheep are very fond of? That might be what we call the cane grass; but the rabbits have destroyed all that. It was never very plentiful; it only used to grow in swamps. We used to use it for thatching sheds—it made very good thatch; but that is almost totally gone.
2532. The lignum flats do not produce any fodder, I think? They do not produce much, except after a flood, and then they throw up a tremendous lot of herbage.
2533. Your station goes back 80 miles from the river? The frontage is about 16 miles due north and south. The station goes back 80 miles, and the water finds its way back from the river 50 miles.
2534. How do you provide water for the stretch of 30 miles? Simply by tanks dependent on the rainfall.
2535. *Mr. Levien.*] You say the water goes back 50 miles from the river;—I suppose it fairly saturates the country when it overflows? The water which goes back 50 miles is in well-defined creeks. It is not like the frontage country, which is all covered in flood.
2536. What kind of grasses do you grow there? They are all natural grasses. The spear grass is the chief grass, but there are lots of others for which we have no particular name, such as umbrella grass and lake grass.
2537. Do they last you any length of time? A great deal depends on the season, and the way they are stocked. The spear grass stands very well.
2538. That is about the best grass out there? It is about the most plentiful.
2539. And it stands the worst of the seasons? It stands longer than any of the others.
2540. How do you get your sheep into the market? We do not try to send them to market. We always sell them as stores on the station.
2541. You are merely dependent on the wool and the selling of stores? We find that it pays us better than trying to fatten.
2542. But can you fatten out there? We could fatten in a good season.
2543. How often does a good season happen? They have been very few and far between lately.
2544. Within the last five years how many good seasons have you had in which you could have fattened? One, and that was five years ago.
2545. Have you ever been in the Liverpool Plains country? Never.
2546. Or in Riverina? I have been in Lower Riverina,—about Hay and those places.
2547. Without disparaging your country, would you compare it even with Lower Riverina? No; Lower Riverina will grow wheat. Our country will not grow wheat in one year out of two.
2548. I suppose it is only in exceptional seasons that it will grow wheat there? That is all.
2549. How long have you been there. Twenty-three years.
2550. How many seasons have you had in which they could have grown wheat and hay at all during that time? We did not go in for growing it before 1885.
2551. How many crops of wheat and hay have you grown since that year? I should say about seven crops in fourteen years.
2552. Have they been successful? The heaviest crop would not exceed three-quarters of a ton to the acre.
2553. I suppose you think that a fair thing? We think that very good.
2554. Are the ears pretty full? Very full. In a good season I have seen wheat there which would do for seed.
2555. What is the nearest railway station? Broken Hill, which is 70 miles away.
2556. What is the road like between Menindie and Broken Hill? It is a very fair road provided that you can get water and feed.
2557. At one time they proposed to run water from some of these lakes to Broken Hill? Yes, from Lake Menindie. According to Mr. Russell they would have to raise the water 800 feet to take it to Broken Hill.
2558. Now, what is your opinion about that scheme? I think it would be possible. Unless Menindie Lake were dammed the water would all run out of the lake as the river fell.
- 2559.

2559. As the river falls so do these lakes get lower? They do on the western side of the river, but not on the eastern side. J. J. Phelps.
2560. You would not absolutely depend on these lakes for a supply? Not for a permanent supply. I have seen them all dry. 12 Sept., 1899.
2561. All this western country is absolutely dependent on rainfall? It is altogether dependent on rainfall. I have seen plenty of water out on the lakes, and no feed. The water was practically of no use.
2562. *Mr. Trickett.*] Do you know the Toorincaca bore, which was started about 30 miles from Menindie in 1895? Yes.
2563. At the end of 1896 they were down about 1,100 feet, and had got no results? No.
2564. Has it been more successful since that time? I think the bore has been abandoned. There was another bore put down between there and the river, which was also abandoned.
2565. They did not get water? No.
2566. They got brackish water, and when they got under the hard stuff they struck no artesian water? No.
2567. There is no hope of getting artesian water out there, to judge from that experiment? Not at that depth. If they went down 5,000 feet, as I believe they have done in other bores, they might get artesian water; but I do not think the country would pay for that. It is not like Queensland country.
2568. At a reasonable depth, such as we generally go to in other parts of the Colony, they have not been able to get artesian water out in that country? No.
2569. What water have they got? We have wells on the run. The deepest well we have is about 120 feet.
2570. Is that good water? Fresh water.
2571. You pump that water up for the stock? We cannot get it everywhere; it is only guesswork.

SATURDAY, 23 SEPTEMBER, 1899.

[The Committee met at the Court-house, Bourke, at 10 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Frederick Hersey, farmer, Pera Bore, near Bourke, sworn, and examined:—

2572. *Chairman.*] How many miles is Pera Bore from Bourke? Across the punt we reckon it 9 miles. F. Hersey.
2573. How many years have you been at Pera Bore? Three and a half years.
2574. You are the holder of one of the 20-acre blocks, which you leased from the Government at a rental of £5 per annum? Yes. 23 Sept., 1899.
2575. That is, including the use of water from the bore? Yes.
2576. Under what conditions? We agreed to get 21,000 gallons per day, but we have not got much more than half of that quantity.
2577. Owing to the bore not being sufficient to meet the requirements of all, you have not received more than about half that quantity? I would not say that; but considerably less than we agreed to have.
2578. How long has that happened—all the time you have been there? No. Only during last summer I felt the want of water so badly. For the first two years I was there only ten blocks were taken up.
2579. How many now? The whole of the twenty; but some of the holders are not residing on their blocks.
2580. *Mr. Dick.*] Can you give the Committee any idea of the number of gallons per acre per annum which you consider necessary to successfully irrigate your block? No, I cannot; but every watering it requires less. I think the more watering it gets it will not absorb the water so much. At the first watering it requires nearly double as much as at any other watering. With that bore water, after the ground has been watered six or eight times I think that the water will not soak into the ground, but will lie on the top of it.
2581. Do you mean to say that there is something in the composition of the water which brings about a difficulty with regard to waterings after the first or second? I cannot say whether rain water would cake the ground the same as the bore water does.
2582. Have you experienced any serious inconvenience from the diminished flow from the bore during last summer? Yes.
2583. Sufficient to imperil the prospects of your block as regards making it pay? Yes.
2584. Will the supply from the new bore be sufficient to provide enough water for all hands there? Only in ordinary seasons. Of course, we do not yet know what the supply from the new bore will be; it has not been fully tested.
2585. Presuming that the supply from the new bore is at least at large as the present output of the old bore, with the two combined the supply should be ample? Yes.
2586. Have you had any previous experience in irrigation? Yes, when I was on the Darling.
2587. On what part of the Darling did you gain your experience? Eleven miles this side of Louth.
2588. What was the area you had under irrigation there? Only a small vegetable and fruit garden—about 4 acres.
2589. With a pumping-plant? Yes; a Tangye plant.
2590. Presuming that the river Darling were locked (say) from Bourke to Menindie, do you anticipate that the various landholders along the locked course of the river would avail themselves of the water of the river for the purposes of irrigation? Yes, I think they would.
2591. Can you say why very few of them have done it now when the river is not locked? No, I cannot. They have tried centrifugal pumps; but the water being so low, they will not carry it up from the bed to the top of the bank. For instance, at Gundabooka the pump would not work successfully.

- F. Hersey. 2592. In view of your statement that they are likely to take up irrigation, what crops do you think would be grown along the river? All sorts of green crops—fodder crops principally, because having so many dry seasons the expense for fodder is very great.
- 23 Sept., 1899. 2593. We have it in evidence that the land immediately adjoining the river is not of good quality for cultivation, and that to get land of better quality you have to go a short distance away from the banks of the river;—is that your experience of the river? Where I was, there was as good soil as you could possibly get on the bank; but that was red soil.
2594. Are those patches of frequent occurrence along the river? No; there are not many of them.
2595. Do you think that having to go far back from the river would impose a serious difficulty in the way of successful cultivation? They would have to go a good way back in some places. The higher country not likely to be flooded is the better soil.
2596. What distance back from the river out of the flooded area is there good available country? I do not know. On almost every holding down the river you would get good country right at the water's edge.
2597. Would the produce grown on those irrigation areas be for local consumption, or do you think that there is any chance of the landholders exporting produce, in case the river were locked? This soil on the river is suitable for onion-growing, and onions would realise about £10 a ton in Bourke. We get them very early. This soil also seems to be very suitable for grape and raisin growing. The grapes appear to be free from disease. Apricots and peaches also do well on the river—all citrus and dry fruits do well.
2598. The Pera bore cost a certain amount of money to sink, the fluming and various other apparatus also cost a considerable amount;—do you think that it would pay a private individual to take up an area like that around a bore and cultivate it in the way the land is being cultivated at Pera? No.
2599. On what grounds do you base your statement? So far it is only an experiment. At the annual rent we are paying some of us have scarcely made a living. I have lived on it, but I know that the annual rent we are paying would not pay interest on the money expended in connection with the bore, and it would not pay a private individual to sink as much money in such an enterprise.
2600. Then, so far, you think that the Pera Bore settlement is yet in the experimental stage, and is practically on its trial? Yes.
2601. Which, in your opinion, would be the cheaper, for a private individual to undertake irrigation by means of a bore, or by pumping water on to land close to the river? Very much cheaper to pump from the river.
2602. Can you give the Committee some idea of the crops which have been taken off either your own holding or some of the other holdings, with the use of the bore water? I have not kept any account of it.
2603. What have you yourself grown there? Our summer crops are pumpkins and melons. We have a fair market for them, and they do very well there.
2604. Have you grown any fodder crops? Yes.
2605. What was the yield of any of those? I cannot say. I have sent most of my fodder crops to Bourke for green feed.
2606. Within your personal knowledge are there any areas close to the banks of the river where a number of small holders could combine, and by dividing the cost of pumping appliances cheapen the cost of irrigation to themselves? Yes; at Redbank.
2607. What area of good soil is there? Unlimited—tens of thousands of acres. The Redbank is almost a perpendicular bank, and there is a fall from the river bank over a large area. At East Toorale there is also a red bank, and at Myrtle Vale there is a good, high, perpendicular, red bank close to the river, and that soil goes some distance back.
2608. *Mr. Watson.*] You stated, in reply to Mr. Dick, that after a few waterings with the bore water the ground seemed to absorb less than it previously had done? Yes; considerably less.
2609. Do you know any way by which to account for that;—do you think that because of the subsoil becoming moistened there is less room for water to go down, or is it from the ground caking? From the ground caking, but even when broken up it does not take so much water.
2610. Then it may be attributable to the moisture being below? It may be.
2611. Do you think there is any element mixed with the water which encourages caking? Yes, I think so.
2612. You cannot tell whether ordinary rainfall would do that? No, I cannot.
2613. You had a fair fall of rain there recently, between 3 and 4 inches, had you not? Yes.
2614. How long ago? About a month.
2615. What effect did that have? It did not cake the ground the same as the bore water does.
2616. What depth of water do you put on one block, with a fair watering? I do not know. Some ground will absorb so much that I do not know how many points it would reach.
2617. You have never tested it in any way? No.
2618. You say that you were pumping water for irrigating about 4 acres near Louth? Yes.
2619. Did you find there the same tendency to cake? No. I planted my crops there in the bottom of the drains; but at Pera I plant them on ridges, because the land cakes so hard.
2620. From that it would appear that the river water is much more suitable for irrigation? Yes, undoubtedly, it is more suitable. Then, again, the land near the river bank may have more sand in it.
2621. But it is not usually so, is it? It was rather lighter soil where I was, near Louth, than what I am working now at Pera.
2622. So it is possible that the nature of the soil may have had some influence? Yes.
2623. Is there a considerable area of land similar to that where you were near Louth? Yes, at Myrtle Vale, a homestead lease—thousands of acres.
2624. Close to the bank of the river? It is flatter country, and the water would run back, perhaps, a mile.
2625. Does the land slope away from the river? Slightly; but it is fairly level. It would not require much force to raise the water high enough to send it back.
2626. And you say that there are thousands of acres which would be just as suitable for cultivation as the land you were using? Yes.
2627. Do you know the country well between here and Louth? Yes.

2628. Are there plots of land suitable for irrigation distributed along there? Only three.
2629. Of what area? Almost unlimited. Where you get a redbank like that it is flat for miles back from the river. The first is at Redbank, which is 30 miles from Bourke by road, and then Gundabooka has a high bank.
2630. How far from Redbank is Gundabooka by road? Seven miles.
2631. Below that, what is there? East Toorale. That is reckoned 7 miles from Gundabooka by road. There is also Clover Creek which almost adjoins Myrtle Vale, which is where I was.
2632. Between that and Louth are there any similar spots? No; Myrtle Vale is the last high red bank. There are other suitable spots, but with very high floods they become flooded. All those I have mentioned are above flood-level.
2633. And all sufficiently light soil to be suitable for irrigation? Yes; all of them have good light soil.
2634. That would be five places between here and Louth? Yes.
2635. How does the river mileage generally compare with road mileage? Three to one it is reckoned at.
2636. Between here and Redbank, which is 80 or 90 miles by river, there is no place that you know of fit for irrigation? No; not land that is above flood-level.
2637. In the scheme that we are considering there would be four locks and weirs between the existing weir and Redbank, and the first three of those, embracing 50 or 60 miles of river, would not have adjoining them any land fit for irrigation? I do not say that; but for permanent irrigation blocks you want high country. Between here and Redbank two stations—Yanda and Jandra—are both irrigated; but not on land above flood-level.
2638. You consider it necessary, then, for permanent irrigation that the land should be above the flood-level? Yes.
2639. Do you know anything of the results of the attempts at irrigation on the stations you have just named, below flood-level? No, I do not.
2640. Where is your outlet for the produce from your farm at Pera? Bourke and Cobar.
2641. What do you send to Cobar? Melons and pumpkins.
2642. In truck loads, I suppose? Yes.
2643. Is the freight for such goods reasonable between here and Cobar? We deliver on the trucks at Bourke, and our customers pay the railway freight; so I cannot say exactly what it is.
2644. Still you are able to compete with the people of the coastal districts in the supply of those things? Yes.
2645. For other produce your market is Bourke? Yes.
2646. That is for fodder, I suppose? Fodder and vegetables.
2647. Do you think there is a fair outlet in and around Bourke for the produce of as many farmers as there are now at Pera? Yes; there has been no difficulty so far.
2648. But your holdings are not bearing to the full extent yet? No.
2649. How do you think you will get on when they are;—will you rely solely on Bourke, or also seek other markets? We shall seek outside markets. Some of us intend to go in for raising crops or drying fruits. We are raising vegetables only to keep us going until then.
2650. Do you think that there is a fairly large outside market for dried fruits? I think so.
2651. You have no doubt about finding a market for them? Not the slightest; and no doubt Bourke also will consume considerably more dried fruits than we shall produce for some time to come, because dried fruits are used to a great extent in this climate.
2652. Have you any idea whether the freight on dried fruits would be heavy—I mean in proportion to the value of the fruits? I do not think so.
2653. Supposing that a number of similar settlements were existing along the river, using, of course, pumped river water for irrigation, would there be a reasonable chance of their getting an outlet, first by river, and thence by rail to Sydney? I think so.
2654. You do not think that the distance and cost of freight would be prohibitive? I do not think so.
2655. Is quick transit a necessity for dried fruit? No, it is not.
2656. So the slow transit down the river, if cheaper, would be preferable for that? Yes. This climate is suitable for fruit-drying, because we do not do it by means of an evaporator, but by natural means.
2657. I should imagine that fruit dried in the natural way, without the use of an evaporator, would be better from a market point of view? No; I think it would be only equal.
2658. Then, speaking generally, from your own experience of irrigation, you think that land and water are the only things required;—you have no doubt about the market? No, I have not.
2659. Assuming the bore at Pera to continue to give out water in sufficient quantities, are you satisfied with your own prospects of making what you are doing there a success? Yes.
2660. You think the caking could be overcome? Well, for fruit-trees you do not require to use so much water.
2661. And consequently the land does not cake so much? No, it does not.
2662. Is there any method of keeping the land freer than it is naturally? Only by manuring. That keeps it looser on the top.
2663. You can counteract the influence of the water so far as caking is concerned by the addition of manure or other substances? Yes.
2664. *Mr. Shepherd.*] How long were you cultivating the 4-acre block you spoke of? Two or three years.
2665. What kind of crops were you raising? Vegetables—principally for supplying the shearing sheds during the shearing seasons; they constituted my principal market.
2666. There you pumped the water from the river? Yes.
2667. Did you find that the 4-acre block paid you for cultivating? Yes. I kept it all under cultivation all the while.
2668. You were able to make a living off it? Yes.
2669. You say you have not been able to get sufficient water at Pera bore? No.
2670. Do you think that that was in consequence of the falling off in the supply, or was it from other causes? No doubt it was from the falling off in the supply.
2671. Have you any idea what the proportion of the falling off was? The decrease was one-half.
2672. At what period did the falling off take place? It was not noticed until the beginning of last summer.

F. Hersey.  
23 Sept., 1899.

- F. Hersey. 2673. I suppose you irrigate in the small open cuttings? Yes.  
 23Sept., 1899. 2674. Do you find that after using them for some time they become watertight? Yes.  
 2675. There is evidently something of a clayey nature in the soil, and it becomes puddled? That is it. We have to use a Planet Junior, and go through after every crop for the purpose of keeping the surface loose.  
 2676. What description of crops have you been growing at Pera bore? Pumpkins, melons, onions, peas, and cabbages.  
 2677. All garden produce? Yes. I have also grown amber cane and millet for fodder.  
 2678. Do you find that any particular crop requires more water than other crops? No; I have not noticed that.  
 2679. How do you regulate the quantity in irrigating? Only by the appearance of the crop. We irrigate when the land seems to want water. In running the Planet Junior through, you can tell whether it is moist or not.  
 2680. How far are your open drains apart? According to the crops—for growing amber cane or other fodder crops, about 2 feet apart. This water will not soak very far.  
 2681. And for vegetables? About 2 feet; and for peas about 2 feet 6 inches.  
 2682. It is pretty well a dead-level were you are irrigating? Yes. We have to grade it a little.  
 2683. How long do you keep the trenches full? Until the water gets to the end of the trench. We fill it up once and then turn the water off.  
 2684. The one filling, then, affords a sufficient supply for the time-being? Yes.  
 2685. Supposing you have no rain after the filling of the trenches, how long is it before you require to fill them again? For some crops, a week.  
 2686. Does that not seem rather frequent? Not for some vegetable crops. Cabbage or lettuce grown in summer-time will not go long without water.  
 2687. It depends on the weather? Yes. In the winter it may be two or three months, but in summer the ground requires watering frequently.  
 2688. Do you know how many settlers there are holding land at Pera bore? Twenty are holding it, but some of them are away.  
 2689. What is the area generally allotted to farmers wishing to take up land there? All except two are 20-acre blocks, and two are 24 acres.  
 2690. You have to clear and fence the land yourself? Yes.  
 2691. Does each holder fence off his own 20 acres? At the ring fence around the old station it is netted, but each holder has to fence his own block.  
 2692. Do the settlers seem pretty well satisfied with the results? No.  
 2693. You say the rent is £5 a year for 20 acres, and that that includes the supply of water? Yes; it includes everything.  
 2694. There must be something very defective, then, if a man cannot make a living off that;—what is the reason? I think the principal reason is that they do not know anything about cultivation or irrigation.  
 2695. Are they not being instructed in any way? Yes.  
 2696. It is a funny thing for a man to take up an occupation he knows nothing about;—is there no one there who is supposed to give instruction? There is the Government experimental farm, and the manager gives any information they want.  
 2697. Are not meetings held which these people are invited to attend for the purpose of getting instruction? No.  
 2698. So that each man does the best he can for himself? Very few of the people there know the crops suitable for the climate or the time for putting them in.  
 2699. Are there no means of ascertaining? Only from experience.  
 2700. There is no information, then, to be gained as to the kind of crops to grow and the proper time to grow them, if the people there ask for it? I suppose that the manager of the Government farm would tell them, but I do not know any one who ever went to ask for it.  
 2701. Does there seem any disposition on the part of the people there to go for information, or do they prefer to go on in their own way? They prefer to go on in their own way.  
 2702. *Chairman.*] Then you look upon this Pera farming settlement as a failure? I cannot say that; but most of the settlers there look upon it as a failure.  
 2703. Are the majority of the men there doing anything besides farming? Yes; all of them, except three or four.  
 2704. What do they do? Some are carriers, some shearers, and some general contractors.  
 2705. Supposing the whole of the twenty farms—equal in round numbers to 400 acres—were in full swing under cultivation, would there be a local market sufficient for the produce? No, there would not be.  
 2706. I suppose that the distance from Sydney and other centres of population would be too great for the settlers at Pera bore to send perishable vegetables and fruits to those places, would it not? Yes, it would be.  
 2707. Do you think that if there were really practical farmers at Pera bore—men who are skilled—they would be able to do better? There is no doubt of it.  
 2708. Is there a paucity of that kind of farmer, or is it that the right men have not come to Pera bore? That is it—the right men do not seem to have come there.  
 2709. Farming by the process of irrigation is, I suppose, a special kind of farming, and requires special knowledge? Yes.  
 2710. And you do not think that the men at Pera bore have that special knowledge? They certainly have not.  
 2711. As regards local markets, you say you have sent some produce to Cobar;—besides Bourke and Cobar, what other local markets would there be for the produce grown at the Pera farms? I have also sent produce to Byrock and Coolabah. There is not much of a market for perishable goods, but when the river is navigable there is a market at Louth and Wilcannia. However, the river has been navigable only a very short time since we have been at Pera.  
 2712. To make that kind of farming a success it would be necessary that you should produce citrus fruits, or fruits capable of being preserved and sent to distant markets—that is the future of that kind of farming? Yes.

F. Herey.  
23 Sept., 1899.

2713. Are there any fruits at Pera of that kind? Yes.
2714. What fruit-trees have you on your own holding? Six hundred.
2715. What are they? Principally apricot and peach.
2716. Are they doing well? Yes, very well.
2717. And, if those keep on doing well, you propose to preserve and dry those fruits? Yes; they are all drying varieties.
2718. Could that industry be carried on profitably at Pera, considering the distance from Sydney? Yes, I think so.
2719. Are any other holdings at Pera planted to that extent in that way? Yes.
2720. How many? Seven have the same area planted with trees as I have.
2721. Are those the men who chiefly do nothing else but look after their farms? Yes, principally.
2722. After a tree is planted there, how long is it before it will bear fruit? Three years before it is payable.
2723. You are looking forward to the next season to get crops from your trees? Yes.
2724. What do you do with the remainder of your land? I am growing fodder crops and vegetables and melons.
2725. What do you do with your fodder? I have been sending it to Bourke.
2726. Have you any special crop? Principally barley and lucerne—lucerne in the summer, and barley in the winter.
2727. How are your crops of that kind getting on now, with very little water? Without water we did not get any crops of lucerne, or not until very late. Of course, the barley does not require water in the winter.
2728. How often do you get water? We get it for twelve hours every four and a half days.
2729. Is that sufficient? At present it is, but could we get more water we should put in more crops.
2730. How much land would that supply? For fruit-trees it would supply 15 acres.
2731. What are you using your water for? Various crops—melons, pumpkins, and peas.
2732. How much is that short of what the Government proposed to give you? I think it is about half. We get it in turn, every settler the same. It comes round in sections. We used to get it at first as we ordered it.
2733. Then the Pera Bore settlement, looked at independently of the Government experimental farm, and as a reproductive work, is not very productive to the State;—do you think it is fairly payable to the Government? No, I do not.
2734. Which do you think the better, watering that kind of land with bore water or with river water? The river water, undoubtedly.
2735. And with regard to the character of the soil, for agricultural crops, which is the better—the red soil? Yes, for some crops, but the black is better than the red for others. Onions do much better on the black soil, and that would be the principal crop here. They do fairly well on the red soil, but not nearly so well as on the black.
2736. The advantage of the red patches is, I suppose, that that land is above flood-level? Yes, and it is much better for pumpkins and melons, and for fruit-trees.
2737. It is more easily worked than the black soil? Yes.

Arthur Senior, wool-scourer, near Bourke, sworn, and examined:—

2738. *Chairman.*] Where do you reside? Two miles from town, down the river.
2739. How long have you been there? Five years; but I have been on the river twenty-one years.
2740. *Mr. Watson.*] Have you had any experience in irrigating there? A little. I am doing some at present. A. Senior.  
23 Sept., 1899.
2741. By means of pumping machinery, I suppose? Yes. I utilise the scour water.
2742. Is it suitable for that purpose? Yes, the best of it. We do not put the soapy water on. We utilise only what we call the rinsing water.
2743. Is your land below or above flood-level? It was all flooded in 1890, but an ordinary flood would not go over it.
2744. What is the class of soil? It is mostly black.
2745. Of a clayey character? Yes, inclined that way; it is stiff. We have some loamy soil as well, but not very much.
2746. How has your irrigation turned out so far? It has been very successful.
2747. What do you grow? I have wheat, oats, skinless barley, and the ordinary Cape barley. I am experimenting to see which crops are most suitable for the climate.
2748. Have you been irrigating long? Only about two years.
2749. And only for fodder? Yes, just for my own use.
2750. Have you gone into the figure aspect of the matter, to see whether it pays you better to pump water out of the river and grow fodder, than it would pay you to import the fodder? Well, during the washing time there is no further expense; but during six months of the year I have to raise water independently of the scour. During the washing time we always have steam in the boiler, and there is no trouble in putting the pumps on. I lay myself out for irrigation, because I believe it will be cheaper and better to grow our own fodder. We get very inferior stuff sent by rail sometimes.
2751. What has been the price of fodder here ordinarily? It has been from £5 to £6 for the last two years until recently. Now it is down to £4, since the rain.
2752. What has sent it down—the larger quantity of fodder offering in the places from which it is usually brought to Bourke? I suppose the rain has had something to do with it. Any horses not doing much work now can be turned out and can live on the herbage, and there is a surplus of fodder in the farming centres.
2753. Where does it usually come from? Dubbo, Orange, and Wellington.
2754. Your experience, seeing that you are using some of the water twice—once for wool-scouring and again for irrigation—is hardly one upon which you can base figures as to the probability of the undertaking paying under ordinary circumstances? I have no doubts on that score—at proper places where an irrigation scheme could be carried out without an expensive plant. I am satisfied that irrigation is paying at more than one place on the river. If it had not been for irrigation they would have been in

- A. Senior.  
23 Sept., 1899.
- a terrible mess at the present time. They put away stocks of lucerne and other fodders, and they make it a rule to keep on irrigating and growing these crops as a stand-by. Winbar station is, particularly, one in point. Mr. Thomas told me that if it had not been for lucerne they would have been starved out, and would have had neither horses nor cattle left.
2755. As to the navigation aspect of the question that is before the Committee—have you given that any consideration? A little.
2756. As to sending away wool and other produce from the district towards the coast by the river, I understand that latterly people have been depending on the railway pretty well, owing to the river being down? Yes, considerably so. We have practically had no river the last few years; in fact, during all the dry time we have been deprived of the benefits of the river.
2757. I do not suppose that a temporary rise in the river would assist production by means of irrigation, to any material extent? Of course, we should have cheaper facilities for carriage if we had to buy that kind of thing; and if we had a reasonable level in the river upon which people could rely the probability is that they would go in more for irrigation plants, but when the river fluctuates as it does, down to bedrock almost, you want an expensive plant to raise the water on to the high banks suitable for irrigation.
2758. The engineers tell us that weirs above 10 feet in the river would be rather dangerous, and the greatest difference in height with the locking of the river would only be about 10 feet;—do you think that that would make any considerable difference as to the encouragement of irrigation? Yes, I do. With a uniform level, people would know exactly what water a certain-sized boiler and pump would supply per acre.
2759. Do they ever run short of water now for irrigation purposes? There has always been a certain quantity in the river, but at such a low-level, sometimes, that it was very expensive to raise it, and people have not gone in for it extensively.
2760. You are, perhaps, aware that the question of irrigation in connection with the locking of the Darling is only incidental, and that the main matter before the Committee is that of making the river navigable so far as the locks will be extended;—do you think that the expenditure that would be necessary to lock the river is justifiable from the point of view of navigation, leaving the matter of irrigation out of consideration for the time being? Yes, I do. I think it would be of great advantage to the Colony generally, and more particularly to these arid districts.
2761. In what way? I must bring in irrigation now.
2762. Leave that out, and take only the question of navigation; you have already stated that you think that irrigation would be materially encouraged by the provision of permanent supplies of water at a standing level;—but how do you think it would help the people in the way of navigation? I think it would induce people to settle on the land if they could rely on the water carriage to bring goods to their doors at a reasonable rate.
2763. You know that we have a very large area of Crown lands in the basin of the Darling generally? Yes.
2764. Do you think that the locking of the river would enable these lands to be settled in smaller areas? I do; I think that the absence of it is one of the things which is keeping settlement back.
2765. Why? Because people have no inducement, and men with small capital cannot attempt to settle down under present arrangements.
2766. You think that the fact of supplies being cheap and certain would encourage men with small capital to take up blocks in small areas? Yes; and we should be able to raise our own produce.
2767. Do you know how many sheep a man would require in order to make a living in this part of the country? I know some men who are making a living with 5,000 or 6,000 sheep; but I do not think they are making a fortune. I know some men who are pretty comfortable with that number; but they did not start with a big handicap upon them.
2768. What area should a man require to carry that number in an ordinary average season? On the river frontage they have from 4,000 to 6,000 sheep on 10,000 acres.
2769. Would those men have only one block for their sheep? They would have only one block, but it would be divided, of course, into paddocks.
2770. That is a pretty good-carrying capacity? That is only in good seasons. I am not alluding to the present time, for some people have not 2,000 sheep on their block.
2771. If they had 2,000 sheep now, it would be a sheep to 5 acres? Where I originally got fifty bales of wool, I am now getting only from fifteen to twenty.
2772. Do you know whether the placing of the homestead lessees on land, mostly along the frontage of the river, has resulted in more sheep being carried than were previously carried by the larger holdings? That is a question I can scarcely answer, because this country has been gradually deteriorating in regard to producing good grasses. Grass which you could see fifteen or sixteen years ago, such as Mitchell grass, you cannot see now.
2773. Is that from overstocking? I cannot say. It may have been owing to the seasons. From 1895 we have been gradually going backwards until the present. There had been no seeds spreading.
2774. How do you send your scoured wool away? Always to the train.
2775. Would it pay you better when the river is up to send it by train? That is a matter for my constituents. I do not buy from them, but merely scour on commission.
2776. Do they prefer the Darling? They have to depend on the train, for if they get it on the river it may be delayed nine or twelve months. I have known wool to be lying on the steamer when sheep were being shorn in the sheds the next season.
2777. So not much wool has gone down the river from Bourke? I have known several clips go down the river from Bourke, but not much.
2778. Does much come down to Bourke? Yes; whenever the river is navigable. Many a time the river is navigable to Bourke, but not lower down.
2779. So wool that comes from higher up the river is generally transhipped at Bourke and put on the train? Yes.
2780. Does that occur often when there is a fair river? Yes; sometimes we have a navigable river here when the Murray is not navigable, or there may be a high Murray and a low Darling. It amounts to the same thing.

2781. You think that the wool would go by river if the wool-growers could depend on the water all the way? I think that any wool shipped on the river would be taken right through, and not taken off the boats and put on the train. A. Senior.  
23 Sept., 1899.
2782. So we may anticipate that if the Federal Government should take up the question of locking the Murray, and if the Darling also be locked, the heavy traffic of wool will probably go by river, and not by rail? Well, it is just a question whether people will test the local markets previous to shipping. Some people might prefer to test the local markets, and then, if they did not get a satisfactory offer, ship their wool.
2783. Do you think it is likely that Sydney will present better chances in the way of a wool market than Adelaide or Melbourne, which might be reached by going down the river and a short distance by rail? At the present time there is an idea in some people's minds that Sydney is really the market of the colonies for wool.
2784. There is a great number of foreign buyers there usually? Yes.
2785. Do you think that they attend the Sydney wool sales in greater numbers than those of other colonies? Well, Victoria stands second, as far as that goes. I think the buyers like to see the wool first-hand, and they can take a second chance in London afterwards if necessary.
2786. You think, then, that the idea of the selling of wool at Sydney will grow with people and become of greater importance year by year? Yes; I think that Sydney will be the leading market of the colonies as regards wool sales.
2787. And, if that were so, it might pay the wool-growers to give the railway more in freight, in order to get their wool to the market where the greater number of buyers would be? Well, they are guided a good deal by how the London market happens to be, and they may catch it by sending the wool by rail, whilst they might miss it by sending the wool by river.
2788. What is your own opinion as to which would be used in preference;—assuming an open river to the coast to be guaranteed, which would get the greater amount of traffic of a heavy character—the river or the railway? I do not think there would be very much advantage in locking the river right through just now. I do not see the force of opening the whole of this river to the other colonies at present. We should perhaps wait until we see what Federation may accomplish.
2789. You think that the partial locking of the river would attract trade towards Bourke? I do.
2790. Supposing the river were locked between Bourke and Menindie, how far do you think the attraction of the Bourke railway would extend? Well, unless the river were navigable below the locks, it would sap the country from Wilcannia up. Wool comes from Wilcannia now. I have wool now from Buckanbie, Rosedale, and Budda.
2791. What does it cost those people to send their wool to you? On an ordinary river it averages from £1 to 25s. a ton.
2792. And after it is scoured they have to pay rail freight from Bourke to Sydney? Yes.
2793. What is that freight? About £5 a ton on scoured, and £4 on greasy.
2794. That would be a total of £6 5s.? Yes. It varies a little according to the river.
2795. Well, say £6, cost between Rosedale and Sydney? Yes.
2796. We were given to understand that the freight from Wilcannia to Adelaide was much less than that? Well, it all depends on whether it is going by a long river or a short one. They vary the freights accordingly. I have known the freights from Bourke and Wilcannia to be £3 10s. and £3 per ton; but that was only because there was a short river.
2797. *Chairman.*] I understand you to say that if this project were carried out, and the river were locked from Bourke to Menindie, that would in all probability make that portion of the river a feeder to the Bourke railway? Yes, and also induce settlement.
2798. What extent of cultivation have you where you reside? I have not very much—about 16 acres or 18 acres, and it is not all under crop at present. Last year I lost nearly all I put in, because we could not pump sufficient water to keep it going.
2799. You seem to be favourable to irrigation on the holdings along the river banks;—do you regard that cultivation as practicable to the extent of feeding large flocks? I do not know that you could go in for irrigation for ordinary flocks; but you could save the stud flocks by this means.
2800. Take a man with 40,000 or 50,000 sheep;—is it possible for him to go in for cultivation by irrigation with a view of feeding a flock of that size? I do not think so.
2801. Well, then, as an aid to a large grazing holding, to what extent do you think a man could profitably go in for cultivation for his stud flocks, horses, and cows? I can hardly answer that question, for if you take up such an extensive piece of country for irrigation, you must have an expensive irrigation-plant, and then comes in the question of cost.
2802. Do you think that a man could with advantage cultivate 100 acres or 200 acres? That would be the outside; but even on 50 acres or 100 acres he could grow a grand stand-by.
2803. If he were to do that, and good seasons were still to prevail, could he not keep his fodder in stacks? Yes, he could stack it up for a dry day. If a man has more than he can do with, and puts it under cover it will come in handy some time.
2804. The wonder seems to us to be that this has not been gone on with more than it has, and it seems to be a general inquiry, "If this could be done, why has it not been done?" Here are men with holdings along the river, where fairly small pumping plants could bring up water of which they could avail themselves, and still it has not been done—how is that? Previous to 1893 we were never in such a fix as we have been since, and we have had to adopt different means to meet the times of scarcity. Men have to resort to all possible schemes now to save money, whereas they did not have to do that before the Bank smash, for until then you could always get advances when you required them.
2805. Even in an ordinary drought a stand-by such as we speak of would be a great advantage, would it not? Yes; I do not think that anyone will ever lose the chances again—he will always try to have something to fall back upon.
2806. And therefore you think that if the large holders could with advantage pump the water a reasonable height from a constant river, they would go in for that? Yes, I am sure they would; in fact they are doing it now.
2807. The impression seems to prevail that you should go in for irrigation only on land that is not subject to flood? I do not think there is anything in that. Usually, the Darling country generally is subject

- A. Senior. subject to floods, only like the 1890 flood; but in 1879 we had a reasonable flood, and we had to go as much as 15 miles from the river in order to get down the river.
- 23 Sept., 1899. 2808. You think the graziers would chance their land being flooded? Yes. As a rule when we have good big rivers extending back we have more rain. It seems to draw the rain. If we have a low river we do not get any rain. With regard to the land adjoining the river banks, it has been stated that that land is of a clayey character, apt to cake and crack when treated with water. There is something in that statement; but that state of things is to be met by treatment in the way of manuring the ground. For instance, if you irrigate the land to-day, in the course of a week you will see cracks appearing again, and unless you run a scarifier or a Planet Junior through and break it up it will cake; but once the land is worked it does not require the same amount of irrigation to keep it going; but you must keep it worked.
2309. So it is a little more troublesome and expensive than the red soil above flood-level? Yes. Our ground here does not cake with the river water as a rule.
2810. *Mr. Shepherd.*] You say that this black soil is apt to crack a good deal? Yes, in places.
2811. Have you had much experience in cultivating that soil? Not here.
2812. Have you ever seen any of it that has been well drained? No; I cannot say that I have.
2813. You have been a long time resident in this district? Yes; twenty-one years.
2814. And you have been irrigating land about five years? Only about two years.
2815. What area have you been cultivating? I have about 15 acres there, but have not a crop in the whole of it now. I grow all my own vegetables. It is black soil where the vegetables grow, and so also is some of the wheat land.
2816. You have not tried draining? No; I merely dig the ground.
2817. What do you manure with? Just the ordinary stable manure.
2818. You spread it over to a depth of 3 or 4 inches? Yes; and work it in with scarifiers or harrows. We mulch the small plots used for vegetables.
2819. Have you been pretty successful in producing crops on this land? Yes, so far. During the last dry season I had a splendid crop of amber cane and skinless barley.
2820. Have you any idea how much water it took per acre to irrigate those 15 acres? No.
2821. How often did you irrigate? Perhaps a fortnight between each watering—sometimes a month.
2822. How many days did you take to pump water in order to irrigate the 15 acres? We only irrigated a patch at a time.
2823. You kept no record? No. A portion of the ground was put in with wheat as a chance crop.
2824. Have you noticed the various kinds of pastures in the district? I have.
2825. Have you noticed the disappearance of any of them? Yes; the Mitchell grass, or blue grass, in particular.
2826. Have you been able to account for it in any way? Only on account of the dry seasons we have had, no seed being left to germinate again.
2827. Do you not think that overstocking has had something to do with it? I do not put it down to overstocking, but to the rabbits.
2828. And the saltbush has disappeared to some extent? Yes. I have a little in my paddocks.
2829. Have you heard of any proposal to shut up these areas for the purpose of preserving these grasses? Only what I have seen in the papers.
2830. There has been very little attempt, I think, to sow artificial grasses? I do not remember any, except that I put some in during the last rain.
2831. What kind of grasses? A general mixture for a dry climate. I have about half a dozen different sorts, all mixed.
2832. In your opinion the locking of the Darling would assist the taking up of smaller areas? Yes.
2833. In what way would it assist that? As regards better facilities for getting supplies and sending produce away. We should have a navigable river and reasonable freights.
2834. Is much produce brought to this district from distant parts? Yes.
2835. Maize, oats, hay, and lucerne? Yes.
2836. You are of opinion that the locking of the river would induce people here to produce those things themselves? Yes; produce a lot of them.
2837. But in connection with that, I suppose it would be necessary to irrigate? Yes; they would have to irrigate.
2838. We have had it in evidence that the river would not afford sufficient water to irrigate to any extent;—what is your opinion about that? I think there is nothing in that. Thousands of tons of water get to the sea in seasons like the present. A good river if locked would throw the water up the creeks and back channels, and wherever that water lies there is always a certain amount of good picking to be got.
2839. The misfortune is that, at the time you would require to irrigate, the river would be at its lowest, and you could not get the supply you would require? I have seen good rivers here. At one time we had a navigable river pretty nearly every year.
2840. Taking one year with another what is the average period that the river is navigable? I do not know. I have not studied that matter much.
2841. *Chairman.*] You mentioned something about the rabbits doing great injury in this district? Yes.
2842. Do they not regularly eat the roots of the grasses? I believe they pull the whole thing out. I have poisoned thousands of them. The rabbits are more destructive than any stock would be, because they scratch the grasses out. I believe that is the cause of the present depression here.
2843. They destroy the grasses more than the sheep do? Considerably. The sheep do not root it up, and they do. They go straight for the roots and scratch it out.
2844. *Mr. Watson.*] Do you know the river between here and Louth? Pretty well.
2845. We were informed by a previous witness that there were only four or five places between Bourke and Louth sufficiently high, and with a sufficiently sandy soil, to be fit for irrigation;—do you think that is the case? Well, there have never been floods in those particular places.
2846. Do you think there is a lot of other land similar to that which you are now irrigating which would also be suitable for irrigation? You may get little blocks, but the country is more lignum country, and that is very stiff.
2847. You do not think that the general run of the black clayey country is suitable for irrigation? No, I do not; I mean the heavy lignum country.

John Plunkett Fitzgerald, grazier, Fort Bourke, sworn, and examined :—

2848. *Chairman.*] How far is Fort Bourke from Bourke? Three miles across the punt, and 6 across the bridge.

2849. Have you a river frontage? Yes.

2850. To what extent? From 18 to 20 miles.

2851. What extent is your holding? 173,000 acres, I think.

2852. Have you gone in for agriculture at all? I have a small garden a little distance from the river.

2853. *Mr. Dick.*] Would you favour the Committee with your experience of irrigation in your garden? My garden is about a quarter of a mile from the river—not on the bank.

2854. Why did you select that portion;—is the immediate bank of the river not suitable? No; it is too low, and a Billabong divides it from the river.

2855. Do you find that the various plants do well with irrigation? Yes; provided we do not get floods.

2856. Does an ordinary flood go over the garden? I do not know about an ordinary flood, but the 1890 flood did us a lot of damage.

2857. Has the necessity for growing fodder crops been borne in upon you by losses during drought? It has.

2858. Can you give any reason why you have not gone in for irrigation for growing crops? The country which can be watered from the river is not suitable, and it would be too expensive to grow crops by pumping water. I am speaking in regard to crops for station use.

2859. It is your opinion that it would not pay to grow fodder crops by irrigation from the river, for station purposes? I am speaking only of my own place and not generally.

2860. Are there many properties on the river situated as yours is with regard to the problem of irrigation? I cannot say from personal knowledge.

2861. Would you say that your 20 miles of river frontage does not offer any opportunity for the growing of fodder crops by irrigation for station purposes? None whatever.

2862. Would that reply embrace the statement that it would not pay you to irrigate 100 acres or 200 acres for the purpose of preserving stud and other valuable stock during drought? I do not think the country is suitable for it.

2863. Then, if we have it in evidence, as we have, that every station-owner cultivating areas along this river could, if he so desired, make a success, from a financial point of view, of the growing of fodder crops to provide as a sort of insurance against losses during droughts, what do you say to that statement? I only speak in regard to my own place. I am not speaking for anybody else either above or below our place, but only for myself.

2864. Would you favour us with your opinion on this statement made by Mr. McKinney, an expert on irrigation:—

I will go so far as to say that it is disgraceful to the enterprise of the pastoralists that there is not more done in that way.

Would the irrigation of several thousand acres be an expensive undertaking? Yes. You asked me to state the area of irrigable land. I think every large station there should have 100 or 200 acres under cultivation.

? Speaking from a financial point of view, I do not think it would pay us. I think that black ground requires a lot more water than the red ground does; and it is far more expensive to irrigate with pump and engine. I may state that we are in the happy position of having two bores, and we irrigate from those and grow our crops there; but if I thought that I could grow a crop on the river (as it is so necessary after the late drought) I should tackle it there as well as on any other land,—for of course the bore supply of water is limited; but from a financial point of view I do not think it would pay us.

2865. Presuming that you did not have the bores, would your statement still hold good;—that it would not pay you to irrigate? Yes.

2866. In times of drought you think it would pay you better to buy fodder than to grow it yourself? Yes.

2867. This inquiry includes the problem of navigation as well as that of irrigation;—presuming the river were locked from Bourke to Menindie, would you send the whole of your wool down the river or by rail to Sydney? That would depend on the charges made by the teams.

2868. Would you state what has been the general practice? When the river has been up we have sent the wool by water in preference to sending it by team from our shed 13 miles to the railway-station at Bourke, but I should prefer to send it by team even if I had to pay a little more than by river.

2869. Have you ever sent your wool down the river to Wilcannia? I have, and am sorry to say that it has been delayed on the river two years, owing to the snags, and I would not run the risk again unless the river were cleared.

2870. If the river were locked all the way would you send your produce by the river? I am not prepared to say that I would, as I think there is too much risk.

2871. In what way? Well, the wool was delayed on the river two years owing to the snags, and even with a permanently-locked river I think there would be a certain amount of danger. But if other people got through all right we should perhaps be prepared to do the same. It would depend on whether the railway authorities were prepared to compete against the steamers, and lessen the railway freights considerably.

2872. If competition between the river steamers and the railway were to bring about, practically, an equalising of freights, would the advantage of the Sydney market be sufficient to determine you to send your wool to Sydney by rail? I cannot say that at present, for a great deal depends on the market as to whether we will send the wool to Sydney for sale there, or to Melbourne for sale there, or ship it to England for sale there.

2873. *Mr. Shepherd.*] You say you have a holding of about 173,000 acres? Yes.

2874. I suppose it is stocked entirely with sheep? Yes, and a small milking herd.

2875. What number of sheep have you on it? I cannot tell you; we are afraid to count them at present.

2876. Has there been a reduction during the last few years? Yes, a very large reduction.

2877. Will your holding carry one sheep to 3 acres in a good season? No; one to 8 acres is our assessment by the Government.

2878. In a very good season I suppose you have a large surplus of grass, herbage, and so on? Yes.

2879. Have you ever attempted to conserve those at all? Yes; it has been conserved in the shape of bush hay.

2880. In the shape of ensilage? No; not ensilage—just a stack of hay.

2881.

J. P.  
Fitzgerald.  
23 Sept., 1899.

- J. P. Fitzgerald.  
23 Sept., 1899.
2881. You have not tried ensilage? Not up here, but I have tried it in other parts.  
2882. Did you not like it? Yes; it turned out to be much better than we anticipated.  
2883. The general opinion is that ensilage is worth about twice as much as hay? Yes; my experience is that stock are very fond of it.  
2884. Is your holding paddocked? Yes; it is all paddocks.  
2885. You spell it occasionally, I suppose? As far as possible.  
2886. Have you found the grasses disappearing at all? Some of them.  
2887. Do you give your land a season of seeding in the "spell" time? Yes, as much as we possibly can, but in these parts it is very hard to be guided by anything done (say) in the Riverina districts. We have to be guided here entirely by local circumstances. In the Riverina the seasons are very certain, and people there can do a lot of spelling, but we cannot always do it. In seedy paddocks we are obliged to do it for the sake of the wool.  
2888. Of course you know the advantages of it? Yes.  
2889. So far as cultivation is concerned, you have irrigated only a small area of your own kitchen garden, I suppose? Yes; that is, from the river.  
2890. Have you tried fruits at all? We had a few fruit-trees, but the 1890 flood killed all our stone fruits.  
2891. What kind of fruits do you find answer the best? Oranges, figs, and mulberries grow best with us.  
2892. Have you not tried apricots? Not since the 1890 flood, which killed them.  
2893. Have you tried vines? Yes; we have vines.  
2894. They do well, I suppose? Yes; we have a few peach-trees which are doing well enough, and I believe would pay us well if we had a sufficient quantity of them. Lemons also do well.  
2895. Do you think it is at all likely that the locking of the river would lead to the cultivation of larger areas? Not so far as I am personally concerned.  
2896. I mean, generally? I am not prepared to give a direct answer to that question. I have not thought over the matter.  
2897. Do you think that the river would be largely used in the event of its being locked in such a way that it would be always navigable? I think so.  
2898. Do you think there would be sufficient trade to justify the expenditure of over £500,000? I am not prepared to state that. I was greatly surprised at the cost of the first lock. I would not like to see the country put to such great expense; but the matter does not affect me so much as people lower down the river, who are dependent on carriers when they cannot get a river.  
2899. Do you think the river would be used more than the railway if it were always navigable? Others, like myself, may think there is more danger in using the river. We have paid for our experience, and are very careful, and £100 would be comparatively nothing compared with the risk of the wool being delayed on the river.  
2900. I suppose that in time the river will be snagged the whole distance? Yes; but there must still be a certain amount of danger from trees on the banks falling into the river quite unexpectedly.  
2901. Has there been no attempt to remove the trees that are in dangerous proximity to the river? I cannot say, because I have not watched what has been done. I have been told that the snagging has been well done.  
2902. Judging from the formation of the country we saw yesterday, I should think there would be a difficulty in irrigating the land in the immediate vicinity of the river, because it seems to be very much broken? All I say is that our own property is not suitable for it; but other properties may be.

Malcolm Robertson, grazier, Jandra station, near Bourke, sworn, and examined:—

- M Robertson.  
23 Sept., 1899.
2903. *Chairman.*] How far is your station down the river? Eleven miles.  
2904. What is its frontage to the river? Sixteen miles.  
2905. What is the size of your holding? 125,000 acres.  
2906. *Mr. Shepherd.*] How long have you been resident at Jandra? Nineteen years next December.  
2907. I suppose that sheep are your principal stock? Yes.  
2908. How many sheep do you run? Usually between 30,000 and 40,000.  
2909. Has the number diminished of late years? Yes.  
2910. To what extent? I should say 50 per cent. I have not counted the sheep, but I should say that that is it.  
2911. You attribute that, I suppose, entirely to the four years' drought? Yes.  
2912. Do you find that any of the best kinds of grasses are diminishing? Yes.  
2913. Being lost altogether, in fact? Yes.  
2914. What kind do you find generally missing first? I have missed the good Mitchell-grass flats since the 1890 flood.  
2915. Any other grasses in particular? All the finer grasses are diminishing, including blue grass.  
2916. To what do you attribute the extermination of these grasses? I consider that the succession of droughts has been the cause of it.  
2917. Have the inferior grasses disappeared to the same extent as the more valuable ones? There is no grass of any sort just now.  
2918. Is your holding divided into paddocks? Yes; the whole of it.  
2919. Do you carry out a rotation of spelling and feeding? No; I simply do not overstock any paddock.  
2920. Do you not think that spelling the pasture occasionally, and allowing it to go through its seeding, would be an advantage? That is not my experience. The coarser grasses in this country are more rapid of growth than the good grasses, and I think that sheep naturally like a short pick instead of grasses growing long and coarse.  
2921. But do you not think that all grasses naturally disappear, unless they are allowed to seed and reproduce themselves? Yes.  
2922. So, in that case, it would be of advantage to give them a season of seeding occasionally? It would, certainly; but I claim that I have not overstocked my country.

2923. You may not overstock, and yet the sheep may not allow the grasses, particularly the favourite ones, to seed? There is not any grass left now, but I do not say it will not grow again.
2924. But even when you have a good supply of grasses, do you not find that the sheep go for one particular kind of grass more than another? Yes.
2925. They will not eat the inferior grasses when they can get the favourite ones? No.
2926. By that means the favourite grasses are exterminated first? Yes.
2927. In what seasons do you get the rains usually? Up to 1890 we usually got them in October; but since then there has been no settled period.
2928. Things have quite changed? Yes. Before that time we expected to get our rains in October from the north-east; but since then all our rains have come from another direction altogether.
2929. Do you remember ever having such a long period of drought before? No.
2930. Not during the whole of your residence here? No.
2931. And I suppose that last year was about the most severe of all? Yes.
2932. Have you paid any attention to the proposed locking of the Darling River? Yes.
2933. In the event of the river being locked, do you think that it would take all the wool? Yes; I think that insurance would go down and enable the river to compete against the railway, and the wool would go by the river.
2934. Of course, the river carriage would be much lower than the railway carriage could possibly be, and therefore you think the river would have the preference? Yes.
2935. Is the insurance very high? It has been as high as 33s. per cent.
2936. Would that in any way equalise the charges by rail? There was very little difference; but in sending by rail you would get your returns very much more quickly, and so we sent the wool by rail.
2937. Therefore, if the charges in any way assimilated, the railway would be used in preference? Yes.
2938. There is always a danger of accident on the river, I suppose? Yes.
2939. I see that even recently a steamer was sunk on a snag? Yes.
2940. But the snagging is being carried out, and I suppose that before very long the whole river will be snagged up to Bourke, and then the danger will decrease a great deal? Yes.
2941. And, probably, the insurance would be lessened in amount if the danger from snagging were taken away? Yes.
2942. Have you any idea of the tonnage that is taken by the river or by the railway? No.
2943. Do you think that the locking of the river would give any impetus to the cultivation of country? Yes, in isolated places.
2944. Have you attempted to cultivate your land at all? Yes.
2945. What area have you under cultivation? A very small area—a vegetable garden, under 2 acres.
2946. Have you not attempted to cultivate at all for wheat or hay? Yes.
2947. What extent have you under cultivation for that? I have none now, but I tried 5 acres frontage to the river.
2948. And you gave it up as a failure? Yes.
2949. Did you attempt irrigation at all? Not for the wheat.
2950. You irrigated the garden? I irrigated a small lucerne patch and the garden.
2951. What description of soil have you in the garden? Sandy loam.
2952. Is it a red sandy loam? No, dark grey.
2953. Have the results been satisfactory? They have; on the small area which is constantly fed by manure from the wool-shed; but it is absolutely necessary that it should be fed with manure.
2954. It is irrigated from the river, I suppose, by pumping? Yes.
2955. Have you any idea what quantity of water it takes to irrigate the 2 acres? No; I have never calculated it.
2956. *Chairman.*] You have possibly noticed the effect of the present weir on the river? Yes.
2957. What has it been above the weir, between the town and the weir;—has it backed up the water? Yes.
2958. Will you tell us what the effect of the construction of the weir has been below it, down towards your place? I have seen the water fall very rapidly within twenty-four hours, from 2 feet to 3 feet, and 4 feet.
2959. When was that—on more than one occasion? Yes, on more than one occasion. I cannot give you dates.
2960. How has that affected you? The effect has been that it has left the banks in a very muddy, boggy state, and the sheep going into the water, of course, got bogged.
2961. Did you lose any sheep by that means? No, we did not on that occasion. I was afraid we would, but there happened to be a small rainfall on the occasion I speak of, and, therefore, the sheep did not go to the river.
2962. That points to the fact that, in dealing with the river, any process of lowering the water rapidly would have a damaging effect on the grazier's stock by subjecting them to possible bogging and drowning? I should certainly think so.
2963. Have you any cultivation on your place? A very small area.
2964. What extent? Two acres in all.
2965. Just a house garden? A house garden and a small lucerne patch.
2966. What is the lucerne for? Feeding milking cows and a few horses about the house.
2967. How is it that you have not gone in for a greater extent of cultivation? The country is not good enough.
2968. Would you describe the character of the soil? The soil is sandy loam.
2269. Is your place above flood level? No; it is below flood level.
2970. Is it soil that is not easily worked, or is liable to crack? It is easily worked.
2971. Will you tell us its advantages or disadvantages? My idea is that, on the Coolabah ridges on the frontage, the whole of the surface soil has been carried away by the river, and nothing left but a mixture of clay and sand, which is too poor to grow crops.
2972. You have never tried it to see whether crops would grow or not? Yes, I have. In two successive seasons I had a crop of about 5 acres of wheat and oats, and on neither occasion was it worth cutting.
2973. Was that owing to drought or to bad soil? I am convinced it was owing to bad soil. It was not a particularly bad season.
- 2974.

M.  
Robertson.  
23 Sept., 1899.

- M.  
Robertson.  
23 Sept., 1899.
2974. Did it come above the surface? Yes, and then withered away.
2975. How high did it grow? The wheat averaged about 9 inches, and the oats 4 or 5 inches.
2976. And then it died off? Yes.
2977. Is that soil a fair sample of the river-bank soil for any distance from your place downwards? It is a very fair sample of the soil, excepting one or two spots, between Louth and Bourke.
2978. How do those spots differ from the others? The red soil goes right into the river.
2979. It is a better class of soil? Yes.
2980. Above flood level? Yes.
2981. Then you think that the effect of floods has been, instead of enriching the soil on the river banks, to wash away the good soil and leave the worst? Yes.
2982. How far does your knowledge of it extend from Bourke downwards? I know the river, more or less, to Wilcannia, but I know it well as far as Louth.
2983. How many miles? Sixty miles by road, and, I suppose, 120 miles by river.
2984. From your knowledge of that part of the river, both from observation and from what other people living on the river banks have told you, do you think it is unfit for cultivation? I do, excepting in small areas.
2985. In the course of this inquiry we have had the statement made that the squatters ought to cultivate considerable patches of land—say, to the extent of 100 acres—so as to make hay and so on, in order to keep their stock alive in bad seasons;—do you think that it is practicable to do that? I do not think it would pay.
2986. What is your alternative—to buy fodder, or let the sheep perish? Cut scrub, or buy fodder, or remove the sheep to other places, where there may be grass.
2987. Has that been done at all in this district? Yes.
2988. Where have they been sent to? To the mountains below Gundagai.
2989. By train? Yes.
2990. Did that pay? I cannot say.
2991. You did not do it? No.
2992. What do you generally carry on your run in a fair season? About 30,000 sheep.
2993. How many have you now, approximately? I should say we have lost 50 per cent.
2994. Then you have left in round numbers about 15,000 sheep? I should say so.
2995. Has that been a gradual loss from year to year? No, it has not been a gradual loss.
2996. The greatest loss has been within what period? Within thirteen months.
2997. Does it not seem strange that you should stand by and see your flocks decrease 50 per cent., and do nothing to save them? We have made all the provision we thought possible.
2998. In what way? In spending money on cutting scrub. We have spent large sums of money on scrub cutting.
2999. You have done all that, and yet the sheep have died? Yes.
3000. Supposing you had looked ahead, and had had a considerable quantity of stored hay or ensilage, is that a feasible project at all? I think it is.
3001. Supposing you were to get a good season from now, with a prospect of three or four bad years coming after two or three good years, would you profit by your past experience and try to save your sheep in the event of a bad season coming on again, or would you trust to chance and run the risk of your flocks dying? I should make every possible provision in conserving fodder for the stock.
3002. Well, seeing that you do not think that the land on your run is suitable for agriculture, aided by irrigation, what would you do? Go on the country that is suitable. I do not say that all my country is not suitable, but only the frontages—the flooded country.
3003. You might cultivate some of the back country? Yes; I think some of the red country is suitable.
3004. How far back from the river? Eight miles.
3005. You would have to deal with that, and trust to the rainfall? Yes.
3006. Do you think it is possible out in this dry country? Some say it is; they get a crop every three or four years.
3007. What is your average rainfall in ordinary seasons? I should think that 15 or 16 inches is the average.
3008. If that came at the right time for your wheat crop, that would be ample? Yes.
3009. We are told that the rain generally comes about October;—would that be the right time? No. I should think that sowing wheat in April, and trusting to rain in May, would be better.
3010. Do you get rain in May sometimes? Very seldom.
3011. Then, from present information, it would seem that this country is rather bad country to enable you to assist your flocks by growing crops for them? By irrigation depending on the river, it is.
3012. Have you bought any fodder for your stock during the last drought? Yes; large quantities.
3013. For the general flock, or for the better class of sheep? For the better class of sheep.
3014. I suppose that you are feeding them now? No; they are living now on the natural grasses.
3015. A slight fall of rain has given you a little herbage? Yes.
3016. Has this been the worst drought you have known since you have been in the district? Yes.
3017. Up to the present drought, have you got along fairly well? We had a bad time in 1884; but then the country was not watered to the extent it is now.
3018. Watered by tanks? Yes.
3019. Now that your flock is reduced to 15,000, will those keep on diminishing, or do you think you have a chance of saving them? I think we shall save those.
3020. As far as your knowledge of the country goes, do you look forward to it as a part of New South Wales in which, aided by irrigation, agricultural pursuits are likely to be extensively indulged in? No.
3021. Too dry country, too uncertain rainfall, and too far away, I suppose, from the market? Yes; and soil too poor.
3022. In the course of our inquiry it has been suggested that along the banks of the river Darling there may be patches which could be cultivated, the water being pumped up on a co-operative principle to irrigate a number of adjoining holdings;—do you think that is a feasible proposal? No.
3023. Do you know of any sites upon which you could put your finger which would be suitable for that kind of undertaking? No; I do not think it would pay.

M.  
Robertson.  
23 Sept., 1899.

3024. The soil is not suitable? It is not suitable, except in one or two isolated places.
3025. And when they grew the stuff, what would they do with it? No market, I think.
3026. Does that extend pretty well from Bourke down to Louth? I think so.
3027. You said just now that if the river were locked, and weirs were erected, and there were a free river, that would be the means of the river being largely availed of for transit purposes? Yes.
3028. Supposing this proposal were carried out from Bourke to Menindie, do you think that that locking would be the means of bringing produce and wool up the river as a feeder to the Bourke railway? Yes; from all the country below Louth I think it would.
3029. With a good river always navigable, but not taken beyond Menindie, you think that nearly all the produce from there would come to the Bourke railway? Yes; below Louth it would come by boat.
3030. Of course, if the locking were continued beyond Menindie to Wentworth, the boats would still go on, and possibly down to South Australia? Yes.
3031. How do you send your wool? By rail to Sydney.
3032. Before the Bourke railway was built how did you send it? By steamer to Wentworth and Adelaide.
3033. Do you find it pays you better to send it by train direct? Yes.
3034. Certainty of transit has been the chief ingredient? Yes, and quick despatch.
3035. With a free river right down to South Australia, would you then send your wool to Sydney by train? No.
3036. If you could send it more cheaply by river, you would send it by river? Yes.
3037. So this position presents itself: that, with a free river from here right down past Wentworth, our constructing locks and weirs would divert trade from the railway at Bourke? Yes.
3038. Locks and weirs from here to Menindie would be the means of bringing trade to the Bourke railway and keeping it in the Colony? Yes.
3039. Do you know any squatters on the banks of the river who have engaged in large cultivation areas—say, 100 acres in extent? No.
3040. Have you ever talked over that matter with them—about growing fodder? Yes.
3041. What have their opinions been? Their opinions are the same as my own—those that have country not suitable. Some who have fair country on the river have a good few acres irrigated.
3042. *Mr. Watson.*] Do you think it would be practicable for a number of pastoralists to combine in the laying down of a large pumping plant, with the view of sharing the water later on and irrigating a small plot belonging to each; in that case, you would require the holdings to adjoin? They would be a considerable distance apart.
3043. Does this sandy clay invariably extend 8 miles back from the river through your country? No.
3044. Are there tongues of good red soil coming down through it occasionally? So far as my frontage is concerned, there are no tongues of red land coming down through it.
3045. It is practically uniform in character? Yes. It does not always extend 8 miles back, but here and there there are red salt-bush plains.
3046. How close would they come to the river, in some instances, on your own land? About  $4\frac{1}{2}$  miles.
3047. That would be too far for taking water for irrigation? When I said 8 miles I meant the country suitable for irrigation—nice friable soil.
3048. That would be 8 miles back? Yes.
3049. Too far to carry the water? Yes.
3050. You are not very hopeful of the prospects of irrigation? No.
3051. *Mr. Dick.*] Mr. Harper gave the following evidence in reference to this proposal. He was asked: If the river is rendered permanently navigable, have you no hope of successfully competing with it? No. What-ever insurance is paid would then necessarily become lower. Would it be possible for the railway to compete with the river traffic? Yes. Do you think you would lose the Bourke traffic if the river were made permanently navigable? We should either have to lose it, or so reduce our rates that they would be absolutely ruinous.
- Do you agree with Mr. Harper, that if the river were made permanently navigable by a series of locks, it would be impossible for the Bourke railway to compete against it; in other words, do you think you would send your wool by the river rather than by the railway? It is all a question of rates.
3052. I think you gave it as your opinion that the soil immediately adjoining the river, on either bank, is practically a sub-soil, the original red soil having been eroded by the river? Yes.
3053. And hence you think there is not much prospect of successful irrigation on such soil? I do not think there is.
3054. Have you ever made a contrast between the cost of scrub-cutting, purchasing fodder, and other means that you adopt at present for saving your stock during drought, and, on the other hand, the probable cost of growing crops by irrigation on your holding? No; but I shall be able to do so now we have got through this scrub-cutting experience.
3055. Would you hazard an opinion now as to which you think would be the cheaper—growing crops by irrigation, or using those other means? My evidence is that you could not irrigate on this river, and make it pay.
3056. Do you know whether there are any patches on your holding having a slope away from the river, suitable for irrigation—red soil, for instance? No; there are none.
3057. *Chairman.*] What scrub have you been cutting for fodder during this weather? Mulga, chiefly.
3058. When that is cut down it does not grow up again? We have been following out the principle of leaving one small branch below the cut, and in those cases the tree will grow again.
3059. In cutting your mulga you have taken the precaution to leave enough vitality in the tree for it to grow again? Yes.

Walter Bankes, caretaker, Bourke Weir, sworn, and examined:—

3060. *Chairman.*] You are the Government caretaker at the weir 4 miles below Bourke? Yes.
3061. How long have you been there? Ever since its completion.
3062. And also during the latter part of its construction? Yes.
3063. When the weir was completed and first brought into operation, what was the height of the river? The river was very low.

W. Bankes.  
23 Sept., 1899.

- W. Bankes. 3064. At the public opening, which took place in July, 1896, the river was very low and the movable shutters were left up? Yes, they were up at that time.
- 23 Sept., 1899. 3065. They remained up until when? The shutters were lowered for the first time on 3rd August, 1896, when the river level was 12 ft. 2 in. above, and 5 ft. 3 in. below the weir.
3066. What was the height of the river at the opening of the weir? The height of the river at the official opening of the weir was 10 ft. 7 in. above, and 1 ft. 10 in. below.
3067. At the opening of the weir the shutters were standing—what effect had those shutters on the height of the river above the weir? They were backing up the water.
3068. To what extent? It rose very gradually until August, and then a fresh came into the river and the rise was more rapid, and it very soon went over the crest of the weir. In about four days it topped the weir.
3069. It continued to run over the top until when? We lowered the shutters then immediately. The river became navigable and they had to be let down.
3070. You let them right down? Yes.
3071. There was then a sufficient depth of water for navigation? Yes.
3072. That state of things went on for how long? The river was navigable for about two months.
3073. And then the river began to fall? Yes, and the shutters were raised again.
3074. With the result that the water was backed up again to the top of the shutters? Yes.
3075. And that went on for a considerable time? Yes, until the next rise came.
3076. And then did you lower the shutters again? Yes. As soon as the river becomes navigable they are lowered.
3077. Tell us the next time that the shutters were lowered? They have been raised and lowered frequently until just recently. We let them down just before the last rise.
3078. On what occasion was that—to let a steamer down? No; the present rise that is here now.
3079. *Mr. Watson.*] Is it not a fact that the shutters were lowered at the request of the people of Wilcannia, with a view of letting a steamer down with a lot of produce? I cannot say at whose request it was done, but I got instructions to do it if possible.
3080. And it was done? Yes.
3081. What was the height of the river above and below the weir? On 6th October, 1898, when the steamer "Pilot" and her barge were flushed down, the river level above the weir was 13 feet 2 inches, and below it 6 feet 7 inches, previous to the lowering of the shutters, and after the lowering of them the river was 9 feet 9 inches above the weir and 9 feet 3 inches below it.
3082. *Chairman.*] From October, 1898, until now, have you had the shutters up and down? Yes.
3083. And each time they have been raised has the effect been to block back the water? Yes, excepting once.
3084. When was that? During last year, just before Christmas. It raised it then to a certain level.
3085. Was that the time when Mr. Darley was up here? Yes.
3086. Is there much water escaping through those shutters? Yes, a considerable volume.
3087. How does it get away—through the interstices? Yes, and at the junction of the shutter with the sill, which is not a close joint.
3088. Have any steps been taken to try to prevent such a lot of water from getting away? Yes. Just before Mr. Darley came up we put in some rope stoppers, in order to see the effect. They were not put right across, but only about half way.
3089. What effect did they have? They blocked a considerable amount of the flow in the spaces between the shutters.
3090. But at the bottom the escape was just the same? Yes.
3091. Was the proportion of water that escaped much larger than that which was kept back? Certainly it was, because the latter ran down to zero.
3092. Then, as a means of backing up the water when the river was low, the shutters were not effective? No, they were not.
3093. They are down now are they not? Yes.
3094. Then the only water that is kept back now is up to the height of the sill—where the foot of the shutter touches the sill? That is all.
3095. As a means of damming back the waters of the river Darling, I suppose these shutters cannot be compared with a fixed weir, because in the case of the latter the water must have been left there, unless you had opened the gates and let a lot of it through? Yes.
3096. Do you find much difficulty in manipulating these shutters? No; there is no difficulty.
3097. How is it done? By means of a punt and a winch.
3098. How many men? Three when the river is low, and two when the river is as it is now.
3099. And one shutter at a time? Yes.
3100. And how many shutters? Thirty.
3101. And how long would it take for three men to close the shutters? With men who understood the work, six hours.
3102. Do they come up easily with a good rush of water against them? Yes.
3103. They are not brought up as a solid body? No, they come up feathered.
3104. Is it easy to adjust the receding rod? That is where the main difficulty is; they are apt to tilt forward.
3105. Did they ever get out of place when once they were up? Yes, they have. When the river gets very low the wind blows them forward, and then they have to be lowered and pulled up again.
3106. *Mr. Watson.*] Then they are not keeping any water back? No.
3107. *Chairman.*] Mr. McKinney said that there were means of preventing so great an escape of water by putting slides of wood over the openings between the shutters? That has not been tried. We have tried only the rope.
3108. That would be rather a primitive and difficult thing to do? There would be some difficulty in getting them into place owing to the suction. The rope is easily got there, because the suction draws it into position.
3109. Can you tell us how far back the water was dammed when the river was at its strongest current, and when the shutters were up? I believe 50 miles. So the captains of some of the river boats told me.

3110. The effect was visible, of course, at Bourke? Yes, and above the weir for 50 miles.
3111. It is admitted that unless you can guarantee a plentiful flow of water, the shutter is not a suitable kind of weir for sending the water back; but it has also been suggested that it would not involve very much labour to make these shutters water-tight, and that the man in charge could easily do all that was wanted to make the shutters water-tight;—would it be an easy job? I do not think it would be possible to make these shutters absolutely water-tight; but a great deal of the flow could be stopped.
3112. The covering up of those interstices would not be an easy matter? Not to do it effectively.
3113. It would be a work of time, and require a very careful fitting of the slides? Yes.
3114. What width are the openings? An inch at the lower half of the shutter and 2 inches above.
3115. I hand you a photo of the weir taken on the day of the opening, and included in the report of the Minister for Works, showing the escape of water through these shutters;—does that give a truthful representation of what went on at that time, and what goes on generally, when the shutters are up? Yes. The water is always flowing through like that.
3116. That looks as if it were anything but an effective weir to keep back the water? Yes. A very large quantity passes through.
3117. What has been the result of your observation in regard to silt at the weir? The weir is perfectly clear of silt, both above and below.
3118. Does that indicate that the stuff is of such a fine character that it goes away with the water? I suppose it does.
3119. On the lock side of the river there is some silting up? Yes.
3120. How do you account for that? There is an eddy there. The lock is situated immediately behind a bend, and behind all the bends in this river there is a sandspit.
3121. There is an eddy on that side of the river which causes the sediment to stop there? Yes; but that deposit is formed only when the lock is entirely submerged in a very high river.
3122. Does it wash away as the river goes down? No, it does not.
3123. It will have to be dredged away? It wants some appliance. We have to put in a spur to force the current over to that side in order to scour it away.
3124. This lock and weir are erected not very far from a bend in the river? Immediately behind a bend in the river.
3125. In the proposal before us, Mr. Darley's idea is to have the locks and weirs always, when practicable, in a long straight reach? Yes.
3126. There ought to be no silting up then? No, there ought not to be. Most of the silt has accumulated with a 28 feet level.
3127. Is this silt so bad now that the lock gates cannot be worked? In the chamber of the gates themselves, it is.
3128. Have you drawn the attention of the Department to that? Yes.
3129. And they are going to have it remedied, I suppose? I think so. The silt is liable at any time to get into the gate chambers and prevent them from closing.
3130. Is it very difficult to remove? It depends on circumstances. Sometimes we can clear the four gates and shut them in a day; but sometimes it will take three or four days.
3131. But supposing these locks were regularly working? If they were regularly working no silt could get there, because there would be no current passing through. It is only when the whole thing is opened that the silt gets there.
3132. So, if the locks and weirs were in full work the trouble from silt would disappear? Yes.
3133. From your evidence there seem to be several little details, as well as these fixed shutters, that want looking to before this lock and weir would be in thorough working order;—is that so? Yes; in a river like this the freshes come down so strangely. It is not like rivers in other countries.
3134. The silt is of a character that does not readily accumulate? No; it is very fine, and it passes away. Once it is stirred up it is easily removed. Where it now collects, caused by an eddy in the river, I think the accumulation of silt could be prevented by the erection of a spur or wall that would cause the water to run straight through, instead of putting it into the present pocket or corner when it accumulates.
3135. We have had before us as witnesses here one or two gentlemen who have holdings below the weir, and they say that the movements of the weir have affected the river very rapidly on their runs, and have caused a sinkage of the water, and their sheep to get bogged on the river banks;—have you heard any complaints of that kind? Yes, I did hear them; but they never say anything when the river rises and falls, in the natural course, that way.
3136. But they say that is very gradual? It rises and falls very rapidly sometimes.
3137. They say that in a gradual fall of the river the river mud hardens, and the sheep are able to walk on it? Yes, in a very gradual fall it does; but sometimes it will fall a foot a day, and the mud cannot have time to harden then.
3138. Then you think their case is a little overstated when they make a complaint against the weir? Yes, I do.
3139. Has the character of the water above the weir suffered at all by the damming-up, as regards its purity or otherwise? I think that improved it during last summer, owing to the greater depth of water; and it was certainly cooler.
3140. Has the erection of this weir been, as it was intended to be, a kind of object-lesson for us at the present moment in this investigation? Yes.
3141. In what way? To keep them clear of these bends in future, so that they will not silt up.
3142. That is, in constructing weirs in future? Yes.
3143. This is what a former Committee said:—
- Before any general scheme for locking the Darling is adopted, ample time should be afforded to test the effect of the construction of the Bourke weir upon the river channel, both above and below, and to ascertain if movable shutters become unworkable after long submersion.
- The effect of this weir, you say, has been to purify and cool the water? Yes.
3144. And it has backed the water for 50 miles? I believe so.
3145. Below the weir there has been no accumulation of silt? No.
3146. And the water itself has not been affected? No.
3147. Because, when the weir was up, and there was an overflow, people below it got the whole flow of the river just as they would if the shutters were down altogether? Yes.

W. Bankes.  
23 Sept., 1899.

- W. Bankes. 3148. When these shutters are down, and on the bed of the river, do you notice much or any accumulation of silt upon them? There is none whatever.
- 23 Sept., 1899. 3149. The water shoots well over, and the silt does not accumulate? Yes.
3150. When the shutters have been lowered and raised again at various times, has that been done on your own motion, or who directs that the shutters shall be raised and lowered? Generally it is left to me.
3151. And what guides you in dealing with the matter? When the river falls to navigation level—that is, 6 feet 6 inches—the shutters are raised.
3152. And when the river begins to rise again, you lower the shutters? Yes. We get reports from a number of places, and know when a rise is coming, and when it reaches Bourke we lower the shutters again; but we did once let them down specially to let the steamer “Pilot” go through to Wilcannia. I have not heard of any complaints since the weir was officially opened. We close only half of the weir at a time, and let the water rise gradually, and therefore the people below the weir get a flow all the time. As the river rises, so we keep on closing the shutters one at a time. My instructions have been to cause as little inconvenience as possible to the people, both above and below the weir, when I am manipulating it.
3153. Has the lock ever been used? Yes.
3154. Once or more? I suppose a dozen times.
3155. With what result as regards ease of working and time for a vessel to negotiate the lock? It takes about twenty minutes to put one through.
3156. Is the lock easily worked? Yes.
3157. How many men? I can do it by myself; the gates are opened by a lever.
3158. And they work well? Yes, very well. Of course, they are heavy.
3159. With a fixed weir, do you think that one man at each weir would be sufficient to manipulate affairs, assisted by the steamer men? Yes, certainly.
3160. And keep things in order? Yes.
3161. As regards the expense of working a fixed weir and the expense of working movable shutters, there is no doubt that it is largely in favour of the fixed weir? Certainly.
3162. If one of the shutters were to get injured by something knocking against it, or by the struts getting out of order, or by the hinges getting broken, I suppose that that would incapacitate that part of the weir altogether? None of it would be any good until that was repaired.
3163. And would it not be a considerable trouble to get a thing like that repaired? Not when the river runs low; then it can be easily done.
3164. But supposing the accident occurred a long way down the river, at a place far removed from a township, and with no blacksmith’s or engineering shop near at hand, would that not be rather a serious thing to contemplate? Certainly it would.
3165. And it might happen at the critical time when the saving of water was very desirable? You would either have to put in a coffer dam or let the river run dead low.
3166. When you put the shutters up with a falling river, from then until you let them down again with a rising river, the weir is in the nature of a fixed weir for the time, although not quite watertight? Yes.
3167. Do you see any evidence of silt above the weir when next you let the shutters down, or during the interval? No; when the weir is up the silt does not accumulate. It is only in a high river, when everything has been opened, that the silt has accumulated here.
3168. Fears have been expressed by some people that, with fixed weirs, a certain amount of silt would accumulate above them;—do you think that is likely, judging from what you have seen of this weir? I do not think so. I think it would go over, because it is very fine stuff, and is carried with the current. It is only where there is an eddy that it deposits.
3169. *Mr. Shepherd.*] Have you noticed whether, when all the shutters are up, there is very much difference in the level of the water above and the level of the water below the weir? Certainly there is.
3170. So that the whole of the water does not escape through these openings? Not when there is a good flow.
3171. You say it requires three men to attend to each lock properly? To this particular lock.
3172. Have you had any experience of fixed weirs? Yes.
3173. Where? In England.
3174. Did you find them answer well? They answer well there.
3175. There would be less labour, I should imagine, in working a fixed weir? Yes, certainly.
3176. And you say it is harder to adjust these shutters when the river is low than it is when the river is high? Yes; it takes three men when the river is very low, but two can do it when the river is high. There is then more pressure against them.
3177. You say the weir affects the river for 50 miles up? I am told so.
3178. Is that when the river is down to the level of the weir? It is when it is running over the crest of the weir. There may be 4 feet below, and there may be 13 ft. 6 in. above.
3179. That is when the whole thing is blocked? Yes.
3180. What was the height of the river when the photograph which you were shown was taken? I cannot say exactly, but I should think about 9 feet.
3181. That would be something about the same as it is now? Yes.
3182. And at that time the shutting of the shutters made a considerable difference in the level of the river? Yes; you can see that from the photo.

George Pickhills, sworn, and examined:—

- G. Pickhills. 3183. *Chairman.*] You have been master and owner of steamers plying on the river Darling, during the past thirty-five years? I have.
- 23 Sept., 1889. 3184. *Mr. Watson.*] You have heard of the proposal to lock the river between Bourke and Menindie? I have been one of the foremost believers in locking from the inception of locking, and have agitated for the Bourke weir.
3185. What do you think has been the effect of putting the Bourke weir in? I think the weir is not high enough, and that the lock is on the wrong side of the river.
3186. Why do you think the lock is on the wrong side of the river? Because the lock is out of the current, and in an eddy, and is, therefore, more likely to have silt deposited upon it. 3187.

3187. You think, then, that the fact of placing it on the inside of the bend where it now is makes it more likely to be silted up? It is a mistake. G. Pickhills.
3188. Why do you think the weir should be higher? Simply for this reason: If the weir were, say, 3 feet higher, it would not have cost a great deal more money, and would have thrown the water very much further back. 23 Sept., 1899.
3189. But, of course, if you had weirs sufficiently near each other to provide navigable water all the way, that objection would not be of any particular value? No.
3190. Speaking generally, do you think that a number of weirs, each with a 7-foot lift, will be sufficient for navigation? The locks would need to be very much closer.
3191. What do you think is a sufficient allowance in the way of depth of water for navigation—what do you want to be guaranteed? Five feet.
3192. With a guarantee of 5 feet of water, navigation could be safely continued? Yes.
3193. You have advocated the locking of the river from Bourke to Menindie, and no further? Yes.
3194. What do you think would be the effect of that? That you would get the whole of the river trade for the Bourke railway, instead of allowing it to go through to South Australia. You would also get the trade of White Cliffs.
3195. Is it not quite possible that within a short time even the Federal Government would cause the river below Menindie to be locked, even if it were locked from Menindie to Bourke in the first instance? I should say that locking the river from Bourke to Menindie is actually necessary.
3196. But I suppose you are aware that the Federal Government, which is shortly to be initiated, will have control of navigation and all things that pertain to it, and consequently would have power to put weirs in the river from Menindie downwards? Yes.
3197. It may, therefore, be necessary to look at this project as though it were intended to take it right from Bourke to Wentworth;—what do you think would be the effect of that on the opening of country in the surrounding districts, and on traffic generally? My opinion, then, would be that, with the Federal Government and an equal tariff, possibly a great proportion of the trade would go to South Australia. I think that a great deal of the wool would go to South Australia instead of over the railway, because the Murray is very seldom low. It is not like the Darling—erratic in its movements.
3198. The Murray is nearly always navigable when it is necessary to carry heavy goods over it? Yes.
3199. During the period when you are putting out wool? Yes. It invariably rises, you may say, from April or May, and right up to Christmas—nine months in the year.
3200. It continues navigable until when? Until Christmas, and sometimes until January.
3201. And before January, I presume, the wool would be down? Oh, yes.
3202. So that, for the purposes of an outlet for wool and similar products, the Murray would be navigable? It would.
3203. Supposing the trade in that case did go to South Australia, do you think there would be any compensations accruing to New South Wales by reason of the opening up to any great extent of her Crown lands? I do not think so. And you would not benefit South Australia very much either. The wool would be shipped to Port Victor and go to Melbourne, and be diverted from Sydney. Possibly in some cases it might be transhipped into other vessels at Port Victor, but in most cases it would go to Melbourne. You can deliver wool from Bourke to Port Victor for something like £5 a ton, f.o.b. at Port Victor, for transit to London.
3204. They can get it taken from here to Sydney more cheaply than that? Yes; but stations 100 miles below would prefer to send their wool by river, if a river could be guaranteed.
3205. It would appear from what you say that New South Wales has not a great deal to expect from the expenditure of money in locking the river, unless it is confined to as far as Menindie? That is my opinion.
3206. We seem to be not in a position to guarantee a cessation of the work after we get just past Menindie? My opinion is that the trade below Menindie is not worth having, because there you are so close to South Australia that South Australia has been supplying the people there for years past; but, by opening the river to Wilcannia, you would supply Broken Hill and the adjoining country out to White Cliffs, and also an immense area of country on both sides of the river.
3207. What has been your experience as to the navigability of the river;—during what portion of the year was it possible for you to continue running, on the average? On the average, about seven months in the year, but I have lain here seventeen months without moving a paddle-wheel. However, that was during an exceptional season. On the average, navigation is assured for about seven months in the year now.
3208. How long is it since you ceased active work? Only lately.
3209. Does there seem to have been any difference in later years;—any increase in the depth of water, on the average, or any decrease? No alteration, except in certain places where a slight island in the river may have been removed by an extreme flood, or a deposit may have taken place, which was afterwards washed away.
3210. Merely local alterations? Yes, and not permanent. In some cases break-throughs have formed, cutting off a bend. That is natural, but only where the river is so narrow that there must be erosion gradually straightening the river out.
3211. Do you know any of the work done lately in regard to snagging? I was up the river with Mr. Trickett, the Government superintendent of snagging, in the steamer "Lady of the Lake."
3212. Do you think that that work has been effectively done? My experience is that it has been well done between here and Brewarrina. I cannot speak of other places.
3213. I did not mean as to the manner in which the engineers have done their work, but as to whether other snags would not take the place of those removed? It will be a great many years first.
3214. Is it possible if logs are going down in a flood to notice them particularly? Always with a heavy flood, of course, floating timber which has been lying on flats—perhaps cut in dry seasons—and the tops of trees, will come down the river, but I do not think that they become permanent snags in the river. They form floating masses of timber, which catch against other timber in the river, but they do not cause any permanent obstruction.
3215. Do you think it is probable that after the river were once effectively snagged a small patrol party could keep it free from every obstruction of a dangerous character? Most undoubtedly. I believe that two parties could keep the river clear between here and Wentworth if it were once effectively cleared.

- G. Pickhills. 3216. Do you know the average rates of freight between here and Wilcannia? Everything depends on the nature and stability of the river. Sometimes it is a permanent river during the wool season, and things are taken down at a rate as low as 30s. a ton. Latterly they have been taken from here to Wilcannia at £3.
- 23 Sept., 1899. 3217. The 30s. rate is when you have had loading each way? Yes; and a permanent river. At present the rate is £3, and it has been for months past because the river has been so fluctuating, and boats have been liable to be stuck up.
3218. Did you ever trade right through from here to Morgan and down the Murray? For some years I did.
3219. When you had a good river, what did you get for freight from here right down to Morgan? I never had less than £5 a ton, but that is many years ago. The freights have gone down considerably since then. I have latterly been trading up the river, and from here to Wilcannia. South Australian boats come up here during the wool season, and leave their barges at stations for months. They wait for a good river without engaging a crew, and in the meantime the wool is loaded and it is taken sometimes at as low as £2 a ton from Wilcannia to Morgan. Some of the barges carry from 1,700 to 2,000 bales of wool each.
3220. It is proposed to place these weirs at seventeen places on the river between here and Menindie; the weirs vary in height from 7 feet to 10 feet;—what do you think would be the maximum height at which you could place a weir without injuriously affecting the country away from the banks if a flood were on? Ten feet, safely. It would be an advantage with 10 feet.
3221. In what way? Because a number of creeks would not be filled if you had only 6 feet or 7 feet, but 10 feet would fill them.
3222. Do you think 10 feet would have an appreciable effect in flooding the country around? No; it would take 14 feet or 15 feet to do that. Twelve feet would not go over the flats; 12 feet would be quite safe.
3223. With a weir 12 feet high, would some of the small creeks have water backed into them? Many of them, and it would go for miles inland.
3224. In many places the banks are so high that that would not occur? In many places.
3225. But, occasionally, there would be a backing up of water into these blind creeks if you had weirs 12 feet high? Undoubtedly; and I think it would do a vast amount of good.
3226. But the raising of the water, say, 1 foot or 2 feet inside the banks would not make a great deal of difference when spread over a mile or so of country outside the banks? It would be hardly perceptible.

MONDAY, 25 SEPTEMBER, 1899.

[The Committee met at the Court-house, Bourke, at 10 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Clarence Hardie Gorman, Manager, Pera Bore Farm, sworn, and examined:—

- C.H. Gorman. 3227. *Chairman.*] How long have you been at Pera Bore? Three years.
- 25 Sept., 1899. 3228. Will you kindly explain what your duties are? The general management of the farm and orchard, and the care of the settlement. I am in charge of the distribution of water to the settlers, and the general management of the settlement, under the new arrangement which the Department has now made.
3229. What is that new arrangement? Under the terms of my appointment, the farm and the settlement were under the Public Watering Places Branch, in which there was a sort of dual control; but the Minister has approved of the whole place being transferred to the Agricultural Department, and worked under that branch, having only one officer in charge at Pera.
3230. So you have the stock-drinking troughs? That comes under me. There is a caretaker specially for the work of attending to the watering of travelling stock, the distribution of water to the settlers, and the keeping of the flumes in repair, under my direction.
3231. The staff consists of yourself, the caretaker, and two farm hands? Yes; one is foreman. Up to a month ago I had three hands, but one has left, and I have not yet engaged another man in his place. The staff is really two hands and a foreman.
3232. What are you growing there? We are principally experimenting with fruit. That is really the object of the farm.
3233. How many fruit-trees have you in, and what kinds? I cannot say the exact number now, but we have about 33 acres planted with fruit-trees—citrus and deciduous trees. I include a small vineyard in the 33 acres.
3234. Have you been there long enough to be able to say which kinds of fruits are the most suitable? So far as the growth is concerned, I can certainly say that the citrus trees will be the most remunerative, though I have not been there long enough to arrive at what will be a fair crop, because the trees have not come into full bearing yet; but judging from the growth and the habit of the trees, and the lack of disease, I think that the citrus trees will eventually be most successful, and there is no doubt that raisin-growing and the cultivation of sultanas and currants will be another great industry there.
3235. The soil there is red soil, is it not? Yes.
3236. You have been for several years the holder of a block of land at Mildura, which I believe is what they call the mallee and pine country;—you can, perhaps, tell us how the soil there differs from the Pera soil? Yes. I think that the soil at Pera is not so free. At Mildura the soil seems to be of a much freer nature.
- 3237.

3237. That being so, are you able to make a comparison as to which is the better class of soil for fruit-growing purposes? I would hardly make a comparison, for this reason: I have not been long enough at Pera to see any return from the trees. The growth has been very satisfactory, but the cost of working is a little more expensive than at Mildura.

C. H.  
Gorman.  
25 Sept., 1899.

3238. The effect of the watering at Pera is to make the soil get very close, is it not? Not necessarily the watering.

3239. The water has that effect? Yes.

3240. And you say that the remedy for that is a thorough system of green manuring? Yes.

3241. Would that make the farming very much more expensive? Not at all. There would be a certainty of increased returns so far as the farming is concerned; but the trees would not feel it for some time. So far as small crops are concerned, the return would be shown in the crop.

3242. I understand that there are twenty blocks of about 20 acres each available for farming at Pera, and they are all let at present? There are eighteen blocks of 20 acres each and two of 24 acres each, and they are all let.

3243. Are they all being worked by the holders? I cannot say that at the present time. Five of the settlers are away, and I cannot say whether they intend working their blocks again or not.

3244. How many permanent farmers are there who are not occupied otherwise than in farming? About fifteen.

3245. Do not some of them do other work when they get a chance? Yes, such as contract work.

3246. Shearing? No; there are no shearers there now.

3247. Any teamsters? One teamster; and others, I think, take small contract work.

3248. Is there one, or more than one, instance of a man getting a living on the holding without doing anything else? Yes.

3249. How many are there getting a living on the holdings without doing anything else? There are two I know of getting a living from a block, and I think a third.

3250. Have they any fruit-trees in? Yes.

3251. Do you know how many? About 7 acres of fruit-trees.

3252. And the rest is cultivated in what way? They make their living from market gardening—supplying vegetables and green fodder to Bourke.

3253. The fruit-trees are not in a stage yet to give a return? No; they have not come to maturity yet.

3254. Is the growth of the fruit-trees satisfactory? Quite.

3255. We understand that latterly the supply of water to the settlers has been curtailed about one-half;—how has the shortness of water affected their crops and their fruit-trees? We had to put all our energies on to the fruit-trees in order to keep them going, and had to allow the small crops to go. That is the only thing we could do.

3256. But under their contract the settlers were to get a certain quantity of water with which the Government has not supplied them? Yes.

3257. Are they suffering, as regards their crops, by reason of the shortness of water? Some of them have. Had there been more water available they would have had more ground under cultivation.

3258. They are now limiting the extent of their cultivation and are using all the water they can get for what they have, in order to keep that going? Yes; we have always endeavoured to give them a fair proportion of the water—in fact, the Government farm has suffered in that respect.

3259. How often do you think the trees should be drenched? It all depends on the season, and also on the age of the trees.

3260. The seasons here are always pretty dry? Yes; but we may get rain at a certain time which may, perhaps, save two irrigations.

3261. You have had nothing of that kind lately? No; we have had one fall of  $3\frac{3}{4}$  inches.

3262. In continuous dry weather, when you look to irrigation as the means of keeping the crops and the trees in working order, how often do you think they ought to be drenched? Three-year-old trees require a good irrigation at least once a month.

3263. And other crops, such as vegetables? I cannot lay down any rule as to what quantity they would require, but the water should be available at least once a week for vegetable culture—in fact, in very hot weather, twice a week.

3264. As far as your experience has gone, is the bore water in any way injurious to the soil or the crops? Not at all; in fact the soil has been analysed and no bad effect has been discovered.

3265. There is no salty crust on the soil after using the water, is there? Not with a proper system of cultivation. If you allow the water to run, you get a white, sodary matter on the ground afterwards, and there is a sort of black substance that seems to run close to the white; but that will not be noticed if the ground is perfectly cultivated and kept well open and absorbent.

3266. Is that crust injurious to the crops? No, I have not found it to be so. I have allowed the furrows in some cases to remain open a considerable time, and I have never seen any ill effect.

3267. Would you mind telling us what was your experience of irrigation at Mildura? Practically, similar to the work I am doing at Pera; but it was only on small holdings.

3268. But as regards expense; in the first place the holders of land at Mildura were under a very much heavier rental and charge for water than the people at the Pera bore are? Yes. When I first went to Mildura we paid 6s. per acre per annum for water there.

3269. Were you a freeholder of the land? Yes. The land itself cost £20 an acre; at least, that was the upset price. I know that as much as £40 an acre has been paid for land there, without it being cleared.

3270. What would it cost to clear the mallee off? From 10s. to 18s. an acre—that is, the light mallee. Some of the very heavy mallee would cost almost as much as £3. I am speaking generally of the land around Mildura. Then, after two and a half years of work there, the water-rate was raised to £1 an acre. There is one grower in Mildura with whom I had been in communication for some time, and who has said that he would be prepared to pay £2 per acre per annum for the water if he could get it when he wanted it, he is so satisfied that the returns could be increased, proportionately to the charge for water.

3271. Has Mildura been a failure as a settlement? I hardly think so. Certainly the company went to very extreme methods in developing and laying out work that was really too far ahead of the demand, and instead of keeping the settlement compact, they went out to such a distance that they had to make tremendous channelling in order to water the isolated blocks. I do not think they would have had any trouble

C. H.  
Gorman.  
25 Sept., 1899.

- trouble there had the company kept the settlement compact; but there was a desire to sell land at any price, and they allowed people to select anyhow.
3272. At the present time is the supply of water at Mildura stopped? No; there appears now to be a much better feeling, and the people there appear to be more successful.
3273. The water there is all pumped from the river? Yes.
3274. What height of lift? In some cases up to 50 feet.
3275. Are there various pumping stations? There are four pumping stations.
3276. And have they large reservoirs for holding the water? No; they pump direct into the channels. These are all earth channels. There is no fluming there, except at some places where they have a few chains of fluming. The channels are all made out of the natural earth, in some cases concreted and cemented.
3277. Would there not be a lot of waste, consequent on the earth channels being used? That was our trouble there at first. The crayfish used to bore through the earth channels, and let the water get away. That is the reason why we had to use concrete in some places, for it was only in bad places that the company concreted; but I think that, with the improvements which the Government have made at Mildura, the majority of the big supply channels will be concreted.
3278. With regard to Mildura, I suppose that the surface to be planted and irrigated was laid out on such a system, to begin with, as to get a gradual fall for the water? Yes. The company delivered the water to the highest corner—not point—of every block, and each landholder had to prepare his land for irrigation. On my own block I paid £2 an acre for grading alone, in order to make the furrows.
3279. What was the size of your holding? Only 20 acres.
3280. Can you tell us what area one of those pumping appliances would serve at Mildura? I have been informed that a 10-horse-power engine, with a lift of about 18 feet, would irrigate a block of land about 200 acres in extent.
3281. You have been one of the early settlers at Mildura, and having taken up one of the 20-acre blocks there, would you mind stating to the Committee how it is you severed your connection with that place? I have not severed my connection with it. At the time I left, having been there six years, and my fruit-trees just coming into bearing, there was an agitation among the settlers as to the supply of water—as to whether the irrigation company representing the settlers should have charge of the water, or whether Chaffey Brothers should have charge of it. The agitation was really so upsetting that many of us decided to lease our blocks—not actually giving them up—if we could get suitable lessees, and try to start somewhere else in the meantime. That was the only reason why I left.
3282. Why, if they gave you water, as required, at a fair charge? The trouble was that they were not giving us the water. We could not get the water when we wanted it, even though we were prepared to pay a fair price for it.
3283. The water-supply not being satisfactory, then, caused you to leave? Yes.
3284. And you have let your holding to a farmer? To a neighbour.
3285. Is he working it? Yes.
3286. And keeping it on as a going concern? Yes.
3287. How is he doing? I have not had returns for last year's crop; but I do not think he is doing very well on it.
3288. Do you know what they are now paying for water? Twenty shillings per acre per annum, I think, still.
3289. Coming back to Pera Bore: you, I understand, were sent to Pera as a man having had some experience of fruit-growing on an irrigation settlement? Yes.
3290. How did you find the place as regards its laying out for the purposes of irrigation—was it satisfactory or not? Very faulty.
3291. In what respect? The land had not been laid out at all. Orchards had been planted, but no attempt had been made to grade the land so that we could get the water on to it with the least possible waste.
3292. Have you tried to remedy that? Yes, we have been grading and grading; but it is very difficult to grade throughout an orchard that has been planted.
3293. Do you mean your own place, or for the settlers? I am speaking only of the Government farm. As far as I could judge when I first came, the settlers had made no attempt to grade. They had followed the example set by the manager or whoever was in charge of the work at the Government farm. It was peculiar the way the place was started. It was originally a public watering-place, and the Department decided that they would plant a certain area, and they went on adding to this without any system at all. The officer then in charge had had no practical experience of the work, and, of course, it is of no use a man trying to lay out such a place unless he has had some experience.
3294. The system of supplying water was by raised flumes of sheet-iron? Yes.
3295. Is that still in vogue? Yes.
3296. How have you altered the 60 acres you are now irrigating—have you altered the whole level of it? Yes; and I have put in new surface drains. I took away all the distributing channels on the Government farm. I had to do so.
3297. Is it working more satisfactorily now? As satisfactorily as we can work it; but, as I have said, it was so difficult to grade while the trees were in, and I simply did the best I could without removing the trees. Planting an orchard where you depend on the natural rainfall is totally different from planting one where you are going to irrigate. In the latter case you must have the land in such a way that the water will run from one end of it to the other, otherwise the cost of working your land will ruin you. I could quote instances at Mildura where the men paid from £1 to £3 an acre for grading alone.
3298. Are the farmers at Pera taking advantage now of your experience? Yes, I think they are. They are all regrading now. They have been grading ever since I have been at Pera. For three years they have been grading. Having only 20 acres each, if they had, even twelve months after taking up the land, begun grading it thoroughly they could have made more use of the reduced supply we have been giving them. Without grading, you have waste of water, and there is so much land you cannot get the water to unless you grade.
3299. Do you think the soil and the situation at Pera Bore are suitable for the purposes of a farm? I think they are suitable for fruit-growing. I do not think that, taking into consideration the area, it would ever pay the settlers to farm; but I think it will pay them to grow fruit for canning and drying purposes, and also to grow garden supplies.

3300. Do you think that a man with one of these 20-acre blocks, keeping the larger proportion of it under fruit-trees suitable to the climate, and using the other portions for market gardening, and also for growing crops for his own horses, could make a living out of it? I am certain of it, if he would go the right way to work. To make these holdings a success it is necessary that there should be men there who are practical farmers, or, at any rate, men who will learn, taking advantage of the experience of other people. C. H.  
Gorman.  
25 Sept., 1899.
3301. The class of crops you think would pay there would be fruits for drying purposes? Drying, canning, and jam making.
3302. Considering the long distance of Pera from a big market, do you think it would pay to pack fruits and send them to Sydney or other large centres of population? I am rather of opinion that we could make a success of shipping fresh fruits from here.
3303. What kind? Apricots, peaches, and figs. Those are the fruits that will carry best, and the fruits that really do better at Pera than any other class. We were very successful at Mildura in shipping fresh fruit to Melbourne, although we had a very much harder road to go than we have here. We had no train there. I made several trips for the company from Mildura to Swan Hill. We had to go practically 350 miles by river and 170 or 180 by rail. We had a certain system of packing our fresh fruits in chip baskets, which is really the Californian system. If fruit could go from here to Sydney by the mail train, the fruits being early here, we could get the first and highest market prices. Drying fruits will be the principal industry at Pera. In this district alone there is a large market for dried fruits.
3304. The Government farm is not yet reproductive, is it? No.
3305. So that at the present time, as regards the expenditure that has been incurred in connection with the bore, in the erection of buildings, in the putting up of fencing and fluming, in the employment of a manager and hands, and so on, the only return is £100 a year for the twenty blocks of land and whatever is received for the water that is supplied to travelling stock? Yes, and a small revenue from the farm. There has really not been very much yet.
3306. So the affair must only be looked at at the present time as a kind of experiment? It is quite in its experimental stage yet.
3307. And it cannot be regarded in any way as a reproductive work? No.
3308. When the fruit-trees begin to bear, I suppose the Government may look for some return? Yes; I have told our Department that in three years' time we ought to pay for all the work done there, and I really think that can be done, provided, of course, that we have no unforeseen difficulties.
3309. *Mr. Shepherd.*] What is the gross annual outlay for the Government farm at Pera? I should say from £500 to £600 a year; I cannot say more accurately from memory.
3310. You have 60 acres under your control? Yes.
3311. You have 32 acres of fruit trees? 32 or 33 acres of fruit-trees and vines.
3312. How long have those trees been planted? Some are in their fourth year, and some were planted last year.
3313. So you have not been able to judge, so far as their producing qualities are concerned? No; we have had no return at all from them yet.
3314. What kind of crops are you growing on the balance of the land? Purely fodder crops.
3315. Have you estimated the return? Not yet.
3316. You have no idea what the return is per acre? I cannot say just yet.
3317. Are the citrus fruit-trees in their fourth year? A few trees are, but the bulk of the citrus trees I put in about two years ago.
3318. They have not borne much yet? Only a few.
3319. The stone fruit-trees—peaches, at all events,—I suppose, bear pretty freely? No; they have had only one or two on.
3320. You say the Mildura land is much more easily worked than the Pera? The bulk of it is.
3321. You attribute that to the difference in the quality of the soil? Yes.
3322. Do you find that the soil at Pera puddles, and that in a short time it becomes almost impervious to water? Yes.
3323. Have you any means of breaking the crust after it forms? The only way is not to let it get hard—as soon as the ground can carry the horses, to put the cultivators on.
3324. You just fill the trenches and allow the water to soak in gradually? Yes. In irrigating, the drains should never be left there permanently. They should be struck out every time the water is required, otherwise the value of the irrigation is gone—the evaporation is so great.
3325. You say there are eighteen 20-acre blocks and two 24-acre blocks? Yes.
3326. And men have taken them up who have had no experience whatever? Yes. I think that, with the exception of two or three, the men have not had any practical experience at all.
3327. These men surely must have expected to get some instructions? Quite so. They were in exactly the same position as we were in at Mildura.
3328. It is no part of your duty to give them instructions? I am there if they require instruction.
3329. And if they apply to you for information you are willing to give it? Certainly. I am only too happy to give it at any time, and some of them do avail themselves of the information they can get.
3330. Have they taken advantage in many instances of the opportunity of acquiring information from you? Yes. Furthermore, apart from getting information from me, they have the advantage of meeting the different experts attached to the Department who periodically visit Pera.
3331. You say that you do not think there are more than about two getting a living there exclusively from farming? I would not say with any certainty that there are more than two.
3332. Do any of them employ labour? Yes; I think that every man on the settlement employs labour.
3333. At Mildura you used river water? Yes.
3334. Do you think the river water preferable to the bore water for irrigation? I think I would sooner have it. We know all about the river water. We have yet to learn about the bore water.
3335. Do you not think that the alum which is contained in the Pera bore water is, to some extent, a disadvantage? No; it has not shown any bad effect in the crops; but the river water, of course, has so many natural manurial properties.
3336. Have you the means of forming an opinion as to whether the settlers at Pera are satisfied with their prospects, as a rule? I think some some of them are. The opinion is divided as to the chances of success.

- C. H. Gorman. 3337. I suppose they have not had time to form a proper opinion? No. We have really had bad luck in the flow decreasing; otherwise, I think, the settlement would have shown better returns.
- 25 Sept., 1899. 3338. I believe that the supply of water from the bore has diminished nearly one-half? More than one-half.
3339. Has any scientific opinion been given as to the cause of the failure? I believe the Department have had an opinion, but I do not know what it is. I have not had it sent to me. It was at first thought that there was an obstruction of the bore, but the Department took means to find out whether there was any obstruction and cleaned the bore out, but no more water was obtained. I think the matter was submitted to Professor Jack, of Queensland, but I do not know what his report was.
3340. I think you have a nursery for propagating young fruit-trees? Yes; a small nursery, so that we may send out acclimatised trees, true to name, especially for this district.
3341. Is there an idea going about that people are not able to procure trees true to name from private nurseries? There has certainly been that idea going around.
3342. Do you think that that opinion is at all general throughout the Colony? I would not like to express an opinion.
3343. Do you think it is, in this neighbourhood? I have not found it, in this neighbourhood. Any stock that I have had from nurseries has certainly been exactly what it was labelled. There have been objections as to the stock the nurseries have worked on. I do not make that charge myself; but it seems to be the general opinion.
3344. Have you found that the trees produced in this district are more suitable for this district than those brought from places outside it? Undoubtedly, those trees propagated from cuttings are; I will not say from the worked trees, because I have not had time to judge yet. Under irrigation, very much stronger nursery stock can be grown than by natural rainfall.
3345. You say that when you left Mildura your trees were about six years old, and were just coming into bearing;—what kind of trees were those? Peach and lemon trees. The trees were not six years old.
3346. I suppose that some were five years old? They were just coming into bearing.
3347. A tree six years old is supposed to be in its perfect state? Yes.
3348. Do you not think it would be an advantage if periodical lectures were given to assist the settlers at Pera? I think that practical demonstrations would be very much better than any lectures.
3349. *Mr. Watson.*] I suppose that most of the men who have gone on blocks at Pera have had but little capital? Very little.
3350. One would imagine that it would be necessary to have some capital in order to have a reasonable chance of success there? Quite so. A reasonable amount of capital is necessary, there is no doubt.
3351. Where you have to wait some years for your orchards to bear, and consequently have only a portion of your land in profitable use until the orchards bear, one would imagine that it would require capital to make the undertaking a success? Quite so.
3352. At Mildura, after the men had paid for their land, did most of them have some capital? Yes. The company always advised any man who came to take up 20 acres of land to be prepared to put his hands on £600, and I think everybody there did.
3353. That is, after he had paid for his land? No, altogether. The men there had ten years deferred payment for the land, or of course they could buy it outright if they preferred to do so, and had the necessary money.
3354. The company reckoned that a man taking up a 20-acre block required at least £600? Yes, at least £600.
3355. Irrespective of the cost of the land, he would require a capital of at least £400? Yes.
3356. So the men at Pera, running their land on the same basis as at Mildura, would require £400 capital each? Quite so.
3357. That is, if the Chaffey Brothers' advice was good? Yes. Chaffey Brothers never for a moment supposed that everybody at Mildura would go in for market gardening; but at Pera everybody has, to some extent, gone in for market gardening, which has tided them over, in conjunction with contract work which they have obtained round about.
3358. It seems, from what we hear, that there are one or two people on the banks down the river who are irrigating, on a small scale, practically black soil—stiffer, more clayey soil than you are working at Pera;—do you think that it would be a sensible thing to attempt to do that extensively? Unquestionably. I like the black soil. I am speaking only from results I have seen on the black soil—on land similar to that black soil between Bourke and Pera, the plain which you came across the other day.
3359. There seems to be a general impression amongst the people here that nothing but the extreme red soil will be of value for irrigation? As against that, I may say that at Belalie station they are getting wonderful returns from irrigating with bore water on black soil. I understand that they have from 80 to 100 acres of wheat in there and fruit-trees round the homestead, and that the lemons and oranges are doing wonderfully well, although with apparently little attention, although the trees were eight or nine years old before they were pruned.
3360. It would seem from that that there would be a much larger area of land down the river—seeing the greater part of it is black soil—fit for irrigation, than we supposed, always provided, of course, that the people there could get a supply of water for it. We were informed that between Bourke and Louth there were only three or four places where the red soil comes close to the river, and it has been assumed by a number of witnesses that unless you have red soil it is not worth while to start irrigation; but from what you have just said it would appear that, so long as the people had enough water, quite a large proportion of the river-banks would be fit for irrigation? I will not say the river-banks, but I am certain the black soil would be. If it can be done in one place, there is no reason why it should not be done in another, in the same district.
3361. I think you stated that you found the land at Pera much stiffer to work than the land at Mildura? Yes.
3362. Do you think that the black soil would be easier or more difficult to work than the red? I think easier.
3363. Is it not supposed to contain more clay? It may have a little more clay.
3364. What would make it easier? It is very much more friable. The red land packs together so hard. The sand seems to be so fine.

3365. You think the clay would help to separate the soil? Yes; I mixed a lot of the black soil with the red on a small plot near the cottage, and the wheat on that plot looks healthier, fresher, and has more body than the wheat on the red soil itself. I should prefer the black soil if I were choosing some for myself. C.H. Gorman. 25 Sept., 1899.
3366. What is ordinarily termed the black soil—plain country, you think, is quite suitable for irrigation? Yes.
3367. You think that in any case you would require to have the cultivation a little way from the bank of the river, so as to provide against the contingency of flood? Yes; that is, cultivation to any extent.
3368. If you were going in for the cultivation of fruit it would not be advisable to select a spot that was liable to inundation by floods? Yes.
3369. That would kill the trees? Quite so.
3370. It was stated on Saturday by one of the witnesses that he knew of land some little distance back from the river bank which he thought was suitable for irrigation, both from its being above flood-level and owing to the quality of the soil; in that connection can you tell us what would be the extreme distance that it would be payable to take water, assuming a piece of land 5, 6, or 8 miles away from your pumping station on the river bank;—how far could you afford to carry the water by means of a concrete channel, or by any other method, back to that land? At Mildura the water is carried back 12 miles from the river. There are 180 miles of channelling at Mildura.
3371. At Mildura do they charge the same water-rate, irrespective of the distance from the pumping-station? Yes.
3372. Of course, that is practicable where you have a large number of consumers? Yes.
3373. You think, then, that you would be justified in attempting, with a supply of water, to cultivate land 8 miles from the river bank? Yes.
3374. That would practically mean that, given sufficient water for pumping purposes, it would be practicable to pump it from the river at Bourke to supply a place at Pera? Yes.
3375. You think that would pay? I am certain of it.
3376. What are the considerations against the carrying of water—evaporation, of course, for one thing? Yes, evaporation.
3377. And the cost of the channels? Yes.
3378. Are the channels very costly if made with concrete? Yes; they cost from £3 to £7 per chain.
3379. You have at Pera, how many hundred acres arranged for cultivation? 500 acres.
3380. To supply that area from the river here, what do you think the main channel would cost per chain? It would cost £6 or £7 per chain; but, of course, it all depends on how you have to build the channel up, in consequence of the level. You cannot arrive at the cost of the channel unless you know what the level is going to be. You may have to put flumes over some high or low places, as the case may be.
3381. What percentage do you estimate is lost by evaporation in the fluming at Pera? 10,800 gallons out of 250,000 gallons.
3382. That would be something under 5 per cent.? Yes.
3383. Is it customary always to convey water by open channel over long distances like that? Yes, always.
3384. In preference to pipes? Yes.
3385. And channels in preference to fluming also? Yes, except where you have bad places to cross.
3386. Supposing you were pumping from the river, you would prefer to use open channelling to anything else? Yes. We have always used it at Mildura. We have very little piping in use there.
3387. I suppose the Mildura practice is based on the experience in California and other similar places? Yes.
3388. As to a market, do you think that there would be room for a number of settlements similar to the one at Pera, as regards area and the same object? There certainly would not, so far as market gardening is concerned. Three settlers at Pera can supply the whole of this district with market garden produce. But I think that in the matter of dried fruits you could have as many settlements as you liked about here, and could always find markets, provided that the article offered for sale were good.
3389. Plenty of room in the outside markets? Yes.
3390. Dried fruits carry well? Yes.
3391. You could send them to the world's markets without difficulty? Yes; in fact the fruit we sent from Mildura, from four and a half to five years ago, beat the California fruit.
3392. From what point of view? As to price. That was in the London market, too.
3393. Do you think that was due merely to the novelty of the importation, or to the article's own intrinsic value? I think it was the article itself. It was an exceptionally fine article, and we took a lot of trouble with it.
3394. Did it pay at the price you got? Yes.
3395. I mean, considering the amount of trouble to which you had gone? Yes.
3396. So your opinion is, that there is plenty of opening for the selling of dried fruits and similar produce, if people have the opportunity of going in for it? Yes, I feel certain of that, in New South Wales alone; because there is very little drying going on in New South Wales. I understand that a great deal of Mildura dried-fruits is used in Sydney. They are now drying on this side of the river at Mildura.
3397. Is the climate at Bourke and further down the river as suitable as the climate of Mildura for the natural drying of fruits? Quite as suitable.
3398. In giving your opinion as to the suitability of the land near the banks of the Darling River for irrigation and cultivation purposes, I suppose you would not advise the planting of crops in places that were liable to be flooded? Certainly not.
3399. If the land has been denuded of the soft portion, and has been left of a cakey character, would you advise cultivation of that portion? No, I would not.
3400. I suppose we may take your opinion as being one of a general character, without your having examined the nature of the banks? Yes. I have never been far down the river.
3401. It is your opinion, but not from having examined the character of the whole of the country down the river? Quite so.

John Hedrick, secretary, Stock Board, Bourke, sworn, and examined:—

- J. Hedrick. 3402. *Chairman.*] The Inspector of Stock is ill at present? Yes.  
 25 Sept., 1899. 3403. How long have you been here? I came here at the end of last year.  
 3404. You produce an extract from the books of the office showing the stock returns for what years? 1894 to 1898 inclusive.  
 3405. These are correct? Yes, as taken from the books.

RETURN of Stock in the District of Bourke for the Years 1894 to 1898, inclusive.

Year.	Horses.	Cattie.	Sheep.	Camels.
1894 .....	8,639	14,541	2,436,226	• 652
1895 .....	7,780	12,828	1,502,672	545
1896 .....	7,853	15,278	1,969,906	528
1897 .....	6,556	14,763	1,982,411	
1898 .....	6,638	14,422	1,430,822	631

3406. That return shows that during the year 1898 this district suffered a loss in sheep of 551,589? Yes.  
 3407. And since then the loss has also been very great? Yes; about 50 per cent., anyhow.  
 3408. Owing to the prolonged drought? Yes.

WEDNESDAY, 27 SEPTEMBER, 1899.

[The Committee met at Yanda station, Darling River, at 8:30 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Henry Dean, Yanda station, sworn, and examined:—

- H. Dean. 3409. *Chairman.*] How far is this station from Bourke? Sixty miles by river, and 25 miles by road.  
 27 Sept., 1899. 3410. *Mr. Watson.*] How long have you been on the river? About eighteen years.  
 3411. You know that the main business the Committee are considering is the question of locking the river, with the view of helping navigation? Yes, I believe so.  
 3412. So far as the people round here are concerned, would it help them in any way if the river were locked and made secure for navigation? It might in the way of getting goods up the river; but that is the only way I can see. I mean people away from the railway, at Bourke.  
 3413. Supposing the river were navigable right down, do you think that the Yanda wool and the wool of any adjoining stations would go to Bourke, or down the river to some other outlet? It would go to Bourke at the present rate of carriage, and under present conditions.  
 3414. If the river were locked down as far as Menindie and no further, do you think the effect would be to draw trade towards the terminus of the railway at Bourke, or wherever else it might happen to be on the river? If the locks kept the water up so that steamers could carry, undoubtedly it would. Carriage would be cheaper by boat than by team, and naturally the wool would go the cheapest way.  
 3415. Do you think that the railway terminal points would have an influence with the locked river for a considerable distance on either side? Yes, I think so.  
 3416. The wool from this station, I understand, goes to Bourke? Yes.  
 3417. Have you ever sent it down the river? Years ago.  
 3418. Not recently? Not during the last fifteen years.  
 3419. That is, before the construction of the railway to Bourke, I suppose you sent it down the river? Yes.  
 3420. Since then you have regularly sent it *via* Bourke and the railway? Yes.  
 3421. Do you get your station supplies from Bourke? Yes.  
 3422. I notice that you have a small irrigation patch at the homestead? Yes, just for the station use; that is all.  
 3423. Is that black soil? Yes; all black soil.  
 3424. How is it situated with regard to floods? The 1886, 1890, and 1891 floods were all over that patch.  
 3425. For any considerable depth? In 1890, 3 or 4 feet.  
 3426. Have you any fruit-trees in? Yes.  
 3427. Can you give us a rough idea of what you have in that patch? Vines, peaches, apricots, nectarines, figs, mulberries, almonds.  
 3428. You grow vegetables also, I suppose? Yes.  
 3429. What was the effect of the flood on your fruit-trees, if any? It killed the stone-fruit trees. Mulberries, figs, and vines, a pear-tree, and a couple of apple-trees were left.  
 3430. It seems that it would not be wise, as a rule, to attempt irrigation on land liable to floods, so far as stone-fruit is concerned? Not from a business point of view.  
 3431. But, with irrigation, how have the fruit-trees and other things turned out on that black soil? Fairly good.  
 3432. The results have been fairly good? A lot better in a naturally good season, than under irrigation. Perhaps we do not understand all things in connection with irrigation; but, nevertheless, that is my experience.  
 3433. How far back would you have to go from your homestead to get land beyond the reach of any flood that has been known? A quarter of a mile.  
 3434. So that, presuming you could get the water pumped cheaply from the river, if you were to start irrigation a quarter of a mile back, there would be no danger of flooding? No. 3435.

H. Dean.  
27 Sept., 1899.

3435. Is there much land around this homestead, back from the river and above flood-level, which is of value for irrigation? We may say it is all high land about here, except just a fringe on the river.
3436. Do you know the river between here and Bourke? Yes.
3437. Can you say, roughly, how far back from the river, on the average, the land liable to flood extends? About 10 or 12 miles.
3438. That is between here and Bourke? Yes.
3439. So that, so far as making a business of irrigation between here and Bourke is concerned, you would require, on the average, to go 10 or 12 miles back before you would have land suitable for permanent irrigation? Yes; out of the reach of high flood-water.
3440. Then, going down the river from here, is there much land that is high, comparatively speaking? From here to Louth, you may say, the red soil runs nearly all the way down close to the river.
3441. How far is that by road? Forty miles.
3442. By river, approximately how far? 100 miles.
3443. And you say that the high land predominates between here and Louth? Yes.
3444. How far back between here and Louth would you have to go, on the average, to get this high land? I cannot say exactly, but I should not think more than a mile or so. It is red soil all the way, travelling on the road, barring a few patches.
3445. The red soil, which is generally on the higher land, comes closer to the river between here and Louth than it does between Yanda and Bourke? Yes, considerably.
3446. The question of irrigation, of course, is affected by the proposal the Committee are considering, from the fact that if a certain quantity of water were conserved for locking purposes, a certain quantity more would probably be available for irrigation;—do you think that if that water were made always available by means of weirs, and so on, people along the banks would be likely to use any of it for irrigation to any extent? I do not think so.
3447. Why? The expense of pumping and raising the water would be too great, and there is no market.
3448. Supposing you were to have suitable land, and plenty of water, would there not be as much chance of a market for an irrigation settlement between here and Louth as there would be for one at Mildura? Judging from past experience of the irrigation settlements, I do not think it would pay.
3449. We were informed by a witness in Sydney that if the water were made available by means of weirs and locking, each of the pastoralists down the river would probably put a fair-sized area of his own land under irrigation, with the view of making sure of saving in drought-time at least his best stock? I think it is doubtful.
3450. Do you not think that it would pay him to do that? I do not think so, considering the rate at which you can get forage.
3451. When you say, "considering the rate at which you can get forage," do you refer to ordinary seasons, or to times of drought? Times of drought.
3452. Even then you think you could get forage more cheaply than you could grow it yourself by irrigation? Yes. I do not think it would pay to feed stock in that way; it would be too expensive to raise the fodder yourself, or purchase it for feeding sheep.
3453. Of course if you had the river locked, you would have permanent and easy means of communication by boats for heavy loads, such as fodder would be, and you think that with a locked river they would prefer to get fodder for their sheep up by boat from some more favoured part of the colonies rather than grow it themselves? I think that, with a good river, fodder from more favoured portions of the colonies would be so cheap that people would economise by buying from outside rather than by growing it by means of irrigation, but not for feeding sheep.
3454. Is the black soil that you are cultivating here very difficult to work? Yes; it is very stiff.
3455. A considerable quantity of clay? Yes; I may say that this is a bad specimen of the black soil.
3456. It is worse than the usual run of black soil? I think it is.
3457. Does it entail much expense in the way of labour, for the small plot you have here—I mean, comparatively speaking? No, not much expense.
3458. How much have you under irrigation, including the garden? Not more than 2 acres.
3459. Do you put in anything in the way of green manure, or other agents, to make the soil more friable? I just top it with sheep manure.
3460. Does that have the effect of making it freer? Yes; it has that effect. It opens the soil.
3461. Do you think that the experiment that has been made here, in regard to irrigation, is encouraging, or otherwise? No, not to go to any large extent.
3462. In 1890 your stone-fruit trees were destroyed by the flood? Yes.
3463. Did you put in any other trees in their place? Yes.
3464. You do not have that kind of flood very frequently? Very rarely. Of course, the land itself is suitable for irrigation, it being very level. It would be easy to carry the water over the soil.
3465. There would not be much expense for grading, with the view of carrying water, as they do in the settlements, if irrigation were decided upon? No; but I think it would cost so much to raise the water, and get it on to the land, that it would not pay.
3466. Do you think the quantity of water required would be very great? Yes.
3467. Have you any idea what you put on your small plot here in dry seasons? It takes pretty nearly two days in the summer-time with a 4-inch Tangye pump to irrigate half an acre.
3468. How frequently do you apply the water in a dry time? We require to put it on once a month.
3469. Is that for lucerne, or for trees? For lucerne.
3470. Of course, you water lucerne more heavily than anything else? We thoroughly soak it.
3471. How frequently do you water the trees? They want it as often.
3472. So, roughly speaking, the whole of the land under cultivation requires watering once a month? Yes—that is, in a dry season. When the river is high you can work the pump better. But, in a dry time, the river is, of course, generally low.
3473. The lift is greater in a dry season than at other times, owing to the lowness of the river? Yes.
3474. What height do you then have to raise the water? I suppose 30 feet of a perpendicular from surface of water to top of bank.
3475. Coming down the river we have seen a good deal of black soil, and here now we have some red soil;—how do the two compare for pastoral purposes? For pastoral purposes the black soil is far ahead of the red.

- H. Dean. 3476. Does it grow grass more quickly after rain? No; the red soil has quicker growth, but the black soil has better quality grass and more lasting.
- 27 Sept., 1899. 3477. Have you tried any feed crops here on the red soil, depending on the natural rainfall? Yes.
3478. What has been the result? We have got very good crops in decent seasons, but during the last four years we have not been able to get anything.
3479. Prior to those years, when you had a moderate season, what did you get from it in the way of hay? I never bothered about ascertaining the weight, but we had a very good crop.
3480. To what height would it grow? About 3 feet.
3481. And fairly headed? Yes.
3482. Wheat, I suppose? Yes.
3483. You look upon that as a very fair crop? Yes.
3484. So you do not seem to think, on the whole, that the prospects of any adequate return resulting from locks and weirs on the Darling are encouraging? No, I do not.

[The Committee met at Gundabooka station, Darling River, at 2 p.m.]

David Langlands, manager, Gundabooka station, sworn, and examined:—

- D. Langlands. 3485. *Chairman.*] How far is Gundabooka from Bourke by road? Thirty-five miles.
- 27 Sept., 1899. 3486. How long have you been here? Eleven years.
3487. *Mr. Shepherd.*] What is the extent of the holding? About 230,000 acres.
3488. What number of sheep have you running? At present about 20,000.
3489. Of course, the holding is not fully stocked? Not if we had a good season.
3490. Has there been much falling off the last few years? Very considerable.
3491. How many sheep were you running about five years ago? 65,000.
3492. Have you had a pretty good return of wool this year? No; a very poor one.
3493. That, of course, is attributable to the drought? Yes.
3494. Are you running any other kind of stock here besides sheep? Cattle. We have at present about 850 cattle; but they were bought only about four months ago.
3495. So you cannot judge yet how they will do? No.
3496. What description of grasses and herbs have you here chiefly? The principal edible grasses are mulga, blue-grass, crowfoot, star-grass, umbrella-grass, and summer-grass.
3497. Have you no Mitchell-grass? No.
3498. And no saltbush, I suppose? Very little. The saltbush we have is not of any value.
3499. Have you noticed any of the grasses disappearing since you came here? Yes; blue-grass is disappearing rapidly, and also mulga-grass—the two best grasses we have. We also have No. 9 or wire-grass, the seed of which is very bad for the wool, though the grass itself, when green, is good fodder grass.
3500. Have you noticed that it is generally the grasses which the stock like best that disappear soonest? Yes; and that the rabbits like best. We are very heavily rabbit-infested here.
3501. Is much of the run paddocked? It is all paddocked.
3502. Do you carry out a system of periodic "spelling"? As far as possible. We have never actually been overstocked.
3503. I mean a system of "spelling" for seeding purposes? As far as possible I carry that out.
3504. I suppose you get short of feed, and have to use that grass? Yes.
3505. What crops have you tried under irrigation? Wheat, lucerne, green or skinless barley, oats, and Cape barley, besides potatoes and garden vegetables.
3506. Have you kept a record of the returns? No.
3507. I suppose you can hardly say the return per acre you have had from those crops? No.
3508. Have they all done really well? No; they have done far better than they would have done without irrigation, but not as well as they should have done, some of them not being suitable for irrigation, I think.
3509. Have you used manure as well as irrigation on all the crops? Not on all of them; but on some of them.
3510. Have you noticed any great difference between the crops you did manure and those you did not? Yes; a very considerable difference.
3511. I suppose the advantage is in favour of the crops you did manure? Yes.
3512. What kinds of fruits have you tried to grow here? Oranges and lemons of various kinds, apricots, and peaches.
3513. Do you find the orange and the lemon do really well here? Remarkably well, and the apricot gives a very good crop, too.
3514. And grapes? Yes.
3515. Are you of opinion that it would pay to grow fruit here for market? I am of opinion that oranges and lemons would pay very well to grow for market. We get fruit here six weeks or two months before it is ready at Parramatta.
3516. Have you ever tried their keeping qualities? Yes.
3517. What means have you adopted for keeping them? The best means I have found is packing them in sand, dried artificially—baked.
3518. Did you ever try packing them in dry straw? No; but I do not think it would be suitable up there.
3519. Do you attempt to dry the fruit at all before you put it in the sand? No; pack it straight from the tree. I may mention that I have preserved some of the grapes for household use by drying them, and have kept them for four, five, and six months.
3520. How did you treat the grapes? Dried them on galvanized-iron; I laid them out in the sun, and the sun dried them.
3521. Did not that shrivel them at all? Yes, it shrivelled them; but when they were cooked they were very good.
3522. *Mr. Dick.*] Part of this scheme has been said to involve a system of irrigation by which each landholder along the course of the river might be able to successfully cultivate from 200 to 400 acres of his holding near the river as a means of insurance against drought;—do you think that, if the river were locked,

locked, the pastoralists along the river would find it to their interest to indulge in such a departure from their old-established methods? There are other things hinging on that, because if a pastoralist put up an expensive plant, he would need to have some surety that he was really putting it up for himself, and not for the Government—that the land could not be resumed from him in a few years' time; but if a man were assured in the possession of 300 or 400 acres of freehold land, I think it would then be done.

3523. How long have the leases now to run in the Western district? Fifteen or sixteen years.

3524. You do not think that is long enough to induce a man to go in for irrigation to such an extent? No.

3525. From your experience of irrigation on your holding here, do you think that it is practicable, given those conditions which you mention, to irrigate considerable areas along the course of the Darling? Yes.

3526. What market do you anticipate would be supplied by the cultivators along the river? I take it that we should cultivate chiefly for our own use in periods of drought.

3527. Can you say what has prevented the pastoralists from doing that, seeing that they have practically a never-failing supply of water? We are of opinion that it is not a never-failing supply by any means, for it gets so low, and the water is so hard from the minerals running into it, that it is not fit for irrigation at that time.

3528. You have attempted to cultivate land near the river, too, without irrigation, have you not? Yes.

3529. What has been your average experience? About one good crop in five crops.

3530. Presuming that a man went in for a properly organised irrigation plant, do you think it would pay him to feed his stock in times of drought on the produce of an irrigation farm? Yes.

3531. Can you give us any comparison as to the respective results derived from irrigated land, and from land cultivated in the ordinary way depending entirely on rain—is the produce very much superior? I do not know that it is superior; but there is more of it. I should say there would be 5 tons on irrigated land where there would be 1 ton on non-irrigated land.

3532. Would the locking of the river have any effect as regards the disposal of your wool; would you still continue to send it to Bourke, or would you take advantage of the highway of the river; would it offer you any special facility in the way of reduced freight? It would be hard to say, because we do not know whether there would be tolls on the river, or something else, to prevent our sending the wool down the river. If the freights were the same down the river as they are now, I should probably send my wool down the river.

3533. The freights vary according to the state of the river, do they not? Yes.

3534. When the river has been a good river for a long time, freights have become very low? Yes.

3535. Presuming that the freights on the locked river would be as low as they are when you have a good river for a considerable period, would you then send your wool down the river? Yes.

3536. *Chairman.*] What lift have you with your pump? At present we are lifting 55 feet.

3537. Is that about the maximum height you can lift? No; we have lifted up to 65 feet. However, that is not merely to the top of the bank; but 10 feet above it. The height is 55 feet from the top of the bank to the lowest river. A 55 feet lift would be needed for irrigation.

3538. You are using the water from the scour for irrigation at the present time,—you having a wool-scouring plant on the edge of the river? Yes.

3539. Can you tell us what it cost you for irrigation per acre, or can you estimate it in any way? At present I cannot estimate it, because I have not gone into figures in regard to it. It practically costs me nothing to put the water on the land, because I have the scour plant already on the ground, and I use the surplus water from the scour to irrigate with.

3540. Have you carried on irrigation independently of the water from the scour? Yes.

3541. At what cost? I am not able to compute the cost.

3542. As regards the lucerne crops and the wheat crops that you have in, do you look upon the lucerne from irrigation as a success? Yes.

3543. And comparing the crop on a piece of irrigated land with the crop on the adjoining piece, which is not irrigated, the result is very marked in favour of irrigation, is it not? Yes, very marked.

3544. Your operations have been on the red soil? Yes.

3545. Do you know of any similar irrigation works on the black soil? Yes; at Winbar, lower down the river, on the river banks, and at Jandra and Yandra.

3546. With what result? In some cases, very good results. Winbar has had very good returns from irrigation.

3547. Referring to your reply to a question that Mr. Dick asked you, do I rightly understand you to mean that you think that it would be possible, and also payable, to cultivate a sufficiently large area of land to grow crops which would sustain your starving stock of 40,000 or 50,000 sheep in a bad season on this run? Yes; in a bad season it would pay me to grow them instead of employing scrub-cutters.

3548. You do not know exactly when a bad season is coming; would your procedure be to grow crops every year and keep on storing them? Yes; store up a certain quantity.

3549. You think that would be practicable, and also remunerative? I think so.

3550. As regards the river and its level, what would be the height necessary to enable you to carry on irrigation to advantage? The maximum lift to the top of the bank would have to be 45 feet to enable us to carry on irrigation profitably.

3551. The present level of the river, namely, 45 feet, is about 9 feet above the ordinary summer height of the river? Yes.

3552. So that, to enable you to carry on irrigation with advantage, locking and weiring the river would be necessary to maintain about a 45-foot level? Yes, to just about maintain that.

3553. What do you look upon as the best kind of soil for the growth of crops and fruit-trees, and also for household garden purposes? I do not know that one is superior to the other. I have seen very good crops on the black soil as well as the red.

3554. But is not the red soil easier to work and maintain than the black soil? I think it would be.

3555. The proposal that we have before us is to lock and weir the river from Bourke to Menindie only; and I understood you to say that you agreed that that work would be the means, possibly, of keeping the wool trade for the Bourke railway? I should think so.

3556. But if the river work were carried further than that, and were taken as far down (say) as Wentworth, then the tendency, I suppose, would be to divert the carriage of wool to the southern colonies? I should think so, as a matter of business.

3557.

D. Langlands.  
27 Sept., 1899.

- D. Langlands. 3557. So, the river work, if carried out as far as Menindie only, with money expended by New South Wales, would be of advantage to New South Wales; whereas, if the river work were carried further than Menindie, with money expended by New South Wales, it would be of advantage to the other colonies;—would that not be so, if the trade went away? Yes, I should think it would.
3558. In this large paddock, adjoining, you planted five crops without irrigation? Yes.
3559. In what years? 1890, 1892, 1893, 1894, and 1895.
3560. With what results? In 1890 I had a good crop; but in the four succeeding years there was no crop.
3561. Do you think that that was owing to bad seasons, or to some other causes? Owing to the season not being suitable.
3562. Was that a sufficient experience, do you think, to show that attempting to grow large crops without irrigation could not be looked upon favourably? I have found that to be my experience.
3563. *Mr. Watson.*] You said, I think, that you thought that any work done in the way of irrigation, following on the weiring of the river, would be confined to fodder crops, and so on? Not necessarily. I think that fruits could be grown very profitably up here—the sorts to suit the inside markets.
3564. Do you think that there would be any chance of finding an outlet for dried fruits? Yes.
3565. Do you think that that could be done from places along this river? Yes, I think it could be done; but I do not think it would be profitable unless worked with something else.
3566. Why do you think that? There is always the chance of a failure of a crop. As a commercial undertaking, I think that farming, unless it is mixed farming, will not pay. It has not proved profitable at Mildura.
3567. We are informed that at Mildura the settlers had to pay high prices for the land, and high rates for the use of the water; and it is quite possible that has helped to keep them back;—but so far as you know, there is nothing to prevent stone fruits, or fruits suitable for drying, from growing well here? No; there is nothing to prevent it.
3568. You think you could get land suitable, with the application of water, for the growing of those fruits? Yes.
3569. And the climate is also suitable? Yes.
3570. If other places similarly situated have been successful, there should be no difficulty in this case? No.
3571. As to the quantity of land suitable for irrigation that is available, it would not be wise, I suppose, to put irrigation settlements on land liable to flood? No.
3572. Is there much land within a reasonable distance of the river, either red or black soil, between here and Bourke, which is sufficiently high to be suitable for irrigation? No; there is very little.
3573. For how far back from the river is that so? You would have to go, in some cases, 10 miles back, but in other cases the good land runs on to the river.
3574. What would the average be, roughly speaking? I should say about one-fifth of the river bank between here and Bourke would be composed of good land.
3575. That would be a fairly large area of land, would it not, in the total? Yes.
3576. Between this place and Louth is the land more suitable for irrigation close to the bank of the river? No; it is about the same as upwards. There is perhaps more red soil above the flood-level than there is up the river towards Bourke.
3577. At what proportion would you put the good land between here and Louth? About one-fourth.
3578. If one-fourth of the land between here and Louth is suitable for irrigation, that would probably be a large enough area to exhaust all the supply of water likely to be stored up in the river bed? Yes.
3579. So, for all practical purposes, it would seem that there is sufficient good land along the banks of the river? Yes.
3580. We had it given in evidence that, allowing for evaporation and various losses, a height of 3 feet in the bed of the river would be sufficient to irrigate 24,000 acres between Bourke and Menindie? Yes.
3581. If the statement is true that it requires 3 feet of water from Bourke to Menindie to supply 24,000 acres, it would require a considerable area of land to exhaust the total quantity of water that would be available? There is more than sufficient land to exhaust the available supply of water, even with weiring.
3582. So, in your opinion, we need not trouble ourselves about the possibility or probability of there being insufficient land? No.
3583. The question is how to get sufficient water? Yes.
3584. Is there anything that you could mention to the Committee touching on the navigation question, as to whether the permanent opening of the river for the carriage of produce would have any effect in the way of inducing smaller settlement when the present leases run out;—would the certainty of communication and the cheapening of commodities have the effect of inducing a larger number of men to take up holdings and promote closer settlement? I think it would.
3585. At present, I suppose, it requires more capital than it would do if communication were certain and regular? Yes.

THURSDAY, 28 SEPTEMBER, 1899.

[The Committee met at Louth at 12 o'clock noon.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Thomas Andrew Mathews, grazier, near Louth, sworn, and examined:—

- T. A. 3586. *Chairman.*] Where do you reside? At Retreat, 3 miles down the river from Louth.
- Mathews. 3587. How long have you been a resident of the district? Forty years on the 18th of next January.
3588. During that period you have been engaged in pastoral pursuits chiefly? Yes.
- 28 Sept., 1899. 3589. At present you have various interests in the district? Yes. 3590.

T. A.  
Mathews.  
23 Sept., 1899.

3590. This proposal is to erect seventeen locks and weirs between Bourke and Menindie, in addition to the one already erected at Bourke, with the view of improving the navigation of the river between those two places, and also assisting the irrigation of suitable land within a reasonable distance of the river banks;—would you, as a very old resident of the district, give us your views on that proposal—as to whether it will be beneficial or otherwise? It will be beneficial in every way. It will enhance the value of this country very considerably. It will also do a very great deal of good to Sydney. There are many things that are absolutely worthless now which will be sent, and be of great benefit to the residents of the Darling, and also to the men who are engaged in the sale of these goods. There is a lot of wool, there are also bones, and there are rags for the paper mills, and many other things I could enumerate. But I do not think it would be any benefit to New South Wales to carry out this work below Menindie.

3591. Dealing with the river as far as Menindie, do you think that that would induce trade to go up the river and act as a feeder to the railway at Bourke? Certainly.

3592. As an old resident, can you tell us anything about the inconvenience arising from the present state of affairs and the uncertainty of the river? The state of affairs, until quite recently, has been deplorable. The teamsters had hardly anything to do. The traffic barely kept the horse teams alive, and it was terrible to have to pay £3 and sometimes £3 10s. per ton for carriage by road from Bourke. When navigation used to take place, when the river was up, people were getting their wool and other goods in some places carried for perhaps 15s. or 16s. a ton, or certainly for £1 a ton. The steamers then, as a rule, served all the way down, and they would do so still if the river were navigable; but in the present state of things that cannot be done.

3593. What did you pay by river, with a decent river, as against the £3 by road? Thirty-five shillings.

3594. I suppose the river has always been looked upon as the natural outlet for the produce of this district, and also for bringing goods to it? Yes. It costs so much to feed horses, that although the teamsters charged £3 or £3 10s. a ton, some of them, I know, had to knock off carrying altogether.

3595. So that in a dry season, when they resort to team carriage, feed is so scarce that there is nothing in it for the teamsters? Yes. If you want a bag of chaff, even at Louth, you have to pay 7s. and sometimes 7s. 6d. for it; and below Louth it is hardly to be got, unless a man can grow it himself.

3596. Looking at the river as the rival of the railway, do you think that the railway could compete against the river? The river would be a great feeder to the railway.

3597. You mean if the locking stops at Menindie? Yes.

3598. But if the locking and weiring were carried further down than Menindie, then the river would be used entirely? Yes,—as a rule, to go to either Adelaide or Melbourne. In former days hardly any goods were obtained from Sydney, but nearly all came from either Adelaide or Melbourne by river.

3599. You having been a resident of the district for such a long time, how do you regard it;—has it been progressive or otherwise? With good seasons, it has been progressive. During the last season it has gone back. I consider that, with very few exceptions, half the stock has died.

3600. That is owing to the nearly five years' continuous drought? Yes. But with ordinary good seasons people could live comfortably. But as to making a fortune, my experience as regards squatting—the pursuit I have always been occupied in—is, that the man who takes up the country and improves it never does any good for himself; it is the man who sells who does.

3601. As far as your observation has gone, it has been that people who have come here have not done well? They have not done well.

3602. Do you attribute that to irregular seasons? Yes. In a good season you have, perhaps, not half enough stock, and in a bad season you have considerably too much stock.

3603. That being the state of affairs, this proposal has, for one of its objects, the improvement of the state of things by giving you a regular river to get to a railway, and by combining with that the idea of irrigating a certain quantity of land for the purpose of growing crops to help to keep the stock alive in bad seasons;—what do you think of that part of the proposal? That would be a great boon to the people here.

3604. But would irrigation be engaged in, do you think? There are very few men—hardly anybody who has not irrigated—who would not, naturally, for their own benefit, be absolutely compelled to irrigate.

3605. You have the water at your door, and soil which, with water, will apparently grow anything; why, then, all these years have not the people here assisted nature? Some of them have, and some of them did not stay long enough. There were other small reasons; but the facilities people have now for irrigation they did not have in years gone by. They had not these small engines or windmills, but now they are beginning to irrigate, as a rule. Some two years ago I had a trip down the river, and I never saw people with such means for irrigation as I then saw.

3606. You notice that people are now becoming alive to the necessity of having a little cultivation ground? Yes.

3607. We have been told that the varying height of the river banks is a great detriment to consistent irrigation, and that if we could give them a pretty regular height to deal with in the way of pumping, irrigation would be largely gone on with;—do you think it would? I am sure it would.

3608. Would you do that on your own place? We are doing it now.

3609. How long have you been pumping and irrigating? About three years. At first it was a great failure, but now the parties are doing very well at it. The shifting of the pump is a great drawback. You are continually doing that, and you cannot do it without interfering with the piping, and, as a rule, you have no facilities for making the piping suit again. You can always manage when the river is up 10 feet or 15 feet, for you can have banks where you can have stages, where you can set your pump and work from it.

3610. What result have you got from irrigation? Very good, so long as it lasted.

3611. What do you mean by "so long as it lasted"? The man I sub-let to belonged to the anti-labour association. As a rule, when a man who is not deeply interested in the land puts a crop in he wants to begin to sell it almost the day after he has put it in. The locking of the river will do away with all excuses. There is hardly a distance of 3 or 4 or 5 miles where there will not be irrigation pumps.

3612. Do you know the river pretty well between Bourke and Menindie? Yes, I may say, to Wentworth.

3613. What is your opinion as to the number of sites and the quantity of land available on or near the river banks, with soil of a suitable character, and, secondly, with a suitable contour or formation, which could be treated with irrigation? They are numerous, and the land is good.

3614. Do you know Gundabooka station? Yes.

T. A.  
Mathews.  
28 Sept., 1899.

3615. Do you know many places such as that where there is a nice piece of land that could be treated with irrigation? There is a piece this side of that—Mr. Mackey's—which is considerably better than Mr. Langlands'.

3616. Therefore, with a locked river, and the water dammed back, and with a fair tenure to the squatter or the smaller holder, you think that there is ample land to use the water for irrigation purposes, and that it would be largely used to assist them in their operations? Ample land, quite sufficient with fixity of tenure—if the men knew what they were going to do; but the land-laws of the Colony have been so tinkered with that a man hardly knows what may take place the next day.

3617. Of course, before a man would go in for an irrigation pumping plant, and grade his land and prepare it for irrigation, he would want either a freehold or a long tenure, say, at least of twenty-five years, to encourage him to do anything in the way of irrigation? Yes.

3618. The idea is that in growing these crops, as an assistant to squatting operations, 100 acres or 200 acres should be dealt with, and that if the produce were not consumed in one year, it should be stored up and be good when a dry season does come;—have you considered, from a financial point of view, whether that could be profitably done, or whether it would be too costly? The whole thing must be considered as a financial pursuit, together with accommodation.

3619. Well, what do you think of it? I think it would be very good. It would be just the thing for hay crops. Mr. Langlands does not compare in any way with Mr. Mackey's, which is a splendid place. Redbank, too, where the hotel is, is another very good place.

3620. We have been told that during the continuous droughts, squatters have had to import fodder to keep their stock alive? Yes; they must do that.

3621. Could they grow crops by irrigation at prices as reasonable as those they have to pay for fodder? Considerably more reasonable, and they would have it when they required it.

3622. And they would have no freight to pay? No freight to pay.

3623. And there would be no necessity to wait for teams or steamers to get it to their doors? No; it would be there.

3624. It appears that, in this district, scrub-cutting, for the purpose of maintaining stock, is resorted to very much;—is that a kind of last resource? It is the very last resource; and now that itself is about done altogether.

3625. How is that? When once the mulga is cut it is done. It is like no other scrub; it dies. Other scrub comes on again, but mulga will not come on again, except, perhaps, in a very few places.

3626. We have had varying opinions as to the merits of the red soil, and of the grey or dark soil, for crop purposes;—which do you think the better of the two? I consider the red soil is the best soil. But there is a mixture of the white and the black, and that is very good; but still it is sandy, and where the soil is all white it is cracky.

3627. But that cracky kind of soil, I presume, prevails only close to the river banks? No. It is a good way out, too, where the ground is white.

3628. That is not good? No.

3629. The construction of these locks and weirs is to cost, in round numbers, about £500,000;—do you see any prospect of the State getting back, directly or indirectly, any return for that large expenditure? I see every prospect of the State getting it back.

3630. In what way? It will enhance the value of the country and give employment; and you cannot give employment without benefitting the State—that is, if it is judiciously done.

3631. But do you not think that it would be fair that there should be a direct charge for such a large expenditure, in the way of small tolls on the steamers, and a small charge for the water used by people in irrigating? I would say, as a rule, that, if the charge were a small one, I think it would be fair to charge something.

3632. But you look on the indirect benefit to the State? Yes. I think that the benefit would a great deal more than recompense for the interest on the capital expended.

3633. *Mr. Shepherd.*] You contend that, with improved pumping machinery and that kind of thing, people would be encouraged to irrigate? Yes.

3634. How much land is there irrigated now? Very little.

3635. How much do you suppose? At Dunlop I think they have about 40 acres.

3636. They have had these improved implements for a number of years? Yes; and they have crops out back that help them.

3637. You think that with improved machinery people will be encouraged to irrigate? Certainly.

3638. Well, those at Dunlop, having enjoyed the use of this improved machinery for a number of years, and having only 40 acres irrigated now, it does not look as though they took much advantage of it? I was talking only of one place, but there are other places.

3639. How many months in the year do you suppose you run short of water in the river here? I cannot say how many months. It all depends upon the rain. For instance, we were eighteen months and had no steamers on the river.

3640. The river ceases running altogether occasionally, does it not? It has done so. I have known it to cease running altogether only twice or thrice.

3641. In how many years? In forty years.

3642. Well, I suppose that so long as the river is running, you can get sufficient water for irrigation? Yes; but there is this to be considered: Where you could get sufficient water you might not have facilities on the bank for pumping.

3643. The land you would irrigate would not be land liable to flood? Exactly.

3644. It does not matter what the level may be;—if you have an ample supply you can pump it on to the land? Yes; if you have the means.

3645. *Mr. Watson.*] Your contention seems to be that if the water were kept to a level a little above what it is at the present time a great number of people would go in for irrigation? Yes.

3646. You say that the height of the water is too variable at present? Yes.

3647. And sometimes it goes down until there is no water at all at some points? Yes, except some deep holes, from which you could not irrigate.

3648. At some points you would have no water when the river is at its lowest? Yes.

3649. And there would be no means of irrigating unless some such proposal as that now before us for damming the river were carried out? No.

3650. Do you know the river between Bourke and Louth? I do, well.
3651. Looking at the proposal from the point of view of irrigation, do you think there is sufficient land between Bourke and Louth to use in irrigation all the water that might possibly be conserved there? Yes, I do.
3652. You are aware that, for some miles below Bourke, so far as the outlook from the river is concerned, there does not appear to be much land suitable for irrigation? Certain places. I have enumerated two places—Gundabooka and Mackey's—and there is also suitable land this side of Mackeys, and at other places.
3653. But, take it more on the Bourke side of Gundabooka? It is not so good.
3654. Would you have there to go a further distance back to get suitable land? You would have to go further than your machinery would carry, I think. It is all white ground after you pass Yanda.
3655. On the Bourke side of Yanda, the soil is unsuitable for irrigation? There are some places, but not sufficient soil to induce people to irrigate at those spots.
3656. How far back from the river would you have to go to get land suitable for irrigation? In some cases 7 or 8 miles, in others 3 miles, and, in some, 2 miles; but that would not pay.
3657. You say that in some cases, you could get land some 2 or 3 miles from the river suitable for irrigation? Yes.
3658. Is that a considerable area in one block? No; in various blocks.
3659. Is there not one block of land of considerable area so suitable? I do not believe there is. My idea of the land from Yanda upwards is such that I do not believe that there is any land worth speaking about, up to Bourke, which is suitable for irrigation; I mean, in good seasons.
3660. Are there 1,000 acres in one block? There are not. There are not 500 or 300 within 2 or 3 miles of the river.
3661. If you go back 5 miles, can you get plenty of irrigable land? Yes. There is good land out from Jandra. There is a spot at Jandra, but it is small.
3662. So, if irrigation were attempted between Bourke and Yanda, it would require to be some distance back from the river? It would.
3663. Where do the people of Louth get their supplies from now? From Sydney.
3664. By what? A little, lately, by the steamers, but principally by overland carriage from Bourke.
3665. And the steamers come from where? Also from Bourke.
3666. So that latterly you have not been getting any goods by steamers coming up the river? No. I have not got any from there for some years.
3667. I mean the people of Louth generally? Very little, if any.
3668. Why is that? The simple reason is that their dealings are with the Sydney market and the Sydney people. Formerly it was not so. The railway to Bourke has caused, as a rule, all the necessary requirements to come from Sydney. Formerly they came from Victoria—Echuca as a rule—and from Adelaide. That was done away with years ago.
3669. But with a good river, would you not get goods more cheaply from Adelaide by river than from Sydney *via* Bourke? There is this to be considered—you might not be dealing with any merchant in Adelaide who would be the means of sending you the goods, and it would be only now and then that the river would be able to supply you. As it is, we are dealing with the people in Sydney. They are our customers. We supply them and they supply us, owing to the railway coming to Bourke. Many years ago the teams came from Kelso, 2 miles the other side of Bathurst, all the way down here to Toorale, and charged £28 a ton for cartage.
3670. But, if the locks and weirs were completed from Bourke to Menindie, you think that the Bourke railway would serve the people right down to Louth, and beyond to Menindie? Yes, certainly.
3671. And if the Federal Government, which will have control of this river, amongst other things, for navigation purposes, were to complete the locking sufficiently far to ensure navigation right up from the coast to here, do you think that you would continue to trade with Sydney, or would the people here trade with Adelaide or with Melbourne? I am not a prophet, and cannot say what the people will do in twenty years.
3672. I am asking you what would suit their interests best? That is where the shoe pinches. We have our trade now concentrated in Sydney. The people there serve us, and we find it to our interest to deal there, and not with Adelaide or Victoria, and I believe we shall always continue that way.
3673. You think the probabilities are in favour of the people here continuing their trading connection with Sydney? Yes.

Simon Oakes Laycock, storekeeper, Louth, sworn, and examined:—

3674. *Mr. Dick.*] How long have you been engaged in business here? Eight years.
3675. In the district longer? Yes, the last fifteen years, on and off.
3676. This proposal is mainly for the construction of a great highway from Bourke to Menindie, practically for traffic, with the subsidiary object of irrigation;—would you, with your knowledge of the course of traffic here for some years past, give us your opinion as to what would be the effect upon traffic of the locking of the Darling for that distance? I think it would be of great benefit to the whole of the district between Bourke and Menindie, in fact to the whole of the river, not only to Menindie, but right through to the Murray. As regards getting goods from Sydney, I do not think that the carrying out of this proposal would affect the Sydney people at all, for about four years ago we had some goods come this way from Sydney through Adelaide and Melbourne, and we got them for 35s. a ton, Sydney to Louth, right round; but they were stopped for about three months just below Wilcannia, and we had to wait for them.
3677. How did the freight by rail from Sydney to Bourke, and by team from Bourke to Louth, compare with that 35s. a ton *via* Adelaide? At that time the railway freight from Sydney to Bourke was £8 a ton for miscellaneous goods, and the carriage by team was about £3 a ton. We paid as high as £5 at that time for loading from Bourke to Louth.
3678. In that case you say the great disadvantage arose from the fact that the goods could not be got up the river? Yes.
3679. But with the river locked from Bourke to Menindie that difficulty would disappear? Yes; we should be able to get them at any time.
3680. Do you think you would still get goods from Sydney round by Melbourne or Adelaide? Yes.
3681. Do you not think it would pay better to get them from Melbourne or Adelaide? No.

T. A.  
Mathews.  
28 Sept., 1899.

S. O. Laycock.  
28 Sept., 1899.

- S. O. Laycock. 3682. You think the course of trade in this district will be from Sydney? Yes.
- 28 Sept., 1899. 3683. What effect would that have on the railway from Sydney to Bourke? It would make a little difference to the railway; but I think the river would make up for it.
3684. You think that, although the outward traffic from Sydney to Bourke would be reduced, the locked river would act as a feeder to the railway at its terminus at Bourke? Yes.
3685. *Mr. Watson.*] You stated, in reply to Mr. Dick, that, in your opinion, the construction of the locks and weirs from Bourke to Menindie would act as a feeder to the Bourke railway, and yet might have the effect of reducing the outward traffic from Sydney on that line? Not exactly that. I did not mean to say that it would act as a feeder to the Bourke railway, but that it would not take the business from Sydney. The Sydney people would still derive benefit from the locking of the river. We would not send to Adelaide for goods. We could get them from Sydney more cheaply than we can now.
3686. You found that when the river was up it paid you to get goods round all the way from Sydney, rather than take them a shorter distance from Adelaide? Yes.
3687. You have to chance the river being up all through, to get goods at the rate of 35s. direct from Sydney? Yes.
3688. How do you account for the fact that you are able to buy more cheaply in Sydney than in Adelaide or in Melbourne? Most of the people in the back country will deal with Sydney—I mean New South Wales people will.
3689. Is that merely from sentiment, or from the idea of profit? From the idea of profit? They will deal with the Sydney people; and not only that, but most of the Sydney warehousemen have also warehouses both in Adelaide and in Melbourne.
3690. Well, take a warehouse with branches in Sydney, Adelaide, and Melbourne—if you were to send an order from here now for a certain quantity of goods, from which place would they send those goods? From Sydney, certainly.
3691. How do you account for that? The Adelaide people do not know the back country people; but if I were to send an order to Sydney the goods would be put on the boat in Sydney and come round to the forwarding agents in Adelaide, and then be trans-shipped there to the river steamers.
3692. Would it not be a shorter distance to bring them from Adelaide under like circumstances? It would, but I do not think the carriage would make sufficient difference. If we could get the goods carried for 35s. a ton we should not trouble about Adelaide.
3693. It has been contended that, owing to Sydney being the terminus for the great shipping lines, and a sort of depôt for the island trade, it will always be possible to get goods from the outside markets more cheaply there than at any other point along the coast;—do you think there is anything in that? I do not think so, for I believe that at the present time in Adelaide you can buy goods a trifle more cheaply than you can buy them in Sydney.
3694. And yet you would prefer to buy in Sydney rather than in Adelaide now, notwithstanding the difference in price? Yes.
3695. Do you think there are many more people built like that? Yes; and I believe that if we get Federation it will cause them to be more so.
3696. What do you mean? Because if we have Federation I should say that we should have a small toll from the steamers and New South Wales would receive the same benefit as the other colonies.
3697. New South Wales being the owner of the lands adjoining the Darling would receive a benefit if greater settlement accrued from the locking of the river? Yes, I believe that would bring people here to settle on the land.
3698. You are of opinion, then, that the mere direction of trade is not so important as getting the people settled profitably on the soil? Yes. If the people settle on the soil the trade must be there.
3699. And the direct rent from the land, or the purchase money for the land, would accrue to the New South Wales people? Yes; I believe that New South Wales would receive a larger benefit from the locking of the Darling than any of the other colonies would. About five or six months ago the river was dry here, and the Chinamen had to stop drawing water from the river for irrigation purposes.
3700. You have known of instances where it has been impossible to get water from the river at Louth for irrigation purposes? Yes, I have. There was not a depth of 3 inches of water in the bed of the river, and the water was not more than 1 foot wide.
3701. Of course, there would be no possibility of irrigating any quantity of land from that? Not the slightest.
3702. Your contention, then, is that unless the river were weired, either with or without locks, there would not be sufficient water conserved to allow of irrigation in any quantity? Yes.
3703. What irrigation is now going on along the banks of the river is, of course, precarious, to the extent that the water varies in height, or disappears? Yes; and where the best lands for irrigation purposes are is generally the highest bank, and the pump has to be moved up and down. Sometimes the river falls here 20 feet in a week.
3704. So that, practically, it means that at the present time there are only a few feasible spots, where deep pools exist, where irrigation has any possibility of permanency? Yes. In fact they could not irrigate there to any great extent.
3705. Notwithstanding that element of insecurity, a considerable number of people are irrigating small patches along the banks of the river? Yes, just a few acres, that is all.
3706. Do you think that, generally speaking, the prospects for irrigation in this district are good? Yes.
3707. Do you think there would be an outlet for produce in the way of dried fruits, fodder, fresh fruit, and so on? Yes.
3708. *Chairman.*] How many people are there in Louth at the present time? About 100.
3709. Has the place been progressive, or otherwise, during the time you have known it? During the last few years it has not progressed much.
3710. That shows there is something wanting? During the last twelve months it has progressed to some extent, because of the employment of 150 men scrub-cutting on Dunlop, but that is the only progression we have had here. That really is no progression. The sheep are dying.
3711. But in undertaking a large work of this kind you want to look ahead a little, and see what you are going to get out of it;—what do you think the Government will receive, by way of direct or indirect benefit, for this large expenditure? I do not think they would receive much at the present time, but I think this is the time for the work to be done.

3712. In years to come, what will be the benefit? The people will settle on the land, and there will be more produce required. The water-carriage to Bourke would make it cheaper, and they could always get a market for their produce. They could get a market for their chaff now. S. O. Laycock.  
8 Sept., 1899.
3713. Do you mean small holders would settle on the land? Irrigation farmers. Anything that would enhance the value of the land would be good for the whole of the Colony, as well as for the district, inasmuch as the Crown owns nearly all the land here. There is very little freehold.
3714. Do you really think that the district is retarded by not having any reliable means of communication? I believe it is.
3715. And I suppose that, owing to the tortuous character of the river, railway communication, to suit all the holders who must have their centre of operations on the river banks, is impracticable? Yes.

George Leggatt, grazier, El Dorado, near Louth, sworn, and examined:—

3716. *Chairman.*] How many miles do you reside from Louth? About 4 miles. G. Leggatt.  
28 Sept., 1899.
3717. What is the size of your holding? About 84,000 acres.
3718. *Mr. Shepherd.*] How many sheep have you? At the present time, about 16,300.
3719. How many had you (say) four years ago? That was a bad time of drought. I cannot say how many; but I had not so many. That was the 1885 drought, when there were heavy losses. We had, perhaps, 13,000.
3720. How many had you twelve months ago? Twenty-three thousand five hundred.
3721. You have lost about 7,000? No; I have sold some. We have lost about 4,600, I think.
3722. What kind of pasture have you, chiefly? Only the natural grasses.
3723. What kind of grasses? Mitchell grass, blue grass—in good seasons this is,—umbrella grass, star grass, barley grass, mulga grass, silver grass, and No. 9.
3724. Of all those, which do you consider the best for sheep? The blue and Mitchell grasses I consider the best.
3725. Have you taken any steps to preserve those grasses? No.
3726. Is your run paddocked? Yes; divided into twelve sheep paddocks.
3727. Do you not think it would be of advantage to “paddock” some of your best grasses with the view of conserving them by enabling them to seed? I do not think so; we have not the country to spare. We have to keep a certain number of stock on in order to keep our head above water at all.
3728. Have you never had any experience of such “paddocking”? Not in saving paddocks like that, in order to let the grass go to seed, though we save them for lambing purposes.
3729. Are you aware that by “spelling” portions of a run you largely increase its capacity for carrying stock? I believe so. It is no doubt of great advantage to allow the grass to go to seed.
3730. I suppose you attribute the small loss, comparatively speaking, of your sheep to the fact that you have your run not overstocked? Yes, that is it, and the expense we went to in employing labour in keeping the sheep alive with scrub.
3731. What is the full capacity of your run in favourable seasons? Seventeen thousand or 18,000 sheep.
3732. So you have it fairly well stocked now? Considering the season, it is very well stocked.
3733. Have you any other stock besides sheep? Only a few dairy cattle and horses.
3734. Just for home use? Yes, that is all.
3735. Have you tried any cultivation? Not irrigation. We have put in a cultivation paddock of 10 acres this season.
3736. With wheat? Yes.
3737. Was the result satisfactory? No.
3738. Owing to the drought, I suppose? Yes.
3739. Have you any garden cultivation? Yes. I have some young fruit-trees coming on.
3740. Not in bearing yet? Only about half a dozen.
3741. Have you been growing vegetables for any length of time? Yes, for years.
3742. Is the soil dark or red? Dark.
3743. Do you find that satisfactory? It is very good at our place—very rich soil.
3744. Have you any means of watering it? Yes, pumping—irrigating machinery.
3745. Have you studied the likely effects of locking the river? I have never made much study of it.
3746. You must have thought over it, surely? Yes. I have seen so much about it of late years in the newspapers.
3747. Do you think it would be of advantage to the people on the river to have the river locked? I think there is no doubt about its being of advantage for irrigation purposes.
3748. And for the purpose of carrying wool and goods? Yes, it will be of advantage.
3749. Do you think that, if the river were always navigable from Bourke to Menindie, the Bourke railway would be used largely for carrying goods and wool? I do not know. So far as I am concerned myself, I should say “Yes,” because all our wool is sold in Sydney, which is the best wool market in the Colonies; and naturally we should get our supplies from Sydney by rail to Bourke, and send our wool that way too.
3750. Would it not be cheaper to send to Adelaide or to Melbourne? Yes, much cheaper. One year a party offered to send the wool from El Dorado to London, and land it there cheaper than we could get it from Bourke to Sydney by rail.
3751. Do you not think that people would be likely to use the cheapest route? Yes; I am inclined to think that the large holders would, but the majority of the homestead lessees in this district I do not think would. Large places, like Dunlop and Toorale, would; though, when the river has been in flood, they have sent their wool to Sydney by rail, when they could have sent it right through by river to Adelaide.
3752. It is also proposed to construct a railway from Cobar to Wilcannia;—do you think that that railway would be largely used for sending wool to Sydney? Not if the river were locked.
3753. Do you think that the wool would be sent to Bourke rather than to Wilcannia? Yes. The carriage by water would be cheaper. I do not think that that railway would get a bale of wool.

- G. Leggatt. 3754. Do you think that it would be a feeder to the river by bringing wool to it? Yes; from perhaps halfway between Wilcannia and Cobar that railway might fetch it into Wilcannia.
- 28 Sept., 1899. 3755. So you really think the locking of the river would be of advantage to the Bourke railway? Yes.
3756. It has been the opinion of many that the locking of the Darling would deprive New South Wales of a great deal of the produce of the river—that the wool would be sent to Adelaide and Melbourne;—you do not participate in that opinion? No, I do not. In the flood times, Toorale and Dunlop, and nearly all the stations round here, send their wool *via* Bourke to Sydney. I do not know why they do it, but they do it. It has been done for years by Dunlop. They used to send their wool down the river, but they have not done so of late years.
3757. *Chairman.*] Your losses do not seem to have been very heavy compared with those of other holders;—how have you kept your stock alive during these four or five bad seasons? Understocking the property is one thing, and we have been fortunate in getting thunderstorms to make grass, and the country is well improved. There are nearly 65,000 cubic yards of excavation, and that is a big thing, not counting the river frontage, and there are small creeks. We started scrub-cutting when the sheep were strong, before the grass went off, and put on one man to 1,400 sheep, instead of one man to 2,500, as most of the people do. The great loss in most places is through carelessness—letting the sheep get too low, and then not putting enough men on to feed them with the scrub.
3758. Is that scrub done for, or will it grow again? The bulk of it will not come again. The mulga will not grow again, but the beefwood and the leopardwood will, and the whitewood will grow from the stump.
3759. I suppose you run your place on the lines which you think are most advantageous from a business point of view;—we have heard a great deal of the desirability of irrigating patches of land (100 or 200 acres), and growing crops to maintain stock in bad seasons;—how do you regard that proposal? I think that if the river were locked it would be carried out largely.
3760. Has the river not been locked been an obstacle to your doing it? Yes; we cannot get the power.
3761. Too high a lift? Yes.
3762. With a reliable depth of water, and not too great a height to pump, would you go in for irrigating cultivation paddocks? Undoubtedly.
3763. Would that be more advantageous than having to cut scrub for your sheep? Yes, very much.
3764. Would the expense of doing it, do you think, be too great a handicap? No; it would be much cheaper than scrub-cutting.
3765. And the mulga—which is the bulk of the scrub—once cut is done for? Yes.
3766. So, from that point of view, you think the locking of the river would be of advantage? Yes.
3767. *Mr. Watson.*] At the present time you have about one sheep to 5 acres on your holding? Yes.
3768. I suppose you would call this the worst period of the drought? No; the drought is broken now. We have feed now.
3769. Still, the number of your sheep has not been increased since the worst period of the drought? No.
3770. And what were you carrying prior to that, in a fair season? From 18,000 to 20,000; but, with lambs, in a good season we have had as many as 23,000.
3771. That would bring you up to nearly one sheep to 4 acres? Yes; but when we have an increase we make room for them by selling sheep after the shearing, so as not to overstock.
3772. That compares favourably with any other property we have seen on the river? Because it is well improved.
3773. Is your country any better than that surrounding, or further up, or down the river? No; I cannot say that it is.
3774. Do you think that, on the average, it is much better than that of the surrounding holders? No; not on that side of the river. In fact, the adjoining country, Dunlop, is as good as the best of our country.
3775. Do you think that, with locking and weiring the river, and the consequent cheapening of supplies which ought to accrue from easy and regular communication, it would be possible, on the expiration of the present leases, to get a larger number of settlers on smaller holdings? Yes, I think so.
3776. And do you think that that would result in a larger number of sheep, in the aggregate, being carried on the same quantity of land? I do not know about that.
3777. You have a small holding compared with others around? Yes.
3778. It seems that you are able to carry more sheep per acre than some of the holdings we have seen;—do you think it likely that a man with a small holding, giving greater attention to sheep, would carry more sheep to a given area than a large holding? Yes, I think it is likely.
3779. What number of sheep do you think a man would require to enable him to make a living in this district, assuming that he had a holding sufficiently large to carry them? About 10,000.
3780. He would want that number to make anything like a decent living? Yes; if a man with a family, he would want a run capable of carrying 10,000 sheep.

Leonard Sydney Pearson, chemist and hotel-keeper, Louth, sworn, and examined:—

L. S. Pearson. 3781. *Mr. Dick.*] How many years have you been in this district? I have been twenty-one years in Louth.

28 Sept., 1899. 3782. Will you make a statement as to what you think the probable effect of locking the river from Bourke to Menindie would be on the general course of traffic? My opinion is that if the river be locked from Bourke to Menindie it will be of very great benefit to the district. It will be the means of our getting stores to this place much more cheaply than at the present time, by train from Sydney, and by river from Bourke. When I was a storekeeper some years ago I was dealing with Adelaide and Melbourne, and it cost me £5 per ton carriage to land goods from Adelaide at Louth. The steamer got stuck up down at Henley, and again at Wilcannia. The steamer being stuck up, I had to buy again, and the carriage I paid from Sydney to Louth was £28 7s. 6d. per ton, by train to Dubbo and thence by team to Louth. It was £6 7. 6d. to Dubbo and £22 from Dubbo.

3783. Have you been getting stores from Sydney since the railway was extended to Bourke? Since the railway has been extended to Bourke, what I get in the hotel-keeping line is very trifling. I had some beer from Sydney, but I do not know what the carriage was. It was landed here free.

3784.

3784. Was that by river, or by rail? It came by water all the way from Sydney, *via* Adelaide. L. S. Pearson.
3785. With a locked river, permanently navigable, should you get your stores from Adelaide? Certainly. 28 Sept., 1899.
3786. Do you think that that would hold pretty generally with the storekeepers and pastoralists, and others, along the course of the river? I think it would, after they got to know which was the best place for them to deal with. Most of them have been dealing with Sydney, and nowhere else; but when they try Melbourne, Sydney, and Adelaide together, they will find that Adelaide is the cheapest market to buy in. They will save in carriage, and also in market price as well.
3787. Even if the markets were equal, you think that the saving in carriage would be sufficiently large to induce them to trade with Adelaide instead of with Sydney? Certainly.
3788. With respect to the principal produce—wool, skins, and so on—of the properties south of Bourke to Menindie, in which direction do you think it would be sent, if the river were made permanently navigable? It would be sent down the river. Of course, with locks and weirs, there would be a toll. But, at the present time, whenever the river is up, it is cheaper to send goods down direct. I have had a good deal of experience in forwarding wool from the stations.
3789. You think the tendency will be to send the produce down the river rather than by rail? Yes; it will be much cheaper. The freight from here to Adelaide is much lower than it was formerly. Gidgea station belongs to Dalgety & Co., and I used to forward their wool to Adelaide. Pulpoola and Wittagoona stations, belonging to the Bank of New South Wales, send their wool *via* Bourke. The head office of the bank being in Sydney, I suppose they have their wool-scouring plants in Sydney, to which they send the wool.
3790. Can you offer any opinion as to what would be the effect on the produce brought in from places north of Bourke, in this Colony, and those parts of Queensland which now send *via* Bourke to Sydney;—do you think that produce would go right down the river, if it were made permanently navigable, or would it still be sent to Sydney? I cannot say as regards places above Bourke.
3791. We have had a good deal of evidence to the effect that the Sydney wool market offers such material advantages to wool-producers, that, even if the freight on the railway were heavier than on the river, they would prefer to send their wool to Sydney;—do you think that, with a permanently navigable river, that advantage in favour of the Sydney market would be neutralised by the low charge for carriage down the river? I think that, after all, Adelaide would be the best place for them to forward their wool to, for transhipment to England.
3792. Have you noticed whether pastoralists in this district have taken advantage of the river for irrigation purposes at all? I think that Winbar was the first to take advantage of irrigation, and then Dunlop. Dunlop is going in very much for it now, increasing the area under irrigation every year. Winbar has been irrigating for a number of years.
3793. Can you say whether the uncertain level of the river, with the consequent necessity for changing the level of the pumps, has been a serious obstacle to general irrigation? It has been a great obstacle, for when the river is down so badly, as it very often is, people have to put on so much more force in order to get the water up that they cannot very well get the power to do it, unless they are men of money and can buy the necessary plant.
3794. Can you offer an opinion as to the financial aspect of irrigation as a means of insurance against drought—in other words, do you think it would pay pastoralists to place an area under fodder crops for the purpose of providing against seasons of drought? They could do it to a certain extent, but not to feed the whole of the stock on the land.
3795. Could they feed the better quality of their stock in that way? Yes.
3796. With respect to the localities where irrigation is possible, of course they must be near the river bank, and must offer facilities in the way of good soil, and also have a grade away from the river; do you know of many places along the river where such conditions prevail? Redbank is about the best part of the river that I know of, and there are also Gundabooka and Myrtle Vale. I do not know much about the other side of the river.
3797. Do you think that the locking of the river, and the resulting advantages, would encourage a system of smaller holdings? I think that if the river be locked it will be the means of causing settlers to come on the river, and of increasing the settlement. With droughts, there is no water to make any crops grow, but if the river were locked they could get water from the river, when otherwise it would be low.
3798. What would be the smallest holding, in land of the character we find about here, which would be sufficient to enable a man—I do not mean a man with a lot of capital—to make a decent living? If he had suitable ground, and had a suitable place for irrigation, I think 640 acres should be sufficient.
3799. But a man with 640 acres would not be able to keep any sheep? No; simply an irrigation farm.
3800. How would he be able to make a living from 640 acres, with irrigation? By growing fodder crops, vegetables, and fruit. He could grow any kind of fruit.
3801. Apart from fruit, what market would he find for other crops, such as fodder crops? We have to get all our horse-feed from Bourke and Sydney; also potatoes and other things which could be grown here if there were irrigation plants.
3802. It would not require many 640-acre blocks to supply this district with potatoes? They might find an outlet in that way.
3803. Do you think that a number of men with 640 acres each would find sufficient encouragement, year in and year out, to grow fodder crops for the adjoining squatters? I do not know that they could now, for the squatters are irrigating for themselves.
3804. *Chairman.*] The district generally seems to have gone back lately; how do you account for that? I do not know that it has gone back much outside the town. I do not see much difference in it. There are a great many more people about—homestead lessees, and so on—who were not here before; and if we had good seasons they would be all right.
3805. Do you think that a man could get a living from farming, independently of sheep-breeding? A few men could.
3806. I suppose you regard the district generally as more a grazing district than a farming one? Yes.
3807. Do you know which is the better soil, the red or the black? The grass grows quicker on the red, and also dries the quicker; but when you get the rains the grass on the black soil lasts a considerable time. Where the irrigation farms are is very nearly all red soil.

- L. S. Pearson. 3808. Is some reliable means of communication, in your opinion, the one thing that is necessary to raise the district? That is what is wanted. The carriage is very high—£3 5s. by team from Bourke, and £8 or £9 by rail from Sydney to Bourke. The river freight is from 25s. upwards. With a good navigable river, it is 25s. from Bourke.
3809. Do you agree with former witnesses that, if the river be locked only as far as Menindie, that will bring trade to the Bourke railway? Certainly—that is, if the river is not navigable below Menindie.
3810. Of course, if it be made navigable farther on, it will take the trade down the river? Yes.
3811. *Mr. Shepherd.*] What is the average number of months during a year that the river is navigable? I cannot give an exact reply. The river might not run for two years, or we might have it for twelve months.
3812. The last four years have been exceptionally dry, but you surely have an average? I never took that notice of it.
3813. I suppose it is navigable some portion of every year? Not necessarily. Sometimes we have it just for the steamers to go down. They might start from Bourke and not get this far before the river sank, and at other times we might have a river up for nearly twelve months.
3814. You think it is only when the river would not be navigable below Menindie that Bourke would be likely to reap benefit from the locking of the river? Yes.
3815. So if the river were running nearly the whole twelve months there would be no traffic taken to Bourke for the railway? Not from below Buckambie, the freight to Buckambie being much less than to places below it.
3816. How often do the steamers pass here? When the river is navigable there are about six steamers plying continually.
3817. But how many times a week does a steamer pass? One goes up and down every fortnight. That is the "Florence Annie," a passenger and hawking vessel. I think there is about an average of six steamers continually going when the river is navigable.
3818. Do they make the passage from Menindie to Bourke once a fortnight each way? No; down to Wilcannia generally. There are also boats that go right through, and these come up from Adelaide with goods.
3819. Supposing that the river had the whole of that traffic, and Bourke had the benefit of it, do you think it would pay New South Wales to invest £500,000 in the locking of the river, and to spend something like £5,000 per year besides to maintain it? It might not pay New South Wales at the present time, but eventually it would from Menindie; but, if we had Federation, and the work were carried right through, it would perhaps not pay New South Wales.
3820. You think that New South Wales would benefit to that extent? It would reap a benefit if the river were navigable only to Menindie, but not if it were navigable all the way down below Menindie.
3821. I suppose that wool would be the principal freight? Yes.
3822. Is there a pretty general idea in favour of the locking of the river? Everyone I have spoken to about it, since we heard about your coming, seemed to be in favour of locking the river.
3823. And they are all of opinion that it would be a good investment for New South Wales? Yes, and of great benefit to the district. I have not heard one person speak against it.
3824. Is there anything else you can think of which would be of advantage to the Committee to know in connection with the locking of the Darling? Of course, if the river be locked there are stations out towards the Paroo, and on the other side towards Cobar, which would have the means of getting goods by river instead of by rail, and it would be much cheaper.

[The Committee met at Dunlop station, Darling River, at 7 p.m.]

James Wilson, part-owner of Dunlop station, sworn, and examined:—

- J. Wilson. 3825. *Mr. Dick.*] You are part owner of Dunlop? Yes.
3826. What is the size of the holding? About 700,000 acres.
- 28 Sept., 1899. 3827. Will you state in what way you think this western district would be affected by the locking of the Darling? I am of opinion that it would be a good thing for the whole community, and that the river Darling should be locked as a feeder of the railway system of New South Wales.
3828. You think, for instance, that wool grown on properties adjoining the Darling River would be sent up to Bourke, were the river permanently navigable? We have always sent our wool up to Bourke. If the river Darling be locked as a feeder to the railways, those people not using it for that purpose, and sending their wool the other way, should pay a toll for their produce going down the river, not for the sake of protection, or anything of that sort, but simply for services rendered by the Government. Of course, I cannot say what other people would do.
3829. Do you think that those people whose properties are financed from Melbourne will in all probability continue to send their wool down the river, even if the river be locked? Yes.
3830. Do you think that those people who now are in the habit of sending their wool by the Bourke railway to Sydney, in order to catch the Sydney market, would still, even if the river were locked, and the charges on the river were less than those on the railway, continue to send their wool to Sydney? I do not know what other people would do, but ever since the railway came to Bourke we have always used the railway for the carriage of our wool.
3831. You sell your wool in Sydney, or in London? In London. We do not sell any in Sydney. We would not get such good prices in Sydney, and we shall very likely continue to sell it in London, because our wool has made a market for itself, and it is known, and its brand. If you make a name for a brand, it is a most important thing.
3832. Supposing that the river were permanently locked as proposed under this scheme, and navigation were kept open throughout the whole of its course, would it not be a matter for you to consider whether carriage down the river would be cheaper than carriage to Sydney *via* Bourke, since you could get your wool

wool carried to London from Adelaide as well as you could from Sydney? The railway was made for the use of the squatters of the district and we thought we ought to support it, and even now when the river is navigable we send our wool to Sydney, because it is a large shipping port. Another set off against cheapness of carriage is this: When we send wool by rail we never insure it, but when we have sent wool down the river we have paid as much as £1 10s. per cent. for insurance, and if that were added to the carriage there would not be so much difference, and there is always danger in going down the river.

J. Wilson.  
28 Sept., 1899.

3833. Was that a determining factor in your case? It was.

3834. In case the river were locked the insurance would be much lighter? There is no doubt there would be less risk if the river were kept properly snagged.

3835. Is there any advantage in shipping from Sydney as compared with shipping from Melbourne or Adelaide? Not that I know of. But our business is done in Sydney. When the railway came to Bourke we had business with Melbourne, but since the railway came to Bourke we have done that business with Sydney, and where you do one sort of business you generally do another sort. I think the railway charges for the carriage of wool are very reasonable. I think the Railway Commissioners carry on the railway business to the advantage of the whole community. There is one advantage in sending the wool *via* Bourke. It reaches the shipping port quickly, and is delivered in London, per Orient Company, in six weeks; whereas, I have known wool sent down the river to be six weeks on the way to the port of shipment. In sending it to Sydney we save interest on the money, and that has to be taken into consideration.

3836. If you had the same certainty of transit down the river, with cheaper carriage, it might pay you to ship from Melbourne rather than from Sydney, and therefore to send your wool down the river, if it were locked? That is a hypothetical question. It depends on a great many things.

3837. You have had some experience in irrigation? Yes, a little.

3838. Can you offer the Committee any opinion as to the general prospects of irrigation along the banks of the Darling, if it were locked as proposed under this scheme? No, excepting on a very small scale.

3839. Do you think that here and there it would pay to irrigate (say) patches of 200 acres? So far as my experience of irrigation goes, it is only the red soil where we can do anything with irrigation. There is a piece of a paddock here with black soil, and when the water is put on to it it is made into a state of pulp, and when that soil dries again it is like a brick-field—all in cracks. We find that it is only on the red patches of soil along the Darling where we can grow crops by irrigation. That is, at any rate, my experience.

3840. Do you think that on red soil, then, it would pay to irrigate patches of 200 acres? Yes, I think so, if you can find them on the banks of the Darling; but where can you find them.

3841. You think that the portion of the river known as Redbank is a fine site for an irrigation settlement? I think it is the best piece of land for irrigation on a large scale on the Darling that I know of. I think I should qualify that answer to a certain extent. I do not believe that irrigation will pay working expenses if water has to be pumped. We have an engine and a pump here supplying the home station, and the garden, and another little place. We cut extra channels to them, but we have no extra plant to keep up.

3842. Have you ever gone into a calculation as to what it would cost you per acre to irrigate? No.

3843. We have been assured by several witnesses that, merely as a protection against heavy loss during drought, it would pay each and all of the pastoralists along this river to irrigate patches of (say) 100 or 200, or even up to 400 acres, for forage crops to feed starving stock during times of drought;—would you subscribe to that statement? That is a matter in regard to which I have never made a calculation. I was going down to consult McCaughey & Co. on that very point. I work up the sheep to a fine condition. Some of the sheep that I will show you in the morning are worth £1 per head. I cannot afford to lose these sheep, as I could not buy them again at £5 per head; but none of us have decided yet what shall be done. We want to have a consultation as to the best mode of saving the stock after we have once got them.

3844. Do you think, then, that one of the methods by which such valuable stock may be preserved during times of drought may be by means of irrigated paddocks? I will tell you what I was going to propose to my partners: To select a paddock—a nice, level, sandy piece of country—and to put down a bore specially, and try the bore water. It could easily be done in this way: We should, first of all, have to select a place where the biggest flow of water is, because less than 500,000 gallons would not be of any good for the irrigation of sandy soil; and that is the only place where we could grow crops here. We should put down a bore and put a tank all round it—say, 4 feet—and have a flood-gate. The only way to irrigate now is—not by little dribbles—you must have a good flow of water, and let it run over the ground, and then take it off. If you let the water settle on the crops here for twenty-four hours in the summer it will kill them; you might as well pour boiling water on them. The water must flow over them, but not a drop be on them the next day when the sun rises. We have come to the conclusion that it will not pay to lose these sheep, and if you do not work your stock up how can you compete. But, as to giving an opinion as to what is the proper thing to do—that is a matter that will have to be settled by experience. I will tell you what Mr. McCaughey is doing for Riverina. He is working with irrigation, and he is going to grow sorghum for sheep. He has entered upon it on a large scale at North Yanko station. He says that sorghum is the cheapest thing he knows. You must prepare the ground in sections, and your check-drains must not be too wide apart. It is impossible to get ground so level that the water will not run into holes in spite of you, without grading; but if you have check-drains you can stop your water when you like, and start it again. Mr. McCaughey says that you can begin at the beginning of a drought, and four months after can feed every sheep with sorghum. That is his plan. Whether he will succeed or not, I do not know; but if he tries anything he generally succeeds.

3845. Is he going to use bore water, or river water? He has no bore water there.

3846. And will he use the river water by gravitation or by pumping? I think gravitation.

3847. You do not anticipate much in the way of irrigation by means of pumping the water from the river on to the land? I do not think that would pay, to grow crops for the general public. It might pay you, to save sheep. That is how you should look at the matter—not merely what it will cost you to do it, but what it will cost you if you do not do it.

3848. Along your river frontage, have you any patches of land which, in your opinion, could be fairly easily irrigated by means of pumping water from the river, in preference to going further inland and

J. Wilson. sinking a bore? No; I think that bore water would be cheaper than any other water for irrigation purposes. There is another thing against irrigating with water from the Darling. The land is very uneven, and it would cost £4 or £5 per acre to grade it. I will, to-morrow, show you a piece of country that I am grading now.

28 Sept., 1899.

3849. *Chairman.*] You do not think much of the irrigation part of this scheme? I do not think it will pay, to grow crops against the world. I think it will pay on a small scale in the way we do here. But supposing you were growing grain, how could any person begin and prepare land, and grade it, and put it into sections, and have to pump his water, and then grow crops in competition with people in places like the place where I was at Cowra, where there is a rainfall of 28 inches in the year.

3850. Admitting that it would not pay to grow grain crops, and such crops as, compared with others, are not of so high a value, do you think it would pay to grow more valuable crops, such as fruit? I have not had any experience of that, and I would not like to give any opinion on something I know nothing about. The whole of the Victorian water schemes for irrigation were a failure financially. I do not desire to say anything against irrigation; but I say, at once, that it should be gone into on a very small scale at the beginning, until people know what they are about.

3851. Well, considering this scheme merely as a scheme for navigation, do you think the Government would be justified in spending £500,000 in locking and weiring the Darling from Bourke to Menindie? That is a question for Members of Parliament to consider. I think it would be a good thing for the country; but, whether it will pay the whole community to sink so much money is another thing. We have begun here with acre-blocks of lucerne, and supposing that people have better land than we have they might go in for 100 acres, but we have not got much land here fit for lucerne.

3852. Have you tried to grow lucerne on the black soil? We have.

3853. Was it a failure? It was. But, even supposing it had not been a failure, the whole of the black soil here is under water about every third year, and that would kill the lucerne. In the 1890 flood, the river Darling was out 10 miles on each side, our garden was 2 feet under water, and our people had to live on what is called the "Knob."

3854. *Mr. Shepherd.*] You said that the insurance on wool going down the river was something considerable? It was when we were paying it, but I do not know what it is now. We have paid as high as £1 10s. per cent.

3855. Did you ever know the reason why such high insurance was charged? The loss of wool-vessels in going down the river.

3856. Are vessels not so likely to be sunk in going up the river? No. In going down the river the wool is carried in barges, the steamer going ahead of the barge with a long tow-rope. The men have not so much command over the barges as they have over the steamer, and in going round some nasty turns the barges sometimes swing round into the banks. That is how there are so many losses. All losses that I know of have occurred in going down the river, with the exception of one vessel which was coming up with a cargo of lime. However, I think that that loss was not owing to the current, but owing to something being the matter with the lime.

3857. You said that an attempt was being made to grow sorghum for sheep? Not here.

3858. Is the intention to grow it for a season, or to store it in the shape of ensilage? I do not know what the intention is, except that if a drought were to come on they could start, and in four months they would have good feed for the sheep.

3859. Do you not think that it would pay to cultivate a considerable block of sorghum or maize, or some of the best material, for ensilage, and lay up stores of ensilage for future use? We never went in for ensilage. We are satisfied if we grow a crop of hay only once in two years. During the last three years we have not got anything, and I do not know that we shall get anything this year, except a few pieces.

3860. Of course the last four years have been exceptional seasons? We should be satisfied if we were to grow a ton of hay to an acre every second or even every third year here, because the crops we grow are far better than what we buy. We have tried them only lately—that is, to keep the horses, not sheep.

3861. You have not grown sufficient hay to stay you over three or four years? No. In a good year you do not want hay for the horses.

3862. Is any considerable portion of the run paddocked, in order that you can "spell" portions of it occasionally? It is all fenced and has been divided into paddocks from the very beginning.

3863. Of course one great object in dividing the run into paddocks is that you may spell a portion of it occasionally and give it a seeding season in order that you may preserve the grasses? That is one thing in regard to which I differ from a great number of people. They say, "Why do you not keep grass for the bad seasons?" We find from experience here that grass which is eighteen months old will not keep anything alive. Since I joined Sir Samuel Wilson I have spent close on £100,000 in improving this run, as it is now.

3864. Do you not find that by giving it a seeding season, you preserve the grasses instead of having them exterminated? We find at Dunlop that if, instead of eating the grass when it is in its first state, and turning it into wool, you let it stand eighteen months, it will not keep anything alive, because it gets rotten. Our policy has been to eat the grass when we could get it, and turn it into wool. It is a mistake to think that adequate stocking prevents grass from seeding. In good seasons the grasses here seed freely, in spite of any number of sheep that we have ever carried, and, when shed, the seed is harrowed in by the action of the sheep's feet, with a tendency to thicken the sward; and the rest depends on the rainfall.

3865. Of course, it is in bad seasons when you would reap the benefit of conserving your grasses? I am giving evidence about Dunlop at the present time, and do not say that what I am saying applies to every other place. Supposing I had been managing in Victoria, or on the Murrumbidgee, and I came up here, I might think that I must do the same as I did there; but it would not work. You must find out what a district will do, and what sort of stock it will support. I brought some of the Victorian sheep—the western sheep—to Dunlop, and thought they were the best sheep out, but I found that they were very bad sheep for this part of the country, not suitable at all, and we had to change. It is a mistake to reason from premises you do not know anything about. One man says, "The western is a good sheep"; I say that it is a good sheep, and if I were a western man I would stick to the western sheep; but when

I brought the western sheep to Dunlop there was very little besides their wool, and I had to go in for another sort of sheep.

J. Wilson.

28 Sept., 1890.

3866. What kind of sheep have you here now? Vermonts.

3867. I suppose that the merino sheep is one of the hardest? It is. I have seen merino sheep on Dunlop living when the rabbits were dying from the want of feed. If you give a merino sheep plenty of water it will do with very little feed.

3868. Then, the Leicester sheep would starve, probably, where the merino would do very well? This is not the country for Leicester sheep. We may call the western part of New South Wales and Queensland the merino country.

3869. As a rule, the best sheep country is where the grass grows to a certain extent in tussocks? What we call the best sheep country is "two-acre" country. When it gets over "two-acre" country it is not what we call the best merino country.

3870. That is 2 acres to a sheep? Yes.

3871. What is this country? Ordinarily one to five, but at the present time one to ten.

3872. What I wanted to get your opinion about was, of course, a matter which I think would apply to any kind of pasture—that is, the best means of conserving the pasture, preventing it from being worn out;—it is very clear that if grass is not allowed to seed it must very soon become extinct? Yes; but I suppose there is such a thing as grass growing from the roots again.

3873. But the roots would eventually die if not reproduced by seed, and that is the great object in paddocking, so far as my experience goes? But I would not eat down the country to such an extent that there would not be some grass seed upon it. Say in a good year you put on half stock and plant grass seed, then if next year is a bad year that grass will remain there, and at the end of twelve months it would not keep sheep alive. That is our experience at Dunlop, and it certainly stands. In severe droughts the grass seed will blow off the ground. A dust storm comes, and I have seen a fence silted up to the top of the wire with grass seeds. When our sheep have got to such a pitch as at the present time, we must try to modify things in some way.

3874. Have you not known instances where, when country was first taken up, there were certain grasses which have now disappeared? On the contrary, when I came here to take up land on Dunlop, there were only some patches with any grass on it, and it is the stocking of the country which has enabled the grasses to take root. The soil was so loose that the wind blew the grass seeds and everything else off it. When I first came here I saw sandhills in which anyone would sink up to his ankles, but now, owing to the sheep running on them, they are the best grass plots on Dunlop.

3875. What descriptions of soil have you? Only two descriptions—what we call the black soil, which goes out about 10 miles—flood country, and the red soil.

3876. Is the black soil generally flood country? It is all flood country. It goes out about 10 miles to the bottoms of the ridges.

3877. Do you find that a different description of grass is produced on the black soil from what is produced on the red? Yes; in a good year the black soil produces better wool than the red soil, but in a bad year it produces about the worst wool we have.

3878. Have you the trefoil on the black soil? It is beginning to grow, but only in the garden. It is a different trefoil from what we have on the Murrumbidgee. It is more like clover here. We call it the "Darling clover," but it is something like the trefoil on the Murrumbidgee.

3879. Have you the Mitchell grass or the blue grass here? Only to a very small extent. The Mitchell-grass and the blue-grass we have in a few of the frontage paddocks. We have tried to grow them. They grow between the red and the black soil, but when you come to the red soil they do not grow.

3880. Is there any salt-bush on this run? Yes.

3881. Which salt-bush—the dwarf or the tall? There is no old-man salt-bush here now, but there was when I came here first. It is the salt-bush that seeds and springs up any year—that is, when there is any rain at all.

3882. Do you find the sheep are fond of the salt-bush? No, they are not very fond of the little salt-bush.

3883. *Chairman.*] You know Mr. M'Kinney? Yes.

3884. In his evidence before the Committee in Sydney he made a very sweeping assertion; he said that it was a great reproach to all the squatters on the River Darling that they had not irrigated and cultivated patches of land, 100 acres or 200 acres in extent, for the purpose of growing feed for their valuable stock—horses, and other animals used for station purposes; do you agree with that proposition as a whole? I would tell Mr. M'Kinney that I wish he would come up and show us how to squat on the Darling.

3885. You think it is an opinion given without sufficient knowledge of the circumstances? Yes, without a knowledge of the surroundings.

3886. Talking of irrigation on the red soil, is Mr. Langlands' place at Gundabooka an exceptionally good site for the purposes of irrigation, having red soil close to the river bank, and high up? I think it is an exceptionally good site.

3887. There are not many like that about that you know of? There is another exceptionally good site which you will see to-morrow, with crops growing on it—that is, at Winbar. They have nice crops of lucerne growing on the same sort of soil as you see here.

3888. Is it red soil or black soil? Red chocolate soil.

3889. The continuous succession of bad seasons has now set the graziers thinking that they must do something to try to cope with the long period of drought? Well, they should do it. One thing against squatting more than anything else at the present time is, that we have had no lambing of any consequence for the last four years, and the result is that now we have all old sheep, and no young ones to take their places, and it is the young sheep which turn off the good fleeces.

3890. I suppose you have to pay a great deal for scrub-cutting? £1 per week and rations for each man.

3891. Have you weighed the two positions—the employment of men at scrub-cutting, and the killing of your mulga, as against the possibilities of growing stuff to feed your flocks? We have come to try both. We do not know whether we shall succeed at either one.

3892. But, as regards graziers on the river Darling, the growing of fodder for the purpose of saving starving stock in bad seasons is at present in its infancy—it has not yet had a trial? Only on a small scale. We have been ploughing land and sowing it in the month of March, and on account of the bad seasons that has been a failure, comparatively. We got a little hay off some portion of it.

3893.

- J. Wilson. 3893. You say that now you are thinking that you will have to do something in that direction? Yes; to save our good sheep.
- 28 Sept., 1899. 3894. But, seeing that you think you will have to go back from the river, and use bore water for that purpose, the prospects of using the water from the river Darling for the purpose are very remote? I do not know any place on Dunlop where we could do it.
3895. Does that opinion apply to your general knowledge of the river—that you could not get many good sites for irrigation on red soil on the banks of the river? It applies, from my knowledge, to Dunlop. At Winbar I have seen crops growing on red chocolate soil—the same sort of soil as we have.

FRIDAY, 29 SEPTEMBER, 1899.

[The Committee met at Curranyalpa station, Darling River, at 8 p.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN.)

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

James Ireland, manager, Curranyalpa station, sworn, and examined:—

- J. Ireland. 3896. *Mr. Watson.*] How long have you been in this district? Twelve years.
- 29 Sept., 1899. 3897. What is the extent of the holding? About 170,000 acres.
3898. How much stock is it carrying at the present time? 11,000 sheep.
3899. How does that compare with your totals in ordinary years? It is a reduction of about 50 per cent. on the last two or three years.
3900. Where do you send your wool to at the present time? To Bourke.
3901. Do you generally send it by river? By river when it is navigable.
3902. And when the river is unnavigable? By team.
3903. But, in any case, always to Bourke? Yes, always to Bourke.
3904. What is the river freight between here and Bourke when you send by river? It is generally about 25s. per ton on an open river, and about 30s. or 35s. per ton on a small river.
3905. So that, with plenty of water in the river, the steamers carry the freights so much more cheaply? Yes.
3906. How does that compare with the cost of carriage by team when you have no river? The cost of carriage by team is generally equal to about £6 per ton—that is both ways. Very often you cannot get teams unless they can get down-loading.
3907. So practically you always have to arrange for back-loading? We have not; but they may get down-loading for someone else, and pick up our wool.
3908. The wool is carried to Bourke for £3 per ton? Yes.
3909. That is fairly high, compared with the rate of carriage by river? Yes.
3910. So, if you did not happen to give them back-loading of your own, or were not able to work in with some other station-holder, you would have to pay a much higher price? Yes; that is, when the teamsters have to feed their horses.
3911. So we may look upon £3 per ton by team to Bourke as being the minimum charge? Yes.
3912. Have you had to bring any fodder—chaff or other feed—for your stock during the last season? Since last October.
3913. Which way have you brought that? Mostly by team from Bourke.
3914. The river being, during that time, mostly unnavigable? Yes. I think we have had only two loads by river.
3915. It would appear, then, that it would mean a considerable saving in the carriage of supplies to the station and produce from it, if you had the river permanently navigable? Yes.
3916. Does your trade amount to any considerable tonnage during the year, taking it to and from the station? Yes. I daresay it would be about 70 or 80 tons altogether.
3917. Including in and out? Yes, excepting in a drought, when we would have to buy more fodder.
3918. Supposing that the river were locked and weired from Bourke to Menindie, do you think that that would have any effect in the way of attracting trade to the railway at Bourke, and thence to Sydney? Yes.
3919. And if later on the locking were carried out to Wentworth, have you formed any idea as to whether that would probably result in the transference of trade from Bourke and Sydney to Melbourne or to Adelaide? I think that all the river produce would go that way.
3920. Because of the cheaper means of getting it away, with a certain river? Yes.
3921. Have you ever sent any wool to Melbourne or to Adelaide by the river? No; it has always gone to Bourke.
3922. Even when the river has been open right through, you have always sent it to Bourke? Yes.
3923. Is that because of the Railway Commissioners offering any special facilities to send it to Sydney? No. It has been our rule always to send it to Sydney.
3924. I suppose that, with a high river, you have been offered favourable terms by the steamship proprietors to take it the other way? No. We never inquired about trade down the river until last year.
3925. What was the result of the inquiry then? I think it amounted to about the same thing. There was no river, as it turned out.
3926. But any offers that were made to you would be on the supposition that there was a river, I presume? Yes. 3927.

3927. And even in that contingency they were not prepared to make any reduction on what you now pay *via* Bourke? No. J. Ireland.
3928. You cannot say what you yourself would be likely to do if the river were locked right through—whether you would alter your present arrangement of sending your wool to Sydney? I do not know. 29 Sept., 1899.
3929. You are perhaps aware that, connected with this proposal for locking and weiring the river with a view of making navigation certain, there is another idea, somewhat depending upon it, in the shape of irrigation; we have noticed that a number of people up the river have engaged to a limited extent in irrigation;—do you think that that would be a matter of any great importance if the water were there to work with more conveniently than now? Yes, I do, at suitable sites for irrigation.
3930. Do you know the river between here and Bourke fairly well? Yes; pretty well.
3931. Do you think that, at different points between Bourke and here, there is a sufficiency of land fit for irrigation to use whatever water might be stored between the river banks when the river were locked? Yes.
3932. You think there would not be much difficulty in getting land of a character that would be suitable for irrigation? I do not think you would get enough land for a big extent of irrigation, but small patches here and there.
3933. What land would you consider suitable—only the red soil? Oh, no; some of the black soil; but some you could not irrigate—it is too loose.
3934. It seems a mistake to speak too generally of black soil, as there would appear to be a great variation even in black soil;—do you think that is so? I do not think you could irrigate the loose black soil in the lignum country.
3935. So it would appear that there is some black soil fit for irrigation and some black soil which is not? Yes.
3936. Which variety of black soil would you class as fit for irrigation—that with sand in it? What we call the hard flats, not the scalded country, but the salt-bush country.
3937. That is a freer black soil? Yes.
3938. It should be above flood level? Yes; it should.
3939. Between here and Bourke, do you think that there is any considerable area of land fit for cultivation? No; I think that most of the black soil is subject to flood.
3940. And the red soil is limited in quantity? Yes; I do not know what extent there is of it. I know, perhaps, of only two places on the river where the red soil runs into the river.
3941. Have you been inland a little distance back from the banks of the river? Yes.
3942. Does the flood country extend invariably for a long distance back from the banks of the river? Yes—12 or 14 miles in places, and more than that.
3943. And is it intersected occasionally by tongues of higher land? No; it is not, to any extent. The higher ground is generally on the river banks.
3944. Have you made any attempt to irrigate land at Curranyalpa? We have not tried yet.
3945. I understand that it is your intention to do so? Yes.
3946. With what object; providing fodder for your stock in times of drought? For our stock in times of drought, for working stock, principally horses.
3947. What area do you anticipate being able to irrigate? I thought we might make a start with about 10 acres.
3948. That, I suppose, would be only about sufficient to carry your working stock in the meantime? Yes.
3949. So that anything for the main body of the stock would require to be left over until you saw the result of the first experiment, I suppose? Yes; we should want to irrigate to a large extent to provide for all the stock.
3950. Have you made any calculation as to what it would cost you, in labour and machinery, to irrigate the 10 acres? No; we have been trying to find out and cannot do so very well. We thought about £3 per acre to prepare the land.
3951. That is to get it ready for the water? Yes.
3952. Would that be grading it? Yes.
3953. Have you made any calculation as to the number of men you would require to employ for that area, that is, including pumping and the working of the land itself? No; I do not think we should do it if we had to go outside ordinary station labour to do it.
3954. You would not care to engage men specially for that work? No.
3955. Do you know what will be the cost of a plant to pump sufficient water? No; we have a plant here or we should not attempt irrigation. We have had one for years.
3956. What is the height of your lift? About 40 feet.
3957. From the present level of the river? No; from summer level—about the lowest level.
3958. Is it a disadvantage to have to pump the water 40 feet? Yes.
3959. We have been told at one or two places on the river that the varying height of the river is a drawback to irrigation, owing to the fact that men have to shift their pumping plant to accommodate it to the height of the water? Yes; that is awkward. Of course with a big plant you cannot do it very well.
3960. We have also been told that in some places there is at times practically no water to pump;—is that so here, or have you a permanent pool? We have no permanent water here. It was dry here last summer—there was only a bit of a gutter. The river stopped running here last summer.
3961. So last summer, if you had had an irrigation plant, you would not have had any water to pump? No.
3962. Yours, then, is one of those holdings which would be benefited from an irrigation standpoint, from having the river locked and weired? Yes.
3963. If you were to have the water about 10 feet higher at your frontage than it is at the present time, it would be of advantage to you from an irrigation standpoint? Yes.
3964. Do you think that that example would be followed by many others on the river banks if the river were locked? Yes, I think that everybody would go in for a little irrigation.
3965. You think that every holding could find an area of land, which would be suitable for irrigation, within a reasonable distance of the river? Yes.
3966. What do you purpose putting in on the irrigation area which you propose to have? We should try wheat, and a little lucerne.
3967. You do not propose to put in any fruit? Yes, a little.

- J. Ireland. 3968. For household use? Yes.  
 3969. Not with a view of sending it away to an outside market? No.  
 29 Sept., 1899. 3970. Do you think it is likely that if the river were locked, you would put down a larger area than you propose to put down? Yes, if we made a success of the smaller area.  
 3971. You have seen the results of irrigation on your neighbours' properties? Yes, I have.  
 3972. Has what you have seen there encouraged you to go in for it yourself here? Yes.  
 3973. And do you think that there is a likelihood of your being as successful as they have been? Yes.  
 3974. You think that your land is as suitable for irrigation as their land is? I think that we have a more suitable site.  
 3975. *Chairman.*] During this prolonged drought what have you been doing to maintain first your homestead stock and then your sheep flocks? We have had to buy fodder. We have grown enough fodder I think four years in the last seven to keep the working horses going, and at other times we have had to buy it.  
 3976. And for the sheep? We have had to cut scrub.  
 3977. If mulga scrub is cut will it grow again? Very little of it will—some of it grows and some of it dies. It is the same with all the scrubs.  
 3978. So, does not this position arise: you must now look ahead; if you are going to have any more droughts you must either get some permanent way of feeding your stock or let the whole thing die out;—is that what it has come to? That is what it will come to.  
 3979. Do you think it is practicable to go in for irrigation and cultivation sufficiently to enable you to maintain large flocks of sheep? No; I do not think we could get sufficient country to irrigate.  
 3980. This proposed locking and weiring of the river is estimated to cost over £500,000; at the lowest borrowing rate, 3 per cent., that means £15,000 per year for interest;—do you think that, if the river were locked, the squatters would be inclined to pay something in the way of tolls? No; I do not think they could.  
 3981. With regard to irrigation, do you think that they would be able to pay 5s. per acre per annum for the use of the water? I think they might manage to do that.  
 3982. That would not come to a very large item? No; I do not think there would be a big extent irrigated.

Herbert Cochrane Suttor, proprietor of Curranyalpa station, sworn, and examined:—

- H. C. Suttor. 3983. *Chairman.*] Have you considered the scheme for the locking of the river Darling, between Bourke and Menindie, from the point of view whether, as there is to be a large expenditure—over £500,000—the State should or should not expect some return as a contribution towards the payment of interest on the capital outlay and the cost of maintenance, in round numbers, in all about £20,000 a year? Of course, if the Government construct the weirs, they are perfectly justified in getting interest on the money, but if it is to come out of the squatters' pockets, the squatters would consider whether it is better for them to pay for intermittent land carriage as at present, than for them to be continually taxed towards payment of the interest on the money expended on these works.  
 3984. But it is not intended to tax the squatters only—there would be other contributors? I quite understand that; but even then the squatters' share would come to more than they pay now for intermittent carriage. For some years past, with an open river, we have had the benefit of the river for nothing.  
 3985. I did not mean to convey that there should be a direct tax, but a toll on the tonnage of the goods conveyed by the river? Then, I suppose, the consumers would pay the tonnage dues.  
 3986. But if the squatters in this part of the country were dealt with in a more liberal spirit by the Government, in regard to extension of tenure, the squatters would be put on a better footing? Certainly, they would; and I do not suppose that they would grumble at paying for any advantage they might derive at the hands of the Government.  
 3987. What do you think would be a fair tenure, having in view the fact that this country is subject to such prolonged droughts? I think that a fifty years' lease would not be too much—I mean thirty years added to our present term.  
 3988. Having had a considerable experience of the country adjoining the river Darling, do you consider that it is suitable for small settlement? No, I do not.  
 3989. I suppose the reason is that for grazing purposes you must have a large acreage to support a sufficient number of sheep for a man to live on, and that, for agricultural purposes, owing to the distance from a market and the low rainfall, the expense of agriculture would be too great? With this rainfall it takes a large area to run a large number of stock. Our average rainfall is about 11 inches.  
 3990. Would you like to supplement Mr. Ireland's evidence with regard to the necessity for doing something to provide on squatting properties against prolonged droughts? I think it is practicable to grow a certain amount of stuff here to keep your large stock through a drought, but I do not think it is practicable to grow enough stuff to feed sheep. It would take 4 lb. a day to keep a sheep in fair condition. Some people think that 2 lb. would do it. A sheep might live on that quantity, but it would only just do that.  
 3991. *Mr. Watson.*] I suppose you always have a certain proportion of your flocks of sheep which is especially valuable to yourself—that is, the breeding ewes and rams? Yes.  
 3992. Would it not be possible to grow sufficient fodder to at least carry those through a time of drought? It would be possible to grow sufficient fodder, I daresay, to keep the rams and a few stud ewes alive.  
 3993. If a man has spent some years and money in working up a flock of sheep he does not like to part with the best of them, even though to keep them alive it may cost him more than they might bring in the market? Most people here have found it impracticable to breed stud sheep on account of the general shortness of fodder.  
 3994. *Mr. Dick.*] From the evidence of your manager we gathered that with a fair river the average freight is about 25s. per ton as against £3 per ton on an average road carriage to Bourke; if the river were canalised by means of these locks and weirs, do you think it would pay you to send all your produce to Bourke and to get all your stores from Bourke at the present average freight of 25s. per ton, and with a Government due of 10s. per ton both inwards and outwards? Yes, I think it would pay me. It would be a matter of calculation as to what it would cost by land carriage.

3995. Supposing that by means of the construction of these locks and weirs transit down the river to Adelaide or to Melbourne were rendered permanently safe, do you think that under those circumstances you would send your wool either to Melbourne or to Adelaide instead of to Sydney? I would rather send it to Sydney, if I could get it taken to Sydney as cheaply. In fact, I would pay a little more to send it to Sydney rather than to Adelaide or to Melbourne. H. C. Suttor.  
29 Sept., 1899.

3996. Is Sydney, in general, a better market for the sale of wool than either Melbourne or Adelaide? I do not see why it should be. Good wool will bring its price, and buyers go to the markets where the good wool can be bought. I have sold wool both in Sydney, Adelaide, and Melbourne.

SATURDAY, 30 SEPTEMBER, 1899.

[The Committee met at Kallara station, Darling River, at 9 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Charles Graham Weir Officer, part-owner of Kallara station, sworn, and examined:—

3997. *Mr. Shepherd.*] What is the extent of this run? In round numbers, 1,000,000 acres.

3998. What is its carrying capacity in a fair season? We have had the place valued several times by competent people, and they reckoned that in an average season it ought to carry about 160,000 sheep. C. G. W.  
Officer.  
30 Sept., 1899.

3999. About 1 to 7 acres? Yes.

4000. Has there been any decrease of late years in the number of sheep? Yes, a considerable decrease.

4001. Do you know what the losses have been? No; but the losses have been pretty considerable. The difficulty is to get any increase at all. This year we have lost nearly all the lambs.

4002. I suppose you know what you have on the run at present? This time we have shorn 81,000, and we expect to shear also 15,000 stragglers. Last year we shored 83,779, so we have a slight increase this year. The year before that I think the number shorn was about 101,000.

4003. Has the average yield of wool per sheep decreased at all in these bad seasons? Of course, on the older sheep the drought has had a very bad effect. A lot of old ewes, I suppose, do not now cut more than 3 or 4 lb. per head, and there are very few young ones coming on to take their place.

4004. And of course the younger sheep give the largest yield? Yes. Another point is the class of sheep one employs. I think it is five years ago when we went in for Wanganella rams—merino sheep that come from the Wanganella estate, in the Deniliquin district. They are a famous breed, and they are having a distinctly favourable effect on the cutting capacity of the wool; but then the drought has interfered very much, because their progeny nearly all died in the droughts, and we are left with the old sheep.

4005. I suppose that, as a rule, you introduce other sheep occasionally, not only with the view of improving the quality of the wool, but also for the hardiness of the sheep? In recent years we have confined ourselves entirely to Wanganella sheep. They seem to combine hardiness with a fairly good quality of wool. They have obtained a great name in Riverina.

4006. What description of grasses have you on this run, chiefly? I do not know the names of most of them. There is very little Mitchell grass. There are couch grass, Mulga grass, silver grass, and star grass. Those are about the principal kinds.

4007. Have you none of the blue grass? Very little. We have another grass, namely, the cane grass. Horses are fond of it. On the Paroo there is a native sorghum. That grows on the flood-country, after the water has gone over it. It grows 6 feet high. It is too rank for sheep, but it makes excellent fodder for cattle. However, you get that only after a flood.

4008. Have you any quantity of trefoil? No; but we have something allied to it—the Darling clover.

4009. I suppose you have the ordinary scrub that is used for feeding sheep in bad seasons? Yes; we have mulga, leopard wood, and that kind of stuff. There is very little of that on the leasehold area of Kallara. It is nearly all in the back country, on the resumed area.

4010. Have you been using the scrub during the last two or three years? We have been using the scrub for the last three months.

4011. Have you had very many men employed in cutting it? There are three camps, but I do not know the exact number of men; I suppose there would be twenty-five or thirty altogether.

4012. You had not cut any scrub prior to about three months ago? No. I mean we had not cut any scrub during the present drought. In the past, I believe there was scrub cut for a few weeks on one occasion, and then the rain came. We have been more fortunate than some people have in this drought. For one thing, we are very much under-stocked.

4013. Can you account for your having an increase, and other people having a decrease? Last February twelvemonths we had a very good rainfall—a very much better share of the rain than anybody else round about—and it was followed by an inch a fortnight afterwards in a thunderstorm; and that gave feed throughout the whole of the year, when other people were forced to use their scrub.

4014. To that you attribute the increase this year? Yes, combined with the fact of our being under-stocked.

4015. You have been carrying out a system of irrigation here for a great number of years? Yes.

4016. I suppose that you have heard of and studied the question of locking the river? We have heard a great deal about it. I do not know that we have given it a great deal of consideration, but we have talked over it.

4017. Have you not talked over the advantages you are likely to derive from the locking of the river? Yes; certainly.

4018. What advantages do you think that not only yourself but also the squatters generally along the river would reap from the locking of the river? In the first place I suppose we should get very much longer

C. G. W.  
Officer.

30 Sept., 1899.

longer navigation, which would of course mean cheaper transit; and, secondly, it would give us a higher level of water for irrigation purposes. All our wool goes to London by way of Adelaide; it goes down the river.

4019. If the river were locked you would have even greater facilities than you have now for shipping *via* Adelaide? Yes; I suppose that locking the river would certainly mean better or longer navigation. Our sheepskins have gone up the river—small lines—to be sold in Sydney.

4020. Have you never sent the bulk of your wool, *via* Bourke, to Sydney? Yes; last year most of it went by team to Bourke, but that was because there was no river navigation, and it was shipped from Sydney to London.

4021. But, in the event of the river being locked, I suppose you would invariably send down? Yes; unless circumstances should arise from which we might think it more advisable to sell our wool in the Colony. But we have always sold our wool in London ever since my father started the business; we have stuck to the original arrangement.

4022. You send by the cheapest route? Yes. When the river generally is open for navigation permanently in a fairly good season, I think that 35s. per ton is the freight to Goolwa, with 5s. more to the ship's side at Adelaide. Of course, in a season like the present, when the river is open only spasmodically, we have to pay higher rates.

4023. Have you frequently been blocked for want of navigation? Yes, pretty frequently. Last year, we got a little wool away by the river. That went up the river, because we could not get it down.

4024. *Chairman.*] This work will involve a very large expenditure—£500,000;—if locking the river in the way proposed enabled you to send your wool regularly to Adelaide, do you think you should be prepared to pay some percentage on the freight towards the payment of the interest on the Government expenditure? I suppose we should. I should have to consult with my co-partners before I could answer such a question; but speaking personally, I do not think there would be any doubt about it.

4025. With a safe river, you would have to pay a much lower rate of insurance, would you not? Yes. I do not think there would be any difficulty about the matter to which you have referred.

4026. Does it not strike you as being reasonable? Certainly it is reasonable.

4027. With regard to the irrigation question, do you think that irrigation crops could be grown, which would help you to maintain your more valuable stock during dry seasons here? I believe we could on this place. You see, we have the plant already, and it is used not only for irrigation, but also for other purposes. Of course, the supply of steam power is one of the principal questions.

4028. Is it at all feasible that you could go in for growing fodder by irrigation to provide for your big flocks in times of drought? I do not think it would pay us to grow fodder here for the purpose of keeping our large flocks in times of drought; but I believe it would pay us to grow fodder for our horses and our stud rams. We have not grown anything by irrigation for our rams yet, but are talking over the possibility of doing it.

4029. How many acres of wheat have you in crop, irrigated? Twelve acres.

4030. And also the garden attached to the residence? Yes.

4031. And you are encouraged by that wheat crop to enlarge the irrigation? Yes, we think of putting down a new field next year; we propose to put down 17 acres.

4032. *Mr. Watson.*] During the last year's drought most of the pastoralists on the river seem to have been consuming their capital, or reserve power in the shape of scrub, with the view of tiding over the difficulty of the present trouble;—do you see any way out for them, in the future, in the way of getting other methods of keeping their stock in bad times? That is an exceedingly difficult question to answer. I should think that one way would be to reduce the number of stock on the runs in ordinary seasons.

4033. Practically, to carry under your capacity? Yes, carry under the Government assessment.

4034. Some of the stations lately have been carrying considerably under the Government assessment—for instance, at Curranyalpa, with 170,000 acres, this year they have shorn only 11,000 sheep, I understand; and those it seems have been kept alive on scrub since last October;—in that case there would not be any way out of the difficulty by a further reduction of the number of sheep, because I should not think that 11,000 would be too many for that large area of country? No, it would not. The Government would have to make some considerable allowance.

4035. Do you think there is no other method than the present one of dealing with this back country—that is, in the way of clearing off useless scrub, and encouraging other scrub to grow, by conserving in paddocks or something like that? Of course in those places you do conserve as much scrub as possible. But all paddocks have not got scrub to feed sheep on, and you have to make the best of your opportunities.

4036. But, after this extensive cutting of scrub during the last year or so, the outlook is rather black for another drought? Very gloomy indeed. I have often talked over that matter with people here, and we have not been able to see a clear way out of the difficulty. Perhaps if the country were "spelled" for a good time, grasses and natural scrubs might come again,—for, according to all the experience of the older men here, there is no doubt that twenty or fifteen years ago this country was fit to carry a much larger number of sheep than it is at present. A great many of the natural scrubs and shrubs have either died or been killed. The rabbits, for one thing, have done an enormous amount of damage.

4037. They are not very numerous at present? No, the drought has killed them, as it has the stock.

4038. Is your holding netted against rabbits? Not all the way round; but the greater part of it is netted.

4039. Some of the pastoralists in the Central Division, having no scrub to rely upon, have, during this last drought, been feeding their stock on oats and lucerne bought in the Sydney market; might it not pay people, who have facilities in the way of water and decent land, to grow either oats or lucerne with the view of carrying their stock through here in a similar way? I am very doubtful whether it would pay in this country. In the first place it is not altogether an easy matter to get a suitable place for irrigation, along the river, because it is all subject to flood. A flood may come down and wash away all your fences, drains, and everything else. There are only one or two spots along the frontage where you could properly irrigate, and if you were to go further back you would have to take the water too far.

4040. How far back would you have to go in order to escape the flood area on your run? You would have to take the water back 2 or 3 miles; but the area is limited, and as the ground is high there would be a very considerable lift for the water.

4041. But, taking the general run of the frontage, how far would it be back to the land that is not liable to flood? The flood area is very irregular. In 1890 we could row in a boat from here to Goorimpa, 60 or 70 miles. There are sandhills, and the country is too high to be dealt with by means of irrigation. You could never get it level enough.

4042. Therefore, so far as irrigation is concerned there is not a great area on Kallara which is suitable? No considerable area. There is a very small piece of it, indeed, that is suitable for irrigation.

4043. *Mr. Dick.*] When the river is navigable you usually send your wool to London *via* Adelaide? Yes.

C. G. W.  
Officer.  
30 Sept., 1899.

4044. With the river made permanently navigable, as it would be under this scheme, and with a consequently reduced insurance, and other advantages which such a river would offer, there would be still less temptation on your part to send your wool to London *via* Bourke and Sydney, would there not? Yes, considering all things equally. There might arise circumstances in the wool market which might induce us to sell either in Melbourne or in Sydney.

4045. But so long as you desire to sell your wool in London you will send it down the river? Yes.

Andrew Whittet, engineer, Kallara station, sworn, and examined:—

4046. *Mr. Dick.*] How long have you been here? A little over sixteen years.

4047. Have you personally superintended the irrigation which has gone on here? Yes.

4048. How long ago is it since you started it? Seven or eight years ago.

4049. With what area? Eight acres, I think.

4050. What did you sow that with? With lucerne for three years.\*

4051. What was the crop in each of those three years? It was not a success. I do not know whether it ran out or what was the cause.

4052. Did you get any crop off it at all? Yes; but it did not grow to the height to which lucerne generally grows.

4053. After the first three years, what did you do with the irrigated area? Enlarged the paddock into 12 acres and sowed wheat.

4054. What was the result of that sowing? Very good.

4055. Can you give quantities as to that? I should think from 25 to 30 tons off the 12 acres. We irrigated three times for one crop unless it rained.

4056. Putting on at each irrigation, how much water? We pumped four days and four nights.

4057. With a pump discharging how much? Roughly, say, 500 gallons a minute.

4058. And as the result of that you got from 25 to 30 tons off 12 acres? Yes.

4059. Can you give us any idea what labour, other than the labour involved in pumping, was employed in one year in preparing the land, &c.? I suppose it takes a man with two horses about fourteen days to plough, sow, harrow, and roll the seed in. The ground is exceedingly hard for ploughing. While irrigating, there are two men all the time on the paddock watching it. The paddock is not properly graded. If it were, one man to watch it would be sufficient.

4060. The 500 gallons per minute that you mentioned comes to 3,000,000 gallons per watering? Yes.

4061. And three times for each yearly crop would be 9,000,000 gallons for 12 acres? Yes.

4062. Do you think that the fact that the land was not properly graded in the first instance necessitates the use of a larger quantity of water than would be the case if the land were properly graded? Yes, I should say that it takes about one quarter more water on account of that.

4063. How long do you allow the ground to lie after each watering? If the weather is hot, perhaps three weeks or perhaps a month. It all depends on the weather. Between three weeks and a month is the usual time.

4064. It is on the red soil, is it not? Yes; but not the usual red, sandhill soil.

4065. Does that crack much after the sun gets on it? Yes, very much.

4066. Do the cracks absorb a large quantity of water? Yes.

4067. Do you think if you could get a suitable site composed of black soil it would be better for irrigation or worse? I do not know. The black soil cracks very much, too, after a flood.

4068. Does the red soil become very hard and consolidated after the watering? Yes.

4069. Viewing the matter generally, do you think that irrigation on patches such as that, or larger patches, is a success compared with buying fodder? In a place like this; but, I do not think it would ever do for people to come here to start irrigation—I mean I do not think that they could compete against people who get water naturally.

4070. We have been assured by one witness, who presumes to know a great deal about this question, that it is a reproach to all the pastoralists along the Darling River that they have not availed themselves of the water of the Darling to irrigate patches of from 200 to 400 acres for the purpose of growing fodder as an insurance against drought—in other words, to keep large numbers of their sheep alive during a drought; do you think that that is practicable? Certainly not, unless it were for stud rams or other specially valuable stock.

4071. How do the fruit-trees grow in the garden here with irrigation? Splendidly.

4072. What fruits grow well here? Apricots, grapes, oranges, lemons, limes, peaches, nectarines, almonds, figs, quinces, dates, strawberries, and mulberries—in fact, everything except bananas.

4073. It is all above flood-level where these grow? Yes.

4074. We have been assured that, in most cases, if a pastoralist went in for irrigation it would be absolutely necessary for him to have his plot above flood-level; if an area of good black-soil country, properly graded, were placed under irrigation, do you think that the fact that it was not above flood-level would be a serious obstacle to the successful growth of fodder crops? No; I do not think it would be a serious obstacle, for this reason: A flood such as we are talking of does not occur very often. I have seen it only about four times on the black soil in sixteen years.

4075. You do not think that the fact that the ground is within the flood-area is a serious obstacle to the successful growth of fodder crops? No, I do not.

4076. The worst that could happen would be the killing of the crop then on the soil? Yes.

4077. And they could soon plough up the ground and go on again with other crops? Yes.

4078. One watering, at the rate you have been accustomed to give your paddock, would be equivalent to how much rain? I should think 2 inches.

4079. *Mr. Shepherd.*] Have you attempted to grow anything besides lucerne and wheat there? No. Well, there is a little oats in, but that is all.

A. Whittet.  
30 Sept., 1899.

- A. Whittet.  
30 Sept., 1899.
4080. Do you not think that it would be possible to grow crops of maize or sorghum on a large scale, and manufacture ensilage for the purpose of feeding sheep in a bad season? I do not think so. That must run into a tremendous lot of money.
4081. I know of squatters who have had to pay £5,000 each for feeding their sheep; that would go a long way in irrigating land, would it not? It would; but it is a back-breaking business, either way.
4082. Ensilage is very much more valuable than dry food—very much better than hay? Yes. It is a very unusual thing to provide for stock in this part of the country with ensilage or hay. I think it is only exceptional places, such as Dunlop, which could do a thing like that. I do not think it would be done here.
4083. But do you not think it is a question that must be considered; the enormous loss of sheep occurring year after year through drought requires to be provided against in some way;—do you not think it is feasible to grow feed to stay them over a bad season? It would be very costly with irrigation.
4084. It is of course a matter of cost; if it would not pay to do it, it must be left alone; but it would not be wanted every year; supposing that you were to have three good seasons and one bad, could you not grow sufficient food to stay the sheep over the one bad season? Yes. Twelve or fourteen years ago there was a run of three or four good seasons; but since then, matters have gradually got worse every year until this year, when we think it is the last ebb. As to the matter of understocking, if 4 or 5 inches of rain were to come now, you could stock Kallara up to its old rate, so long as the new grass lasted—probably until another drought, if rain did not come. The seasons here are very irregular.
4085. And the seasons are getting drier and drier? Yes.
4086. Have you ever tried to think out any cause for that? I have.
4087. What is your opinion? Nothing further than no monsoons coming this way. They appear to have gone out of their usual course during the last few years. I do not think the cutting of scrub has had anything to do with it.
4088. You do not think that the killing of the timber has had anything to do with it? No.
4089. Where there is a large quantity of timber growing do you not think that there is an immense amount of moisture carried into the atmosphere through the foliage of that timber? Yes.
4090. Do you not think that it is only reasonable to suppose that where there is a large amount of moisture carried into the atmosphere, it is more likely to come down somewhere near the spot where it is taken up than be carried away hundreds of miles to the sea? No. I think the amount of evaporation that goes up through trees is infinitesimal.
4091. It would not be your opinion that, if a very large amount of moisture were taken up into the atmosphere, it would be more likely to come down close by than be carried away hundreds of miles to the sea? I should not think so. Here, I think, it is carried away by the wind as soon as it is evaporated. I do not think that the cutting of timber has anything to do with it.
4092. If the seasons have become drier there must be some causes for it? There has been no scrub-cutting in this part of the world up to the last three years, and less rainfall has been gradually coming on the last twelve years—a little less and less, and so on.
4093. I suppose that the last four years have been about the driest you remember having here consecutively? Yes. My own opinion is that nothing can alter the rainfall.

MONDAY, 2 OCTOBER, 1899.

[The Committee met at Surreyville, Darling River, at 10.30 p.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Henry William Ewan, selector, Surreyville, sworn, and examined:—

- H. W. Ewan.  
2 Oct., 1899.
4094. *Mr. Shepherd.*] How long have you been at Surreyville? Twenty-one years. About nine or ten years ago I commenced my cultivation with the aid of irrigation.
4095. What area have you? Sixteen hundred acres.
4096. You are cultivating only a portion of it? Yes.
4097. How much under cultivation? Twenty-two or 23 acres.
4098. That is, including cereals and fruits? Yes.
4099. Do you grow the cereals for the grain or for hay? Chaff.
4100. What is the yield per acre? Last year I sold to the store, I think, 36 tons 15 cwt. off about 20 acres, or close upon 2 tons to the acre.
4101. About how much do you get per ton for it? It varies a great deal. I have got as high as £25, but that does not always happen. Last year I got £8 2s. 6d. I find the bags for the chaff.
4102. You irrigate that area? Yes.
4103. Have you any idea what quantity of water it takes per acre or for the whole area irrigated? I cannot exactly say. We give it three waterings—that is, when there is no rain. The first watering it takes a lot. If we were to have rain to-morrow I should not have to water it any more this time, and I should have given it only two waterings.
4104. Do you know what your pump throws per hour? There is a lot of difference. The way the water is now, you can do twice the area with the same pumping power; as the river is now, it takes only half the labour that it takes when the river is lower.
4105. What is your present lift? About 25 feet, I think.
4106. What would your greatest lift be? About 35 feet. When the water is very low it is not so good for irrigation, because it is rather salty—brackish. There are a lot of little springs in the river, and I believe that they make the river water salty when it is very low.
- 4107.

4107. As the river is now, how many days pumping does it take to irrigate the whole of your area under cultivation? It would take now, with that pump, about nine or ten days, working about ten hours per day, for the first watering, and for the second and third waterings combined it would take eleven or twelve days. The pump is supposed to throw 30,000 gallons an hour, with a 25-foot lift. H. W. Ewan.  
2 Oct., 1899.
4108. And three waterings are sufficient for your cereal crops? That is, if there is no rain at all.
4109. With regard to your fruit, grapes seem to be your principal crop? Yes.
4110. How much land have you under crop with grapes? I cannot tell you. Last year we made about 9½ casks of wine.
4111. And in a dry season you irrigate the grapes about every fortnight? Yes; before the grapes are big; after that we do not irrigate much—only for the lucerne then.
4112. What kinds of grapes do you grow? I have almost all the best kinds.
4113. Have you any idea of the number of vines you have bearing? I think 500 or 600.
- 4113½. What age are they? From about 3 years to about 7 years.
4114. Of course you send away a good deal in fruit in addition to the wine you make, therefore you cannot form a very correct estimate of the quantity of wine that you could produce? No.
4115. What other kinds of fruits are you growing? I have about 150 young peach-trees which are going on very well, but are not bearing yet.
4116. Have you any oranges? Yes, about thirty orange trees.
4117. Are they in bearing? Three of them are.
4118. Have they produced pretty freely? They have only just started to bear, but they will bear well this year.
4119. Have you no matured trees at all? Only quinces.
4120. Do they bear well? Yes, splendidly.
4121. You are really making a living off your cultivated land alone? Yes.
4122. Are you quite satisfied with your prospects? Yes. I have made a living off the ground besides paying 10 per cent. interest on what it cost me.
4123. Do you work the whole area yourself or do you get assistance in the shape of labour? In the summer, after we start harvesting, I employ a little labour until the next crop is in—one man cutting wheat, and two or three harvesting and cutting chaff, and others looking after tomatoes, &c.
4124. The rest of the year you do all the work yourself? Yes. In the winter, when there is only the crop to water, I can manage all that myself. Almost everything will grow here. Corn grows splendidly.
4125. Have you tried any of the millet crops? I have tried planter's friend. I have also tried maize.
4126. And you find they do well? Yes.
4127. All the ground that you are cultivating is what is termed, down here, black soil? Yes.
4128. Originally covered with lignum? Yes; it is the best ground.
4129. Have you tried the red soil at all? Only out back.
4130. And you have found that that is not so satisfactory as the black soil? No, it is not.
4131. In planting your grapes, did you simply plough the ground or did you trench it? I did not do either, but just dug holes.
4132. Can you form any idea of the depth you have ploughed in putting in your cereal crops? I have not ploughed for the last three years—just harrowed it in very deep.
4133. Has the trefoil come there naturally or did you sow it? I did not sow it.
4134. It has come there of its own accord? Yes.
4135. Have you ploughed the ground for the lucerne? No; it comes up after the couch. The couch withers after the summer, and then I sling some more seed over, and it is up before the couch starts again in the spring, and I think it stops the couch from coming up so much, and takes its place. It shades the couch, and I think that is what hurts the couch.
4136. *Chairman.*] I understand that your holding is 1,600 acres, of which 23 are under cultivation, and that the remaining 1,577 acres are at the present time absolutely valueless? Yes; it would not keep two calves.
4137. And is it the same character of country as your cultivation? Yes, the very same.
4138. Is your cultivation above flood-level? It is above any ordinary floods, but the 1890 flood was over the lot; but the 1879 flood was not.
4139. What effect had the 1890 flood on your cultivation? It killed all the stone fruits and the cereal crops.
4140. But did not affect the other fruit-trees? No; I put an embankment around the ground, but the flood-water came up. I did not think it would be so high. The crop was up 6 inches, and I did not like to dig that up to make the embankment bigger. If I had had a larger embankment I might have saved the crop.
4141. But the effect of the flood was to kill it? Yes; after the flood-water broke down the embankment it was over the crop about ten weeks.
4142. Do you find that the soil cracks very much? Yes. It is not cracked much now; but let it lie until I put the next crop in and then it will crack again. Still, I think that is a good thing. If you let it lie all the summer it cracks, and then if you plough it that soil goes down about 3 feet in the cracks, and you therefore have a new soil altogether. This soil is much the same as I have seen in San Joachim Valley, California.
4143. Is there much of this class of soil about here on the river? Thousands and thousands of acres.
4144. Suitably situated and above ordinary flood-level? Yes; just about the same level as this.
4145. Where is that? Between here and Bourke.
4146. You have seen it yourself? Yes.
4147. We have had it given in evidence, chiefly, that the red soil is the best for cultivation;—you seem to differ from that? There might be some red soils that are very good, and I expect that there are, up about Redbank. There are some nice red flats there. In Wilcannia you can see things growing nicely on red soil, but that ground has been trenched about 2 or 3 feet, and that would be no criterion for a man taking up land.
4148. Then your version about the black soil is that there is a larger quantity of it than there is of the red, and that it is better situated? It is richer soil.
4149. Not only is there more of it, better situated, but it is also of a better character? Yes. It is more level. Of course, you could not get very much red soil that is regular enough for irrigation.

- H. W. Ewan. 4150. There is not enough of the red soil in a suitable locality? I have seen gardens on the red soil—  
at Murtee, for instance—which have been a perfect failure.  
2 Oct., 1899. 4151. With irrigation? With irrigation by a windlass.  
4152. Do you think the soil at your place is more expensive to till than the red soil is? No, not according to the way I have cultivated.  
4153. But you do not seem to have gone very thoroughly into ploughing? No, I have not.  
4154. How far are you from Wilcannia? Six miles by road.  
4155. Can you name any other places similar to your own where cultivation is carried on? They tried it at Murtee, to about the same extent, and it was a failure, I think from lack of proper supervision; and at Murchison they have had a cultivation paddock too. That was on the red soil.  
4156. What was the result there? I think it was a very poor result; but I do not think that they attended to it properly.  
4157. *Mr. Shepherd.*] What depth have you, before you come on your cultivation ground, to the nodular limestone which appears here on the bank of the river? Well, I went down 33 feet for my well, in the same soil as I am cultivating now, without coming to any limestone, and at another spot I bored 140 feet, all through pure sand.  
4158. So this nodular limestone does not appear to extend any distance from the river? No. The following is a report, which I received from the Department of Agriculture, by Dr. A. Helms, M.A., F.C.S., Analytical Chemist to the Department, on the analysis of my soil:—

Locality of soil—Wilcannia.  
Nature of soil—Loam.

*Mechanical Analysis.*

Root fibres .....	·00 per cent.
Stones over $\frac{1}{4}$ inch diameter .....	·00 "
Coarse sand, more than $\frac{1}{8}$ inch diameter .....	·00 "
Fine soil .....	100·00 "

*Analysis of Fine Soil.*

Sand (extremely fine) .....	35·75 per cent.
Moisture .....	7·00 "
Volatile and combustible matter .....	7·82 "
Impalpable matter, chiefly clay .....	49·43 "

(Organic substances and water of combination).

*Determination of Substances soluble in hot Hydrochloric Acid of 1·10 specific gravity.*

General Value.

Lime (CaO) 0·8656 per cent. Very good—equivalent to 17,312 lb. (a) in an acre of soil 6 inches deep.  
Potash (K<sub>2</sub>O) 0·7752 per cent. Excellent—equivalent to 15,504 lb. (b) in an acre of soil 6 inches deep.  
Phosphoric acid (P<sub>2</sub>O<sub>5</sub>) 0·0599 per cent. Fair—equivalent to 1,198 lb. (c) in an acre of soil 6 inches deep.  
Nitrogen 0·0882 per cent. Satisfactory—equivalent to 1,764 lb. (d) (equal to 1·1071 per cent. Ammonia) in an acre of soil 6 inches deep.  
Magnesia 1·2252 per cent. Ferric oxide 3·8908 per cent.

NOTE.—(a) This amount of lime would be supplied in 19,235 lb. of quick lime, or 25,418 lb. of slaked lime, or 34,349 lb. of chalk.

(b) This amount of potash would be supplied in 28,698 lb. of commercial sulphate of potash, or 110,743 lb. of kainit.

(c) This amount of phosphoric acid would be supplied in 2,615 lb. of commercial bone dust, or 1,974 lb. of superphosphate.

(d) This amount of nitrogen would be supplied in 8,820 lb. of sulphate of ammonia, or 10,584 lb. of nitrate of soda.

Special points of value in the soil—Potash.

Special defects in the soil—None.

General character—Very good.

Crops for which it is most suitable, judging by its mechanical condition and chemical composition—Any crops suited to climate.

Crops for which it is unsuitable without special manure or special treatment—None.

Manures and treatment recommended—Its very fine mechanical condition indicates need of proper working, *never when wet*, as for a clay soil. As to manure, experiments with bone-dust are recommended.

[*The Committee met at Murtee station, Darling River, at 3 p.m.*]

Arthur Irwin Johnston, manager, Murtee station, sworn, and examined:—

- A. I. Johnston. 4159. *Chairman.*] How far is Murtee station from Wilcannia? Eight miles by road and 18 by river.  
2 Oct., 1899. 4160. How long have you been on the station? For the last twenty years.  
4161. How many acres are there in the run? 340,000.  
4162. How many sheep does it carry in an ordinary season? About 50,000, but owing to the prolonged drought the number is now reduced to about 17,000.  
4163. You are aware of the proposal that is under consideration—to erect seventeen locks and weirs between the present weir at Bourke, and Menindie, for the purpose of improving the navigation of the river, and also with the view, if practicable, of aiding the irrigation of some of the available land near the river banks;—would you state whether you are favourable to that proposal, which, you will understand, is to be carried out only so far as Menindie? I am not favourable to that at all.  
4164. Why not? The land is not suitable for irrigation, and there would not be any market for the stuff if you grew it. You might irrigate sufficient for your own use, but you could not irrigate a quantity and sell it, because people can land it here from elsewhere more cheaply than it would cost you to produce it by irrigation.  
4165. The Departmental authorities urge that it is practicable for the squatters, by means of irrigation, to cultivate areas varying from 100 to 200 acres each, for the purpose of assisting to keep their stock alive during seasons of drought—at any rate the valuable stud stock, and the horses and cattle required for station use; what do you think of such a proposal? I think it is very good, to keep your valuable stud stock alive, but outside that I do not think it would pay. This has been such an extensive drought. In other seasons droughts have been in localities. We might have suffered here, but you could go into other districts and get cheap sheep, but this general drought has caused a great loss of stock. I have had to sell sheep at 1s. per head. In 1891 I sold nearly 10,000 ewes at 1s. a head.  
4166. You had your runs stocked up to their fullest extent? Yes.  
4167. And as lambs were coming on you had to sell the stock for what you could get for them? Yes. In 1892 we sold 17,000 ewes at 2s. 3d., with a twelve months' bill. In 1895 I sold 10,000 ewes at 1s. 7½d.  
4168.

4168. During those three years, can you tell us what number of acres were required for a sheep? We shore 50,000 sheep that year. We had fair lambings.
4169. Can you tell us in round numbers how many acres it takes to a sheep in such seasons as you speak of, when you had to cease going on increasing your stock? About nine acres to a sheep, as I have fed them by cutting scrub.
4170. That is about the utmost carrying capacity of the run? Yes.
4171. And from that time down to the present things have gradually got worse? Yes. We had no sheep to sell. We could not rear any lambs.
4172. Do you, as a man of long experience here, see any way of coping with prolonged droughts in this part of the country, as regards sheep-farming? No; I cannot make a suggestion as to getting through a prolonged drought. A one-year drought I could see my way to get through by cutting scrub, but not a succession of years of drought.
4173. Will the scrub you cut grow again? Some will and some will not—leopard wood will, but mulga will not.
4174. Is there much leopard wood? Yes, there is a good deal on this run.
4175. Is the run paddocked? Yes.
4176. Seeing that you do not approve of the river being locked only so far as Menindie, do you not think that with a constant river between Bourke and Menindie it would suit the squatter to send his wool by river up to the Bourke railway and on to Sydney market? It might in some seasons. But I do not think that people down here would do it.
4177. Then your view is this: That if New South Wales were to spend over £500,000 in locking this river as far as Menindie the result would be to send the trade of this part of the river down to South Australia? Yes. All the lower people will cart it over to Broken Hill as they do now.
4178. Then, if higher up the river we have had evidence that the trade will go upwards towards Bourke, you think that is a mistake—they thought it would happen all the way down the river? I do not think so. All the people from Wilcannia downwards are either South Australians or Victorian people.
4179. Their sympathies in trade are with Melbourne and Adelaide? Yes; and it will be cheaper to send it that way.
4180. So far as your experience goes, do you think that the locking of the river would induce a number of small settlers to come here and take up holdings, and irrigate the land and grow crops and fruit? I do not think so. I think that they could do far better inland, towards Sydney, where they get a rainfall and do not require to irrigate. They are close to a market there; but there is no market here. I think it would be only putting the people on the land to perish. If they had any money they would lose it.
4181. Beyond a few holdings of that character, to supply local requirements, you do not think that it would pay people to come to this distant part of the Colony, and go in for growing fruits for drying purposes? No, I do not think so. The market is so limited here, and I do not see how they could compete against what other people could bring up from below. Mr. Ewan, at Surreyville, in my opinion, is kept going by reason of the droughts, and the consequently high prices for produce locally. In good seasons he could not, in my opinion, compete against the imported produce.
4182. If your view is correct, that, with a locked river, all the produce would go to Adelaide or Melbourne, what do you think would happen if a railway were constructed from Wilcannia to Cobar;—do you think that the graziers near Wilcannia would use that railway if they had a favourable river? No, I do not. A man will not pay £5 for what he can get for £2 10s.
4183. They would use that railway merely as a convenience when they could not get the goods down the river? That is all. It would be very handy to Wilcannia in a time of drought, I admit, and would enable people to get their starving stock away to another district, or to fetch fodder hither.
4184. You are not sufficiently patriotic to say that you or your employers would use the railway if they could get the river transit cheaper? I am not patriotic in that way at all.
4185. If your view is correct—that locking the river would have the effect of taking away the trade from the chief port of export of New South Wales—would it not seem that it would be fairer that an undertaking of that kind should be shared in generally by the colonies? Yes; I think it is entirely a Federal matter.
4186. *Mr. Dick.*] Would you, during the drought of the last four years, have been able to avail yourself of a railway—that is, presuming one were built to Wilcannia—for the purpose of getting your starving stock away to more favoured districts? Yes.
4187. How long could you keep them there? I should try to sell them.
4188. The object would not be the preservation of their lives with a view of bringing them back to this place? No; to get them out of the district with the object of selling them.
4189. Would the boiling-down establishment give you the same opportunity of disposing of your stock in such seasons? Yes; but they give such low prices for them. They can boil down only at a very low price.
4190. Then you do not think that there is much in the use of such a railway for the purpose of carrying starving stock away with the view of bringing them back at the end of the drought? You could bring back young breeding ewes. If you were pinched and had to send them away you would perhaps bring them back, but I do not think it would pay to bring old ewes back.
4191. During the last drought, which would have been the more economical, to send your breeding ewes and valuable stud sheep away to some more favourable locality or to import forage to feed them here, supposing you had had a railway in each case? That is a moot point, because there is so much country rented by inside people that I do not know where you could have got good country last season, there being a general drought. Of course, that would not apply to ordinary droughts. I think you could feed only stud sheep, rams, and horses, on imported fodder, because of the great price of fodder here.
4192. Supposing the river were locked, do you think that, to liquidate the interest on the cost of the locking and the expense of maintenance, a Government due of 10s. per ton on goods, inwards and outwards, would be excessive? It is a big item.
4193. What is your carriage now to Melbourne? I send *via* Wentworth and Echuca.
4194. What is your carriage to Melbourne with a good river? I cannot exactly tell you, for the simple reason that it is paid in town, and I do not get any account of it; but it is within £3.
4195. Do you know how much extra it is with a bad river? About 10s. a ton. The carriage of goods that I had brought up on the last rise (last November) and this rise was £2 per ton from Echuca. We got

A. I.  
Johnston.  
2 Oct., 1899.

A. I.  
Johnston.  
2 Oct., 1899.

got the wool taken right down into South Australia from Wilcannia for £1 per ton, and goods have been taken from Morgan to Bourke for 10s. per ton with a full load and a good river.

4196. Then you still think that 10s. would be a serious charge for the Government to impose for such services as the locking of the river would give? Yes. I think 5s. would be ample.

4197. *Mr. Watson.*] How have you got your goods during the droughts of the last year or so;—did you always manage to get them by river? Yes.

4198. You would get sufficient in at a time? Yes, for twelve months.

4199. And during the twelve months you would get a chance of getting more goods up? Yes.

4200. Have you always been able to get your wool away on a rise? It has been here some time. Three times since I have been here I have had to send two clips away together.

4201. Would it not pay you to get your wool away at an extra cost of 10s. per ton? Yes.

4202. What Mr. Dick was trying to ascertain was whether it would pay you to give 10s. more than you give on an ordinarily full river, for the purpose of insuring certainty of transit, and the consequent reduction of insurance following on certainty of transit? I doubt it.

4203. You do not think it would pay you? No.

4204. The charge from Bourke to Sydney by rail would be enormously greater than the charge from here to Adelaide or to Melbourne, with a full river? Yes.

4205. But is it not likely that whichever authority undertakes the work of locking the Darling will expect to be recouped in some way by dues? Yes.

4206. Have you formed any opinion as to what would be a fair charge, both for the Government and for the people who would benefit by the locking? I should think 5s. per ton.

4207. Is river insurance now a large item on wool? Yes.

4208. How much per ton would it amount to, approximately? The locking of the river would not alter the insurance.

4209. The safety of the navigation would have that effect? The insurance varies, but I do not think to such an extent as that. However, I am not prepared to say what it is, as these things are all seen to in town, and I get no account of them.

4210. At any rate, you think that an extra charge of 5s. could be borne without any hardship? Yes, I think so, for the certainty of transit.

4211. You said you thought that there would be no market for any large area of irrigation produce? Yes, I said that.

4212. Would that be your only objection to irrigation—for instance, do you think that people could get enough land along the banks of the river to use whatever water might be conserved? I do not think that the bulk of the land is suitable for it. There are only a very few spots suitable for irrigation.

4213. You have had some experience of irrigation here? Yes; and I did not get any good result.

4214. What class of land? An ordinary black-soil flat.

4215. Was it subject to flood? Only to a very heavy flood.

4216. Was it land that was covered by the flood of 1890? Yes. All the country, excepting the sand-hills, was under the flood-water in 1890.

4217. Was the land you tried anything like a fair average of the land along the banks of the river? Yes; I picked it.

4218. And the result was not satisfactory? No.

4219. Can you inform the Committee more in detail what your experiences have been, as your evidence seems to be against the evidence we have had from people up the river? Away up the river you get different soil; it is different country altogether after you pass Tilpa; the country gets better up above that. I never got a good result. I reckon that half my seed was lost through the cracks. The water took the seed down the cracks. I put 2 bushels to the acre, and it ought to have come up thicker.

4220. Have you attempted to get over that difficulty by filling up the cracks when cultivating? Watering it causes it to crack after a time; this can only be avoided by keeping it moist all the year. I only ploughed the ground and harrowed it once and put the seed in. The only decent crop I got was on the banks of the drain where the water did not go over the land but percolated underneath—the crop was good on the banks.

4221. That is your experience in attempting to grow fodder? Yes.

4222. Have you attempted to grow fruit? Yes.

4223. With what result? The trees bore good crops some years.

4224. All under irrigation? Yes.

4225. To what do you attribute the variation in the fruit yields? I cannot tell you. I thought that that was natural to all fruit crops—that if you had a big crop one year you did not get it the next. Grapes grow well every year.

4226. What kinds of stone fruits have you been able to grow? Peaches and apricots.

4227. Have they grown well? Yes; the apricots are not very large, but the peaches are very good.

4228. Were the peaches planted on land below the highest flood-level? Eight feet above the highest flood-level.

4229. Do you think that with suitable pieces of land, such as you have near your house, 8 feet above the highest flood-level, people here would have as good a market for dried fruits of that description as the people at Mildura would have? No.

4230. Why? Because the Mildura people are nearer to Melbourne and Adelaide.

4231. But with a locked river right through, I presume that they would be able to get their fruit away very cheaply, would they not? Yes.

4232. But you think that on this portion of the river there is not a great deal of suitable land sufficiently high? No; there is not.

4233. You think there would be no possibility of getting fodder to an outside market and competing against those who rely on the natural rainfall? No; I do not think that anybody could do any good with fruit out here. See the terrible struggle people had at Mildura, where they had every convenience. In Tasmania, Victoria, and round about Sydney, people can grow any quantity of fruit, and some people have told me that they feed pigs on it; but what could we do with fruit here. Poor people could at the utmost stay here only a year or two.

4234. You are not very favourable to small settlements here, then? No.

4235. What outlook is there for the grazier if any big drought comes on; supposing this one to be finished,

finished, which it is not yet, there would not be a very great deal of scrub left, would there? I have plenty of scrub but no water where it is. The outlook is very bad. Nobody could live here if another bad year were added to this series of droughts.

4236. Have you attempted to get water at places away from the Darling? Within the flood area of the Darling we can get water by sinking for it and drawing it up with whims, but there is no scrub there. Outside that, the chances are that you will get salt water. In prospecting for water and sinking trial shafts, you get ten salt-water shafts before you get one you can drink from. I am talking of the south side of the river. I know nothing about the other side.

4237. *Mr. Shepherd.*] You have lost considerably more than half of your stock here? Just about two-thirds.

4238. And I think that is about the general average of the losses all the way up the river to Bourke, is it not? As far as I hear, yes.

4239. Of course, that presents a very serious outlook for the future? It does, indeed.

4240. Has any combined effort been made on the part of the stock-owners between here and Bourke to consider the condition of things? Not that I am aware of.

4241. Do you not think that it would be wise to have a conference for the purpose of devising some scheme by which these terrible losses might be averted? I do not see what they could do, for this reason—the drought has been so general, that even if there had been a conference and they had arrived at anything, it would have failed. That is my opinion. The only thing, so far as I can see, that they could have done was to get the sheep out of the district, and then they would have been only going into the fire.

4242. At that rate, the whole country would become depopulated? It would if this drought were to continue.

4243. But there is an old saying, "In the multitude of councillors there is wisdom," and by having a conference of a large number of stock-owners it is possible that one might suggest one thing, and another another, and out of the whole something might arise that would possibly assist in staving off these terrible losses by drought? It might, but I cannot see what form it could take to meet a drought like the one we have gone through.

4244. You do not seem to have any hope in regard to the irrigation part of this proposal? Very little.

4245. You have tried irrigation, and it proved a failure? Mine was a failure, at any rate. There are very few good spots for irrigation along the river. I have a little red ground upon which I could grow a crop if I went to the necessary expense.

4246. I think it is a fact that within the last twelve months many squatters in the Colony have spent over £5,000 each in buying fodder for their sheep? Yes.

4247. If half that money were expended in providing pumping machinery and preparing land for irrigation, do you not think that some good might arise from it? Yes, I do.

4248. By providing the means of irrigating, and cultivating certain grasses that are found to suit the district, ensilage could be manufactured so as to stave off the effects of a bad season? I started to cut scrub when the sheep were fairly strong. They did not begin to die till after being three months on the scrub. I was cutting for nine months altogether. A year ago last month I shored nearly 43,000, and I had nearly 20,000 lambs, and I sold 7,500, which reduced the number to about 55,000, which, if we had started to do what you suggest, I should have had to feed, and it would have taken a terrible quantity of stuff. It would have amounted to 2 or 3 lb. a day for each sheep, and if you went into figures you would find that that would have meant a terrible quantity of fodder. If it had lasted six months I should have been put to terrible expense, and the sheep would have died after all. You can get through a short drought. I got through the 1888 drought—I got through the one year fairly well. We lost a few thousand sheep, but we got over that very quickly.

4249. The object of irrigation is to take the place of rain, and if irrigation can be made to act in the place of rain in some way or other, there might be some means devised of producing sufficient food, not to keep the stock in a marketable condition, but to stay them over a bad season? You might stay them over a few months, but this year we had twelve months' drought, and in fact are in it now.

4250. What did the scrub-cutting cost you? I did not go into figures this year as to what it cost me; but I have cut scrub here for three months for 35,000 sheep and it cost me 1d. per head per month.

4251. Were you able to do it with the station hands? No; I had to put on extra labour.

4252. That scrub-cutting cannot go on for ever? No; we would cut the scrub out.

4253. And when that is exhausted you must look to some other source of supply? Yes. The scrub is now cut too far away from the water.

4254. You think that the country round about here is, as a rule, unfit for irrigation? That is my experience at any rate. There are isolated spots a man might grow a decent crop on.

4255. And even if you had a railway from Cobar to Wilcannia, you think that it would be very difficult to move stock to another district where feed could be secured? There would be no difficulty about it, except in a season like this when there has been a general drought. It is not often that a general drought takes place all over the Colony. At Milparinka they had a magnificent season for four years, while we have been perishing. All last summer they had green feed knee-deep.

4256. Have you tried to cultivate anything here beyond lucerne and wheat, in the shape of fodder? No. I have had a small patch of millet in the garden here. I got one crop off it; but I thought it would grow three crops in one season, which was a mistake.

4257. *Chairman.*] You stated a little while ago that to maintain sheep on dry food—not the natural growth—they require about 2 lb. each per day? Yes.

4258. To maintain a flock of 50,000 sheep it would amount in round numbers to 45 tons a day? Yes.

4259. Now, as a practical manager of a station for a number of years, do you say it is practicable, either by means of ensilage or by planting patches of cultivation, to carry out a proposal of that kind? No, I do not.

4260. Would it pay? No, it would not. It did not pay the people on the Murrumbidgee to feed their good sheep. They ate their heads off, and their owners also lost them. Outside our rams and a few stud sheep it does not pay to feed sheep in that way.

4261. You stated a little while ago that it cost 1d. a sheep per month to feed them by scrub-cutting? Yes.

4262. With fodder at £5 a ton the cost would amount to 2s. 8d. a sheep per month;—is that not too much out of proportion to attempt to feed your flocks upon imported fodder? Quite too much.

A. I.  
Johnston.  
2 Oct., 1899.

WEDNESDAY, 4 OCTOBER, 1899.

[The Committee met at Tintinallogy station, Darling River, at 2 p.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Bertram Reid, Tintinallogy station, sworn, and examined:—

- B. Reid.  
4 Oct., 1899.
4263. *Mr. Dick.*] How far is Tintinallogy from Wilcannia? Fifty miles by road.
4264. What is the acreage of the holding? 183,000 acres, approximately.
4265. Carrying, in a good season, how many sheep? About 30,000 or 35,000.
4266. But now, owing to the protracted drought, carrying only how many? Between 3,000 and 5,000, according to muster.
4267. As a practical producer, and one pecuniarily interested in this matter, do you think that the locking of the Darling would have the effect of sending trade to the Cobar-Wilcannia railway if it were built? So far as we are concerned, it would not. It might in an extreme case, but not to the extent of sending all the wool or stock.
4268. In general, your main product would be sent, as it is at present, down the river? Yes.
4269. And, even if the river were not locked, so long as you had a navigable river it would still pay you to send your wool down to Adelaide? Certainly.
4270. Can you say whether there are others in a similar position to you, who would do the same thing in case a railway were built from Cobar to Wilcannia, whether the river were locked or not? Yes; I say that others would do the same.
4271. You think that as a commercial undertaking it would always pay you to send your wool down the river and home to England rather than by rail to Sydney? Yes.
4272. Well, presuming the proposed Cobar-Wilcannia railway were not built, and that the river were locked and weired, do you think it would pay you to give 10s. per ton on inward and outward goods for the benefit of permanent and safe navigation by means of the locking—in other words, do you think that that would be an excessive charge to levy? Yes, I think it would.
4273. Can you offer any opinion as to what would be a fair charge? I am not in favour of locking the river.
4274. Will you favour the Committee with your reasons for objecting to it? I do not look upon it only as a matter of personal convenience and of saving money, but I consider that the surrounding country does not want the expenditure.
4275. Do you think that there is anything in the secondary proposal, namely, that of irrigation in connection with the scheme for locking the river;—do you think that small blocks of 200 or 400 acres could be irrigated along the course of the river if its level were permanently raised by means of these locks? They could be irrigated.
4276. Do you think it would pay to irrigate the blocks? No, I do not.
4277. It has been stated to us, as a reproach to all the pastoralists situated along this river, that they have not availed themselves of the water of the river for the purpose of producing fodder crops, as a sort of insurance against losses of stock during times of drought; do you think that such a scheme of insurance against those losses is a practicable one? No, I do not.
4278. Will you indicate to the Committee the condition of your run at present in regard to feed? Yes. On the whole of the 183,000 and odd acres there is not a blade of grass now, and the few sheep we have are living on windfalls and blue-bush, and what little edible scrub is left; and at the end of this week I shall have to start scrub-cutting again.
4279. How long is it since you ceased scrub-cutting? About ten weeks, as near as I can remember.
4280. Is much of the surrounding country in the same deplorable condition as yours? Yes.
4281. A good deal? Yes, a very big area. It may not be quite so bad, but it is much of a muchness.
4282. May the Committee take it for granted that in general—leaving out the small exceptions you have mentioned—neither the construction of the railway from Cobar to Wilcannia nor the locking of the river Darling would result in the sending of your wool and other produce to Sydney? Yes.
4283. *Mr. Shepherd.*] I think that, so far, you have irrigated only for garden purposes round about the house? That is all.
4284. Do you think that you have any considerable quantity of land here that would be suitable for irrigation? No, we have not—not close to the river. It is nearly all black ground, and you cannot irrigate that in a practicable way. It is too hungry; you could pour water on it for days and you would not see any of it on the surface.
4285. You have no red soil that would be accessible for irrigation? No, we have not.
4286. Have you ever tried any crops on the black soil without irrigation? No.
4287. I think you said that the run is now quite destitute of grass? It is.
4288. Have you any kinds of shrubs or other forage, such as scrub, for the sheep? Yes, we have some.
4289. I suppose that is the only stand-by you have? Yes, it is. We have no salt-bush. That was the great stand-by of this country, but practically that is all dead.
4290. How do you water the sheep out at the back of your run? With wells.
4291. Are they still affording a water supply? Yes.
4292. Have you to sink very deep for water? No; the deepest well is 100 feet.
4293. And the wells give you an ample supply? Yes.
4294. Is there no land out back, where those wells are, which would be suitable for irrigation? Where those particular wells are, there is not, because they are right on the bank of the Talyawalka Creek, and that country is similar to the river country.
4295. What extent of land have you irrigated for your garden purposes, round about the house? I suppose 1 acre or 1½ acre—that is, under irrigation now.
- 4296.

4296. Do you find all kinds of vegetables answer well? Nearly every kind.

4297. And fruits? Yes, most fruits.

4298. All that I have noticed have been a few vines and oranges; have you any stone-fruits? Yes, apricots and peaches.

4299. And they do well also? Yes, very well. We have not many peaches now. The white-ants have killed the trees. I think we have only three or four peach trees left.

B. Reid.  
4 Oct., 1899.

FRIDAY, 6 OCTOBER, 1899.

[The Committee met at the Mechanics' Institute, Menindie, at 10 a.m.]

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | WILLIAM THOMAS DICK, Esq.  
JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Samuel Klemm, junr., storekeeper, Menindie, sworn, and examined:—

4300. *Chairman.*] How long have you lived here? Twenty years.

4301. And you have a pretty good knowledge of the district generally? Yes.

4302. Would you tell us, in the first instance, what effect you think the locking and weiring of the Darling, between Bourke and Menindie, would have from a navigation and trade point of view? It would have a most beneficial effect because we would have a regular river for the boats, whereas now it is very irregular.

4303. I would emphasise the fact that the present proposal stops at Menindie? Yes.

4304. And you say that it would induce trade along the river, by giving you a regular river for the getting of your goods and for the disposal of the produce of the district? Yes.

4305. But in what direction do you think that would tend—up the river or down the river from Menindie? Up the river.

4306. To where? To Bourke, I think.

4307. What makes you think that? Having a regular river it would pay everyone to get his goods by the river because he could get his supplies regularly.

4308. Do you think that that would prevail where there is such a great difference between the charges for river carriage down towards Adelaide, and the charges for river carriage from here to Bourke, and rail carriage from Bourke to Sydney? I would sooner pay a little more to have a regular river, so that we need not keep surplus stock, in which case you often overbuy.

4309. Can you tell us what are the rates by river from here to Adelaide, with a good river, and also with a bad river? The freight from Adelaide varies from about £2 10s. to £6 per ton.

4310. The distance by river from here to Adelaide being how many miles? About 600 miles, I think, to Murray-bridge, where the goods are put on the railway.

4311. Do you know what the railway freight is from Murray-bridge to Adelaide? About £1. It varies according to the goods, but averages about £1.

4312. The distance from here to Murray-bridge by river seems to be about the same as the distance from here to Bourke by river; with a regular river from here to Bourke, do you think that the river freight would be much less than the amounts you have indicated between here and Murray-bridge, with an irregular river? I consider that with a regular river from Bourke the boats would carry goods for £1 per ton.

4313. And, then, of course, in addition to that, you would have the railway freight from Sydney to Bourke? Yes.

4314. Do you know what that is? No.

4315. How do you get your goods now? From Adelaide.

4316. From Adelaide traders or from Sydney traders? From Adelaide traders at present. Sometimes I get goods from Sydney; but they take some time to get round. On a rise in the river, like the present, I might order goods from Sydney and they might be delayed at the Adelaide wharf, and then the river might go down. I have had goods lying at Adelaide for six months. Another lot of goods that I obtained from Sydney could not be got at Adelaide, and they were taken to Western Australia, and thence brought back, and were delayed in delivery nine months.

4317. There is also under consideration a proposal for the construction of a railway from Cobar to Wilcannia, Cobar being only about 200 miles from Wilcannia by railway. I suppose that the carrying out of these two proposals, the locking of the river and the construction of the railway, would serve you even better than the other? Yes.

4318. So far as your twenty years' experience has gone, has the intermittent river traffic been a serious disadvantage to the people of Menindie and other residents in the locality? It has.

4319. Do you know whether graziers have suffered inconvenience by reason of not being able to get their wool away? Yes.

4320. Is the rate of insurance considerably higher by reason of the dangerous state of the river sometimes? It is. I know that the insurance companies were rather disinclined to insure on the low rivers, because of snags.

4321. Going down stream, I believe the steamers do not, as a rule, travel at night time? No, they do not. There is a condition in the insurance policy that they are not allowed to travel after sunset with anything insured.

4322. Seeing that this scheme involves the expenditure of about £500,000, do you think that the residents of Menindie, and other people along the river, including yourself, individually, would be willing to pay something in the way of river dues, or in the shape of an increased tonnage rate, to help in some degree to pay the

S. Klemm,  
junr.  
6 Oct., 1899.

- S. Klemm,  
junr.  
6 Oct., 1899.
- the interest on such a large expenditure? I think so. I, myself, would be very willing, because I have suffered great inconvenience through the river being down.
4323. Seeing that you think that the river steamers would carry the goods, with a good river, at about £1 a ton, as against prices ranging sometimes as high as £6 a ton, which you have to pay, do you think that a river-due of about 10s. per ton would be a fair thing? Yes, I think it would.
4324. That, of course, would be for the whole length of the locking. I suppose that for shorter distances it would not be so much? I think that the river steamers would carry big loads even for 10s. a ton.
4325. Do you know what some of the barges carry when fully loaded? From 150 to 250 tons of goods; and most of the steamers drag two barges.
4326. So that sometimes as much as 500 tons would go at one haulage by a river tug? Yes, you can put it down at about 600 tons, for the steamer itself would carry some as well.
4327. With a regular river, and being able to keep their hands constantly employed, and with a reduction in the insurance rate, and possibly being able to travel day and night, it would seem only reasonable that a fair due should be paid for all those privileges? Yes.
4328. And at the rate I suggest—10s. a ton—the dues on a tug and its two barges fully loaded would result in an amount of revenue to the Government of £300 each trip? Yes.
4329. At the present time, after the prolonged drought, of course the conditions of the district are no guide; but in good seasons and with large flocks on the Darling lands, is there always a large amount of trade here up and down the river? Yes, supplies inwards and wool outwards.
4330. Do you know whether the graziers have suffered inconvenience by reason of their goods being detained on a low river? Yes, they have.
4331. Have they had to keep their wool in sheds for a long time? Yes. A person just below here carried his wool on to the bank of the river, but the steamer could not get up because the water had closed, and the wool was left on the bank of the river for nearly twelve months. It was covered with tarpaulin, but it all got wet with the light rain, because it had not sufficient covering. It was a very severe loss for him. That is just one instance; many others could be given.
4332. Having regard to your own knowledge of the capacity of the land about Menindie for cultivation purposes under irrigation, what has been the result of your observation? So far as I have seen, irrigation has been very successful.
4333. On what class of country? On all.
4334. Red soil and grey soil? Yes; the grey soil on the flats is a splendid soil for irrigation.
4335. I suppose it is necessary that the land should be above ordinary flood-level? Yes. Some people are using the grey soil for gardens, and they have a dam above the 1890 flood-level, so as to protect them from other floods. Irrigation has been successful in the growth of hay, lucerne, and vegetables. Onions and potatoes have been very successfully grown.
4336. I suppose it has been engaged in only for the purposes of local supply? Yes.
4337. Not to any great extent? No.
4338. The reason, I suppose, being the distance from a market, and the difficulties in the way of conveying perishable crops to market? Yes. About here, people look to the Broken Hill market a great deal, because the overland carriage is too slow and too expensive.
4339. You know the Menindie Creek, 3 or 4 miles below the town of Menindie; will you tell us what height the water in the river has to rise above ordinary summer level before it flows into that creek and fills it, and subsequently feeds Lake Menindie? It feeds the lake at about 12 feet above summer level.
4340. Can you tell us what height at the present time the water in the river is above summer level? The gauge indicates that at the present time the water is about 10 feet 2 inches above summer level.
4341. So that a rise of 2 feet more would induce a flow into the lake? Yes.
4342. The proposal of the Government, as regards the heights of the locks and weirs, if carried out, will not permanently raise the water in the river to as great a height as it is at the present time; that being so, I suppose we may take it as a certainty that those locks and weirs would not have the effect of forcing the water back up Menindie Creek into Lake Menindie? That is quite correct.
4343. As a reason for that, I may state that these locks and weirs must not be constructed too great a height along the entire length because, if they were to be made higher than is proposed, then, owing to low-lying banks adjoining a great portion of the river, they would have the effect of flooding large tracts of country; and I suppose you agree that that is a matter that ought to be considered? If the locks and weirs would not raise the water in the river higher than it is now, there need be no fear of the locks and weirs flooding any part of the country all along the river, so far as I know it—that is, as far as Wilcannia.
4344. I should like you to give that answer some little thought, because Mr. Darley, who is the Engineer-in-Chief in charge of works of this kind, stated that he could not recommend that the height of the weirs should be raised by more than 1 foot above the proposal on the plan, because if that were done the floods would go all over the country, and possibly do damage;—do you agree with that? No. If the weirs would not raise the water more than 4 feet higher than it is at present they would not, in my opinion, do any damage. I base my opinion upon experience of previous rises and observation. I feel quite certain on the point.
4345. You, then, regard the proposed scheme as one that would largely fail in its objects unless the effect of damming the river by these weirs were to send the water up these creeks and anabranches of the Darling;—is that so? No.
4346. Do you not think that that would be a very desirable thing to do? It would benefit even more if it were the case.
4347. With regard to Lake Menindie, how long has that lake been dry? The water went all over it in March last, after a flood, and then it emptied itself again, and at present it is dry.
4348. Can you tell us what height the river was when that happened, and was the lake fed from the river? The river rose up to about 15 feet 6 inches, and the lake was fed from the river.
4349. What is the greatest depth of Lake Menindie when the lake is full? It is about 25 feet in places.
4350. What keeps the water in the lake after a flood;—does it all run out again? Yes. Menindie Creek is very deep. I think the water in the lake pretty nearly all runs out because the creek runs right through Lake Menindie into Lake Cawndilla.
4351. So that when the river becomes lower than the entrance to Menindie Creek at its junction with the Darling, the water begins to flow outwards into the Darling again? Yes.
- 4352.

4352. That being so, if, in connection with this scheme, it were proposed to impound the water in Lake Menindie some kind of weir would have to be erected in Menindie Creek? Yes.
4353. Do you think it is desirable, in the interests of this district, that Lake Menindie should be kept as a water reserve, or be utilised in any other way? I think it should be kept as a water supply.
4354. What would be its utility? There are homestead lessees and other people who live around the lake whom it would benefit, if you had water in it.
4355. For their stock, and also for irrigation? Yes.
4356. Has there not been some other idea? Yes, ideas differ. Some people say that Lake Menindie ought to be kept for irrigation and farming.
4357. What do you think of that idea? The soil is very good, and it would not cost much to irrigate it, after the water was once over it.
4358. But, owing to its considerable depth and the large catchment area, would not the crops be liable, in a sudden downfall of rain, to be flooded? No.
4359. The absorption would be too great? Yes.
4360. If that were done, the entrance to Lake Menindie would have to be blocked up, so that the river water could not flow into the lake? Yes; it would not be very costly.
4361. When I was here in September, 1896, the residents of Menindie were very keen on railway connection between Broken Hill and Menindie, for various reasons—a large supply of firewood to Broken Hill, Menindie to be the outlet for the Broken Hill people, and cultivation by irrigation to go on at Menindie, with the view of supplying the requirements of the Broken Hill people;—are you and other people still of opinion that that would be one of the best things for Broken Hill, and also for Menindie? Yes; it would be a great boon for Broken Hill, and for Menindie, too. It would mean a population here of about 3,000. It would be one of the best things that could ever happen for this place, and also for Broken Hill. The present price of firewood at Broken Hill is 30s. a ton. If a railway were constructed from Menindie to Broken Hill, we, having an unlimited supply of timber, firewood could be landed in Broken Hill at about 10s. a ton, including railway freight. Besides that, there would be a lot of irrigation in this district.
4362. Do you still, as an old resident of Menindie, regard a railway from here to Broken Hill as one of the first necessities in the interest of this district? Yes. There are a number of people hoping that that line will be constructed, and waiting to start irrigation settlements. I am one of them. I would go in for irrigation straight away if I knew that that railway was going to be constructed, and there are others waiting here with the same object.
4363. *Mr. Shepherd.*] Where do you get your goods from now? When there is any river I get them from Adelaide; but when the river was good I used to get them from Sydney. I get all my boots from Sydney now, but I have to use the parcel post.
4364. Would you be willing to pay the extra freight on railway carriage from Sydney, if the river were made permanently navigable? I have been paying extra freight from Sydney in getting these goods from Sydney. The charges are very heavy in Adelaide. There are certain lines that I can buy more cheaply in Sydney, and that makes it worth my while to get them there.
4365. If the river were always navigable, that would render it easier still for you to get the goods *via* Bourke than *via* Adelaide? Yes.
4366. You would then get the whole of your supplies from Sydney *via* Bourke? Yes.
4367. Do you think that that idea is generally prevalent amongst the storekeepers here? It seems to be.
4368. With regard to Lake Menindie, I did not gather exactly the effect of the return of the water after a flood subsides;—it does not empty the lake altogether, I suppose? Practically it does.
4369. You say there is about 25 feet of water in Lake Menindie? In the 1890 flood there was.
4370. And a 12-foot rise in the river fills that lake? No, it does not fill it; it runs over the bed of the lake.
4371. What rise in the river will put 25 feet into Lake Menindie? It was a 29-foot rise in the 1890 flood here; but, that is phenomenal.
4372. Then, I suppose, there was 29 feet in Lake Menindie? Practically. The lake is a little higher than the bed of the river.
4373. But I always understood that as a rule Lake Menindie was regarded as a permanent supply;—was that not so? When the dam was across Menindie Creek there was water in it for about two years, until the dam broke away. I think that in the 1886 flood the Government sent the unemployed up to construct a dam there.
4374. *Mr. Watson.*] I think you stated that, with the river at 12 feet above summer level, the water would begin to flow from the creek into Lake Menindie? Yes.
4375. Would that be sufficient to carry it into the other lake beyond Lake Menindie, which communicated with it? Yes; it would just about run into Lake Cawndilla as well.
4376. If the proposed weir immediately below Menindie were raised 4 feet more, which would bring it up to a 10-foot lift, that would put the water 3 ft. 6 in. above what it is in the river at present? Yes.
4377. That would be more than sufficient to run into the lakes you mentioned? Yes. That would be 12 feet.
4378. Assuming it to run in at 12 feet, 4 feet more on the lift on the weir below Menindie would ensure a level of 14 feet on your summer gauge? Yes.
4379. And that would be 2 feet above what would be required to make the water run into Lake Menindie? Yes.
4380. With a 12-foot river, what depth of water would you get in Lake Menindie;—would it just run in and no more? It would be deep in patches. It might be 1 foot or 18 inches in places, but in other places only just over it.
4381. So, with 3 feet 6 inches additional on to a 12-foot river it would not mean a very great depth of water in Lake Menindie? No.
4382. Only 4 feet or 5 feet at the outside? Yes.
4383. How long do you think that would last as against the evaporation, assuming that a flood-gate were put in to block the water? It would last twelve or eighteen months. The evaporation is not very great.
4384. Do you know the circumference of Lake Menindie—the area that is covered by water occasionally? No; but I think the distance across it is about 12 miles.

S. Klemm,  
junr.  
6 Oct., 1899.

- S. Klemm, junr.  
6 Oct., 1899.
4385. I have been informed that the lake is about 35 miles in circumference;—would that be approximately correct? Yes, it is quite that.
4386. Do you know anything as to the quantity of land that is suitable for irrigation about here, independently of the lake area;—do you know if there is much that is high enough and suitable in quality? All the land around the lake is suitable for irrigation.
4387. But, confining ourselves for the time being to the river bank, is there any land adjoining the river, or close to it, which is suitable for irrigation? Yes.
4388. High enough as well as being the right quality of soil? Yes.
4389. Would that be of considerable area, or limited? There is a considerable area of it.
4390. It has been stated in evidence that land subject to flood is not suitable for irrigation, at any rate so far as the cultivation of some kinds of fruit trees, and so on, are concerned;—is there much land not subject to flood about here? Yes, any quantity of it.
4391. It seemed to us, when travelling down the river, that the immediate banks were lower about, and towards Menindie, than further up the river;—is that so, or is it a fact that the banks are not so much subject to flood about here as they are further up? I cannot say for certain.
4392. Take the 1890 flood, for instance, which was one of the highest floods you have had; how far back from the ordinary banks of the river did that flood extend? It is hard to form a gauge, for at some parts it goes out a long way, and at other parts it does not. From here to Albermarle, a distance of 18 miles by road, it is high land all the way—that is, on the northern bank of the river—and the flood water does not go out more than about half a mile, excepting into two lakes.
4393. That would not apply to the southern bank of the river, I presume? No.
4394. That is more subject to floods? Yes, although there is a good bit of high ground there. But this side it is nearly all high ground.
4395. Is this land, in addition to being sufficiently high, otherwise suitable for irrigation? Yes, very suitable.
4396. Has any of it been tried in that way? Some people are trying it now.
4397. What has been their experience? The results have been very satisfactory.
4398. So it would seem to be your opinion that there is no doubt about getting sufficient land of the right character to use any water that could be stored in the river? I am quite sure of that.
4399. You do not think the getting of the land is the difficulty? No. You can get the land and the right soil, too.
4400. That seems to be the tenor of the evidence we have had, so far, from people on the river—that they do not anticipate any great difficulty in getting land, but rather the difficulty of getting enough water? That is it. Once we get the water we shall get the land.
4401. It has been stated in evidence that flood-land is not suitable for irrigation? I have seen flood-land irrigated with great success.
4402. What were they cultivating it for? They were growing potatoes and onions.
4403. But the market for that kind of produce would be comparatively limited in a place like this? I do not know.
4404. Supposing you had a good river between here and the coast, you could hardly hope to compete in regard to that class of produce—such as potatoes and fodder—against the more favourably situated people in good climates, could you? I think I could compete against them.
4405. That is, supposing you had cheap carriage by river? Yes.
4406. Have you yourself attempted to grow anything by irrigation? Yes, I have just experimented.
4407. Generally speaking, you think you could compete against people on the coast, in regard to such produce, by means of irrigation, notwithstanding their better climate, owing to the easier means of access you would have? Yes, I feel sure of that.
4408. As to the suggestion made by Mr. Darley, which the Chairman mentioned—that the raising of the weirs 3 feet or 4 feet more above the present level of the river would be a danger;—have you any doubt in regard to the opinion you expressed a little while ago? No, I have no doubt.
4409. You think there would not be any danger? There would not be any danger at all.
4410. How much above the present level could the river rise without flooding the adjoining banks? It would take a 7 or 8-foot rise before it would commence to flood the adjoining country; the river would have to be about 17 feet or 18 feet above summer level before it would commence to get across the flats.
4411. And you think it would be safe to put the weir to the height of (say) 4 feet above the present level of the water in the river, which is 10 feet 2 inches? Yes; you could go 5 feet above it, I think, without any danger.
4412. If you had the water at 14 feet in the river, because of the weiring it would go over the banks sooner than if the river were not weired? Yes.
4413. Do you think that if that flood-water went over the surrounding country, because of the river having been locked and weired, there would be any trouble in the way of a claim by owners of adjoining country for compensation? No; I do not think so.
4414. Do you think that, spread over the adjoining country, the flood would be any great depth? No. Most of those people like to see the country occasionally flooded, because when the water has gone off there is feed.
4415. *Chairman.*] You have been here about eighteen years? From eighteen to twenty years.
4416. How is it that people about here have not gone in for irrigation where they are close to the river? I do not know. It seems to have been a lack.
4417. You are beginning to wake up? Yes. Since the homestead leases were introduced, people have begun to go in for pumping plant—windmills, and so on. All those settlers are commencing to irrigate land for gardens.
4418. Whereabouts? More so below Menindie. They are coming up from below, and taking up land as they go on. Up to Wilcannia there are a lot of settlers who were not there a few years ago.
4419. What is the population of Menindie now? Very little over 100, I think.
4420. It has fallen off lately? Yes.
4421. Why? Through the continuous droughts. People had to go somewhere else to seek a living.
4422. I suppose you look upon the droughts as a menace to the district more than any risk of flood-water injuring the district? Yes. There would have been more irrigation if there had been an outlet for the produce.

4423. Therefore, with a river suitable for irrigation, you must have some outlet for your produce? The two things would combine. S. Klemm, junr.
4424. *Mr. Watson.*] In the event of the river being flooded to the height of the banks, there would be a considerable area of land in lakes and creeks, ordinarily dry, which would be filled before the water extended over the general surrounding country, would there not? Yes. 6 Oct., 1899.
4425. You said the water would begin to go over the ordinary banks at about 18 feet? Yes.
4426. At what level would it begin to flow into Lake Pamamaroo? That lake gets filled very quickly.
4427. At about what height? About 11 feet would flood it.
4428. Would other lakes be filled at a similar height, or would they require more? No. Tandora Lake takes about 15 feet in the river.
4429. So that all those natural reservoirs would have to be filled before the general body of the surrounding country would be inundated? Yes.
4430. It would be an advantage, I suppose, to the surrounding stock-owners to have those filled? Yes.
4431. And the raising of the weirs to the proposed height, as mentioned by the Chairman, would not have the effect of filling those lakes? No.
4432. Whereas the addition of 3 or 4 feet more to the weirs would have that effect? Yes.
4433. *Chairman.*] You have stated that the carrying out of this work would probably induce you to deal with the New South Wales railways and Sydney? Yes.
4434. Others may not be of that way of thinking; seeing that this work is proposed to be carried out at the expense of the New South Wales Government, do you not think that, if it were carried out, they ought, either below Menindie or Wentworth, to impose certain charges on goods going to or coming from the other colonies? I think so.

Alfred Edward Ellis, butcher, gardener, and baker, Menindie, sworn, and examined:—

4435. *Mr. Shepherd.*] How long have you been a resident of Menindie? Four years. A. E. Ellis.
4436. Have you been carrying out any scheme of irrigation here? Yes. 6 Oct., 1899.
4437. To what extent? Five acres.
4438. What does it consist of? Potatoes, onions, cabbages, turnips, parsnips,—every vegetable you can name; and almost every kind of fruit that is grown in the Colony.
4439. You have not tried any kind of cereal crops? No; but there are some self-sown wheat and oats growing luxuriantly there.
4440. Do you irrigate by steam-engine? By steam-pump and boiler.
4441. Have you estimated what it costs you per acre? I have not gone into figures; but we have been clearing about £3 per week out of 2½ acres.
4442. Right through the year? Yes.
4443. Of course the years have been exceptionally dry ones the whole time you have been here? Yes, exceptionally dry—very bad seasons.
4444. In ordinarily good seasons the irrigation would not cost you so much? No; there would not be so much steam required for lifting the water as there has been with a low river. If the level of the river were raised to the extent proposed, much less firewood would be burnt, because less steam would be required, and in ordinary seasons the growing of things would be cheaper, because the rain would help.
4445. You grow all kinds of fruits? Yes—pine-apples, lemons, pears, plums, oranges, strawberries, apricots, mulberries, and figs.
4446. Have you tried cherries? I had a cherry-tree; but, unfortunately, I flooded it too much, and killed it. It was nearer to the tank than it ought to have been, and negligence was the cause of its death; but I am going to put another tree in next June.
4447. Do you find any particular kinds of fruit do better than some others—for instance, do you find the citrus tribe do well here? Yes, oranges and lemons grow luxuriantly here; in fact, we can have them ripe quite two months before you can on the seaboard.
4448. Do you generally dispose of them all in the neighbourhood? Yes; we have had only a few trees, which supplied the immediate wants, because the expense of getting the fruit to Broken Hill by coach would be too great.
4449. How much land have you altogether? We have 5 acres. We are experimenting; but I would take up 100 acres if I had the means of putting the produce on the Broken Hill market as cheaply as the South Australian people can do it.
4450. What effect would the locking of the river Darling have in reference to your industry? It would induce more men to take up land and irrigate it. I am quite sure of that. Last year we supplied homestead lessees along the banks of the river with potatoes and onions when they could not get them up by boat.
4451. You have always found a ready market for what you have been able to produce? Yes; for anything imperishable I have found a ready market.
4452. You have not, I suppose, tested the Adelaide or the Melbourne market with your lemons? No; too far away. Last year we grew a quantity of tomatoes—the most beautiful specimens, I think, you could see. I could not dispose of them here. I sent some to Broken Hill on trial and they fetched 8d. a lb, but the cost of getting them there swallowed up all the proceeds. The balance I turned into tomato sauce—300 dozen—which I sold as soon as I had made it; that gave me 100 per cent. profit. The inhabitants of the place can speak as to its quality, and I am prepared, under favourable conditions, to start a factory which would employ at least fifty hands in that industry alone.
4453. Have you ever estimated the return you have had from any particular crop per acre? No, not per acre. I have taken only the profits we have made weekly.
4454. You have such a large variety, in fact, that it would be difficult to particularise? Yes.
4455. I suppose, there has been no flood in the river since you came here? I came here at a flood-time.
4456. There has been no local rain to speak of since you came here? Hardly any—5 or 6 inches a year.
4457. I suppose, then, you are not able to give much information as to the effect of floods—that is, where the country is sometimes flooded? I have seen the effect of a flood in producing food for stock, since I have been here.
4458. I mean you have not been here during a time when the country has been flooded to any extent, have you? Yes I was here at a flood-time. 4459.

- A. E. Ellis. 4459. To what extent was the country flooded then? All the land on the banks of the river was flooded when I came here.
- 6 Oct., 1899. 4460. What is the extent of the flood;—what area of country does it cover, as a rule (say) with 10 or 12 feet of flood above the bank of the river? On the southern side of the river, the 1894 flood went out about 2 or 3 miles. That was only in one particular spot, right opposite Menindie. Further up and down the river the country was not flooded to that extent.
4461. You do not suppose that the raising of the weir (say) 1 foot would make any appreciable difference in regard to the flood, do you? No, I am sure it would not.
4462. Because where the weir would be built the river probably would not be more than 40 yards wide, and of course a foot rise in that 40 yards, spread over such an immense area, would really make no appreciable difference? No. It would not hurt the banks in any way.
4463. Do you think that in the event of this additional supply of water being given it would induce a large number of people to go in for irrigation? I am quite sure it would.
4464. Is there a large extent of country here suitable for irrigation? Miles and miles of it.
4465. What description of country? Sandy and a grey loam.
4466. More so than the red? It is a red sandy country and a grey loamy country.
4467. Which do you think would be the better to irrigate on a large scale, what is generally termed the black soil, or the red soil? It all depends on what you are going to grow. I have irrigated both sandy soil and grey soil. Some things grow better in one soil than in the other, but they both bear certain kinds of produce excellently and would pay anybody.
4468. But in going in for irrigation on a large scale it would be chiefly for the purpose of producing forage? I have seen cereals, lucerne hay, and grass hay grown to perfection in the sandy country, and I have also seen it grown in the loamy country; in fact I have some growing there now.
4469. What kind of soil would these do best in? They would do well in either soil, the only danger is that on a sandy soil the seeds might be blown away by a high wind if not protected.
4470. Have you seen any attempt made to cultivate millet, sorghum, and planter's friend? Yes; I have sorghum growing now.
4471. How do they seem to do? Very well. They grow to a height of 8 or 9 feet.
4472. Could you form, from your experience, any opinion as to the cost per acre of irrigating to a large extent for the purpose of feeding stock? Well, I have about 1 rood of lucerne and sorghum growing at the present time, and that only gets the attention that we can spare from the butchering and baking, to keep it going—that is two or three hours a day, or perhaps only one hour on some days—you can form an estimate of the cost from that.
4473. That is estimating that about three good waterings would be necessary for most of those crops? So they would.
4474. I want to know what you think it would cost per acre to give three good waterings to (say) 100 acres? I do not suppose it would cost more than 2s. per acre for each watering.
4475. At that rate, then, you think it would pay handsomely to grow forage for stock—sheep for instance? Yes, I am sure it would.
4476. Do you think it is at all feasible that a large extent of land could be irrigated successfully for that purpose? Certainly.
4477. That is, it would pay better than purchasing forage, and bringing it to the spot—it could be produced on the spot more cheaply than it could be imported? Certainly. I have fattened some hand-fed stock myself, and the result was very satisfactory; for instance, I fattened two sheep that way. They were pets about the house, and primer sheep when they were killed I never saw.
4478. In the area that you have cultivated, have you manured freely? Yes, very freely.
4479. What kind of manure have you used? Stable manure and bone-dust—phosphates.
4480. Of course, in cultivating a very large area, it would be almost impossible to manure it? The sandy soil requires little or no manure. I found, in the first planting of seeds, that they did not thrive as well as they ought to have done, although they came up very prolifically. I then tried manuring, and it was more successful; and I should advise anybody taking up flood-country, that they would find it profitable to manure, because the result is so much greater.
4481. Is the large quantity of country which you have said is suitable for irrigation so situated that it could be irrigated without grading? No; it would all have to be graded.
4482. I suppose, then, it is undulating to a certain extent? Away from the immediate bank of the river it is undulating.
4483. But you do not think there would be any difficulty in bringing it under irrigation? No difficulty whatever.
4484. *Chairman.*] With regard to Mr. Shepherd's question as to growing food and making ensilage, did you intend your answer to apply only to stud stock and station horses and cattle, or to the whole of a man's herd? I think that small homestead lessees could raise stock and always have fat stock by hand-feeding them, and make a profit out of them; whereas, under present conditions, they lose half their flock, and in some cases the whole of it.
4485. But you do not intend that to apply to flocks of 15,000, 20,000, or 50,000 sheep, I suppose? Oh, yes. The larger the number fed that way the more profitable for the owner raising them.
4486. How much dry fodder per day do you estimate it would take to sustain a sheep? I used to give my two sheep from 3 to 4 lb. of grain and chaff.
4487. Are you aware that for a flock of 50,000 sheep 2 lb. of fodder per sheep a day would amount to 45 tons a day;—do you think that it is practicable for a man to grow and store such a large quantity of fodder to sustain his flocks in seasons of drought if he has to give them 45 tons a day? I should hardly think that it would be practicable for one man to do it unless he had a very large amount of capital at his back, but very few holdings about here are carrying such a large flock as 50,000 sheep.
4488. *Mr. Watson.*] Did the two sheep to which you gave the 3 or 4 lb. get anything else to eat? No.
4489. But on a station where there is some herbage I suppose that less than that quantity would do for two sheep? Yes; half the quantity would do where there was any picking at all.
4490. *Chairman.*] But are you aware that during the present drought on the Darling there are holdings of 180,000 acres with not one blade of grass upon them? Yes.
4491. *Mr. Watson.*] But where there is no grass there is probably herbage which helps to keep the sheep alive? Yes.

4492. Have you any idea what is the lowest per ton at which you could grow fodder, for I want to know whether you think you could compete against people on the coast; for instance, if they had a free waterway right from there to here? I could grow lucerne for £5 a ton, extensively. A. E. Ellis.  
6 Oct., 1899.
4493. Could not people on the coast, with a free river, afford to sell lucerne hay here as cheaply as that? No; we cannot get even very bad lucerne hay as cheaply as that.
4494. At Newcastle and in the Hunter River valley, generally, people sell lucerne as low as £2 10s. and £3 per ton; assuming it to be delivered at Adelaide at £3 5s. per ton, what do you think the price would be here, with a good river? Quite £6.
4495. And you say you think you could grow lucerne and sell it, at a profit, at £5? Yes.
4496. So, even with a free river, you think that with irrigation you could compete against the imported article? I am certain that I could.
4497. *Chairman.*] You spoke about homestead lessees just now;—do you mean those who occupy 10,000 acres each? Yes.
4498. How many sheep do you think a man could keep on 10,000 acres in this country, in a fair season? Most of the leases that I see about here would go about 9 or 10 acres to a sheep, and that would mean a little over 1,000 sheep on 10,000 acres.
4499. Could a man make a living out of 1,000 sheep? He could make a living, but it would not be a very grand one.
4500. *Mr. Shepherd.*] In feeding the sheep the object would not be to get them fat? No; to maintain them until a better season.
4501. And do you not think that a sheep could be kept alive on  $\frac{1}{2}$  a lb. a day? I am quite sure that it could be kept alive on 1 lb. a day. I made my two sheep very fat on 4 lb. a day between them.

William Maiden, hotelkeeper and stock-owner, Menindie, sworn, and examined:—

4502. *Mr. Dick.*] How long have you resided in this district? Ever since 1859. W. Maiden.  
6 Oct., 1899.
4503. Do you think that the direction of the main body of traffic, both inwards and outwards, to Menindie and places as far up as Bourke, would be materially altered by the construction of these locks and weirs from Bourke to Menindie? I do.
4504. In what direction? It is water that helps to bring people to settle on the land, and what the people here at present so often require is a means of sending away their produce. The river is up one week and down the next. When it is in flood freights are fairly low, but on these small rises all kinds of freights are charged according to the height of the river, to a very great extent. If there were a standard freight from here to Sydney, *via* Cobar or Bourke, Sydney people would know what they were doing, but at the present time it is quite uncertain what they may have to pay for the carriage of produce.
4505. At the present time is not the whole of the trade of Menindie and many places further up the river carried on with Adelaide or with Melbourne? A good many of us carry on trade with Adelaide. However, a great many stations deal with Sydney firms, but the goods come from Sydney *via* Adelaide on account of that being a better route.
4506. What class of goods? I am now speaking of station stores from Sydney.
4507. Is there a fair proportion of the pastoralists in this district who trade with Sydney in that way? I believe a good many.
4508. And do you think that, with a permanently navigable river, the number of those who trade with Sydney *via* Adelaide would be increased? Yes.
4509. For how many months in any one year, since the construction of the railway to Bourke, has there been a navigable river, within your recollection? We once had a good river for about two years.
4510. During that period of two years in which you had a good river, did you notice any alteration in the course of trade along the river;—did it concentrate at Bourke instead of going to Adelaide? A good deal came down from Bourke, and a good deal also came up; but the river is sometimes up to-day and down to-morrow, and people by ordering big lines from one port get the goods so much more cheaply. At that particular time steamers coming up stream were landing stuff at a wonderfully low rate, on account of the quantity, and because the water was open from Adelaide to here much longer than it was open from here to Bourke. The river from here to Bourke was closed perhaps two or three months earlier, and that of course blocked trade between here and Bourke to a very great extent.
4511. We are also inquiring into a proposal for the construction of a railway from Cobar to Wilcannia: presuming that that railway were constructed, and that the river were locked from Bourke as far as Menindie, do you think that Wilcannia would then become a centre which would draw the produce from places as low down as Menindie, out east and west, and concentrate it at Wilcannia for transport to Sydney? I do—including White Cliffs, which is a big place, and all the country round about there.
4512. Do you think that the main body of the outward trade of the river below Wilcannia would be concentrated at Wilcannia, for transport to Sydney, if the river were locked? Yes; I do.
4513. Have you had any experience in irrigation along the river? No, I have not; but at the time Colonel Home came through here I happened to be coming in from Broken Hill, and I came along with him from Lake Speculation, and we drove round Lake Menindie, and he reckoned that the soil and the formation of the country were really splendid, and that it would be very easy land to put water on. He said that if you were to "lock" Menindie Creek that would keep the water in Lake Menindie at one height, whereas now it runs in and goes straight out again, because the creek is almost on the same level as the lake.
4514. As the locking of the river will necessitate the expenditure of a large sum of money, it is only natural that the Government should look for some means of recouping themselves the interest on the cost of construction and the expense of maintenance;—do you think that a general due of 10s. per ton on inward and outward goods would be considered an excessive charge for the advantages of a permanently-navigable river? No; I do not. I think it would be a very fair charge. I have seen as much as £16 per ton paid from here to Wilcannia, and £30 per ton from here to Wentworth.
4515. Supposing that the river were locked from Bourke as far as Menindie, would the lower reaches of the river still offer, for certain or uncertain periods of time, the same obstructions to navigation as are now offered by the present river? The river below Menindie lasts longer than the river above it. Lake Menindie, being a large body of water flowing back into the river, keeps the water up longer between here and

- W. Maiden. and Wentworth; and Lake Cawndilla also empties into Lake Menindie, and, flowing into the Darling, increases the quantity of water going down the river.
- 6 Oct., 1899. 4516. But each of those would be above the lowest weir of the series? Yes. Lake Pamamaroo is also a very big lake, and all the water there runs back into the river. All these creeks are quite as deep as the river-bed itself; therefore, every drop of water that flows into them from the river goes back. Lake Pamamaroo is about 27 miles round, and is very deep.
4517. But if the level of the river were permanently raised above its bed, as it would be by these weirs, that source of water-supply for the lower reaches of the river would be cut off? Yes, it would.
4518. Do you think that, with the construction of locks and weirs as far as Menindie, the lower reaches of the river—below the lowest weir—would still offer serious obstacles to navigation? Yes, I think they would.
4519. And, therefore, this scheme, so far as regards providing a permanent means of intercourse with Sydney *via* Adelaide, or with Adelaide or Melbourne, is in that sense an incomplete one? Yes; if the water stopped flowing over the weir, of course it would be.
4520. Which do you think would offer the more advantages to the district around Menindie—a railway from Cobar to Wilcannia, or a river locked from Bourke as far as to Menindie? I think that the river locked down as far as Menindie would be the better.
4521. But you are still of the opinion that, if we had the river locked as far as Menindie, and if we had a railway from Cobar to Wilcannia, the locked river would probably act as a feeder to the railway system? Yes. I may say that some time ago 5,000 acres were laid aside for village settlement around Menindie, and a great number of people at Broken Hill were coming hither, as they thought the Government intended to put water on the land; but when they found that they would have to provide all kinds of machinery themselves, which they are not able to do, they did not come. I am sure that, if there were means of irrigation—providing the Government supplied water at fair rates—the land all round these lakes would be taken up by people from Broken Hill with families.
4522. You have had a good deal of experience as a stock raiser? Yes.
4523. As a practical stock-raiser, do you think it would pay to grow large fodder crops by means of irrigation along the Darling, as a means of insurance against loss of stock during periods of drought? I do.
4524. Does your answer include the insurance of the whole of the flocks, or merely valuable stud rams and large stock used at the station, such as horses? It would also include a portion of the ordinary flocks.
4525. You have heard the calculation set forth by the chairman of the quantity of food that would be required to feed a flock at so many pounds per day for each sheep? Yes; but the other day I was coming down on a steambot between here and Wilcannia and I met the steamer "Maggie" coming up, and she had on board 485 rams which were being taken from Echuca to Wilcannia. Being anxious to find out what it would take to feed a sheep, I asked the skipper how much it took for those rams every twenty-four hours, and he said that he was astonished. He said, "These rams have improved greatly on the way up, and all that they have had each day has been between six and seven or sometimes eight bags of chaff for the whole lot." Those sheep were full and looked splendid. They were rams going to a station behind Wilcannia called "Salisbury Downs." They had some bran, too, but they did not care much about it.
4526. *Mr. Shepherd.*] Did you calculate what weight that was for each ram? About half a pound each sheep per day.
4527. You say they improved on that? Yes. The sheep looked really well, and the skipper said that they had improved a great deal since they came on board.
4528. In cultivating (say) 100 acres with such crops as lucerne, maize, sorghum, or planter's friend, do you not think that it is quite feasible that sufficient could be grown in that way to keep the whole of the stock alive and prevent these fearful losses during a bad season? I am sure it could. That is the only chance the people have up here.
4529. *Mr. Dick.*] What is the ordinary freight for the carriage of chaff by the river? In bad seasons, when people want chaff most, it cannot be obtained sometimes. I have known people round about here having to pay as much as £8 or £10 per ton for the carriage of chaff. Even from Broken Hill the freight has been £5 or £6 per ton, on the top of railway charges; I myself have paid in Broken Hill £9 or £10 per ton, and £5 or £6 on that makes it very dear.
4530. Can we take it that the ordinary price of chaff delivered on stations along the river would be about £5 per ton? Yes; that is, with everything in its favour.
4531. Well, omitting the bran which those sheep consumed on the voyage, and presuming that ordinary flocks would require no more food than those sheep did, half a pound of chaff a day would be sufficient to keep a sheep alive? Yes, it would, according to what I was told.
4532. And that, with a flock of 50,000 sheep, and with chaff at £5 per ton, would mean about £45 a day to keep them alive? Yes.
4533. Do you think it would pay anyone to try that in seasons such as the one we have had recently? It is like this: perhaps a person would have to do it only for a week or fortnight, because, when rain comes along the routes, a man has a chance of taking the sheep away to other parts.
4534. Do you think the locking of the river would offer any facilities whatever for the transferring of starving stock to more favoured districts? I think it would, very much.
4535. In what direction? There are plenty of people who would send away fat sheep even, but the routes are so dry that it is impossible, there being no water and no feed. At other times they keep them too long, and the sheep get too weak to travel, and they really have to keep them on the station to die. If this river were locked, the sheep could be taken by barge and transferred to places inside, where their owners would have a chance of getting something for them.
4536. Take the district north of Wilcannia;—presuming that the river were locked, where could starving sheep from that district be sent to? They would go towards Sydney—to Orange and Dubbo, and other places.
4537. But do you know that all the available land in that part of the country is usually snapped up by the Riverina squatters? That would be the only chance—getting them away to other parts, which had better seasons.

4538. You still think that the locking of the river would afford a means of getting fat and other stock away? Yes. If fat stock could be taken away quickly, and did not have to travel over bad country, they would, of course, be landed in a better condition. W. Maiden.  
6 Oct., 1899.
4539. *Chairman.*] I understood you to say that you had had some experience in pastoral matters? Yes.
4540. In this Darling district, what do you think would be a fair number of sheep for a man to have, from which to get a fair living? If he could keep them, I think he could make a very good living out of 1,200 or 1,500 sheep.
4541. From the wool? From the wool and the sale of the increase. I am speaking only of the very small holders.
4542. A man could live on 1,200 to 1,500 sheep? He could. It would be equal to about £300 or £400 a year.
4543. What is a sheep worth per annum as a producing animal—for wool and lambs? Six or seven shillings, or perhaps more. It depends greatly on the increase. The small owners with only 1,200 or 1,500 sheep do a bit of dealing—buy and dispose of other sheep—and I am not counting that. They may make a few pounds in that way; sometimes they do not, but very often they do. The season has everything to do with the profit or loss.
4544. Do you think it is practicable, either for the small owner with his 1,200 or 1,500 sheep, or for the large holder with much larger flocks, to grow, by means of irrigated land, sufficient fodder to maintain his flocks in bad seasons? The small holder as a rule has not the means, and the big holder would have to reduce his numbers very much.
4545. But money is necessary for plant, pumping machinery, draining the land, and so on? Yes.
4546. It is rather an expensive handicap for a small holder to carry it on on any extensive scale, is it not? Yes. If water were laid on to the land for him, and he were assisted in that way, he could do it all right.

David Edwards, blacksmith, Menindie, sworn, and examined:—

4547. *Chairman.*] How long have you been here? Since 1881.
4548. Have you any other occupation besides that of a blacksmith? Yes; I am an insurance agent, and do an auctioneer's business. D. Edwards.  
6 Oct., 1899.
4549. But nothing connected with pastoral or agricultural pursuits? No.
4550. Have you given any attention to the proposal now before us? Not a great deal of attention; but I have always considered it desirable that we should have a permanent river for the purpose of traffic, and also for irrigation purposes.
4551. From a traffic point of view, seeing that the expenditure would fall on this Colony, how do you think the locking of the river would benefit the revenue of the Colony? I think the revenue of the Colony would not suffer in any way through the river being locked.
4552. But, seeing that £500,000 is the estimated expenditure, what would New South Wales get, either directly or indirectly, from the outlay of that sum of money? I understand that tolls would be levied on all freight carried on the river, and therefore the revenue would be increased instead of being diminished.
4553. Do you think that the locking of the river would be the means of inducing a closer settlement of people in this part of the country? Yes, I have no doubt it would. If the river were locked and water were conserved, I think settlers, from Broken Hill especially, would come to reside here and produce food-stuff for Broken Hill.
4554. From your long knowledge of the district, do you think that the want of a regular water-supply is the one great drawback to this part of the country? It is not the one drawback, but it is an exceedingly great one.
4555. It would seem to a stranger that the great desideratum is to increase in some way the producing power of this vast waste, as it presents itself at present? Yes, and the producing power of the district would be increased by the locking of the river. Irrigation which would be possible then is almost impossible now, through the river having such a rise and fall; but if the river were always kept at a certain height, irrigation would be much more simple, and small holders could irrigate, whereas now they could not.
4556. Have you seen the river at Menindie at a very low ebb? I have seen it down to summer level.
4557. What depth would that be? Just at Menindie there would be 10 or 12 feet.
4558. But there is a deep pool here? Yes. It extends a few miles—a very large and deep pool.
4559. But we have been told that, higher up, the river has been absolutely dry, except for small holes here and there;—does that ever happen here? I have never known it to be dry since I have been upon it—since 1875. It may have been dry, but it has not come under my observation.
4560. If the river were locked, and irrigation and cultivation took place to a great extent, where would be the market for the produce? Without railway communication to Broken Hill there would practically be no market—the one depends upon the other; but with railway communication with Broken Hill there would be always a permanent market, and I feel sure that the producers on the river could compete most favourably with the South Australian producers.
4561. Then, as regards Menindie and its surroundings, we may look to Broken Hill as the natural outlet for the bulk of the produce that could be grown here? Yes, I think so.
4562. We have been told that there is a great deal of timber here that would be consumed in Broken Hill? There is an immense amount of timber here lying ready on the ground; whereas, when I was in Broken Hill a month ago, I was told that the people there were paying from 23s. to 28s. per ton for firewood, and even then there was a great scarcity of wood, and it was almost unobtainable from South Australia.
4563. Looking at the question of the future of Menindie, it would seem that connection by railway with Broken Hill is the first necessity? Yes, it is; but I think that it would be a far greater advantage to Broken Hill to be connected with Menindie than it would be to Menindie to be connected with Broken Hill.
4564. In what way? As a sanitarium for their invalided population. They have no convenient place to which they can go now. If they want to make a trip in the summer for recreation purposes, they have to go to South Australia; and I am sure that if we had railway communication with Broken Hill an enormous number of people from Broken Hill would pay our township a visit. Railway communication, to be of benefit

- D. Edwards. benefit to Broken Hill, must necessarily come to Menindie, it being such a short distance from Broken Hill, compared with other places, the distance being only between 60 and 70 miles.
- 6 Oct., 1899. 4565. Can you give us any more information about locking the river? No, except that I think it would benefit the settlers below Menindie as much as those above Menindie, for I feel sure that they would be able to send their produce even beyond Wentworth. When the river is in flood the Murray is backed up to a distance of 40 miles, and, with these lakes acting as reservoirs for supplying the river, I think navigation could be carried on pretty well continuously, and produce could be sent as far down the river as Wentworth, and compete favourably with South Australian produce.
4566. You seem to have studied the question more from a local point of view than from a general point of view, as regards the locking of the whole of the Darling? Yes, principally from a local point of view.
4567. Do you agree with former witnesses that there is a vast area of land about here suitable for agriculture by means of irrigation, and which is above flood level? The quantity is practically unlimited.
4568. Will you state why, in your opinion, crop-growing has not been engaged in more than it has been, up to the present time? The want of a market; there is no market. Supposing that crops were produced here under very favourable circumstances, people could not dispose of them.
4569. Speaking of Menindie as an outlet for Broken Hill, do you look upon this as a healthy climate? Most healthy; that is my reason for having remained here. Otherwise, I should have settled in Broken Hill some years ago. Having a family growing up I thought it better to remain here than go to Broken Hill, although, perhaps, I might have made more money there than here. I can manage to make a living here, and I thought that it was better to do that than go to Broken Hill and risk the health of my wife and family there.

John Hugh Gordon, homestead lessee, Box Tank, near Menindie, sworn, and examined;—

- J. H. Gordon. 4570. *Mr. Watson.*] How far is your place from Menindie? Twenty miles, towards Broken Hill.
- 6 Oct., 1899. 4571. Have you been long on your holding? Six years.
4572. Prior to that were you a resident of this part of the country? I have been in this district ever since 1866.
4573. Have you any land in addition to your own homestead lease? I am subleasing another homestead lease.
4574. That gives you a total of 20,000 acres? Yes.
4575. What stock have you been carrying on that area during ordinary seasons? About 1,500 sheep on each place.
4576. Ordinarily, you would have 3,000 sheep on the two blocks? Yes.
4577. What have you at the present time? I am now reduced to about 800 or 900. The others have died in the bad seasons.
4578. Have you any market for fat stock? Yes; Broken Hill.
4579. How far are you from Broken Hill? Box Tank is 45 miles, and the block I sublease about 53 miles, from Broken Hill.
4580. So, in having a market for fat stock, you are in a slightly better position than lessees on the river frontage would be? Yes.
4581. Do you find that is a considerable help to you? Yes.
4582. Do you think it is possible for a man to make a living off a 10,000-acre block, situated as yours is? It is not enough.
4583. Are there any homestead lessees who are able to make a living off one block of 10,000 acres, or do many of them follow your example and sublease from other people? There are plenty of them who are living on 10,000 acres; but they have really been going back—doing no good—the way the seasons have been. If the seasons were good, I have no doubt that they could manage to struggle along on 10,000 acres.
4584. I suppose, in view of the history of this part of the country, it would be rather unreasonable to expect a constant succession of good seasons—you must be prepared for a fair number of bad seasons? Yes.
4585. So I should imagine that, in cutting up land with a view to settlement, you would require to allow a sufficient margin to allow of a man making a living right through? Yes.
4586. How do you think the locking of the river will affect the homestead lessees in and around the district? I think it will assist them greatly. It will give them access to some places to which they have not access now, because of the river rising and falling so quickly as it does. If they were to have a permanent river they would have an outlet for their wool, and it would also enable them to get provisions.
4587. I understand that supplies are exceedingly dear occasionally owing to the lack of communication? Yes, they are very dear. I have known flour to be £20 per ton here.
4588. For any considerable length of time? Yes.
4589. Was that recently or a considerable while ago? In 1886 or 1887, I think it was. I have known carriage from Wentworth to Menindie to be £30 per ton.
4590. You mean, I suppose, that the goods were brought by river to Wentworth, and by team from there? Yes.
4591. And the teamsters charged £30 per ton? Yes.
4592. There being no feed or water on the route? Yes, for a long distance.
4593. Has there been any difficulty of late in the way of securing supplies? Not since Broken Hill started. Of course we have to pay the extra carriage between there and here.
4594. What does that amount to? It runs from £4 to £6 per ton.
4595. In addition to what it cost to get the goods to Broken Hill, you have paid £4 or £6 per ton to bring them on to Menindie? Yes.
4596. That would mean a pretty heavy total charge in the way of freight? Yes.
4597. Has there been any difficulty in getting wool away? Sometimes. Sometimes it has to be stored on the river for twelve months in some places.
4598. To a man with small capital, that is a considerable disadvantage? Yes, unless he carries it by team from here to Broken Hill, which makes the carriage very expensive, including the railway carriage at the other end.

4599. It is proposed, as you are probably aware, to construct these locks between Bourke and Menindie, and it has been suggested that if that were done a considerable portion of the trade that now goes to South Australia and Victoria, *via* the river, might be attracted to the railway at Bourke, or any future extension of the railway system towards Wilcannia;—do you think there is anything in that suggestion? I have no doubt it would. People here would sooner pay extra freight to have a permanent river than take the chances they have to take now. We have frequently to wait for a rise in the river a long while, and perhaps the boats just get enough water to come up this far and then get stuck. If they do happen to get down, then the freight is so much that it comes very hard on people. They would sooner pay a little extra for regular carriage, for it would really be cheaper for them in the end.

J. H. Gordon.  
6 Oct., 1899.

4600. Having regular and constant communication, it would be worth their while to pay a little extra? Yes.

4601. From the point of view of irrigation, supposing a considerable quantity of water to be stored in the river, do you think that the locking of the river would be of any material advantage to the homestead lessees along the river frontages? Yes, not only along the river frontages but also out back where the lakes are. There is any quantity of country round these lakes, which could be made use of if there were water permanently in the lakes. There is all the country out towards Bullabulka, about 40 miles from the river.

4602. There is country fit for irrigation there? Yes; it is beautiful country.

4603. But would it not require a very high river to fill those lakes? No water goes out to them unless the river is high—unless there is really a flood.

4604. The river would require to be pretty well a banker I presume? Yes, a banker.

4605. The scheme at present under consideration does not contemplate the raising of the river so high as the banks, consequently a number of those lakes would not be filled by this scheme alone? No, they would not.

4606. I suppose you were going on the assumption that, with a considerable body of water permanently in the bed of the river, the watercourses communicating with the lakes would be filled sooner by a moderate flood, perhaps, than by a much higher one under other conditions? Yes; that is what I thought.

4607. When the lakes that you have mentioned are full, are they of any great depth? Very deep. There is then as much as 20 or even 25 feet of water in them.

4608. That would stand evaporation for a considerable time? Yes. When full, I suppose Bullabulka Lake would have five years' water in it. There is also Victoria Lake.

4609. Is that near Bullabulka? It is 40 or 50 miles from the river.

4610. Any connection with Bullabulka? It is within a few miles of Bullabulka.

4611. And fed by the same watercourse or intake from the river? It leaves the river in one channel, and branches off into other channels.

4612. And you say that around a number of those lakes there is land that is suitable for irrigation? Yes.

4613. Above flood-level? Yes.

4614. And with good soil? Yes.

4615. We have heard fears expressed by some people to the effect that, if the weiring of the river were carried to a greater height than 10 or 12 feet, it would result in the flooding of the surrounding country to such an extent that there would be claims for damages;—do you think there is any possibility of that occurring? No.

4616. It is, rather, more likely that the people would be glad of the water coming over the country? Yes; they would, indeed.

4617. That is, so far as low-lying country is concerned? Yes.

4618. I understand that you are favourable to the construction of the locks and weirs? Yes; I am, indeed.

4619. Do you think there would be any possibility of the Government recouping itself to any extent for the expenditure incurred, which is estimated to come to about £500,000, in addition to the annual cost for maintenance, which would be about £20,000? I have no hesitation in saying that it would connect us with Sydney, and a lot of the produce of this part of the country would go to Sydney.

4620. Of what character? Almost everything sent from this part, I think, would go to Sydney if there were a connection.

4621. Do you think that the wool would? Yes, wool and other things; and supplies would be brought back.

4622. Do you think that the people could, for the certainty of regular communication, afford to pay something in the way of a toll upon the goods that were carried on the river? Yes; I think it would suit everyone in this part of the country to pay something extra on the carriage.

4623. Of course, the probability is that with regular communication the steamers could do the work more cheaply than they do at the present time? Yes.

4624. And that any toll that was imposed would probably not be more than the difference between present rates and the cheaper rate at which the work could then be done? Quite so.

4625. You think that there would be no difficulty in collecting a reasonable toll? Yes.

4626. Reverting to the question of the maximum area of homestead leases, what do you think would be a fair area for a homestead lease with this character of country? Twenty thousand acres, I think.

4627. At present the maximum area is 10,000 acres? Yes.

4628. You think that an area of 20,000 acres is as little as a man can make a living upon? Yes—that is, taking one season with another.

4629. What is the term of the tenure of your homestead lease? Twenty-eight years.

4630. Do you think that is sufficient to encourage a man to take up land, if the area were large enough? Yes.

4631. Some of the larger holders along the river seem to be of the opinion that a term of twenty-eight years is not long enough for their holdings, and they have indicated that greater improvements would be made if a considerable extension of the term of tenure were allowed them;—do you think there is any necessity for that? I have never heard of any complaint about the length of the term, but about the quantity of land; I have heard a lot of complaints about the smallness of the holdings. I think that twenty-eight years is a fair term.

4632. Taking into account the fact that the holdings on the river frontages usually have water in plenty for stock, and the usual characteristics in the way of herbage and grass,—do you think that the holdings on the river frontages, looked at all round, are superior to the back blocks? No; the back blocks are superior to the river frontages.

4633.

- J. H. Gordon, 4633. Why is that? There is better country there all through. There is not so much of the black ground or of flood-ground, and there are salt-bush, mulga-scrub, and lots of things which are not to be found on the river frontages.
- 6 Oct., 1899. 4634. So your experience is that the higher ground carrying herbage is better than the flood-ground which occasionally has heavy crops of grass? Yes.
4635. It would seem, then, that the idea some people have that the river-frontage holdings are especially valuable is not correct as applied to the country round about there? No, it is not.
4636. Therefore, in respect to the river frontage holdings, equally with the country further back, a homestead lessee would, you think, require 20,000 acres? Yes.
4637. Taking generally the country to which we have been referring, do you think that your own block of 10,000 acres, on which you said you ordinarily carry about 1,500 sheep, may be taken as a fair criterion of the rest of the land? Yes, a very fair one.
4638. So we should be justified in assuming that that would be a reasonable number of sheep to put on any 10,000-acre block? Yes—that is, to keep them in good condition, and taking one season with another.
4639. And that number of sheep is rather few for a man to make a living from? Too few.
4640. So everything seems to point to the desirability of giving a man a larger area if he is to do any good for himself and the country? Yes.
4641. *Mr. Shepherd.*] Have you tried any cultivation? None whatever.
4642. You are satisfied that the land is suitable for it? Yes.
4643. With regard to the water in these lakes, you say that when once full a lake would have about a five years' supply? Yes.
4644. These lakes, then, are not situated similarly to Lake Menindie? No; the water is confined.
4645. The lakes to which you have referred are of considerable depth, and when once filled they will remain full for some time? Yes. Of course, Lake Menindie rises and falls with the river, and so does Lake Cawndilla.
4646. How many sheep have you on your holding now? Eight hundred or 900. I generally have about 1,500.
4647. Are they in fairly good condition? Yes, they are.
4648. Have you been scrub-feeding them? No; all natural food.
4649. What kinds of grasses or herbage, besides salt-bush, have you? Spear-grass, principally.
4650. Have you any Mitchell-grass? No.
4651. Have you cut any scrub at all for the sheep? No.
4652. Have you any other grasses or herbage besides the spear-grass or the salt-bush? Not generally; but other herbage sometimes comes up after a rainfall.
4653. Do you know the names of any of the herbs besides the salt-bush? Spinach. That is the only other thing that grows out my way.
4654. In a fairly good season, what do you consider your holding is fairly capable of carrying? In a fairly good season 2,000 sheep would not be too many; but at present, and as the seasons have been, lately, 1,500 is quite enough for a block to carry.
4655. You have not suffered, then, to the same extent as the station-holders near the river? Not in losses.
4656. Do you think that if the river were locked these small holdings would be more likely to be taken up than they are now? I think so.
4657. You think that that would offer greater facilities for the smaller holders to work upon? Yes.
4658. Can you explain why you think that that would be the case? For the simple reason of the connection; that is the principal thing.
4659. Do you think there is a disposition to resort to irrigation for the purpose of assisting stock;—have you considered the matter yourself at all? I do not know much about irrigation and hand-feeding stock. I have not had anything to do with it.
4660. I suppose you realise the fact that if seasons such as you have experienced for the last four or five years were to continue, stock-owners would be obliged to resort to some different means of feeding their sheep? They would be obliged to do something—in a small way, I should think.
4661. Have you not taken the matter into consideration at all? No, I have not. It is a matter I cannot speak about.
4662. *Chairman.*] If it came to the position that you either had to prepare land, and sow it for the purpose of feeding your flocks, or clear out of the district, which alternative would you take do you think? It depends on the water part of the question. I would sooner cultivate and feed the stock, if I had the necessary water. The land is quite good enough to grow anything if it gets water.
4663. But where you are you say that that is out of the question—you are too far from the river? Yes; there is no water supply there for that kind of thing. That could be done only on or near the river.
4664. Therefore, for people away from the river banks any distance, it is not feasible to grow fodder for the stock? Not any great distance; but there are many lakes about here, and they run away out back, and there is plenty of land there that could be made use of.
4665. You generally have about 3,000 sheep; do you think that, if the grass and herbage were to fail altogether, it would be practicable, and would pay you, to grow crops to feed those 3,000 sheep? That is a matter I have never had anything to do with, and therefore I cannot answer the question.
4666. *Mr. Watson.*] What rental are you paying to the Government for your block of 10,000 acres? £32 per annum, or equal to about three farthings per acre per annum.
4667. How does that compare with the rental paid by the pastoral company whose land adjoins yours? I know we are paying more than they do; but I am not quite sure as to the amount which they are paying.
4668. What holding is it that you are on? Kinchega. I believe that Kinchega is paying under one halfpenny an acre per annum for their land.
4669. *Chairman.*] Have they not a great deal of river frontage? No, not a great deal; but what they have is about the best here—it is high ground. There are sandhills which run right into the river.
4670. *Mr. Shepherd.*] How long does the New Zealand spinach last? One good hot wind destroys it.
4671. It grows very rapidly, of course, after rain? Yes.
4672. Do you find that it comes up any time in the year after a shower of rain? Any time, almost.
4673. Do the sheep fatten well on that spinach? Yes; it is very good food for them.

Harry Webb, manager, "West End Hotel," Menindie, sworn, and examined:—

H. Webb.

6 Oct., 1899.

4674. *Chairman.*] How long have you been in Menindie? Ever since 1887.
4675. Have you found that the district and Menindie itself suffer by reason of uncertainty of communication with places with which you do business? Yes, suffer a good deal.
4676. Has the delay in the delivery of goods to people at Menindie often been of a marked character? Yes.
4677. Where do you get your goods from? Principally from Adelaide by river, simply because it is the most convenient, although very often there is great delay on the river. We have sometimes got goods from Sydney.
4678. What do you pay, as a rule, for the carriage of inward goods by the river? With a good river you will get it at about £2 per ton, but with a river like the present it will sometimes cost you £4, and sometimes even £5.
4679. At the present time you are getting it at from £2 to £2 5s.? Yes.
4680. If this scheme were carried out, and a toll were put on at Wentworth, you would not get your goods brought by railway either to Wilcannia or to Bourke, and thence by river to Menindie, at as low a rate as that? No; I do not think we should.
4681. If you would have to pay a higher rate from Sydney *via* Bourke or Wilcannia, and you could at the same time get a river, I suppose you would still stick to the river? Yes. If the river were locked and the land were settled upon, we should have more facilities for doing business, and, perhaps, be in a better position to pay more for carriage; but there is no doubt that we would always stick to the cheapest.
4682. Having been in Menindie for some years, do you agree with the other residents that communication with Broken Hill by railway would be a good thing for both Broken Hill and Menindie? Yes. I do think it would be a splendid thing for both places.
4683. The two places seem to be allied in various ways, and require communication between them? Yes.
4684. Looking at the question as you do, mostly from a local point of view, do you think that that is a great necessity for these places? Yes, I do. It is almost an absolute necessity to have that railway in conjunction with the locking of the river. Then I think the district would be very prosperous. We could then help ourselves a little, although, of course, the principal thing that we want is rain.
4685. During the last four or five years, when you have suffered so much from drought, have the town and the surrounding districts suffered in very many ways? Yes, they have.
4686. With a good season the district had good prospects, had it not? Yes.
4687. You had a very elaborate and costly meat-preserving establishment erected and in full swing? Yes.
4688. But the continuous drought has paralysed that, and caused it to shut up? Yes. In a good season it employs from 100 to 150 men. At the present time it is closed, owing to the want of sheep; but even if they had the sheep to boil down and the tallow rendered, they could not send it away sometimes, because there is frequently no river.
4689. Do you agree with the statement that, with a railway to Broken Hill, the growing of vegetables and other supplies in this district would be largely taken in hand, with the aid of irrigation, and the produce would be sent to Broken Hill? Yes, I do. I think it would be taken in hand by a great many people, mostly in a small way. It would give employment to a lot of families, and keep the money in the district.
4690. You think that, with the advantages of railway communication with Broken Hill, and with plenty of water for irrigation, owing to the locking of the river, a large population would be settled here, and the progress of the district would be greatly advanced? Yes. I think that not only the district, but also the Colony would be greatly benefited.

Robert Scobie, saddler, Menindie, sworn, and examined:—

R. Scobie.

6 Oct., 1899.

4691. *Mr. Dick.*] How long have you been here? I have resided twenty years on the Darling.
4692. Will you make a general statement as to what you think would be the effect of locking the river, as proposed, from Bourke to Menindie, its effect on the district, the course of trade, and in any other respects in which you think the carrying out of the project would have any material effect? I should like to begin by saying that I lived for six years in India, where I saw the benefits resulting from irrigation. I consider that the locking of the river Darling, from Bourke to Menindie, would cause settlement in the valley of the Darling on an exact system, whereas now it is simply a gambling with nature. All kinds of horse-fodder are grown on the river now, without irrigation. Eight thousand acres of wheaten crop were cultivated last season around Wentworth. Above that point I know personally two homestead lessees who have continuously cropped, one 800 acres, and the other 700 acres, year after year, consecutively, without any loss. No irrigation was used to grow these crops. Last year the man who cultivates the 700 acres realised, I believe, £700 out of the quantity of chaff that he disposed of, besides having several thousand bushels of wheat and a large quantity of chaff left for his own requirements. The question then is, if horse-feed can be largely grown on the holdings on the Darling River frontages, will the holders of the State lands from 50 to 200 miles back from the river be more cheaply supplied then, by means of horse-teams, with rations, horse-feed, and everything required for the development of those large pastoral holdings, which, on account of their distance from the water frontages, and the difficulty of making water on them, are really not accessible to the smaller pastoralist—the homestead lessee. For instance, at Langawirra station, the manager, about 1890, put in a crop which, when reaped, cost something like £2 per ton; freight from Wilcannia at that time being £12 per ton. The saving at once becomes obvious. It may be said that the traffic would go down the river if the river were locked. I do not concur at all in that opinion. Grog in bulk—spirits and wines—can be purchased as cheaply now in Wilcannia, rail and river borne from Sydney, as they can in Adelaide. I base that statement on invoices which local publicans have shown to me. In regard to cultivation on the Darling, there is one point which I have not heard alluded to to-day—root cultivation. The cultivation of turnips was first introduced into Great Britain 100 years ago. Since then, by means of root culture, although the grazing lands are considerably contracted in area, the grazing lands now carry three times the quantity of stock they ever carried before. In Lake Menindie we have, in round figures, 40,000 acres of land, and adjacent to that is an irrigation settlement, 12 miles from Menindie. When Mr. Copeland dedicated an irrigation reserve there, the idea was to irrigate it from Lake Menindie by

R. Scobie.  
6 Oct., 1899.

by pumping; and the calculation was that it would take 1 foot of the quantity of water contained in the area of the lake to water 61,000 acres of land, giving it three waterings per annum. At Mildura, on by no means such good land as we have locally, tons of lucerne have been grown to the acre. Similar results could be secured here; that is a certainty. Fifty miles in a direct line north-west we have the largest population, but one, established out of Sydney, namely, at Broken Hill. All their food supplies are drawn from a point 350 miles distant. In 1891 the residents of Menindie sent a deputation to interview the Sectional Committee then taking evidence in regard to the Cobar-Broken Hill railway scheme. We then asked for a connection with that line of railway, on the Glenlyon country. At that time, firewood could be got at "The Hill" for about 10s. per ton. The last time that evidence was taken in Menindie in regard to railway connection with the Barrier districts, namely, in 1896, the price of firewood was 20s. per ton. It is now as high as 30s. per ton, and it is very difficult to get. Prosecutions are of daily occurrence on "The Hill" of wood-carters who are now rooting up the country to obtain the boree roots, thereby destroying the natural formation of the soil, to the detriment of the homestead lessees who are renting the country—a proceeding, in my opinion, contrary to justice on the part of the State now leasing them the land. In regard to the lakes which exist along this river, I will deal first with those on the left, or what I may call the eastern, bank of the river. There is, first, Terryawinnia Lake, which, when full, is a large inland sea. This lake is filled from an inlet called Terryawinnia Creek. In a bend of this creek, the three pastoral holdings of Terryawinnia, Albemarle, and Tolarno, at a cost of £10,000, constructed a dam to throw the water into this lake, prior to its passing on to fill Lakes Victoria and Bullabulka and a host of minor lakes and small creeks. Bullabulka Lake presents the appearance, from its water-worn shores, of having at one time been filled from a considerably higher level. Now, the Talyawalka Creek takes out of the Darling, at a point considerably above Wilcannia. It then works its way round, and flows into the Darling, and then goes out again. Bullabulka has at one time been filled from a considerably higher level, and, looking at the levels on the plan, and the diagram of the locks, it is perfectly plain that, if Lake Bullabulka were made to fill from a higher mouth, an ordinary flood would send the water out to those lakes. Victoria Lake, distant from Menindie about 50 miles due east, is about 40 feet deep. Lake Bullabulka is generally spoken of as being about 27 feet deep. In addition to that there is a lake called Sayers' Lake, which takes the flood-water of the Darling due east for a distance of 70 and odd miles. I fancy that when the water was about 27 feet high in the river it would be entering Bullabulka Lake, and by that time it would have filled Terryawinnia and Victoria Lakes. I have heard it stated that, were the river locked, steps would be taken to fill those three lakes, by means of pumping appliances erected on the lower inlet of the Talyawalka Creek. There are innumerable smaller lakes, each capable of containing a large body of water, but I want to point out that Sayers' Lake was one time spoken of as to be connected by a canal, a distance of 177 miles, with the head of Willandra Creek, which comes west 100 miles, giving 300 miles of water frontage—the proposal being to send the flood-waters of the Darling down in that direction to feed the Lachlan, which, since the erection of the weir at Willandra Creek, has dwindled down to a stream of no importance. On the western side of the river Darling there are eight lakes between Wilcannia and the site where the last weir is proposed to be constructed. All those lakes are good holding lakes, and when full contain a considerable quantity of water. Questions have been asked relative to the flood-waters spreading over the banks of the river. The result of my observations is that the water first makes back up the creeks, then it rises in each creek, and at its inland end floods the surrounding country until the water makes back to the river again, where it joins the main stream. On the ground opposite to Menindie there is a house now standing which was never reached by the water in the flood of 1890, and a dam of about 3 feet or 4 feet high would have kept the water in the channel, and prevented inundation of a large tract of country which was inspected, by Mr. Bruncker's instructions, in 1889, with a view to the formation of small homesteads which I was then applying for. I applied for an area of 5,000 acres, which could be irrigated throughout its entire extent by gravitation if the river were at that height. Two years ago the bed of Pamamarroo Lake was granted as an improvement lease to the boiling-down company at Menindie, with the right of constructing dams, culverts, and everything else necessary for an irrigation settlement. My idea is that such a course of action in dealing with Lake Menindie would result in a complete success; and as the bed of the lake contains, in round numbers, 40,000 acres, it would give ample room for the initiation of irrigation on the Lower Darling. I consider that it would be desirable to raise the last weir to a sufficient height to convey the water along Menindie Creek into Lake Menindie. I am aware, from personal observation, that all kinds of fruits and vegetables can be profitably grown on the Darling. If the proposed locking of the Darling were accomplished, people would avail themselves of the readiest and most regular means of transit, which would doubtless be up the river. No business man would allow several thousand pounds' worth of wool or other produce to lie from eight to twelve months on the banks of the Darling when he could avail himself of the regular water-carriage to send it to a point where it could be immediately placed on a market. The most beneficial result which I would expect to accrue from the carrying out of the scheme that you have under consideration would be the settlement of thousands of people on the lands of the Darling valley, owing to the assured nature of the country when permanent means of communication were offered for the sale of their produce. If the locking of the Darling were to succeed in settling an industrial lot of agriculturists on the adjoining lands, horse-feed would be procurable at such reasonable rates that the cost of carriage to the pastoral holdings in the area that is known as the north-west corner would come down to the extent of from 40 to 60 per cent. By no means could it ever be brought down except by the locking of the Darling.

4693. You do not think, then, that with a permanently-locked river, fodder could be brought up from districts where the natural rainfall is sufficient to grow it cheaply, in competition against the locally-grown fodder? I do not think so.

4694. Presuming that, after the accomplishment of Federation, the river were locked below Menindie, and you had the whole course of the river from Bourke down to its entrance permanently navigable, do you think that then the locally-grown horse-fodder could be procured as cheaply as that from other more favoured districts? I think so, considering the cost of carriage from places at a distance.

4695. Can you offer an opinion as to how many seasons, out of (say) twenty, people in this district could get a crop? Well, the area is so large that what one man would lose another must make. The rainfall is very patchy. A few days ago 4 inches of rain fell at Sayers' Lake, and it is not many weeks since we had 35 points in Menindie, and a few points only at Lake Speculation.

4696. *Mr. Watson.*] Do you think that anyone would be justified in putting in a crop near here and trusting to the natural rainfall, with the view of making a living in that way? The homestead lessees are making a living out of sheep.

R. Scobie.  
6 Oct., 1899.

4697. But that is not cultivation? That is certainly not cultivation. A person living on agriculture alone would not be justified in starting to grow a wheat crop without irrigation.

4698. Do you think that, with a good water supply, there would be a considerable number of people who would be able to successfully irrigate? Yes. Our experience on the Darling is, that when the water is spread abroad we have a greater and more copious rainfall, and if we do not get a rainfall we get a heavy dew, because of the quantity of water that presents itself for absorption. For the last five years it is allowed that the quantity of water evaporated from the soil by means of the trees and other vegetation, has been very much greater than the quantity of rain that has fallen in that time. The conservation of the immense body of water that would be conserved by the construction of these locks and weirs would have a beneficial effect on the adjacent country, because of the inducing of dews.

4699. *Mr. Dick.*] You said that, with the locking and weiring of the river, the homestead lessees would be placed in a better position? Yes; by the increased facilities they would enjoy for procuring their supplies and sending away their produce—the less expensive manner in which they would be able to conduct their work, owing to regularity of supplies.

4700. Would you, then, differ from the evidence which has been offered to us, that 10,000 acres is not sufficient for a homestead lessee in this district, even with a locked river? A 10,000-acre block of prime country is good enough; but when a man gets back from the river, away from permanent water, and has to make water on the country, he requires a concession in area—not in rental. No hard-and-fast rule can be applied to the pastoral lands of the Darling valley. There is a necessity for classification and survey, to insure that each settler shall get sufficient to carry a good number of sheep, and give him a proper living.

4701. *Chairman.*] Do you think that, to make any scheme for putting weirs in the river Darling effective, the weirs should be of such a height that the water would be diverted into Talyawalka Creek, and also into Menindie Creek? I think so. In regard to the question of the payment of a toll, I consider that the residents would be well able to afford to pay this toll out of the amount of money they would save by reason of the advantages conferred on them by the construction of these locks and weirs—that is, taking one season with another, and averaging it all round.

MONDAY, 9 OCTOBER, 1899.

[The Committee met at the Court-house, Wilcannia, at 11 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Duncan Sinclair, master of the steamer "Lancashire Lass," sworn, and examined:—

4702. *Mr. Watson.*] Are you a certificated master? Yes.

4703. How many years' experience have you had in trading on the river? Twenty-five.

4704. Have you found any great difficulty in the navigation of the river during the last few years? During the last few years we have found great difficulty in navigating the river, owing to snags being so prevalent in the water.

4705. Government employees are engaged at present in removing those obstructions? Yes, they are.

4706. And a portion of the river is now free from them? Yes, very free; a great improvement.

4707. Do you anticipate that that work will have to be done periodically—that is, will other snags take the place of those removed? Yes, at long terms.

4708. It will not have to be done very often? By no means.

4709. Can you give us any idea of the period during which, in the last five years, the river has been open to navigation? Altogether it has been open about twelve months in that period.

4710. Can you tell the Committee what freights you get from different points on the river down towards the South Australian railways? When the rivers are low we generally get from £2 to £3 per ton from Wilcannia down.

4711. That is when navigation is difficult? Yes, and when we cannot carry much.

4712. When there is a high river what do you get? From 25s. to 30s.; 25s. is the lowest I have ever known the freight to be; 30s. is about the standing rate with high water.

4713. That is between Wilcannia and Goolwa? Yes.

4714. I presume that, in addition to that, railway freight would have to be paid on the cargo from Goolwa to Adelaide? Yes. The railway freight runs from about 9s. to 17s., according to the class of goods.

4715. Would wool be held to be of a high class? Most of the wool goes out at Goolwa, and I think it goes for about 3s. per ton to Victor Harbour, and vessels call in there for it. It is only about 12 miles on the railway. Sometimes we are called upon specially to deliver at Morgan instead, if ships pass there; but most of our wool goes down to Victor Harbour.

4716. What effect do you think the locking of the river from Bourke down to Menindie would have in regard to the direction the goods would take, supposing there to be a railway at Bourke, as at present, and another at Wilcannia, now proposed to be made? I think that with a low river below Menindie, traffic would be attracted to the terminal points of the railway, and goods would also be distributed up and down the river from the railway termini.

4717. Assuming that the river were navigable right through—that is, as far as the Murray,—do you think that then the railway would be able to compete against the steamers for freightage? No.

4718. You think that if the river were navigable right through, the steamers would get all the heavy goods there were to carry? Yes, undoubtedly.

4719.

D. Sinclair.  
9 Oct., 1899.

- D. Sinclair. 4719. At present the wool from places between Bourke and Dunlop goes to the Bourke railway, does it not? Yes.
- 9 Oct., 1899. 4720. Assuming that the Federal Government were to complete the chain of locks and weirs between Bourke and Wentworth, do you think that the wool now carried *via* Bourke to Sydney from as far down the Darling as Dunlop would continue to go in that direction? No, I do not.
4721. You think it would go down the river? Yes; there would be nothing to prevent it.
4722. Why—because carriage that way would be the cheapest? Yes.
4723. Then, in your opinion the complete locking of the river would divert a certain proportion of the trade now accruing to the Bourke railway? Yes.
4724. And the river would continue to hold the traffic it now has, as against the proposed railway to Wilcannia? Yes, undoubtedly.
4725. So far as your knowledge goes, do the steamers carry much fodder up the river in times of drought, in the shape of chaff and such things? Yes. I traded here for nearly four years, during which we carried nothing but fodder—every trip a full load.
4726. From what point did you bring that fodder? Echuca, on the Murray.
4727. What freight did you get for that between Echuca and Wilcannia? We did not carry it as freighting. We bought and sold it, and the profit on our sales was equal to a freight of from 30s. to £7. That was in times of drought.
4728. You can hardly take that as a criterion of what freight would be? We never let any of the fodder go for less than the equivalent to a 30s. freight.
4729. Do you know if any steamers were, during that period, carrying on owners' account? Yes.
4730. What freight did they get? Thirty shillings. We made the common freight the lowest standard of profit.
4731. The distance between Dubbo and Wilcannia is 342 miles, and assuming that the proposed railway from Cobar to Wilcannia were constructed, and that people desired to bring fodder from Dubbo, the cost to them by railway would be about 10s. 6d. per ton;—at the rates now prevailing on the railway lines, do you think the steamers could compete against that? No, they could not compete against 10s. 6d. per ton.
4732. What do you think would be the lowest at which it would pay the steamer proprietors to bring fodder from Echuca to Wilcannia with a good river? £1.
4733. Even allowing you to get it in big cargoes? Yes.
4734. Supposing you had a 6-foot river all through, what loading could you carry, including barge loading? With a 6-foot river we could bring about 200 tons on the "Lancashire Lass," and her barge.
4735. And with your present strength of crew and other expenses, you think it would require £1 per ton to make it pay? Yes.
4736. The steamers are not in the habit of carrying live stock as freighting? No.
4737. So the locking of the river would not afford any outlet for fat stock? None whatever.
4738. It has been suggested that, in the event of the proposed locks and weirs being placed in the river, a certain toll might be imposed, with a view of recouping the Government, at any rate, a portion of the annual expense;—do you think it is a fair proposition that some toll should be imposed? If a toll were imposed it would certainly be added to the freight of the boat. The consumer would have to pay that. If there were no toll the freight would be so much less.
4739. Do you think that the advantage to the consumer would be sufficient to make it worth his while to pay the extra price involved in the payment of the toll? Yes, I think so.
4740. The Engineer-in-Chief for Harbours and Rivers expressed the opinion that it would not be necessary, if fixed weirs were used, to employ lock-keepers, he thinking that the crews of the steamers themselves could be relied upon to open and shut the locks, thus saving a certain amount in the expense of the maintenance of the works generally;—do you think that would be practicable? Yes; I think very practicable.
4741. The Engineer-in-Chief for Harbours and Rivers, in giving evidence, also said that the captains trading on the river might be licensed—that is, so as to have some guarantee of good faith—and each be trusted with a key with which the locks might be opened;—do you think that that would be sufficient in the way of convenience, so far as the steamer trade is concerned? Yes; I think it would be quite sufficient.
4742. You think the crew could always open and shut the locks? Yes; we had a system of that kind on the Goulburn River—we had to open and close all the bridges.
4743. They were lift-bridges? Yes.
4744. And the steamboat people had to lift and close those bridges themselves? Yes—go through and tie up, and come back and close the bridge.
4745. Were there any serious complaints in regard to inattention to details on the part of the steamer people? No.
4746. Always worked satisfactorily? Yes.
4747. So in this case you have no reason to anticipate there would be any trouble? No.
4748. The detention involved in the locking of a steamer and her barge would be somewhere between twenty minutes and half-an-hour for each locking;—do you think that that would be a matter of serious moment? No.
4749. The delay would not be important? No—hardly feel it.
4750. As to the size of the locks, it is proposed to make them 200 feet long by 37 feet wide; we are informed that 37 feet in width will be sufficient to admit all the steamers on the river now with the exception of one; do you think that 37 feet will be wide enough? Yes.
4751. And the length of 200 feet, it is estimated, will be sufficient to allow of a steamer and barge being locked at the same time; do you think that is satisfactory? Yes; I think that will be long enough.
4752. What is the length of the longest barge on the river? The length of my boat and barge now is a shade over 200 feet.
4753. That is cutting it very fine? They would have to overlap each other, and they could overlap a good bit.
4754. Are there any steamers and barges trading on the river the combined length of which is greater than your own? Yes. The steamer "Decoy" and barge, at present lying at Wilcannia, are together of greater length than my steamer and barge; but I think that 200 feet in the length of the lock would be sufficient to accommodate any steamer and barge. There would be nothing to spare; but I suppose that any steamer and

and barge would get through. However, with a view of meeting all requirements, I think it would be safer to make each of the locks at least 210 feet in length.

4755. It was originally proposed to make each of the locks only sufficiently long to take in a steamer or a barge separately;—do you think that the latter idea is the better one—the proposal to lock both together? Yes. In taking through one at a time the delay would be too great.

4756. You think that the greater expedition and convenience in locking is a matter to be considered? Yes. It would save an immense amount of time taking the two through together.

4757. You know that in connection with this scheme of locking the river there is also to be considered the possibility of irrigating areas of land along the banks of the river with the water that would be conserved by the locking and weiring of the river;—I understand that you, yourself, have had some experience in irrigating? Yes, a little.

4758. Do you think that there is any room for small irrigation settlements along the river banks if water were conserved in the river? Undoubtedly there is.

4759. Was your experience of irrigation in connection with land in any way similar to the land on the banks of the Darling? I have had a good deal of experience with land very similar to it.

4760. What was the outcome? I found that things would grow well, and it was a profitable scheme.

4761. Was your land subject to flood? No. It was all high land, above flood-level. Land of the same character as the Darling land yielded the heaviest and richest crops in our district—that is, black (lignum) ground.

4762. We have been informed at some points along the river that lignum ground is of no value;—that has not been your experience? It is of value. I have proved it to be good land.

4763. And you think there is a fair opportunity for a number of people to make a living by means of irrigation, if water be conserved in the river? Yes. If a man cannot make a living off 100 acres on the Darling it is his own fault—that is, if you provide him with water.

4764. *Vice-Chairman.*] Can you state in which direction the wool from the various stations on each side of the river, from Wilcannia to Menindie, is sent—that is, by river out of the Colony, or by rail through the Colony? By river, out of the Colony—the whole of the wool.

4765. *Mr. Shepherd.*] Is it usual for steamers to travel down the river at night? No, it is not usual.

4766. No matter what the state of the river is? Yes.

4767. You say that for five years the river has been navigable for only a little over two months per annum on the average? Yes, about that.

4768. What was the average before that—say, for the previous five years? I think it was from six to nine months a year for a good term before that.

4769. So the last five years have been exceptionally bad? Yes.

4770. Do you think that the locking of the river from Bourke to Menindie would assist navigation between Menindie and Wentworth? No.

4771. Do you not think that a good deal of water would escape and assist the river lower down? That little drop of water will be going down all the time, only just sufficient to keep life in the river—nothing to raise it.

4772. You do not think it would affect it to any appreciable extent? Not to any extent at all.

John Banks, Customs Officer, Wilcannia, sworn, and examined:—

4773. *Vice-Chairman.*] You hand in a statement showing inwards and outwards tonnage of shipping to and from Wentworth, with the approximate amount of cargo during the years 1893 to 1899 inclusive? Yes, as follows:—

COMPARATIVE Statement showing the Outward and Inward Traffic on the River Darling, from and to Wentworth, for the years 1893 to 1899 inclusive:—

Year.	From Wentworth.			To Wentworth.		
	Total Number of Steamers and Barges.	Total Registered Tonnage.	Approximated Tons of Cargo.	Total number of Steamers and Barges.	Total Registered Tonnage.	Approximated Tons of Cargo.
1893 .....	223	19,281	8,531	233	20,169	9,108
1894 .....	266	23,423	9,162	269	23,833	11,637
1895 .....	197	14,658	5,053	182	12,832	3,949
1896 .....	232	19,842	8,292	248	21,841	9,655
1897 .....	166	14,128	7,757	158	13,244	6,159
1898 .....	138	9,834	3,488	133	9,713	2,286
1899 (to 30th September)	98	8,382	4,327	96	7,702	3,273
Totals.....	1,320	109,548	46,610	1,319	109,384	46,067

4774. You also hand in a yearly statement showing the amount of goods entered at Wilcannia in bond during the years 1895 to 1899 inclusive, together with the amount of duties paid at Wilcannia in each from 1889 to 1899? Yes; as follows:—

STATEMENT showing Value of Goods passed through, and Duty collected at, Customs House, Wilcannia:—

Year.	Value.	Duty.	Year.	Value.	Duty.
	£	£ s. d.		£	£ s. d.
1889	.....	13,244 3 3	1895	28,864	10,426 4 1
1890	.....	15,938 15 5	1896	64,750	11,791 6 9
1891	.....	21,061 3 4	1897	44,680	9,957 10 5
1892	.....	17,264 13 4	1898	32,580	8,812 4 0
1893	.....	16,559 9 11	9 months ended		
1894	.....	14,130 7 6	30 September, 1899	25,944	4,742 2 1

D. Sinclair.  
9 Oct., 1899.

J. Banks.  
9 Oct., 1899.

- J. Banks. I may mention that these returns do not give the total amount of inward river-borne traffic, because many classes of goods do not come under the jurisdiction of the Customs Department at Wilcannia.
- 9 Oct., 1899. 4775. Can you supply the Committee with a statement showing the number of vessels engaged in hawking on the river which have reported at Wilcannia? Yes; as follows:—1896, 25; 1897, 14; 1898, 6; 1899, to 30th September, 4.
4776. Can you state what the average tonnage of these hawking vessels is? No; the papers do not show that.
4777. These vessels are engaged in bringing supplies to residents along the river, and in removing their produce? Yes.
4778. You have also some statistics referring to the cargo vessels on the river, which have reported at Wilcannia? Yes; as follows:—For 1896, 67; 1897, 37; 1898, 20; 1899, to 30th September, 20.
4779. Those returns show, since 1896, a diminishing amount of shipping per annum;—to what do you attribute this falling off? To the fact that the river has not been navigable during the greater portion of each year.
4780. Your returns do not include vessels trading from Wentworth direct to Bourke? No; they do not. Nor do they include any vessels trading from Bourke to Wilcannia.

TUESDAY, 10 OCTOBER, 1899.

[The Committee met at the Court-house, Wilcannia, at 9.30 a.m.]

Present:—

WILLIAM THOMAS DICK, Esq. (VICE-CHAIRMAN).

The Hon. PATRICK LINDESAY CRAWFORD SHEPHERD. | JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

Edmond O'Donnell, Mayor of Wilcannia, sworn, and examined:—

- E. O'Donnell. 4781. *Vice-Chairman.*] How long have you resided here? Over twenty years; about thirty years in the district altogether.
- 10 Oct., 1899. 4782. Presuming that a series of locks and weirs were constructed from Bourke to Menindie, can you state in general terms what changes would be brought about in the amount and the direction of the traffic? No, I cannot.
4783. Do you think that any of the stations below Bourke, which now send their wool to the Bourke railway for transmission to Sydney, would, if the river were made permanently navigable as far as Menindie, send their wool to Adelaide or to Melbourne? No, I do not think they would. I do not think it would make much difference to present arrangements.
4784. You are prepared, are you not, to furnish the Committee with certain statistics? Yes.
4785. Will you kindly read the statistics which you have had prepared concerning the municipality of Wilcannia? Yes; they are as follows:—

MUNICIPALITY OF WILCANNIA.

*Estimated Returns.*

Population—1,183.	Wharfs (2)—£1,700.
Dwellings, shops, &c.—231.	Metalled roads, 1 mile 4 chains—£1,680.
Capital value of the freehold of improved property—£100,500.	Formed roads, 1 mile 47 chains—£508.
Capital value of the freehold of unimproved property—£10,960.	Cleared and drained, 3 miles—£300.
Fair average gross rate of interest on freehold value, which buildings and dwellings are yielding—10 per cent. on capital value.	Cleared only—£60.
Estimated value of water-works, including mains—£10,000.	Footpaths, asphalted, 15 chains—£495.
	Do formed, 2 miles 70 chains—£232.
	Kerbing and guttering, stone, 1 mile 12 chains—£1,720.
	Culverts (2), wood—£120.
	Kerbing and guttering, wood, 70 chains—£280.

*Estimate of Receipts and Expenditure.*

Receipts: Ordinary rates—£432 2s. 3d.; water rates and assessments—£1,230; night fees—£280; total—£1,942 2s. 3d.	Expenditure: Average water-works, including interest to Government—£980; night-work—£160; general—£400; total—£1,540.
--	---

4786. *Mr. Shepherd.*] Are you aware of the amount that the locks and weirs are estimated to cost? No.
4787. About £500,000; and for the maintenance and the labour alone is estimated to cost about £3,000 per year;—do you think that that expenditure for constructing these locks and weirs would be justified? Not at all, so far as Menindie. I do not think it would be of any good use at all to the general district. If the locks and weirs went only to Menindie, we should be only about as well off as we are now. If they started from Wentworth, and came up to here, it would be of benefit to us, but you are commencing at the wrong end. The present proposal is not worth the paper it is written on.
4788. But, if it started at Wentworth and came up to here, it would not be likely to be of benefit to New South Wales? I think it would benefit New South Wales. Any man getting his material to this place at a cheap rate, it is of benefit to him, and would benefit the Colony, no matter where it came from. It would help New South Wales more if it came from Sydney, no doubt; but, if any person can get what he requires brought to him cheaply, that benefits him, and thereby benefits the place and the district he lives in.
4789. But do you not think that, by facilitating the transmission of goods to Victoria and South Australia, a larger quantity would find its way to those colonies than is actually the case now? Yes, no doubt. But at the same time the money comes back, and we have the use of it. The mere fact of produce travelling through Victoria or South Australia *en route* to England is of no benefit to either of those colonies, with the exception of the railway freight on perhaps a few things, and the money paid there for reloading into other steamers. If I send 100 bales of wool to London it makes very little difference to Sydney or to Adelaide, whichever I may send through.
4790. It is generally thought that it makes a great deal of difference? But I do not think so.

4791.

4791. It is generally considered that in sending through Adelaide or Melbourne it is taking the trade away from New South Wales;—do you not regard it in that light? No, I do not. I do not think it is a great matter. E. O'Donnell.  
10 Oct., 1899.

4792. It is generally considered that taking trade to Victoria, or to South Australia, is, to a certain extent, robbing New South Wales of that trade? I have no doubt it is generally considered so; but if I send (say) 100 bales of wool from here to London *via* South Australia at a cost of £2 per ton, instead of sending it through Sydney at a cost of £5 per ton, I consider that this Colony, as well as myself, would benefit to the extent of £3 per ton.

4793. You mean the squatters would benefit to that extent? The squatters and this part of the Colony too—for to my knowledge nearly every penny which they get is spent here, and has been for the last twenty or thirty years.

4794. At all events, the Colony to which the goods are transmitted must to some extent benefit by it? There is no doubt of that.

4795. So the expenditure of this money in locking the river Darling would be at any rate to some extent in favour of South Australia and Victoria? There is not the slightest doubt it would to a certain extent; but I do not think it would to the same degree that some people think it would. This Colony would get the benefit of the money afterwards.

4796. What is your opinion generally about the locking of the river? I am very much afraid I am hardly able to give an opinion. I certainly do think that an extension of the railway from Sydney to this district would be far more beneficial in every way.

4797. But both these schemes are proposed? If I had my choice of the two, I would certainly take the railway.

4798. You think the railway is of much more consequence than the locking of the river? Yes. The locking of the river may come in course of years; but may take a long time. It would be very expensive; though I do not know exactly what the cost would be.

4799. *Mr. Watson.*] Admitting that the other colonies would benefit by this expenditure, to a certain extent, do you think it would be a proper thing to expect them to contribute something towards the cost of the works? I certainly think they ought to do so, but I doubt very much if they would. Some years ago we tried to start a steam navigation company in Wilcannia, and spent over £1,000 in surveying the Darling River from Bourke to Wentworth. Copies were taken of the plans of work done by the Government here. The original plans were burnt at the time the Garden Palace was burnt; but we have copies of them in the Commercial Bank yet. I think they cost between £400 and £500.

Alexander Munro, manager, Mount Murchison portion of Momba holding, sworn, and examined:—

4800. *Vice-Chairman.*] How many miles is Mount Murchison from Wilcannia? Eighteen miles by road, in a north-easterly direction. A. Munro.

4801. If a series of locks and weirs were constructed from Bourke to Menindie, as set forth in the plan, what do you think would be the effect upon the course of traffic along the river? Locking the river from Bourke to Menindie would, no doubt, send the trade to South Australia. 10 Oct., 1899.

4802. You think that even stations which now send their wool *via* Bourke to Sydney would, with such a system of locks and weirs, be induced to send their wool either to Melbourne or to Adelaide? Most certainly.

4803. Would the locking of the river from Bourke to Menindie remove the greater number of the objections which pastoralists now have to river navigation? Yes.

4804. Then you think that one of the effects of the locking of the river would be to reduce the earnings of the Bourke railway? Yes, certainly—that is, if the river were navigable from Menindie downwards.

4805. We have been assured by several witnesses, one of them being Mr. McKinney, of the Water Conservation Branch, that if the level of the river were permanently raised, as it would be under such a system of locks and weirs, pastoralists and others along the course of the river would be enabled to successfully prosecute irrigation, in the case of the pastoralists, for the purpose of growing fodder crops as an insurance against droughts;—do you think that such would be a result of the locking of the river from Bourke to Menindie? Possibly, by erecting locks and weirs sufficiently high to send the water over the back country.

4806. We have been assured by the Departmental experts in this matter that it is not practicable so to raise the level of the water by means of these locks and weirs as to send it over the back country? I do not think that irrigation under such circumstances is practicable except at very great expense.

4807. On what do you base that opinion? The land is not suitable.

4808. Which land? The land that would be irrigated by raising the water sufficiently high.

4809. You think, then, that the land on the immediate banks of the river is not suitable for irrigation? I do not think it is, except small areas by pumping.

4810. Do you think it is practicable for a pastoralist to irrigate (say) 300 acres by pumping, for the purpose of growing fodder crops? Yes; that is possible—small areas of 100, 200, or 300 acres.

4811. Do you think it would be more economical for a pastoralist to irrigate, from a locked river, 300 acres for the purpose of growing fodder, than to obtain his fodder by means of a railway to be constructed as far as Wilcannia without a locked river? It would be far cheaper to get it by rail than to grow it.

4812. In other words, you think that the river would not be able to compete against a railway in regard to the carriage of fodder and such produce inwards? I do not think it would be. Speaking from memory, I may say that I irrigated 37 acres close to Mount Murchison station, and I think the crop cost £2 15s. per ton to produce it.

4813. What kind of fodder was it? Wheaten hay; and the third season it cost nearly £4, the return being so small.

4814. To what do you attribute the falling off in that season? I think that the ground was not suitable. I selected a place where no levelling was required. It was simply a matter of making the drains, channels, and tanks; no levelling was done.

4815. Do you think that, if a railway from Cobar to Wilcannia were constructed, in preference to the locking of the river, much of the wool which now goes down the river to Adelaide or to Melbourne would be taken by that railway? If there were no locks and weirs, it must go to Sydney, I think.

- A. Munro.  
10 Oct., 1899.
4816. Even with a full river? Not with a full river, unless the wool were intended to catch some particular market; and then it would go by rail.
4817. The traffic, then, on a railway to Wilcannia would be of a somewhat fluctuating character? Yes; just according to the state of the river.
4818. A good deal of wool from Queensland comes into Wilcannia, does it not? Not much of it at present.
4819. If a railway were built to Wilcannia, in preference to the locking of the river, do you think that that would attract more of the Queensland wool to Wilcannia for carriage to Sydney? I do not think so. To get the Queensland wool even then you would require to have a line to Milparinka and Mount Browne. Wool that now finds its way to Broken Hill from Milparinka would find its way to Sydney, if there were a railway from Wilcannia to Milparinka.
4820. Is there not an advantage of 10 miles in favour of Wilcannia as compared with Broken Hill, from Milparinka? From Milparinka to Broken Hill the track is better watered.
4821. Then you do not think that wool which comes into this Colony at Milparinka would be attracted by the proposed railway from Cobar to Wilcannia if it were built? Possibly. A good deal would depend on the state of the roads between Milparinka and Broken Hill. If the track to Wilcannia were better the wool might be sent to Wilcannia in preference to Broken Hill. A good deal would depend on the seasons.
4822. *Mr. Shepherd.*] You said that you considered the land near the river not suitable for irrigation? There are suitable patches, but very small patches.
4823. Not of any extent? No.
4824. At a distance from the river there are suitable areas? Yes; but the expense would be too great to get water over that land, on account of the cost of levelling.
4825. You do not think that it would be possible to irrigate it by gravitation? I do not think so.
4826. But still the height to pump would be very slight indeed? If the locks were kept closed sufficiently long to send the water over the back country, too much country would be wasted—would be under water.
4827. So you think that irrigation on the Darling on a large scale is impracticable? Quite so.

Mark James Curry Tully, Inspector of Stock, Wilcannia, sworn, and examined:—

- M. J. C.  
Tully.  
10 Oct., 1899.
4828. *Mr. Shepherd.*] Have you prepared any returns? Only a few figures as to the surplus fat stock that have been sent away from the district during a number of years.
4829. Have you not a return showing the number of stock in the district? I can give you that from memory.
4830. During the last few years prior to the drought commencing, and also the number since the drought has set in? Four years ago the number of stock in the district was 1,500,000.
4831. Would you state the boundaries of the district you are giving these returns for? It extends to within 20 miles of Menindie down the river; 25 miles above Tilpa up the river; about 130 miles up to Paroo; 100 miles out along the Mount Browne road; about 100 miles direct west, and about 70 miles south.
4832. In that country four years ago there were 1,500,000 sheep? Yes.
4833. What is the number according to the last return? The number last December was 900,000.
4834. Has there been a gradual decrease or has the decrease taken leaps and jumps? It has been rather a gradual decrease year by year. In the first year the decrease was 300,000. In the next year it was 250,000, and the decrease has been more gradual in the last two years.
4835. So the largest loss was about three years ago? Yes.
4836. Have you ever considered the effect that the locking of the river would have in respect to the stockholders on the river? I have considered the matter of the locking of the river.
4837. Do you think that the locking of the river as proposed would be largely to their advantage? It would be to their advantage. It would be to everyone's advantage if the river were permanently navigable.
4838. That is the object of locking it, of course;—in what way would it be to their advantage? The only way that I should consider it would be of any advantage would be in the cheapening of the carriage of all heavy goods, including wool, of course.
4839. Have you given the subject of irrigation any consideration? Yes; I have considered it.
4840. What is your opinion as to the practicability of irrigating large blocks of land on the river, after the locking of the river? I do not think it would ever become a paying industry.
4841. Of course, the irrigation would always have to be carried out by a system of pumping? Yes.
4842. And you think it would be too expensive? Yes; it would be too expensive. The difference between a river of 6 feet or 8 feet, such as we now have in places, and 10 feet more of water, would be so little in the matter of pumping that it would not justify the expenditure of a large amount of money.
4843. But, if the river were locked, a larger quantity of water would be available; of course, not for irrigation purposes alone? Yes.
4844. Without the locking of the river, I presume that pumping for irrigation purposes would be almost impossible in some seasons? To a large extent it would be impossible.
4845. How long have you been resident in the district? Thirty-three years.
4846. How many times can you remember when the river has ceased running during that period? I cannot say positively how many; but it has ceased running entirely at least three or four times. When I first saw it, it was dry for miles.
4847. But, as a rule, there is some water running in it? Yes.
4848. Sufficient for irrigation purposes on a limited scale? Yes.
4849. Have you visited many of the small irrigation areas on the river—in some instances upwards of 20 acres? Yes; I have visited them.
4850. Have you generally found that the persons who are carrying on these irrigation schemes are satisfied with the result? No; I can mention some irrigation blocks which for two, three, four, or five years were irrigated constantly, and then thrown up in disgust, and nothing more done. They could not produce anything near the rate at which it could be purchased in ordinary seasons.
4851. Have you noticed the description of soil where these failures have occurred? Yes.
4852. What is the character of the soil? Principally black soil on the river flat.
4853. And the most successful irrigation is on the red sandy loam? Yes; but then, of course, the height to pump is greater. One point I may mention I have particularly thought out is that, in the event of the

the river being locked, presumably it would be navigable all the year round, and the river-carriage for produce would be then charged for at so low a rate that produce grown by irrigation could not possibly compete against produce grown under natural conditions, because produce can be grown under natural conditions at one-third of the cost at which it can be grown by irrigation, and, with the low rate of freight, produce grown under natural conditions could be delivered here much more cheaply than could produce grown by irrigation, even under the most favourable circumstances.

4854. So you think it would be cheaper to buy produce in the cheapest markets and bring it to here by water? I do.

4855. What effect do you think the locking of the river would have on the diversion of the traffic as at present;—do you think the river would be adopted generally in the event of its being locked and being permanently navigable? I think it would.

4856. In preference to the railway? I am not comparing it with a railway from Wilcannia to Cobar.

4857. Well, with the existing railway at Bourke? Yes, it would—for one reason, because from Menindie downwards the river is open for steamer traffic for several weeks after it closes at Wilcannia, and if the river were locked to Menindie freightage would go to Adelaide or to Victoria for two or, perhaps, three months longer.

4858. You think that the locking of the river would have the effect of increasing the trade with Melbourne and Adelaide? It would undoubtedly, because, if the river were locked from Bourke even only to Menindie, there would be only a short track of country from Menindie to Broken Hill—only 65 or 70 miles.

Edward Quin, owner of Tarella station, sworn, and examined:—

4859. *Mr. Watson.*] How far is Tarella from Wilcannia? Forty-six miles north-west from Wilcannia.

4860. At one time you were a Member of the Legislative Assembly? Yes; in three Parliaments.

4861. *Mr. Shepherd.*] You are aware of the proposal to lock the river? Yes.

4862. Have you given it any consideration? Yes, I have.

4863. What is your opinion as to the general effect it would have on the squattages on the river? Of course it would be better to have continuous navigation as against non-navigation; but I do not think it would be worth the cost to the country.

4864. Do you think that it would have the effect of drawing traffic from the Bourke railway, for instance? No, I do not; because the freight on the Bourke railway, and the freight down the river by boat, would preclude people from using the river, except very near to the railway.

4865. The river is largely used now for conveying wool to Victoria and South Australia? Solely used. No one thinks of using any other way—that is the only highway.

4866. And for bringing stores back from those places? Yes.

4867. Is the river used at all for the purpose of sending wool to Sydney, or bringing goods from Sydney? To a very limited extent. There is a heavy railway freight from Sydney to Bourke, and then the boats charge £3 10s. per ton from Bourke to Wilcannia. That would necessarily preclude the boats from competing against the Cobar to Wilcannia railway. The river-traffic is so uncertain that only one or two boats lay themselves out for it, and they charge a high rate, and, therefore, not much is brought from Sydney that way.

4868. It is very rarely that the river is navigable the whole year round? Very rarely.

4869. Almost unheard of? Yes.

4870. Is the river generally navigable about the season that wool is ready to be sent away? Very often it is.

4871. And, I suppose, that for a considerable distance up the river the wool always finds its way down stream? Yes.

4872. But I suppose that, within a reasonable distance of the Bourke railway, all the people avail themselves of that line? Yes; I think that if there were a railway from Cobar to Wilcannia it would be availed of more than some people now think. For instance, take the case of the Tibooburra wool. If there is the slightest uncertainty as regards the river, the Tibooburra people say, "We will send our wool to Broken Hill; the river is not safe." If there is a certainty of a river here they send their wool to Wilcannia, because Tibooburra is nearer to Wilcannia than to Broken Hill; but, with uncertainty of the river, they prefer to pay for the extra carriage from Tibooburra to Broken Hill, because there is certainty of transit there.

4873. Is any considerable quantity of wool sent *via* Broken Hill? I cannot give you any figures. I sent 220 bales that way myself this year.

4874. That was before the river was a certainty? Yes; although I am within 46 miles of the river, I sent the wool to Broken Hill.

4875. I suppose the quantity of goods brought from Broken Hill to places in this district is not very considerable? Very much larger quantities were at one time taken to White Cliffs from Wilcannia, which is a natural market for White Cliffs; but, in consequence of their being no goods here owing to the river not being navigable, the White Cliffs people had to send to Broken Hill for goods. If the proposed railway from Cobar to Wilcannia had then been in existence, all the goods then required for White Cliffs would have come from Sydney.

4876. If the river were navigable the goods required for White Cliffs would not come *via* Broken Hill at all? No.

4877. Of course, the principal object in locking the river is navigation; but it was also thought that the Committee should inquire into the advantages that might be derived from irrigation;—have you considered the question of irrigation? Yes, I have.

4878. Do you think it is feasible that any large areas could be irrigated if the river were locked? I do not think so, judging from my experience and from seeing what has been done on the river by some of my friends. They have irrigated a few acres at great cost, simply to produce fodder for their own horses; and if they had been able to purchase fodder at £6, £7, or even £8 per ton, I think it would have been cheaper. Irrigation is very costly. The wages of engine-drivers, the cost of firewood, and other expenses of lifting the water from the river, make the irrigation of small patches very costly.

4879. The Committee have found by investigation that, as a rule, the land near the river is not so suitable for irrigation as is the land farther away from the river? No, it is not. The land near the river has some properties in it which are not conducive to the growth of certain crops.

4880.

M. J. C.  
Tully.

10 Oct., 1899.

E. Quin.

10 Oct., 1899.

- E. Quin.  
10 Oct., 1899.
4880. There are two descriptions of land, which are generally called the black and the red? Yes; and the red seems to be the better; but the red is nearly always elevated. I never saw it sufficiently depressed that you could gravitate water on it.
4881. Sometimes it is designated sandhills? Yes—just sandhills.
4882. Do you not think it would be possible to convey the water for some distance from the river for the purpose of utilising this red soil? I think it would be possible, but it would be costly.
4883. You do not think it would pay? No, I do not. If people could get cheap fodder, either on the stations or at Wilcannia, I think you would hear nothing more of irrigation, locally, at any rate.
4884. It might not pay to irrigate on a very large scale to feed the whole of the stock on the station, but do you not think that it would be quite possible to irrigate a sufficient area to keep the stock alive through a bad season? No. You might keep your few "studs" alive, which are generally very valuable; but I do not think it would pay to do anything else, and even in the case of the "studs" I think there would be a difficulty.
4885. You are aware, I suppose, that in some cases squatters have paid over £5,000 each for forage for their stock, in the last twelve months? Yes; I am aware of that; but, if they had known in the first instance that they would have had to pay the £5,000, I think they would have let the stock go. I have known people to cut scrub for twelve months, and then the stock died, and if they had known that the stock would have died, they would not have cut the scrub.
4886. Do you think that if fodder could be carried at 10s. per ton from Dubbo, for instance, that would obviate the necessity for irrigation here? I think so, for any "out-back" station. Of course you hardly know what a man 100 miles up the river would do, for it would depend on what he could get his goods for from here to his place, but I think that very few people who could get their goods from Wilcannia at a moderate cost would indulge in irrigation. It is a costly experiment.
4887. I believe you said you have been on the Darling country for about thirty years? Yes.
4888. What kind of country was it thirty years ago? Apparently very much better than it is now. I think the country has deteriorated very much.
4889. What grasses were there chiefly then? Mulga grass, star grass, umbrella grass, and within a short distance of, perhaps, not more than 100 miles from the river, Mitchell grass. There was a sort of trefoil growing in some places. There were also wild geranium and crow-foot, and many other grasses including Nardoo. There were many edible scrubs, including cotton and salt-bush, which in many places have now quite disappeared.
4890. How many of those have disappeared altogether? In a good season nearly all those grasses re-appear in limited quantities with the exception of the cotton and the salt-bush. Where this is absolutely dead, it never seems to revive. It has been a growth of a long time, and the constant nibbling of it, whether by rabbits or by sheep, prevents its recovery. The erosion of the soil is a considerable factor in affecting the grazing capacity of the country. For instance, a great deal of this country has a subsoil 4 or 5 inches below the surface, and the constant stocking causes the top 4 or 5 inches to become loose, and in high winds it shifts about, and after severe rain such as occasionally falls in this district this soil is carried into the creeks and water-holes and tanks, and silts some of them completely up, leaving the hard subsoil exposed, which grows nothing. In some of the stony country the removal of the surface-soil leaves exposed a conglomerate which is within about 4 inches of the top soil, and which never grows anything. In that way the country is deteriorated.
4891. Have you noticed any new grasses make their appearance? No; but I have noticed new herbs, which nothing eats. For instance, there is the herbage which we call the Caustic bush. It produces a white milk, and the stock will not touch it; and there are many other bushes which are of no value.
4892. So there is no grass or herbage here of any value beyond that which was here originally? No.
4893. What was the country capable of carrying thirty years ago, as compared with its capacity at the present time? I should say, all over the district, fully one-third more than the extent to which it can be utilised now, even in a good season.
4894. To what do you attribute this great falling off in the carrying capacity of the country? The stocking chiefly, and then the rabbits. The rabbits have been the climax. You cannot "rest" country as you could once. Formerly you could "spell" one or two paddocks, but you cannot do that now. If you "rest" country now it means breeding rabbits; so the thing is to stock lightly and poison the rabbits, if you can. If you do not fight the rabbits you will be the loser. It pays every man to fight his own rabbits.
4895. But would not the "resting" of the land have the effect of concentrating the rabbits and making them easier victims? It would, unless perhaps, 20 points of rain happened to fall, for those 20 points of rain would produce such a green nibble for the rabbits that you would not be able to poison them. I have gone through a whole summer and perhaps not had 2 inches of rain, and in no case more than 30 points at one time, and yet we could not poison the rabbits. As soon as they got a nibble anywhere else, it distributed the rabbits. Nor could you get sheep feed anywhere. It is quite a common saying, "We have plenty of rabbit feed, but the sheep cannot get a bite at it." I think that the presence of rabbits in this country must be recognised as part of the stocking.
4896. Have you not thought out any scheme by which the country could be redeemed from the terrible curse which seems to be upon it now by reason of the rabbits and the drought? Just as I have suggested. I think that if conditions were improved, as I have already suggested, then everything that could be taken out of the country would be taken out of it. There is too much money involved in this country for people to throw it up if they can get along on it at all, if they can possibly hold it, but most of the properties are being held now at large annual losses in the hope that something is going to be done. For instance, all that I have I have in this country, and if I were to throw up the country I should also throw up everything I have.\*
4897. You think that fixity of tenure for a long period would enable squatters to spend money in improving their land and would alleviate a good deal of the distress? Yes; and it would increase capitalists' confidence.

\* NOTE (on revision):—I referred before this to the homestead lessee being able to take up an improvement, use it for two years, and then abandon it. Unless it is done *bona fide* lessees will cease to make improvements or maintain those made; some protection must be given to present holders.

- Thomas Henry Bell, editor and proprietor, *Western Grazier*, Wilcannia, sworn, and examined:— T. H. Bell.  
 4898. *Mr. Shepherd.*] What are you by occupation? I am editor and proprietor of the *Western Grazier*, 10 Oct., 1899.  
 Wilcannia. I am also a licensed and a mining surveyor.  
 4899. How long have you been here? Fourteen years.  
 4900. *Vice-Chairman.*] Would you kindly express to the Committee your opinion as to the advisableness of constructing locks and weirs between Bourke and Menindie? I think that, if the work be carried out at all, it should be carried out only as far as Wilcannia. If carried out to Menindie it will simply help to feed the South Australian and Victorian railway systems by inducing the traffic to go that way. If the river were locked down to Menindie there would be a demand for a railway from Broken Hill to Menindie, and that, if constructed, would form a direct connection with South Australia.  
 4901. If the river were navigable to Menindie, as it would be under such a system of locks and weirs, and not navigable below Menindie, you think that the wool would be sent from Menindie to Broken Hill for transmission to Adelaide? Yes.  
 4902. Would that hold if there were a railway to Wilcannia from Cobar? Oh, no.  
 4903. Do you think that, if there were a railway from Wilcannia to Cobar, the construction of these locks and weirs would make the river a feeder to the Cobar-Wilcannia railway? I think so.  
 4904. But, if the locking were completed as it might be by the Federal Government along the whole course of the river, what would then be the effect of the locks and weirs on the proposed line from Cobar to Wilcannia? I think that, even in that case, the locks and weirs would not affect the Cobar-Wilcannia railway injuriously.  
 4905. Do you think that, with these locks and weirs, irrigation on any comprehensive scale would be profitable along the course of the river Darling in competition against more favoured districts, watered naturally? No, I do not.  
 4906. So you do not think there is much in the idea of irrigation as a secondary result of locking the river to Menindie? I do not. I go further. First of all, there is the cost of lifting the water, which would be considerable. Secondly, if any permanent settlement were to take place along the river, and if irrigation farms or colonies were formed, any very high flood would destroy everything. But, if irrigation would pay, it might be carried on at a distance back from the river some 4 or 5 miles.  
 4907. *Mr. Watson.*] You said just now, in reply to Mr. Dick, that, presuming the proposed railway from Cobar to Wilcannia to be built, and the river to be locked from end to end, that railway would be injuriously affected as regards its traffic? Yes.  
 4908. Do you think, then, that the locking of the river would result in any material reduction of freights on the river as compared with the freights on it at the present time? I do not think so.  
 4909. Is it not probable that whichever authority may construct locks and weirs on the river would charge a small amount by way of toll? Yes.  
 4910. And that would be added to the freight? Yes; and insurance must be added as well, in view of the extra charges likely to be levied on a locked river as tolls, I still think that the Cobar-Wilcannia railway would command the bulk of the traffic.

TUESDAY, 24 OCTOBER, 1899.

Present:—

THE HON. WILLIAM JOSEPH TRICKETT (CHAIRMAN).  
 The Hon. ANDREW GARRAN, LL.D. | WILLIAM THOMAS DICK, Esq.  
 JOHN CHRISTIAN WATSON, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

- William John Allen, Fruit Expert, Department of Mines and Agriculture, sworn, and examined:—  
 4911. *Dr. Garran.*] Have you been at the irrigation settlement at Wentworth? Yes, in May last. W. J. Allen.  
 4912. Have you been at the Hay irrigation works? Yes. 24 Oct., 1899.  
 4913. Have you been at the Pera bore? Yes.  
 4914. Have you been down the Darling? I have never been down the Darling.  
 4915. One of the subjects which this Committee is inquiring into is the expediency of locking the Darling, first, with regard to navigation; second, with regard to irrigation. I will not ask you any questions with regard to the navigation of the Darling. With regard to irrigation the point to be considered is, is there likely to be so much use for the water for profitable irrigation as to justify the expense of locking the Darling;—have you formed any opinion as to that? I could not very well form an opinion on account of not having seen the soil. Unless I knew the quality of the soil on the river, I could not give any idea as to whether or not it is suitable for irrigation. Different kinds of soil are required for growing fruit and for growing cereals.  
 4916. We are told that soil on the lower ground is clay, and that that on the higher ground is lighter? I will say that on the heavy, flat, boggy soil it would be useless to go to any very great expense to put water on the land; but on the lighter soils it would answer very well. You could cover most of the land with water, judging by the land that I have seen on the Murray and on the Darling.  
 4917. You think that only the higher portions would respond to irrigation? I think that most of it would respond to irrigation, except the very heavy soils; but I think that the cost of putting the water on the heavy soils would be too much as compared with the return that you would get.  
 4918. Would the cost be greater on the lower land than on the higher land? The cost on the lower land would not be greater; but the heavy soils are not the best for growing anything. That land is no good for fruit growing. If it is very heavy, it is of little value for cereal growing. If it is heavy loam you might grow wheat very well; but it would be useless for lucerne, whereas the higher soils would be very good for fruit-growing, and most of the land, perhaps all, good for cereal-growing.  
 4919. Could not the roots of the lucerne penetrate the heavy soil? It would in some places, but it would never give a good crop. You could not get heavy crops, and the cost of putting the water on the land and levelling it would be more than the return would justify. 4920.

- W. J. Allen. 4920. Lucerne likes a fairly open soil through which its roots could penetrate? You want a fairly loamy soil. If the subsoil is too heavy, the lucerne will not do well. It will live, but you will not get heavy crops.  
24 Oct., 1899.
4921. Lucerne likes to go down to the water? It likes to reach down, if necessary, to water.
4922. It draws nourishment from the soil to a great depth? Yes.
4923. If you know Pera bore you probably know that there is a site for cultivation which has been pointed out as a suitable place, near the irrigation farm? It has not been pointed out to me.
4924. Is the soil about there similar to that which you cross in going over the bridge? I think that the soil would do fairly well there for cultivation. If you put such soil as that under water you could make fruit and cereal growing pay.
4925. Is that at all like the soil at Wentworth and Hay? No; most of that at Hay is much heavier.
4926. Would it be better soil? The Bourke soil would be better than most of the soil at Hay and Wentworth.
4927. What is the colour of the soil at Hay? There are several different soils there. There are from 100 to 200 acres of fairly loamy soil with a heavy subsoil, but which I consider very fair for fruit-growing. A large quantity of it, however, is very heavy, and will make good dams and hold water, but will not be very profitable for cultivation.
4928. Then the whole of that area at Hay is not first-class irrigation land? It is not.
4929. Do you think, then, that more expense has been incurred there than the good area of land justifies? As far as I can see—and I have visited most of the irrigation settlements—I do not think they have put the water on the best soil.
4930. What is the soil at Wentworth like? It is not any better than the Hay soil.
4931. I suppose some portions are not fit for irrigation? Some of it is suitable for growing cereals, but not for fruit.
4932. Then the prospects of those two settlements are not very brilliant? No.
4933. When you say that we have not applied water to the best soils, do you mean on those settlements or on the rivers generally? I mean on the rivers generally. At Wentworth we have, I believe, in the area in which the irrigation area is situated some good soil within a few miles, but it is on a higher level.
4934. I understand that you have been at Mildura? Yes.
4935. And you know the quality of the soil there? Yes.
4936. Is it different soil from that at Wentworth or Hay? There is soil at Mildura similar to that at Hay, and some better—it varies.
4937. Is it a better site? I do not consider that Mildura is a good site.
4938. You think you could choose a better site with your present knowledge? I do.
4939. Do you know any better site in this Colony than that at Mildura? I have not been over the site at Tooleybuck, but there is a large tract of good red soil there, coming right up to the Murray River. I should say that there are 7,000 acres of good red soil.
4940. How far below Swan Hill? About 22 miles.
4941. How far above Wentworth? About 140 miles.
4942. So far as you have seen of Mildura and the two Government irrigation settlements here, do you think there is adequate justification for the Government spending any considerable sum of money in starting fresh irrigation schemes? I certainly do.
4943. And you think that the best place is on the site you refer to? That is one good site. I have not been all down the river from Albury, but I have no doubt that there are many good sites. There is one between Wentworth and Mildura.
4944. We have been told that the great difficulty at Wentworth and Hay was to get persons who have enough knowledge of irrigation to do justice to the land? That is certainly a drawback. You might say that there is no person to instruct them on those areas, but it is a thing that can be easily picked up if they would take a little more care in reading up.
4945. Then we have to train a population to do justice to irrigation? We have, to a certain extent.
4946. Then, if the Government starts an establishment, it would be almost essential that there should be some one in charge to teach the people what to do? I think there should be somebody in such a settlement to advise the people. There should be some place where people could go for advice. But they do not always take advice when it is given to them. You have to wait till they come for it.
4947. At the place you selected there would be no local market for the fruit? No local market whatever.
4948. We should have to look to exportation? There is a market in New South Wales for fruit. We have not supplied our requirements in the way of dried fruits yet.
4949. There is no market within a few miles of that place? No.
- 4949½. Is there any advantage in going so far west to make irrigation farms? The two main things are to get good land and a good supply of water. We found last year that the Lachlan and the Murrumbidgee Rivers were comparatively dry. We could not have pumped any large quantity of water out of them, but the Murray has always had a fairly good supply of water.
4950. It would be dangerous to start an irrigation farm on the Murrumbidgee in a dry year? Some years you would have a good supply of water, but last year you would not have had much.
4951. If you begin to irrigate an orchard you must keep on irrigating it? You would have to continue.
4952. Then the large estates on the Murrumbidgee could not profitably be turned into irrigation farms? For many years you would get sufficient water for growing cereals, but not for growing fruit. There are thousands of acres of land that are good for growing cereals, but of no value for fruit-growing.
4953. Does fruit take more water than cereals? Yes. You must have the water. If you miss a season with cereals it does not matter very much; but if you miss a season with an orchard, you lose your orchard.
4954. If the trees are accustomed to water, they will die if they do not get it? Yes.
4955. Could they not hold their own without bearing for a year? I am very doubtful. If you had a very dry year, and no water, it would damage the trees and put them back.
4956. Is there any great difference in the climate on the eastern side of the main range, and on the western side, as far as the production of fruit is concerned? On the coast side of the range the climate is suitable for growing fruit; but not fruit for drying. There may be places in the coastal districts where you could grow fairly good fruit for drying; but as far as my experience goes the drier the climate is the better is the fruit for drying.

4957. Then, for eating or green fruit, the eastern slopes are very suitable? Yes.
4958. But if you want to grow fruit for drying you must go out west? Yes, and you could grow oranges and lemons, which we can export quite easily. We had no trouble in sending oranges from Mildura to England.
4959. It is so superior that it will bear keeping? Fruit grown in a dry climate will keep much better than fruit grown in a moist climate.
4960. Is that because there is less moisture in the peel? I could not explain what the difference is; but in a dry climate, if you irrigate your oranges and lemons until two months before they are ready to be picked, and then cease to irrigate them, you will have good fruit, which will keep. If you irrigate your trees up to the time for picking the fruit, you will get fruit that will not keep so well.
4961. Has it not been found to be one of the difficulties in shipping oranges in cold chambers that there has been an exhalation of moisture from the peel? Yes.
4962. And that would take place more in the case of oranges grown in the Parramatta district than in the case of oranges grown at Mildura? Yes.
4963. Could you get rid of that difficulty by artificially drying the oranges before sending them? It might be got rid of to a certain extent. I think our oranges could be exported from here if we could get proper chambers to send them in; but not so well as back-country fruit.
4964. Is the peel of the back country fruit softer than that of the fruit grown in the coast district? The peel is tougher and drier.
4965. That is probably owing to the dryness of the air? Yes.
4966. And it does not dry up the fruit inside? No; we get the best quality of fruit from the interior.
4967. The dry air only affects the peel? Yes. You get as good oranges in the interior as can be grown anywhere.
4968. How far should we have to go from the main range—say from Yass—before we got into a climate dry enough to meet your views? I should say anywhere from Narrandera to the westward.
4969. You think Narrandera would be dry enough? We could do well on the red soil near Narrandera, or in any back country.
4970. But you would have the difficulty of occasionally wanting water at Narrandera? Yes.
4971. If we could have a large reservoir, such as Mr. McKinney speaks of, and could keep the Murrumbidgee sufficiently in flood, or if we could bring water down by aqueducts from a great reservoir, we could get over that difficulty? If you could get over that difficulty you could get suitable land without going so far back.
4972. If you could get water at Narrandera for three years, it would be safe to start an irrigation farm there? I have never seen any very large tract of the best land there. In starting an irrigation settlement for fruit-growing, I take it that we should have to get a good-sized tract of land which could be watered economically, so that the 10 or 20 acre holdings could be planted side by side, and the people could work together.
4973. It would be better to have one good large settlement than twenty scattered small ones? Yes.
4974. Then the people could help each other? Yes; they could co-operate in regard to the handling of their produce, and securing a market.
4975. You know of no good site nearer to Sydney than that place on the Murray, that would be suitable? No; I could not mention a particular site.
4976. You want three things there—a dry climate, plenty of water, and good soil? Yes. If you have to pump you want to be in a position to get fuel at a reasonable price, unless you use gasolene.
4977. Have you anything to do with advising the settlers in regard to the Hay and Wentworth irrigation schemes? I have made two trips to Hay, and one to Wentworth irrigation works. I called on most of the settlers at Hay, and gave them advice, telling them what was best to plant on their different holdings, and since that time I have been back there showing them how to do their pruning.
4978. Do they shape well? It is only about six months since I made my first trip. Some of them are doing very well.
4979. You do not think they are hopeless settlers? No; Hay could not get along well without that settlement.
4980. It may ultimately turn out to be remunerative? I do not doubt that. In the back country, where food is so scarce, they should make it pay, if only by growing cereals.
4981. Do you think it would pay to grow fodder in the back country to keep sheep in dry seasons? I could not say. If sheep keep up their present price, I think it would.
4982. We have had evidence to the effect that on the Darling it would not pay to grow fodder to keep the sheep alive throughout a dry year? I think that if you got a large tract of land to irrigate, without too much expense in levelling, and if water could be put on by gravitation at a reasonable cost, they could make it pay in years of this kind, but not in years such as we have just passed through, with wool at a low price.
4983. Last year you would have had to keep the sheep all the year round;—would not the cost amount to more than the value of the sheep? I think it would not, if water could be supplied at a reasonable cost.
4984. Assuming that we have to lift the Darling water 30 feet, you do not think it would be commercially possible to grow fodder to save the starving sheep? Not unless you have exceptionally good land.
4985. Of course, there is no comparison, as regards economy, between getting water by gravitation and having to pump it? Pumping is more expensive, but for fruit-growing it does not make any difference. A difference of 5s. or 10s. an acre on good soil does not matter to a man growing fruit. Take the case of Mildura: On the best soils they are making from £20 to £60 an acre. Twenty pounds is a very ordinary average for lemons, oranges, sultanas, and raisins. That is on the best soils. On the other soils it hardly pays them to grow fruit.
4986. And that would imply that, assuming the pumping is done on the Darling, orchard cultivation is more likely to be profitable than cereal cultivation? Yes.
4987. And market gardening could be carried on? No; market gardening would require water so often, and where you have to supply water to settlers once a week or once a fortnight, it is very expensive.
4988. How often should you want your orchard to be watered? Perhaps, in the hottest part of the season, once in six weeks.

W. J. Allen.  
24 Oct., 1899.

- W. J. Allen. 4989. Consider the cost of keeping an expensive pumping plant and only using it once in six weeks? If you have a good-sized settlement the pump is going continually.
- 24 Oct., 1899. 4990. But on some settlements it would not be so? Small settlements cannot be run so economically as large ones.
4991. Some of those gardens are irrigated more for amusement than as a commercial speculation. Yes.
4992. Just to grow a supply of fruit and vegetables? Yes.
4993. You could not make a living at it? Yes. If I had from 20 to 100 acres, on a river, I could make it pay well, growing fruit on good land.
4994. But not growing vegetables? I think it would be too far away for vegetable growing; it would be hard to get the vegetables to market.
4995. You spoke of the Darling exclusively when you said you could make a living? No; I mean anywhere where you could get sufficient water.
4996. Looking at the eastern side of the range, where the most fruit is grown at present, would there be any improvement in introducing irrigation into the existing orchards? I do not see where it could be done on a large scale.
4997. The only way would be to get a very large block of good soil, supplied with water continuously from an unfailing source? Yes; and in putting water on land you want the land not too rolling, but a fairly even tract of country.
4998. You want it graded? You have to grade it so that it can be irrigated properly. To put water on a tract of land economically you want it as level as possible.
4999. What is the best slope for irrigation? There should not be too much of a slope. We can make it answer where there is a slope of 5 feet in 100 feet, but I would not recommend anyone to go on that kind of land. I would choose a piece of land with a fall of 1 foot in 500. A fall of 2 feet would not be out of the way.
5000. You want it just so that the water will run? Yes; in irrigating an orchard, a fall of 8 inches or a foot in a mile would do for the main channel.
5001. When the natural surface is steeper than that, it is less suitable for irrigation? You can irrigate a fairly steep hill, but it is a little more difficult to handle the water.
5002. What I want to get at is: are the existing orchardists to the east of the main range likely to be superseded by orchardists to the west? I think that as far as fruit for export goes, they will be, but the orchardists on the eastern side will always have the local market.
5003. At certain seasons of the year they might have the Melbourne market? Yes; if a good-sized scheme were started on the Darling or the Murray, they would be closer to Melbourne than to Sydney, and could get to Melbourne as cheaply as they could to Sydney.
5004. From a place on the Murray they could send fruit to Melbourne as cheaply as they could send it to Sydney? Yes; it would cost 9d. or 10d. a case for fruit.
5005. No doubt under Federation there would be just as good a market at Melbourne as elsewhere? Yes; as far as dried and canned fruits are concerned, New South Wales is not producing 20 tons a year, whereas in Victoria they are producing a little more than they require.
5006. Is not their climate drier than ours? Yes.
5007. North of the Dividing Range there is a nice dry climate? Yes.
5008. But we do not get that, until we are west of a range? No.
5009. Our climate is not suitable for producing dried fruit? You can dry the fruit, but it is not of the best quality.
5010. *Mr. Watson.*] During our visit to the Darling, there seemed to be a great diversity of opinion amongst those who had had experience of irrigation as to which soil was best suited for it;—some think red soil, others favour black soil;—have you had any experience of the soil along the river there? On the bank of the Murray, near Wentworth, there is a black soil which will grow almost anything, but as you get further back, as a general thing, it is not so good. It is only a few hundred yards close to the bank. For lucerne, the red soil is not the best.
5011. When I asked which was the best, I meant for fruit-growing? There is no doubt that the black soil will grow cereals well enough when it is not flooded, but in some country the fruit-trees live through the flood; perhaps the flood would not stay up very long. Some kinds of fruit—oranges and apricots—would do very well, but you would not get the same quality on black soil as you would on red soil. Raisins and sultanas, dry produce, would not be worth so much by 1d. or 2d. a lb. Raisins grown on the heavy soil are not of such good quality as those grown on the lighter soil.
5012. On the map you will notice a diagram showing a system of proposed locks; for some distance back there is black soil, liable to inundation, and we were informed that, roughly speaking, the red soil does not come within 3 to 10 miles of the river bank; that is the land which you say is best for fruit;—how far do you think it would pay, assuming the land at that distance back to be good to carry the water from the river after having pumped it up? Of course, that would depend on the area of the country that you were sending your water back to. The channel would have to be concrete or cement.
5013. I am assuming that the quantity of good land, once you get a distance back, is unlimited; we were informed that a distance back, varying from 3 to 10 miles, we could get any quantity of good, red land; I want to know what would be the distance that it would pay to send water back? I should think that 10 miles would be the very outside, if the land were not subject to flood. I think 10 miles would be the outside for a good-sized tract of country.
5014. You think it would pay? If you had the best soil; otherwise it would not.
5015. What is the extreme distance back from the pumping-station that land has been irrigated at Mildura? They have gone back 10 or 12 miles. They should not have gone back there; the good land is very scattered. I would not recommend country of that kind for irrigation for fruit-growing. It is all right for growing cereals; but not one-third of it is good enough for fruit-growing.
5016. Is it patchy? Yes.
5017. What do you think would be the extreme lift that would be payable in the way of pumping? I do not know that I could say. Of course, if you had good land, it would pay very well if it cost 30s. or £2 an acre for water. I should think that it would pay to water large tracts of land close to the river by lifting the water even as high as 80 feet.
5018. Then 40 or 50 feet would not be out of the question if the land were good? Not at all.

5019. Have you any doubt as to the ability of people settling, say, on the banks of the Darling, on irrigation farms, to find a market for dried fruit? No; if they raise their fruit on good soil no doubt they will get a market. W. J. Allen.  
24 Oct., 1899.

5020. As long as the quality is there? Yes; as long as the quality is good there is not the slightest doubt about a market. At present we import into New South Wales over £100,000 of dried fruits every year.

5021. It would not take many fair-sized settlements to supply New South Wales? No; we could grow a good many thousand tons, and we could put them on the market in the Old Country at a profit. The sultanias raised in New South Wales are second to none that I have seen.

5022. *Mr. Dick.*] Presuming that they have fairly good land along the Darling, could you tell us in inches how much water should be distributed over an irrigation area, at each watering—first for cereals, and second for fruit? There should be sufficient water available so that the supply would be equivalent to one cubic foot per minute for every two acres.

5023. A cubic foot per minute? Yes.

5024. Could you give the inches along the surface? I could not off-hand.

5025. *Mr. Watson.*] Mr. McKinney said that with a rainfall of 12 inches in the year it would require the supply of another 10 inches, but, to make sure, he would double the quantity and make it 24 inches? You could do fairly well with that; you could grow most fruits with 24 inches of water.

5026. If you had 10 or 12 inches of rain, would you still require to use 24 inches of water? It would not be necessary, but you want it to be there so that you could use it.

5027. Would that be a sufficient stand-by? If I were laying out an irrigation settlement I should want to be able to get 30 inches per annum if I needed it. It would take 14,520 gallons to flood an acre 4 inches deep.

5028. *Mr. Dick.*] During our inquiry on the Darling, we found that on one irrigation farm used for the growth of fodder crops three waterings were given, each of them being equal to 10½ inches over the whole surface;—could you say whether that is excessive, sufficient, or not enough? I should say it is very excessive, and it is one way of spoiling the land. In the hottest months you would not require more than 4 inches for anything.

5029. Then for fruit crops a considerably smaller quantity would be sufficient? I would not recommend more than 3 inches per month. As a general thing, in this country they give the land too much water and not enough cultivation. They put the water on the land without any cultivation, and without thinking of the damage that they are doing to the land.

5030. We noticed on our visit of inspection down the river that at various points there are high banks of red soil;—do you think that isolated and separate patches of that kind could be successfully irrigated? It could if you could get from 1,500 to 2,000 acres. I think it would pay very well. If the Government wished to start a settlement I would not recommend less than 2,000 acres.

5031. Assuming that there are isolated patches of 200 acres each on the river, do you think it would pay separate holders to take those up and irrigate them? If separate holders could do that, and could get a small plant at a reasonable price, I think it would pay them well.

5032. Do you think that the best results from irrigation are to be obtained by co-operation? Yes; all working together, like a large company or trust.

5033. *Chairman.*] What, in your opinion, should be the first step that should be taken before starting an irrigation block? The first step should be to look around and find out where there is good land with a never-failing supply of water.

5034. You would have for that purpose, an analysis of the soils below the surface as well as above? I would; but I would rather have experience instead of analysis. Analysis will not tell you what the land will do for you.

5035. One of the peculiarities of the land on the River Darling is that on the face of it it looks like a sandy loam, but when heavy winds come and the surface is blown away a kind of hard red clay presents itself? In that case I would recommend that you should find out what kind of subsoil there is. Any person used to that soil, if he dug down, would tell you the nature of it.

5036. The character of the soil is the first thing to inquire into? Yes.

5037. Then is not the next point the question as to the lay of the land? That would have much to do with irrigation. You want fairly even land, so that with a main channel you can water as much land as possible. You can get a tract of land which you can irrigate by running a channel through it.

5038. Would wavy land be suitable for irrigation purposes? It is not so suitable as fairly level ground, but it will do if you have good soil.

5039. For purposes of irrigation, must you not get land of one uniform slope? You have to get it so that you can run water down the furrows in one direction.

5040. It must not consist of a lot of hills? No.

5041. If it were wavy land, would not the intervals have to be filled up before you could irrigate? Yes.

5042. I mean where indentations occur at frequent intervals? That kind of land is not the best.

5043. It would have to be level or graded? Yes.

5044. Is not that an expensive process? It is.

5045. How much an acre would it cost? It costs from £1 to £5 an acre in rough country. In comparatively smooth country, it should not cost more than £1 an acre at the outside.

5046. But if it is rolling country, it will cost from £1 to £5 an acre? It will cost up to £5 an acre.

5047. Coming from a general view to a practical view, what character of country is at Mildura? We had all kinds of land there; we had some very good soil, and some of the worst.

5048. Will you describe what was the nature of the growth on that land before it was cleared? Mallee, pine, belar, and blue-bush.

5049. That all that had to be cleared first? Yes.

5050. Was the clearing costly? It cost £1 an acre to grub round and burn the rubbish off, and £1 an acre to get an engine to pull the trees down after they had been grubbed round. It cost £2 an acre to get the land cleared and for subsoiling; then there was the levelling.

5051. What did it cost before it was ready for the trees to be put in? It cost about £4 an acre on the average.

5052. That would be in addition to the value of the land? Yes, and it does not include fencing.

5053. Did the water flow along the furrows there? After we had planted the land, we made furrows with a small plough, through which the water ran.

- W. J. Allen. 5054. Can you tell what it cost per acre to plant the land with fruit-trees? That depends upon the kind of fruit-trees you are putting in. It costs about £5 per 100 for citrus trees, and from £4 to £5 for good deciduous trees.
- 24 Oct., 1899. 5055. If you put in eighty, they cost about £4 an acre? Yes. Then staking out and planting costs from 30s. to £2 an acre.
5056. I want you to say what the total cost will be when your trees are planted? About £10 an acre.
5057. In addition to the cost of the land? Yes.
5058. Then, in addition to tending these trees, there would be a quarterly or annual charge for water? Yes, £1 an acre I should say. I consider that a good supply of water would be very reasonable at £1 an acre.
5059. From your experience of Mildura, is it necessary for these stone fruits that the land should be above flood-water level? I may say that most of our soil was above flood-water level. Any soil that was not above it was not worth using.
5060. So your opinion endorses the evidence that we got on the Darling River, that land that is subject to floods is not fit for the growth of fruit-trees? I could not recommend such land.
5061. Either for trees or other crops? It is good for nothing.
5062. So that it is a first necessity that the land must be above flood level? Yes.
5063. Lately, in visiting the River Darling between Bourke and Menindie, we noticed that the ground was cracked a great deal and was full of crab-holes;—is that a good indication for agriculture? No. Most of that soil that has cracks and crab-holes in it is of very little value for growing fruit.
5064. Do you regard Mildura as a successful result of irrigation settlement? I could not say that I do, for this reason: they have a lot of exceptionally poor soil, to reach which they put down long channels, the land being miles away from the river; and the expense they have gone to to put the water on a few thousand acres of good soil has been altogether excessive.
5065. Are there good tracts of country there as well as bad ones? There are some very good tracts, but they are not very large. On those tracts the settlers are doing very well.
5066. One witness who was called gave it as his opinion that the settlement at Mildura would have been a success if it had been properly managed;—do you think that management has anything to do with it? I do not think that management has anything to do with it. If they had had good soil it would have been all right. I do not think that anybody could have made it a success with so much poor soil.
5067. Do you know Lord Ranfurly's settlement, and what has been the result of his farming there? On all his good soil, which is red, he has been getting a good return for the last four or five years. Then, on parts of his holdings, he got unsuitable trees, and was compelled to dig up some and rebud others. I might also say that part of his soil was heavy clay, not suitable for fruit-growing. Those portions, after working the land for several years, he has practically abandoned for fruit-growing, but he is growing cereals on some parts of it.
5068. You said a little while ago that you thought that, taking a block of 2,000 acres, it would be necessary to construct a 10-mile drain to convey the water through to irrigate that block;—could you tell us what would be the cost to make a drain through country which is likely to crack? I would hardly recommend the running of a 10-mile drain for 2,000 acres. I should want 10,000 acres if I were to run a drain 10 miles. The concreting alone would cost about £2,000 a mile.
5069. If you had merely to construct a channel to convey water along the surface of the ground, that would be all right? Yes.
5070. But if you had to convey it by means of an aqueduct it would not pay? No; I would not recommend it. There is too much good soil without doing that.
5071. In Mildura, where there are some farms distant from the river, have they aqueducts to bring the water? No; they carry the water back through channels to fairly good country, passing through poor country. It is all carried through channels, except in a few places where flumes are used.
5072. Did they have any difficulty there in regard to the cracking of the soil? Not in the lighter soils.
5073. It is only in the heavy clay soil that you have that trouble? I would not recommend the making of open channels; I would recommend that the channelling should be concrete and cement. The water taken from the Murray River is full of crayfish which bore into the channels and cause an immense waste of water.
5074. The surface channels should be of concrete? In every case they should be concreted.
5075. Have you had any experience in the growth of cereals? I used to have a good many teams working in the orchards under me at Mildura, and we grew enough fodder for the horses.
5076. Was that a successful crop? Yes; under irrigation on mallee land  $1\frac{1}{2}$  ton per acre was a small yield, and we had as much as 3 tons per acre.
5077. Did you ever calculate what it would cost to produce a ton of fodder on that land? Yes; the cost would be about £2 a ton.
5078. That would be taking into consideration labour, interest on the cost of preparing the ground, and everything of that kind? Yes; considering that we grew 2 tons to the acre, the cost was a little under £2. If it were  $1\frac{1}{2}$  ton to the acre we considered the cost to be £2 a ton.
5079. What did you pay for the use of the water? £1 per acre per annum.
5080. And you drenched the land, how often? Two or three times during the growth of the crop.
5081. How many inches did you put on? It would be from 3 to 4 inches each irrigation, according to the nature of the soil.
5082. At what intervals did you do that? Before ploughing the land we should irrigate it. We should then plough and sow it, and irrigate it once or twice afterwards, according to the season, using about 4 inches to the acre each watering.
5083. Was it a red soil there? No, it was a mallee soil.
5084. Did the land cake or harden on the surface? No; mallee soil never cakes or hardens when properly worked.
5085. You did not try that on red soil? Yes; I have tried it on red soil.
5086. With equally good results? No.
5087. With regard to caking, did any of the soil cake? Any soil will cake if you grow anything that requires cultivation and you do not cultivate. If you are growing cereals—wheat or barley—the land does not cake.
5088. The growing of lucerne is regarded as very desirable on those stations on the bank of the river Darling;—did I understand you to say that you thought it desirable that lucerne crops should be close to the river, so that the roots could go down and get moisture from the river? No.
- 5089.

5089. You said it was necessary for the ground to be well saturated? At each irrigation, once a month, you should give it a good soaking. Lucerne requires from six to seven floodings in a year. W. J. Allen.  
24 Oct., 1899.
5090. In that dry country would lucerne patches irrigated to that extent do well? They would do splendidly. In the mallee country you could grow some of the finest crops of lucerne.
5091. Could you tell us whether out of the present holdings at Mildura there is one which you could point to as being a profitable investment? Yes; I could point to many, I think.
5092. There are many that are paying? Yes.
5093. And are those the people who originally took up the land, and who have stuck to it? Yes. They are doing well on that land. They would not sell it on any consideration, as long as they can get sufficient water to keep going.
5094. Are they working farmers? Working fruit-growers. They are on the place looking after the work themselves.
5095. They are not capitalists employing labour? No. Capitalists have not made money at fruit growing there.
5096. It is necessary, therefore, for a man to succeed that he should be on the spot and superintend the working of the orchard? He should be, unless he has a very good man to put in his place. It is men who are living there that are making money, generally speaking.
5097. Do the preserved fruits from Mildura find a ready market throughout the Colony? Yes.
5098. Are they exporting any? Yes; they are exporting a few hundred tons of raisins and dried apricots this year, and finding a good market. We cannot supply enough sultanas and currants for the local market yet.
5099. That being so, could you account for the kind of the depression that seems to hang over Mildura;—it does not seem to boom as one would expect? The reason is that they have a hundred miles of main channelling, and all that channelling has to be kept in repair. They have heavy pumping machinery, sufficient to pump water for three or four times the land that they have, and to raise water they have to work these big engines. The depression is caused by many settlers who have poor land leaving and giving up paying their water rates. The water rates are now falling on to the few who hold good land. Instead of 15,000 acres supporting the pumps, from 5,000 to 8,000 acres have to support them, which is increasing the price of water, as it costs nearly as much to pump the 5,000 or 8,000 acres as the 10,000 or 15,000 acres.
5100. The fact is that those people clearing out does not speak well for the prosperity of the settlement? They are clearing out because they have not good soil. It does not pay a man with a poor holding to grow cereals alone.
5101. Can you tell us what is the extent of Mildura that is provided with irrigation? I think that about 15,000 acres have been sold, and from 12,000 to 13,000 acres were planted at one time.
5102. Do you think, then, that the mixed character of the soil there is somewhat of an index as to the difficulty of getting large tracts suitable for irrigation in one block? It is a difficulty; but I think that such tracts could be found. I know there are good tracts in New South Wales which could be put under water at a very reasonable expense.
5103. To what extent? I think 10,000 acres is necessary.
5104. You think that all those spots that are suitable for agriculture under irrigation would be found not in very large tracts, but in tracts of 10,000 acres? Yes.
5105. I understood you in your former evidence to say that from 5,000 to 10,000 acres would be a fair thing to work on the co-operative principle? Yes.
5106. If within a reasonable distance of water, and where you would not have to convey it by aqueducts for any distance? Yes.
5107. How does the fruit from Mildura go to market? There are only about eight months of the year during which they can market their fruit? They send it by river to Morgan, then on to Adelaide.
5108. They are not in a very favourable locality for getting their produce to the market? Part of their
5109. With regard to such products as dried fruit, the difficulties of transit are not insurmountable? No. fruit goes to Swan Hill, and from there to Melbourne? All the dried fruit goes down by boat.
5110. I suppose that, not having visited the Darling between Bourke and Menindie, you would not like to give an opinion on that country? I would not give an opinion on any soil unless I had first seen it.

WEDNESDAY, 25 OCTOBER, 1899.

Present:—

The Hon. WILLIAM JOSEPH TRICKETT (CHAIRMAN).

The Hon. ANDREW GARRAN, LL.D.

JOHN CHRISTIAN WATSON, Esq.

WILLIAM THOMAS DICK, Esq.

ROBERT HENRY LEVIEN, Esq.

The Committee further considered the expediency of constructing Locks and Weirs on the River Darling, between Bourke and Menindie.

James Granter, surveyor, Water Conservation Branch, Department of Public Works, sworn, and examined:—

5111. *Chairman.*] For some time you have been employed in connection with the proposed locks and weirs on the river Darling? Yes; I made all the surveys that have been made except one, in connection with the present scheme for locking the river below Bourke. J. Granter.  
25 Oct., 1899.
5112. *Mr. Dick.*] Have you a detailed statement of the heights of the various off-takes of the ana-branches on the river Darling between Bourke and Menindie? I have not prepared a statement; but I have taken out some of the levels which I can now give in evidence, going from Bourke downwards. I took the main ones on the south or left bank of the river. I did not go on to the north bank at all. The proposed reduced level of the pond above the lock site No. 9, is 247 feet above mean high-water mark, Sydney. Three or 4 chains back from the river the reduced level of the bed of Talyawalka Creek is 258.49. That would give a cutting of 11½ feet to reach the level of the upper pool. It would never do to take off at that depth, as the effect would be to turn all the water down the creek. Following the course of the Talyawalka downwards, the cutting would about run out at 20 miles where the reduced level is about 240 feet. The cutting would vary from 11 feet down to nothing at 20 miles. The next take-off is at the Ten-mile Creek entrance, off Culpaulin Island, and it goes from there to the junction of the

J. Granter. the Upper Talyawalka. There has been a survey of that made. The reduced level of the upper pool, at lock site 13, is 212 feet. Then the level along the bed of that creek shows that a cutting 20 feet deep would be required. I have only got the levels for 6 miles—as far as the detail plan went. It shows that a cutting as deep as 20 feet would be required. The deepest point would be 4 miles back from Culpaulin Island. That is following along the course of it as far as our detail survey went.

25 Oct., 1899.

5113. You stated that it would be inadvisable to cut a channel in this creek down to the proposed level of the pool? Yes.

5114. On the ground that you might possibly divert the whole of the water of the Darling into that channel? Yes, it would be possible.

5115. Could that be regulated by having gates at the lower end of those anabranches where they come into the river again? Not at the lower end, but at the off-take.

5116. In what way could those creeks be filled, in connection with the proposed system? They could only be filled by making these cuttings, unless you raise the height of the weir, which I do not think would be permissible.

5117. Would it be a costly work to make gates to regulate the flow of water into the creek from the Darling? It would be costly.

5118. Have you taken the level of the returns of those creeks? We have not.

5119. You say it would be inadvisable to place flood-gates at the entrance of the creek;—would any complication arise from the fact that the Upper Talyawalka and the Ten-mile Creek join and form the Lower Talyawalka? No complication would arise. I suppose you allude to the fact that some of the water goes back in time of high flood.

5120. I suppose you have no return showing how often these anabranches are filled? No; but I infer from the levels that have been taken that they have not run since 1891.

5121. Could you offer an opinion as to what utility to the country the filling of these creeks would be? I should think it would be of immense benefit from the fact of its giving those lakes a water supply. It would fill all that string of lakes if you could divert water in that direction for any length of time.

5122. Do you think, with such a cutting as you have mentioned, these lakes could be kept permanently full? I would not like to say permanently.

5123. It would prevent them from drying up? I think so. There would be such a supply put in in times of flood that any small rise afterwards would replenish the lakes.

5124. Can you explain why it would not be advisable to have flood-gates at the lower ends of these creeks, to conserve the water? I do not see what object they would have. They would only form a dam for a short distance. The water has to go in at the upper end before it can reach the lower end, and when you get the water down to the lower end it is bound to get away somewhere.

5125. The purpose is to dam the water back? Yes; but you must regulate the flow into the lakes. If you let the whole of the water go down, you will take the whole Darling.

5126. Presuming that a weir were constructed at the lower end of Talyawalka Creek, how far back do you think that would throw the water? Assuming that the banks of the Talyawalka Creek were as high as the banks of the Darling, I should say that it would throw the water back in a direct line 30 miles, equivalent to about 60 by the bed of the creek.

5127. It would also have the effect of preventing the emptying of the lakes and the billabongs? Yes, but the lake would be prevented again by the regulator immediately at the outlet of the lake.

5128. In order to conserve the water in the lake it would be necessary, not only to have a regulator at the in-take of the anabranches filling them, but also one at the entrance to each lake? I would not say at the entrance, I would say at the outlet, where the water would run out again.

5129. In reference to the 20-foot cutting in the Ten-mile Creek, what would be the distance along that creek that it would be necessary to make the cutting? As far as we had levels, it showed a distance of 6 miles. I think we should have to go further down the Talyawalka Creek than that, because the level there is 229 feet. It would not be an abrupt fall into the Talyawalka Creek, but a gradual one, so I think that the cutting there would be 20 miles long.

5130. Would that be equivalent to 20 miles of 10-foot cutting? Yes; that would be the average.

5131. What would be the length of the 11½-foot cutting on the Upper Talyawalka Creek? I think it would be 20 miles.

5132. Now, in reference to the filling of the lake on the western side of the river? Well, I start at the Tandure Creek. It fills by a short channel about half a mile long to the east of Lake Menindie.

5133. *Mr. Watson.*] From which pool would it be supplied? The one above lock site 17. The reduced level of that last pool is 182 feet. Unfortunately we have no levels of the lake; a survey was made when the lake was full of water, and I could only get the height of the lake at that date, and it was probably 191.16 feet. Probably the bed of the lake will be 187 feet.

5134. *Mr. Dick.*] The depth of the water would be about 5 feet? Yes, at that time. I find that the level of the water opposite Tandure Creek shows 182 feet. It would have to be 187 feet before it would run into the lake.

5135. *Mr. Watson.*] If the locks were completed the level of the water in the pools would be about the same as it was when we visited that part of the river? Yes.

5136. And that would not be sufficient by 3 feet? Not by 5 feet, approximately. We have no survey of the bed of the creek.

5137. What is the connecting length between the river and the lake? About half a mile.

5138. It would be easy to cut a channel 5 feet deep there? Yes. I think the people there would rather have the irrigation by floods than have the water shut in, because beautiful grass grows there when the flood goes down. A rise last year sent water over the bed of the lake, and after the water had gone down that was the only place in that part of the country where there was any feed.

5139. Do you know whether the bed of Lake Tandure is much lower than the creek that fills it? I think it must be 5 or 6 feet lower than the creek that fills it. There is a creek that runs out through the middle of it. The water has to rise above the banks of the creek before it gets over the bottom of the lake. The same lock would affect Pamamaroo Lake. They would all be affected by lock 17. In this case, no levels were procurable. The only thing we could get was the water-level, which was given as 190.82, on the 22nd October, 1892. The same remark that I made about Lake Tandure applies to Lake Pamamaroo; the water runs over the bed of the lake in the same way. There seems to be an immense body of water going by the creek. The water runs out about 4 miles before it spreads over the bed of the lake.

5140. Does the same thing apply to Lake Menindie? Yes; exactly the same thing applies there. The average height of the bed of Menindie Lake is 186 feet, so that it would take 4 feet more water than is shown by this lower pool to spread over the bed of that lake. The level of the water, the day that we passed that site, was, approximately, 180·5, that is about 18 inches below the proposed level of the pool, which is 182 feet. J. Granter.  
25 Oct., 1899.

5141. Could you state whether any material advantage would accrue to the people of that district from the permanent filling of this lake? I should think so.

5142. You are aware, I suppose, that a dam was built across the creek leading into Lake Menindie to conserve the water there? Yes.

5143. Could you sketch the history of that enterprise? I have only got it by hearsay. I heard that the dam was put down by the unemployed, and that it was done during a flood. It was merely done by means of sandbags tipped in whilst the river and the lake were full of water. I heard it said afterwards that the water had broken out. I think a high flood got in and broke round the end of the dam and washed the whole thing away, making a new channel. It left part of the dam but washed round the end of it.

5144. *Chairman.*] It made a sufficient outlet for the water to get away? It made a deeper creek than the original one.

5145. That would point to the fact that it would be necessary for the flood-gates to be very substantially and well constructed? Yes; and of sufficient area to carry a large flow of water.

5146. *Mr. Watson.*] Assuming that the weirs were constructed as proposed, it would not then require so large a flood as at present to cause the water to flow into the anabranches? I do not think it would take quite so much, but the difference would be very small, because, when these weirs become submerged, a flood then does not make a very great difference.

5147. With these weirs I suppose you start with from 6 to 16 feet of water in the bed of the river in the shallow parts? Yes.

5148. And a fresh coming down on top of that, which now would only rise to the extent of 8 or 9 feet, might then be just about sufficient to cause the Talyawalka Creek to flow? Yes; if you got 8 or 9 feet on the top of that, the Talyawalka Creek would flow, because some distance back from the weir it would raise the water. When you get the weirs entirely submerged, then a rise above that is inappreciable.

5149. Of course, the greater the height to which you raise the weir the sooner will any succeeding fresh run into those anabranches? Yes; no doubt it would run more quickly.

5150. What do you think would be the limit of the height to which you should raise the weirs;—it is a fact, is it not, that the banks are higher, speaking generally, on the upper part of the river than lower down? Yes.

5151. Consequently you could raise your weirs with safety to a greater extent there than on the lower part of the river? I am not prepared to go into the question of raising the weirs. Some hold that you could, and others that you could not raise them.

5152. Supposing that the result of the weirs being raised were to more frequently flood the surrounding country;—do you think that the people who hold that land would be in any way annoyed at having it flooded? No; I should think they would be only too pleased to have it flooded.

5153. It would probably result in greater certainty of a crop? It would give them grass, in any case.

5154. So that even if there were a danger of the weirs helping to flood the country more frequently, that would not be any drawback? No; I think it would rather do good than harm.

5155. During the visit of the Committee they noticed that site No. 3 seemed to be on a rather awkward bend of the river? Yes; that would be at Singleton Crossing.

5156. It looked as though it might be expected to silt up;—do you think there is any probability of that? The actual site is not in the bend. The bend would make it awkward for steamers approaching the lock. It is in a fairly straight place, and it is proposed to make it even straighter by taking a piece off the bank below the lock site.

5157. Is not the lock as difficult of approach now as the existing one near Bourke? I think it is very nearly as difficult.

5158. And would be as likely to be scoured by the action of the current? I am sure that the lock site is a good deal further away from the acute bend than the one at Bourke.

5159. You think that it is sufficiently far to be outside any large influence from the current? I would not say from the current. The current there is pretty strong. There is a good fall over those rocks. That is the reason why it was put there; it is the highest point we could get on the river.

5160. It is not possible, you think, to get a new site without going far down? Not with a rocky foundation, which is essential.

5161. *Dr. Garran.*] You were saying to Mr. Dick that a weir at the outlet of the Lower Talyawalka Creek would throw the water back for 30 miles by the course of the creek;—if we want to keep the whole of that Talyawalka Creek full after a flood we should have to make a series of these dams right away up? Yes.

5162. We could do it? Yes.

5163. Then you could store all the water that that creek would hold? Yes.

5164. Would that much water stand a year's drought? Yes; it would probably stand a three years' drought.

5165. What would be the average depth of it, if it were dammed up? It would be about 15 feet.

5166. Witnesses have told us that 15 feet in the lake is a very fair depth, and that it holds pretty well? Yes.

5167. You think that if that were stored right full, it would hold the water for three years? I am certain that it would.

5168. It is very seldom that a drought lasts more than three years? It would be very seldom that you would not get a river in that time.

5169. Eastward of the Talyawalka Creek, about the middle of its course, there is a very important series of lakes, which lie in a direct route between the Talyawalka Creek and the beginning of the Willandra Billabong;—do you know anything about the level of those lakes? No.

5170. A witness from Albemarle station told us that if we could raise the water, as you suggest, by a series of dams, we should have plenty of water running, and we should send a good deal of that water back into the lake? Yes; the object of the survey that was made was to see if we could not fill the lakes from the river.

5171.

- J. Granter. 5171. It is a good way back to the Darling? Yes.
- 25 Oct., 1899. 5172. It would be of immense advantage in that part of the country to fill those lakes at every flood? Yes.
5173. You think it is not impossible to do that? Not at all.
5174. It would mean a sufficient damming of the Talyawalka Creek, and we should have to make good channels back to the lake? Yes.
5175. But it would be only in flood-time that it could be done? Yes; and unless you altered the creek, it would have to be a very high flood.
5176. Those high floods come only once in four years? I think that the really high floods come only once in twenty years. The 1870 floods and the 1890 floods were high enough.
5177. You cannot say how high a flood it would require to send the water back to that lake? It would take a flood of about 45 feet. The 1890 flood, I think, went 47 feet on the Bourke gauge, and 45 feet at Wilcannia.
5178. Forty-five feet from the bed of the river? Yes; from the time the river ceases flowing.
5179. Have you been across from the Talyawalka to the Willandra Billabong? No; I have only been on the Willandra Billabong at its take-off from the Lachlan River.
5180. You know nothing of the levels between the two points? No; I think that some surveys have been made in that country.
5181. Going further up the Darling, there is a large lake called the Poopelloe? Yes.
5182. Does that fill with anything except a high flood? No; it requires a very high flood.
5183. Would it be a shallow lake then? I think it would.
5184. Would that go inland any more than the breadth of the lake itself;—is there any creek running eastward out of it? I do not know.
5185. I suppose there is a creek connecting it with the Darling? Yes.
5186. Does the herbage grow better after a flood in that lake than in the surrounding country? Yes; when the water goes off.
5187. Then the lakes are very valuable grazing ground after the water has dried up? Yes.
5188. They are too large and too shallow for purposes of water conservation? Yes.
5189. If they were less than one-tenth of their present size and ten times deeper they would be more suitable? Yes.
5190. Would it be possible to dam all these creeks, and when you got the water, to keep it? Yes.
5191. It would not pay the squatters to do it? I do not think it would, and their works are always liable to be carried away. At the Pamamaroo Lake there was a dam across the creek. I understand that the Menindie Meat Company put a dam across it, but it was washed away.
5192. Have you travelled from Menindie to Broken Hill? Never.
5193. You know nothing about Stephen's Creek? No.
5194. Do you know anything of the anabranches that take off from near Menindie down to Wentworth? No.
5195. In choosing sites for your locks, you have been compelled, for the sake of the foundation, to go where there were rocks? Yes, as far as practicable.
5196. And sometimes you have had to choose a place not so good as you wished, because it was the only place where you would have a good foundation? Yes.
5197. None of those locks are to be made in soft ground? No.
5198. Then you have to choose the lesser of two evils? Yes.
5199. You have not considered the question of raising the weirs? No; that is entirely an engineering question. I only deal with the surveys.
5200. If we contemplate providing water in the lakes and anabranches, the raising of the weirs in the first instance is a matter of primary importance, and should be thoroughly thought out before we determine the height of the weirs? Yes.
5201. I suppose the height of the weirs has been fixed purely with regard to navigation? Purely.
5202. The question of irrigation has been left out altogether? Yes.
5203. Mr. McKinney says he looks upon irrigation as the more important of the two objects to be served? I think the drawback to irrigation on the Darling is the height of the lift. No doubt every foot you raise the water by the weirs would reduce the cost of pumping, but I do not think the height that we can reduce it by locking the weirs would be sufficient to warrant irrigation.
5204. You saw the working of the shutter-weir at Bourke? Yes.
5205. Are you in favour of that principle? I do not know.
5206. If you were advising the Government to construct weirs, would you recommend solid or shutter weirs? I should certainly recommend solid weirs for the Darling.
5207. Are you afraid of sand silting up against the weir? Provision can be made against that by sluices.
5208. Do you think it better to have sluices or trust to the dredging of the river? I am in favour of sluicing.
5209. Would that be better than dredging the river? Yes; but dredging would be a necessity in any case—you cannot tell where the river might silt up.
5210. You think that a sand-pump dredge will be necessary? Yes.
5211. Then, if we have that, is there any need to have sluices in the dams? Possibly there may not be.
5212. You would have to lift the sluices before the flood got over the top of the dam? Yes.
5213. Would there be any risk of their getting choked? There might be; a log might come down in a low river and get into the sluice.
5214. All these complications make it undesirable to have these sluices? When I said sluices I lost sight of the fact that it was proposed to use a dredge.
5215. Would not a sand-pump dredge be sufficient for all practical purposes? I should think it would. One of those dredges can remove a bar of silt in a very short time.
5216. You think that the use of the sand-dredge would put the making of sluices out of the question? Yes.
5217. Have you formed any opinion as to the value of the water to the squatters in the neighbourhood? I think it would be a very great improvement to the country abutting immediately on the river. It would give the station-owners a shorter lift for their water. They all have little irrigation areas. It would enable

- enable them to pump more water than they can pump at present. When I was making surveys last year the river was practically dry, and a number of irrigation plants, and also scouring plants, had to be shut down. J. Granter.  
25 Oct., 1899.
5218. How did the fruit-trees stand it;—did they die? They managed to give the fruit-trees enough water to keep them alive. I know of no instance in which they died from drought.
5219. You have seen the river in one of its driest seasons, without any locks? Yes.
5220. Suppose all these locks had been built before last year, the flow of water down the Darling would not have been more than it was then? No.
5221. Did you provide for the waste of water by evaporation and the locking? The evaporation is a big item, but the waste by locking would not be very much.
5222. At present there is no supply except at that lock above Bourke? No.
5223. Well that is not a very large supply? I have not gone into that at all.
5224. You see how dry the river is;—could water have been spared for irrigation if the locks had been there? I think so.
5225. You could dry up the pool? There would be the fact of always having that amount of water there.
5226. You cannot afford to lower your pool? You have a foot or two to spare above the navigation level. It is proposed to make the minimum depth 6 feet, and you would not require more than four for navigation. If you gave them 5 feet that would leave a foot of water to spare.
5227. Still, if you have any large amount of irrigation, you would use more than a foot of water? Yes.
5228. It is not worth while to lock the river for irrigation unless you are going to have a large extent of irrigation? No.
5229. If you are going to have a large extent of irrigation you will take off more than 1 foot of water? Yes.
5230. Then, when we do that, what becomes of the navigation? It will cease.
5231. Then either navigation or irrigation has to go to the wall, unless you have a large storage of water somewhere? Yes; so it was proposed that we should keep a supply of water near the Brewarrina Rocks.
5232. There has been a suggestion of a reservoir somewhere I know? There is a very long flat reach of river there.
5233. Do you think it would be essential to have something of the sort? It would.
5234. As the scheme before us provides for no such reservoir, there will not be enough water in very dry seasons to provide for both irrigation and navigation? I should say not. The river was practically dry from about November, 1898, until the occurrence of this last rise. I think from November, 1898, until about March or April this year.
5235. I suppose that is about the longest period on record? No, I think not. I think that in 1884 and 1885 there was a longer period of dry river than that.
5236. Your evidence shows the difficulty there is in diverting the water from the river laterally, and it goes to show that we could not expect to irrigate much back country, under any circumstances, from the Darling? Yes.
5237. What irrigation would be possible would be on the banks of the river? Yes.
5238. On selected sites? Yes.
5239. And only that? Of course you desire to irrigate both kinds of land. Opinion on the subject is divided. Some people will tell you that you can only irrigate red soil, but you will see very good patches of black soil that are irrigated.
5240. In loamy soil there is a risk of crops being destroyed in case of flood? Yes.
5241. The risk of flood is not so great as the risk of drought? No; the risk of drought is the greater of the two.
5242. *Chairman.*] Although you do not care to give an opinion about the Bourke weir, will you say whether you would recommend a continuance of such a kind of weir for locking purposes on the Darling? I certainly would not recommend it.
5243. You would rather have a fixed weir? Yes. As regards the shutter weir, the impossibility is to make it water-tight. In a dry time we have seen the water running through the weir.
5244. At the very time you want to dam the water back it is difficult to keep the weir water-tight? Yes.
5245. And the process of raising these weirs is rather troublesome? Yes, it is tedious.
5246. And it requires two or more men to do it, and occupies a long time? Yes.
5247. With regard to the weir at Bourke, is it not self-evident that it is in an undesirable position? I think the mistake in regard to the Bourke lock and weir was that of placing the lock on the wrong side of the river. That was done to avoid possible collisions with steamers when the river was running over the lock walls.
5248. But, whatever the object, the result is that, above the entrance to the lock, a considerable sandbank is formed, which at the present time would almost prevent a steamer entering? Yes, that has been the effect of it, no doubt.
5249. With regard to the other sites for weirs that the Committee inspected, do you think they are the best procurable? Taking into consideration the conditions imposed upon us, that we were to get rocky bars for foundations, I think so. The reason for having the sites on the stony bars was the fact that they were the highest points of the river, and safe foundations. There is no doubt that, with a bigger survey of the river, we should find clay banks probably in better positions than some of the present sites. The rocky bars are the highest points of the river, and they are safe foundations.
5250. Do you think that all those sites could be made workable? I do. As far as my surveys have gone, they all could be. The Curranyalpa site is an admirable one.
5251. Do you think it is necessary that we should have that number of weirs for the purpose of backing the water to the height required at Bourke? I should not like to say that, because, if it is decided to raise them at any time, of course you could do with a less number.
5252. Raised to what extent? I could not say to what extent. The number that could be done away with would be regulated by the extra height.
5253. Suppose they were only raised a couple of feet, could you do with fewer weirs then? Yes. You could shift them a little further back, and probably do away with one or two of them.
5254. Mr. Darley in his last evidence was very emphatic that he could not recommend the raising of the weirs by more than 2 feet, because he said it would jeopardise the flooding of a large extent of country;—do you agree with that? I should not like to say. Of course, by raising the weirs, you would raise the water for a certain time. Then, after you get a flow with an even surface it is held by authorities that you practically do not affect the height of the floods. 5255.

- J. Granter. 5255. I cannot understand that position, because if by raising the weirs a certain height you make the water higher than a certain portion of the river banks, that must throw the water on to the land at the back of those banks? Yes.
- 25 Oct., 1899. 5256. Mr. Darley says that it would not be wise to put more than 1 foot on any of the 10-foot weirs, because by doing so you might flood the country where the banks are low? Certainly.
5257. I suppose it would be rather a serious thing to build weirs and flood the country? Supposing that you made your weir 11 feet high—the depth of the Darling is about 45 feet—it would not raise the flood-mark to any appreciable extent until after you got up to the height of the flood. Suppose the flood-level were 40 feet, and the height of the water 11 feet, the water would run on a pretty level surface after it reached, say, 20 feet; then any flood running on the top of that would have a very inappreciable effect, but a number of low places would be inundated.
5258. Of course there is a difference between flood-water and waters raised by artificial means, such as by the erection of weirs? Of course with regard to flood-waters, there is no remedy, but if by raising weirs you flood the country there is a remedy.
5259. That is a position that would have to be carefully guarded against? Yes.
5260. With regard to the erection of gates and weirs at the entrance of a place like the Talyawalka Creek, or the creek that runs into Lake Menindie, would that be a very costly work? It would be fairly costly.
5261. I suppose it would cost as much as locks and weirs? No.
5262. Not with the drains you would have to dig? That would be a big item.
5263. You would have to protect your entrance and the sides very carefully? Yes; you could put down your regulator at the entrance. The cost would be anything from £6,000 to £10,000. Then there is your cutting afterwards in the creek. That would be a big item, because you would have to cut so far away to let the country benefit by a small rise.
5264. It would be a large item? It would; but the whole channel would have to be large to give any flow.
5265. Do you think this work, if the Government undertook it, should be begun from each end, at the lower end, or at the top end? The lower end would be the better end to start at, but seeing that we have the Bourke lock practically finished, it may be a question whether it would not be better to follow them down from the upper end.
5266. As a matter of finance it would be better to begin at the upper end, because if we were to improve the river down towards Menindie it would take the trade away from us down the river? Yes.
5267. *Dr. Garran.*] Is the site next below Bourke a good site? Yes.
5268. Would it be worth while to make a practical experiment on that site? We have made one experiment which is not altogether a success.
5269. Would it be wise to make another before committing the country to a large scheme? I think it would be a very good thing.
5270. You think it would throw light on the matter? I do.
5271. If we made a solid weir? Yes. I may describe that first site. The first site below Bourke is distant  $38\frac{1}{2}$  miles; it is near Yanda station. The approach to it down the river is at the bend of the stream. Round the bend there is a good straight run in the river for a considerable distance, and as the rock extends some distance from the point of the turn, a lock and weir could be placed in such a position that the approach from either way would be easy, and the risk of the lake silting up very small.
5272. Do you think it would be advisable to make an experiment with the solid weir? I think it would be.
5273. Is there any anabranch that goes up between the existing site and this proposed new site? I do not think so.
5274. We have had some evidence that these anabranches have been mostly due to the obstruction caused by rocks; do you think that is at all likely? No, I think not, because I can point out an anabranch that starts away immediately on the top of a rock.
5275. Could it have been any obstruction offered by the rocks to the water that led to the diversion of the channel? No, I think not, because the rock on the river is on the same side as the anabranch, not on the opposite side.
5276. The argument has been that if the natural obstructions like rock have been the cause of these diversions an artificial weir would do the same thing;—do you think there would be any risk in building weirs that we should form new anabranches? I think not, at the height we are going.
5277. Certainly not on the upper part of the river? No.
5278. We are too far below the top of the bank? Yes.
5279. Then if we made this No. 2 weir we should have a pool  $28\frac{1}{2}$  miles long in which the water would always be navigable? Yes.
5280. You think it would be worth the money to try the experiment again? I think it would be.
5281. Can we alter the existing shutter weir, and make it a solid weir without much trouble? Yes. The foundations are in, which would do for the altered weir. It is only a matter of putting the extra amount of concrete on the top of that.
5282. Then if we were to make a solid weir, and find it a success, we could transform the shutter weir into a solid one? Yes.
5283. The bulk of the expenditure would still be to the good? The bulk of the expenditure is in the lock.
5284. The lock costs more than the weir? Considerably more. It is two solid walls 200 feet long, but the weir is only about 100 feet long.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Locks and Weirs on the River Darling, between Bourke and Menindie.

APPENDIX.

A.

[To Evidence of C. G. W. Officer.]

IRRIGATION AND SETTLEMENT ON THE DARLING RIVER.

Sir

Kallara, Louth, New South Wales, 4 November, 1899.

When the Parliamentary Standing Committee on Public Works were leaving Kallara after their recent visit, I was requested to furnish some additional evidence re cost of irrigation as carried on on this station. Mr. Rostron, manager, has supplied a statement of cost, and this, together with a few general observations, I now have the honor to place before you.

Since 1889 we have had an area of eleven (11) acres under cultivation. For the first three years lucerne was grown, but was not found profitable, because of its requiring so much water in the summer.

Since 1892 wheat has been yearly sown, with more satisfactory results.

The following is a statement of cost:—

	£	s.	d.
Ploughing, 1 man, for 2 weeks, at 30s. ....	3	0	0
Harrowing, sowing, and rolling, 1 man, 1 week .....	1	10	0
Seed-wheat, 12 bushels, at 5s. ....	3	0	0
First irrigation—			
(a) Field hands, 4 men, 3 days, at 30s. ....	3	0	0
(b) Engine, 2 men, 3 days, at 30s. ....	1	10	0
(c) Wood, 6 cords, at 10s. ....	3	0	0
Second irrigation .....	7	10	0
Cutting, stacking, &c., 8 men, 4 days, at 30s. ....	8	0	0
Total .....	£30	10	0

In this statement, interest on, and depreciation of, plant are omitted, as, both engine and pump being used for other purposes, the sum to be charged to irrigation is merely nominal.

The pump used is a 6-inch centrifugal, driven by a 12 h.p. portable engine; and the height to which water has to be raised is 60 feet.

In fair seasons two waterings are sufficient; but, in a bad one like the present, three are necessary. In the statement above, two only are allowed for.

The crop of wheat from the 11 acres averages from 25 to 30 tons, and is used entirely for fodder purposes. The cost is, roughly, £1 a ton.

The ground under cultivation is of too clayey a nature to give the best results. It cakes very hard and cracks badly after being watered; and it may also be mentioned that the grading is bad, so that we actually use much more water than would be otherwise necessary.

Although under present conditions we deem it impracticable to grow enough fodder, artificially, to feed our general flock in times of drought, yet there is no doubt that it pays to grow sufficient to feed horses and stud stock. So convinced are we of this, that we purpose putting a much larger area under cultivation at a more favourable locality several miles up the river.

Although there is no doubt that it pays to grow crops by irrigation for fodder purposes, yet we consider the possibility of growing wheat in this manner to compete in the general market to be out of the question, and for the following reasons:—

- (1) Lack of sufficient suitable land along the Darling, where by far the greater portion consists of alluvial flats of much too stiff and clayey a nature to admit of successful cultivation.
- (2) Liability to floods, and consequent loss of crops and destruction of fencing and irrigation channels. Flood-water in this country has a most destructive effect on wire, so much so that whole panels of fencing will entirely vanish during a flood. It must be remembered that in this district flood-waters remain on the ground much longer than in the watersheds of the coastal rivers of New South Wales.
- (3) Lack of cheap transit for produce in many seasons.

*Artesian Bores.*

There are seven serviceable bores on Kallara, but more than double this number have been put down. In every one the supply of water has diminished since it was struck. In no case has the water proved useful for irrigation. The best bore, both as regards quantity and analysis of water, gave very disappointing results. The soil surrounding this bore is of a light sandy or loamy nature, and should be well adapted to cultivation; but although both lucerne and wheat were tried, the ground would only produce one crop, and not payable at that. The ground became very caked and hard, and in trying to grow the second crop the seed would not germinate. This piece of land remained barren till two good rains had fallen on it.

*General Remarks.*

The idea that closer settlement, in the form of irrigation farms, can be effectively accomplished on the Darling we consider utterly impracticable. It would fail even as the attempted closer settlement on 10,240-acre blocks has failed. We believe most of the homestead lessees would be only too glad of any chance to get out of their country. The manager of a station near Bourke told us the other day that there were 60,000 acres of homestead leases on his place alone that could be bought out for £500. At another leading station on the Darling we heard a similar tale. In many cases the homestead leases are reverting to the stations.

This country, on account of the extreme uncertainty of the rainfall and the frequent disastrous droughts, can only be made to pay in large areas, and even then it involves the expenditure of an immense amount of money, principally to provide an adequate water supply. Here we would point out that under the present Act, owing to the insecurity of tenure under which we hold our resumed area, a very large extent of country remains practically unimproved. In our own case none of our resumed area has been taken up by homestead lessees, as it is so remote from means of transit, besides having a smaller rainfall than the frontage country.

Profiting by other people's experience, who found that the improved portions of their resumed areas were the first to go, and that they did not get anything like adequate compensation, we have put a minimum amount of improvements on; but if we could get better tenure we should at once start to improve the country by putting down more tanks, dams, and bores, and erecting more fences. We could then carry more stock and employ more men.

Since

Since 1884 all this resumed country has practically remained undeveloped. By putting on improvements under the present Act we run the risk of having the improved country selected. Although it said we have "tenant-right," yet in reality it is in name only. We spend, say, £1,000 in making a tank to water a large area; a selector comes along and takes up a block of 10,000 acres with our tank in the middle of it. Now, the tank is much larger than he requires for his block, and although worth £1,000 to us may be only worth £250 to him, and this is all the compensation we would get. Is it likely that we are going to offer inducements in the shape of cheap water to the selector to take up our country.

The 1884 Land Act has been a huge failure, and has been a positive hindrance to the development of the country.

We hope that, in view of these things, and of the past few years of exceptionally disastrous drought and heavy loss, the Government will recognise that this country is unsuitable for close settlement, and give us, the present occupiers, who have borne the brunt of opening up an intractable country, a chance to get some return for the capital we have invested. Most of us who are here would gladly get out if we could, but we cannot, except at enormous sacrifice. This being so, we consider we may fairly ask the Government to give us some concession in the form of increased security of tenure, especially of our resumed areas. If we could get this under fifty or even twenty-five years' lease it would raise the capital value of all station property, and the country would be adequately improved, whereas now the great bulk of it is lying in a virgin state, without water and without fences, and a safe harbour for all vermin, especially rabbits and dingoes.

In the event of your requiring any further information or figures *re* conditions in this district, I shall be pleased to afford all the assistance I can.

I have, &c.,

GRAHAM OFFICER, B.Sc.

The Secretary, Parliamentary Standing Committee on Public Works.

1899.

(THIRD SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## FLOOD PREVENTION IN THE HUNTER RIVER.

(REPORT BY C. NAPIER BELL, M. INST. C.E.)

*Printed under No. 1 Report from Printing Committee, 3 August, 1899.*

To the Honorable the Minister for Public Works,---

Sir,

Acting under your instructions, I arrived at Sydney on the night of 21st <sup>Itinerary</sup> March, and at once proceeded to read and make notes from the great mass of documents which, during the last thirty years, had been collected and stored at the Public Works Office, as well as to inspect the plans and sections made from the late Mr. Moriarty's time till quite recently by different engineers who had reported on this subject.

After an interruption for Easter holidays, on the 12th April I went to Newcastle, and, in a steam-launch, went up the Hunter as far as Pitnacree; also up the Williams and Paterson, and spent many days driving and walking all over the flooded districts, such as Miller's Forest, Phoenix Park, Largs, Dunmore, Morpeth, Wallis and Fishery Creeks, Bolwarra, and Oakhampton.

I then, according to your instructions, took such evidence on the subject of floods as people were willing to come and give me, which evidence, collected all over the district as far up as Muswellbrook, I have attached hereto.

On the 8th May I went to Muswellbrook, and drove all over the Upper Hunter district as far up as Page's Creek; also up the Goulburn as far as the bridge; to Denman and to the site of the proposed dam for an impounding reservoir; to the mouths of all the large creeks or tributaries; then to Singleton and all over that district; and, on the 17th May, back to East Maitland, where I stayed to make plans and calculations, and write this report.

Although all particulars respecting the Hunter and its floods, and the conditions which give rise to the flooding of the lower districts, have been repeatedly set forth in much detail in many previous reports since 1869, I think that, to make my report better understood, it will be necessary to repeat some of what has been said so often, if only to avoid the necessity of referring back to previous originals. Former Reports.

The first very complete report on the floods of the Hunter was made by the late Mr. Moriarty, Engineer-in-Chief for Harbours and Rivers, in 1869, who, in making minute calculations of flood discharge, and the distribution of flood-waters over different parts of the flooded districts, has left to subsequent investigators almost the only data that there is on the subject, and everyone after him has taken his observations and calculations as the basis on which they deal with the question.

Mr. Moriarty, after indicating what might be done to mitigate the disastrous effects of these floods, was possibly deterred by the magnitude of the phenomena he had before him, and only recommended some slight palliative measures, which he thought might relieve the West Maitland and Bolwarra districts. At the same time he expressed a warning of the danger that would be incurred if West Maitland Mr. Moriarty's Report.  
erected

erected high embankments round the town; if it were attempted to block the flood overflow at Cummins; if the great backwater of Wallis and Fishery Creeks were shut in by flood-gates; or if people were allowed to embank the lands of Bolwarra.

Royal Com-  
missioners'  
Report, 1870.

In 1870, the Government appointed a Royal Commission to investigate the subject of the Hunter River floods, which they did in a very exhaustive manner, and collected a great quantity of evidence from residents and others who knew all about the floods; but the result of their investigations was that the Royal Commission was unable to recommend anything to be done, evidently under the impression that as much harm as good might arise from undertaking any work to mitigate the floods. The Commission reiterated the warnings of Mr. Moriarty not to close the flood overflow at Graham's (or Cummins), not to raise the embankments round West Maitland, not to shut the floods out of Wallis and Fishery Creek valleys, and not to embank the Bolwarra lands.

Mr. Gordon's  
Report.

In 1890, Mr. Gordon made a very complete report, accompanied by a large number of plans, sections, diagrams, and calculations. He remarked that it was impracticable, or even preposterous, to attempt to "take off the top of the flood" by diversions to Port Stephens or Lake Macquarie, or from Wallis Creek to Hexham; and I quite agree with him that it is so.

Mr. Gordon made two recommendations: One was the construction of about six impounding reservoirs on six of the upper tributaries and larger creeks, by which a great flood should be held back until the flood water from the lower river should have passed by, when the water held up in the six reservoirs was to be let go; the effect being that only about half a flood was to come down at a time. This project was to be accompanied by some comparatively slight works in strengthening the most crooked parts of the river between Maitland and Morpeth, and some small amount of dredging below Morpeth. Mr. Gordon favours this project on account of less cost, quicker construction, less interference with rights of property, and more certainty of effecting the desired object of keeping down the height of high floods.

He discussed the project of widening and deepening the whole of the river from Hexham to Morpeth, but dismisses it for his less costly project of diverting and shortening the river, by his diversion called No. III, from Eales' Flat to near Hexham.

Mr. Gordon's second recommendation, therefore, is to make a diversion of the river between the Horse-shoe Bend at West Maitland and Morpeth, called No. II, to widen and deepen the river from Morpeth to Eales' Flat, to cut a diversion from Eales' Flat to near Hexham, called by him No. III, of a dimension to carry 108,000 cubic feet a second, leaving 53,000 cubic feet a second to flow in the present main river round by Raymond Terrace, and finally to deepen and widen the main river from above Hexham, where his diversion No. III comes out, to Ash Island; the stuff excavated, both in diversions and main river, to form embankments on each side to keep floods within them.

He estimates the total cost of making the six reservoirs, with the reduced amount of dredging, protective works, &c., at £714,565, and the cost of making diversions II and III, with the necessary dredging, at £664,500.

Mr. Darley's  
Report.

Mr. C. W. Darley, Engineer-in-Chief for Public Works, objects to Mr. Gordon's project for six reservoirs as being much under-estimated; and thinks that under the conditions which frequently obtain during floods, such as floods coming in pairs, or occasionally several floods following each other, that it is doubtful whether the floods in Upper Hunter could be retained in the proposed reservoirs before another flood came on top of them; and that if the water in reservoirs was let out after a flood the effect would be that the river would be kept in half flood, or bank full, for double the length of time which it naturally is now; and that this state of things would be more injurious to farmers than a big flood coming and going in its own time.

Mr. Darley objects to Mr. Gordon's project of diverting and dredging as greatly underestimated, and as injuriously interfering with the navigation of the river, and the water rights at Raymond Terrace and settlers along the banks; he thinks that the river would silt up from Eales' Flat to Raymond Terrace; and from Raymond Terrace to Hexham the navigation would be seriously impeded, if not assisted by expensive training walls.

Mr. Walsh's  
Report.

Mr. H. D. Walsh, District Engineer, Harbours and Rivers, Newcastle, in 1894 proposed making a diversion, called the Bolwarra flood channel, along the foot of the hills on the Bolwarra side from Hayes' Lagoon to Largs, to come into use when the

the river rose to the 20-foot level at Belmore Bridge ; to discharge 20,000 cubic feet a second ; to enlarge the river where this diversion entered it at Narrowgut Reach to Morpeth, at an estimated cost of £118,000 ; to make an overflow channel from above Pitnacree Bridge into Howe's Lagoon, and from there into the main river, at estimated cost of £11,200 ; to make an overflow channel from Duckenfield to Greenaway's Creek, estimated to cost £50,000 ; and to remove some of the rock at Green Rocks at a cost of £6,000.

In 1897 the late Mr. Price, C.E., having carefully inspected the whole district of the Hunter and its tributaries, found a site 9 miles below Denman which he considered suitable for a dam for an impounding reservoir, which would hold so great a quantity of water that Mr. Gordon's six reservoirs would all be contained in the one, and a great deal more—in fact, with a dam 130 feet high it would hold the unheard-of quantity of forty thousand million cubic feet of water. Such a quantity would very probably be more than any one flood from the Goulburn and Hunter Rivers, below the junction of which the dam is situated, and Mr. Price emphatically recommended the adoption of this system of mitigating the Hunter floods, and added his conviction that no other method would be successful.

Mr. C. W. Darley, in his report on Mr. Price's project, repeats the objections he urged to Mr. Gordon's similar project, and states his opinion that, beside the injury of keeping the river in half flood for double the natural time, that it would be difficult, if not impossible, to handle this vast body of impounded water so as to give the relief sought and not to do harm ; and he calls attention to the danger to all people in the valley below, of having this body of water stored above them. Mr. Price also referred to the possibility of utilising the water in his dam for irrigation ; but Mr. Darley shows that, under the circumstances, this would be impracticable, as it would not be possible to make the impounded water serve two purposes diametrically opposite to each other.

The above reports, with a great mass of evidence, and no end of plans, sections, cross-sections, &c., are the data which I find at hand—in fact, nothing could be more complete than the information of this kind collected during the last thirty years. The only thing left in doubt is the quantity of water discharged in high floods, which it is almost impossible to measure correctly, unless one took measurements of current velocity during a flood at the cross-section of the river under trial ; and this has never been done.

The watershed of the Hunter, with its tributaries, contains 9,127 square miles, of which the Williams and Paterson have 857 square miles, leaving 8,270 square miles as the watershed of the Hunter proper. This may be divided into the Lower Hunter, between Maitland and the sea, 1,095 square miles ; the Central, between Maitland and the junction of the two main rivers, the Hunter and Goulburn, 1,944 square miles ; and the Upper District, from the junction to top of watershed, 5,230 square miles.

The Williams and Paterson tributaries, at the lower part of the river, have each a tidal part of about 20 miles up from their mouths, beyond which they enter the hills and reach the top of their watershed in a distance of about 50 miles. The Hunter, Paterson, and Williams all head up in the same range of mountains, which are from 2,000 to 4,000 feet high.

The Hunter is tidal to West Maitland, a distance by the river of 44 miles from the sea at Newcastle. From Maitland to the junction of the Goulburn the bed of the river rises at the rate of a little over 2 feet per mile, and in this stretch it receives four large tributaries which bring down heavy floods. From the junction of the Goulburn, both rivers rise more rapidly to the top of their watershed in the Liverpool Ranges about 4,000 feet high.

The Hunter Valley, from the sea to very near the top of its watershed, is the finest and most fertile valley I have seen, and I do not think there is any like it in these Colonies. Flats of the richest alluvial soil, from half a mile to 4 miles wide, form its meadow lands, and higher terraces of alluvial soil in many places make the total valley from 5 to 12 miles wide.

The upper valley—that is, from Maitland upward—has its meadow lands heavily flooded in high floods ; but as the people do not generally live on the flooded land, the farmers and graziers do not object to the floods, which, they say, greatly enrich and refresh the soil. Singleton and Denman stand on the flooded ground, and in consequence suffer damage when high floods occur.

At

The Lower  
Valley.

At Maitland the valley becomes more flat, and spreads out in great alluvial plains, through the upper part of which, from Maitland to Morpeth, the river winds and turns in a most unusually crooked course; so that although the straight distance is  $3\frac{1}{4}$  miles, the distance by the river is  $14\frac{1}{2}$  miles. But lately the effect of closing the great backwater of Wallis Creek, and embanking the Lorn and the Bolwarra land, the floods have become more violent at this part, and have broken through three of the bends and reduced the length of the river between Maitland and Morpeth from  $14\frac{1}{2}$  to  $8\frac{3}{4}$  miles.

From Morpeth to Newcastle the river continually increases in width and depth, probably under the action of the tides; and although it has great turns and loops, it is nothing like so crooked as above Morpeth. At 28 miles from Newcastle the Paterson joins the Hunter, and at Raymond Terrace, 19 miles from Newcastle, the Williams comes in. Both of these tributaries flow in winding courses through rich alluvial flats, also heavily flooded by the obstruction which the Hunter offers to the discharge of their own waters.

Although the tide reaches to Maitland, where it has now a range about 18 inches, but formerly about 3 feet, the bed of the Hunter has a gradual slope from Maitland to Ash Island, the depth increasing from 3 feet to about 20 feet below water. The surface of the land also slopes, though irregularly, from about 28 feet above low-water at Maitland, to about 6 feet above low-water at Ash Island, which is close to Newcastle. In most places the banks of the river are from 4 to 6 feet higher than the land further back from the river.

Wallis Creek.

Just below West Maitland two creeks called Wallis and Fishery Creeks enter the river, which, coming from the south-west, flow for nearly 10 miles through wide flat valleys of rich alluvial soil, which valleys, before flood-gates shut them in, were filled at every flood by backwater from the Hunter; and as these valleys are very low, a flood in the Hunter used to store in them an enormous body of water.

Cummins'  
overflow.

Three miles above Maitland there is a low place in the right bank through which the floods used to overflow to the extent, according to Mr. Moriarty, of about 20,000 cubic feet a second, and pouring through what appears like an old channel of the river, discharged into the valley of Wallis Creek; so that in a flood, Maitland became an island with the flood in front and behind it. Maitland is situated on the naturally raised bank between the river and this overflow, and the highest known flood, that of 1820, nearly topped the highest part of this position.

Extent of  
flooded land.

The alluvial plains of the Lower Hunter, which are subject to be flooded, are estimated at from 35,000 to 40,000 acres; but so fertile is the land that each acre of them is worth at least ten acres of possibly any other land in the country, with the exception of similar land on the Northern rivers. The selling price of this land varies from £60 to £20 an acre.

The floods.

Floods in the Hunter are so extremely irregular that farmers cannot make any provision against them. A high flood may occur twice or even six times in a year, or there may be many years without any high flood. Floods in winter do not cause so much loss of crops, but those of summer frequently kill or greatly damage them. The flood of 1857 is said to have caused damage to the amount of £150,000, and that of 1893 very much more.

The town of West Maitland is partly inundated by all high floods; in that of 1893, parts of the town were under water from 3 to 12 feet deep, damaging goods and furniture very seriously. The entire width of the valley between Maitland and Morpeth, about 2 miles from hills to hills, was flooded in 1893 to various depths from 3 to 15 feet deep, and numerous dwellings built on the highest spots were surrounded by water, some up to the eaves of the roof.

As the land is chiefly devoted to the cultivation of lucerne, with patches of maize, sorghum, potatoes, &c., few cattle are pastured on the fields; but every farm keeps cows and horses, which, if the flood comes gradually, may be driven away to the low hills which bound each side of the valley; but a sudden flood like 1893, rising to its height in the night, was the cause of a great number of cattle and horses, besides pigs and fowls, being drowned.

People do  
not take  
precautions.

It is to be observed that the people are to blame for much of the damage and inconvenience they suffer, for whereas in Queensland houses are built with the floors raised from 6 to 9 feet above the ground, here the people build with floors flat on the ground. In West Maitland, in situations liable to be deeply flooded, numbers of houses are seen with the floors lower than the street, and it would seem as if no efforts

efforts are made to try and remedy the inconveniences of their position. I was told of houses washed away near Raymond Terrace, but rebuilt just as before, with the floors flat on the ground.

I have said above that the inclination of the bed of the Hunter from Singleton to Maitland is about 2 feet a mile; but after passing West Maitland it curves about in such an extraordinary manner that its fall is not quite half a foot per mile as far as Morpeth; whereas, if it had a straight course, its fall would still be 2 feet a mile. The consequence of this is that as soon as a high flood reaches Maitland it overflows and covers the whole valley. The crooked river channel then becomes inoperative; so that when most wanted there is no channel between Maitland and Morpeth, and the river takes charge of the valley 2 miles wide. The flow in the channel under these conditions being nearly stopped, it is extensively silted up; and although to some extent this silting is cleared away by smaller freshes which do not overflow, yet the channel in the crooked parts is far shallower and narrower than in other parts where the flow of the flood is not checked.

The whole of these plains have been formed by deposits from the river, the soil being a sandy loam, with beds of sand through it. Every flood lays down on the land a new deposit of silt or sand; but it is noticed that the flooded area between Maitland and Morpeth (including the valleys of Wallis and Fishery Creeks) are being silted or warped with great rapidity. Thus I am told of places which were lagoons or swamps thirty years ago and are now cultivated; in other places fences are silted up to their tops; and I was shown a house near Pitnacree which, some years ago, was built with its floor 3 ft. 6 in. above ground, but is now level with the surface.

This rapid silting of the country between Maitland and Morpeth is due to the crooked course of the river channel causing the floods to overflow more frequently, and it receives the first tribute of silt before those parts lower down. All this valuable warping, which is making higher and better land, will be entirely stopped by the embankments which the people have put up to keep out the floods.

It is generally believed that the fertility of this land depends on the periodical top-dressing of silt which floods lay down, and instances are given where land has been enclosed by embankments for many years that its fertility is seriously impaired. If this is true, then those lands from which floods are excluded will in time have to resort to manure, which would be a heavy tax, possibly amounting to more than the former loss and damage by floods.

This, however, is a question which the farmers seem to have made up their minds about; for, since the reports of Mr. Moriarty and the Royal Commission, all of whom deprecated the embanking of the flooded land, the whole of the left bank has been embanked from Bolwarra House to Largs; also the great flood overflow at Cummins has been closed by a stop-bank, the right bank has been embanked from Oakhampton to Maitland, the town is surrounded by banks, and the great back-water of Wallis Creek is closed by flood-gates; the right bank is further embanked from the flood-gates to Pitnacree, and a great part of the Phoenix Park is enclosed.

The Bolwarra and town embankments are made up to 1893 flood level, so is the top bank at Cummins; but the top of the Wallis Creek flood-gates is 7 feet below 1893 flood level. Thus everything that Mr. Moriarty and the Royal Commissioners warned them not to do has been done. But the Commissioners warned them that if they did these things the banks would break under some great flood, and no one could tell what would happen. Strange to say the great flood did come in 1893; all the banks gave way, and nothing particular happened in Maitland with the exception of much goods and furniture spoiled.

The late Mr. Price shows that in the great flood of 1893 the rainfall in twenty-four hours over the Lower Hunter district (see page 7) was 13 inches, on the central area 9 inches, and on the upper district 4 inches. From evidence given me I believe the rainfall in the upper district was greater than 4 inches; for at Denman it was 5.1 on the 9th March and 2.1 on the 10th; and at Muswellbrook they say it was 9 inches, but possibly this may be for the two days 9th and 10th March, and in any case a rainfall in twenty-four hours should not be taken as the measure for a great downpour lasting perhaps three days, and resulting in a high flood.

Mr. Moriarty, from very uncertain data, reckons that the flood of 1857 was caused by a rainfall of 5 inches over the entire centre and upper districts. But the 1893 flood was about 6 feet higher than that of 1857.

All

Behaviour of  
floods.

All previous reports notice the extreme irregularity of the Hunter floods. A diagram by Mr. Gordon, attached hereto, shows that from 1856, while there is one interval of ten years without any flood, there were six floods in 1870 in three months, and it is also noticed that floods frequently come in pairs, separated by one or two weeks. In the last twenty-five years there have been eight high floods, which, at Singleton, ranged in height above summer level from 38 to 47 feet.

According to Mr. Moriarty, the distance by way of the river from Singleton to Maitland is 49 miles, and the 1857 flood took twelve hours to travel that distance, while it took six hours to travel from Maitland to Morpeth, about 17 miles, by way of the river; but from Muswellbrook to Singleton, which is a shorter distance than from Singleton to Maitland, it took forty hours. These times are for the crest of the flood, and do not indicate so much the speed at which the flood travels as the time the flood takes to fill all the wide spaces that are inundated; so that there must be a great deal to fill from Muswellbrook to Singleton; less to fill from Singleton to Maitland; and more to fill from Maitland to Morpeth; and the flood can only attain its crest height when these places are filled.

Maximum  
discharge of  
floods.

The maximum quantity of water carried by a high flood I find to be most difficult to arrive at, as there are no observations at the particular places where the whole of the flood passed. Thus, Mr. Moriarty gives the discharge of 1857 flood at Singleton as 131,416 cubic feet a second. That was the quantity flowing in the channel of the river, but he omitted to estimate the great body of water which was flowing 2 miles wide over the fields south of the town.

Then Mr. Moriarty has given the discharge of the river channel at Oakhampton at 132,283 cubic feet a second, but omits to estimate what flowed through the overflow at Cummins and over the banks between Oakhampton and the section he took. But if he had taken his section above the overflow at Cummins (or Graham's), where the whole river has to pass, he might have found the quantity to be about 154,000 cubic feet a second; although this is uncertain, because one can only assume the gradient of the flood surface at this place.

Floods of  
Williams and  
Paterson.

It is well known that the Williams and Paterson generally receive the first of the rains, and, bringing down their floods, fill up the lower river before the Hunter comes down with its flood. Usually the floods from these lower tributaries have had time to subside considerably before the main flood arrives; at other times the two floods meet before the Paterson and Williams have had time to subside; and all these circumstances make the floods extremely irregular in height and duration.

It is also noticed that usually the Hunter flood comes down in a double wave, the first being caused by the large tributary creeks between Denman and Maitland, shortly after followed by the main flood out of the Hunter and Goulburn.

This feature is indicated, but not very clearly shown, in the 1893 flood, which at Singleton attained its maximum height on Thursday, at midnight, and soon afterwards commenced to fall very slowly; on Friday it was falling rapidly, and on Saturday the flood had gone down. At Maitland, on Wednesday, at midnight, the flood had risen 30 feet, and continued slowly rising till Thursday night; it then rose more smartly, and at 4 p.m. on Friday attained its top height of 37 feet.

This does not show, as people assume, that the Cockfighter and other tributaries below the junction of the Hunter and Goulburn are capable of raising the flood at Maitland to nearly the height that the combined flood of the Hunter and Goulburn does; because the flood from the Hunter and Goulburn, long before attaining its top height at Singleton, has already helped to fill the river-bed all the way to Maitland; and if the Hunter and Goulburn had been kept back by a dam, the flood from the tributaries below it would have been insignificant.

Observations of this kind are not accurate, and may be misleading. The only way to get accurate knowledge of the floods in their courses is to have stations every 4 or 5 miles along the river, accurately levelled from one datum, and when flood occurs to take gauge readings of the rise of the water at the same time at every station; but this is not likely to be done, as it would require a number of persons kept on the look-out, for no one can tell how long.

Mr. Moriarty remarks about this first wave, that it rises with great rapidity, but rarely attains a dangerous height, and soon commences to subside; but before it has had time to get away through the crooked channel between Maitland and  
Morpeth

Morpeth it is overtaken by the second wave, and the flood then attains its greatest height; and a section herewith, taken right across the valley from Morpeth tram-line to the hill at Largs, shows the condition of things in 1857 and 1893 floods.

There have been numerous projects advocated for reducing the height of floods in the Lower Hunter, all taking the form of relief or overflow channels. One proposes to cut an overflow channel to Macquarie Lake; another to cut a relief channel from Wallis Creek to Hexham; another to cut a relief channel from Raymond Terrace to Port Stephens. These projects are utterly impracticable, and need not further be considered. Projects for lowering floods.

Then we have Mr. Gordon's project to cut a relief channel from Eales' Flat to the river above Hexham to carry a part of the flood, leaving the remainder to flow round by the main river by way of Raymond Terrace; and finally we have Mr. Price's project of a great impounding reservoir below Denman.

If floods carried nothing but clear water any of these schemes might work well; but it must not be forgotten that vast quantities of silt and sand are also carried, and any diminution of the body of water is at once attended with the process of silting-up. For this reason, if there is to be any shortening or diversion of the river, it should be the whole river or not at all. Uselessness of diversions and relief channels.

Every one must have observed that if part of the water is taken away from a river, the channel at once silts up to correspond with the lessened quantity of water, so that floods will not be lowered in this way.

On this subject a highly scientific and experienced engineer, Mr. J. G. Morrison, in a lecture delivered at Shanghai in 1888, remarks:—"When the Chinese have been troubled with floods in their rivers, they have always been too ready to cut extra channels to carry off the surplus waters. This is, as a rule, the exact opposite of what should be done. The extra channel lowers the velocity, the river deposits more silt, the bed rises, and the level of floods becomes worse than ever."

Also, Mr. Gustav Deyer, speaking of the work of the Mississippi Flood Commissioners, remarks:—"Outlets in any form, whether waste weirs, reservoirs, or waterways connecting directly with the sea, all come under the same head, and require the same treatment; each part of the volume of which the main channel is temporarily relieved will require a proportionate expenditure for construction and maintenance, and the object in view will fail of accomplishment. The Mississippi Commission has accordingly striven to raise the levees and dredge the channels, and concentrating the scour by groins, so as to get uniform velocity."

The prosperity of the whole district depends on the harbour at Newcastle, and any tampering with the river will certainly result in affecting the depth of water on Newcastle bar, which is maintained at its present depth by the existing flow of the river, flood waters, and tides together; and if any considerable quantity of flood-water were taken out of the river, whether by relief channels or impounding reservoirs, some injurious effect would most likely be felt on the bar. In fact, the bar as it is may be too narrow or too shallow for the tidal basin inside, as is seen in Mr. Moriarty's tide diagram, which shows that high-water spring tide is 1 foot 6 inches lower at Hexham than it is at sea, indicating that the flood-tide of high-water springs is throttled either at the bar or among the shallows of Bullock Island. Newcastle Harbour may be affected.

The entrance at Newcastle is constantly threatened by the encroachment of the sand-spit on the north beach, which has increased greatly during the last thirty years, and the Harbour-master tells me that in the absence of floods the bar slowly silts up, but every 20-feet fresh clears it out again (meaning 20 feet of flood on Maitland gauge). If that is true, then a great flood with a velocity of 8 knots over the bar might clear away the accumulations of years both on and round about the bar.

It may be useful for future reference to note here that the tide at Newcastle seems to have had very little effect on the 1893 flood; thus, at low-water, when there should for that day have been 1 foot on the tide-gauge, it showed 6 feet; and at high-water, when it should have stood at 6 feet it showed 6 feet 8 inches. Also, the velocity of ebb-tide over the bar is about 6 feet a second, while that of the 1893 flood was about 13 feet a second.

Before I can discuss any proposals of my own for mitigating the floods I must state my objections to the previous proposals of Mr. Gordon and Mr. Price. Objections to previous projects.

Mr.

Mr. Gordon proposes to cut a straight diversion of the river, called by him Diversion No. II, from the Horse-shoe Bend, near Maitland, through Howe's Lagoon to the bend at Morpeth, the diversion to carry the whole flood which he takes to be 140,000 cubic feet a second. In the making of this diversion he adopts it only on condition that the whole of the river below Morpeth be so improved that it can take away the extra quantity of water which the Diversion No. II will bring to Morpeth over and above what comes to Morpeth now; or, as he says, to enable the lower river to take away the flood which at present is retarded at Maitland.

From this it follows that the river channel is to be enlarged from Morpeth to Eales' Flat. At Eales' Flat, in order to keep down the height of floods, and save the expense of enlarging the river channel between Eales' Flat and Raymond Terrace down to Hexham, he proposes to cut Diversion No. III, which, leaving the river at Eales' Flat, shall cut through the rock ridge (to be seen on plan), then through Miller's Forest, and out again into the river near Greenaway's Creek, 3 miles above Hexham.

At Eales' Flat he has increased his quantity of flood by 21,000 cubic feet a second, which he takes as the flood discharge of the Paterson, his total being 161,000 cubic feet a second. Of this Mr. Gordon proposes to pass 108,000 cubic feet through Diversion No. III, leaving 53,000 cubic feet to flow through the main river round by Raymond Terrace to Hexham.

At Greenaway's Creek, which is the outlet of No. III, he adds 22,000 cubic feet for the flood of the Williams, making a total of 183,000 cubic feet, to carry which he proposes to enlarge the river channel from Greenaway's Creek to Ash Island, where the river splits into two channels, which he infers, I presume, will carry the quantity without much alteration of height over its present flood rise, and so on to Newcastle and the sea.

In the above scheme I quite agree as to the advantages of Diversion No. II; but I do not admit that, as a consequence, it is necessary to enlarge the river below Morpeth, or, in fact, to do anything at all to the lower river in consequence of making Diversion No. II. The reasons for this will be stated further on.

Respecting Diversion No. III, I said above that I do not believe any diversion will be successful unless the whole river is turned into it, and, consequently, that it would be a useless expense to turn a part only through the diversion. It cannot be said of this diversion, as of many other short cuts in rivers, that the river in time would take charge, and pass entirely through, because it cannot do so on account of the rock cutting at the ridge mentioned above. But if the main river had 108,000 cubic feet taken away from it, and was left with only 53,000 cubic feet, no one can doubt that it would rapidly silt up to fit its diminished requirements. It would become half as deep and much narrower than it is now. I do not think anyone can predict exactly what would happen in this case, because so much depends on the nature of the sediment that would be lodged with floods. With the shingle and heavy sands of New Zealand rivers, I should say that in such a case the main river would finally close up altogether, considerably raising the height of floods, and flowing with increased depth and velocity through the diversion. However, I can only say with confidence that the main river would silt up considerably, and block the navigation between Hexham and Eales' Flat.

Again, as long as the main river below Eales' Flat kept its present depth and width, the making of Diversion No. III would, of course, lower the height of floods at Eales' Flat and Raymond Terrace; but when the main river had silted up to fit its new conditions, the floods would be as high as ever.

The proposal which Mr. Gordon favours as a more certain and quicker-executed remedy for the floods is to build on the upper parts of the Hunter and Goulburn, and on four of its large tributary creeks, six impounding reservoirs capable of holding back half a great flood. No one knows what these six reservoirs would cost, because the sites for them are not yet known. Mr. C. W. Darley, in his report on Mr. Gordon's scheme, thinks they would cost much more than Mr. Gordon estimated. Without knowing where these reservoirs would be placed, I can only infer that if they were placed high up in the steep and rocky parts of the rivers they are to dam, they would hold too little water to be of any use; and if they were placed in the lower parts, they would inundate and render useless just as much land between them as Mr. Price's great dam below Denman would do, and all of these creeks have beautiful fertile valleys in their lower parts. Although the danger to people in the

main

No. II  
Diversion.

No. III  
Diversion.

Six reser-  
voirs.

main valley would be less than with Mr. Price's dam, the difficulty of handling and letting out the stored-up water so as to produce the desired effect would probably be even greater than in one big dam.

Works of this kind cannot be looked on as permanent, because the holding capacity is diminished by every flood, or small fresh, which lodges gravel, sand, and silt in the reservoir; and the smaller the reservoir, the shorter is its life from this cause. Take, for instance, the following example:—In 1874, the Selwyn (N.Z.) County Council erected a concrete dam across the Kowai River, with the object of raising the water sufficiently to flow through a tunnel to irrigate the higher plains. The dam was about 22 feet high above the bed of the river, and dammed the river back in a lake about a mile long. In 1883 I had to report on the tunnel, the invert of which was being cut up, and to my astonishment I found the lake filled up with shingle and sand level with the top of the wall; just a pot-hole was with difficulty kept open to supply the tunnel, and the scouring sluice was buried in sand and would not work.

Such works  
not perma-  
nent.

Of course in a case of this sort the silt and sand in the river below the dam would be greatly diminished, and might even relieve much of the necessary dredging at Newcastle; but the evil would only be evaded not cured, for when the dams had silted up the position would be as bad as ever. In many reservoirs tanks are provided to catch the detritus before it enters the main reservoirs, which have to be cleared out from time to time; but one can hardly imagine the labour it would take to clear out the stuff brought down these great creeks in a flood. It is also to the point to observe that usually reservoirs are very large and are supplied by small streams, but here the reverse of this would obtain, and the effect might be that, although ordinary reservoirs may last 100 years without having their holding capacity impaired by silting up, reservoirs of this character might not last twenty years.

In order to form an opinion of the late Mr. Price's proposal to mitigate the heights of floods by means of a flood storage reservoir, I went to see the site of the dam he proposed to build, which is about 9 miles below Denman and  $6\frac{1}{2}$  miles below the junctions of the two main rivers Hunter and Goulburn. I also examined the valleys of each river for some distance above Denman.

Mr. Price's  
proposed  
dam.

The area of land that would be inundated when the dam was full would be according to the size of the flood that was retained. That of 1893 might require the dam to be of the full height of 130 feet as proposed, when the land submerged would be about 23,000 acres, the 1857 flood proportionately less.

The whole of this land is of excellent quality, quite as fertile as that of Pittacree or Bolwarra. It produces lucerne, maize, wheat, sorghum, clover, potatoes, pumpkins, fruit, and in good seasons abundant pasture. I got much evidence as to the supposed effect of flooding this land when the sluices of the proposed dam should be closed. Between the time of closing the sluices and getting the water off the land again we may assume that the land would be under water for a fortnight; but, on occasions when floods come in pairs, as they often do, the land might be submerged for nearly a month.

Quality of  
land.

All the evidence given me was to the effect that the pastures would be ruined by such a submersion, and that cultivation would be abandoned. Witnesses represented that after holding up a flood the deposition of silt would be enormous, and that all finer grasses would be killed; that it would take six to eight months before the coarse grasses would spring up through the deposits, and during that time the pastures would be useless.

Effect of  
flooding by  
dam.

One can only make a guess at the quantity of silt that a great flood would lay down over the land; but if the muddy and sandy water of a flood contained one-fiftieth of its bulk of silt, which is less than  $\frac{1}{4}$  of an inch of sediment deposited from a pail of water 12 inches deep, then the deposit of a flood might be about 9 inches deep over the whole surface, which would mean that where the water stood 1 foot deep there would be a deposit of  $\frac{1}{4}$  inch, and where it stood 100 feet deep the deposit would be 2 feet deep. It was also represented that a flood brings down incredible quantities of drift timber, which, when the dam was emptied, would pile up great masses at the dam and there be buried in the deposits of mud and sand.

Silting-up.

This beautiful valley is at present held by great proprietors, and there is little cultivation; but if it were held in small holdings it would be all cultivated and would be most productive.

Flats of river  
indispensable.

My witnesses showed that the large proprietors could not dispense with that part of their holdings which lies in the flats of the valley and would be submerged, for if their cattle were put off the flats by the flooding and subsequent want of grass their hill pastures would be overcrowded, because, as they say, their hill pastures produce no fat beasts; in fact they were unanimous in the opinion that landowners would not part with their flats unless their whole properties were taken also. I got a list of six proprietors holding 82,200 acres, of which 19,100 acres were in the river flats and would be submerged.

Value of land.

Witnesses valued the flats at £10 per acre, and were of opinion that, subject to being submerged from time to time, the land might let at from 1s. 6d. to 2s. 6d. per acre yearly rent, the rent value at present being 5s. to 6s. per acre, but they thought that no one could rent the land unless they had the adjacent hills to drive their stock to when the dam was filled.

It was also represented to me that the village of Denman, 250 people, with churches, schoolhouse, post office, hotels, shops, and dwelling-houses, must be shifted on to the hills, and all existing roads and bridges would be rendered useless where they pass through the proposed submerged land.

Fear of dam.

Many witnesses expressed great fear of living below such a dam, and the Mayor said that the people of Singleton would be in great dread of such a body of water being held up above the town, and would unanimously oppose the construction of the dam.

I cannot help agreeing with what the Mayor of Singleton and other witnesses expressed, that it would be unreasonable to injure 23,000 acres of the finest land in the Colony, in order to afford a partial relief from flooding to the lands of the Lower Hunter, and that the dam at Denman would be a standing menace to everyone living in the Hunter Valley below it.

One cannot deny that there is some risk of a dam of this magnitude giving way, however carefully built; and it is well-known that several great dams, both of earth and of masonry, have burst with disastrous consequences; and whatever justification there may be for erecting a great dam across some rocky river gorge, to place one across a fertile populated valley and impound up such a vast body of water would involve a responsibility which I do not think any Government would care to incur.

Site of dam.

At the site of the dam there is a steep rocky hill on the right bank, at the foot of which is the river flowing in a flat meadow 600 feet wide, the river itself being about 200 feet wide. From the meadow the site on the left bank is located on a low ridge rising in terraces to a hill 30 chains from the river. The dam would stand on the back of this ridge with ground 40 feet lower, 500 feet off, on the lower side; thus the site is excellent on the right bank, but by no means the best on the left.

The borings show sandstone, shale, and coal on the right, and yellow shale, gravel, to blue shale on the left. To get in the foundations across the river and its 600 feet of flats, the excavation would have to be about 60 feet deep to reach the blue shale; in such a trench, liable to be flooded at any time by the river, there is always the possibility of getting bad work just where the best is required for safety. The low ground below the ridge on the left side, mentioned above, is a bad feature only to be remedied by sinking the foundations much deeper, depending on the dip of the beds of shale.

One should not omit to consider the enormous mass of sand and mud which would be brought into this reservoir, not only by big floods, but by every freshet, and what could not be washed out through the sluices must remain there. In a very few years I imagine the bed of the reservoir would be silted up to the level of the sluices, and after that the silting would go on year by year, diminishing the capacity of the reservoir, unless it could be washed out through the sluices; and it seems to me that only a small part of the deposits could be got rid of in that way.

Uncertainty of dealing with water.

I do not know how a flood stopped back in this reservoir would be disposed of. No one can tell what rainfall is going to cause a flood. I heard of a case where 4 inches of rain in twenty-four hours did not raise the Goulburn nor Hunter more than a few feet, because the rain was preceded by nine months of drought; yet the 1893 flood, the greatest ever experienced, according to Mr. Price, was caused by 4 inches, the country being previously well soaked. But between such extremes there are many means, among which it would take a wise man to know which should be stopped back, and which allowed to go down the river. Then

Then it is known that floods frequently come in pairs. If the first to arrive is held back, it would have to be let out very quickly so as not to have the second on top of it. If it were held up too long the second flood would find the reservoir with the first flood still in it, and when the second had passed over the dam, the reservoir would have to be emptied, which would prolong the flooded condition of the river to an injurious length of time, seeing that while the river was thus kept bank high, all adjacent lands would be water-logged for want of drainage outlet.

A case occurred in 1870 when six floods followed each other between 5th March and 25th May. If each of these had been held up in the dam and let out again, the lower river would have run bank high for nearly three months, and all the lands would have been water-logged for that time.

But the first reached its height at Singleton from the 11th to the 12th, and the second between the 18th and 19th, so that there was no time between these to let the first flood out of the dam before the second was on top of it. On the 16th, the first flood had gone down greatly, and it is not unlikely that, seeing the weather cleared up, the keeper of the dam would have opened the sluices; but immediately he did so, the second flood was coming, and he would have to shut the sluices forthwith, for if he did not he would blend the two floods into one. In like manner, between the fourth and the fifth floods of this series, there was hardly time to empty the dam of the fourth before the fifth was at hand, and the fourth was the highest of them all.

Now, under these circumstances, this reservoir would not have served its purpose; neither would it on the more frequent occasions, when two floods follow each other at short intervals. In any case, seeing how uncertain is the arrival of floods, how uncertain what rainfall will produce one, how careful the man must be who handles such a vast body of water, and how entirely new and experimental is such a method of regulating floods, I think it would be more prudent to let some other country try the experiment first, and see how it works. One knows that this method of restraining great floods has been proposed in France and other countries, but I notice that they have never carried it out.

Reservoir  
useless in this  
case.

Mr. Walsh proposes to cut a channel at Duckenfield, through the ridge there, with the object of lowering the height of floods by this overflow.

The bottom of this channel is to be sloped from high-water mark at Duckenfield to high-water mark at Greenaway's Creek, where it joins the river again.

The effect of this would be, that the depth of water in the cutting at the entrance would be the height of flood above high-water mark. In 1893 the flood was 20 feet above high-water mark at Duckenfield, and 13 feet above high-water mark at Greenaway's Creek. The slope of surface of water in the cut would, therefore, be 1 in 3,500.

As Mr. Walsh says that the discharging area would be 4,800 square feet, the quantity this channel could discharge would be 30,000 cubic feet a second at the top of 1893 flood. The effect of withdrawing 30,000 cubic feet from the main river, calculated at the cross-section at Green Rocks just below, would be to lower its height about 1 foot 4 inches. But as the water in the main river was lowered, that in the overflow channel would be lowered also, and the discharge would be less than 30,000 cubic feet a second; therefore, the effective lowering of height would be less than 1 foot 4 inches, and it would not be worth while to spend £49,400 for such a trifling reduction in the height of floods.

The 1857 flood would be scarcely affected in height by this overflow channel, because it would flow through it only 12 feet deep, and discharge about 14,000 cubic feet a second.

I have no plans of Mr. Walsh's proposed flood overflow channel at Bolwarra, by which to calculate what his proposal to take off 20,000 cubic feet a second from the top of a flood would lower its height.

Mr. Walsh says that when the river should rise to 33 feet on Belmore gauge, this proposed channel would be discharging 20,000 cubic feet a second.

The 1857 flood rose to 29 feet on the gauge; therefore the cutting would not draw anything like 20,000 cubic feet from that flood; but the 1870 flood rose to 34 feet, and it would therefore take more. In any case, judging from the above calculations of the effect at Duckenfield, the effective lowering of flood height would not be much—certainly not worth the estimated cost of £118,000—and it would be much more useful to remove the great obstruction to the flow of a high flood, which Mr. Walsh mentions as existing at Green Rocks.

Present proposals.

I come now to my own proposals to mitigate the floods in the Lower Hunter; and I must first say that, although the floods may be lowered between Maitland and Morpeth, I do not think that they can be lowered between Morpeth and Hexham by any works within a reasonable cost. By spreading over the land, the floods are now as low as they can be; but if they are prevented by levees or embankments from so spreading, their height will not be lowered. The section herewith shows that uniform gradients from Newcastle to Morpeth may be given to the bottom by dredging, and the narrow parts may be enlarged to give a uniform sectional waterway; but still the river channel will not hold a big flood within its natural banks; so that if the water is to be kept off the land, the flood must be shut in between embankments, and will be as high as ever.

I will therefore first consider the case between Maitland and Morpeth.

Straightening river.

On the section herewith I show a diversion from Pitnacree to Morpeth, shortening the river from its former length of  $14\frac{1}{2}$  miles, or its present length of  $8\frac{3}{4}$ , to  $3\frac{1}{4}$  miles; and I must observe that it is not now advisable to keep to Mr. Gordon's Diversion No. II, because the river is greatly altered since his report.

Mr. Moriarty, Mr. Gordon, and Mr. Price asserted that this should on no account be done unless the whole of the river to Hexham was previously improved, so as to take away the extra water that the cutting would bring down, and so raise the flood level at Morpeth and the lower river.

No injurious effects.

I wish to show that the diversion from Maitland to Morpeth may be cut, and that it will have no injurious effect on the river at Morpeth, nor anywhere down the river; and as it appears to me to be urgently necessary, for the safety of Maitland and adjacent land, that this diversion should be cut, but it is not urgently necessary to improve the river all the way to Hexham, I must try and make it clear on this point; because unless people are convinced that no injurious effects will follow the cutting of the diversion, it will never be done.

Mr. Moriarty has gauged the discharge of the river channel at various cross sections from Maitland to Morpeth, and has taken the fall by which the discharge at each section is calculated as the difference of height divided by the length measured round about the windings of the river, which method, as he shows, reduces the flood gradient from 1 in 3,246 at Maitland to 1 in 9,359 at and below Pitnacree, and from this he deduces the quantity received at Morpeth, while the flood was at its height at Maitland (page 31), as 37,730 cubic feet a second.

Calculations wrong.

I cannot believe this statement, for as long as the flood is contained within the banks of the river Mr. Moriarty's calculations are correct; but as soon as the flood overflows the banks, the calculations cease to be true, and by the time the flood has filled the whole width of the valley, 2 miles wide, and to an average depth of  $6\frac{1}{2}$  feet in 1857, and  $10\frac{1}{2}$  feet in 1893, the river channel has ceased to flow.

This shows that instead of Morpeth receiving, as Mr. Moriarty and Mr. Gordon call it, a "retarded flood," and therefore being protected from the great body of the flood which is raging at Maitland, it really receives the great body of the flood, just as much as Maitland is doing.

Examining the facts.

The fallacy of reckoning the discharge and deducing consequences from the flow of the crooked river channel may be seen by examining the facts of the case. The river, in a length of  $14\frac{1}{2}$  miles, turns and twists in every direction, some of the reaches being across, and some against, the general slope towards Morpeth. As soon as the flood, rising above the banks, begins to flow over the land down the general slope towards Morpeth, those reaches of the river which lie against this slope have the surface level of the water highest at their lower end of the reach, and lowest at their higher end; then the water in this reach not only ceases to flow, but flows the wrong way and spills over the banks. This phenomenon was confirmed by the evidence of a settler who observed in the 1893 flood that the reach of the river between  $8\frac{1}{4}$  and 9 miles above Pitnacree Bridge was flowing the wrong way—that is, from the bridge towards the  $8\frac{1}{4}$  mile point, where there was a great overflow.

Those reaches, on the contrary, which lie in the same direction as the general slope, partake of the general velocity of the wide inundation, flowing over the land, which is swifter than the current in the river channel before it overflowed, as may be proved by calculating the velocity in the channel with its slope of 1 in 9,300, and that of the overflow over the land with its slope of 1 in 2,100.

This

This shows that the crooked channel from Maitland to Morpeth is not the vehicle of a high flood, and therefore calculations of the flood discharge made from the sections of the river channel are wrong. On the contrary, the entire width of the valley with its slope of 1 in 2,100 is then the waterway of the flood; and if, as Mr. Moriarty says, the discharge of the 1857 flood at Belmore Bridge was 132,000 cubic feet a second, then it seems to me that the flood stream everywhere between Maitland and Morpeth was discharging the same quantity.

The quantity of 37,700 cubic feet a second, which Mr. Moriarty asserts was all that flowed past Morpeth, while 132,000 cubic feet were flowing at Oakhampton, is quite out of the question. I have had a section taken right across the valley, from the high land at the Morpeth tram to the high land at Largs, and on it is drawn the level of the floods of 1893 and 1857. This shows a body of water 8,900 feet wide, with average depth for 1893 of  $10\frac{1}{2}$  feet, and for 1857, of  $6\frac{1}{2}$  feet; the gradient of the surface in the latter was 1 in 1,600, the area of the waterway was 55,000 square feet, the calculated velocity is  $5\frac{1}{2}$  feet a second. But, as this gives a quantity out of all reason, we must assume that there were obstructions, and that the velocity was less. If we take it at  $2\frac{1}{2}$  feet a second, this gives more than the 132,000 said to have been flowing at Maitland; and, as this section is only 50 chains from Morpeth, we cannot avoid the conviction that at the same moment this quantity was also passing Morpeth.

Valley flooded  
from side to  
side.

Mr. Moriarty calculated that if a straight channel were made from Maitland to Morpeth, the floods would be lowered at the former and raised at the latter place, because, as he asserts, the flood is delayed in coming down the crooked channel. He does not seem to have taken the water flowing all over the land as part of the flood to be reckoned with; but it is quite evident that in 1857 flood, four times as much water flowed over the valley as was possible to flow in the river channel, and in the 1893 flood seven times as much. As I understand the phenomenon, about the same quantity of water must flow past each place; from which I infer that if the excessively winding channel of the river were straightened, the flood would rise no higher at Morpeth than it does at present.

The Royal Commissioners evidently saw that straightening the river from Maitland to Morpeth would not have the effect of raising the flood at Morpeth (page 20, Report), and that it would lower the flood height at Maitland. But it is not easy to follow their reasoning on what they call the local effect to be produced by the disgoring of the water at the outlet—that is, at the great bend at Morpeth. They return to Mr. Moriarty's views about the carrying capacity of the river channel at Morpeth, which, as they assert, is only capable of carrying 40,000 cubic feet. From this they draw the conclusion that the straightened channel must not be made capable of carrying within its banks more than 40,000 cubic feet (page 21), because if the capacity were made to carry, say, 60,000 cubic feet, while the channel at Morpeth can only carry 40,000, "20,000 cubic feet would be suddenly shot over the banks at the bend at Morpeth, producing, probably, the most disastrous results." This leads one to suppose they thought that the water would issue from the straight cut like a cataract. But nothing like that could occur; because, the flood coming down the cut, and the flood getting away below its mouth, would swell and rise equally together. This anticipation of theirs seems the more unintelligible, seeing that they acknowledge that at the top of the flood, the whole river is at its equilibrium of flow, or "in train," as it is called; so that as much as is brought down by the cut, precisely the same quantity would be flowing away in every part of the river. In this condition it is no longer a question of what quantity the channel at Morpeth is capable of carrying, for the whole country below Morpeth is overflowed—the river is "in train," and all that comes from one part is flowing away at the other.

I have said already that the height of the floods cannot be lowered in the river below Morpeth, but that is no reason why it should not be lowered where it is urgently necessary—that is, between Maitland and Morpeth. There the people, in a sort of heedless self-defence, have embanked the town and the land, and shut the floods out of Wallis Creek; and, as the case now stands, either the banks must break at every flood, or the river must be straightened to save them.

If the people below Morpeth should take a notion to embank their lands also, then the height of floods will rise, and either dredging improvements will have to be undertaken to keep it down, or the consequences must be put up with, until, in the course

course of years, the increased velocity of the confined floods will gradually scour out the channel to suit itself. In a great flood the quantity of water to be confined is so great that of course the banks will burst right and left, which infers that the embanking below Morpeth must be carried out very gradually, and the river improved at the same time, or else it must be left as it is.

Flood not delayed in quantity.

I can understand a flood being delayed in time, but I do not agree that in a case like this it can be delayed in quantity; and as the settlers of Morpeth are greatly afraid that if improvements are made in the present winding channel it will "bring the flood down upon them," I will try by a simple example to explain that no change in the usual flood-level can take place.

Example.

The straight distance from Maitland to Morpeth is  $3\frac{1}{4}$  miles, and by the winding of the river  $14\frac{1}{4}$  miles, and the fall being the same for both, the crooked river has a far flatter gradient than a straight cut would have. The river winds about in a flat valley, 2 miles wide, which slopes at about the same rate of fall as the straight cut would have.

Now, take a tin trough,  $3\frac{1}{4}$  feet long, 6 inches wide, with sides 6 inches high; set it under the tap of a tank with a fall of  $\frac{1}{2}$  an inch, turn on the water at the rate of 1 cubic foot of water a second, and in about one second the trough will be discharging 1 cubic foot a second at its lower end, and will not overflow.

Take another similar trough  $14\frac{1}{4}$  feet long, but bent into twists and kinks, so that its two ends are  $3\frac{1}{4}$  feet apart; lay it on a flat table,  $3\frac{1}{4}$  feet long by 2 feet wide, scribe on the table the outline of the trough, and cut it out; then sink the trough in this groove so that its top sides are flush with the table. Then set the table with a fall of  $\frac{1}{2}$  an inch under the tap of the tank at its top end, and turn on the water at the rate of 1 cubic foot a second. The water will flow slowly round the bends and kinks, and, being thus delayed, will soon overflow its sides and inundate the flat table; but, the table being much steeper gradient than the trough, the water will rush down the slope, falling into the trough wherever it crosses its path; and the result will be that in about seven seconds the water will have reached the lower end, with  $3\frac{1}{2}$  cubic feet of water in the trough, and  $3\frac{1}{2}$  cubic feet overflowed on the table; and the water will continue to flow from the lower end at the rate of 1 cubic foot a second, just the same as the straight one is doing. This shows that the flood is delayed in time but not in quantity.

How quantity may be delayed.

There is only one way by which the flow at the lower end can be made less than 1 cubic foot a second, which is by shutting off the tap before the water has reached the lower end.

The above is just like the case which occurs at Morpeth in a high flood; and the only way by which the flow at Morpeth can be less than it is at Maitland is that during the time the maximum flood is taking to pass from Maitland to Morpeth the supply at Maitland should suddenly fail. But if this is true at this place it is true everywhere down the river to the sea, provided that during the time the height of the flood is travelling to the sea the full supply is kept up at Maitland.

According to Mr. Moriarty, the 1857 flood kept at its maximum height at Singleton for seventeen hours, at Maitland for twenty-seven hours, and at Morpeth for twenty-four hours; so that if the flood-level had kept up at Singleton for any length of time, the flood at Morpeth would have risen no higher.

Fears of settlers groundless.

But according to the same authority the top of the flood took six hours to reach Morpeth from Maitland, so that by the time it reached Morpeth, and for twenty-one hours afterwards, the full supply was kept up at Maitland; therefore the crooked channel of the river did not keep back any of the flood, and the fears of settlers down the river that works to straighten the channel will be injurious to them are groundless, for they have experienced the full maximum flood already, and they can get no less from a crooked instead of a straight channel.

Confirmed by calculation.

Another proof of this is given by calculation of the flood discharge at the section above Cummins Dam, which gives for the 1893 flood about 250,000 cubic feet, while at Eales' Flat, making a deduction for the flow of the Paterson, the quantity is about 246,000 cubic feet a second. Both these sections contain the whole flow of the river; but the calculations must be taken as only approximate, as the gradient of the flood is uncertain at both sections.

Great rivers do retard floods.

As I do not wish this subject of "retarded floods" to be misunderstood, I will explain that under suitable conditions, a flood may be retarded both in time and quantity, and in large rivers it usually is so. Thus

Thus the 1857 flood took twelve hours to come from Singleton to Maitland, and Mr. Moriarty says that its maximum discharge was maintained at Singleton for seventeen hours; therefore the quantity discharging at Singleton was not abated at Maitland. But suppose the river were so long that the top of the flood took three days to come down, then the quantity that passed Maitland in a given time would have been less than at Singleton (assuming that no additional water came into the river between the two places), because the supply at Singleton, lasting only seventeen hours at its maximum, was abated before the flood, taking three days to reach Maitland; and the longer the river is the more will a great flood in its upper part be abated in its lower.

We may also try to show how the case of the 1893 flood is reduced in quantity by time. Mr. Price says in his report that 4 inches of rain fell in the Upper Hunter district, producing 48,600 millions of cubic feet, or at the rate of 562,511 cubic feet a second; and that the central district, with 9 inches of rain, produced 36,130 millions of cubic feet, or at the rate of 418,176 cubic feet a second, and suppose that the rain after the twenty-four hours fall above stated cleared off. The 1893 flood tried by this rule.

Mr. Price thinks that about 70 per cent. of the rainfall may have reached the rivers, the remainder following afterwards by draining through the rocks and soil. Then 70 per cent. of 562,511 cubic feet is 393,750 cubic feet a second, and to find approximately the rate at which this passed Maitland, we must assume the time it took to travel that distance. Say the rain took one day to fall, one day to reach the mouth of the Hunter and Goulburn, one day to reach Singleton, and half a day to reach Maitland—that is, the rain of one day must be distributed over  $3\frac{1}{2}$  days, which reduces the 393,750 cubic feet to 112,530 cubic feet a second.

Then the central district yielded 70 per cent. of 418,176 cubic feet, equal to 292,723 cubic feet a second, and say it took one day to fall, one day to reach Singleton, and half a day to reach Maitland, or two and a half days, which reduces the 292,723 cubic feet to 117,090 cubic feet a second. But as they came down together, by reason of the obstruction to the flow of the first flood waters between Maitland and Morpeth, as described by Mr. Moriarty (see page 27 of his Report), they passed Maitland at the rate of 229,620 cubic feet a second.

This is merely a guess at the actual facts; but it is singular that the above quantity of 230,000 cubic feet a second is not far off the quantity ascertained by calculation as passing the section above Cummins Dam at the height of the 1893 flood.

In case it is thought that I have gone into this subject of "retarded floods" at a tedious length, I must remark that Mr. Moriarty (page 31), Mr. Gordon (page 6), and Mr. Price (page 2), all agree in asserting that no straightening of the river between Maitland and Morpeth can be done without raising the flood to a disastrous height at Morpeth, unless the river is improved at a great cost all the way down to Hexham; whereas I have shown quite clearly that straightening the river would have no effect on the height of the flood at Morpeth.

I attach hereto a plan, showing the embankments that have been raised on both banks of the river. These banks have been raised without regard to the effect that they may have on the height of floods, and, as a fact, they have caused the floods to rise higher than they did before; also the great reservoir, or back-water, of Wallis Creek, is now closed by gates to all but very high floods, and the flood overflow at Cummins is closed by a stop bank. All these banks are now up to the level of the 1893 flood, but the top of Wallis Creek floodgates is 7 feet below that level. River embanked.

There can be no question now of undoing this work, and the thing to be done is to make the banks reasonably safe—especially the banks round the town of West Maitland should have particular care; but the banks are not such as the town should have for its own safety. All the land on which the banks stand should be public property. The banks should have a core of clay sunk down into the original ground; they should be at least 15 feet wide on top, and it would be safer if they were made a public roadway, so that their condition could always be seen. At present they are of various widths, from 6 to 9 feet, and, as they are fenced off where they pass through private property, they cannot be properly inspected. In places there are fences on top of them, with post-holes sunk deep along the top; in other places they are tramped down 2 or 3 feet low, where cattle pass over. Along the Oakhampton Road the banks are too light, and very unsafe. I think the road itself should be raised to serve as the bank. Banks not safe.

The

The banks on the Bolwarra side are not made with the hope of keeping out very high floods, and, although they are up to 1893 flood level, they may be breached whenever they are topped by the rising water; and the same is the case with the West Maitland banks.

River must be straightened for safety's sake.

Nothing now can make these banks, and the town of West Maitland, reasonably safe unless a straighter course is made for the river as far as Morpeth. I have shown my reasons for believing that if the river were so straightened the height of floods would not be raised at Morpeth, or anywhere else down the river.

Bad effect of banks.

The embanking of Maitland and the Bolwarra lands having raised the height and increased the rush of floods over the land, has caused three of the loop-like bends of the river to break through, and before long two more will break through, and then the river will have a much shorter course to Morpeth.

Proper course for diversion.

Still this is not the best course, and would not be so effective as a straighter and shorter one; besides, the river at present flows on high ground. But if it were diverted through Howe's Lagoon it would be on ground over 10 feet lower, and it is always best to have the river on the lowest ground. The proposed diversion is shown on plan herewith; but when it comes to be undertaken it should be decided which course should be taken of two lines shown on plan, the lower of which would save the bridge at Pitnacree, but the upper would require a new bridge. Borings should be put down so as to get the required depth of cutting clear of the rock, which will be found some depth down, near Howe's Lagoon.

Dimensions of it.

For this diversion I have taken the flood as discharging 150,000 cubic feet a second, which is about the quantity of the 1857 flood. The diversion being 400 feet wide at bottom, and the flood 37 feet deep in it, with an inclination of 1 in 3,300, the effect would be that the flood would be lowered over 7 feet at Belmore Bridge below what it was in 1857, 5 feet opposite Horse-shoe Bend, 2 feet at Pitnacree Bridge, and remain the same height at Morpeth as it was in 1857.

Cannot contain 1893 flood.

The 1893 flood, discharging 250,000 cubic feet a second, would not fit this channel unless the banks were raised very high so as to confine it within them; in which case such a flood as that of 1893 would be the same height as it was at Belmore Bridge about 4 feet higher than it was at Pitnacree, and the same height as it was at Morpeth, always supposing nothing is done to the river below Morpeth; but the whole flood would be contained between the banks raised at each side from the excavations. Seeing that the channel will not reduce the height of the 1893 flood, I must explain that on the occasion of the flood in 1893 the stop bank at Cummins carried away, letting a prodigious quantity of water flow down on the south side of Maitland; also, the Bolwarra and town banks burst, letting the water spread all over the country.

If none of these banks had given way, the height of the flood would have been over 6 feet higher than it was at Belmore Bridge, remaining as it was at Morpeth. The same may be said of the 1857 flood, which, if it came now, when all these banks are up and Wallis Creek closed, would rise many feet higher than it did when it flowed all over the country in 1857.

Diversion will lower flood.

This diversion, therefore, will considerably lower a flood like that of 1857 in the neighbourhood of Maitland and Pitnacree, and contain it all between its banks. If the banks are raised to a considerable height it will also contain the 1893 flood; but it will not lower it at Belmore Bridge under what its level was on that occasion. It will raise its level at Pitnacree above what it was, and leave it as it was at Morpeth.

If, however, when this diversion is made, a flood like that of 1893 should occur, and the banks all burst as they did then, the height of the flood would be some feet lower than it was in 1893.

The new channel could not be cut without making high and very wide banks on each side out of the excavations, and filling up all low places within reach of the dredge pumps.

Old river channels must be left open.

This would confine a flood like that of 1857, except that the old river channel should be left open, so that it may silt up more quickly. Of course, the flood would get in by that opening and flood the old channel within a few feet as high as it did in 1857; but in a flood like that of 1893 the old channel would be flooded even higher than it was in 1893, supposing the banks did not break above the opening; and, in fact, if it is proposed to keep such a flood as that of 1893 within the banks, then all the banks now existing round about the windings of the old channel must be raised considerably in height.

The

The fact is, that such a flood as that of 1893 cannot be controlled; and if Maitland can be secured against it, it must be left to burst the banks and go all over the country, for if the diversion is cut it will not rise so high over the Bolwarra and Pitnacree districts as it did then. 1893 flood unmanageable.

If such a diversion as that mentioned above were made, one must expect to incur considerable expense in keeping the river in its new channel, for in the soft, silty soil it would immediately commence to deviate, and if left alone would in time develop as many twists and turns as it has now. This tendency must be stopped, as soon as the current begins to eat into either bank, by protecting with stone, of which there is abundance close at hand. Diversion would deviate if allowed.

The diversion from Maitland to Morpeth will only benefit the Maitland, Bolwarra, and Pitnacree districts, and the question remains as to what should be done for the country between Morpeth and Hexham. The lower river.

I have stated above the objections I find to Mr. Gordon's proposal to divert part of the river from Eales' Flat, through Miller's Forest, to Hexham; and I think there are equally strong objections against diverting the whole river through that part, such as the opposition of settlers and landowners in the Miller's Forest, the ruining of the navigable channel of the main river between Eales' Flat and Hexham, which, diverting the whole river through Miller's Forest, would cause it to silt up.

This would certainly give rise to claims for damage by the people of Raymond Terrace and holders of property along the river, who would be deprived of those advantages of navigation which they enjoy at present. As long as any contemplated works are kept to the existing river channel, whoever undertakes them will be within their rights; but whenever one leaves the main river, then one becomes liable for all the unforeseen consequences, whatever they may be. Diverting through Miller's Forest.

To divert the whole river through Miller's Forest is an immense work. To carry a flood of 175,000 cubic feet a second, the cutting would require to be 500 feet wide at bottom and 27 feet deep; the flood retained by the side banks would be 35 feet deep in the cutting. This would cost about £400,000, and take many years to finish. The outlay would be of no benefit until its completion, and, after completion, repairs and maintenance to keep the river from attacking its soft banks would require continual expenditure.

Rather than incur the great cost, as well as all the risks and liabilities of making such a diversion, I would prefer to keep to the main river, even if to deepen and widen it so as to reduce the flood level should cost more money than the diversion mentioned above. In other countries, in similar circumstances, the practice is to embank the flooded land, and improve the river by dredging. Glasgow used to be inundated in its lower parts by floods in the Clyde; but they have deepened and widened the river, and are no more troubled with floods; and, after careful consideration, I can see nothing better to be done in this case. Prefer to keep to the main river.

I think that the first step to take in order to improve the flood-carrying capacity of the river should be to straighten the two sharp bends, as shown on plan herewith, and next to enlarge and deepen the waterway at Green Rocks. At this place Mr. Walsh, C.E., of the Harbours and Rivers Department, observes that in the 1893 flood there was a fall in the surface of the water of 2 feet in about a mile, and the current was running at the speed of 11 miles an hour, or 16 feet a second. This plainly indicates a great obstruction, which should be removed, even if nothing else were to be done to the river. But the cause of this obstruction must be verified, for I observe that on the right bank embankments have been built close to the river; and as there is high ground opposite on the left bank, the flood is here gorged to a very narrow passage, which may be the cause of the extraordinary obstruction observed by Mr. Walsh during the 1893 flood. If this is found to be the cause, then these embankments must be removed; and they should not be erected at this place nearer the river than a quarter of a mile. Cut off two bends.

If, however, the serious obstruction observed at this place is caused by the rocks of Green Rocks, then the first thing to be done to assist in lowering the height of floods is to remove this bar of rocks to an ample width and depth, but chiefly depth, as shallow width is of no use.

Mr. Walsh in his report advocated enlarging the waterway, by cutting back the rock at low-water level; but, considering how very small is the effect of any enlargement which has only a shallow depth, I would recommend that the enlargement Green Rocks.

enlargement be cut down to the depth of the deepest part of the river at this place. There is no difficulty in doing this by rock-drills worked on a punt, the rock blasted by dynamite to be raised by dredging. In the Brisbane River a great reef of rocks was deepened to 26 feet in this way in a very short time.

I show on a section of the whole river herewith, and on the cross sections pertaining to it, how the channel might be enlarged and dredged to a uniform width and gradient which would contain within the embankment such a flood as that of 1857. This shows no reduction whatever in the height of such a flood, owing to the fact mentioned before, that the flood, when spread all over the land, is as low as it possibly can be.

It shows, however, that the flood-level can be kept down to the same height as is attained by Mr. Gordon's plan of diverting part of the river through Miller's Forest, which is seen by inspecting the figures indicating flood-heights on his section and on the one herewith.

Work not so  
easy as it  
appears.

This work, shown on the section and cross-sections, looks very well on paper, but the following considerations cannot be overlooked.

There are so many uncertainties attending the dredging of a river that no one can tell exactly what the result would be. Thus, if the channel were dredged and enlarged to accommodate a big flood it would be far too large for a small one, and the many small ones that intervene between each big one would silt up the enlarged channel to such an extent that when a big flood occurred it would fail to scour out all that had been deposited in the interval. This is what occurs in ill-designed sewers, and causes so much trouble. Of course, if the river channel could be dug out to such a shape that small floods would be accommodated equally with great ones, the channel would keep clear of deposit; but in an ordinary river this is impossible.

In enlarging a river artificially, in places where the river is curved, the new enlarged section will not suit the requirements of the current which, in such places, requires extra depth and not extra width; consequently, if extra width is given it will be silted up. At present the river is of unequal width, and where it is wide it is shallow, and where narrow, deep. An artificial channel of uniform width and depth can only keep so provided the channel is straight. If it is curved the river will soon make the curved places deep and narrow; and as the river is not only frequently curved, but curved in reverse directions, it is obvious that if it is given a uniform width and depth it will not keep so for long. Any improvements, therefore, in the river channel are almost unmanageable unless the river is trained within stone training walls.

In the Mississippi, it is remarked that only such dredging as is done in the natural axis of the current is permanent, and if this is not studied for every bend and reach the dredging will silt up again. In undertaking such work in this river, it would have to be carried out with much experienced observation, so as to choose the best position and direction in which to deepen or widen, because in a river without training-walls, dredging, heedlessly done, will certainly be work thrown away. I have seen much money thrown away by not observing such indispensable precautions in dredging a river.

Land might  
be embanked;

but this will  
raise floods.

Injurious  
effects.

As is done in other countries, the land might be embanked and the river left alone. But in this case it is evident that at present the height of floods is as low as it can be, because they spread all over the land, and if the water is to be shut in between embankments the height of floods must be greater than it is now. From trials which I made on sections of the river as it now exists, with assumed flood gradients, the 1857 flood, for instance, would be raised 9 or 10 feet higher if shut in between embankments 400 feet away from the river bank at each side, and the 1893 flood far higher than it attained in 1893.

Such a raising of the flood height would affect the height of floods all up the river, possibly as far as Maitland. From this it would appear that embankments, without widening and deepening the river, would rid the lands of inundation, but would raise the flood level to a dangerous height, if it could be contained within the banks.

Nevertheless, there is no doubt that embanking the river, however low the embankments might be, would promote scour. By so much of the water not being allowed to spread over the land the height of floods would be raised. This would increase the velocity, which would increase the scour and so deepen the channel.

From

From the above considerations, I think the safest way to attain the object sought, of preventing floods from inundating the land without producing violent and unlooked-for changes, would be to gradually carry on the work of embanking and dredging together. First, beginning at the lower end to raise the banks, say 5 ft. high, between Hexham and Morpeth, and to dredge and enlarge the channel so as to keep down the extra height of floods as much as possible; then, in succeeding years, to raise the banks a few feet more, dredging and enlarging the channel at the same time. In the end, the banks being raised as high as experience shows they require to be, and the river dredged and enlarged to correspond, there would be a fair chance of permanency in the work, the floods would be very little higher than they are now, and the land entirely protected from all but unusually high floods, which would breach the banks, and then they must be made up again. Great floods occur only at long intervals, and in every country where land is protected in this way they never pretend to expect complete immunity from accidents by unusually high floods.

Fortunately for this part of the Lower Hunter there is high ground all along the river at moderate distances from it, on both sides; so that there is no necessity for people to live within the limits of the flooded land, and those who cannot afford to live on the rising ground should leave the district for the sake of their own safety.

It would take many years to finish the work of gradually raising banks and dredging the river, the time depending on the number of dredges employed; but, commencing from below and working up, the results would be useful from the commencement; and as the lower river, from Hexham downward, is not in such urgent need of protection from floods as the Maitland district, the people should be content during the time necessary for the completion of the work. Some countries have taken centuries to carry out works of this kind, and in the Mississippi they have been working at the levees and dredging the river for the last sixty years.

The Williams and Paterson have flats which it is equally important to protect from floods, and the work of making banks is required here also. But there is no necessity to dredge any part of the Williams, and at only two or three shoal places is it required on the Paterson. The banks for these two rivers could, therefore, be made from ditches in the usual way.

It is important that the embankments made from the dredgings be set back from the river banks as far as possible, so as to give the floods more room, and prevent the embankments being undermined by changes in the river. There is no waste of land by doing this, as the land outside is even better pasture than the land enclosed.

The modern high-power suction dredges can do this work, and only such should be used; two dredges, each capable of discharging 1,500 tons an hour, and depositing at a distance of 1,000 feet, and 18 feet above water level, should be employed. In America, suction dredges are used to make levees, and they are said to do the work at a cost of 3d. per cubic yard.

The stuff dredged to improve the river channel must be placed on either side to form embankments, and in most places this material would be greatly in excess of what is required to form the embankments; consequently, the dredgings would form great mounds on either side of the river. The width of these mounds, depending on the amount of dredging at any particular place, might be over 300 feet; but as the material would most likely be a muddy sand, the mounds themselves would be good land, growing abundant grass; and even where the dredgings were pure sand, there would be no difficulty for the dredge to pump over the mounds a thick covering of silt and earth, procured from the adjoining banks of the river. Such mounds should be immediately sown with grass, to protect the slopes from waves from high winds when the river was in flood.

I cannot tell whether the land occupied by the dredgings to form these banks would have to be purchased. One would naturally infer that landowners would not charge for the land, which would not be lost to them; and they would have the further benefit, that all low, swampy places within range of the pumps could be filled up with the dredgings, and made high and dry.

The work contemplated above is to improve and embank the river from Hexham upward to Morpeth, it being assumed that the river, as it is below Hexham, will carry off the flood water, without much change of height, to Newcastle and the sea.

Carry out work gradually.

Plenty of high ground near at hand.

Time to finish.

Williams and Paterson.

Banks to be set back.

High-power dredges.

Embankments made from dredgings.

But if the longitudinal section of the river herewith is examined, it is seen that the existing river channel from Morpeth to Hexham has a good depth, and somewhat uniform inclination, till it reaches Hexham. At this place the river separates into the north and south channels, which, after a course of some miles, unite again in the harbour of Newcastle.

Shoals of north channel.

Immediately below the point of separation, the north channel becomes very shallow, and encumbered with sand-banks; but when they meet again there is a depth of over 36 feet below low-water.

This is probably the place where the tide is throttled, as mentioned above, and if a wide cut were dredged through the shallow part of the north channel, the tide would flow more freely up the river as far as Morpeth. The result of this would be increase of scour in the whole river, resulting in giving a more uniform depth and increased get-away for floods.

Deep cut through these shoals.

It would cost much money to dredge through these shoals a cut, say, 500 feet wide, to a depth of 20 feet at low water; but such a cut, if properly located to fit the curves of the river, would be permanent, and would greatly benefit the river above it, both as regards tidal flow and flood discharge. I believe that the final result would be that the south channel would silt up, the dredged cut through the shoals of the north channel would correspondingly enlarge and deepen, and after a few years the whole river would flow through the north channel with a permanent depth of over 20 feet where now the greatest depth is 8 or 9 feet.

There is no possible advantage in having two channels, the north and south, to let either the floods out or the tide in, as one channel with ample depth is far more effective than two shallow ones, for both these purposes.

The above projects to deepen and embank the river between Morpeth and Hexham would cost large sums of money, and many years of time. It is very improbable that owners of land along the river could bear any but a small part of the cost, and consequently, unless there was a very urgent need of the improvements which the work contemplates, it is not likely to be done.

Necessity to improve lower river.

It does not seem to me that, between Morpeth and Hexham, there is any urgent need to improve matters as they now are; and if settlers and owners protest that there is, it is not unlikely that their views on the subject would be modified, if they were asked to contribute towards the cost of remedying the present state of things. No one can deny that they suffer heavy losses and damages when great floods occur, but between times they reap very profitable crops, and the floods are acknowledged to leave behind them some benefits in the way of renewed fertility of the land.

Partial work recommended.

Taking these different views of the case into consideration, my advice would be to straighten the river between West Maitland and Morpeth, cut through the two sharp bends above the Williams, remove the obstructions at Green Rocks, and make a cut 500 feet wide through the shoals of the North Channel. This would greatly relieve the floods, and might be all that is required for many years to come.

Board of River Conservators.

Since 1869, when Mr. Moriarty wrote about the want of a system of proper drainage for the cultivated land, this has been much improved. Still there are many places in want of good drainage, which, in some cases, is prevented by not having authority to drain through other people's land. This could be put right if there was a Drainage Board, or Board of River Conservators, under the authority of which all requirements, such as drainage, the positions of embankments, the protection of the banks with stone, the checking of encroachments of the river, regulations of the planting of willows along the banks, prohibition of throwing trees into the river, and generally, all matters connected with the river and the district would be controlled.

At present they are lining the left bank of the river with stone below Maitland, to prevent the bank wearing away; but the bank is wearing away, because the river is now so shut in with embankments; and if the enlarging of the river-bed, shown on my cross-sections, should be carried out, all this stone would have to be removed.

A Board of River Conservators would see that no work was done on the river or its banks unless in accordance with a well-considered plan.

Total dredging.

The estimates given below show the immense total of 59,000,000 of cubic yards to be dredged to make the river capable of carrying a high flood within embankments; the flood quantities being 150,000 cubic feet a second above the Paterson,

Paterson, 171,000 cubic feet above the Williams, and 193,000 cubic feet below the Williams. The estimate is divided into—1st, from Maitland to the mouth of the Paterson; 2nd, from the Paterson to the Williams, including two cuttings to straighten bends; 3rd from the Williams to Ash Island; and 4th, making a cut 500 feet wide through the shallows of the North Channel, which I believe would have a most beneficial result in lowering the floods of the river, as well as enabling the increased flow of the tides to keep the whole river channel in a better condition than it is now. This cut, also, by doing away with the throttling of the tides, which I assume to be caused by this shoal, would have a beneficial effect on the bar at Newcastle.

To straighten the river between Maitland and Morpeth, and enlarge the river bed up to Belmore Bridge, would, by this estimate, cost about £200,000, which is a very large sum, but it would relieve Maitland and the Bolwarra districts of all anxiety from floods.

Besides this, I recommended, on page 20, that two bends above the Williams be cut through, the obstructions at Green Rocks removed, and a deep cut be made through the shoals of the North Channel. These would cost £253,065. <sup>Cut through bends.</sup>

The total estimate for improving and embanking the whole river is £1,076,600, <sup>Total cost.</sup> which is about £130,000 more than I estimate that Mr. Price's proposed dam would cost, and it is a much safer and more trustworthy way of alleviating the floods of the Hunter.

I have the honor to be,

Sir,

Your obedient Servant,

C. NAPIER BELL,

M. Inst. C.E.

East Maitland, 20th June, 1899.

## FLOOD PREVENTION IN THE HUNTER RIVER.

### APPENDIX.

ESTIMATE of cost to straighten and enlarge the river to carry 150,000 cubic feet at Maitland, 171,000 cubic feet below the Paterson River, and 198,000 cubic feet below the Williams.

*J. Ferry*, Inspector of Roads:—In 1893, the water which overflowed the land at Pitnacree flowed in a very strong current; he says he noticed that river underneath flood ran in channel very strongly.

*J. Fenwick*, Miller's Forest:—A good smart flood comes just up to the surface at his house, but in the 1893 flood it was 9 feet deep, and flowed towards Hexham very strongly; it overtopped the ridge where Mr. Gordon proposed to cut through, Diversion No. 2 as he calls it, 2 ft. 6 in. deep; the 1893 flood was 5 feet higher at his house than any previous flood; the ridge is the refuge of all people and cattle in Miller's Forest, who drive by the road to the ridge for safety during floods; the flood of 1893 kept up at its full height for twenty hours; it was never heard of before, of flood topping the ridge at the spot where Mr. Gordon proposed to cut it through; Miller's flat is fine fertile land, and reckons it worth £30 an acre; lucerne on it is cut every seven weeks, three-quarter ton per acre.

*J. W. Allworth*, District Surveyor, East Maitland:—In Maitland district they get  $1\frac{1}{2}$  ton per acre of lucerne five crops a year, average value, 35s. per ton; at Denman, 1 ton per acre, four crops a year, at £2 5s. per ton.

*2nd June, 1899 (East Maitland).*

*H. H. Bennett*:—He has lived at Pitnacree since 1859; the 1893 flood was the biggest ever since he has seen; he thinks that the whole valley between rising ground at Morpeth and the rising ground at Dunmore was filled in that flood; generally the whole mass of the water was flowing downwards at different velocities, causing many eddies from different currents; the only way to distinguish the river channel was by the willow trees on its banks; the height of the flood was 4 inches upon the deck of Pitnacree Bridge; it was not possible to tell the way the river channel was flowing; he thinks the flood kept at its height above the deck of the bridge about three days; he thinks that the embankment all around Maitland and Bolwarra lands have done injury to the rest of the district, causing the flood to rise higher and rush over the land, doing much damage; cannot think of any remedy for this state of things except a canal to take away the water, or else to have the river straightened; he thinks the river cannot carry the water of a great flood, and that embankments now being put up have made matters worse; he thinks the permanent cure for floods on all rivers would be a canal from Bolwarra House to Woodville to Seaham, across the country to Port Stephens; 1872 flood just came into his house; there was no embankment then, and the floods spreading out over the land did less harm than now when the land was embanked; he thinks the dams have greatly improved the low and swampy parts by keeping them dry, but they have damaged other parts which are not protected by dams.

*Council Chambers, West Maitland, 4th May, 1899.*

*Robert Scobie* said that all the country was covered with forest and dense scrub a long time ago; he thinks the scrub and forest retarded the progress of the water in floods; he says that the banks were more or less stable, which caused the flood to scour channel and keep it deep—so much so that sailing-boats and other craft (shell boats) habitually came up to West Maitland; he has observed that the river in East and West Maitland and Pitnacree districts is shoaling up a little, but thinks, however, that since the settlers have embanked their land as far as Pitnacree, and kept the flood more or less in the river channel, that the scouring-out has recommenced; he has been told that the country in Pitnacree and East and West Maitland districts is silting up greatly; he has noticed the great overflows of the river at just beyond Mayo's and at McCrae's Hollow, and thinks that these overflows have been caused by the cultivation of the land and the undermining of the banks; he has always advocated the embankments, which have been carried out to a great extent as far as Largs; since the 1893 flood the land has suffered very little injury from floods; he is not in much hopes of excluding very large floods by embankments; such floods are at long intervals; the settlers are the best judges of the advantages to be derived from embankments, and they would not have put up these banks and kept the floods out if they did not feel that they had derived substantial advantages from embanking their lands; he has advocated the embankment of the land between the rising ground in large blocks, but as it was nearly impossible to do so in the crooked parts of the river, he therefore advocated the diversion of the river as shown on the plan; he does not think that the diversion proposed would have an effect that the people at Morpeth could fear, as he thinks that the whole of the water of a flood which comes down has to pass Morpeth as well as anywhere else; he remarked that the Morpeth people, who made many complaints, have never tried to assist themselves, by embankments or otherwise, as the rest of the people have done higher up; he observed that the left bank of the river is embanked from Bolwarra to Largs, but the present crooked river he sees no way how it can be embanked on the right side, as floods would certainly destroy the bank in time; and it was for that reason he had advocated straightening the river by the diversion shown on the plan, which could be banked on both sides; he thinks the district could not support Mr. Gordon's project of making No. 2\* diversion of the size to carry the full volume of the river in flood, and that the district might afford a relief channel in the same position, which in future, when the district could afford it, might be enlarged to the full capacity to carry the river in flood; he thinks if the channel were made as he proposes the river would scour it out completely, and does not think that the material carried down would materially shoal the river, provided it were embanked on each side on the lower parts; he notices that wherever the flood overflows the land there the river is shoal, and infers that if this were prevented such shoaling could not take place; he thinks if No. 3 diversion† were cut through, the river also would take charge in a short time, in which case the river from Eales' Flats to Raymond

\* No. 2 is a straight cut from Maitland to Morpeth.

† No. 3 is a diversion from Eales' Flat to near Hexham.

Raymond Terrace would silt up, but the river from Raymond Terrace to the mouth of No. 3 diversion would be kept open by the current of the Williams; he thinks if the river were embanked that it would scour itself a sufficient depth; he thinks if the river were embanked all the way along down to Newcastle floods would be kept within their banks, and, in consequence, there would be less necessity for so much dredging; he has observed that neither the tides nor strong gales have any perceptible effect on the height of the flood; he thinks that the silting up of the country at East and West Maitland which now goes on would to a great extent still go on if the diversion No. 2 were cut, because floods would flow in the old crooked channel, and deposit in it their silt; he agrees that if a relief channel is cut the old channel naturally would correspondingly silt up as a large portion of its water was withdrawn; No. 1\* diversion passes through rock, and on the lower end discharges into flat silt country, where its course would be impossible to control; he thinks further, that if such diversion were made, the original channel of the river, past both Maitlands and down to the mouth of No. 1 diversion, would silt up to such an extent that the two channels together would only be equal to one; he thinks the overflow which is now taking place into Howe's Lagoon, would, if left alone, in time become the river channel, as he thinks it was formerly; he thinks the embankments which settlers have put up have been of great use in keeping out a large number of small floods, which seriously obstructed cultivation and caused much damage; in regard to the 1857 flood, he examined the river above Cummins, and observed that by reason of its very high banks the whole body of the flood passed through the channel, and thinks, therefore, that if that were the case at this place the same thing might be made elsewhere, by means of banks carried on down the river; on account of the protection given to roads and traffic on them by reason of the banks, the Government was induced to give £1 for £1 towards the construction of such banks, which surround the town of West Maitland; he is in doubt as to whether it would be possible by means of embankments to exclude such a flood as 1893 from covering the land; he thinks that the embankment at Cummins should be maintained to prevent the overflow, and if the flood overflow at Cummins were shut up, that the original river before long would so scour out as to accommodate itself to the increased quantity; he thinks that the fertility of the land is of not so much consequence as the exclusion of numerous small floods which cause damage to the crops of the farmers; he thinks that if the land were allowed to be covered by frequent freshes the damage to the land would be greater than if they would have to manure their land in consequence of the exclusion of the flood-waters; he thinks the irregular character of the floods causes a great deal of damage which cannot be provided against except by embankments, and thinks that embankments, in addition to their benefits by keeping the river within its channel, contribute to enlarging the carrying capacity of the river, and in doing so they tend to lower the height of the floods; he thinks that the land, being a sandy loam, is peculiarly suitable for cultivation of lucerne, because of its loose texture and ready drainage; he thinks that the successive crops of lucerne taken off the land must naturally lessen its fertility, and thinks further that lucerne plant, which throws its roots to a great depth, is not readily fertilised by such top-dressing as the flood deposits puts on the land; consequently he thinks that manuring by means of flood overflow would not be effective in regard to lucerne-growing; he thinks that the reputed decrease of fertility of Bolwarra embanked land is probably due to the exclusion of flood-water, whereby the deep soil has become dry; he thinks that the floods do not last long, and the land, the further and further it gets from the dry parts in the centre (when it is embanked), is consequently less fertile than the land which has received more copious quantities of water from recent floods; he notices that the sandy loam composing these fertile lands is very porous, and readily dries away the surplus moisture; he thinks that lucerne, if submerged under floods in winter, will last many days without dying, but in hot weather of summer a few hours' submersion will kill the plant; he thinks that if the diversions proposed became the main channel of the river that the tide would come up in much greater volume as far as Oakhampton, and would bring salt water in the dry weather to the intake of the pumps, and other arrangements would have to be made to preserve the fresh water at the intake of the pumping station; he notices that in a great many floods the first flood wave comes from the lower rivers and attains very nearly to the height which the second wave coming from the upper rivers attains, and that this is very often the case; he says that the first wave comes forward and then there is a halt, and soon after the second wave appears, which he takes to be the flood-waves from the Goulburn and the upper river; if that be the case Mr. Gordon's half-flood diagram is not correctly shown, because it would reach from the lower river-level nearly to the full flood height and then be drawn out for several days, as he has shown, in which case the benefit of half-flood promised by Mr. Gordon's flood-scheme would not be attained; although he acknowledges that the high crest of the wave would not last long, he has a number of objections to a long continuance of the height of half-flood; he thinks the great objection to the reservoir at Denman is the length of time which the water would be kept up to a high level, at a height which would prevent the opening of flood-gates and stop most of the drains; he thinks in any case, now that most of the land is embanked in the Maitland and Pitnacree districts, that the floods get away quicker than formerly, when all low-lying lands were filled by the flood; he thinks that the cultivated lands at Fishery and Wallis Creeks might be still further improved if the creeks were embanked to guide the water to its exit instead of allowing it to spread all over the cultivation and flats; he thinks Mr. Price's scheme is too large to begin with, and would sooner see it carried out in detail on a small scale on the smaller rivers; he remarks that the Goulburn passes through sandstone rocks, and the whole bed of the river is filled with sand; he thinks that if such reservoir were made, it is not improbable that before many years the sand brought down would silt up reservoir to the level of the lower sluices; he thinks the sand would come through the sluices whenever they were opened as soon as it reached the level of the bottom; he thinks that hitherto there has been a tendency for settlers to place their banks too near the river.

Council Chambers, West Maitland, 3 May, 1899.

*Samuel Porter* :—I have seen all the floods since 1857; I do not know whether the 1893 flood was as high as the 1820 flood; I am of opinion that the channel of the river in high flood is inoperative,—as a proof of it I have observed at McCrae's Hollow that where the water overflowed the land from one bend to another the water was driven backwards and flowed up the channel; high floods deposit much silt on the land; the silt deposit is good manure except the sand; the sand mixed with silt makes good soil, but the bare sand does not; the sand deposits are brought on to the land by strong currents,—weak currents

\* No. 1 diversion is a straight cut from Bolwarra to Largs.

currents and still waters from floods deposit silt; I think that excluding the floods by means of an embankment is injurious to the land, and that the river-bed is rapidly silting-up with sand-beds and silt; before 1857, I noticed that the banks were sloping and often grassed; the 1857 flood was the first to commence to cut away the banks; I think the river is raised by the falling down and wearing away of the banks; the cutting called Gillies' Diversion has brought the sand which is now noticed to overflow the land; the cutting of the diversions proposed by Gordon would be a benefit to all parties at East and West Maitland; I do not think it would affect or increase the floods at Morpeth, because the water would get away quicker; if the flood is excluded from the land for a number of years the land would become impoverished; without manures, I acknowledge the land would get exhausted; if the people were compelled to use bone-dust and superphosphates they would be losers by the change,—the change being the excluding of the floods; I am not in favour of forming a reservoir at Denman; if an accident happened to the reservoir they would be all drowned at Maitland; if the bank at Cummins had not broken, the Belmore Bridge would have been carried away; the breaking of the Bolwarra banks and the town banks in 1893 was the reason why not so much damage was done as might have been expected; the system of farmers making the embankments as they like has the effect of one injuring the other, and there is no remedy yet for this sort of action; the Government system of inspection should prevail in the flooded districts, and the Government should have the supervision of erection and building of all banks; I am not prepared to answer whether the settlers would agree for the interest on the large sum involved in these reliefs; diversions proposed to shorten the river would have a very beneficial effect in getting the floods away quicker; I advocate the diversion of the river from East Maitland to Morpeth,—that would cause as much relief as they want in this district, but I nor anyone else here do not wish to see the people at Morpeth injured for our benefit; the embankments by shutting out the floods have done harm to the farmers because when dry weather comes the ground produces nothing; I think they have made a bad exchange by keeping out the floods instead of letting them come over the land as formerly.

*John Gillies*:—Mr. Gillies does not think that he can give any evidence which would be of particular service seeing that so much evidence has already been given on the subject, and all the engineers have discussed the subject for years past; he is much concerned with the interests of West Maitland, and has been an observer of the flood prevention discussion for years; he does not wish that anything should be done to the injury of others; of all the schemes that he has seen for flood prevention he most favours that of Mr. Price for reservoir at Denman; he thinks that project the only feasible one to effect the purpose at the cost which is possible to be raised for this district; he thinks that the work is a national work, and that the Government should at least contribute one-half; he states that two former Governments have intimated to him that they would do so much: he caused to be published to the public of West Maitland Mr. Price's scheme, showed them how practical this scheme was, and endeavoured to allay the fears which were entertained as to the effect of such a dam breaking by telling them that the Johnstonville dam was not a case in point, because Mr. Price explained to him that if the Johnstonville dam had been properly built it would not have burst; this dam had been leaking for some years, and was defective in many details; Mr. Price explained to him that if the dam were built with the engineering skill which it required it would be impossible for it to carry away; he thinks that, as Mr. Price showed it, on the erection of his dam the land would not be flooded; as a proof that the foundations of the dam were good, he had since obtained a grant given by the Government of £800, which he used in sinking bores to test the ground of the foundations, and found it to be of a very reliable character; if the dam and proposed diversions, as proposed by Mr. Gordon, were to be the same cost, he still prefers Mr. Price's dam proposal; he thinks if the diversions were made, the full strength of the current at West Maitland would be much increased, and consequently there would be the more danger of cutting away the banks on the town side, and the same applies to the banks in the course of the river so altered.

Council Chambers, East Maitland, 2 May, 1899.

*John Ewing* said that he gave evidence at the first Commission in 1869, and then favoured the idea of making a cutting from Pitnacree down to Morpeth; this would not flood Morpeth; he had no proof of this, it was simply a scientific fact; Mr. Dickson offered the Government as much land in Bolwarra as would carry a canal from the river right from Bolwarra House down to the river at Largs; Mr. Moriarty recommended the Government not to accept the offer, because it would flood Morpeth; it would not flood Morpeth; the quantity of water that passes down the river in a given time is the same at West Maitland as at Morpeth; the water will not affect Morpeth more than West Maitland; there is no way of effecting the relief of the floods without straightening the river; the 1893 flood was much higher than any previous flood; there is no effective cure for such floods as the 1893 one; in the 1893 flood the water might have been 3 feet higher at Belmore Bridge, but that is only a guess; at Pitnacree Bridge the 1893 flood was 6 feet higher than any previous; it was much less at Belmore Bridge; if the bank at Oakhampton had stood, it would have caused a great inundation at Bolwarra; the banks put up by West Maitland and private people have had the effect of washing away much property, and if such banks carried away there would be serious consequences; the Government cannot regulate private people building the banks; the action of such persons building dams at their pleasure makes it risky for people opposite; the excessive bends in the river make channel inactive in a high flood, and a crooked channel is very inactive in time of flood, but it moves in some way underneath the surface of the water; silt and sand is brought down in time of flood, and deposited on the land between Maitland and Morpeth; if the channel were straightened there would be an effective flow in the right direction, and the great body of the deposit would be carried by; the land would lose a large part of the present deposit, but the farmers are taking deliberate steps to shut it out; Bolwarra farmers and others have told me that the crops are not nearly so good, now that the floods are shut out, as they were formerly; in this matter I do not think the Government has any function to interfere; I have heard of the proposal to make a reservoir at Denman, and do not think it a wise proposal; I think that the floods of the lower river are capable of flooding the district, even if the upper river were retained; in 1893 flood, the land was flooded before a flood occurred at Singleton; the effect of a dam at Denman would be to prolong the floods longer than otherwise, and such prolonging the floods is what the farmers most suffer by; such a dam would be very dangerous, if it broke away the results would be disastrous; the project is highly dangerous for the people living in the valley below;

the

the people of the valley of Maitland would be in a dangerous position if the dam broke; I would rather have the risk of being flooded than drowned; the effect of Gillies' Cutting was to lower the height of the flood at Belmore Bridge by 9 inches; this is proved by the fact that when the flood flows over the flood-gates now, it is 9 inches lower at Belmore Bridge than it was before any cutting was made; I think that this is a very good proof of the effects that would occur by straightening the river from Maitland to Morpeth; I expect great lowering from the bends being cut out; (this circumstance was told me by Dr. Alcorn); the flood-gates have been a blessing to the farmers at Fishery and Wallis Creeks; big floods, of course, come over the gates, but the farmers are relieved from numerous small ones; the embanking of the land carried out by farmers also relieves them from numerous small floods, but when big floods come over them they will be in a bad way: originally the only course of the floods was across Bolwarra Flats, and for that reason Mr. Dickson offered the Government land to make a channel through there; he also offered £1,000 or £2,000 to help the work, and when the Government would not accept his offer, to protect Bolwarra these banks were made; no channel or works of any kind would reduce the height of such a flood as the 1893 flood; the road from East Maitland to Pitnacree Bridge had a deposit of 2 feet of silt on it in the 1893 flood, which shows that there was no current in the water; in the 1893 flood there was very little current anywhere, for the flood-boats could be pulled about anywhere without being affected by currents: artificial works would nevertheless always be useful for numerous smaller floods up to 31 feet on Belmore Bridge; such floods have all to pass between the rising ground at Morpeth and Largs; I do not know what the strength of the current is there; if the river is straightened from Maitland to Morpeth it would cause a considerable drop in the usual height of floods; I do not believe that straightening the river can have any effect in increasing the height of floods at Morpeth.

*G. T. Chambers*:—The 1893 flood was 8 feet higher than previous floods in East Maitland; the 1893 flood was much less at Belmore Bridge than at East Maitland; the flood was falling from the back into the river over the timber embankment, and flowed across the railway embankment; the reason was that it flowed from the backwater into the river because it entered it at a higher level than is at Oakhampton; West Maitland platform was 9 feet under water in the 1893 flood; the railway embankment from Wallis Creek to East Maitland backed the floods and raised them higher than they would be; if the dams, flood-gates, and other obstructions now existing had existed in 1857, the 1857 flood would have been as large as the 1893 flood; the river is considerably higher than it used to be, and on account of being banked all round and shut in by flood-gates it will rise higher than it used to do; the clearing of the country has contributed to the rising of the floods more rapidly than before; the flood in Wallis Creek was much heightened by the railway embankment; the only way of mitigating floods is to begin lower down and improve the get-away; if the river is straightened from Maitland to Morpeth, means would have to be provided to get the rapidly-rising water away from Morpeth; a great deal of extra water would be brought down to Morpeth if the river was straightened which would also back-up the Paterson; the recent break through of the river at bends has lowered the flood levels in West Maitland; the bank at Cummins has saved the whole of the valley of West Maitland from floods; the banks at Bolwarra and Cummins have increased the floods at and below East Maitland; the best means of relief would be No. 3 diversion; people think that if that were cut, the river would silt-up between Green Rock and Raymond Terrace down to the mouth of the Williams; if this diversion were made only as for an escape, the tide would keep the river open; Wallis Creek has greatly silted-up its bed because of the flood-gates checking the run of water both ways; if diversion No. 3 were made merely as an overflow, the tide would keep the river channel between Raymond Terrace and Hinton open; I do not think it is true that schooners and steamers used to go up to West Maitland; the river from Morpeth to West Maitland is much shallower than it used to be; the clearing of the up-country generally has been the cause of the rise of the silt; floods out of the Goulburn bring great quantities of sand; I know of old trees being burnt down 9 feet in the ground, showing former deposits, and I know of fences being covered up by deposits of recent times; I know of places which were swamps when I was young, and are now cultivated; the effect of a great reservoir at Denman would be to prolong the floods; I do not think it would be an effective relief; such a dam is all very well for one flood, but when floods follow each other it cannot be used.

*George A. Eckford*:—I live at Pitnacree Road: the floods and the sediment greatly improve the land; when land is scoured, of course it is injured; Bolwarra has embanked its property, but it has impoverished its land; in making a diversion, and shortening the river, the people lower down should be considered; I have heard a lot of talk about these two diversions, and think that it would be the best that can be done; below Pitnacree Bridge the 1893 flood was 6 feet higher than any previous floods; I think the average depth of the flood over the ground between Morpeth and Largs is 5 feet; the current across this place is very strong in places in a high flood; the embankment put up by settlers has raised the river, and is injurious to the properties lower down; this refers especially to Bolwarra; the river in a high flood has no channel, as existing crooked channel does not act; the new diversions, with the banks raised by excavation, would have to be under the same condition as the original river with its present high banks; these proposed diversions are about the only effective remedy, provided they are carried down to the bottom, and not a partial scheme; I disapprove of the project of the reservoir at Denman; I fear it would result in bursting, like Johnson's reservoir in America; no municipality has received more Government assistance against floods than West Maitland, and all the Bolwarra embankments were subsidised, pound for pound, by the Government; I do not see why other parts of the district should not be also assisted; if the district were charged by the Government with the heavy cost of making reliefs proposed, the land would not be worth the taxes put on it.

*East Maitland Council Chambers, 1st May, 1899.*

The Mayor of East Maitland, in conversation with Mr. Bell, said that the water from the town runs out through under the railway, and some runs across the grass paddocks; the floods have kept on raising that land, and there is no get-away for the water over the land; we have no right to let the water away: two fences have been completely covered with silt.

*Mr. McLaughlin* said that the main drain from East Maitland reaches the river at Raworth; it is a very deep drain, the farmers cut it; it is not very straight, the depth is about 10 feet; this is the only drain we have from the town, and the water runs into the hollow beyond the railway, and between Morpeth and Maitland railway line, where there are some ponds; it is there where it has silted up so tremendously.

*Mr.*

*Mr. Bell*:—The ground has silted up so as to cover the fences in places? I know when the flood broke through beyond West Maitland, it lowered 18 inches; instead of cutting down behind the town, it cut across the road and into the river; it was higher in the back than in the front; the water bent the piles at High-street Embankment into the river.

Fishery Creek never comes over the bank after it has come down the river? Wallis and Fishery Creeks could never rise over the bank unless it filled from Oakhampton.

And supposing that the bank stands and does not break, what do you imagine would happen? I believe the Belmore Bridge would be carried away.

And you say it would rise the river under the Belmore Bridge? I know a friend who lives beyond the bridge, and he said that half an hour after the embankment went at Oakhampton, it was lowered 18 inches.

*The Mayor*:—The water above the bridge lowered 18 inches within half an hour after that embankment gave in; I believe that under the Hospital, at Campbell's Hill, was originally the river.

*Mr. McLaughlin*:—I gave evidence in 1869; there was a proposal to cut a canal from beyond West Maitland into Hexham, and since that time Mr. Price has made a survey of a large reservoir at Denman—which do you favour? I favour the canal, because the water that goes down the canal will be outside Nobbys before the water that went through the river would be at Morpeth.

But the canal would shorten the river by 15 miles? Well, the canal would shorten the river more than from Morpeth to Hexham, because it is 16 miles from the bridge to Morpeth by the river, and it would shorten it by 10 miles; of course the cut would be a straight one.

*Mr. Bell*:—Persons tell me that thirty-five years ago, schooners, ships, and steam-boats, drawing 7 feet of water, came to West Maitland; when I went up the river the other day in a boat drawing 3 feet, she stuck all the way up? When I came to Maitland they were building a steamer at the Horse-shoe Bend.

They tell me that the deposits brought down were mostly silt? I know a great deal of it is sand.

The country between here and Singleton is now more or less cleared;—that would allow a more rapid flow of the river, would it not? It would in one measure; there used to be no sand in the river; when I first saw it the river was not filled up with sand; there was 15 to 20 feet of water; on the bottom it must be gravel or mud, but it did not gather in heaps.

They are now banking the river up, and the object of that banking is to keep the river in its bed; this they have done more or less successfully except at high floods; the more they bank the river up in this way the higher the river floods will become? Yes, the river floods will be higher; it was 6 feet higher than it ever was before in Melbourne-street, East Maitland (the 1893 flood); it was higher than it ever was for the last fifty-nine years.

The more successful they are in embanking the river, the more they will keep down the silting-up process;—will that not be injurious to the land? It will be injurious to the land; they can afford to have a flood every five years, but it is hard to have three or four in a year; the silt caused by the floods is a valuable manure; if the river goes rapidly over the ground, it will take the substance out of the land; I have proved from a garden I had; I have seen 18 inches of silt on it.

What do you suppose is the average amount of silt that the flood leaves? I cannot say; it is all according to the way the water runs over the land; it will leave no silt on the land if it goes rapidly over it.

If you were to make this canal, the real effect would be that less silting would take place than now? I do not expect the canal would prevent the very large floods, such as the 1893 flood; it would do a great deal of good to prevent the ordinary floods, and it would lower the floods, and possibly shorten their duration.

What do you think about Mr. Price's dam? I would be very sorry to live within 10 miles of the dam; some of the land down at East Maitland would be flooded by a 10-foot rise.

You gave some evidence as to what the people would pay, or what you would pay? Yes; I think the same now.

It was in 1822 that Mr. Cullen sailed a boat up Melbourne-street, East Maitland, and landed stock on Stockade Hill; the mayor said that the 1893 flood, in East Maitland, was the highest, and that the water was 2 feet higher this side of the railway than on the other; the only get-away was the little culvert in the railway; the water was 4 feet 6 inches in the Council Chambers.

SYDNEY: WILLIAM APPLIGATE GULLICK, GOVERNMENT PRINTER.

1899.

[2s.]

CIRCULAR QUAY ACCIDENT INQUIRY BOARD.

REPORT.

To the Hon. William John Lync,

Premier and Colonial Treasurer,—

THE Board appointed by you on 26th October, 1899, "to thoroughly investigate and report as to (1) the cause of the recent accident to the stage of the floating jetty at Circular Quay, and (2) whether the accident arose through negligence on the part of the Manager of Public Wharfs, the officers of the Public Works Department, or any other Government official," have the honor to report as follows:—

The Board has made a careful inspection of the scene of the accident and of the fractured stage. They have held twelve sittings, and have examined twenty witnesses.

The decked pontoon and landing stage at which the accident occurred were located at the south-east corner of the Circular Quay, near the foot of Phillip-street. The pontoon is approximately 60 feet in length and 35 feet in breadth, and was moored by chains and anchor some 20 feet distant from the Quay wall. The space between the pontoon and Quay was bridged by a platform or stage 24 feet in length and 11 ft. 2 in. in width, the actual width available for traffic being 10 ft. 10 in. It was constructed as follows:—Three 10-inch by 5-inch longitudinal Oregon beams secured at the shore end by wrought-iron hinges, one to each beam, and resting at the outer end on the deck of the pontoon, on which the stage was free to slide between guide-pieces with the rise and fall of the tide. The beams were framed and bolted together by 1-inch wrought-iron tie rods and nuts, 4 ft. 4 in. apart, and on them were nailed transversely 2-inch hardwood planks, extending 7 inches over the face of the outside beam and forming the decking of the stage. Hand-rails were secured to each side of the stage by 4-inch by 3-inch hardwood stanchions bolted to the outside beams; the top rail was formed by 3-inch by 3-inch hardwood, notched diagonally into the top of the stanchion. The middle rail was formed of 3-inch by 2-inch hardwood checked over the stanchions and secured with nails.

The Board inspected the broken beams in the Water Police Court premises, where they were laid out in their relative positions. The wood was very much decayed, particularly on the top side of the beams, which had been opened up by the many nails driven from time to time through the deck planking, thus allowing the damp to percolate—the combined action of rain, rust, and dirt all contributing to the general deterioration. Judging from the number of nails and holes in the beam, the Board is of opinion that the decking had been replaced on more than one occasion, although the Department of Public Works are cognisant of one redecking only. One side beam was broken directly through the middle, while the other parted about 3 feet from the centre, the effective section being reduced in the first beam to 5 inches by 5 inches, and in the second to 5 inches by 6 inches. The middle beam was broken in two places, viz., at the centre and at the end of the hinge, and had absolutely no sectional value whatever, it being supported from the decking. At all the points of fracture decay appeared to have been caused or hastened by rust from the bolts which passed through at these positions, the timber being largely perished wherever the iron had been in contact with it. The middle beam, owing to a permanent deflexion, had been at the time of the last repair through-fastened to the decking by three bolts, it being drawn up by this means in line with the other beams. The ends of the longitudinals had 10-inch by 4-inch hardwood fish-pieces 5 feet long bolted alongside, intended, apparently, to relieve the ends from the wear on the deck of the pontoon. These pieces gave no support whatever to the structure.

The

The Balmain Steam Ferry Company's steamer "Waterview," shortly before half-past 6 o'clock on the evening of September 23rd, was landing at the Floating Jetty a picnic party estimated to number 500 children and 200 adults. When a considerable number of the passengers had landed upon the pontoon, the boys, a majority of whom had left the steamer, were directed to remain behind until the whole of the girls had gone ashore. The teachers forthwith proceeded to muster them upon the stage, where they remained until the girls had reached the Quay. As the last rank of girls were stepping ashore the stage parted in the centre. It bore at the time probably from sixty to seventy children and a few adults—the exact number cannot be ascertained. When the boys commenced to move ashore the fracture occurred, precipitating them into the water and resulting in the loss of two lives.

The Board is of opinion that the accident was caused wholly by the defective condition of the stage. The Oregon girders had become so rotten as to be quite unfit to support even a lighter stationary load than that to which they were subjected at the time of the accident. It does not seem to have occurred to the men who redecked the platform two years ago that the permanent deflection of the centre beam was detrimental to it, nor does this defect appear to have been brought under the notice of any responsible officer of the Public Works Department. The workmen when examined as to the condition of the stage at that time stated that the timbers then exhibited no sign of decay. There can be no doubt whatever that decay must at that time have been active. The officer under whom the repairs were executed has since died, and the Board cannot ascertain that the girders were examined by him when directing the work, but the men who executed his orders appear to have had no doubt as to the soundness of the timber. Verbal reports are alleged to have been made by two watchmen at Circular Quay of what appeared to them evidences of the weakness of the stage; but the Manager of Public Wharfs, who has invariably acted upon the supposition that none of his officers are competent to express a reliable opinion upon the stability of the structures under his management, does not appear to have thought it incumbent on him to forward their reports to the Department of Public Works. One witness of the occurrence attributed the collapse of the platform to a shock imparted to it through the bumping of the pontoon by the steamer "Bald Rock." The steamer was undoubtedly close to the pontoon at the moment of the accident; but the Board are quite satisfied that she could not have touched it, and that her approach did not unduly disturb it.

The Board cannot discover that the accident is in any degree due to neglect of duty on the part of any officer of the Government. An unfortunate misunderstanding between the officers of the Department of Public Works and the Manager of Public Wharfs undoubtedly led to the use of the stage for a purpose other than that for which it was constructed. The Manager of Public Wharfs had purchased a pontoon to replace one, the use of which for both passenger and wool traffic had been sanctioned by special regulations, and the officers of the Department of Public Works constructed a stage upon the assumption that it would be used in connection with the pontoon which had been moored at the extreme eastern corner of the Quay, which had been used exclusively for wool traffic, and which had been removed and not replaced. The Manager of Public Wharfs, assuming that the structure handed over to him fully answered his requirements in point of stability, permitted its unrestricted use for both passenger and wool traffic. The Department of Public Works have had no official knowledge of the use of the platform. The only substantial repair of which any record can be found was effected in 1897; the stage was then replanked; and neither then nor at any other period was any intimation conveyed to the Department that the platform was, under any load, considered unsafe.

The evidence reveals a most unsatisfactory state of affairs in regard to the inspection of the many wharfs, jetties, and stages owned by the Government. There is an entire absence of responsibility on the part of any officer for inspection, however casual or superficial. The various structures, on their completion by the Department of Public Works, are handed over to the Treasury, which deposes its officer, the Manager of Public Wharfs, to arrange for their lease and general use and to collect the consequent revenue. No officer of the Department of Public Works is instructed to subsequently inspect this Government property with a view to insure its security

or

or reasonable and proper use ; and it is obvious that neither the Manager of Public Wharfs nor his subordinates, in the absence of the necessary technical knowledge, can satisfactorily discharge this duty. In point of fact, the Manager of Public Wharfs emphatically disclaims any responsibility in this direction, derived either from the terms of his original appointment or from any subsequent instruction, although he has been in the habit of directing the attention of the Treasury or of the Department of Public Works to any necessity for repair which has come under his own observation or that of his subordinates. The ordinary routine by which repairs have been effected has been as follows :—If, in the discharge of their respective duties, the officers, either of the Department of Public Works or of the Treasury, have observed any structure in need of repair, they have reported it to the head of their Department ; and the Department of Public Works has been formally requested by the Treasury to do what may have been necessary. Minor repairs, however, have been carried out by the Engineer of the Metropolitan District on the request of the Manager of Public Wharfs, or on the report of his own officers. All work of an important character has been referred to the Treasury, and has ultimately obtained the sanction of the Engineer-in-Chief for Public Works. This unsystematic and irresponsible inspection has afforded no guarantee for security. Nor is any supervision exercised as to the proper use of the large number of structures under the control of the Manager of Public Wharfs. Officers of the Department of Public Works have directed his attention to an obviously improper use of wharfs and sheds, and the cause of complaint has in each case been removed ; but in the absence of systematic inspection, and of such technical knowledge on the part of the officers of the Manager of Public Wharfs as would enable them to determine a safe limit, considerable damage might be done or great risk might be incurred before the intervention of the Engineer-in-Chief for Public Works was sought.

The Board has been informed that at the urgent request of the Under Secretary for Public Works temporary provision has been made for the inspection of the stages in use at the Government wharfs in the metropolitan district. It is, however, of opinion that an officer should be immediately appointed to systematically inspect the whole of the Government wharfs, jetties, and stages in the metropolitan district ; that this officer should report to the Engineer of the Metropolitan District and should be empowered to interdict the use of the whole or any portion of a structure which he might consider dangerous by reason of its defective condition, and to direct the discontinuance of any use of a wharf, jetty, or stage calculated to impair its security.

The Board desires to express its appreciation of the valuable services which have been rendered by Mr. B. H. Friend in his office of secretary and shorthand writer.

G. McCREDIE,  
Chairman.  
C. McALLISTER.  
W. McRITCHIE.

B. HARRY FRIEND,  
Secretary.

---

MINUTES OF PROCEEDINGS of the Board appointed to inquire into the cause, &c.,  
of the Accident, on 23rd September, to the Floating Jetty, Circular Quay.

---

WEDNESDAY, 4 OCTOBER, 1899.

The Board met at the Board-room, 40, Young-street, at 10 a.m.

Members present:—G. McCredie, Esq.; C. McAllister, Esq.; W. McRitchie, Esq.

Resolved, on motion by Mr. McAllister, seconded by Mr. McRitchie, "That Mr. Geo. McCredie be appointed Chairman of the Board."

The Board having deliberated as to their procedure inspected, at the Water Police Court yard, the broken beams of the staging of the Floating Jetty.

The Board then proceeded to inspect the scene of the accident.

The Board, at 12:40 p.m., adjourned until 10 a.m. on Thursday, the 5th October.

GEORGE McCREDIE,  
Chairman.

---

THURSDAY, 5 OCTOBER, 1899.

The Board met at the Board-room, 40, Young-street, at 10 a.m.

Members present:—C. McAllister, Esq.; W. McRitchie, Esq.; G. McCredie, Esq. (Chairman).

The minutes of the previous meeting were read and confirmed.

The Board proceeded to the Water Police Court, where they resumed their inspection of the beams of the fractured staging, which had been placed as nearly as possible in their respective positions. The Board also took measurements and sections and the data for a calculation of the strength remaining in the structure at the time of the accident.

The Board then proceeded to the Government carpenters' workshops, Circular Quay, and thence inspected the decking and handrailing of the fractured staging. Planks constituting portion of the flooring were weighed with a view to obtain the weight of the entire decking.

The Board, at 4 p.m., adjourned until 10 a.m. on Friday, the 6th October.

GEORGE McCREDIE,  
Chairman.

---

FRIDAY, 6 OCTOBER, 1899.

The Board met at the Board-room, 40, Young-street, at 10 a.m.

Members present:—C. McAllister, Esq.; W. McRitchie, Esq.; G. McCredie, Esq. (Chairman).

The minutes of the previous meeting were read and confirmed.

Resolved, on motion by Mr. McAllister, seconded by Mr. McRitchie, that representatives of the Press be not admitted to the sittings of the Board.

The Secretary was instructed to furnish on application, daily, to representatives of the Press a summary of the proceedings of the Board.

The Board deliberated as to their procedure.

The Board, at 3:30 p.m., adjourned until 10 a.m. on Tuesday, the 10th October.

GEORGE McCREDIE,  
Chairman.

---

TUESDAY, 10 OCTOBER, 1899.

The Board met at the Board-room, 40, Young-street, at 10 a.m.

Members present:—C. McAllister, Esq.; W. McRitchie, Esq.; G. McCredie, Esq. (Chairman).

J. S. Cargill, Esq., Crown Law Department, was also present.

The minutes of the previous meeting were read and confirmed.

The following witnesses were sworn and examined:—William Henry Mitchelmore, Henry Aiken, Ole Hansen.

The Board, at 1:15 p.m., adjourned until 10 a.m. on Thursday, the 12th October.

GEORGE McCREDIE,  
Chairman.

---

THURSDAY, 12 OCTOBER, 1899.

The Board met at the Board-room, 40, Young-street, at 10 a.m.

Members present:—C. McAllister, Esq.; W. McRitchie, Esq.; G. McCredie, Esq. (Chairman).

J. S. Cargill, Esq., Crown Law Department, was also present.

The minutes of the previous meeting were read and confirmed.

The following witnesses were sworn and examined:—Matthew Agnew, William Edward Cullam, Alexander McMaster, Oscar Thomas Broughton Miller.

The Board, at 1 p.m., adjourned until 10 a.m. on Monday, 16th October.

GEORGE McCREDIE,  
Chairman.

---

MONDAY,

*MONDAY, 16 OCTOBER, 1899.*

The Board met at the Board-room, 40, Young-street, at 10 a.m.  
 Members Present:—C. McAllister, Esq.; W. McRitchie, Esq.; G. McCredie, Esq. (Chairman).  
 J. S. Cargill, Esq., Crown Law Department, was also present.  
 The minutes of the previous meeting were read and confirmed.  
 The following witnesses were sworn and examined:—Frederick Gerder, Francis Kirkpatrick,  
 Robert Rowan Purden Hickson, Cecil West Darley.  
 The Board, at 12:45 p.m., adjourned until 10 a.m. on Wednesday, 18th October.

GEORGE McCREDIE,  
 Chairman.

*WEDNESDAY, 18 OCTOBER, 1899.*

The Board met at the Board-room, 40, Young-street, at 10 a.m.  
 Members present:—C. McAllister, Esq.; W. McRitchie, Esq.; Geo. McCredie, Esq. (Chairman).  
 J. S. Cargill, Esq., Crown Law Department, was also present.  
 The minutes of the previous meeting were read and confirmed.  
 The following witnesses were sworn and examined:—John Williamson, James Walter Grimshaw.  
 The Board, at 12:15 p.m., adjourned until 10 a.m. on Monday, 23rd October.

GEORGE McCREDIE,  
 Chairman.

*MONDAY, 23 OCTOBER, 1899.*

The Board met at the Board-room, 40, Young-street, at 10 a.m.  
 Members present:—C. McAllister, Esq.; W. McRitchie, Esq.; Geo. McCredie, Esq. (Chairman).  
 J. S. Cargill, Esq., Crown Law Department, was also present.  
 The minutes of the previous meeting were read and confirmed.  
 The following witnesses were sworn and examined:—George Scott, David Mitchell, James Platt,  
 John Stephen, John Jackson, George Castle.  
 The Board, at 3:30 p.m., adjourned until 10 a.m. on Friday, 27th October.

GEORGE McCREDIE,  
 Chairman.

*FRIDAY, 27 OCTOBER, 1899.*

The Board met at the Board-room, 40, Young-street, at 10 a.m.  
 Members present:—C. McAllister, Esq., W. McRitchie, Esq., Geo. McCredie, Esq. (Chairman).  
 The minutes of the previous meeting were read and confirmed.  
 The Board, accompanied by the Engineer-in-Chief for Public Works, and the Engineer of the  
 Metropolitan District, proceeded to Cockatoo Island for the purpose of witnessing the test of an Oregon  
 beam (24 ft. 6 in. in length, 10 inches depth, and 5 inches in breadth). A dead load was applied in the  
 centre, and the beam broke under the stress of 7,980 lb.

The Board, at 2 p.m., adjourned until 10 a.m. on Monday, 30th October.

GEORGE McCREDIE,  
 Chairman.

*MONDAY, 30 OCTOBER, 1899.*

The Board met at the Board-room, 40, Young-street, at 10 a.m.  
 Members present:—C. McAllister, Esq., W. McRitchie, Esq., Geo. McCredie, Esq. (Chairman).  
 J. S. Cargill, Esq., Crown Law Department, was also present.  
 James Walter Grimshaw was further examined.  
 Angus Moir was sworn and examined.  
 The Board considered their report.  
 The Board, at 1 p.m., adjourned until 10 a.m. on Tuesday, 31st October.

GEORGE McCREDIE,  
 Chairman.

*TUESDAY, 31 OCTOBER, 1899.*

The Board met at the Board-room, 40, Young-street, at 10 a.m.  
 Members present:—C. McAllister, Esq.; W. McRitchie, Esq.; Geo. McCredie, Esq., Chairman.  
 J. S. Cargill, Esq., Crown Law Department, was also present.  
 John Jackson was recalled and further examined.  
 The Board considered their report.  
 The Board, at 12:40 p.m., adjourned until 10 a.m. on Friday, 3rd November.

GEORGE McCREDIE,  
 Chairman.

*FRIDAY,*

FRIDAY, 3 NOVEMBER, 1899.

The Board met at the Board-room, 40, Young-street, at 10 a.m.

Members present:—C. McAllister, Esq.; W. McRitchie, Esq.; Geo. McCredie, Esq., Chairman.

The Chairman submitted a draft of the Board's report.

Resolved, on motion by Mr. McRitchie, seconded by Mr. McAllister, That the report be now received.

The Board, at 11:30 a.m., adjourned *sine die*.

GEORGE MCCREDIE,  
Chairman.

## MINUTES OF EVIDENCE

TAKEN BEFORE

## THE CIRCULAR QUAY ACCIDENT INQUIRY BOARD.

TUESDAY, 10 OCTOBER, 1899.

Present:—

C. McALLISTER, Esq. | W. McRITCHIE, Esq.  
 GEORGE McCREIDIE, Esq. (CHAIRMAN).

J. S. Cargill, Esq., Crown Law Department, was also present.

William Henry Mitchelmore sworn and examined:—

1. *Chairman.*] You are in the employ of the Balmain Steam Ferry Company? Yes. I am at present master of the steamer "Bald Rock."
2. You remember the 23rd September, the date of the accident to the floating jetty at Circular Quay? Yes.
3. You were in command of the "Bald Rock" on that day? Yes.
4. Will you be good enough to tell the Board, as nearly as you can remember, what you observed at the time of the accident? I was not at the wharf when the staging broke. I left Circular Quay on the afternoon of that day with a picnic party from, I think, a Wesleyan church at Newtown. It was a harbour excursion, and I took the excursionists on board at the floating jetty at about half-past 1 or 2 o'clock.
5. Were there many of them? I had, I suppose, speaking roughly, about 150 on board.
6. You had an opportunity to observe the excursionists as they came on board your boat? Yes. I went alongside the pontoon, and saw the secretary. I did not go on to the pontoon. There were only a comparatively small party of excursionists.
7. You were about to land the excursionists at the floating jetty at about the time of the accident? Yes; I left Clark Island at about a quarter-past 6 in the evening. My intention was to go to No. 4 jetty, but when I got about half-way down the cove, I remembered that I had heard the man who provided the refreshments telling the man who brought them down to the floating jetty to be there between 6 and half-past 6. I suddenly thought of that, and headed for the floating jetty, thinking that I had better land the passengers where I had got them from. As I was approaching the floating jetty, I heard a crash. The "Waterview" was alongside at the time disembarking her passengers. At first I thought the crash came from a small boat which might have been lying alongside the pontoon. I thought I might have crushed her, until I heard the shrieks. I had a fireman and deck-hand with me. My fireman had thrown the eye of the line over the bollard on the pontoon, and was holding the end of the line in his hand. As soon as he saw what had happened—or rather heard, because he could not see much—he dropped the line, rushed out on to the pontoon, jumped overboard, and assisted in the work of rescue. By this time all my people on the bridge had got out on to the iron surrounding the top deck to see what was the matter. As soon as I could force my way out, I asked them to get off the iron, because it was liable to collapse, and I then started to throw out life-buoys. Then to my surprise, I found that my ship was not fast, and I called out to the deck-hand to take a turn with the line.
8. Up to this point, you had not been fast to the pontoon? No.
9. On which side were you? The "Waterview" was alongside the eastern side, and I was coming in on the western side.
10. Did you touch the pontoon at all? No; I did not. So many people were standing in front of me that it was difficult for me to say the exact distance I was from the pontoon when I heard the crash; but I reckon that I was about 8 or 10 feet from it.
11. You are sure you did not bump against the pontoon? I never touched it.
12. *Mr. McAllister.*] You went astern before you lost headway? I was crawling in. I put my mouth to the trumpet to tell the engineer to go astern, and as I stood upright again I heard a crash; then I sang out "Stop."
13. Do you think it likely that your steamer caused a considerable wash? The wash of the steamer could not have reached the pontoon. We gave a couple of strokes astern, but the wash resulting from that could not have reached the pontoon before I heard the crash.
14. There was not sufficient wash caused by the motion of your steamer to joggle the pontoon, you think? I am quite sure of that. It was getting dark at the time; it must have been about twenty minutes to 7 o'clock, and, as I say, we were simply crawling in. You have to feel your way into these places, especially when there is a crowd of people standing about.

W. H.  
 Mitchelmore.  
 10 Oct., 1899.

W. H.  
Mitchelmore.  
10 Oct., 1899.

15. Did you go astern just after or just before you heard the crash? I put my mouth to the trumpet and sang out, "Go astern." I suppose there were one or two revolutions, and I had scarcely stood upright again when I heard the crash. I then called out "Stop!" and the boat merely drifted up towards the pontoon. The fireman had a line on the bollard, and was holding the end of it in his hand. When he saw what had happened he dropped the line and went off the boat at once.
16. You saw him jump overboard? I heard that he did so, but I did not see him. He afterwards told me that I had struck him on the back of the head with the first lifebuoy I threw out. The blow, he said, made him feel dizzy for the moment; but he rendered very good service in rescue work, although his name has not, I think, been mentioned. I saw him putting children on the lifebuoy and pushing them over to the water police to take them off.
17. What is the man's name? Frederick Gerdes. The name of the deck hand was Davis. I do not know what he did. As soon as I got a chance I passed out a lamp to give them as much light as possible.
18. *Chairman.*] I suppose that after the accident you landed your passengers at another wharf? Yes; when all those overboard had been picked up I went round to No. 4 jetty.
19. *Mr. McAllister.*] You say you were carrying adult excursionists? Yes.
20. And I suppose they would come down to your steamer singly or in small parties? Yes.
21. How long were you at the floating jetty before you left? I might have been there twenty minutes or half an hour before I got away. There were a few excursionists waiting on the pontoon when I arrived there, and others continued to arrive in detachments until they were all there.
22. At no time did you notice more than two or three persons together on the pontoon? I did not take particular notice of that.
23. I suppose it would not be usual in any case for passengers to stand on the staging; if they stood anywhere it would be on the pontoon? Yes, as a rule.
24. *Mr. McRitchie.*] What was the state of the tide at the time you are speaking of? It was pretty well full tide then.
25. *Chairman.*] During your experience as master of a steamer I suppose you have seen a great number of persons passing over the floating jetty in a body? Yes.
26. Do you remember any particular occasions? I have landed a large number of excursionists there from Sunday school and other picnics.
27. Do you think you have at any time seen as big a crowd on the staging as were there at the time when it gave way? I could not say. As a rule, when we get alongside we have quite as much as we can do to look after our own gangway stage. We cannot very well see what number of persons are standing on the stage of the pontoon. Our object is generally to get passengers out of the boats as quickly as we can.
28. And they are generally very anxious to get ashore? There is no doubt about that.
29. I suppose this particular floating jetty has been used mostly for the embarkation and disembarkation of excursionists at picnics? Yes.
30. It is the only jetty available for the landing of excursionists? No; there is No. 4.
31. *Mr. McRitchie.*] No. 4 jetty is used now for the landing of excursionists from picnics, is it not? Yes; I was there on Sunday. There were eight boats running from that wharf on Sunday.
32. But you were formerly in the habit of going to the floating jetty? Yes; it was the only jetty we could use. Occasionally we used the eastern side of the Watson's Bay jetty. We took people from there during the time the Manly company had the wharf; but now it is reserved for Government launches and the police. The police launch was moored alongside when we went in on the Saturday night. When people come down to engage steamers they generally mention the floating jetty, because it is the place where excursionists are in the habit of embarking.
33. *Chairman.*] What have you to pay for the use of the wharf? As a rule, before we have been alongside many minutes a wharfinger comes up. He generally knows the steamer is coming. When the parties come down from the picnic he finds out a responsible person, and obtains 10s. for wharfage. The parties hiring the boats pay the wharfage as a rule, not the company.
34. Suppose you went to the wharf with a picnic party, would you have to pay for laying your boat alongside? If we landed anyone there they would come on us for wharfage; but I have heard—I do not know how true it is—that we can lay alongside at any of the Government wharfs for ten minutes, and go away again without paying wharfage.
35. Do you remember seeing any money paid on this particular day for wharfage? The parties in charge of the picnic would do that.
36. Do they pay 10s. per diem, or 10s. every time they go alongside? The wharfage is 10s. a day—that is, 10s. has to be paid for every boat engaged.
37. *Mr. Cargill.*] Would the wharfage fee of 10s. entitle you to use any other jetty besides the floating jetty? Yes; No. 4.
38. So that you could take your passengers from, or land them at, either the one wharf or the other? Yes; as far as I understand the matter.
39. That is why you told the Board just now that your first intention was to return to No. 4 jetty? Yes.
40. Where were you when you changed your mind? About half way up the cove.
41. Was there any boat at No. 4 jetty? I did not notice.
42. Did you, when you changed your mind, see the "Waterview" alongside the floating jetty? I did.
43. Was there anyone on the pontoon? I could not say whether at that moment that was the case or not, but as I approached I saw people standing there.
44. How close were you when you first noticed people standing there? I was going in.
45. Were you 5 or 10 yards off? I suppose I was about 8 or 10 feet off.
46. And up to that point you cannot say whether or not you noticed persons standing there? No.
47. When you got to within 8 or 10 feet of the pontoon did you see any persons standing there? I saw a person standing there, but I did not take very much notice of him.
48. You did not see that it was crowded? No; I could not swear that it was crowded.
49. Had you seen it was crowded you would not have gone alongside? Yes I should; there would be nothing to prevent my going alongside, even if the pontoon were full of people.
50. Would not it be your object to get your passengers off as quickly as possible? I had only a handful of people in this case.

51. That is to say, 150? Yes; 150 persons on a boat like the "Bald Rock" is not many.
52. But there would be some difficulty in getting that number of persons on to a crowded pontoon? Yes. W. H. Mitchelmore.
53. I understand you to say that before you heard the crash you were not nearer than 8 or 10 feet from the jetty? Yes. 10 Oct., 1899.
54. Did you not say that when you first heard the crash you thought you were crushing a small boat against the jetty? Yes.
55. Could you crush a small boat in a space of 8 or 10 feet? Yes.
56. What would be the average beam of a small boat such as would be lying alongside the jetty? I should say about 5 feet.
57. So that, to have crushed a boat with that beam, you must have been closer to the jetty than 8 or 10 feet? Of course I could not swear to a few inches.
58. But you think you were about 8 or 10 feet away? Yes.
59. Where was the fireman who had the rope on the bollard? He was on the sponson.
60. Forward or aft? Forward.
61. That would be the only line you had out at the time? Yes. When we are coming alongside a wharf the fireman and the deck hand would be forward on the sponson; one would be standing by the paddle-box and the other forward.
62. Had not the man forward his line out? The fireman was forward.
63. Near the paddle-box? Right forward.
64. Where was the other man? He would be attending to the other line.
65. But you say he had not his line out? No. Of course I am only telling you what I have heard. I myself did not see what actually occurred.
66. How far from the pontoon were you when you gave the order to stop? I suppose I was 300 or 400 yards.
67. After that you gave no order until the crash came;—is that so? Yes.
68. So that the steamer at the time was drifting into the wharf? Yes.

Henry Aiken sworn and examined:—

69. *Chairman.*] You are master of the "Waterview," a steamer belonging to the Balmain Ferry Company? Yes. H. Aiken.
70. You were in command of the steamer on the night of 23rd September? Yes; I took a Sunday-school picnic down the harbour on that day. 10 Oct., 1899.
71. Will you tell the Board what took place at the time of the accident, as far as you were able to see? I will tell you what I did in connection with the picnic. I went alongside the wharf in the morning, and took away excursionists in three trips—at 9, 11, and half-past 1 o'clock.
72. Did you start from the floating jetty? Yes.
73. Who arranged the picnic? I am not sure, but I think it was a picnic in connection with the Church of England Sunday-school at Enmore. I started on the first trip about a quarter past 9 o'clock.
74. How many passengers did you take on that trip? I think there were about 500 children. I am going by what the secretary said. I asked him how many children there were, and I think he said 500.
75. I suppose there were some adults also? There were a few teachers, but the passengers on that trip were mostly children.
76. How were the children embarked—did they march on board, or did they rush on board as they pleased? They were marched on to the boat.
77. Did they march over the staging on to the pontoon? Yes.
78. Were they marching in file in an orderly way? Yes.
79. Did you take any particular notice of the pontoon at the time? No.
80. How many passengers is your boat supposed to carry? 680 adults.
81. Is it a paddle-boat? Yes.
82. At what time did you make your next trip on the 23rd? At 11 o'clock.
83. How many passengers did you take on that trip? There might have been about 200.
84. Were they children? No; they were chiefly adults. It was the visitors' boat.
85. You made another trip at half-past 1 o'clock? Yes.
86. How many passengers did you take on that trip? About twenty, I think. They were all adults.
87. Do you think that on the occasion of any of those trips there were as many persons on the platform as were there when it broke later on in the day? No; I do not think so.
88. You brought the whole of the excursionists back in the evening in one trip? Yes; and I had not a full load then.
89. About what time did the accident happen? Just before half-past 6 o'clock.
90. Did you take any notice of the state of the tide then? I did not.
91. You came into the floating jetty? Yes; into the eastern side. There were 500 children and about 220 adults; but I am allowed to carry two children under the age of 12 in place of one adult.
92. I suppose the carrying out of your duties as master would necessitate your being on the bridge? Yes.
93. And, being there, you would have a good view of what went on? Yes.
94. I suppose that, at the time of the accident, you were at your usual post on the bridge? Yes.
95. Will you tell the Board all you saw in connection with the accident? I cannot tell you very much about the accident, because directly the steamer is alongside we have to look after our gangway, especially in a case of this sort, when there are youngsters rushing about, and when there is a chance of someone falling overboard or getting injured. It is necessary to stand by the gangway from the steamer to regulate the disembarkation of the passengers. Although I was lying alongside the pontoon with the ship's head at the end of it I did not know what was occurring. I heard the crash, and the screaming which followed; but I really did not know what was the matter until some time afterwards.
96. You did not see the staging break? No; there was a crowd of people standing on the pontoon, and I could not see the staging.

- H. Aiken. 10 Oct., 1899. 97. Could you see whether the staging was crowded? I could not see the staging. I could see only the people on the edge of the pontoon. There was a steady stream of passengers going out. About 250 girls, I suppose, went first; they were mustered on the pontoon, and marched up on to the wharf across the staging.
98. They were got into some sort of order on the pontoon before they crossed on to the wharf? Yes.
99. Teachers were there, I suppose, in charge of the children? Yes.
100. Did they regulate the arrangements which were made for getting the children across on to the wharf? I suppose so. I had no more to do with them when they had crossed along my gangway on to the pontoon.
101. After the children got on to the pontoon the teachers had charge of them? Yes.
102. They took some of them up the platform and landed them? Yes.
103. But you say that you could not see the platform from where you were standing? No.
104. Were you thoroughly fast to the pontoon before you commenced to unload? Yes. I could not go in with any way on, because when I am fast to the pontoon I am only 3 feet from the stone wall. You will see that I have to go in very carefully. As soon as I come to the pontoon I allow the steamer to drift in. I can tell within a foot where I am, and of course I stop the engines at that.
105. You did not bump coming in? No. As soon as I got fast to the wharf I stepped out on to the paddle-box, and I noticed that there were two lines out forward and a line aft. I walked back to the telegraph and sang out "That will do."
106. The engines did not move afterwards? No.
107. You did not notice any vibration of the pontoon? No.
108. While you were lying alongside the pontoon, and when you had made fast, did you notice another steamer approaching it? Yes.
109. Did she have much way on her? No way at all.
110. Which side was she on? On the western side--on the side opposite to me.
111. How far do you think she was from the pontoon? She was from 10 to 15 feet off when I first saw her.
112. You did not notice whether the engines were going? They were stopped at that time. She was just drifting in.
113. You are quite sure she did not strike the pontoon? Well, I was standing alongside the gangway, and if she had struck the pontoon she would have shifted it, and I should have felt the shock.
114. You do not think the steamer coming in created any wash which shook the pontoon? I cannot see how it could do so, because she had such little way on her. One turn at the outside would bring the boat to a standstill.
115. Would the pontoon loaded or unloaded be more affected by an approaching steamer? I should say it would be more affected unloaded.
116. But you did not notice that it was affected at all by the "Bald Rock"? No; I do not see how it is possible for the "Bald Rock" to have affected the pontoon in coming in, because she was hardly moving.
117. What did you do when the accident happened? I could do nothing. My deck-hand and fireman ran away to ascertain exactly what had occurred, and I had to stand by our own gangway regulating the disembarkation of passengers as best I could. The people were simply frantic when they heard of the accident.
118. Did any of your hands jump overboard? I think not. They were all dry when I saw them after the accident.
119. How long have you been in the charge of steamers of the Balmain Ferry Company? I joined the Balmain Company on the 28th May, 1882.
120. During the time you have had charge of the company's steamers you have had a number of picnics? Yes; I think I can touch the record as regards picnics and excursions. I do not suppose there is another man on the harbour who has taken away as many picnic parties as I have done.
121. Have you often on those occasions taken in your passengers at this particular floating jetty? Yes. I have embarked and disembarked some large picnics at that jetty.
122. Have you any idea of the number of excursionists? No.
123. I suppose it is a favourite place for the embarkation of picnic parties? Yes. We also go to No. 4 Jetty. At one time we had invariably to go to the floating jetty, but we go now sometimes to No. 4 Jetty. A picnic has been arranged for next Thursday, from Enmore, to go from the floating jetty, if it is fixed up in the meantime.
124. Do you, yourselves, make arrangements to go there, or do the persons arranging the picnics make the appointment? The arrangement is generally made between those in charge of the picnic and our manager.
125. Who pays the wharfage? The secretary of the picnic party generally pays the wharfage.
126. Have you on previous occasions, when you have gone to this particular jetty, taken away or brought back a greater crowd than were there on the 23rd? I dare say I have had as big a crowd; my boat carries 680 adults, and allowing for the children, I do not suppose I had more than between 500 and 550 adults on the 23rd.
127. That would be considered a rather full picnic? No; we have had bigger picnics than that.
128. Have you noticed upon any particular occasion when you have landed passengers at the floating jetty that they crowded the platform more than they did on this particular occasion? That I could not say. As a rule, when picnic parties get alongside the pontoon or wharf, the teachers muster the children to see that they are all there, and there is then a steady stream of passengers from the boat to the wharf. The children generally keep together until it is ascertained that they are all there.
129. Do you mean to convey that the children massed together would form a heavier crowd in disembarking than would an ordinary crowd of grown-up persons leaving the pontoon? Yes.
130. Because the children are mustered on the platform and then marched off in a body? Yes.
131. *Mr. McRitchie.* It is a rule of your company that you stand by the gangway when disembarking passengers? Yes. If I cannot be there myself, I see that someone else is there; but I am generally there myself.
132. You were standing by the gangway of your steamer when the children went on to the pontoon? Yes.
133. Did they leave the steamer quietly? Yes.

134. You had a stage with a double railing leading on to the pontoon? Yes.
135. Your responsibility ceases when you get the children from your steamer on to the pontoon? Yes. I cannot understand the staging giving way with a few children upon it. You would think that if you piled the staging up with as many children as it could hold, it would stand and would not carry away.
136. Did you notice whether it was high or low water at the time of the accident? The water was pretty low. I could not say whether it was ebbing or whether there was a young flood.
137. The staging would go well up and down in that case? Yes. I do not know the height of the pontoon, but it is higher than No. 4 jetty.
138. The lower the water the less the strain upon the staging would be? That, I think, would be the case.
139. *Mr. McAllister.*] Had you only one gangway out? The floating jetty is not long enough to admit of my putting a gangway out aft.
140. There would be no room for you to put out a second gangway? No.
141. Your deck-hand and fireman were assisting you to regulate the exit of passengers? Yes. After the ship is made fast to the pontoon or wharf their duty is to put the gangway plank out.
142. Assuming the gangway to be out, and your sponson to be close against the pontoon, would there be any children, teachers, or parents stepping off the sponson on to the pontoon, or were they all waiting their turn in an orderly way? In a case of this sort there are generally some adults who jump off close to the gangway in their effort to get out first. A great many persons went away and caught the tram, and did not know anything about the accident. The accident happened when the last batch of children were going ashore.
143. What would be the average age of the children you had on board? I suppose their ages would vary from 3 or 4 years to 10 or 12 years.
144. Would there be any children of 14 or 15 years of age? Some of that age.
145. The children mustered on the platform would naturally be of the more helpless section of the party? I do not know what their regulations are; but I should think that all the children, whether big or small, would be mustered.
146. You say that it was when the last section of the children were being landed that the staging broke down;—would you be able to see from where you were standing on the steamer that that was the case? No; I could not see it from where I stood. I could not see the gangway from the steamer.
147. It being low water, you could not see over the heads of those on the pontoon? No.
148. The Board wish to arrive at a reasonable estimate of the weight of the children on the gangway at the time it broke down. You have said that it was when the last section of the children from your steamer were passing over the gangway that it broke; these were little children who had been mustered on the gangway by their teachers, or whoever was in charge of them? The children had been mustered, and, as far as I could gather, they were standing on the staging waiting for the other children in front of them to get clear.
149. After the accident what happened;—did your men stay on board the ship, or did they help to get children out? My deck-hand and fireman went away, but I, of course, could not leave the gangway.
150. Were there many people on the pontoon at the time of the accident? Yes.
151. They were pulling the children up on both sides, I suppose? Yes, wherever they could.
152. When did your steamer get away? We stopped about an hour.
153. All the children had been rescued before you left? Yes.
154. How did those who were on the pontoon get across to the wharf? I took them all on board again, and went round to No. 4 jetty and landed them there.
155. You landed at No. 4 jetty all who were on the pontoon? Yes. Grant, one of the boys who was drowned, was taken down to our stoke-hole.
156. He was insensible when recovered? Yes.
157. And he died about three hours afterwards? I believe so.
158. What measures were taken to resuscitate him;—was anyone in charge who knew the proper treatment? Yes; Dr. Paton. He was in the stoke-hole for nearly an hour conducting operations for resuscitation. It was not till after we had started for No. 4 jetty that I knew the boy was there. I then saw people looking down into the stoke-hole. Dr. Paton said, "He is all right; I am going to send for the ambulance, and have him taken to the infirmary." I said, "If the boy is all right you had better leave him here. It is a cold night, and he is wet, and has nothing on him. We will look after him." The doctor said, "It is all right, we will send him up to the infirmary." The ambulance came and took the boy away, and a couple of hours afterwards he was dead.
159. *Chairman.*] When the platform broke did it cause the pontoon to surge at all? It might have lifted up a little bit when the weight was off, but as to that I could not say much.
160. *Mr. McAllister.*] You did not notice much movement of the pontoon? No; there could not have been much movement. When everyone had got clear of the ship I went round afterwards with my hands to see exactly what had happened. The platform from the wall on to the pontoon seemed to have collapsed in the centre, and I think a great many of the children were pulled out before it parted altogether. Some children fell out on either side, no doubt; but I do not think many fell right down between the broken pieces of the staging.
161. *Mr. Cargill.*] Who went off your boat first—the girls or the boys? A great many adults went off first, and the girls followed.
162. Did you fix that order of going off? No; I had nothing to do with it.
163. So that as regards the disembarkation of passengers you had nothing to do with it except to see that persons did not fall into the water? Yes; all that I had to do was to see them safely off my boat.
164. You say that some adults went off first, and then the girls? Yes.
165. What children were leaving the pontoon at the time the crash actually took place? That I could not say.
166. Who were crossing the ship's gangway at the time the other gangway broke? A mixed crowd.
167. Were the girls all off? Yes; and I think they had gone up to the tram.
168. What persons remained on board your boat at the time the accident actually occurred? There were some adults and a few children. A great many persons kept their children on the boat and took them away themselves.
169. Were there any boys on your boat in charge of their teacher at the time of the accident? That I could not say.

H. Aiken.  
10 Oct., 1899.

- H. Aiken.  
19 Oct., 1899.
170. But you were at the gangway? Yes; but I could not keep my eye upon every one on board.
171. Do I understand you to say that the bulk of your passengers had disembarked? About two-thirds of them.
172. They were off the boat, but not off the pontoon? Quite so.
173. You do not know how many were off the pontoon? No.
174. You could not see them leaving the pontoon from where you stood? No.
175. Have you any idea how many persons were on the pontoon at the time of the accident? I could not say.
176. You were looking after something else? Yes.
177. You say your gangway was forward of your paddle-box? Yes.
178. Was there anything to prevent your seeing the gangway which broke except the people on the pontoon? Had there been no one on the pontoon I could have seen it.
179. So that the pontoon must have been pretty thickly crowded? There would not require to be many persons there to prevent my seeing the gangway, because it was getting dark at the time.
180. *Mr. McAllister.*] Were you standing with your back to Circular Quay? Yes.
181. *Mr. Cargill.*] Where was the "Bald Rock" when you could first see her from your position? About 10 or 15 feet from the pontoon. She was in a direct line out from the pontoon, coming in gradually.
182. How could you see her from where you were standing;—would not your paddle-box be in the way? No; I could see her.
183. What would be the width of the pontoon? About 50 feet, I should say.
184. The "Bald Rock," you say, was coming in almost in a line with the pontoon, and was about 10 or 15 feet off when you first saw her? Yes.
185. Did anything happen to direct your attention to her? No; I merely saw the top of her funnel over the people's heads.
186. All you saw was the top of her funnel? Yes; I saw her when she came up close. I could see the top of the paddle-box.
187. When you first saw her, you say you could see the top of her funnel, and she was then, you say, 10 or 15 feet from the pontoon;—in what position was she when you first saw the boat herself? She was alongside.
188. Was she as near to the Quay wall as you were? Not quite; the boat is not quite as long as my boat.
189. But she was within a few feet of the Quay? That I could not say. She was on one side of the pontoon and I was on the other. I did not take particular notice.
190. But you say she was 10 or 15 feet off when you first saw her;—after that you did not take particular notice? No.
191. You cannot say whether her lines were out when the accident happened? No.
192. You said in answer to the Chairman that the "Bald Rock" did not bump the pontoon or you would have noticed the shock? Yes.
193. I suppose there was a certain amount of motion in the pontoon during the whole time? Yes.
194. You said also that in your opinion it would take more to affect the pontoon when it was heavily loaded? Yes.
195. What you mean, I take it, is that the shock would not be so perceptible? We should feel the shock just the same, but it would take more to move the pontoon loaded than if it were light.
196. Do you not think it would be possible for the pontoon loaded to receive a shock without your noticing it? If we were on one side of the pontoon, and the boat struck the pontoon on the other side, we could feel the shock; we should probably hear it too.
197. But, as a matter of fact, you did not hear any blow? No.
198. Did you feel any motion when the gangway gave way? No.
199. Would you not expect to feel some shock? No; I think not.
200. As a matter of fact, you did not feel any extra motion when it gave way? No.
201. You also told the Chairman that there were not as many children at any time during the morning on the gangway as when it broke? I think that is quite right.
202. But, as a matter of fact, you do not know how many children were on the gangway when it broke? No.
203. So that you cannot speak positively upon that point? No.
204. When you said in answer to the Chairman that there were not at any time during the morning as many children on the gangway as when it broke, you really did not know? No.
205. As a matter of fact, there might have been more children there when it broke than at any time during the morning? Yes.

Ole Hansen sworn and examined:—

- O. Hansen.  
10 Oct., 1899.
206. *Chairman.*] You are in the employ of the Government? Yes; I am a watchman.
207. Under whom? Under Captain Jackson, the Manager of Public Wharves.
208. How long have you been in the service? Between eight and nine years.
209. Will you tell the Board what are your duties? They include a number of things. I am required, in the first place, to control the larrikinism on the wharves. The Department look to me to put a stop to it as far as I can.
210. You are employed in the daytime? I was originally appointed as day watchman at Woolloomooloo, and I was on day duty for several years. A change was afterwards made, under which the watchmen took night and day duties in alternate months. At the present time I am night-watchman one month and day-watchman the next month.
211. On the 23rd September, the date of the accident at the Floating Jetty, Circular Quay, you were on night duty? Yes.
212. At what time did you go on duty? I go on duty at 6 o'clock at night, and come off at 6 o'clock in the morning—eighty-four hours a week.
213. Do you recollect the accident? Yes.
214. Where were you at the time? I was standing at the inside corner of the landing stage of the Floating Jetty.

215. Will you tell the Board, as far as you can remember, what took place? I saw the "Waterview" coming in heavily loaded with passengers from a picnic. I was standing at the corner of the landing stage watching the passengers landing on the pontoon to the point of overcrowding. I spoke to one or two gentlemen on the subject, and I said, "There is going to be trouble." The reason I said that was that another steamer, the "Bald Rock," was approaching with passengers from another picnic. I could see that there would be danger to the pontoon with two heavily-laden steamers there at one and the same time.

O. Hansen.  
10 Oct., 1899.

216. Danger in what way? Danger to life.

217. But from what—do you mean from a crowd overweighting the pontoon? No. The pontoon could carry as many as you could pack upon it. The danger I thought of was that resulting from carelessness, such as you generally see shown by people returning from picnics. I made an attempt to get down through the crush of people with the intention of warning the captain of the "Bald Rock" not to come close in until some of the crowd already on the pontoon had passed away. I should like, at this point, to mention a matter of great importance, so far as we watchmen are concerned. We labour under a great disadvantage. We are not recognisable among the crowd. As soon as we interfere, in the execution of our duty, we are regarded as persons who should be minding their own business. We have no outward and visible sign of authority.

218. You wear no description of uniform? No. We are continually being asked who we are and what we want. We are told to carry out certain duties, and we find it most difficult to carry them out for this reason.

219. You were saying that you went on to the pontoon with the intention of warning the captain of the "Bald Rock";—how did you get on? I could not get on at all; I had to give it up. The children were packed upon the staging of the pontoon like red herrings. A number of boys were mustered there.

220. You tried to get down on to the pontoon, I understand, through the crowd of boys mustered on the staging, and you had to give it up? Yes. In fact you may say the accident happened before I had time to give it up. As I was turning down the staging the accident happened.

221. But you had the intention, you say, of warning the captain of the "Bald Rock" not to come in on account of the danger which you thought might result from the landing of the additional passengers; I should like to know what particular form of danger you had in your mind; did you think that the mere fact of the steamer coming alongside the pontoon would affect it;—did you think, for example, that in the crowded state of the pontoon a concussion would affect it? What I had in my mind was that the pontoon was already overcrowded. Some officials in connection with the Sunday-school had practically taken charge, and they stood on the landing stage preventing the children from getting ashore. The children were packed on the stage like a small regiment of soldiers—I suppose with the intention of marching them up to the tram in that order. My common-sense told me that if the crowd from the other steamer got ashore among the crowd already on the pontoon, there would be confusion and perhaps trouble. I saw as I thought many hundreds of persons practically ignorant of the danger, and I thought someone should act.

222. Did you think that the platform itself upon which the children were mustered was unsafe? I did; I have thought so for a long time.

223. What were your reasons for thinking so? In the first place, there was an unreasonable weight put upon it. It might not be unsafe under ordinary conditions, but there was an unreasonable number of persons kept standing still on the staging, and it was never intended for that purpose.

224. What makes you say that the staging was never intended for that purpose? I presume that if it were intended for that purpose it would have been built of stronger material.

225. Did it not strike you that if the staging were intended for the landing of passengers, it should be strong enough to bear the weight of the people who would pass over it? It might be strong enough under ordinary circumstances. I have seen grown-up persons marching over the staging as closely as they could be packed upon it on many occasions. In this case there was a solid weight kept standing upon it.

226. Was your idea of the weakness of the staging derived from your seeing it at any time as you thought overcrowded? Yes; almost every time I have looked at the staging, when a crowd has been passing over it, I have seen it bending—springing up and down. I have seen a clear bend in it, almost a semi-circle.

227. It was that circumstance which made you feel anxious on this particular occasion then? Yes.

228. Is it within your province, when you notice anything of that kind, to report it? I thought it was. I have followed my own judgment in the matter, and I did report it.

229. Have you reported the staging as being in your opinion unsafe? I have.

230. When did you so report it? Allow me to explain. We have what we call a head watchman who gives us our orders, and who receives from us any reports or information. A man named James Platt—he is generally called George, I think—is the officer.

231. Was he the man to whom you made the report? Yes. I said, "Look here, George, that stage is not safe; there will be a great smash one of these days."

232. It was a verbal report then? Yes; I have never put it into writing, but I have spoken of it to Platt several times.

233. How long prior to the date of this accident did you last report the matter? It is not so very long ago.

234. Was it this season? No; last season.

235. Then it is practically twelve months ago? Yes.

236. On the occasion of your last report, had the platform been in use by any picnic or other party which led directly to your mentioning the matter? I was induced to mention it from what I had seen on several occasions when unreasonable loads of people have passed over the staging. From time to time it has occurred to my mind that the staging was not safe.

237. From your observation of the staging? Yes. An accident occurred to the stage at one time, when the ship "Brilliant" carried away the rails with one of her ropes. Some damage was done to the top part of the stage.

238. Nothing underneath was damaged by that accident? That I could not say. The rope lay over the top and it broke the railing, which was repaired. I remember on one occasion Platt saying to me, "I have reported the matter to the "Old Man"; we have done our duty, and the thing is now out of our hands."

239. *Mr. McRitchie.*] Whom do you mean by the "Old Man"? Captain Jackson.

240.

- O. Hansen. 240. *Chairman.*] Platt told you distinctly that he had reported the matter to Captain Jackson? Yes; he said, "Look here, Hansen, this is out of our hands. I have put the thing before him, and our duty ends there." That was the effect of what he told me.
- 10 Oct., 1899. 241. Have you ever made a minute inspection of the platform. Have you ever, for instance, looked underneath it? Not for the purpose of inspection. Of course, I have looked underneath it a number of times.
242. Did you know anything at all of the condition of the beams on which the platform is constructed? I knew that they were soft wood; I knew that it was a clumsy rig up altogether.
243. You are acquainted with the way in which the staging was constructed? Yes.
244. You know that there were three longitudinal pieces of Oregon with hardwood planking over the top? Yes. If you were standing on the corner of the pontoon at low water you could not help looking underneath the stage. I have looked at the thing casually, and I have said on several occasions that I thought it unsafe.
245. Do you know whether anyone has made an inspection of the staging during the past twelve months? I have heard that an inspection has been made; but I have not seen it made. Of course the inspection would not be made at night time when I was on duty, and when I am on day duty I am employed on the other side of the Quay.
246. You are generally standing near the floating jetty, I suppose, when picnic parties come in? As a rule I am there when they come in.
247. If you are on duty you are supposed to be about the place at that time? Yes.
248. How many other watchmen are there at Circular Quay having similar duties to perform? There are James Platt, Harry Jackson, and myself. There is another watchman named Waddy, who is always on night duty.
249. Were any of these other watchmen there on the 23rd, when the accident occurred? No; I was the only watchman there.
250. Did Platt say anything to you after you had reported the matter to him as to the safety of the staging? I am not quite certain whether he put the matter in writing or not; but the statement he made to me seemed to imply that he had done so.
251. I believe, when you were examined at the Coroner's inquest, you said something about the "Bald Rock" tapping the pontoon; did she, as a matter of fact, tap it;—did you see her strike it? I did not see her strike it; but I could see the effect of her striking it. Nothing else could have broken the staging, in my opinion. I am not speaking from mere memory of what occurred, because on the morning after the accident I put down in my note-book all the particulars, when they were quite fresh in my mind. I am not depending now at all on my memory.
252. You think the staging would not have broken unless something had touched it;—had you that note in your book? What I have in my note-book is this:—"There was a fairly heavy weight on the stage when the schoolgirls were on it. Then, when the boys were on it, it broke. The boys were little fellows."
253. Is it not possible that the heavier weight of the bigger girls may have strained the staging to the last point, and that, being strained, it may have broken when the boys were mustered upon it without anything touching it? The point is that the staging broke with a far less weight upon it than it had had. The heaviest weight was put upon it five or ten minutes before it actually broke.
254. You say you did not see the "Bald Rock" strike the pontoon, but you come to the conclusion that it must have struck it, because the staging broke? My conclusion is based upon direct evidence, so to speak, because I was looking at the steamer. She was so close to the pontoon that she must have touched it. Of course, it was approaching night-time. I felt the pontoon give a jerk. Something must have done it.
255. Do you think anyone on the pontoon would be in a better position to know whether the steamer struck it than would any person standing on the staging or on shore? They would be in a better position, providing their minds were not otherwise engaged.
256. Anyone standing upon the pontoon would feel the concussion? Yes; I myself felt it on the staging.
257. How do you know that what you felt was due to the steamer striking the pontoon;—might not the jerk caused by the breaking of the platform lead you astray in that respect. Would it not be very difficult for you, under the circumstances, to say definitely whether the steamer struck the pontoon? What makes me certain that the "Bald Rock" struck the pontoon is that no boats, especially a paddle boat, could come alongside under the circumstances without touching it.
258. Was the "Bald Rock" fastened to the pontoon at all? Afterwards; but not at the time the stage broke. The "Bald Rock" was overlapping the pontoon with her bow.
259. You saw that from the shore looking over the heads of the people? Yes.
260. *Mr. McAllister.*] But you have told the Board that you were standing on the stage;—are we to conclude that you saw all that you have described from that standpoint? Yes. The school officials were holding out their arms and preventing the children from getting ashore. If they had let the children run ashore the accident would not have happened; but the children were mustered in rows on the staging. I myself spoke to one of the teachers about it, and he wanted to know who I was.
261. *Chairman.*] Assuming that you were standing on the corner of the staging near the Quay wall, could you see from that point the steamer "Bald Rock" strike the pontoon? No. It is a matter of reasoning with me; she must have done so.
262. That is the conclusion to which you arrive, from what you felt? That is my idea, based upon the shock which the pontoon received. There was a heavy jerk on to one side, and that put the strain on to one of the girders. I am not now speaking from mere fancy.
263. *Mr. McEitchie.*] Was not the staging attached to the Quay wall? Yes.
264. *Chairman.*] Do you not think that the captain of the steamer would be better able than you are to know whether or not his boat struck the pontoon? No; I believe he could not tell. As a rule, the captain of the steamer would be attending to the engines, and there would be a number of passengers standing around him, so that he would have difficulty in seeing exactly what occurred.
265. You did not actually see the "Bald Rock" strike the pontoon, but you think she must have done so? Yes.

266. That, in your opinion, was the cause of the breaking of the staging? Yes. The girders got a jerk when they were at a good sharp angle. Perhaps in another position it would not have mattered.
267. Have you any idea at what angle the staging was towards the Quay when it broke? I suppose it would be about half-tide. Perhaps the water had risen about a couple of feet.
268. When the staging broke, did it fall right away? It snapped off suddenly. The whole thing went down in one lump, and the majority of the children on it were hanging on to the chains and rails.
269. Did the people on the pontoon help to pull the children out? No; they did nothing but scream and yell, and the men who did work had to fight their way through a frantic crowd in order to get at those they wanted to help. When the crash occurred I ran round, as I thought, to the police launch, because I thought substantial help would be required, but the launch was not at the jetty, and it was of no use to shout because the people on the "Bald Rock" were cheering and singing, while the unfortunate children in the water were shouting for help.
270. Did it not strike you, that seeing that the picnic season was approaching, it would be well for you to make a special report as to the general condition of the platform;—you have already told the Board that you did not consider it safe? I would have done so, but I do not think my report would have had much influence with the authorities.
271. You do not know of any official whose special duty it is to examine this platform? I do not know of any.
272. I think you said at the Coroner's inquest that you were present when the New South Wales Lancer Contingent went to England, and when they passed over this very platform? Yes.
273. Were they marched over it? Yes.
274. How many in a file? I think four.
275. How far apart? Just far enough apart to enable them to march comfortably. They did not keep step; they broke their step.
276. Did you notice much sagging or vibration of the platform? Yes.
277. Did it strike you then that it was not safe? It was as safe then, I believe, as when it broke. The staging would have broken on that occasion had it been put to the same test. Heavy weights pass over the staging frequently. Night after night the guard boat takes away a large number of soldiers from that place. I have seen a large number of soldiers passing over the stage frequently.
278. *Mr. McAllister.*] I presume you are referring to relief guards, consisting, probably of from fifteen to twenty men? Sometimes there have been as many as 200. I do not know where they would be going to or coming from.
279. *Chairman.*] I suppose, from your knowledge of the platform having sagged when you have seen weights passing over it, you concluded that there was a certain amount of risk attaching to its use? I always thought, when I saw a heavy weight going over it, that it would break sooner or later; but you know what happens in these cases. You get accustomed to seeing the weights pass over without the staging breaking, and you finally come to the conclusion that it is safe enough.
280. You were standing there when the first steamer came in? Yes.
281. Did she come in quietly, or did she strike the pontoon? She came in as nicely as ever I saw a steamer come in. She came in on the east side of the pontoon.
282. *Mr. McRitchie.*] When you reported what you considered the unsafe state of the staging to your superior officer, did he take it as an act of grace or as an offence? I did not report anything to Captain Jackson directly; I reported to James Platt. There has been a certain amount of misunderstanding in the Department, and Captain Jackson has furnished us with what I might call a sort of "boss." When there is anything to report we report to him, and he tells Captain Jackson.
283. *Chairman.*] The report goes through the man immediately above you? Yes; in the case of this particular accident, however, I made out a written report of it to Captain Jackson.
284. *Mr. Cargill.*] That was at Captain Jackson's request? Yes.
285. *Mr. McRitchie.*] You reported to Platt that you believed the platform to be unsafe? Yes.
286. And as far as you are aware he reported the matter to Captain Jackson? Yes.
287. But you have no authentic knowledge of his having reported to him? He told me that he had done so and that we had done our duty in the matter.
288. When the rope of the ship "Brilliant" carried away the rail of the platform, was much damage done? Not to the platform, only to the hand-railing.
289. No repairs were at that time made to the staging itself? The rails were fixed up, that is all.
290. How long ago would that be? I suppose it would be about a year and a half ago.
291. You have noticed since then what you described as a bending or sagging of the girders? Yes.
292. Have you noticed that for many years? It has been pretty much the same all the time. When it is low water the staging would have an angle of almost 45 degrees.
293. *Mr. McAllister.*] Surely not as much as that? Almost as much as that, I fancy. When it is high water you have to go up hill, say, about a couple of degrees above horizontal.
294. Do you recollect when the staging was last repaired? Yes; I was on day-duty then. I remember that the pontoon was away at Cockatoo Island getting overhauled. That would be a couple of years ago. The staging was taken away with the pontoon. It was put on to the pontoon and the whole thing was taken away.
295. When it came back did you notice that it had been newly decked? I saw that the stage was in the same condition as when it went away. They had done nothing to the stage as far as I could see.
296. Where were you standing when you first saw the "Waterview" coming in;—were you on the Quay, or had you taken up your position on the staging? I took up my position in the first place on the Quay for the special purpose of guarding against the danger which exists there. When you come off the staging and turn to the right, you are liable to walk into the water, because at that point there is no iron railing.
297. I understand then that when the "Waterview" came in, you were standing at the spot on the Quay wall, where there is no iron railing? Yes; my object was to prevent an accident at that corner.
298. How long did you stay at that spot? Until the stage broke.
299. But you said a short time ago that you were standing on the end of the stage when it broke? That is where I was standing when it actually broke. I stood a little while on the Quay, and afterwards I forced my way on to the stage. I was on it when the smash occurred.

- O. Hansen.  
10 Oct., 1899.
300. Did you fall into the water? No; I had hold of the handrail, and I immediately made a jump on to the Quay, rushed round to the Water Police and told them to hurry up. When I had given the alarm I came back.
301. When you were standing at the head of the gangway, whom did you notice coming up first from the pontoon? A lot of girls came up first, and they went straight away. The boys were afterwards mustered on the staging.
302. Were the boys who were standing there little children? Some were pretty small, but they would not be half the weight of the girls. The girls appeared to be young women.
303. Before the teachers stopped the children from coming ashore, had the gangway been filled with children? No; the girls were first landed, and as soon as they had passed away the boys came.
304. Were the girls coming up in sufficient numbers to fill the whole of the flooring of the gangway;—would you describe the gangway as full? Yes; and a number of grown-up persons were squeezing their way through the girls to get away.
305. The gangway was as full as it could be; it was just like a crush, I suppose, coming from a steamer? Yes.
306. When the teachers mustered the small children upon the gangway, in order to get them all together, were there other persons crowding past them? Exactly.
307. Then there must have been only a very small portion of the stage unoccupied? Yes; the only space unoccupied was that between the teacher and the edge of the wharf—say 3 or 4 feet.
308. Were you standing at the end of the staging when the teacher began to muster the children? I forget where I was at that moment, but fearing danger I kept getting nearer to the gangway. I tried to gain a hearing, but it was of no use.
309. Did your previous experience of the condition of the gangway lead you to give advice to the teachers as to getting the children off as quickly as possible? I have many times warned persons. Sometimes I have actually had to drive a horse and cart off the pontoon.
310. On this particular occasion, did you speak to the teachers? No; I had no chance to do so, on account of the noise and general confusion. Then, again, we are not recognised as officers of the Department, and people think we are interfering without any warrant.
311. When was it that you saw a horse and cart going over the staging? That is only two or three months ago. I suddenly looked round and saw a horse and cart standing on the pontoon; it got down there without my seeing it.
312. Was the gangway level then? Yes, or the driver would not have attempted it.
313. What description of vehicle was it? It was a single dray. It came down after tables and chairs after a picnic. I spoke to the driver. I said, "If your horse gets scared and goes overboard, who will pay the damage?" The man said, "Oh, it is all right." I said, "Suppose a steamer comes alongside?"
314. I suppose the horse went down on to the pontoon in the usual way, head first? Yes; it was not backed down. I told the driver to get off at once, and he did get off.
315. Did he go off before he had loaded his dray? Yes; I compelled him to go.
316. When he was going off, did you notice what effect the weight had on the staging? That would not affect the staging.
317. The cart was empty? Yes; there was not much in it.
318. You saw the New South Wales Lancers pass over the staging? Yes.
319. Did their horses go over with them? No; there were only the men themselves. A horse and dray, however, had been over the staging twice to my knowledge.
320. On what other occasion beside that which you have described have you noticed a horse and dray going over the staging? It would be further back. I made no memorandum of the date, but I should think it would be over a year ago.
321. Have you any recollection of what kind of vehicle it was? No; but I remember that it was a white horse. I should not be surprised if it was the same man who was standing there the other night when the accident occurred. I was speaking to a driver then whom I knew by sight.
322. It was a single dray which went over on the second occasion? Yes.
323. On what business was the driver there? He was taking away empties returned from a picnic.
324. On both occasions the driver was there in connection with a picnic? Yes.
325. Have you ever heard of a dray-load of fodder being taken over the gangway? I have heard something to that effect; but I was not there.
326. You have no personal knowledge of it? No.
327. *Mr. Cargill.*] In referring to the bending of the gangway when weights were passing over it, you used the words, "in a semi-circle";—where were you standing when you observed the gangway bend in, as you say, a semi-circle? I was standing a little distance away from it, about half-way between the Watson's Bay ferry and the stage—say about 150 feet away. My eye was in a horizontal line with it.
328. You say you were 150 feet away? About that.
329. Had you any particular reason for watching the stage when you say you saw it bend? I had a special reason.
330. What was it? Whenever a heavy weight goes over it, I always look at it.
331. What was the heavy weight on that occasion? A lot of grown up people.
332. How many would there be? The stage was full of them.
333. But how many do you think there were? Speaking roughly, I should think, there would be about fifty people on the staging.
334. Were they standing on the stage or passing over it? They were marching over it.
335. Did it appear to bend at any particular portion of its length? It was an even bend from end to end.
336. Did it appear to you to bend much? It appeared to bend too much to my liking.
337. How much was it out of the straight, do you suppose? I suppose at least from 4 inches to 6 inches.
338. That was due simply to fifty persons marching over it; when these persons came off the staging did it resume its natural position? Yes; but it never was thoroughly straight. It was naturally a bit curved. It sprang up to its natural position in such a way that an inexperienced eye would not be able to see any change in it.

339. But you think that when there was a weight upon it even an inexperienced eye could detect the change? In proportion to the weight, so it gave. O. Hansen.
340. You are sure that what you call the bending was not due to the pontoon becoming more submerged? 10 Oct., 1890.  
I am quite sure of that.
341. You know the weight of the staging does have the effect of submerging the pontoon? Yes; I know the pontoon goes down a couple of inches with a heavy weight.
342. But it was not that, you think, which gave the staging the appearance you describe? No.
343. You say you reported these occurrences to Platt? Yes.
344. Did you report to him more than once? On several occasions he and I had a conversation on the subject.
345. Did you report to Platt formally? I did.
346. How many times? A couple of times.
347. When was the first occasion? A couple of years ago.
348. And the second occasion? That would be a later occurrence—say a year ago.
349. On which of these occasions was it that Platt subsequently told you he had reported the matter to Captain Jackson? The last occasion.
350. That would be about a year ago? Yes.
351. Was anything done to the staging after that to your knowledge? I think some repairs were made to it, but I was on day duty at the time.
352. You did not see the repairs? No.
353. But you think that something was done? Yes; I think something was done in the way of planking.
354. You told the Chairman that you did not think it worth while reporting, because attention was not paid to your reports? I do not think I said that. What I said was that my reports would not be taken much notice of.
355. You say now that you thought your reports would not be taken much notice of? Yes.
356. Why did you think that? Because we are such insignificant individuals, we are supposed to know nothing.
357. Have you ever made a report that has been ignored;—do you mean the Board to understand that you have made reports which have been put aside without consideration;—is that what you mean? Well, I have brought several things under Captain Jackson's notice—things of which he has not taken any notice, so far as I know.
358. In fairness to Captain Jackson, will you say what the nature of these reports was? They were several unimportant matters pertaining to my duty in connection with certain things that are going on at night time. At one time, for instance, we had the unemployed sleeping here by the hundreds, and creating a lot of nuisance. I spoke of that several times. It seemed to me that people were getting so uncivilised that something would have to be done in the matter. I put the matter in writing, and directed it to Captain Jackson.
359. As far as you known no action was taken upon that report? As far as I know no notice was taken of it.
360. You do not know whether or not Captain Jackson did take notice of it;—all that you know is that he did not carry out your recommendation? He did not. The police took the matter in hand some time afterwards.
361. But you do not know that Captain Jackson did not communicate with the police? Of course not.
362. Because that particular report of yours was, you think, not taken notice of, you are of opinion that it is not worth your while reporting? We have no encouragement to report because our reports are not taken much notice of. I have reported to Captain Jackson how my authority is called in question, and that I am practically put down as an impostor when I collect the money. The answer I received was, "Do the best you can."
363. These would all be matters pertaining to your duty? Quite so.
364. But you did not consider it part of your duty to inspect this gangway? No.
365. *Mr. McAllister.*] Is it part of your duty as night-watchman to collect wharfage money from any vessel which comes alongside the Government jetties during the night hours when the office is closed? Yes. The whole thing is left in my hands after 6 o'clock.
366. Supposing anything unusual occurred calling for special mention;—to whom do you report? To Platt.
367. Suppose there were a fight, or that a horse fell over the wharf, what notice would you take of such occurrences? I should call for the help of the police.
368. Would you report them to Platt? I would tell him what had happened during the night. I pulled a man out of the water at 3 o'clock last night, and took him to the police station.
369. But you would make no special report of such an occurrence except to Platt? No.
370. And your reports to Platt are verbal? I only make written reports in special cases where I think there is a necessity for it.
370. Only when you are requested to do so? Sometimes when I am not requested. I was not requested to report the nuisance created by the unemployed.
371. On that occasion you put your report in writing without being requested to do so? Yes; my duty was to water the blocks, and I could not use the hydrant when those men were there, because they wanted to know who I was. That was why I had to report the matter.

THURSDAY, 12 OCTOBER, 1899.

Present:—

C. McALLISTER, Esq. | W. McRITCHIE, Esq.  
G. McCREDIE, Esq., CHAIRMAN.

J. S. Cargill, Esq., Crown Law Department, was also present.

Matthew Agnew sworn and examined:—

- M. Agnew. 373. *Chairman.*] You are a sergeant of the Police Force, and are stationed at Newtown? Yes.  
 12 Oct., 1899. 374. You remember Saturday, 23rd September? Yes.  
 375. I believe you were on special duty at a picnic on that day? Yes.  
 376. Is it a rule of the Force that a sergeant or constable is detailed for duty at these picnics? If the committee of the picnic apply for police protection, we have to go. We do not go unless we are asked.  
 377. What are your duties on these occasions? We endeavour to preserve order, and see that there is no rowdyism. We also assist the teachers.  
 378. Did you leave Newtown on the 23rd September, with the children who were going to the Christ Church Sunday School picnic? Yes.  
 379. How many children were present when they left Newtown? I think there must have been between 400 and 500; I do not think there were any more.  
 380. I suppose the children were brought down to Circular Quay by tram? Yes.  
 381. Were you present when they went on board the steamer "Waterview" at Circular Quay? I was.  
 382. Did you notice whether they were marched on to the pontoon and thence on to the steamer, or were they allowed to crowd on to the steamer as they pleased? They did not march down, but they walked down pretty regularly; perhaps five or six abreast. They were not marched down in a body.  
 383. The floating jetty from which they left was that at which the accident occurred at a subsequent hour of the day? Yes.  
 384. When the children and others were going on board the pontoon to reach the steamer did you take any notice of the platform or staging on which they walked? I did not.  
 385. You did not observe any movement in it? No.  
 386. You yourself crossed over on it? Yes.  
 387. And you did not notice any undue vibration? I did not.  
 388. At what time did the steamer leave Circular Quay? I think we left shortly after 9 o'clock.  
 389. Do you remember whether the platform leading on to the pontoon was fairly level, or whether it was on the incline? There was an incline from the Quay.  
 390. You do not know whether it was high or low tide? I do not.  
 391. At any rate, while the children were crossing to the pontoon there was nothing to indicate to you any weakness in the platform? Nothing whatever.  
 392. You proceeded with the picnic to Cabarita and returned with it in the afternoon? Yes.  
 393. Will you tell the Board, as nearly as you can remember, what took place at the floating jetty when you came in on the return journey;—where were you standing? I was standing on the port paddle-box.  
 394. You remained there until the steamer came right into the wharf? Yes.  
 395. How did she come in; did she come in quietly, or did she bump? I did not notice any bumping. She came in in the usual way—quietly.  
 396. Do you recollect how the passengers left the boat? I recollect that the portion of the steamer where I was standing was pretty low in the water,—the gangway or plank leading on to the pontoon was nearly perpendicular. It was awkward for the children to get up. A gentleman named Whittaker took one side of the gangway, and I took the other, and as the children came up we caught them by the arms and landed them on the pontoon.  
 397. That would be part of your duty? Yes.  
 398. What did the children do when they were landed on the pontoon;—did they go straight ashore, or were they mustered on the pontoon? I heard the order given—I cannot tell by whom—that the boys should remain behind while the girls got off.  
 399. You are sure that that order was given? Yes. I understand, from inquiries I made later on, that the order was given by the Rector—the Rev. Mr. Dunstan.  
 400. Did the girls go off the steamer first? Yes, they were the first to pass me. We landed them on the floating jetty, and I did not afterwards behind look to see where they went to. I had my back to the staging leading from the pontoon on to the Quay.  
 401. Did the girls get off safely? I think so.  
 402. Have you any idea of the number of girls who went across the platform? I could not say; but I should think there were between 200 and 300.  
 403. Of about what age were they? I suppose the average would be 8 or 9 years.  
 404. Can you remember whether the girls were older than the boys who subsequently passed you? Some of them were, and others were not. The order was given for the boys to stand back on the pontoon while the girls got off.  
 405. What took place when the girls passed off? I do not know whether it was after or before the girls passed off the pontoon, but I remember hearing a crash, followed by a lot of screaming.  
 406. Did you look to ascertain the cause? I rushed to the end of the floating jetty to see what was the matter.  
 407. What did you see? I saw a space between the floating jetty and the quay, with a great number of children. It appeared to me as if they were sinking in the water.  
 408. What had become of the platform? It appeared to have given way; part of it was hanging down below the pontoon and another part was hanging from the quay.  
 409. There was a complete break? Yes.  
 410. The two portions were not hanging together in the middle? No; it was completely broken.  
 411. And you saw a number of children struggling in the water? Yes.  
 412. Was there great excitement? Yes, both behind me on the pontoon and in front of me on the wharf.

413. What did you then do? I got hold of the chain which goes from the pontoon across to the Quay, and reached out as many of the children as I could. A young fellow was there beside me, and we pulled them out as fast as we could catch them. M. Agnew.  
12 Oct., 1899.
414. Did you observe any rushing or crowding on the part of the boys prior to the accident? No; I observed nothing unusual.
415. You have a fair idea of what generally takes place at these picnics? Yes; I have been attending picnics of that kind for the last twenty-six years.
416. And nothing unusual occurred, so far as crowding was concerned, on this occasion? Nothing.
417. Did you, at the time of the accident, notice any other steamer at or near the floating jetty, besides the steamer by which you arrived? I did.
418. Do you know the name of the steamer? I could not tell you her name.
419. Was she alongside the pontoon, or was she out in the cove? When the rush was over, and after we had got the children out of the water, she was alongside the pontoon.
420. Could you say definitely whether or not that steamer struck the pontoon? I could not say.
421. While you were standing on the pontoon, handing the passengers ashore from the steamer, you did not feel any shock, such as would be likely to occur had the steamer struck the pontoon? I did not. Any steamer coming in would be likely to create a wash leading to some movement of the pontoon; but I did not pay particular attention to it. It was very nearly dark at the time.
422. You remained there until all the children were taken out of the water? Yes. One child who was taken out was insensible. We succeeded in restoring animation, and he was sent to the hospital, where he afterwards expired.
423. How many boys do you think were mustered on the pontoon prior to their starting to walk up the platform on to the Quay? I could not give you an estimate; but I know there were a good many.
424. How many boys were on the platform when it broke? I could not state positively; but it seemed to be pretty well loaded with people.
425. I am referring now to the platform leading from the pontoon to the Quay? I could not speak as to that, because my back was turned to it.
426. How many children did you pull out? I and the young fellow who was beside me pulled out nine.
427. Were the children clinging together? There were two girls who were clinging together; they seemed to be 16 or 17 years of age. We could not get them out until we obtained assistance. They were standing on the platform, I was told, when it fell in.
428. Could you tell the Board whether there were many girls of that size on the platform? No.
429. How many people over the age of 10 or 11 were standing upon the platform when it broke? I could not say, because my back was turned to it. I noticed these two girls particularly because we had to hold them up in the water until we obtained assistance to pull them out.
430. Were the names obtained of those who tumbled into the water when the accident occurred? No.
431. *Mr. McAllister.*] Did you notice where the captain of the "Waterview" was standing when the children were landing on the pontoon? I did not.
432. So far as you know, there was only one gangway from the steamer to the pontoon, and that was the one at which you and Mr. Whittaker were standing? I think there was only one; I fancy some of the boys got off the steamer from the bow without using the gangway.
433. You did not notice the captain of the "Waterview" standing at the gangway assisting to hand the children out? He might have been standing at the bottom of the gangway. I was standing on the pontoon. The upper portion of the gangway projected over the pontoon, and it was rather awkward for the children to get off it; it was almost perpendicular. As the children came up, Mr. Whittaker and I caught hold of them when they were within a few steps of the top and lifted them up.
434. You are not sure then whether the captain was or was not then at the foot of the gangway? I could not say who was there.
435. After the accident had occurred where did you take the boy Grant when you were endeavouring to restore animation? I saw Dr. Harvey. He gave instructions, and the boy was worked on the pontoon until the boy showed signs of life. We then took him down into the stoke-hole of the "Waterview," where we had to cut some of his clothing off. We then put some dry clothes on him and brought him too.
436. How were those on the pontoon, including those who did not fall into the water, and those who did fall in and who were afterwards rescued, landed? The steamer pulled out from the floating jetty and went round to another wharf.
437. Did you look after the children going home in the tram, or did they go home with their parents? They went away just as they came off the boat; some of the teachers saw the children up to the tram. I did not like to leave, thinking that more bodies might be brought out of the water. I remained behind for some time, and sent the boy Grant to the hospital under Dr. Harvey's instructions. He was sent up in the ambulance.
438. *Mr. Cargill.*] At which end of the boat was the gangway by which the children were landed on the pontoon? I think it was between the paddle-box and the Quay.

William Edward Cullam sworn and examined:—

439. *Chairman.*] You are an accountant residing, at Enmore? Yes. I am employed principally by W. E. Cullam. Langdon, Hopkins, and Langdon, and I reside at "Montrose," Enmore. 12 Oct., 1899.
440. You are a teacher at the Christ Church Sunday School at Enmore? Yes.
441. Do you recollect Saturday the 23rd September? Yes; the school had a picnic on that day to Correy's Gardens.
442. You were in charge of a part of the Sunday School on the occasion? Yes.
443. How did the children come in to the Circular Quay from Newtown? They were brought in by special tram, and they embarked on the steamer at, I think, No. 3 floating jetty.
444. What was the name of the steamer? The "Waterview."
445. Did you take any special notice of the platform by which the children reached the pontoon enabling them to get on board the steamer? When we embarked, the children marched along the full width of the platform down to the pontoon. They went down in a body, not in any regulated numbers; but they occupied the full width of the gangway. 446.

- W. E. Cullam. 446. Of about what age were the children? Their ages would range from 7 to 12 or 13; perhaps 14 would be the extreme age.
- 12 Oct., 1899. 447. Were the boys and girls intermixed? They were kept separate.
448. Did you notice anything the matter with the platform;—did it appear to you to be in a shaky condition? I did not notice anything unusual. I thought it was all right. I went up and down the gangway several times after the children had gone aboard, and I did not notice anything at all the matter with it.
449. You did not notice any unusual motion when the children were crossing the gangway? There was nothing to lead any person to suppose there was anything wrong.
450. Do you recollect whether the platform was nearly level or whether it was on the incline? The platform was more level when we went away than when we returned. The tide, I presume, was higher. I had occasion to walk up and down the platform several times before the steamer left the Quay, because I wished to see friends who were standing ashore, and I had to take tickets from them, and to see some of them on board. My recollection is that the platform was then pretty level.
451. Do you think that when the passengers were embarking there were at any time as many of them standing on the platform as were standing there at the time it broke? I do not think so.
452. The children all got away safely? Yes; we reached Correy's Gardens, spent the day there, and reached Circular Quay on the return journey at about half-past 6.
453. Will you tell the Board what, to the best of your recollection, happened after the steamer reached the Quay? The children commenced to embark. The understanding was that the girls were to leave the steamer first, and that the boys were to follow; but apparently some boys and girls got with teachers and some of their friends on to the pontoon. A goodly number were on the pontoon, and the boys began to congregate on the gangway. The girls were marching past them on one side out on to the Quay. I was in charge of a senior class of girls on the return journey, and I remained with them. I may say that I was the last off the boat with the girls. I had nine girls with me—seven of them were walking in front of me, and two of them were walking behind me. As we reached the top of the landing stage, two of the girls were still walking behind me. I remember noticing the boys to the left as we passed up. There were a good number, I should say from seventy to eighty—eighty, I think, would be the maximum number; they were standing there in charge of teachers. I may say that there was a teacher and a policeman at the steamer's gangway handing the children on to the pontoon, and a policeman and a teacher at the top of the gangway handing them on shore. The boys were pretty thickly massed on the left-hand side of the gangway. There was no disturbance of any kind; they were quite quiet, and there was no bustle or confusion. I spoke to several of the teachers as I passed out. I had reached the edge of the wharf, and put one foot out to land, when I heard a creaking noise, followed almost immediately by a crash. Directly I heard the creaking noise, I turned round and saw the staging bend. It was actually bent before the collapse took place. The creaking noise directed my attention to the gangway, and I had just time to turn round, when I saw it giving way in the middle. It broke down, and the major portion of the children who were standing on it fell into the water. The rescue work then commenced. Those who were on the pontoon nearest to the children pulled the majority of them out. I stood for a second looking for a place where I could jump into the water, but I could see none. If I had jumped at all, I should have had to jump on to the top of some of the children. I afterwards lowered myself down from the front of the wharf, and pulled out a couple of children who had fallen over. When those on the pontoon had pulled a number of the children out, there was a space for rescue work, but until then it was very difficult to know what to do, because the children were so thick in the water.
454. Have you any idea of the number of children in the water? I should say there were from seventy to eighty.
455. Did the "Waterview" come in quietly to the pontoon? Yes.
456. She did not bump the pontoon? No; she did not strike the pontoon; there was no oscillation to speak of; but naturally a steamer coming into the wharf would cause a certain amount of rocking of the pontoon.
457. Did you notice any other steamer there? Yes; the "Bald Rock" came in.
458. Had she come quite in when the accident occurred? No; there was a space between the pontoon and the "Bald Rock" at that time. Her engines were eased down, and she was drifting in just as the accident occurred. She could not have struck the pontoon, because she had not reached it.
459. You seem to be quite satisfied that she did not strike the pontoon? I am quite satisfied of that. She came up alongside the pontoon while the work of rescue was going on.
460. While the boys were on the platform, waiting for the girls to pass by, were you on the pontoon or on the vessel? I was on the top portion of the steamer.
461. And when the accident actually occurred you say you had one foot on the platform and the other on the shore? Yes.
462. Had you much difficulty in getting from the steamer up to the top of the platform? I walked up the platform past the boys who were massed there. Two of the girls in my charge were walking just behind me, and they dropped into the water when the gangway broke. I managed to get on to the shore. Momentarily, as the gangway broke, I stepped on to the quay.
463. Did you run up the gangway? No; I walked up at a slow pace.
464. You did not notice any spring in the platform even then? No, it seemed to be quite solid; there was no bend or displacement.
465. So that practically, in your opinion, there was no warning of the accident? None. There could not have been more than two seconds between the creaking I heard and the occurrence of the smash.
466. Have you, as a teacher in the Sunday school, had an opportunity to hear how many children actually fell into the water;—have their names been recorded? No statement has been made which would show the exact number.
467. Have you attended any previous picnics which have embarked or disembarked at this platform? I went to a picnic in connection with St. Stephen's Church from the same wharf.
468. Did it seem to you that the staging was perfectly safe? Yes.
469. After the accident, were the children taken home by the teachers? I sent thirty odd home, and I remained on the wharf assisting to get others landed. When they were landed on the wharf I took cabs up to the hotel, and the children were sent away in cabs from there. In fact, I looked after that portion of the arrangements.

470. *Mr. McAllister.*] You say you were in charge of nine children? Yes; nine girls. Seven were <sup>W.E. Cullam-</sup>walking in front of me and two behind.
471. Were the girls walking past the boys on the gangway in single file? No; the girls walking in <sup>12 Oct., 1899.</sup>front of me would be, say, three in front and four behind them.
472. The gangway was 10 feet wide between the rails? Yes.
473. And the boys were massed on the left-hand side going up? Yes.
474. Should you say that the girls, generally, as they marched up were three abreast? I cannot say as to that; I came with the last of the girls. I have no doubt that the number of boys mustered on the staging increased during the progress of the girls on shore. The number was increasing all the time. When I arrived at the stage there was just sufficient space left for the last of the girls to go through three or four abreast. There was enough space to enable them to walk through, comfortably, three abreast.
475. That would mean that about one-half of the gangway would be left clear? There would not be one-half left clear.
476. Do you think there would be a space of 3 feet 6 inches for the girls to go up? Yes; or 4 feet.
477. The boys massed there, then, must have occupied about two-thirds of the width of the gangway? Yes.
478. The Board wish to arrive at a reliable estimate of the weight of the children on the gangway at the time of the accident? You may take eighty as the maximum number of children on the gangway, and you would have to average the age of the children. Some of the children were 4 or 5 years old, but the majority of the boys, I suppose, would be about 10 or 12.
479. In calculating the superficial area of the gangway, we find that it would not be possible to muster more than about 100 children altogether upon it? That would be about the number, I should think.
480. If one-third of the space were kept clear during the time the girls were going up, that would leave two-thirds of the space occupied by the boys who were mustered there;—that would bring the estimate of the number of children massed there to something like fifty-five or fifty-six? Yes.
481. Were the boys closing up behind as you and the girls went up? Yes. They were aware that all the girls had passed off, and they were, therefore, closing up behind them.
482. Under those circumstances the vacant third of the space might have been filled up? Not altogether. No doubt some of the area filled up, but there could not have been time for it to fill completely.
483. Looking at the matter from that point of view, it would seem that the gangway was covered nearly to its full capacity? Very nearly, I should say. I have estimated that there were about eighty children upon it.
484. The policeman and the teacher at the top of the gangway were keeping the boys from moving ashore, and were, I suppose, keeping a certain amount of space clear until the girls had all got on to the Quay? Yes; the boys all seemed to be waiting patiently. They knew the regulations. It had been customary for them to do that for a number of years.
485. *Mr. McRitchie.*] Was it dark at the time of the accident? No; darkness was setting in. There was quite sufficient daylight to enable you to distinguish any person you knew.
486. From the point where you were standing on the steamer could you notice any deflection in the gangway while the first of the girls were passing over it? No; I do not think it would have been possible to notice it.
487. One witness has told us that he could see it? I doubt whether it would have been possible.
488. It being pretty nearly dark? Quite so.
489. You were standing on the top of the steamer looking down on to the gangway? Yes.
490. In that position you would be at a distance of about 80 feet from the platform while the girls were passing off, and you think that having regard to the approaching darkness you could not at that distance have seen any sagging or deflection in the platform? I think not.
491. You say that the boys were all very orderly? Yes.
492. And you are sure that the "Bald Rock" did not touch the pontoon at all? I am positive of that.
493. If she had bumped it you would have felt the concussion? Yes, I should have noticed it, coming off the steamer, as I did, with the last of the girls before the accident occurred. Immediately after the accident happened I was facing the "Bald Rock," and could see her coming in, so that there can be no doubt about the matter.
494. *Mr. Cargill.*] You said you were the last off the vessel with the girls;—do you mean that you were actually the last persons who left the vessel, or that you were the last teacher in charge of the girls? I was the last teacher in charge of the girls. There were some other girls and children left on board in charge of parents and friends.
495. Were all the boys belonging to the school off the boat at that time? I could not say; but apparently a good number of them were. The major portion of the school is composed of girls.
496. When did you first see the "Bald Rock" before you left the steamer? I saw her coming up the cove in the distance.
497. How far off was she? Several hundred yards off; I suppose 300 yards. I could not give you the exact distance.
498. Did you watch her particularly? No.
499. Can you tell the Board where she was when you left the "Waterview"? No. As I came down on to the pontoon my back would be turned to her. It was not until I went up the gangway that I saw her again. She was then a short distance off the wharf.
500. Which gangway are you speaking of now? The one that broke.
501. You are sure you did not see the "Bald Rock" as you crossed the gangway of the "Waterview"? No; I could not do so.
502. Why? Because my back was turned to her. I came down the paddle-box.
503. You did not cross the "Waterview's" gangway at all? No.
504. You say you saw the "Bald Rock" again as you went up the gangway which broke? Yes.
505. Did you turn round? Yes, I turned round and looked casually at the vessel.
506. How far up the gangway were you then? I was within 6 feet of the top.
507. The "Bald Rock" was then in what position? I should say from 70 to 80 feet from the pontoon.
508. I suppose you did not stop? No.
509. You turned round again almost immediately as you got to the top when you heard the creaking? Yes.

- W.E. Cullam  
12 Oct., 1899.
510. At the moment the clash occurred, how far off did the "Bald Rock" appear to be? I could not say.  
511. Just at the time of the crash you cannot say where she was? No.  
512. And, after the collapse of the gangway, where was she? About 10 feet from the pontoon.  
513. Immediately after the collapse? Immediately afterwards.  
514. Ten feet from the side of the pontoon, or 10 feet from the end? Ten feet from the side.  
515. So that, between the time you turned round when you were on your way up the gangway and immediately after the accident, the "Bald Rock" had come up 70 or 80 feet? Yes.  
516. You informed the Chairman that there was a teacher and a policeman at the top of the gangway from the ship, and a teacher and a policeman at the top of the gangway that broke, helping the children ashore? Yes; they were on the gangway which broke; I spoke to them.  
517. Was there only one teacher? There were several teachers among the crowd of boys. I cannot say how many. There were three or four, if not five. I spoke to two of them.  
518. Were there other adults with the teachers? No.  
519. *Mr. McAllister.*] Did those teachers fall in with the children? Yes; they were standing in charge of their classes on the gangway, and went down with them.  
520. *Mr. Cargill.*] By whose orders did the boys remain on the gangway? I am not in a position to say; but the intimation was conveyed to me by another teacher that the boys were to remain, and that the girls were to go off first.  
521. But, so far as you know, was there any physical obstruction preventing the boys leaving the gangway? No; none.  
522. So that their remaining there was probably due to an order to that effect? Yes.

Alexander McMaster sworn and examined:—

- A. McMaster.  
12 Oct., 1899.
523. *Chairman.*] You are a constable in the Water Police? Yes.  
524. You recollect the 23rd September, and the occurrence of the accident to the floating jetty at Circular Quay? Yes.  
525. Were you on duty on that occasion? Yes, on the Quay.  
526. Where were you when the accident took place? I was standing on the sponson of the "Waterview," the boat conveying the picnic party.  
527. How did you come to be on the sponson of the "Waterview"? The children were all trying to get ashore, and were rushing the gangway before it was placed in proper position.  
528. Were you on the Quay previous to going on board the "Waterview"? Yes; I was on duty on the Quay. I knew that the picnic boat was coming in, and I was waiting for it.  
529. You passed down the platform on to the pontoon, and went on board the "Waterview"? Yes; some of the boys were attempting to jump from the sponson on to the pontoon, instead of going up the gangway. I was endeavouring to prevent them from doing so, because the sponson was considerably under the level of the pontoon.  
530. Did you take any notice of what the passengers did when they landed;—did they congregate on the front of the pontoon, or did they pass straight away on shore? Some of those who had small children with them remained on the pontoon. I heard one of the teachers calling out to the girls to muster on the Quay, and that the boys were to remain behind the girls on the pontoon.  
531. Do you know whether that order was carried out? I saw the girls marching up the gangway, but I was not aware at the time that they were mustering the boys on the gangway. I thought they were marching on.  
532. Did they muster the boys on the gangway? Apparently, from what occurred afterwards.  
533. The boys may have been mustered on the pontoon and marched part of the way up the gangway? They were stationary on the gangway, and a passage was left for the girls to march up past them.  
534. How did you first become aware that an accident had happened? I had my back towards the stage at the time the accident occurred. I heard a crash, and saw all the children falling in a heap into the water.  
535. When you heard the crash, you looked round? Yes; and I saw that the gangway had collapsed.  
536. Was that immediately after you had heard the crash? Yes.  
537. Did the gangway part entirely in the centre? It appeared to go down all at once.  
538. What did you do then? I jumped off on to the pontoon, ran along, and got off on to the chain leading from the pontoon to the Quay. I got hold of the chain, and managed to get one of my feet on to a portion of the broken platform. In that position I could reach a considerable number of children. I passed them up as quickly as I could get any one to take them from me.  
539. Have you any idea how many children were in the steamer? I should think about eighty.  
540. Did you take any notice of the size of them? There was a considerable number of very small boys. I should think the average age would be about 8. I know that boys as old as 14 were there. I know one of them personally.  
541. Were there any grown-up persons? I saw one girl, I think, about 15 or 16.  
542. Were you on duty at the Quay when the picnic party went away in the morning? No.  
543. You have been on duty at the Quay on previous occasions when there have been picnics, and when a number of persons have embarked or disembarked at the floating jetty? Yes.  
544. Have you ever noticed anything wrong with the platform? No; I never knew that there was anything wrong with it.  
545. Had you any idea that it was weak? No; I was always under the impression that the girders were of hardwood.  
546. So that you were very much surprised when it gave way? Yes; in fact, I could not understand for a few seconds what had happened.  
547. Have you seen any very heavy weights upon the platform? Yes; I have seen drays going over it. I have seen loads of produce going down to the Quarantine Station.  
548. How long prior to the accident? I noticed it last summer. I noticed a number of people on the gangway, too, when the Lancer contingent went away. There were then as many people upon the gangway as it could possibly hold.  
549. Had you noticed anything wrong with the platform, would it have been part of your duty to report it? I should certainly have reported it whether it was my duty or not; but it would have been my duty to report it had I seen anything wrong with it.

A. McMaster.  
12 Oct., 1899.

550. To whom would you have reported it first of all? To Inspector Hyem.
551. Did you notice in what way the "Waterview" came into the wharf on the evening of the 23rd? She came in very easily.
552. She did not bump against the pontoon? No.
553. Did you notice any other steamer at the pontoon? The "Bald Rock" came in just prior to the collapse of the gangway.
554. Was she alongside when the gangway collapsed? She was just about abreast of the corner of the pontoon. I looked at her purposely, to see if there were many people on board. I wished to ascertain whether it was necessary for me to go over to them, as the passengers on the "Waterview" were nearly all out; but I noticed that there were only a few persons on the "Bald Rock," and, therefore, I did not go over to them.
555. Were you in a position to say definitely whether or not the "Bald Rock" knocked against the pontoon? So far as I am aware, she did not knock against the pontoon. I should have felt it if she had hit it with any force at all. She could scarcely come in without touching it, because there is so little room. The "Argus," the police launch, was lying on the other side, so that there was very little room to spare.
556. Do you know if the "Bald Rock" was fastened to the pontoon immediately prior to the accident? She might have had her lines out; but she was not squared up in a proper position; she was abreast of the pontoon; but I could not say whether she was alongside.
557. You are satisfied that she did not bump against the pontoon? Yes.
558. Were you one of the constables who took charge of the timber of the staging after it had broken? I took charge of the piece which was sawn off on the day of the inquest.
559. *Mr. McAllister.*] You spoke just now of drays passing over the gangway;—do you know how long ago that occurred? I think it was last summer.
560. You saw a dray pass over the gangway on more than one occasion? Yes.
561. What description of dray was it? An ordinary dray.
562. A two-wheeled spring van, I suppose? Yes.
563. With what description of produce was the dray loaded? With bales of hay.
564. How many bales would the dray hold? I do not think it would hold more than two bales.
565. Was it compressed hay, with bands round it? Yes.
566. Then there would be altogether, including the van and horse, about 1 ton weight? Yes.
567. Was the driver leading the horse slowly down on to the pontoon? Yes.
568. Was there any objection made by any person in charge—by yourself, for instance—to the horse going down on to the gangway? No. We have no control over the wharfs; we have nothing to do with them.
569. Suppose it was attempted to take a horse and cart down the gangway at Prince's Stairs, whose duty would it be to stop it;—would it be the duty of the Water Police? At a place like that it would certainly be our duty. The floating jetty was used chiefly in connection with wool.
570. How long is it since you saw any wool going over that jotty? I have not seen any this season.
571. Was the wool rolled down in bales or trucked down? Sometimes it was trucked down, and sometimes rolled down. If the platform were very steep it would be rolled down.
572. And, I suppose, it was loaded into barges alongside the pontoon? Yes.
573. Was the wool sent down one bale at a time, as a rule? Yes; it was trucked chiefly from Talbot and Flood's stores.
574. Then it would come round by dray, I suppose? No; it was trucked from the stores in single trucks, one bale at a time.
575. How long after the accident were the floating lights thrown from the stern of the Japanese steamer? The children were all out of the water then with the exception of the two who were underneath. We were very much hampered from the want of light previous to the appearance of the floating lights.
576. You could not see from your position on the sponson of the "Waterview" whether the gangway of the pontoon was unduly crowded or not? No. I was not aware that they were mustering the boys there until I heard the crash, and saw the boys going down with the gangway.
577. Were you on the Quay when the Lancers embarked? I was on the other jetty at that time in charge of the police launch.
578. But you could see the Lancers going down on the pontoon? Yes.
579. Do you recollect whether they walked down in step or whether they fell out of step and walked down as an ordinary crowd of citizens? They marched down in regular order; but a crowd of people got on to the platform after they were down.
580. Was no one about to prevent the public from crowding up the Lancers and hampering their movements? Yes; several police were there to keep the public back.
581. So that the Lancers and their friends might occupy the pontoon and the stage? Yes.
582. But you think that upon that occasion the pontoon and the stage had as many men upon them as they could hold? I am positive of it.
583. *Chairman.*] Do you know of any picnic parties having refused to embark from this particular pontoon? No, I do not.
584. You never heard from anyone that they did not consider it safe to pass over the platform? No; I never heard of it. At one time it was the only place from which picnic parties could go.
585. Up to the time of the accident, in your opinion, the platform was perfectly safe? Yes; I always understood so.
586. *Mr. McRitchie.*] Do you recollect the time of the wool riots at Circular Quay? Yes.
587. You recollect that the mounted troopers charged the crowd of people there, and that hundreds of people went on to the pontoon, and that one of the troopers' horses went down also? I could not say; I was in charge of the launch at that time. I heard that such a thing did occur.
588. If there was anything wrong with the staging then it would have shown signs of it, because it was packed as closely as it could be packed? Yes.

O. T. B.  
Miller.

12 Oct., 1899.

Oscar Thomas Broughton Miller sworn and examined:—

589. *Chairman.*] You are a police constable stationed at Newtown? Yes.
590. You remember the 23rd September last? Yes.
591. You were on special duty on that day? I was on duty with the Christ Church picnic to Cabarita.
592. Did you accompany the children from Newtown to Cabarita? Yes.
593. Were you present when they went on board the steamer "Waterview" at Circular Quay? I was.
594. Did you take any particular notice of the manner in which they went on board the steamer? No; they all went on board very quietly and steadily.
595. In an orderly way? Yes; they were a considerable time getting on board. The boat must have been lying there for about an hour.
596. How many passengers were taken by the steamer on the trip by which you went? About 550.
597. How long do you say the steamer lay alongside the floating jetty to take passengers on board? She was lying there fully an hour after I got there.
598. And there was no rush at all? No.
599. You returned with the picnic party from Cabarita in the evening? Yes.
600. Were you on the steamer just prior to the accident? Yes.
601. Where were you standing when she came into the floating jetty? I was standing on the top of one of the paddle-boxes.
602. Did you notice how she came in? She came in very quietly.
603. She did not bump the pontoon? No; she came in as steamers generally do.
604. What did you do when the steamer got alongside? I sprang off the paddle-box on to the floating jetty. I was the first person to leave the steamer. I went on to the gangway connecting the floating jetty with the quay, and stood there to see that no children fell off into the water while they were landing. I remained standing on the platform.
605. What part of the platform? About 10 feet from the Quay and 14 feet from the jetty. That would be about midway.
606. That was immediately after the steamer arrived? Yes.
607. Did you notice how the children went on shore from the pontoon? I did. Mr. Dunstan, the rector, came first, and he said to me, as I stood on the gangway, "Keep the boys back as much as possible, and allow the girls to land first." We did so. Assisted by a teacher, I asked the boys to remain on the boat as much as possible, and allow the girls to land first.
608. That is usually done at these picnics? Yes. About 200 girls went ashore. Mr. Dunstan then said, "I will take the girls up to the tram; you men had better wait and bring the boys up behind." He then left with about 200 girls.
609. Where were you standing then? I was still standing in the centre of the platform.
610. Did the boys congregate at the bottom of it. Yes. A number of boys were eager to get away. They got up on to the platform and kept encroaching on it.
611. What followed? As the boys came on to the [platform there was a space kept free on the right-hand side for any of the stragglers among the girls to follow on after Mr. Dunstan. The girls had all got off, when one of the teachers said, "Now we will follow." I was in the act of moving, and had my back turned to the quay, and was facing the floating jetty, when, without any warning, I heard a crash. The platform gradually subsided. It did not break immediately, but it went slowly down towards the water, and then parted.
612. Did you go down with it? Yes; I went right down into the water. I suppose not more than a second and a half elapsed before the platform struck the water. I had no time to get off. There would then have been from sixty to eighty children on the platform, and my impression is that there were about eighty. They were all precipitated into the water.
613. What did you do when you found yourself in the water? A number of children clung to me; but I should say that about twenty or thirty children saved themselves without any assistance by clinging to the broken portions of the gangway. One of these portions hung down into the water from the Quay, and the remaining portion was suspended from the pontoon. As I fell into the water some of the children fell on top of me. I went underneath, and when I rose a number of them were clinging to me. I was then about 10 feet from a portion of the gangway hanging in the water.
614. Was it deep water? The water appeared to be about 10 feet deep; that would be about the depth. I dived down almost immediately afterwards.
615. You had to swim to keep yourself afloat? Yes; I had to swim to the gangway with some of the children clinging to me. I seized hold of a plank by one hand, and began to hand the children out with the other hand. The children were all round me in the water, and I passed them out to people on the Quay, who reached down and took them up.
616. How long were you in the water? I should say I was there about fifteen minutes before we got the last of the children up. I was the last man to leave the water. I took the body of the boy Grant from the water. He was the last child recovered.
617. Before the collapse of the gangway, you had no warning of any description? I had no knowledge of anything being wrong. I heard a crash, and on the instant the platform seemed to go down.
618. Did you notice any other steamer coming in? I noticed another steamer coming in on the west side of the pontoon.
619. Did she come right alongside the pontoon? No; she was nothing less than 10 feet from the pontoon at the time we were thrown into the water. I saw the people on board of her trying to spring on to the pontoon to come to our assistance; but they could not do so, because she was not alongside.
620. You have been to picnics of this sort on previous occasions? I have been to several.
621. Was this particular picnic party conducted in an orderly manner? It was one of the most orderly picnic parties I have ever seen.
622. There was no undue crowding or crushing? None at all. The children were well under the control of their teachers, and were very well disciplined, indeed.
623. Did the staging open out as it went down towards the water? Yes.
624. Then the children were all afloat? Yes.
625. The chain underneath the staging did not prevent the fractured portions from opening out altogether? No; about thirty children saved themselves immediately after the accident, and reduced the work of rescue

rescue considerably. There was a space between each board in the planking of the platform of about 1½ inch, and the children got their fingers between these spaces and climbed up as they would climb up a ladder. The average age of the children, I should say, would be between 11 and 12. Some of them mounted by the portion of the staging hanging on to the pontoon, and others climbed up the portion hinged on to the Quay.

O. T. B.  
Miller.  
12 Oct., 1899.

626. Does the illustration published in the *Evening News* fairly represent what occurred? It is a very fair representation of what occurred. The handrail of the portion of the staging hanging upon the Circular Quay disappeared in the water; but the handrail of the remaining portion of the staging remained intact.

627. *Mr. McAllister.*] When you first took up your station on the gangway you were 10 feet from the edge of the wharf? Yes.

628. Did the boys encroach at all upon that space, crowding you on to the wharf? No; I myself did not move.

629. At no time until the accident occurred was the portion of the gangway between you and the Quay filled with children? No; but some of the adults from the picnic were there with children, and the girls were also going ashore. There may have been a few in the space between myself and the Quay at the time of the accident. I know there were some; but I cannot tell you how many.

630. The space was not unduly crowded? No; there would be only a few persons there.

631. At about the time the crash occurred, did you notice whether the portion left vacant for the girls had been occupied by the boys crowding up from the rear? Portion of it may have been.

632. At the time the order was given by the teacher for the boys to move along, did they come with any kind of rush from the pontoon? No.

633. They moved along in an orderly and slow way? Yes; there were teachers interspersed among them, every few feet. Each teacher had his class.

634. Then the gangway in your estimation would not have been more than two-thirds filled at the time of the accident? No.

635. The only adults upon it at the time were the teachers and yourself? Yes; and there were two girls about 17 years of age who were nearly drowned. I suppose there were not more than four or five teachers on the gangway when it broke.

636. *Chairman.*] You say you have been to other picnics of this kind leaving this floating jetty? Yes.

637. Have there been a greater number of children at those picnics than were present on this occasion? Yes; three times as many; the picnic from St. Joseph's Roman Catholic Church at Newtown is a very heavy picnic.

638. Did the persons attending that picnic go over this particular floating jetty? Yes.

639. How long ago would that be? About last October.

640. *Mr. McAllister.*] Were you, on the occasion of any of these heavy picnics, on duty during the landing of the children? No; I was at St. Joseph's picnic simply as a visitor.

641. In getting ashore you came up the gangway in the usual way;—did you notice whether it was very much crowded? It was crowded with adults; we were pushing one-another very much.

642. Your impression on that occasion was that the gangway was loaded to its full capacity? Yes; that would be twelve months ago.

643. The crowd would be as dense as a crowd at a fire, for example? It was quite as densely crowded as it was when the boys were mustered on it on the occasion of this particular picnic.

644. Did you notice the gangway move at all? I remember that it swayed as we walked off last year. I distinctly remember that, because I was wondering at there being so many of us on it. Still, I did not anticipate any danger. That would be just twelve months ago—October, 1898.

645. Was the picnic entirely an adult's picnic? Not entirely so; but the boat by which I came back was entirely an adult boat. The picnic is generally so heavy that the boat has to make several trips.

646. It is safe to say that on that particular occasion there were only adults on the gangway? Yes.

647. *Chairman.*] You have never at any time heard any one say that the gangway was unsafe? No; the only thing I ever heard was some one saying that it was peculiar that there was no handrail put round the pontoon. I have never heard anything said about the gangway.

648. On the night of the 23rd did you hear any one warning any of the passengers? No.

MONDAY, 16 OCTOBER, 1899.

Present:—

C. McALLISTER, Esq. | W. McRITCHIE, Esq.  
GEORGE McCREDIE, Esq., CHAIRMAN.

J. S. Cargill, Esq., Crown Law Department, was also present.

Frederick Gerdes sworn and examined:—

649. *Chairman.*] You are a fireman in the employ of the Balmain Steam Ferry Company? Yes.

650. You recollect the 23rd September last? Yes; the date of the accident at Circular Quay.

651. You were employed on that date on board the steamer "Baldrock"? Yes.

652. Will you tell the Board your recollection of what occurred at the time of the accident? I was standing at the forward gangway when the boat came in to the floating jetty. The line was over the bollard on the pontoon, and I was in the act of making it fast when I heard a crash. I at once dropped the line, jumped on to the pontoon, and into the water.

653. Did you notice the occurrence of the accident? I noticed that the gangway from the pontoon to the Quay gave way.

654. Did you see it break? I did not actually see it break, but I noticed it just as it touched the water. I heard the screaming.

655. As soon as you saw the children in the water you jumped in? Yes.

656. Do you recollect whether the steamer "Baldrock," when she came in to the wharf, had much way on her? Very little way.

657. Before you jumped overboard she was not fastened to the jetty? No.

658. You were about to fasten the line, you say, when the accident occurred? Yes.

659.

F. Gerdes.  
16 Oct., 1899.

- F. Gerdes.  
16 Oct., 1899.
659. Had the steamer touched the pontoon? No.  
660. About how far from the pontoon was she? I should say from 5 to 6 feet.  
661. You are quite sure that she was not fastened to the jetty? Quite sure.  
662. Do you remember how long before you jumped ashore the steamer's engines had been stopped? Previous to her going astern they must have been stopped about two minutes.  
663. When did she go astern? Just as we came to the pontoon.  
664. Just before the accident happened? Yes.  
665. Did you notice how many children were on the platform when it broke? I did not.  
666. When you jumped into the water did you swim to the broken platform? I dived, and I came up among the children.  
667. What did you do then? I caught hold of one child, and swam to the pontoon with him.  
668. Did you remain in the water any length of time? About six or seven minutes.  
669. Did you notice whether the broken platform hung together in the middle, or whether it was completely apart? It was completely apart.  
670. Were the children struggling in the water? Most of them were struggling in the water; others were clinging to the broken parts of the platform.  
671. How many children did you rescue? I could not say; I was too busy to count them.  
672. I suppose you handed them out as quickly as you could get hold of them? I put them on lifebuoys, and pushed them to the pontoon.  
673. Do you remember the captain of the "Baldrock" throwing lifebuoys into the water? Yes; one struck me on the back of the head.  
674. I suppose that lifebuoy was of some service in the work of rescue? Yes.  
675. There was not much light at the time? It was just getting dark; we could not see very plainly.  
676. *Mr. McAllister.*] You said that you might be 5 or 6 feet from the jetty when you jumped on to it? Yes.  
677. Had you any difficulty in jumping the distance? No difficulty whatever.  
678. You are fairly certain about the distance? Yes.  
679. Did you jump into the water from the pontoon on the side next to the Circular Quay? Yes; I ran along the pontoon and jumped into the water at the circular end of it—at the side at which our steamer came in.  
680. When you were running along the pontoon did you notice many children there? I took no notice at all.  
681. The only children you noticed were those in the water? Yes.  
682. Your steamer went astern as her bow got abreast of the end of the pontoon, is that so? Yes.  
683. You did not notice any wash from your steamer disturbing the pontoon? No; it was perfectly steady.  
684. Where was the captain of the "Baldrock" standing when he threw the lifebuoy? When I came up from under the water I heard him giving orders to the people to get back from the iron, and then I was struck by a lifebuoy.  
685. He must have been standing at the forward end of his steamer, throwing the buoys from the hurricane deck? Yes.  
686. You are perfectly certain that your steamer did not touch the pontoon, and that her wash did not disturb it? I am quite certain of that.  
687. *Mr. Cargill.*] You had the line over the bollard, you say? Yes.  
688. How long was that before the crash occurred? A very short space of time—I should think about a minute.  
689. After you got the rope over the bollard right at the end of the pontoon, did you take a turn round with the rope on your boat? No.  
690. You simply had the line in your hand? Yes.  
691. What were you waiting for that you did not take a turn with the line? I was waiting for the boat to come closer in.  
692. She was still going slowly ahead then? I could not say; but at any rate she could not have had very much way on her—scarcely any way at all.  
693. Were there any other lines out from your boat? I did not notice any.  
694. You had the forward line? Yes.  
695. Any other line would be at the after end of the boat, and the paddle-box would be between you and the man with that line? Yes.  
696. Have you any idea how far along the pontoon you had to run before you dived? About 30 feet.

Francis Kirkpatrick sworn and examined:—

- F. Kirkpatrick.  
16 Oct., 1899.
697. *Chairman.*] You are under Secretary for Finance and Trade? Yes.  
698. The Board would like to know the practice adopted by your Department with reference to the taking over of wharfs from the constructing authority, and also with reference to repairs;—I presume your Department has nothing whatever to do with the construction of wharfs? Nothing whatever.  
699. Your Department controls the financial part of the business;—you collect the dues? Yes, and make the best arrangements possible with regard to the wharfs.  
700. I presume that work is entrusted to an officer of your Department? Yes; Captain Jackson is the manager of the wharfs.  
701. What is the usual practice when wharfs are taken over; for example, is any step taken by your Department to ascertain the condition of the wharfs at the time;—you might refer particularly to the floating jetty, at which the accident recently occurred at the Circular Quay? I am not in a position to give you any information as to that particular jetty; I cannot discover that any papers were sent over to us when it was finished. The usual course is for the Public Works Department to inform us that a particular wharf is completed, and we then hand it over to Captain Jackson. I have the original minute with reference to Captain Jackson's appointment; it is in these terms:—"Treasury, 27 October, 1884. The office of Manager and Collector of the Circular Quay having become vacant by reason of the retirement upon allowance of a month's pay for each year's service of Mr. John Bell, the Colonial Treasurer recommends the appointment of Captain John Jackson to fill the vacancy; such appointment to date from the 1st

1st proximo. Salary—£425 per annum, as voted. George R. Dibbs." That is the minute paper for the Executive Council. The Treasury minute is as follows:—"Appointment of Captain John Jackson as Manager of the Circular Quay, 24th October, 1884. Mr. John Bell having been granted leave to retire from the above office from the 31st instant, thereby creating a vacancy, I appoint Captain John Jackson to be his successor from the 1st proximo, at the voted salary of £425.—G.R.D." There are also papers pointing out that Captain Jackson is a deserving man and a careful officer, and I have certainly found him to be so.

F.  
Kirkpatrick.  
16 Oct., 1899.

702. Have you any papers defining the duties of the Manager of wharfs? His duties are not defined. He represents the Treasury.

703. When wharfs are handed over to your Department by the Public Works Department, do you receive a certificate from any officer of that Department showing in what condition the wharves are? No.

704. Suppose, for example, a wharf were handed over to your Department in a dangerous condition, what would be the practice of your Department;—would you report it to the Public Works Department? They would not hand over to us any wharf in a dangerous condition.

705. Suppose a wharf got out of repair, and became in a dangerous condition? Undoubtedly if Captain Jackson noticed that any repairs were required he would report the fact.

706. But it would not be his special duty to inspect, with a view to reporting the necessity for repairs? No; but as a man of common sense he would report the need of repair at once, either to the Treasury or to the Public Works Department.

707. You do not know of any officer in your Department whose duty it would be to examine the wharfs? No. I understand that that work is carried out by the Harbours and Rivers Department, but I could not say under what officer.

708. Have you any knowledge of an inspection of the pontoon and staging where the accident occurred? No; but I have some other papers bearing upon the question of control of wharfs which may throw some light on the subject. I find that on the 31st May, 1898, a great quantity of coal had been stored on the Norddeutscher Lloyd's wharf. The fact was brought under the notice of the Treasury, and we had the coal removed. Mr. Burrows, resident engineer, wrote as follows to Mr. Grimshaw:—"I have to call attention to the fact that the Norddeutscher Lloyd Company have stored on their leased wharf at the northern end of the cargo-shed some 700 tons of coal. I understand this coal has been stored in anticipation of the cessation of work at the collieries; but this wharf is in such a state of tension (on the land ties) that the weight of this coal on the back of the wharf may add considerably to the risk of its possible displacement." Upon that Mr. Grimshaw wrote:—"The coal is piled up against the side of the cargo-shed, which is very undesirable." Mr. Darley wrote:—"Captain Jackson's attention should, I suggest, be immediately drawn to this action of the Company." The papers came on to me, and I referred them to Captain Jackson. The upshot was that the coal was removed. That will illustrate to you the official routine in these matters.

709. *Mr. McRitchie.*] In the Blue Book of 1892, the name of an officer (Mr. Lovelock) appears as overseer of stage;—his name does not afterwards appear, and the Board would like to know whether he was superseded by Captain Jackson or by the Public Service Board? I could not give you that information; but I should say from the way the name appears in the Blue Book that he must have been the overseer of some particular stage.

710. He would not be the overseer of the whole of the stages? I could not say that; it is a good while ago. I do not consider that the manager of public wharfs at any time has officers under him who are capable of finding out defects of stages. His officers would not be likely to discover such defects unless they were very apparent.

711. You think that is more the work of the Construction Department? Yes; or of a supervising engineer.

712. *Chairman.*] Do you think it is necessary to have an officer of that description in charge of platforms and stages? Not attached to the Treasury. Such an officer might be a good or a bad one, and we should not know. I have a paper bearing upon that question. It is a minute written since the accident took place by the Under Secretary for Public Works, and it shows the relations of the Departments to the wharfs very clearly. The minute is dated 27th September, 1899:—"Construction of wharfs, jetties, &c.—The evidence taken before the Coroner in connection with the sad accident that occurred at the floating jetty last Saturday evening discloses a very unsatisfactory state of affairs as regards the inspection of the Government wharfs, jetties, and landing stages. This Department is charged with the erection of these structures, and upon completion they are handed over to the care of Captain Jackson, the Government wharfinger. In his evidence, Captain Jackson stated that the wharf in question was in his charge only for the purpose of collecting revenue. He had nothing whatever to do with the inspection of the wharfs, but if he saw that any repairs were necessary he always reported them. These landing stages have in holiday times to carry a very heavy traffic, and it appears to me that some proper system of inspection should be adopted whereby the safety of the public should, as far as practicable, be assured. Although the wharfs, &c., are handed over to Captain Jackson, he has not the professional skill, nor have the staff at his disposal, to say if the structures are safe, or whether certain repairs are required. I am of opinion that that is a responsibility which should rest with this Department, and, with a view of meeting the case, I recommend that one of the Harbours and Rivers inspectors be specially appointed to make periodical inspection of these structures, and report the result to this Department. I would suggest, as a further precaution, that a notice be posted up by Captain Jackson limiting the number of people using these landing stages." That recommendation was approved by the Secretary for Public Works on the 27th September, and was noted by Mr. Darley, and sent on to the Treasury. Upon that minute Captain Jackson wrote:—"4 October, 1899. Sir, I have the honor to acknowledge receipt of your letter of the 2nd instant, enclosing copy of minute approved by the Hon. the Minister for Public Works, in reference to the safety of public jetties, &c. With regard to the instructions to erect notices limiting the number of persons to be allowed on jetties, &c., at one time, I presume that these apply not only to jetties used by the public for picnics, but also to the leased jetties, &c., and as the leases contain a condition that these shall be kept in repair by the Government, they will also require to be regularly inspected. I would ask that I be furnished with a statement by the Works Department stating how many persons can be allowed on the Government jetties and pontoons at Circular Quay and Erskine-street at one time, and as regards the inspection of the same, I beg to suggest that such inspection be made every quarter, in the months of January, April, July, and October, and that I be furnished with certificates as to the safety

F.  
Kirkpatrick.  
16 Oct., 1899.

safety of the various structures. I note that it will be my duty to report to the Treasury any failure in regard to the inspection of the landing stages. I have the honor to be, sir, your obedient servant, John Jackson, Collector and Manager." I may say that I had written upon Mr. Hickson's minute, the following:—"Captain Jackson might be so informed and instructed to see that the inspections are periodically made. Any failure to be at once reported." That was approved by Mr. Sec, who was at that time acting for Mr. Lyne.

713. Has an inspector been appointed? I could not say.

714. *Mr. McRitchie.*] This particular pontoon is 61 feet long by 30 feet wide, and allowing 4 feet of room for each adult, it would accommodate 457 persons; but an inspector would have considerable difficulty in ascertaining whether that number were or were not on the pontoon? You are speaking of the pontoon, I was referring to the stages. Captain Jackson, I presume, would see that the number mentioned for the stages was not exceeded.

715. *Chairman.*] One of the witnesses, Hansen, in giving evidence stated that he had reported that this particular platform at Circular Quay was unsafe two years ago, and also twelve months ago; he appears to have reported on two different occasions;—has it ever come to your knowledge that a report of that character was made? No, I never heard it.

716. I suppose a report of that character would reach you through Captain Jackson? It would depend upon the person making the report.

717. Supposing the report were made by one of the watchmen? In that case I might know nothing of the matter. Captain Jackson would probably take action himself without reference to me. No report was ever made to me.

718. To your knowledge has any report been made to your Department at any time that this particular stage was unsafe? I do not remember any.

719. Do you remember the circumstances connected with the handing over of the stage or pontoon to your Department? No; I could not tell in what year it was. I have not been able to trace any papers at all dealing with the question. It would be handed over probably before I took office as Under Secretary in 1891. I do not remember it being handed over since that date.

720. *Mr. McAllister.*] Mr. Bell preceded Captain Jackson;—is there any minute or instruction defining his duties? If any were issued it would be before my time. I could not tell you whether there were any instructions unless I looked up the appointment of Captain Bell.

721. We may presume, I conclude, that Captain Jackson's duties were precisely similar to those of his predecessor? Undoubtedly.

722. Would he be furnished by any Department with particulars, or would he have to discover himself the absolute range of his duties? I do not think Captain Jackson was ever furnished with any particulars as to his duties; I do not think they were ever defined.

723. He would gather in a general way from you, I presume, what his duties were? He was appointed before I became Under Secretary.

724. Captain Jackson is a retired shipmaster? I believe so.

725. Has he any technical knowledge beyond that which a shipmaster would pick up in a general way as to the integrity of timber and the stability of wharfs and structures of that kind? Captain Jackson is a very careful man, but I do not know that he possesses any technical knowledge of the kind you mention.

726. So far as you are aware, he gains his information as to the state of the wharfs casually from watchmen and others? No; I think by going round. He is always on the wharfs.

727. His duties compel him to be about the wharfs? Yes; he manages the whole wharf business. He recommends the leases of certain wharfs, and looks after the collection of revenues, the placing of ships, and attends to wharf matters generally. He supervises the whole business.

728. Suppose Captain Jackson had as an assistant a practical shipwright, whose duties it would be to look after repairs, and so forth, connected with the wharfs and sheds, would not that meet the requirements of the case? I think it would be better for such an officer to be connected with the Public Works Department, where there would be a supervising engineer. If a man were appointed under the Treasury he might not do that which was right; he would require to be supervised, and Captain Jackson, I take it, would not have the necessary technical skill to supervise such work.

729. Suppose a thoroughly reliable technical man were appointed whose integrity and qualifications were entirely above suspicion, whose previous record showed him to be a man of skill and experience, and suppose he were made responsible, would not such a man do the work as well as if he were looked after? I think not. The Treasury is a revenue-collecting department. We have not any engineers in connection with it. The Public Works Department, on the other hand, have engineers. It is an advantage to have a supervising engineer, and the Public Works Department would have other engineers going about who might notice things. The Treasury could not undertake work of that kind. They could not be in any way responsible for the work of the officer appointed to supervise.

730. *Chairman.*] You think the Public Works Department should not cease to be responsible for the stability of such structures as wharfs? No; the responsibility should undoubtedly remain with them.

731. *Mr. McAlister.*] It should not be difficult to hand over the responsibility for the stability of these structures to an existing officer skilled in that sort of work? No; the Public Works Department have themselves recommended that course.

Robert Rowan Purdon Hickson sworn and examined:—

R. R. P.  
Hickson.

732. *Chairman.*] You are Under Secretary for Public Works and Commissioner for Roads? Yes.

733. Your Department is charged with the construction of wharfs and jetties? Yes, Government wharfs.

16 Oct., 1899.

734. Will you inform the Board of the practice which obtains in regard to the control of the wharfs when the construction is completed? When a wharf is completed by the Public Works Department, it is handed over to the Treasury, and they are then responsible for its working. If any repairs are required they generally inform us, and we carry them out. They have no skilled men in that Department fit for such work. The repairing of wharfs, as was proved by the evidence taken at the Coroner's inquest, is in a most unsatisfactory state. I wrote a minute, drawing the attention of my Minister to the fact, and he forwarded the minute to the Prime Minister, who approved of the recommendation. The

of

of it was that although we would still hand over the wharfs to the Treasury, as far as the working was concerned, we would have an officer appointed whose duty it would be to make a particular examination of the wharfs, and to report to us whatever may be required in the shape of repairs or alterations.

R. R. P.  
Hickson.

16 Oct., 1899.

735. Do you recollect when this particular floating jetty at Circular Quay was constructed? No, I do not. Although I was in the Public Works Department at that time, I was Commissioner of Roads, and the matter did not come under my supervision in any way.

736. Supposing that at any time within the past two years a report had been made as to the unsafe condition of the platform, would it have come under your notice? Yes, anything of that kind, since 1896.

737. But you have not seen any such report? I do not recollect it, and, as a matter of fact, I do not think there has been one.

738. Such a report would come directly from Captain Jackson to your Department? It would go through the Treasury.

739. So that Mr. Kirkpatrick would be likely to know if there had been such a report? Yes, the records would also show it; but I have no recollection of any such report.

740. We have the evidence of a watchman named Hansen that he reported two years ago that this platform was in an unsafe condition? I presume he reported it to Captain Jackson.

741. No such report has come under your notice? Not to my recollection, and I do not think it has. I am sure I should have remembered it.

742. Had you received a report from Captain Jackson, as to the unsafe condition of the platform, you would have had it attended to? At once.

743. From whom could we obtain particulars as to the construction of the platform? From the Engineer-in-Chief for Public Works, or from Mr. Grimshaw. Probably Mr. Grimshaw would be able to tell you the particulars better than would Mr. Darley.

744. You said you wrote a minute suggesting that an inspection of platforms and wharfs should be made? Yes.

745. The question suggests itself whether the inspection should be under the Public Works Department or under the Treasury;—you think it would be better that it should be under Mr. Darley, who is directly responsible for the safety of the structures? When I mentioned an inspection, it did not necessarily mean the appointment of a new man. One of our present inspectors would do the work.

746. He would be responsible to you for it? Yes.

747. You think it is necessary that such an inspection should be made? Most undoubtedly.

748. *Mr. McAllister.*] When the gangway was decked, about a year ago, did the repairs come under the notice of your Department? They did not come under my notice. I have seen, from the papers, that something was done.

749. Would you be informed by the Treasury that such work was necessary? It depends altogether upon how the thing came about. I only know from seeing the evidence taken at the inquest that some time ago the floating jetty went up to Cockatoo Island, to have some repairs made. When the pontoon was sent up the landing-stage was sent with it; but no request was made, I believe, that anything should be done to the landing-stage; and, as a matter of fact, I think nothing was done. The matter did not come under my notice at all until I saw the result of the inquest.

750. Have you any recollection of a floating jetty at one of the ferries becoming leaky one night? Yes.

751. Was that officially reported? It was telephoned to me at night by my messenger. I telephoned back for the fire-engine, and did everything in connection with the matter. It was not an official report by the Treasury. As a matter of fact, we knew all about it, and had the pumps at work in consequence of the action taken by our head messenger in the Public Works Department. He telephoned me up in the middle of the night, and I communicated with the man in charge of our tugs, and telephoned to the fire station, and got everything in working order.

752. Have you any recollection as to how long that punt had gone without any skilled inspection? No.

753. Was the necessity for the appointment of an inspector to deal with such matters mentioned at the time? Not to my knowledge. The matter did not come before me. What took place was not the result of anything wrong with the punt itself. It was an accident such as might happen at any moment to a new punt.

754. Something ran into it? Yes.

755. Have there been any other accidents of that description within the past few years? To the best of my recollection, no.

756. Suppose a wharf in the course of ordinary wear and tear became cobra-eaten, and consequently dangerous, would you do anything to that wharf, unless you were advised of its condition by the Treasury? We should make repairs if our inspector observed the thing himself; but there is just a possibility that he might not observe it; and that is the weak point in the whole matter. There is no officer whose special duty it is to examine wharfs, floating jetties, and landing stages. Our inspectors look after all new wharfs or additions, or repairs to wharfs when they see that there is any necessity for repairs. They naturally report the matter at once, but it has not been part of the inspectors' duties in the past to go round to all the wharfs, irrespective of whether he is doing anything to them, and to report the state they are in. He only reports what happens to come under his observation, whatever it may be.

757. Does he supervise the erection of sheds on wharfs? No.

758. Who supervises the erection of sheds? That would be an architect connected with the Harbours and Rivers branch.

759. A man who was in the habit of looking after repairs to buildings on the wharfs would be more likely to have his attention directed to the immediate details of his own department—he would not be likely to be looking underneath the structures to ascertain their strength? No; the sheds are looked after by an architectural draftsman, who does nothing at all below the floor of the sheds. The wharfs and everything below the shed would be reported upon by Mr. Moir, the inspector.

760. Had you any special inspector in your mind when you recommended the appointment? Yes.

761. What have been his duties? He has charge of the erection of all new wharfs, and of the repair of any wharfs, but it was not part of his duties to examine the whole of the wharfs with a view to find out whether they had any defects; he carried out whatever he was told to do in the shape of repairs.

762. From whom would he receive his orders? From Mr. Darley, through Mr. Grimshaw. The inspector is immediately under Mr. Grimshaw.

- R. R. P. Hickson.  
16 Oct., 1899.
763. *Mr. McRitchie.*] Are you aware that since the inquest Mr. Moir has been going round putting planking on all the old stages? I have no doubt of it.
764. I have observed that new planking has been put upon the stage at Drummoyne, upon the stage leading into Mort's Dock, and upon the one at the Leichhardt ferry? I have no doubt that that is the case. Mr. Moir is now the responsible officer, and he has been since I wrote the minute to which I have referred.
765. This accident has woke him up? It was not a question of waking him up; it was never part of his duty to go round examining wharfs. He was never told to do so; but it is now part of his duty, and naturally he carries it out.
766. *Mr. McAllister.*] Mr. Moir is the officer who has been appointed to supervise the necessary repairs? Yes; but he is in no way to blame for this particular accident, because it was no part of his duty to inspect the particular staging. He did all that he was told to do.
767. *Chairman.*] Could you furnish the Board with a list of the wharfs under the control of your Department? Yes.
768. One man would have plenty to do in going round to look after the different wharfs? I should think so.
769. Is this new duty added to Mr. Moir's former duties? Yes; but if he cannot carry that out, we must have a man doing nothing else. The work will be done, and it will be done properly.

Cecil West Darley sworn and examined:—

- C. W. Darley.  
16 Oct., 1899.
770. *Chairman.*] You are Engineer-in-Chief for Public Works? Yes.
771. You are the head of the Constructing Branch of the Public Works Department? Yes.
772. The Board understand that with respect to wharfs, on their completion by your Department, they are handed over to the Treasury, and they would like to ascertain from you what has been done more particularly with respect to maintenance and repair of the floating jetty at Circular Quay, at which the accident recently occurred? That case is quite exceptional. In other cases wharfs and jetties are constructed from special votes on the Estimates. We then prepare plans and carry out the work. But this was a small emergency job, such as Captain Jackson asks for from time to time. The Treasury find the money for the work in those cases, and we are asked to carry it out. In many such cases the papers do not reach me as the head of the branch at all; they would go direct to the district engineer. In the case of this floating jetty, they went to Mr. Williams, under whose direction a stage was made for putting wool on to a punt.
773. The Board are to understand, then, that this particular jetty and stage were not specially designed for the purpose for which they were afterwards used? They were not designed by the Head Office; there were no drawings, and no one in the office knew anything about it.
774. No plans whatever were made so far as you are aware? No. It was a job which was carried out in a hurry for the Treasury for the shipment of wool. Formerly there was a small suspended stage on the end of the wharf near the Orient Company's berth, which Captain Jackson did not lease to that company. There were two piles out in the water, and a stage was slung from them. The punt was brought underneath, and the wool was run down. It was found that that space was wanted for other purposes, and when the slung stage was done away with they asked that this floating punt should be put in the corner to replace it. Here is a minute which will inform the Board of the history of this particular floating pontoon and stage:—

The stage was constructed for purposes of shipping wool into punts, by Inspector Moir, by day labour, under Mr. Williams' direction, in July or August, 1892. The punt was moored, and stage fixed, and all reported ready for use on the 1st September, 1892.

New Oregon purchased from the Federal Timber Company, originally covered with 2-inch pine planking; but the planks wore through with the truck wheels, and Captain Jackson asked for the deck to be renewed. This was done on the 19th and 20th November, 1897, by day carpenters, Williamson and Stephen, who did the work on a Saturday, making overtime, as it was urgently required.

The new decking put on was 2-inch hardwood, and I learn from the carpenters that they found the bearers quite sound; but they noticed a slight sag in the centre one, and they inserted three  $\frac{3}{4}$ -inch bolts vertically through the beam to tie it to the planking.

The punt was under repairs at Cockatoo Island in September, 1897, being taken into the Dock on the 6th September, and undocked on the 14th. All the necessary repairs to metal, &c., were carried out. The stage was laid on the punt when it was taken to Cockatoo; but no repairs was carried out, as none were asked for.

I have referred to the time-sheet for the Public Works Department for the fortnight ending the 24th November, 1897, and I find that Williamson and Stephen were at work upon the punt and staging on the 19th and 20th November; the time-sheet shows that the men received for repairs to the pontoon at foot of Phillip-street, Circular Quay, £2 6s. 4d. When these repairs were made Inspector Moir was away ill. As a rule, he would look after the men doing that kind of work; but in his absence another man, a very good man indeed, acted for him. This man afterwards went away up to Bourke and died on the return journey.

775. What was his name? I forget his name; but he was acting for Moir. I did not know him personally, but he was always spoken of as a good officer. He was not in good health here, and the doctors said that if he went inland he might improve. He went up to Bourke, but he unfortunately struck the heat-wave there and died in the train at Orange on the way back.

776. *Mr. McAllister.*] The platform bears evidence of having been decked twice, in addition to the original decking;—have you any recollection of the second decking being carried out? No; as far as I am aware there was the original decking, and then, when that decking was taken off in 1897, a hardwood decking was substituted; I know of that redecking, but I do not know of any other.

777. Would Mr. Moir be likely to know of any other? He might know, or perhaps Mr. Williams might be able to give you some information. A number of minor matters of this kind do not come into the head office.

778. There are officers under you who can exercise a certain amount of discretion in the carrying out of small repairs of this description? Yes. The Treasury order the thing to be done, and the papers are then marked off for the officer to carry out the work.

779. *Chairman.*] When this platform was first handed over to Captain Jackson was any information given him regarding the strength of the structure, and the weight which should be put upon it? There was no handing over in the matter; the work was constructed for him. He asked for it, and the office made it for him as if they were acting for him. He asked for a staging and pontoon for the shipment of wool. The structure was put there for the shipment of wool, and it was not thought that it would be used for the shipment of passengers at all. C. W. Darley.  
16 Oct., 1899.

780. But Captain Jackson appears to have used it for passenger traffic? Yes.

781. *Mr. McRitchie.*] This particular pontoon is not the first pontoon which was put there;—there was an iron pontoon there at one time? Yes; and before that there was an ordinary stage. I think it was in 1886 or in 1887 that the first pontoon was put there.

782. *Chairman.*] Had your Department been aware that the stage and pontoon were to be used for passenger traffic you would have specially designed them for that purpose? Yes.

783. Have you, since the occurrence of the accident, gone into the carrying capacity of the platform? I have.

784. Taking the beams to be new beams? Yes.

785. Will you tell the Board the result of your calculations? The breaking load of the central girder was 88.44 lb. per square foot. The safe load was  $\frac{2}{3}$  of that, or 11.05 lb. per square foot. The two side girders had a breaking strain of 224.89 lb. per square foot, and a safe load of 28.11 lb. per square foot.

786. Did you take out the weight of the platform? The weight of the deck was 2,940 lb., and the weight of the beams and spikes in planks 300 lb. I distributed that, and in the dead load I took the factor of safety at 4, with 8 for the live load. That is, assuming the timber to be sound.

787. *Mr. McAllister.*] What do you usually set down for the modulus of rupture of Oregon? 7,900 lb. 788. What do you reckon the whole platform would carry as a safe load? The centre girder carries double the load of the two side girders. The side girder gives 731.18 lb. per lineal foot. That is the distributed load to each girder.

789. Do you think the platform was safe for the carrying of live loads such as it was made to carry? It was safe supposing the load were moving, but it was not safe for crowding such as occurred under the unfortunate circumstances when the accident took place. If persons were marching upon the platform you would get nothing like the load to which it was then subjected, but as far as I can make out persons were crushed on to the platform, and held on it stationary. If they were marching the state of things would be altogether different. We had proof of that a short time ago when troops marched over the platform. In that case you had adult men, and that was only a few months ago. Apparently, however, the platform has not been safe for some time. It was most unfortunate that the children should have been crowded on to it, and kept there stationary. It was the worst thing that could have happened. If they had been allowed to pass over the platform there would have been no trouble at all.

790. Who is the officer who generally designs these platforms for the use of the public? Mr. Rossbach; he does the designing for all our wharfs, and for what you may call our permanent work. This work did not reach him at all. It was looked upon as a temporary thing, and it did not reach the head office.

791. Could you tell us what factor of safety Mr. Rossbach allows for the live-load in constructing these platforms? I cannot say at this moment, but we always use hardwood in these cases; it is quite exceptional to use Oregon.

792. But a certain rule is adopted—that is to say, a sufficient margin of safety is always insisted upon in construction? Yes.

793. And Mr. Rossbach would not have used Oregon having regard to the purpose for which the staging was subsequently used? We never dreamt that the staging would be used for such a purpose. I was astonished to see it so used.

794. Suppose a report had been made at any time to the effect that the staging was unsafe, I suppose you would have heard of it; it would have been brought under your notice? Should the papers have come into the office I should have seen them, of course.

795. One of the watchmen employed by Captain Jackson has told us that he reported that the staging in his opinion was unsafe, two years ago, and as recently as twelve months ago. These reports appear to have been made to the officer immediately above him, who said that he reported the matter to Captain Jackson;—the Board would like to know whether these reports reached your Department? We have no record of any such reports, and we should know of them had they reached our Department.

796. Of course, had you received such a report, it would have received your immediate attention? We should have certainly looked into the matter at once; but our officers are so fully occupied that they cannot be expected to go about looking for work.

797. You think that the appointment of an officer, as recommended by the Under Secretary for Public Works, whose duty it would be to inspect these stagings, will insure their safety in the future? I do not think it will be necessary to appoint an officer; we could tell one of our local inspectors to look after all these things.

798. Mr. Hickson has informed the Board that he has recommended that a man be appointed whose special business it would be to look after the platforms at the wharfs? There used to be an officer of the kind in the Treasury. I do not know when he was superseded. If you look at the Blue Book of a few years ago you will find an officer who was called an Inspector of Stagings.

799. That officer appears to have been superseded? Yes.

800. *Mr. McRitchie.*] You do not know whether he was superseded by the Public Service Board? No. Captain Jackson would be able to tell you about that.

801. *Chairman.*] When this staging was sent up to Cockatoo Island for repairs were any special instructions sent with it? As far as I know, nothing was said about the platform at the time. It was said that the punt wanted repairing. As far as I can make out, the staging was left upon the punt as a matter of convenience, and was not touched at all.

802. I suppose the staging would be shifted off the punt while they were repairing it? It would probably be put aside. The platform was redocked in November, and the punt was repaired in September, 1897.

803. I suppose none of the engineers in your office would have had occasion to inspect the staging when at Cockatoo Island? No; instructions were sent up to do certain things to the punt. I have not the papers which were sent up, so that I do not know what was asked to be done; but a requisition goes up

C. W. Darley. for every work done in the dock. I do not know at this moment whether the punt was simply caulked or redecked.

16 Oct., 1899.

804. Who is the responsible officer at Cockatoo Island for carrying out repairs of that description? Mr. Pratt, the docking-master—the foreman shipwright.

805. When work of that description is sent to the dock, is he given *carte blanche* to make a good job; does he carry out merely the repairs specified, or is he instructed to make a good job;—suppose, for example, certain repairs are specified, and it is found other repairs are necessary? In that case it would be his duty to call attention to the necessity for them, and he would then be instructed to carry them out.

806. He would call your attention to the necessity for them? Yes.

807. Would the matter be brought under the notice of the Secretary for Public Works? No; it would come to me direct.

808. If, for example, when the sheathing was taken off, it was found that some of the planking was defective, your attention would be called to the matter at once? Yes.

809. And you would then give the necessary authority for the work to be carried out? Yes.

810. Suppose that in such a small matter as the repair of the staging it were found that the girders were not in sound condition, would the rule to which you have referred be carried out;—would the men repairing the staging call Mr. Pratt's attention to the defective girders? In that case the men were working for Mr. Grimshaw. The work was not done at the dock; it was done on the spot. The staging was not moved at all. If the men found the timber was not sound, they should have called the inspector's attention to it, and he would have spoken to Mr. Grimshaw at once. They stated, I believe, that in making borings they found the girders perfectly sound.

811. The men who carry out work of that description are not authorised to do anything except what they are directed to do? No; the inspector is always within reach, and they can refer to him at once. It would never do to give the carpenters power to do what they like.

812. *Mr. McAllister.*] In making your calculations with respect to the strength of the stage you assume that twice the weight of the side girders is on the middle beam? Yes.

813. Would not the thickness of the decking very materially modify that estimate? To some extent; but it is always safer not to allow for the planking distributing much load. When the planking was new it was pine wood, and that would not distribute very much.

814. We found that a section of the middle girder had latterly no value whatever;—it was all so rotten that the decking must have been hanging to the side girders, which were taking all the load? The engineering practice in designing a new staging is to halve the load—to put half the load on to the centre girder where there are only three girders, and a quarter of the load on to each side girder.

815. Would it not be a good plan when constructing a girder, instead of having a straight hand-rail, to construct it in truss fashion, so as to give an extra factor of safety to the structure without making it more expensive? It is cheaper to put a straight piece of strong timber in at once.

816. But in putting on your handrails and bolting them to the side, it would be easy, would it not, to have them tied up, giving an extra factor of safety, which would be always under observation? If it were your object to make them light, you would adopt that system, of course; but in the case of these stages there would be no great object in making them light, and it would be better to put plenty of timber in. When you have a long ship's gangway, the proper course is to lighten it up.

817. These stages are subject to so many conditions as regards weight;—for instance, sometimes there is a big crowd passing over them, and occasionally a horse and cart going down? There is no other stage in the harbour like this one. If an ordinary stage broke, nothing would happen, because the punt would be underneath. This stage was put there as a temporary work, and was, unfortunately, allowed to remain. Another complication which enters into the matter is this: the top of the stage is fixed rigidly on hinges to a stone wall. I gather from the evidence published in connection with the Coroner's inquest that a number of children were crowded on to one side of the punt; the result would be to tilt the punt a little; and if you did that, the girders being fixed as I have described, most of the weight would come on to one girder. The evidence taken before the Coroner showed that another steamer was coming in, and struck the punt. Just when all the strain was upon the one girder, the punt appears to have received this blow. There was therefore a combination of stresses upon the outside girder.

818. *Chairman.*] The evidence which the Board has taken so far would seem to show that there must have been some misunderstanding as to the "Baldrock" striking the pontoon;—the Board have made very careful endeavours to find out whether the "Baldrock" did, as a matter of fact, strike the pontoon, and we are inclined to think that she could not have done so? I heard two men giving evidence before the Coroner, and one of them, who was under Captain Jackson, declared that the steamer which was coming in at the time did touch the pontoon, and that just as she touched it the platform went down. However, whether she touched it or not, she probably created a certain amount of wash, and that wash would give things a twist.

819. *Mr. McAllister.*] Have you any idea when the Treasury first authorised the use of this punt for passenger purposes? I do not know how long ago that would be, but it would be a considerable time ago.

820. It occurs to me that as soon as it became customary to use the pontoon for passenger purposes, the attention of the Works Department should have been called by Captain Jackson, or by someone, to the necessity for a hand-railing; but that was not done—the pontoon appears to have been allowed to remain as it was? It is still used as a wool stage. When the wool is there it is shipped from this punt. The punt has not been transferred from the purpose for which it was originally put there. When there has been no wool to ship, passengers have used the punt, apparently.

821. *Chairman.*] Hansen, in his evidence, told us that he considered it his duty to report the unsafe condition of the staging to Platt, his superior, so long as two years ago;—would Platt report the matter to the Public Works Department or to Captain Jackson? He would report the matter to Captain Jackson. We do not know him at all. The matter would have to come to us through Captain Jackson, who would report the matter to us and ask for repairs.

822. I suppose that when Platt reported the matter to Captain Jackson it was optional with him whether he reported it to your Department or not? He usually writes, asking us to do what is necessary, and we attend promptly to his request. So far as I know, everything for which Captain Jackson asks in our office is carried out promptly. We generally give immediate attention to his reports.

823. *Mr. Cargill.*] Do you know whether the redecking of the platform was or was not done at Captain C. W. Darley Jackson's request? I assume that it was; it was almost certain to have been done at his request.
824. When the old decking was taken off by Williamson and Stephen it would be done under the supervision of the inspector who was acting for Moir? Yes. 16 Oct., 1899.
825. And it would be his duty to report to Mr. Grimshaw if he found it necessary to do anything outside of the work he was specially instructed to do? Yes.
826. As to the inspector of staging to whom you have referred, who formerly appeared you say in the "Blue Book," you do not know personally what his duties were? No.
827. You do not know whether those duties are now being performed by another officer? No. It is quite possible that his duty may have been to look after the old long spar stages.
828. You really do not know what his duties were, and, as far as you are aware, they may be carried out by some other officer? Yes; he would be an officer under Captain Jackson.

WEDNESDAY, 18 OCTOBER, 1899.

Present:—

C. McALLISTER, Esq. | W. McRITCHIE, Esq.  
GEORGE MCCREDIE, Esq. (CHAIRMAN).

J. S. Cargill, Esq., Crown Law Department, was also present.

John Williamson sworn and examined:—

829. *Chairman.*] You are a shipwright? Yes. J. Williamson.
830. You are in the employ of the Government? Yes. 18 Oct., 1899.
831. How long have you been in that employ? A little over nine years.
832. Where are you employed? At different places round the wharfs.
833. Who is your foreman? Mr. Moir; he generally supervises my work.
834. You know the floating jetty at Circular Quay at which the accident took place on 23rd September? Yes.
835. Have you at any time repaired the stage of that jetty? Yes.
836. How long ago? It is nearly two years ago, as far as I can remember.
837. What did you do to it? We removed the old decking, and put new decking on.
838. Of what was the old decking composed? Two-inch Oregon, as far as I remember.
839. Under whose instructions did you redeck the platform? As far as I can remember, it was done under Mr. Christian. Mr. Moir at the time was away on sick leave, and Mr. Christian has since died. He was acting for Mr. Moir, to whom we have always to go for instructions.
840. Did Mr. Christian order you to remove the planking of the platform? As far as I remember, he did; but someone must have given the order. We should not do a thing of that kind without instructions.
841. Was the planking which you took off bad? As far as I can remember, it was worn a bit. The wool season was coming on, and I suppose that, in view of the traffic during that season upon the platform, they wished to make the top good.
842. Did you take the whole of the old planking off before you put on the new planking? Yes.
843. You did not take it off a few pieces at a time? I am not sure about that. I remember that when we undid the planking at the lower end of the platform we found part of the stringers were worn away, and we bolted hardwood pieces along the side in order to raise the level of the bottom end of the platform.
844. You did not do that in order to strengthen the beam? No; it would not have given any strength to the bearers, because it was obvious that if they went at all they would go in the centre.
845. You bolted hardwood pieces alongside with through bolts and nuts? Yes.
846. And you replanked the whole platform with 2-inch hardwood? Yes.
847. After you had taken off the old material forming the decking, did you notice the condition of the beams? Yes.
848. In what sort of condition were they? They were in fairly good condition; I can honestly say that.
849. Did you pay particular attention to their condition after the nails were drawn? Yes.
850. Did you notice any fracture in the side of one of the stringers? No, nothing. There was nothing we could have detected. We had to bore holes through, and we should have soon seen if the timber were bad; but there was no sign of it.
851. *Mr. McAllister.*] What did you bore the holes for? For the hardwood pieces at the end of the staging.
852. *Chairman.*] Do you recollect how many holes were put through the stringers, and what the size of them was? I know that there were three tie-rods for bracing the whole structure together.
853. Do you recollect how heavy they were? I think they were 1-inch iron.
854. Did you notice, when putting the holes through the timber for the tie-rods, whether it was worn in any way? I am certain that at that time there was nothing wrong which could be seen.
855. When you put the planking across, did you fasten it with nails? Yes.
856. Did you fasten it in any other manner? I thought at first that I put only one bolt in the centre beam; but I found, when I went to see the thing the other day, that I had put three bolts through the planking and through the beam.
857. What did you put the bolts in there for? We found that the middle beam was a little sagged. It is generally the case in these structures that the middle beam does sag a little. The bolts we put in are what you would call service bolts—to pull the work together. There was no defect that I could see in the beam. We thought that it would save the jar resulting from the trucks running down, and would prevent the drawing of the nails.
858. The bolts were not put in to tie any fracture? No; I am quite certain of that.
859. You did not notice any fracture? No.

- J. Williams. 860. How far away were the planks that you put on from one another? About a quarter of an inch; we might have put them closer. If the timber was new it would soon shrink a little and become open.  
 18 Oct., 1899. 861. Did you notice any knots at the top of the Oregon? No.  
 862. Have you had much experience of this sort of work? A good deal. I have had nine years' experience in connection with the different stages.  
 863. Is it usual to use Oregon for them? No; this is the only case I am aware of. Hardwood is generally used.  
 864. Had you to move the rails at the side of the platform when you were renewing the planking? No, it was not necessary; we cut round them.  
 865. In your opinion, did the rail form any stay whatever to the platform? It would assist to a certain extent.  
 866. Were there any diagonal braces? No.  
 867. Would there not be a weight rather than any assistance to the stability of the structure? I do not think it would add much weight to it. It would, perhaps, help to stop the vibration.  
 868. Where was the platform repaired? At the wharf where it was in use. It was not necessary to unship it from the Quay.  
 869. You had every opportunity, you think, to notice whether the beams were fractured? Yes. I had a good opportunity to see in these cases if there is anything wrong, and, if I notice it, I always call attention to it. Besides none but a madman would dream of putting new planking over rotten beams.  
 870. You have seen the beams since the accident happened? Yes.  
 871. In what sort of condition do you consider them? In very bad condition.  
 872. They are rotten, are they not? I would not have known them to be the same pieces of wood.  
 873. How do you account for the beam becoming rotten so soon after the repair of the structure;— what reason can you assign for it? When Oregon gets to a certain age, there is no nature, so to speak, in the timber, and once the wet gets into it, that and the heat of the sun combined, would make it go very quickly.  
 874. Have you been engaged since this accident has occurred in repairing any other gangway? Yes.  
 875. Where? At Princes Stairs. I think we put an extra hinge on it.  
 876. Did you notice in what sort of condition the beams were? They were in first-class condition.\*  
 877. They are hardwood? Yes.  
 878. Do you know the size of them? They are 12 in. x 6 in., I think.  
 879. What sort of planking is there on the top? Kauri, I think.  
 880. The platform in that case is much smaller than the platform at Circular Quay? It is narrower.  
 881. Do you know the size of it? I think it is 6 ft. 6 in. in width, and about 24 feet in length, I think; but I am not quite certain about it.  
 882. Is it constructed upon the same principle as that of the platform upon which the accident occurred? It is somewhat similar, but it rocks on a socket at the bottom. There are two castings.  
 883. Are there three bearers in that width of 6 ft. 6 in.? Yes; three bearers of 12 in. x 6 in. ironbark.  
 884. *Mr. McRitchie.*] When you bored the holes down to the beam, you put washers at the lower end of the bolts to screw them up? Yes.  
 885. You are sure that when you bored those holes you detected no fracture in the beam? We could not see any.  
 886. The Board notice that the timber was split, and we naturally came to the conclusion that the bolts were put in to stiffen it? The bolts were not put in to support the middle beam at all; they were put in to bring the work together.  
 887. Did you begin to put in the new planking at the shore end? Yes.  
 888. And you worked downwards? Yes; and as we got near the middle, we found a bit of a sag.  
 889. When the whole of the planking was stripped away, you could not see that any portion of the beam was decayed? No.  
 890. You told the Chairman that you could not account for the Oregon rotting so quickly in two years;— any practical man examining the work as you did ought to know whether the wood was good or not? Quite so.  
 891. Did you put bolts or nails into the hardwood planking? Ubank nails.  
 892. And you did not notice any rot whatever? No; the Ubank nails are flat on the point, and when driven in they do not split timber of that size.  
 893. You are sure there was no splitting of the timber, such as would subsequently let in water? I am quite sure of that.  
 894. *Mr. McAllister.*] Did the pieces of hardwood you put on constitute the first part of the repairs you effected to the gangway? Yes.  
 895. Did you take off sufficient planking at the bottom end of the gangway to allow of your putting on the pieces of hardwood, or did you take off more planking than that? As far as my memory serves me, we took off enough to allow of our putting in the hardwood.  
 896. When you had put in the pieces of hardwood, what was the next portion of the repairs you carried out? We started then to undo the top, and as we took off the old planking we laid down the new planking.  
 897. You did not interrupt the traffic;—there were people coming up and down all the time? There was a temporary fence along the top, and a plank or two were thrown across. There may have been a little interruption to traffic, but not much.  
 898. Therefore you put down the new flooring almost immediately after taking the old material out? Yes.  
 899. You think you put in the new flooring one or two planks at a time? I am not at all certain about that. I am inclined to think that we took off all the old material, prepared the surface for the new material, and then started from the top and worked down.  
 900. Then the traffic was interrupted? To some extent.  
 901. Will you tax your memory so as to enable you, if possible, to throw some light upon the point whether the old planking was removed one or two pieces at a time, and the new planking put down in its place in that way, or whether the old planking was all taken off before the new planking was put on? That I cannot remember.

902. The Board, on examining the old timber, found a shake about 4 feet long, which had been tied <sup>J. Williamson.</sup> together by three  $\frac{3}{4}$ -inch bolts; assuming that you had not noticed the shake, why did you divide those bolts so nicely as to cover the limits of the defect in the beam;—if you did not know that it was there, <sup>18 Oct., 1899.</sup> can you explain how it was that you put in the bolts in that way? I forget the width of the planks; but there would perhaps be one bolt in each plank. The bolts would be put through about the middle of the plank for the purpose for which I put them there. They would therefore be equidistant.

903. One of the bolts went right down alongside the centre tie, and a hole being bored there, practically increased the weakness of the beam instead of strengthening it, on account of the material bored out? That, I suppose, was so.

904. *Chairman.*] You appear to have missed one plank;—if you intended the bolts to tie the centre of the beam why did you not put in three bolts in consecutive planks instead of missing one plank and then going on to the next? We did not take any particular notice. The bolts were not put in to remedy any defect in the beam, but simply to bind the work together in the middle, where the staging was a little bit sagged. I am quite certain of that.

905. *Mr. McAllister.*] Have you any recollection whether you stretched planks up and down on the timber work to keep the traffic open while the repairs were going on? Now I come to think of it, I do not think we did.

906. As a matter of fact, you do not quite recollect the details of the operation;—you do not remember exactly what you did; nothing occurred to fix the matter in your memory? No; there was nothing unusual.

907. The Board, in their examination of the old timber, noticed that a great many of the old nails, instead of being pulled out were knocked down and driven on to the wood, the hardwood planking being put down on the top of them;—did you and your fellow-workman, Stephen, do that? We generally break the nails off. We do not, as a rule, draw old nails.

908. In this case they were not broken off; probably about one half of them were turned over and flattened down, showing that the nails were of good material;—did you notice that the nails offered some obstruction to the bed of the new timber you put on? I do not remember.

909. Do you not think that if the wood were soft enough to enable the nails to be driven down so as to be flush with the new decking when it was on, that should lead you to be suspicious as to the quality of the wood beneath? If they resisted turning over it would have shown that the timber was very good. If it had been bad the nails would not have turned.

910. They were 6-inch nails, and they were driven in probably about half way through the timber, so that there was only 2 inches of the nail sticking up, or perhaps less than that; you bent that 2 inches down and knocked it into the surface of the wood, so that no obstruction might be offered to the cross-pieces you were putting on? That, I believe, was so.

911. Would not that have raised the suspicion in your mind that the timber was not good if it was soft enough for the nails to be driven down in that way? As a rule we break the nails off close in order to get the new work down to where it is required. It is possible that the nails to which you refer may have been bent over when the staging collapsed.

912. We have examined most of the timber that came out, and the nails have come out with the pieces;—the nails to which I refer are nails that came out of the decking previous to the decking you put on? I cannot account for what you describe, because we always make it a rule to have everything close down for the planking.

913. Did you notice that the staging had been decked twice before you decked it? I observed that there were marks of nails in it.

914. Did you observe the old nails bent over from a previous decking? There may have been some, but I do not remember any.

915. *Mr. McRitchie.*] You told Mr. McAlister that during the repairs you thought the traffic was stopped to some extent, what traffic did you refer to;—did you mean constant passenger traffic or casual traffic up and down the gangway? Casual traffic. Perhaps a little boat might come in without being aware we were repairing the gangway, or some scafaring man may have been ashore. [In that case he would run down the beams, to which he would be accustomed.

916. You are not referring to the traffic of picnic parties? No.

917. *Mr. Cargill.*] Was Mr. Christian present while this work was being done? I do not remember; but I recollect that Mr. Moir was away on leave, and that Mr. Christian was acting for him.

918. But you do not know whether Mr. Christian was there at the time? No. As far as I can remember, Captain Jackson's attention at some period of the work was called to it, because I remember his asking me what I was doing to the foot of the staging. I believe his attention was called to the hardwood pieces at the end of the stringers, and, as far as I can remember, he came and looked at them.

919. In answer to Mr. McAlister, you said you did not know how many deckings had been put on the stringers? No; I do not remember having noticed it. We built the structure in the first instance.

920. When was that? It would be about six or seven years ago.

921. What was the decking then? Oregon.

922. Did you at any time between the original building and the putting on of the hardwood decking make any repairs to the stages? I am almost sure we did not.

923. When you took the Oregon planking off two years ago, do you remember noticing whether they were the planks you had put on in the first instance? I could not say for certain whether they were or not.

924. When you took the planks off, was there anything to indicate whether or not it was the original decking? Not as far as I can remember.

925. You did not see any nail holes which would lead you to suppose that there had been another decking after the original decking? No; and it is quite possible that if at any time any of the planking got a bit loose from the wool traffic, some one might have been sent to refasten the planking. That might account for some of the nails which were found.

926. But you yourself did not see anything to lead you to suppose that you were putting on the third deck? No.

927. *Chairman.*] You said you built the platform originally? I assisted to do so.

928. Did you have any plan? I do not think so.

- J. Williamson. 929. Under whose instructions was the platform constructed? I suppose it would be under the direction of Mr. Williams. He was the supervising engineer at that time.
- 18 Oct., 1899. 930. Where was it constructed? Circular Quay.
931. Do you know of any reason why Oregon was put in for the beams? I am sure I cannot say.
932. Was it new timber? It was splendid timber.
933. Ordered for the special purpose? Yes.
934. *Mr. McAllister.*] Have you any recollection as to who assisted you in the building of the gangway? Mr. Christian was what you would call the leading man—he was my senior.
935. *Chairman.*] You do not know whether any calculations were made for the weight the beams were to carry? No. If they had been I should have no knowledge of it. As a workman I should simply do as I was told.
936. You worked to no special plan? Not that I can remember.
937. Who told you what to do;—under whose instructions did you actually carry out the work? Under Mr. Moir, as far as I can remember. I think he was supervising.
938. In making a platform of this description, you would depend entirely upon the instructions of the man immediately over you? Yes.
939. Did you know for what purpose the platform was to be used? I heard that it was to be used temporarily to run wool down.

James Walter Grimshaw sworn and examined:—

- J. W. Grimshaw. 940. *Chairman.*] What is your position in the Government service? My latest grading is Assistant Engineer—first-class. The charge I have is the Harbours and Rivers in the Sydney and South Coast District, including the snagging of the Darling and Murrumbidgee Rivers, and the North Coast, up to Lake Tuggerah.
- 18 Oct., 1899. 941. The construction of wharfs and similar work would be under your charge? All wharfs and training walls, and general engineering, with the exception of the larger sheds on the wharfs, and light-houses. I have not had anything to do with them lately.
942. Will you give us the history of the platform which broke recently at the Circular Quay, as far as you can remember it? The first I can recollect of the matter was that we deepened that corner of the Circular Quay. While doing so the pontoon previously there was moved, and when the deepening was completed it was proposed to put a jetty there. At the same time, Captain Jackson asked to have the pontoon brought back. The pontoon had been used in the meantime for carrying stone at Garden Island. The pontoon was brought back. We did not moor it with piles, because it was not considered necessary. We used merely chains. The staging which has recently broken was made at that time. It was made, I believe, on verbal instructions, by day-labour, and the timber was obtained by requisition. It is hard to remember now; but I believe that Christian and Williamson were the two carpenters, who made it, under the supervision of the clerk of works, Mr. Moir. From time to time repairs have been made to the pontoon or gangway, as Captain Jackson asked for them, or as we might discover them to be necessary. I remember seeing some new planking put into the pontoon. I have looked up all the facts about the pontoon going to the dock, and I obtained the pay-sheets and requisitions showing when it was redecked; but I remember nothing about repairs to the staging at that time. What I do remember distinctly is that the whole thing was intended for the loading of wool. It was never looked upon as a passenger wharf.
943. Were any plans made of the structure, or was it merely constructed by direction of the foreman in charge of the work? I never saw any plans, and I am quite certain that there would be none. Mr. Williams would simply give instructions for the running out of the three timbers, and for the hinging of them on to the wharf. A requisition was made out for the material, and then the work would be constructed. If any defects were afterwards found out they would be corrected.
944. Do you know whether any calculation was made as to the carrying capacity of the platform? I do not think so.
945. If any were made you would know of them? Yes. I am confident that no plan was ever made. It was never dreamt that there was any necessity for it. It was not for a permanent structure.
946. As a matter of fact, the staging was not constructed at all for the carrying of a live load? No. If it had been it would never have been constructed in that way. The matter would have gone before the Engineer-in-Chief, who would have had a proper design made. I understand that for a long time previous to that it was the custom at Circular Quay to have two spars running out with some cross timber lashed on to them, and then some planks upon which the wool was run out to punts and barges or small vessels; and this pontoon was regarded as an improvement upon that, because it would not require fixing up every time it was used. It proved to be so good that they went on using it. It was used, in the first instance, by Departmental boats, and then afterwards the Treasury began to obtain a revenue from it, and other boats came there, until it became a particularly favourite wharf, being outside the traffic. There appears to have been a distinct demand for the wharf.
947. Had you been consulted professionally as to this particular platform, what would have been your opinion as to its adaptability to the carrying of live loads, seeing that you knew the material of which it was constructed? It is easy to say now that it was certainly not adapted for that purpose in any way, and I think I should have said the same thing before the accident. In the first place, there were no piles to keep the punt in position; therefore, any boat coming in would carry it as far as the chains would allow one way or the other, and at low tide the chains would allow it to be carried further than at any other time. That would bring over the staging, and there would be a great strain on the hinges unless there were rollers. In this case there was a great distance between the pontoon and the shore, and in that respect it was unlike other pontoons, where there is scarcely any distance separating them. In this case, if the platform did break, anything upon it would naturally go into the water. Then, again, the punt was not a new one, and the staging was a very light one. I feel convinced that no consideration whatever was paid to weight. It was constructed just as a builder would construct a scaffolding such as he had constructed again and again before, and had proved amply strong.
948. Had you been constructing the staging for the carrying of passengers you would not have constructed it in that way at all? Certainly not.

949. As regards the inspection of this platform, have you at any time received a report from the officer of any Department as to its bad condition? Never; a report was made to the effect that some of the planks of the pontoon required repairing, and the repairs were made. I remember that I was sent down to look into the matter, and I reported upon it. I remember that fresh planks were put on, but I could not say at this moment how long ago that would be—probably about five or six years ago.

J. W.  
Grimshaw.  
18 Oct., 1899.

950. Have you ever had a report to the effect that the platform itself was dangerous—that it was not strong enough? No.

951. One of the watchmen under Captain Jackson has told us that he reported what he considered the defective condition of the staging, not to the Works Department, but to another officer in his own Department, on two occasions. Those reports, I suppose, have never been forwarded on to you? No.

952. If such reports were made, your Department certainly did not receive them? I do not remember anything of the kind. I have searched through all the papers on the subject which I could find in order to get information, and I have not found any recent papers of that kind at all.

953. Had you received a report of that description you would have made a careful inspection of the staging? Certainly. I receive a great number of similar reports, both verbally and in writing. If the matter is of importance, we naturally get the reports written. If the matter is a small one, it is attended to at once.

954. Up to a recent date, has there been any inspector of the platforms at the different wharfs? None that I know of. My only inspectors are employed in construction and in carrying out certain works and repairs which they are instructed to carry out. I could not say that there has been any special inspection of the platform. There are men who are employed in cleaning and looking after the wharfs, but whether they are told to inspect and advise I could not say.

955. Is Mr. Moir under you? Yes.

956. What is his actual position? He is called an inspector. He is a senior shipwright and wharf inspector. He superintends the construction as a clerk of works. He may occasionally deal with quantities, but he is not supposed to do so, as a rule. He has simply to see that the work is properly carried out up to specification, and he has to see that all the timber is sound and good. He has more discretion than any other inspector. He has charge of all the shipwright labour upon work in and around Sydney. He would be asked also to inspect any dangerous timber of which he might hear.

957. I suppose he would have been asked to inspect this particular staging if your attention had been called to it? Yes. He would have put a shipwright on to do any little thing that might be necessary, or if he thought it desirable he would send up to the office and get an officer to come down and look at the thing for himself. The officer would then make a report upon the subject.

958. Would it be a part of Mr. Moir's duty to inspect without having his attention drawn to any defect by Captain Jackson, or by the Treasury? No. I have never heard of any such instruction being given to him; he has not the time to do so.

959. You are not aware of any officer whose duty it would be to inspect these platforms? Not in our Department.

960. You know that a recommendation has been made that such an officer should be appointed? I have heard that that is so; but I do not know whether or not he has been appointed. I have no official knowledge of it.

961. You think it would be a good thing to have an officer of that description? Yes; provided he has the time in which to do the work. I think it is quite worth while to have such an officer now. We have a large number of wharfs in Sydney, and it is necessary that someone should go round and see in what state they are. It will take a man all his time to inspect properly.

962. *Mr. McRitchie.*] You do not know who empowered Captain Jackson to take toll for the use of this wharf? No; but I think he has power under the Act to collect tolls. He is the manager of wharfs under the Treasury. I do not know what his actual appointment may have been, but I have always understood that he was appointed more particularly to collect revenue. I believe him to be one of the most zealous officers the Government have. No doubt the fact of his taking tolls from steamers coming to this wharf is evidence of his desire to obtain revenue, and, not being an engineer, he would not dream of the platform being insecure for the purposes for which he used it.

963. *Chairman.*] You do not consider that when the fact of the jetty being used largely for passenger traffic came under your observation there was any responsibility upon you or upon any officer of your Department to direct Captain Jackson's attention to the fact that the staging was not originally constructed for such a purpose? The fact to which you refer never came under my notice in any way. I had no idea that such large crowds of persons were in the habit of embarking and landing there. I was not aware that many steamers, apart from Departmental steamers, came there, and I certainly do not think that either pontoons or stages of that sort should be used by persons waiting, but merely as a gangway. If there is a necessity for waiting-rooms they should be on the shore or on the wharf.

964. When these wharfs are handed over to Captain Jackson, I suppose the responsibility in connection with them is handed over with them? That is what I maintain. We hand over the wharfs, and we hand over with them the keys of the gates and sheds. After that Captain Jackson brings vessels alongside, and puts loading on to the wharfs without consulting us. He has sometimes gone considerably against our wishes in the matter. I will mention an instance: A large quantity of coal was stored on a wharf distinctly against the Engineer-in-Chief's wishes. Some cargo in a shed was also loaded up against some doorways and burst them back. When we direct Captain Jackson's attention to a matter of that kind he would simply say, "I have made arrangements for that; it will be repaired"; and that settles the matter. With Captain Jackson it is entirely a question of business. He says, "If I can make £100, and the repairs can be done for £10, I make £90 by the transaction." I do not see why he should not do so; but we do not like it, because we do not care to see the wharfs and sheds knocked about in that way. Then, again, take what happens in connection with the ferries. We construct a jetty and put a shed on it, and it is let to some company, and the first thing we see is that the company are cutting the timber and making alterations to suit themselves. I do not see any great harm in it; but I merely point out that these things are done without our being consulted. It appears to me that the Treasury are distinctly responsible for the wharfs after they have been constructed and handed over just as are the Railway Department or the Water and Sewerage Board in the case of their works.

965.

J. W.  
Grimshaw.  
18 Oct., 1899.

965. In designing such structures as that under consideration, what is the usual factor you allow over the breaking weight? I have had so little to do with the designing of them lately that I do not know what factor of safety has been allowed. I have been attending to the carrying out of contracts and doing outside work.

966. You think a sufficient margin should be allowed to admit of no risk whatever where live loads are concerned? That is generally allowed. The actual margin, I think, is enough; but in these cases there is the contingency of ships coming alongside with a great bump. There is also the moving about of the pontoon and a certain amount of twisting. All these things require a very large margin. At the same time we have not had many accidents, and such accidents as we have had are accidents which would have occurred with whatever margin had been allowed. For instance, the cobra get into a pontoon and nearly sink it before anyone can see what is the matter. It is not a question of margin in such a case; it is a question of design. The cobra get in perhaps where we do not anticipate that they will get in.

967. This particular platform would have been designed very differently had it been intended for a live load? Quite differently.

968. *Mr. McAllister.*] You were informing us a short time ago of Mr. Moir's duties;—from whom does he receive special instructions? I am responsible. He takes his instructions from me. If he gets them from anyone else I am still responsible; I am in charge.

969. He receives his instructions directly from you? Usually; but sometimes one of my assistants may give them. If it were a matter of great importance, I should give them myself. I am aware that Mr. Burrows, a very reliable officer of my office, often gives the instructions, but when that happens, I hold myself responsible for what is done.

970. Doubtless he has received all his instructions lately as to the repair of the ferry gangways and so forth from you? Yes.

971. Do you instruct him as to the *modus operandi* in connection with the different repairs? No; I do not go into details; he is quite competent, and knows what to do.

972. I have noticed several of these gangways under repair lately, and the repairs appear to have been carried out with a view not to obstruct the traffic; the men for example would take up two planks at a time, and would then put down two new planks and so on;—do you think that proceeding with the work in that way they have a fair opportunity to examine the condition of the timber underneath? No doubt if the whole of the timber were stripped off, they would have a much better chance of discovering any defects; but the traffic cannot usually be interfered with.

973. Suppose, for example, they took off six planks at a time, and laid down longitudinal planking for the public for the time being; they would have a much better chance of discovering defects? Quite so; and if they were to do so, I should not raise any objection, if it did not obstruct the traffic, and although the work might take a little time longer, I should not object to it, if there were any material advantage from the point of view you mention.

974. It occurred to me that from the way in which the men were carrying out this work it would be difficult to find out the exact condition of the timber below. I endeavoured to obtain from the shipwright, Williamson, the information whether he adopted the practice I have described in the redecking of this particular gangway some two years ago, but he could not recollect what occurred? I thought they would have a free hand, because they work from Friday night until Saturday night. The work was done in overtime in order that the traffic might not be obstructed. The staging is used for wool, and the men would not work at that on Saturday.

975. Does Mr. Moir give his personal supervision to these men? Yes; he is out of doors entirely.

976. But his time is divided between different places? Yes.

977. Have the men general instructions that if they notice anything which may have escaped Mr. Moir's notice they are to direct his attention to it—suppose for example there were bad timber or any other defect? That has been the recognised practice.

978. The men would naturally take that course? Yes; we put a little more confidence in a shipwright than we should put in an ordinary labourer. The shipwright is a tradesman and knows his trade. We listen to him and encourage him to tell us anything such as you mention. He is not like a labourer who, having no knowledge, might come to us and want to show us how to do the work. We trust a shipwright just as you would trust a mechanic with a certain amount of discretion. Mr. Moir, of course, cannot be standing over the men all the time. The men, as a rule, are all very good men, and I am sure that nothing defective would be concealed.

979. As to all the wharfs under the control of the Treasury, I suppose it never occurred to Mr. Moir or to any other officer of your Department to take it upon himself to inspect them; they would not be likely to look into these matters without instructions received from the Treasury through you? I have often reported matters if I have found anything wrong, but my officers could not, and are not in a position to make any regular inspection, nor have they the time. If we heard that a certain wharf was failing we should have it inspected whether report came from the Treasury or not.

980. You would have an inspection made, under those circumstances, from whatever channel the report reached you? Yes.

981. So far as you are aware, the Treasury have no responsible person to obtain definite information as to the condition of wharfs? I do not think so.

982. Excepting Captain Jackson? He has certain outdoor officers, and if they observe anything wrong they would refer the matter to him and he would refer it to us; but we have not had a responsible man to go round examining the wharfs in rotation and to report upon them. It would take an officer all his time to do that.

983. Have you any recollection of the Milson's Point Ferry punt becoming leaky one night? Yes.

984. That was due to some of the planking being cobra-eaten? Yes; nothing was noticed until the punt began to sink. In that case a fire engine was employed and the punt was kept afloat.

985. Who effected the repairs in that case? I believe the dock sent some men down and they made the urgent repairs. We repaired it afterwards.

986. Would the Treasury rely upon the information it received from the North Shore Ferry Company as to the condition of that particular punt? I cannot speak for the Treasury, but I should imagine that they would.

987.

987. If the Treasury received such information they would inform you and you would effect the repairs. Yes. The Treasury would inform the Department, and I would be instructed to make the repairs.

J. W.  
Grimshaw.  
18 Oct., 1899.

988. But you do not know whether the North Shore Ferry Company make a practice of informing the Treasury as to the condition of the punt? I think not, unless there is something wrong. If they saw anything wrong they would write a letter and it would be forwarded to our Department. Eventually, the matter would come to me for a report. I remember that we repaired the North Shore pontoon, and we then discovered one of the great difficulties in connection with the pontoons. We could not take them into dock to repair them because if we did there would be no means of conducting the traffic, as we had no pontoon to put in the place of that taken away. A similar case occurred at Erskine-street, and I took the first opportunity to recommend that we should have a spare pontoon to replace the one needing repair. The Engineer-in-Chief approved of the suggestion, and we are now having two pontoons built of different sizes. One of the difficulties has been that these pontoons are all of different sizes, and by constructing two the big one will suit one wharf and the smaller one another. The two of them together will suit a third wharf. In this way we shall be able to accommodate the different wharfs. As soon as this has been done, I hope that all the pontoons will be sent to dock for repair and overhaul periodically, because they undoubtedly want it. It is quite necessary.

989. After the episode of the pontoon, to which I have referred, did your Department take any special precautions by way of inspection? Yes; and we noted that that particular pontoon was to go to dock as soon as we could manage it.

990. But did your Department take any measures to secure a periodical inspection such as is carried out in the case of vessels? No. The necessity for it has sometimes been referred to, but I have never had any instruction upon the point.

991. Do you know whether the inspection of pontoons is included in Mr. Moir's duties? He has received no instructions to that effect. If Mr. Moir received such instructions I should strongly protest against it, because they would interfere with his other duties.

992. *Mr. McRitchie.*] You think he has quite enough to do already? Yes, more than enough.

993. You think that the inspection of pontoons and staging should be carried out by a special officer? Yes; it will take up the whole of the time of one officer.

994. *Mr. McAllister.*] You think that, having regard to the number of wharfs, pontoons, stages, and works of that description under the Treasury, the proper course would be to appoint an officer, whose special duty it would be to keep himself informed as to the condition of each individual work? Yes; he ought to keep a book, in which he would note the date upon which he inspected a certain wharf, and the condition in which he found it. That could be always referred to in order to show that every attention had been paid to each wharf. He should also be empowered to state whether he considered there was anything irregular going on in connection with the wharfs. Such an officer would be very useful.

995. He should be a properly-qualified shipwright? He should be a man who could always give evidence, and who could keep a book, and he ought to be also an experienced shipwright or engineer.

996. You would place him under the Public Works Department, I suppose? Yes.

997. Although he would be examining work under the control of the Treasury, you think he should be directly responsible to the Public Works Department? I would not express any opinion upon that point; it is a matter of arrangement. He should have a free hand, and should know exactly what he ought to do. If a man in either Department were to be taken off his ordinary work in order to make this inspection, he would be practically of no use, because we should not know what he was doing. I should like to mention that when I first took charge of the district, the west side of Circular Quay was in a most dangerous condition. Captain Jackson had reported the matter several times, and Mr. Williams had confirmed his reports. I believe I made a strong report on the subject. The work was in such an awful condition that we have never since seen anything calculated to make us afraid. The piles were simply hanging on to the girders, and there was a deck and two sheathings. The whole place was in a frightful condition.

998. Who was responsible for that condition of the wharf? I do not know. The matter was reported, but there appeared to be some difficulty in obtaining authority to build it, and the Treasury still went on using it. Persons would hesitate before they tried to block the wharf from being used; but it was, nevertheless, in a very dangerous condition. The Glebe Island and Pymont Bridges have also been in an awful state, and they are only just starting to build new bridges now.

999. It was the lack of funds, you think, as much as anything else that caused this necessary work to be deferred from time to time? Probably; but in this particular case doubtless the accident was due to the want of inspection, and the use for one purpose of a work which had been constructed for another purpose.

1000. Is Captain Jackson recognised by your Department as being a competent man to express an opinion as to the stability of these structures? No. I do not think we should ask him to do that. He is simply a business man. He is quite competent to tell us of his requirements from the point of view of leasing the wharfs, and to deal with matters in a businesslike way. We should not consult him as to stability; but we should give him any advice or assistance for which he might ask.

1001. Is it within your knowledge whether he has any professional assistance to keep him informed in technical matters? I understand that he has not. Originally two men were under him, one of whom was called an inspector of staging, and the other an overseer of staging; you will find their offices mentioned in the Blue Book; but those were in the days when the Department ran out beams from the Quay, and when they wanted men who understood how to do it.

1002. Has the impression got abroad in the Public Works Department that it was from motives of economy that the services of these inspectors were dispensed with? I do not know what the impression of the Department may be. The men were no doubt dispensed with from motives of economy, because having no longer to form the stages which were then in use they were not required. They had not their former duties to perform. Captain Jackson takes up the ground that he was never supposed to go round the wharfs to inspect them, that these two men had not that duty, and that their duty was confined to an inspection of the temporary stages I have described. The only one left was that which has just broken, and that was of a more permanent character than the others.

1003. It evidently did not occur to the Treasury Department that the other works required skilled supervision? I do not think they ever considered the matter.

- J. W. Grimshaw.  
18 Oct., 1899.
1004. Presumably, the minds of the officers of that Department run so much upon figures that the practical part of the wharf management is left out of consideration? If the matter were considered by them they would probably have said that the Works Department looked after repairs and so forth. The Works Department, on the other hand, would say that they handed the wharfs over to the Treasury, and repaired them when asked to do so. You will see that between the two Departments there is a gap.
1005. You think there has been something in the nature of a misunderstanding between the two Departments? I think that if the two Departments had not worked so well together, as they have done, a difficulty would have arisen. But we have always worked very well together, and they have not had any accidents such as that which recently occurred, so that the individual responsibility of each Department has not been considered.
1006. Do you not think that under some circumstances a little tension of armed neutrality, so to speak, between two Departments is more beneficial as regards the maintenance of discipline, and so forth? I think that sometimes it is a good thing to stand one's ground. There has been a little armed neutrality, as you describe it, or what we have called unfriendly acts. When, for example, I have said that I considered that coal ought not to be heaped up upon the wharfs, Captain Jackson, although in quite a friendly way, has said that he considered it to be an unfriendly act. He has said that, to some extent, in chaff, but at the same time he has stated that the wharf ought to be able to carry the coal, and that it was his affair as manager of the wharfs. On the occasion of that particular complaint he distinctly maintained that the wharfs were under his charge.
1007. *Mr. Cargill.*] You said that on one occasion you went down and saw some planking put into the staging which broke? Yes.
1008. Do you remember when that was? No; but it would be some five or six years ago.
1009. That was not the occasion when it was redecked? No. When I said that I was merely giving you my personal recollection of the staging.

---

MONDAY, 23 OCTOBER, 1899.

Present:—

C. McALLISTER, Esq. | W. McRITCHIE, Esq.  
G. McCREDIE, Esq., CHAIRMAN.

J. S. Cargill, Esq., Crown Law Department, was also present.

George Scott sworn and examined:—

- G. Scott.  
23 Oct., 1899.
1010. *Chairman.*] What is your occupation? I am a shipwright.
1011. Where are you employed at the present time? At Cockatoo Island. I started to work there on Saturday morning.
1012. But you were formerly in the Government employ, were you not? Yes.
1013. How long ago? I have been in their employ twenty-two years on and off.
1014. You have not been a permanent hand? I am not exactly permanent, but for the last seventeen years I have never had to look for employment in any other direction.
1015. The Board called you this morning to ascertain whether you could give us any information as to the platform at which the accident recently occurred at Circular Quay;—the Board have been informed that you could give them some information regarding that platform—that is as to the condition in which it was when the pontoon was repaired at Cockatoo Island? Before I answer that question I should like to state that it was reported a fortnight ago last Friday, that I and Mitchell had given evidence here. That was the first intimation I received that I was to give any evidence.
1016. Have you any idea who circulated that report? No.
1017. Do you know anything at all about the platform to which I refer? I can speak only as to the condition of the punt—not of the platform. I could tell you the condition of the hull of the punt—that is all.
1018. *Mr. McRitchie.*] You worked only at the punt? Yes.
1019. You made no repairs whatever to the platform? I saw the platform there, but no one did anything to it while I was there.
1020. You heard nothing said as to the state of the platform? No.
1021. *Mr. McAllister.*] Where was the platform when you repaired the punt? Lying on the deck.
1022. Flat or on its edge? It was canted up on to its edge, so that it might be out of the way while we were repairing portion of the deck. When we had repaired that portion, the stage was moved over, so that we might get to work on the other side.
1023. Did you assist in the shifting of the gangway? No; Mr. Pratt's labourer did that.
1024. And as you repaired the various places on the pontoon, the platform was shifted to make room for you? Yes.
1025. That is the only opportunity you had of seeing its condition? Yes.
1026. Did you take any notice of its condition? No; it was covered all over with mud. I could not see if there was anything the matter with it.

---

David Mitchell sworn and examined:—

- D. Mitchell.  
23 Oct., 1899.
1027. *Chairman.*] What is your occupation? I am a shipwright.
1028. Where are you at work? At Cockatoo Island; I went there on Saturday.
1029. Have you been employed at Cockatoo Island at any time previous to that? Yes; during the last fourteen or fifteen years, on and off.
1030. Do you remember the pontoon and platform, to which the accident recently occurred at Circular Quay, being at Cockatoo Island for repair? Yes. I was at work on the punt; but I did some repairs to the platform also.
- 1031.

1031. What did you do? One of the beams was springy, and I put another bolt into it to pull the work together. That was all I did. D. Mitchell.
1032. Into which beam did you put the bolt? Into one of the outside beams, I think. It would be the beam on the eastern side of the Quay. 23 Oct., 1899.
1033. You are sure you did not put it in the centre beam? It is so long ago that I forget; I am not positive.
1034. You say you put the bolt in in consequence of a spring? Yes.
1035. Did you notice any fracture on the side of the beam into which you put the bolt? No.
1036. Did you put the bolt through the planking? I could not say.
1037. But if the bolt were intended to take the spring out of the beam, you would put it through the planking, would you not? I should think so. The order I got was to put the bolts in.
1038. Then you put in more than one? I think so.
1039. How many? I cannot say; but I know there were more than one. I think there were two.
1040. Who gave you the order to put them in? Mr. Castle.
1041. He is the assistant foreman? Yes.
1042. Did you pay any attention to the platform, while you were putting in the bolt;—did you see whether there were any defects in the various parts of it? No.
1043. You did not examine it with a view to ascertain its general condition? No.
1044. *Mr. McRitchie.*] When you put the bolt in you had to bore a hole? Yes.
1045. Was the timber sound? Yes.
1046. How long ago would that be? It must have been over two years ago.
1047. Mr. Grimshaw told the Board that nothing was done to the platform at Cockatoo Island, and that the repairs were confined to the pontoon. He told us that if we made inquiries at the dock we should find that nothing was supplied for the repair of the platform;—did you get the bolts you put in from the stores? They were brought to me.
1048. And you are quite sure the timber was sound? Yes.
1049. Did you screw the bolts up with a washer below? Yes.
1050. Mr. Williamson, a shipwright under Mr. Grimshaw, has told us that he put three bolts into the centre beam, because it sagged down in the centre; they were put in as service bolts;—if you put in one or two more bolts, as the case may be, that would make five or six altogether? I am not positive as to the beam into which I put the bolts.
1051. The Board could discover no bolt-holes except in the centre beam? I know I put bolts in somewhere.
1052. May it not have been in connection with the hinges? It is so long ago that I forget; I could not say positively.
1053. *Chairman.*] As a practical man, with a good deal of experience of structures of this kind, would you say that the structure was strong enough for the purpose for which it was being used when you put in the bolts? I did not take any particular notice of the condition of the platform.
1054. Had there been anything specially wrong with it, do you think you would have noticed it? I think I should.
1055. How would you take the spring out of the beam by putting in the bolts you describe; were they merely put in to draw the work close together, to make it compact; you would not add to the safety of the beam unless the bolts were put through some resisting medium; you do not know whether you put the bolts through the planking or not? I could not say.
1056. Did you go back to Circular Quay with the punt to hinge the platform in its position? No.
1057. Could you tell the Board who did so? I could not.
1058. Do you remember whether there were any iron tie-rods between the beams? I could not say.
1059. *Mr. McAllister.*] Another witness has sworn that he put three bolts into the middle beam; the Board know that there were no bolts in the two other beams; cannot you tax your memory to admit of your stating definitely into which beam the bolts were put? I cannot; but I have a strong impression that they were put into one of the outside beams. I do not know how I got the idea in my mind, but it is there.
1060. Do you think you replaced one of the old bolts with a new one? No; I bored new holes.
1061. Did you discover the shake to which you have referred? No; it was discovered before. I was merely sent to do the work.
1062. Was the platform on its edge at the time, or on its flat? On its flat.
1063. Was it off the decking of the pontoon? No; part of it was over the edge of the punt; that is all.
1064. How did you get to work at it? I am not sure now exactly what was done. I cannot remember into which beam I bored the holes.
1065. The Board could not discover any bolt-holes in the side-beams? Then I could not have put them in there, but I know I put in bolts somewhere.
1066. May they not have been hinge-bolts? It may have been one of the hinge-bolts; I know that it was an up-and-down bolt.
1067. And you say that while you were working on the platform it was lying flat all the time? Yes.
1068. Did you see it when it was tilted up on its edge? No.
1069. At no time while you were engaged in repairing it? No.
1070. Was any of the decking taken off it while you were repairing it? No.
1071. Then how did you arrive at a correct conclusion as to the position in which you should put in the bolts? I fancy that the bolts were put in one of the side girders. In that case I should measure from the end of the plank.
1072. You cannot say anything as to the condition of the beams? No.
1073. *Mr. Cargill.*] Was anyone else working at the platform at the same time that you were working on it? No.
1074. And you say that whatever you did was done under the direction of Mr. Castle? Yes.
1075. You were not told to look over the platform generally? No.

J. Platt.

James Platt sworn and examined :—

- 23 Oct., 1899. 1076. *Chairman.*] You are a watchman under Captain Jackson, the Manager of Wharfs? Yes; the head watchman.
1077. How many watchmen have you under you? I am now at Circular Quay; there are two night watchmen, and two day watchmen in addition to myself.
1078. What are your hours of duty? I am on duty twelve and a half hours for six days of the week. I am there from a quarter to 6 in the morning until quarter-past 6 at night—at Princes' stairs.
1079. You are a sea-faring man? Yes.
1080. Is it part of your duty to keep an eye upon the stages used for passenger traffic? Since I have been there, I have always felt it my place to do so, but I have never received any definite instructions to that effect. I felt it my duty to see that all was quite right.
1081. You know the particular stage at Circular Quay to which the accident recently happened? Yes.
1082. Have you paid special attention to the condition of that stage prior to the accident? I have seen it almost daily during fifty weeks of the year. I am constantly on it greasing the blocks and tightening the chains, and exercising general supervision. I have been there to attend to anything which wanted attention.
1083. Have you ever noticed anything which caused you any anxiety as regards the safety of the platform? Some eighteen or twenty months ago I saw a crowd of people on the stage. It was quite full. I was standing a few yards away from it, and I saw it sag down in the middle to an extent which looked to me to be dangerous. I rushed up to the front of the stage and asked the people to get off, and they did so. The stage then came up naturally to its proper position. I then got a line and put it across the outside end of the stage to prevent any more people from going on to the pontoon until the steamer arrived.
1084. How many people had the stage on it on that occasion? I could not say how many there were; but I know the pontoon was full.
1085. Were they adults? It was a mixed crowd; children and adults, such as you generally see at a picnic.
1086. When you noticed this danger, as you thought, attaching to the use of the platform, did you direct anyone's attention to it? Yes; I reported it immediately to Captain Jackson.
1087. Was your report in writing? I am not sure upon that point; but I know I reported it either verbally or in writing.
1088. What was the result of your report? I saw men at work repairing it in the course of a day or two afterwards.
1089. What did they do? They took off the old pine decking and substituted hardwood decking of 2-inch stuff. Two heel-pieces were put on to the two outside girders. The heel-pieces would be about 3 feet in length, I suppose. The heel of the staging working on its bearings had become worn. The girders being of soft wood, the timber ground away, and that is why the hardwood pieces were put on.
1090. Do you think that was sufficient to ensure the safety of that part of the stage? I am not a mechanic, and I have not a sufficient knowledge of mechanics' work to judge. Two shipwrights carried out the repairs.
1091. After that repair of the staging, did you notice that it sagged at all with a load upon it? I never saw anything wrong afterwards. I have seen it springing, but nothing to speak of—not to an extent I should consider dangerous. It was just the sort of spring you would expect in any platform of the kind.
1092. Have you at any time received a report from any of your men as to the condition of the stage? No; there would be no necessity for them to report to me. I am there every day. I should be in a ten-times better position than they would be to make any report if it were necessary.
1093. None of the other watchmen have ever directed your attention to what they considered the dangerous state of the staging? I dare say we have frequently talked the matter over; but there has been nothing in the form of a report.
1094. Where were you on the night of the accident? It occurred some few minutes after I went off duty on the Saturday night.
1095. If at any time you see anything wrong in connection with any of the wharfs or platforms, I suppose you report the matter to Captain Jackson? As soon as possible. If I see anything wrong I am only too anxious to let him know of it at once, so that if an accident happened it could not be said to be my fault.
1096. *Mr. McRitchie.*] One of the watchmen under you is named Hansen? Yes.
1097. Did he ever report to you verbally or in writing that in his opinion the staging was unsafe? No; there would be no need for him to do so. I was there daily, and had a better opportunity than he could have to see the condition of the stage.
1098. He says that from where he was standing on the night of the accident he saw the staging buckling, as it were; and he says he had reported similar occurrences to you a considerable time before that? I do not remember it.
1099. *Chairman.*] Hansen, in reply to Question 229, said :—
229. Have you reported the staging as being in your opinion unsafe? I have.
- I do not remember it.
1100. You have no recollection of that? I have not the slightest recollection of anything of the kind. Some words may have passed between us on the matter; but he made no report.
1101. *Mr. McRitchie.*] He says that you said to him, "I have seen the old man, and the matter is now out of our hands; we have done everything we can," or words to that effect? As I say, there has been no more than conversation between us in reference to the matter. It is very likely that I should have used words of that kind if my attention had been directed to the matter.
1102. You think, then, you may have used those words? I have no recollection of anything of the kind. My judgment would be much superior to Hansen's in such a case, and the opportunities I have of giving effect to what I thought necessary would be better than his. If anything required attention it is not likely that I should give another man the chance to report it to me.
1103. Do you remember when this platform was first used as a passenger platform? No; but I was not in the service then. I have been in the service seven and a half years. It was used on holidays and Sundays for passenger traffic—that is, during the wool season.
1104. *Mr. McAllister.*] You have mentioned one occasion on which you have said you thought the platform looked dangerous;—have you noticed that appearance on other occasions? No. I only remember

remember noticing it in what I thought to be a dangerous condition on the one occasion I mentioned to you.

J. Platt.  
23 Oct., 1899.

1105. Do you remember seeing the Lancer contingent pass over the platform? I was on the Quay when they went away; but I was down at No. 4 Jetty.

1106. Have you ever seen a horse and cart pass over the platform? Yes, once; but long before that. We should not allow such a thing to take place if we were watching it at the time.

1107. Have you seen detachments of military pass over the platform? Yes, on many occasions; perhaps two or three times a week. Men going down to Middle Head for training would use the platform. They would generally march down four abreast. I have suggested to the officers occasionally that the men should be allowed to break their step in going over the staging; in that case, of course, the strain would not be so severe.

1208. Have you noticed whether the men have kept step;—did the practice continue after you spoke of it? Of course, if I were there, I should remind them of what I thought necessary, supposing they were all in step. I merely mentioned the matter as a precaution.

1209. From whom do you receive your immediate orders? From Captain Jackson and Mr. Warren, the assistant manager.

1210. Do you receive orders from anybody else? No.

1211. Do you regard it as part of your duty to keep yourself informed as to the condition of the landing stages round Circular Quay? I do so as a matter of fact, but it is not my duty; I was not instructed to do it.

1212. Had you any instructions to that effect from Captain Jackson? None whatever.

1213. Do you know of any other Government official whose duty it is to keep himself informed as to the condition of the jetties and stages? No one outside of the Public Wharfs Department, and there is no one in that Department who is specially instructed to make an inspection.

1214. Have you seen men from any other Department doing this work? I have seen men occasionally from the Public Works Department making repairs, and so forth.

1215. Were those men carrying out repairs to the necessity for which you yourself have called attention? Yes. For instance, the railing of this particular stage was carried away by the ship "Brilliant," and on the attention of the Public Works Department being called to it they repaired the stage.

1216. Who reported that damage? I do not know. There is another man about the Quay besides myself looking after these things; but I do not know that it would be part of his duty to make a report in such a case. I am referring now to a man named Lovelock. He points out to Captain Jackson sometimes any breakage he notices.

1217. But there is no one in your Department whose special duty it is to make an inspection and to report breakages or the need for repair of any kind? No.

1218. Captain Jackson has never given you yourself definite instructions to look for defects? No; he has given me no instructions at all.

1219. What are your duties? I am head watchman, and in that capacity I have a hundred different kinds of orders in the course of a month.

1220. From whom do you receive your orders? From Mr. Warren, the assistant wharf manager.

1221. But are your duties not more or less defined? It would be almost impossible to define my duties, they are so numerous.

1222. What would you consider your chief duty? To look after picnic boats.

1223. I suppose you are charged with the maintenance of order on the wharfs, and that if you noticed any disturbance you would immediately call attention to it? Yes; if I am unable to quell any disorder myself, I apply at once to the Water Police Station for help.

1124. Which do you regard now as the picnic wharf? No. 4; it is the only wharf we have now which would be of any use for the purpose.

1125. The Floating Jetty has been largely used for that purpose? Yes.

1126. About how many picnics in the course of a week would be leaving the Floating Jetty? In the present month, October, picnic parties would be leaving there every day.

1127. Have you noticed the return of these picnic parties at night? They seldom come back in my time. When I am there I see that order is maintained. I make a point of never allowing the people to accumulate on the pontoon or staging. Immediately they come off I insist upon their going ashore.

1128. Have you ever noticed any persons fall overboard from the Floating Jetty? No.

1129. It does seem to have occurred to anyone that railing should be put round the pontoon? It would not do to put a railing round it, because the steamers' gangways would come in at the sides; the railing would be in the road of the gangways.

1130. Has it ever occurred to you to take a boat underneath the stage of the Floating Jetty and to examine it? No; I have taken a casual glance at it when taking in the slack of the mooring chains, that is all.

1131. How often is it necessary for you to do that? Two months might pass, and it might not be necessary to do it, and during the next month you might require to do it half a dozen different times.

1132. When the tide is low the chains would be at their slackest; at high tide when the punt rises it would pull the anchor home? Yes; we find it necessary, after spring tide, to tighten up the mooring chains.

1233. Have you had to remove the anchor? Only when the punt went to dock—some years ago.

1234. Have you assumed it to be part of your duty to report to Captain Jackson any defect in the decking of the wharfs? Yes; I have felt it my place to let him know that. It has occurred to me that if there were a hole in one of the wharfs, and any person broke his leg in it, the Government would be liable. I have, therefore, always felt it my duty to report anything of that kind, although I have never been instructed to do so.

1135. You have been doing this so long without instructions that you have finally come to regard it as part of your duty? Yes; I suppose others have come to regard it as my duty also, although I never received any instructions.

1136. *Mr. McRitchie.*] You give a receipt when you take money from the steamboat proprietors? Yes.

1137. And you deliver what you receive to Captain Jackson? To Mr. Warren.

- J. Platt.  
23 Oct., 1899.
1138. Do you put down the number of the wharf from which you receive the dues? No; I never make any distinction between the wharfs from which the dues are received. I am not instructed to do that. The picnic service is taken as a whole.
1139. Then you are unable to say how many picnics have left the Floating Jetty in the course of, say, six months? I could tell you how many boats have moored there; but I could not distinguish them.
1140. *Mr. McAllister.*] It would be impossible for you to distinguish the picnic boats from the other boats now? Yes. I collect revenue also from Princes' Stairs, No. 4 Jetty, the eastern side of Watson's Bay jetty, and the floating jetty.
1141. *Mr. Cargill.*] You said that on one occasion when you were standing near the platform, you saw it sag;—where were you standing? I was standing along the side of the iron punt, a few yards away from the staging.
1142. On the Quay? Yes.
1143. Looking down from the top to the bottom? I was standing a few yards from the jetty looking across the staging.
1144. What sort of appearance did the platform present when it buckled, as you say? You could see a little bend in it, not an extensive one; but sufficient to make it look dangerous.
1145. How much out of the straight would the platform be? I could not say; perhaps 3 inches, and perhaps 2½ inches. That would look a good bit in a length of 24 feet.
1146. Did it retain that shape while the people were on it? Yes.
1147. After the new deck was put on, you did not notice anything of the sort? Nothing beyond a little spring; nothing to make the thing look dangerous.
1148. Having once seen the platform sag after the new decking was put on, you took particular notice of what occurred? Yes; I had my eye on the staging for that purpose.
1149. And you never detected any sagging afterwards? No.
1150. Coming to the question of Hansen's reports to you;—you say he never reported? No; he had no instructions to do so.
1151. You would recollect his making any report? I think so.
1152. The matter being one of some importance? Yes.
1153. Had he reported to you, what action would you have taken? I should have referred the matter to Captain Jackson immediately.

John Stephen sworn and examined:—

- J. Stephen.  
23 Oct., 1899.
1154. *Chairman.*] What is your occupation? I am a shipwright, in the employ of the Harbours and Rivers Branch.
1155. Where are you now employed? I am now over at Glebe Island, doing all sorts of work.
1156. You were employed at Circular Quay at one time? Yes.
1157. Who instructed you as to your work at Circular Quay? Mr. Moir, the inspector, generally gave us our instructions.
1158. Do you remember the platform where the accident happened? Quite well.
1159. Do you remember repairing it at any time? Yes.
1160. How long ago? About two years ago; in the middle of November, to the best of my knowledge.
1161. Under whose instructions did you make the repairs? Mr. Williams had charge of the job. He told me that we should have to do the work in overtime on the Saturday afternoon—that would be the only chance we had of doing it, on account of it being in the wool season.
1162. What did you do to the stage? We put on a new deck, and we also put some clamp pieces at the bottom.
1163. Did you do anything besides that, by way of strengthening the stage, for example? We put three or four bolts in through the centre girder.
1164. What was your object in doing that? The middle girder had a sag, and as we worked downwards with the planking, we found that the nails would not draw the planking down to the girder. We therefore put in some bolts to draw the work together.
1165. You are quite certain there was no other reason for the putting in of the bolts? There was no other reason.
1166. You did not notice any fracture in the beam? No.
1167. When you were boring holes for the boats, did you observe from the core what condition the timber was in? It may have been a little bit stained—as you generally find wood stained from iron fastenings; but that was all.
1168. Did you put the bolts through the planks? They were counter-sunk into the planking. They were let in flush, and screwed up from underneath.
1169. Who was supervising the repairs? Mr. Christian. Mr. Moir was away at the time, and Mr. Christian was acting for him.
1170. Did he make a special survey of the structure when you had the planking up? No.
1171. Did you remove the platform in order to redeck it, or did you allow it to remain in its usual position? It was allowed to remain there; it was not unhinged.
1172. Do you remember whether you took all the planking off before you redecked it, or whether you took off only a few planks at a time? We took off three or four planks from the top, as there was some fitting to do round the hinges. We did that first while the traffic was going on. One plank was taken up at the time, and a new plank was put in. We then took off three or four planks from the bottom, in order to put on the clamps. The tide was high, and the stage was down close to the deck, and we took off the planks so that we could get in between and bore holes for the clamps. The other portion of the planking was taken off all at once. We commenced at the top, and worked right down.
1173. *Mr. McAllister.*] Have you a distinct recollection of that? Yes.
1174. What fixes it in your mind? I have been thinking a good deal about it, and, of course, the whole thing has gradually come back to my mind. For example, I can remember that some prisoners came down from the Water Police Court. They were principally women. One plank was put down over the opening, and as they were walking over this plank one of the prisoners said, "I can jump over that quite easily."

1175.

1175. It is customary, is it not, in repairing a stage of this kind, to take up two or three planks at a time and then to substitute new ones before any more planks are taken up? Yes; but that was not done in this instance. We wanted to get the job done that afternoon; there was not very much in it after we had done the fitting work. We had all the planks cut and ready to go down, and the easiest way was to take the lot up and put all the new planking in at the one time. J. Stephen.  
23 Oct., 1899.
1176. You distinctly remember doing that? Yes.
1177. Was the decking which you took off in bad condition? It was merely worn.
1178. Was it badly worn? It was pretty well worn.
1179. The Board found that a great many of the nails used in the old decking were left in the girders and were bent over;—would that not point to the fact that the flooring must have been very bad when it was taken up? It may have been split a little bit at the ends, and that would leave the nails in the girders.
1180. Is it not customary to break the nails off before you put down a new decking? Yes.
1181. When you were turning the nails down, did it not occur to you that the top of the girder was pretty soft;—had it not been soft, would you have been able to drive the nails flat into it? You could drive them flat with a mawl into any kind of Oregon.
1182. It is not a thing, however, which a good tradesman would do? No.
1183. You would not consider it a proper thing to do? Certainly not.
1184. If the wood were very soft at the top, and you found that the nails went down easily into it and remained flush without any trouble in knocking them down, that was probably the reason you bent some nails over without breaking them off? I do not think we should have done that. It may have been that our feet caught against them when we were bringing the planking down, and then perhaps the nails having been bent we turned them right over.
1185. Where was the new timber? On the wharf alongside the stage.
1186. And you put the planking down from the top end? Yes.
1187. So that you would not be walking upon the girders and knocking your feet against the nails or anything else? No; but in taking the old timber up, we may have knocked against some of the nails and turned them. It is quite probable that we walked up the girders and did that.
1188. Do you recollect the amount of sag in the middle girder? I could not tell you exactly, but I remember that as we worked down towards the centre, we found that the nails would not draw the planking down, and we therefore put in the bolts; otherwise there would have been no fastening in the centre.
1189. Do you recollect how many bolts you put in? I think there were three.
1190. You distinctly remember boring the holes for the bolts? I do.
1191. Were the holes bored from above or below? From above; there was no possible way of getting in from below unless we had had a boat or stage.
1192. Did you examine the girders from underneath, in order to make yourselves acquainted with their condition? We had to bend down to screw the bolts up, but when we were doing that I did not notice anything wrong with the girder.
1193. When you were boring the holes, you noticed nothing to attract your attention to the quality of the wood? There was nothing except the staining which you commonly see where there are iron fastenings. That always extends to the depth of the fastenings.
1194. The borings showed the timber to be reasonably fresh? Yes.
1195. Have you had much experience of Oregon? A good deal.
1196. If you had effected repairs to Oregon and had found it in good condition, you would expect it to be reasonably good for five years afterwards? A good deal would depend upon the position in which the wood was lying.
1197. Making allowance for atmospheric influences and the exposure of the wood to sun and rain? The first job I did for the Department was to go down to Moruya and fix up five punts. The punts were lying there for three years. The sun used to shine on the counter at one end, and at the other end there was a sort of half-deck. There were three or four planks which the sun did not get at which were completely rotten. When we put in the caulking-iron from outside the whole of the inside fell away. There was merely a coating of tar.
1198. From your experience of Oregon, would you have expected the timber in this particular platform to decay in the course of two years, assuming it to have been sound at the time you made the repairs? That I could not say.
1199. You have seen the wood since the accident occurred? Yes.
1200. Would you expect it to perish in that way in two years? I should not have thought it would go like that; still you can never tell. We did not plug up the nail holes. If we had plugged them it might have stood longer. The water might have got into them.
1201. Did you use ordinary Ubank nails when you made the repairs? Yes.
1202. Did you bore holes through the planking with a brace and bit before you put the nails in? Yes.
1203. Did your nails go in easily? They would go in easily at any time in that sort of timber.
1204. But they did not appear to go in more easily than usual? No.
1205. Suppose the wood had been rotten at that time, do you think the ease with which you drove the nails would have attracted your attention? Yes; the nails would not have gone any further than the head into the hardwood.
1206. At all events, the nails held well? Yes.
1207. And you did not notice anything unusual in driving the nails? No.

John Jackson made an affirmation, and was examined:—

1208. *Chairman.*] What is your official position? I am Manager of Public Wharfs and Resumed Properties. J. Jackson.  
23 Oct., 1899.
1209. When were you appointed to that position? I have held it for fifteen years within a few days. I was appointed on the 1st November, 1884.
1210. At the time of your appointment, did you receive any particular instructions as to the duties you were to perform? No; I understood that I was only to administer the Wharfage and Tonnage Act.
1211. Have you a copy of your appointment? No.

- J. Jackson. 1212. Did you regard the administration of the Wharfage and Tonnage Act as the limit of your duties?  
At that time, Yes.
- 23 Oct., 1899. 1213. Have any other duties since been added to your office? Not connected with the wharfs; but the Government have put all the resumed properties in my charge.
1214. All the wharfs are under your control? Yes.
1215. Including the wharfs at Pyrmont, Woolloomooloo, and White Bay? Yes; also the wharfs at Botany, the northern rivers, Bourke, and other places.
1216. You consider that your duties relate more particularly to the collection of revenue? I have the business part of the wharf management.
1217. When wharfs are handed over to you from the Public Works Department are they accompanied with any certificate as to their completeness? No; I may say that I sometimes have to obtain the use of a wharf before it is completed. The Public Works Department work in with me in order to give me a completed portion, and I obtain revenue from that. When the entire wharf is completed I take charge of it, but there has never been any formal handing over that I know of. I naturally notice when a wharf is nearly completed, and I write to the Treasury to have it proclaimed under the Wharfage and Tonnage Act to admit of the legal charging of dues.
1218. Are the wharfs and sheds built after suggestions from you as to what is required? Yes; I generally write to the Treasury when a new wharf or when more shed accommodation is wanted.
1219. You formally apply for it? Yes. The application is sent to the Treasury. The Treasury approve of it, and it is then sent on to the Public Works Department. They then do the whole of the work.
1220. Do they consult you while the works are in progress? Yes, sometimes. I will give you a case in point. It was planned on the eastern side of Woolloomooloo to make three berths of 300 feet each. I objected to that, because berths of 300 feet are of no use now-a-days. I suggested that they should do away with those 300 feet berths, and make one long one of 1,000 feet.
1221. If after you have taken possession of wharfs you find that any alteration or repairs are required, what procedure do you follow? I write to the Treasury, and the same routine is gone through which I have already described. Suppose, for example, a berth is too short, and I ask that it may be extended to a certain length.
1222. Is that routine observed always in the matter of repairs or maintenance? I have absolutely nothing to do with maintenance.
1223. Have you no staff to look after repairs? No; nor is there any man appointed to look after them. No one of my officers knows anything of the technical part of wharf construction.
1224. Have you no inspector who reports to you from time to time the condition of the wharfs? No.
1225. Have you at any time had such an inspector? No.
1226. In the Blue Book for 1891 an officer is described in your Department as an inspector of staging? Yes. He was, I think, inspector of planking and stages. He had the supervision of the rigging of the old stages which were 70 or 80 feet long, and which were used on the eastern side of the Circular Quay when the ships were double and treble banked. He was an expert in the rigging of those stages.
1227. Was he a sea-faring man? No; but he had been a long time on the wharfs.
1228. He was not a tradesman? No. These stages were done away with in 1893 or 1894.
1229. Ever since you have been in charge of public wharfs, therefore, there has been no regular inspection of wharfs or jetties? No.
1230. There has been no officer whose duty it has been to report to you the condition, safe or otherwise, of platforms? Most emphatically no.
1231. How comes it, then, that you have been made acquainted with the necessity for repairs? I am always round the wharfs; I am at every wharf at some time in the course of the week.
1232. Whose particular business is it to notice anything wrong in connection with the wharfs or jetties;—has it been anybody's business? No one has ever been appointed to perform that duty. If I have seen anything wrong it has been my practice to send a memo. to the Public Works Department, directing their attention to it. When a wharfinger draws my attention to a matter I take the same course.
1233. You are acquainted with the stage which collapsed on the 23rd of last month? Yes; one of my officers, named Platt, drew my attention to it some time previous to that—I cannot say exactly how long ago. I sent a memo. to the Public Works Department requesting that the stage might be repaired, and it was repaired.
1234. Would that be about two years ago? I think so; and, if my memory serves me right, I asked that the pontoon might be taken into dock, the decking being bad. I am not sure whether I drew attention to the condition of the stage before or after the redecking of the pontoon.
1235. Had you noticed the condition of the stage at any time previous to the action? I never saw anything wrong with it.
1236. Do you remember receiving a report from any of your watchmen as to the stage? I received the report I mentioned from Platt, I think, about eighteen months ago.
1237. Was it in writing? I do not think so.
1238. It was a verbal report? Yes; they always make verbal reports at the Quay. At Blackwattle Bay, Woolloomooloo, or Pyrmont they send me written statements, and I send them on to the Works Department.
1239. Do you recollect any one reporting this particular stage to be dangerous? No.
1240. Did Platt merely say that the stage was out of repair? He suggested that hardwood planking should be put on instead of soft wood. It was only the decking of the stage which I understood was out of repair.
1241. Did he say anything to you as to the stability of the structural part of the platform? Not that I remember; I do not think so.
1242. Have you any officer in your employ who would be competent to express an opinion on such a point? No.
1243. So that in arriving at an opinion as to the stability of a structure you would have to depend entirely upon officers of the Public Works Department? Entirely, so far as the structure of the wharfs is concerned. When I take the wharfs over I take it for granted that they are substantial.
1244. Some of the wharfs are under lease to companies? Yes.

1245. Are they responsible for the repair of any damage that may be done to them? For any damage done; fair wear and tear is excepted. Of course, I should be at once made acquainted with a collision, and I should report the matter to the Public Works Department, and they would send down an inspector. J. Jackson.  
23 Oct., 1899.
1246. The Public Works Department would be referred to to assess the damage? Yes.
1247. Have you yourself any technical knowledge of wharfs? No.
1248. You would not be able then, from an engineering point of view, to determine whether a structure is strong enough to sustain the weight for which it is being used? No.
1249. Do you remember when this particular stage was first put in its position? It would be a long time ago; before my time. I think the first stage was put there in 1883. I have here copies of the regulations which apply to that stage; they are issued from the Treasury under the heading of "Additional Wharf Regulations," and are dated 29th October, 1883. They are as follows:—

REGULATIONS FOR THE USE OF THE LANDING STAGE ON THE SOUTH-EAST CORNER OF THE CIRCULAR QUAY.

1. The stage to be used only for the purpose of embarking or landing passengers and their personal luggage, but no luggage is to be left upon the stage.
2. Steam launches or other vessels shall only be permitted to lie alongside when taking in or discharging passengers, and the stage shall not be used as a mooring place.
3. No vessel whose registered tonnage exceeds 100 tons shall be allowed the use of the landing stage.
4. Exclusive of Sundays, and holidays set apart for regattas, boat-races, and other public festivities, the charge for the use of the stage shall be 10s., which amount shall cover any further use the same vessel may make of it on that day. In the other cases mentioned the charge to any vessel using the stage shall be 15s. for the day.
5. No vessel shall be permitted to lie alongside for more than twenty minutes at any one time.
6. No cart or vehicle is to be permitted to come upon the stage.
7. For the contravention or infraction of any of the above regulations the master or owner of any vessel so offending shall be subject to a fine not exceeding five pounds nor less than two pounds.
8. The 1st, 4th, 6th, 8th, 13th, and 14th clauses of the regulations of 24th August, 1880, shall be applicable to this landing stage.

There can be no doubt, therefore, that the wharf was intended for passenger accommodation—in fact, it was put there at the request of a man named Holstead, a steamboat proprietor. He and others made application for it.

1250. You were under the impression that this particular stage was intended for the use of passengers when it was first constructed? Yes; the regulations will tell you that.

1251. The Board have been informed that the stage was built by the Public Works Department especially for the wool traffic? There were two pontoons there at the one time, one of which was used for wool, and the other for passengers. One of these was taken away, and the remaining jetty was then used for passengers and wool. Finally, both the old punts were removed; one of these was an old iron punt. It was a reclamation punt, which had been decked over; it became so thin that it commenced to leak. The other old pontoon was afterwards used as the "Vernon" stage, and at a later date it was used at the foot of Erskine-street by the new Balmain Ferry Company.

1252. And the present Floating Jetty and stage were put there in substitution for one of those old pontoons which had been used for both wool and passenger traffic? Yes.

1253. You were, therefore, under the impression that the jetty and stage were constructed for both wool and passengers? There can be no doubt about that. The regulations make it quite clear that the jetty there was to be used for passengers.

1254. Do you not think it would be a wise precaution to have an officer appointed whose special duty it would be to inspect stages by which passengers embark and disembark? No doubt there should be such an officer with such instructions. I have an instruction now—the first instruction I have ever received upon the subject—to see that an inspection is made by the Public Works Department, and I will see that it is carried out. I myself suggested a few days ago that the platforms should be inspected every three months. My instructions from the Treasury are in these terms:—

Sir,  
I am directed to enclose, for your information, a copy of a Minute by the Under Secretary for Public Works, which has received the approval of the Honorable the Minister for Public Works.

Your attention is specially drawn to the suggestion as to the erection of notices limiting the number of persons using landing stages, and you are also requested to see that the inspections are made periodically, and to report any failure in this regard.

I have, &c.,

F. KIRKPATRICK,

Under Secretary for Finance and Trade.

The Manager of Public Wharfs, Circular Quay.

1255. Do you know whether the Inspector referred to has been appointed? Not yet, I believe; but all the landing stages have been inspected since the unfortunate accident.

1256. By an officer of the Public Works Department? Yes. I have a certificate from the Public Works Department in regard to the Princes' Stairs and No. 3 jetty.

1257. You think that the officer making this inspection should be directly responsible to the Public Works Department? Yes; otherwise there would be a dual control, and that is not advisable.

1258. Do you think that if there had been an officer charged with the duty, the recent accident would have been prevented? I certainly think so.

1259. *Mr. McRitchie.*] You say that whenever your attention is directed to any particular defect you report the matter to the Public Works Department, so that it may be rectified? Immediately.

1260. Are you aware that the North Shore ferry punt, on the Sydney side, is in a dangerous state? Some time ago they rang me up, and said there was something wrong with it, and I communicated with the Public Works Department. I am not aware that the punt is in a dangerous condition now; but I know that it was.

1261. The punt was only patched where it is;—it was not taken to the dock to be repaired? No; but I think they made a good job of it.

1262. Has not that punt a thousand people on it sometimes;—if there were any doubt as to its safety, do you not think it should be removed, and another punt substituted? I understand the Department had to patch the punt there, because they had not at the time a relieving punt.

1263. It has been only patched? Yes; as soon as the new pontoons are finished the pontoon to which you refer will be taken into dock. The Department is now constructing relieving pontoons; they have been in course of construction for some time.

1264. You do not know that the punt to which I refer is now in a very bad condition? I do not.

- J. Jackson. 1265. I am informed it is affected by both cobra and dry rot? I could not say as to that.
- 23 Oct., 1899. 1266. Suppose that is its present condition, it is impossible to say what casualty might happen? I think there should be relieving pontoons, and that all the pontoons should from time to time be taken into dock.
1267. I have been informed by a gentleman in the service of the company that it is very necessary something should be done to this particular punt? No doubt something ought to be done. From what I have observed the punt has been repaired under considerable difficulty.
1268. I have been informed that the punt could not be properly repaired where it now is, and it has been merely patched up? Of course, it could not be properly repaired unless it were taken into dock. It should be thoroughly examined, and I presume that has been done by the Public Works Department.
1269. You think they are aware of the condition of the punt? Yes; they are also aware that the punt at No. 3—the late No. 4 jetty—has cobra in it. They are aware of that, because, hearing an officer say that there was cobra in it, I would not take it over without a certificate.
1270. Since this lamentable accident occurred they have been putting new decking on all the stages? Yes.
1271. Did you suggest it? I think I mentioned it to Mr. Grimshaw.
1272. Mr. McAllister.] You say you joined the Service in November, 1884? Yes.
1273. And the additional wharf regulations that you have quoted are dated 29th October, 1883? Yes.
1274. Did they relate to this pontoon? Yes.
1275. That would make the pontoon sixteen years old? Of course, this is not the same pontoon, nor is it the same stage; but the regulations referred to a pontoon and stage in use at that particular place.
1276. Were the regulations framed by you? No.
1277. They were in existence before you came into the Service? Yes. The former stage and pontoon there were of hardwood. I think the girders would be about 9 by 4; that is, as near, as I can remember. However, that stage was taken away.
1278. It is quite obvious from the regulations that the pontoon was put there for the use of small steamers embarking and discharging passengers? Yes.
1279. It is evident that the jetty was intended for the use of the public, because it is expressly stated in the regulations that no vessel should be allowed to lie there longer than twenty minutes? Yes.
1280. Several witnesses have told the Board that this stage was not intended for the use of passengers? That is the first time I ever knew it; the regulations prove the contrary. The stage has, of course, been used for wool also.
1281. Is it beyond all doubt that this particular platform was there in substitution for the platform to which the regulations you have quoted specially applied? Beyond all doubt.
1282. Have you any knowledge why these particular regulations were framed for that punt? I could not say.
1283. While it was in use exclusively as a wool platform were there any regulations? The pontoon at that place has never been used exclusively as a wool pontoon.
1284. Mr. Darley and Mr. Grimshaw have said that the punt at which the accident happened was originally put there at the request of your predecessor, Mr. Bell, for use in the wool traffic? There can be no doubt, I think, from papers in the Department that the pontoon was put there at the request of Mr. Holstead and other ship-owners. I myself have seen the papers. Mr. Waterhouse was among the applicants.
1285. Would the papers be in the Treasury? Yes; with regard to this particular pontoon, for half the year there would be a loss of revenue if it were not used for passengers, because during many months it would not be in use at all for wool export. Most picnic parties have preferred to use the jetty, especially since the Circular Quay has been so crowded with omnibuses. It is more convenient in every way for picnic parties.
1286. Have you called the attention of the Public Works Department through the Treasury to any very glaring defects in the wharfs round the Circular Quay—on the west side, for example? Yes. I objected to take over the responsibility unless something were done to the wharfs there. Before that the matter was reported by Mr. Williams, of the Public Works Department.
1287. What actuated you in the matter? I could see the rotten state of the wharf. When vehicles passed over they shook the wharf.
1288. I suppose that, in the daily discharge of your duties, it is necessary that you should go to a great many of the wharfs? Yes; every week I am generally twice at every wharf, except, of course, the small wharfs at Botany, White's Bay, and those places.
1289. How often do you see them? I do not see the Botany wharf very much, but they always send me notice if there is anything wrong with it.
1290. Then you immediately direct the attention of the Public Works Department to the matter? Yes.
1291. Do you communicate with Mr. Grimshaw? Generally with the Engineer-in-Chief.
1292. Did it not occur to you that it was rather undesirable that you should obtain information as to an important matter of this kind—that is, as to the dangerous condition of different structures—from officers of your Department who were not responsible for the inspection, and who had no technical knowledge? I never thought of the matter, because it was no part of my duty. I take the wharfs over in good faith, and I have no reason to suppose that there is anything the matter with them.
1293. But they all grow old, and in the course of time become more or less decayed;—does it not occur to you that having regard to such a large number of wharfs and appliances under your control it would be desirable to have an officer whose duty it would be to keep you thoroughly posted up as to their condition? No; I never considered it any part of my duty to inspect wharfs. I have always regarded that as the duty of the Construction Branch.
1294. Why have you assumed it to be part of your duty to convey the information which you say you have conveyed to the Public Works Department? If I saw anything wrong, involving possible danger to life or to Government property, I should naturally report the fact.
1295. You say that you have been constantly doing it—that you have constantly reported to the Public Works Department the necessity for repairs? I have not made reports; I have sent in memoranda.
1296. But you have sent in requisitions for repairs, have you not? No; what I have done has been to direct attention to the fact that such and such a place required repairing.

1297. Have you done this on many occasions? Frequently. I suppose I have done it as frequently as three times a week; sometimes more often than that. J. Jackson.
1298. This has been over and above what you considered your duty? Certainly. 23 Oct., 1839.
1299. Has it never occurred to you that it would have been the better plan to state that, in view of the frequent necessity of these memoranda, you would be glad to be relieved of the necessity for them by the appointment of someone to supervise such matters? No inspector would be about the wharfs as I am; my duties always take me there.
1300. But you say it has been no part of your duty to make these reports? I should not consider that I did my duty if I saw a defect and did not draw attention to it. At the same time, it has not been my official duty. I have made no formal report, but I have directed attention to the necessity for repairs.
1301. When a man for a number of years continues to do a thing which is outside of his ordinary official duties, it gradually comes to be considered part of those duties? There is no doubt about that, and I have no doubt the Public Works Department have thought it part of my duty to do this sort of thing.
1302. Do you think that this may have kept the Public Works Department blind to the necessity for the appointment of an officer to perform this special work? That possibly may have been the case. Of course, the Public Works Department know that I have nothing to do with the construction of wharfs or with their maintenance.
1303. Have your watchmen no specific details given them in regard to their duties? No; they have to see that order is preserved on the wharfs; they have to watch cargo, and go round with the tell-tale every hour.
1304. Do they receive all these instructions verbally? I give instructions in writing to the wharfinger, and he transmits them to the men.
1305. Is it any part of these watchmen's duties to report to you defects in wharfs, stages, or pontoons? No.
1306. Yet they do so regularly? Yes.
1307. Has your attention been under this arrangement called on various occasions to a defect which you might otherwise have missed? There is no doubt about that.
1308. Were the duties of Loclock altered by your instructions? No; he was called originally overseer of planking and staging, but that did not constitute the whole of his duties.
1309. Do you think an officer should be appointed to see to the stability of the different wharfs, jetties, and stages, and that he should have the power to say to what use they should be put. For example, if he finds upon examination that they are being put to a use to which they are not adapted, you think he should be empowered to report that? Yes.
1310. You think that should be part of the duty of such an officer? Yes.
1311. Suppose, for example, that he thought a wharf was being loaded to too great an extent;—suppose he thought that more weight was being put upon it than that for which it was constructed, he should report the fact? I am afraid that would interfere very much with the business of the wharfs. I take it that every wharf the Government build ought to stand much more than is ever put upon it.
1312. Of course, such an officer would require to be a professional man? Yes; he should be an engineer.
1313. And he should be in a position to say whether or not a wharf was being submitted to improper use? Yes.
1314. If he thought more weight was being put upon a wharf than it was able to carry, he should report it to the Public Works Department? If you will allow me to say so, I think there would be some clashing under that arrangement. Such an officer might have certain motives, for example—I do not say it would be the case—in making reports. Take the case of a wharf upon which cargo is landed; I may have a large amount of cargo to put out of a ship, and the officer you speak of may object to it. What I would suggest is that the Public Works Department, when a wharf is constructed, and afterwards, every twelve months, should give me a certificate as to the quantity of cargo which should be placed upon it. Of course, I should then become responsible.
1315. You mean you would be responsible for the placing on it of any additional cargo beyond that specified? Yes.
1316. But, at the same time, you think the wharfs should be so constructed as to carry any reasonable weight? Yes.
1317. And the same, of course, would apply to passenger jetties? Yes.
1318. *Mr. McAllister.*] Instead of the recent regulation, limiting the number of people to be allowed on a jetty, would it not be better to have an assurance that the jetty was able to bear as many persons as could crowd on to it? That, of course, would be preferable.
1319. It is hard sometimes to regulate the number of persons going on to a jetty? Yes. When I received my instructions I wrote to the Public Works Department asking them to furnish me with the number of persons who might be allowed upon one of these floating pontoons.
1320. How would you regulate the number supposing the particulars were furnished to you? If there were more than the specified number the people themselves would have to take the responsibility.
1321. Your officers could not always count the number? No; the regulation would be a dead letter. Of course, the jetties should be strong enough to carry any weight of passengers. No doubt these pontoons, if they were in good order, would carry all the people that could crowd on to them.
1322. *Mr. McRitchie.*] Do you not think it would be better to have a handrail right round the pontoon? We have a handrail at the outer end, but not at the sides, because it would be an obstruction to passenger traffic.
1323. *Mr. McAllister.*] Could you not have chains or falling bars? You might have chains slung along the side of the pontoon, or you might have life-ropes round the pontoon. The chains, besides, would have to be very strong, because the larrikin element is very difficult to deal with.
1324. Do you not think there should be two lifebuoys, with 15 fathoms of lanyard on them, and some boathooks on each pontoon? We put out lifebuoys and boathooks, and 15 or 20 fathoms of line, but the following week they were all stolen.
1325. *Mr. Cargill.*] Do you remember when the change in this particular stage were made? I think it is about four years ago.
1327. Do you remember the Quay being deepened there? Yes.
1327. Was it about that time? I am not quite sure about that.

- J. Jackson. 1328. Do you know how the original pontoon came to be taken away? I think the old iron pontoon was leaking.
- 23 Oct., 1899. 1329. That is the only reason, as far as you know? Yes.
1330. Was the present pontoon substituted at once, or was there any lapse of time? No; there were two pontoons, as far as memory serves me. One was for wool and one for passengers.
1331. They were side by side? Yes.
1332. Were they fastened together? No; there was a passage in between them.
1333. There were separate landing stages? Yes; one was further over. One was about where the Watson's Bay ferry is now, more to the westward.
1334. Which was that? That was the passenger pontoon.
1335. Was that the iron pontoon you have spoken of? Yes.
1336. So that the other pontoon would be used for wool? Yes.
1337. When the iron pontoon was taken away, what was substituted for it? There was only the wool pontoon left.
1338. Was it shifted from its mooring? No; it remained there, and the roof was put over it.
1339. And when the iron pontoon was taken away the passenger and wool traffic went to the remaining jetty? Yes, as far as my memory serves me.
1340. That remained there in use for some time? Yes.
1341. Did any period of time elapse between the removal of this jetty, which you say was used for wool and passenger traffic conjointly, and the substitution of the present punt;—was it a matter of a day or two or a matter of a week? I could not say; really I do not remember; but I know that I got permission to purchase this pontoon.
1342. From whom did you get permission? From the Treasury.
1343. You purchased it from whom? From Robert Towns & Co.
1344. How did you get the staging made? The Public Works Department made that.
1345. Upon your requisition? Yes.
1346. I suppose the papers will show the date of that requisition? No; my impression is that the papers will refer only to the first pontoon, which was put there in 1883.
1347. Do you remember what you asked for when you applied for the staging? No, I cannot say now. I presume I asked for a gangway.
1348. Did you see any officer of the Public Works Department; or did any officer come down to see what was required? I cannot remember now what occurred. Probably I had a conversation with an officer of the Department in reference to the matter; but I cannot remember now what was done.
1349. You did not state to the Department what the pontoon was going to be used for? No; of course the pontoon already there was used for wool and passenger traffic, and I assumed that this pontoon would be used for the same purpose.
1350. But you did not, as far as you can remember, tell the officer of the Works Department that? No.
1351. You have a watchman named Hansen under you? Yes.
1352. Is he in the habit of reporting to you? No.
1353. Has he ever done so? Not that I can remember.
1354. Not merely with reference to this particular stage; but with reference to anything connected with his duties? Not in connection with any defects in wharfs.
1355. Do you remember that upon one occasion when the unemployed were sleeping down at the Quay he reported to you the difficulty he had in watering the blocks? Yes.
1356. And did you act upon that report? I did.
1357. In what way? I drew the attention of the Treasury to the danger of these men sleeping there, and using paper and matches to light their pipes. Afterwards the police removed them.
1358. Acting on instructions from the Treasury? I think so; there were also complaints from the P. and O. and Orient Companies.
1359. It may be assumed then, that at any time Hansen did report to you, his report received consideration? Yes.
1360. Whether you gave effect to his recommendations or not? I never receive a report from anyone without dealing with it at once.
1361. You do not always give effect to recommendations? No; the watchmen sometimes mention all sorts of absurd things; they sometimes object to go round with the tell-tale.
1362. *Mr. McAllister.*] Has there been any friction between you and the Public Works Department at any time? Never.
1363. On one occasion when coal was piled up at the Norddeutscher Lloyd's wharf, did anyone call your attention to the fact that there was too much weight upon the wharf? The Public Works Department wrote to the Treasury.
1364. Did you at that time observe that it was not their business to make such complaints? No. The Department were written to, not because of the weight on the wharf—the wharf would hold double that—there were only 780 tons—it was on account of the defective land-ties, and they are there now.
1365. An officer of the Public Works Department at that time distinctly said that the straining of the land-ties rendered the wharf unsafe, and that you were asked to have some of the coal removed? Yes; and that was done.
1366. Did you describe that as an unfriendly action on the part of the Public Works officer? I think I did say so in a joke to Mr. Grimshaw.
1367. Did you really mean to say that his officer was taking upon himself a duty which was one of your own? No; I did not. I may have said this to Mr. Grimshaw, "I have always considered you friendly, but you did a very unfriendly act in this case."
1368. Upon that particular occasion did you lead him to understand that the wharfs were under your charge, and that the matter complained of was therefore out of his jurisdiction;—do you consider yourself a better judge than a Public Works officer in such a case? If the land-ties were what they ought to have been there would have been no danger to the wharf. It could certainly hold the weight, and if it carried away I should decline to take the responsibility. I should have declined the responsibility even had there been more weight upon the wharf at the time than there actually was.
1369. Do the Public Works Department understand, in a general way, that you decline to take any responsibility in such a case? I cannot say.

1370. You do not wait until an accident happens before you acquaint the Public Works Department with anything needing attention? If I see any defects of course I call attention to them.
1371. You use your judgment in the circumstances as they arise? Yes. That is not the only occasion upon which I have spoken to Mr. Grimshaw about what I considered an unfriendly act.
1372. The suggestion made as to the removal of the weight upon the wharf was carried out promptly? Yes.
1373. You would not have insisted upon the coal remaining there had a responsible officer of the Public Works Department desired to have it removed? Certainly not. There is often more weight on the wharf than that. There is more weight on the wharf now.
1374. I take it that what was objected to was the fact of the coal being backed up against the shed? To my mind, at the time there was not the slightest danger, because the door was protected with a 3-inch plank, and the pile of coal was not more than 9 feet high. I came down at 9 o'clock at night and stopped the colliers from putting out any more coal.

J. Jackson.

23 Oct., 1899.

George Castle sworn and examined:—

1375. *Chairman*] What is your occupation? I am a shipwright. I am assistant to the foreman shipwright at Cockatoo Island, Mr. Pratt.
1376. Do you remember the particular platform to which the accident recently occurred at Circular Quay? Yes.
1377. Do you remember it being sent to Cockatoo Island for repairs? I remember the pontoon coming over.
1378. What were the instructions you received at that time? I received my instructions from Mr. Pratt. He, as a rule, would mark upon the punt what was to be taken out.
1379. But on this occasion you had no instructions whatever as to the platform? No.
1380. Do you recollect anything being done to the platform? I remember it being canted up on edge, so that we might repair the punt; that is all.
1381. You did not instruct anyone to put a bolt into one of the girders of the platform to strengthen it? I did not.
1382. Do you remember two men named Mitchell and Scott being employed in repair of the punt? Yes.
1383. They would take their instructions from you? In some cases they would take them from Mr. Pratt; if he should not instruct them I would do so.
1384. They would not receive their instructions from any other officer? No.
1385. Do you think that, if either of these men had made any repairs to the platform, you would know of it? I do.
1386. And you do not recollect giving any instructions to that effect? No.
1387. You recollect, when I came over to Cockatoo Island, Mr. Pratt telling me that nothing was done to the platform when the pontoon was repaired? Yes.
1388. When you lifted the platform from the deck of the punt, did you notice any weakness in it? No; it stood all right to be lifted.
1389. If you had noticed any weakness in the platform, you would have repaired it, irrespective of your orders? I should have called Mr. Pratt's attention to it.
1390. Were you on the punt when the platform was lifted? Yes; it was lifted through my instructions.
1391. *Mr. McAllister.*] Who engages the shipwrights at Cockatoo Island? Mr. Pratt.
1392. Does he ever delegate the duty to you? I have very rarely done so.
1393. Are these men, Mitchell and Scott, regular employees of the Government there? They have been off a few times.
1394. How long were they off before they were recently employed there? About two months, I should think.
1395. Might it have been three or four months? It might have been.
1396. Do you know why their services were dispensed with? There was no work for them to do as far as I know.
1397. Is it usual to employ shipwrights on Saturday morning? They are employed at any time in the day when they are required.
1398. *Mr. McRitchie.*] These two men were at work last week at Dalgety's wharf, and they went to Cockatoo Island on Saturday morning;—is it not an unusual thing to employ shipwrights on Saturday morning? They are employed at any time of the day they are required. They are paid by the quarter hour, and it is immaterial when they start work.
1399. *Mr. McAllister.*] Have you heard of any friction between these men and Mr. Pratt? Yes; I heard of some friction between them.
1400. Is it not true that they were dismissed when they were last employed at Cockatoo Island, in consequence of this friction? It is difficult to say; I know that other men were put off with them at the same time.
1401. It is not within your own knowledge that there was any friction? I know there was friction, but I could not say the real cause of it. No one has ever explained it to me, and I have seen nothing in writing.
1402. One of these men states distinctly that he received orders from someone as to the repair of this platform, you have no recollection of giving such instructions? I have no recollection of anything in the shape of repairs being done to the platform.
1403. When the platform was tilted up would it not strike you, as a practical man, that you should examine it? No, there was no order in reference to the platform.
1404. You are not supposed to keep your eye about you to detect needful repairs unless you have special orders;—you do not form your own impressions in a case of this kind? No; Mr. Pratt is supposed to do that, if anyone. Of course, if I notice anything wrong I call Mr. Pratt's attention to it. If he gives orders for the work to be done, it is done.
1405. Would you think it part of your duty as assistant foreman when this pontoon or stage went over to the island to examine them thoroughly to ascertain whether they were in order or not? No.
1406. You regard yourself as an ordinary labourer; you do what you are told and no more? That is so.

G. Cast'e.

23 Oct., 1899.

MONDAY, 30 OCTOBER, 1899.

Present:—

C. McALLISTER, Esq. | W. McRITCHIE, Esq.  
 GEORGE MCCREDIE, Esq. (CHAIRMAN).

J. S. Cargill, Esq., Crown Law Department, was also present.

James Walter Grimshaw was further examined:—

J. W. Grimshaw.  
 30 Oct, 1899.

1407. *Chairman.*] I understand that since you were last examined by the Board you have searched for papers in connection with the platform referred to in your previous evidence? Yes.

1408. Have you succeeded in finding any documents which are material? Yes, I have obtained a paper written in 1892 in which Captain Jackson asks that the pontoon on the eastern side of Circular Quay may be replaced; and also certain correspondence in connection with the replacing, including a report to the effect that it had been moored at Circular Quay. There is one other paper referring to the repair of the punt, but I cannot say where it is. These, so far as I know, are all the papers connected with it, beyond the requisition and vouchers handed in by Mr. Darley.

Angus Moir called in, sworn, and examined:—

A. Moir.  
 30 Oct, 1899.

1409. *Chairman.*] What is your position? I am Inspector in the Harbours and Rivers Branch.

1410. When were you appointed? I entered the Department in June, 1879.

1411. What is your particular duty? I look after contracts and day-labour works.

1412. Do you act as clerk of works? Yes.

1413. You mean in reference to new works carried out by the Public Works Department? Yes.

1414. Do your duties end there? No, I generally have the execution of any repairs.

1415. Do you make repairs upon instructions received from the Public Works Department? Yes.

1416. You do not make any repairs upon your own responsibility? Not unless I see they are urgently needed.

1417. It is not part of your duty to look for any part of a wharf or jetty which may be considered dangerous? Not without instructions.

1418. Do you remember the platform to which the accident recently occurred at Circular Quay? Yes.

1419. You superintended the making of that platform? Yes.

1420. Under whose instructions? Mr. Williams was my superior officer at the time; I received my instructions from him.

1421. He is not now in the Department? No; I think it is five years since he was pensioned off.

1422. Was the punt at the Quay when you made the platform? Yes.

1423. Was it moored there? Yes.

1424. Can you remember the exact instructions you received? To make a platform for a wool punt.

1425. Did you make the platform at Circular Quay? Yes. We made the platform on the punt, and then shipped it on to its hinges, and hauled the punt out. That, as nearly as I can remember, is what was done.

1426. Who instructed you as to the timber you were to use? I could not say. I know that the punt was supposed to be there only for a short time.

1427. You understood that the punt and platform were a temporary provision? I understood they were temporary. If the arrangement were permanent, a punt such as that would not have been furnished.

1428. But what led you to believe that the arrangement was only temporary? There was an old iron punt there, and two spars were run out with cross-pieces lashed to them, and planks 30 feet long were run down to the deck of the punt. The Quay wall there was quite different at that time, and was much lower than it is now. When the Quay was reblocked that portion was all taken away, and the wall was set back.

1429. Do you know whether at that time there was any proposal to make a jetty for passengers? I understood that there was.

1430. And that led you to suppose that the stage was only a temporary measure? Yes.

1431. Do you remember the platform being repaired at any time? I believe it was repaired about two years ago. I was laid up with influenza at the time.

1432. Before you went away ill did any report reach you as to the condition of the platform? I do not remember any.

1433. Do you know anything of the repairs made to the platform? I remember that the decking was Oregon, and it was asked that hardwood might be substituted, as the trucks were cutting the decking too much. I suppose a bale of wool would weigh about half a ton, so it is easy to understand that the trucks may have worn the Oregon.

1434. Who was the officer who took your place in the superintendence of the repairs to the platform? Mr. Christian. He has since died.

1435. Since this accident occurred have you made an inspection of any of the other pontoons or platforms about the Quay? I got the order to put on an extra hinge at Prince's Stairs. We have also done some repairs to the pontoon at Erskine-street. The deck was gone in one or two places. We put two planks in the Birkenhead side of the pontoon, and two into the Dock side. Planks were also put into the new Ferry Company's pontoon.

1436. Have you received instructions from the head of the Public Works Department to generally inspect landing platforms belonging to the Government? I received no special instructions. I was asked to look at a jetty down at Woolloomooloo; that was the only instruction I received.

1437. How did you come to be inspecting the jetties without instructions? I am at the Quay about half a dozen times during the day, and I am passing the Balmain Ferry Company once or twice.

1438. Would there be sufficient work to occupy an Inspector continuously in the inspection of jetties and landing stages? I do not think so.

A. Moir.

30 Oct., 1899.

1439. Supposing the inspection included wharfs, do you think there would be enough work for one man to do? I myself have to superintend the whole of the repairs now. I do not say that I make a regular inspection, but if any repairs are wanted I generally have to make them.
1440. Do you not think there has been a good deal of laxity in supervision in the past, and that if the supervision had been better this accident would not have occurred? Perhaps not; still it might have occurred, even had there been an officer looking after such things.
1441. Do you not think that if an officer were specially appointed to look after these works, and were responsible for their stability, the public would be safeguarded? There is no doubt about that.
1442. Do you think that such duties could be added to those which you now discharge? No; I often have more than I can manage as things stand.
1443. Do you think, then, there is a necessity for an appointment such as I describe—that is, an officer who would be about the wharfs day after day, and who would have an opportunity of taking notice of defects? No doubt it would be better to have somebody who would be responsible.
1444. Do you remember some time ago, when a complaint was made in reference to the overloading of a wharf at Circular Quay? Yes.
1445. Had you anything to do with that? Nothing.
1446. Suppose you had noticed anything wrong in connection with the platform to which the accident occurred, what would you have done? I would have had it put right, and reported the matter.
1447. Would you have had to report it to the office first? Had I noticed that the platform was in a dangerous state I should have repaired it first, and reported it afterwards. That is what I generally do if I see anything wrong which requires immediate attention.
1448. Did it ever strike you that the platform was dangerous? No.
1449. I suppose you never examined it carefully? No; we always look for any requests for repairs to come to us from Captain Jackson. Often, when I see that repair is necessary, I ask Captain Jackson to formally ask for it. I do not care to do things of the kind without some authority. I am supposed to have authority for all I do.
1450. *Mr. McRitchie.*] You spoke of putting some planks into the punt at the Balmain Ferry;—did you do anything to the platform on that occasion? We redecked the whole platform. Some of the planks were very thin; they were worn down  $\frac{1}{2}$  of an inch.
1451. You did not see the platform under consideration redecked two years ago? No.
1452. Do you recollect how often it was redecked? I think it was only redecked once. A plank may have been put in now and again.
1453. When we were examining the platform we saw some 6-inch wire nails not broken off, but bent over; it looked as if there was something the matter with the platform, as if the short nails would not hold it, and as if long ones were put in? If there were anything wrong the stevedores would very likely put in nails—for example, to tighten a plank which they might see loose. I have no doubt that that sort of thing has been done.
1454. The longitudinal girders were riddled with nails; would not they tend to split the wood? I am almost sure the platform was redecked only once.
1455. You mean when the hardwood was substituted for Oregon? Yes.
1456. *Mr. McAllister.*] Have you not received a commission from the Public Works Department to thoroughly inspect the various stages since the accident occurred;—have you had any instructions regarding the stages? I have had only one, and that was to put on an extra hinge at Prince's Stairs.
1457. Did you put in some flooring at Prince's Stairs? We had to put in a new hinge, and for that purpose we took up some planks which we did not put down again. We substituted new ones. As far as I can remember we put down one new plank in the middle.
1458. From whom did you receive instructions with reference to the repairs to the Balmain Ferry Company's punt? I think I told Mr. Burrowes or Mr. Grimshaw, and got their authority.
1459. Did you receive no orders from the Department? Papers connected with the work do not come to me.
1460. Did you mention particularly to Mr. Grimshaw or to Mr. Burrowes that the punt was in need of repair? Yes.
1461. Did they instruct you to carry out repairs according to your discretion? Yes.
1462. You are perfectly certain that you received no instructions as regards the examination of stages generally? I did not.
1463. Who repaired the Milson's Point punt the other day when it became leaky? I did.
1464. Did you receive any instructions about keeping an eye on the floating jetties generally? No.
1465. Did what occurred there have the effect of increasing your own vigilance in looking for defects, seeing that such a thing would be liable to occur at any time? No; I cannot say that I exercised any more vigilance.
1466. Were you in the habit of calling Captain Jackson's attention to any defects which came under your own notice? Yes.
1467. You did not report to your own Department? We always looked to Captain Jackson to give us notice of any defects that wanted attention; I think Captain Jackson will bear me out in this.
1468. Has not one of the pontoons at Circular Quay become leaky during the last few weeks? I am presuming that you are referring to No. 3 Jetty;  $8\frac{1}{2}$  inches of water were found in the hold, and it appears that there were a big crowd of people on her. One lot went on board a steamer, and the other lot who were going on to another steamer remained standing there. The pontoon canted over; all the water in her rushed to one side; and people got frightened about it.
1469. Do you remember the date of that occurrence? No, I do not.
1470. Did the steps taken to repair the pontoon come under your personal notice? It really did not want repair. There was a lot of water in the pontoon, and it rushed suddenly over. The pontoon has not been pumped out since it has been there, and it has been there for five or six years.
1471. Are there any pumps fitted on to the punts? Yes; two if not three.
1472. Whose duty is it to pump the pontoons out and see that they are kept quite empty? I could not say. The other day when the water was out I went down below and found that the pipes connected with the pumps were about 5 inches away from the bottom. I mentioned it to Mr. Grimshaw, and told him it would be better to lengthen the pipes, and to put a rose round them to prevent dirt getting into them. I have orders to do that now.

1473.

- A. Moir.  
20 Oct., 1899.
1473. Would portion of the water in the punt be rainwater? It was nearly all rainwater.  
 1474. Have you ever seen persons pumping out the punts? Not until the other day. The North Shore people look after their own punt themselves. I suppose that if any water gets in they pump it out.  
 1475. *Mr. Cargill.*] You say that before the punt under consideration was put in position there was an old punt with two long poles running out? Yes.  
 1476. Used as a wool punt? Yes.  
 1477. You are sure of that? Quite sure.  
 1478. Was there any other punt in the neighbourhood at the time? Not while the iron punt was there.  
 1479. There were not two pontoons side by side within 20 feet of one another? No. There was one there later on with a roof, but I had nothing at all to do with that.  
 1480. Was the iron punt in the same position as the punt at the present time? As nearly as possible.  
 1481. It was in practically the same position? Yes.  
 1482. And, as far as you are aware, that iron punt was never used for passengers? Small launches might come alongside, but no boat went there with any authority.  
 1483. Were not picnic parties despatched from that wharf? I do not think any picnic parties ever went away from the iron punt. It was a very rough arrangement.  
 1484. In what year do you remember seeing the iron punt there? It must be fifteen or sixteen years since it was there.  
 1485. That would be about 1883 or 1884? Yes.  
 1486. It was there until the deepening of the Quay took place? Yes.  
 1487. During the whole of that time, from 1883 until the Quay was deepened, was there only that punt there? There was another punt there, but we had nothing at all to do with it. I know that it was put there, and that a roof was put over it. It would be somewhere about where the Watson's Bay Jetty now is.  
 1488. You are not aware that the pontoon with the roof over it was moored where the present pontoon lies? No.  
 1489. *Mr. McRitchie.*] With regard to the North Shore punt, I understand that you repaired it? Yes.  
 1490. It was in very bad condition? Yes.  
 1491. You could not repair it very well below water? No; we had to cant it over.  
 1492. Do you think that pontoon is safe at the present time? The part I repaired is as safe as any other part.  
 1493. But the other parts might not be safe? We made a good job of it.  
 1494. You went over and saw the punt yourself? Yes; I was there every day they were working.  
 1495. Did you take any planks out? We took them all out. Mr. Pratt was sent down from the Dock the morning the punt was sinking. He patched it over with some boards, oakum, and felt, temporarily, to keep it afloat. The question arose, what could be put in its place if the punt were taken away. They had nothing to put there.  
 1496. There are some relieving pontoons being built now? Yes.  
 1497. Do you think the punt to which I refer is perfectly secure? As to the part I did, I am quite satisfied about that.  
 1498. You examined the punt all over? As far as we could without docking her.  
 1499. In several cases the decks of these punts project over the side; I suppose no one ever goes below to see whether the cobra gets in at the corners of the deck and the punt side? That is just where the cobra does get in.  
 1500. But you think that particular punt is quite safe? Yes.  
 1501. Do you not think that if these punts were covered with yellow or Muntz metal, instead of iron, it would be much better? Yes; it would be cheaper in the long run.

TUESDAY, 31 OCTOBER, 1899.

Present:—

C. McALLISTER, Esq. | W. McRITCHIE, Esq.  
 GEORGE MCCREDIE, Esq. (CHAIRMAN).

J. S. Cargill, Esq., Crown Law Department, was also present.

John Jackson was recalled and further examined:—

- J. Jackson.  
31 Oct., 1899.
1502. *Mr. Cargill.*] You have read the paper produced by Mr. Grimshaw with reference to the construction of the stage, in which you recommend the erection of a small jetty and the return of the punt to the south-east corner of the Circular Quay, where it was originally moored? Yes.  
 1503. That jetty was not erected? No, it never has been.  
 1504. But a pontoon was moored where the pontoon previously used for wool and passenger traffic was? Yes.  
 1505. In your minute of 14th June, 1892, you say that the covered punt used at the "Vernon" was not required;—what punt was that? That was the one which was taken up to the "Vernon,"—a small wooden punt from the south-east corner of Circular Quay.  
 1506. Is that the punt which you have said was used for wool and passengers? Yes.  
 1507. It was too small, and that is why you say it was not required? Yes.  
 1508. You also say, "Mr. Williams has the use of the original wool punt that I proposed to replace";—which punt would that be? That would be the covered punt.  
 1509. That punt had been used for both wool and passengers? Yes; and for stores.  
 1510. But not for wool only? No.  
 1511. Have you seen the minute of the 5th July, 1892, from Mr. Grimshaw to Inspector Cameron? No.  
 1512. Having read that minute, can you say what punt is there referred to? I really do not know what punt is referred to.

1513. When you bought the punt from Robt. Towns & Co. do you know where it was? I do not know where it was; but I have an idea that it was one of the punts which was used in the building of the Hawkesbury Bridge. J. Jackson.  
31 Oct., 1899.

1514. Did you yourself take delivery of it in order to have it moored at the Quay? I am not quite sure as to that.

1515. Did you inspect the punt before its purchase? Yes, I looked at it myself.

1516. Where was it then? I cannot remember; but it was probably at the Quay.

1517. At any rate, you do not know that it was used either by the Treasury or by the Public Works Department before it was moored at the Quay? No, I do not.

1518. Were you present when the pontoon was moored at the Quay? I do not know; but I generally give directions for the mooring of punts. I generally take it upon myself to see that they are properly moored.

1519. You cannot say where this particular punt was brought from? No, I could not.

1520. Having read your own minute of the 14th June, you still say that it was your intention that the punt should be used for passengers and wool? Undoubtedly; the wool season lasts only for three months in the year—for four months at the outside—and it would be folly for me to allow it to lie idle for six or eight months. It is true that in my minute I did not mention passengers; but I did not think it necessary to do so.

1521. *Chairman.*] Did you at any time inform the Department of Public Works that that pontoon and stage were being used for passengers? No; there was no need for me to inform them, because they could see it for themselves every day. Officers of the Department could see picnic crowds going for the jetty.
