---

 REPORT.
 

---

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 9th February last, "*to consider and report upon the claim of the Rev. D. H. M'Guinn to a stipend,*"—"with power to send for persons and papers,"—have agreed to the following Report:—

Having examined the Rev. Denis M'Guinn and Mr. Halloran, and the papers produced by them, your Committee are of opinion that sufficient evidence has been adduced to shew that the reverend gentleman was an officiating Roman Catholic Clergyman, in receipt of an annual stipend of £150 from the Government, for ten years prior to the passing of the future State Aid Prohibition Act; and that, on the 5th November, 1861—after the Bill had passed your Honorable House—the Rev. D. M'Guinn was transferred from the district where he was officiating, by the authority of his ecclesiastical superiors; and, from that date, his name was removed from the list of Clergymen entitled to State Aid under Schedule C of the Constitution Act. Your Committee also find, that the Rev. D. M'Guinn has continued, and still is, an officiating Roman Catholic Clergyman under lawful authority within the Colony; and, as no evidence has been adduced to justify the discontinuance of his stipend, your Committee believe that an injustice has been done to him, and therefore recommend his case to the favourable consideration of the Government.

THOMAS H. MATE,  
Chairman.

No. 3 Committee Room,  
Sydney, 10 March, 1869.

---

## PROCEEDINGS OF THE COMMITTEE.

FRIDAY, 12 FEBRUARY, 1869.

MEMBERS PRESENT :—

Mr. Mate,		Mr. Burns,
Mr. Bell,		Mr. Hart.

Mr. Mate called to the Chair.

Committee deliberated as to their course of proceedings, and decided to examine Henry Halloran, Esq., Principal Under Secretary, the Very Rev. S. J. A. Sheehy, Vicar General, and the Rev. D. M'Guinn, at next meeting.

[Adjourned to Wednesday next, at 10-30 o'clock.]

WEDNESDAY, 17 FEBRUARY, 1869.

MEMBERS PRESENT :—

Mr. Mate in the Chair.

Mr. Burns,		Mr. Roberts,
Mr. J. Campbell,		Mr. Bell.

Rev. Denis M'Guinn called in and examined.

Witness withdrew.

Henry Halloran, Esq. (*Principal Under Secretary*), called in and examined.

Witness handed in copy of Return to Order, "Correspondence relative to the stipend of the Rev. Denis M'Guinn," ordered to be printed 4 October, 1866.

Witness withdrew.

Re-assembling of the Committee to be arranged by Chairman.

[Adjourned.]

FRIDAY, 5 MARCH, 1869.

MEMBERS PRESENT :—

Mr. Mate in the Chair.

Mr. Burns,		Mr. Roberts,
Mr. W. Suttor,		Mr. J. Campbell,
		Mr. Hart.

Committee deliberated.

Clerk directed to summon the Very Rev. S. J. A. Sheehy, Vicar General, and the Rev. Denis M'Guinn, for examination next meeting.

[Adjourned to Wednesday next, at 11 o'clock.]

WEDNESDAY, 10 MARCH, 1869.

MEMBERS PRESENT :—

Mr. Mate in the Chair.

Mr. Burns,		Mr. W. Suttor,
Mr. Hart,		Mr. Roberts,
Mr. J. Campbell,		Mr. Bell.

Clerk brought under the notice of the Chairman, letter from Mr. T. Makinson, stating that the Very Rev. S. J. A. Sheehy could not attend and be examined,—which he read to the Committee.

Rev. Denis M'Guinn called in and again examined.

Witness withdrew.

Committee deliberated.

*Ordered*,—That the Return of Stipends and Allowances from Schedule C to Roman Catholic Ministers of Religion, ordered by the Legislative Assembly to be printed, 30 July, 1862, be appended. (*Vide Appendix*.)

Chairman submitted and read Draft Report.

Several verbal amendments made in same.

Motion made (*Mr. Burns*), and *Question*,—"That the Draft Report, as amended, be the Report of this Committee,"—*agreed to*.

Chairman to report to the House.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

CLAIM OF THE REV. D. H. M'GUINN.

WEDNESDAY, 17 FEBRUARY, 1869.

Present:—

MR. BURNS,  
MR. ROBERTS,

MR. J. CAMPBELL,  
MR. BELL.

THOMAS HODGES MATE, ESQ., IN THE CHAIR.

The Rev. Denis M'Guinn called in and examined:—

1. *Chairman.*] You are a Roman Catholic clergyman? Yes.
2. Are you the gentleman whose case was brought before Parliament by Mr. Roberts? Yes. The Rev.  
D. M'Guinn.
3. You presented a petition, I believe? No. 17 Feb., 1869.
4. *Mr. Burns.*] Did you not present a petition to the House last Session? No.
5. No petition containing a statement of your case was presented? No, not to the House.
6. *Chairman.*] Do you allege that an injustice has been done to you in consequence of some action of the Government? I do consider so.
7. Will you be good enough to state to the Committee in what way you consider injustice has been done to you? The State Aid Abolition Act secured, or was intended to secure, their salaries to all clergymen who were, at the time of its passing, in receipt of a salary. I was in the receipt of a salary at the time the Bill was introduced, and for four or five months after it passed the Assembly, and after it passed the Upper House.
8. At the time the Bill was passed, where were you stationed? At Wellington.
9. And you received a stipend after the passing of it? No, just at the same time. I received salary for the month of October, and the Bill was passed on the 31st October. I received the last payment of salary on the 25th November, and the Bill passed the Upper House on the 31st October.
10. *Mr. Burns.*] In what year? 1862.
11. *Chairman.*] Did you apply as usual for your salary after the passing of the Act? No, I did not think it necessary. I had left my signature at the Treasury, as was usual, when I began first to receive salary, and the money used to be deposited every month to my credit in the bank which I named.
12. Did you continue in the same place, parish, or district, officiating under lawful authority, after the passing of the Act? No, I was removed.
13. By whose directions were you removed from Wellington? The Archbishop's.
14. Is it within the province of the Archbishop, or the head of your Church, to remove clergymen wherever he thinks proper? Yes.
15. He has the power of appointing and removing ministers? He has.
16. Who succeeded you at Wellington? The Reverend Mr. Woolfrey. He had a salary of his own at the time he replaced me.

The Rev.  
D. M'Guinn.

17 Feb., 1869.

17. Are you aware whether your stipend fell in at that time, or was continued to any one else? I do not know what became of it. I know the clergyman who succeeded me had a salary from the State, at the time, and had had it for years before.
18. For how many years were you in receipt of a stipend from the Government? Since the year 1851 or 1852.
19. *Mr. Burns.*] Were you living at Wellington in all 1862? No, I was removed in November or December, and the Act passed the Upper House on 31st October.
20. Up to that time you were living at Wellington? I was, and for some weeks after.
21. Do you know whether the heads of the various denominations receiving State aid sent in to the Government, or to the House, a schedule containing the names of the clergymen that were receiving State aid at the time the Bill was under consideration? I do not know. Mr. Cowper told me, when he introduced the Bill into Parliament, that he wrote to the heads of the different Churches, requesting them to send in the names of those clergymen who were in receipt of salaries.
22. Do you know whether your name was contained amongst them? It must have been.
23. When was it first notified to you that your stipend was discontinued? I did not know it till I sent my pass-book to the bank, two or three months after.
24. No reason was given? No.
25. Where had Father Woolfrey been stationed before he succeeded you? At Brisbane Water.
26. And he was in receipt of a stipend also? Yes. If I might make the remark, it was said in Parliament, by some of the Members, that I was removed in order to place a younger man in my place; but the fact is, that Father Woolfrey is a much older man than I am.
27. Then that remark was not true? No.
28. *Mr. Roberts.*] Do you, of your own knowledge, know that Father Woolfrey was in receipt of a stipend previous to his succeeding you? Yes, I am sure of it; but that can be seen at the Treasury.
29. Are you aware of any other clergyman belonging to your Church being placed in a similar position to yourself? No, I do not think there is one; in fact, I am sure there is not.
30. You say you had received a stipend from the Government for ten years previous to the passing of this Act? Yes, since I came to the Colony, at the end of 1851, or beginning of 1852.
31. *Mr. Campbell.*] It was at Carcoar I think you were stationed? No, at Wellington.
32. Were you stationed at Wellington when you received this stipend? Yes.
33. And you were not removed for some time after the passing of the State Aid Abolition Act? Not for some weeks afterwards.
34. Are you aware whether those gentlemen who were then receiving stipends receive them now in the same way as heretofore—the stipends being paid to the individuals themselves, or handed over to the heads of the Church? The money was paid to the individuals themselves—it always was.
35. That you believe to be still the practice? Yes.
36. So that, in that case, the money is not received by the heads of the Church, and distributed as they like? No.
37. *Mr. Burns.*] When your salary was discontinued, did you communicate with the head of your denomination about it? Yes, verbally.
38. Was he able to give you any explanation as to the way it was done? No, I did not ask him for any.
39. Do you know whether any communication was made to the Government on the subject? I am not aware.
40. *Chairman.*] Did you take any action in the matter yourself? Yes, I spoke to Mr. Cowper about it, and he seemed to think there was an injustice done to me, and said he would see into it and remedy it.
41. *Mr. Burns.*] I suppose the steps you have taken to obtain redress have been taken in conjunction with the heads of your denomination? No, I did not consult them about it—I did not think it necessary.
42. *Chairman.*] Did you not request some Member to bring the case before Parliament? I spoke to several Members about it.
43. You did not petition at all? No; I explained the matter to Mr. Cowper, and to Mr. Martin also.
44. *Mr. Burns.*] Did you not submit your case to Mr. Martin last session? Yes.
45. Did Mr. Martin have the case investigated? He told me he did not think it necessary, because he thought I had a just claim; and he promised that he would not lose sight of it, but would put it on the Supplementary Estimates. Mr. Butler, the barrister, also spoke to him about it, and he made the same statement to him.
46. *Chairman.*] Since your removal from Wellington, have you continued to officiate at other places, under the authority of the Archbishop? Yes; Forbes and Carcoar, and at Berrima for the last eighteen months.

Henry Halloran, Esq., Under Secretary, called in and examined:—

H. Halloran,  
Esq.

17 Feb., 1869.

47. *Chairman.*] Are there any papers, in the Colonial Secretary's Office, relating to the application of the Rev. D. M'Guinn for the restoration of his stipend as a State-paid clergyman? I have the originals in my hand (*produced*), and I will hand in a printed copy of the papers, as they were laid before Parliament in 1866, and ordered to be printed. These are the whole of the letters. (*The witness handed in the same.*)

48. Are you aware whether the several heads of the Churches have the power of appointing and removing clergymen in the various districts, without the sanction of the Government? That question I cannot answer positively unless I refer. I should think they have that power, otherwise the discipline of the Church could hardly be maintained. H. Halloran,  
Esq.  
17 Feb., 1869.
49. Can you inform the Committee whether the salaries clergymen were in receipt of, at the passing of the State Aid Abolition Act, were allotted to the districts, or to the clergymen individually? As regards the Church of England, I am quite certain it was to the individual—not to the district.

WEDNESDAY, 10 MARCH, 1869.

Present:—

MR. BURNS,	MR. HART,
MR. CAMPBELL,	MR. ROBERTS,
MR. W. SUTTOR.	

THOMAS HODGES MATE, Esq., IN THE CHAIR.

The Rev. Denis M'Guinn further examined:—

50. *Mr. Burns.*] At the time the Bill to prohibit future grants in aid of public worship was under the consideration of the Assembly, you were at Wellington? I was at Wellington. The Rev.  
D. M'Guinn.  
10 Mar., 1869.
51. And from there you were transferred to Forbes? To Forbes.
52. You were transferred under the authority of the Archbishop? Of course, by his direction.
53. Have you all along since then continued to officiate as a clergyman of your Church under his authority as the head? Ever since. I have never left the Colony, and I have been officiating ever since.
54. Do you not, besides your other offices, hold the office of Gaol Chaplain, as a clergyman of your Church? Yes.
55. How came you to hold the office of Gaol Chaplain—Was it through the nomination of the head of your Church? Yes.
56. So that, all along you have been officiating under the authority of the Archbishop? Yes, from the time I came to the Colony up to the present time.
57. How long a period elapsed from the discontinuance of your stipend until you applied to have it restored to you? I had several interviews with Mr. Cowper, and he promised to rectify the mistake; but before he could do so, he left office.
58. Had you conversations with Mr. Cowper before you wrote to him complaining of the stoppage of your stipend? I spoke personally to him.
59. You first wrote to him in November, 1865? I forget the date.
60. Did you communicate with the Vicar General, or with the Archbishop, about your stipend? No, I knew it would be no good to apply to them.
61. Can you account for the long time that elapsed between the discontinuance of your stipend and the first time you wrote to the Government complaining of its discontinuance? I did not think there was any remedy for it.
62. Were you aware that your name was in the list of clergymen laid upon the Table of the House when the Bill for the abolition of State-aid was under consideration? Of course; otherwise I should not have been in receipt of a salary.
63. You are aware that, when that Bill was under consideration, Mr. Cowper, who introduced it, laid upon the Table of the House a list of clergymen entitled to receive a stipend? Yes.
64. You were never aware of your omission from any schedule entitling you to receive State-aid until your stipend was stopped? No, I got no intimation at all.
65. No intimation either from the head of your Church or from the Government? No; in fact, I did not know that payment was stopped until three months after, when I sent my pass book to the bank to be made up.
66. The first time you became apprised of the fact was, when you received your pass book, and found that you were not credited with the payments from the Government? Yes.
67. *Chairman.*] The money was always paid to your credit by the Government? By the Government, ever since I began to receive a salary.
68. *Mr. Sutor.*] Had you any intimation from the head of your Church, before the Act passed, that your salary would be transferred to any other? I had no intimation.
69. *Chairman.*] Did your interviews with Mr. Cowper, respecting your case, take place before this official letter to him of November, 1865? Yes. I had a personal interview with him, and saw him at this office.
70. How long after you saw from your bank book that your stipend was stopped, was it before you spoke to Mr. Cowper? I think it was twelve months.
71. Do you recollect in what month it was you first discovered your stipend was stopped? I think it was in February, as well as I recollect, I sent my pass book to the bank, and found there was no money received from the Treasury.
72. Up to that time you believed you were still receiving your stipend? Yes.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

---

## WATER RESERVE, TOWNSHIP OF RYDAL.

(PETITION—CERTAIN FREEHOLDERS AND RESIDENTS OF RYDAL, RESPECTING.)

---

*Ordered by the Legislative Assembly to be Printed, 5 March, 1869.*

---

To the Honorable the Legislative Assembly, in Parliament assembled.

The humble Petition of the undersigned freeholders, householders, and residents of the township of Rydal,—

RESPECTFULLY SHEWETH:—

That Petitioners, having purchased from the Government allotments of land in the township of Rydal at high prices, and made improvements thereon, on the understanding and faith of a permanent water reserve being laid out and held for them and for their use on Solitary Creek—said Creek running through the township, said water reserve being then marked on the plan from which the allotments were sold.

That Petitioners enjoyed this privilege up to a late period, when the Government took up the reserve for railway purposes.

That Petitioners expected when the wants of the railway would be supplied that the remainder should revert to Petitioners for their use as a water reserve.

That Petitioners complain that the Honorable the Secretary for Works has let the most important portion of said water reserve to private parties, to wit, to Messrs. M. Asher & Co., for the purpose of carrying on the business of wine, spirit, and general storekeepers; that said private parties have erected stores, dwelling, and offices on the banks of the creek, thereby debarring and hindering the free access thereto and materially affecting the interests of said Petitioners.

Your Petitioners would therefore humbly pray, that your Honorable House will take into your favourable consideration the great grievances under which they labour, and grant them such relief and redress as you may deem meet.

And your Petitioners, as in duty bound, will ever pray.

Rydal, 23rd February, 1869.

[Here follow 45 Signatures.]

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

---

MR. RICHARD HENRY WRIGHT.

(PETITION OF.)

---

*Ordered by the Legislative Assembly to be Printed, 4 February, 1869.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of Richard Henry Wright, late Line Inspector in the Telegraph Department of Tenterfield,—

HUMBLY SHEWETH:—

That your Petitioner was under suspension from his public duties, from the 9th January to the 29th March, 1866, owing to the charges made against him, by the new Telegraph Station Master of Tenterfield, of "insubordination and neglect of duty."

That your Petitioner applied to the Honorable the Secretary for Public Works for an investigation into the charges preferred against him; but it appears, by a reply to his application, from the Under Secretary of this Department, that this indulgence will not be granted; and your Petitioner has been injured in his good name by the accusations made against him, and absolutely dismissed the Public Service, without defence heard; and your Petitioner has thereby suffered great wrong and injury.

Your Petitioner, therefore, humbly prays your Honorable House to cause full inquiry to be made into the circumstances of his alleged misconduct, and dismissal, and cause such steps to be taken in the matter as to your Honorable House may seem meet. And your Petitioner, as in duty bound, will ever pray.

R. H. WRIGHT.

### Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland,  
Queen, Defender of the Faith, and so forth,—

To our trusty and well-beloved—

JAMES CARLISLE, Esquire, R.N. ;  
EDWARD ORPEN MORIARTY, Esquire ;  
MORRIS BIRKBECK PELL, Esquire, B.A. ;  
JOHN RUSSELL, Esquire ; and  
JAMES HENRY THOMAS, Esquire ;

Greeting :

WHEREAS complaint has been made to us that the practice, which now prevails in this our Colony of New South Wales, of testing marine steam-boilers in use, by an hydraulic pressure, double that of the extreme working pressure required when under steam, is most destructive to the boilers which may be subjected to it, and, in its after-consequences, exposes, to most serious risks, human life and property : Know ye, that we, reposing great trust and confidence in your zeal, industry, discretion, and integrity, do, by these presents, authorize and appoint you, or any three or more of you, as hereinafter mentioned, to make a diligent and full inquiry into the validity of the objections raised against this practice, and to report thereon as to the advisability of any alteration being made in the method, which now obtains, of testing marine boilers : We do, by these presents, give and grant to you, or any three or more of you, at any meeting or meetings to which all of you shall have been duly summoned, full power and authority to call before you all such persons as you shall judge necessary, by whom you may better be informed of the truth in the premises : And our further will and pleasure is that you, or any three or more of you, after due examination of the premises, do, and shall, within the space of one month after the date of this our Commission, or sooner if the same can be reasonably certified to us, in the Office of our Colonial Treasurer, under your or any three of your hands and seals, certify what you shall find touching the premises : And we hereby command all Government Officers, and other persons whomsoever, within the said Colony, that they be assistant to you, and each of you, in the execution of these presents : And we appoint you, Morris Birkbeck Pell, to be President of this Commission, and do give you power, at your discretion, to procure such clerical or other assistance as may be absolutely necessary for enabling you duly to execute this Commission.

In testimony whereof, we have caused these our Letters to be made Patent, and the Great Seal of our said Colony to be hereunto affixed.

Witness our right trusty, and well-beloved Cousin and Councillor,  
SOMERSET RICHARD, EARL OF BELMORE, Governor and Commander-in-Chief of our Colony of New South Wales, and  
(L.S.) Vice-Admiral of the same, at Government House, Sydney, this ninth day of June, in the year of our Lord one thousand eight hundred and sixty-eight, and in the thirty-first year of our reign.

BELMORE.

By His Excellency's Command,

GEOFFREY EAGAR.

The Honorable Geoffrey Eagar, Esq., M.P.,  
Minister for Finance & Trade,  
&c., &c.

Sydney, 18 May, 1868.

Sir,

We beg most respectfully to bring under your notice a practice which now prevails of testing Marine Steam-boilers by an hydraulic pressure, double that of the extreme pressure to which they are to be subjected, under steam, when working.

This practice, for which there appears to be no authority under the Board of Trade Regulations, is, we would respectfully represent, most destructive to the boilers which are subjected to it, and in its after-consequences, exposes to most serious risks, human life, and property.

Under these circumstances, we beg leave to submit, that if the Government entertain any doubt that this system should at once be discontinued, the question might be submitted to the determination of a Commission of properly qualified men.

We have, &c.,

JOHN BREWSTER,  
Chairman, A.S.N. Co.

M. METCALFE,  
Director, I.S.N. Co.

C. WISEMAN,  
Manager, C. & N.E.S.N. Co.

BENJAMIN LEE, JUNR.,  
Chairman, H.R.N.S.N. Co.

FRANCIS MITCHELL,

## TESTING MARINE STEAM-BOILERS IN USE.

# REPORT.

To His Excellency SOMERSET RICHARD, Earl of Belmore, Governor and Commander-in-Chief of the Colony of New South Wales, and Vice-Admiral of the same.

MAY IT PLEASE YOUR EXCELLENCY,

We, the Commissioners appointed to inquire into and report upon the validity of the objections raised against the practice, which now prevails in this Colony, of testing Marine Steam-boilers in use, by an hydraulic pressure double that of the extreme working pressure required when under steam, have the honor to report as follows :—

A Memorial having been submitted to us, signed by a number of gentlemen connected with several Steam Companies in this port, and addressed to the Honorable the Treasurer, complaining that Marine Boilers in use have been liable to much injury from the method of testing adopted by the Government Engineer-surveyor, we caused a letter to be written to Mr. John Brewster, whose name stands first among the signatures to the Memorial, informing him, and the gentlemen associated with him, that we were prepared to receive any evidence which they might have to offer in support of their allegations. In answer to this letter, we were informed by the Secretary to the Australasian Steam Navigation Company, that the gentlemen signing the Memorial referred to desired us to take the evidence of Mr. John Struth, Mr. Edward Evans, Mr. Francis Napier, Mr. Thomas Jaffrey, Mr. John Fyfe, and Mr. Wilson, Government Engineer-surveyor at Melbourne. We have examined all these gentlemen excepting Mr. Wilson, whom we did not consider it necessary to summon from so great a distance, as his practice in testing boilers might be otherwise ascertained, and nothing further could be learned from his evidence but his individual opinion on the subject in question. In order to learn what Mr. Wilson's practice is, and at the instance of the same gentlemen, we took the evidence of Mr. Thomas Cromack, Chief Engineer of the steam-ship "City of Melbourne," in which vessel he frequently visits the port of Melbourne. We also examined Mr. Thaw, Superintending Engineer to the Peninsular and Oriental Steam Navigation Company, whose name is attached to the Memorial referred to.

We do not consider that it is proved by the evidence of these witnesses, nor by that of the many others whom we have called, that there is any case in which it can be asserted confidently that a boiler has been injured through the application of the hydraulic test by the Engineer-surveyor in this port. The method has been in use for some time, and only five or six cases, at most, are adduced, in which there appear to have been grounds for suspecting that injurious results followed from its use. Twice, it is said, slight accidents happened to the boilers of the "Wonga Wonga," shortly after testing. Something of the same kind occurred to the "Balclutha," and the steam-chest of the "Collaroy" gave way on the first trip after the testing of her boilers. It is stated, also, that the boilers of one or two of the Parramatta River steamers, immediately after testing,

testing, have shown leaks under steam, which did not exist, or were not observed, at the time when the hydraulic pressure was applied. It is alleged, also, that the recent accident to the steam-ship "Clarence" was caused by the severe test to which her boilers had been subjected three months previously. This is the only case in which we have been able to obtain sufficiently detailed information to enable us to form an opinion of the justice of the complaint made; and upon this case, therefore, we consider it desirable to report somewhat minutely.

The boiler of the steamship "Clarence," to which the accident happened, is an ordinary marine tubular boiler. At the back of the bridge behind the furnace, is an open space commonly called the "hollow-back." The flat surface of the boiler, beneath this space, was secured by means of stays, at intervals of about 12 inches each way. The stays were of an inch and a quarter section, and screwed through the plate, and cold riveted over. The accident occurred through the plate drawing away from four of the stays, thus allowing the water from the boiler to escape into the furnace. It is urged by the witnesses who attribute the accident to the strain exerted upon the boiler three months before, that under that pressure the plates at this part of the boiler must have bulged out between the stays, causing the stay-holes to open a little on the inside, thus weakening the hold of the stays upon the plates, and at the same time admitting the water slightly into the thread of the screw; that, in consequence of this leakage, corrosion of the threads took place; and that, in the course of the intervening three months, the hold of the stays became so much weakened, that they gave way altogether under steam pressure. It is the opinion, also, of the same witnesses, that this distortion of the plates, and consequent injury to the stays, may have taken place under the hydraulic pressure, without its being observed at the time. On the other hand, there is evidence that this part of the boiler was stripped at the time of the application of the test, and was examined whilst under pressure; and some of the witnesses maintain, that if anything of the kind had taken place, it must have been noticed. It is the opinion, also, of a number of skilled and experienced engineers, in no way concerned or interested in the matter, that if the Engineer-surveyor did his duty, and was properly assisted by the engineers belonging to the vessel, in watching for any indications of weakness in any part of the boiler, whilst under pressure, any such distortion of the plates as would injure the hold of the stays must have been observed. And upon this point we must remark, that nearly all the witnesses who have ever been present at the testing of a boiler by the Engineer-surveyor, including those who object most strongly to his method of testing, agree that he is most careful and attentive in its application.

After the occurrence of the accident, the other boiler of the "Clarence," which is of precisely the same construction as the one injured, as above described, was subjected to the same hydraulic pressure; but the evidence, as to whether the plate in the corresponding part of that boiler did or did not bulge out in any sensible degree on that occasion, is so conflicting that we do not feel justified in drawing any conclusions from it.

It is the opinion of the Engineer-surveyor, and of some other witnesses, that during the interval of three months between the testing of the boiler and the occurrence of the accident, the part of the boiler which gave way may have been injured by heating, in consequence of the practice, which prevailed on board the "Clarence," of blowing the water out of the boilers immediately after entering port, and before the ashes and other refuse, which may have accumulated behind the bridge, had time to cool. We agree, however, with several other witnesses, who consider it extremely improbable that heating to any dangerous degree could have occurred in this way.

The hold of the stays of the boiler in question may have been injured by the hydraulic pressure, in the manner supposed; but we consider that the accident could be fully and clearly accounted for, even if no such test had ever been applied. Whether any such injury was produced or not, it is quite certain that it could not have resulted from the double pressure, if this part of the boiler had been properly stayed. If the plates bulged so much under that pressure as to injure the hold of the stays, it was a sure indication that the stays were not near enough together; and it is the opinion of the

the great majority of the witnesses, and we consider it as beyond doubt, that if the stays, such as they were, had been fixed by means of nuts on the outside, instead of being, as they were, merely screwed through and riveted over, according to a common but most objectionable practice, the accident could not have happened. On this important point, we beg to refer to the evidence of the following gentlemen:—Mr. Bailey, 384—390; Mr. Napier, 431—441, 451—457, 468, 469, 479; Mr. Fyfe, 656—659; Mr. Struth, 726—729, 754—758, 762—765; Mr. Rorison, 999—1003; Mr. Tracey, 1112—1115; Mr. Snell, 1298, 1322—1331; and Mr. Lang, 1607, 1614, 1615.

We have carefully examined the heads of the four stays which gave way in the accident under consideration. None of them appear to have had a good hold of the plate. The worst, and the one which probably gave way first, was holding by three threads at the most, and those fitting badly. There is no appearance of their ever having been riveted over. The bats, if ever there were any, are gone. It is proved by the evidence of Mr. Tracey, Foreman Boiler-maker at the Australasian Steam Navigation Company's Works, that there was no appearance, after the accident, of the bats having been broken off on that occasion. There is no appearance of their ever having been broken off. They were probably worn away by gradual corrosion. We are of opinion that the faulty condition of these stays is of long standing, and affords a striking illustration of the extent to which the hold of stays, fitted in this way, may either be originally defective, or become weakened by corrosion, without the defect being detected upon examination, or exhibited under hydraulic pressure. On this point we beg to refer to the evidence of Mr. Snell, Chief Engineer of H.M.S. "Blanche," who inspected the heads of the stays in our presence.

Having thus considered the only case which we have been able to investigate fully, and it appearing to us that the complaints so far fail in establishing the validity of their objections, we will now proceed to consider the *a priori* arguments advanced against the existing practice.

The Engineer-surveyor, very frequently, before granting the usual certificate to a steamer, tests the boilers by a pressure under water, equal to twice the pressure allowed under steam. It is maintained by some of the witnesses that although a boiler may be perfectly capable of withstanding the authorized pressure under steam, it is liable to injury by being subjected to double that pressure under water—that such injury may not be noticed at the time of testing, but may lead to subsequent accident. It is particularly insisted upon, that the frequent repetition of this testing pressure is most injurious. On these points we have taken the evidence of a number of Engineers of undoubted professional ability, and of long experience in this Colony, as well as in other countries. Their evidence, on the whole, seems to show, that a boiler fully equal to the pressure allowed under steam would not probably be injured by double that pressure under water; and that if every part of the boiler could be carefully examined during the operation or testing, and any symptoms of weakness noted, and the proper remedy applied, no injurious results would follow. But there are some parts of a boiler, fixed in a vessel, which are usually beyond observation; and moreover, a full examination can scarcely be made by the Engineer-surveyor alone, unless assisted by the hearty co-operation of the engineers of the vessel, which cannot be always depended upon.

Though several Engineers, whose long experience and known abilities entitle their opinions to great weight, consider that the present system is perfectly sound, and that if a boiler is not safe from injury under double pressure, its working pressure should be reduced, yet the bulk of the evidence shows, and we are of opinion, that all the legitimate objects of the water test could be attained, and the safety of the public amply secured, if the test pressure were in general confined to fifty per cent. above the working load. The object of the test is not to ascertain whether the boiler will burst, which a competent person could probably determine by examination alone, but to detect with more certainty the existence of weak points and leaks. These objects, we think, could be attained without any appreciable risk of injury to the boiler, by limiting the test pressure as above suggested. At the same time, a new boiler, or one which has been removed from the vessel and thoroughly repaired, and is in a position where every part may be carefully observed, should, in all cases, be subjected to double pressure, to test the efficiency of the new work.

It is the opinion of many of the witnesses, and perhaps they are right, that a perfectly competent and careful person can ascertain, by examination alone, any defects which may exist in a boiler, and that, under the inspection of such a person, the safety of the public could be amply secured, without any test at all. This may be so; but, nevertheless, we do not feel inclined to recommend that reliance should be placed entirely upon the skill and vigilance of any person, however competent and trustworthy, but would rather that he should be assisted by the unfailing indications of the water test, carefully and moderately applied. We insist, however, that the hydraulic test should not be considered as in any degree a substitute for examination. Without a careful examination of the boiler before, during, and after pressure, the test may be regarded as worse than useless. A Surveyor who puts on the pressure, and is satisfied if the boiler does not burst, is worse perhaps than no Surveyor at all.

We find that the Engineer-surveyors to the Board of Trade have the power of subjecting marine boilers in use to a test pressure equal to twice the working load; but it must be a power seldom, if ever, exercised; for, although we have examined several Engineers of large experience at Home, we have not heard of a single instance in which such a test, or any test pressure, has been applied to a boiler in use. We concur, however, in the opinion of a number of the witnesses, that, in this respect, the practice here is preferable to that in England.

The Engineers on some lines of railway in England object altogether to the hydraulic test; on other lines, the boilers are tested, about once a year, to 50 per cent. above the working pressure; and the same practice prevails in Belgium, and in this Colony. Somewhat the same system should, in our opinion, be adopted with respect to marine boilers.

We think it probable, although no specific case has been proved, that boilers may have been injured by the double pressure applied to them in testing. The Engineer-surveyor is of opinion, and he is undoubtedly right, that it would be extremely dangerous (62) to test a boiler up to a pressure equal to two-thirds of its ultimate strength; but there seems no doubt that he must have done so unwittingly in some cases. He certainly entertains an exaggerated idea of the strength of the boilers under his inspection. He is of opinion that a considerable number of them would bear six times their working pressure without bursting (39—43), and that all of them would bear four times, excepting a few which are on their last legs. Now, according to the evidence of Mr. Evans—formerly Engineer-surveyor, of Mr. Napier—an Engineer of great experience, who has occasionally acted in the same capacity, and of the Superintending Engineers of several Steam Companies, who may be presumed to be minutely acquainted with the capabilities of the boilers under their care, and to be unlikely to exaggerate their defects, none of these boilers would bear six times the working load, very few of them four times, and the majority would probably burst under a pressure of steam equal to three times the load on the safety-valve. The testimony is so uniform as to leave no doubt whatever that the Engineer-surveyor is wrong in his judgment on this point, and that he must, in many cases, have tested boilers to an extent which, in his own opinion, is extremely dangerous. We must repeat, however, that if the boilers in use were stayed as they ought to be, no such extreme danger would arise from the application of the double pressure.

During late years, the working pressure applied to marine boilers has been gradually increased; but, as appears in the evidence, there has not been a corresponding increase in the strength of the boilers. The number of stays has been increased, but not sufficiently; and the practice has been somewhat recently introduced of fixing these stays by screwing through the plate and cold riveting over—a practice which we most entirely and emphatically condemn. It is quite true that where the workmanship is good, and the material sound and undecayed, a stay so fixed is capable of withstanding a pressure much greater than it is ever likely to experience; but there is always a liability to slight leakage, and consequent corrosion of the thread, a process which may go on unobserved, and at an increased pace as the plate becomes thinner by wear and tear, and thus lead eventually to serious accident, as happened in the case of the "Clarence." The witnesses are generally of opinion that the stays should be fixed with

nuts

nuts on the outside; and, upon a matter of such plain common sense, it is surprising that any difference of opinion should exist. The thread in the nut is not liable to corrosion, nor to injury by bulging of the plates, and could still hold, although the thread within the plate might be entirely destroyed in consequence of leakage. Some Engineers object to nuts in the fire-place; and, if such objections be valid, which is doubtful, the stays in such positions may be otherwise securely fixed (190, 440). We have dwelt thus minutely on this point, which may appear to be a matter of detail interesting only to engineers, partly because some of the witnesses exhibit, what appears to us to be, an unreasonable prejudice against the use of nuts in fixing stays, and partly from the importance which this apparently trifling matter assumes, from the consideration that there are a number of marine boilers with their stays fixed in the same manner as those of the "Clarence," and that no one can say that many of them may not be in the same defective condition as those which gave way on board that vessel, and thus liable at any moment to lead to similar disastrous results.

Upon a review of the whole of the evidence, we are of opinion that the marine boilers in use are not generally sufficiently strengthened. The number of stays should be increased, and, in many cases, they should be more securely fitted. As the pressure upon marine boilers is raised, not only is the liability to accident increased, but, when accidents do occur, they become much more serious. The strength of the boilers, therefore, should be increased more, if anything, than in proportion to the higher pressure applied to them. What the boilers want, generally, is more efficient staying, which could be effected without any considerable outlay, and would conduce not only to the safety of the public, but to the ultimate benefit of steam-boat proprietors (1076—1079).

In condemning what appears to be a common method of fixing stays, and by our remarks generally respecting the defective staying of boilers, we do not intend to cast especial blame upon any particular Company or its responsible officers, who cannot be considered justly liable to censure for sanctioning or adopting a common practice; nor do we intend any censure upon the Engineer-surveyor, who could not certainly be expected, on his single authority, to condemn methods in common use.

Our opinion as to what should be the practice in surveying marine boilers in use is, we think, sufficiently indicated in the foregoing remarks: and although we think, of course, that it would be desirable that the attention of the Engineer-surveyor should be drawn to what we here record as our deliberate and unanimous opinion, formed after mature consideration, and after listening to his own evidence, and to that of the most competent authorities known to us in the Colony, yet we cannot recommend that his authority should be weakened, or his responsibility diminished, by any additional regulations restraining him from applying the double pressure in cases where he considers it necessary, or otherwise affecting his freedom of action in performing the very arduous duties of his office.

# MINUTES OF EVIDENCE

TAKEN BEFORE

## THE COMMISSION

ON

## TESTING MARINE STEAM-BOILERS IN USE.

WEDNESDAY, 17 JUNE, 1868.

Present:—

MR. PELL, PRESIDENT.

MR. MORIARTY,  
MR. CARLISLE, R.N.,

MR. THOMAS,  
MR. RUSSELL.

Mr. Daniel Cameron Dalglish, Engineer-surveyor to the Steam Navigation Board, called in and examined:—

1. *President.*] Since what date have you held your present office? Since February, 1866.
2. You are aware that complaints have been made as to your mode of testing marine boilers? I am not officially aware of it.
3. Will you describe to the Commissioners what is your method of testing steam-boilers? It varies with the circumstances; I have no uniform method.
4. Do you not apply the hydraulic test in all cases? Not in all cases.
5. In cases in which you do use it, how do you apply it? In the first instance I have the boiler filled thoroughly up with water; I then put on a test-valve—a valve measuring a quarter of a square inch—properly weighted, and apply the ordinary force-pump in use in the ship, until such time as the pressure is attained which I consider to be sufficient for the purposes of safety, in cases where a doubt exists.
6. Is this a hand-pump? The common hand-pump which is used, generally speaking, for pumping up the boilers to the ordinary level for getting up steam. The ordinary pressure-gauges are in use, but in some cases they are cut off by the stop-valves being shut. I put on a valve which I have had made, on application to the Steam Navigation Board. They furnished me with a valve at my request, as I found the indicators of the steam-gauges to vary so much as to cause very great errors in testing by them.
7. Do you consider that any particular care or caution is necessary in applying the hydraulic test? I do. In every instance I pay particular attention to the form of the boiler. I go through the boiler myself, to see if any indication of weakness exists; if so, I make a note of it, and cause it to be strengthened. I have found out many serious defects in that way, which it would be totally impossible to discover in any other mode.
8. Do you find that the pressure gets up at all suddenly? No; there is rather a difficulty in getting up the pressure, because, even in good boilers there is a certain amount of leakage. It more frequently gets up quicker in small boilers, where they are tighter.
9. How long is it since you have made use of this method? From the first time I have had the position of Engineer-surveyor, in every case where I considered a doubt existed. When I was first placed in this position, I found the boilers in such a dreadful state that I had to make a uniform practice of it without any discrimination at all, in order to get the system into vogue.
10. Had this system not existed before your time? I was told it had not, but I believe it did to some extent.
11. Did you adopt it under any special authority? No, the Board leave their Surveyors to their own resources.
12. Have complaints ever been made to you of this method? None. I have never heard of any complaint being made. I have asked persons who have made vague objections, to state any instance in which any boiler belonging to them has been injured by me, or by the system in vogue, but could get no definite answer.
13. Are you aware whether the same system of testing boilers in use is in operation in England? I can only prove it negatively—not by anything positive. I made application to the Steam Navigation Board for instructions, if there were any; and the only answer I got was a copy of the Instructions to Surveyors under the English Act, which I found in some instances not to be applicable to our law here—in fact, in many instances. In the *Engineer* of the 11th July, 1862, you will find an editorial article on an accident that had occurred

Mr. D. C.  
Dalglish.

17 June, 1868.

Mr. D. C.  
Dalgleish.

17 June, 1868.

occurred on the Great Northern Railway, and Captain Tyler, in giving his evidence in that case—But perhaps I had better furnish the Commission with these references on some other occasion, if they would allow me to do so, when I can do so more connectedly. In pursuance of the request of the Board, I have prepared a return of the steam-ships sailing out of this port, shewing the register tonnage, the horse power, the number of boilers, the test pressure at last survey, and the working pressure upon the safety-valve allowed by the certificate—which I beg to hand in. (*Vide Appendix No. 1.*) The other particulars mentioned in the letter I have not been able to supply. I have no sketches of the boilers, nor am I in a position to state their age, or to give you the time when the last general repair was made. You will find that a fair percentage of the boilers have not been tested at all.

14. Not tested at all? Except by internal and external examination.

15. What rules are you guided by as to whether you apply this test or not? In cases where I find the boiler cannot be examined, and deterioration or oxidation has gone on, where rutting has gone on in the plate—grooving, as it is commonly called—where the stays are eaten away where they can be seen, and where there are a number of places in a boiler that can neither be seen nor felt, I consider in these cases it is my imperative duty to find out, by some test, whether there are not some places weaker than the rest which I cannot find out by examination. It is in such cases that I apply the hydraulic test. In cases where old boilers are taken out and new boilers put in their stead, I consider it useless to apply the test until I find cause existing for it.

16. You think that by this test you can ascertain whether a boiler is defective, even though it should not go to the point of bursting? Yes; I have never had occasion to alter that opinion; I have found many instances of it.

17. Suppose a new steamer comes under your inspection, what is the first step you take towards giving her a certificate? I go through the boilers internally and examine them, take a note of the stay area, the area left unstayed, the mode in which the boiler is constructed generally, whether it is well strengthened with angle irons, the dimensions of the angle irons, take out the safety-valve, ascertain the working load on the valve, and whether the load is too high or not, in proportion to the strength of the boiler.

18. Do you do that without applying the test? I do that in every case; but in the case of a new ship, there may be a defective plate or a seam of rivets sprung, and to find that out I can apply the hydraulic test to such a pressure as, in my opinion, is not calculated to injure the boiler.

19. Your practice is to apply the test to double the working pressure? No; my practice is to reduce the working pressure, if I imagine it is in any way too great. I do not use the test as a means of finding out the strength of the boiler, but as a means of finding out defects which cannot be discovered otherwise. I use it as a blind agent.

20. What rule are you guided by? My rule is, to reduce the working pressure if the boiler is imperfectly stayed for the load it has to carry.

21. What pressure would you apply by the hydraulic test? Two and a half tons to the square inch is considered to be the working load; five tons is the Board of Trade regulation.

22. Is it not your practice to test them up to double the working pressure? I do not know of any absolute rule for working pressure. The working pressure is determined by myself, or by the maker of the boiler. If I find that the maker has determined it in such a manner as to leave no doubt, I do not interfere with it.

23. Do you test up to that? On the first occasion, certainly.

24. Would you allow any more than double the test to be put on? Not under any circumstances.

25. What proportion do you consider the working pressure should bear to the full pressure the boiler is capable of sustaining? One-eighth is a rule arrived at by many makers, one-sixth by others.

26. Do you consider one-sixth a fair allowance of strength? I find no fault if I can find that strength in the boiler.

27. Then an hydraulic test of double the working pressure would be one-third of that? Yes.

28. In the case of the accident to the boiler of the "Clarence," did you examine the stays afterwards? I did.

29. Would there be any difficulty in making those stays so as not to be liable to such an accident? None, in my opinion. I think a great deal of misapprehension exists as to these stays and the whole affair generally. At the inquest I was thoroughly gagged; I was not allowed to explain my meaning. When I wished to explain what I thought to be the cause of the accident, I was told that was no place to go into a dissertation on boiler-making. When I mentioned the other boiler of the "Clarence" I was told not to do so. I was obliged to tell the Coroner that I must decline to answer a question which he insisted on my answering in a particular way.

30. Perhaps you will explain to us what you consider to have been the cause of the accident? The "Clarence's" boilers are fitted with what are called hollow backs, upon which the bridge is built and the furnace bar rests. In my opinion—although it is merely matter of opinion—this hollow back becomes a receptacle for soot and ashes, which accumulate to a certain extent during the time the vessel is running. After the vessel returns from a voyage of (we will say) forty hours duration, the probabilities are that this is red-hot. Since the accident, and since the inquest, I have been informed that it was the practice of the engineer to blow his boilers thoroughly down—entirely down. Under these circumstances, provided that one boiler was blown down a little in advance of the other, two minutes would suffice to make that plate red-hot, and by making it red-hot expand it so much

Mr. D. C.  
Dalgleish.

17 June, 1868.

much as to cripple it. Now, seeing that this accident did not take place till three months after my survey had been made, and that this system of blowing down could have been going on every voyage, on an average once in ten days, the boilers being also blown down at the other end, I think the probabilities are that the boilers have been overheated and injured in that way.

31. By blowing down, you mean blowing the water out? Blowing all the water out. (*Witness explained the construction of the boilers of the "Clarence" by a pencil sketch.*)

32. Did you examine the bottom plate of the back combustion chamber of the "Clarence's" boiler? I did.

33. Could you form an opinion whether that had been red-hot, from the appearance of it? I think it had been heated at some time since the survey.

34. And that you think injured the hold of the stay? The expansion consequent on its getting red-hot would of necessity injure the hold of the stay. One of the holes in particular had never been a good thread, in fact none of the tap holes had been full thread, in my opinion. The stay bolts are in existence at the Coroner's Office, and it would be a great advantage to the Board if they would send for them; the best evidence would be the bolts themselves.

35. Would it be possible to fit a stay of that kind in such a way as to render such an accident almost impossible, by a nut on the outside, or more thorough riveting? No doubt nuts are very advantageous under certain circumstances, but there are many disadvantages attending their use as well. Mr. William Fairbairn has given, as the result of his experience, the additional advantage of a rivet at fourteen per cent. more than the screw, that it is only fourteen per cent. stronger with the rivet; and that the plate has sufficient hold of the stay without being riveted, if it is a good fit.

36. Did you ever hear of a stay breaking under such circumstances? I have seen broken stays in boilers in many cases.

37. Broken by pressure? I know of no other way of breaking them.

38. Was that stay in the "Clarence's" boiler fitted in the usual way? It was fitted in the usual way, except that it was a bad fit.

39. *Mr. Moriarty.*] Do you think there is any boiler running out of this port that would stand from eight to six times the ordinary working pressure? Yes.

40. Will you mark off in this list those that would stand six times the working pressure? (*The witness did so with a pencil.*)

41. Are they high or low pressure? Both.

42. The others you think would not stand six times the working pressure? A considerable time has elapsed since they were surveyed, and very probably they may be reduced in pressure.

43. Do you think that, at the date of the last survey, the boilers you have not ticked off would not have stood six times the working pressure? No, I do not think they would. I do not think there are any that would not stand four times the working pressure, with the exception of some that were on their last legs, and that have been condemned and taken out since.

44. *President.*] At the time of the last survey were they fit to stand six times the working pressure? No; some had only a month or two months' certificates.

45. Do you think it was necessary then to reduce the working pressure? No; but testing the boilers under these circumstances would bring out the weak places, if they existed, without injuring the boiler in a material way.

46. Would you not consider the mere fact that it would not stand six times the working pressure, sufficient reason for reducing the working pressure? No, not in all cases.

47. *Mr. Moriarty.*] Then, at the date of the last survey, you think the boilers you have not ticked off might be supposed capable of carrying four times the working pressure? Yes.

48. *President.*] Would you test those boilers to double the working pressure? You will find, from the list I have handed in, that I do not in all cases apply double the working pressure. If I wish to see that everything is tight, I use a moderate test; if I have any doubt whatever, and if no objection is taken by the parties owning the boiler—there never have been any, as a matter of fact—I apply the full test, especially if the boiler has been a long time from under my care, as was the case with the "Clarence," which had been away for upwards of two years.

49. Do you not think applying the hydraulic test equal to one half what the boiler would bear, would injure it? I never have applied a test equal to one half what the boiler would bear. You will find, from the list, that I do not use the double test except in rare instances. I use my own discretion in applying it; I have no distinct or definite rule. I depend more upon my own personal inspection—internal and external inspection—than upon anything else. I go in and out of every portion that can be got at; I sound every place to ascertain its thickness; and if I think it requires it, I have it strengthened. There is hardly a boiler out of this port that I have not had to have additional stays put in.

50. *Mr. Moriarty.*] Did you ever find any boiler give way under the hydraulic test? I have, and I have pointed out where they would give way before they did so, and requested that they might be strengthened; and the testing was then used to convince the parties owning the boilers that they were wrong.

51. The test develops the points that will not stand the test? It does.

52. Might it not be possible that another part might be just strong enough to resist the test, and yet not three times as strong? That is possible, of course. There is nothing perfect that I know of, and even a test is not a perfect measure of safety, but it approaches to it. I use the test to discover weakness where it cannot be otherwise discovered.

53. What I want to arrive at is this,—whether having applied a test to a boiler under which some parts have sprung, and which have consequently been repaired, but other parts have not

Mr. D. C. Dalglish.  
17 June, 1868.

not sprung, and so far have stood the test, whether you consider these other parts could be pronounced to be equal to withstanding three times the pressure brought to bear on them by the test? No, I could not use the test as a means of ascertaining that. I think the test should never be used for the purpose of ascertaining the ultimate strength of a boiler.

54. You do not understand me. Would you consider the parts that did not give way, safe up to three times the pressure? I am not altogether clear that I understand the question yet.

55. A certain hydraulic pressure has been put on a boiler, some parts have given way under that, and have clearly shewn that they could not stand the pressure—other parts have not given way quite; but in the infinite gradations of strength in a boiler, may it not be that they were just on the point of giving, and yet did not? That possibility exists, no doubt.

56. Is it not a probability? The weaknesses I find developed in boilers are generally those that can be measured in some way; for instance, it may be a general thinning of the plate or it may be only a groove at the landing, or in some instances it is a groove at the angle iron that is put in for the purpose of strengthening the boiler. Under these circumstances, if that particular portion is worn so thin as to cause apprehension of giving way, by its being properly mended the boiler can be made as strong as it was at first. I therefore think that if I cause the weak places in a boiler to be repaired, then the boiler is equal to three times the strength that has been put upon it.

57. You spoke of a general thinning of the plate—May it not be that that general thinning of the plate, which has arrived at one part at such a stage as not to stand the test, may at another part have arrived at such a stage as will just stand the test and no more? That condition might occur; but as I have said before, I do not use the test for that purpose.

58. Assuming the possibility of such a state of things, would you pronounce all boilers which stood the test to be three times as strong as the test indicated? I could not pronounce authoritatively, but I might form my own opinion.

59. Referring back to your original statement that a boiler should be equal to six times its working pressure—? I understand that to be the case when the boiler is new. I intended merely to speak of the rule in vogue with boiler-makers—that one standard is as high as eight times, and another as low as six times. I know of none that is lower than six times.

60. *President.*] What I wanted to arrive at was this,—What proportion should the working pressure bear to the actual strength of the boiler—the existing strength? I think it never ought to be above one-third; the working strength ought never to exceed one-third the ultimate strength of the boiler. If the boiler is in that state, it is dangerous.

61. In that case, double the working pressure would be two-thirds of the ultimate strength? Yes.

62. If a boiler could just stand 60 pounds of pressure without bursting, and no more, do you think putting 40 pounds on it would injure it? I do; I think it would be extremely dangerous. Such a thing is altogether unknown in practice.

63. Should you say such a boiler might work up to 20 pounds? Yes.

64. Double that would be 40 pounds. Yes.

65. Is not that what you apply? No; the working pressure is not determined from the testing pressure. I do not determine the working pressure from the test load at all. As I have said before, I use the test simply as a means of ascertaining weaknesses I cannot discover otherwise—for the purpose of finding defects if they exist. For instance, the test load on the bottom plate of the "Clarence" was such as would not have caused a rupture of the plate itself without a single stay.

66. Take the case of the "Lord Ashley"—I see the working pressure is 20 pounds—do you think those boilers would burst at 60 pounds? No.

67. I see you put 40 pounds on them? I did, without the slightest defect being observed. I did that because a very dangerous flaw was discovered in a seam of rivets on the top of the boiler; that was found out before a pressure of 5 pounds was attained. The boiler was considered to have been thoroughly repaired, and on going to test it this defect was discovered; and when that was repaired, considering that it had had a general overhaul, and was supposed by me to be sufficient to bear the pressure, I tested it to double the working load.

68. *Mr. Moriarty.*] Would that boiler have stood six times the working pressure? I believe it would.

69. When you give boilers a short term to run, which I believe is a practice, do you, as a rule, test those boilers? As a rule, I do.

70. Supposing you give a boiler only three months to run, being doubtful of its strength, do you make it a practice to test it? In answering that question I shall be obliged to explain. For instance, the "Illalong"; when I first visited that boiler officially, I found it loaded to 18 pounds the square inch on the safety-valve. On making my inspection I considered it to be loaded dangerously, and I reduced the load (I think) to 12 pounds. I considered that a load the boiler was capable of bearing for a certain time—three months, I think. I tested the boiler then to double the load I had fixed upon—twice twelve; and I found the boiler stand well under that pressure, without any sign of weakness at the weak places that had caused me to take the precaution. The weakness was so general that it would not have paid the proprietors to repair it, and they agreed to reduce the working load. We then tried it, to see if any of the places could be got to exhibit further weakness; and finding that that was not the case, I gave a short certificate.

71. *President.*] I see her working power is up to sixteen pounds now? She has new boilers.

72. They have been tested? The only reason they were tested was that there were some bad

bad plates in the boilers—laminated plates, which had become blistered. I have sometimes given short certificates, not from any danger that existed from weakness, but where the boilers have been dirty, and the accumulating dirt would have caused a danger.

Mr. D. C.  
Dalgleish.

17 June, 1868.

73. *Mr. Moriarty.*] We are speaking now of the strength of the boilers. When do you consider it necessary to limit the certificate to three months—or have you limited it to less time? Yes, I have given certificates for (I believe) a fortnight, for the purpose of allowing a vessel to continue running until such time as the strengthening remedies I considered necessary could be done. A boiler may be safe for a fortnight that would not be safe for six months; and it might derange a Steam Company's trade to have her laid up just at the moment. I may, therefore, in such a case, give a certificate for a fortnight, so that the voyage may be performed, and the necessary strengthening done on her return.
74. You have limited your certificates to periods less than six months, because you thought the boilers, with ordinary fair wear and tear, would not run six months? Certainly.
75. In such a case as that, would you say what has been your practice, or have you adopted any uniform practice, with regard to the pressure you have applied to such boilers? The practice is not uniform. No two boilers agree in circumstances, nor do any two boilers wear alike. For instance, the "Wonga Wonga," at her last certificate, the test pressure was seventeen pounds, and the working load fifteen pounds. The test was applied simply for the purpose of ascertaining if there were any sprung joints.
76. Is there any case in which you have limited the certificate of a steamer, by reason of the weakness of the boilers, to a less period than six months? Yes.
77. Have you in any such instances proved them to double the working pressure? Yes. The "Emu" is a case in point. Her boiler is taken out now. The owners requested me on several occasions to apply the double pressure; but the boiler was in such a state that I would not do anything to it; I condemned it.
78. Would that boiler on that occasion have stood six times the working pressure? No, it would not.
79. Could it have stood three times, if the test had been applied? No, I do not think it could, without developing sores. But in that case I had other things to take into consideration. The working pressure was six pounds to the square inch.
80. What do you think would have been the bursting pressure of that boiler? I believe the boiler would have stood twenty pounds without shewing any burst.
81. What was it proved to? To twelve pounds.
82. More than half its ultimate strength as it was? I think that is hardly a fair way to put it, because if any weakness had been developed, it could have been seen; it would have been in places where oxidation had taken place, principally caused by leakage from the deck. I had had the decks taken up on a previous survey, and had it made, as I thought, perfectly safe, in which I was warranted by the fact, but I would not allow it to be repaired again—that is to say, to vouch for it in any way—and I did not do it.
83. You say the boiler of the "Emu" was proved up to twelve pounds, and you do not think it would have stood twenty pounds without giving way? I said it would.
84. What would have been its ultimate strength—what pressure of steam would be likely to rend that boiler? I certainly think twenty pounds would not be likely to rend it. The principal defect was in the bottom of the boiler, where I could not get at it, to see it at all.
85. What pressure do you think would have rent it? That is a matter I could hardly form an opinion on now.
86. When you limit a boat's certificate, do you consider that the boiler of the vessel to which that applies is capable of carrying six times the working pressure until the expiration of the certificate? No; six times is the rule for new work; not in all cases for old work.
87. What do you consider to be the rule for old boilers? I consider four times to be an ample margin, and even less under certain circumstances.
88. How much less? I never anticipate it should be less than three.
89. Then if you prove a boiler up to double its working pressure, you prove it to half its ultimate strength? I do not think I ever do. In the case of boats which work at a very low pressure, and where the general strength of the boiler is not impaired, excepting at particular places, I do not think twice the load would develop anything serious.
90. Do you not think these developments might be sufficient to produce danger—Supposing a boiler were to rend along the bottom and steam to escape, might it not lead to the destruction of the engineers? It might.
91. Have there not been cases where the whole of the engineer's crew have been destroyed by the rip of the landing? There may have been such cases, but I have never found any record of anything of the kind, and I do not believe, as a matter of record, such a thing has ever taken place. All the great boiler explosions have taken place in boilers that have never been tested.
92. With reference to the boilers of the "Clarence," was there anything unusual in the formation of the boiler that gave way? No.
93. You said something about its combustion chamber? That was simply an arrangement for decreasing the space behind and carrying the bridge, and was used instead of a mass of brick-work.
94. Was there anything unusual in the formation of the boiler where the stays gave way? No.
95. *President.*] Was there anything unusual in the formation of the fire-places? No.
96. *Mr. Moriarty.*] To all intents and purposes it was an ordinary boiler? Yes; there are other boilers exactly the same.
97. Is this back plate, that goes from the bridge up to the back end of the smoke-box, a solid

Mr. D. C.  
Dalglish.

17 June, 1868.

solid plate, or open work? A solid plate of cast iron, but there are openings in it; there are bricks built on the top of that again, to protect the iron from the flame.

98. How could the ashes you spoke of have got down there? In the course of three months these bricks get burned, and there are spaces in them; and then the cast iron plate is open—it has holes in it.

99. If it were full, would the ashes at the bottom be hot? I think it possible they might be very hot after a forty hours run. They would be more apt to be hot from soot than from ashes.

100. Would there be any soot in a place like that, where there is such a tremendous draught? It is protected from the draught.

101. Do you think it possible there could be much soot there? Yes, I think it very possible. It was all cleared away after the accident before I saw it—the bars and bricks were out, and everything swept out—although I was on board the same night.

102. Was that done in both boilers? Yes.

103. Is there any evidence to show there was soot there? No.

104. And there might not have been any? There might not have been any.

105. *President.*] You say that other boilers are arranged in the same way, and that a practice prevails of blowing the boiler off immediately? The practice does not prevail; it is a very injurious one; the water ought never to be blown down to the bitter end of a boiler in that way under pressure. As a rule, engineers do not blow their boilers off in that way.

106. *Mr. Moriarty.*] Is it necessary to blow the boiler off before the fires are drawn? The fires should be drawn before the boilers are blown off.

107. And then the furnaces, crowns, tubes, and tube plates would be of the same temperature as the water and steam by which they were surrounded? Yes.

108. Could they then ever become red-hot? Where bricks are built against the back and they get red-hot, when the water is blown off they make the plates next to them red-hot also. In the same way, if the water is blown from the bottom of a boiler, the temperature of the red-hot ashes, or other refuse that may be below, will communicate itself to the three-eighth plate, which would then become red-hot in a couple of minutes.

109. Do you think, allowing for the bad manner in which heat is conducted downwards, ashes, with the small vitality it has for retaining heat, would be able to heat a plate below it? Yes, I think under the circumstances the plate might become red-hot. I cannot account in any other way for the accident. It simply could not have occurred from the pressure stated; it is as impossible that that plate could have been torn up by steam as that I can fly.

110. Is it not the case that when fresh water is taken into a boiler it causes leaks to develop which would not show with salt water in the boiler? It would not show any leak that did not exist, and that could not be found out by inspection with salt water.

111. Is it not the case that a salt scale will form, with a deposit of salt upon it, which will peel off when fresh water is put in? No, I do not think the scale will ever peel off, but when the leak is simply closed by salt, the salt may be washed out, and the leak developed.

112. Is it not the fact that you can work a boiler with salt water, which, if you take in fresh water becomes so leaky that it will not hold water? I never heard of a case of the kind. I have heard of boilers that would not hold salt water without the addition of horse-dung and bran.

113. You never heard of a boiler that would hold salt water, but would not hold fresh water? No, except after a sufficient time had elapsed to allow of the formation of the scale.

114. Do you think fresh water might not act as a solvent on the incrustation of salt about a stay head, for example? I do not think it would. I think you might boil an incrustation of salt—that is, what is commonly called salt; it is pure lime, as a rule; if salt exists at all, it is as a mere impregnation, hardly perceptible to the taste. You might boil the scale that forms from salt water for ever in fresh water, and not dissolve it. A letter has just reached me from the Steam Navigation Office, that may be of interest to the Commission. It is a request that I might survey the steamer "Herald," which has been subjected to some repairs where found defective, and states that the pressure in use at present is forty pounds to the square inch, and for perfect satisfaction the hydraulic test has been applied to the extent of sixty-five pounds. The "Herald" has been surveyed by me, and I have refused to give a certificate. The pressure of sixty-five pounds was attained. The survey was not satisfactory, and the leak was so excessive that I could not possibly get another pound by the pump. I therefore got into one of the spaces behind the frames—by this time the pressure had gone down to twenty-five pounds—and with a single blow of the hammer it went through the boiler.

115. Then the hammer test was the proper test there? I believe in the hammer test in every case where it can be applied.

116. With regard to sounding boilers, do you think you can really detect any very material difference in the thickness of a plate by sounding? Yes, I am certain of it; I can detect a difference of the sixteenth of an inch by the sound and the blow together, by the different degree of elasticity from the same stroke.

117. Has not that something to do with the place struck? That has all to be taken into consideration.

118. Do you not think it requires a very sensitive ear? I do not take it by the ear altogether. In all these things there is a mode of acquiring knowledge which you cannot impart to another.

119. *President.*] Do you ever apply the hammer to a boiler when it is under this pressure? No; I may sometimes use the hammer to tap some particular place where I think there is

is weakness; for instance, in the case of the "Herald," I did so when there was twenty-five pounds of pressure on it; but I am convinced that if twice that pressure had been got on that boiler it would have opened it out.

Mr. D. C.  
Dalglish.

120. *Mr. Carlisle.*] In all cases, where boilers are two or three years old, would you apply the hydraulic test? No; there are cases where the boilers are two years old where I do not apply the test. 17 June, 1868.

121. Where they are three years old? In some instances. A great deal depends on circumstances. For instance, the "Blackbird" has not had the test applied this time, and I think her boilers are more than five years old.

122. The working pressure you would put on would be half the hydraulic test? Not always.

123. Do you consider a boiler would be safe to work that would not stand double the working pressure? No; I think every boiler ought to stand double the working pressure.

124. Then why not put double the working pressure on? I do not think it is necessary in all cases. I only use the test to discover defects that cannot be found out otherwise. For instance, a crack in an angle iron might be developed, or rather would be seen; or supposing a steam leak existed in the flues, it could not be seen when the fires were lighted, though it might perhaps be heard; but when the boiler was filled with cold water under pressure it would be detected. At the last survey of the "City of Newcastle," a defect was discovered in the frill, by hydraulic pressure, in one of the boilers, when the pressure was only fifteen pounds per square inch—less than the working pressure. That had certainly been developed from the time of the last survey. It had to be remedied, and afterwards the test was applied to nearly double the working pressure, and the boiler stood the test; but notwithstanding, I had the boiler sheeted in certain places where it had stood the test satisfactorily, because it was due then to have stood for six months. I put the hammer very near through in one part of the up-take at a single blow—an ordinary light hand hammer.

125. In all cases where you have a doubt, you test to double the working pressure? Yes, but I do not take that as the only guide I have in coming to a conclusion.

126. But still you would not grant a certificate to a boiler —? I would not grant a certificate to any boiler that would not stand double the working pressure.

127. This hydraulic pressure would be about one-third of its ultimate strength? As a rule, it ought not to exceed that.

128. If a boiler were three years old, would you put the same pressure on it as if it were new? No; it would depend on circumstances. If after inspection I found nothing deteriorated, I would see no reason for taking the pressure off the boilers. For instance, the "Susannah Cuthbert" has very old boilers in her. I believe about her first trip a flaw was developed in one of the back plates; that was mended, and some other things were done; the principal thing that was wrong was that no provision was made for cleaning them, and I had to get doors cut to allow of that. I believe those boilers are now running at the original pressure, and she was tested at the last survey to sixty pounds to the square inch most satisfactorily.

129. *Mr. Thomas.*] Do you not consider it probable that the application of a pressure of 100 per cent. over that which the boiler has to withstand does permanently affect its ultimate powers of resistance; that is, does not the iron itself or the tenacity of the joints suffer to such an extent that it would explode with a much less force than the pressure it has been subjected to? That question, if I were to answer it in the way in which it is put, would lead to misapprehension of what I should say. At least, I think one hundred per cent. more than it ought to carry would never injure a boiler, but one hundred per cent. more than some people would ask a boiler to carry, would be only fifty per cent. under its ultimate bursting strength.

130. Do you not think it probable that the mere fact of putting on that force would permanently affect its ultimate powers of resistance? I do not. I find, from a recent number of the *Engineer*, that Howard's boilers have been tested to twelve hundred pounds per square inch, without showing a sign of leakage.

131. Have you ever heard of a boiler having been made of perfectly new plates, tested, and examined, and yet it has exploded? I know of no such case, except the case of Stewart and Company, where they were in the habit of testing boilers by steam to a little over the working load, and a most disastrous explosion took place. All the authorities agree that in that case, if the boiler had been subjected to hydraulic pressure, the defect would have been developed, and the accident would have been saved. I would like any one that has anything to object to the hydraulic test to double the working pressure being used, to give some tangible reason against it. The only reason I can get any one to give is, that they do not like it. That is a reason I cannot understand.

132. *Mr. Russell.*] With reference to the sketch you made of the "Clarence's" boiler, when you granted a certificate for this boiler, did you examine the stay or the plate? I did; I went right through the boiler. The boat had been away for two years, and I had only surveyed the boiler once prior to her going to the north. I think it was the first month I was in office. At that time the boilers were carefully surveyed, and the vessel was then sent north for about two years. When she came back again she was laid up for survey; everything was swept quite clean, and I went all round her and examined the boilers and applied the pressure. That is about four months ago now. An impression exists that I had been in the habit of testing this boiler every six months; and I believe that impression has arisen from the fact that the same test is used by the Surveyor in the north.

133. We are to understand it as your opinion that no injury was done to this boiler by the test of double the working pressure applied three months before the accident? Most decidedly.

Mr. D. C. Dalgleish. 134. Do you think it was possible? I think it perfectly impossible. I am asked to believe that these stays gave way under a pressure of nine pounds to the square inch; it is perfectly impossible.

17 June, 1868. 135. Might there not have been something wrong with the safety-valve? The safety-valve was examined by me and was in perfect order, but it was loaded to eighteen pounds. The Government regulation allows of a test of five tons per square inch in section of stays; but taking that any way you like, you cannot make the test applied more than six thousand pounds per square inch.

136. After considerable repairs have been done, is it usual to test to double the working pressure? To double the pressure I allow it to work at, but not double the original working pressure.

137. After certain repairs had been done you would prove the boiler to thirty-six pounds, supposing the working pressure to be eighteen? I should do so, provided that in my opinion the boiler was capable of withstanding that pressure.

138. It is usual to examine boilers inside and out, so far as you can? I do it on every occasion.

139. Do you think it possible some parts of the boiler may give way under the hydraulic test, not in such a way that you could find it out or see it; for instance, a stay might give way? In every instance where stays have given way I think I have heard them, and on examination have found them and caused them to be replaced. The greatest encomium on the hydraulic test is, that stays do give way. For instance, a vessel that had just come from Melbourne was for survey here, and was carrying a pressure of twenty-four pounds per square inch. When tested, previous to repair, one of the stays gave way at twenty-nine pounds per square inch—a margin of safety of five pounds above the working pressure. This was discovered by the Superintending Engineer of the Company the ship belonged to. Whenever I can persuade the parties that have charge of the work, I always endeavour to get them to test the boilers before the repairs are done, so that weaknesses may be found out and the repairs go on regularly; but of course I have no control over how they do their work. They generally do what repairs they consider necessary, and then call me in to see if anything further has to be done. The New Zealand Company do not do so; they test the boilers before repairing; and if I do not test the boilers, they do it themselves. The Hunter River Company also test before repair; and the consequence is, they discover places that are defective, and the repairs go on regularly.

140. What was the name of the vessel you referred to in your last answer? The "Rangitoto."

141. In your opinion, would it not be better for the safety of the public, that a shorter certificate than six months should be granted, and the test reduced? I do not know that giving a shorter certificate would be any safeguard, because we have the power of giving certificates for any length of time we like; there is no restriction in the Act as to the term, except that no certificate can be given for a longer term than six months. It may be for a term as much shorter as the judgment of the surveyor may lead him to think the boilers or machinery will be safe for. Before boilers have been finally condemned, they have had very short certificates indeed.

142. In the case you referred to, of finding out a defect in one of the New Zealand steamers, when a plate gave way at a pressure of five pounds above the working pressure, what certificate had that ship? Her New South Wales certificate had expired, she having been in the Melbourne trade. I did not say it gave way; it was a defect underneath the funnel; and as the funnel had not been taken down, it was not seen. In that position a steam leak would not have been discovered, because the steam would have gone away up the funnel, and the defect might have gone on increasing until it became dangerous.

143. With reference to new boilers manufactured in the Colony, what pressure would you consider sufficient as a test? I prefer to take the opinions of other and more eminent men than myself in these matters. Macquorn Rankine says that the "moderate" test of two and a half times the working load should be used; Bourne states that it should be from two to three times the working load; the law of France is that it should be twice; and the law of Louisiana, in America, three times the working load.

144. The question I want to ask is this—If any of these Companies had a new boiler built, what test would you require that boiler to be subjected to in your presence, before giving it a certificate? Twice its working load, but the working load would have to be determined from the build of the boiler and its stay power. I have every reason to believe the boilers built in the Colony are equal to the boilers built in any part of the world.

145. *President.*] You said you have tested the other boiler of the "Clarence"? I have.

146. Did you find anything in it corresponding to what you suspected in the case of the one that gave way? No, there was no leak except from the ends of some of the tubes.

147. No evidence of its heating in the way you describe? There was no evidence of heating at all, and it withstood the pressure.

148. What pressure did you put on? Thirty-nine pounds.

149. And it stood that well? It stood that pressure. I am given to understand there was a slight spring in the plate at that, but it must have been very slight. Mr. Bailey and Mr. Jaffrey were both present, and they were in the boiler taking notes; I was on the top, watching the increase of the pressure on the test-valve; they sent for me, I went down, but by that time the pressure was two pounds less, and I could detect no spring in the plates.

150. Did Mr. Jaffrey seem apprehensive you had injured the boiler? I never heard one word of that until after the fatal termination of the accident.

151. This testing was since the accident? Yes, but prior to the death of the man.

152. *Mr. Moriarty.*] Under the pressure you have named, the boiler is said to have sprung? The

The boiler sprung very slightly. In all flat surfaces there may be a slight springing which is not injurious, provided it goes back again, and is not permanent; just as there is a deflection in all bridges when they are tested, but they are not supposed to be injured on that account.

Mr. D. C.  
Dalglish.

17 June, 1868.

153. Still it was said that pressure had caused these plates to spring? Yes.

154. But you did not see it yourself? When I went down there was no spring on the plate visible. Both the plates in the boiler that burst are now secured in what may be called their normal state; that is to say, the plate that had been raised is secured in the place to which it was raised by the accident.

155. There has been no attempt made to draw it back? No. Both boilers have been strengthened in a similar way—the same number of additional stays have been put in the interior of both. The stay-head was simply pulled through the plate, which had risen from the stay-head about an inch and three-quarters. What caused the death of the man was the sudden jet of water injected into the fire, which caused it to blow out steam and ashes upon him.

156. Not the steam from the boiler? No. I had no opportunity of seeing the actual state of things immediately after the accident; before I got on board everything had been cleared away; the whole of the furnace bars and bridges had been taken out of both boilers.

157. *Mr. Thomas.* You say that in testing these boilers it does sometimes occur that stays break. Now, a stay being, I imagine, made up of a number of fibres like a rope, supposing you strain or break a certain proportion of these—say there are a hundred, and you destroy fifty—you weaken that stay a hundred per cent., do you not? It all depends upon the number of fibres that are broken. If fifty out of a hundred are broken, I presume the iron is weakened a hundred per cent., or rather, fifty per cent. I may mention that in cases where I have found it necessary to condemn boilers I have never tested them. For instance, the “Rangatira” was running with a certificate which allowed her to carry eighteen pounds to the square inch. The first time I went on board to examine her I condemned her, although her certificate had only begun; and I condemned her for general decay. A portion of the combustion chamber is in the Steam Navigation Office now. That combustion chamber was longer and six inches wider than the “Clarence’s,” and of the same description, and it had not a stay in it from end to end; yet it was loaded to eighteen pounds. It was bulged four inches. And those that had taken tickets to go to Melbourne in that vessel had nearly taken tickets to go to some place else, where they give no return tickets. The first time I surveyed the “Wonga Wonga,” I found the same state of things—as long a combustion chamber, six inches wider, and not a stay in it from end to end. When the cake of ashes and soot, which I insisted upon having out, was taken out from the bottom of the furnace, I could put the handle of the hammer right through from end to end.

158. *Mr. Moriarty.* What was the thickness of the plate in the “Clarence”? Three-eighths.

159. Is it full three-eighths now? A quarter and one-sixteenth, perhaps. The bottom of the “Rangatira’s” boiler that was in this condition was little more than one-sixteenth of an inch uniformly; and that boiler had a certificate to carry eighteen pounds.

160. Do you believe the Clarence’s boiler had only a pressure of nine pounds when the accident happened? I do not believe anything of the kind; if there was not a stay in it, it would not have given under that pressure. I may mention that a square tank was experimented upon at Waterview Bay within the last week; it was three feet ten inches in length by two feet two and a half inches wide from centre to centre of the rivets, and it stood a pressure of thirty pounds per square inch, springing at the centre in its length five-eighths of an inch, and in the centre of its width three-eighths of an inch, without a stay in it.

161. Did it assume a permanent set at that? No; when the pressure went off, it assumed its normal state—went flat back.

## APPENDIX 2.

D. C. Dalgleish, Esq., to M. B. Pell, Esq., President of Commission on testing Boilers.

Steam Navigation Board Office,  
Sydney, 24 June, 1868.Mr. D. C.  
Dalgleish.

17 June, 1868.

Sir,

I have the honor to comply with your request, by sending you a list of articles published in the *Engineer*, bearing on the question of testing boilers by hydraulic pressure :—

The 11th July, 1862, page 35, also pages 27 and 322 of same year.

The 20th January, 1865.

8th September, Board of Trade Test.

6th October, on Board of Trade Test for boilers, pages 213, 221, 235, 254.

I also enclose an account of a trial before the Coroner for Central Middlesex, with portions of the evidence of Captain Tyler, Government Railway Inspector, underlined by me for the purpose of calling your attention to important portions of the evidence of that gentleman.

I beg also to call your attention to a number of the *Artisan*, which I enclose, for November 1st, 1863, page 261, place underlined.

I enclose a copy of *Engineer* for June 10th, 1864, page 357, in which will be found a leading article on testing Locomotive Boilers.

I beg also to call your attention to three volumes of Engineering "Facts and Figures," for the years 1864, 1865, and 1866 :—

The volume 1864, on testing boilers by hydraulic pressure, pages 67 to 71.

The same volume, pages 103 to 107, but more especially to page 105, where lined.

Volume 1865, pages 77 to 80.

Volume 1866, pages 97 and 99.

I beg also to enclose the book quoted by the *Sydney Morning Herald* as a standard work. The leader mentioned is founded on the four paragraphs on page 23 of this book. There is not another word in it on the subject.

I have also the honor to enclose a few written extracts from articles in the *Engineer*.

I have, &c.,

D. C. DALGLEISH.

## THE LATE EXPLOSION ON THE NORTH LONDON RAILWAY.

YESTERDAY, at noon, Dr. Lankester, Coroner for Central Middlesex, and the jury empanelled on the 18th ultimo, to investigate the death of William Davis, the stoker of No. 4 engine, which exploded on the line of the North London Railway, on the morning of the 16th of August, resumed their investigation into the causes attending that occurrence, at the St. Martin's Tavern, Pratt-street, Camden Town.

Prior to assembling in the inquest room, the Coroner and jury proceeded by train from Camden-road Station to the locomotive shed of the North London Railway at Bow, and made a minute inspection of the exploded engine, and on their return to Camden Town the evidence was resumed.

Captain Tyler, Government Railway Inspector, was present. Mr. Sleigh watched the case on behalf of the Directors of the North London Railway Company; and a number of railway engineers and scientific gentlemen were present. The proceedings excited great interest.

Mr. Sleigh said he attended on behalf of the Directors of the North London Railway Company, to afford the Coroner and jury every facility in the conduct of the inquiry. For that purpose, two scientific gentlemen who were thoroughly acquainted with the construction of locomotive engines, Mr. Craig and Mr. Mitson, who had carefully examined this engine, were in attendance for the purpose of giving evidence.

Captain Tyler, the Government Inspector of Railways, was first sworn, and said he had examined the engine No. 4, and had made himself master of all the circumstances connected with its explosion. He had made a report on the subject for the Board of Trade, and which he then read to the jury, and by means of diagrams he explained the various points of rupture in the fire-box, and the general effect of the explosion on various parts of the engine. His report was to the following effect :—The passenger train from Kew and Chalk-farm met at the Camden-road Station, and proceeded together to Bow and Fenchurch-street. The 9.0 a.m. train from Kew reached Camden-road at 9.39 (according to the guard), five minutes late, on the day in question, the 16th August, consisting of an engine and six carriages, including a break carriage. The Kew engine ran round to the back of its carriages and pushed them forward against five other carriages which had previously arrived from Chalk Farm. A porter had coupled the two sets of carriages together, the Kew guard stood whistle in hand about thirty feet from the Chalk-farm engine, which was in front of the combined train, looking out for the station-master's signal to enable him to start that train, and the engine-driver was waiting for the guard's whistle before opening his regulator, when a loud report was heard. The station and platform were at once enveloped in steam, and it was found, after the steam had cleared away, that the engine was no longer on the viaduct on which it had been standing, but had fallen upon its wheels into the road twenty feet below. It had turned over, however, in the course of its fall, so that its funnel, which was fronting towards the east before the explosion, was afterwards turned towards the west. The engine-driver had acted in that capacity for two years and a half, and has been in the Company's service altogether four years and a half. He came on duty at 5.45 on the morning in question, and left Bow at 6.15 with the engine No. 4. After doing some shunting at Camden Road he started for Kew with a passenger train at 7.40, reached that station at 8.10, and started again at 8.30 with another train, reaching Camden Road at 9.4. After shunting the train there he proceeded to Chalk Farm, and leaving that station at 9.32 with the express he reached Camden Road at 9.34, a few minutes before the explosion occurred as already described. He states that his engine was blowing off steam moderately from both safety-valves at a pressure of 120 lbs. to the square inch, and that he had about  $4\frac{1}{2}$  inches in his gauge-glass, and therefore 8 or  $8\frac{1}{2}$  inches over the top of the fire-box, before the explosion occurred, as well as that his fire-box was tight, and there was no leakage whatever about his engine, which appeared to be in all respects in good working order. He was standing on the left of the foot plate, and was blown away several yards, falling on the platform. The fireman, who was standing on the right of the foot plate, was blown in the opposite direction, and fell in the intermediate space between the two lines of rails. He survived his injuries twelve hours. Fortunately none of the passengers suffered any injury. No. 4 is a tank engine, with leading wheels, 3 feet 6 inches, and middle and trailing wheels, 5 feet 3 inches in diameter, and coupled together; the wheel box measures 6 feet from driving to leading, and 7 feet 6 inches from driving to trailing wheels. It weighs about 9 tons in the leading, 11 tons on the driving, and 10 tons on the trailing wheels. The cylinders are 15 inches in diameter, with a stroke of 22 inches. They are provided with two safety-valves, one on the dome and the other on the fire-box, each  $3\frac{1}{2}$  inches in diameter, and with a Bourdon's pressure-gauge, which worked correctly up to 150 lbs. to the square inch, when tested with another, in my presence, after the explosion. The internal heating surface of the fire-box is 7 feet 4 inches, and that of 148 tubes, each 10 feet 5 inches long and  $1\frac{3}{4}$  inch in diameter, is 705 feet 3 inches, making a total of 3,776 feet 7 inches. This engine was supplied to the company by Messrs. Stotherd, Haughton, and Co., of Bristol, in 1854, and has therefore been working on the

Mr. D. C.  
Dalglish.  
17 June, 1868.

the railway for about ten years. It has run during that time 291,508 miles, and of these, 60,359 miles have been performed since its last thorough repair in 1862. The explosion occurred in the fire-box, and evidently commenced at the angle formed by the upper and rear sides of the left-hand copper plate. That plate was torn off irregularly, along its upper, lower, and rear sides, was blown inwards, and was partially bent back against the tube plate, its front side being unbroken. One of the roof stays also that was on the left of the roof plate, and near the junction of the roof plate with the left-side plate, was turned round and bent downwards, with the portion of the roof plate under it. The violent escape of steam which occurred on the left of the fire-box caused the engine to turn over partially on its left side, and to strike against the parapet of the viaduct. The engine met with less damage than might have been expected from such a fall as it had over the parapet. The funnel was knocked off, the top plate of the right railing spring was broken, and the left leading spring was damaged, but the axles and wheels and leading parts of the engine uninjured. The fire-box measured 3 feet 8 inches long by 3 feet 6 inches wide, and 4 feet 1 inch high. The copper plate of which it was composed was but little reduced at the part which first gave way, from its original thickness of  $\frac{3}{4}$  inch. At the level of the fire-box the thinnest part was rather less than  $\frac{3}{16}$ , except at one point, where it had evidently been bent and attenuated by the force of the explosion, and where the thickness was  $\frac{1}{4}$  inch. The copper plate of the fire-box and the iron plate of the outer shell were secured in their proper positions (about  $2\frac{1}{2}$  inches apart) by ninety-four copper stays  $\frac{1}{2}$  inch in diameter and  $4\frac{1}{2}$  inches apart from centre to centre. Of these stays nineteen remained in the copper plate, and the remaining seventy-five in the iron plates after the explosion. These seventy-five stays, which depended mainly upon the screws for their attachment to the copper plate (after the rivet heads inside the fire-box had been more or less burnt away) were pulled out of that plate, while the nineteen which were detached from the iron plate must have been, and evidently were, very defective. Their ends remained in the iron plate; they were fractured close to it, and they appear, many of them, to have been broken through before the explosion occurred; and, indeed, other stays which still remained in the iron plate, and had been pulled out of the copper plate, proved upon fracture and examination to have more or less failed in a similar manner. The gradual failure of these stays near the inner surface of the iron plates, arises no doubt from the movements of the iron and copper plates, due to their different rates of expansion ( $18\frac{1}{4}$  inches copper to 12 inches iron) at an equal increase of temperature, and to the higher temperature to which the copper plate is exposed. Of the nineteen stays which were thus fractured, eleven were situated, as will be seen by the enclosed diagram (Captain Tyler here handed in the diagram), at the angle of the copper plate above referred to as having first given way, and four more were in continuation along the upper side of that plate; one stay only remained on that side in the iron plate. The other four fractured stays were situated in the front side, and one near the angle formed by the lower and rear side of the plate. The Locomotive Superintendent of the Company was good enough, at my request, to cause a portion of the opposite copper plate to be cut away on the right side of the firebox, and I thus discovered that six stays were broken on the right side in the angle corresponding to that at which the explosion had commenced on the left side. The copper stays that thus failed had been in the firebox during the whole existence of the engine, and no weakness appears to have been previously observed in the firebox. The engine came in for its last thorough repair in December, 1861, and lay idle till April, 1862. It was thoroughly repaired during May, June, and July, 1862. Besides numerous other repairs and renewals, a patch was put at that time upon the rear side of the firebox, under the fire-door, which still remains in its place. Some iron stays, which are visible in the side plate of the firebox, appear to have been inserted some five or six years ago. The boiler was tested in July, 1860, when it was stripped up, to 180 lbs. by water and 140 lbs. by steam, but has not been tested since that time, and it does not appear that there has been any leakage since reported in the firebox except from tubes. This engine has exploded, then, in consequence of the failure of certain copper stays on the left of the firebox, and these stays have been gradually broken through during the ten years that the engine has been at work. *The engine has been working for some time in a critical condition, and for a considerable period with a less margin of strength than ought to be preserved between working pressure and bursting pressure; and it would have gone on working but for the explosion, unless symptoms of leakage or bulging had been observable in the interior of the firebox.* It becomes important to consider, under these circumstances, whether this locomotive boiler should not have been subjected to more frequent tests by hydraulic pressure. The Locomotive Superintendent of the North London Railway does more than the officers of most of the great Railway Companies in this respect, in testing his boilers whenever they are stripped or brought in for a thorough repair. *But still more is evidently required.* This explosion shows that many of the copper stays required renewal within a shorter period, and that it is not safe to wait for leakage or perceptible bulging under the firebox before renewing them in an old boiler. There is great difficulty in ascertaining the condition of these stays without taking the boiler to pieces. The space between the firebox and the outer shell is closed for a number of years, but a weakness is exhibited by the stays, nor can any defects in them be detected by the sound of the hammer until they have been actually fractured, while there may be a great many of them partially fractured, as has happened in this case, without its being known that they are in that condition. One remedy to which I would refer, as being practicable and like to prove efficient, is that of using hollow stays, which has been done, I believe, for many years by Mr. Beattie, on the London and South Western Railway. Each stay would then break and show its weakness when it was partially broken. *The only other remedies that I am aware of, are more frequent tests by the water pressure and earlier renewal of the stays.* The strain upon each stay at 120 lbs. to the square inch in the boiler would in this case have been 2,430 lbs.; and its ultimate strength, when new, would have been about six times that amount, taking the tenacity of the copper at 36,000 lbs. to the square inch. The total strain upon the side of the firebox to be resisted by the 96 stays which supported it would have amounted to upwards of 100 tons. I may add, in conclusion, though it had nothing to do with the explosion, that I observed extensive symptoms of channelling in the iron plate at the back of the angle at which the explosion commenced; and that there were no hanging stays in this boiler for connecting the outer shell to the roof stays of the firebox, such as there ought to be, in my opinion, for additional security, in every locomotive boiler.

Captain Tyler, in answer to a variety of questions from the jury, expressed his conviction that the explosion of the firebox had not resulted from undue pressure, but from undue weakness, which was not discoverable by mere ordinary inspection. *He said that the Locomotive Engineer of the Company took more than the ordinary precaution in testing the strength of the boilers by hydraulic pressure, and it was his opinion that such tests should be more frequently applied.*

Mr. Adams, the Locomotive Superintendent, was recalled, and examined as to whether the large amount of fuel consumed by the running of the engine sixteen hours per day for ten years would not have a serious effect on the calculated strength of the firebox. He denied that the engine had been running sixteen hours per day for ten years, having been a great portion of the time in the shed, but admitted that the consumption necessary to work an engine for such a time would naturally affect the strength of the firebox.

Mr. Sleight again tendered the evidence of Mr. Craig and Mr. Kitson, but the jury having heard Captain Tyler's evidence, and judging from their own inspection, deemed the examination of those gentlemen unnecessary.

The Coroner then summed up.

The jury retired to consider their verdict, and after an absence of half an hour they came again into Court, and it appeared that there was a strong difference of opinion as to whether the death of the deceased was accidental or otherwise; but being informed if they believed that any one was responsible it would be a verdict of manslaughter, the jury accordingly agreed to concur in a verdict of death by misadventure, and

and appended the following remarks thereto:—"The jury empanelled on the 18th August and 1st September, to inquire into the cause of the death of William Davis, having returned a verdict of death by misadventure, are of opinion that the fire-box of the locomotive engine that exploded and killed the said William Davis ought to have been more thoroughly examined; and, considering the age of the engine, and the appearance of the rivet heads, the said jury also recommend to the North London Railway Company, for the future, to make a strict examination of the fire-boxes, especially as the rivet heads of the stays of the fire-box which exploded show such evident signs of weakness."

The inquiry then closed.

Mr. D. C.  
Dalgleish.

17 June, 1868.

*Engineer, September 8th, 1865.—Editorial.*

"The position of Engineer Surveyor to the Board of Trade is, in fact, one of much responsibility and anxiety, &c. He makes a six months certificate that all the Board of Trade requirements have been fulfilled. He may then be said to be the person answerable as to the trustworthiness of the document.

"But the mere fact that the safety of the vessel depends so much on her boilers has naturally led to the greatest care being given to this part of the ship's gear. The Surveyor can require the boiler to be tested to twice the working pressure, and as the result of his examination, he can put the option before the shipowners of either lowering the working pressure or of renewing the boiler."

*Engineer, October 6th, 1865.—Editorial.*

"As is well known, every boiler of a steam-vessel carrying passengers can be required to be tested to twice its working pressure.

"An Engineer-surveyor has to give his written declaration that the boilers are good for six months fair wear and tear. He does not, as one would suppose by the questions, in all cases apply the test as a preliminary to passing a boiler. All new boilers are indeed tried by water pressure as a test of workmanship, but in the case of old boilers it is rather employed by the Surveyor as a means of practical demonstration to the owner that an old rickety boiler is really unsafe, and must either be removed or worked under a lower pressure."

*The National Boiler Insurance Co. Abstract of Report of Engineer. (Engineer, 26th Jan., 1866.)*

"The judicious application of the hydraulic test would probably have led to the detection of weakness in some of the boilers which have failed.

"It was also recommended to apply the hydraulic test after the alterations had been completed. Unfortunately the tube was not strengthened as advised, and on the test being applied the tube collapsed almost along its entire length when the pressure had reached about 83 pounds per square inch; thus proving the value of the hydraulic test, as, had the boiler been set to work, the flue would in all probability have failed, with fearful results.

"If the boilers will stand out for a month, and if they will only just stand double pressure of cold water, and without reference to stay power, that may be enough for a man who wants to sell an old vessel, but it would not be enough for a man who would work a boiler on his own responsibility, and it is not enough for the safety of the public, and yet some owners think themselves sorely ill treated if a Statutory Declaration and a Passenger Certificate were not granted under the circumstances."

FRIDAY, 19 JUNE, 1868.

Present:—

MR. PELL, PRESIDENT.

MR. MORIARTY,  
MR. CARLISLE, R.N.,

MR. THOMAS,  
MR. RUSSELL.

Mr. William Thaw, Superintending Engineer, Peninsular and Oriental Steam Navigation Company, called in and examined:—

162. *President.*] You are aware of the method in common use here of testing marine boilers? No, I have never had any tested here. Mr. W. Thaw.

163. You know the Engineer-surveyor makes use of hydraulic pressure? I have been told so. 19 June, 1868.

164. You know that he commonly, though not always, applies pressure by means of the hydraulic pump, up to double the working pressure? Yes, and sometimes over it, I have been informed. I only know anything of it from what I have been told.

165. Have you any reason to suppose that applying double the fair working pressure by this means would be likely at all to injure a boiler? Yes, I have reason to suppose it was so in the case of the "Clarence."

166. Speaking generally? No, I could not say so; I have never known any case; I have never seen it done.

167. You have never seen such a pressure applied? No, never.

168. What reason have you to suppose the boilers of the "Clarence" were injured by this test? I was called to look at them, and from what I heard of the pressure that was on the boilers at the time, I did not think it possible they could have given way with that pressure; I thought the flaw had been caused previously by pressure applied in some way or another; and that was the most likely thing to do it, that I could think of.

169. You are aware the working pressure on the safety-valve was eighteen pounds? Yes.

170. You think that was not sufficient to produce the accident? I think not.

171. Did you examine the boiler after the accident? I did not see it immediately after the accident—not until the man died, three or four days afterwards.

172. Are you aware that several persons have given an opinion that the accident arose from the defective construction of the stay originally—that it was a bad fit? The first stay that gave way was not so well riveted as the rest, that is to say, the mark on the plate was not so broad; but the plate had had a tap put through it, and I would scarcely be able to say that that one was worse than the rest. I thought it was worse because it had given way first; the plate was not so much bulged, and I judged from that that it had given way first.

173.

- Mr. W. Thaw. 173. If one defective stay gave way, it would increase the likelihood of others giving way? Yes, certainly. Two of the others were quite good.
- 19 June, 1868. 174. Do you think it possible that a test of forty pounds applied to these boilers three months beforehand should have injured this stay so much that it gave way under eight or nine pounds of steam? That was the only reason I could think of, unless the boilers may have been heated before.
175. You think that may have been the reason, merely because you could not think of anything else? Yes. It is quite possible the boiler may have been heated before.
176. Might it not have suffered some deterioration in the meantime that might account for it? In the course of only three months—I think not.
177. Have you any other reason for supposing this test was injurious? No.
178. Do you think a boiler that could not stand forty pounds pressure without injury would be safe to work ordinarily up to twenty pounds? I think so. It might not give way at forty pounds, but you might damage parts of it.
179. I do not think you understand me. If a boiler was not capable of standing a pressure of forty pounds without injury, would such a boiler be fit to work up to twenty pounds under steam? I should say it would. I know it has been done in very many cases.
180. Are you aware in what way boilers in use are tested in England and other countries? Just with the hammer—a man going in and examining them with a hammer; there is no other way that I have ever seen, and I have had boilers tried in two or three different ports.
181. They are examined in fact—not tested? Yes.
182. Do you object to this mode of testing, then? No, I do not; but I think it was overdone in this case.
183. Supposing the working pressure on a boiler to be twenty pounds, how far would you carry the hydraulic test? I should say one and a half; fifty per cent. above the working pressure would be safe enough.
184. You are aware that new boilers in England are tested? I know a number of them are. The best makers test them.
185. Do you know by what rule they are guided? I do not think there is any rule; none that I know of.
186. Are they not tested by authority? No. I have known them tested in France by authority, but never in England. They may have been, without my knowing it; but I have never seen any stamps on boilers, and I have been connected with them a number of years now.
187. You think if they were tested to the extent of fifty per cent. of the working pressure, instead of one hundred per cent., there would be no objection? I think not. I think when they put so much on it they do not look to the boiler sufficiently. In this case that my attention has been called to, I do not know yet whether the bottom of this part that gave way was seen or not; but from seeing it afterwards I should rather think it was not. When they tried the other boiler, I was told it sprang very considerably under forty pounds pressure.
188. Was the stay riveted? Yes.
189. There are other ways of fixing stays? Yes, it could have been put in without a rivet, or put in with a nut.
190. Is there not some other way? It could be riveted without a screw, with a thimble inside as a stay for it. I think the best on the whole are riveted stays, but I never see them now-a-days. Those that have given me least trouble have been without threads and riveted, but I have not seen them in steamers for many years.
191. I think you said you examined the boilers of the "Clarence"? I examined the defective part.
192. This (*showing witness a pencil sketch*) is, roughly speaking, a section of the boiler. Do you think it is possible that, after this vessel had been working for three months, ashes, soot, and other refuse, might have collected here and nearly filled up this space, and that after running under steam for many hours, thirty-six or forty-eight hours, this mass might have got red-hot? It is possible, but very unlikely.
193. Then, supposing it to have been the practice to blow the boilers out immediately after drawing the fires, and before anything had had time to cool, do you think it possible the stay might have been injured by this hot mass remaining there after the water had been drawn below that level? I do not think it would; I do not think it would get hot in any way to injure it—although there was a mystery attending it. All this was cleaned out when I saw it. Everything appeared to me to be very sound. I cannot account for it giving way with the pressure it did.
194. You saw no particular occasion to find fault with the construction or fitting of this stay? No, I cannot say I did; I thought it a very fair job as the boiler stood. If it had not been for the accident, I should never have dreamt there was anything wrong with the other. I considered it a very fair specimen of boiler work.
195. Taking it merely as a general question, do you think a boiler that would stand forty pounds pressure would, without any deterioration, afterwards give way under a pressure of eight and a half or nine pounds? I am under the impression that it was the forty pounds pressure that hurt this stay, though it was not noticed at the time. That is the only theory I can account for it on—the pressure had drawn it partly up, and that a little more pressure would have burst it out. I have no doubt that if she had got forty pounds on her the next day, it would have given way altogether.
196. Supposing that the stay had been just able to bear thirty pounds, and that the test you propose—fifty per cent. in advance of the working pressure, which would have been thirty pounds—had been applied, would not the same thing have happened? Yes, I do not say it would not. You must have a limit somewhere.

197. Wherever you fix the test, might it not happen that you would just hit the point where the boiler would bear the test and no more. Whatever the limit of pressure you might put on, would you not always be liable to that kind of thing? Yes, without looking at it very narrowly. Mr. W. Thaw.  
19 June, 1868.
198. There would always be a possibility of that kind of imperfection? Yes, you never could make it actually safe.
199. In such a position as that described, I suppose it would not have been possible to have examined this part of the boiler? Yes, it was quite easy; you could walk over it. I do not mean to say that it was the case, but I imagine the stay might have been started.
200. You say none of your boilers were tested in this way? Never in this port, or any other that I know of.
201. Have you ever heard any complaints amongst engineers, as to the mode of testing? I have heard engineers talking of the trouble of getting safety-valves fixed, and so on. My acquaintance here is very limited, I must mention.
202. How long have you been in this port? About nineteen months.
203. *Mr. Moriarty.*] You say you have never known it to be the practice to test boilers in this way? No.
204. And your experience has been, how long? Since 1847.
205. Have you had much experience in English ports, with regard to the survey of boilers? I have had boilers tried three or four times in Liverpool, and twice in Southampton, in ships I was in.
206. By hydraulic pressure? No, a man just came in with me and tried them with a hammer. I have had them tried in Bombay also.
207. Do they prove them there by hydraulic pressure? No, I never heard it hinted at at all.
208. Do you think, from your knowledge of steam boilers generally, that any marine steam-boiler you have ever seen would stand six times the ordinary working pressure? No, I do not think so—none that I have ever seen—none that ever I have worked, any way.
209. *President.*] Not a new one? No, I do not think it.
210. *Mr. Moriarty.*] There is a certain proportion of strength to the ordinary strains likely to be put upon it, in all parts of a marine engine as well as in the boilers. Is there any part of a steam-engine that is not at least three times as strong as any strain likely to be brought on it? I think not; I think all the parts are always three times as strong as they are likely to be strained to.
211. Do you think there is any reason why the boiler should differ from any other part of a steam-engine, in not being three times as strong as any strain that may be brought on it? No, I cannot give you the reason, but I know it is not the case.
212. Should you say three times the greatest strain likely to be brought on it would be an unreasonable strain? I think every boiler ought to stand that; but I think it would spring with it.
213. What is the strain that would injure it? If a boiler is made new that cannot stand three times the pressure that is going to be put on it, it is going to be pressed too much.
214. Then a boiler ought to be three times as strong as any strain likely to come on it. Would you say then, to prove that to two-thirds of its ultimate strength—that is, twice the ordinary pressure of steam likely to be brought upon it—would injure it? When it was new I do not think it would; that is to say, if you are going to run it at ten pounds, I am understood to say thirty pounds should not hurt it, when it is new. Twenty should not hurt it at all.
215. If a boiler is just strong enough to carry thirty pounds, and at about that pressure give way, do you think it would be judicious to work that boiler at a pressure over ten pounds? I dare say it would.
216. How much more? I could not give the exact limit; I should have no hesitation in working it to fifteen pounds.
217. If it would burst at thirty? No, if thirty would injure it.
218. I mean such injury as might lead to its ruin and the death of those about it; for instance, thirty pounds of steam might produce such a serious rent as to destroy the boiler and everybody about it. Should you say it could be safely strained within half, when no other part is ever strained above one-third its ultimate strength? If it would burst at thirty pounds, I should say I would not put more than ten pounds on it as a working load, if you mean it that way. I do not think it would be safe to put on more than ten pounds, if it would burst at thirty pounds.
219. Would you consider that under these circumstances it would be safe to strain it by hydraulic pressure up to fifteen pounds—just half its ultimate strength? Yes, I think it would.
220. That would be fifty per cent. above the ordinary working pressure? Yes, that is just the pressure I have given you as a kind of limit; that is the nearest I could guess it at.
221. You would not go up to twenty pounds? I would not, after seeing what I have seen here.
222. *President.*] Speaking of new boilers—Supposing a boiler were constructed to work up to twenty pounds, what pressure do you suppose would burst it—do you think it would burst under six or four times the working pressure? I dare say it would at four times—the best of the boilers you can get. There is a great difference in the makers of boilers. Something would give way at four times—you would see that some parts were defective.
223. You think that about the ordinary proportion? I am scarcely an authority on such a point. I have seen very few boilers tried that way.
224. *Mr. Moriarty.*] You have calculated the strength of boilers, I suppose? Yes, I have occasionally; but if I were making a boiler, I would prefer seeing what had been done, to making fresh calculations for myself.

- Mr. W. Thaw. 225. You were saying you thought the stay of the "Clarence" had probably been injured by the hydraulic test to which it had been subjected? Yes, I think it probable it was injured by some pressure previous to what was on it when it gave way.
- 19 June, 1868. 226. You have seen a sketch of the smoke-box and the space behind the bridge? I have seen the boiler itself.
227. Do you think it at all possible, supposing that boiler to have been running some time, that the ashes had dropped down and been banked up there—Do you think it at all possible these ashes could have got red-hot from the surface? No; but the coals used here need a good width of fire-grate, and if there were any possibility of a few getting in below, it would be possible to heat it; but I do not think it likely.
228. Supposing that that stay had had some of its threads strained and injured by the hydraulic test, that that produced a slight leak, and that the ashes were allowed to remain in the box, which we have had described to us, about that leak, do you think that would tend to produce corrosion about the head of the stay? It is possible it might.
229. Has not any leakage about a stay head or rivet head that tendency? Yes.
230. Supposing that stay to have been injured by the hydraulic test, and that a leak had taken place, would not the fact of the ashes lying about it accelerate the corrosion? Yes, it might do that. If it were dried up very often, of course it would corrode sooner.
231. Supposing then, some three months afterwards, this vessel takes fresh water into her boilers, might not that loosen the scale of lime and salt about the rivet head, and still further accelerate the evil? Yes, it is quite possible.
232. Under those circumstances then, that rivet head being gradually eaten away during the course of three months, do you not think it likely it would give way at some time or other? I think not. I saw the rivet, and all the eating away that I saw was very little. The bolt was drawn through; it was quite a tight fit. If you have a thread of the sixteenth of an inch pitch, and you draw the half of that, one thread begins to ride upon another.
233. It opens inside? Yes. That was the state of that rivet.
234. Do you think the evil was likely to be accelerated or increased by the fact of subjecting the boiler to double the strain of the ordinary working pressure? I am under the impression that that was done. Something more than the pressure when the accident happened had been put on it. I thought at once this was what injured it; but it may have been injured in other ways that I know nothing about. I inquired if anything had happened, and was told the hydraulic test had been applied.
235. After the accident, I think you said, you saw the other boiler tested? No, I did not see it tested; I heard it was tested.
236. How many times the ordinary working pressure do you think the boilers, speaking generally, of the P. and O. Company's steamers would stand? I could not give an opinion; we have never tried them; they are tried in the factories, I understand, up to twice. I am speaking only from hearsay; I have never seen any tried myself.
237. Do you not think there may be a difference in trying boilers when new, to see whether they are properly stayed, and subsequently at every half-yearly survey? If I were making a boiler I would try it.
238. But not try it afterwards? Yes, I might try it, but not to double the working pressure, though I do not think any boiler should give way at that.
239. You would do the same after any serious repair? Yes, especially if I could not get about it to see it.
240. *President.*] You say it is highly probable the stay was injured by the hydraulic pressure—Supposing that injury did take place, and that the boiler when under pressure was examined, would it have been apparent? If it had been narrowly watched it might. It was covered, probably, with soot, and might have escaped notice.
241. *Mr. Carlisle.*] If a boiler came under your notice that had been running for about three years (say) at twenty pounds, that you had not seen it before, and you had to give an opinion whether it was safe to continue it at twenty pounds, would you think it safe to apply any test? I do not think I would.
242. You would be satisfied with drilling plates? I am little afraid of plates that will not give way with the hammer.
243. You would be satisfied then without applying any test at all? As I tell you, I have never been in the habit of seeing that done. I should be quite satisfied to go round with the hammer myself. Of course that is merely an opinion I am giving you.
244. *Mr. Thomas.*] If you were asked to put an hydraulic test on such a boiler as mentioned by Mr. Carlisle, what pressure would you put on it? I must just give you the answer I gave to the Chairman—fifty per cent. above the working pressure. Previous to coming here I did not think of any pressure exactly; I am just answering you on the spur of the moment.
245. You would consider that the extreme? I would not like to put more. I would depend a great deal more on examining it carefully with the hammer, than I would upon putting on twice the working pressure and thinking it would do because it would stand that.
246. Then your opinion with regard to testing boilers comes to this—that you would examine them with a hammer, and if you thought there was some place you could not see very well that might be defective, you would put hydraulic pressure on it, but to a very limited extent? Yes, say fifty per cent. I would rather put less than more, and try it with a hammer.
247. *Mr. Russell.*] If boilers are proved under hydraulic pressure by means of a pump, do you think it would give the boilers a better chance of standing the pressure—that it would be less likely to do damage to the boilers—if the water were heated slightly? Yes, I think so.

248. If you were called upon to survey the boiler on board a steamer, after proving it to *Mr. W. Thaw.* your satisfaction by hydraulic or any other pressure, for what time do you think it would be safe to let it run? That would depend a great deal upon the age of the boiler. *19 June, 1868.*
249. Supposing the boiler had been in use for two years? I think there is a very good rule here in Sydney—that the certificate should not exceed six months.
250. Supposing the boiler to have been running for two years, that all necessary repairs had been done, and that you had satisfied yourself as to its condition, to what time would you limit the running of that boiler? It has been my business lately to write concerning a boiler six years old, and that question was asked me; I have said that the boiler was good for eighteen months, getting the usual overhaul when it comes into port.
251. We have a practice here that certificates are granted for six months, after certain repairs have been done; and I understand some owners of steamers are under the impression that, after they have got a certificate from the Government Engineer that a boiler has been proved, and that she is good for six months, she does not require anything done for that time? I do not think any man can give a certificate that a boiler will not need any repair for six months; but I think the practice here of re-opening the question every six months is a very good one—it is a very good time to allow. If you cannot give a certificate for six months, the boiler ought to be put under repair; she ought to be made to last for six months.
252. Your steamers get a thorough overhaul every three months? Every time they come into port everything is examined, ship and boilers.
253. *Mr. Moriarty.* You do not approve of the practice of giving certificates for three months? No. If I were examining a vessel, and thought she would only be able to go for that time, I should say she ought to get something done to her. I think it is all nonsense saying you will allow a boiler to run for a month, and not for two. No man can tell how long a boiler will run; it may give way the minute after the vessel goes to sea, or it may run for six months.
254. *Mr. Russell.* You do not approve of the hydraulic test to boilers except when they are new? When they are new I do not object to it; but I object to the way in which this boiler was tried. That was the likeliest thing I could think of to lead to the accident. I had to write a short report about this, and the way I put it was, that I thought the boiler had been over-pressed at some previous time, and that the pressure she had on at the time of the accident had not been the original cause of it.
255. *Mr. Thomas.* You think, if the hydraulic test is employed, it would be better to have the boiler heated in some way? Yes; it is quite possible that may take the shock off to some extent, for it is quite likely the pump may give a shock to the boiler the same as a blow of the hammer.
256. Is it not the case that iron, when heated, has greater tenacity than when cold? I believe it has, when moderately heated.
257. *President.* Would not heating the water make it inconvenient, or impossible, to examine the boiler? No, a moderate heat only need be applied.
258. Suppose you should learn that the boilers of the "Clarence" had only been tested up to thirty pounds instead of forty, would you still have the same opinion that the boiler had been injured by the test? I would scarcely like to say that; for it is quite possible that this open space may have been very dirty below, and that it may have got red-hot. There is a possibility of it, although I saw nothing of the kind to justify me in saying even so much. Everybody who has been inside a boiler knows they do very frequently get very dirty in these out-of-the-way places.

---

MONDAY, 22 JUNE, 1868.

Present:—

MR. PELL, PRESIDENT.

MR. MORIARTY,  
MR. CARLISLE, R.N.,

MR. THOMAS,  
MR. RUSSELL.

Mr. Benjamin Bailey called in and examined:—

259. *President.* You are Superintending Engineer to the Panama Steam Company? *Mr. B. Bailey.* Yes.
260. You are aware of the method in use here, of testing marine boilers by hydraulic pressure? I am. *22 June, 1868.*
261. Have you any reason to be dissatisfied with it? No.
262. Are you aware that it is a common, though not a universal, practice with the Government Engineer to test up to a pressure equal to double that on the safety-valve? I am.
263. Have you any reason to think that that might in any case be injurious to a boiler? If it proved to be injurious, the injury ought to be made good.
264. Do you think that, in any case, a boiler competent to stand a pressure on the safety-valve of (say) twenty pounds, might receive some injury, so as to diminish its value, by being subjected to hydraulic pressure up to forty pounds? Of course, if it were only fit to stand twenty pounds, testing it to forty would do it an injury.

- Mr. B. Bailey. 265. I mean if, according to the common practice, it was well able to work up to twenty? In that case it ought to be able to stand the test to forty pounds without injury.
- 22 June, 1868. 266. Have you ever witnessed the testing of boilers by the Government Engineer? Many times.
267. Have you ever heard any complaints on the subject? I have never seen him test any except those that I have had to do with, except on one occasion.
268. Have you ever heard any of the officers of the different Companies complain? I cannot say I have. I should take no notice of any talk out of doors.
269. You have seen the boilers of your own Company's steamers tested? Yes.
270. Have you any reason to complain of the manner in which it was done? None whatever.
271. Would you recommend that the practice be continued as it is? With the same care that Mr. Dalglish uses, I would. He is certainly one of the most careful Inspectors I have ever met with.
272. Do you know what the practice, as to testing boilers, is in England or other countries? They examine them, that is all; but I believe they have the power of testing them by hydraulic pressure to double the working strain if they choose.
273. The Government Inspectors have? Yes, if they think a boiler is unsafe, they give notice that it must either be subjected to double pressure, or that the pressure then on must be reduced. Of course the option lies with the owner whether he will submit to it or not. At least they could do that when I left; I have been away from England about a year and nine months, but I have not heard of any alteration since.
274. Do you think it possible that, by testing to double the working pressure, injury might be occasioned which would not be perceived at the time—injury that might escape notice at the time, and yet lead to accident afterwards? No, I think not; if any injury were done, there would be a proof of some bulging.
275. You think something would be observed? Certainly, if care is taken to observe it.
276. Do you know anything of the particulars of the accident to the boilers of the "Clarence"? Yes, I know some little.
277. You know one of the stays gave way? Four stays gave way.
278. Was it not supposed that one gave way first, and the others afterwards? When I saw it, four had given way.
279. Do you know sufficient of the circumstances to give us any opinion as to the cause of the accident? I have given an opinion already on that.
280. Were you examined as a witness before the Coroner? Yes.
281. What, in your opinion, was the cause of it? Being asked if there had been defective workmanship, I said yes, in the first place, but that there had been leaks there, and that the stays had been caulked to make them tight, and been shook undoubtedly by the caulking.
282. Do you think it possible that the fact of this boiler having, three months before, been subjected to hydraulic pressure, might have caused the accident? No, I do not think the hydraulic test had anything to do with the accident.
283. Do you think it possible that, when the test was applied, a slight leak might have been developed? If there had been a careful examination, it would have been seen at the time. I was asked by the jury how I accounted for the accident, assuming the engineer's statement to be correct, as given on oath, that there was only nine pounds of steam on, and bearing in mind that, some three months before, the hydraulic test had been applied by the Government Engineer. My answer was, that I could not reconcile the statement that there was only nine pounds pressure on the boiler when the accident took place, with the facts of the case, as I had observed them.
284. And you cannot reconcile them now? Certainly, I do not think nine pounds pressure did that. I was not asked any more about it; and I think I was only justified, when before a jury, in answering the questions put to me, and speaking of what I could see. I do not think it right to assume things to be the case and then give an opinion, or perhaps I could assume very nearly the truth as to the cause of the accident.
285. Did you examine the boiler after the accident? I did.
286. In what way did the stay seem to have given way? The stays had drawn through the plate. I believe these stays had never fitted the holes properly; the rivet had come clean through in one case without affecting the thread.
287. You do not think it possible the hydraulic test applied three months before could have been the cause of that? Certainly not.
288. How was it these stays were able to bear that pressure of forty pounds on that occasion, and still, a few months afterwards, give way under a much smaller pressure—only nine pounds? That is the pressure we are told, but I say I cannot assume that to be correct.
289. You do not suppose there were more than eighteen pounds upon the safety-valve? I cannot say.
290. It is not likely? It is impossible for me to say. It is very difficult to give an opinion on the cause of an accident, unless you see the surrounding circumstances.
291. Do you see any reason to suppose there had been any tampering with the safety-valve? No. It is a question whether pressure had anything to do with it at all perhaps. That I cannot say.
292. Might not the stays have been injured in some way during the three months by heating or rusting? If there had been a leak, they would have been impaired more or less.
293. Did you examine the boiler before anything had been done to it? No, I was asked to go over, by Mr. Dalglish, to see him note the pressure on the sound boiler—to prove that the Government valve then worked at the pressure said to be on the boiler, eighteen pounds.

294. Had anything been done to the boiler before you saw it? No, no work as to repair, Mr. B. Bailey. but the place had been cleaned out; the ashpit and all the backs had been cleaned out.
295. Have you any reason to suppose that part of the boiler had been unduly heated at 22 June, 1868. any time? It is quite possible it may have been.
296. Did you see anything to lead you to suppose that it had? No, I did not examine as to that.
297. *Mr. Moriarty.*] Can you tell us what the practice in London is with regard to boilers—if it is the practice to prove them by hydraulic pressure or not? Not by the Board of Trade; they can do it, but they do not do it—at least, I have never seen them do it—and I have had a good deal to do with them both in Liverpool and London. The only testing I have known of has always been with new boilers; and that, I think, is an invariable rule.
298. There would be more reason for testing a new boiler, would there not, than for testing an old one, in order to shew where it was necessary to put in stays, and so on? No, I think there is quite as much reason for testing old ones, to ascertain the extent of deterioration. Corrosion goes on more rapidly in some boilers than in others. Some iron is better than other iron. I think if the test stands good in the one case, it stands good in the other.
299. Is it not essential, in the case of a new boiler, to prove its strength by some plain and obvious test, in order to shew where additional strength is necessary? Yes, I think it would be the height of madness to attempt to get steam in a new boiler unless it had been proved.
300. Do you think there is any boiler in this port, or, as a rule, any marine boiler in any port in Great Britain, that could stand six times the ordinary working pressure? I should be sorry to say there are not many that would not give way at double the pressure. Still, I do not say they are safe. We all know how very anxious owners are to keep their machinery running. We know the great difficulty those who have to guard the public safety have to contend with is, to convince people their money is being laid out well—in fact, to guard them against accidents, and satisfy them there is a necessity for it.
301. If the practice of proving all the boilers in Great Britain to double the working pressure were adopted, you think the chances are it would burst most of them? No, I should not say most of them; I should be very sorry make such a sweeping assertion.
302. Could you fix upon any proportion? No.
303. Do you think your own boats here would stand six times the working pressure before something would give way? Something might give way that could be easily remedied, but I believe they would stand perhaps from four to five times the working pressure; at the same time I should expect to see the boiler totally ruined, after they have been at work so long.
304. Do you think boilers differ in any essential particular from all other engineering structures and pieces of machinery, in that there should not be a safe ordinary limit of strength above the greatest strain likely to be brought on them. Take, for instance, the crank pin—do you think it would be safe to work with a crank-pin that was not at least four times as strong as any strain likely to be brought on it? I think the lowest practice is with the piston-rod, and with that you generally allow a factor of six,\* and in many cases ten. I think you should allow a larger factor with a boiler than with a piston-rod.
305. Generally it is much less? Yes, I believe many boilers are running within an ace of ruin, and people do not know it. Such a state of things should not exist though.
306. What would you consider a fair factor of strength with regard to a new boiler? Maudsley's factor of strength with their boilers used to be, some five or six years ago, ten times; and theirs are the best constructed boilers that I know of.
307. Marine boilers? Yes.
308. Does that apply to the stayed part or to the shell, where the form is circular? I am speaking of what may be considered its weakest part, because that must be considered in substance its strongest. You see how gradually we are coming on. Fifteen years ago, or little more than that, we were thought to be doing a great deal by working marine boilers up to twelve pounds; they are not a bit better stayed now, and they go up to twenty-five pounds.
309. They are not increasing the strength as they are increasing the pressure? No.
310. Then, in point of fact, you think that although the factor of strength in boilers ought to be ten times —? I do not say so.
311. Six times you think? Yes —.
312. In point of fact, in most cases it is not anything like that? I did not say in this Colony. I have no doubt there are boilers that will do that.
313. *President.*] Do you think if this present mode of testing was abolished, we should soon have some that would not stand the pressure? I think it very likely they would soon increase the pressure to get a little more speed on the ship, and never mind the risk.
314. *Mr. Moriarty.*] Do you think any piece of machinery should be loaded or strained to half its ultimate strength? Our best authorities tell us not to strain iron to half, although there is one that goes up much higher than that. You will see a table of his in Fairbairn, where he proves that iron has not been hurt by going up to three-fourths of its strength.
315. As I understand you, you would not consider it safe that a boiler, or any other part of an engine should be strained to half its ultimate strength? I consider you ought really to have a larger margin of safety with your boilers than with your engine.
316. If you consider you ought to have a factor of safety of six times the working pressure, would you consider it safe to strain a boiler so constructed to half its ultimate strength? No, I should not like to do that. But if I was straining that boiler, I should have indexes about the boiler to see what I was really doing, and whether I was producing any effect by straining it.
- 317.

\* NOTE (on revision):—Lowest factor, five or six.

Mr. B. Bailey. 317. When you have your boiler under pressure—unless you happen to have the eyes of Argus, you cannot see every place at once—do you not think it possible that some part might be springing when you are carefully examining another part? With myself, I put the boiler-maker and the engineers about the boiler with straight edges, to observe any bulging in any part, and I note the gauges myself, and particularly examine every part I consider the weakest. Of course I go inside the boiler and examine it carefully first; I would not think of testing it without doing so. I test our boilers sometimes before repairs up to their working pressure, or perhaps a little beyond it. I find out in that way flaws and leaks that I could not look for when steam was up, especially in the steam-chest and back of the furnaces.

22 June, 1868.

318. You do not make it a practice then of going much beyond that limit? No, I leave that for the Government Surveyor to do; but I am there when he does it. There is another thing,—I would not have a boiler tested by the gauges that are on. I have very seldom seen a steam-gauge correct yet. I believe some boilers have been tested without getting rid of the air in the boiler, and I believe that has a very bad effect; in fact, you will see a steam-gauge fixed with it.

319. *President.*] The gauge would not act? No.

320. That seems strange? It does. I cannot account for it, and I have asked others to account for it, but they could not do it.

321. *Mr. Moriarty.*] That is a thing which occurs in some gauges and not in others? I would not attempt to test a boiler without I knew I had a vent on the top for the air.

322. Do you think a Salter's gauge —? It is best to have a small valve with a lever and weight, and that cannot go wrong.

323. Supposing a boiler was strained by undue hydraulic pressure, would it not have the effect of slackening the stay in the hole. Supposing the stays are drawn through the plate and riveted over, and the plate subjected to an undue strain, whereby it slightly springs in the intermediate part between the stays, would that not have the effect of opening out the inner shoulders of the stay, and slackening it? I look upon a stay, properly screwed and riveted, as almost amalgamated with the iron—as near as possible as it can be. I do not believe you can slacken that stay without injuring the thread, and showing that you have done so.

324. If the plate bulges between the stays, has it not the effect of drawing the plate back from the thread? The plate does not enlarge its aperture—it elongates, if anything. I do not believe that by any stress you can strain the hole larger.

325. When you have the whole boiler under pressure, might not two or three stays in out of the way places, which you were not looking at at the time, be strained and injured, and yet not exhibit the effects of it? They ought to be looked at at the time. The plate would have to bulge to a larger extent before the hole would open out like that (*referring to an explanatory pencil sketch made by Mr. Moriarty*), and I should think any persons that were desirous of doing their duty, and following the thing out to a truthful end, would note and easily know the weakest part of their boiler, and that would be the part they would keep their eye on most.

326. What we really want to arrive at is, what you think about it. Do you believe in proving boilers to the extent of double the working pressure—Would you say it was really for the good of the public and the good of the steam-boat proprietors? It is for the good of the public, undoubtedly.

327. It is, you think? I do; but it is a question whether the boiler's life is quite as long—that is a question for the proprietors; but I do not think for that reason the public should be rendered unsafe.

328. If the boiler's life is not quite so long, does not that mean that it will give way sooner? No, it will be condemned the sooner. In fact some of them would run on, if they could, until they condemned themselves altogether.

329. Do you think, then, that the double pressure is necessary for the public safety? If I was a surveyor I should be very anxious to have it used. Fearing that great blame would come on me if an accident occurred, I should try and render myself as safe as possible.

330. But here is a case where it is asserted broadly that the proof-strain has produced this evil in the case of the "Clarence"—that the hydraulic test injured the boiler? How could it do it! If it did, the boiler was not what it ought to have been. Besides, it was not the weakest part of that boiler that gave way, assuming that the stays were perfect in the holes; so if the testing did it, why did it not show in a weaker part of the boiler? Upon what grounds do they say it was injured? I was there with the Surveyor, and tested the other boiler, to prove that the other safety-valve was floating. It was I who asked for a straight-edge to see if there was any buckling in the plate. Mr. Jaffrey went into the furnace with me at the back, while Mr. Dalgleish was putting the pressure on. There were something like thirty-eight or thirty-nine pounds on, and I fancied the plate was giving, and I said so. I was holding the straight-edge. I said we had better draw Mr. Dalgleish's attention to this before he goes any further.

331. The plate was springing? No, I fancied so. At the same time I said they ought to get a gauge made. You know old plates are not quite flat, and I wanted a couple of pieces of wood made to try underneath the edges of the straight-edge. When we went in, there was a lot of water there, and it was suggested we could feel what we were doing with our fingers. I believe it was only an optical illusion—that as the vessel moved, the water moved. The light went out. I said the plate was giving if anything, and Mr. Dalgleish was brought down, but could see no difference whatever.

332. In spite of all the care you took, you do not now feel satisfied the plate did spring? There was no proof of it afterwards. If it came at all, it was not the sixteenth of an inch, and that in a three foot straight-edge.

333. Supposing it did yield — ? I should not think anything of it. If there is a square foot without any stay, it can bulge the sixteenth of an inch without affecting the stays. Again, I do not think the hydraulic pressure could possibly have injured that boiler, because there have been a number of boilers tested since then under the same pressure, and stayed exactly the same, and they have been running ever since, as well as sometime before; so that I think it quite absurd to say the hydraulic test had anything to do with that accident. Mr. B. Bailey.  
22 June, 1868.
334. *Mr. Carlisle.*] Do you think it possible the boiler could have been so much injured by the double pressure, without shewing signs of it at the time? No; if it injured the boiler, it must have given signs of it.
335. If the boiler did not give signs of weakness under the double pressure, you would consider it perfectly safe to work? Yes. In fact, that is the only safety I feel. No one can say what a boiler will burst at. We know the great difficulty there is in assuming anything, when we know the immense difference there is in the quality of the iron we have to use. We accept as a standard twenty tons to the square inch; but we know that in experiments at home, it has parted at four and a half tons to the square inch. How are you to find out this bad quality of iron? You cannot judge by looking at it—you must prove it by some means.
336. If you had to examine a boiler that had been at work three years, and had not had the pressure reduced at all, and there were no signs of weakness about the boiler, would you put double the working pressure on it to prove it? I should examine it first.
337. If you saw no signs of weakness, would you consider it safe? Yes. Some boilers will run six years; although I think no boiler ought to run more than five or six years.
338. *Mr. Thomas.*] Were you engaged at the testing of this boiler of the "Clarence" in any other way except as a spectator? I was asked by the Surveyor of the port to oblige him by seeing him put the pressure on, and that the Government safety-valve lifted at that pressure. It was supposed to be loaded at eighteen pounds, I think. That was the boiler that was sound. If the testing did an injury to one boiler, how is it it did not do an injury to the other. That boiler has been tested again since the accident.
339. *President.*] A second time since the accident? Once since the accident.
340. *Mr. Thomas.*] You do not think it possible so to injure a stay by pressure that the boiler would burst? Yes, I do think it possible by pressure to do it; but it would depend on the state of the stay at the time.
341. Supposing it is not sound? If it is injured, it ought to shew it.
342. Did you never see a crank-shaft injured so that it was almost impossible to see the crack in it? Yes, I have seen a number of them.
343. You do not think it possible to injure a stay by that pressure? No, not by that pressure, if the stay was previously good. I think it would shew if any injury was done at the time. You would see the signs of injury on the outside.
344. Might it not be injured inside? That I cannot say.
345. Do you not think it possible so to injure a stay inside that it would not be observed, and yet the next time it was tried at a similar pressure it would go? I should not expect a stay to be cracked. If it had any injury at all, supposing it had enough hold of the thread for its strength to be tested, the stay would possibly stretch, or the thread would be injured.
346. *President.*] You mean that there would be very little chance of the stay actually parting? No, because the depth of the plate is not sufficient for it to hold until the stay parted—it would draw the thread.
347. *Mr. Russell.*] I should say, from the position you hold, you must have had considerable experience? I have had some.
348. Do you think it better to have a uniform test for all boilers, or to leave the proving and passing of them to the skill and experience of an officer appointed for the purpose? That is really a delicate question to answer. You must put faith in your officer, and must give him some latitude. At the same time, I cannot hold that you can make fish of one and flesh of another.
349. Do you think accidents would be less likely to happen if it were left to the experience and knowledge of an inspecting officer, or if there were a uniform test? I think certainly there should be a test.
350. What would you limit that to? As I said before, if I were the Surveyor, unless other people would not allow me to do it, I should use the same test adopted here.
351. It is assumed that at the time the boiler of the "Clarence" was tested it received a certain amount of injury, and three months afterwards shewed it by bursting. Happening as it did in this particular part, the hollow back, might not the injury have escaped the notice of the inspecting officer at the time? It was only in the back of the ashpit. If there had been any leak from it, I cannot but think he would have seen it.
352. It might have been strained without leaking? No, I think not. How could it affect one boiler and not the other? Anybody who asserts that that plate moved more than the sixteenth of an inch, asserts what I know to be incorrect.
353. You are speaking of the boiler that did not give? Yes, when it was tested after the accident. There are weaker parts of the boiler than that. If the test did the injury, why did it not do it in the weakest part of the boiler.
354. Then you are of opinion that all boilers, after they come to a certain age, are not liable to injury by proving them to double the working pressure? I am not going to assert that, if they are going to be left in the same state as they were; but all boilers have additions of strength made to them by additional stays, sheathing, and so on, so as to keep them up to the original standard as near as possible.
355. Supposing a steamer's certificate expires at the end of six months, the boiler is three years old, and requires considerable overhaul and repair to get another certificate, would you consider

- Mr. B. Bailey. consider it safe to test that boiler after it had been repaired to double the working pressure? I would apply the same test as when she was considered to be in first-rate working order.
- 22 June, 1868. Say she was allowed to work at twenty pounds six months ago, she has had six months deterioration, and it is accepted she wants repairs; she gets those repairs, and I should think she was put in as efficient a state as she was before.
356. You would make no allowance for depreciation? I should say that is made up.
357. You would not reduce the pressure? I would after a time, when the boiler got too old for it. You know as well as I do, boilers are strange and capricious in many ways. Plenty of boilers look well with five or six years work, while others look as bad with eighteen months or two years work.
358. How many years have you been at your profession? I have been chief engineer since 1852.
359. You have risen step by step? Yes, I have my indentures now.
360. And you have had considerable experience in superintending the construction of boilers, both on shore and on board ship? Yes.
361. That experience has given you sufficient knowledge to enable you to go to what is likely to be the weakest part of a boiler? Yes.
362. What number of years may your experience have extended over? I have been at the trade ever since I was fourteen, and I am now near forty.
363. I apprehend your experience in making boilers has been since you left your apprenticeship? I was under Maudsley's firm when I was twenty-two, and worked with them till I was twenty-four.
364. Do you think an engineer who has been on board a ship as engineer for five, six, or eight years, will have sufficient experience to qualify him to give an opinion about the boilers as well as the engines? That would be making rather a broad assertion. We know all men are not alike. Some men get as much experience in five years as others in twenty.
365. An engineer employed in a steam-boat has a better opportunity of knowing the cause of accident in boilers than an engineer on shore can possibly have? There is no doubt about that, I think.
366. What number of years were you chief engineer of a steam-ship? I think I first came out here with the "Harbinger," which took the first direct mails to Southampton that were ever taken from here. That was in 1853. In 1852 I was first appointed.
367. Do you think there are any steam-boats out of Sydney that are safe to prove to three times the working pressure? That I cannot say. I do not know anything of any other ships than my own.
368. Mr. Thomas.] Would you hesitate to put three times the working pressure on any of yours? Certainly I would.
369. Would you hesitate to put twice? That is done constantly.
370. Mr. Russell.] Before you allowed that pressure to be put on, you would thoroughly satisfy yourself no injury would accrue from it? Certainly. I think it is madness for a person to force water into a boiler without having first examined it thoroughly inside.
371. After that has been done, you have not only been satisfied with the pressure, but you have inspected the boiler afterwards inside and out, to see that no damage has been done? Yes, and have gauges on to indicate any little bulging of the plate.
372. What is your opinion of the practice adopted of proving boilers with the ordinary force-pump—Is it not possible that one stroke of the pump, when there are five or six men on it, may increase the pressure considerably and suddenly? It would, but they are or should be looking out for that, and should take it gently when the pressure is mounting up to the point required. Besides, the stroke of the pump is diffused over the whole boiler. I do not think it causes any more injury than the donkey engine pumping in water when the steam is up.
373. When there is a pressure of twenty pounds of steam, there is something to work against; but supposing with the pump you have to get up the pressure to forty pounds, and it is standing at thirty-nine, one or two strokes of the pump might have the effect of putting it up at once to forty-two or forty-three? I presume those looking after it could caution the men in time, to go very easy. They could very soon increase the pressure if they liked to do it; but it would be very culpable on the part of the Surveyor and those in charge of the property to allow such a thing as you suggest to be done. From what I have seen of the Surveyor here, he is too cautious a man to permit it. Whenever he tests our boilers, he will not have a word spoken, or the sound of a hammer, and puts the pressure on very gently. I think that pressure of importance, because the steam-gauges are corrected by it.
374. Mr. Thomas.] Have you been present when Mr. Dalgleish has tested many boilers other than those of your own Company? No; but he has never tested any of mine unless I was present and carefully watching the effect. I know engineers will sometimes think they have done a very smart thing when they run the pressure up, but they are very liable to commit an error, and the Inspector be blamed for it.
375. Mr. Moriarty.] You look upon it as a rather dangerous experiment unless carefully watched? I think it requires to be in careful hands, and all indications should be noted. No doubt it is a most important object you have before you. Where is there the same risk of life and property as in steam-boilers in ocean-going vessels? I am sure you cannot look upon steam-boilers as anything else than powder barrels. It is possible that some boilers are working just up to the pressure they will bear.
376. You consider that one of the great advantages of the proof test is, that it puts a stop effectually to running boilers to the very margin of their strength? Yes. At the same time, it wants to be in very careful hands, and to be carefully watched.
377. There is danger attending on it unless it is carefully managed? Yes.

378. *Mr. Russell.*] It depends greatly upon the construction of boilers—boilers of different construction will stand with safety more pressure than others? Yes.
379. Supposing there were two steamers to be inspected, with boilers differently constructed, or the one set in a better state than the other, one might stand with safety double the working pressure, while the other would not; therefore, it would require a man of great experience to know what pressure to put on those boilers? It strikes me the thing to do in that case would be, to make the boiler so that it would stand double the working pressure. I presume the Surveyor, before he applies this test, goes into the boiler and satisfies himself it will stand the pressure he intends to put on it; and if he thinks it will not, his bounden duty is to advise those who own it that he is going to put a pressure on it that he thinks it will not stand, and that if they do not like it they must reduce their working pressure, or have the boiler strengthened. I do not think it is the surveyor's duty to put a pressure on without previously cautioning the owners.
380. Supposing a boiler is put on board a steamer, with a working pressure of twenty pounds, and is proved to double that, after four or five years would that boiler be safe to prove at the same pressure, unless in very good order, and after very considerable repair? It is quite possible that in five years that boiler would be used up, and you would want a new one.
381. We have boilers here much older than that? That may be; but, as I have said, it is my opinion that all boilers should be lifted out after five or six years.
382. *Mr. Moriarty.*] Do you not think so severe a trial as double the working pressure necessarily confines boiler-making work to the best hands and the best material and workmanship? Yes, certainly it does.
383. *President.*] What you mean on the whole is this,—that if it is time to diminish the test pressure, it is time to diminish the working pressure, or repair the boiler? Yes.
384. The stays that gave way in the "Clarence's" boiler were fixed by a thread and a little rivet? Yes, they were supposed to be so.
385. Is there any better way of fixing them? I do not hold with that plan, although it is the general plan.
386. With a nut, for instance? I prefer a nut.
387. If this had been fixed with a ferrule inside and a nut outside, do you think the accident would have happened? I do not like ferrules. If you put two nuts on the stay, you can tighten the nut up till you get a fit.
388. If this stay had been fixed in that way, do you think the accident would have happened? I cannot say it would not, but I think it would have been safer.
389. Would it increase the expense to fix stays in that way? About 4s. on each stay perhaps.
390. That would bear a very small proportion to the cost of the boiler? Yes. All this comes on first cost.
391. You say you do not think the part that gave way was the weakest part of the boiler? No, assuming the stays to have been sound.
392. Is it not strange the weakest parts would not have gone? There may have been a cause that could not have been got at.
393. Supposing the safety-valve to have been unduly loaded? Then the weakest part ought to have gone.
394. How do you account then for this, that the weakest part did not go? I think it is quite likely there was an accumulation of scale within that plate so that the water was not able to get to it, and that there was fire on the top of the plate.
395. Was it in such a position that fire could get to it? The fire could get over the bridge, and it is quite possible there was not a free circulation of water under the plate. I do not think that accident came about in five minutes; I believe it had been going on for some little time.
396. *Mr. Carlisle.*] If the boiler had been properly examined before, they would have found it out? Yes. I do not say positively there was fire there\*; it was all cleared away when I saw it. If they blew their boilers right down, it is what I should think a very unwise trick to do with bridges in; and we know if people are not looked after they are not in a hurry to draw their ashpits nice and clear, and it is difficult to get at the back.
397. *President.*] Did you form any opinion as to whether there had been any deposit of scale on this plate? I only saw loose scale inside the boiler and under that plate.
398. Could that have been prevented by proper care? I should think that boiler could never have been sludged out from the time it was last tested, for that amount of loose scale to be there.
399. Supposing that when in this state a lot of fresh water had been put into the boiler from the city mains, would that have produced any effect? If they were like that previously, it might have softened the salt and increased the deterioration.
400. Do you think that if the testing pressure were reduced somewhat, so that instead of being onehundred per cent., it should be fixed at fifty per cent. of the working pressure, do you think the result would be sufficiently satisfactory? No, I could not put that forth as my opinion, against that of our best written authorities at home.
401. *Mr. Moriarty.*] Who are the written authorities that recommend testing to double the working pressure? Macquorn Rankine is one.
402. He is not a practical man? We have to take him as our guide in engineering.
403. As to strengths perhaps—but is he a good guide as to mere matters of practice? He is one of our greatest writers on the subject. There is Fairbairn too; he insists on the strength at any rate. Macquorn Rankine speaks of it in both his works. In his last work—

\* NOTE (on revision) :—The cleaning refers only to the top of the plate.

Mr. B. Bailey. work—of which I do not think there are copies yet out in the Colony—I have almost the first one bound—he speaks of it again.

22 June, 1868. 404. And recommends the test by hydraulic pressure? Yes.

405. *Mr. Thomas.*] Do you know of any other authorities? There is a very practical engineer who examines more boilers perhaps than anybody else; that is, the engineer who examines for the Manchester Association for the Prevention of Accidents by Steam-boiler Explosions. Then again there is the engineer for the Insurance Companies.

Mr. Francis Napier called in and examined:—

Mr. Francis  
Napier.

22 June, 1868.

406. *President.*] You are an engineer by profession? Yes.

407. You are aware of the method of testing marine boilers made use of here? Yes.

408. You know it is customary for the Surveyor to test up to double the working pressure? Yes, I believe so.

409. Do you see anything objectionable in that practice? I think no general rule can be applied to all boilers. Some boilers it would injure, and others it would not. It is a thing that should be left entirely to the discretion of the Surveyor. I would not recommend double pressure being applied. I believe in many instances it would not injure the boilers, but I would not recommend it.

410. You think some boilers may be perfectly fit to work up to twenty pounds, and yet be injured by the hydraulic test up to forty pounds? Yes, according to their construction. If they have flat sides and stays they might be injured.

411. And still be fit to work up to twenty pounds? Yes, if not injured by the test.

412. Do you object to the test generally? I object to any general rule.

413. Would you use the hydraulic test in some cases? Yes, I consider the hydraulic test the best test to a certain extent.

414. But you think it should not be carried so high as that in all cases? Not in all cases; in fact, in few cases is there a necessity for it.

415. You think one boiler might be injured by testing to forty pounds, and another might not be injured, and still they would be equally safe? The one that would be injured would not be so safe, but it would be equally safe if it had not received the injury.

416. Equally safe to work up to twenty pounds, but not equally safe to be tested up to forty pounds? No.

417. Do you know what the practice is in England, as to testing boilers in use? The hydraulic test is used, I believe, in some places.

418. By Government authority? That I cannot say.

419. What would you recommend, if called upon to advise the Government as to the system of testing boilers? I would make no recommendation, only to leave it to the Inspector; he ought to be so thoroughly qualified as to require no directions.

420. Would you tie him down to no general rules? No, decidedly not; I would leave him to his own judgment.

421. You would not fix any rule; for instance, that the pressure should not be more than once and a half the working pressure? No, that should be left entirely to his own judgment.

422. Do you think the safety of the public would be endangered if the hydraulic test were discontinued altogether? I should not recommend its being discontinued altogether. No boiler ought to be injured by mere pressure from thirty to fifty per cent. above its working strength—it ought to be strong enough to withstand that without being injured.

423. If it is not, the pressure ought to be reduced? Yes.

424. Did you make any examination of the boilers of the "Clarence" after the accident? No.

425. Do you know anything to enable you to form an opinion as to the cause of the accident? Had they had nuts on the stays they would not have gone, nor would they have been injured by the hydraulic test.

426. You think nuts ought to be used in all cases? In cases where they are out of the fire; and where the fire is, I would use large rivets put in hot.

427. You think the accident is attributable to there not being nuts? If nuts had been on, it would not have taken place.

428. Is it possible the hydraulic test of forty pounds, three months before, had anything to do with it? It is possible. Frequent applications of pressure—

429. It was not frequent—only applied once? The plate was bulged, I understood, before the explosion, and that shewed it to have been over-pressed. The other plates were stated to be bulged between the stay bolts, and that shews they were too weak.

430. Would you consider the boiler too weak to work up to twenty pounds? Not with nuts.

431. You think if nuts had been there the accident would not have happened? Decidedly I think so. I have seen similar explosions from similar causes, which would have been prevented by nuts being put on.

432. Is there any objection to using nuts? They are objected to in the furnaces, on account of their burning off and the fire-irons striking them.

433. Is there any objection in other places? No, I do not know any objection at all. I have always used them myself, and have had them stand for many years without the slightest trouble.

434. Would they increase the expense? Not perceptibly. In fact, I should say it would be rather less, because you could do with a smaller stay. It is not the stay-bolt that gives way—it is the thread which strips. Mr. Francis Napier.
435. What is the section of this stay? About an inch and a quarter or eighth in diameter. 22 June, 1868.
436. It would not be likely to part with the pressure? No, it would stand fifteen times the ordinary pressure before it would break the iron, if good.
437. Did you ever know a stay to give way where it was fixed by a nut? I have never experienced it.
438. Have you known many such cases where they have been fixed with a thread and rivet? Yes, several.
439. I think we have some evidence that there is some objection to using nuts? I have not found it, except in the furnaces.
440. In the furnaces is there no better way of fixing them than by a thread and rivet, because the hold a stay can have on a thin boiler-plate must be very slight? I always put a large rivet with a ferrule inside so as to have the same effect as a nut. With a screw stay they must rivet cold, and they do not get sufficient surface on the rivet; with a hot stay you can get a sufficient head.
441. Is there no objection to that in practice? Not that I know of.
442. Have you any reason for supposing this part of the boiler had been injured by heating? I did not see it myself, and cannot say.
443. *Mr. Moriarty.*] You have had a good deal of experience with marine engines? Yes—for more than thirty years.
444. And you have built a good many engines and boilers yourself? Yes.
445. And been actively engaged in the profession? Yes.
446. You are also an Associate of the Institute of Engineers? Yes.
447. You have had as good opportunities of forming an opinion on these matters as any man in the Colony? I do not think any man in the Colony could have had the experience I have had in the matter.
448. Do you think any of the boilers running out of this port could stand six times the ordinary working pressure on them? I cannot say, for I have not seen all the boilers, but I should not think so; I should be disposed to think not.
449. You have occasionally done duty as Engineer-surveyor for the Steam Navigation Board? Yes, in the absence of the proper officer.
450. Do you think any of the boilers that came under your inspection then could stand six times the working pressure? No, nor four times.
451. If they were proved up to double the working pressure, do you think that would be a dangerous approach to their limit of ultimate strength? As I said before, that depends upon the shape of the boiler. Where every part is circular it is not injured; but where there are flat sides the whole strength depends on the stays, and if the stays are depending on threads, any pressure, however little, will bulge the plate a little; that makes a larger hole, and does away with the hold of the rivet.
452. *President.*] Would there be the same danger if fixed in the way you described? No, because you do without threads at all then.
453. *Mr. Moriarty.*] The head of a nut covers a much larger area of the plate than the head of a rivet? Yes, especially when the rivet is put in cold, as it is in this case.
454. *President.*] Is there any justification whatever for making use of the present mode of fixing these stays? The reason generally given is that nuts are in the way.
455. In the fire-holes? Yes.
456. You say that can be easily obviated? Yes, in my opinion, by putting in the stay hot in such places, and so getting a larger head to the rivet.
457. Have you ever heard any objection to your mode? No.
458. You think that if all these boilers with flat sides were stayed with stays fixed in the way you describe, there would be no danger in putting on double the working pressure? No, but still I would not advise it. I do not see any occasion for going beyond half more. In all new boilers, of course, I would put double pressure on.
459. *Mr. Moriarty.*] The object in that case is different—it is done in order to ascertain where the boiler wants strengthening? Yes. The stays are reduced perhaps to one-third of their strength in the course of a very short time.
460. Do you think, if a person, possessed of sufficient experience and acquaintance with boilers, makes a thorough examination of a boiler inside and out, it is then necessary, or that it would be attended with beneficial results to that boiler, to prove it to double the working pressure? I would rather not do it. It is putting on a pressure there is no occasion for. It ought to stand it, but there is no occasion to try it to that extent.
461. So that, as a rule, you would prefer not seeing the practice of proving to double the working pressure carried out? Yes. (*Drawings of the boilers of the "Clarence" exhibited to Witness.*)
462. This appears to have been altered after the design was made—Do you think if that boiler had been carried out as originally designed, it would have been so likely to have gone? No, I think not.
463. *President.*] Would it have made much difference to the expense if it had been carried out according to the circular line? No.
464. Do you think leaving this corner square increases the liability to accident? No doubt it does, when the stays have no nuts on.
465. *Mr. Moriarty.*] Is not this part of the boiler—the bottom of the ash-pan—a part which is apt to corrode rapidly? Yes.
466. The plate is apt to get unusually thin there? Yes; if there is any leakage, it is sure to be there.

Mr. Francis  
Napier.

22 June, 1868.

467. So that that is the part of the boiler where the effect of straining is likely to be the greatest? Yes.

468. With reference to the accident to the boiler of the "Clarence"—Supposing that the thread of the stay is not much injured, that the head on the stay is there to the good, and that the plate has been drawn clean over it, would you not rather attribute that to weakness in the plate than to any defect in the stay? It would shew either that there were not sufficient stays, or that the plate was too thin. A thin plate has no hold at all over the thread.

469. *President.*] It would not have been drawn in that way over a nut? No.

470. *Mr. Russell.*] If an old boiler comes for repair, would you prefer putting in new stays in intermediate spaces, or taking out the old ones? That would depend on what state the stays were in. If the stays were good, I would rather put in intermediate stays. An additional number of stays is far better than strengthening one stay.

471. Particularly when the plate gets old and thin? Yes, decidedly.

472. If you found any bulging in the plate? Then the plate is too weak, and wants additional stays.

473. *Mr. Carlisle.*] Do you think it possible to injure a boiler by double pressure, without there being anything visible? No, I think not—not without being able to discover it by examination. A person having sufficient experience could tell whether it had been overstrained or not.

474. *Mr. Russell.*] You think it would be safer to leave the testing of these boilers to a man who has had sufficient experience, rather than fix a principle that all boilers should be tested under certain pressure? Decidedly, because if you fix a principle on him, and anything occurs, he throws it off his own shoulders. He says, you have limited me to this, and I am not responsible. A man ought to have sufficient experience of his own.

475. What number of years' experience as a practical engineer do you think ought to be sufficient to qualify a man for this duty? I should think ten years, and he should have experience not in land work but in marine work.

476. Marine boilers are of a different construction? Yes, quite different, and exposed to different effects altogether. They are two perfectly distinct branches. An engineer accustomed merely to land work would be perfectly at sea with marine work. And it is of no use that he should have experience simply in new work; he must have had experience in repairing old work in every stage of decay.

477. Do you think a boiler that had been running two or three years, that had then undergone thorough repair, and been proved to double the working pressure, could receive, while being proved, an injury which the Inspector could not discover, and which, three months afterwards, might be the cause of its giving way? I think it could be discovered at the time the pressure was on, if it were thoroughly examined, although it might not afterwards.

478. Do you not think it might receive some injury from the test that would gradually deteriorate it, so that it might eventually burst at less than the working pressure? That would depend on the man that had charge of the boiler. Any injury done by the test should have been noticed at the time. There was evidence at the inquest that these rivets had been caulked up afresh, showing that they had leaked.

479. *President.*] None of this could have happened at all if there had been nuts on the stays? No.

480. Have you ever, when proving boilers, new or old, under hydraulic pressure, found that stays have given way or started? Yes, frequently. We very seldom test a new boiler but we find some leakage in some part or other.

481. Have you ever known an instance where a stay has given way without being discovered at the time? No, I cannot say I have.

482. If a stay gives way, it makes a good deal of noise? Yes, it makes a sharp crack.

483. *Mr. Moriarty.*] The way in which this would shew, would be in the leakage? Yes, the rivet-head being so very small.

484. You said some boilers cannot be injured by the hydraulic test to double the working pressure—boilers of round form? Yes, because they cannot open if there is a slight curve in them; they retain their shape whatever the pressure you put on them.

485. That is a condition you cannot very conveniently get in all parts of a boiler? No.

Then I say, where you must have them flat, put nuts on the stays instead of rivets.

486. Where you are obliged to use flat surfaces, a boiler might be injured by double pressure, and therefore, you would think it injurious to apply it? Not to the extent of from thirty to fifty per cent. above the working pressure, according to the judgment of the Inspector. There might be cases where the Inspector knew the boiler well, and would not require to put any pressure on it.

487. Supposing a boiler to be four or five times as strong as the greatest working strain that is likely to be brought upon it —? I should say five times would be quite strong enough.

488. Then what do you think should be the hydraulic test? That would depend upon the construction of the boiler. All boilers should not be tested to the same extent.

489. *Mr. Thomas.*] Do you think the duties of the Inspecting Engineer in this port are too much for one person to perform, seeing that we have an Inspector to each Company? I think it is rather too much for one man, unless well experienced.

490. *Mr. Moriarty.*] Do you think this hydraulic test has in any way the effect of diminishing the responsibility of the engineers who have control of the vessel, as well as the Inspecting Engineers belonging to the Companies—do you think the fact of its having passed this severe ordeal is considered by them as freeing them from the just responsibility they

they ought to be under to keep their boilers in proper order? I do not think so, unless there is carelessness. The hydraulic test does not do away with the necessity for the engineer looking after his boilers. Mr. Francis Napier.

491. *Mr. Russell.*] Perhaps he might not pay that attention to them he should do, after having had them tested so severely? That is for the Companies to find out for themselves—it does not affect the public. They would get more careless, I think, if there was no Inspector. 22 June, 1868.

492. Do you think, from the construction of the "Clarence's" boiler, it was possible or likely that it should have been heated at the part where it gave way? It is a very unlikely part to heat, because there would probably be ashes there, and that would protect it from being heated; and if there was any leakage in the boiler at all, the water would collect there.

WEDNESDAY, 24 JUNE, 1868.

Present:—

MR. PELL, PRESIDENT.

Mr. MORIARTY,  
Mr. CARLISLE, R.N.,

Mr. THOMAS,  
Mr. RUSSELL.

Mr. Thomas Jaffrey called in and examined:—

493. *President.*] You are Superintending Engineer for the A. S. N. Company? Yes. Mr. T. Jaffrey.  
494. How long have you held that office? Two years and a half. 24 June, 1868.  
495. You are an engineer by profession? Yes.

496. You are of course aware of the way in which boilers are tested by hydraulic pressure, up to double the working pressure generally? Yes.

497. Do you see any objection to that mode of testing boilers? Yes, I look upon it as being unsafe for the public, and very injurious to the boilers as well.

498. Do you object to hydraulic pressure altogether, or to the extent to which it is carried? Only to the extent to which it is carried.

499. You approve of testing by hydraulic pressure? Yes.

500. Is there any general rule you could lay down as to the amount of pressure that ought to be applied? In a great measure it depends upon the condition the boiler is found in on examination.

501. Supposing a boiler is considered to be fit to work up to twenty pounds on the safety valve, what hydraulic pressure would you consider it safe to apply as a test? I should say twenty-five pounds, or in some cases thirty, where the examination might be such that you could not tell exactly the condition of the boiler in some parts.

502. You would not go more than fifty per cent. above the working pressure in any case? No.

503. What has led you to this opinion—was it merely from considering that a severe hydraulic test must necessarily have a bad effect, or from having observed that it does do injury? We have had experience of it.

504. Have you observed that it has injured your boilers? Yes.

505. Could you point out any instances in which you have observed injurious effects? I have had several cases where stays have been carried away, and boilers otherwise injured, rents in the plates, and so on.

506. During the process? Not during the process, but immediately afterwards.

507. Will you name any case? The boilers of the "Collaroy," about the 19th September last, were pressed up to forty pounds, and the first trip afterwards, going up the Hunter, she rent the steam-chest, although it shewed no signs of injury when the forty pounds pressure was on.

508. Is there any other instance? Yes, once in the "Balclutha" and once in, I think, the "Wonga Wonga"; the first trips after being pressed they broke out.

509. How long ago did this happen? All within the same twelve months.

510. Have you been of the same opinion respecting the injurious effect of this method of testing, ever since you have held your present appointment? Yes.

511. You frequently witness the application of the test? Always.

512. Have you ever complained to Mr. Dalgleish that he was injuring the boilers? Yes.

513. Have you ever protested against its being carried out? Yes, I have to the Company. I have represented to the Manager the injurious effect it was having on the boilers.

514. Have you observed whether the Government Engineer makes use of the test judiciously and carefully? Yes, I believe he does.

515. You have seen him? Yes.

516. Have you any reason to complain of any want of care in the application of the pressure? None, with the appliances we have. Of course, in some cases, I consider the test much more severe than in others. Where there is a very large pump made use of, I consider it more injurious than where there is a small pump applied.

517. Is that because the pressure gets up suddenly? Yes, there is more concussion from the pump in forcing the water into the boilers.

518. In such cases there is a jerky motion of the indicator? Yes.

519. You have observed that? Yes.

520. Were you present when the "Clarence" was tested, three months before the accident? Yes.

521.

- Mr. T. Jaffrey. 521. Was the portion of the boiler where the stays gave way carefully observed at the time? Yes, the boilers were all cleaned out and fresh painted.
- 24 June, 1868. 522. Did it show any signs of injury? No.
523. The stays that gave way were screwed in and riveted over? Yes.
524. What, in your opinion, was the cause of those stays giving way under so small a pressure as is represented? I am under the impression that the double pressure injured the stays.
525. In what way? By the pressure that was on them at the time. My belief is that the pressure partly stripped the thread and broke the bat off the rivet at the same time.
526. Did you observe that part of the boiler during the experiment? No, I did not.
527. Did Mr. Dalgleish, do you know? He went in through the furnaces after the pressure had been on, but not at the time when the full amount of pressure was on.
528. The plate was drawn off the stay, I think? Yes, the plate was drawn off the stay.
529. If that stay had been fixed in the way some engineers recommend, by having a nut on the outside, do you think the accident would have happened? The nut, in all probability, would have held, but the plate may have parted. There was a slight flaw in one of the plates after the accident. I consider the riveting of the stays was equal to break the stay itself; the thread and the riveting was equal to break the stay itself.
530. It did not break the stay? No, I believe the plate went first. The plate, in bulging up in the centre, round about the stay, would open the thread underneath, make it like a cone, and break the rivet off at the same time.
531. Do you think that could have happened if there had been a nut? No, not if the plate had stood.
532. Do you think the plate would have given way? There was evidence of the plate having given way at the time. I believe the plate gave way before the stay.
533. Is not the part of the boiler where the accident took place more liable to be injured by corrosion than other parts? No; there is more wear upon it inside, but not in the ash-pit.
534. Might not the thread of that screw have been deteriorated by corrosion during the three months? Not if it had been a tight fit in the thread, it could not.
535. Suppose it was not originally a tight fit? If it was not a tight fit, then corrosion would have taken place.
536. The accident might be accounted for in that way? Yes. But I believe when the hydraulic pressure was on, it opened up the thread, and consequently allowed the water to get in.
537. And corrosion ensued? Yes.
538. Have you any objection to the use of nuts on these stays? Only where the fire acts.
539. Do you not think the stays would be safer if secured by nuts? I do not know that they would. If riveted stays are properly put in, they are just as safe as nuts.
540. But they would be more liable to bad workmanship, and then the hold would not be so good? No, I do not think so; you might get a bad nut or a bad staybolt the same way. I consider a bolt would be more likely to break at the thread than a screw stay.
541. Have you ever addressed any complaint to the Directors of your Company, in writing, as to your objections to this mode of testing boilers? Yes.
542. It is upon record then? Yes.
543. Do you think the safety of the public would be sufficiently insured, or more effectually insured, if the test pressure were limited to somewhere about thirty per cent. above the working pressure? Yes.
544. You would not recommend that the hydraulic test should be abolished altogether? In the case of new boilers I would have no objection to double pressure, when the boilers are in the shop; but I should object to even thirty per cent. above the working pressure applied every three or six months. Sometimes our boats are surveyed three times in six months.
545. You object to the test being applied so often? Yes.
546. But not altogether? No; in some cases it might be advisable to put it on.
547. Do you think trifling defects in the boiler may be detected by that method? No, I do not think they are.
548. Do you not think it possible in that way to discover defects that would not otherwise be detected? I have never discovered any yet through it.
549. *Mr. Moriarty.*] Do you not think the hydraulic pressure likely to detect leaks which cannot be detected when the boiler is under steam? No, I do not think so.
550. Is not a boiler generally much tighter under steam than when under hydraulic pressure? After a boiler has been wrought for any short time she is tight under both—both steam and hydraulic pressure.
551. As a matter of fact, when testing, do you not constantly observe little jets of water coming out in various places? Only in case of leakage.
552. Do you not think the hydraulic test is useful to enable you to detect these leaks—I am not speaking now of the double test, but a test slightly above the working pressure under steam? No; I think you can see them under steam just as well.
553. Supposing the back tube plate has been leaking? You can easily find it out afterwards if you examine it.
554. You do not object to the hydraulic test, if judiciously applied within moderate limits? No, but I object to its being so frequently applied.
555. You think all the defects of a boiler may be ascertained by a competent person going inside and examining it for himself? Yes.

556. I think I understood you to say that when the hydraulic test was applied to the "Clarence's" sound boiler, after the accident, the plates did spring? Yes, fully three-eighths of an inch. Mr. T. Jaffrey.  
24 June, 1868.

557. What space was there between the stays? Twelve inches one way, and fifteen the other. I could get my fingers below the straight edge when the pressure was on.

558. Did the plate recover its original form after the pressure was removed? Yes, this one did; it went back to its original position.

559. Then I understand that you consider that test had arrived at the degree when its frequent application would deteriorate the strength of the boiler—it had got beyond the fair testing load? Yes.

560. What proportion of strength do you consider boilers should have to the working pressure? I should say they should have about two-thirds over.

561. Not more? No, I should say two-thirds would be quite sufficient.

562. I mean the ultimate strength of the boiler, when you would expect it to begin to burst—how much above the working pressure would you fix for that? I should say, if fifty pounds were the bursting pressure, twenty pounds would be quite enough to carry.

563. Would you not consider it a little too much? No; it would depend upon the form of the boiler a good deal.

564. I am speaking of the ordinary marine boiler—Is that, do you consider, the proportion in most of your boilers running in this port? Yes, I should say that is about the average of them; that is, for those not carrying over twenty pounds pressure.

565. Is that your experience of the general proportion of strength of steam-boilers to their working pressure? Yes.

566. You consider, then, that testing a boiler to twice the ordinary working pressure is too close an approach to its ultimate strength? Yes.

567. Do you think that if, in proving the "Clarence's" boiler, you had gone on pumping until the pressure amounted to sixty pounds, the plate would have torn away altogether? Yes, I think it would have gone before they came to sixty pounds.

568. *Mr. Carlisle.*] Would you consider it necessary, in the case of an old boiler, to apply the same test to it after inspecting it, before you got steam up? Not if I could examine the boiler internally. If I could get into the boiler to examine it all internally, I should say it was not necessary to apply the test, unless there had been an accident with the boiler requiring extensive repairs.

569. Suppose a boiler had been carrying twenty or thirty pounds of steam for three or four years, and had then been undergoing extensive repairs, would you think it necessary to test it? Yes, I should certainly apply the test.

570. To what extent? I would certainly not go beyond half as much more.

571. Do you not think the test even more necessary in the case of old boilers than new ones? A boiler four years old will not be carrying so much pressure. The pressure would be reduced perhaps ten pounds.

572. I have known some boilers to carry the same for three or four years, and have plenty of running too? We cannot get our boilers to do that; we generally reduce them every two years. I should say that if boilers at the end of three years were carrying twenty pounds pressure, it would not be necessary to put cold water pressure on at all, unless by examination they were found to be defective, and to require extensive repairs.

573. *President.*] And then you apply the test to test the new workmanship—the efficiency of the repairs? Yes.

574. *Mr. Carlisle.*] You would not think it necessary to apply the test, but would continue at the same pressure? I would reduce the pressure after the boiler got aged.

575. Supposing you did not find it much deteriorated? Then I might allow the boiler to go on at the same pressure. Perhaps the boiler, in the four years, might not have been doing three months work. In that case I should consider it a new boiler. It depends upon the wear and tear. It would depend altogether upon the result of the examination—on what condition I found the boiler in. I have never found any defects out in a boiler, where they cannot be seen, by the hydraulic test; and there has never been an accident from any part of a boiler giving way where it could not be seen. Accidents generally take place about the furnaces or fire-box, and those places are easiest got at and easiest seen. I do not consider the hydraulic test of any use at all, where a man can see and examine with a hammer.

576. *Mr. Thomas.*] You do not altogether object to hydraulic pressure. No, I do not.

577. Do you think it possible to lay down any scale of pressure according to the age of the boiler, or the number of miles it has run, the percentage above the working pressure that should be applied? No, I could not lay down any scale at all, because two boilers will not wear alike. Deterioration goes on faster in some boilers than in others. I think it impossible to lay down any scale by time.

578. *Mr. Russell.*] What is the average pressure on your steamers, the lowest and the highest? Our lowest is about twelve pounds, and the highest is forty pounds.

579. The working pressure? Yes.

580. What vessel carries forty pounds? The "Diamantina." There are none above twenty-five pounds, except the "Diamantina" and the "Leichhardt." The "Leichhardt" is thirty-five.

581. Have you proved the "Diamantina" under hydraulic pressure? Yes, to eighty-six; and she has been proved by the surveyor to eighty-two.

582. Since she has been working? Yes, to eighty-two.

583. Did you notice any bulging of the plates under that pressure? No.

584. Do you think that pressure likely to do any damage to the boiler? No, not to that boiler; it is a circular boiler, and all double riveted, and stayed every nine inches.

- Mr. T. Jaffrey. 585. When the Inspector is proving your boilers, do you take any means of finding out where there are any weak points in them, by stretching lines across, or by using straight-edges on the outside? No, the only precaution that is taken is that a stoker is put into the back of each boiler, with a lamp, to examine the boiler all round the furnaces and combustion chamber and up-take. Gauges are always put on, on the top of the steam-chest.
- 24 June, 1868. 586. At what age of the boiler do you generally make the reduction in the working pressure, or are you guided by the appearance of the boiler? According to the condition we find the boiler in.
587. Do you make a considerable reduction on each occasion? About two pounds.
588. Suppose a boiler had run two years with ordinary wear, what reduction would you make? I would not make any at all, unless, after examination, I found a good deal of corrosion; if so, I would reduce it about two pounds.
589. The pressure the boilers are to work at is regulated by you as Superintending Engineer? Yes.
590. Has the Government Engineer ever objected to any pressure you named? No.
591. Merely proving it by hydraulic pressure to double the amount? Yes.
592. Has any instance occurred where a boiler has not stood double the working pressure named by you, and he has insisted on a reduction? The hydraulic pressure has always been applied to double the pressure of steam fixed upon for it.
593. If the boiler did not give satisfaction under the pump, at double the working pressure named by you—that is, supposing the pressure named by you to be twenty pounds, and the Inspector proved it to forty, and found the boiler not satisfactory at that pressure, has he insisted on a reduction of the working pressure? No, not that I remember. If he pressed the double pressure we always got the half. I do not remember an instance of his refusing to give that.
594. What number of years experience do you think would qualify a man for the office of Inspector? That would depend upon the number of boilers he had had through his hands. He ought to be a thoroughly practical man himself, that has had the management of boilers, and had frequent opportunity to examine them, and see the action that goes on with them.
595. Do you think that if a man had made half a dozen boilers he would be equal to it? No, I do not think the man that makes a boiler would be the best surveyor.
596. Do you think two or three years experience in superintending the repairs of boilers would qualify an ordinary engineer out of a workshop? I hardly think so.
597. Will you tell the Commission what, in your opinion, ought to be the experience that should qualify a man to pick out the defects of a boiler without applying the pump—that is, even if the pump would shew all the defects? I should say he should be a man that has had a long experience in steamers himself, not only in one but in different steamers. If a man has had five or six years experience of that kind, he ought to be able to go through a boiler and detect defects in it.
598. *President.*] Do you not think some men learn as much in two or three years as others in seven? Yes.
599. In applying the test, what pump do you use? We generally use the donkey engine pump, or if we have not a donkey engine we use the deck pump.
600. How large is it? About six inches.
601. How many men are put on? Sometimes thirty. Many times he has to get pipes and slip them on to the ends of the handles to make room for more men to get the pressure up.
602. Then you require great power at the pump? Yes, I think I had six or eight and twenty men on the pump when I tested the boiler of the "Clarence" after the accident.
603. *Mr. Russell.*] In proving these boilers, have you noticed that, after you have got the pressure up say to forty pounds, one stroke of the pump will run the pressure up very considerably? Yes, we have some boilers in which one stroke would run the pressure up five pounds.
604. And that five pounds above the pressure required might do an injury that would not be noticed at the time, but might cause an accident? Yes.
605. Would it be too much to ask you your experience as an engineer from the time you left your apprenticeship? Twenty-three years.
606. How many years did you serve an apprenticeship? Seven years.
607. And as engineer on board steamers? Twelve years. I was three and a half years with the Cork Steam Navigation Company, superintending the repairs of their boilers and engines.
608. During that time did you prove the boilers in any way? No, never except in the shop—never in the ship. I was twelve years running out of Liverpool, and I never saw one pressed in any ship I was in.
609. All the repairs in the steamers of which you were superintending engineer were done on examination merely? Yes.
610. Had you any accident during that time? No.
611. Then you are of opinion that boilers could be effectually and efficiently examined and passed by a competent man without resorting to the hydraulic test at all? Yes, I believe so.
612. Would you have any objection to proving boilers in that way to a half more than the working pressure? I would, if it were done every three or six months. I think it is only necessary where very great deterioration has taken place in the boilers. Supposing there were any accident, such as that in the "Clarence," after the boiler was repaired, I would put on a pressure of perhaps a half more.
613. *President.*] You say you consider the plate of the second boiler of the "Clarence" was bulged by the testing? Yes.

614. Do you think such a bulging, although the plate is afterwards restored to its original form, does injury to the plate? It must do, and not the plate simply but also the thread where the stay goes through. It opens up the thread off the stay, and allows the water to get in. Mr. T. Jaffrey.  
4 June, 1868.
615. You say that on board the "Collaroy," the next voyage after testing in last September, some of the stays gave way? No, it was in the steam-chest—a rent in the steam-chest, along the angle iron.
616. There was something similar in another steamer also? I think it was the "Wonga Wonga," or the "Balclutha"; my memory will not serve me exactly; but I know we have had three instances where these things have occurred the first voyage after testing.
617. In the stays? Not in the stays—in the plates as well as the stays.
618. Do you remember any instance of a stay giving way? We have had stays give way under the double pressure.
619. When they do give way, it is generally by the thread stripping, is it not? No, sometimes the stay will break.
620. What is the ordinary section of one of these stays? Our stays generally run an inch and three-eighths, but the thread reduces it to an inch and a quarter.
621. What pressure ought that to stand, if of reasonably good quality? I should say it ought to be quite capable of carrying thirty tons.
622. Surely then that would not give way under the pressure applied, unless there was some very serious defect—If such a stay should actually part under the hydraulic test, would not that shew that the stay itself must have been very defective? Yes, if it would do so, decidedly.
623. It is not a thing which happens often, I presume? No. But supposing you injure that stay by double pressure, and do not detect it, the next time you get steam up, you will find it give way with less than half the pressure.
624. A stay might stand forty pounds to-day, and twenty pounds applied to-morrow might break it? Yes. The tension may be only on the boiler for a time, and anything strained may resume its original position after it is removed, but constantly repeating the same thing, you weaken and at last break it. If you take a piece of hoop iron and bend it once it will not break, but if you do it a number of times it will break.
625. *Mr. Moriarty.*] Is it not your experience that when a boiler is proved to excess, either by steam or by hydraulic pressure, the injury is not so much to the stay as to the plate, by reason of the bulging between the stays? Yes, but that must injure the stay as well.
626. The thread of the stay? Yes.
627. Is there not some considerable injury to the plate? Yes, the plate will begin to crack all round about the stay. That was the case with the "Clarence's" plates. They were cracked in about half an inch round the hole.
628. Was the bat torn off the rivet? Yes.
629. The "Clarence" was proved to double the working pressure? I believe she had forty-two pounds on by the gauge.
630. In estimating that, did you take into account the additional pressure on this particular part? No, there is about sixteen feet to be added.
631. That is about eight pounds? Yes.
632. Then she was really proved to fifty pounds, not to forty-two? Yes.
633. Did that appear on any of the documents? No.
634. Is that the practice—When a boiler is said to have been proved to a certain number of pounds, does it mean on the steam-chest? It means on the top of the steam-chest, where the gauge is applied. In our case the gauges are all applied at the top of the steam-chest.
635. *President.*] How far is that from the bottom of the boiler? Sixteen feet from where the stay gave way. If we put on a tap on the bottom of the boiler to suit his indicator, he then makes allowance for the height of water—he must go that much over double pressure.
636. *Mr. Moriarty.*] Then, in point of fact, if the bursting on the "Clarence's" boiler was 60 pounds, he had about five-sixths of that on? Yes.
637. Is that the general practice with regard to proving boilers? Yes, that is the way ours have been always proved.
638. *President.*] Sixteen feet is not an unusual height for a boiler? No, it is about the average.
639. *Mr. Moriarty.*] Then, in point of fact, this very place where the stay gave way in the "Clarence" is about the part where the greatest strain will come on the boiler? Yes, it is only six inches water space from the bottom of the boiler.
640. Then, when that boiler was said to be proved to forty-two pounds, it was really proved to fifty pounds? Yes, in that particular part.
641. *President.*] And that is the part most liable to deterioration? Yes.

Mr. John Fyfe called in and examined:—

642. *President.*] You are Superintending Engineer of the Hunter River Company? Yes. Mr.  
John Fyfe.
643. How long have you held that position? About seven years. 24 June, 1868.
644. Of course you are acquainted with the method made use of in testing marine boilers by hydraulic pressure? Yes.
645. Have you any objection to that method? No, I think properly speaking there is no objection to the test by water pressure. My opinion is that it is most safe and convenient.\*
- 646.

\* ADDED (on revision):—At page 97 of a work called "Engineering Facts and Figures," you will find the following extract:—"The test by hydraulic pressure, when carefully applied, is a simple and effective one, and we sincerely trust that its use may become extended." The foregoing extract entirely coincides with my opinion.

Mr.  
John Fyfe.

24 June, 1863.

643. The practice is generally to test up to double the working pressure? That is a different thing. After being put out of the factory and believed by all parties to be efficient, I do not object to a new boiler being tested in that way; but I object to the double pressure being continued at intervals afterwards, as being uncalled for, and likely to be injurious. I do not object to boilers being moderately tested by hydraulic pressure every six months, although in establishments in England they are not tested more than once in twelve months.

647. You consider constantly testing them up to double pressure is injurious? Yes.

648. Do you form that opinion from having observed that injury is occasioned by it? Yes, my own observation has been to that effect for years, and it is strengthened by what I have seen in other works. I might endeavour, with your permission, to give you something like a reason why this pressure is injurious. I am aware that although boilers may have been efficiently made, both with good workmanship and good material, in course of time, by a constant repetition of that testing, we put portions of these boilers out of their original shape, and shake the stays in certain positions, by affecting the formation of the plates wherein the stays are tied. And I have reason to believe, from my own observation, that fracture has taken place, by the stays being impaired not only by that pressure but by the frequent working of the plates.

649. When you say the stay is impaired, I suppose you mean the hold of the stay on the plate? I mean stays put into a boiler for the purpose of stiffening flat places. Some of them are put in as screw stays. If the stay were thus fitted, and this action took place which I have been endeavouring to describe, it would have a tendency to slacken the screw, and the smallest leak of water which might never be seen would cause corrosion to take place, and the screw would very soon be destroyed.

650. Stays are usually fixed by screwing and riveting over? The holes are generally tapped with a very long tap, sufficiently long to go in through the water space; then the stays are made of the best iron and chased to fill that well; sometimes they have a nut inside and sometimes one outside, but not where fire places are, and where there is no nut on the fire-side they are commonly riveted over.

651. Do you think stays are safer for having nuts inside and out—safer than when simply riveted over? I do not know if they are safer. The only reason why a nut is not put outside is where it is exposed to the fire, because they frequently burn off.

652. Do you think stays should be fixed with nuts in parts of boilers not exposed to the fire? Yes, I think they should.

653. Do you consider there would be less liability to accident if stays were fixed with nuts in positions where nuts are allowable? Yes, I dare say there would.

654. Are you aware of the particulars of the accident on board the "Clarence"? I never went on board, but I think I know the particulars.

655. You know the thread of the screw was stripped, and the plate drew off? Yes.

656. Do you think that would have happened if there had been a nut on the outside? So far as I understand the place that gave way, there might have been a nut there.

657. Ought to have been a nut? Ought to have been a nut, I should say. If there were no nut, a repetition of the same thing I have been endeavouring to explain to you would be very likely to affect that place.

658. Was there any reason why there should not have been a nut there? No further than that the person who made the boiler might have thought it was not necessary.

659. There could be no objection to it? I can see no objection to it.

660. You do not object altogether to the hydraulic pressure—How high would you carry it out—what should be the extreme limit on a boiler in use? I have long formed my opinion, and have remonstrated with the engineers of the Steam Navigation Board on the subject, that it is perfectly sufficient if they tested a boiler at half more than the safety-valve was loaded to.

661. Have you ever observed any cases in which boilers have been actually injured by the hydraulic test? I think I have.

662. Could you name any case? I believe the "Collaroy's" boiler gave way at a lower pressure than the safety-valve was loaded to, the first voyage after she had been pressed and had got a certificate.

663. Have you ever observed that any of the boilers under your superintendence have been injured by the hydraulic test? I have observed more than once, that we have been put to considerable expense, but whether that might be considered injudicious on the part of the Government Engineer, I leave to you. It might be thought to justify the testing, that it made us to know there were weak points there. Still I am of the same opinion, that they are more likely to be weakened by the additional pressure than anything else.

664. If I understand you correctly, you would not object to hydraulic pressure being applied occasionally, if it were not carried to more than fifty per cent. above the working pressure? Supposing she carried twenty pounds on the safety-valve, I think she might be tested to thirty pounds.

665. Do you think that by a careful examination of a boiler by an experienced person, any defects could be ascertained equally well as by the help of hydraulic pressure? They might be. But I remember one observation that took my notice particularly, and that was the use of an expression with reference to water testing. I think that party called it "a blind agent," meaning that in consequence of the agency of the water he was enabled to see what perhaps he would not have seen otherwise. I think that view is correct, so that you see I lean towards the pressure by water as an agent for detecting defects.

666. *Mr. Moriarty.* Would you give us your idea of how many times the ordinary working pressure the boilers of vessels running out of this port are generally capable of withstanding. Suppose a steamer is worked up to upwards of twenty pounds, what pressure do you suppose would make the boiler give way? I do not think I can answer that question correctly.

Of

Of course we know that all parts of a boiler are not formed with that mechanical accuracy that they will all resist the same pressure.

667. Take the weakest part? That might get out of shape a long time before it would give way; and if they will get out of shape, the question is, how much more will it take to burst them. We have a good right to look up to such a man as Fairbairn, who has spent a great deal of money in making experiments, and he says it requires a certain amount of pressure, if the iron is good, but not above half if the iron happens to be otherwise. This is a line we can hardly draw, because it is supposed all iron should be good, and all workmanship also. I have observed boilers get out of shape at about double the working pressure—something about thirty-six pounds or thereabouts, if the boiler was working to twenty.

668. *President.*] If three times the working pressure were put on, would you expect the boiler to burst? The generality of boilers are so made that I do not believe they would stand three times the working pressure; and if they are to stand it, I must just turn back to what I said before, that something must be weakened.

669. *Mr. Moriarty.*] If a boiler has become distorted in shape under pressure, is not that a clear proof that it has been injured by the pressure? No doubt of it. It may stand long enough, but I think it behoves the officer in charge of this property not to allow it to run without stiffening it, whether he can bring it back to its original shape or not.

670. In testing the boilers of the steamers that you superintend, is it customary to allow for the head of water in the boiler, in estimating the double pressure—Supposing a boiler is fifteen feet high from the steam-chest to the bottom, and is working to eighteen pounds, and said to be proved to thirty-six—would that be thirty-six pounds on the indicator at the top of the steam-chest? I have many times asked that question, and I have never been able to solve it in my own mind. I am aware that for every two feet of a column of water there is a pound weight per square inch, and you accumulate a good weight that way in a boiler. If the boiler is filled with water, you get a certain number of pounds of pressure on the bottom, according to its height. But it has been argued with me, that the moment you put pressure on, and it shows at the top, there is no more pressure on the bottom than there is at the top. I have actually intended to purchase an additional gauge for testing, and to put that gauge on the lower part of the boiler, to make the experiment.

671. Has the Government Surveyor told you that? We need not say who told me; but I think I may say that opinion is his. Speaking of the "Collaroy," I should be sorry to say anything I did not believe was correct; but I have some reason to believe the same thing was done to two other vessels of that Company.

672. Could you give us the names? I think the "James Paterson" and the "Balclutha," but I could not be positive.

673. How long ago was that? In the beginning of last September the "Collaroy's" boiler was tested to forty-two pounds, and gave way on the first voyage under the usual pressure.

674. Whereabouts in the boiler did she give way? The top of the steam-chest. It was made with angle iron, and I think it gave way about the joint.

675. Could you give us the dates at which these accidents to the "James Paterson" and "Balclutha" occurred? I could not.

676. Was it within the last year or two? They all took place within the inside of two years.

677. With reference to what you said just now, I would ask whether it has been distinctly asserted to you by the Government Engineer, that he did not believe the weight of water in the boiler made any difference? I believe he did not think there was any more pressure on the bottom than there was on the top.

678. Have you reason to believe that is his belief now? He may have had a new light on the subject.

679. How long ago is it since he entertained that opinion? Within the last six months, at any rate. I have no reason to complain of Mr. Dalgleish; he has treated me always very fairly.

680. In proving the boilers of your Company's vessels, is the test gauge, generally speaking, screwed on at the top of the steam-chest? Yes, I have made preparation for all ours in that way, they are so easily got at; in fact I never have much doubt about the bottoms of our boilers. All our boilers in use now are what are called dry bottoms, and the boilers are very convenient to get at; therefore I never have any doubts about anything below.

681. Is it the practice of the Engineer-surveyor to test your boilers to double the working pressure? That has been the practice.

682. Is that double pressure as indicated by the gauge fixed on the top of the steam-chest? Yes.

683. *President.*] The usual height is about sixteen feet, I think you said, from the steam-chest to the bottom of the boiler? Yes, fully that.

684. *Mr. Moriarty.*] What pressure are you carrying on the "Morpeth" now? Eighteen pounds.

685. What was she proved at last survey? About thirty-two pounds; I think not the double pressure.

686. Then supposing there were eight pounds more to be added, for the weight of the column of water, that would bring the proof test up to forty pounds? Yes.

687. Nearly two and a quarter times her working pressure? Yes.

688. Is it the practice for the Engineer to go inside the boiler, after the proof by hydraulic pressure, and make an inspection of it? Yes, I think the practice is that he goes in. He has been in the "Morpeth's" boilers this time, and pointed out several defective stays.

- Mr. John Fyfe. 689. *Mr. Carlisle.*] You do not object to the hydraulic test altogether? I do not, but I object to testing too high.
690. With an old boiler would you object to the test? I would not object with any boiler, if it does not exceed half as much again as the working pressure.
- 24 June, 1868. 691. You think if a boiler will stand that without showing any signs of weakness, it will be safe enough to work for six months? Yes, under ordinary circumstances.
692. And with ordinary care? Yes.
693. *Mr. Russell.*] Do you usually prove your boilers by the hand pump or the donkey pump? All by hand. I like the hand pump that is used for filling the boilers, because that must be kept in good order, and will therefore do the work efficiently.
694. How many men do you generally put on? Generally a dozen men.
695. Suppose one of your boilers was being proved, and the pressure had got up to thirty-six pounds, do you think one stroke of the pump would much increase the pressure? It is hardly possible to get a pump of that kind thoroughly tight, and there may be leakages otherwise, and the least leak of water that escapes when you come to that pressure relieves it to a considerable extent. But if a pump of that size was forced with full power, of course it would send a great concussion on the boiler. I do not suppose there is any great danger from such concussion as that; but I have seen the handle of the gauge spring a good deal.
696. As much as five pounds? I cannot say I have seen it spring as much as four or five pounds. But of course we would be watching the pressure, and would sign to the men to go easy, and keep it just at the pressure we wanted.
697. Have you on any occasion known one of your steamers to be tested by hydraulic pressure in the morning and leave Sydney the same night? No, we never have a boiler tested but there is always something to do to it; therefore the ship cannot be got ready to leave that day. I always lay out my account, when a boiler is tested, to have something to do with it.
698. *Mr. Moriarty.*] And probably the higher the test the more you would have to do to it? Yes.
699. *President.*] Is Mr. Dalgleish sufficiently careful in making use of this test—Have you any reason to complain? No, I have no reason to complain of the way in which he does it.
700. Have you ever complained to him that he was using this test to too great an extent? I have showed teeth sometimes—I have spoken to him sometimes very strongly; but through the piece he has treated me very fairly.
701. Have you ever complained to your Directors that your boilers were being injured in this way? I have said, in some of my reports, that it was the cause of some of these flat plates getting out of shape.

FRIDAY, 26 JUNE, 1868.

Present:—

MR. PELL, PRESIDENT.

MR. MORIARTY, | MR. CARLISLE, R.N.,  
MR. THOMAS.

Mr. John Struth called in and examined:—

- Mr. John Struth. 702. *President.*] You are an engineer by profession? Yes.
- 26 June, 1868. 703. You are aware of the method adopted by the Government Engineer-surveyor, in testing marine boilers in this port? I am aware it is an hydraulic test by cold water, but I am not quite aware to what extent the pressure is carried.
704. His practice generally, but not universally, is to test to twice the working pressure—Do you see any objection to that practice? Very much objection.
705. On what ground? That it is injurious to the boilers—very injurious.
706. Do you object to the hydraulic test altogether, or to the extent to which the pressure is carried? I would not object to the hydraulic test if it were merely a small percentage over the working pressure, and that applied properly, in an easy manner.
707. The test requires care? Great care.
708. Speaking generally with respect to boilers in use, what percentage above the working pressure would you consider it safe to apply? Are you speaking generally of boilers not specially ordered of any peculiar material?
709. Of marine boilers in ordinary use. Take the boiler of any steamer here, which is perfectly safe to work up to a pressure of twenty pounds—in testing such a boiler what hydraulic pressure would you put upon it? I would consider that anything over ten per cent. would be injurious to the average of boilers. Where you have one boiler made to carry a pressure of twenty pounds, a dozen would come under that, and would not be capable of carrying it without risk. Condensing engines of late years are wrought at a much higher pressure than they were formerly, without the material being improved in quality; and much greater risk is therefore run. I think that many boilers made, unless specially ordered of superior material, are scarcely capable of carrying twenty pounds pressure.
710. I do not think you quite understand me. I do not want you to tell me what pressure should be put on the boiler, but what pressure it should be tested to, if worked up to twenty pounds? I would not put more than ten per cent. over the working pressure. I cannot see

see what is to be gained by it. If the safety-valves are properly adjusted at twenty pounds, why should the boiler ever be tested much above that twenty pounds?

Mr.  
John Struth.  
26 June, 1868.

711. Will you tell us what are your reasons for supposing that hydraulic pressure of (say) twenty per cent. above the working pressure should be injurious to a boiler? This is a question it is difficult to treat in the general way we are doing, because I am speaking more particularly of common boilers—cheap boilers.

712. We are speaking of boilers as they ought to be. The test is to ascertain whether they are what they ought to be? A great deal of iron is produced now by the hot blast, and that is weaker and more brittle than the iron produced by the cold blast. Hot blast iron is brittle when cold, but not so when hot. Most boilers are made of this poor, hot blast iron, which is very brittle when cold. It may sustain a good pressure of probably twenty pounds on the inch when hot, but is not capable of bearing much more when cold. It is very brittle indeed, but when heated up by steam it is stronger than when cold. Then, again, in constructing marine boilers, they are more complicated than in former days. All plates of iron, especially the commoner sorts, have a grain, the same as wood, and as the plates are mostly bent cold, the grain is injured. I had the superintending of two sets of boilers lately in England, for an owner out here, and I watched the process very narrowly. These plates get strained, and the slightest extra pressure on them may cause them to start, whereas, if there had not been any extra pressure they might never have failed; but if you come to put on double pressure, you just ruin the iron and make them no longer serviceable. I consider that arises from the cheaper description of hot blast iron being used.

713. It is not the object to adapt this test to inferior boilers or inferior iron, but to ascertain whether any defects exist, from whatever cause, which would render the boilers unsafe. The regulations with reference to testing would proceed, I presume, upon the supposition that the boilers were of good materials, and were safe to work up to the pressure allowed on the safety-valve. The test is not to be adapted to boilers existing, but to ascertain whether existing boilers are fit for use. Because there is bad iron in use, that is no reason why the test should be lowered to meet the circumstances. The boilers should rather be improved to meet the test which, in the opinion of competent persons, should be applied? My reason for objecting to any testing over ten per cent. beyond the load on the safety-valve is, that I consider three-fourths of the boilers are made of such iron as I have attempted to describe; and therefore, I think it is unwise to put on much more pressure than is actually on the safety-valve, because I cannot see the object of it, if the safety-valve is properly looked after.

714. Do you think a boiler made of this inferior material, which is capable of standing a pressure of twenty pounds, but unfit to be tested to more than 10 per cent. beyond that, is a fit boiler for use? I do. If the safety-valve is adapted to twenty pounds, how are you going to get any more on it?

715. Do you not think the deterioration which gradually goes on would reduce the capability of the boiler to bear the pressure? I do not think deterioration goes on so rapidly as that. If the boiler is neglected, it is a very different matter.

716. Independently of any want of care, is not deterioration necessarily going on? Not so rapidly.

717. Is it not a very small margin to observe, only two pounds out of twenty? I would not think so; and if I had boilers of my own, left entirely to my own management, I should certainly not test them to a greater extent than what I have stated; not on the score of economy, but I should consider it much safer than straining them to a higher point. You scarcely ever hear of great accidents with old boilers; it is new boilers that the greatest disasters occur with.

718. What is the practice as to testing new boilers? By hydraulic pressure generally.

719. What is the general test? I am not aware of any fixed amount. The boilers I speak of, that I had made in England, I had tested not much higher than the working pressure, because I consider it injurious.

720. Even to new boilers? Yes. I had those made that are in the "Fire King," as well as some others that were sold to some of the other Companies. I have always found that if a new boiler will bear the weight of the water in it and be tight, there will be no fear of going to work with it at a moderate pressure.

721. *Mr. Moriarty.* Do you not think that, with new boilers, it is a great advantage to ascertain clearly, by a test, whether they want any additional stays in any parts that may have been overlooked in the manufactory, or in the design? Yes, I think something like 10 per cent. will shew that.

722. For new boilers you would not go any higher than that? I hardly think I would, because, if the plate is ordinary common iron, it is apt to get injured even more than in boilers that have been in use some time.

723. Do you not think the ultimate strength of a boiler should be from five to six times its ordinary working pressure? In high-pressure boilers, constructed on a different principle, I should have no objection to 100 per cent. They may be pressed to double the working pressure with the greatest safety.

724. Are we not verging on high pressure with regard to low pressure boilers now? We are so.

725. And might not your rule with regard to high pressure boilers be applied with some considerable force to what are called low pressure boilers, when they go up to 20, 30, or 40 pounds? Just so. But in marine boilers you are obliged, to a great extent, to construct them to suit the place where they are put, and so forth; therefore they cannot be constructed on the same scientific principle for strength as a locomotive or land engine boiler on shore could be. Therefore there is the greater necessity for not over-straining a boiler in the

- Mr. John Struth. the first instance. A boiler with flat sides is at a great disadvantage, and it must be recollected that a pressure of 20 pounds to the square inch gives considerably over a ton to the square foot.
- 26 June, 1868. 726. You provide for that by means of stays? It requires a good number of stays.
727. Supposing the boilers are made to meet that, being stayed on the flat sides with (say) an inch of section of stay to each square foot of boiler? If the stay is properly constructed, that would, of course, meet the case very much.
728. Say an inch and a quarter stay, tapped into the boiler? That is a poor affair, unless it is nitted also.
729. I was going to say that it should be nitted. Would you not think that stay and boiler surface could be safely made to carry more than the working pressure? I should not like to be accountable for anything with 40 pounds on it.
730. I suppose you are acquainted with the construction of marine boilers as at present used? Yes.
731. In your opinion, is any marine boiler that has recently come under your observation capable of carrying five or six times the ordinary working pressure? I do not think so.
732. That is about 18 to 25 pounds? Yes.
733. What do you think they would stand before giving way? I saw some tested during the time I was lately in England. Friends of mine were having boilers made in different works; and I have seen some low-pressure boilers tested up to 50 pounds, but they would not stand the test of the straight edge upon them.
734. What pressure were they intended to work at? Twenty-five pounds.
735. Then they were pressed to double? Yes. One I went to see was tested four times before it could be got to stand. The plates bulged, and I do not think they ever went fairly back again. They went out of shape completely; and that was only at a hundred per cent.
736. Wherever you have seen the practice of testing new marine boilers in England at double the working pressure, you have seen them permanently alter their shape? The shape was altered during the time the pressure was on, and I do not think they ever returned to their original shape again; because if you bend iron when cold, it is not like steel—it will not come back again.
737. Do I understand that the greatest care was taken in proving these boilers by means of straight edges, to see how far it would be judicious to go? Just so; and as they kept working up the pressure, they were always stopping and trying again, and watching in the most minute manner, and when they came up to a hundred per cent., which they call a heavy pressure, the water was put in very gently indeed, and the gauge watched with the greatest care.
738. Do you think that if that pressure had been carried on to 200 per cent. they would have stood it? I do not think so.
739. *President.*] Do you think they would have given way altogether—that some stay would have given way? I think so. If 20 pounds on the inch gives upwards of a ton to the foot, it becomes an immense pressure.
740. *Mr. Moriarty.*] Was not the fact of some of these stays having given way under this proof, some argument in favour of using the proof, because it gave an opportunity of putting in stronger stays where necessary? No, because the boiler stood very well up to the working test, and if the safety-valves are properly adjusted, there could not, of course, be any more pressure on the boiler under steam.
741. Although it might stand the test up to the working pressure, might not the condition of the boiler become so deteriorated within (say) twelve months, by corrosion, that something would give way under steam? The engineer or person inspecting would see whether the boiler was deteriorating.
742. Is it not your experience that boilers are not generally well looked after? As a rule, they are not; but I do not think the pressure is any advantage, even in that case.
743. You are aware that the best authorities lay it down that new boilers should be proved to twice or twice and a half the working pressure? I do not think half the new boilers would bear it.
744. Ought they not be made to bear it? No, I cannot see the object of it.
745. If boilers were subject to this severe ordeal, do you not think the inevitable consequence would be that they would be made stronger and of a better shape than if allowed to pass at only the working pressure? If we were to have them as they ought to be, perhaps that might be the case.
746. Do you not think that if the rule were rigidly enforced it would ensure it? I am very doubtful of that. If a steam test were applied in place of the hydraulic test, I should have no objection to go higher.
747. Do you not think that would be very unsafe? It would not be so safe as the hydraulic test, but then it would not be so trying to the boilers.
748. Does it give you the same opportunities of examining the boilers under pressure? No, I admit that.
749. *President.*] Suppose a bridge were to be made intended to carry 1 ton and no more—if it were under such regulation that it would be impossible for more than 1 ton at a time ever to go on it—do you think that bridge would be safe if it would just bear twenty-two hundredweight, and no more? I do, if it carried it, and the weight was never to be increased.
750. Such a thing as deterioration goes on—unknown sometimes? I grant you that, but it does not deteriorate so rapidly as to be dangerous on that account, if cleaned and kept in order.
751. Are you aware how much, in such a case, railway engineers would require the bridge to be tested up to? A good deal would depend on climate. 752.

752. Are you aware what the rule is? I cannot speak positively.

753. Here the engineers would consider it necessary to test that bridge up to four tons, before they would report that it was safe? I do not say it is not so; but running a train over a bridge is a different thing from simply laying a ton upon it.

Mr.  
John Struth.  
26 June, 1868.

754. Would you consider a boiler, with stays screwed through, and riveted over in the flat parts, safe? No.

755. If an accident should happen in such a case, by a stay giving way, would you not consider that it would naturally follow from the construction of the boiler? Yes, just so.

756. Are you aware that the stays of the "Clarence's" boiler were fixed in that manner? Yes, I read that in the evidence.

757. If you heard that an accident happened in such a case, would you think it unnecessary to go beyond that to account for it? I should decidedly ascribe it to the want of nuts. It was only in the latter part of my time that screw stays were introduced—since the great change in the increase of pressure on marine engines. There was no such thing in my early days; indeed there were very few stays at all; it was thought if they wrought up to anything more than three or four pounds it was a great pressure on marine engines. Then when they began to introduce these screw stays, there was always a nut put on the point.

758. This way of screwing and riveting over-cold is a little cheaper? It is merely the saving of the nut. If you put a screw, you must rivet it cold, and then it is no rivet at all.

759. *Mr. Moriarty.*] You would not think an inch-and-an-eighth screw bolt, riveted over cold, could carry a pressure of fifty pounds to the square inch? No; I think if you were to suspend it, and put a ton weight on, it would be dangerous, especially if it had been subjected to a pressure a good many times, which might cause it to alter its shape and a little leakage to take place, so that it would corrode and be eaten away. That is one reason why I am opposed to carrying an excessive pressure in the tubular boilers, because your tube plate will spring slightly in a boiler that has been two or three years in use, and there will be a little leakage when the boiler is cold. All that deteriorates and wears the hole larger.

760. Also, if there are leaks through the back tube plate; the leakage is very apt to drop into the bottom of the ash-pit? Yes, you never know the extent of the damage it is doing.

761. Is it your experience that the bottom of the smoke-box and ash-pit corrode more rapidly than other parts of a boiler? Yes, I think they do. I have always found, in my experience, that those parts required replacing sooner than others, with the exception perhaps of the take-up.

762. *President.*] Is there anything that you can see to justify running passenger steamers with stays placed in that way, screwed through and riveted over? I think they ought to be condemned.

763. You think there is nothing to justify it? No. The head of a bolt wears a very long time indeed; I do not know that ever I saw the head of a bolt give way. You can always put a nut outside.

764. Would not the head be just as liable to burn away as the nut? No; the nut not being part and parcel of the bolt would expand, and the screw be slackened a little. But I do not see why a nut should not stand sufficiently well.

765. I ask these questions particularly about the use of nuts, because on the evidence there appears to be a difference of opinion on the subject. Some engineers have a great objection to the use of nuts, and have told us they do not think a stay is any safer with a nut than without it? The contrary is my opinion. If I had a nut burned off every trip I would put on a nut. I should not consider it any stay at all simply tapped into the boiler.

766. *Mr. Moriarty.*] Supposing you were putting in a stay, and it did not go fair through, and you could not screw the nut right up against the plate, you would have to bevel the nut, which would be a tedious operation, or else bevel the head of the stay? If the head would not come up, you would have to put a thick-sided washer on. I dislike screw stays altogether. There are many other descriptions of stays that can be used, but they are too expensive for the cheap way of doing things which is adopted now.

767. *Mr. Thomas.*] In the case where you noticed the stays give way on two occasions, might not the third lot of stays put in have been injured by the test, so that afterwards that boiler might have burst under a much less pressure than was put on it at the time of testing? They were new stays put in each time, and made stronger each time.

768. Although those stays did not give way the last time, might they not have been injured? Probably, in carrying out the second test, if they had stopped at a pressure of a pound less than they did, the stay might not have gone, and yet it might have been injured. In that way also plates get injured, and in time when the other portion of the plate, that was left got worn a little more, they might burst. The boiler would have lasted longer provided it had not been subjected to that severe test.

769. Although a severe test put on boilers might raise the standard or quality of boilers, it may not afford any safety to the public, because if there is a test you may injure the boiler to a certain extent, and then you are no better off than with a lower class of boiler and a lower test? I do not think you ensure any better article. People will go for cheap things, in boilers as well as everything else. I think myself, as a rule, that one hundred per cent. is more than is necessary, decidedly more.

770. *President.*] You think ten per cent. is enough? I really do. Carefully and judiciously applied it will not injure the boiler; and if the safety-valves are kept in order, I do not see how the pressure is going to get above the amount allowed.

771. *Mr. Moriarty.*] The object is, that a boiler which has stood double the working pressure

Mr. John Struth. pressure shall be safe to go on working for six months? Probably if that pressure had gone on for a pound more, it would have sent it off.  
 26 June, 1868. 772. Have you ever heard of boilers giving way under the ordinary steam pressure shortly after they had been proved to double the working pressure? No, I am not aware of anything of the kind of my own knowledge.

Mr. Edward Evans called in and examined:—

Mr. E. Evans. 773. *President.* You are an engineer by profession? Yes.  
 774. You are aware of the method at present in use here of testing marine boilers? Yes.  
 26 June, 1868. 775. It is carried generally to about double the working pressure? Yes, by hydraulic pressure, repeated every six months, or even less.  
 776. Do you see any objection to that mode? I think it very injurious to the boilers.  
 777. Do you object to it altogether, or to the extent to which it is carried? Altogether for old boilers, not for new ones.  
 778. You think old boilers may be safe to use, and still not safe to be tested by hydraulic pressure? Yes.  
 779. Have you ever known any particular instances in which boilers have been injured by the hydraulic test? I have never seen it applied before.  
 780. On what account do you consider it injurious? It tends to bulge the plates when the boiler is cold, throwing a different strain on the iron to what it would have to bear when under steam. It is a different pressure altogether.  
 781. Different, inasmuch as the iron is cold? It is more likely to bulge than if it was hot.  
 782. When you speak of old boilers, do you mean old boilers in use? Yes, that is, boilers in ordinary use.  
 783. Would you not have them tested at all? No, not the square marine boilers.  
 784. You think their efficiency could be sufficiently determined by inspection? Yes, quite sufficiently.  
 785. Do you not think defects might be discovered by this hydraulic test that might escape attention otherwise? Really I do not see that it would show anything, except a bulge in the plates perhaps.  
 786. Might it not show leaks? Yes, it would show leaks.  
 787. That might not otherwise be noticed? Yes.  
 788. Is not a leak a dangerous thing, causing corrosion? Yes.  
 789. Might not the hydraulic test show that leak? Yes; but a defective part might be tight then, and not be tight when the steam was up.  
 790. I was under the impression that wherever steam would get out, water would get out? Boilers under steam and under pressure are so very different, that this condition does not always apply.  
 791. Do you not think that if steam should come out under a pressure of twenty pounds, water would come out under a pressure of forty pounds? Sometimes it would not do so.  
 792. Do you know any specific case in which any particular boiler has been injured by the hydraulic test? The boiler of the "Clarence," I should think, was injured by the hydraulic test.  
 793. Have you any personal knowledge of that case? No, I never examined it.  
 794. You only think it may be so? Yes.  
 795. Not from any actual use of this test? I have never seen it applied before.  
 796. Have you seen it applied here? Yes.  
 797. Your opinion is not formed from actual observation of injury having resulted, but you simply think it would do injury? It would do very great injury.\*  
 798. *Mr. Moriarty.* Was it not your practice to test boilers, when you were Engineer to the Steam Navigation Board? Only the high pressure ones.  
 799. I thought you pumped up all the low pressure ones as well? No, only in one or two instances when they had been under some repair.  
 800. But you did prove the high pressure boilers? Yes.  
 801. What percentage over the working pressure did you use? Double the working pressure.  
 802. Why would you consider it safe to apply it in one case and not in the other? There were several reasons for it. In the first place, the boilers were elliptical-flue boilers—rather of a dangerous form. Then it was also necessary to satisfy public opinion, and to keep the pressure as low as possible.  
 803. *President.* You speak of elliptical flues—that is the places where the fires are? Yes.  
 804. Does that form make them more dangerous? Yes.

805.

\* ADDED (on revision):—I am of opinion that it is a strain on the material of a boiler to which it has not been designed to apply in practice; it bulges the plates, strains the stays, and that possibly in positions that cannot be examined; attended with the probability of imperceptible injury, to be afterwards acted upon by the natural and mechanical forces that come into operation on the application of heat in the generation of steam. It tends to destroy that equilibrium of form which these forces and laws have caused the different parts exposed to the action of the flame of furnaces to assume, and is consequently attended with great and repeated deterioration of the strength of the material, upon the alternate action and reaction of the deviation from, and recovery to, that form which natural laws dictate. It gives an artificial confidence to many who have the care of boilers, under the supposition that the result of such hydraulic pressure to which they are subject, is that of undoubted strength; consequently, is likely to interfere with that carefulness and examination which boilers require, and so it is a system not only productive of repeated injury, but also that of a negligence in care.

805. *Mr. Moriarty.*] Did you uniformly apply the pressure, or merely keep the power now and then to apply it, if you thought they wanted to run too high? No, it was always done in the case of these boilers. Mr. E. Evans.  
26 June, 1868.

806. Do you not think the hydraulic test might develop a thin plate which otherwise might pass a man examining merely with a hammer? I should think if he touched it with a hammer it would sound as being thin.

807. Suppose he did not happen to touch it with the hammer, might not the hydraulic test be useful, by making it bulge and show the thinness? He might not see that bulge, and if it escaped him, the boiler might blow up the next time steam was got up, because the bulging would be an injury.

808. You think on the whole the hydraulic test is not advantageous to low pressure boilers? I do not think it is.

809. You are pretty well acquainted with the boilers of vessels belonging to this port, I think? Yes.

810. What percentage over and above the working pressure would you say they could carry without giving way? Do you mean by water pressure?

811. By any pressure? That depends so much upon their condition and form. They are as good here as in any part of the world perhaps.\*

812. Do you think they would give way with three times the ordinary working pressure—most of these marine boilers? I certainly should not like to put three times the pressure of steam upon them.

813. Do you think it would injure them or make them give way? It is possible they would give way.

814. I want to know generally your opinion. Would they stand ten times the working pressure? No.

815. Would they stand five times? I would not like to put on much more than they are designed to carry.

816. Then you think what they are designed to carry is a safe maximum? Yes.

817. That is, the ordinary working pressure? Yes.

818. Do you think anything above that would be likely to carry them away? I can hardly say; boilers vary so much.

819. Suppose a boiler carries twenty pounds on the safety-valve, do you think sixty pounds would burst it? It might do it some injury.

820. Something would give way, you think? It is very possible.

821. *Mr. Thomas.*] Do you know of any boiler that you think you could with safety put five times its working pressure on? No.

822. *Mr. Moriarty.*] Do you know of any one that would stand three times? I should not like to put three times, or twice, steam pressure.

823. You think under that they would be very apt to give way? Yes.

824. *Mr. Thomas.*] You would not like to stand near them? No, certainly not.

MONDAY, 29 JUNE, 1868.

Present:—

MR. PELL, PRESIDENT.

MR. MORIARTY,

MR. CARLISLE, R.N.,

MR. THOMAS,

MR. RUSSELL.

Mr. Thomas M'Arthur called in and examined:—

825. *President.*] You are a partner in the firm of M'Arthur and Co., Waterview Bay? Yes. Mr. T.  
M'Arthur.

826. You are aware of the method at present in use for testing marine boilers? Yes.

827. Have you any objection to it? None whatever.

828. Are you aware that it is common to test boilers, by the hydraulic pressure, up to double the working pressure? Yes. I think if they are not fit to stand double the working pressure, they are not fit to be in a ship, or factory, or anywhere in use.

829. Do you think it possible for a boiler in good condition to be injured by such an amount of pressure? No, I never knew of a single accident. I have detected faulty stays sometimes with it.

830. You were formerly Superintending Engineer to the Australasian Steam Navigation Company? Yes.

831. Did you leave that Company before Mr. Dalgleish obtained his present appointment? He joined just about the time I was leaving, I think.

832. Did you ever see him testing any boilers? I have seen him testing our own boilers at the wharf.

833. Before Mr. Dalgleish held office, were boilers tested by hydraulic pressure? No. I have tested them sometimes myself, but not by order. I have done it for my own satisfaction, or because it was required by the specifications, or when altering the form of a boiler I have employed the test to see whether I was right in staying them.

834.

\* ADDED (on revision):—And as water pressure is a dead pressure, whereas steam pressure is a living force, inasmuch as the whole form of boilers is in motion according to the variable temperature of the different parts, which force is irresistible, and injudicious staying to overcome the consequences attendant upon hydraulic pressure is inapplicable to that of steam, and as the generation of steam is their use, no other consideration should be allowed to interfere.

- Mr. T. 834. You have not had many opportunities of witnessing Mr. Dalgleish's operations? I  
M'Arthur. have seen him pressing some of the boilers. He tested one I had made for the French  
29 June, 1868. Government, and there was a commission held upon it as well.
835. For what vessel was that? The "Marceau."
836. It was done at the instance of the officers of the vessel? It was done by specification.  
The boiler had to be tested, and the iron also before it was put in.
837. A new boiler? Yes.
838. What was the working pressure? Twenty pounds.
839. How high was the test? About forty-two.
840. Rather more than double? I dare say it was more than that before we stopped. I  
offered to press it higher if they wished.
841. It seems to be the opinion of several engineers that, although the method may be  
adopted for testing new boilers, with old boilers it is a different matter? I do not see why  
it should not be adopted with one as well as the other when necessary. The water pressure  
merely indicates any weak points, and prevents accidents. I have never known a single  
accident to occur by water pressure.
842. Have you known of accidents occurring soon after? Boilers are supposed to be under  
inspection at the same time that the testing is going on, and any spring in the plates or  
bulging anywhere, where it is too weak, can be made good, and the test applied again.
843. It appears that Mr. Dalgleish, in testing boilers, places the gauge on the top of the  
steam-chest, which is somewhere about sixteen feet above the bottom of the boiler? Yes.
844. You are aware then, of course, that the pressure on the bottom of the boiler is about  
eight pounds more than at the gauge? Yes.
845. So that if tested to forty pounds by a gauge so placed, the lower part, which engineers  
seem to think most liable to deterioration, would be pressed to forty-eight pounds? Yes,  
it will add to the pressure indicated that much more; but I have seen the gauge put in  
front of the boiler.
846. Would you think it safe, if a boiler were intended to work at a pressure of forty  
pounds, to test that lower part up to forty-eight? A boiler that will stand double pressure,  
will stand, I should say, three times the pressure, if well made.
847. You think it would not be liable to injury? No, I have never known boilers injured  
by it. I have known them show signs of weakness, and it was necessary to strengthen  
them; but that is what the water test is for.
848. As an engineer, or in any capacity, have you tested boilers? I have, frequently.
849. What is your practice with old boilers? I test to double the pressure they are  
carrying. If they are working at twenty pounds, I test with forty.
850. That is your practice? Yes.
851. Have you ever heard any complaints made by persons belonging to the various Steam  
Companies that their boilers were being injured? The only thing that ever I heard was  
that they do not like it. It necessitates keeping the valves in first-class order, and all the  
joints must be good, or they cannot get up the pressure. The test ensures that all the  
fittings about the boiler are correct, and sometimes that causes inconvenience to vessels  
which have not sufficient time between their trips to get the necessary work done. Even in  
the works it takes time to make valves and joints all tight before they can bring the pressure  
up to what is required. When the test is on, the boilers are tried by measuring the parts  
inside and outside, to see whether there are any indications of weakness while under  
pressure; and it takes a good deal of time and trouble to make up all the defects that are  
discovered in this way.
852. Do you know from experience that defects can be discovered by the hydraulic test  
which cannot be detected otherwise? Yes. Of course you cannot try steam to double  
pressure, but with water there is no danger, and you can see where plates indicate that more  
stays are required, and that the boiler is too weak.
853. Speaking generally of marine boilers in this port, what ratio do you suppose their  
ultimate strength would bear to the ordinary working pressure? That all depends upon  
the strength of them, and whether the stays are properly divided.
854. Speaking of boilers as they are? Without examining a boiler I could not say any-  
thing about it.
855. Suppose a boiler were working at 20 pounds, would you expect 60 to burst it? No;  
but some parts might give way, and want strengthening.
856. You would expect something to give way at 60? I do not know that I would; but  
it may not be sufficiently stayed. If you examine a boiler and see where the stays are  
placed, you can almost tell where it will give way. A great deal depends upon the care  
taken of boilers.
857. Would you expect 80 pounds to burst an ordinary boiler working up to 20 pounds?  
They say they ought to stand six times the ordinary pressure, according to past experience  
of eminent men in England; but I have never gone to that extreme. Hydraulic pressure  
is the only way of testing work. Work may be bad, and you cannot see it. You may  
believe it is all right by examination, but how can you be sure? There may be defects in  
the iron plates, or in the stays, or in the riveting, which cannot be found out merely by  
examination.
858. Some engineers are of opinion that by examination by the eye and hammer they can  
determine sufficiently whether there are any defects—Does that coincide with your opinion?  
I have often gone into a boiler and said how much pressure it would stand by testing in  
that way, but I do not think it is sufficient to trust to that kind of examination. By  
using water pressure to a given amount, you protect yourself if anything goes wrong.
859. You are aware, perhaps, how the stays which gave way in the "Clarence's" boiler  
were fixed? I read of it—I know how they were fitted. 860.

860. Do you think that is a good way of fixing them? Yes, a very good way.
861. Do you know any better way? Some persons adopt nuts; but in many boilers that I have seen the holes are not fair, and then the nuts cant, and you have to put on a washer. Stays are not properly fitted when they are fixed in that way.
862. Is there any objection to that? I do not consider it is workmanship at all.
863. Is there any reason why nuts should not have been used in the part of the "Clarence's" boilers that gave way? No, no particular reason.
864. Do you think a stay is safer with a nut? No, I cannot say I do. Many causes of accident may transpire in a boiler. There might be scale and deposit on the plate, preventing the water acting on it; and the way the bridges are made, there might be a mass of soot or ashes, red-hot almost, during a voyage from Brisbane to Sydney; and this continued for a time might loosen the threads and cause the stays to give at the weakest parts.\*
865. You think that part—the combustion chamber—might have been red-hot? It might have been hot, not red-hot, and keep the heat by this hot ashes and dust of coal, during a voyage of forty or fifty hours. That is sure to draw. The furnace sides will draw sometimes where the brickwork is, and waste away as well.
866. Do you think it is impossible that the hold of one of these stays may have been injured by the hydraulic test applied three months before, causing leakage and consequent corrosion? If there were any indication there it would be seen in the testing, when they were examining the boiler. The plates must rise if not sufficiently stayed, and that is the time to secure them again.
867. Might not the stay have been injured by the hydraulic test, without its being observed at the time? No; if there was any weakness, it must be indicated at the plate.
868. The accident happened, we are told, by the plate drawing off the stay—the threads of the screw were stripped. Would that have been so likely to happen if a nut had been fixed on? The thread might not be a good one in the bolt, and then the nut would come off in the same way. There may have been some undue action in that boiler that no one knows anything about. I adopted nuts long ago, and carried them on for a long time; but I found I could make a far better job by having a fine thread on the stay and riveting over.
869. Riveting cold? It is not long cold when they begin to hammer. It may harden a little at first, but it softens as they go on with it.
870. Do you not think this hammering of the iron cold at first, at all events, hardens and injures the quality of it? It softens if you keep at it. I have tried, in many instances, putting a hot iron on it to anneal it down, but I do not think it is any good; it warms the bolt right through, and weakens the thread. Proper screws ought to stand, unless there is some undue action. It is stated that that boiler was thinner there by one-sixteenth of an inch than the original thickness of the plate. Why was it thinner there, and not in another plate?
871. *Mr. Moriarty.* I think you said you consider that all boilers should be tested to twice their working pressure? Yes.
872. Does that apply to boilers when they are new, or after they have undergone repair; or would you apply it at frequent intervals to boilers in ordinary service? I think it does interfere a little with the working of vessels if done every six months. Every twelve months might be sufficient, when the boilers are known to be good. It might be done oftener, once in three or four months, when the boilers become aged. If a boiler shows good work, and not much deterioration of the stays and angle irons, or furnace plates, or back end plates, then every twelve months should be sufficient; but if by examination there were shown to be deterioration going on, it would be necessary to do something, and six months might then be enough to let the boiler run without testing. It does not do to make a great quantity of work to satisfy an idea; some boilers run longer than others without showing much deterioration. I think a boiler should be at all times capable of bearing double its working pressure.
873. Without injury? Without injury. A boiler may be carrying twenty-five pounds for (say) twelve months, perhaps two years, and everything be going on well; but if you think, on examination, there is rather too much pressure, you may reduce it (say) five pounds or so, and then press your boiler to double that.
874. If it is necessary to reduce the testing pressure, it is necessary also to reduce the working pressure? Yes.
875. Suppose a boiler is getting old, it has been (say) four or five years in a ship, and has undergone ordinary wear and tear and occasional repairs; that boiler gets a three months certificate, and goes on with three monthly certificates for twelve months—Would you consider it sound practice, under these circumstances, to prove that boiler to double its working pressure, or would you rather trust to a very careful examination by the eye and hammer, or such other examination as you could make—do you think it would do the boiler any harm which might escape detection, if it were constantly being tested to double the working pressure? I cannot see any difference between an old boiler and a new boiler; if it has to bear a given pressure, it ought to bear double that amount.
876. You think the same principle holds good? The same principle holds good all through, and the test is even more required by old boilers. Why should people trust their lives to pent up vapour like that in an old boiler more than a new one? If there is any slight stoppage at sea, the pressure may get up perhaps four or five pounds.
877. The question is, whether it is possible for a boiler to be injured by the excessive strain of

Mr. T.  
M'Arthur.  
29 June, 1868.

\* ADDED (on revision):—This action would ensue when the water was blown out of the boiler at the termination of the voyage; the heat left under the bridge would, to a certain extent, distort the plate at that particular part.

- Mr. T. of double the working pressure? I have seen a great deal, and I never saw anything wrong except when the water did its duty and showed defects. I have seen stays being renewed in boilers—long stays and pins being put in; boiler makers are not very particular if they can get the pin in at all. That pin may have all the strain of the boiler, and when you put on the pressure the boiler goes to its original position—you hear it breaking. If that boiler had not been tested, and there had been any sudden stoppage of the machinery, or a pressure inside, it might have burst some more of them.
- 29 June, 1868. Mr. Arthur. 878. *President.*] You refer to testing either new boilers or those that have been under repair? It is the most effectual way to test before you begin to repair, but we do not get time to do it; the bustle is to get the repair done and let the ship away.
879. You are aware that locomotive boilers are sometimes worked up to one hundred and fifty pounds? Yes.
880. Do you think they ought therefore to bear a test of three hundred pounds? I think so generally. From the way they are made, they are sufficiently stayed for the pressure they use.
881. You think they ought to bear three hundred pounds, or they are not safe to work to one hundred and fifty? Plenty of people run boilers whether they are safe or not; but if they want to do justice to their employers, whoever they may be, they ought to see that these boilers are thoroughly tested for safety.
882. *Mr. Moriarty.*] Do you think the practice of testing, as a rule, would ensure better design and better workmanship, if they were made to undergo this severe ordeal? Yes, they must have good workmanship and good material to stand the pressure. You cannot be certain of the plates at the best of times.
883. When you were managing for the Australasian Steam Navigation Company, did they ever object to the proof of double the pressure? The Company never interfered; they entrusted all that to me. I never knew them once to interfere about what we were using; they always gave me what I ordered.
884. *Mr. Russell.*] With regard to the "Clarence's" boiler, was that boiler manufactured at the Company's works while you were Superintending Engineer? Yes.
885. In your opinion, it was not possible that boiler was injured by being proved on the last occasion previous to bursting? No, I have never seen any indication of it on any boiler; and why this one?
886. We are told this boiler was proved up to forty-two pounds, and it is possible the pressure may have gone up to forty-five pounds; adding the weight of water, eight pounds, it would make it at least fifty pounds on that particular part of the boiler. Is it not possible that the screw of the stay might have been injured by the plate bulging a little under the pressure, opening the inner side of the hole and weakening the screw, or perhaps the screw of the plate riding on the screw of the stay? That is only supposition. I cannot say whether that was the case or not, or why it should be so. If the boiler was examined, every plate bulging should be seen. The question with me is, why was that plate thinner there than in any other part of the boiler?
887. It is your opinion that the pressure of fifty pounds on that part of the boiler is not likely to have been the primary cause of that accident? No, I cannot see it; the boiler ought to stand far more than that.
888. You are of opinion that the plate may have been injured by being corroded by leakage mixing with the ashes and soot accumulated there? Yes. The question arises with me, how does that plate become thinner there than elsewhere? A boiler of that kind should have no leaks in it. Blowing off the boiler is very injurious indeed without everything is cleared out. Then there is the working of the furnaces by different firemen; they do not fire always exactly alike. There will be more coals at one part, and the flame may strike in one place, and the fire changing again, it may go to another place. That may displace the water to such an extent that the iron may become very malleable indeed, and yet the boiler is sufficiently stayed to stand the pressure.
889. *Mr. Moriarty.*] Do you remember what you proved that boiler to when it was new? It would be forty-two or forty-four pounds, very likely. We did not keep any record.
890. How long was that before this accident occurred? The boiler was about twelve months in the shop before I tried it. It was fitted up by Mr. Jaffrey just before I was leaving; and the vessel went to Brisbane, and remained in that trade a considerable time before she came back here again.
891. How long had it been at work before the accident? About two years.
892. *President.*] It appears that this part of the boiler stood fifty pounds test pressure without shewing any signs of injury, and still, according to the evidence at the inquest, these stays gave way at a pressure of nine pounds, three months afterwards—How do you account for that? If I had seen the inside of the boiler before it was touched, perhaps I might have arrived at some opinion whether the stay had been bad, or the threads had been bad.
893. If the threads had been bad, would they not have given way under the fifty pounds test? Yes. After a job is once disturbed, no man, however good he is, can tell what is the cause of an accident like that.
894. *Mr. Moriarty.*] Suppose the workmanship to have been thoroughly good in the first instance, and the plates pretty fair also, and that after two years of work, with ordinary wear and tear, the thickness of the plate in the ash-pans had diminished, do you think bulging might then be expected under excessive pressure? If the plate has been subject to being lifted up in any way when the boilers were empty, that must affect the weakest part, and that may have been the rivet. They say the boilers were all tight; and this part was shut off by iron bridges.

895. Could the water run down to the front? Yes, there is a hole there for getting in under the bottom of the bridge; but it is not every day that is pulled down to be examined.

896. Perhaps you can tell us whether it is the practice in Queensland to prove boilers to double the working pressure? No.

897. Supposing it to be so, do you think it is a power which should be put into the hands of any but the most thoroughly competent men? No, I think a man intrusted with such a power ought to be a competent man, and an honest man, independent of any partiality or anything of that sort. Without examination, pressing is not worth anything.

898. That is the main thing,—whether it is not a dangerous power to put into the hands of any but the most thoroughly experienced and careful man—It might be liable to do injury if the pressure got up suddenly? You cannot raise it suddenly with the pump.

899. Supposing a boiler is proved here to double the working pressure, gets a three months' certificate, and goes away to one of the adjoining Colonies, is pressed there again, and gets another certificate, then comes back here, and her certificate from this port being up, gets pressed again—Do you not think the frequent repetition of this process is liable to do injury? The surveyors should accept each other's surveys.

900. Supposing that by law or for other reasons they cannot do it, would not these frequent hydraulic proofs injure the boiler? I cannot see that injury would be done, as long as the test is carefully applied. I know if the "Agnes Irving" had been tested with cold water there would never have been any explosion there. Engineers of vessels are sometimes very careless. If a stay is indicating that it is getting bad, an engineer will sometimes cover it up so that it cannot be seen, and the defect can only be found out by applying pressure. The trouble it gives is generally most considered by all people who have to do the work which the test shews to be necessary. It gives them the trouble of making everything tight—valves, joints, and so on.

901. Would you hold with its frequent application, or only reserve it for special occasions, when proving a new boiler or making considerable repairs in an old one? I consider there should be special examinations of the boiler frequently, and testing at times when it is considered necessary. As a boiler gets older I believe it wants more inspection than ever, bearing in mind that the pressure should be reduced according to the judgment of the party inspecting.

902. Would you still apply the test? I would have no objection to do it with the work I am connected with; in fact, we do it now; but they have made plenty of boilers when I was at home without any pressing whatever, and we never had anything come back as unfit for work, or any accident whatever.

903. Do you know whether it is the practice at home to use the test? Not when I left England.

904. We are speaking of old boilers? Old and new.

905. Do you know whether any change has taken place in the practice? Some of the great authorities at home think it ought to be used. I never yet met with a man that could tell me what injury water did to a boiler at double pressure. They do not like it—it gives a great deal more work to do. But people travelling have a right to be protected.

906. *President.*] We have evidence that on two or three occasions, the first trip after testing under hydraulic pressure, something has given way? I have known boilers to give way without being pressed at all—the plates have split; but if they had been tested, that would not have been so. I have known boilers split at the man-hole door. The test is the only safeguard we have, and it keeps the machinery in order. As far as I can learn, the French Government applies it to the engines as well.

907. Is it the practice of the French Government to test their boilers by hydraulic pressure? I cannot say; but I know they tested the one I made for the "Marceau." They tested the iron also, with their own men, not mine; and then there was a commission held again to test the boiler in the vessel.

908. *Mr. Russell.*] You say there can be no objection to the hydraulic test, if the practice is superintended by a man of experience—Do I understand you to mean a man of considerable experience? A man being very particular in the examination of everything as he goes along, and independent enough to do his duty, has experience enough if he has had anything to do with the trade—if he has been brought up to the trade and been at work of this kind or seen it made. Then when he is put in a position like this he can take every care it is possible for him to do. It may go too far for some people; but I suppose a man is examined, when he is put into a position of this kind, to see whether he is competent or not.

909. Would it not take a number of years to gain experience? I have seen plenty of men with twenty years experience who are not worth their wages. A thinking man will gain experience, but how many thinking men are there? Some men you may trust your life to, but others work in such a way that the whole shop is exposed to danger.

910. Would a man who had been merely a boiler-maker have experience enough? There are very few boiler-makers who have sufficient judgment, though they may make very good work.

Mr. Thomas Cromack called in and examined:—

911. *President.*] You are an engineer? I am chief engineer of the "City of Melbourne" steamer.

912. Do you frequently visit the port of Melbourne? Yes, I have been running there these sixteen years.

Mr. T.  
M'Arthur.

29 June, 1868.

Mr. T.  
Cromack.

29 June, 1868.

- Mr. T. Cromack.  
29 June, 1868.
913. Can you inform us whether the Government Surveyor of marine boilers there makes a practice of testing them in any way? Never with the water test. I have been in three different ships that have been examined by him; but not within the last two years, because they take our certificates.
914. How does he test them? By thorough examination.
915. Does he ever test by hydraulic pressure? I have never known him to do it but once—that was the case of the "Western." She had Rowan's patent boilers, and they had put connecting pipes underneath. They could not get their joints tight, and he would not allow her to go until she stood the test.
916. He has power to test with water if he likes? I should think so. In that case she carried 100 pounds pressure, but he did not test her to more than the working pressure.
917. You have witnessed the testing of boilers in this port? Yes.
918. Have you ever known accidents to happen shortly after such testing? Always. Mr. Dalgleish tested the "Wonga Wonga's" boiler twice during my time in her, but she invariably went the first two or three trips afterwards.
919. How many times did that occur? Twice he tested her.
920. And both times there were accidents? No, no accident; I never had an accident in my life.
921. What happened? The boilers burst out in several places, but never to stop me.
922. What gave way on the first occasion? The boilers were very old, seven years old, when he tested them, and there were channels above the water-line, and grooves along the landing; in these places they blew out.
923. The plate opened? It would blow a little, but nothing to stop me on the passage.
924. On the second occasion what happened? We had a blow-out in the bottom, but no more than I could keep the boat going with.
925. Was this the first trip after testing? We had several such leaks as these for three or four trips afterwards; they would not all go at once.
926. Have you ever known anything of the same sort to happen to any other steamer? I could not speak positively of that. I myself am opposed to this system of pressing with cold water, after a boiler is in use. I think if she is made properly at first and tested, and that material is kept up in her, with a thorough investigation of the boilers you can keep them secure. If they are badly constructed at first, I presume the Inspector would order them to be altered, and if insufficiently stayed, he would order proper stays to be put in. After that, there would be no necessity to continue the cold water pressure. That is the principle on which Mr. Wilson, the Inspector at Melbourne, works, and he has been most successful.
927. Mr. Russell.] Is Mr. Wilson a man of considerable experience? Yes, I think him a man of very great experience; he is so considered in Melbourne, and I am certain his knowledge of the weaker parts of a boiler is perfect—he knows just where to find them. He has been Inspector there for seven or eight years.
928. Did I understand you to say these leaks took place in the "Wonga's" boilers, one or two trips after testing? Yes.
929. When were they proved? Every six months. The first six months the Government Inspector stopped the boat for fourteen days, and we had some five hundred pounds' worth of work done. The last certificate he did not test her, but we put a good deal of work into her.
930. Did any of these leaks take place from any of the stays? We used to have a deal of trouble with our stays, and consequently, I used to keep a good look-out after them. On her backs, above the furnaces, she was screwed with nut stays; and, from the peculiar construction of the boiler, there was a very great amount of flame on the back, and it used to burn these nuts off.
931. Were they screwed stays—nuttied? No; ferrules inside, and nuts outside.
932. Any screw stays? Yes, in the bottom.
933. Were they nutted? No, riveted. The boilers I have in now, we have nuts on them in the ash-pits, and they are very troublesome—corrosion takes place all round them. I think screw stays, properly put in, and with a good rivet, equal to a nut. I was nine years in Mr. Penn's employ before I came out here, and he used to put screw stays nutted; but in all parts where the fire touched the plate we had a good deal of trouble with these nuts. I consider screw stays, properly put in, superior, if properly riveted. I would even prefer, in the bottom, to put in ferrules and a round rivet-head, and nuts outside. I saw that once in a mail-boat here, and the stays looked beautiful after being four or five years running.
934. President.] Is it the nut on the inside you object to? Yes; I do not care about the outside.
935. Is it not more secure with a nut than with a screw stay riveted over? I do not think so.
936. Mr. Thomas.] You would prefer rivet-headed bolts and nuts on the outside? Yes, rather than put nuts where the flame comes.
937. President.] Would you put them in the ash-pit? No, I would prefer a riveted one securely screwed—they never give way.
938. They have given way, it appears? I know they did in that case, but there are many reasons assigned for that. Mr. Wilson says the reason has not been found yet.
939. Mr. Russell.] When your boilers are tested here, is the pressure taken on the steam-chest? In the first instance we were tested by our own pressure gauge, which is some ten feet below the steam-chest, but Mr. Dalgleish has had a valve made which he puts on the steam-chest now.

940. *Mr. Moriarty.*] Is any allowance made for the head of water in the boiler? No; he has always pressed her to twice the pressure, independently of the water in the boiler. There is always that much more on the lower parts of the boiler.

*Mr. T. Cromack.*

941. *Mr. Russell.*] What pump is used? A hand pump.

29 June, 1868.

942. What is the size of the piston? The size of the "Wonga Wonga's" pump was four inches and a quarter.

WEDNESDAY, 1 JULY, 1868.

Present:—

MR. PELL, PRESIDENT.

MR. MORIARTY,  
MR. CARLISLE, R.N.,

MR. THOMAS,  
MR. RUSSELL.

Mr. William Thaw called in and further examined:—

943. *President.*] I think you expressed an opinion that the hydraulic test applied to the "Clarence's" boiler had injured it, and probably led to the accident? Yes.

*Mr. W. Thaw.*

944. You made an examination of the boiler after the accident? Yes.

1 July, 1868.

945. And there was something in the appearances which presented themselves which led you to suppose that the boiler had at some previous time been injured by a greater pressure than could have been on it at the time of the accident? Yes.

946. What was there that led you to that supposition? I thought, if there had been no stay at all, the pressure said to have been on the boiler at the time of the accident could not have burst the plate out to the extent it did, unless it had been previously strained by some greater pressure.

947. I think you said something about the condition of the stay itself, or the screw-hole in which it was? I mentioned that the mark in the plate round the hole did not appear to be so broad as on the other rivets.

948. Did you observe anything in the appearance of the thread? I thought naturally that, as this one appeared to have less hold than the rest, it was the first to give way.

949. Did you observe whether the plate was cracked round the one that gave way first? I think it was not; I could not say for certain. You must understand that there had been a larger tap put through this hole before I saw it. I did not see it immediately after the accident.

950. You had no means of judging how far the thread was affected? No; a tap of an eighth of an inch larger had been put through it.

951. You made some report on the matter? The Superintending Engineer of the Company asked me to look at it, and I wrote a short report upon it.

952. When you made that report, you were aware that this larger tap had been put through? Yes.

953. *Mr. Russell.*] From your experience, and the number of years you have been employed in inspecting boilers, do you think you could tell the thickness of the plate to the thirty-second or sixteenth of an inch, by a blow of a hammer? No, I could not, not to the sixteenth; I might to an eighth.

954. It requires a man with a good deal of experience to do that? Yes.

955. *President.*] Did you observe anything in the condition of the plate in the "Clarence's" boiler? No, I thought the plate looked very well, but it was thinner inside, and by my eye I should say it had gone about a sixteenth; but I did not measure it in any way.

956. You think nine pounds of steam would not have burst it if there had been no stay at all there? Yes.

957. Then you are under the impression that there must have been more pressure at the time—The hydraulic pressure could not have been the cause of the accident, if the boiler would have been strong enough to bear the pressure said to have been on it without any stay at all? I mentioned before, that I thought the hydraulic pressure had taken it half a thread through, and then that the pressure she got afterwards, and the vibration of the engine and boilers, had shaken it.

958. Surely, if it had been ever so much shaken, it must have been stronger than if there had been no stay at all? I would suppose, if I had been asked, that there was more pressure than there was said to have been.

959. You would not suppose there was more than eighteen pounds and a half? I would not suppose that, when I knew the safety-valve was there.

960. Do you think eighteen pounds and a half would have produced the accident? I must think so; there is no other way that I can account for it.

961. You are aware there was very strong evidence that there was only nine pounds of steam on at the time? Only from what I asked the people. I was really surprised to find it had gone the way it was.

962. Independently of the stay? Yes, even independently of the stay I would not have thought it.

963. *Mr. Russell.*] If you were going to prove a boiler to a pressure of forty pounds, where would you put your gauge? On the top; there would be the least pressure there.

964. Would you make any allowance for the weight of water in the boiler? No, I would give it that much extra.

965.

- Mr. W. Thaw. 965. Would you consider there was a greater pressure on the bottom of the boiler than on the top? I would think so, but I have never tried it.
- 1 July, 1868. 966. If the gauge at the top indicated forty pounds, and the boiler were sixteen feet high, there would be an additional pressure of eight pounds on the bottom of the boiler? Yes, eight or thereabouts.
967. *Mr. Thomas.*] When the water is at rest? Yes; if you put a pound pressure on the top, you put a pound extra on the bottom.
968. *Mr. Russell.*] That would be eight pounds more on that particular spot? Yes, if there were sixteen feet of water above it.
969. *President.*] Suppose the height of the gauge placed on the steam-chest was sixteen feet above the bottom, how high would be the usual water level in the boiler? Six or eight inches above the smoke-box—say about nine feet.
970. That head of water would give an extra pressure of about four pounds on the bottom of the boiler, when under steam? Yes.
971. Therefore, the bottom is more liable at all times to a greater pressure than the top? Yes.
972. Then, supposing the working pressure to be eighteen pounds, the double hydraulic test would be thirty-six pounds; and the extra eight pounds, when the boiler is full, is about double the pressure of the water ordinarily in the boiler when under steam. Eighteen pounds on the top when under steam would be twenty-two pounds on the bottom; and thirty-six pounds on the top, under the hydraulic test, would be forty-four pounds on the bottom; which gives the double test all through the boiler? Yes.

Mr. James Rorison called in and examined:—

- Mr. J. Rorison. 973. *President.*] You are an engineer by profession? Yes.
974. And you are manager of the works at Balmain for M<sup>r</sup>Arthur and Co.? Yes.
975. You are acquainted with the method in use here of testing marine boilers? Yes.
- 1 July, 1868. 976. You are aware that Mr. Dalgleish tests them by hydraulic pressure sometimes, or commonly, up to double the working pressure? Yes.
977. Do you see any objection to that mode of testing boilers? No.
978. As applied to old boilers in use? No.
979. Have you ever seen the test applied by the Surveyor here? Yes, when I was in the "Rakaia" and the "Mataura."
980. Do you think it requires care? Yes, to observe the effect of the testing upon the boiler.
981. Does the Surveyor seem to exercise care? Yes, he does.
982. It requires that every part of the boiler, while under pressure, should be observed as far as practicable? Yes.
983. Is there not a difficulty in one man doing that? He has generally got the assistance of the chief engineer and one or two of his men in applying gauges and straight edges.
984. Have you ever known any instance in which a boiler has been injured by this test? No.
985. Do you think it possible some part might be injured without being observed, and afterwards lead to an accident? No, I do not think it could happen, if there were care taken in observing it.
986. When you were engineer on board the two ships you have named, did you ever see the boilers tested before Mr. Dalgleish tested them? Yes, by the makers.
987. Afterwards when they were in use? Only Mr. Dalgleish tested them.
988. Did you ever see a boiler in use tested except by Mr. Dalgleish? No.
989. You have had experience in England? Yes.
990. Are boilers ever tested there after they are put into the ship? I have never seen any tested after they were put into the ship; before they are put in they are tested.
991. Are they surveyed? Yes, by the Board of Trade Surveyor.
992. What steps does he take to ascertain their condition? He goes inside and examines them.
993. It is not the practice, then, to test boilers in use in England? They do not do it in London or Liverpool.
994. You think the system here is better than the English one? I do.
995. You do not think the double pressure is too much to put on a boiler? No, I think it is a very moderate test.
996. You do not know anything respecting the boiler of the "Clarence"? No. Mr. Dalgleish asked me to look at it, but the repairs were going on, and the holes were fresh tapped when I saw it.
997. Have you had much experience in superintending the making or repairing of boilers? Yes, I had two years practice in London.
998. You are aware how the stays were fixed in the "Clarence's" boiler? Yes, in the usual way—tapped in the plate and riveted.
999. Do you think they would have given way if there had been nuts outside? No.
1000. You think, then, the accident occurred through the defective fitting of the stays? I can hardly say.
1001. You say it would not have happened if there had been nuts? No, but that is not often done.
1002. Is there any reason why it should not be done? No; Maudsley generally does it.
1003. Would there be any objection to nuts in that position? None.

1004. Is there any objection to nuts in any position? Yes, where the fire reaches.
1005. How would you fix stays in such places? Tap them in, and rivet them cold.
1006. Is there not another way—riveted hot—not tapped in at all? Some put thimbles in, as they call them, but that is not a good plan.
1007. How would you put them into the fire-holes? Tap them in and rivet them over, and have nuts where no fire plays upon them.
1008. What is the objection to the mode of having a thimble? I do not think they are fitted so well.
1009. What objection would there be to putting in a ferrule and securely riveting while hot? I do not think that a good plan. If the thimble or ferrule does not fit exactly between the plates, you draw your plate and bring an unnecessary strain on that one stay.
1010. It depends upon having the ferrules carefully fitted? Yes, I think there is nothing to equal the nuts.
1011. I am speaking of places where you object to nuts? If the nuts cannot be applied, I would not put a thimble.
1012. Have you ever experienced any inconvenience from having nuts in the fire-places? I have generally seen the plates bulge very much round the nut.
1013. What is the cause of that? The extra heat—the heat not being taken away from the nut; there is too much metal exposed to the action of the fire by having these nuts.
1014. The nut gets very hot? Yes, they are too thick; the heat is not transmitted to the water fast enough.
1015. How often would you apply the hydraulic test to boilers, to double the working pressure—do you think it is a thing that should be frequently done? Yes. With careful men it is not perhaps necessary to test more than once in twelve months; but with the ordinary run of men in charge of boilers, I do not think once in six months is too often.
1016. Do you think it possible a boiler may be injured by the strain of double the working pressure, in a place where perhaps it might not be detected, where there were not facilities for getting about in all directions? Not by double the working pressure.
1017. You think a boiler should safely stand that without injury, or it is not fit to go into a ship? It is not.
1018. Supposing you were called upon to survey an old boiler, and you found it to be generally reduced in the thickness of the plate, would you prefer putting it under the hydraulic test to ascertain whether it would bulge anywhere, or would you order an additional number of stays to be put in wherever you had a doubt about it? I would examine the boiler and put in the stays where I thought they were deficient, then I would test the boiler. If it were a very awkward boiler to get at, I would test it first of all, carefully observing the effect of the testing.
1019. Supposing a boiler was running under a three months certificate, a short certificate, by reason of its being old, would you think it likely to be injured by being subjected to the test? If it could not get more than a three months certificate I think it would—I think it would be in a very bad state if it could not get a longer certificate than that.
1020. From your experience of the ordinary run of marine boilers, how many times the ordinary working pressure should you say it would take to do it a serious injury? I think most of the boilers that I have seen would stand six or eight times, or even ten times, the working pressure.
1021. Are you speaking of what they would stand, or what they should stand—Do you think they would stand that? I think they might have a permanent set before they would get to that. They would stand three or four times.
1022. I am not speaking of new boilers you understand? I beg your pardon; I thought you meant new boilers.
1023. I am speaking of the ordinary run of boilers in use, as one meets them in all ports—Do you think they would stand four times before giving way? A great many would not.
1024. Do you think there are many that would stand three times? Yes, many of them that are only about eighteen months or two years old.
1025. Supposing a boiler to be five years old, how many times would that stand? Not more than three times.
1026. And it should be a good boiler to do that? Yes.
1027. Then, if a boiler whose working pressure is twenty pounds would be injured at sixty, if you prove it to forty pounds you get within one-third of its ultimate strength—Do you not think that is rather a dangerous degree to approach to its ultimate strength? It is.
1028. In a case like that, would you prefer ordering additional stays or repairs wherever you considered them necessary, or would you endeavour to develop weakness by straining the boiler up to forty? I would strengthen it first.
1029. And test it to forty after you had strengthened it? Yes, having made it as good as I could.
1030. Do you think, as a rule, marine boilers, especially old ones, are sufficiently stayed, both as to the number of stays and the mode of fixing them? No, they are not so well stayed now as they used to be fifteen years ago, considering the increase of working pressure.
1031. Would there be any great trouble in increasing the number of stays? No.
1032. Would there be much trouble in renewing them? There is some trouble in renewing stays on board a ship in some cases; in other cases there is not.
1033. It can be done without any very serious expense? Yes; it is done every day in practice.
1034. *Mr. Moriarty.*] I gather from you, that you consider the severe ordeal of the double test would tend to cause boilers to be made stronger and kept in better order than if allowed to pass with a less severe test? Yes, undoubtedly, that is what I mean. They would give you better material and better workmanship.

Mr.  
J. Rorison.  
1 July, 1868.

Mr.  
J. Rorison.  
1 July, 1868.

1035. *President.*] Do you think the safety of the public would be endangered if the testing pressure were not applied to more than 50 per cent. above the working pressure—do you not think that amount of pressure applied would answer most of the purposes—would not such a pressure develop most of the weak places? No, I do not think it would so well as the double pressure.

1036. You would stick to double the pressure? Yes, or even go beyond it.

1037. You are acquainted with the engineers of steam-vessels in Sydney? I meet them occasionally.

1038. Did you ever hear any complaints from any of them that their boilers are injured by the hydraulic test? No.

1039. *Mr. Carlisle.*] If a boiler stood double the working pressure without shewing signs of weakness, would you think it at all injured by it? No.

1040. *Mr. Russell.*] Have you proved many boilers under hydraulic pressure? Yes, in London I have.

1041. I mean old boilers? Yes, I have tested a good many here.

1042. How many have you tested in Sydney? About twelve, I think.

1043. It is from your experience in proving boilers in Sydney, by hydraulic pressure, that you think double the working pressure is not too severe? I go by my home experience as well. I have never seen old boilers tested till I came to Sydney; but my experience in London is sufficient to guide me.

1044. You see we are speaking more particularly of old boilers? It is just as necessary, or even more so, for old boilers as for new ones.

1045. In this case of the "Clarence," suppose that stay had given out in the bottom of the boiler instead of where it did go—in the up-take of the combustion chamber, what would have been the effect? Perhaps it would not have injured any one, going down into the bilges—it would not have had such injurious effects.

1046. Suppose the boiler was injured, by the double pressure, at the bottom, where these screw-stays cannot be got at to be seen, and were afterwards to give way when the ship was on a lee-shore, might not the ship and the lives on board be in jeopardy? It might happen in that way where they cannot get under the bottom to examine it; but I do not think the "Clarence" was one of that sort. But even so, the Inspector might see the effect inside the furnace; if the stay has given way outside, the plate will rise.

1047. Suppose this pressure injured the stay slightly, not sufficient to make it give way at the time, and it gave way afterwards from the severe test having been put upon it? I do not think it would injure it slightly—it would carry it away if it did anything.

1048. It might start the thread? That would shew inside the furnace by the plate rising. You would suspect something wrong when you saw the plate rise inside.

1049. I am speaking as to the effect of injuring the stay slightly—weakening it, not destroying it altogether—reducing its strength, and causing an accident some time, perhaps three months, afterwards? I do not think it will do that. Such a thing has never come under my notice. I think there is no medium; they will either stand or give way.

1050. *President.*] Is it not possible for the thread to be injured? It might draw the thread, but it would show the head of the rivet. I saw the heads of these rivets, but the holes were retapped. One stay seemed to have given way first, and the others followed.

1051. Do you not think the test applied may have opened these holes, and caused a leak, which, by inducing corrosion, ultimately led to the accident? If it had been carefully examined, that would have shewn in the testing.

1052. Suppose the same thing happened underneath the boiler, that would not shew? You could not see it so well.

1053. *Mr. Moriarty.*] Have you ever met with boilers that will bulge between the stays and the back end of the smoke-box? It is a common thing.

1054. That, I think, you very often see in old boilers? Yes; where there are small water spaces and defective circulation, you will find that in boilers.

1055. Do you not think that in a place like that, where the plate is already bellied away, you might somewhat injure the plate about the stay-head by putting on excessive hydraulic pressure? It is a very severe strain on the stay in a case of that sort.

1056. And also on the plate? Yes. In that case you should put in extra stays.

1057. In a case like that, where the plate is obviously bulged, would you prefer ordering additional stays to be put into the bulged part, or trying it under cold water to see whether it would stand? I might try it to a medium test first, to satisfy the owners.

1058. What would you call a medium test? Up to the working pressure, or a half more. But I would be satisfied in my own mind before I would do that, I would only do that to satisfy the parties connected with the ship.

1059. At all events, what you would do would be to order new stays, instead of merely applying the hydraulic test, and if you did not see it give way, leaving it? Yes.

1060. Supposing a case such as that, where the boiler has sprung between the stays and the smoke-box, and the plate has buckled; if such a boiler were carrying twenty pounds of steam, do you think it could be strained up to forty pounds? No; I would like to put in extra stays if there was any bulging.

1061. Do you think any such boiler could carry three times its working pressure? I dare say it would. These bulges frequently happen from defective circulation.

1062. The plate getting hot? The plate getting hot, and the water not solid round it.

1063. *Mr. Russell.*] Do you think that boilers could be maintained, and kept in thorough working order, by a competent man of experience, without having to resort to the hydraulic test? Yes, I think they could with a careful man. I do not think an accident would occur with a careful man, who would inspect his boilers at every opportunity.

1064. What term of experience would you consider would qualify a man for holding such

a situation? He would require a good deal of experience, and should be a cautious, careful man, who would take an interest in his job.

1065. What experience would he require to have, to be capable of taking charge of boilers, overhauling and repairing them, giving instructions to put in stays, and judging what pressure a boiler would stand, without having to use the hydraulic test? It would require a man to have been ten or fifteen years at the trade.

1066. You would not take a fitter out of an engineer's shop and put him in that situation? Decidedly not, unless he had passed his grade, and worked his way up.

1067. And had had a few years experience as a junior engineer on board a steamer? Yes, it would require him to be at least five years at sea-going before he could do anything of that sort.

1068. *Mr. Moriarty.*] Do you think danger might arise to the public from a too confident reliance on this hydraulic test—from a man believing that, as he had put the test on, and the boiler stood, that was all that was required. We have heard that in some places (I do not refer to Sydney) it is the common practice for persons to get pumps rigged, put on double the working pressure, and so long as everything does not fly about their ears, they are quite satisfied? A man who does that is not fit for his position. I think it requires care to observe the effect of the test.

1069. Care, skill, and experience? Yes.

1070. *President.*] If you had the care of boilers, would you test every boiler every six months? Not boilers I was in charge of myself; but to take them promiscuously I would.

1071. Suppose you were Inspector? I would. I would examine them first, to see if they were fit for it.

1072. And if not fit for it, they would not be fit to receive a certificate? I think not.

1073. *Mr. Russell.*] You would put the pressure on, after satisfying yourself that the boiler would stand it? Yes.

1074. *Mr. Moriarty.*] Is it your opinion that general attention should be devoted to making boilers keep pace in strength with the increased pressure they are continually being made to bear? Yes.

1075. And you think any severe test they are subject to, which is likely to answer that end, would be for the benefit of the public? I do.

1076. *President.*] Would it be any great hardship if ship-owners were compelled largely to increase the number of stays in existing boilers? I think it would be a decided advantage to them; the boilers would last longer, and the risk would be less.

1077. How much would it increase the cost of a boiler to put double the number of stays, for instance? It would add from ten to fifteen per cent. on the boiler.

1078. Doubling the number? Perhaps not doubling them, but distributing them better. There might be more of them, but it might not require double the number if they were properly distributed.

1079. Would that not make a saving in the expense of subsequent repairs? Yes, and make them last longer. It would add perhaps a couple of years to the boiler's life.\*

#### THURSDAY, 2 JULY, 1868.

Present:—

MR. PELL, PRESIDENT.

MR. MORIARTY,  
MR. CARLISLE, R.N.,

MR. RUSSELL,  
MR. THOMAS.

Mr. Arthur Tracey called in and examined:—

1080. *President.*] You are foreman of boiler-makers at the Australasian Steam Navigation Company's Works? Yes. *Mr. A. Tracey.*

1081. You have had long experience? I have—twenty-five years and upwards.

1082. In repairing boilers, what parts do you find are generally the first to need repairs? Generally the furnaces need repairs first. 2 July, 1868.

1083. The plates, do you mean? The cracking of the plates in the furnaces, between the rivet holes, and such like.

1084. How do the stays stand? The stays very often give way, and we have to renew them.

1085. In what way do the stays give way? Sometimes on account of the inefficiency of the workmanship, at other times they give way with the pressure.

1086. In repairing boilers, have you ever had occasion to suspect that they have been injured by the hydraulic test? Frequently.

1087. Are there any specific cases in which you suppose injury resulted in that way—any particular steamer? In the late case of the "Clarence," I consider it was done by the hydraulic test.

1088. Any case before that? In trying the old "Balclutha" we broke some stays, whereas if they had been tried only by the regular pressure of steam, no stay would have gone.

1089. The stay went under the pressure? Yes, cold water pressure; she was over-tested.

1090.

\* ADDED (on revision):—During the time I was Manager of the Blackwall Iron Works, London, in 1864, I fitted out a small steamer, to be employed as a tender on the Dover and Calais Mail Packets, to be stationed at Calais. Before the French Post Office people accepted her, they tested both engines and boilers to 60 lbs. per square inch, being three times the working pressure.

Mr. A. Tracey. 1090. To double pressure? Yes.

1091. Do you not think it a fortunate thing that the stay did break, and shew that it required to be renewed? No, I cannot consider it fortunate, because there would have been no danger whatever with her working pressure; but with double the pressure in old boilers they are not able to stand it.

2 July, 1868.

1092. If they are not able to stand double pressure, do you think it would be safe to work them up to the working pressure? They would be safe to work up to their ordinary working pressure, but not safe to test to double with water. Sometimes stays are not put in sufficiently strong to stand this double pressure, but they are strong enough to stand the working pressure and a good deal more, perhaps twenty-five per cent.

1093. What is the kind of defect—is it in the workmanship? Sometimes there is not a proper thread in the hold, if they are screw stays, and if they are thimbles they may not be properly packed, and probably not properly screwed up; but there is no fear of explosion from the like of them, where there are large nuts and bolts.

1094. Do you consider that screw stays are safe? I prefer a bolt and nut.

1095. You think that is safer? Decidedly; though if there are a sufficient quantity of screw stays put in, and put in properly with a good thread, they are perfectly safe.

1096. Would it increase the expense in any sensible degree to have the stays secured with nuts? It would be more expensive, but nothing of any great consequence.

1097. In what way do you suppose the stay that gave way in the "Clarence's" boiler was injured by the hydraulic test? When at the working pressure the plate was perfectly flat, but when the double pressure came on, it would take a sort of curved form. There are stays along the centre, and when the plate bulges up, it naturally draws away from the stays, makes the hole a sort of oblong, and in the course of a little time there may be a leak, and the thread decay away; so that the stay may go at a very slight pressure some day, because it had been injured previously.

1098. You mean that the thread would gradually corrode away? Yes.

1099. Suppose that stay had gone some distance through the plate, and a good thick nut had been screwed on? It could not have drawn up in that manner.

1100. The accident could not have happened? No.

1101. In spite of the hydraulic test? No.

1102. These (*referring to old stays on the table*) we are told are the heads of some of the stays that gave way—here is one of them which appears to have been holding by three or four threads—When under the full working pressure of steam, what pressure do you suppose this one stay was subject to? The working pressure was eighteen pounds.

1103. This stay supported a surface of about one foot? Yes.

1104. And the pressure on that would be how much? Equal to eighteen pounds to the inch.

1105. One hundred and forty-four times eighteen? Decidedly.

1106. That would be something considerably over a ton? Yes.

1107. Do you think it reasonable to suppose such a pressure could be sustained by a few threads like these? I do not suppose that thread was as bad at the time.

1108. Is it reasonable to suppose these few threads could be safely and constantly subjected to that pressure? If that was a good thread, properly fixed, and not over-strained—if there were a number of them in the boiler, they would stand double that.

1109. Are not these threads always, under any circumstances, liable to corrosion? No, not if put in tight and never over-strained.

1110. Does it not frequently happen that they are not put in very tight, notwithstanding all the care the superintending engineer may exercise? The only way I can account for that is, the hole being made a little too large.

1111. There is a liability to leakage and corrosion? Yes.

1112. And if these threads corrode, there is nothing else to depend upon? No, it draws out of the plate.

1113. Would it not be much safer if a good thick nut were put on? Yes; that is the way I did it, when I repaired the boiler.

1114. Is not that the way it ought to have been done at first? That is the way I should prefer it.

1115. And if that had been done, the accident would not have happened, in spite of the hydraulic pressure? No, it certainly would not have drawn through the stay.

1116. How would you fix stays in the fire-places? I would put them in closer in the fire-places, and fix them as these were, because I would not expose a nut to the fire—it burns off.

1117. Could it not be arranged to put the nuts below the fire-bars? We do that when we put nuts in at all; but when we put in screw stays riveted over cold, we can put them above the fire-bars.

1118. Is it necessary to put them actually into the fire? Yes, sometimes.

1119. Would it not be safe to put them in with a ferrule, without a screw, and rivet them over hot? Yes; they used to be done in that way in former days.

1120. Would they not be much safer than screw stays? I think they would.

1121. *Mr. Moriarty.*] All the old boilers were that way? Yes.

1122. With a great thick lump of a head? Yes, large rivets and a great bold head on them.

1123. *President.*] As a matter of practice, if you had to turn out a boiler, and make the best job you could of it, you would not put in these screw stays riveted cold? In flat surfaces, where these big heads are in the way, I would introduce them.

1124. Would it not be better to use the nut and ferrule? It would be a stronger job.

1125. Would it increase the total expense of the boiler much? It would be a little more expensive, but not a great deal.

1126. Would it add five per cent. to the cost of the boiler? Five or six per cent., I dare say.

1127.

1127. Have you ever seen the hydraulic pressure applied by the Government Surveyor? Mr. A. Tracey. Yes, frequently.

1128. Have you observed whether he used care in applying it? Yes, he is always very careful. 2 July, 1868.

1129. Does he take steps to ascertain whether there are any signs of weakness while the pressure is on the boiler? He is always on the look out, and has the engineers and firemen placed about to see whether there is any leak, while he is at the gauge himself.

1130. Do you not think that by the hydraulic test, defects might be found out that would escape attention in any other way? I do not consider the cold water test a fair test at all for old boilers. All defects can be found out by careful examination, without the water test.

1131. Do you object to the water test altogether, or to its being carried so far? I totally object to it for an old boiler. I agree with it for new boilers; but when a boiler gets to be two or three or four years old, I consider it very wrong to test it with cold water.

1132. If it is very wrong to test an old boiler with cold water, it must also be wrong to work it up to the original pressure? After they have been over-strained, they may go at any time—a month, or a week—whereas if not over-strained, they might stand for a length of time.

1133. Do you not think that if they have become so dangerously weak that they will not stand hydraulic pressure to double the working pressure, it is time to reduce the working pressure? When the working pressure is only eighteen pounds, and you test the boiler up to thirty or forty pounds, it makes a considerable difference.

1134. Do you think it likely a boiler would be injured by the test, without its being observed at the time—do you not think any injury is generally observed at the time? Yes, generally.

1135. Is it not a good thing to shew the weak places? Yes; but it strains the boiler to such a degree as to put it past repairing sometimes. Many boilers never recover the cold water test.

1136. Do you think any part of a boiler could be really injured permanently, without its being put out of shape so as to be seen? Yes; it could be injured and not put out of shape; it could be strained to such a degree as to approach rending, without actually rending.

1137. It could hardly be brought to that point without shewing some signs? There are certain corners and portions about boilers that will not shew any bulge, but a portion away from that will feel it.

1138. It will shew it? Yes, if it was possible you could see it. Some places you cannot see; for instance, underneath the boiler.

1139. These parts seldom give way, do they? They seldom do any damage.

1140. Parts liable to deterioration can generally be seen while under the test? Yes.

1141. Is there much danger, then, of the boiler being injured without its being noticed at the time? The boiler may be injured and you may not notice it; you cannot see whether it is injured. For instance, the "Clarence's" boiler was injured by the test, and it was not perceived at the time.

1142. In what way do you suppose it was injured? The whole of these stays that gave way were injured by the test. When the plate bulged up, it bulged up in such a manner that these stays were held, and formed a cup in the plate; they held so hard that the plate bulged up all round about them.

1143. Could that have happened at the time without its being observed? Yes, it might.

1144. Is it not a part that could be easily observed? No; the brick bridges were over that.

1145. That was all taken out when the boilers were tested? I do not know whether the bridges were out when they were tested—I mean the test previous to the last one. I know at the last one the bridges were out; that is, when they were tested since the accident.

1146. Did you ever see the surveyor test a boiler without taking out the bridges and stripping the boiler as far as he could? I cannot say whether I did or did not.

1147. Suppose the boiler was stripped at the time? You could see it then.

1148. Did you examine the plate after the accident—I suppose it came under your notice? Yes, I repaired the boiler.

1149. Supposing the stay were wanting there altogether, do you think it would have gone under a pressure of eight and a half pounds? If there had been no stay it would not have gone with eight and a half pounds, nor yet with twelve pounds.

1150. Then supposing the hydraulic test had broken the stay right in half, even that would not account for the accident? It ought not.

1151. How then did it happen? Because of the double pressure.

1152. But you say that even supposing the hydraulic pressure had broken these stays right across, even then the boiler should not have burst under eight and a half pounds? No, it should not.

1153. Why then did the plate go? They were injured previously by the hydraulic test.

1154. You mean the stays? The stays and the holes in the plates.

1155. You say the plates would have stood without any stays? But the plates were bored.

1156. The holes being open would weaken the plate—is that what you mean? Yes; if the plate had been in its original position and no holes in it, it would have stood the pressure.

1157. Did you notice whether any of the plates were cracked about these holes? Yes, there was a crack on the outside surface.

1158. Round the holes? Round the holes.

1159. Outside? Outside, on the top. That was done when the plate bulged up.

1160. Supposing that during the hydraulic pressure a bulging had taken place tending to draw the plate away from the stay, and had gone so far as to crack the plate, which side would it crack—if the stay held, on which side would the plate crack, on the inside or the outside? It would be likely to crack on the inside, but this plate was cracked on the topside, and

- Mr. A. Tracey. and was cracked inside too. It was a visible crack on the outside, and by putting your finger in the hole you could feel a crack in the inside also, but of course you could not see it inside.
- 2 July, 1868. 1161. If there had been any cracking caused by the hydraulic pressure it would have been on the inside? It might crack with the hydraulic pressure even on the topside. It would be more likely to shew a crack on the inside; but still there is no rule for that, because it might crack on the topside.
1162. *Mr. Moriarty.*] Are any of the boilers of your Company bulged in the smoke-box, between the stays, now? I think there is a slight bulge in the "Alexandra" at present in her back end. I think so, but I have not been in her for a length of time; we have done nothing to her for some time.
1163. Do you know how that was caused? I do not.
1164. She carries a high pressure of steam, does she not—forty pounds? She works up to twenty pounds, but was tested to forty pounds.
1165. What distance apart are her stays? Fifteen or eighteen inches; I never measured them.
1166. I think you have said you have had a good deal of experience in boilers in this Colony. How many times the ordinary working pressure would the boilers running out of this port carry, on the average, without giving way seriously—could they stand three times the working pressure without giving way? Most of them could.
1167. Could stand three times? Yes, under steam.
1168. Do you think they could stand four times? I would not say that; some of them might not be sufficient to stand four times.
1169. Take, for instance, the "Wonga Wonga." Do you think the "Wonga Wonga's" boilers could stand forty-five pounds pressure? Yes, I am certain they can.
1170. Do you think the "Collaroy" could stand fifty-four pounds? Yes, I am certain she can, because we are repairing her at present, and they will be almost new boilers when they are done.
1171. What would you be prepared to prove her boilers to when they are repaired? I would not attempt to prove them to much more than the working pressure—say twenty-five per cent. more. I do not think it is requisite to overstrain them.
1172. You think it would overstrain them? I do not think it would; still there might be some weak parts that might be injured, that I could not account for.
1173. Do you think you could put one hundred pounds on the "Leichhardt's" boilers without their giving way? No.
1174. You think something would give way? Yes.
1175. Do you think you could put ninety pounds on the "Coonanbarra's" boilers—If you saw the steam-gauge up to ninety pounds, what would you do? I would clear out.
1176. If you saw a hundred and twenty pounds on the "Diamantina's" boilers, what would you do? I should do the same.
1177. If you saw a hundred and twenty pounds on the "Alexandra's" boilers, what would you do? I would not be there at all.
1178. If you saw seventy-five pounds on the "City of Brisbane's" boilers, where would you go to? I would not like to be near them.
1179. If you saw sixty-nine pounds on the "City of Adelaide's" boilers, what would you do? I dare say she would stand it.
1180. These pressures are three times the working pressure in each case, and you do not think they would be safe? No.
1181. Do you think the "Yarra Yarra's" boilers would be safe at fifty-four pounds—three times the working pressure? I do not think her present boilers would.
1182. You think these pressures would be very apt to carry away the boilers? I think they would be very apt to carry away some portions of the boilers.
1183. As a rule, in examining old boilers, would you prefer to thoroughly examine the boilers yourself, and trust to your experience to say whether new stays or new patches should be put in, rather than subject them to the hydraulic test? I know no other real way of doing it but by thorough inspection, assisted by the hammer. I would prefer that to the hydraulic test.
1184. Do you think, as a rule, that the strength of boilers has been increased in proportion to the increased pressure they have been made to carry, of late years? I do not think so.
1185. Is it your opinion that it should do so? I should say so.
1186. Do you refer now to the number of stays, the way in which the boilers are stayed, or to the shape of them? To the shape of them, and likewise to the insufficiency of the stays. When they diverge from the circular shape, and approach flat surfaces, they should be extraordinarily stayed.
1187. I think I understood you to say there would be very little difficulty in increasing the number of stays considerably, and with very little additional expense? Very little.
1188. And if you were examining a boiler, you would prefer ordering additional stays, where the plates were thin or at all bulged, rather than subject the boiler to the hydraulic test? I would.
1189. *Mr. Russell.*] Has your experience been principally in repairing boilers, or in making or superintending the construction of new boilers? Principally latterly in repairing them.
1190. For what proportion of your twenty-five years' experience have you been repairing boilers? I am not confined to repairing; I build them occasionally, but I have done most of the repairs for the last three years. Previous to that I did, in fact, all the boilers that were made there.
1191. Could you take a hammer, and go inside a boiler, and by striking the plate tell the thickness of it? Yes, by one touch.
1192. Could you tell the thickness to the thirty-second part of an inch? Yes, I have never failed yet in it.
- 1193.

1193. That has been acquired from long experience? Yes.
1194. How many years? Twenty-five years and more.
1195. Is it likely a man of two years and a half or three years experience could tell that? 2 July, 1868. I do not think it.
1196. Has it come to your knowledge, on any occasion, that one of your steamers has gone to sea, after being tested to double the working pressure, and that anything has given way in the boilers during the passage? I do not recollect. The only thing that I can recollect was about the "Balclutha." There was a stay broken, and we repaired that stay; and she was tested again, and there was another stay broken when she came back.
1197. Broken on the voyage? I cannot say whether it broke on the voyage, or broke at the time of testing, without our noticing it. She came back the next trip. That was some time ago.
1198. Is it your opinion that, if this testing by hydraulic pressure was done away with altogether, steam-boats boilers, after being in use, could be kept in proper working order, if the repairs are effected under the superintendence of a competent and experienced man? I do think so; I know it from experience; it has been done for years.
1199. Without using the hydraulic test? Yes.
1200. When boilers have been tested in your presence, has the gauge usually been put by the Inspector on the top of the steam-chest? He puts his own gauge generally on the top of the man-hole doors.
1201. Is it usual to clean out the boilers thoroughly, and take down the bridges, before granting a certificate, after testing them? Yes, everything is cleared out—everything is scraped down; and therefore, there is full opportunity of seeing everything.
1202. Do you find that stays frequently give way at the bottom of the boiler? Yes, a great number of them; the plates corrode away about the holes after some years.
1203. That is a part that cannot be seen when proving the boiler under pressure? Generally the flooring is up, and they generally look underneath. Most of our boilers you can see well into the bilges. Certainly there is a small portion of the bottom, in the centre, that you cannot well get at; but you can get a good way down, in consequence of their being round.
1204. *Mr. Thomas.*] Do you think iron is more likely to give way when it is cold than when it is warm? Yes.
1205. *Mr. Russell.*] You would warm the boiler first? Yes. Even after repairs I would get steam up gently, and press them then. If they thought proper to put more than the working pressure with steam, I would prefer it to the water pressure.
1206. Is it customary in your Company's steamers for the engineers to blow the boilers right out? Yes, they blow them down; but some of these very old boilers, with very old and bad bottoms, sometimes they do not blow them down; but all their good boilers they generally blow down.
1207. Suppose there is a plate covered with fire-bricks, do you think if the boilers were blown down, these bricks would have a tendency to make the plates red-hot? It would have that tendency, and it has often done so.
1208. *President.*] Behind the bridge? By the side of the bridge, where the brick bridges are built. Those red bricks would make a plate red-hot.
1209. *Mr. Moriarty.*] That is not on the bottom of the ash-pit? No.
1210. *Mr. Russell.*] Do you think it possible ashes or soot could have gone down behind the bridge, in this case of the "Clarence," and heated the plate, after blowing off, to such an extent as ultimately to cause the accident? I could not say whether such a thing as that occurred.
1211. Do you think it possible they could be injured in that way? I do not think they blow them down so low as that.
1212. *President.*] I gather from your answers, that you think the water pressure is more severe than the same amount of pressure under steam—What reason have you for supposing that? In the first place, the boiler is cold; and then the pressure of the water is a solid pressure, coming dead against it; whereas steam is an elastic pressure, and expansive. The plates also get warm, and will yield under steam, and are not so liable to rend or tear.
1213. Have you ever observed, when the pressure is got up by means of the pump, whether it gets up suddenly—will it jump up three or four pounds at a time? Half a stroke of the levers will make it take a sudden jump, and go a pound or so beyond the pressure intended, particularly when the boiler is tight.
1214. Supposing boilers were fitted with more than the usual number of stays, and these stays were all fixed in the best manner possible, do you think fifty per cent. above the working pressure, by water, would hurt the boiler? It would not hurt a new boiler, but I think it would hurt a boiler that had been in use, because some parts get so weak in places where they are not stayed at all; for instance, one part might be three-eighths thick, and another only a quarter of an inch, and the place where it was thinnest would be liable to be weak.
1215. Do you mean originally? No, the plates decay away.
1216. Then it is time to renew them? Some parts, use what precaution you may, will be thin.
1217. Is it not desirable, by means of moderate hydraulic pressure, to find out where these thin plates are? It will rend them.
1218. *Mr. Carlisle.*] Would you consider it safe to work a boiler with steam, if it would not stand half as much again as its working pressure? I would consider it safe to work the boiler to its working pressure with steam, but not safe to trust it with the pressure you speak of with cold water.
1219. *Mr. Moriarty.*] Would you consider it safe to work a boiler to within a third of its bursting pressure? No.

- Mr. A. Tracey. 1220. *Mr. Carlisle.*] If it would burst at thirty pounds, would it be safe to work it at twenty? It would not be liable to burst working at twenty pounds.
- 2 July, 1868. 1221. Would it be safe to work at twenty pounds, under steam, if it were so weak as to burst at thirty? No, I would not work it under steam to twenty pounds, if I considered it not safe to stand thirty pounds.
1222. Then the working pressure ought to be reduced? Yes, decidedly.
1223. *Mr. Moriarty.*] Are these stays (*referring to four old stays on the table, from the "Clarence's" boiler*) just as they came out of the boiler? Yes.
1224. Was there no more riveting over the heads than we see here—did the plate draw over that? Yes, the plate drew over that, and the stays remained in the bottom of the boiler; I cut them off with a chisel.
1225. These, in fact, all drew through the plate? Yes.
1226. The riveting seems to have been completely corroded? The riveting is completely corroded off them.
1227. *President.*] Who made that boiler? Mr. McArthur's foreman that is now; he was in the A. S. N. Company's shop with him, and went with him to the Dry Dock.
1228. Do you judge that these rivets have corroded, or that there never was a rivet? They were properly screwed in the hole, and the form of the plate is a proof they held extraordinarily well.
1229. You do not consider the stays were injured then? The stays were injured some time previous, I do believe. The hole decayed away, and the plate left the stays.
1230. When do you suppose the cupping you speak of was produced about the stays? I suppose it was done by the hydraulic test.
1231. Take that stay (*one of the four*)—how long should you say it was since the riveting had been worn off that stay? I should say that had been gone six months.
1232. How do you account for these rivets having the bat knocked off? I do not know, unless it was corroded and eaten off.
1233. Do you think they were ever riveted properly? I think they must have been all done the same.
1234. There must have been leakage? No; I know for certain there never was a caulking tool placed on any of them. They have never been caulked since they were made, to my knowledge.
1235. When you took those stays out, did you see any symptoms of the riveting having been recently torn off by ordinary wear and tear? I perceived no signs of any rivet having been torn off.
1236. Supposing that had been riveted down, and coming away had drawn the bat off, do you not think it would have left a recent mark? There does not appear to me to be any recent mark.
1237. You think that is the way it was before the accident? Yes.
1238. Suppose an experienced man had looked at those stays before the accident, would he have pronounced them safe? The stays are safe, even if they are put in with no rivets at all; they are frequently put in and left just as they are, and will stand great pressure.
1239. If you saw all the riveting gone, would you not think them unsafe? No, not if they were screwed in. The screw is what I would depend on in screw-stays, not on the cold rivets.
1240. Would you not trust something to the rivet too? It makes it a little stronger by having the bat of the rivet well riveted over. The way I do is to heat them with a large heater.
1241. Suppose I called upon you to examine a boiler for me, and you saw the rivet-heads as they are on that stay, would you call my attention to it? I would.
1242. *Mr. Moriarty.*] Do you not think screw-stays are apt to get corroded about the thread—If there is the slightest working or leakage, will not that tend to corrode about the thread of the plate? Yes.
1243. On that account, do you not consider it a good thing to have the bat well about the plate? Yes.
1244. Therefore, if you found a rivet-head or bat corroded away, would you not consider that attention should be drawn to it? I would.
1245. Do you think the hydraulic test is used, under any circumstances, to obviate the necessity of carefully examining all the parts of the boiler in detail? I do; because it does not require a man to go underneath a boiler. It is a matter of great labour to go round all these holes and corners.
1246. Did the crack on the plate, at the rivet-hole, appear to be a recent one or an old one? It appeared to be an old one; it was salted up—rusted up; it took a good deal of picking and scraping to clear it. There was more than one.
1247. How far did they go into the plate? Not very far; one went an eighth of an inch into the thickness of the plate. I put my penknife into it, and it seemed about an eighth of an inch deep; I could feel in the same hole with my fingers two cracks underneath, one a large one.
1248. On the inside of the plate? Yes.
1249. Did that seem to be salted up? They were all salted up.
1250. Not recent cracks? They must have been produced when the plate was bulged.
1251. When was the plate bulged? The plate I consider must have been bulged when the boiler was tested by hydraulic pressure.
1252. Did anybody observe that at the time? No; that is only my opinion.
1253. Do you know whether this boiler was proved in Brisbane before that? I do not know it of my own knowledge, but I believe there was some proof there.
1254. *Mr. Russell.*] Have you ever told Mr. Dalgleish that you thought it was wrong to prove boilers to double the working pressure—that it was not giving the boiler a fair chance? Yes, I have occasionally said so.
- 1255.

1255. What was his reply? He said, at one time, "What other means have I of proving Mr. A. Tracey. it?" Why could he not examine the boiler all over, as he does now, with the hammer?
1256. Was that the practice before Mr. Dalgleish's time? Yes. 2 July, 1868.
1257. Had you ever any accidents then? I do not know of any.
1258. Has Mr. Dalgleish made any difference of late in his mode of examination? He has not put on the hydraulic test to any of our boilers since this explosion; he goes in and examines them now.
1259. *Mr. Thomas.*] Do you know what the system of testing is in Melbourne? I am not aware; but I believe Mr. Wilson, the Surveyor there, does not approve of this hydraulic test.
1260. *Mr. Moriarty.*] You are confident Mr. Dalgleish has made a change in his practice? I am, for I have been with him; he has not tested them with cold water since the accident. The last boiler we repaired was that of the "Boomerang"; we did a great amount of sheathing to it; but he did not test her, and everything was perfectly tight when she went under steam.
1261. *Mr. Russell.*] Do you think the same practice could be carried out thoroughly under the superintendence of a practical man of great experience? If it was, there would not be the slightest danger of accidents.
1262. *President.*] You say testing by hydraulic pressure was not adopted until Mr. Dalgleish came into office? No.
1263. Do you remember anything about the boilers of the "Rangatira" at that time. Is it the fact that the combustion chamber of that boiler was rather longer than the "Clarence's," that there was not a stay in it from end to end, that it was loaded to eighteen pounds, and that it was not more than an eighth of an inch thick. These are the allegations—are you prepared to deny any of them? I am not.
1264. Would not that have been discovered if hydraulic pressure had been put on that boiler? Yes, probably it would, if double the working pressure had been put on it. Still, there was no accident.
1265. *Mr. Moriarty.*] Do you think the absence of the stays could have been discovered by mere inspection, without hydraulic pressure? Yes.
1266. And the thinness of the plate, also, by drilling a hole through it? Yes, or if the Inspector sounded the plate.
1267. All these things that were defective in the "Rangatira's" boiler might have been discovered without the hydraulic test? Yes.
1268. *President.*] If the hydraulic test had been in use, such a boiler could not have borne the double pressure? No.
1269. But under the system which existed at the time it seems to have passed? Yes.

Mr. Charles Cook called in and examined:—

1270. *President.*] You were present, I believe, when the second boiler of the "Clarence" Mr. C. Cook. was tested, after the accident had happened to one of them? I was.
1271. Were you present when the portion of the boiler corresponding to that which burst, 2 July, 1868. was observed during the pressure? Yes.
1272. In the smoke-box? Yes.
1273. Mr. Jaffrey and Mr. Bailey were present with you at the time? Yes.
1274. They had a straight edge? Yes, some six feet of batten, to see whether there were any defects.
1275. Did you see or feel any bulge in the plate? I only saw what took place.
1276. There was light enough to see? Yes, they had a lamp.
1277. Did you observe any deflection? The ends of the straight edge were up so that I could nearly get my finger in.
1278. Owing to deflection of the plate? It gradually rose so that I could have got the bottom part of my finger in.
1279. Are you sure that was owing to deflection of the boiler-plate, and not to any accidental movement? Nobody touched the straight edge. I did not know what the effect of the straight edge was until Mr. Bailey called Mr. Jaffrey's attention to the fact of the boiler rising, and then Mr. Jaffrey, I think, said "Oh! never mind, it's all right," or something of that kind.
1280. You think it was about three-quarters of an inch? Not so much as that; I think I could have put my finger underneath it. Mr. Jaffrey kept on feeling it, and Mr. Bailey called his attention to the fact of the boiler rising; he said "It is springing," I think—I will not be sure of the term. I may explain that I only went to see the principle of testing a boiler, as a matter of curiosity. I saw a long piece of wood put across the flat bottom, and before the pressure came on the thing was perfectly flat. When I was on deck I saw the test applied by Mr. Dalgleish on the top of the boiler, and when the pumping was up to thirty-six pounds, I think it was, I went down below to see the effect. The straight edge was put between the back of the boiler and the stays, and it gradually came up till the ends appeared to me to rise so that I could have put my finger underneath. I did not try, but I saw Mr. Jaffrey appear to do so. I did not take particular notice, but from the distance there appeared to be between the straight edge and the bottom of the boiler, I think I could have put my finger underneath.
1281. It was more than the sixteenth of an inch? Yes, half an inch at the very least.
1282. Perhaps Mr. Bailey was observing some other part which did not spring? He might have observed the other end; I do not know how far the canting of the straight edge might have gone.

FRIDAY,

FRIDAY, 3 JULY, 1868.

Present:—

MR. PELL, PRESIDENT.

Mr. CARLISLE, R.N.,  
Mr. MORIARTY,Mr. RUSSELL,  
Mr. THOMAS.

Mr. John Snell, R.N., called in and examined:—

- Mr. J. Snell, R.N.  
3 July, 1868.
1283. *President.* You are Engineer of H.M.S. "Blanche"? Yes.
1284. You have had considerable experience in marine boilers? I have had a few years experience; I suppose about twenty, take it altogether.
1285. Are you aware that it is the custom in this port for the Government Engineer-surveyor to test marine boilers by hydraulic pressure? I do not know that it is the custom in this particular port, but I know that in all home dock-yards, and in nearly all the large establishments in England, it is.
1286. You refer to new boilers? To new boilers.
1287. It is the practice here to test old boilers by hydraulic pressure, to a pressure equal to double the working pressure? By the same rule, they do the same in England.
1288. Do they do the same in all boilers? In all, old as well as new, after being repaired.
1289. It does not appear that the practice here is confined to the testing of boilers after extensive repairs have been effected, but that it is also applied to every boiler on board a ship trading from this port, about once in six months—Do you see any objection to that practice? It depends entirely upon the length of time the boiler has been worked. If a boiler has been in use four or five years there is no objection to it; but there is this objection, from the weight of the boiler, if it is resting on its own bottom and bedded in cement, and there should be any bad places there, there is no chance of getting it out to see.
1290. You do not think, where a boiler has been worked four or five years, double the working pressure would be an excessive test to apply? No.
1291. It has been objected by persons interested in marine boilers here, that this testing has sometimes injured boilers without its being perceived at the time, and that they have subsequently given way under ordinary working pressure—Should you think that likely? No, I should not think so; because the pressure applied being double the pressure it is supposed to work at, if there were any defect it would shew it if carefully examined at the time the pressure was applied.
1292. There are certain portions of the boilers which cannot be examined? You cannot generally examine under the ash-pit.
1293. Is it not the case that those are parts—the parts you could not see—which are not so much subject to deterioration? The bottom of the boiler, near the ash-pit, would be liable to deterioration if the practice were adopted of damping the ashes, because the damp arising from the ashes itself would cause it to go after a few years.
1294. Only after the course of a great many years? After about five or six years; if the boiler were lifted out, a great deal of rust would be found about it.
1295. Are not the parts most likely to go about the ash-pit? It depends upon how they are used. If you are in the habit of damping the ashes and placing them in front of the boiler, it will go there sooner than in any other part.
1296. Suppose that a boiler, which is working up to 18 lbs. of pressure on the safety-valve, is tested up to 36 lbs., and three months afterwards an accident occurs—one of the stays behind the bridge, near the ash-pit, gives way, or several of them—or, speaking more strictly, the stays draw away through the plate, the steam escapes, and a man is killed—do you think it reasonable to suppose that this double pressure of 36 lbs. upon this boiler could have injured these stays three months before, so as to lead eventually to this accident? No, because if it were injured at all, it would have shewn it at the time.
1297. In what way would it have shewn it at the time? By leaking.
1298. These stays were fixed by screwing through and riveting over; they were of about an inch and a quarter or an inch and a half section, and the boiler plate was three-eighths of an inch in thickness—Should you think that mode of fixing the stays in any way would account for the accident? I think it a bad way of fixing the stays; but it is hard to say whether it would account for the accident, because it depends upon the sort of iron used. In my opinion, however, a thread through a boiler is not a sufficient stay; and, on the other hand, in riveting the end of the stay over cold, it hardens that part, and that rivet is of no use to the stay, for the slightest pressure will make it crumble away.
1299. It appears, judging from the appearance of the stay, that the bat was gone before the accident happened, so that it was depending only upon this thread which you see (*handing one of the stays to witness*)—Does it appear to you surprising that these stays should give way? No.
1300. Do you think it is necessary to go back to the test that occurred three months before to account for the accident, considering the state these stays are in (*referring to the stays on the table*)? What was the distance of these stays apart?
1301. One to the square foot about? Then, if that stay was in when they put the pressure on, I think it would have withstood the pressure as it is.
1302. Then how was it it gave way under the ordinary pressure? The way in which these things occur is sometimes beyond comprehension.
1303. It is the opinion of some engineers that when this pressure was put on, probably the pressure, without its being observed, opened a stay-hole, and that consequently, a leak was produced which led to corrosion of the thread; that this went on during three months, and the accident

accident resulted therefrom? If at the time the water pressure was on, the boiler had been carefully examined, that would have been perceived, and the accident would in all probability have been prevented.

1304. Suppose it should appear that this plate was carefully examined at the time, and that nothing was observed? Of course it must then be considered sound, and be allowed to remain.

1305. Is it not possible this may have drawn through one-sixteenth of an inch, and it would have caused a slight deflection of the whole plate if all drew one-sixteenth of an inch? If this drew one thread, it would draw the whole of the threads away, and soon the water would come through, for these things could not go one-sixteenth without drawing the thread. The threads here are about ten to the inch; it would have taken two-thirds of the thread by drawing that about one-sixteenth through, and the consequence would have been that the thread would have been stripped.

1306. Is not that a part of the boiler, where these stay-heads are, more liable to corrosion than other parts at the back of the bridge? It is according to how they are formed.

1307. Is it not a place where they are liable to damp? I do not know how it is with your vessels,—our fire-bridges are perfectly dry, they are built of fire-bricks, and—

Mr. Moriarty drew a sketch of the fire-bridge of the "Clarence," and pointed out the difference between it and the fire-bridge of one of Her Majesty's steam-ships.

Of course, if the water leaked through it would deteriorate the iron.

1308. On the whole, you do not see how this pressure having been applied to the boiler so many months before, could have led to this accident? No, not if the boiler were examined correctly.

1309. At the time? At the time.

1310. You do not think it is an excessive pressure to put on the boiler? No. In the case of my own boiler, after having been working five years, I should apply the same test. We work to 32 lbs., or rather, after five years working, we work only to two-thirds of that pressure; but if I were testing her, I would apply a pressure of 64 lbs.

1311. Would you not, in testing her, as you have reduced the pressure in her ordinary working, also reduce the test pressure one-third? No; in testing an old boiler, you test it according to the original working pressure.

1312. Then, in fact, you would, with an old boiler, test it at three times the working pressure? Yes, but at twice the original pressure.

1313. You have done that? Yes.

1314. Is that the common practice in Her Majesty's vessels? I do not know; it is the practice I have adopted.

1315. Have you found it shew signs of weakness? No, I have never seen any signs of weakness yet.

1316. Suppose in testing a boiler up to double the ordinary working pressure, a plate should bulge out, should you consider that that was a sign the plate was not sufficiently stayed? Yes.

1317. Supposing this testing had bulged a plate and so injured a stay, you would attribute that to a defective stay? Either to a defective stay or to an insufficiency of stays.

1318. In any case, whether the stay was injured or not, you would attribute the accident not to the practice of testing up to double pressure, but to that boiler being deficiently stayed? There is a stay here every square foot; if the stay gives way, it is quite possible the plate will give way too in that place.

1319. Then the injury arose from there not being sufficient stays? Yes; or from the plate being unsound.

1320. Suppose the Surveyor, upon testing boilers in this way, should observe a deflection of the plate, do you think it would be his duty either to require that the plate should be strengthened in some way or —? Yes; he should have it extra stayed.

1321. You think the mere fact of its bulging under double pressure, is an indication that it is not strong enough for the work? Yes.

1322. How would you think that these stays should have been fixed in the boilers? Different makers have different ideas on that subject. I think one nut inside and one out.

1323. How are they on board men-of-war ships? On both sides of the plate.

1324. Sometimes by screwing through? I have seen them so, but I do not like that plan.

1325. What is the object of the inside nut? To prevent the thread coming out; there is no thread in the boiler plate.

1326. Is not the boiler more liable to leakage? I do not think so, if properly screwed up and a little red lead put between. You have two surfaces, and if there is any inclination to leak you see it about the ash-pit, or about the side of the boiler, and you can then take one of the nuts off, and repair the leak.

1327. How are your stays in the furnace fixed? By the same means.

1328. Have you found any inconvenience from that? No.

1329. Do you find them burn away? No.

1330. Some engineers object to them very much? I have heard plenty do so, but I think the objection groundless. I think it a very safe method; if the nuts do burn away, you can take them away, put new ones on, and save the bolts.

1331. If these stays had been fixed with nuts outside, do you think the accident would have happened? No.

1332. Are you aware what the practice of the Board of Trade Surveyor in London, as to marine boilers, is? No.

1333. You say you test your old boilers yourself? I test them occasionally, not as a rule.

- Mr. J. Snell, R.N. 1334. Is that the case generally in the Navy, or is it a practice peculiar to yourself? It has been peculiar to myself. I do not know whether the practice is general in the service.
1335. Or among other engineers anywhere? Or among other engineers anywhere.
- 3 July, 1868. 1336. How do you apply the hydraulic pressure—by the ship's pumps? Yes, by the common hand-pump.
1337. What is about the diameter of the piston? Our piston is seven inches.
1338. Does it require much power to get the pressure up? Yes, we have sixteen men to the pump.
1339. Do you find the pressure gets up suddenly? It goes gradually, because the men cannot work the pumps rapidly; it takes great pressure to bring down the plunger into the barrel.
1340. It has been objected by some that, to obtain the pressure by means of a hand-pump, is something like hammering at the boiler, because the pressure gets up suddenly in a jerking way? It cannot do so if you have the pressure of a seven-inch plunger, because it requires a great pressure to bring it down, and it must go steadier.
1341. You observe the steam-gauge when the pressure is applied? Yes.
1342. Did you ever observe the pressure got up suddenly, in jerks? The only instances where I have done so has been when they have been applying a small hand-pump; but where a large pump is used, as on board our ship, and at Chatham, where I have seen it used, it has gone up gradually.
1343. Some have objected to large pumps, on account of their getting up the pressure too suddenly—Do you not think there is a stronger objection to small pumps? Yes, every jerk of the pump causes a sudden pressure. We tried with a small hydraulic pump, and could not get the water up.
1344. Have you much acquaintance with mercantile steam-vessels? Very little.
1345. Do you know whether it has been the practice to increase the pressure in marine boilers? That I cannot say.
1346. Within a period of fifteen or twenty years—do they not work up to a much higher pressure? Yes.
1347. The tendency is to increase the pressure? Yes.
1348. Do you think the tendency is to increase the strength of the boilers in the same proportion? Yes, I think so, from the way they are stayed. The tubular boiler is a stayed boiler in itself, but the old flue boiler they have to stay differently.
1349. You scarcely know anything of the boilers used in vessels that run from this port? No; I should not like to give an opinion until I had seen them.
1350. You would not recommend that the present mode of testing boilers should be discontinued? No. What other mode could you apply if you did discontinue it?
1351. It is the opinion of many, that if you had a man of long experience he could judge of the capability of a boiler by thoroughly examining it? He could with respect to those parts which he could examine, but there are parts which he could not get at; the points of the stays might look very well on the outside, but they might not be in a sound state between the ash-pit and the boiler; but when you get these weights on, you can tell what state your stays are in.
1352. Might not the same remark be made with respect to the hydraulic test,—that a leak might take place in parts of a boiler that could not be seen—I am speaking of testing a boiler in the ship? There are parts you could not get at to examine.
1353. Would not that apply to the hydraulic test as well as to a personal examination? No doubt, as far as the bottom of the boiler was concerned.
1354. You think hydraulic pressure, properly applied, is better than inspection? Yes, I would trust to it in preference to the opinion of any one.
1355. Suppose, upon survey, it was found that the stays were in the state in which these stays are—the bats are broken off (*referring to the stays on the table*)? I should have them taken out—I should not consider them fit to be used again.
1356. Mr. Moriarty.] Will you look at that stay—(*handing the same to the witness*)—that has the appearance of having had a pretty good hold of the plate; the thread is pretty clear and well cut? Yes.
1357. That appears to have had a fair hold of the plate? Yes, on one part of the bolt, but not on the other; the thread is all out of the plate on the other side.
1358. Still, taking it all in all, that appears to have had a fair hold upon the plate? One part has been good and the other bad, and therefore it cannot be considered to have had a good hold of the plate.
1359. I would draw your attention more particularly to another of these—(*referring to another stay upon the table*)—do you not see a manifest difference in these two stays, as regards the thread? There has been very little hold in that stay—it is completely filled with rust, the bottom part of this.
1360. Look at the other—you will see there is still less hold. How many continuous threads can you detect as having had any hold at all? Three.
1361. Are they continuous all round? No, on one side there has been no hold at all in three of the threads.
1362. They are gone? Gone completely.
1363. President.] We understand you, that they had no hold before the accident—not that the thread has gone since? No, they had no hold in the iron at the time of the accident.
1364. Mr. Moriarty.] I would ask you to measure from the butt of the thread where it seems to have had any hold on the plate—Do you think the head of that must have been underneath the plate—From the appearance of the thread, do not you think the plate must have been buckled over that thread? You may find the place where the plate has been resting on it, but I cannot see any.

1365. Could that have been in the plate recently? It must have been in the plate, but Mr. J. Snell,  
R.N. there is no thread in this from the plate.
1366. Measuring from the lowest thread where there is any appearance of contact, could the head of that have shewn properly above the plate? According to this, the point of the 3 July, 1868. bolt would have been partially through the plate.
1367. You say that the stay-bolt was never fairly through the plate of late years? No.
1368. Looking at the stripped part, is that an indication of recent strip at all? No, I should say that is eaten away by the action of water.
1369. In point of fact, that stay must have been utterly valueless as a stay? Yes.
1370. *President.*] You think there are only three or four threads that would hold? Yes.
1371. Do you think that must have been so originally, or could it have been by any means brought into that condition? I could not say; the action of water might have eaten this thread through.
1372. It could not have been drawn into that state? No.
1373. *Mr. Moriarty.*] I think you will see upon the edge of the iron indications of some strain? Yes, as if the thread had been torn away.
1374. That is not recent either? No.
1375. Do you not think, from indications on that stay, that it was injured some time before the accident? I should not like to say that it was injured by excessive pressure, for in the first place there is one thread gone, and if the pressure stripped one it would have stripped the whole, because you cannot get one thread to give without the lot, especially as this is on the outside.
1376. *President.*] Could the stay have given away with its original pressure, if it had had a hold? No.
1377. *Mr. Moriarty.*] If it had not a hold on the thread, but had a slight hold by the bat, the strain might strip the bat? Yes.
1378. Do you think there is any indication of its having been so loose in the thread as to have broken the bat without injuring the remaining threads? Yes, from the appearance of this, I should say so.
1379. Do you think if a man had gone into the boiler and examined that stay, without trusting to the "blind agent" we hear so much about, he ought to have seen it was a little too much below the surface of the plate? Yes, and if he had seen the point bad, and were a man of common sense, he would have had the old stay out and put a new one in.
1380. The thread there (*referring to another stay*) is much deeper—there is indication of a three-eighths plate well inside the rivet? Yes.
1381. The other is pretty much of the same character—you will see indications of that being well inside? Yes, that is well inside.
1382. And that likewise (*referring to another stay*)? Yes, if you look all round this, there is scarcely any thread here—the thread is nearly all gone off. If it corresponded with the thread in the plate, nothing could have prevented its going.
1383. That has been in the plate, because there is no salt about it? There is no salt about it.
1384. That (*referring to another*) has evidently not been in the plate? That has been below it.
1385. *President.*] It appears that the Surveyor went into the ash-pit at the time the pressure was on? I have seen some go into the ash-pit, and into the boiler when the pressure has been on, but it has been a mere formal matter.
1386. *Mr. Moriarty.*] Seeing that these stays which have been shewn to you passed the hydraulic test satisfactorily, do you consider that the hydraulic test is of itself sufficient? I do, if the boiler is carefully examined at the time the test is on.
1387. It is not to supersede examination, but to assist it? Yes, if there is a bad seam or rivet it will shew immediately—I do not think there is anything better.
1388. Do you consider that it should be exercised with the greatest caution, and that there should be the most careful examination after the hydraulic test? Yes, I do, because mischief might occur while the test is on, and a person might not be able to discover it then.
1389. It requires the most careful examination after the test, to see whether any mischief has been done—to see whether any stays have been carried away? Yes.
1390. Looking at that stay, should you say it would be better to get a moderate pressure over and above the working pressure, say fifty per cent., upon the boiler, by hydraulic pressure, and then to go carefully round and search, in order to see whether the water was making its appearance, or whether there was any yielding of the plates? If you have an old boiler. But still the pressure ought to be gradually raised to double the original working pressure.
1391. Would you prefer that to squeezing it up to double pressure, and then walking off without examination, and saying "It's all right"? Yes, I should prefer the application of (say) fifty per cent. above the working pressure, and a careful examination afterwards.

---

Mr. John Kell called in and examined:—

1392. *President.*] You are Superintending Engineer for the Parramatta River Steam Mr. J. Kell. Navigation Company? Yes.
1393. You are, of course, aware of the method by which the Government Surveyor tests 3 July, 1868. marine boilers in this port? Yes, by hydraulic pressure.
1394. Sometimes up to double the working pressure? Yes.
1395. Have you any objection to that mode of proceeding? I think it much too severe a test.

- Mr. J. Kell. 1396. Do you object to hydraulic pressure altogether, or to its being carried to such an extent as double the working pressure? I think it is too much.
- 3 July, 1868. 1397. About how far would you carry it? About fifty per cent. would be sufficient.
1398. What is your objection to the application of the double pressure? I have found, on various occasions, after being pressed by hydraulic pressure, that boilers have leaked which were tight before.
1399. Afterwards you discovered the leaks? Afterwards I found the flues leaking.
1400. Do you think an experienced man could ascertain, by inspection merely, the defects of a boiler, without resorting to the hydraulic test at all? There might be parts about a boiler which he could not get at to see properly.
1401. You mean that defects in such places might be detected by the hydraulic test? Yes.
1402. You would approve of its being continued, but only to a moderate extent? I do.
1403. Could you name any specific cases in which you have reason to suspect boilers have been injured by the application of the hydraulic test? Generally in flues.
1404. Can you mention any particular steamer where you think the test has injured a boiler? I remember two occasions in one boat, and one in another.
1405. What boats were they? The "Emu" and the "Pelican."
1406. Have you had much experience in superintending the repairs of old boilers? I have been about twenty years in steam-boats.
1407. Is it not the case that they have been rather increasing the pressure on steam-boats the last fifteen years—working at a higher pressure than they used to do? They do put more on than they used to do in former days.
1408. Do you think the boilers generally in use have been increased in proportion to the working pressure? Yes.
1409. You think the proportion has been kept up? Yes; our boats have more stays than they used to have.
1410. Do you think they have enough? I think so.
1411. Mr. Thomas.] Is that the case with vessels belonging to other Companies, as well as with those belonging to your own? I do not know.
1412. You are referring only to the boats belonging to your Company? Yes; in fact, I have no time to go into any other place; my own boilers are enough for me.
1413. Mr. Russell.] Have you complained to the Inspector of his insisting on putting on the double pressure? Yes, I have always been against it—I said it was punishing the boilers too much.
1414. On more than one occasion? On two occasions on the "Emu," and one on the "Pelican."
1415. Did you explain to him what the effect might be? No; I merely told him that I found my boiler was leaking after being tested.
1416. Did you tell him he was likely to injure the stays, or flues, or any particular part of the boiler? It has generally been in the flues.
1417. How long is it since Mr. Dalgleish first proved any of your Company's steamers under this pressure? It was shortly after he was appointed.
1418. About two years and a half ago? Somewhere about that.
1419. When Mr. Dalgleish first proved any of your Company's steamers, did he go into the boiler, and make a thorough inspection before he put the pressure on? Yes, he always went into the boiler before he put the pressure on.
1420. After proving, did he inspect the boiler again? No; the steam was then got up.
1421. President.] Do you mean that he did not examine the boiler while under pressure? He merely went inside the flues while the pressure was on.
1422. Did he not make a careful examination of the boiler while the pressure was on? No, he merely goes down to the furnace and looks in—I have never known him to go round the flues.
1423. Mr. Russell.] Nor after, to see whether any of the bats were off the stays, or anything of that kind? No; he merely stands by the steam-gauge to see that the pressure is kept up, and, I suppose, judges from that that no water is running out.
1424. And he thinks that is sufficient? That is what he thinks, I believe. I have never known him to go round the flues once.
1425. How often have these tests been put on in the year? Every six months.
1426. If, then, a steamer has got a certificate for six months, has he found it necessary to press it between the dates of the two certificates? No. The last time he tested the "Pelican" he did not press it up to double; instead of pressing it up to twenty pounds, which is double, he did so merely to eighteen pounds.
1427. Is that since the repairs were done? Yes, about three weeks ago.
1428. Do you think by pressing the boiler to double the working pressure, the boiler might be seriously injured and the Inspector not know it at all? There is no doubt of it.
1429. In fact, there are parts of a boiler where it is impossible to tell whether injury is done, unless it is shewn by leaking? Yes, there is another thing that would shew it—if there is great difficulty in getting the pressure up. The last time the "Pelican" was tested, we found there was a leak in her flue, and we discovered two of the rivets at the bottom of the flue, under the bridge.
1430. She was not on that occasion pressed up to double? She was pressed up to eighteen pounds, her ordinary working pressure being ten.
1431. Mr. Moriarty.] What are the boats under your charge? The "Emu," "Pelican," "Cygnet," "Ysabel," and "Adelaide."
1432. What does the "Emu" carry? Six pounds; she is not running at present. "Pelican," ten pounds; "Adelaide," twenty pounds; "Cygnet," sixty pounds; and "Ysabel," fifty-five pounds.

1433. If you happened to be on board the "Emu" when the steam got up to eighteen pounds, what would you do—if by some accident the safety-valve was jammed—should you consider it dangerous? I would not think it very safe. Mr. J. Kell.  
3 July, 1863.
1434. Suppose under the same circumstances the steam in the "Pelican" was up to thirty pounds, would you consider the boiler likely to give way under that? I would not trust it much without a minute examination.
1435. If you found the "Adelaide" had the steam up to sixty pounds, should you expect it to stand? I think the "Adelaide" would stand sixty pounds, for she is well stayed.
1436. Do you think she would stand eighty pounds? She might.
1437. She might give way about that? She might.
1438. If the "Cygnet" were up to one hundred and eighty pounds, what would you do if you were on board? I would not be afraid.
1439. Do you think she would stand two hundred and forty pounds? I do not think she would.
1440. That would be four times her working pressure? Yes.
1441. The "Ysabel"—what do you think her boiler likely to give way at—she is carrying fifty-five pounds? I think her boiler would stand one hundred and fifty pounds, or one hundred and sixty pounds.
1442. Her limit of strength would then be about three times her working pressure? I think she would stand about that—not more. The "Emu" and "Pelican" are flue boilers, the others are tubular.

MONDAY, 6 JULY, 1863.

Present:—

MR. PELL, PRESIDENT.

MR. MORIARTY,		MR. THOMAS,
MR. CARLISLE, R.N.,		MR. RUSSELL.

Mr. Daniel Cameron Dalglish called in and further examined:—

1443. *President.* On the occasion when you tested the boilers of the "Clarence," three months before the accident happened, were the boilers stripped? They were. Mr. D. C.  
Dalglish.  
6 July, 1863.
1444. The fire-bars taken out? Yes.
1445. Did you go into the fire-place? I did.
1446. Whilst the boilers were under pressure? Yes.
1447. And you observed the part in question? I did.
1448. Were the soot and ashes and everything cleared away? Everything.
1449. You saw nothing wrong? Nothing.
1450. Nothing wrong about the heads of the stays? Nothing wrong then. The stay-heads were all deeply caulked originally; in my opinion, more than they ought to have been. At the time of making them, the caulking tool was run well into the plate; not only the head of the rivet caulked over, but the plate cut into, so that there was a slight ring made in the plate by the tool.
1451. Are you quite sure there was no perceptible bulging of the plate on that occasion? Perfectly sure.
1452. Did any one else examine that part of the boiler at the time besides yourself? I think the boiler-maker or second engineer was stationed there. I always have one man in the backs to observe anything that may be going on there. Of course I cannot be everywhere myself. I have to observe the pressure, and when I am not doing that I set a man to see that it is not increased above a certain point, while I go round the boiler.
1453. Supposing, when the pressure was applied, the bats should give way on any of the stays in that part of the boiler, do you think they would make a noise? Yes; I have known many instances where stays have given way.
1454. I mean that, without the stay actually drawing out, the bat should fly off? I have never known a stay to draw out or the bat to break off.
1455. Supposing the bat should break off? It would leak. It could not possibly break off unless the plate had bulged outwards.
1456. That would make a noise? It would not only make a noise, but the bat itself would be visible.
1457. Do you find, generally speaking, that the engineers belonging to the ship assist you efficiently in these cases—do they observe closely for you, and point out defects? No, they seem to think it is my place to find them out.
1458. Do you not experience some difficulty in making an inspection of the whole boiler yourself—May there not be some parts that escape you? When the boilers are under pressure, I at all times visit every portion myself.
1459. While the boilers are still under pressure? Yes.
1460. Does not the pressure immediately go down? I keep the pump going, and set the valve at a certain pressure, and station a man to see that that pressure is kept up. I am, in fact, always about. My rule in testing a boiler is that everything is to be quiet; if the carpenters are working I even get them to cease working while the pressure is being applied. I do not think a stay could crack, or even a buckle come out of a plate, without its being heard. I have never known a stay to break unless it was heard, and on examination found out.
- 1461.

Mr. D. C.  
Dalglish.

6 July, 1868.

1461. Whilst examining the different parts under pressure, can you be certain the pressure is kept up during the whole time? I know what the pressure is when I go away, and the gauge is there to speak for itself when I come back. I do not wish it to be understood that the engineers would intentionally or wilfully deceive me, as a rule; but it is a pervading idea that their interest is the interest of the Company, and when pushed for a boat they would rather hide a little fault than expose it. I do not think, if there was anything really dangerous, and they knew it, they would do so; but the practice previously to my holding this position was to cover up every fault, even of the most dangerous character, without in any way strengthening the stays. For instance, the "Agnes Irving"; all the defective stays in her had been covered over, without the stays being of any value. Where the stays themselves had lost their hold, and the water was running through, instead of the stay being replaced, a patch was just put over the iron, and over the head of the stay; and the stay not passing through it, it did not in any degree strengthen the boiler; and that was the cause of the accident, in my opinion, to the "Agnes Irving." Even in a vessel of the A.S.N. Company, only on Saturday last, the "Florence Irving," in making a survey I found two stays in the same position as those which gave way in the "Clarence," in the back combustion chamber, which had been leaking; and two circular caps had been fitted over the heads of the stays, these caps being no strengthening whatever, but simply to stop the leakage from the stays themselves. It was just a circular patch cut out, and the patch itself dished upwards to allow room for the head of the stay, and four bolts put in round it. If this patch was not sufficiently dished, the pressure would force the plate off the stay. In that one boiler there were two stays covered up in that way, although they know I never will allow it, if I see it, but I cannot always see it. The plates in the bottom were as flat as the first day they were put in—not a sign of a buckle, but still the stays were gone. They have now put in two new stays, one on each side of each bad one, rather than take out the old ones.

1462. You told us that supposing a boiler was only just able to bear (say) sixty pounds pressure, it would be highly dangerous, you thought, to test it to a pressure of forty pounds? I think so.

1463. If a steamer were running at twenty pounds pressure, and the boiler was only capable of bearing sixty pounds without serious accident, it would be highly dangerous to test her up to forty pounds? I think it very probable it would injure the boiler, but in such a way as could be seen.

1464. When you have applied double pressure to a boiler carrying twenty pounds of steam, you have believed it would sustain a far greater pressure than sixty pounds? Yes. When I used the term ultimate strength, I should rather have said ultimate weakness—the point at which the boiler is no longer capable of bearing anything.

1465. Supposing a steamer to be working at twenty pounds and tested to forty, if you could be convinced that the boiler would burst at sixty pounds, you would allow you had made a mistake in testing to forty? Yes.

1466. If you should be convinced that the boilers of the steamers generally, under your inspection, would not bear more than three times the working load, then of course the application of the double pressure would, in your opinion, be injurious? Certainly, if I could be convinced of that. There are sometimes local weaknesses of very small extent that might give way at double pressure, or even before double pressure is reached, yet these local weaknesses being found out and repaired, the boiler is equally strong, and in no way injured. A great number of people do not know how to test a boiler. The Chief Engineer of the "Otago," one of the Panama Company's boats, thought he would anticipate me by testing his boilers before I came. The result was, that he blew the backs of his combustion chambers out altogether. But I do not think he did any harm. Although there was a greater amount of damage done than there need have been, I think the back ought to have come out. Instead of being an argument against double pressure, it is a forcible one in favour of it. Before he had reached double pressure on his gauge, the whole of the backs came out.

1467. Supposing you had applied the test, would you have blown the backs out? No. He did not take the air out of his boilers, and the consequence was, he had an atmosphere capable of forcing everything out at once. It does not give any warning. It is not a pressure that is relieved immediately, like water pressure. The fact is, his boiler was converted into an air gun.

1468. When you assumed office here, there was no such thing in practice as testing boilers in use by hydraulic pressure? I think the practice did exist. The assumption evidently is, that a test should be used. I have to make a declaration which assumes that some pressure, other than steam pressure, must be used, because the form is so prepared that I have to declare that I have tested the boiler to so much, being so much more than the actual pressure on the safety-valve. Therefore, on the very face of the document, the assumption is that I have tested the boiler; and if I do not test it, it has to be stated on the face of the declaration that I have not done so.

1469. Is it your opinion, speaking of marine boilers generally, as they come under your inspection, that the safety of the public would be more amply secured, and even the interests of the steam-boat proprietors advanced, by a general additional staying of the boilers? There is hardly a boiler out of this port that I have not had to have additionally stayed.

1470. Do you not think it might be carried even further, with advantage to all concerned? There are some boilers that might do with additional stays, and that are perhaps weakly angle-ironed; but where the boilers are strongly angle-ironed, that is a great additional strength to the boiler itself. That has to be taken into consideration together with the stays. In fact, the construction of each boiler must at all times be taken singly; you never can

can speak of a number of boilers and apply the same rule to them all. Some boilers are three times as strong as others. Some have been originally made, in my opinion, to stand ten times the pressure they are working at.

Mr. D. C.  
Dalglish.

1471. You are aware that, of late years, the pressure applied to marine boilers has been gradually increased? It has. 6 July, 1868.

1472. Does your experience extend over a sufficient number of years to enable you to give an opinion whether the strength of boilers has been increased in proportion to the increase of working pressure—where they used to work at four or five pounds, they now work at twenty pounds? In my experience, five pounds has been changed to ten, and from that to fifteen and twenty-five. The best makers, at the time when they worked to fifteen pounds to the square inch, stayed every twelve inches, or put stays of a power equivalent to doing so; but many of them, at the present moment, do not stay so closely. There are many boilers stayed, twelve by sixteen, and twelve by fourteen.

1473. Generally speaking, they are not sufficiently stayed? Wherever I think so, I cause extra stays to be put in. As a rule, I have found that the top parts of the boiler—the places that are easily got at—are well stayed; but in the water spaces, and in the bottoms, where they are not so likely to be seen, they are not only badly stayed, but the stays are of the worst possible form—that is, not direct in their strain. In many instances stays are put in which are bent like an S, and which are of very little advantage at all, because before any considerable strain comes on such a stay it must straighten itself out, which would allow the boiler to go beyond the ultimate strength of the plate before the strain was brought to bear on it.

1474. Do you think that a boiler which has a pressure of fifteen pounds on it ought to be stayed every twelve inches? No, I think for a pressure of fifteen pounds it would be sufficient to stay it every fifteen inches; but from twenty pounds upwards there ought to be nothing less than twelve inches.

1475. You said something about something equivalent to a stay—did you mean stronger stays at greater intervals? Stronger stays and stronger angle-irons, built into the boilers as part of the original construction; so that the flat sides are made on the same principle as a bridge.

1476. Do you think any strength of the stay itself can make up for increased distance between the stays? I think with more angle-irons, which may be called the girders, stronger stays at less distances would be quite sufficient.

1477. Do you not consider it would be a better practice to put in smaller stays closer together? The fact is, there are plenty of boilers that I cannot get into now, except in such a way that if the slightest faintness came over me, or any other person that had to go into those boilers, they would have to cut the boiler to pieces to get us out. I do not think a boiler ought to be made with the stays so close that it could not be got into to be cleaned and examined. I am speaking of marine boilers, with a pressure of twenty-five pounds downwards. The best form to obviate that is the round boiler, which is now coming into favour for marine purposes; and the only reason that it was out of favour was, on account of its taking up a little more room. These flat boxes are objectionable in every way.

1478. If a boiler is not stayed sufficiently to stand a pressure of sixty pounds, do you think it would be unfit to work up to twenty pounds? I think, if the stays went, that would be the case; but when I speak of the ultimate pressure a boiler will bear, I wish it to be understood that that is its ultimate weakness—that point at which the boiler gives way somewhere.

1479. Supposing there are two boilers of similar construction—one that would stand sixty pounds, and another that would stand one hundred pounds; the one that stands one hundred pounds does so because it is better stayed? Certainly. There are boilers now running out of this port at a working pressure of one hundred pounds.

1480. If a boiler is so stayed that its ultimate weakness, if you prefer that term, is sixty pounds, ought it not to be better stayed before it is allowed to work up to twenty pounds? Certainly.

1481. Do you think that your efficiency as Inspector would be much impaired, or the public safety endangered, if you should use this hydraulic test to no more than 50 per cent. as a rule—not that that should be forced upon you, but that you should, in your own practice, reduce the testing pressure generally to 50 per cent. more than the working pressure? If such a rule were brought into force, the result would be that pressure would be continually brought to bear on me to make that the ultimate pressure I would adopt; and the result would be that boilers would run longer at their first working pressure, because it is always with great difficulty that a reduction of the working pressure can be obtained—they will fight for it pound by pound.

1482. Have you not power to reduce it? We have the power, and it is the exercise of that power, and the knowledge that double pressure can be applied, that is objected to. As a rule, you will find from the return I gave you, I do not apply the double pressure.

1483. Do you not think you could detect most of the weaknesses by a pressure of 50 per cent. above the working pressure? I could detect some of them, no doubt; but whenever an absolute necessity arose for condemning a boiler, I should never have the power to do it. My opinion is, that the public safety would be most seriously endangered by restricting the test pressure to 50 per cent. more. For instance, the "Emu"; I was pressed time after time to apply double pressure on this last occasion, before the boiler was taken out. The Managers pressed me time after time.

1484. And you condemned it? I did.

1485. Supposing your practice were limited to 50 per cent. more, you would have done the same thing? Practically speaking, unless some other regulation was made, it would not make one bit of difference to my practice.

Mr. D. C.  
Dalglish.

6 July, 1868.

1486. I cannot see, from what you say, that the power of using double pressure assisted you there; you condemned the boiler without applying it? No, it did not help me in that case, neither has it helped me in other cases. As I before stated, in no case where a boiler has been actually condemned has double pressure been applied.

1487. We observe, in looking over your list, that in a very considerable number of cases you did not apply double pressure—I think somewhere about half of the whole number? No, I should think the double pressure was not applied to more than one-third, speaking from memory.

1488. Can you give us a clearer idea of how you are guided in this matter. It seems that in some cases you only put on the working pressure, sometimes only 50 per cent., and sometimes 100 per cent.? The "Rangitoto" was a vessel that came up here for general repairs; she was tested to double pressure, or very near it—42 pounds, the working pressure being 24 pounds. The "Kaikoura" was tested to 46, working pressure 25.

1489. Something less than double? Yes. It was after a regular repair, although a new boiler. The "Kaikoura" is working with surface condensers, and the action of the water on the large surface of copper piping in her produces something very like galvanic action, so that some of the stays in her bottom that were originally an inch and a quarter, were less than three-eighths of an inch of metal; and although I tried every stay with an iron prod and a candle—the only way I could do it, for I could not get in, as there were only six-inch water spaces—still, one stay might be missed, and by applying hydraulic pressure in a case of this kind, where we know danger may exist that we cannot see, we find out the defects.

1490. You carried the pressure up to forty-six pounds—not quite double? Yes. Sometimes there are reasons for that which are acted on just at the moment. For instance, at the man-hole door, the gasket may give way—blow out—which it is more apt to do with water than with steam, because the action of the water washes the white lead away that makes the joint, and a leak ensues. Something of that kind may happen when double pressure is going to be applied; and if no weakness has been detected we do not put them to the expense of running the boilers down and going through the whole operation again. In many instances, where the pressure has been dropped short by a few pounds, it has been occasioned by something of that sort. For instance, a feed-pipe might burst, but the pressure having gone sufficiently high, I do not order a repetition of the test, even though the double pressure has not been attained, when I am satisfied everything is sound. In other cases where the pressure has been only a pound or two above the working pressure, it has been some old boiler, or perhaps a new one. If a new boiler which has been tested before to double pressure, it may only be applied to a little above the working pressure, to see if any joint has sprung, or if any particular part of the sheathing or doubling of the iron has given way, which we cannot see when the fires are lighted, but the moment the water is filled in, it finds it out without carrying it to double pressure. In many instances, where boilers are double the sheathing plate gets injured, and if they have a short certificate, instead of applying double pressure we fill the boilers up to see that the old sores are not increased, and that the new work is tight. The case of the "Albion" is a peculiar one. The vessel came up from New Zealand, having been bought to sell at Japan; and the owners were particularly anxious to get our certificate. In fact, they all are when they want to sell their vessels; they are extremely anxious to get the certificate of our Board. On examining the ship, I found several stays defective in the back combustion chamber. I pointed them out to the engineer. The orders of the captain and agents were that everything was to be made effective. The consequence was the strictest form of proof was gone through, very much to the satisfaction of her owners. But I refused to apply the double test to the boilers before these stays were renewed.

1491. Take the case of the "James Paterson," only tested to fifty per cent. above the working pressure? She gave way at a particular part at that pressure. It was a place where we knew weakness existed, and the pressure was applied to find it out. It did find it out, and the boiler was then made stronger in that place; but I did not consider it necessary to apply the test again.

1492. You knew the weak part before testing? Yes.

1493. Then would it not have been sufficient to have ordered it to be repaired without testing? There happened to be a difference of opinion respecting it.

1494. Supposing they had consented to remedy this defect, would you have applied the pressure? I would; but merely to see that the work was tight.

1495. Supposing a vessel to have been thoroughly repaired, overhauled, and tested, and you give her a six months' certificate—she comes back at the end of the six months, and you find she has merely undergone ordinary wear and tear—would you test her again? No, I should not consider it necessary. There are cases where you cannot be certain whether defects exist or not, without the test. For instance, a seam of rivets may happen to be sprung, but you cannot tell, by merely looking at it, whether it is sprung or not; the hammer will not tell you; then, instead of allowing the plate to be caulked and perhaps the joint strained, the water will shew it at once, and it may be caulked up afterwards without any detriment to the boiler, but if caulked up before the water was tried it might be water-tight but not strong.

1496. Some of them seem to have been tested to very little above the working pressure; for instance, the "Wonga Wonga"? That was the old boiler. That boiler had been condemned, and the ship laid up to have it taken out, but they wanted to make a demonstration at the time of the Prince's visit. I think an express letter was sent to the Steam Navigation Board on the subject, and she got, on my survey, a certificate for a month, but at a reduction of the pressure she had been working at; she had been working at twenty pounds previously, but I only allowed her fifteen.

1497.

1497. You tried her at seventeen? Yes, in order to see whether any of the plates had started—for the mere purpose of seeing that the old work was tight and not strained. The vessel never ran with that certificate, except on that one occasion—to go to meet the Prince.
1498. The "Yarra Yarra" was not tested at all? No, she had been tested to double pressure on the previous survey.
1499. A pretty long list of boats seem not to have been tested at all? Yes. The "Alexandra," running at twenty pounds, was not tested. The "Breadalbane" was running out a short certificate. Her boiler is now taken out, and on the wharf; and, although it is an expense I do not feel justified in going to myself, if the Commission thought fit to have it temporarily repaired for the purpose of pumping it up, and bursting it, it would test the truth of what I have stated,—that its ultimate strength would be at least three times its last working pressure.
1500. What was that? Seventeen pounds.
1501. You think it would stand three times that now? Yes, I am sure of it.
1502. Still you condemned it? Still it was condemned because of its age. It is what is called a dry-bottomed boiler; and in order to let it pass its last examination, they were obliged to fill up the bottoms of the legs with cement and put bolts right through, to prevent the bottoms of the legs from opening up. Although it does not appear that it was tested at the last survey, it was tested a week before that, and stood it.
1503. To thirty-four? To thirty-four. The only reason why we could not get the pressure upon it was, that the hand-pump failed. They have a new pump, a new donkey, and a new boiler, now.
1504. *Mr. Moriarty.* Will you look at that stay (*one of the stays from the "Clarence's" boiler*), and say what hold it had upon the plate? It had a very poor hold.
1505. From the lowest thread marked by the plate to the top of the stay, what distance should you say it is? There is a taper upon the thread. This is the stay that I alluded to in my evidence as imperfect in workmanship, both in the stay and in the hole. The female thread in the hole was hardly marked at all.
1506. Rusted up? It had never been there at all. This thread has not been turned over—not forced or drawn in the way an overhauled thread generally is; neither was the thread in the plate overhauled—it had simply never been there.
1507. In measuring it, how deep should you say it was through the plate—did it go through the plate? Yes, it went through the plate.
1508. What was the thickness of the plate? It was a three-eighths plate. I think I stated in my former evidence it was rather better than a quarter and one-sixteenth.
1509. Had that stay that hold? Very near that. The thread would be diminished by the thickness of the plate.
1510. Is there any appearance on the head of that stay of its having had any hold at the bat at all? Very little; on one side none at all. There has been no wear on the top of these threads; they are as perfect as when they left the machine.
1511. Should you say that stay was capable of standing forty-seven pounds on the square inch, over a foot of surface? The stay would be, but the thread would not hold—it is my opinion it would not.
1512. So that, when it appeared to have stood it in the "Clarence," it must have been strained almost to its breaking weight? Its stripping weight. But you see it has not been stripped.
1513. But the plate has been opened, or something has cracked? The hole that this stay was supposed to fill was a defective hole from the first; it was always too large; there never was a full thread in it.
1514. Does not all that shew that fifty pounds on the square inch must have been the very margin of the breaking weight—of the giving way of that stay? Of course if there is a defective place it will be weak to that extent; but I do not think the plate would have given way at all.
1515. It seems to have stood the pressure? Yes.
1516. And to have given way afterwards? I do not think it gave way from pressure at all.
1517. Looking at the head of that stay, as well as the others, should not a careful inspection have shewn that it was defective? No; it could not be seen. This was one of the cases where a caulking-tool, being edged round it, and taking the plate as well, gives it the appearance of being riveted over. They are riveted over cold, and to rivet them long would be to destroy the rivet. If a long time were taken to hammer them, they would get brittle. They are generally made of the best iron, and even then, if hammered for a long time, it gets brittle.
1518. Do I understand you to say that the caulking of that would make it appear as if the head extended further? Yes, it does in all instances give the head the appearance of being larger than it really is.
1519. *President.* Are you clear that the bat was not broken off at the time of the accident? Yes, perfectly clear that the bat was not broken off at the time of the accident, and that no undue strain was exhibited on any one of the stays at the time of the pressure.
1520. *Mr. Moriarty.* Would you have put that boiler down as one of those capable of standing three times the working pressure? Yes, if these stays had been as they ought to be.
1521. The hydraulic test did not develop the defect in that plate? No, it merely shewed that it was strong enough to withstand the test. It was not the explosion that killed the man. If it shews anything, it shews that the boiler was strong enough to stand the shock of the explosion without rending, for there was not a rent in the plate. The Board of Trade and many eminent men recommend a fusible plug to be put into a boiler. If a fusible plug had been in and had melted out, an accident exactly similar would have resulted,

Mr. D. C.  
Dulgleish.

6 July, 1868.

resulted, if the man had been in the same place. It was the jet of water breaking into the furnace and generating steam within it which caused the death of the man.

1522. *President.*] Do you think the heads of these stays ever were riveted over at all? Yes, they have been riveted slightly.

1523. Do you think their defective state is of long standing? I think it very probable these stays may have been caulked and recaulked, similar to the two I found in the "Florence Irving" at the last survey; and very possibly, by a little more caulking, a leak might have been developed, and a cap put on to prevent the leak being seen.

1524. *Mr. Moriarty.*] I understood you to say that you never did prove a boiler to more than double its working pressure? No.

1525. Was not the pressure on the "Clarence" considerably more? The hydraulic pressure on the "Clarence" was more, but that was not my fault; but no bad result ensued even then.

1526. I mean in the first instance, when she was proved, three months before the accident? It is that I am speaking of. It was when I was making the inspection of the boilers the pressure got up.

1527. *President.*] Have you not a valve which makes it impossible for the pressure to get beyond the amount you fix upon? I set the index, and a man is stationed to watch it.

1528. Does it not relieve itself? It relieves itself, but the valve is not large enough to relieve the pressure on the boiler; it is only a quarter of a square inch.

1529. In proving these boilers, do you estimate the height of the boiler? The working height of the boiler is a constant quantity, and is always in addition to the pressure of steam carried. The A. S. N. Company, for reasons of their own, generally have a place for my gauge put on their man-hole door on the top. As a rule, on all the other boilers, where I choose myself where I will have it put, I put it at the water-level. But for convenience and handiness to themselves, they take the man-hole door into the shop, tap it, and fit a brass plug in afterwards. At the same time, it makes a difference of six or seven feet of water, which I consider of no moment.

1530. *Mr. Moriarty.*] Do you not think it would conduce more to the safety of the public, as well as the better management of marine boilers, if you were to go in boldly at once for insisting on additional staying, rather than trust to the development of weaknesses by this hydraulic test? I always do go for additional stays. I do not know what boilers there are now which require additional stays. In almost every instance I have insisted on additional stays. A boiler may come out new, and stand the hydraulic test; but, if there is a bad circulation of water, six months afterwards there may be bulgings developed; that is from the fierceness of the fire acting on the parts where there is a bad circulation of water, and perhaps the formation of scale. In that case, I make them put in additional stays in the intermediate places. In the case of new boilers from England, belonging to the Panama Company, I have refused to put the pressure on until the stays were in. I would not accept the responsibility of bursting the boiler, when I knew it was insufficiently stayed. We cannot take the pressure off those boats.

1531. The question arises whether a man is safe in trusting solely to this hydraulic pressure? I never do trust solely to hydraulic pressure; I always insist on having stays put in where they are requisite. Mr. Jaffrey and myself quarrelled because I insisted on stays being put in, in the first instance, in the "Collaroy," where the flat plate had gone up more than an inch and a quarter. Mr. Jaffrey refused to stay it, and the Manager of the Company took his part, and appealed to the Steam Navigation Board, who upheld me in my decision; and the stays were put in. They are there now. That was before they had been tested by cold water at all.

1532. *President.*] Is it your opinion that boilers would last much longer, or any longer, if they were more efficiently stayed? I am perfectly certain of it. The "Wanganui," which has come from New Zealand and is under repairs now, was very imperfectly stayed, and I am sure the defect in the staying was the cause of the decay in the bottom of the boilers.

1533. It would be for the benefit of the steam-boat proprietors? Yes.

1534. Do you not think your system of requiring additional stays might be carried even a little further. It is the opinion of many practical engineers that boilers are not sufficiently stayed? I do whatever I can to get them stayed properly, but great objection is made; I have to go into battle with them.

1535. You have a strong weapon to fight with—refusing a certificate? I always do it, but still it causes a very great deal of dissatisfaction. Very likely there would be a great many complaints about the way in which I insist on having boilers unnecessarily stayed; and perhaps another Commission to inquire into that. When the "Hero" came from Melbourne, I had to lay her up till she was stayed; the same with the "Barwon"; and the "You Yangs" was reduced in pressure. In fact, when the "Blackbird" came up this time, some of her stays were like harp strings, and some as loose as water.

1536. You see we have this fact staring us in the face,—that the boiler of the "Clarence" was not properly stayed, and in consequence of that an accident did happen, the imperfection not being detected? This was not in its weakest part by a long way.

1537. It was not perfectly stayed there? The stays were not bad in number, but the workmanship was bad, and that I cannot be expected to see; in fact, no man can unless it is taken out.

1538. *Mr. Moriarty.*] Still, it is plain the heads were not properly riveted? There is a very slight rivet upon them certainly.

1539. *President.*] The great bulk of the witnesses agree that these stays ought to have nuts on the outside, and that any stays without them should be condemned—Does that coincide

coincide with your opinion? A very great deal may be said on both sides. In locomotive boilers no such things as nuts are put on; and if the bolt had to stand the action of flame, the nuts would burn off.

Mr. D. C.  
Dalglish.

1540. These had not? They had when I surveyed the boiler; the alteration was made after I made the survey.

6 July, 1868.

1541. When you say you object to nuts, do you speak from your own experience? From my own experience, I have found nuts the very worst form of fastening for stays exposed to flame in furnaces. I have to be more careful over them than anything else. In the backs of the furnaces they have to be covered up with rings and fire-clay to protect them.

1542. Have you any objections to nuts where they are not exposed to flame? There are some objections, but they are only such as imperfect workmanship. Where the workmanship is good, and the bolts put in true, for places not subject to the action of flame, they are the best form of stay that can be used. For instance, when the "Lady Young" got new bottoms in her boilers, I recommended that the stays should be put in with nuts, and that was done. The difficulty is, that the holes require to be perfectly fair; because, if you put on a nut and tighten it up, when the holes are not exactly opposite one another, you strip the thread; and a dishonest workman, knowing he has stripped the thread, and that censure will follow, says nothing about it, and the nut to all appearances is sound.

1543. Even then it would be just as strong as it would be without a nut, because it would still have hold of the plate it was screwed through? Generally speaking, they are not so particular when they know they are going to put nuts on.

1544. *Mr. Russell.* In speaking of the examination of boilers previous to the test, you say you go inside and outside? I do.

1545. Does that refer to the flues and furnaces? The flues and furnaces, and inside.

1546. Through the man-holes? Through the man-holes and all; in many instances through the mud-holes also, where they are large enough to get in. I consider the furnace to be outside, and all within the manhole inside.

1547. And after the test do you pursue the same course? I do.

1548. Do you think it possible the bats might have been started off these stays, and you would not see them? No. I have had about seventeen stays taken out of the boiler of the "Florence Irving," and the only indication we could see was, a slight starting about the rivet.

1549. I have seen a rivet started, and yet it could not be knocked off with a hammer and chisel; still it was weakened? Yes, very much weakened. Of course in some instances, where a rivet has been caulked immediately before my inspection, it may have been started and yet escaped detection; it would defy it, in fact.

1550. Do you think it injures the stay at all, to hammer it cold to form the bat or button on these stays? If hammered too long, it makes the iron brittle; and although the iron is turned over, it is of little value.

1551. In fact, then, the bat or button or the end of the stay, is of little use? It is weakened in consequence of being hammered too long, and hammered cold.

1552. Caulking under those circumstances would not have a beneficial effect? No; supposing the iron was destroyed in its fibre, and full of cracks from the riveting, passing the caulking tool over it would close up the outside and make it appear to be good, whereas in reality it was crippled.

1553. When you first took office, did you make it a uniform practice to prove boilers by double pressure? Yes, the old boilers.

1554. How long did you continue that practice? I abated it, as they began to get new boilers in the ships. A very great number of these vessels have new boilers, or the old boilers have been taken out and thoroughly repaired.

1555. There has been such difference of opinion among practical men that we have had here, that I have asked the extent of their experience—Have you any objection to give the Board your practical experience in these matters? I was brought up to the trade in a shop where marine engines were being continually repaired—J. B. Maxton & Co., at Alloa and Leith—where your former partner, Mr. Dunlop, served his time.

1556. I understood you were apprenticed at Alloa principally for land engines? I worked in both shops, but principally in Leith. My apprenticeship extended over the whole term of the firm's existence. The firm was insolvent when a short period of my apprenticeship was unexpired. I was a premiumed apprentice, and had to go into the drawing office and pattern-making shop, and was made to take great interest in the work.

1557. Since then, what has been the extent of your experience? Since then I have been continually at the trade, with the exception of a few years in Sydney, and always at marine work; in London for Joyce, Rennie, & Spiller, and in Hull for Clifford & Brown, where they had the work for all the northern boats, and the St. Petersburg and Hamburg boats.

1558. As an engineer? As an engineer.

1559. Not employed on boiler work? Not on boiler work; but still, an engineer that does not take an interest in boilers, and a great deal more interest than boiler-makers do, as a rule, is very little worth. My experience of boiler-makers is, that they are the most dangerous class of men we have to do with; they will patch up anything.

1560. What has been your experience in Sydney? Even during the time I have not been working at the trade I have been continually taking an interest in it; and I think nothing has transpired that I have not been in.

1561. I suppose you have gained considerable experience since you took office? I do not think so; except that no man can ever learn enough. On the occasion of the boiler bursting at Waterview Bay, I gave some evidence which shews that before I held my present position I knew something about it. I expressed an opinion on that occasion which was different from that of the most eminent men of the time—Mr. Broderick, Mr. Moriarty,

Mr.

- Mr. D. C. Dalglish.  
6 July, 1868.
- Mr. Jaffrey, Mr. Evans, and in fact, I may say, Mr. McArthur, until he went to examine the boiler himself. Still the jury did me the honor to believe me; and the boiler that I said would not, in my opinion, stand more than thirty-five pounds, when tested with cold water, collapsed at thirty-four pounds. If it was only a guess, it was a very near one. Mr. Moriarty stated his conviction it was safe at fifty pounds; and Mr. Evans, that the collapsing strength was 240 pounds per square inch.
1562. Some of the engineers we have had here have told us that boilers could be kept in order without the use of the test at all. Do you think that could be done by an experienced officer? I should be very sorry to accept the responsibility of the office in that case. I prefer to have the use of the test when required.
1563. Up to what extent? To the extent of double the working pressure. I am in the habit of reducing the pressure on boilers; and if I reduce the pressure on a boiler to a certain extent, and the owners are not satisfied, and I wish to convince them, would you take the only power I have of convincing them away from me?
1564. You may refuse a certificate? The fact of the matter is, it is always in boilers that are dangerous and bad that any objection is made; I never knew the objection being made to any good boiler being tested yet. People that are going to sell their boats always like very well to get a certificate from me that their boilers have been tested to double pressure. I think I may venture to hand in an American certificate. Every State has its own law on the subject, but this is from the State of California, and will shew what the practice is there. (*The witness handed in the same.*)
1565. *President.*] I see they test up to a very small pressure? Twenty-eight pounds, and the maximum working pressure is twenty-one pounds. The test there is imperative.
1566. The certificate runs thus:—"That we have subjected the said boilers to a hydrostatic pressure of twenty-eight pounds to the square inch, and the maximum working pressure allowed is twenty-one pounds to the square inch, determined by the rule prescribed by law, which is three-fourths of the hydrostatic pressure for low-pressure boilers."—The steam pressure, therefore, is three-fourths the hydraulic pressure? Yes.

TUESDAY, 7 JULY, 1868.

Present:—

MR. PELL, PRESIDENT.

MR. MORIARTY,	MR. THOMAS,
MR. CARLISLE, R.N.,	MR. RUSSELL.

Mr. Charles Lang called in and examined:—

- Mr. C. Lang.  
7 July, 1868.
1567. *President.*] You were Chief Engineer of the "Clarence" at the time the accident took place? Yes.
1568. Were you Chief Engineer at the time she was tested, three months before? Yes.
1569. You were present on that occasion? Yes.
1570. Was the boiler stripped? Yes, everything was cleared out.
1571. Where were you at the time of the testing—what part of the boiler did you notice particularly—did you go into the furnace? Yes.
1572. Whilst the pressure was on? Yes.
1573. Did you notice any signs of weakness? Not the least.
1574. Did you examine the heads of the stays? I did not take particular notice of them, but I saw that everything looked tight.
1575. You did not see the plates spring? No.
1576. Did Mr. Dalglish examine the boiler whilst it was under pressure? Yes.
1577. If a rivet had broken off the head of a stay at the time the pressure was on, or anything of that kind had happened, do you think you would have heard the noise? Yes; and the water would have got out.
1578. Suppose a stay had started without actually giving away, would that have made a noise that you would have heard? I do not think so; but it would have shewn wet.
1579. Had you ever had occasion to do anything to the heads of the stays in that part of the boiler? Never; we never touched them.
1580. How long had you been in the vessel at that time? About two months before the testing which preceded the accident.
1581. Nothing was done to the heads of these stays all the while you were there? Nothing all the while I was in the ship.
1582. You never observed any leakage about the heads of these stays? Not the least.
1583. Is that part of the boiler apt to be wet—does any water come from the tubes, or anything of that sort? It might, and not be seen; there is brickwork there. There was very little, if any; if there was much I would see it.
1584. Did much refuse or ashes collect there? Yes, in course of time, if not cleaned out.
1585. Do you ever clear it out or strip the boiler except when the Inspector comes? I have done it in my time, but not in that ship.
1586. It was not cleared out or examined from the time of the testing till the time of the accident—three months? No.
1587. You were on board when the accident happened? Yes.
1588. Where were you at the time? In the engine-room.
1589. Could you see the steam-gauge? Yes.

1590.

1590. Did you look at it immediately before the accident? I looked at it about a minute or so before. Mr. C. Lang.
1591. And it stood at —? About eight and a half or nine pounds. 7 July, 1868.
1592. After the accident you cleared out the fire? We did, as soon as we could get it done.
1593. Did you find much refuse behind the bridge? Nothing was in it; it was quite clean.
1594. What condition did you find the plate in, the plate that sprung? The plate was right enough; one of the holes was cracked about a quarter of an inch in.
1595. Which side of the plate? Inside the boiler. You cannot see the outside of the plate, only the inside; where the stay went through was cracked round the hole—three small cracks about a quarter of an inch in.
1596. How deep were they? I think they were mostly through.
1597. Were you in the habit of blowing the water out of the boilers when you came into port? Yes.
1598. You drew the fire first? Yes.
1599. And immediately afterwards blew them out? Yes.
1600. How low down did you blow them? Till the steam gets out; I generally leave two or three pounds of steam in the boiler.
1601. Would that blow her below this plate where the accident happened? Yes, it is below that.
1602. After the accident, did you find there was any incrustation, any salt or caking about the plate that gave way? No, it was quite clean; the boilers were very clean.
1603. *Mr. Moriarty.*] Did you observe these stays before the accident? No, I could not say my attention was particularly drawn to them.
1604. Had your attention been drawn to them when the vessel was being surveyed by Mr. Dalgleish? No, never. It is not easy known what state they are in, to look at them; except you were to take them out, it would not be easy to ascertain what rivet was on them; you could have no idea what the size of the rivet might have been.
1605. Does this (*one of the stays*) look to you as if the plate had been for some considerable time almost drawn off the head of that stay—Look at the marking of the thread? There was no bulge in it. There seems to have been no rivet there.
1606. Does it not seem as if the plate had been partly drawn off—If you measure from the last thread that seems to have been in the plate, it would almost look as if a three-eighth plate would project above it? That is about the depth of a three-eighth plate, I think.
1607. Do you think it at all probable that a strain of fifty pounds on the square inch could have injured that stay when it was in that state—If you were in a boiler, and saw a rivet, the head of which was in that state, almost level with the plate, and no rivet on it, and you found you had a pressure of fifty pounds on the square inch, would you consider it safe? No, I would not, if I had had my attention drawn to it. These things, in my opinion, require nuts on them. The rivet is too small; and to rivet that up in a cold state, when the boiler is made up, will shake the hold of the small thread there is on it.
1608. Do you think that when that stay had a pressure of fifty pounds to the square inch on it, that might not have done it some injury? If it had been a particularly good fit in the plate, I have no doubt it would have been safe enough.
1609. Looking at it as it is, does it not look like an old corrosion—does it not look as if it had been a long time in that condition? Perhaps there was very little rivet ever on it.
1610. At all events, you do not consider stays fixed in that way are good, or would be safe under a pressure of fifty pounds? I do not.
1611. *President.*] How many threads were holding, do you think, on that stay? About three and a half.
1612. Do you not think it had been holding by those few threads for a very considerable time? Yes, no doubt.
1613. You attribute the accident, then, to the want of proper fitting of that stay? I do.
1614. If a nut had been there, you do not think the accident would have happened? I do not think so; although I greatly condemn the pressure that was put on the boiler, in the state it was in.
1615. On account of the state of the boiler? According to the age of the boiler it requires more care. But still I believe, if there had been a nut firmly on the top of that stay, it would have been right.
1616. Would you object to the hydraulic pressure, if it were limited to half as much again as the working pressure? I think, at all events, the water should be heated to one hundred and ten or one hundred and twenty degrees before the pressure is put on in old boilers.
1617. *Mr. Moriarty.*] If the water were warmed up, would you object to it? No.
1618. To what extent would you go? I would not consider double pressure is so much, if the water is about one hundred and twenty or one hundred and thirty degrees.
1619. And if the stays were all properly fixed? Yes.
1620. Would you not prefer examining stays like that with your own eyes, rather than trying them with double pressure, and if they stood that, saying they were right? Yes, certainly. If I was to be allowed to examine the boiler I could be quite satisfied without any test at all.
1621. Do you consider too much reliance has been placed on this test? I do.
1622. *President.*] Did you ever see Mr. Dalgleish test a boiler, except on that one occasion? Yes, often.
1623. Is he careful in the application of the pressure? Yes.
1624. And in watching for indications of weakness? Yes.
1625. You have no reason to complain in that way? No. His valve lets off the air before he puts the pressure on.

Mr.

Mr. William Lacey called in and examined:—

- Mr. W. Lacey. 1626. *President.*] You are an engineer and boiler-maker by profession? Yes.
1627. And belong to the firm of Vale & Lacey, carrying on business in Sydney? Yes.
- 7 July, 1868. 1628. Have you had much experience? I have been all my life amongst engines and boilers.
1629. You are accustomed to superintend the repairs of boilers? Yes.
1630. You are aware of the mode of testing by hydraulic pressure adopted here? Yes.
1631. That it is carried up very often to double the working pressure? Yes.
1632. Do you see any objection to that mode of testing boilers in use? No.
1633. You see no reason to suppose a boiler is liable to be injured by it? I should think forty pounds such a slight pressure, taking into account what a boiler should carry, that a boiler ought not to be injured by it.
1634. Do you think boilers as they actually are would be injured—not as they should be? If a boiler were badly constructed, possibly it might injure it.
1635. Suppose a boiler had that stay in it (*one of the stays on the table*), covering a square foot of surface, and it was subject to a pressure of fifty pounds to the inch, do you think that would be liable to injure the hold of that stay? I should not think, if that stay was put in properly, it would injure it in the slightest.
1636. I ask the question with reference to that stay as it is? This stay appears to have been drawn through the iron entirely.
1637. Do you think it would be safe to put a pressure of fifty pounds to the inch on that? I think it would, providing the plate was tapped to fit the screw.
1638. I mean as it was, not as it ought to have been? It would injure it, I should imagine.
1639. Can you form any opinion, from looking at that, whether it was originally a bad fit? It seems to me to be very evident that there never had been any fit—no thread to correspond with this in the plate.
1640. What makes you think that? Because if it had been a fit, and had been drawn out with any force or strain, it would have stripped the thread on the stay—what is technically termed, overhauled it.\*
1641. You do not think that has been forcibly drawn out? No; there has been no force used at all.
1642. Do you not think it possible the thread that originally fitted that might have corroded away? I should think not. I may mention that I have stayed very many boilers in this way, high pressure boilers too, and I never found the hole any worse. The boilers may have been worn out completely; but when the stay was a proper fit, I have never found the holes in the plate the worse for wear—the thread in the plate has been quite good.
1643. Do you think that stay was ever riveted over? It has been so cut about, that it appears to have been brought to a point; it seems to have been subjected to a chisel. That is not the usual way a bolt end is left when it is put in. I have never seen a bolt have that appearance.
1644. That would not have been done in what they call caulking? No. Bolts are never left in this fashion. The end of the bolt is generally left something like uniform, and there is no uniformity about this at all.
1645. That cannot have been cut since it came out of the boiler—it was drawn out by the explosion, and there was no occasion to cut it at that end? Then the stay has never been properly riveted at all. I never saw a stay with a head like that in a boiler. The ends of these stays are generally left very square—rather hollow, if anything; and by that means, when put through the plate, they are easily burred back. There would be no possibility of putting a burr on this, because the end is so small. Before you could burr it, you would knock it through the plate. If it was cut square off, there would be a possibility of riveting it down, and getting the edges chamfered over; but as it is, you could do nothing with it.
1646. *Mr. Moriarty.*] Do you think these are chisel marks, or are they not marks of corrosion, the fibre of the iron giving way more at one part than another? I do not think it is done by corrosion. That (*referring to another stay*) is evidently done by corrosion; but this has all the appearance of a stay-bolt that had been hacked about to get it out of the plate.
1647. Do you not think the probabilities are that it has been corroded—the stay-head eaten away—that the whole thing has been more or less corroded? I do not think that, if this was properly fitted, the stay would corrode; but the thread in the hole would still be perfect round this, and be a tight fit. I know we have taken stays out in the Railway Department, in boilers that have been running three years, and have had occasion to drill the whole of them out; and I have never known one but what the thread was quite perfect in the plate. The bolts may have been corroded away, and yet the thread I have always found perfect.
1648. That is, where it is a good fit? Yes.
1649. Where it is a bad fit? The water would get through, and cause corrosion.
1650. *Mr. Thomas.*] Even if warm riveted over? Even if warm riveted over, there would be nothing but the burr, and the water would be in the hole with the stay.
1651. Would there be a leak? There would be a leak if it was not properly fitted, because the burr of a stay is not sufficient to keep it tight—not for any length of time.
1652. *President.*] Do you think the safety of the public would be at all endangered—that  
boilers

\* ADDED (*on revision*):—There is no medium with a screw; when it is strained it will shake off the thread. If the hole or stay was injured by the pump, it would have leaked at the time.

boilers would be at all apt to be kept in worse repair, if the test pressure were limited, as a rule, to fifty per cent. above the working pressure? Of course there is another mode of inspection. A man may get into a boiler, and sound it all over with a hammer; but he cannot sound every place in a marine-boiler, because he cannot get at it; therefore it requires some kind of silent agency to shew where weaknesses exist.

Mr. W. Lacey.

7 July, 1868.

1653. Would not fifty per cent. above the working pressure be sufficient, as a rule, for that purpose? It may possibly do; but I do not think boilers suffer at all, when properly constructed, from being tested to double pressure.

1654. Still, would it not be as well not to subject them to that pressure? I do not think it does properly constructed boilers any harm. Seeing the great amount of pressure boilers are submitted to sometimes, I do not think our low pressure engines are subject to any pressure to injure them. The usual test for condensing-engines is about forty pounds, but very few of them carry more than twenty pounds. I do not think a test of forty pounds for a boiler carrying twenty pounds is anything excessive.

1655. Supposing you had to inspect boilers, do you think you could keep them in good order by examination, and testing to the extent of fifty per cent. beyond their working pressure? It may be done, no doubt.

1656. Mr. Thomas.] Do you not think that fifty per cent., with thorough examination, is quite sufficient? There is this much to be said, that many boilers which are supposed to carry only fifteen or twenty pounds of steam, have sometimes a great deal more; for instance, when a boiler is making steam very fast the engine may be stopped for a time, and it then makes steam faster than the safety-valve will allow it to escape.

1657. Mr. Moriarty.] Is not the safety-valve considered to be sufficiently large to allow the whole of the steam to escape? It is the rule, but it is not always followed out.

1658. Has your experience been principally with marine, or with locomotive boilers? I served my time with Mr. John Struth, of this city, and during that time he had a great deal of marine work.

1659. Within what limit of the strength of a boiler would you consider it ought to be safe to work it—supposing the chances were that a boiler would burst at a pressure of one hundred pounds, what pressure would you consider it safe to work that boiler up to? I think it would be safe to work it up to forty.

1660. Would you test that boiler up to eighty pounds—within twenty pounds of its breaking pressure? No.

1661. Do you consider it a good practice to test any structure within one-fifth of its breaking strain? No, certainly not.

1662. Then you would have to correct your answer? In what way?

1663. I asked you, if a boiler would about burst at one hundred, what pressure it might be worked to—you said forty, and that it might be tested up to eighty, that is, within one-fifth of its ultimate breaking weight; then I asked whether you consider it sound engineering to strain anything—I do not care what structure or piece of machinery—to within one-fifth of its ultimate strength? I do not think it would be wise to strain it to within a fifth of its bursting capacity; but I do not think even double the working pressure on our boilers at present working is anything near that, or is even half of their bursting pressure.

1664. You are speaking of marine boilers? Yes.

1665. Take this boiler of the "Clarence"; it was subjected to a pressure of fifty pounds—Do you think by any possibility it could have been made to stand one hundred pounds? I do not know the condition of the boiler.

1666. Looking at the obvious condition of these stays, do you think any man going into that boiler, and looking at that riveting over these stays, and knowing that the stays were a foot apart, would say that that boiler, as it then stood, could carry one hundred pounds? I should think not, seeing that the rivet is entirely gone in this way. I imagine the Inspector should have had them immediately repaired.

1667. President.] You think the defective state of these stays ought to have been observed on inspection? I think so.

1668. Supposing there had been caulking going on round it, might that have concealed the defect? It is quite possible it might have concealed the defect, because it would be hammered and caulked in such a way as to deceive a man.

1669. Do you not think it is a great objection to that mode of fixing stays, that they are liable to be so far gone as to have scarcely any hold, and yet you cannot, by looking at them, tell what state they are in? I should imagine that if these stays were properly fixed, if there had been a good thread in the hole, they would stand even without any burr at all, the thread in the hole would carry the strain without any burr at all.

1670. Not only was there no burr, but the screw was a bad fit, and yet neither of these circumstances was discovered by testing or examination? If there is bad workmanship in a boiler it is almost impossible for any person to detect it while the boiler remains together, carrying the working load. It is very difficult for a man to discover these things.

1671. Is not the mere fact that it cannot be done—that this defect was concealed, and not exhibited even by the hydraulic test—a strong argument against using that kind of stay altogether? No, I think not; I think these things will always arise. You may have a man staying these boilers that is very careless of his work, and it is impossible even for the foreman after him to know whether the stays are properly fitted or not. I know these are the stays used in locomotives, and they are subjected to the very highest test. I have put in stays like these myself, and tested the boiler to over two hundred pounds.

1672. Mr. Russell.] Do you consider the pressure put upon a boiler by the hydraulic test more severe than the same pressure under steam? Slightly, because of the thud of the pump.

1673.

Mr. W. Lacy. 1673. To what extent? Not to a very great extent.

1674. How much do you think, considering that the water is cold and the boiler is cold? It is a question I could not answer—not with any great certainty, at any rate.

7 July, 1868. 1675. I think I understood you to say you approve of testing boilers to double the working pressure? I do; I do not see how else you can form any idea of the state of the bottoms of your boilers or water spaces which you cannot get at. I know a pair of boilers now running, that have been running for some fourteen years, and they would stand double the working pressure at the present moment; I believe they would stand eighty pounds pressure.

1676. Without injury? Without injury.

1677. That is, a boiler working at forty would stand eighty? Yes.

1678. Mr. Moriarty.] How much more would they stand? I believe about a hundred.

1679. That is about the proportion you gave to me? Yes.

1680. Mr. Russell.] Suppose a boiler is in good working order, and the valves properly regulated, if the machinery is stopped for four or five minutes, will not the valves relieve the boiler? Properly constructed, they should do so; but many boilers are not made on very scientific principles; I have known boilers with the safety-valves not at all in accordance with the capacity of the boilers.

1681. Is it possible the steam could get up within half an hour to fifty per cent? Quite possible.\*

1682. Then, do you not think the valves might not relieve the boilers? Not always.

1683. Mr. Moriarty.] Do you think, as a rule, marine boilers are as strong as they ought to be, considering the increased pressure we are gradually going towards? I do not think they are. I think there is not sufficient attention paid to staying marine boilers.

1684. Do you not think marine engineers should take a lesson from locomotive boiler-makers? I do; I think they are the most perfectly stayed boilers there are. Marine boilers are stayed almost at random, I may say.

1685. You get a stay capable of carrying an enormous weight, but the imperfect mode of fixing adopted makes it capable of carrying only about five tons? Yes.

1686. Mr. Russell.] When you were foreman of the Railway Engine Works, what was your practice in testing boilers? We tested the boilers we made up to two hundred pounds.

1687. How much was the working pressure? One hundred and twenty.

1688. Considering that you only pressed locomotive boilers that had to work up to one hundred and twenty, to two hundred pounds, do you think marine boilers ought to be proved to double the working pressure, looking at the difference in the construction of the two boilers? The word "boiler" is a very general term; some boilers are very well made, others are badly made; some will carry the pressure easily, and others will not stand it.

1689. Taking the general run of marine boilers now made, and for some years past, do you not think that, to prevent any possible accident happening, a less pressure would be sufficient? I believe it would be sufficient, because a man could get inside and sound a boiler with a hammer; but for the places a man cannot get at, he must have some silent agency to shew him what they are made of.

1690. Mr. Moriarty.] If you should see stays like these in a boiler,—instead of putting on double pressure, and, if the stays stand it, passing them, do you not think it better not to pass them at all, if you are not satisfied with their appearance? If I had a serious doubt on my mind that these stays would not stand the pressure in this state, I should not destroy a boiler by putting the double test on it; I should say, take the stays out.

1691. President.] Supposing you saw stays in that defective state, and you tried them to double pressure, and found they stood it, would you be satisfied then? As I said before, it is so easy to deceive the eye in a matter of this kind, that possibly these stays, before they were taken out, may have appeared to be quite thoroughly riveted. No man could say, no matter what practice he had, but that these were properly riveted, until they were taken out. A man would require to go in and scrape these stays as clean as the day they were built, without being able to detect the insufficiency of the rivet.

1692. Mr. Russell.] We are told that the plate was caulked round these stays on board the "Clarence"—Unless there was a head on the rivet, do you see any advantage that would follow from that—do you not think it would only tend to weaken the plate? When they found out the deficiency, they would caulk the stay to fill up the plate. It would leave a mark the same as if a ring had been cut in it. The tool would make a slight recess round it, which would be filled up with dirt and could not be seen.

1693. President.] If we have evidence that it was caulked and was seen, would you consider that that shewed there was something wrong? Yes.

1694. Mr. Thomas.] You do not see any serious objection to the use of nuts? The objection is, that if they are put in the fire they burn off—if they are in the furnace, for instance. Anything that has a sharp edge projecting from the plate will burn away in a short time.

1695. Would it not be better to renew them? That is a very expensive operation, because the thread would become injured.

1696. President.] It is a great deal more expensive to have boiler accidents? Yes.

1697. Mr. Thomas.] You think these screw stays would answer the purpose? Yes, if properly fitted and riveted, there would be no danger of their giving way.

1698. Mr. Russell.] Have you, in your experience, come across boilers that have been "repaired" by putting a patch on the top of a leaky stay? Yes, I have known it done frequently. That was the way the boiler of the "Agnes Irving" was repaired before the accident on board of her.

1699. Mr. Thomas.] You do not consider that a proper mode of repair? No man in his senses would do it.

1700.

\* NOTE (on revision) :—Not unless the valves were locked.

1700. *President.*] Does it not amount simply to concealing the defect? It is a very stupid Mr. W. Lacey. thing, because the stay is destroyed—the very life and soul of the boiler.

1701. *Mr. Moriarty.*] Did you see that in the “*Agnes Irving*” yourself? I did not; but 7 July, 1868. I was credibly informed it was the case. I believe some boiler-makers, if left to themselves, would go on board a vessel and do such a thing. In fact, it did happen to me the other day. I sent a boiler-maker on board a vessel; a stay had given way, and the plate was cracked; and the boiler-maker repaired it in that way. When I went on board and saw it, I had it altered, of course. There is another thing I may mention. I think the thread of the stays (*referring to those on the table*) is entirely too fine. It may appear at first sight, that by having a fine thread you get more in the plate; but I think a coarser pitched thread, even though there are less of them in the plate, would be better than these. I think these are five-eighths pitch; locomotives are generally tapped with a seven-eighths pitch.

## SUGAR CULTIVATION.

### No. 1.

PETITION OF MR. T. SCOTT.

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of Thomas Scott, of Point Clare, Brisbane Water,—

MOST RESPECTFULLY SHEWETH :—

That for these thirty-five years, he has used every exertion to awaken public attention to his practical discovery, that the sugar-cane attains to a far greater degree of perfection and profitable yield in this Colony than it is known to do in any other part of the world, including Queensland. That this national important fact has been practically proved at Kiama, by many of the leading men residing there, by tests of so conclusive a character as wholly to preclude any doubts upon the question, detailed in the *Kiama Independent* of the 18th October, and the *Sydney Herald* of the 30th October.

That your Petitioner, with his sons, are anxious to form a small model plantation, thereby practically and otherwise to convey to the colonists the required instructions to qualify them to embark in the industry. That therein he disclaims any present or personal interest beyond that of a far future one,—that the Government may extend towards his family a consideration commensurate to his late efforts and his now proposed services to advance the material interests of the Colony.

He therefore prays your Honorable House may be graciously pleased to afford him such aid as, considering the merits of his appeal and the great value the industry must prove to the Colony, in your wisdom may be deemed meet.

That in the year 1835 he incurred an outlay of £250, in the formation of a model sugar plantation practically to develop and thereby to prove his discovery. This expense and labour were at that time incurred with a view to benefit himself, and also to benefit his adopted country ; but for these many years past he has exerted himself solely to benefit the Colony, and without even the hope of any personal advantage.

That now, in his old age, he, as a parent, upon a wide and public principle, wishes to benefit his sons, and consequently the sons of all his fellow-colonists, by this his final effort practically to develop a latent science of colonial wealth, greatly exceeding that which sugar-producing has invariably bestowed upon every locality where it is carried on.

And your petitioner will for ever pray.

THOMAS SCOTT.

Sydney, Nov. 16, 1866.

### No. 2.

MR. THOMAS SCOTT to THE COLONIAL SECRETARY.

Sydney, 16 November, 1866.

SIR,

In reference to my petition, which you so graciously entertained, I learn that it is the intention of the Government to foster this embryo industry, by bestowing a handsome bonus upon the party who first produced a ton of sugar.

Hereon I most respectfully beg leave to submit that, while I freely admit the merits of that party to public commendation, I would remark, without any prejudice to his rightful pretensions, that it is I who put him in motion, and to whom I imparted public and personal instructions.

If such a central dispensation of reward be carried out, it would wholly exclude me, the first, an untiring pioneer, who, at considerable cost, practically discovered the great value of this industry, from any reward, simply and only because my means were too limited to enable me to reap its certain fruits.

In my petition I seek the notice of the authorities, the guardians of the public interests, agreeably there to its merits, and the conceived value of my long-continued efforts to benefit my adopted country, by pointing out another, but far more enduring and moralizing gold field, which has heretofore laid unheeded within her prolific soil. These form the basis of my hopes of being now countenanced.

I have, &c.,

THOMAS SCOTT.

### No. 3.

## No. 3.

MR. THOMAS SCOTT to THE COLONIAL SECRETARY.

Point Clare, Brisbane Water,  
7 December, 1866.

SIR,

I have the honor to forward, for the inspection of His Excellency the Governor and the Ministry, a sample of sugar, made partly upon the principle of my new invention, as published in the *Herald*. In its manufacture I had to contend with the rudest appliances.

This new process of desiccating the cane juice will make sugars of so superior a quality and quantity to that of the present, as in a great degree to supersede the refiner's vocation, and at the same time enhance the planter's profits fully thirty-five per cent.

To these facts I therefore most humbly beg to direct the attention of the authorities, and to the gift with which it has pleased Providence to bestow upon this Colony, by an industry which will elevate its material prosperity.

I have, &c.,  
THOMAS SCOTT.

## No. 4.

MR. THOMAS SCOTT to THE COLONIAL SECRETARY.

Brisbane Water, 14 April, 1868.

SIR,

In June last I had the honor of handing to you a memorial, which you most courteously promised to lay before the Executive Council, and to which I have not received a reply.

As the object of my continuous efforts for thirty-five years to benefit the Colony, in the manner indicated in that memorial, must now be admitted as having been consummated, I most respectfully beg the favour of your informing me if the Government intend to extend towards me any consideration, as the practical pioneer of an industry which evidently will signally augment the material interests of the Colony.

I have, &c.,  
THOMAS SCOTT.

## No. 5.

THE PRINCIPAL UNDER SECRETARY to MR. THOMAS SCOTT.

Colonial Secretary's Office,  
Sydney, 25 April, 1868.

SIR,

In acknowledging the receipt of your letter of the 14th instant, further respecting the cultivation of sugar in this Colony, I am directed by the Colonial Secretary to inform you that your case will be considered on an early day.

I have, &c.,  
HENRY HALLORAN.

## No. 6.

THE PRINCIPAL UNDER SECRETARY to MR. THOMAS SCOTT.

Colonial Secretary's Office,  
Sydney, 11 September, 1868.

SIR,

Referring to your further letter of the 14th April last, relative to the introduction and cultivation of sugar in this Colony, I am directed by the Colonial Secretary to inform you that the memorial which you therein state you presented in June, 1867, has been mislaid, and to request that you will be good enough to furnish a copy thereof.

I have, &c.,  
WM. GOODMAN.  
(For the Under Secretary.)

## No. 7.

MR. THOMAS SCOTT to THE COLONIAL SECRETARY.

Point Clare, Brisbane Water,  
18 September, 1868.

SIR,

I am in receipt of your letter of the 11th instant, wherein you require me to furnish a copy of my memorial, handed to you (I think) in January, 1867, the same being mislaid.

In reply, I have the honor to state, that I did not retain a copy thereof; but, in conformity to your desire, I herewith enclose another, which, to the best of my recollection, is substantially a repetition of the missing one.

THOMAS SCOTT.

No. 8.

## No. 8.

The Honorable the Members of the Executive Council of New South Wales.

The Memorial of Thomas Scott, Sugar Planter,—

HUMBLY SHEWETH :—

That on his passage to Calcutta, he arrived here in the year 1816; but from his experience as such in Antigua, and having visited the sugar plantations at New Orleans, he was so forcibly convinced of the suitability of this Colony as a sugar producing one, that he remained for the sole purpose of developing that never failing source of national prosperity.

That, at that time, local and other events precluded him from prosecuting his object; he therefore accepted an appointment from the London Missionary Society to establish that industry at Riatega, which he effected so satisfactorily, that the Agent, the late Rev. Mr. Marsden, awarded him a double salary. On his return from thence, in 1819, Major Goulburn, the then Colonial Secretary, sent for and offered him a salary of £250 per annum, to perform the same duties at Port Macquarie. That salary he declined to accept, but offered them, without any pay, and practically to prove that the climatic influences upon the cane in this Colony would mature it to high perfection; after which he relied upon the justice of the Government to reward him agreeably to his merits. That he commenced his duties at Prospect, on the Hastings River, in 1819, by erecting a model plantation. In 1822 he made sugars of a far superior quality to the imported, at the rate of four tons to the acre, for which he was rewarded by a bonus of £800, and received orders forthwith to form an estate capable of making two hundred tons sugar annually; for which a guarantee was given that one half of all the crops he made were to be handed over to him free of every expense. He accordingly formed that plantation at Rolland's Plains. In due time he made a requisition for works to take off his crop; and in reply thereto, was informed that "coppers only could be supplied." Therefore he was constrained to *invent* a motive power, and to make a wooden mill, the rollers of which had to be almost daily renewed. The boilers consisted of the thinnest sheet copper, which, as he foretold, gave way after making only seventy tons of sugar. At this juncture a bush fire ignited the canes. These events, and the penal character of the settlement being about to terminate, he retired from his ill-supported duties.

That after these grievous disappointments to his originally cherished object, he applied his faculties to their utmost extent to develop this industry; and, well knowing that, in propounding the suitability of the climate for its successful introduction, that its history was directly antagonistic to his practically ascertained facts that it is far superior to the tropical,—therefore, to neutralize this mammoth opponent to his object, at a cost of £250, in 1833, he erected a model plantation here by which he made sugars of very superior quality, which, with the canes from which they were made, he sent to the *Herald* Office and elsewhere for public inspection; and, in his published letters relative hereto, he invited the friends of the Colony personally to witness the practical proofs of the statements he had made in the public journals, as they related to his discovery. Not one solitary response was made to that public appeal—expressly prepared at so great an expense indelibly to prove his writings hereon, and thereby to remove the most universal scepticism with which his voluminous letters were received. Amidst these and other deadening discouragements, he wrote about one hundred and twenty published letters, pressing upon the colonists this certain source of national prosperity in all its features; and more than five thousand private ones, conveying instructions and replying queries.

In about the year 1851 he totally abandoned all hopes of receiving any personal advantage from his labours herein; still he relaxed not in his energies thus to benefit his adopted land.

At far past the eleventh hour of the longest period of man's existence he now enjoys the high gratification of knowing that the untiring energies which he has put forth to develop this valuable industry have resulted in the most ample success. He will not presume to shadow forth the prospective benefits which this industry will confer upon the Colony, further than by noting the fact that they will exceed those which are enjoyed by the residents within the tropics.

That he is now an unusually aged man, with eleven children, ten of whom are dependent upon him, and in narrow circumstances, which entail anxieties.

Therefore he humbly prays that his lengthy and expensive labours to benefit the Colony, as succinctly detailed, may receive your gracious attention, and induce you to award to him such pecuniary consideration as in your wisdom and the general features of his case may appear to merit.

And your Memorialist will, in duty bound, for ever pray.

I have, &c.,

THOMAS SCOTT.

1868-9.

[*Price*, 1s.]

339—A

# EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE LEGISLATIVE ASSEMBLY.

VOTES, No. 35. TUESDAY, 9 FEBRUARY, 1869.

22. Mr. Thomas Scott—Sugar Cultivation :—Dr. Lang moved, pursuant to Notice No. 15, That the Order of the Day for the consideration in Committee of the Whole of the propriety of addressing the Governor, praying that His Excellency will be pleased to place upon the Supplementary Estimates for the present year the sum of £1,000, as a gratuity to Mr. Thomas Scott, of Brisbane Water, for his indefatigable and successful exertions, through the press and otherwise (during a period of forty years), in naturalizing the cultivation of the Sugar-cane and the manufacture of Sugar in this Colony,—which lapsed, from the want of a Quorum, on Friday, the 8th January,—be restored to the Paper, and stand an Order of the Day for Tuesday next.

Debate ensued.

Mr. Burns moved, That the Question be amended by the omission of all the words after the first word "That," with a view to insert the following words, viz.—"the alleged services to the Colony of Mr. Thomas Scott, of Brisbane Water, in naturalizing the cultivation of the Sugar-cane and the manufacture of Sugar, be referred to a Select Committee for inquiry and report.

(2.) "That such Committee consist of Dr. Lang, Mr. Forster, Mr. Hoskins, " Mr. De Salis, Mr. J. Stewart, Mr. Farnell, Mr. S. Brown, Mr. Wilson, and the " Mover."

Debate continued.

And the House continuing to sit until after midnight,—

WEDNESDAY, 10 FEBRUARY, 1869, A.M.

Question,—That the words proposed to be omitted stand part of the question,—put and negatived.

Question,—That the words proposed to be inserted be so inserted,—put and passed.

Whereupon, Question :—(1.) That the alleged services to the Colony of Mr. Thomas Scott, of Brisbane Water, in naturalizing the cultivation of the Sugar-cane and the manufacture of Sugar, be referred to a Select Committee for inquiry and report.

(2.) That such Committee consist of Dr. Lang, Mr. Forster, Mr. Hoskins, Mr. De Salis, Mr. J. Stewart, Mr. Farnell, Mr. S. Brown, Mr. Wilson, and the Mover,—put.

The House divided.

Ayes, 26.

Mr. Robertson,	Mr. Dignam,
Mr. Forster,	Mr. Windeyer,
Mr. Samuel,	Mr. W. Suttor,
Mr. Sutherland,	Mr. Byrnes,
Mr. Tighe,	Mr. Burns,
Mr. Driver,	Mr. Cunneen,
Mr. Morrice,	Mr. Farnell,
Dr. Lang,	Mr. Cummings,
Mr. Parkes,	Mr. Egan,
Mr. J. Suttor,	Mr. Burdekin,
Mr. Eagar,	<i>Tellers.</i>
Mr. Garrett,	
Mr. Oatley,	Mr. Hoskins,
Mr. Piddington,	Mr. S. Brown.

Noes, 3.

Mr. Tunks,

*Tellers.*

Mr. J. Stewart,  
Mr. De Salis.

VOTES, No. 61. WEDNESDAY, 24 MARCH, 1869.

4. Mr. Thomas Scott—Sugar Cultivation :—Dr. Lang, as Chairman, brought up a Progress Report from, and laid upon the Table the Minutes and Proceedings of, and of Evidence taken before, the Select Committee, for whose consideration and report this subject was referred on the 9th February, 1869.

Ordered to be printed.

MR. THOMAS SCOTT—SUGAR CULTIVATION.

---

## PROGRESS REPORT.

---

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 9th February last,—“*to inquire into and report upon the alleged “services to the Colony of Mr. Thomas Scott of Brisbane Water, “in naturalizing the cultivation of the Sugar-cane and the manufacture of Sugar”*—have agreed to the following Progress Report :—

Your Committee have examined the witnesses named in the margin; but as additional evidence of importance in the case could not be procured before the close of the present Session, in consequence of the witnesses residing at Port Macquarie, your Committee have resolved to bring up this Progress Report, together with the Evidence taken, and recommend that the inquiry be resumed next Session.

Thomas Scott, Esq.  
Joseph Marshall, Esq.

JOHN DUNMORE LANG, D.D.,

Chairman.

No. 3 Committee Room,

Sydney, 24 March, 1869.

---

# PROCEEDINGS OF THE COMMITTEE.

---

THURSDAY, 25 FEBRUARY, 1869.

MEMBERS PRESENT:—

Mr. Burns, | Mr. Farnell,  
Mr. J. Stewart.

Motion made (*Mr. Burns*), and *Question*,—That Dr. Lang be the Chairman of this Committee,—*agreed to*.

Re-assembling of the Committee to be arranged by Chairman.

[Adjourned.]

---

THURSDAY, 11 MARCH, 1869.

MEMBERS PRESENT:—

Dr. Lang, in the Chair.

Mr. Burns, | Mr. Farnell,  
Mr. J. Stewart.

Thomas Scott, Esq., called in and examined.

Witness withdrew.

Joseph Marshall, Esq., called in and examined.

Witness withdrew.

Committee deliberated.

Re-assembling of the Committee to be arranged by the Chairman.

[Adjourned.]

---

WEDNESDAY, 24 MARCH, 1869.

MEMBERS PRESENT:—

Dr. Lang, in the Chair.

Mr. Burns, | Mr. J. Stewart,  
Mr. Farnell.

Clerk brought under the notice of the Committee several alterations made by Mr. Scott in his evidence.

Certain amendments allowed.

Chairman submitted Progress Report.

Same read and agreed to.

Chairman to report.

---

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

MR. THOMAS SCOTT—SUGAR CULTIVATION.

THURSDAY, 11 MARCH, 1869.

Present:—

DR. LANG,  
MR. BURNS,MR. J. STEWART,  
MR. FARNELL.

THE REV. JOHN DUNMORE LANG, D.D., IN THE CHAIR.

Thomas Scott, Esq., called in and examined:—

1. *Chairman.*] You reside at Point Clare, Brisbane Water? I do. T. Scott, Esq.
2. What have you been employed in these many years? In this Colony as a private man—  
which I have not been always—I have devoted myself to disseminating information upon, 11 Mar., 1869.  
and awakening the attention of the colonists to the importance of, the culture of the  
sugar-cane here.
3. Where and when did you acquire your acquaintance with sugar cultivation?  
Originally in the Island of Antigua, where I managed my father's estate, Golden Grove,  
for nearly eight years. I was there one year as a novice, but I was afterwards gifted  
with the management of the property.
4. At what date might that have been? That was in 1796 or 1797.
5. It was in the West Indies, therefore, that you acquired your knowledge of sugar  
cultivation, in the first instance? Distinctly so.
6. Have you had occasion to observe the cultivation of the sugar-cane in any other  
country than the West Indies? I have, in my travels in America. I expressly went to  
New Orleans, where there are extensive sugar plantations, and there I acquired a know-  
ledge of the difference—the vast difference—between the management in that climate  
and what I had observed within the tropics.
7. When did you first arrive in New South Wales? In 1816.
8. Did you come as a settler to the Colony, or in what capacity? I was intending to  
join my uncle, Sir David Scott, in Calcutta. The ship in which I came to this Colony  
had convicts on board, and touched here on her way to Calcutta.
9. And you remained in this Colony? I have since remained in this Colony, with little  
exception. Shortly after my arrival here, I was employed by Captain Henry, on the  
part of King Pomare, to establish a sugar plantation in Tahiti.
10. What induced you to remain in this Colony, instead of proceeding on your way to  
Calcutta? Solely and only seeing the superiority of this climate to that of New Orleans,  
where the canes are destroyed by frost, and they are obliged to work night and day,  
Sunday included, to save them. I saw in this climate infinitely superior advantages.  
Perhaps, I may be permitted to state the motives I had in remaining. They were three:—  
Firstly, to develop an industry I knew would confer on this Colony as great national  
benefits as it has done on all other parts of the world where it is pursued; secondly, I  
had an ambition to be a public benefactor; and thirdly, I pressed and persevered in the  
matter with the vain hope, as it has proved, of bringing up my sons as sugar planters, in  
a country whose climate and soil are so well calculated to render the industry profitable.

T. Scott, Esq. 11. When did your engagement with Captain Henry take place—at what time after your arrival in the Colony? About eight months or less after my arrival here.

11 Mar., 1869. 12. In what year? 1816 or 1817.

13. How long were you absent on that engagement in Tahiti? Four months only. I may perhaps be permitted to state why I came back so soon. Pomare was engaged in trade, the machinery was at Riatea, and they paid no attention to the matter. I saw no prospect of the object being carried out, and I returned with the first vessel that came here, in company with the late Reverend John Williams.

14. You saw the object could not be carried out at that time? I saw it was impracticable. They were wholly engaged in trade, and the machinery was not at hand; but they satisfied me very liberally notwithstanding. They fulfilled their engagements amply with me; that is, Captain Henry did, who was agent for King Pomare.

15. What was your next engagement after returning to the Colony? With the London Missionary Society. As I have said, I was a passenger with the late Reverend John Williams, on board the "Westmoreland," on my return to the Colony. During the voyage he ascertained from me that I was willing to undertake the same office, to establish the cultivation of the sugar-cane at Riatea, where sugar works had been provided by the London Missionary Society.

16. How long were you on that second engagement at Riatea? About twenty months—not more than twenty months. I was engaged for three years, but having accomplished the object of my engagement, they remitted the residue, and paid me for the full period for which I was engaged, together with a bonus for performing an extra office I had not originally undertaken.

17. What was that office? The cultivation and curing of tobacco.

18. You carried on that branch simultaneously with the cultivation of the sugar-cane and the instruction of the natives? Yes; not only the growth, but the curing of tobacco. I received a very satisfactory bonus for that extra service.

19. What was your next engagement? Very shortly after my return from the Islands, the late Mr. Robert Campbell, of the wharf, and the late Reverend Samuel Marsden, who was agent for the Missionary Society, made some communication to Major Goulburn, the then Colonial Secretary, of the result of my services at Riatea; in consequence of which, I received a note from him desiring an interview. I saw him, and he offered me a Government appointment to proceed to Port Macquarie, then a penal settlement, for the purpose of testing the capabilities of the climate here for the growth of cane and its conversion into sugar. He offered me the highest salary that the Imperial Government then permitted the Government here to give to a civil officer—£250 a year, which I knew and felt was not commensurate with the services I could render. I therefore declined it; but at the same time I undertook the duty without salary, throwing myself entirely on the consideration of the Government, when I had proved the adaptability of the climate for the successful growth of the cane and the making of sugar, which I did so satisfactorily that I received a bonus of £800 and an official guarantee, which, if I had been supplied with machinery by the succeeding Government, would have been worth upwards of £3,000 a year to me. The guarantee secured to me one-half the sugar and rum I might make, landed in Sydney free of expense.

20. What induced Major Goulburn to enter into that speculation on the part of the Government? From what I could elicit, in various conversations with him, he had had an interview with the late Reverend Samuel Marsden and the late Mr. Robert Campbell, and had seen the sugar I had made at Riatea, and also some clayed sugar I brought, and some muscovado. I felt assured in my own mind, from what I elicited from him, that these facts induced him to ask an audience with me, and to confer the appointment.

21. You brought some of the produce of the industry you superintended at Riatea to this Colony? There was a good deal of it brought. I brought some of my own, and a great deal was sent to Mr. Marsden and Mr. Campbell. Major Goulburn showed me some of the sugars, and made inquiries. I advised him of those I had made, particularly the clayed sugar, which was like lump sugar.

22. Was Major Goulburn of a speculative turn in regard to the capabilities of the Colony and its productions? I cannot say that he was professionally qualified to pronounce an opinion. He had never been within the tropics, nor had he been in New Orleans. But I knew perfectly that he was a very zealous, faithful, public servant, and that he wished to get the convicts employed in some way that would both be beneficial to the Colony at large, and lighten the expenses of the Government in their maintenance.

23. How long were you at Port Macquarie? About\* eight years altogether—nearly eight years; but I was three years only there before I had practically demonstrated all that I had undertaken to perform, for which I received the reward to which I have alluded.

24. What was the result in point of production? The produce of the first or model plantation at Prospect, on the River Hastings, was at the rate of fully four tons to the acre; but I did not crop a whole acre—I wanted the canes for plants. I made only 500 pounds of sugar there. This was a model plantation, a preparatory one, established for the purpose of practically testing the adaptability of the climate for the successful culture of the cane and the production of sugar.

25. What quantity of sugar did you produce during the time of your employment at Port Macquarie? Afterwards there was a very large plantation at Rolland's Plains, where I made 70 tons.

26. What did you receive in compensation for your services at the close of your engagement

\* NOTE (on revision):—Seven years nearly; not eight, as stated by me.

ment at Port Macquarie? Prior to my leaving, I had ascertained that the Government T. Scott, Esq. were so lax or incapable of providing the machinery requisite to carry off the crop—of which I had grown sufficient to make 250 tons of sugar—that I acquiesced in a proposal made to me by the Government to simplify my engagement by the acceptance of a salary. Seeing that I could not get machinery, I accepted a salary for the last three years, yielding up an infinitely more advantageous agreement, under which I was to have received one-half of all I made. When General Darling came here to replace Sir Thomas Brisbane, and Major Goulburn had left the Colony, the sugar-growing establishment at Port Macquarie was not looked upon with the same spirit, and had not the same attention paid to it; and the total failure of the Government in supplying me with machinery induced me to accept a salary for the latter part of my engagement.\*

27. What did you actually receive from the Government for your services at Port Macquarie? Nearly £2,000 for the eight years.† The Government, in order to induce me to yield, as I was disposed to do, to their suggestion to take a salary in preference to having one-half of all I made, said they would date my salary from the time of my first leaving Sydney. These are facts which are on record in the Colonial Secretary's Office, and they could be referred to.

28. Your original engagement was under Sir Thomas Brisbane's Government, when Major Goulburn was Colonial Secretary? Yes, that was when I was first engaged to go down to Port Macquarie.

29. I understand that the subsequent arrangement, when you were induced to accept a Government salary, was made under General Darling? Yes.

30. When Major Goulburn had left the Colony? Yes; after Major Goulburn and Colonel Dumaresq left, there was not the same attention paid by the authorities to supply me with the only material requirements that I needed to successfully carry out my duties; that was, the machinery. In other respects, I received all appliances. In Sir Thomas Brisbane's time, I was supplied with money, men, and everything that could be obtained in the Colony; but it was not so when General Darling came.

31. Was the establishment broken up in consequence of this failure of the Government to carry it on with the spirit in which it was originally commenced? Yes; it was broken up in consequence of their not supplying the necessary machinery for the manufacture of sugar. The only material I received were some coppers. I had no mill—no motive power—not even horses‡; and these coppers were totally inefficient. I reported officially to the Government that I did not think they would work for one week; but they endured till I made seventy tons of sugar under the most herculean difficulties. I had to put new rollers in the mill, such as it was, almost every day—wooden rollers only, that were made by a mechanic I had there.

32. Do you mean to say the new Government under General Darling took no interest in the establishment at Port Macquarie? From all his official acts regarding the sugar plantation at Rolland's Plains, decidedly it appeared to me there was no interest evinced in it, either by the Governor or the officials at head-quarters,—not the least.

33. In these circumstances, you returned to Sydney, and gave up? I did; I gave up. In point of fact, with an establishment without machinery, and when the coppers gave way, I was as much disabled or prevented from carrying out my duties as a ship at sea dismasted and without a rudder, or without instruments to ascertain her position. I was totally helpless; and, of course, I stated so to the Government, and resigned.

34. Your correspondence with the Government will, of course, be in the Colonial Secretary's Office? All my correspondence with the Government should be among the public records; and it will bear out all the facts I have detailed in reply to your questions.

35. How were you situated after you returned from Port Macquarie, after giving up the sugar plantation? I then retired, as a private man, to a grant of land, a maximum grant of 2,560 acres at Brisbane Water; but I was afterwards in the Government employ.

36. That was the maximum grant that the Government were in the habit of giving to those who had claims? It was. My public position previously entitled me to 2,560 acres.

37. And you took the land at Brisbane Water? I commuted it; I took it on a reserved township; I commuted it for 360 acres on a Government reserve for a township; but, ultimately, I was given two separate sections of 640 acres each, in addition to the portion of the grant that they gave me on the Government reserve.§

38. When did you go to settle at Brisbane Water? In 1829.

39. And you established yourself there as an agriculturist, I presume? Exactly. It was the locality and the quality of the land for growing the sugar-cane that induced me to make the sacrifice I did. I had an idea that I would have been able to make a plantation there

\* NOTE (on revision):—When I discovered that the Government could not supply me with machinery to take off my crop, I accepted a salary instead of one-half of all I produced; and the £800 originally given to me as a bonus, in 1825, was then charged to me as part of my salary.

† NOTE (on revision):—It was £1,709, not £2,000, having been only six years and ten months under pay. During the three first years, when acting without any salary, as a matter of favour the Government loaned to me £200, which was afterwards debited.

‡ NOTE (on revision):—After having been refused either a mill to crush the canes, or motive power, I applied for horses. This also was refused. The Honorable and Reverend Chairman holds that official refusal.

§ NOTE (on revision):—My reply hereto requires the following corrective facts:—I commuted it for 360 acres on a township reserve. Afterwards, the Government requested me to surrender it. It having been a special favour conferred upon me to give me this reserve, after a long correspondence, I acquiesced upon those conditions, namely, that I was to retain my improvements, 25 acres, and two sections of land, only one of which I received, so that in fact I got only 665 acres; and, still worse, the township was afterwards removed to a very distant locality.

T. Scott, Esq. there; but, in myself, I had not sufficient funds, and it is an industry which never will pay on a small scale.

11 Mar., 1869. 40. Did you form a sugar plantation on your property at Brisbane Water? I did.

41. To what extent? Five acres only. May I be permitted to qualify that answer. At this time, and for many years afterwards, there was not, I believe, an individual in the Colony that gave credence to the possibility of growing the cane, much less its being profitable; and, in order to neutralize the scepticism that was universal, I went to the expense of £250 for a little machinery, to prove to the colonists the truthful recommendations that were contained in my various letters. I invited the friends of the Colony to come to Brisbane Water; and I stated, in letters published in the *Herald*, that I was prepared to cut the cane in their presence, and convert it into sugar, so that they might see the quantity and quality of the sugar; but I had not a single response to my repeated invitations. That model plantation was made solely and only for the purpose of practically convincing the colonists of the truthful recommendations that I held out to them. I knew I would lose by it, for I could buy sugar cheaper than I could make it on so small a scale.

42. Would a plantation of five acres be sufficient for profit in that branch of industry? By no means. A less quantity would have done—an acre or a couple of acres would have done—for the purpose to which I referred just now; but I planted five acres, expecting that, from the practical proofs I was prepared to afford, there would be a demand for plants, and therefore I planted more than was necessary.

43. I understand, then, that a plantation of five acres might be sufficient for experimenting, but not for profit? By no means. No profit can be made from a sugar plantation on so diminutive a scale.

44. And you had not the necessary capital, I presume, to embark on the requisite extensive scale? Had I had capital to obtain machinery, I would now have been as wealthy as any man in the Colony; and, ten years ago, we should have been exporters instead of importers of sugar. I had it not, and I vainly hoped to induce some enterprising person to find capital to put me afloat in it. But there was not the least heed or notice taken of me. I was disbelieved, except by my friends who knew me. I do not believe that, at the time to which I am alluding, there were five people in the Colony who gave credence to the truths I stated, and which are now fully and satisfactorily established.

45. Did you go on experimenting and giving information to the public through the Press, from the time of your commencing the small plantation at Brisbane Water? Unintermittingly; so much so that, in the *Herald* alone, exclusive of many others, there have been about 150 of my letters detailing the industry in all its parts.

46. What did you ascertain, in the process of your experimenting, in regard to the fitness of the sugar-cane for the soil and climate of Australia? I ascertained most clearly and satisfactorily, and it has been proved by those parties whom my efforts have set in motion, that this climate, on good soil, will produce four tons of sugar to the acre.

47. What is the produce of the West Indies and of New Orleans respectively? The maximum is three tons, and mostly only one crop. Here we have seventeen or eighteen crops from one planting.

48. You mean that the plant must be renewed? It must be renewed almost every year in the West Indies; the plants will only give one or two rattoons; and the lands have to be resuscitated by dressing and manuring; but here I have had seventeen crops from one planting.

49. You found that the produce per acre was much larger in this Colony than either in the West Indies or at New Orleans? Greatly; twenty-five or thirty per cent. more than in the West Indies, and about fifty-five more than in New Orleans.

50. Did you observe any other peculiarity in the plant in this Colony, as compared with the West Indies and New Orleans? The canes in the West Indies attain their maximum maturity in twelve months; here, from climatic influences, the plant canes do not attain their maximum maturity for two years, or nearly so; and ratoon canes in eighteen months. The causes are, as I have explained in the *Herald*, that winter checks them, and they are then of very sluggish growth. In the West Indies there is no check, but an unintermitted torrid heat. The winter here causes the plants to require a longer period to mature, and during that prolonged growth the saccharine matter becomes richer and denser, and of more value. Cane juice in the West Indies marks 9° or 10° Beaume; here it will reach 10° and 12° Beaume. That has been proved by those I have set in motion on the rivers to the northward.

51. Is there any other peculiarity in the canes of this Colony, as compared with those of the West Indies and New Orleans? They are larger, and attain to a greater length of cane. Under favourable circumstances, their joints are larger, and their juices, as I remarked just now, are richer and more valuable, caused by the longer period of growth.

52. What is the character of the cane in this country, as compared with those other two countries, in regard to its arrowing? In the West Indies the cane always arrows, and when it arrows it ceases to grow, and from that moment it deteriorates. Here it never arrows; the canes are constantly growing and maturing, and the longer they are in the ground the larger and more productive the crop. In New Orleans they have to cut them in ten months, and for that reason it never arrows there; but the canes do not mark more than 8° Beaume, and one ton and a half to the acre is about the medium or maximum yield of the canes in that climate.

53. What was the general impression of those of the colonists with whom you came in contact, as to the practicability of growing sugar-cane profitably in this Colony, when you commenced your experiments? I cannot refer to an instance but what they all gave a dissenting opinion—that it was an abortive attempt. It was considered a fallacy to attempt

attempt it—that it was only to be done within the tropics—and they did not give credence to it. The Rev. Mr. Holland, of Port Macquarie, was the first gentleman who practically tested my recommendations. Then that brought the colonists to notice my letters. Afterwards, at Kiama, some gentlemen took the matter up, and gave me a public dinner and a purse of twenty sovereigns. There the yield of the cane proved to be at the rate of four tons to the acre. The sugar I made there was sent to the Melbourne Exhibition, and was declared by the judges to be worth £36 a ton. I had only very imperfect machinery at Kiama—merely culinary utensils—to desiccate the juices.

T. Scott, Esq.  
11 Mar., 1869.

54. Was Mr. Holland the first who gave credence to your representations? The Rev. Edward Holland was the first gentleman in New South Wales that gave credence to, and practically tested, what I had stated; and in a letter which he sent to the *Empire*, he stated that he was at first sceptical. He had been seventeen years in the West Indies, and, from the difference of climate, he did not believe the cane could be profitably grown here. But perusing my letters, and seeing the cane grow well, it claimed his attention; and ultimately he went to some expense to prove the fact. He detailed the facts in a letter, with some remarks respecting myself.

55. Mr. Holland had been a missionary in the West Indies? Yes, at Jamaica, for seventeen years.

56. And he was incredulous at first as to the practicability of growing sugar in this country? Exactly; and it was only in consequence of reading my letters that he was induced to make a practical trial. He then, after some years, proved what he related to the public in his letter. He has written two or three letters on the subject. I have never seen that gentleman, but I have had a very long correspondence with him.

57. From that time, I understand, the idea has been making progress in the Colony? It has been gradually making progress. Mr. Holland's success, and the events that occurred at Kiama, removed the bias that was so rooted in the minds of the colonists as to the impracticability of producing sugar to a profit in this Colony.

58. You mentioned having sent a quantity of sugar, as a specimen, to the Melbourne Exhibition. What quantity did you send? I did not send it; it was the gentlemen at Kiama that sent it. There was a company formed to make a trial plantation, and it was they who sent the sugar. I saw it in the papers, and they communicated it by letter to me.

59. These gentlemen at Kiama, who had formed a company for the production of sugar, sent for you to give them instructions? Practically to operate to convert the cane into sugar. I had given them all necessary instructions, in innumerable letters, prior to my going there.

60. Do you know what quantity of sugar they sent to the Melbourne Exhibition? I am not perfectly aware of the quantity, but I think it was two or three, or it might have been four pounds. It was but little I made. The vessels I had to operate with were small, and I could not make above five or six pounds of sugar from them.

61. Did you make any communication to the Paris Exhibition? I only responded to the invitation of the Commissioners. They called upon the colonists to send to the Melbourne and Paris Exhibitions such products as they could procure. I sent 28 lbs to the Commissioners here for the Paris Exhibition, and 28 lbs for the Melbourne Exhibition.

62. Of your own produce? Of what I made myself, on my little model plantation. At that time, and for years before, I had not the least idea of being benefited for the labour I had put forward to benefit the Colony—never till 1867, when Dr. Lang kindly suggested it to me. I never applied to you, Doctor; you suggested to me to send a memorial to the Government. That was the first time I ever thought of such a thing.

63. You consider that the present state of sugar cultivation, throughout this Colony and Queensland, is in a great measure, if not exclusively, the result of your experiments and writings on the subject for thirty years? Naturally, from the deductions, I feel assured that that is the case. A neighbour of mine (Mr. Marshall) was induced, solely at my instance, to invest a capital of £6,000 in forming a sugar plantation at Brisbane Water. It has been the same at the Manning. I have heard from correspondence, that they nearly all state that they were induced to turn their attention to the culture of the cane, from the perusal of my letters which appeared in the *Herald* and *Empire*. I cannot say positively that it was so, but it is a natural deduction, for I was the first man, and for many years the only one, who wrote publicly on the subject. In Queensland, on my two visits there, they admitted that I set them in motion.

64. May I ask what is usually done with the refuse of the sugar-cane? It is converted into rum, otherwise it is totally useless; it is suitable for no other purpose; but the refuse of the boiling-house makes a sufficient quantity of rum to pay the current expenses of the plantation. In the West Indies the rum pays all the local expenses. Every impurity that is rejected in the manufacture of sugar is all converted into rum, which pays the current expenses of the plantation, and in Queensland double the expenses. Mr. Raff is more than doubling his expenses by the rum that he makes. The Queensland Government have given permission to the sugar planters, of whom there are a great many there now, to make rum, and have remitted two-thirds of the duty upon it. The duty is 10s., and the grower only pays one-third, or 3s. 4d. a gallon.

65. Supposing the cultivation of the sugar-cane were to become general in this Colony, what do you think the planters would require in reference to that part of their produce? The making of rum constitutes an essential portion of their profits; but here they will not be able to enjoy that under the existing law.

66. Do you think it will be necessary for the Government to grant the planters of this Colony the same privilege as is done in Queensland? I should decidedly say "yes." It would give an impetus to the more early introduction of the industry; it would draw

T. Scott, Esq. capital at once, and give confidence; and there is not a question but it would accelerate the industry so largely as, in a very few years, to render the Colony independent of the supply of sugar from abroad.

11 Mar., 1869.

67. Would not that affect the revenue? No doubt of it. If there were any remission of duty, it should be carefully done; it should be done under certain conditions.

68. What is done in the West Indies? There is no duty whatever there.

69. And at New Orleans? No duty whatever.

70. *Mr. Burns.*] Did you establish at Riata an industry of the kind which you were afterwards engaged by the Government here to establish at Port Macquarie? I was at Riata before I was in the Government employ.

71. Did you establish a sugar plantation at Riata? Yes, so far as this, that my engagement was to instruct the natives to make sugar. I could not speak the language, but I instructed Mr. Williams, and qualified him perfectly to do it. That accomplished the object of my engagement.

72. You established a sugar plantation there? I did in that regard.

73. Was it successful? In regard of qualifying Mr. Williams and some of the natives to make sugar. They were selected natives, to whom Mr. Williams interpreted my instructions, which were practically conveyed. A native could do it, and Mr. Williams could do it; and when they could both make good sugar without me, the object of my engagement was accomplished.

74. Was the result of the instruction you gave them the successful establishment of a sugar plantation at Riata? From that time onward they made sugar.

75. Did they while you were in the place? Not while I was there; they only made very little.

76. How long were you there? About nineteen or twenty months. I was to have been three years.

77. Was it under an engagement to the London Missionary Society you went to Riata? Under an engagement to the London Missionary Society, negotiated by the late Rev. Samuel Marsden. I had what I may call an official letter from the late Mr. Robert Campbell, of Campbell's Wharf, who was the mercantile agent.

78. Have you any documentary evidence of your engagement with the Government to go to Port Macquarie to establish a sugar plantation? A few days ago I got some fragments of my correspondence with the Government. Some few years ago I had the misfortune to have my cottage burnt down, and most of my papers were then destroyed; and beyond that, I had become so hopeless of deriving any benefit from, I may say, my immense labours, that I put no value on my papers. I did not even retain the newspapers with my published letters. It was only the other day that I saw some of my letters to the Government while at Port Macquarie, which had accidentally escaped the conflagration of my dwelling.

79. Can you obtain any documentary evidence showing that you declined to accept a salary from Major Goulburn, when you went to Port Macquarie? None. What passed between that officer and myself was only oral. The only public record on that head was a letter which Major Goulburn showed me, and I took it down with me—a recommendation to Captain Allman, the Commandant, stating my engagement, and requiring that I should be recognized in a way congenial to my views and position in life. That letter is, of course, on record in the Colonial Secretary's Office.

80. Did you engage to reside for any term at Port Macquarie, after having declined to accept a salary for your services? There was no stipulated time whatever.

81. Then what was the nature of your engagement with the Government of that day? When I declined the £250 a year, the understanding was, that I was to be remunerated by the Government, commensurate with the value of my services and the practical result I would produce, which I did produce in the most ample and tangible form, so much so that they gave me £800. I mentioned £2,000. The £800 was deducted from the £250 a year which I afterwards accepted as a salary. It was so stated in a public letter,—that the £800 would be debited to me, and counted as a portion of my pay for the whole period.

82. Did you not receive from the Government about £2,000 in all? Yes; I was nearly eight years there, for which I was paid at the rate of £250 a year.\*

83. From what time did your engagement at £250 a year commence? In 1821 or 1822.†

84. That would be about two years after you went to Port Macquarie? I went to Port Macquarie about 1822.

85. Then, when you went, you went under an engagement to receive a salary? By no means. I was offered a salary, but I declined it, and preferred leaving my remuneration to the consideration of the Government, when I had proved what could be effected in growing sugar there; feeling assured that I should receive not £250, but £500 or more.

86. The money you were afterwards paid was a computation at the rate of £250 a year from the time you went there? Yes.

87. You received about £2,000 altogether? I received, for the whole period of time I was at Port Macquarie, at the rate of £250 a year.

88. That, for eight years, would be about £2,000? Yes. The £800, which was at first given as a bonus, was deducted from that amount.

89. You also obtained a grant of land? Yes, 2,560 acres, to which I was entitled, by reason of my appointment at Port Macquarie.

90.

\* NOTE (on revision):—This response was erroneous. It was only £1,709, as shown in my note to a previous answer.

† NOTE (on revision):—I mistook this question, thinking it applied to the time I first went to Port Macquarie. The answer ought to have been—Shortly after I was refused the means of taking off my crop,—about February, 1826.

90. What appointment? As Superintendent of the Sugar Plantation at Port Macquarie. T. Scott, Esq. That dwindled down afterwards to 360 acres. I commuted my grant.
91. The grant of 2,560 acres was given to you in consideration of your services as superintendent of this projected plantation at Port Macquarie? I never understood that it was given in consideration of that, because all the officers and gentlemen who applied for grants received similar grants. I never considered, neither was it ever stated, that the grant was given me in consideration of my services, but simply on account of my position as a Government officer. It would have been the same had I held any other position in the service.
92. Did you hold any office under the Government besides that of superintendent of this sugar plantation? Not then. I did afterwards—after I left Port Macquarie.
93. Was it not at the close of this projected sugar plantation business that you received the grant of land from the Government? About eight or nine months afterwards.
94. Had you entered upon any other office under the Government after that? I was appointed Clerk of the Bench and Registrar of the Court of Requests at Brisbane Water.
95. Did you not obtain a right to select this land before you were made Clerk of the Bench? I had the right to select the land before I was appointed Clerk of the Bench.
96. Can you tell any reason why you should receive a grant of 2,560 acres, if it was not in consideration of your services at the sugar plantation? Only that it was the practice to give such grants of land to all Government officers of a certain standing. Previously to that, when I was in Sydney on leave of absence, Major Goulburn offered, and in a manner pressed upon me, a grant of 2,560 acres at the Hunter, which I declined, on the ground that my public duties sufficiently occupied me. He said all the Government officers were taking up grants of land there, and I might as well do the same—that I could take the land and let it lie; but I did not take it. It was never either orally or officially notified to me that the grant I received arose from any merits that I had meted to me as superintendent of the sugar plantation at Port Macquarie.
97. Had you held any office under the Government other than that of superintendent of this establishment at Port Macquarie, when you were allowed to select so much land as 2,560 acres? I held no office under the Government after leaving Port Macquarie, save that of Clerk of the Bench at Brisbane Water.
98. Was it the practice of the Government of that day to allow every one who thought fit to take it, to have 2,560 acres? It was a regulation in the Colony at that time, that all officers of the grade in which I stood were entitled to a maximum grant. Immigrants received grants according to their interest or position in life.
99. When did Mr. Holland first write to the *Herald*, testifying to the success of your efforts in producing and manufacturing sugar? At the latter end of 1866.
100. Do you know whether other parties had not successfully cultivated the sugar-cane in Queensland before you had moved in the matter? Not to my knowledge. The first gentleman who understood it there was the Honorable Captain Hope. He paid me a visit when he was in this Colony. Whether he came from Queensland purposely to get plants I cannot say; but he visited me at Brisbane Water to get instruction and plants.
101. Had Mr. Hope commenced his plantation before he paid you this visit? He was only beginning. He got most of his plants from me. He had a few from the Botanic Garden at Brisbane, he told me.
102. Had he not commenced his plantation before he had any communication at all with you? I believe not.\*
103. Are you aware that several parties at the Manning River have been engaged in cultivating the sugar-cane? Through my instrumentality. Not until after the publication of the events that took place at Kiama, and the Rev. Mr. Holland's practical illustration of the truthfulness of my published letters.†
104. When did this test take place at Kiama? At the latter end of 1865.
105. Had no canes been produced and tested before that in any part of the Colonies? They were growing canes as if for curiosity; but, as far as I know, no one had made sugar.
106. Who in Queensland told you you had first set them in motion? I went down to Queensland for the purpose of instructing and putting them in the line of enjoying the industry. At the time I went down, there was no cane in Queensland but a little that the Honorable Captain Hope had and some in the Botanic Gardens.
107. In what year was that? In 1863 or 1864. I supplied Queensland with sugar-canes. Captain Hope got about 200,000 plants from me.
108. Do you state that Captain Hope obtained his plants from you in the first instance? He had about 200,000 from me—a large quantity, at all events. I will not be precise, but a very large quantity.
109. Were the plants that Captain Hope first planted in Queensland obtained from you? When the Honorable Captain Hope first landed there I cannot say, nor can I say when he commenced; but, on my first visit, he had very few canes growing, and no machinery.

\* NOTE (on revision):—I replied,—“I believe not. When he was here, he did not tell me he had planted any canes.” On after-reflection, I find this reply was incorrect. He had planted canes before that event, but not until twenty-eight years after I had practically demonstrated the fact, and wrote perhaps fifty or seventy public letters upon my discovery that this Colony is, from a variety of favourable circumstances, better suited as a sugar-producing one than any other part of the world.

† NOTE (on revision):—This may or may not be correct; but certainly it was not until very many years after 1833, when I made several samples of sugar here, which were exhibited at the *Herald* office. In 1822 or 1823, the late *Sydney Gazette* published the fact of what I had done at Port Macquarie, and the unusual superiority of the sugar I made there.

T. Scott, Esq. I sent them samples of the sugar I made; and, the second time I went to Queensland, they admitted to me, in a semi-public manner and privately, particularly, that they were indebted to me for the benefit Queensland now enjoys.

11 Mar., 1869. 110. Who told you that? Mr. Raff.

111. Did the Honorable Captain Hope also admit that? That was the inference I naturally drew, seeing that there was no other party in the Colony that first mooted, and promulgated, and pressed it on the Colony for twenty years before any sugar was grown.

112. Mr. J. Stewart.] You were eight years superintendent of the sugar plantation at Port Macquarie? Yes.

113. And received £250 a year? Yes.

114. Did the Government supply you with assigned servants? The servants for the work were penal prisoners.

115. Did the Government pay your servants—the men employed on the farm? I had two servants—an ostler and a house-servant.

116. Who paid the farm-servants? The Government found all the farm-servants.

117. How many were employed? I had on an average about 150.

118. Did the Government find rations? Yes.

119. Where did you get the land from? Crown lands.

120. Did the Government find any utensils? Every requirement, save and except only the most important—that was, machinery to take the crop up—which they failed to do. Every supply was furnished, or nearly so, with the exception of machinery; and it was an utter impossibility for me —

121. Please to answer the questions. How much sugar did you produce during the eight years? I only made one crop—70 tons in the whole.

122. What is the cost of preparing cleared land for sugar-canes, per acre? The lands at Rolland's Plains had no timber; they were plain land ready for the plough; but the entire expenses were borne by the Government.

123. Have you ascertained what it would cost per acre to prepare land for sugar-canes at any place? That would depend upon the weight of timber on the land.

124. Suppose it was cleared land? If the land is cleared, to plant an acre would cost about £5.

125. What is the outlay until the crop is ripe? In the proportion of one labourer to every three and a half acres.

126. What is the cost of the sugar per ton yielded in this Colony? The entire cost upon a well-organized paying establishment is £10 per ton.

127. On the estate? On the estate. That includes interest of money, wear and tear, servants' wages—everything.

128. Please to confine yourself to answers to the questions. What size must a sugar plantation be to be profitable? Not less than to make 50 tons of sugar.

129. How many acres? Thirteen or fourteen acres of land at the northward, on the banks of the rivers, well tilled and cultivated, would make that quantity.

130. Then it would be a profitable investment if thirteen acres could be planted? Yes.

131. What is the size of your farm—the farm you live on just now? I have none.\*

132. Have you no sugar plantation? I have no sugar plantation. I have a model plantation, but it costs me double as much to make sugar as I can buy it for.

133. You never had a sugar plantation? Only a model plantation.

134. You never grew sugar for market? The Government sold a great deal of sugar I made.

135. Did you ever make sugar for market yourself? No, I had not the capital.

136. What capital is required to be invested in a sugar plantation of fourteen acres. At least £2,500.

137. What was the cost of the machinery used at Kiama? That was only a practical test to see what could be effected on a large scale.

138. This sugar was made without investing any money in costly machinery? No money whatever was invested in machinery.

139. And you are still of opinion that it would not be safe to go into sugar planting without a capital of how much? £3,000. You would lose money with less.

140. To bring fourteen acres at least under cultivation? Yes. To clear land on a proper plantation would cost £10 an acre, with labourers' wages at £75 a year.

141. Have you ever applied to the London Missionary Society for a bonus for introducing sugar cultivation? I never conceived the idea. They paid me very liberally.

142. Do you mean to apply to the Queensland Government for compensation? I do not. If they have not the moral principle to do it voluntarily, I will never apply to them.

143. Sugar-cane ought to be as profitable in Queensland as in New South Wales? It is not. They only get two tons to the acre there. Their canes will oftentimes arrow.

Here the land will produce four tons to the acre.

144. Is that the fault of the climate? The canes there arrow.

145. What is that owing to? It is the termination of the growth. From that time they decline in value—the density of the saccharine juices becomes weakened and degenerated.

146. You mean to say cane will not arrow in New South Wales, but it will in Queensland? I have seen it in Queensland, but I never saw it in New South Wales.

147.

\*NOTE (on revision):—To this question I replied "I have none," conceiving, at that moment, as I am defective in my hearing, that it referred to the size of my sugar plantation.

147. You are practically convinced it does not arrow in New South Wales? I am T. Scott, Esq. persuaded it does not.
148. Are you sure it always arrows in Queensland? I learn that there are some kinds of cane in Queensland that do not arrow. 11 Mar., 1869.
149. It seems Dr. Lang first put it into your head to apply to this Government for compensation? Dr. Lang applied to me for my views on the subject of sugar growing. He submitted to me that he had an idea of moving the Legislature for a bonus to the first grower of sugar-cane who should produce a crop of sugar. I replied to his communication, and I think he thanked me, and said if I came to Sydney he would like to see me. I called upon the Doctor, and he proffered to introduce me to Mr. Parkes. I then conceived the idea of applying to this Government. But, sir, I felt conscientiously in my mind that, after having spent upwards of £300 solely for the benefit of the Colony, and after the labour I had performed in urging the importance of the matter on the colonists, I was due a money consideration for the services I had done; for I had consummated my objects, and the truth of my statements in my letters have now been verified by innumerable and practical proofs by many gentlemen.
150. Where did sugar-cane first come from—what part of the world was it first found in? There are various kinds of sugar-canes, and they come from different parts of the world, but mostly all from the torrid zones.
151. Have they not got it in Spain? They had it in Spain 120 years ago.
152. Did the Government compensate the person who introduced it into Spain? I cannot say. I have read of the canes having grown there, but never of any act of the Government arising out of the growth of the cane. I have ascertained that they can make no profit of it.
153. Did you ever hear of any Government in the world compensating any one for the introduction of the sugar-cane? In New Orleans, Mr. Du Boir got a very handsome compensation. He was the first cultivator of sugar there.
154. It was not for introducing the sugar-cane, but for improving the mode of extracting the juice? No man made sugar there till Mr. Du Boir entered into it, and he was considered a madman in his first essays.\*
155. *Chairman.*] You have mentioned that the grant of land you received from the Government was not given on account of your services at Port Macquarie? Distinctly not. The records will show it.
156. Was it the practice of the Government at the time to give such grants to officers, on their ceasing to be connected with the Government? It was a practice—a universal public practice—to give these grants, not only on ceasing to hold, but during their possession of office. For instance, all the Government officers got grants of land at the Hunter, and still retained their offices.
157. *Mr. Burns.*] What office did you hold under the Government (if any) previous to receiving this appointment at Port Macquarie? No office whatever.

Joseph Marshall, Esq., called in and examined:—

158. *Chairman.*] You are engaged in the cultivation of sugar at Lake Macquarie? I am. J. Marshall, Esq. 11 Mar., 1869.
159. To what extent, may I ask? I have 50 acres planted.
160. What induced you to engage in that branch of cultivation? Seeing Mr. Scott's letters, and having conversation with other parties respecting the growing of sugar.
161. You had no idea beforehand of the practicability of growing the sugar-cane profitably in this Colony? None at all. I never saw a cane in my life until I saw one on board the "Black Swan," coming from Brisbane Water. I had then some conversation on the subject with Mr. Flett, who was a passenger along with myself, and was going to see Mr. Scott. I then put myself in communication with Mr. Scott, asking him questions respecting it.
162. Your engaging in that branch of cultivation was suggested by Mr. Scott? Yes; I asked him if my place was suitable, and he wrote me a letter saying it was. I therefore tried the cane, and finding that it was not injured by the frost, I progressed.
163. What is your experience as to the suitableness of the plant for the soil and climate of this country? The plant is suitable in all flat alluvial land adjoining salt water; inland it will not grow.
164. What was the amount of produce you have realized? I have only made experiments as yet.
165. *Mr. J. Stewart.*] You have sold no sugar? No; I have used it in my brewery.
166. How long has your plantation been made? Four years in August.
167. When will you have a crop ready for market? I expect to make sugar next August.
168. How much? I could not say. I have not been up there lately. I intend going next month.
169. *Mr. Burns.*] You say you have 50 acres planted? Yes, but it does not all come into crop.

170.

\* NOTE (on revision):—Previously to Mr. Du Boir's introduction of the growth of sugar in New Orleans, the lands were worth only from four to seven and eight dollars per acre. Subsequently to his discovery, they rose to 300 dollars. The cane wholly superseded the growth of all other products; and the Commissioners appointed by the Senate of the United States to report upon the sugar plantations there, officially stated that 700,000,000 of dollars were invested upon them.

- J. Marshall, Esq.  
 11 Mar., 1869.
170. *Mr. J. Stewart.*] Do you know of any one who has sold sugar? Mr. Meares, of Port Macquarie.
171. Do you know who was the first that made sugar for market? Mr. Meares. Mr. Scott did so many years ago, I believe, before I came here.
172. Do you believe Mr. Meares makes sugar at a profit? He is able to sell sugar. I could not answer for his affairs.
173. *Mr. Burns.*] Are your plants all healthy? Yes.
174. And some are maturing? Yes.
175. So that you will be able make some sugar in August next? Yes.
176. Do you think sugar-growing will be profitable? It will be profitable, provided we get encouragement from the Government.
177. What encouragement? Encouragement to follow out the business properly. We want labour, and permission to keep a still.
178. Do you expect the Government to provide labour? No; but they can put such plans in force as at Mauritius, that we can get some black labour to assist us.
179. *Mr. J. Stewart.*] The same as in Queensland? The same as in Queensland; but in Queensland it is spoilt by coming in communication with white labour.
180. *Mr. Burns.*] You do not think the production of sugar will be profitable unless the Government import black labour? Not unless they give us the encouragement of the still, and likewise the encouragement of black labour. It consumes a vast quantity of labour, and white labour will not go to it. But the Government are going the right way to make the white labourers work; that is, by not importing emigrants. That will reduce wages, and make them work.
181. Supposing the Government resume immigration as hitherto? Wages will rise.
182. *Mr. J. Stewart.*] And then sugar-growing will become unprofitable? We must follow it out into every detail; there must be nothing lost.
183. *Mr. Burns.*] You think the Government ought to introduce some of the labourers of Polynesia? We ought to have cheaper labour than we are getting.
184. Have the labourers of Polynesia been imported into Queensland by private individuals? Yes.
185. Have not private persons here the same facilities as in Queensland? Yes; but I know we have the prejudice of the papers against us; and any man who does it will be run down.
186. How could the Government prevent this prejudice existing? I do not see how they could. It would take many years to remove it.
187. Still you think the Government ought to import labour of that character? It makes very little difference what colour it is, so long as we get labour.
188. But without a fresh supply of labour, you think sugar-growing will not be profitable? No.
189. *Chairman.*] You spoke of distillation as a necessary accompaniment of sugar-growing? Yes, it will yield as much spirit in value as what it will in sugar.
190. Do you think that that is indispensably necessary to sugar-growing in this country? It is.
191. Would it not affect the revenue very injuriously? Not if we paid duty. It makes no difference how you get your revenue.
192. What privilege then would you ask for the planter? I would ask to be allowed a still for those who put up machinery, and not to be larger than a sufficient size, so that they may make it available for their property. A thousand-gallon still (which I believe is the law at present) would be ridiculous, unless on a plantation of a thousand acres.
193. Would you ask any remission of the duty on spirits? I would not ask that; it must pay the duty; but you may make a difference between imported and colonial spirits which I believe now exists—a small difference—I am not well up in duties.
194. You would be willing to pay duty, but you think the duty should be less than that on the imported article? Yes.
195. To be determined, of course, by the Legislature? Yes.
196. You think that indispensably necessary? Yes; because the megass, which is the cane crushed, has a vast quantity of spirit in it; and unless distilled it can be made no use of except as manure, for which purpose it is equally valuable after the spirit is taken from it.
197. *Mr. J. Stewart.*] What sum have you invested in this 50 acre plantation of sugar-cane? £5,420.
198. On 50 acres of cane? Yes, and clearing other land ready for cultivation.
199. As yet, you have had no return? No return, further than merely a sample.
200. That includes the cost of the land and clearing? Yes.
201. Was it heavily timbered land? Yes. No land is suitable unless it is heavily timbered, and near salt water. Even in Moreton Bay they are touched with frost.
202. *Chairman.*] The frost is not sufficient to destroy the cane, as in America? No, it only touches the top leaves. Last winter was a severe winter, but it only touched mine on the top leaves, and they began to grow again in August. The growth stopped in the winter.

1868.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

---

## OYSTER BEDS ACT.

(REGULATIONS UNDER.)

---

*Ordered by the Legislative Assembly to be Printed, 15 December, 1868.*

---

Department of Lands,  
Sydney, 20 October, 1868.

THE following Regulations, which have been made by His Excellency the Governor, with the advice of the Executive Council, for carrying into effect the Oyster Beds Act of 1868, are hereby published for general information.

J. BOWIE WILSON.

---

1. Leases for the purpose of Oyster Fishing for any term not exceeding ten years, may be granted, either at auction or otherwise, as may be deemed expedient by the Government, of any Crown Land not exceeding in area fifty acres, and being part of the shore and bed of the sea, or any estuary or tidal water above or below, or partly above and partly below, low water mark.

2. Applications for such leases, which must be accompanied by sketches shewing with accuracy the position of the lands applied for, shall be addressed to the Minister for Lands; and shall state definitely the areas sought to be leased, the rents offered, the term for which, in each case, the land may be required, whether it is a natural Oyster Bed or otherwise, and such further information as may tend to facilitate the disposal of the applications.

3. In the event of a lease being granted without recourse to auction, the applicant will be apprised of the fact, and of the rent which he will be required to pay; such rent must, for the first year, be lodged in the Treasury within two months from the date of a notice to that effect in the *Government Gazette*, and thereafter within the month of September for each ensuing year.

4. Should it be considered expedient to submit to auction sale the lease of any Oyster Bed or portion of an Oyster Bed, the purchaser will be required to pay the first year's rent on the fall of the hammer, and thereafter within the month of September the rent for each ensuing year during the term of the lease. Any lease bid for, but the price of which may not be forthwith paid, shall thereupon be again offered for sale at auction, unless the Minister for Lands may otherwise decide.

5. Leases shall in all cases end on the 31st December, and should the rent be not paid within the time specified in these Regulations, or should any land leased, not being a natural Oyster Bed, be allowed to remain uncultivated for the space of three years from the date of the lease, such lease will be liable to forfeiture.

---

ST. ANDREW'S CATHEDRAL CLOSE BILL.

(PETITION—MR. JAMES POWELL.)

---

*Ordered by the Legislative Assembly to be Printed, 23 December, 1868.*

---

To the Honorable the Members of the Legislative Assembly of New South Wales, in  
Parliament assembled.

SHEWETH,—

That your Petitioner (one of the Trustees of the Old Burial Ground) having seen, by the report of the proceedings of your Honorable House, that a Bill has been introduced and read a first time, to enable the Trustees in whom this said land is vested for the benefit of the public, and set apart for health and recreation, to alienate a portion of the said land,—most humbly, on the part of the public at large and himself as one of the Trustees, protests against such alienation as is therein contemplated by the powers sought to be vested in them by the said Act.

Your Petitioner therefore humbly prays, that the said Bill may not be passed into law without being submitted to the investigation of a Select Committee of your Honorable House.

And your Petitioner, as in duty bound, will ever pray.

JAMES POWELL.

152 [406]—A

## REPORT ON THE FLOODS IN THE HUNTER.

---

THE ENGINEER-IN-CHIEF FOR HARBOURS AND RIVER NAVIGATION to THE UNDER  
SECRETARY FOR PUBLIC WORKS.

Department of Public Works,  
Harbours and Rivers Branch,  
Sydney, 9th July, 1868.

SIR,

In attention to the verbal instructions of the Honorable the Minister for Public Works, that I would examine the subject of the overflows of the Hunter River at and about West Maitland, with the view of devising, if it be possible, some means of mitigating the injuries and losses they cause, I have now the honor to submit, for his consideration, the following Report, in which I have endeavoured to set forth such information as I have been enabled to procure bearing upon it, as well as the reasonable inferences as to the practicability of any drainage scheme which seem to be deducible therefrom.

The subject of the inundation of the low-lying lands of the Hunter has, since the formation of the Department of Harbours and Rivers, engaged my most serious attention; and I have from time to time collected and endeavoured to classify and arrange all the authentic information bearing on the matter that was procurable, and am thus in a position to give a brief outline of most of the floods which have occurred since 1820. I am mainly indebted to the columns of the local and metropolitan Press for my information; and would here, "*in limine*," observe that, without the careful and patient search for facts which they have made, and the clear, correct, and valuable records they have preserved of each flood, any project of improvement must have been, to a great extent, based on conjecture.

Not that it can be asserted that we are now in a position to declare positively what amount of relief will result from any project of improvement that may be considered advisable, but with a better knowledge of the nature and extent of the forces to be contended against, we can with a more reasonable prospect of success attempt to deal with them. The utmost uncertainty must always attend on attempts to curb and control great rivers, in order to bring them into subjection to what man may consider to be his interest or his comfort, and to look for perfectly certain results from any proposed scheme of improvement is futile. We can only look for approximations, and those none of the closest. Professor Robison, one of the ablest writers on this subject, says—"As to the uniform course of the streams which water the face of the earth, and the maxims which will *certainly* regulate them agreeably with our wishes, we are in a manner totally ignorant. Who can pretend to define the velocity of a river, of which you tell him the breadth, the depth, and the declivity? Who can say what levels will be produced in different parts of its course if a dam or weir were made across its stream, of any given dimensions, or a bridge be carried over it; or to what extent its waters will be raised by turning another stream into it, or how much sunk by diverting a branch for driving a mill? Who can say with confidence what must be the dimensions or slope of this branch in order to furnish the water that is wanted; or, the dimensions and slope of a canal which shall effectually drain a fenny district? Who can say what form will cause or will prevent the undermining of banks, the formation of elbows, the fouling of the bed, or the deposition of sands? Yet these are the most important questions."

Every deep pool in a river's bed, every shallow and every bend, every contraction and every widening of its banks, affect more or less its velocity of discharge. Every whirlpool and eddy, every surge and wave on the surface of a swollen river, is evidence of the existence of some force which is retarding the onward passage of its waters.

waters. The flow of a river being due solely to the difference of level on its surface, we can easily calculate what its theoretical discharge, if influenced merely by the action of gravity, should be; but flowing in irregular and tortuous channels, trending now to the north, again to the south, the east, and the west, it can be readily understood how great and how many must be the retarding influences to which it is subject—influences which are sufficient to deflect the mass of its waters, destroy their momentum in one direction, and divert them into another. And when it is remembered that these retarding influences increase or decrease as the square of the velocity of the current which is ever varying, it will easily be understood how impossible it is to attempt to estimate them exactly. The utmost we can hope to do, is to devise some means by which, knowing the depth of the channel of a river, and the rate of the fall of its surface, we can compute approximately the mean velocity of the whole of its waters.

This has been attempted by Dubuat, Venturi, Eytelwein, Robison, Young, Ellet, and a host of other writers on hydrodynamics, who have endeavoured to construct formulæ with which, having certain data given, such as the cross sectional areas of a river, its hydraulic mean depth, and the ratios of inclination of its surface, they professed to calculate, within moderate limits of error, its approximate mean velocity and discharge. But it is evident, from the very nature of things, that these formulæ, when applied to the ever varying and endless irregularities of a natural river bed, must be received with a good deal of caution.

In each formula the retarding forces are represented by constants, which we know cannot be the case in nature, however accurate when applied to uniform channels.

Venturi has shewn conclusively, that when water flows in a channel of irregular width, widening out at one place and contracted at another, the eddies and counter-currents produced by these irregularities greatly diminish the mean velocity of discharge, and maintain the water permanently at a greater height in the river than would be the case were the whole channel reduced to one uniform section of the area of its most contracted part; and as these contractions and enlargements are endless in their variety and dimensions, so must be their retarding influences.

We are, therefore, compelled to accept these formulæ merely as approximations, approaching nearer to, or being further from the truth, as the channel to which they are applied approaches nearer to or is further from uniformity of section.

In calculating the approximate discharges of the Hunter River at the different points in its course, from Oakhampton, above Maitland, to Newcastle, where cross sections have been taken, I have used the formulæ of Dubuat, Eytelwein, Ellet, and Rankine.

Ellet's formula, which was framed on the results of his measurement of the Mississippi and Ohio Rivers, gives lower velocities than that of either Dubuat or Eytelwein; but although in taking the extreme depth, instead of the hydraulic mean depth, his formula may be open to question, still, when applying the calculation to such rivers as the above, whose cross sections are uniform, and where, besides, the influence of the atmosphere on their broad surfaces may be supposed to form a larger item in the amount of the retarding forces than would be the case in rivers of less magnitude, it is probably correct enough. I yet think that in the present calculations we are safer in using the formula of Dubuat, which is that generally relied on by engineers in calculations of this kind, as it has been found to give results approaching very closely to the velocity of the Po and other large rivers, as proved by actual measurement.

On looking at the accompanying plan and section, it will be seen that there is a fall of 18 feet in the general level of that part of the valley of the Hunter lying between West Maitland and Hinton. The fall on the surface of the river in times of flood is 17 feet, and the average fall of the land is  $4\frac{1}{2}$  feet per mile. The river, it will be observed, in its windings, seeks every point of the compass; thus, whilst the general fall of the valley is from west to east at the rate of  $4\frac{1}{2}$  feet per mile, we find the river in places running in the very opposite direction. This makes but little difference while the flood waters are confined within the banks, and are compelled to travel in the natural channel, having the effect of merely diminishing the ratio of fall, by distributing the actual fall  
over

over a greater length. But the condition of things is entirely altered when the river attains to such a height as to cause it to overflow the banks, which in very heavy floods it does to the depth of from 4 to 6 feet. We then have this anomalous state of things:—A strong surface current, with a velocity due to its mean depth and inclination of surface, flowing down the valley from west to east, while in parts the under-current of the river proper is flowing in the very opposite direction, or nearly west. It is plain that at such times the river is, as it were, thrown out of gear, and its velocity of discharge considerably reduced.

The correct estimation of the value of this retarding influence is, in my opinion, the most difficult part of the problem, and yet on it depends to a great extent the question of the possibility of affording relief to Maitland and the surrounding country from inundations, because, necessarily, it must so materially affect the question of the mean velocity and discharge.

I think, indeed, that probably even Dubuat's formula may give too high a rate of discharge when applied to the Hunter; for although it was found to agree with sufficient closeness to the actual velocity as measured on the Po, still it must be remembered that that river for a considerable length of its course is confined within its banks by extensive levées, and that therefore it would not be subject to the same retarding influence which we find in operation on the Hunter, and which, I believe, militates very considerably against the easy discharge of the flood waters.

It will be seen, when we come to examine more in detail the cross sections of the river, that many of those below Maitland are not half the area of those above the town; and with their diminished hydraulic mean depth and slope of surface they must be utterly inadequate to carry off the waters as fast as they come down in heavy floods; thus the waters are pent up until they break over the banks and inundate the low country, part flowing away into the swamps about Louth Park, Dagwood, and Hungerford Swamp on the one side, and Bolwarra on the other, while another large stream sweeps down towards Morpeth, Phoenix Park, and Dunmore, over-running and, as I have said, partly neutralizing the current within the channel proper of the river itself.

#### PART I.

THE earliest great floods in the Hunter of which we have received any authentic accounts seem to have been those which occurred between the years 1818 and 1820, the highest being that of 1820, a short account of which is given in the *Maitland Mercury* of 3rd September, 1857, from which I extract the following description said to have been given by an eye-witness:—"A large portion of the present site of East Maitland, then a bush, as well as the country around, was flooded." "A small rise at the back of Ogg's was dry, and a small piece of the present Melbourne-street, near the Hunter River Hotel, was also just dry; but, with these exceptions, all the lower parts occupied by the present town were flooded."

"In West Maitland the only houses then existing were a hut nearly opposite the site of the present Waterloo Hotel"; another hut, "nearly on the site of Messrs. Dickson & Co.'s present stores, and a hut built in the rear of the present Angel Inn. The flood was up to the wall-plates of the first hut, touching the shingles, up to the window-sill of the second, and was in the third; but the top of Bourke land, and the high ground extending back from the river near the Fitz Roy Hotel towards St. Mary's Church, were dry," although Mr. Eckford (the gentleman from whom the information is derived) does not speak positively as to how broad or long the dry land was.

The next highest flood after this was that of 1832, which Mr. Eckford thinks attained a height of within 8 feet of that of 1820.

The article then goes on to say, "that if, as we believe, the present flood (*i.e.*, the great flood of August, 1857) was, at West Maitland, 29 feet above high water mark, the June flood (of 1857) was over 26 feet, the 1840 flood was about 26 feet, the flood of 1832 was 29 feet, that of 1826 was less than 29 feet, and the flood of 1820 was 37 feet," the respective heights of the above-named floods may be thus recapitulated, viz.:—

At

## At Maitland—

* 1857—Flood of August	... ..	29 ft. above high water.
" Do. of July	... 26 ft. 8 in. to 27 ft.	" "
" Do. of June	... ..	26 " "
1840—Do.	... ..	26 " "
1832—Do.	... .. about	29 " "
1826—Do.	... .. less than	29 " "
1820—Do.	... .. nearly	37 " "

## At Morpeth—

1857—Flood of June	... ..	10 ft. above high water.
" Do. of August	... ..	14.9 " "
1840—Do.	... ..	8 ft. " "
1832—Do.	... ..	Not given.

Proceeding with the extract, we find it stated, "every old resident we have conversed with is quite positive that more water came down in each of the 1857 floods than during any former flood within their remembrance; and they account for the lesser height of the river by the great extent of land now cleared as compared with the then densely wooded country, and by the river also being now more clear of obstructions in the way of snags, &c." This explanation of the probable cause of the river not attaining the same height now as formerly is perfectly reasonable, and may, no doubt, be received as correct. When the river now overflows its banks, it has an open valley to spread over; formerly, the dense growth of trees and underwood, bound together and intertwined in an almost impenetrable mass by the vines, offered a barrier to the waters on either side; so that the discharging section of the river being strictly confined to the channel proper, the waters were pent up until they attained such a height as was sufficient to restore the equilibrium. And, in point of fact, supposing the river to attain a height of 8 feet at Maitland above the flood of 1857, as the flood of 1820 is said to have done, and assuming that it rose to 5 feet above that of 1857 at Morpeth, which would be a fair allowance, taking into account the extent of the level country, I find that, with the increased area, hydraulic mean depth, and slope of surface thus allowed, the natural channel would be almost sufficient to carry off all the waters of a flood like that of 1857, as fast as they came, down to Maitland. The calculations give four-fifths; the remaining one-fifth would probably have drained back into the swamps of Bolwarra and Dagworth, as at present.

There is, of course, some difficulty, in the absence of actual measurements, carefully recorded, in determining the precise heights of former floods; but Mr. Eckford's reminiscences of the flood of 1820 may probably be relied upon; and, as referring to the highest known flood since the settlement of the Colony, are very important—because, if it can be shewn, as has been asserted, that in the flood of 1857 more water came down in a given time when the flood was at its height than was the case in 1820, we have the experience of forty-seven years instead of ten to guide us in our computations. It is a consideration of very considerable importance in dealing with a subject of this kind, or when designing works on large rivers, to know what height has the highest known flood attained to—a question which we very often find it difficult to get satisfactorily answered.

We are in possession of very full information as to the height, duration, rate of rise and of fall of the more recent floods of 1857, 1861, 1864, and 1867; the last of which is generally admitted to have been amongst the highest since that of 1820. And it will be important, when we come to consider what would be the effect if the river were again rigidly confined within its banks by partial embankments, or by "levées," as they are technically termed, to have these accurate measurements as to floods which there is good reason to believe have been the severest that have occurred within the last half-century.

Reverting

* The correct heights, as given by subsequent measurements, are—						ft. in.

Reverting to the accounts of floods as published in the *Maitland Mercury* and other local papers, we find that the years 1856 and 1857 were unusually wet, and that in the month of June in the latter year the Hunter River district was visited by the heaviest flood which had been seen since 1832. The rain commenced to fall heavily on Tuesday afternoon, June 17th, and continued falling during Wednesday. The water rose with unusual rapidity at West Maitland, "commencing at 1 or 2 feet above high water mark, at 5 o'clock on Wednesday morning, the 18th June,—it reached 26 feet before 5 o'clock on Thursday morning, that is in little more than twenty-four hours." The current is described "as vastly more rapid and more sustained than in any previous flood, bringing down a considerable quantity of large timber, much exceeding the ordinary amount of flood timber."

After receding a few inches at West Maitland on Thursday and on Friday in the forenoon, it commenced to rise again on Friday afternoon, continuing until past midnight, when it attained to one inch higher than on Thursday.

By daybreak on Saturday it had again fallen from 1 to 2 inches; by Sunday morning it had fallen 2 or 3 feet; from which time it continued steadily falling till, on Monday evening, the waters had receded about 8 feet.

It may be as well to recapitulate here the substance of the information as above given in connection with the rise and fall of the flood of June, 1867,\* at West Maitland:—

On Wednesday, 17th June, at 5 a.m., flood level above h.w., 2'.†

On Thursday, 18th June, at 5 a.m., level above h.w., 26'.

Friday, 19th June, say 25'.

Do., midnight, say 26' 1".

Saturday, 5 a.m., 25' 10".

Do., 6 p.m., say 25'.

Sunday, 6 a.m., 23' to 24'.

Monday, 22nd evening, 18'.‡

The Hunter, the Paterson, and the Williams were all in flood about the same time, and the water attained its greatest height at Morpeth, namely, about 10 feet above high water mark, before 8 o'clock on Thursday afternoon. The crest of the flood-wave would thus seem to have taken from twelve to fifteen hours to travel from Maitland to Morpeth, being at the rate of about one and a quarter mile per hour.

At Morpeth, the water rose rapidly till 6 p.m. on Wednesday, 17th June. From 6 p.m. to 10 p.m. it rose 6 inches. From 10 p.m. to 4:30 a.m. on Thursday it rose 3 feet. From 4:30 a.m. to 6 a.m. it rose 8 inches, and continued rising throughout the day; at 8 p.m. commenced to recede, at 10 p.m. had lowered 2 inches; on Friday, at 10 a.m. had fallen 9 inches, at 3 p.m., 11 or 12 inches.

It was noticed that the more rapid rise took place between 2 a.m. and 4 a.m. on Thursday, which was about the time, or shortly after, that the water had attained the greatest elevation at Maitland.

This rapid rise must, I think, be solely attributable to the flood water; the backing up of the tide could have had very little (if any) influence on it, as the tides were at this time at the neaps, and it would have been low water at Morpeth about 2 a.m., and high water about 8 a.m.

By Monday afternoon the waters had receded at Morpeth to within about 2 feet of high water mark, spring tides.

It may be noted then, that on—

Wednesday the 17th, the river was rising rapidly at Morpeth till 6 p.m.

6 p.m. to 10 p.m., it had risen 6 inches.

From 10 p.m. to

Thursday ... 4 a.m., 3 feet. 4 a.m. to 6 a.m., 8 inches; at 8 p.m., was 10 feet above high water; commencing to recede. 10 p.m., had fallen 2 inches.

Friday ... 10 a.m., 9' 3" above high water.

3 p.m., 9' 1" above high water.

Monday, 22nd ... 2' above high water.

Raymond

\* Full Moon, 8th June, 3:27 a.m. † Moon, last quarter, 15th June, 7:14 morning. ‡ New Moon, 22nd, 8:8 morning.

Raymond Terrace was flooded, and the water rose to the floor of Mr. Portus mill.

At Singleton, on Wednesday the 17th,\* it was raining heavily; on Thursday, the weather is reported as being fine, but the river was rising rapidly—on Thursday evening it had risen very high. Detailed measurements of the height of the flood at Singleton and the other towns on the Upper Hunter are not given.

On Thursday, the Wollombi Brook was running fearfully high.

The foregoing dates and heights would afford the means of calculating approximately the amount of the water brought by the river down to West Maitland, as well as the amount discharged past Morpeth—the difference between the former and the latter being the quantity spilled over the banks between these places, and which went to inundate the adjoining low-lying lands; but I have not made these calculations, it being unnecessary to do so, as the subsequent flood of August, 1857, and the last flood of June, 1867, were higher, and we have more detailed information as regards their levels, velocity, and the quantity of water discharged.

At the time of which I am writing, but few attempts had been made to protect the town of Maitland from the effects of floods, and what had been done seems to have had but little effect, so that when the waters rose to about 20 feet, they commenced flowing in many places over the banks; and as the ground generally falls as it recedes from the river, the flood soon commenced to inundate the swamps and low ground at the back. The Horse-shoe Bend, it is said, was the first point submerged; next, the river overflowed the bank at High Street nearly opposite the Queen's Arms; and as it continued to rise, it found other outlets into the low land about the Race-course, and up the valley of Wallis' Creek.

By this flood a considerable part of West Maitland was laid under water, and nearly one half of the houses were more or less submerged, some having the water up to the eaves. The dam at Hall's Creek burst, allowing a large body of water to flow up that creek and flood the back land. By the waters flowing up Wallis' Creek "the whole of the flat lands on Louth Park, Dagworth, Hungerford Swamps, and for miles further up, were submerged; and so rapid was the inundation, that a great many persons were surrounded by water and cut off from all hope of escape."

At Bolwarra immense loss was sustained. The rapid inundation completely covered hundreds of acres, and while some families who were on the alert escaped, others were surrounded by the flood before they could do so, and were lost.

At East Maitland the damage done was comparatively slight; but from East Maitland to Morpeth the road is said to have been bordered on the left by an almost unbroken sheet of water, while at Morpeth the damage done was said to have amounted to £15,000.

Such is a short account of the first, or June flood of the year 1857, taken from the files of the *Maitland Mercury*, in which paper nearly every fact of interest or importance connected with the floods of the Hunter seems to have been carefully collected, and clearly and ably set forth.

The first rapid rise in the Hunter, was clearly due to the flooding of the Wollombi and its other lower tributaries; for we find it bank high at West Maitland on Thursday morning, at which time it had only commenced rising rapidly at Singleton; but the second rise at Maitland at midnight on Friday was probably due to the arrival of the crest of the flood wave which had culminated at Singleton on Thursday evening, and which had thus travelled down the river at the rate of about  $1\frac{1}{4}$  mile per hour.

The next flood in the Hunter was that of July, 1857.\*

It commenced raining on Sunday evening the 26th, continued raining all that night, the following day, and all Tuesday, and in the early part of Tuesday night came down in furious driving showers.

At

---

\* New Moon, 21 July, 4:17 a.m.

At 8 a.m. on Tuesday the 28th, the river stood at about 1 foot above high water mark\*—

By noon it had risen to 3 feet.

5 p.m., 10 feet, being at the rate of 17 inches per hour.

9 p.m., from 17 to 18 feet, or 22 inches per hour.†

11 p.m., to 19 feet, rising at the rate of 6 inches per hour.‡

Wednesday, July 29th, at 4 a.m. had risen to 23 feet.

7 a.m., 24 feet 6 inches.

Noon, 26 feet.

Thursday, July 30th, still rising.

Friday, July 31st, height 26 feet 8½ inches to 27 feet, at which level the water continued from 9 a.m., to 12 o'clock. By 2 p.m. on Friday, the water had fallen ¼ of an inch, by 5 p.m., 2 inches, by 9 a.m. on Saturday, 3 inches. During Saturday night the waters continued falling fast. From Sunday to Monday morning, the fall was inconsiderable, and at noon of the latter day the river was almost at a standstill, there being scarcely any current.

It was remarked that while this flood was at its highest, the rate of current was about 5 miles per hour at Maitland, which is a close approximation to the calculated velocity as given by Dubuat's and the other formulæ.

At Morpeth, at 12:30 on Wednesday, the 29th July, the river stood about 6 feet 6 inches above high water. On Wednesday evening it had risen to 8 feet above high water. On Thursday night it attained its highest level, namely, 10 feet 7 inches above high water. For a short time, about 2 o'clock on Tuesday, the current at Morpeth was running (if any thing) up stream, caused by the flood in the Paterson; but about 4 p.m. the greater body of water rushing down the Hunter bore the smaller stream before it, and re-established the downward current.

It will be observed here, that this flood attained its greatest height at Morpeth earlier than it did at West Maitland. This is, I think, to be attributed to the backing up of the Hunter by the Paterson in the early part of the flood.

In this, as in the former flood, I am unable to observe that the tides had any influence on the rise of the water or the time of the greatest height of the flood at Morpeth, as it would have been low water of neap tides about 11:30 p.m., on Thursday (about the time that it is said the flood attained its greatest height), so that the flood was falling while the tide was rising.

I have been careful to see if there be any connection between the state of the tides and of the flood at Morpeth, but without being able to discover the slightest.

At Singleton, on Tuesday the river commenced rising; on Wednesday it continued to do so with great rapidity; on Thursday the 30th, at 8 a.m., it was at its highest, being 4 feet above last flood, and 5 feet below that of 1832. At 8 p.m. of the same day the river had fallen 4 feet, or at the rate of 4 inches per hour.

The crest of the flood-wave leaving Singleton at 8 a.m. on Thursday, arrived at Maitland on Friday between 9 a.m. and 12 a.m., shewing its rate of descent to be nearly 2 miles per hour.

On the occasion of this flood, the waters broke at West Maitland over all the points of overflow of the former flood, inundating the back country to a greater extent than had then occurred, the back water having reached to within 1 foot of the height of the river; and it is surmised that if the river had continued at its full height for another day, the backwater would have risen fully to its level.

On Wednesday morning the water had commenced to pour across High-street at various points, and continued running in a strong stream for two days, till as we have seen, the back water on Friday evening rose to within a foot of the level of the river, which at that time had receded 2 or 3 inches. We thus gain some idea of the enormous capacity of the flooded back country as a compensating reservoir to the river.

In

\* *Maitland Mercury*, 30 July, 1857.

† Broke over the low land at Horse-shoe Bend. ‡ Moon, first quarter, 29 July.

In this flood the waters fell faster than they did in the June flood—the river continued falling at the rate of about  $1\frac{1}{2}$  foot per day; on Wednesday having fallen to 16 feet, on Friday, August 7th, to 19 feet, from the highest point attained, being then about 8 feet above high water mark. The back-water was then fast receding, being rapidly drained off by Wallis' Creek.

We now come to the August floods of the same year (1857), the highest by which the country had been visited since 1820, and which caused such wide-spread desolation over the Lower Hunter.

The rain commenced falling on Wednesday evening, the 19th August,\* on a country thoroughly saturated by the two preceding floods, which had filled every water-hole and swamp, and spread over every plain. Thus, all the natural reservoirs being already filled to overflowing, it is not to be wondered at, when the unusually heavy rainfall is considered, that this flood should have come down with unprecedented rapidity, and have attained to the extraordinary height it did. The flood diagram attached to this Report shows that the total quantity of water which passed down the river, from the commencement to the termination of the flood, amounted to over 88,000 millions of cubic feet, a quantity which would account for nearly 5 inches of rainfall over the entire valley of the Hunter. The total rainfall for the months of August and September was 6.1 inches.

It commenced raining, as I have said, on Wednesday evening, and continued through Thursday and Thursday night, raining heavily, and blowing a gale of wind from the south-east; but it was not till about sundown of the latter day that the river commenced to rise at West Maitland, and a gentle current was perceptible

On Friday, the 21st, at daylight, the river was seen to be rising, but was not yet very high. At 7.30 a more rapid rise took place, the water being then 11 feet above high water.

Continuing to rise rapidly, it had reached, by 11 a.m., 19 feet above high water; by 12.30 it had risen to 22 feet; and by 2.30 p.m., it was about 25 feet. So rapid a rate of rise had never before been observed at Maitland.

Early on Friday, the 21st, the river had commenced flowing through Hall's Creek, on to the low lands on the south and west of the town, which were already partly submerged by the heavy rain. At about 5 p.m. on Friday, the water was running in a strong stream across High-street, opposite the Queen's Arms Hotel, the water being then 26 feet above high water mark; but the current in the river at this time was not so rapid as it had been during the June flood. By 7 p.m. the water was pouring into High-street, near the Wesleyan Chapel; by 8 p.m., still raining, though not so frequently, the water had nearly crossed the road; at 10 p.m., it had risen to the level of the July flood, namely, about 27 feet above high water, and was still rising. On Saturday morning, at 9 o'clock, it had reached to 1 foot above the level of the July flood, or 28 feet above high water, with a very rapid current in the river. A pause then occurred, and no perceptible rise took place for several hours, till about .5 p.m. on Saturday it commenced rising very slowly, and continued rising until Sunday evening about sundown, when it attained its greatest height, namely, 29 feet above high water. Shortly after, or about 7 p.m. on Sunday, a slight decrease was perceptible; and by midnight it was obvious that the overflow had diminished. On Monday morning it had fallen 4 inches, and continued to fall steadily during that day and the next; and by Wednesday, the 2nd September, it had fallen  $19\frac{1}{2}$  feet from its highest point.

In this, as in the former floods, it was observed that, with a rise of about 20 feet, the water commenced to overflow at one or two points at the Horse-shoe Bend; at 24 or 25 feet, it commenced to overflow at High-street—first below the Rose Inn, then near Russell's; at 26 to 27 feet, it commenced to overflow the dams or levées at the Falls, and the line of the bank along the Free Church street and at the foot of Hunter-street.

The

---

\* New moon, 20th August, 2.30 a.m.

river on the following day (on Monday at noon), when the water was still 13 feet 11½ inches above its ordinary high water level, I am unable to perceive that there was any alteration of level which could indicate that the flood was at all affected by the tides; and we also find that lower down the river, at Raymond Terrace, Hexham, and almost as far as Newcastle, even the tidal action seems to be neutralized by that of the flood.

Recapitulation of rise and fall at Morpeth:—

Friday, Aug. 21—From 6.30 a.m. to 3 p.m. river rose 6 feet = 7' 5" above high water.

Rate, 8 inches per hour. 9 p.m., 10' 7" above h. w.

Saturday .....Rising slowly.

Sunday .....11 p.m., 14' 9" above high water. 12 o'clock, commenced falling slightly.

Monday .....8 a.m., 14' 6½" Noon, 14' 5½".

At Raymond Terrace this flood rose with unusual rapidity, and attained a height of about 5 feet above that of the last flood, or 7.82 feet above high water.

Tracing this flood downwards from the head waters of the Hunter, we find that at Musclebrook the water reached its greatest height on Friday night at 10 o'clock. At Singleton, Thursday, August 20th, there was no appearance of rise in the river. On Friday, Aug. 21, the river had risen during the night with unprecedented rapidity, about 3 feet per hour. On Saturday it was still rising rapidly, the water breaking over the banks above the town. On Sunday morning, at 4 o'clock, it attained its greatest height, (46 feet above summer level), and commenced to fall. On Monday, at noon, the river was falling.

It would thus seem that the crest of the flood or wave was, at—

Musclebrook—on Friday, at 10 a.m.

At Singleton (about 85 miles)—on Sunday, at 4 a.m., having come down at the rate of about 2 miles per hour; the fall being say 3.8 feet per mile.

At West Maitland (49 miles)—on Sunday, at 5 p.m., about 3.8 miles per hour; fall being at the rate of 2.088 feet per mile.

Morpeth (17 miles)—on Sunday, at 11 p.m., 2.8 miles per hour; fall, at rate of, say 1 foot per mile.

Such are the salient features of the great flood of August, 1857, which I have dwelt on at some length, as it and the flood of 1867 form the ground on which I base my calculations as to the quantity of water to be dealt with in any scheme which may be proposed for abating the injuries done by these floods.

By these floods it was estimated that 35,000 acres of land were inundated, four hundred families reduced to destitution, and injury to the amount of £150,000 inflicted on the district, from loss of crops and stock and damage of various kinds.\* These last-named injuries and losses were not caused, however, by the floods alone, for it is pretty generally admitted that during wet seasons even when there has been no flood of importance, that the rain falling on the surface, added to the drainage from the adjoining ridges, is sufficient to lay under water a considerable extent of the richest and best land in the neighbourhood of the Maitlands; the land in the immediate neighbourhood of the river having been raised by the alluvial deposits of ages to a higher level than that of the back lands, a feature of all large rivers, it follows that the drainage into the river from the back lands is rarely perfect in its natural or unimproved state.

From 1857, to February, 1861, there were occasional freshes in the Hunter, but nothing of sufficient importance to warrant further notice; but on the latter date the Hunter was visited by another high fresh.

On

\* See debate, Legislative Assembly.

On Wednesday\* and Thursday, the 6th and 7th of February, it came on to rain very heavily, and early on Friday night, February the 8th, the river commenced to rise; on Saturday morning, the 9th, at 6 o'clock, it had risen 8 feet above ordinary high-water mark; by 6 p.m. it had risen to 12 feet. At 6 a.m. on Sunday morning† it had risen to 15 feet, with a very rapid current, and by 2 p.m. on Sunday it attained its greatest height, being then about 16 feet above high water. The water commenced to recede about 4 p.m., and by Sunday it had gone down about 4 inches.

At 6 a.m. on Monday the water had receded 3 feet, or to 13 feet above high water, and on Monday evening it had gone down to 11 feet above high water.

Little or no damage was done to the town by this flood, but a considerable extent of the low-lying land back from the river was inundated by the water, which for some two or three days continued flowing up Wallis' Creek.

We thus observe that a flood 16 feet in height, while it does no injury to the town, is capable of doing considerable damage to the crops on the low lands, in consequence of the absence of any proper system of drainage.

Early in the following month of March, there was another fresh in the Hunter, which rose to 15 feet 6 inches above high water. Commencing to rise on Friday at sundown, it attained its greatest height on Sunday the 3rd, about mid-day,‡ and commenced falling slowly about an hour or two after; it had gone down 6 inches by sundown, and 2 feet 6 inches by Monday morning. But a second rise took place during the day, and by sundown the river again stood at its highest point—15 feet 6 inches.

This second rise was attributed to the arrival of the flood wave of the Goulburn River—the largest tributary of the Upper Hunter.

The effects of this flood were similar to the last. The town sustained no damage, but the flat country towards the head of Wallis' Creek was again laid under water.

About the latter end of April—barely two months after the last described fresh—the Hunter was visited by another flood.

There had been a good deal of rain for the preceding ten or twelve days; but on Saturday and Sunday, the 27th and 28th of April,§ it came down with great violence, still further flooding the low lands about West Maitland and Hexham, from which the water left by the flood of March had not drained off.

On Sunday evening, the 28th, the river shewed symptoms of a rise. After midnight it commenced rising rapidly; and by 8 o'clock on Monday morning, the 29th, it had risen from 13 to 14 feet above high water. By noon on Monday the river had risen to 16 feet, and at about 8 p.m. it had risen to 19 feet, when it became stationary. It then commenced falling slowly, and by 7 a.m. on Tuesday, the 30th, it had gone down nearly 2 feet. But about 9 a.m. it recommenced to rise, and at 2 p.m. had again risen to 19 feet, and continued rising slowly, with a rapid current carrying down much heavy timber, till about 3 a.m. on Wednesday, when it attained its greatest height of 21 feet above high water. At this level the water remained stationary all day, and until about 7.30 p.m. (16½ hours), at which time it recommenced falling, and at 8.15 p.m. had gone down 1 inch.

On Wednesday night it fell 1 foot. By noon on Thursday it had fallen 2 feet; by sundown, 3 feet; and by daylight on Friday morning, nearly 6 feet; at 1 p.m., 7 feet; at sundown, 8 feet. The river being then confined within its proper banks, no further record of the rate of fall seems to have been kept.

It

\* Moon in last quarter, 2nd Feb., 8.4 p.m.

† New moon, 10th, 9.8 a.m.

‡ Moon in last quarter, 4th, at 5.20 a.m.

§ Full moon, 26th, 8.23 a.m.

It was observed of this flood, that, although on all former occasions a rise of 21 feet would have seriously flooded the flat lands in and near the town on the right bank of the river, on this occasion, in consequence of the dams which had been thrown across the creeks leading into the back lands, comparatively little injury was caused by the river water, except by that which flowed up Wallis' Creek, and thence out over the low lands at its head.

On the left bank of the river it was different, the low lands about Bolwarra being all overflowed.

We thus find that, at this time, a rise of 21 feet in the river, although still inundating all the low-lying lands, had ceased to cause any injury to the town, in consequence of the measures which had been taken by the inhabitants to embank it out.

Some notice was taken of the time which the flood-waters took in travelling from Singleton to West Maitland, on this occasion, and it was estimated that the rate of speed was from 3 to 5 miles per hour.

The first rise during this flood at Singleton stopped at 10 feet on Monday morning; but as the first rise at West Maitland culminated at 8 a.m. at 19 feet, it must have been caused mainly by the waters of the Black Creek, Anvil Creek, and other creeks joining the Hunter below Singleton.

The second rise at Singleton commenced on Monday afternoon, and continued until Tuesday morning the 30th. At 8 a.m., it was 18 feet above the usual height, and by 1 p.m. on the same day attained its greatest height.

The second rise at Singleton is attributed to the arrival of the flood-waters of the Goulburn, which, passing on, also caused the second rise at West Maitland. The second rise, as we have seen, commenced at Singleton at about 5 o'clock on Monday afternoon, and at Maitland at about 8 a.m. on Tuesday, or about 15 hours later, and attained its greatest height at Singleton at 1 p.m. on Tuesday, and at West Maitland about 3 a.m. on Wednesday—about fourteen hours later; which, the distance being, as I have said, about 49 miles, gives a velocity of about  $3\frac{1}{2}$  miles per hour.

It will be observed that, in this flood, as well as in each of those of 1857, there was a second rise in the river after it had attained its first elevation and had commenced falling, and during this last-described flood, it reached a greater height by 2 feet during the second rise than it did during the first.

The next flood that occurred during 1861 was that of July.

It commenced raining over the valley of the Hunter on Tuesday, July 23rd,<sup>†</sup> and continued almost without intermission for the remainder of the week.

The immediate consequences of the local rain was, the accumulation of sheets of water in all the hollows about the town, but the river itself did not shew any symptoms of a rise till Wednesday night.

At 7 a.m. on Thursday, it had attained a height of 7 or 8 feet above its ordinary high water level; at about 3 p.m. it had risen to 10 or 11 feet, and early on Thursday night it had risen to 14 feet above high water. During the night it continued to rise rapidly—3 to 6 inches per hour, and at 10 a.m. on Friday it had attained a height of 22 feet.

Continuing to rise slowly, at midnight on Friday it commenced flowing over the river bank at High Street, near Messrs. Hall and Co.'s stores; and by 5 a.m. on Saturday it had reached to 24 feet above high water, and continuing to rise more slowly, it reached its maximum at about 3 p.m. on Saturday, when it stood at 25 feet 4 inches above high water mark, being nearly at the same level as the June flood of 1857.

Shortly after 3 o'clock on Saturday it commenced to fall slowly at first, but then more rapidly. At 3 a.m. on Sunday it had receded 1 foot 4 inches; at 9 a.m. on Sunday it had fallen 2 feet 4 inches from its highest. At 5 o'clock on Monday afternoon it had gone down 8 feet, being then about 17 feet above high water; and by Wednesday, August 6th, it had receded to within 4 or 5 feet of its ordinary level.

An

<sup>o</sup> New Moon, 6th, 10<sup>58</sup> p.m.

<sup>†</sup> Full Moon, 22nd, 8<sup>10</sup> a.m.

An unusual feature in this flood was the height attained by the river at so early a stage of the rain; and that, when it commenced falling, it went down almost as rapidly as it rose.

*Musclebrook.*

July 26—Friday, forenoon, river at its greatest height.

26— „ noon, had commenced falling.

27—Saturday, 10 a.m., fallen 12 feet.

*Morpeth.*

July 26—Friday morning, river over Queen's Wharf.

27—Saturday, midnight, 9' 0" above h.w.

28—Sunday, subsiding rapidly.

29—Monday, noon, 2 feet above ordinary h.w. springs.

This flood, which rose with unusual rapidity, subsided almost as quickly. This perhaps is in some measure attributable to the rain having ceased to fall heavily after Saturday morning, as well as to the circumstance of the Paterson and Williams being but slightly flooded, thus allowing the waters of the Hunter to drain off more rapidly than they would have done had they been pent up by the back water of those rivers, as occurred in some of the former floods.

The rapid subsidence of the water prevented much injury being done to the crops, "even the young wheat was in many cases saved." This fact should be borne in mind when we are considering the question of drainage.

The waters of the Hunter had not returned to their ordinary level after the flood of July, when they again commenced to rise. On Tuesday morning, August 6th,† it commenced raining slightly, gradually increasing to a steady continuous rain on Tuesday night, Wednesday, and Wednesday night, and the following day and night.

*Raymond Terrace.*

- August 9—Friday, 2 a.m., river attained its greatest height, being 3 feet below flood of August, 1857—5' 07" above h.w.

By this, as by the preceding floods, the whole of the low land on both banks of the river were laid under water. Louth Park and Dagworth are described as seas, and Phoenix Park, Bolwarra, and Dunmore as being one sheet of water; considerable damage was done to the standing crops, and the town also suffered somewhat, the water rising to the eaves of many of the houses in John-street.

A considerable amount of damage was also caused by this flood to the residents of the Paterson and Williams, on both of which the alluvial flats were flooded.

The rains on this occasion seem to have been principally confined to the coast line and not to have extended very far or very heavily inland; hence, probably, the reason why we find the flood culminating at Maitland before it reached its highest at Singleton.

On this, as on the occasions of former floods, the state of the tides, whether at flood or ebb, springs or neaps, seems not to have had any influence on the height, duration, or rate of rise or fall of the flood-wave at Maitland or Morpeth. In fact, when it is remembered that at Newcastle, during heavy floods, the range of tide is only altered about

\* This gave 2.9 miles per hour as the rate of speed of the flood when between Musclebrook and Singleton.

about 1 foot, it is difficult to imagine that it can have any influence on the height of the water at Maitland; and although there is a sensible increase in the velocity with which the flood waters rush out through the narrows at the entrance to Newcastle at the latter part of the ebb, the tide is not found to affect very sensibly the level of the water as far up as Hexham and Raymond Terrace; between which places and the out-fall at Newcastle there are capacious areas for the water to expand over afforded by the river itself, the low-lying land upon its margin, and the wide estuary of Fullerton Cove, all of which act as compensating or regulating reservoirs, and are capable of receiving many hours' discharge of the river without sensibly affecting its level.

It will be observed as an unusual thing, in this flood, that the highest rise at West Maitland, Morpeth, and Raymond Terrace was almost coincident—the times being at Maitland, midnight, on Thursday, August 8th; at Morpeth, 2 a.m., on Friday; and, at Raymond Terrace, the same as at Morpeth.

Such was the last flood of the year 1861; and from that till the year 1864, the district seems to have remained undisturbed by flood alarms.

In the early part of the year 1864, the cycle of wet seasons again came round, and the week previously having been showery, on Wednesday, February 10th,\* a close, steady rain commenced to fall, which soon made itself felt in the river. Towards the close of that day the water had risen about 1 foot, and continued rising at the rate of 1 foot per hour during the night.

By 9 a.m. on Thursday, the river had risen 17 feet above its ordinary level, with a rapid current, bearing on the surface large quantities of heavy timber. The rise continued during Thursday at the rate of about 6 inches per hour, causing successive overflows of the lower portions of the banks and at Wallis' Creek. By Thursday evening it had broken over the bank at High-street. This overflow relieved the river and checked its rapid rise, but nevertheless the water continued steadily, though now slowly, to rise during Thursday night and Friday, and by Friday evening it had attained a height of 28 feet above its ordinary level, being then about 1 foot below the flood of August, 1857, still rising, but very slowly, and running rapidly.

It was remarkable that some houses and some parts of the town which escaped in the great flood of 1857 were flooded on this occasion (though, as has been stated, the general level was 1 foot lower in this than in the former), and others which on both occasions suffered, were invaded at different periods, as regards the times at which the waters broke over the banks at High-street and at the Falls.

The water still continuing slowly to rise, by sundown on Saturday, the 13th February, the greatest height, namely 28 feet 4 inches, was attained, or 8 inches below the height of the flood of August, 1857.

On Saturday night the river commenced to fall, and continued falling through Sunday; and Sunday night the river again returned within its banks, and by 8 o'clock on Monday morning it had fallen fully 10 feet from the highest level. The fall continued to Wednesday, the 17th, when the water had receded 18 feet.

Although considerable injury was done in the town by the water flowing over the river bank, and the low-lying lands in the vicinity of the river were submerged to nearly the same extent as during the great flood of 1857 (indeed, in some places of the Horse-shoe Bend it was said to have attained a greater height)—looking across over Phoenix Park from Morpeth, it is asserted that the water was seen, in an unbroken sheet, extending for 4 or 5 miles—yet the much dreaded backwater in rear and to the south of West Maitland did not rise to within some 4 feet of the level of that flood, in consequence of the empty state of the lagoons and swamps previous to the occurrence of this latter flood.

The

\* New Moon, 8th February.

The following will shew approximately the time at which the flood attained its maximum height at the undermentioned places:—

*West Maitland.*

February 10th.—Wednesday afternoon. River commenced to rise, being then 1 foot above high water mark.

11th.—Thursday morning. River 17 feet above high water; evening, breaking over High-street, 22 feet above high water.

12th.—Friday evening. 27 feet above high water.

13th.—Saturday morning. 27 feet 6 inches above high water.

Do., about sundown. 28 feet 4 inches above high water.

Do., at night. Commenced falling gradually.

14th.—Sunday night. Continued falling—the river being within its banks.

15th.—Monday, 8 a.m., it had fallen 10 feet, or 18 feet 4 inches from high water mark.

17th.—Wednesday, the river had fallen 17 feet, being about 11 feet 4 inches above the ordinary height.

*Singleton.*

10th.—Wednesday, 5.15 p.m. River rising 1 foot per hour.

11th.—Thursday, between 6 a.m. and 2.15 p.m. River, which had risen at the rate of 2 feet per hour, had attained a height of 25 feet, and continued rising at the rate of about 1 foot per hour. 6.15 p.m., river rising at rate of 6 inches per hour.

12th.—Friday, 7.45 a.m. River within 2 feet of flood of August, 1857, or 44 feet 8 inches above ordinary level.

3.15 p.m. Risen 6 inches since morning, or within 18 inches of August flood, 1857—44 feet 6 inches.

6.47 p.m. River just commencing to fall, being within 16 inches of last-named flood, or 44 feet 8 inches above ordinary level.

15th.—Monday evening. River had fallen 35 feet.

*Musclebrook.*

12th.—Friday, 3 a.m. River commenced to fall, being then 1 foot above level of flood of 1857.

Had commenced to fall at *Singleton*, as before stated, at 6.47 p.m.

*Morpeth.*

13th.—Saturday, 12 p.m. River commenced to fall, having attained to within 2 feet of the height of the flood of August, 1857, or 12 feet above ordinary high water, and 8 feet above the Steam Company's Wharf.

16th.—Tuesday. River had fallen 8 feet.

17th.—Wednesday. Fallen 11 feet, and continued falling steadily.

In the following month there was another flood in the Hunter. The river commenced rising on Tuesday, the 23rd March,\* and by Friday, the 26th, had risen to about 21 feet above its ordinary level.

On Wednesday, March the 30th, the river, which had receded to about 5 feet above its ordinary level, again commenced to rise, and by 7 p.m. on Thursday, 31st March, had risen 20 feet.

Another flood commenced in June of this year.

The rain commenced to fall on Thursday night, June 2nd,† and early on Friday morning, the 3rd, the river was found to have risen 6 feet above its ordinary level, and continued through the day rising at the rate of about 1 foot per hour; and on Friday evening it had reached to 20 feet above its ordinary level. Continuing slowly to rise, by 2 a.m. on Saturday it commenced flowing over the banks, and by noon it had reached its

\* Full Moon, 23rd. † New Moon, 4th.

its greatest height, and then stood at from 23 to 24 feet above high water mark; and the backwater continuing to rise, by Sunday evening it had spread over every acre of cultivation between Maitland and the range of hills to the southward. "From the Morpeth Road, on Saturday, an extensive view of the flooded land was obtained, the expanse of water gradually increasing as one approached Morpeth, whence for miles nothing but water and partly submerged houses could be seen."

On this occasion, both the Williams and Paterson were likewise in flood, and the latter overflowed its banks at various points, submerging all the low lands.

At Morpeth, on Saturday at noon, the water had risen to within 14 inches of the February flood, or (say) 11 feet above high water.

One of the peculiarities of this inundation was, the great length of time the water remained at its greatest height at West Maitland, namely,—from noon on Saturday, till near Monday morning, at which latter time it had fallen but 2 feet, and was then subsiding very slowly.

At Singleton, the flood culminated at 9 p.m. on Saturday, when the river stood at 28 feet above its ordinary level.

The flood having reached its greatest height at West Maitland, 9 hours before it attained its full height at Singleton, shews that the rise at the former place was mainly due to the local rainfall, and the flooding of the Wollombi, and the creeks entering the river between those two places.

It was observed on the occasion of this flood, that the Paterson rose with a rapidity never known before. The river, which on Thursday evening was at its usual level, had risen about 17 feet on Friday morning, and continuing to rise during that day with fearful rapidity, by midnight it had attained its greatest height, and then stood at 40 feet above its usual level, or within 3 feet of the great flood of August, 1857. About two hours afterwards it commenced to recede, and at daylight on Saturday had gone down about 2 feet, and by the evening about 6 feet.

The flood in the Williams, on this occasion, rose to within 3 feet of the height of that of August, 1857.

On the following week to that referred to in the foregoing account, and before the river had had time to go down to its ordinary level, the district was visited by another flood, of even greater severity than the last.

At dawn on Saturday, June 11th, the river, which had subsided to within about 9 feet of its ordinary level, was observed to be again rising (having risen 2 feet during the night); it was then at 11 feet above its ordinary level. It continued to rise rapidly during Saturday. From 6 p.m. on Saturday to 10 a.m. on Sunday the river rose 3 feet 10 inches at the Wallis' Creek embankment; and from that time to 8 a.m. on Monday, June 13th, the river had risen 1 foot 10 inches—a mean average rate of 1 inch per hour. At 10 a.m. the river was 23 feet 6 inches above high water mark. At 4 p.m. it had risen to 24 feet 3½ inches, or at the rate of about 1½ inch per hour. At 9:30 p.m. it had risen to 24 feet 9 inches, or about 1 inch per hour. At 6:45 a.m. on Tuesday it had risen 7 inches more, or (say) to 25 feet 4 inches; from this time till about 9:30 the river remained stationary, but it then commenced to rise again at the rate of about ¼ inch per hour until 6 p.m., after which it continued to rise more slowly till at 6:30 a.m. on Wednesday the 15th, when the river stood at 26 feet above high water.

Continuing still to rise very slowly, at a little before midnight on Wednesday the water was about 26 feet 2 inches above its ordinary level, being then about 2 feet 2 inches below the flood of 1864 (February), and about 2 feet 10 inches below the August flood of 1857. Shortly after midnight the waters commenced to recede.

At Singleton, the river rose slowly till about Sunday evening, when it commenced to rise more rapidly; and at about 9 a.m. on Monday, was rising at the rate of 1 foot per hour, being then about 34 feet above the usual level. At 1 p.m. it had risen to 36 feet, having been rising at the rate of 13 inches per hour. At 4 p.m. it was at 37 feet above the level, rising 4 inches per hour. At 7:3 p.m. it was 38 feet.

On

On Tuesday evening at 8 p.m. the river commenced falling, having reached to within 2 feet 8 inches of the February flood, or 41 feet 10 inches above ordinary level.

On Wednesday at 11 a.m., it had fallen about 3 feet.

At Musclebrook it had commenced falling on Tuesday morning; at Singleton, on Tuesday evening; at West Maitland, Tuesday midnight.

During this flood, two houses at the Bend in High-street, which had been partially undermined by former floods, were swept away, the inmates of one just escaping but those of the other house (Mr. Fairfield and his family) were swept away with their house into the swollen river. His wife and another woman were drowned; he himself, with two of the children, were rescued from the wreck, after the house had grounded among some trees.

Scarcely had the flood of June subsided, when, about the middle of the following month, another flood swept over the district.

On Friday, 15th July,\* the river again began to rise, and continued rising slowly through Saturday, 16th; and about midnight on Sunday the flood attained its greatest height at West Maitland, being then about 25 feet above high water mark. For about two hours it remained at that level, and then commenced slowly to recede.

Again, in the following month occurred another flood, though not so severe a one as the last.

On Tuesday morning, August 9th,† the river began to rise at the rate of about 11 inches per hour. By Wednesday morning, the 10th, it had risen to 19 feet, and by Thursday evening reached to 24 feet above ordinary high water mark, and continuing to rise slowly till Friday evening at 8 o'clock, when it reached to within a few feet of the height of the last flood, or about 24 feet 9 inches above high water.

At Singleton, at 11:45 a.m., the river had risen to 36 feet above its ordinary level, and shortly afterwards commenced falling.

It was my intention to have given a brief summary of all the important floods which have occurred in the Hunter River since the year 1857, at which time public attention began to be drawn to the subject, but I find that my space will not permit me to do so; and as the year 1865 and the following year were comparatively dry—no serious flood occurring until the last year of 1867—I shall pass them over, and come to the last flood of June of that year, which, for height, duration, and amount of injury inflicted, has only been equalled by the great flood of August, 1857. And it is a curious coincidence, that the decennial periods of 1857 and 1867 should be marked by floods of unusual severity, number, and magnitude.

On Monday evening, June 17th, it commenced raining slightly, and continued falling with increased force throughout Tuesday, Wednesday, and Thursday. During Thursday night and Friday morning the rain fell in torrents, accompanied by a heavy south-easterly gale.

Up to Wednesday evening there was little apparent change in the river at Maitland, but on Thursday morning it was found to have risen 9 feet, and at 4 p.m. on the same day had reached to 18 feet above tide level, and at the same hour on Friday afternoon the river had attained a height of 27 feet above its ordinary high water level: it was then rising at the rate of about 3 inches per hour, and continued to do so till about 7 a.m. on Sunday, when it reached its greatest height, being then generally about 4 inches above the great flood of August, 1857, or say generally 30 feet above ordinary high water; in some places it was considerably more, in others less.

It then, after remaining stationary for some time, commenced falling slowly. By 11 a.m. the water had fallen  $\frac{3}{4}$  inch: at 1 p.m. it had fallen  $1\frac{1}{2}$  inch: at 8 p.m. 4 inches, and by 8 a.m. on Monday had fallen about 10 inches.

All this time the river continued steadily pouring over the levées which had been erected at various points to keep it out, deluging the town, and steadily adding to the great backwater which covered the country to the south, on both sides of Wallis' Creek.

Many

\* Moon, first quarter, 12th.

† Moon, first quarter, 11th.

Many causes, such as the great height it attained, the rapidity of its rise, the peculiar inclemency of the weather, and the prevalence of sickness amongst many of the poorer inhabitants of the town and surrounding district, combined to render the effects of this flood peculiarly disastrous. It was likewise marked by an unusual amount of injury done to the banks of the river, the caving or slips, from the Falls downwards, being frequent.

At Singleton, at 10 a.m. on Thursday, June 20th, the river had risen 12 feet; at noon, 13 feet 6 inches; at 3 p.m., 14 feet 9 inches; at 6 p.m., 15 feet. At 8 a.m. on Friday, 30 feet; at 12.20 p.m., 37 feet above the ordinary level; at 5 p.m., the river still rising 9 inches per hour; 9 p.m., rising slowly. On Saturday, at 7 a.m., rising 4 inches within the hour, being then above the level of the flood of 1857. About noon on Saturday, it must have attained its maximum, when the water stood at 1 inch above the last-named flood.

At Dunmore, on the Paterson, this flood was stated to have risen to a height of 15 inches above the flood of August, 1857; and at Raymond Terrace, to 8 inches above the same flood.

When a river breaks over its banks, it leaves the heaviest particles of the drift mud and debris on the immediate banks; and it is only the lighter matter which passes on into the swamps and flat lands in rear. Thus the river banks are always receiving addition to their height in a more rapid ratio than the back lands. Whence it is that large rivers in a flat country are generally bordered by extensive tracts of swampy land, more or less under water after each flood. In such cases, the mere banking out of the river is not sufficient; it becomes necessary to have recourse to some system of artificial drainage to facilitate the discharge of the water, whether received from the river or from the smaller creeks. And if a judicious system of local drainage be undertaken, I can imagine that, so far from the inundations caused by overflows of the river being injurious, they would, on the contrary, be in the highest degree beneficial. By the flood deposits those rich alluvial soils have been in the first instance formed, and it is by this same process only that their richness can be maintained. The banks of the Nile, without their annual inundation, would soon be reduced to a desert; and the height of the river in times of flood has for ages been the measure of the favourableness or otherwise of the season, of plenty or scarcity to the people.

In many parts of England the most careful arrangements are made to admit the mud-charged water of the floods to the low lands, where it is allowed to stand until it has deposited the alluvial matter held in suspension, and is then permitted to drain off. There is no reason why the same thing should not be done on the rich alluvial lands of the Hunter; it is the only means by which their extraordinary fertility can be preserved, and, if judiciously carried out, the whole of the advantages of this natural process of "top-dressing" may be secured without very much injury to the growing crops.

On the flood plan of the Hunter, which accompanies this Report, I have sketched out generally the system of drainage I would recommend. It is only a sketch, and does not profess to lay down the exact direction, number, or capacity of the subordinate drains, as I am not in possession of sufficiently detailed information as to the levels of the various parts of the country to enable me to do so.\*

The urgent necessity for some such system of drainage will become obvious on examining the flood plan made immediately after the flood of 1857, by Mr. Adams, who reported the feasibility of preventing a recurrence of the inundations, by excavating a canal which should divert the course of the Hunter through the Bolwarra Estate, and discharge the water again into the river at Largs. I do not question that such a canal might in a slight degree relieve the upper parts of the river, but the extent of relief it would afford is, as I shall endeavour to shew when I come to that part of the subject, much over-estimated.

\* The necessity for some such system of local drainage is indicated by the following remarks in the *Maitland Mercury* of the 19th October, 1858:—"It has now, we imagine, been proved beyond a shadow of a doubt that nearly all the low lands in the Hunter River district are flooded, more or less, after rainy weather, and that a few days' rain only has the effect of turning many localities, containing some thousands of acres of crop, into large inland seas, and this irrespective of any addition which may be received from the rivers in times of high flood. It is, therefore, highly necessary, if the district is to be an agricultural one, and its rich soil is to be tilled by the industrious settler, that some scheme of drainage should be devised."

## PART II.

HAVING in the foregoing pages given a brief history of the different floods which have devastated the lower portion of the valley of the Hunter, as far as the facts can be collected from the only records I have been enabled to obtain access to, I shall now pass to the consideration of that branch of the subject which more immediately concerns the object of this Report,—namely, as to the quantities of water passing different sections of the river in given times, and also, as nearly as it can be estimated, the total quantity of water discharged by the river during flood. It is only by a careful consideration and comparison of these that we shall be enabled to gain any clear ideas as to the practicability of applying any remedies to lessen the inundations, as well as of the nature and extent of such remedies.

The quantities of water passing down the river per second at different places, commencing at Singleton and terminating at the entrance of the harbour of Newcastle, during the great floods of 1857, 1861, and 1867, carefully computed by the different formulæ of Dubuat, Eytelwein, and Ellet, will be found in the accompanying tables.

The floods of 1857 and 1867 are so nearly of the same height, (as may be seen on the longitudinal and cross sections,) that the calculations of the quantities for the former may, without sensible error, be taken as well for the latter; I have, therefore, only given one column for both.

Commencing at Singleton, which is the highest point of the river at which I have been enabled to obtain any authentic measurement as to its cross section, the height of the floods, and the rate of fall of the surface of the water, I am enabled to get the discharge per second with considerable accuracy. Dubuat's formula gives 131·416 cubic feet per second; by that of Eytelwein it would be 132·260 cubic feet per second; and by Ellet's, 141·819 cubic feet per second.

On the last-named formula I do not, as I have before stated, place much reliance; as, although it may have been found to approximate very closely to the observed velocities in such large rivers as the Mississippi and Ohio, it does not contain the corrections which Dubuat found it necessary to introduce when seeking a formula for smaller rivers, such as the Po, which, in some respects, resembles the Hunter in its lower parts, indeed Ellet himself states that he found it necessary to modify Dubuat's formula, as he has done, to suit the case of such rivers as the Mississippi and Ohio. In this Report I shall therefore continue to use Dubuat's formula, as probably giving the closest approximation to the actual discharges.

I may here observe, that the flood of 1861 afforded a very interesting confirmation of the accuracy of this formula. During that flood I caused very careful measurements to be made of the surface velocities, by means of floats, which gave velocities varying from 6·88 to 8·30, or a mean of (say) 7·60, at the site of the Bridge of West Maitland and a little above; lower down, where the channel widens, the velocity was found to diminish. Dubuat's formula, with the observed fall and hydraulic mean depth, gives 7·97 feet per second for the mean velocity, say  $5\frac{1}{4}$  miles per hour—which is a sufficiently close approximation to the measured velocities.

The tables and diagram accompanying the plans, which have been constructed from the admirable records contained in the *Maitland Mercury*, shew the rate of rise, duration, and rate of fall, of the flood of August, 1857. From these I have had an approximate calculation made of the whole amount of water discharged during any given time, from the commencement to the termination of the flood at Singleton, Maitland, and Pitnacree.

The water commenced to rise at Singleton about mid-day of August, the 20th; it attained its greatest height at 7 p.m. on the 23rd, having risen 46 feet. The calculation makes the total quantity of water discharged up to that time about 26,000 millions of cubic feet.

The water did not recede to its ordinary level until about the last day of September, and the total quantity discharged up to that date is shewn to be about 88,000 millions of cubic feet.

At

At Maitland Bridge section the river commenced to rise on the evening of the 20th August, at 7 o'clock; on the 23rd it had attained its highest, and to that time the calculation shews that about 18,500 millions of cubic feet of water had passed down. The difference between these estimates, namely, about 7,500 millions of cubic feet being taken up partly in filling the channel of the river, which would absorb about half the quantity, or say 3,500 millions of cubic feet; the remainder, 3,500 or 4,000 millions of cubic feet, being lost by overflow of the banks. This latter quantity would give a depth of about 3 feet over the whole of the flooded lands on Wallis Creek and in the flat country between Maitland and Morpeth.

From August 23rd, when the flood began to fall, until the last day of September, when it had returned nearly to its ordinary level at Maitland, the total quantity of water which had passed down the river was about 56,500 millions of cubic feet, shewing that in the first three days of the flood about one quarter of the whole quantity, which amounted to 75,000 millions, had run down.

The total drainage area of the Hunter and Goulburn is 7,320 square miles, and the discharge of the river at Singleton, during the flood, which, as I have shewn, amounts to about 88,000 millions of cubic feet of water, would represent a rain fall of about 5 inches over the entire area.

The rainfall of the months of July, August, and September, for that year (1857), was  $11\frac{1}{2}$  inches; and, as the rains of July, when there was also a flood, would have thoroughly saturated the country and filled up the water-holes and river-channel, it would seem as if the nearly whole of the rainfall of August and September, or (say) five-sixths of it were carried away by the river during those two months.

Using Dubuat's formula, we find that the quantity of water passing down the Hunter at Singleton, when the flood is at its highest, is, as I have stated, 131,416 cubic feet per second; and coming down the river to Oakhampton, the place where the next section was taken (about 2 miles 34 chains above the site of the new bridge), the quantity of water discharged per second is found to be 132,283 cubic feet, being but a very slight increase (867 cubic feet, or (say) .066 per cent.) in the quantity found passing Singleton Bridge. The accessions which the river receives between those places from tributary creeks would seem to be small, and to be nearly balanced by the overflow which takes place about a mile above Oakhampton, on the south side.

At the next section of the river, at Bolwarra House, one mile lower down, the discharge per second is 125,664 cubic feet, shewing that between the former and the latter points 6,619 cubic feet of water per second have been spilled over the banks. The overflow would seem, from Mr. Adams' flood survey, to take place principally on the south side of the river; and most of it, no doubt, goes to form the much dreaded backwater which causes so much injury on the low-lying lands on the south of the town.

Coming down to the falls, at the site of the bridge, I find the quantity discharged by the river to be 105,626 cubic feet per second, shewing that between Bolwarra House and this point 20,038 cubic feet of water per second had overflowed the banks and passed away into the flooded lands, partly towards Bolwarra, and partly by Hall's Creek towards Dagworth and Louth Park. A reference to the plan will shew the great extent of the flooded land in this direction.

The sections from Maitland down to Morpeth have been taken at distances of about a mile apart, in order to shew approximately the quantities of water spilled over the banks at the intervals between them, so that the heights and distances back from the banks at which levées or other protective works (if such be undertaken) must be formed, may be determined.

At section 6, which is opposite the High-street embankment, the discharge per second is 74,682 cubic feet, shewing a loss between the bridge and this of 30,944 cubic feet per second; and at section 7, which is about a mile below Wallis Creek, the discharge per second is given at 68,013 cubic feet; the difference, namely, 6,669, being probably the quantity which is received up the channel of Wallis Creek, directly from  
the

the river. To this extent, that is, about one-tenth of the discharge, Wallis Creek would seem to act as a sort of safety-valve to the lower parts of the river; and if the project be carried out which has been suggested, of shutting out the floods from Wallis Creek by means of gates, the effect will be that one-tenth more water will have to be discharged by the river below the junction. I shall refer hereafter more particularly to this part of the subject, and consider more in detail the probable effects of this augmentation, as well as of that which would result from wholly excluding the water which finds its way into the Wallis Creek basin by other channels.

Proceeding downwards from section No. 7, it is found that, with three exceptions (Nos. 11, 12, 13), there is a steady and very rapid diminution in the cross sectional areas of the river, and in the estimated values of their discharges. At Pitnacree Bridge the sectional area of the river is reduced to 6,516 feet—about half what it is at Singleton Bridge and West Maitland Bridge; and the ratio of fall of the surface of the water, which in the two former were 1 in 2,495 and 1 in 3,246 respectively becomes reduced to 1 in 9,359—not quite 7 inches to the mile; and the discharge per second has fallen from 131,416 and 105,626 to 26,129 cubic feet, or to between one-fourth and one-fifth of the whole quantity of water brought down the river.

This is a fact which must be kept prominently in mind, when considering any scheme for the partial protection of the flooded lands above this point; and care must be taken that, when adopting any measures for their relief, proper provision has been made for carrying off from the lower lands the additional quantity of flood water which will thus be sent down on them, or the consequence to the latter must be most disastrous.

Probably the reason why sections 11, 12, and 13 are greater than the others immediately above and below, is that the water which at other places had spread over the banks is partly confined at these points to the channel, by the piece of high ground which is shewn on the plan as extending along the right bank; and the increased scour thus created would seem to have produced a corresponding increase in the capacity of the channel.

At Pitnacree Bridge, as I have stated, we find that not only is the sectional area of the channel reduced to less than half what it is at Oakhampton, but the inclination of the surface of the water, which at the former place was 1 in 2,500, or about 24 inches to the mile, at the latter has been reduced to 1 in 9,359, or about 7 inches to the mile; and as a consequence of this diminished sectional area and rate of inclination, the quantity of water discharged per second is reduced from 132,283 cubic feet at the former to 26,129 at the latter; or (say) about one-fifth of the quantity of water which passes down the river at Oakhampton is carried away by the channel at Pitnacree, the remaining four-fifths having overflowed the banks between these points.

Continuing still further down, we find that section No. 21, at Narrowgut, is only 4,417 feet, or about one-third of that at Oakhampton; so that not more than one-seventh of the quantity of water running down every second of time past Oakhampton is carried off by the channel of the river at Narrowgut.

From Narrowgut down to Morpeth and thence onwards to Newcastle, with a few unimportant exceptions, the capacity of the channel steadily and almost uniformly increases, caused of course by the tidal action.

At Morpeth, the sectional area will be seen to have increased to nearly double what it was at Narrowgut, and to be about one-third greater than it is at Pitnacree, the discharge of water per second which is proportionally augmented, has increased to 33,161 cubic feet. I wish to draw particular attention to this, as the capacity of the channel for discharging the flood-water at Morpeth should be the limit of improvement sought for the upper parts of the river. It would of course be quite possible to relieve Maitland wholly from danger of floods, if a channel sufficiently wide, straight, and deep, could be made to carry off the whole of the flood as rapidly as it is brought down; but then, unless the channel at and below Morpeth be sufficient also to carry it off, we should merely transfer the evil from the former to the latter; and while relieving Maitland, should be swamping Morpeth.

It

It may be said that even now Morpeth is sufficiently afflicted, and that the people of that district should therefore oppose any projected improvements to the river above them, until a corresponding degree of improvement shall have been effected in the river below, so as to ensure the discharge of the additional quantity of water which will thus be brought down on them; and I quite hold with their view, for I believe that any straightening of the channel above Morpeth must have the effect of raising the flood level there, more or less; and it becomes a question of the balance of interest between the two places, as to how far, while seeking to lower the flood-levels at Maitland, it will be safe to raise them at Morpeth. It must result from straightening the channel, that there will not be a damming up of the water at Maitland to the same extent as at present, and Maitland would probably be relieved to a greater extent than Morpeth would be injured by such works; nevertheless, as I have said, some increase in the height of the floods must be looked for at Morpeth, which, unless protective measures be adopted, such as the construction of levées and the deepening of the river, must be attended with more or less injury to the town as well as the adjoining low lands.

The probable increase of height for any given amount of discharge may be calculated, but I must again guard myself against being supposed to give exact results. The question is not one capable of mathematical accuracy, and I only profess (and no one can do more) to answer it approximately.

At section 31, a short distance below the junction of the Paterson with the Hunter, the capacity of the channel is still not equal to that of the Hunter at Oakhampton, and with an inclination of only 7 inches to the mile. Hence, the channel being still unable to discharge the floods brought down by both rivers, the waters rise above the banks, and inundate the country for miles on either side.

Coming on down to Raymond Terrace, at section 34, where the river has widened considerably, it will be seen that even here the discharge per second, after the water of the Williams has been received, is less than the quantity passing Oakhampton.

From Raymond Terrace down to Hexham, and thence to Newcastle, the river widens and deepens considerably, and branches out below Hexham into two considerable channels. The sectional area has increased to 18,438 feet, and the discharge per second to 67,751 cubic feet; so that from this latter point to the sea, the channel may be considered of sufficient capacity to carry off the floods, if moderately improved by dredging. I may here observe, that the dredging operations, which for some years past have been going on in the Hunter, in removing the shoals at Morpeth, Eals' Flat, Raymond Terrace, and the lower flats, have materially contributed to the freer discharge of the floods, and in so far have been productive of much good in this respect, irrespective of the benefits resulting to the navigation.

It will be seen from the foregoing, that at no part of the river between Oakhampton and Hexham is the channel of sufficient capacity to discharge the whole of the flood-waters as rapidly as they are brought down; hence, their overflow of the banks, and inundation of the flat lands on either side.

West Maitland may be considered to be at the head of the delta of the Hunter. The fall of the river, when in flood, from Singleton to Bolwarra, is 102.33 feet. The distance being about 49 miles, gives an inclination of 2.088 feet per mile. At Bolwarra the fall per mile rapidly diminishes to 1.63 feet, and to 0.56 feet per mile where the river is most tortuous, between West Maitland and Morpeth. Below the junction of the Paterson, and between it and the junction of the Williams, the fall per mile again increases to 0.78 feet.

The rapid decrease in the slope of the river below Bolwarra accounts at once for the rapid contraction in the sectional area of the channel. The tidal action is not sensibly felt so far up, and the greater abrading action of the water in the higher parts, due to the velocity acquired from its more rapid fall, which had cut away the sides and bottom of the channel till it established a fixed regimen, or in other words, an equilibrium between the action of the water and the resistance of the channel here ceases.

Below Bolwarra, therefore, the sudden diminution of fall is followed by a corresponding diminution in the velocity and scouring power of the water; and being no longer able to excavate a channel sufficient for itself, every obstruction, however slight, tends to divert the current to one side or the other, till ultimately the channel becomes so tortuous as in many parts to be running in a direction opposite to that of the fall of the country. Hence it is, that in high floods which rise much above the banks, the main upper current, which flows over them and across the bends, is, in many cases, in direct opposition to the under-current in the bed of the river. The river is thus neutralized; and it is obvious that, at such times, the waters must rise until the flat country becomes submerged, and the whole valley is converted into a broad shallow river. That this process has been going on for ages is obvious from the depth of the alluvial deposit about Maitland and on the lower parts of the Hunter; and that such must continue to occur, from time to time, and for all time, is, I think, equally certain.

It has been sought to attribute the great height of some floods to the action of the tides and wind on the lower parts of the river; but it will have been observed that even at Morpeth and Hexham the rise seemed to be independent of the state of the tide—that the floods rise as rapidly on the ebb as on the flood, and fall as slowly during one state of the tide as in the other. The great loss of fall and of sectional area of the river below Maitland are of themselves quite sufficient to account for the damming up which takes place, and we need seek for no other cause; however we may improve the river, this damming up must take place to a greater or less degree, unless indeed the whole course of the channel from Maitland to Hexham were widened, straightened, and deepened to a sufficient extent to carry off the whole of the flood-water—a project which, on account of the enormous cost, it is useless here to discuss.

Some of the evil effects of the floods may, as I shall endeavour to shew, be greatly mitigated; but to prevent inundation wholly I look upon as impossible, even if it were desirable, which I do not consider it would be. Without these inundations, the rich alluvial lands of the Hunter had not existed; and without their occasional recurrence, the wonderful richness of the soil could not be preserved. The question then would seem to be how far is it practicable to diminish the evils produced by the floods, while retaining the benefits derived from their fertilizing action on the land?

In reference to this part of the subject, I think it may be laid down,—

- 1st.—That as respects the town of Maitland, it is indispensable, on every consideration of the welfare, health, and comfort of the inhabitants, that the flood-waters be excluded from the houses and streets—in fact, from the entire inhabited area of the town.
- 2ndly.—That measures should, if possible, be taken to diminish the height and duration of the floods, so that the backwater may not rise so high, or remain so long on the submerged land.
- 3rdly.—That proper means be taken to facilitate the drainage of the submerged land as the floods subside, so that the water shall not be allowed, as at present, to stand for months on the flats, generating malaria, destroying the crops, and rendering the land useless while it remains on it.

With reference to the first part of the question, it will be necessary to consider what will be the effect upon the river of damming back, by means of levées, the large body of water which has hitherto found a vent at this part. Between Bolwarra House and Wallis Creek, a distance of about 3 miles, the river loses 50,982 cubic feet of water per second. I have no means of estimating the proportion of this which used to overflow, or still does overflow on the Maitland side; but judging from the circumstance of its having cut a channel for itself at Hall's Creek, I think we shall not be far wrong in estimating that at least half the above quantity overflowed on that side. If, then, by the construction of levées along the right bank, it be sought to exclude the water from the town, it is evident that, unless proper provision be made for its discharge by the river, by so much must it increase the flooding at other places. If to the 25,400 cubic feet

feet of water be added the amount received up Wallis Creek, 6,670 cubic feet, we would have in the river an additional discharge of 32,070 cubic feet per second to be provided for,—a quantity considerably greater than that which passes under Pitnacree Bridge at present, and nearly double the quantity passing Narrowgut. These figures will give some idea of the danger of attempting any partial measures, such as those which have been suggested for placing flood-gates at Wallis Creek, and erecting levées along the whole river bank at Maitland. If anything effectual is to be done, it must be dealt with as a whole; and before embanking off the water to any considerable extent from one part, care must be taken that provision has been made for the discharge, in the proper channel of the river, of the additional quantity which will thus be thrown into it. If such be not done, the water so excluded must find an outlet in some other direction, and perhaps cause as great evils as those which it has been sought to prevent.

That these objects may be attained to some extent (not a very great one, however,) I am led to think, from one leading peculiarity of the floods in this river:

On reading over the accounts given in the early part of this report, of the great floods of 1857, 1861, 1864, and 1867, it will be seen that in every instance the flood consisted of two distinct waves, the first being due to the lower tributaries—the Wollombi Creek, the Black Creek, Cockfighter's Creek, &c.—which rising nearer the coast, get the rains sooner than the upper heads, and having shorter courses to run, send down their water with greater rapidity. They produce the first flood-waves, which, though rising sometimes very quickly, rarely attain a dangerous height, and soon commence to subside; but before they have had time to flow away, through the contracted and tortuous channel below Maitland, they are overtaken by the second waves coming down from the main heads of the river,—the Goulburn, the Hunter, and the Dart. The result is, that the already gorged channel is utterly inadequate to carry off their united waters; and hence the second rapid and great rise which is observed, by which the banks are everywhere overflowed, and the river channel rendered still less capable of performing its duty. The height to which the waters must rise is simply a question of the continuance of the rains; for the higher the water rises over the banks, the more completely does the channel proper of the river become neutralized and inoperative. In this view, it would be clearly beneficial, as far as Maitland is concerned, to straighten and shorten the channel, so that it may act as perfectly as possible at all heights of the flood, and get the first flood-wave away, as far as it may be practicable to do so, before the second comes down. It is mainly owing to this circumstance of the whole of the flood-water not coming down in one wave, that we may look to being able to effect any beneficial results by straightening and shortening the channel. The quantity of water passing by Singleton per second, and arriving at Oakhampton, being as I have shewn more than the channel can discharge in the flat country of the delta, the surplus must find vent somewhere. It must be allowed partly to escape as at present, but it may I think without much risk be excluded from the space occupied by the Town of West Maitland, if we facilitate the discharge of the remainder by cutting off some of the bends, so as to diminish the danger of the overflow to the inhabitants of low-lying land on the river banks.

## PART III.

ASSUMING, then, that the cuts-off before spoken of, and which will be hereafter described more in detail, have been in the first instance completed, and that due provision has thus been made for discharging safely the additional body of water which may be confined within the channel by levées, we come to the consideration of the best means of excluding the flood-waters from the entire area of the town. In this the people of Maitland will have to follow the example set by the inhabitants of many towns and villages of the Netherlands, as well as of the Mississippi, Po, and other large rivers subject to similar inundation. As regards Maitland, nature has very clearly indicated the line of circumvallation. A reference to the map will shew that the town is almost wholly surrounded by water, having the Hunter on the north and north-east, Wallis Creek on the east, south, and south-west, and Hall's Creek on the north-west. The line of the river frontage is even now protected to a considerable extent by the levées thrown up by the Corporation. These will probably require to be raised, strengthened, and puddled at such places as the currents impinge upon. They should be kept as far back from the margin of the channel as circumstances will admit, so as not unduly to contract the available sectional area of discharge. The channel of Wallis Creek should be straightened, deepened, and brought to a more uniform section, to facilitate the more rapid and free drainage of the lands on its banks on the subsidence of the floods. The material excavated in improving the channel should be formed into a substantial levée along the left bank, or that next the town.

The line of circumvallation will, therefore, be somewhat as follows:—Commencing at the upper end of the town, where Hall's Creek joins the river, the line of the levée would follow the right bank of the Hunter down to the junction of Wallis Creek, thence crossing the railway and running up the left bank of Wallis Creek to the junction of Fishery Creek, and continuing along the left bank of Fishery Creek to the point where George-street crosses it. Here it might leave the creek and follow the line of George-street, which might be formed into a raised causeway for the purpose, to the head of Hall's Creek, thence down the right bank of Hall's Creek to the starting point at its junction with the Hunter. It may be that the space here proposed to be enclosed is unnecessarily large; but besides the advisability of having ample room for the future extension of the town, it would probably be found that the facility for procuring material to form the embankment or levée which would result from the deepening and improving of the channel of the creek, would render it cheaper if the two works were combined, than would be the enclosure of a smaller area without these advantages. The surface drainage of the town might be discharged either direct into the river, or, following the natural slope of the ground, into Wallis Creek, if found safer and more convenient; but in either case, the greatest care should be taken in the construction of the outlet sluices through the levées, so that there should be no risk of leakage or of bursting up under the pressure of the floods. As the only material obtainable for the levée is a loose friable alluvium, care should be taken to have a core or wall of well puddled clay in the centre of each, which should be carried down to such depth in the natural soil as may be deemed sufficient. The line of the levées and the space proposed to be enclosed by them, are shewn approximately on the accompanying plan. I am not in a position, nor do I profess to give the exact lines the levées should follow, that being a question which must be determined hereafter on more careful detailed surveys of each locality than I am in possession of. I merely venture to indicate, generally, the directions I think they should take.

I have before shewn that there is a difference of between 6,000 and 7,000 cubic feet per second in the quantities of water passing those sections of the river next above and next below the junction of Wallis Creek, the discharges being 74,682 cubic feet and 68,018 cubic feet, respectively, per second; and that it acts fully to that extent as a sort of safety-valve or compensating reservoir to the river, is shewn by the circumstance of the water always flowing up the channel of the creek for two or even three days during heavy floods. The 6,000 or 7,000 cubic feet of water received by Wallis Creek per second might not, perhaps, of itself very materially raise the level of the water in the river if confined to it by the proposed flood-gates; but, if to it be added the 25,400 cubic feet which

which it has been estimated is now spilled over the south bank of the river between Oakhampton and it, the effect on the height of the already swollen river will be very great. Greater height implies greater velocity—not only must the water rise higher, but it must flow faster in the channel and over the other submerged lands; and this, as I have said, unless means shall have been adopted in the first instance to secure the discharge of this additional body of water by the channel proper, must find its way by a more rapid and deeper current over the surfaces of the already submerged land. A complete change in the existing regimen must follow—new channels will be formed, lands which are now enriched by the deposition of alluvium will have their soil swept away or be destroyed by a deposit of sand or gravel, the whole condition of things along the banks of the river will undergo a complete revolution. A slight difference in the velocity of the water flowing over the land makes a most material difference in the character of the deposit, a few feet per second making the difference of fine sand, coarse sand, or gravel. I would again observe that too much caution cannot be observed in dealing with this branch of the subject; the equilibrium which nature has established should not rashly be disturbed; if the swollen river cannot find the outlets it has hitherto used, we must be careful to provide others in their stead, or it will take the matter into its own hands in a way that perhaps we should not like, and end by causing incalculable mischief.

Maitland being protected, I repeat that I think Wallis Creek should still continue to act as a relieving channel to the river; and that the low lands of Dagworth, Louth Park, Hungerford Swamp, and Booth's Swamp should still receive its mud-charged waters. With a proper system of drainage, so far from the floods doing injury, I believe that they would be attended with considerable benefit. What is required is, that on the subsidence of the floods the water shall drain freely and rapidly away—with proper drains they need never be submerged more than a few days at a time; and I believe I am correct in stating that few crops would be injured by a few days' submersion, while the soil would in nearly every case be benefited and enriched.

Towards a proper system of drainage the first step would be the improvement of Wallis Creek and its outfalls, straightening, deepening, and bringing it to a uniform cross section, and next the formation of such secondary drains as may be required thoroughly to relieve the land; these latter I have approximately sketched on the flood plans, but I do not profess to give either their size or exact number or direction, not being in possession of the detailed levels and other information necessary to do so; these details are besides better left for settlement to the local bodies which under the Drainage Act would have the control of such local works.

I now come to the consideration of that part of this question on which everything may be said to depend, namely, as to the best means of improving the channel of the river itself at those places where it is now so contracted and tortuous as to be unable to carry off the water with sufficient rapidity to prevent its overflowing its banks. Various suggestions have been made to this end which I shall now shortly refer to, setting forth as clearly as I can their merits or demerits, their practicability or otherwise.

The first and boldest, and at the same time the least practicable, is that of cutting a new channel from Singleton to Lake Macquarie; a glance at the map of the County Northumberland will shew what such a work would involve. Leaving the Hunter at Singleton, the new channel would have to be excavated through at least five ranges of mountains, forming the watersheds of as many creeks—first through the ridges separating the waters of Munnimba and Jump-up Creek from Black Creek; thence across the valley of Black Creek, which would be throughout on a higher level than the new channel; and on through the range separating the waters of Black Creek from those of Wallis Creek, across the Wallis Creek Valley, through the Sugarloaf Ranges, and so down into Lake Macquarie. It will be readily admitted that the cost of cutting a new channel of (say) the same size as the Hunter at Pitnacree, for about 50 miles, through ranges of mountains from 500 to 1,000 feet in height in many places, is very much more than the country could afford; and were there not, as there are, other almost equally insurmountable difficulties in the way, such as the disposal of the drainage of the intervening country, the scheme might still be pronounced impracticable.

The

The next project is that of cutting a subsidiary channel from some point on the river above Maitland to Hexham, leaving the channel at Oakhampton or Bolwarra, and sweeping round to the southward of the town, across the low lands bordering Wallis Creek, and on through the range dividing that creek from Hexham, finally entering the river at the latter point. This scheme, at first sight, has the apparent merit, which some others have not, of supplementing the natural channel where it is deficient in sectional area; but then again, the consideration of cost, as well as the effect on other places, comes in the way. To afford any sensible relief to the river, the new channel would require a sectional area and hydraulic mean depth of 9,600 feet and 27ft. 4in., respectively, for a distance of about 11 miles. Assuming that the level of floods be raised 4 feet at Hexham (which must be done to enable the channel at this point to discharge the whole of the flood-waters of the Hunter, Paterson, and Williams), we should have a fall from Bolwarra by the new channel of about 24 feet, or say 1 in 2,031, and should require, as before stated, a sectional area and hydraulic mean depth of 9,600 and 27.4, respectively, to carry off the difference between 125,664 and 17,623, the discharges per second at Bolwarra and Narrow Gut, that is, in point of fact, to carry off the flood-waters of the Hunter as rapidly as they come down, and prevent accumulation. But then we must consider what would be the effect of this altered condition of levels on the other rivers. If the present flood-level were to be raised 4 feet at Hexham, the effect would be to pen back the Williams and the Paterson to nearly the same extent; so that the inundations which at present occur on the banks of those rivers must be proportionally augmented, and they again would react on the natural channel of the Hunter about Morpeth, and raise the flood-levels there to a greater height than at present. The height to which such a flood as that of 1857 would be raised at Raymond Terrace, would be about 4 feet higher than it then reached, and about the same at Hinton and Morpeth. I have only gone into the calculation of the heights to which the waters would be dammed back, if this scheme were carried out, approximately, the objections to it being so patent as to prevent its ever being attempted, to say nothing of the cost, which could not be estimated at less than 2½ or 3 millions sterling. It will be seen from the foregoing, how dangerous are all partial measures in so-called river improvements; that the effect of shortening and straightening the channel by cutting off bends, is simply to bring down into the lower reaches of the river a greater body of water in a given time than was the case before, and unless those lower reaches are sufficiently capacious to carry it off, the inundations will be merely transferred from one place to another. Hence it is, that in all river improvements, operations should be commenced at or as near the outfalls as may be necessary, and be thence continued upwards, taking care that the lower section shall be sufficient to carry off without injury the waters which would be brought down more rapidly by improvements in the upper parts.

A third plan I have heard suggested, is that of cutting a branch channel from Bolwarra to Largs or somewhere thereabouts; but this, as I have endeavoured to shew, would be merely to partially relieve Maitland at the expense of the country about Largs. The tables of discharges shew that in the 1857 flood, while the river at Largs was discharging 31,368 cubic feet of water per second, at a place lower down called Fisherman's Point the discharge was reduced to 27,181 cubic feet—so that, if to the 31,368 cubic feet any considerable quantity be added by means of the proposed cut, the overflow at Fisherman's Point and lower down must be proportionately increased. It will be obvious from this, that the new cut to be of any avail must be carried to some point lower down, where the channel will be of sufficient capacity to carry off the water brought down by the new cut as well as by the present channel, regard being had to the difference of level which would result from the change; and, as the table of discharges will shew, we shall have to go a long way down before we reach such a point in the river as will meet this condition.

Other suggestions have from time to time been made, with a view to diminish the injury arising from the floods, but they are not, I think, of sufficient importance to require further notice; I now, therefore, come to the consideration of how far it may be possible to effect that object at all.

Referring

Referring to the tables of discharges, we find that while 132,283 cubic feet of water per second was coming down past Oakhampton, not more than 37,730 cubic feet per second was flowing away past Morpeth, the difference having been spread over the flat country; and it is obvious that, without raising the flood-level to a dangerous height at the latter, we cannot expect sensibly to lower it at the former. Morpeth is clearly interested in having the river allowed to remain as it is, unless the channel below it be improved to the full extent of any relief afforded to Maitland; and for this reason as little interference with the river as possible should be permitted, and the operations at Maitland should be purely confined to the protection of the town, which alone will throw some 25,000 cubic feet of water per second into the river. This, if the channel between the two be rendered capable of carrying it, will increase the discharge at Morpeth to 62,730 cubic feet per second, which would, probably, if all confined to the channel, raise the level of such a flood as that of 1857 or 1867, about 3 feet. It is a subject for very serious consideration whether this can be safely allowed. The channel below Morpeth is of course capable of improvement, and the dredging operations which have been occasionally undertaken, by removing the shallows and sand-bars, have been so much in the right direction, but they have not, and could not have been sufficient to make up for the increased quantity of water which would be confined in the river by the circumvallation of Maitland. On the supposition, however, that the river below Morpeth shall have been improved to a sufficient extent to warrant the undertaking, and that levées and such other protective works as may be made have been completed, the works I would propose for the intermediate section of the river are as follows:—

The first cutting would commence at Morpeth, a little above the Queen's Wharf, and be continued nearly in a straight line to the Ten-mile Bend below Pitnacree; then the present channel of the river would be followed, widening and deepening it where required, to the bend just above the Pitnacree Bridge; from this a new cut would be made through the narrow neck of land below Mr. Macintyre's house; thence, following again the natural channel to No. 12 section, the new channel would be taken in a gentle curve to the lower part of the Horse-shoe Bend, crossing the river about half a mile below Wallis Creek. The length of new channel required would be about 1 mile 30 chains; and the total length by river between Oakhampton and Morpeth would be reduced from 16 miles 65 chains to 6 miles 12 chains, effecting a saving of 10 miles 53 chains in the length of the channel.

Another plan by which the shortening of the channel may be effected differs but slightly from that just described, it also would commence at the upper end of the Morpeth reach, but would be carried direct to the Nine-mile Bend, just below the Pitnacree Bridge; thence upwards the new cuts would be similar to those of the first plan. The length of cuttings would be 1 mile 74 chains, the length of river from Oakhampton to Morpeth would be 5 miles 76 chains, and the distance saved would be 10 miles 69 chains. This plan would be more expensive than the first, as it would involve about half a mile more cutting for the new channel.

A third plan would, at the lower part of its course, be somewhat similar to the first, but would differ materially in the upper portions. It would involve considerably more cutting, and a much greater interference with the natural course of the river. By it the length between the points before referred to would be reduced to 5 miles 71 chains, the distance saved would be 10 miles 74 chains, and the length of new channel would be 1 mile 67 chains.

A fourth plan would be a combination of Nos. 1, 2, 3. The distance saved would be somewhat greater than by any of the foregoing, but the length of cutting for the new channel would be 2 miles 31 chains.

Two other means are shewn on the accompanying plan by which the channel might be shortened, but they would both involve considerably more cutting than Nos. 1, 2, besides necessitating the construction of new bridges at Pitnacree.

Plan

Plan No. 1 is that which seems to combine the greatest number of advantages with that of being the least costly. Taking the floods of '57 and '67, and assuming that the natural channel and the new cuts were made equal in section, to that at Pitnacree, I find that the new channel would, with the increased rate of inclination which would result from shortening it by 10 miles 53 chains, be capable of discharging about 61,800 cubic feet per second, thus more than doubling the present rate of discharge at Pitnacree, and bringing up the capacity of the channel from 26,129, or (say) under one-quarter, to nearly one-half the whole quantity of water passing Oakhampton. The effect at Pitnacree Bridge would be to raise the flood-levels about 3 feet 6 inches, and at Morpeth, about 3 feet. Supposing the channel, then, to remain unaltered at Eales' Flat, a rise of about 6 inches above the present flood-level would probably take place. As was shewn in a former part of this report, 61,800 feet per second is about the additional quantity of water which will be confined to the river by the embankment of Maitland, and is the full extent to which, in my opinion, relief should be attempted; but we must not forget that the increased rate of fall in the channel which would tend to drain away the water more rapidly from Maitland, would also the more rapidly precipitate it on to the low country near Pitnacree and Morpeth, unless the increased height attained at these latter places should in their turn so increase the rate of fall from them onwards, as, coupled with the greater sectional area and hydraulic mean depth, would enable them in their turn to carry off the increased quantity brought down from above—in other words, a more rapid and at the same time more uniform rate of slope would be established from some point on the river near Oakhampton, in fact, as high up as the improved drainage would be felt, to some other point on the river lower down, where the greater capacity of the channel would enable it to carry off, without sensible increase in height, the additional body of water brought down. This, on the plan I have sketched, may be considered to be about Hexham.

The flood would be lowered by about 6 inches at Maitland, and the town saved from inundation, but the country between it and Hexham must be inundated to a greater or less degree as a consequence, probably, however, not more than I have stated.

The probable cost of shortening the river by the cuts-off shewn on the first plan, may be estimated at about £137,000, and for the second plan, about £192,000.

In these amounts are not included the cost of the general scheme of minor drainage, which I have described as being necessary to carry away the flood-waters from the submerged lands on Wallis Creek on the subsidence of the floods, and which should, in my opinion, be immediately commenced; their cost would be inconsiderable, and the benefit to the land would be certain and immediate. I have not gone into the details of this scheme, believing it, as I have before stated, to be more a matter for local or municipal action than for the central Government; but if it be desired by the Honorable the Secretary for Public Works, with the information now at my disposal, and a few more levels, I could do so.

In conclusion, I would again observe that, in contemplating changes, we must not lose sight of the fact that any violent interference with the regimen of the river above Morpeth must materially alter the existing condition of things, certainly as far down as Hexham, and that no one can predict with certainty what those alterations will be. We must anticipate that the sand-bars at Morpeth and Eales' Flat will be shifted further down, as will probably be also that at Raymond Terrace; but no one can undertake to say positively where they may be redeposited; and one thing is certain, if the cuts-off I have described are made, that we must be prepared for steady and continuous dredging for many years to come, until the river shall have re-established itself. Indeed the whole subject is one of extreme difficulty; no problem in engineering can perhaps be more so. Once we interfere with the existing order of things, we call into operation forces and causes, the effects and consequences of which may be so varied, and at first sight apparently contradictory, as to be difficult of explanation, and impossible of certain prediction.

These

These observations must be taken as only applying to the very highest floods. In floods of moderate height the relief which would be afforded to Maitland would probably be unaccompanied by very serious, if any, injury to Morpeth; as the first flood-wave being enabled to get away before the second should come down, by reason of the increased discharging capacity of the improved channel, that penning up of the waters which now takes place would not occur. And as the smaller floods are almost annual, while those like the August '57 or '67 are of rare occurrence, I think a case may be considered as made out in favour of undertaking the works referred to. But I have considered it to be my duty to point out as clearly and fully as I could, what would probably be their effects during very great floods; as were they rashly undertaken, without due regard to the precautions which are necessary to guard against or mitigate the dangers which they may occasion, the consequences may be very disastrous.

I have the honor to be,

Sir,

Your very obedient Servant,

E. O. MORIARTY,

Engineer-in-Chief for Harbours and Rivers.

## REPORT ON THE FLOODS IN THE HUNTER.

37

FLOOD, 1857.

Water discharged within certain Periods of Time.

West Maitland Bridge.							Iitnacree Bridge.						
Areas of Sections in square feet.	Hyd. mean Depth.	Inclination of surface of water, 1 :	Velocity in feet per second.	Quantities in cube feet per second.	Quantities discharged within certain periods, in cube feet.	Total quantities discharged since commencement of Flood, in cube feet.	Areas of Sections in square feet.	Hyd. mean Depth.	Inclination of surface of water, 1 :	Velocity in feet per second.	Quantities in cube feet per second.	Quantities discharged within certain periods, in cube feet.	Total quantities discharged since commencement of Flood, in cube feet.

## PROGRESS REPORTS.

---

THE SYDNEY WATER COMMISSION to THE COLONIAL SECRETARY.

Sydney Water Commission,  
Public Works Office, Phillip-street,  
Sydney, 23 December, 1867.

SIR,

In accordance with the terms of the Commission by which we were appointed to inquire into the Supply of Water to Sydney and Suburbs, and which Commission expires to-morrow, the 24th instant, we have the honor to submit the following Report of Progress :—

We have prosecuted this inquiry with all the care and diligence we could bestow, and which its great importance demands. We have held fifteen meetings in our office, for the taking of evidence, and for other business ; and have besides, spent thirteen days in field work, and personally examining the present source of water supply, and various other districts where a future supply might possibly be derived. We have thus inspected the junction of the Nepean and Warragamba, and latterly we have made an extended examination of the country drained by the eastern tributaries of George's River and the Nepean, and by the Port Hacking River. Much work of this kind, however, remains to be done. We think that other portions of the Nepean ought to be examined, and also the Grose, the Couridjah Lagoons, and other places ; and it may likewise be necessary to obtain various surveys and sections before a decision can be arrived at.

We have taken the evidence of fourteen witnesses, and have procured a variety of maps, plans, reports, returns of population, of rainfall, and of drainage areas of rivers, and have put in hand, analyses of waters of more or less promise ; all which information will be important when we can form a judgment on the whole question.

At this stage of the inquiry, we can only recommend that the Commission be renewed for a further period ; and as so much remains to be done, both in the office and in the field, before a Final Report can be drawn up, we would respectfully suggest that the extension of time may be for six months.

We enclose a statement of the expenditure of the Commission up to the present time.

We have, &c.,

## THE SYDNEY WATER COMMISSION to THE COLONIAL SECRETARY.

Sydney Water Commission,  
Public Works Office, Phillip-street,  
Sydney, 20 June, 1868.

SIR,

As the extended Commission of Inquiry into the supply of Water to Sydney and Suburbs expires on the 23rd instant, we have now the honor to make the following Report of Progress:—

Since the renewal of the Commission, on January 24th, we have held seventeen meetings in our office, for the purpose of taking the evidence, and for other business; and we have besides, spent seven days in examining the present and suggested future sources of supply.

Deputations of the Commissioners have spent ten days more in visiting points to which it is not thought necessary to take the whole Commission. We have thus examined the Cataract and Cordeaux Rivers, and the upper parts of the Nepean, also the Grose, the Wollondilly in Burragorang, George's River, the Colo, Wheeny Creek, and the Couridjah Lagoons.

We have caused a section to be made (under Mr. Woore's superintendence) of the country between the Warragambah and Rope's Creek, connecting with Mr. Woore's section from the latter point to Ashfield; and we have at present a section in progress from the Cataract River at Broughton's Pass, along the dividing ridge between the waters of George's River and the Nepean. We have also obtained a survey of the drainage area of the Couridjah Lagoons, and a cursory examination of the whole course of the Cataract River.

Analyses of all the waters examined by the Commission are now nearly completed at the University. From the amount of work remaining to be done, a considerable time must elapse before we can be prepared with the Final Report, and we therefore respectfully crave a further extension of the Commission, say for six months.

We

PROGRESS REPORTS—WATER SUPPLY TO SYDNEY AND SUBURBS. 5

We enclose a statement of the expenditure of the Commission, by which it will be seen that it exceeds by 16s. 5d. the amount of £400 placed to our credit in the Bank of New South Wales.

J. SMITH,  
President of the Commission.

THE SYDNEY WATER COMMISSION to THE COLONIAL SECRETARY.

Sydney Water Commission,  
Public Works Office, Phillip-street,  
Sydney, 19 December, 1868.

SIR,

On behalf of the Commissioners appointed to inquire into the supply of Water to Sydney and Suburbs, we have the honor to submit this our Third Report of Progress.

Since our last Report (under date June 20th, 1868), we have carried on the survey and section of the country from the Cordeaux and Cataract Rivers down to Sydney. The scheme of bringing water by gravitation from these rivers appeared, on examination, to be so promising, that we decided on having the survey and section executed with all attainable minuteness and accuracy. The plan that has been kept in view in this work is, to intercept the waters of the Cordeaux and Upper Nepean at their junction at "Pheasant's Nest," and bring them by a tunnel into the Cataract River, at "Broughton's Pass." The combined waters would then be brought down, partly by tunnel and partly by open conduit, along the dividing ridge between the Nepean and George's River, into a large storage reservoir, to be constructed near "Bull's Hill." From thence the water would be brought to Sydney, by conduit or pipes, as might be found most expedient. A great part of the line is through a rugged and difficult country, which has rendered the

## 6 PROGRESS REPORTS—WATER SUPPLY TO SYDNEY AND SUBURBS.

survey tedious; and we regret that it has not been possible to get this work done in time to allow of a Final Report being prepared before the expiry of our present Commission, on the 23rd instant. Besides this main work, we have caused a minute examination to be made of the Botany Swamps, in order to ascertain how the present supply could be increased, and at what expense. In both cases, the field work is nearly completed; but the reduction and consideration of the results will still occupy much time.

In addition to the work now in progress, we are desirous of examining the Winge-carabee Swamps, and the ridge separating them from the highest tributaries of the Nepean, in order to ascertain if the waters of the former could be thrown into the latter, and at what expense.

We have therefore the honor to recommend that the Commission be again renewed, say for a period of three months.

We have, &c.,

J. SMITH,

President of the Commission.

## FOURTH PROGRESS REPORT.

---

THE SYDNEY WATER COMMISSION *to* THE COLONIAL SECRETARY.

Sydney Water Commission,  
Public Works Office, Phillip-street,  
Sydney, 20 March, 1869.

SIR,

We, the undersigned, on behalf of the Commissioners appointed to inquire into the Supply of Water to Sydney and Suburbs, have the honor to make this, our Fourth Report of Progress.

Since the date of our last Report (19 December, 1868), we have carried on with diligence the works therein specified, but have not been able to complete them so as to report finally before the expiry of our present Commission on the 23rd instant.

We therefore respectfully request that a further extension of the Commission may be granted for two months.

We have, &c.,

J. SMITH,  
President of the Commission.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 15 December, 1868, That there be laid upon the Table of this House,—

“ A Copy of the Petition lately presented by Messrs. Campbell, Windeyer, and Wisdom, to the Minister for Public Works, against the erection of Flood Gates at Wallis Creek.”

*(Mr. Burns.)*

---

## FLOOD GATES, WALLIS CREEK.

---

To His Excellency The Right Honorable Somerset Richard, a Member of Her Majesty's Most Honorable Privy Council in Ireland, Governor and Commander-in-Chief of the Colony of New South Wales, and Vice-Admiral of the same.

The Humble Petition of the undersigned Residents in this District,—

RESPECTFULLY SHEWETH :—

That your Petitioners have learnt with surprise and alarm that the Municipal Authorities of Maitland contemplate the immediate erection of Flood Gates at Wallis Creek.

That, in the opinion of your Petitioners, such Flood Gates will be productive of serious injury to a very large section of the community, because they will close what has been aptly termed by E. O. Moriarty, Esq., Engineer-in-Chief for Harbours and Rivers, the Safety Valve of the District in time of flood, and thereby cast the additional burden of reception of an enormous volume of water upon a space naturally much too limited to admit of the conveyance of water, resulting from heavy and continued rain, to the sea without flood.

That your Petitioners trust your Excellency will be graciously pleased to take the premises into your favorable consideration, and take such steps as may be considered advisable to protect them in the matter.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 369 Signatures.]

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

---

## SUNDAY CLOSING OF HAIR-DRESSERS' SHOPS.

(PETITION—HAIR-DRESSERS OF SYDNEY.)

---

*Ordered by the Legislative Assembly to be Printed, 2 February, 1869.*

---

To the Honorable the Legislative Assembly of New South Wales.

The Petition of the undersigned Hair-dressers, of the City of Sydney,—

HUMBLY SHEWETH :—

1. That the practice of Sunday working in the business of hair-dressing is calculated to demoralize and bring discredit upon the City, from the number of open shops, in which a large number of assistants are compelled to work, in consequence of the increasing number of customers on that day.

2. That the working hours of Hair-dressers in Sydney are, from 7 in the morning until 9 o'clock at night, and every Saturday until 12 o'clock p.m.; and, to continue working until 12 o'clock on the following Sunday is unjust to that portion of the community, and calculated to unfit workmen for anything else of benefit to themselves and the public.

3. That a certain number of persons in the trade have refused to sign an agreement, into which a large majority of the trade have entered, to close on Sunday; and being adjacent to poor men who have signed, are calculated to injure them in their calling.

Your Petitioners, therefore, humbly pray that an Act of Parliament may be passed to compel the closing of all Hair-dressers' shops on Sunday.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 41 Signatures.]

COPY OR EXTRACTS OF ALL CORRESPONDENCE RELATING TO THE  
IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

QUEENSLAND.

Queensland.

Despatches from the Governor.

No. 1.

(No. 49.)

EXTRACT of a Despatch from Governor Sir G. F. Bowen, G.C.M.G., to His Grace the Duke of Newcastle, K.G.; dated Government House, Brisbane, Queensland, 16 September, 1863.

No. 1.  
Governor Sir G.  
F. Bowen,  
G.C.M.G., to the  
Duke of New-  
castle, K.G.  
16 Sept., 1863.

A cotton plantation has been commenced near Brisbane, by Captain Towns, a highly respectable and influential merchant and shipowner of Sydney, lately appointed by the Crown to be a Member of the Legislative Council of New South Wales. About a month ago this gentleman imported, in one of his own ships, 60 South Sea Islanders from the Polynesian group, to work on his plantation. The only law regulating this kind of immigration which is in force here, applies to Indians alone; but my Government agreed with me that it would be desirable to make some inquiries from Captain Towns, who immediately furnished full information respecting his dealings with these immigrants. I enclose printed copies of his engagements, and of his instructions to his agents. The greatest possible publicity was given to these documents, by laying them before the Colonial Parliament, by which they appear to have been considered satisfactory. I enclose further a copy of a circular addressed by Captain Towns to the Missionaries in the South Sea Islands.

[Enclosure 1 in No. 1.]

1863.

QUEENSLAND.—LEGISLATIVE ASSEMBLY.—SOUTH SEA ISLANDERS (IMPORTATION OF).

*Ordered to be Printed by the Legislative Assembly, 26th August, 1863.*

Sydney, 30 May, 1863.

MEMORANDUM of Agreement for engaging Natives for my Cotton Plantation in Queensland, for Six or Twelve Months,—

Witnesseth: I, Robert Towns, hereby engage and undertake to pay as wages to any able adult native that may be hired for my service, at and after the rate of 10s. (ten shillings) per month, in such trade as he may prefer at the end of his agreement, and to return him to his home within 12 months, should he require such.

2. I also agree to find the natives huts or houses, or tents until huts can be put up, and to supply them with good and sufficient food, such as they are accustomed to, and to provide them with cooking utensils, and in every way watch over and protect them, during the period of their servitude.

3. The labour these natives will be required to perform will be chiefly field labour of a light and easy description, such as cleaning and picking cotton when in season, and any other work they may be called on to perform.

Witness my hand this 30th day of May, 1863.

(Signed) R. TOWNS.

Sydney, 29 May, 1863.

Sir,

Referring to our verbal agreement for your present employment on the intended expedition of the "Don Juan," after a number of natives to be employed on my cotton fields in Queensland—

I now give you my written instructions for your guidance, and as I understand you are no scholar, Captain Grueber will read them for you, and explain what is required of you.

First, you will proceed to, and call at, such islands as you are known to the natives; and then explain to them what your object is, namely, to engage for me from 50 to 100 natives, all male, on the present voyage, until they are better known in the district and Colony.

I will prefer young lads, from 14 and 15 to 18, in preference to older men, as the bulk; you must have some old hands amongst the lot to induce the young ones to enlist.

In engaging or persuading these people, you must tell them exactly what they will have to do, that is, their chief work will be in the cotton fields, and that they will have good huts to live in, a kind master to protect, and that you will take them back within twelve months, perhaps in six, and that you will be on the station to explain and interpret for them, and that they will be paid in goods at the rate of 10s. per month (over and above their rations) for the able men, and the others according to their worth and value.

I presume you will call at Leifoo or Ware first, and then to Sandwich; I leave this for you and Captain Grueber to arrange; and while I am on this, I must here remind you, that while you are on board the ship you are to act, and do the duty in every way, as second mate, for which service you have signed the articles of the vessel, and in which capacity you will be paid at and after the rate £5 (five pounds) per month, which pay will be continued you on the station so long as you remain, or other arrangements are made.

In

## 4 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Queensland.

In conclusion, I must remind you of my earnest desire that the natives be treated with the greatest kindness, and on no account allow them to be ill-used by the crew or any person on board; if such is offered to them, it is your duty to report the same to the captain. I will be satisfied with 50 young men and boys, if you can get them, but will be better pleased with 70, if the vessel can bring so many comfortably; but on no account crowd them, or delay the vessel for the purpose.

You must endeavour all you can to keep the natives in good humour and friendly, and on good terms with each other; on no account allow them to quarrel or have any of their national disputes on board; keep all such quarrelling from them; if you find such, unfortunately, to take place, at once separate them and put up bulkheads between them. Take care none of the old beach-coomers (European sailors) smuggle themselves on board with the natives.

You had better call at Leifoo before Hayes gets there, and leave before he may arrive.

I think I have now said all I have to mention, and hope you may have a successful voyage.

I am, &amp;c.

Mr. Ross Luin.

(Signed)

R. TOWNS.

29 July, 1863.

Dear Sir,

Your vessel is now ready, and victualled with supplies sufficient for the voyage and return with natives. You will at once proceed to sea, and make the best of your way to the Isle of Leifoo, or such other island as you may first make, for the purpose of procuring natives for the cotton fields, with which you will return to Moreton Bay with all possible despatch, where I will, in all probability, be to receive and direct you. The above is an outline of your intended voyage.

I will now proceed more in detail to instruct you for your future guidance.

The nature of your voyage is, as before stated, to proceed to the different islands of Leifoo, Ware, and Sandwich, and any other islands you may find it necessary to proceed to for the purpose of selecting the natives, and with a view to collect a useful class of men, lads, and active boys. I have engaged Mr. Ross Luin, who speaks the native language, and well known amongst the islands. This man, now shipped as second mate, will do the needful in engaging the men, which I promise to return to their native land within twelve (12) months from the time they leave. You must endeavour to convince the friends of the people, as well as themselves (those you engage), the honesty of our intention, and if there should be any legal authority, give them guarantee to the same object, that the people will be returned in accordance with their agreement.

And as the natives may not be cognizant with our language, I wish you to be present when these arrangements are made through the interpreter. I have sketched out a memorandum for Mr. Ross Luin to explain to the natives in your presence the terms of their engagement, and the work they have to do; also the rations they will receive; at the same time assuring them of every protection the British law will afford them. In this, you will please to observe we wish you to act as our agent, and not allow any advantage to be taken of the natives, even to our interest.

And when engaged, I look to you to see that they are properly cared for, that they have proper food and attention, and that they are made to keep the place in which they live thoroughly clean.

I have put on board two suits of shirts and trousers for 100 natives. You will please serve out one suit when they first embark, keeping one for their landing. If you can procure 70 natives in all, you may do so; but half the number will do. If you find much difficulty in getting them, on no account attempt force to take the people against their own free-will and consent. If you find any Missionaries at the islands, make their acquaintance, and tell them from me what my object is in engaging the natives to leave the island they belong to and engage for a short season to serve me in cultivating cotton. The labour will be light, in weeding, cleaning, and picking cotton; and I will engage to provide them comfortable huts, and regular rations of rice, meat, pumpkins, potatoes, and yams (if they will grow), and return them to their homes within the twelve months, very likely within six months.

And you may also mention to the Missionary, that it is my intention to bring over their wives with them next year if they like the place, and answers my purpose to do so.

I will make their wages for the best men equal to 10s. per month, with others in proportion. These natives will have every protection equal to Europeans in Queensland, which is a climate as warm as the one they leave. This much you may tell the Missionaries; and if they can find a reader or interpreter, I will gladly receive him, and pay him for what he may be worth over and above his food and lodging, which I suppose will be little; but he will learn civilization.

I mean to exchange these people every six or twelve months, and bring over their wives and families with them when they get accustomed to the country and the work.

I have now shadowed forth my views and intentions, and leave you to carry them out; and, in conclusion, I will again repeat, on no account allow the natives to be ill-used. They are a poor, timid, unoffending race, and require all the kindness you can show them. You may lead them to anything, and I will not allow them to be driven.

If you find it difficult to procure the natives through Mr. Ross Luin, you had better run over to Erromanga, to Mr. Henry's station, and he may be able to assist you, should such be necessary, but it will be a disappointment to me if you cannot procure for me from 50 to 70 natives for the purpose required.

In reporting your ship inwards from the islands, be particular, and state the number, names, and ages you have on hand as passengers for Mr. Towns' cotton plantation; let everything be clear in your proceedings. Mr. Palmer, my agent in Brisbane, will have my instructions respecting you, if I am not in Queensland, to which you will please attend.

Use your utmost endeavour to get over the ground, and land the people as soon as possible. You must be a little easy with Mr. Ross Luin, but if he fails to give you satisfaction, go to Mr. Henry, at Erromanga, or Underwood, at Anietum, and they will put a man on.

Yours, &amp;c.,

(Signed)

R. TOWNS.

Captain Grueber, "Don Juan."

[Enclosure 2 in No. 1.]

To any Missionary into whose hands this may come.

Sydney, 29 May, 1863.

Encl. 2 in No. 1.

Rev. Sir,

Should this meet the eye of any gentleman in that sacred calling, I beg to explain the nature of the voyage on which I am about to despatch the bearer, Captain Grueber, with the schooner "Don Juan."

If I now address an old resident among the islands, my name will be familiar, and justify a belief in the sincerity of my mission to which I am about to explain and solicit your friendly aid; if, on the other hand, the reader has not heard of the writer, I may refer him to Captain Grueber, or any man connected with these islands for the last twenty years.

Suffice

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 5

Suffice to say, I have embarked considerable capital in Queensland in the cultivation of cotton; and as so much depends on the *rate of labour* in the ultimate success of this important enterprise, I am endeavouring to try our natives from the immediate adjacent islands, whose habits, although not strictly industrious, may be rendered most serviceable in the light work of the field labour, in weeding and picking cotton, as the seasons may require. Such being my views on the subject, I have sent this my pioneer vessel to enlist a supply, and will be much obliged if you will kindly assist us in this our worldly mission, and, as I have told your worthy brotherhood, Messrs. Inglis and Geddes, that I with my cotton emigration (returning them every six or twelve months) will do more towards civilizing the natives in one year than you can possibly in ten; they will see what civilization is, and aim to follow it; and if you can supply me with a native *teacher or reader*, as they may be termed, it will very much hasten the object; at all events if you cannot assist me in this particular, you may be able to point out to the poor unsuspecting natives that they have nothing to fear, as I will bind myself to return them within twelve months from the time they may leave, and more likely in six months.

If my scheme prospers, it is my intention to bring over the wives and families of these poor fellows, as a superior race to the ordinary Coolie from India, about whom we hear so much; and for the light work of cotton-picking they are well calculated.

I send an interpreter, a man who says he can speak the language; this is very important to make the poor fellows understand.

Trusting to your kind assistance—

I remain, &c.,  
R. TOWNS.

Queensland.

## No. 2.

(No. 63.)

COPY of a Despatch from Governor Sir George F. Bowen, G.C.M.G., to The Right Honorable the Earl of Carnarvon.

Government House, Brisbane, Queensland,  
16 November, 1866.

(Answered, No. 5, 1 February, 1867, page 18.)

No. 2.

Governor Sir  
G. F. Bowen,  
G.C.M.G., to the  
Right Hon. the  
Earl of Carnar-  
von.

16 Nov. 1866.

MY LORD,

In continuation of many previous Despatches addressed to your predecessors respecting the progress of cotton cultivation in Queensland, I have the honor to transmit herewith an interesting account which has been recently published, of the "Townsvale" Plantation, situated at about forty miles from Brisbane, and the largest hitherto farmed in this Colony. It is the property of Captain Towns, a well-known Australian merchant and shipowner, and a Member of the Legislative Council of New South Wales, and of his partner, Mr. Brooks, a Member of the House of Commons (for Weymouth). I have visited this plantation on several occasions, and believe that the account now forwarded is substantially correct. Some details respecting the South Sea Islanders employed there will be found in my Despatch, No. 49,\* of 16th September, 1863. Enclosure No. 1.

2. I transmit further a return of the quantity of cotton grown in this Colony during the past season. It amounted to 183,680 lbs., or 612 bales of clean cotton, fit for shipment. Of this number, 267 bales were furnished by Messrs. Towns and Brooks from the plantation described above. The crop of cotton raised in Queensland during the last three seasons was as follows:— Enclosure No. 2.

In 1864...	...	...	...	...	...	38,730 lbs.
In 1865...	...	...	...	...	...	145,820 "
In 1866 (first ten months)	...	...	...	...	...	183,630 "

I am informed that a much larger area of ground will be cultivated for cotton in the season of 1867. I need scarcely remind your Lordship that during the first 60 years of the present century the export trade in cotton from America grew up from much smaller beginnings than those already made in Queensland to an annual amount valued at 40 millions sterling.

3. A summary of the progress and prospects of cotton cultivation in Queensland will be found in my Despatches, Nos. 3 and 13, of 1866, and in the copies sent therewith of letters addressed by me (in answer to his inquiries) to Mr. Cheetham, M.P. the President of the Cotton Supply Association at Manchester. As it appears that the intelligence lately received in England respecting the last cotton crop in America is far from encouraging, I venture to submit that it would be well to forward to the Cotton Supply Association a copy of the present Despatch and of its enclosures.

I have, &c.,  
G. F. BOWEN.

## [Enclosure 1 in No. 2.]

## Townsvale Cotton Plantation, Logan River.

As cotton growing in Queensland, at a not very distant day, will be one of the most important branches of industry that will be followed, a truthful and reliable description of the greatest of our plantations ought to be very acceptable. It will go far to encourage others to persevere, seeing that Captain Towns and his spirited partner, Mr. Brooks of London, have done much to demonstrate the question that Queensland can produce cotton, the full commercial value of which is as yet unascertained, from its properties being so remarkably superior to any other class of cotton in the market. Unlike many others that started cotton growing, and gave it up at the very first failure, Captain Towns has persevered, and something like returns are at hand for the expenditure incurred. Two hundred and sixty-seven bales have been sent away from the plantation the past season, and now 450 acres are planted. The plantation is worked by South Sea Islanders. Encl. 1. in No. 2.

Description

## 6 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Queensland.

*Description of Plantation.*

Townsville Plantation consists of about 4,000 acres of land on the upper part of the Logan River, 20 miles above the head of the navigation, and about 40 miles south of Brisbane. It is very nearly on the 28th parallel of south latitude, and on the 153rd degree of east longitude. It is near the station of Bromelton. The position is considerably elevated, and the banana does not fruit very well there, although it is only about 30 miles from the coast. The first appearance of the plantation, on approaching the gates, is rather relieving after a long and monotonous ride. The clearing stretches before you up the broad flat for more than a mile, and at present the tracks of the watercourses are easily traceable, and the numerous bridges, painted white, are quite conspicuous in the plantation. The whole of the cotton is just green down the rows, as you pass a sight down the lines. Immediately on getting through the gate, you come to the little house occupied by Mr. Ross Lewin, the superintendent of the South Sea Islanders employed on the plantation. On the right, across the cultivation, is seen the homestead, a large number of buildings that appear all to be very low, with the exception of the new cotton chamber, which stands very prominently in the midst. The plantation is crossed by several straight roads, and one runs down the middle of the whole. We cross two bridges, and through the far gate to the homestead, and are welcomed to the plantation.

*Ride over the Plantation.*

After dinner a fresh horse was saddled, and a ride over the whole plantation enabled one further to realise the extent of the cultivation, and to see all the islanders at work in their different places. The land is a black, deep, alluvial soil, very good, but not fat, nicely working with the plough, and not liable to bake. There is, however, slight changes in it, but nothing to mention. As the plantation runs up between two ridges in a complete flat, averaging about half a mile wide, and is three miles from end to end of the two plantations. There are about 250 acres in the lower, and 200 in the upper plantation, already cultivated and planted. As a matter of course, all the thinnest timbered land has been put in cultivation first, and most of it has been exceedingly thinly timbered with small apple trees. It is now considerably thicker wherever the plantations will be extended. There is a large area of heavier land between the two plantations, but this has not yet been encroached upon. Some of the slopes on the northern side of the whole will, when cleared, be nice working land, and easier to keep clean than some of the flat is. There are roads crossing at right angles the long road right up the plantation, and the old creeks and hollows are all cleaned out and bridged over with very good bridges. There is in the first plantation a large new building, 60 feet by 40, divided into two rooms, occupied by the islanders of agreeable parties. The building is built of weatherboard, and covered with grass, and has a broad verandah all round. The verandah at one end is made into a tool-house. The rooms are fitted up inside with bunks all round, two in height, all broad enough for two. They are supplied with blankets, and thick sacking for the bottoms. I should imagine they are too close for all English notions of health, though there are plenty of air windows; they are quite under the roof from the verandah, and they admit no light except by the door. There is also a fire in the middle of the floor, and plenty of fleas jump about. No doubt it is a palace to anything the islanders ever dwelt in, and as they would build it nearly themselves, if any windows had been deemed necessary they would have been left. There is also in the upper plantation an overseer's house, with quite a neat latticed verandah for training runners up to cool the house; and several other dwellings for islanders, and sheds and tool-houses.

*The Cotton.*

This season's planting commenced on the 25th August, and the last planted would be on 3rd November. The first planted is about six inches high, and the dry weather following, a deal was replanted, and is now ready for horse hoeing. The after planted is looking more regular, and there is a good plant. As the planting has been continued without intermission, there are all grades of plants, to where it is just peeping out. There is also a large area not yet up. The method of sowing so thickly gives plenty of choice against all disease and insects. With the exception of about three acres of Sea Island, all the plantation is entirely new plants. The three acres are an experiment, and as it did not seem that the stumps were properly shooting it has been planted between also. This is considered very expensive, and no more will be pruned down. The principal part of the plantation is New Orleans, and only about 30 acres are planted with Sea Island.

*Ploughing by Steam.*

On the upper part of the plantation, I found the steam plough at work, busily finishing ploughing the last plot of land for this season's cotton crop. It is worked entirely by islanders, with an English engineer that scarcely ever has to leave the engine. The land had had cotton on before, and was very full of weed, which was being taken off before the ploughing. The engine is an ordinary portable engine of 12-horse power, with double cylinders and reverse motion. It is one of Roby's of Lincoln. It is attached to the drums, on which is wound the wire rope, by means of shackles from the end of the shaft of the fly-wheel. The drums are on a car to themselves, and are Howard's, of Bedford, gearing, as is also the plough. The drums are about four feet diameter, and one foot broad, with deep flanges, and have cog-wheels on each outer side. They are fitted on an eccentric axle, so that each drum can be lifted up to the over working cog-wheels that work from the end of the fly-wheel axle. This gives the drums two motions without the reversing motion of the engine. And the one pulling the plough is only driven, and the other being let down simply lets go the rope the plough pulls back. This allows in all ways for any inequality of ground, distance, or size of drum by rope. The rope is taken round the field, and is supported on little wheels called porters, and at the corners by horizontal wheels, called corner blocks. All these wheels are pulley-wheels for saving the rope, and for giving it the turns at the corners. The corner wheels are kept fast by claw anchors, the two at each end of the furrow held down by three hands that regulated them as the work proceeded. The plough is mounted on four single flanged wheels, about two feet high, and consists of the bodies of six ploughs exactly the same as other ordinary ploughs, fastened under two strong frameworks of iron, on each of which are three ploughs to plough three furrows, each 10 inches broad, and any desired depth each way. When one frame is ploughing, the other is elevated out of the ground, not to save turning round, but because no plough can plough backwards and forwards on the same furrow, inasmuch as one, the ordinary plough, turns the furrow over to the right, whereas the second three ploughs on the steam plough turn to the left. There is thus no ridge and furrow in steam ploughing. It is all left uniformly. The ploughman, an acute and knowing sort of islander, seems quite at home on the dicky of the plough, which is steered by handles acting on the wheels the same as shafts on the fore-wheels of waggons, though not quite in the same style. As the ends are differently ploughing the steering apparatus is altered, one being made fast, whilst the other is used. When the plough gets to the end of the furrow, a signalman with a red flag stops the engine, and then the men at the corner wheels assist the ploughman in elevating the one lot of ploughs from the ground, and in lowering the others. The signalman then hails the engine driver, and off the plough gets back to the other end. This process is continued, and the plough is brought backwards and forwards continually; and five or six acres a day is gone over on an average, although eight or nine can be accomplished if the land is quite clear from weeds, and the plough pass without choking between the frames and different bodies. A man, however, with a handspike follows and keeps this clean.

Attending

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 7

Queensland.

Attending to the engine is one with horse and water barrel, that is filled by a pump from a lagoon; another with horse and cart, carting firewood that is being cut to suitable lengths in the bush at hand by others. There are also pulley men that oil and look after the pulleys.

From this description of the working of the steam plough, it will be seen that all the motions of the gear-work will enable a large block of, say 40 acres, to be ploughed with the engine fixed in the middle, and ploughing it in four squares of 10 acres each, by fixing the ropes and pulleys round the squares alternately to be ploughed.

*Planting.*

All the work to completion is being proceeded with at once. There was following the steam plough five bullock and two horse-teams harrowing each, I must say, well managed by an islander. I fully expected to hear amongst these untutored youths of nature some of the language so frequently associated with bullock driving, but the slightest attempt was never heard. They all went about their work remarkably well, and used sufficient encouragement to keep the bullocks well on. Next following these comes more than a score gathering weeds, and cleaning up before the drilling plough comes to make the seed furrow.

The drilling plough, or ploughs rather, for there are three, fastened on a beam that slings behind a pair of dray wheels, the same as the marker of an old drill-sowing machine. These are the bodies of small American ploughs, and are set five feet apart, doing three rows at once. A Scotchman drives this, and a couple of islanders follow to keep the plough clean and the proper depth. Next came the youths with the seed; and here all my preconceived notions of cotton planting were entirely upset. The seed was carted into the field in the morning, a cart-load or two. The sowers had large bags full slung over their backs, and as they stepped up the furrow large handfuls were dashed in till the furrow was quite white. This Mr. Walker explained to me as being of great importance, to secure a good standard plant from plenty of choice; also, it is a provision for seed being bad, and for tillage, it being the practice in some of the Southern cotton States to return all the seed to the land for tillage. Then followed the men covering the seed with earth, care being taken to keep aside the clods. Then follows another dark-coloured gentleman, perched on the dicky of a double-shafted roller, rolling away as pert in the management of his horses as any of St. Cabby's most devoted followers. I am told these men attend to their horses wholly themselves, fettleing them up in the morning, corning, cleaning, and yoking them for work, quite astonishingly. There are nearly 70 men here, including the teamsters. Thirty more are hoeing weeds in another place; some are fencing at the homestead, others repairing boundary fence. The rest are horsemen, bullock drivers, and stockmen, somewhere else. There are also seven or eight of them cooks, making a total of 170 black men. There are also on the plantation, three carpenters, two engineers, one blacksmith, three overseers, one clerk and storekeeper, the manager, and a few others, making a total of 185 persons.

*Picking.*

The last season's pickings commenced 5th February, and continued more or less to the 25th August when the planting again commenced. There were about 80 islanders, and when they had not full days their time was employed in grubbing round standing trees for Ross Lewin's gang; or they were ginning, drying, and turning, and removing the cotton picked from trays to the drying chamber. How steadily these men work, the following figures will most strikingly show. They are arranged by myself, and the quantities were taken from the "picking book," kindly placed at my disposal by the general manager.

Date.	lbs.	Average each.
2 May ... ..	5,225 picked by eighty	65.25
15 May ... ..	4,952 "	61.72
27 May ... ..	5,514 "	68.74
1 June ... ..	4,270 "	53.30
27 June ... ..	4,492 "	56.12
Total ... ..	24,453	305.13
Averaging ... ..	4,890 lbs., or	61.02

The above shows 61 pounds of cotton with seed to the average picking of five full days. The greatest picking by one man in one day, I noted the entry in the book, to be the "27th June, Charlie, 90 lbs." The smallest was "Eberr., 32 lbs." The cotton is gathered into bags in the field, and each man brings his own bag home at night, and the cotton is weighed without the bag, and an account kept of every day's picking by every man. The weighing very often is done in the candle-light, and every day prizes are given for extra work, and for encouragement to some that may have had poorer cotton to look over. These prizes consist of pocket knives, beads, all colours, buckles, belts, pipes, and figs and cakes of tobacco. Tobacco is mostly used throughout the whole of the islanders, and is always given more or less besides the prize tobacco. All the machinists, ploughmen, bullock drivers, horsemen, stockmen, &c., get extra tobacco daily. Some that get more than they can smoke, truck it away amongst their friends for pearls, beads, and other trinkets; and not unfrequently an Australian aboriginal will drive a close bargain with the islander for his tobacco with a coloured dilly bag. The two races, however, look with supreme indifference on the peculiarities of each other, and on the whole there never is much bother amongst them.

*Ginning.*

The cotton, after being weighed from the field, is spread out to dry either on sheets on the ground, on trays under awnings, or on the floor of the great chamber, just as occurs the work and chance. It is thoroughly dried in the chamber, and turned over backwards till the chamber is quite full up to the roof. The chamber is 60 feet by 35 feet, and is well-ventilated by windows all round, and covered with corrugated galvanized iron. This mixing and rolling back into a great thickness gives the cotton one uniform quality of texture and colour. When that desirable result is obtained, the cotton is ready for ginning. It is then carried down a gangway into the chamber over the gin and the ginned cotton-room, and is fed into the gin, a splendid one, with seventy-five saws, driven by a ten-horse power engine of Stewart and Copeland's, of Glasgow. The gin is four feet six inches broad, so that the saws are nearly three-quarter of an inch from each other. These saws are nearly the same as one foot circulars, with a gauge of wood between them all fastened on an axle, and they work through slits in a curved plate of iron, and the seed falls off the plate down one side into a room to itself, and is filled into a little tram-wagon, and sent into another room to be kept, or it is run down a little railway and tipped off the end of a staging. The cotton is caught on the other side of the saws by a lot of brushes turning against the saws like the brushes in a flour-dressing mill, and they act like a fan also, in blowing the fibre across a room under where the gin is being fed. This room is closed in when the gin is at work, and the cotton settles all over according to its weight. When this is full the gin is stopped, and the cotton is thoroughly mixed up again to obtain an equal sample. The door is then opened under the gangway before mentioned, and which leads to the packing and pressing. The press is lined with the bagging for the bale, and is filled up from the room by baskets full. This is pressed down a time or two, till the bale is large enough, and then the sides of the model are opened when the screw is down. The cloth for the end of the bale was fastened under the press that went down, and the top and front and back sides are stitched together. The other sides of the model are then opened, the bale turned out, and the remaining sides stitched fast. The bale is then branded—

TOWNSVALE

Queensland.

TOWNSVILLE  
COTTON,  
1866.R. T.  
B.

No. ———

The last was numbered 267. It was then placed on the drays, that are all loaded in the shed under the great chamber; and when all the bullock drays are loaded it is sent to Brisbane, *en route* for England. The journey there and back to Brisbane is performed in a week, and the bullock drays are driven by islanders, with one man in charge to get delivery to the agents.

#### *The Homestead.*

The homestead of the plantation is situated on the end of a thickly-timbered ridge between the cultivation and the river, close to several large lagoons. Apparently, there never was any plan or order of going to work when the plantation was started. All the older buildings are scattered about here and there, and front all directions. These, however, are being pulled down where they are obnoxious, or changed a little where they will serve anything, and look a little more uniformly. The buildings consist of manager's house, quite a little unpretending structure, but quite convenient at present for the manager who is a single gentleman, housekeeper's rooms, and kitchen; the latter one of the old log style of houses. These are enclosed with a neat paling fence; the front being a little garden, containing choice flowers, bananas, and a neat little arbour surrounded with passion fruit. The back yard contains fowl-house, with turkeys, ducks, and fowls of all descriptions. At the end of this is another little square plot palled in, and as yet contains only one house for carpenters, blacksmiths, engineers, &c. In front of this is the machine shed, blacksmith's shop, and carpenter's shop, all good buildings and ample enough for the plantation. At the end of these two squares stand the large building used as cotton chamber, and shed for packing, loading, &c., and for all the carriages. Across the end of this runs the giuining sheds, or rather houses, built of galvanized iron, and covered with grass. These are to be altered and made another story higher, up to the level of the great shed, but still following out the same principle of facilities in working the cotton a regular round. The engine is fixed under a shedding at the end of this building, and between it and the saw-mill. The saw-mill is fitted up with movable trucks to the bench, and every kind of sawing is advantageously done, as plenty of pine is growing in the neighbourhood. There is also a 28-inch French stone flour mill for grinding maize into meal after it has been split by another machine, both in an adjoining little room to the engine. There is also a grindstone and other useful machinery here. There are also several different sorts of stores all well supplied. Stables, butcher's shops, stock-yards, all miscellaneous set round. At the homestead there are only two houses used by the islanders, as the wishes of these have been consulted, and different tribes dwell in different parts of the plantation in large houses, well built of weatherboard, and thatched. The whole of the homestead is kept remarkably clean, and it is only by the butchering stock-yard there is any olfactory disagreeableness. This, however, is to be expected from all the model slaughter-yards I have seen in Queensland, where beef is 2d. the pound. A bullock is killed every two days, from a mob of 1,000 head of cattle running about and belonging to Captain Towns.

#### *The Islanders.*

The South Sea Islanders on the plantation are mostly from the Isles of Tanna, Sandwich, Malicolo, and Erromango, in the New Hebrides. They are well-shaped men, mostly black, with short curly hair; they are all remarkably full across the eyebrows, with a deep indent across the nose between the eyes. The nose varies, and some well-shaped faces are among them; they are remarkably docile and quiet, a fight never occurring amongst them at work or any time. They use the hoe very well, but the shovel I noticed they used with the fore hand turned in, and not thumb forward, as is the practice amongst white men. In every other instance I noticed they use tools quite free and easy, always slipping the fore hand down the handles, especially in axework is this necessary to work easy.

They start work in the morning at 6 o'clock when the bell rings; at 8 they stop an hour for breakfast, and then go on till 12. In winter one hour, and now two hours at noon; they then go on till near sundown so as to have supper before dark. They work very steady, especially the older portion of them, but the late arrivals are apt to look at the engines, the working bullocks, and the horses, and require a good deal of watching. They also are either very inferior men, or the keep at the plantation speaks well for the change the older part have undergone. They all appear quite contented. They receive 1½lb. rice and 1½lb. beef each a day. They have nothing else, and they prefer rice to Indian corn meal with molasses, when it is changed now and again. They drink nothing but water. They have clothing what they want, and I should prefer that they wanted more. I think they should be taught to make flannel skirts like the East Indian wears, or like the Scotch skirt. It would be light, airy, and not near so objectionable as some of them appear. The new comers take more than a year before they can work much, and then when they are fairly in working order their time is out, and they have to leave.

#### *Illness and Death.*

Amongst the late arrivals there has been some illness, and a couple of deaths occurred amongst them during my visit. It appears that there is the greatest difficulty in doctoring these men when ill. They will not take anything but the regular rice and beef, and they will not make their case known till quite hopeless. Mr. Ross Lewin told me they never recover when once very ill, and that in the islands they have no application of medicine, botany, or anything, and will take nothing. Here Mr. Walker, Mr. Ross Lewin, and myself went through all manner of persuasions to get some wine and sago down one of these fellows' throats; but all to very little use. One of them held the glass to his mouth as if drinking, but not a drop went down for a long while, and as soon as the eye was turned the glass was put back. The two that died only would be persuaded when near the point of death.

#### *A Funeral.*

The islanders seem to have some fear of the dead, and they do not like to touch them and put them into their coffins. The coffin was made by the carpenter from cedar, and was neatly shaped and jointed. The dead man was rolled up, with a clean white guernsey shirt on, in his blue blanket, and was thus placed in the coffin. In the afternoon all the men on the estate stopped work, and attended at the funeral. The bell tolled as the men collected to the place, whilst the corpse was being carried from the house to a little spring waggon driven by an islander. The *cortège* then moved slowly off towards the burying-ground on the banks of the Logan behind a scrub, and nearly a mile from the homestead. When approaching the grave Mr. Walker, the manager, commenced reading the solemn service for the burial of the dead. When at the grave and the coffin was lowered, I confess that I felt a little at some parts of the service, when I looked at the black faces around, and not one of them in the slightest moved. "O death, where is thy sting! O grave, where is thy victory!" appears to them totally incomprehensible.

Land

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 9

*Land in the Neighbourhood.*

Queensland.

A ride with the manager over to an adjoining cattle station enabled me to see the land further upon the Logan about Beadesert, and on the head of the Albert, at Nindooibah, where the racecourse is for the stockmen in the neighbourhood. Leaving Townsville there is little good open land till within sight of Beadesert, and there the land opens out into a magnificent flat, very thinly timbered, with gently sloping ridges from the Albert side that really are splendid soil. Some of the slopes are chocolate-coloured, thinly timbered, and others black and rather thicker. The whole extent of land here for about five miles is of the best description, and opens out with larger slopes of better land than even Townsville, and I should not be surprised at some future day to see hereabouts a second edition of Townsville. In turning over the ridge to the left, towards Nindooibah, the scenery backwards is quite picturesque in the mountains, and Keats' Peak, Mount French, and Mount Edwards tower their heads amongst others on the main range, and towards the boundary of New South Wales. At Nindooibah the vale is rather too narrow and the slopes too abrupt to be to any great extent fit for cultivation. But further down, on the racecourse and below, is a fair extent of good land, and what is wanted is a good road from the head of the navigation on the Logan, round by all these places to the head of the navigation on the Albert, and there is scope enough for lots of cotton plantations.

*Clearing Land.*

This work is performed by a gang of about thirty of the islanders that have been better than two years on the plantation, and are by far the best men on the whole estate. They are superintended by Mr. Ross Lewin, an old trader amongst the islanders for more than twenty years, and who consequently has a thorough knowledge of their manners, customs, and habits; and I think the services of this portion, and all the men that are now doing the better jobs, was obtained for Captain Towns by Mr. Ross Lewin's agency. The trees are all dug round, and all the roots cut off down to 15 or 18 inches in depth, according to the size of the tree. They are rung at the same time. A large area will be done in this manner, and then the trees are to be pulled down. This operation was being carried on while I was there, and it is done most expeditiously. The trees are pulled down by blocks and tackling by a team of bullocks. First an islander ties a small cord to an iron cotter, and another winds the cord in his hand, and stands by the one who throws the cotter clean over any particular branch, and the cord leaves the hand of the second without any check, whilst the thrower undergoes some exertion in the dexterous manœuvre. A strong rope is fastened to the end of the cord, and this is pulled back over the branch. A noose is made in one end, and one is pulled up the tree, and gets to the place where best to fasten to. By the rope a large chain is pulled up and fastened round the tree. Then the end of a strong steel wire pennant is hung to the chain, and the islander then is let down from the tree. Others have fastened chains round the butt of one of the standing trees behind, and the large blocks with the bullocks are hung on, and the island bullock-driver brings the tree down with a crash. Sometimes a group of five or six lesser trees will be pulled over at one haul, by coupling them, or surrounding them with a wire rope. The trees are then cut up by others, with axes for small branches, and cross-cut saws for the thicker. Some more are working at the stumps with hicks, cleaning it of earth; others are logging the thicker parts. Trees are surrounded in all manners, and left ready for piling and burning; as many as forty and fifty are pulled down in a day and disposed of. I noticed some of these men to be capital cross-cutters and axe-men. Indeed it would puzzle many white men to cross-cut large branches on the under side, when the saw was bitten with the weight on the cut, or to work the saw when both sawyers had to stand on some branch four or five feet high. These men are as nimble as cats, and can stand anywhere. The piling and burning are left this time, and the bullocks have to haul all the bigger logs. The holes from where the trees are turned out are then filled, and levelled, and the steam plough comes next. This land is thinly timbered, and between £4 and £5 is the average estimate per acre for clearing. Some of the very large trees could not be turned over with the tackling then used, but strong chains and blocks with three or four pulleys could be rigged out. It is also the general manager's intention to make tackling for pulling trees down without any grubbing whatever, to be on the lever principle.

## [Enclosure 2 in No. 2.]

Encl. 2 in No. 2.

## THE COTTON CROP OF 1866.

THE Cotton Crop of 1866 being all gathered, it may be interesting to know what quantities have been grown during the past season. The return of the cotton submitted to inspection for the Government bonus will give the information. This we append below, and it shows the crop to have amounted to 183,680 lbs., or 612 bales of clean cotton, fit for shipment. The bonus is given in the form of a land-order, and is considered as equivalent to 4d. for every pound of clean cotton. On the quantity of cotton here given, land orders, equal to a money value of £3,148 9s. 8d., were granted. In the detailed statement below, the names show to whom the bonus was given, together with the quantity of cotton for which it was granted:—

## 10 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

## No. 3.

Queensland. Copy of a Despatch from Governor Sir George F. Bowen, G.C.M.G., to His Grace the Duke of Buckingham and Chandos.

No. 3.  
Governor Sir  
G. F. Bowen,  
G.C.M.G., to the  
Duke of Buck-  
ingham and  
Chandos.  
13 July, 1867.

(No. 36.)

Government House, Brisbane, Queensland,  
13 July, 1867.

(Answered, No. 40, 9 November, 1867, page 19.)

MY LORD DUKE,

\*Page 3.

In my Despatch, No. 49,\* of 16th September, 1863, I reported that a small number of South Sea Islanders from the Polynesian Group had been lately employed on his cotton plantation in Queensland, by Captain Towns, a wealthy merchant and ship-owner of Sydney, and a Member of the Legislative Council of New South Wales. I added that Captain Towns had furnished full information to the Government of Queensland respecting these immigrants, and I transmitted copies of his engagements with them, of his instructions to his agents, of a circular on the subject addressed by him to the European Missionaries in the South Sea Islands, and of his official letter to the Chief Secretary of this Colony (Mr. Herbert), explaining his plans and operations. The greatest possible publicity was given to these documents at the time, by laying them before the Queensland Parliament, by which they appear to have been considered satisfactory. I further observed, that even if Captain Town's position and character were not a sufficient guarantee for his fair treatment of these South Sea Islanders, his plantation was only 40 miles from Brisbane, under the eye of the Government, of the magistracy, and of a vigilant Press, and that I intended to visit it myself occasionally.

2. I have now the honor to report, that on the 25th April, ultimo, Captain Luce, R. N., of H. M. S. "Esk," then the Senior Naval Officer in Australia, addressed to me an official letter, stating that he had lately received accounts of the loss of several vessels and of the murder of several Europeans at certain of the South Sea Islands; and that it appeared, from a letter written by a trader in those seas, that "the natives say that they are perpetrating these atrocities in revenge for the loss of many of their countrymen, who were carried away three years ago to Queensland and the Fiji Islands, by Europeans, who hired them as labourers, and promised to return them to their homes in twelve months." Captain Luce asked for whatever information on this subject the Government of Queensland might be able to afford him.

3 May, 1867.

3. I lost no time in bringing Captain Luce's letter under the consideration of my responsible advisers, and I now enclose a copy of the Minute of the Executive Council, containing their views upon it, and giving all the information procurable in Queensland; Captain Towns, the principal employer of the South Sea Islanders, being resident at Sydney, where Captain Luce could place himself in direct communication with that gentleman.

4. I sent a copy of this Minute to Captain Luce, further informing him that the official returns show that in the aggregate only three hundred and eighty-two (382) South Sea Islanders have landed in Queensland, of which number seventy-eight (78) have returned to their homes. It is stated that those already sent back were under an engagement for one year only; that most of the remainder are under engagements for three years; and that they will be provided with passages to their native islands when that period shall have expired. I added that the principal employer of these labourers, after Captain Towns of Sydney, is Captain Whish, formerly an officer in Her Majesty's 14th Light Dragoons, and now the resident owner of a sugar plantation near Brisbane.

5. It will be seen from the accompanying Minute of Council, that the Government of Queensland, in common with myself, "are anxious to punish all fraud and injustice wherever committed, and to secure the inhabitants of the Colony, of every class, in the full enjoyment of their rights;" and that "should it be proved that further legislation is required for the due protection of the South Sea Islanders, the Council do not doubt that the Colonial Parliament will be ready to pass any measure which facts and documents hereafter to be laid before them may show to be absolutely necessary;" and that "in the meantime the Police Magistrate of the district is ordered to inspect periodically the plantations on which any such islanders may be employed."

In reply to my despatch transmitting to him a copy of the Minute of Council, with the above-mentioned information, Captain Luce stated (in a letter, dated June 4th ultimo), that he "is now well satisfied that the South Sea labour traffic to Queensland will continue to be carried on with justice, and will be of great benefit to the natives themselves."

\*Statutes of  
Queensland, vol.  
2, p. 991.

7. I am advised that the "Master and Servants Act"\* (25 Vict., No. 11) now in force in Queensland, applies to labourers engaged in all "foreign countries," and that (as it has been already stated) the Colonial Legislature will be ready to pass any further measure which may be proved hereafter to be necessary to ensure the maintenance of just and proper relations between the South Sea Islanders and their employers. It will be recollected that, in 1862, the Queensland Parliament passed an "Act to give the force of law to regulations for the introduction and protection of labourers from British India" (26 Vict., No. 5),† and that the regulations published under the authority of that Act received the sanction of the authorities of British India, and the approval of the Imperial Government. Hitherto, however, no advantage has been taken of the provisions of this Act, for those settlers who look to the employment of coloured labour on their sugar and cotton plantations seem to prefer South Sea Islanders to Indians, on the ground (as I am informed) that the former are at once stronger and more tractable than the latter.

†See Statutes of  
Queensland, vol.  
1, p. 831.

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 11

8. I have on several occasions visited the principal plantations on which immigrants from the South Sea Islands are engaged: and, last week, I made it my business to inspect the plantation of Captain Towns, who is (as it has been already said) the first and by far the largest employer of this kind of labour. One hundred and sixty (160) islanders were then paraded before me; and they all seemed to be well fed, well clothed, and perfectly contented. Many of them are to be soon restored to their homes at the cost of Captain Towns, as the period of their engagements is about to expire; and several of these men stated that they would return to Queensland shortly, and would induce their wives and numbers of their countrymen to accompany them.

Queensland.

9. In my despatch, No. 63,\* of the 16th November ultimo, I transmitted a full <sup>Page 5.</sup> account of the Townsville Plantation referred to above, and of the general progress of the cultivation of cotton in Queensland. Mr. Charles Cowper, for many years at the head of the Administration in New South Wales, is now a partner in the firm of Towns & Co., and accompanied me on my recent visit. From him I learned that at least four hundred (400) bales of cotton, of the average value of about £15, will be exported during the present year from this single plantation.

I have, &c.,  
G. F. BOWEN.

[Enclosure in No. 3.]

Encl. in No. 3.

EXTRACT from the Minutes of Proceedings of the Executive Council of Queensland.

At the Government House, Brisbane.

Present:—His Excellency the Governor in Council.

HIS Excellency the Governor lays before the Council a letter (dated 25th April, 1867,) addressed to His Excellency by Captain Luce, R.N., now commanding Her Majesty's Naval Forces on the Australian Station.

This letter states that Captain Luce had lately received reports of the loss of several vessels, and of the murder of several Europeans at certain of the South Sea Islands; and that it appears, from a letter written by a trader in those seas, that "the natives say that they are perpetrating these atrocities in revenge for the loss of many of their countrymen, who were carried away three years ago to Queensland and the Fiji Islands by Europeans, who hired them as labourers, and promised to return them to their homes in twelve months."

Captain Luce asks for information on the subject from the Government of Queensland.

The Council deliberate. They observe that the first and principal importer of South Sea Islanders as labourers into this Colony is the Honorable Robert Towns, Member of the Legislative Council of New South Wales, and resident at Sydney, but the owner of a cotton plantation in Queensland. This gentleman can give Captain Luce more information on the subject than any other person, and they suggest that personal application should be made to him. Moreover, it is believed that the small number of South Sea Islanders who have hitherto come to work in Queensland on the new sugar and cotton plantations have all been landed from ships belonging to Sydney.

The Council further observe that the Masters' and Servants' Act (25 Vict., No. 11.), now in force in Queensland, provides for the due enforcement by both parties of labour contracts, whether made in this Colony or in foreign countries. Should it be proved that further legislation is required for the due protection of the South Sea Islanders, the Council do not doubt but that the Colonial Parliament will be ready to pass any measures which facts and documents hereafter to be laid before them may show to be absolutely necessary.

It need scarcely be said that the Responsible Ministers are anxious to punish all fraud and injustice whenever committed, and to secure the inhabitants of the Colony, of every class, in the full enjoyment of their rights.

The Council advise that the proper Government officers be directed to procure the information respecting the number of South Sea Islanders now in Queensland, &c., as asked for by Captain Luce, R.N., and also that the Police Magistrate of the district be ordered to inspect periodically the plantations on which any such islanders may be employed, and to report to the Colonial Secretary the results of such inspection.

A. V. DRURY,  
Clerk of the Council.

## No. 4.

COPY of a Despatch from Acting Governor O'Connell to His Grace the Duke of Buckingham and Chandos.

(No. 12.)

Government House, Brisbane, Queensland,  
27 January, 1868.

No. 4.  
Acting Governor  
O'Connell to the  
Duke of Buck-  
ingham and  
Chandos.  
27 January, 1868.

MY LORD DUKE,

I have the honor to transmit to your Grace herewith a Petition for presentation to the Queen, purporting to be a Petition from a number of the inhabitants of the Colony of Queensland in public meeting assembled in the City of Brisbane, praying that Her most gracious Majesty will be pleased to prohibit this traffic in human beings (meaning the importation of natives of the South Sea Islands into Queensland for employment on sugar and cotton plantations and on sheep and cattle stations), as being a development of the slave trade, with its attendant evils, in its most modern form.

2. This Petition was brought to me by a deputation consisting of Mr. Alderman Jeays, who signs it, and who was formerly Mayor of this city, and Mr. Robert Short, a gentleman connected with the Press, and one who has delivered several public lectures adverse to the importation of South Sea Islanders.

## 12 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Queensland.

3. The Petition being couched in respectful terms, and the deputation waiting on me to request that it might be forwarded being inhabitants of this city of good fame and respectability, I have deemed it my duty, in view of the common right of Her Majesty's subjects to lay their grievances before Her by Petition, to enclose this to your Grace for presentation.

\* Page 10.

† Page 13.

4. The subject to which this Petition refers, is one which has already been brought under your Grace's notice by Governor Sir G. F. Bowen in his Despatch (No. 36,\* of the 13th July, 1867), and I directed your Grace's answer to that Despatch (No. 40,† of the 9th November, 1867), which was received by the last mail, to be laid before both Houses of Parliament during the last week.

5. I may inform your Grace that there is a Bill now before the Parliament of Queensland, and which has already passed the Legislative Council, intended to protect and regulate the immigration of South Sea Islanders into this Colony, and that this Bill contains all the provisions for their protection, pointed out in your Grace's Despatch, above alluded to, of the 9th November, 1867.

6. I believe and trust the fears of the persons who now petition Her Majesty in reference to the employment of South Sea Islanders in this Colony are unnecessarily excited; at least, I am sure that when once within the boundaries of the Colony they will be safe from any treatment which by any stretch of imagination can be termed slavery.

Enclosure, No. 2.

7. I do not feel so certain, however, as to the mode in which they have hitherto been allowed to be engaged by unauthorized persons on the islands from whence they come; but the Bill, of which I enclose a copy in its latest stage, endeavours to provide a remedy in this respect, and I have no doubt your Grace's communication to the Lords Commissioners of the Admiralty, as mentioned in your Despatch (No. 40, of 9th November, 1867), will have a beneficial effect.

I have, &c.,  
M. C. O'CONNELL.

[Enclosure 1 in No. 4.]

Encl. 1 in No. 4. To Her Most Gracious Majesty Victoria, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, and so forth.

The Petition of a Number of the Inhabitants of the Colony of Queensland, in Public Meeting assembled, in the City of Brisbane,—

Humbly Sheweth,—

That your Majesty's Petitioners have viewed with much anxiety the introduction into this Colony of a large number of natives of the South Sea Islands by private individuals to work as labourers on sugar plantations, cotton plantations, and on sheep and cattle stations.

That these natives have been, and are still being, brought without the sanction of your Majesty's Government, without any Colonial law to control or regulate their introduction, to protect them afterwards, or to secure their return home on the expiration of term of service.

That your Petitioners have reason to believe that many of these natives have been kidnapped and brought forcibly here, and others under false and deceptive representations; while many have been induced to come by the promise that they should be conveyed home within twelve months; that this promise has not been fulfilled, but, on the contrary, that many of these natives have been detained in the Colony for periods of three years and upwards, on the allegation they had engaged for that time.

That this breach of faith, combined with the illegal manner in which these natives have been obtained, has led to the loss of several vessels, and to the murder of several Europeans at the South Sea Islands by the natives in revenge for the abduction and detention of their kindred. These facts are confirmed by Captain J. P. Luce, of your Majesty's steamer "Esk," the Senior Naval Officer on the Australian Station, who communicated to Sir George Ferguson Bowen, on the 25th of April, A.D. 1867, as follows:—"I have lately received reports of the loss of several vessels, and the murder of several Europeans at Hinchinbrook, and other islands of the New Hebrides group. I enclose an extract from a letter written by a trader in that group, wherein you will see that he is informed the natives say they are doing these atrocities in revenge for the loss of many of their countrymen who were carried away three years ago to Queensland and Fiji Islands by Europeans who hired them as labourers, and promised to return them to their homes in twelve months."

Your Petitioners have regarded with dismay the introduction of an inferior and uncivilised race into this Colony to supplant the British and European labourers, as it will have the effect of reducing to destitution and inactivity the working classes of the Colony who have been induced to emigrate here in large numbers by the hope of finding in Queensland an independent home and permanent employment, and they earnestly advert to such introduction being irreconcilably opposed to the constitution of the Colony, and the intention of its foundation.

Wherefore your Majesty's humble Petitioners most humbly pray that your most gracious Majesty will be pleased to prohibit this traffic in human beings as being a development of the slave trade, with its attendant evils, in its most modern form.

And your Most Gracious Majesty's Petitioners, as in duty bound, will ever pray.

Signed by the Chairman, at the unanimous request of, and in behalf of, the said public meeting,—

JOSHUA JEAYS.

Brisbane, Queensland,  
16 January, 1868.

[Enclosure 2 in No. 4.]

Encl. 2 in No. 4. This Public Bill originated in the Legislative Council, and, having this day passed, is now ready for presentation to the Legislative Assembly for its concurrence.

Legislative Council Chamber, Brisbane,  
19 December, 1867.

(Signed) HENRY JOHNSON,  
Clerk of the Parliaments.

QUEENSLAND.

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 13

## QUEENSLAND.

Queensland.

ANNO TRICESIMO PRIMO VICTORIÆ REGINÆ.

No.

*A Bill to Regulate and Control the Introduction and Treatment of Polynesian Labourers.\**

WHEREAS many persons have deemed it desirable and necessary, in order to enable them to carry on their operations in tropical and semi-tropical agriculture, to introduce to the Colony Polynesian labourers: And whereas it is necessary for the prevention of abuses, and for securing to the labourers proper treatment and protection, as well as for securing to the employer the due fulfilment by the immigrant of his agreement, that regulations for the control of such immigration should be framed: And whereas it is necessary that such regulations should receive direct legislative sanction: Be it therefore enacted, by the Queen's most excellent Majesty, by and with the advice and consent of the Legislative Council and Legislative Assembly of Queensland, in Parliament assembled, and by the authority of the same, as follows:—

1. It shall not be lawful for any person or persons to introduce any Polynesian labourers into the Colony of Queensland, unless and except in accordance with the regulations contained in the Schedule to this Act, and the forms thereunto attached. Not lawful to introduce Polynesian labourers, except according to regulations.

## SCHEDULE.

1. All persons desirous of importing labourers from the South Sea Islands shall make application to the immigration agent at Brisbane, in the Form A. appended hereto, stating the number required, and how they are to be employed; such application to be accompanied by a bond in Form K., signed by applicant and two sureties, to secure the return of the labourers to their native islands at the expiration of three years, or 39 moons, from date of arrival. A license in Form C. may then be issued, authorizing the applicant to import the number required. Form of application.

2. The master of any vessel arriving with Polynesian labourers shall be bound to report, on arrival at any of the ports of Queensland, the number of such labourers, and the names of the employers to whom they have been, or are to be, indentured; and shall not be permitted to land any of the immigrants until he has received the certificate (Form L.) of the immigration agent, or other officer of the Government empowered to grant same, that the following regulations have been complied with:— Master of vessel to report arrival, &c.

(1.) The production by the master of the vessel of a certificate in Form I., or certificates signed by a consul, missionary, or other known person, that the labourers have voluntarily engaged themselves and entered into their agreements with a full knowledge and understanding of the nature and conditions of same, and that when they were embarked they were not known to be afflicted with any disease, and were neither maimed, halt, blind, deaf, dumb, idiotic, or insane. Master of vessel to produce certificate.

(2.) The production by the employers or parties to whom the labourers are, or are intended to be, indentured, of the certificate in Form C. authorizing them to recruit. Employers to produce certificate of Immigration Agent.

(3.) That proper means have been taken, since the arrival of the ship, by the Immigrant Agent or other officer, by explanations, questions, and inquiries amongst the labourers themselves, to ascertain whether they have a proper understanding of the conditions of the agreements, and did voluntarily enter into same. That the agreements have been signed in the form prescribed, and the employers bound to observe the rules laid down for the treatment and management of the labourers. Immigrants to understand the nature of their agreements.

3. All agreements (Form D.) shall be completed on board the ship, if possible, and the immigrants taken from same by their employers; and should there arise a necessity for taking any of the labourers to the immigration depot, there maintenance there shall, in all cases, be borne by the employer. Agreements to be completed on board ship where practicable.

4. The arrival of the immigrants shall be registered in the immigration office, Brisbane, or at the custom house in any other port; and, in the latter case, a copy of the register shall be forwarded by the customs officer to the immigration office by following mail. Immigrants to be registered on arrival.

5. The scale of rations and wages shown in Form G., and printed on the form of agreement, shall in no case be deviated from. Scale of rations.

6. A register of hired Polynesian labourers shall be kept by each employer, in Form E., which shall be open for the inspection of any magistrate, or other person appointed by Government for the purpose, who shall record his visit therein. No entry, except the state of muster at the expiration of each quarter, shall be made in the register of the employer, unless from a document of hiring, transfer, death, or desertion, countersigned by the immigration agent. Register to be kept by employer.

7. No transfer of an immigrant shall be made except with the full consent of the original employer, the immigrant, and the Government, in Form F., and no immigrant shall be allowed to leave his employment under transfer until the same has been recorded in the books of the immigration office. All transfers shall be signed by employer and immigrant in presence of a magistrate, who shall before signing explain to the latter the full meaning and effect of such transfer; and all moneys due to the original employer under the transfer shall be adjusted between him and the transferee by the magistrate, and their signatures to the transfer shall be full acquittance for the same. Provided that every transferee shall enter into a bond similar to that of the transferor prior to any transfer being consented to. Transfers, how made.

8. All deaths or desertions shall be immediately reported to the nearest bench of magistrates and to the immigration agent. Deaths or desertions to be reported immediately.

9. Any person supplying Polynesian labourers with spirits shall be punishable as at present in the case of aborigines, under 47th clause of "Licensed Publicans Act," 13th Vict., number 29. Polynesian labourers not to be supplied with spirituous liquors.

10. All masters of vessels about to proceed to the South Sea Islands, in order to obtain labourers therefrom, shall enter into a bond, in Form B., with two sufficient sureties, for the prevention of kidnapping, and for the due observance of these regulations so far as they are concerned. Masters of vessels to execute bonds prior to proceeding to hire labourers.

11. No ship shall carry on her lower passenger deck a greater number of passengers than in the proportion of one statute adult to every 12 clear superficial feet allotted to their use. Provided that the height between decks shall not be less than 6 ft. 6 in. from deck to deck, when the height of the 'tween decks exceeds 6 ft. 6 in., an extra number of passengers may be taken at the rate of 1 for every 144 cubic feet of space. Each ship must be fitted with open berths or sleeping places, in not more than two tiers—the lowest tier shall be raised 6 inches from the deck, and the interval between the two tiers of berths shall not be less than 2 ft. 6 in. Number of passengers. (Vide Imperial Act, 16 & 17 Vict. c. 84.)

12. The length of the voyage to or from the South Sea Islands shall be computed at thirty days for sailing vessels, and fifteen days for steamers. Length of voyage.

13. Three quarts of water daily during the voyage shall be allowed to each adult, exclusive of the quantity used for cooking purposes. Water on the voyage.

14.

\* The Act, as passed by the Legislature on the 18th February, 1868, and assented to by the Acting Governor on the 4th March, 1868 (No. 47), is printed as an Appendix.

## 14 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Queensland.  
Provisions on  
the voyage.

14. Provisions shall be issued to each statute adult during the voyage according to the following scale, namely:—

## DAILY PROVISIONS FOR STATUTE ADULT.

	lbs.	oz.
Yams ... ..	4	0
Or rice ... ..	1½	0
Or maize meal ... ..	1½	0
Meat (pork or beef) ... ..	1	0
Tea ... ..	0	0½
Sugar ... ..	0	2
Tobacco (during good behaviour) per week ... ..	0	1½

The undermentioned clothing shall be supplied to each labourer immediately on embarkation, in advance:—

- 1 Flannel shirt.
- 1 Pair trousers.
- 1 Blanket.

Nominal return  
to be sent at  
expiration of  
each quarter.  
Penalty for har-  
bouring runaway  
labourers.

15. Nominal returns of labourers shall be made by employers of South Sea Island labour to the immigration agent, at the expiration of each quarter, in Form H.

Breaches of regu-  
lations punish-  
able by fine.

16. All persons harbouring or employing Polynesian labourers, otherwise than under these regulations, without reporting the same to the nearest bench of magistrates and to the immigration agent in Brisbane, shall be liable, on conviction thereof, to a penalty of five pounds.

17. All breaches of these regulations shall be punishable by fine, to be recovered in a summary manner before two justices of the peace; for the first offence a fine not exceeding two pounds, for second and subsequent offences not exceeding five pounds nor less than two pounds.

Capitation tax  
for evasions of  
these regulations  
by shipmasters.

18. A capitation tax of £20 per head shall be levied on all vessels in which South Sea Island labourers are introduced into this Colony otherwise than in accordance with these regulations.

## FORM A.

Application for Permission to introduce South Sea Island Agricultural or Pastoral Labourers.

I request to be allowed, in accordance with the regulations now in force, to procure from the South Sea Islands immigrants for agricultural or pastoral purposes, to be employed in the district.

## 18 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Queensland.

2. I beg, therefore, to inform your Grace that I have signified the Royal Assent to this Bill under the advice of the Attorney General of the Colony, Mr. Pring, given in the following terms in his report, forwarded through my Private Secretary :—

"In reply, I have the honor to report that, in consequence of the continued increase and importation of the South Sea Islanders into this Colony, it appears to me urgently necessary that this Bill should be brought into immediate operation; and although it may be characterized as a Bill of an extraordinary nature, still as it does not fall within the class of Bills specified in the Royal Instructions for reservation for the signification of Her Majesty's pleasure, there is, in my opinion, no objection to His Excellency the Acting Governor giving his assent to this Bill."

\* Page 3.

3. This subject, of the employment of Polynesian labourers in Queensland, was first brought under notice in a Despatch (No. 49,\* of the 16th September, 1863) from Governor Sir George Bowen to His Grace the Duke of Newcastle, and it has furnished the matter of several subsequent communications, to the last of which your Grace's despatch of the 9th November, No. 40,† was a reply.

† Page 19.

4. In this latter communication your Grace very justly surmises, that "as the experiment seems to have succeeded with Captain Towns and Captain Whish, the principal employers of these labourers, it is probable that other settlers may desire to follow their example;" for I have now to report that such has been the case.

5. I have obtained from the Collector of Customs in this port a return, which I enclose, showing the number of vessels entered at the different ports of the Colony with Polynesian labourers during the four months ending 29th February, 1868, by which it appears that during that time seven vessels, arriving in five different ports of the Colony, brought to these shores nine hundred and eighteen (918) of these people; and I can add that some are employed, not only on cotton and sugar plantations, but also on sheep stations.

6. The time, therefore, seems to have fully arrived when it is necessary to provide for their protection and their just treatment by some law more applicable to their particular cases than the ordinary one which provides for the enforcing of engagements between masters and servants would be, if standing alone.

7. The law to which I am now referring seems to me amply to meet the case in point; it establishes in the Government a sort of protectorate over these persons and their engagements; and as far as possible it provides that they shall not be engaged except under precautions which ought to prevent any chance of kidnapping.

‡ Page 19.

8. I perceive, by your Grace's despatch, No. 1,‡ of the 8th January last, received this day, that the Lords Commissioners of the Admiralty have instructed the Senior Naval Officer on the Australian Station to make inquiries, and report whether any person has been improperly transported to the Fiji Islands by British subjects, and I can assure your Grace that the Government of this Colony will be prepared to give every assistance and support to such inquiries, should any cases of the nature referred to be found to attach to the emigration of Polynesians into Queensland.

I have, &amp;c.,

M. C. O'CONNELL.

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 19

## No. 2.

Queensland.

COPY of a Despatch from His Grace the Duke of Buckingham and Chandos to Governor Sir George F. Bowen, G.C.M.G.

(No. 40.)

Downing-street 9 November, 1867.

SIR,

I have to acknowledge the receipt of your despatch, No. 36,\* of 13th July, on the subject of the employment in Queensland of the natives of some of the South Sea Islands.

The practical question which arises on your despatch is, whether any measures beyond those already in force can be taken for the protection of these islanders.

So far as regards the people now in the Colony, there seems no reason to doubt that they have been treated kindly and loyally; nor, apparently, would there be any ground for apprehension if the immigration remain as limited as it is at present. But as the experiment seems to have succeeded with Captain Towns and Captain Whish, the principal employers of these labourers, it is probable that other settlers may desire to follow their example, especially if the cultivation of cotton in Queensland should, as may be expected and hoped, prove remunerative, in which case the adoption of some fixed regulations for the protection of these people may be desirable.

It would not be necessary in the case of the small number of South Sea Islanders likely to be introduced, to establish such detailed and elaborate regulations as those made by the Act of 1862, regulating the introduction of Indian immigrants into Queensland.

But if the Legislature should be willing to entrust the Governor with a power similar to that conferred by the above Act, of making rules for the protection of South Sea Islanders, all that is necessary might be done.

The following are, I think, the principal points to which such rules should be directed:—

1. That the ships to be employed in the service should have adequate accommodation, should be properly found, and should not carry above a prescribed number in proportion to their deck area.
2. That no one should be allowed to introduce these immigrants except under a non-transferable license from the Government.
3. That the general tenor of the contract to be entered into with them should be prescribed by the Government, and that the contracts, to be valid, should be countersigned by the Immigration Agent on the arrival of the immigrants.
4. That the immigrants should be placed under the special superintendence of the local magistracy; and, as a consequence, that none should be allowed to estates so remote as to be withdrawn from such superintendence.
5. That a power should be reserved to the Government of cancelling a contract in case of the ill usage of the immigrant by his master, or of the non-fulfilment of the conditions of the contract.
6. That the contract should not be for a period exceeding five years; and,
7. That security should be taken for the reconveyance of the immigrant to his own country at the time stipulated in the contract, and for the grant to him of fair compensation for any unreasonable delay in fulfilling that condition.

A regulation might also be added to provide for the re-engagement of an immigrant who may not wish to return to his country at the end of his five years' contract. In this case the liability to provide for a back passage would rest with the new employer, the first employer paying the immigrant some compensation in lieu of passage.

I shall be glad to learn what course your Government may propose to pursue in the matter.

I have informed the Lords Commissioners of the Admiralty of the steps taken in consequence of Captain Luce's statement regarding the abduction of the South Sea Islanders to Queensland, and have left it to their Lordships to take such measures as would seem to them practicable and expedient, in order to ascertain whether any persons had been improperly transported to the Fiji Islands by English subjects.

I have, &c.,  
(Signed) BUCKINGHAM & CHANDOS.

## Despatches from the Governor.

### No. 1.

No. 1.  
Governor the  
Right Hon. Sir  
J. Young, to the  
Right Hon. the  
Earl of Carnar-  
von.  
12 March, 1867.

COPY of a Despatch from Governor the Right Honorable Sir John Young, Bart., to the Right Honorable the Earl of Carnarvon.

(No. 22.)

Government House, Sydney,  
12 March, 1867.

(Answered, No. 59, 3 December, 1867, page 24.)

My LORD,

I have the honor to forward herewith copies of two communications from Mr. J. Havinden, Master of the schooner "Challenge," reporting the murder of the white crew of the brig "Curlew" by the natives of Hinchinbroke Island, and also the murder of "three white men by the natives of the Sandwich Island, one of the New Hebrides."

2. I forwarded copies of these letters to Commodore Maguire, under cover of my communication to him of yesterday's date, of which I also send a copy for your Lordship's information.

I have, &c.,

(Signed) JOHN YOUNG,

Encl. 1 in No. 1.

[Enclosure 1 in No. 1.]

Schooner "Challenge," New Caledonia,  
16 January, 1867.

Sir,

I beg to report that I have been informed by natives of the Sandwich Island that the brig "Curlew," of Sydney, had been taken by natives of Hinchinbroke Island; captain and the white crew murdered; ship burnt.

To the Honorable  
Colonial Secretary.

I remain, &c.,  
(Signed) J. HAVINDEN,  
Master.

Communicate this information to Messrs. Towns & Co., the supposed shipowners. I think the case is one in respect of which his Excellency may consider it necessary to request the aid of the Naval authorities here.

5 March, 1867.

(Signed)

JAMES MARTIN,  
Attorney General and Premier.

Encl. 2 in No. 1.

[Enclosure 2 in No. 1.]

Schooner "Challenge," New Caledonia,  
16 January, 1867.

Sir,

I beg to report the murder of three white men by the natives of the Sandwich Island, one of the New Hebrides, Saturday, 24th November, trading in the Havannah Harbour, Sandwich Island. I was informed by the natives that the schooner "Mary Jane," had been brought into the South Harbour by the natives, and that Edward Unthank, John Perry, and Harry Collins had been murdered by the natives of the Island of Tanna. I returned on board immediately and got under way, and proceeded to the South Harbour, having a light head wind. I did not reach until after sunset, but could see a small schooner at anchor inside the reef, close to a small island; at 8 p.m. anchored as close to the island as I could with safety. A native came on board and said he was one of the schooner crew, and confirmed the report; at 4 a.m., Sunday, 25th November, manned and armed the boat, and pulled in for the schooner, and getting alongside found the natives had left her, and taken sails, spars, ropes, and all the stores on shore. I took possession of her, and placed Mr. Riddle, my chief officer, on board; I then landed and sent for the chief; he came; I made him understand that all the spars, sails, ropes, and stores he had taken from the schooner should be put on board; he ordered the natives to bring the things; such I demanded, the chronometer, and a breech-loading rifle which I had seen on board; those were handed to me with all the ships papers. I then engaged ten natives of another tribe to assist in towing the schooner to harbour. At 8 p.m. got her alongside the "Challenge." Monday, 26th November repaired the sails, and lent some from the "Challenge." At 2 p.m. weighed, and worked out of the harbour in company. I ordered Mr. Riddle to the port of Pucba, myself being bound for Bylow, New Caledonia. The "Mary Jane" arrived at Pucba, 3rd December, all well; I have left her in charge with Mr. Henry, with all stores and chronometer. The "Mary Jane" is a small fore and aft schooner of 16 tons, and cleared at Sydney the middle of September, 1866, and was the property of Unthank and Perry. Since writing the above I have been on Sandwich, and the natives say it is false about the white men being killed on Tanna, as they were killed on board the schooner; Unthank was killed below, asleep; Perry was killed at the helm, and Harry Collins was made to take the schooner to Sandwich, and when in sight of the island was murdered and thrown overboard. I have every reason to believe the above, as two of my crew belonging to the same island left me on Sandwich, being afraid I should make them fast; they had been with me eight months on board the "Sylvanus," and "Challenge."

I have, &c.,  
J. HAVINDEN,  
Master.

To the Honorable the Colonial Secretary.

[Enclosure

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 21

[Enclosure 3 in No. 1.]

New South  
Wales.Government House, Sydney,  
11 March, 1867.

Encl. 3, in No. 1.

Sir,

I have the honor to forward herewith copies of two communications which have been received by the Colonial Secretary from Mr. J. Havinden, master of the schooner "Challenge."

2. You will perceive that Mr. Havinden reports that the natives of Hinchinbroke Island seized the brig "Curlew," murdered the white crew, and burnt the ship. In his other letter he reports the murder of "three white men by the natives of the Sandwich Island, one of the New Hebrides."

3. I forward these communications for your information as they were sent to me, leaving it to you to test their accuracy, and to take such further steps as you may think requisite.

4. The firm of Messrs. Towns and Co., named in the Attorney General's Minute, is highly respectable, and in the first rank of shipowners in this city.

I have, &amp;c.,

(Signed)

JOHN YOUNG.

Commodore Rochford Maguire, C.B.,

H.M.S. "Challenger."

## No. 2.

COPY of Despatch from Governor the Earl of Belmore to His Grace the Duke of Buckingham and Chandos.

(No. 26.)

Government House, Sydney,  
29 February, 1868.

No. 2.  
Governor the  
Earl of Belmore  
to His Grace the  
Duke of Buck-  
ingham and  
Chandos.  
29 Feb., 1868.

MY LORD DUKE,

I have the honor to forward herewith, for your information, a copy of a Petition which I have received from eight Christian Missionaries, representing the Presbyterian Church in the New Hebrides, accompanied by a statement of facts with regard to the practice now being pursued of engaging natives of these islands for Queensland and other places, and praying that I would take steps to cause an investigation to be made into what they believe to be a revival of the slave trade.

Enclosure No. 1.

2. On receipt of these documents, I at once wrote to Commodore Lambert, and herewith enclosed is a copy of that officer's reply, from which you will perceive that before proceeding to the Islands he will communicate further with me.

Enclosure No. 2.

3. Subsequently I brought the whole of these documents under the notice of my Responsible Advisers, and herewith enclosed is a copy of their opinion on the subject.

Enclosure No. 3.

Enclosure No. 4.

Enclosure No. 5.

Enclosure No. 6.

4. All has thus been done by me that could be done under the circumstances.

I have, &amp;c.,

(Signed)

BELMORE.

His Grace the Duke of Buckingham and Chandos,

&c., &c., &c.

[Enclosure 1 in No. 2.]

To His Excellency the Right Honorable the Earl of Belmore, &c., &c., Governor-in-Chief of New South Wales, and Captain-General and Vice-Admiral of the same.

Encl. 1 in No. 2.

May it please your Excellency,—

The Petition of the undersigned humbly sheweth,—

That your Petitioners are Christian Missionaries representing Presbyterian Churches labouring on the six southern islands of the New Hebrides group, namely, Aneityum, Futuna, Tanna, Aniwa, Eromanga, and Faté.

That in their capacity as such, they, of course, are deeply interested in the elevation of the natives of these islands physically and socially, as well as morally and spiritually, so that while on the one hand any plan which has a tendency to promote so desirable an object, has not only their perfect acquiescence, but their hearty support; on the other, they cannot but regard it as their duty to oppose any system which is found to interfere with the natural rights of the natives, and with the furtherance of those ends for which Missionaries settle among them.

That in fulfilment of their duty, and in the interests of humanity, they feel themselves bound to lay before your Excellency certain facts and allegations, as embodied in the accompanying "statement," relating to a system of traffic in human beings, as at present carried on among these islands.

That your Petitioners humbly and earnestly request your Excellency that an investigation be made into the working of this traffic; that it be put under such supervision and control as shall prevent the rights of the natives, as human beings, from being ruthlessly violated; and that some one be appointed to care for the interests, and investigate the grievances, of those natives of these islands, who reside in the Colony of which you are the head.

And your petitioners will ever pray.

(Signed)

JOHN GEDDIE, D.D.  
JOHN INGLIS.  
JOHN G. PATON.  
JOSEPH COPELAND.  
DONALD MORRISON.  
J. D. GORDON.  
JAMES COSH, M.A.  
THOMAS NEILSON.

[Enclosure

## 22 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

New South  
Wales.

[Enclosure 2 in No. 2.]

Encl. 2 in No. 2. STATEMENT by the New Hebrides Mission regarding the traffic in natives, as at present conducted among the Islands of that Group.

For some time back, and more especially within the last few years, this Mission has had its attention directed to the fact, that a large number of the natives of this group are being carried away in vessels, ostensibly as hired labourers, to Queensland, Fiji, New Caledonia, Tahiti, Torres Straits, and other parts. With reference to the full extent to which this system is carried on, this Mission is not at present in a position to furnish accurate statistics, but we are fully aware that a large number of vessels are engaged in it. Within the course of the last eighteen months, vessels directly or indirectly engaged in this traffic have called at the one island of Faté no fewer than eighteen times, and we are aware that as many as 250 natives at least, out of seven villages of that island, are at present absent from their homes engaged in the service of white men. We are further credibly informed that several of the smaller islands in the northern part of this group have been almost entirely stripped of their male population.

The vessels engaged in this traffic, so far as known to us, sail under one or other of three flags—the British, the American, and the French. They vary in size from ships of seven or eight hundred tons to small schooners of eight or ten tons.

There are various circumstances connected with this system as at present conducted among the islands of this group, to which we deem it our duty to direct public attention.

1st. Many of these natives are taken away fraudulently and by force from their native lands.

*Instance.*—Towards the close of last year a vessel sailing under the British flag, bound for the Fijis, having on board 110 natives from northern islands of this group, lay off Fil Harbour, Faté. Some of the natives of Pango put off to her in a canoe. They were able to converse with the natives on board, as some of them had resided on the islands whence they came. As they neared the vessel some of the natives on board warned them not leave their canoe, adding, "We came off to her in our canoe to trade as she lay to off our shores. While we were thus engaged she bore away, and when we attempted to leave, the crew prevented us, and cut our canoes adrift. Thus they stole us from our land, and if you board her, you will share the same fate. Nor does she come to anchor anywhere lest we escape by swimming ashore."

Other instances of the same kind can be given.

2nd. Many of these natives suffer great hardships and privations on the voyage.

*Instance.*—In the beginning of this year (1867) a small schooner bound for the Fijis, having on board 35 natives from different islands of this group, came to anchor in the harbour of Aneityum. She then started on her voyage, and after having been out a fortnight, returned, reporting that she had met with unfortunate weather, and that her provisions were exhausted. In fact, the captain acknowledged that a number of the natives were reduced by famine, that they could not come out of the hold; and this statement was fully borne out by their wretched appearance.

Other instances of the same kind can be given.

3rd. Some of these natives suffer severe bodily injury, and even death, at the hands of those who carry them away, without any redress or any inquiry being made after their blood. This naturally leads to their cherishing feelings of revenge, and taking opportunities of retaliation against white men generally.

*Instance.*—Towards the close of last year (1866) the people of Emel (Faté) pirated a small vessel and murdered the crew, consisting of three white men. When visited this year by Her Majesty's ship "Falcon" for the purpose of investigating this outrage, they stated, in self-defence, that no fewer than four of their men had been barbarously murdered by persons who had carried them away from their native island, giving names, dates, and circumstances.

Other instances of a similar kind can be given.

4th. In the case of those who go of their own accord, the nature of the agreements entered into with them is very imperfectly, and, in most cases, not at all understood by them; and there is no real security that we know of that these agreements will be faithfully fulfilled by those who carry them away.

This has been acknowledged by those who carry them away, and has been stated to us by persons in the Fijis who have access to natives imported there. It ought to be borne in mind that almost every island in Western Polynesia has a distinct language of its own. The only medium of communication between the natives and the traders is the English language, and this is understood only by a few, and by them very imperfectly. On most islands it is not understood at all.

5th. Most of these natives, as is well known to us, are kept away from their native islands for longer periods than they were engaged for.

This statement is fully borne out by individual instances which have come under our own observation, and by the fact that it is the universal complaint of the natives whenever we come in contact with them. One case of many we may mention:

In August 1866, a small schooner about ten tons burden, took 26 natives from the islands of Emon and Faté to Fiji, for a term of six months. Up to this date (August 1867) not one of those taken from Faté at least has been returned.

6th. Many of these natives are very poorly paid.

*Instance.*—For five months' service on board a vessel trading in these seas a native of Faté received four handkerchiefs, a few pipes, and a few figs of tobacco.

Other instances of a similar kind can be given.

7th. The wives of many of those carried away, despairing of their husbands return, enter into relations with and become the wives of other men. This dissolution of social ties is a fruitful source of disturbance, of destruction of property, and of war.

*Instance.*—In July of this year (1867) a native of Pango, in the Island of Faté returned from Queensland. He had been away for about three years. During his absence, the wife he had left behind him became the wife of another man, on account of which the village had at the time been brought to the verge of a civil war. Immediately after his arrival in July last, hostilities began between the two parts of the village inhabited by the friends of the respective parties. A great deal of angry talk passed between them; threats were made of setting houses on fire. Several plantations were destroyed, and the utmost confusion and alarm prevailed for some days, when at length the matter was settled by the first husband consenting to give up his claim to the woman on condition of receiving twenty pigs as a solution. But the matter did not end there. A month or so after these occurrences, the woman whose second marriage had been the occasion of these disturbances, fled to the house of her former husband, and was received by him as his wife. This naturally led to the renewal of hostilities between the two ends of the village. And there is every reason to believe that, but for the presence of the Missionary and the intercession of the Christian party, the matter would not have been settled without bloodshed.

Other instances of a similar kind can be given.

8th. In almost all cases the men taken away are the strongest and most active in their villages, and by the removal of such men a more than ordinary proportion of old and infirm people, with women and children, remain, which materially interferes with the raising of food, the procuring of fish, and other work necessary to the well-being of the natives.

9th. With reference to those who return, we find that those who have been most often and longest away are generally the worst and most dangerous characters.

10th. The whole system is, so far as we know, under no adequate supervision or control, so that the natives of these islands are at the mercy of any man who can induce, or cajole, or force them to take a passage on board his vessel.

In

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 23

In these circumstances we have no hesitation in denouncing the trade in human beings, as at present carried on among these islands, as in violation of the natural rights of man, as calculated to be injurious to the social, moral, and spiritual interests of the natives, as demoralizing and degrading to the white men engaged in it, as in short a revival of the slave trade, without that security for the temporal well-being of those who are the subjects of it, which would be derived from the fact of their being the property of a man who had invested a large sum of money in their purchase.

Signed, on behalf of the New Hebrides Mission, by—

J. G. PATON, Chairman.  
JOS. COPELAND, Clerk.

Ancityum, New Hebrides,  
7 September, 1867.

New South

[Enclosure 3 in No. 2.]

Government House, Sydney  
17 February, 1868.

Sir,

I have the honor to enclose herewith a Petition which I have received from Christian Mission- Encl. 3 in No. 2.  
aries representing the Presbyterian Church, labouring on certain islands in the New Hebrides, as well as a statement regarding the system, as at present conducted, of so-called engagement of natives of the islands as labourers for Queensland and other places.

These gentlemen, understanding that it is your intention shortly to visit Queensland, have expressed a desire that I would bring the matter under your notice. I accordingly forward the documents in question, in order that you may take such steps as you may think requisite.

I have, &c.,  
(Signed) BELMORE.

Commodore Rowley Lambert, C.B., H.M.S. "Challenger."

[Enclosure 4 in No. 2.]

Her Majesty's Ship "Challenger," at Sydney,  
21 February, 1868.

My Lord,

I have the honor to acknowledge the receipt of your Excellency's letter of the 17th instant, Encl. 4 in No. 2.  
and to return the enclosures as requested.

Before proceeding to the islands I shall communicate further with your Lordship on the subject.

I have, &c.,  
(Signed) ROWLEY LAMBERT,  
Commodore and Senior Officer.

To His Excellency the Right Hon. the Earl of Belmore, &c., &c.

[Enclosure 5 in No. 2.]

MEMORANDUM of His Excellency the Earl of Belmore.

24 February, 1868.

Memorandum,

I wish to draw the attention of my Responsible Advisers to the accompanying papers relating Encl. 5 in No. 2.  
to the engagement of natives of islands in the New Hebrides as labourers in Queensland and other places.

These documents were submitted to me by the Rev. Dr. Steel, on behalf of a deputation consisting of two missionaries and himself, which was to have waited on me, but which was ultimately reduced to himself.

He requested me to draw the attention of Commodore Lambert to them, as that officer was about to proceed to Queensland; I have done so, and am in hopes that on his return he will be able, from inquiries which he may make there, to afford me fuller information with regard to the matter.

On the 17th Dr. Steel addressed the letter to me which I append herewith, and enclosed a copy of a Despatch from the Secretary of State to Governor Sir George Bowen, as published in a Sydney paper, from which I learn that this matter has attracted the attention of the Home Government. In fact, I am sure it will be a subject which will be viewed in a serious light by the Imperial Parliament.

As far as my information goes, none of these islanders are actually employed in this Colony, although they are by residents in this Colony owning estates in Queensland.

But I gather that ships sailing from Sydney are engaged in this business, which circumstance, I think, gives the Government of New South Wales a *locus standi* in the matter.

I therefore submit these papers to my Responsible Advisers, with the object of ascertaining their views as to the desirability or necessity of legislation or interference in the matter, and to what extent, I find that an impression prevails in some quarters that the murder of the crew of the "Marion Renny," concerning which the Colonial Secretary has recently been in communication with me, is, to a great extent, connected with this traffic in South Sea Island labourers. At the same time there is nothing on the face of these documents to show this.

I intend to forward a copy of this Petition and Statement to the Duke of Buckingham and Chandos by the next mail.

I shall therefore be very glad if Ministers are in a position to give me their views by Saturday morning.

I have to request that the papers may be returned to me.

(Signed) BELMORE.

[Enclosure 6 in No. 2.]

OPINION OF RESPONSIBLE ADVISERS.

His Excellency,

These papers have been submitted for the opinion of the Attorney General, and have, by Mr. Encl. 6 in No. 2.  
Martin, been brought under the consideration of the Cabinet.

The papers do not appear to Ministers to present any case in which the Legislature of this Colony could be asked to interfere.

29 February, 1868.

(Signed) HENRY PARKES,  
Colonial Secretary.

A Despatch\* was recently received from the Governor of Queensland on the subject of the treatment of natives of the South Sea Islands who are employed as labourers in that Colony. In this Despatch the Governor reported that he had received a letter from Captain Luce, R.N., of Her Majesty's ship "Esk," from which it appeared that the outrages committed by the Islanders on Europeans were perpetrated in revenge for the loss of some of their countrymen who had been carried off to Queensland and the Fiji Islands by Europeans. The Governor's Despatch was sent to the Emigration Commissioners

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 25

Commissioners, with instructions to report what measures could be adopted for the protection of these islanders beyond those already in force. I am desirous to annex, for the information of the Lords Commissioners of the Admiralty, a copy of the Commissioners' Report, suggesting that an Act should be passed authorizing the Governor to make certain rules for regulating the introduction of these people into the Colony. These measures will be recommended for the adoption of the Government of Queensland.

It appears to his Grace to rest with their Lordships to take such steps as may seem to them practicable and expedient, in order to ascertain whether any persons had been improperly transported to the Fiji Islands by English subjects.

I have, &c.,  
(Signed) FREDERIC ROGERS.

## No. 4.

COPY of a letter from W. G. Romaine, C.B., to the Under Secretary of State for the Colonies.

Admiralty, 7 December, 1867.

SIR,

I have laid before my Lords Commissioners of the Admiralty your letter of the 15th November, and its enclosures, on the subject of the introduction of natives of the South Sea Islands into the Colony of Queensland, to be employed as labourers in the cotton plantations there. My Lords desire me to refer you to the correspondence which took place between the Colonial Office and this department in 1863, relative to the kidnapping of Polynesians to be employed on cotton plantations and other agricultural operations in Peru, and I now enclose, for the information of his Grace the Duke of Buckingham and Chandos, letters of 1863, from the Naval Commander in Chief on the Pacific Station on the same subject, and a copy of a letter, dated the 31st August last, No. 15, from Commodore Lambert, with its enclosure from the Commander of Her Majesty's ship "Falcon," reporting his proceedings at the New Hebrides, and the outrages committed towards the crews of British merchant vessels by the inhabitants, in consequence of some of their fellow countrymen having been kidnapped and ill-treated.

From the perusal of these papers his Grace will perceive how rapidly the trade of procuring labourers degenerated into slave hunting and slave trading. The collection of these savages brought on a system of kidnapping and piracy; and this in turn led, by a natural process, to the murder of innocent white men visiting the islands for the purposes of lawful trade.

My Lords believe, from the reports of their officers, that these islanders are incapable of understanding the nature of a written contract with an employer, or that any of them would knowingly and willingly engage themselves to work far from their own country at all, or at any place, even near their own home, for more than a few months.

My Lords are also strongly impressed with the belief, that whatever regulations may be made for the well-being and liberty of these people on their being brought nominally within reach of the laws and tribunals of Queensland, yet that no proper and efficient control can ever be exercised over the manner in which these people are obtained and placed on board ship. The task of their collection and shipment is, from the nature of the work, likely to fall into the hands of an unscrupulous and mercenary set, who, under pretence of persuading the natives into making engagements as labourers for a term of years, would not hesitate to commit acts of kidnapping, piracy, and murder.

It may be added, that of the wretched islanders imported into Peru nearly all perished from the nature of the work, and the change of living and climate. The Government of Peru was compelled, by the strong remonstrances of England and France, to put a summary end to the traffic.

Entertaining these views, my Lords are unable to concur in any recommendation with regard to framing an Act of the Colonial Legislature for the regulation of the introduction of these people into the Colony.

In compliance with his Grace's wishes, my Lords will send out orders to the Senior Officer on the Australian Station to make inquiries, and report whether any person has been improperly transported to the Fiji Islands by British subjects.

I have, &c.,  
(Signed) W. G. ROMAINE.

P.S.—I am to request that the original enclosures to this letter may be returned when done with.

## [Enclosure 1 in No. 4.]

REPORTING proceedings relative to inquiries into "Curlew," "Mary Ida," and "Kate."

Her Majesty's Ship "Falcon," at Sea, Lat. 19°40' S,  
Lon. 167°37' E., 4 August, 1867.

Encl. 1 in No. 4.

Sir,

In accordance with the directions received from Captain J. P. Luce, I have the honor to report the results of my inquiries respecting the capture and destruction of the "Curlew" brig, also the "Mary Ida" and "Kate" schooners, all the property of British subjects, by the natives of the New Hebrides.

From

Correspondence  
between Colonial  
Office and Admi-  
ralty.

From communicating with the Missionary at Aneityum, I first proceeded to the island of Tanna, and there learnt from a person named Daley, who was a passenger on board the "Curlew," that the chief mate, John Helier, had during the captain's absence, deliberately run away with the vessel from Aneityum, and that after landing him with several natives, passengers, at Port Resolution, she disappeared; the crew (with the exception of three Maré men), all natives of Hinchinbroke, had slipped the cable and taken her out during the night, having first murdered the chief mate and the only other white, a boy named John Cruikshank. There were one or two others, namely, a black cook and a Lascar; it is supposed they were murdered also, and that the Maré men were then compelled to pilot the vessel to Hinchinbroke, where she was run ashore, pillaged, and burnt. The Maré men, hearing afterwards they were to be murdered, took a boat and escaped to Sandwich, where they eventually obtained a passage to their own country.

2. On leaving Tanna I went to Vilu Harbour in the Island of Sandwich, for the purpose of communicating with the Missionaries there respecting the cases of the "Mary Ida," and "Kate" schooners. I was informed that the "Mary Ida," a small schooner in charge of her owners, Messrs. Unthank and Percy, with a man named Collins, who acted as navigator, came to Emel Island, on the north side of Vilu Bay, with the object, it would appear, of obtaining natives; and that soon after she left with ten from that island, intending to go first to Tanna on her way to New Caledonia. Just before reaching the former, these natives murdered the owners, and Collins was compelled to take the vessel back; when within sight of their island he was also murdered, and his body thrown overboard. Captain Havinden, in the schooner "Challenge," lying in Havanah Harbour, hearing of the circumstance, brought his vessel round to Emel Island, where he found the schooner "Mary Ida," the natives having stripped and plundered her of nearly everything. He succeeded in getting possession of the vessel, and recovering most of the property, which he sent to Pucbo, New Caledonia, in charge of his chief mate, as strong suspicion existed that the natives had been instigated to this atrocity by their chief, who, excited, it was supposed, by feelings of cupidity, had selected from among his tribe those who would carry out his object.

A boat was sent, manned by natives from Vilu, with a message that I wished to see him, promising him safety if he came; he at first refused, sending in his stead some inferior chiefs who were not concerned, but seeing the ship on her way to Emel Island he put off in his canoe and came on board.

When questioned with regard to the part he had taken in the affair, he did not seem to disavow his complicity, but gave the following reasons, which I append. It will be perceived that the grievances here enumerated have been spread over a number of years, and although the cause for the perpetration of the unlawful act cannot be divested entirely of the desire for plunder, I am of opinion that due credence should be given to those statements, which are felt as injuries in the native mind, and which may have incited them to this mode of resentment.

3. With respect to the "Kate," the case probably referred to in the postscript of my orders, she was another small schooner, owned by Mr. M. Russell, living at Seonka, Fiji, the substance of whose deposition is to the effect that, in the month of August, 1866, he sailed in his vessel from Seonka on a trading voyage to one of the adjacent islands, with a crew of half-castes and a European boy named Walter Hooker, a native of Auckland, New Zealand, with two passengers, named respectively John or James King and John Johnson, the latter having his wife with him. That while at anchor in the harbour of Wariki Taviuni, his crew at the time being on shore, Johnson, King, and the boy, together with Pisano, a native of Singapore, came on board, took forcible possession of his vessel, and after, severely maltreating him, went first to the island of Koro, where they threw him overboard on to the reefs with his hands tied, and then sailed away, the vessel not again appearing.

I learnt from the same Missionaries, who considered their information reliable, though derived through a native source, that a small vessel, corresponding to the "Kate," having three white men and a woman on board, was seen one morning in shore on the reef, the north-west side of Hinchinbroke; that the natives came down and murdered first two of the white men that came to land in the boat, then went off and murdered the remainder; the vessel being sent adrift. It was also reported they had been eaten.

4. Having obtained a native interpreter at Havannah harbour, I then proceeded to the Island of Hinchinbroke, with a view to communicate with the Chiefs, and ascertain as far as possible from them the truth of the statements I had received, and if there were any grievances they could bring forward in justification of the complaints against them.

I arrived off there on the afternoon of the 1st instant. While steaming along the west coast, saw the remains of the "Curlew" brig lying on a reef off the south-east end of the island, with her masts gone and topsides burnt to the water's edge. I selected an anchorage as close to the reef as possible; up to that time no natives had shown themselves, but immediately on anchoring they suddenly appeared in great numbers, all armed, brandishing their spears and tomahawks; one might be seen more conspicuous than the rest who came down to the water's edge, holding up a sugar-cane reed, as if wishing to communicate. A boat was first sent in with the native interpreter and one of their own chiefs, whom I had brought down from Fiji, to desire the Chief to come on board, promising him safety if he came; on her approach, the natives drew down in greater numbers, levelling their spears and poisoned arrows, giving unmistakable evidence of hostile intentions should the boat attempt to land. They moreover invited them to come on, threatening to take the boat, saying they did not care for a man-of-war, at the same time gesticulating and yelling at the ship in a manner that savages only are capable of.

The result of the first attempt at communication was that the chief represented by the reed refused to come on board; and to show more clearly his determination, he struck off the head of the reed with his tomahawk, which, according to native custom, is a signification of a declaration of war. I waited till next morning, and sent a boat in again, still hoping for a peaceful solution; but they only repeated this hostile demonstration, their tone, if anything, being more defiant.

Finding my endeavours to effect friendly communication resented by determined threats and menaces, I judged that any further temperate dealing by a ship of war, whose visit they were now experiencing for the first time, would be construed by these natives into fear and dread of them, and therefore be likely to encourage them to continue their acts of violence, more particularly as I was informed while at Vilu of the avowed intention of the natives, if they were not punished, to do so. Under the circumstances, I deemed it the wisest course of action that would have the appearance of exacting reparation for their savage conduct, of which it was afterwards proved there was not the slightest doubt, and at the same time impress them with the power of a ship of war, when she comes to enforce retributive justice for the same. As delay might also be construed in allowing their acts to pass unnoticed, and prove dangerous to the safety of other vessels, which any active measures at the present time might be the means of preventing; we landed and destroyed the villages and canoes where evidence of their guilt could be found, having first driven them out of the strong position where they lay concealed in great numbers to await our attack. The fact of this punishment having fallen upon those justly deserving it will, I trust, have a salutary effect, not only with the natives of Hinchinbroke but throughout the whole islands. And I may state that upon my return to Vilu to communicate again with the Missionaries, it was my gratification to hear that the guilty Chief of Emel Island had in the meantime gone over to them with all his Chiefs, and in a formal manner thanked them for having saved their lives and property, promising to discontinue their piratical and murderous practices. I have therefore but to express a hope that the visit of Her Majesty's ship under my command will afterwards be shown to have been productive of good results, and that my endeavours to fulfil my instructions to the best of my ability may meet your approval.

In

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 27

In conclusion, I beg to report respecting the statements made by Captain Havinden, in the "Challenge," referred to in my orders, that the natives of Hinchinbroke were instigated to commit these murders in revenge for the non-restoration of natives who have been taken to Fiji, that I was unable to ascertain if there was any truth in them; but upon inquiry of the Missionaries of Sandwich they were not aware that complaints of the kind existed.

Commodore R. Lambert, C.B.

P.S.—The money taken out of the "Mary Ida" schooner, to the value of £18 7s. 9½d., recovered from the Chiefs of Emel Island, is retained for the purpose of being delivered over to the agents of Messrs. Unthank & Percy, at Sydney.

W. H. B.

DEPOSITION made by Monargonon, Chief of Emel Island, on board Her Majesty's ship "Falcon," on the 29th July, 1867.

On being asked "whether he was aware of the occasion of the man of war's visit?" replied, by commencing to excuse his action in the affair of the murder of the crew of the "Mary Ida," giving the following reasons for the part he took, viz. :—

1st. "That several of his tribe, particularizing five natives, were taken away to different parts and died from the effects of being beaten, naming in particular Captain Edwards of the 'Woodlark,' Captain Vincent of the 'Blue Bell,' and the 'Malay Rangie'; and that his half-brother Tamalsa was 'beaten to death by Captain Vincent.' He further stated, the same captain, with a club, broke both his (Tamalsa's) arms, and that when he died he was buried in a small island off the coast of New Caledonia, and that there were at the time men of Emel on board who witnessed the act."

This case occurred five years ago.

2nd. "A boy named Kalumbuck, with other Emel lads, went in the 'Blue Bell' beche-de-mer fishing. One day, when the surf was breaking heavily, the captain wanted to send the boat to fish, and Kalumbuck declined to go, as it was dangerous, whereupon the captain beat him to death, and his body was thrown into the sea. The boat was capsized on being sent away afterwards, and the natives were with difficulty rescued."

This case occurred four years ago.

3rd. "A case which happened with Captain Vincent in the 'Lion,' when there were natives on board from the village of Akaron and Island of Emel. One of the men belonging to the latter place died, and although they did not know that he had been ill-treated, they were very sore-hearted at his loss."

This occurred two years ago.

4th. "An instance where a lad from Emel Island was away in the 'Woodlark,' captain's name unknown; one day, in a gale of wind, whilst he was on deck attending the ropes, the remainder of the natives being at the time abaft handling the sails, a block fell upon the boy's instep, crushing it, and that after lingering awhile, he died on board."

This case occurred four years ago.

5th. "A case against Captain Lewin of the 'Uncle Tom,' of Morton Bay, who, when ashore at Gogan, Queensland, became exasperated against one of the natives of Emel Island, and took up a stick, with which he hit him in the small of the back. The man was seized with spasms, and died in two days' time."

This took place five years ago.

The following questions were then put :—

Question. Did you plunder the vessel?—Answer. Yes, the vessel was plundered.

Q. What was done with the plunder?—A. It was delivered up, together with the bulk of the vessel, to the "Challenge," Captain Havinden.

Q. What was done with the money?—A. It is on shore. Money to the value of £18 9s. 7½d. sterling was then produced.

Q. How many men did you send away in the "Mary Ida," and where are they now?—A. There were ten Emel men on board; the murder was planned by a native of Hinchinbroke.

Q. Are the ten Emel men here now?—A. Six only; the remaining four are shipped away in trading vessels, the names of which I do not know.

(Signed) W. H. BLAKE,  
Commander.

Witness—HENRY M. JONES,

Her Majesty's Consul for the Fiji and Tonga Islands.

## 30 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Correspondence  
between Colonial  
Office and For-  
eign Office.

His Grace would suggest that the reply to the French Government should be, that Her Majesty's Government are aware that lawless and cruel acts have been from time to time committed in these seas by Europeans, leading to bloody retaliation from the natives; that Her Majesty's Government have had occasion to consider the mode of repressing such outrages, so far as they may be chargeable on British subjects, but have found great difficulty in dealing with them effectually. They would be very glad to be furnished by the French Government with the details of any cases which have come to their knowledge, in order both to the punishment of the criminals, if practicable, and because the consideration of specific cases may suggest some more effectual mode of dealing with them than at present exists.

At the same time, his Grace desires to point out that proceedings of this kind must be distinguished from an emigration of labourers, which appears to be going on to some extent from some of the islands in the South Seas to Queensland, and in regard to which regulations for the benefit of the immigrants have been suggested to the Governor of Queensland, in which Colony some of these emigrants have arrived.

I am, &c.,

GENTLEMEN,

No. 36, 13 July,  
1867, page 10.

I am directed by the Duke of Buckingham and Chandos to transmit to you, for your report, the enclosed copy of a Despatch from the Governor of Queensland, relating to the treatment of natives of the South Sea Islands, who are employed as labourers in that Colony.

I am desired to request that you will inform me whether it occurs to you that any further steps could be taken by the Queensland Government or Legislature to secure that these persons are not induced to go to the Colony by false representations, or under contracts which they do not understand; that they are properly treated while they are in the Colony; and that the engagements to send them back to their own country are duly observed.

It has been suggested to his Grace that it might be advisable that it should be enacted by the Local Legislature that such contracts should not be enforceable against the natives, unless their provisions are approved as fair by the Government.

I am, &c.,  
(Signed) FREDERIC ROGERS.

COPY of a letter from T. W. C. Murdoch, Esq., to Sir Frederic Rogers, Bart.

Emigration Board, 24 October, 1867.

SIR,

No. 36, 13 July,  
1867, page 10.

I have to acknowledge your letter of 5th instant, with a Despatch from the Governor of Queensland, on the subject of the employment in that Colony of the natives of some of the South Sea Islands. You desire us to report whether any measures beyond those already in force could be taken by the Queensland Government for the protection of this class of labourers.

2. The question arises from a statement made to Captain Luce, of Her Majesty's ship "Esk," that outrages recently committed on Europeans by some South Sea Islanders were in retaliation for the fraudulent abduction of some of their countrymen to Queensland and the Fiji Islands. As regards Queensland, it appears that the introduction of the South Sea Islanders was commenced in 1862 by Captain Towns, Member of the Legislative Council in New South Wales, and owner of a cotton estate in Queensland; that the whole number introduced has been 382; that of these, 78 who were under engagements for one year only have been sent back to their country; and that the others, who are mostly under engagements for three years, will be provided with back passages at the end of that time. Sir G. Bowen adds, that the principal employer of these people is Captain Towns, and after him, Captain Whish, late of the 14th Light Dragoons.

3. So far as regards the people now in the Colony, there seems no reason to doubt that they have been treated kindly and loyally; nor, apparently, would there be any ground for apprehension, if the immigration remained as limited as at present; but as the experiment seems to have succeeded with Captain Towns and Captain Whish, it is probable that other settlers may desire to follow their example, especially if the cultivation of cotton in Queensland should, as may be expected, and hoped, prove remunerative. In that case it would not be safe to trust altogether to the justice and good faith of the settlers for the protection of people of this class.

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 31

4. In 1862, in anticipation of Indian immigration, the Legislature of Queensland passed an Act authorizing the Governor to make rules, to have the force of laws, regulating the introduction of Indian immigrants, and their protection in the Colony. In exercise of this power, the Governor proclaimed a set of rules prescribing with great minuteness, the mode of engaging emigrants in India, and the protection to be afforded them in the Colony. It would not be necessary, in the case of the small number of South Sea Islanders likely to be introduced, to establish such detailed and elaborate regulations; but if the Legislature should be willing to entrust the Governor with a similar power of making rules for the protection of South Sea Islanders, all that is necessary might be done. The following are, I think, the principal points to which such rules should be directed:—First, that the ships to be employed in the service should have adequate accommodation, should be properly found, and should not carry above a prescribed number in proportion to their deck area. Second, that no one should be allowed to introduce these immigrants except under a non-transferable license from the Government. Third, that the general tenor of the contract to be entered into with them should be prescribed by the Government, and that the contracts to be valid, should be countersigned by the Immigration Agent on the arrival of the immigrants. Fourth, that the immigrants should be placed under the special superintendence of the local Magistracy; and, as a consequence, that none should be allowed to estates so remote as to be withdrawn from such superintendence. Fifth, that a power should be reserved to the Government of cancelling a contract in case of the ill usage of the immigrant by his master, or of the non-fulfillment of the conditions of the contract. Sixth, that the contract should not be for a period exceeding five years; and seventh, that security should be taken that the immigrant should be re-conveyed to his own country at the time stipulated in the contract; and that fair compensation should be made to him for any unreasonable delay in fulfilling that condition.

5. The detail of regulations to this effect could be best arranged by the local Government, especially in respect to the shipping arrangements, which must depend very much on local circumstances. If such regulations are established and enforced, there will be no risk of the ill-usage of South Sea Island immigrants, and no objection, so far as I can perceive, to their introduction into the Colony.

I have, &c.,  
(Signed) T. W. C. MURDOCH.

## No. 3.

COPY of a Letter from Sir Frederic Rogers, Bart., to the Emigration Commissioners.

Downing-street, 13 December, 1867.

GENTLEMEN,

With reference to your letter of the 24th October, I am directed by the Secretary of State to transmit to you, for any suggestions and observations which you may have to offer, the enclosed letter from the Lords Commissioners of the Admiralty, upon the subject of the introduction into Queensland of the inhabitants of the South Seas.

I am, &c.,  
(Signed) FREDERIC ROGERS.

## No. 4.

COPY of a Letter from T. W. C. Murdoch, Esq., to Sir Frederic Rogers, Bart.

Emigration Board, 23 December, 1867.

SIR,

I have to acknowledge your letter of the 13th instant, with one from the Secretary to the Lords Commissioners of the Admiralty,\* expressing their Lordships' decided objection to any attempt to introduce South Sea Islanders as labourers into Queensland. Their Lordships observed that the South Sea Islanders are incapable of understanding a written contract; that they will not knowingly engage themselves to work far from their own country, or for more than a few months; that whatever laws are made for their protection, no proper or efficient control can be exercised over the manner in which they are collected and placed on board ship; and that the task of collection and shipment is likely, from the nature of the work, to fall into the hands of an unscrupulous and mercenary set, who will commit acts of kidnapping, piracy, and murder. Their Lordships refer, in support of these opinions, to what took place in respect to an emigration from some of these islands to Peru in 1862-63, as reported in Despatches from Admiral Kingcome, which are enclosed.

2. In respect to the people themselves, I may, however, observe, that the reports received from the various officers who have inquired into the matter scarcely bear out the opinion that they are incapable of understanding a written engagement, and will not engage to work for more than a few months, or at a distance from their homes. In the Despatch from the Governor of Queensland of 13th July last,† it is stated that the South Sea Islanders introduced by Captain Towns had been employed under written engagements, some of them for a year, which having expired, they had been sent back to their country;

country; others for three years, which were still in force; while in the report from Captain Richards, of Her Majesty's ship "Hecate," to Admiral Kingcome, dated 8th May, 1863, it is stated that Mr. English, of Fanning Island, had been in the habit for ten years of employing natives from the neighbouring islands on his cocoa plantations, under a written agreement with their king; that they engaged themselves for periods of from one to two years; that the engagement was fair and equitable, and advantageous to both parties; and that many, at the end of their term, renewed their engagements.

3. In respect to the control that might be established over the collection and shipment of the people, I suggested that no one should be allowed to introduce such immigrants, except under a non-transferable license, and that regulations should be established, having the force of law, in respect to the accommodation to be provided on board ship. The effect would be to enable the Government to require security that the people should be engaged in an open and fair manner, while the examination of the people by the Immigration Agent on their arrival, and his counter-signature of their engagements, would afford an opportunity of ascertaining that the people understood the engagements they had made; that they had entered into them willingly, and that the terms are fair. Under such a system it would be scarcely possible that acts of kidnapping, piracy, or murder, in the collection or despatch of these people, could be committed without discovery.

4. That crimes of that description may be committed in the conduct of emigration to foreign ports we are well aware, from the emigration of Chinese from Macao to Cuba and Peru. But we have likewise proof, in the emigration from Canton to British Colonies, that an emigration may be carried on at the same time alongside of it, free from all such abuses, and advantageous alike to the emigrants and the Colonies. I see no reason to doubt that this might be effected in the South Sea Islands, as it has been effected in China.

5. But it may be said that the South Sea Islanders will not distinguish between Europeans, and that they will avenge on innocent British subjects the outrages that have been committed upon them by Europeans other than British. If the immigration were set on foot, licenses to introduce immigrants into the British Colonies would not, I presume, be given indiscriminately for any of the islands of the Pacific, but would be restricted to a few of the more civilized islands; and, as a general rule, to those where missions are established. In that case the natives of such islands would soon learn, as the Chinese have learnt, to distinguish between emigration to British and to other colonies. It is no doubt possible that some disreputable British subjects might engage in procuring emigrants by irregular means for foreign colonies; but men of that class would be controlled, rather than assisted, by the regulated emigration conducted under British law, and would be certain to avoid, instead of seeking, the islands where they would be likely to come under the notice of Englishmen engaged in a legitimate trade.

6. If it be said that the outrages that have been already committed by South Sea Islanders are attributed to revenge for the abduction of some of their countrymen, I may be allowed to point out that the principal authority for this statement is the Chief of Emel Island, who endeavoured thereby to excuse himself to Captain Blake, of Her Majesty's ship "Falcon," for the murder of the crew of the "Mary Ida." Some of the stories told by him are of old date, and would not be easily credible on much better authority; others of them amount to nothing; and it is to be observed that Captain Blake, in reporting the statement, says there was a strong suspicion that the men who murdered the Europeans on board the "Mary Ida" had been placed on board the ship by the Chief from "feelings of cupidity," and that he was unable to ascertain if there was any truth in the allegation that the natives of Hinchinbroke had committed the murders of which they were accused, in revenge for the non-restoration of their fellow countrymen; but that the Missionaries of Sandwich were not aware that complaints of that kind existed.

7. If emigrants from the South Sea Islands were introduced into Queensland there could be no reason to apprehend that they would not be well treated by the employers, and sufficiently protected by the Government. The Legislature would probably invest the Governor with power to make regulations for their protection, in the same way as for Indian immigrants; and in that case the Governor would no doubt apply the principles of the Regulations of 1862 for Indian immigrants to the South Sea Islanders. Those regulations contain many details not applicable to South Sea Islanders, but the clauses relating to the protection of the immigrants might, with little variation, be applied to them.

8. If then the Duke of Buckingham and Chandos should be of opinion that the immigration of South Sea Islanders to Queensland is beneficial, and ought not to be prevented, I venture to think that there need be no insuperable difficulty in so regulating the conduct of it as to prevent abuses in the collection and dispatch of the emigrants, and to secure their good treatment after arrival in the Colony.

I have, &c.,

## No. 6.

COPY of a Letter from T. W. C. Murdoch, Esq., to Sir Frederic Rogers, Bart.

Emigration Board, 6 May, 1868.

No. 6.  
T. W. C. Murdoch, Esq., to Sir F. Rogers, Bart.  
6 May, 1868.

SIR,

I have to acknowledge your letter of the 28th ultimo, with Despatches from the Governor of New South Wales, and the Officer Administering the Government of Queensland, enclosing, the former, a Memorial to the Governor, and the latter, a Petition to the Queen, against the exportation of inhabitants of some of the South Sea Islands to Queensland and other places.

2. The Memorial to the Governor of New South Wales proceeds from certain Presbyterian Missionaries employed in six of the islands of the New Hebrides group. They enclose a statement of the evils which they consider to arise from the emigration of natives of those islands, and request the Governor to institute an inquiry into them. The evils they complain of are, 1st. That the natives are taken away fraudulently or by force. 2nd. That they are exposed to great hardships and privations on the voyage. 3rd. That they are sometimes ill used, which leads to acts of vengeance on their part. 4th. That they do not understand the engagements made with them, and that there are no means of securing the fulfilment of such engagements by the employer. 5th. That they are detained for longer periods than they engage for. 6th. That they are insufficiently paid. 7th. That their wives are left behind and marry with other men, which leads to quarrels on their return. 8th. That the strongest and most active are taken, and the old and infirm only remain. 9th. That those who go come back demoralized; and 10th. That the emigration is under no control. The Memorialists state that the emigration is carried on under the British, the American, and the French flags, and the places to which the emigrants are carried are Queensland, Fiji, New Caledonia, Tahiti, Torres Straits, "and other parts." In support of the several complaints in their statement, the Memorialists give instances of what they allege. These instances, however, with two exceptions, relate exclusively to emigrants taken to Fiji. The exceptions are, that the South Sea Islanders are incited to acts of revenge by ill-usage; in support of which the murder of the crew of the "Mary Ida" by the inhabitants of Emel Island is cited; and that the temporary separation of man and wife leads to subsequent quarrels; in support of which the case of a man who went to Queensland, and whose wife, during his absence, married another man, is brought forward. In respect to the murder of the crew of the "Mary Ida," I would beg to refer to my report of 23rd December last,\* Page 31. from which it will be seen that the excuse offered for that outrage is open to much suspicion. As regards the possible bigamy of women whose husbands emigrate, I do not see how the Government can interfere.

3. The Memorial to the Queen from inhabitants of Queensland, alleges that a number of South Sea Islanders have been introduced into the Colony without the sanction of the Government, and without the control of any local law; that many are believed to have been kidnapped by force or fraud; that they have not been sent back as promised at the end of their engagements; and that the frauds practised on them have led to acts of revenge on their part. The Memorialists add that they view with "dismay" the introduction into the Colony of an inferior and uncivilized race to supplant the British and European labourer, which they denounce as "a development of the slave trade, with its attendant evils in its most modern form."

4. Such being the representations of the Memorialists, it remains to be considered how far they apply to emigration from the South Sea Islands to British Colonies, and how far the Government have power to interfere in the matter. The only emigration which has taken place from the South Sea Islands to a British Colony is to Queensland. Into that Colony about 380 South Sea Islanders were introduced between 1862 and 1867, by Captain Towns, a Member of the Legislative Council of New South Wales, and Captain Whish, a settler, for the purpose of being employed in the cultivation of cotton. In consequence of a statement that outrages committed by the inhabitants of one of the South Sea Islands, were in retaliation for the fraudulent abduction of their fellow-countrymen, an inquiry was last year instituted into the matter by the Governor of Queensland, the result of which was to shew that the people in question had been treated by their employers with kindness and good faith; that such of them as had completed their engagements had been sent back to their homes; but that the engagements of the majority were still unexpired. As far as regarded these people no interference was

## 34 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Correspondence  
between Colonial  
Office and Emi-  
gration Office.

required; but as there might be a risk, if it was proposed to introduce larger numbers, that abuses might occur, the Duke of Buckingham and Chandos, directed Sir G. Bowen to propose to the Legislature of Queensland to invest the Governor with authority to make regulations for the government of this immigration, to the same extent as they had previously done with reference to Indian immigrants. His Grace at the same time suggested the several points which such regulations should include.

5. It appears that while this instruction was on its way to Queensland, the Colonial Legislature had taken up the subject, and had introduced a Bill, which has already passed the House of Assembly, and is enclosed in the Administrator's Despatch, enacting the precise regulations which the Duke of Buckingham had suggested. These regulations require, that any person desiring to introduce South Sea Islanders should obtain a license from the Government to do so, and should give security for the return of the people to their country at the expiration of three years; that the master of the vessel in which such immigrants are to be introduced, shall enter into a bond to prevent kidnapping, and to observe the prescribed regulations; that on his arrival in the Colony he shall produce a certificate from a Consul, Missionary, or other known person at the island from which the immigrants are brought, that they have voluntarily engaged themselves, and understand the nature of their engagements; and the Immigration Agent is required, before the people are allowed to land, to ascertain and certify the same facts; the form of agreement between the employer and the immigrant, and the scale of rations to be allowed to the latter, are prescribed; the number of passengers that may be carried in a vessel in proportion to her deck area is defined; the dietary and water to be issued on the voyage are fixed; a summary jurisdiction is established for enforcement of the regulations; and any vessel introducing South Sea Islanders in contravention of them is subjected to a penalty of £20 per head.

6. So far as regards emigration from the South Sea Islands to Queensland, this Bill is the practical answer to the Memorials both to Her Majesty and to the Governor of New South Wales. If properly carried out, it would provide an effectual protection against fraud or force in the collection of the people; against abuses on the voyage; against their ill-treatment during the period of their engagements, and against their unfair retention after their engagements are completed. It would not, indeed, prevent the emigration of the strongest and most energetic, nor their alleged demoralization. The strongest and most energetic, will, in every country, be the first to emigrate; and the alleged demoralization may, perhaps, be only the exaggerated self-assertion and independence which an uneducated savage would, under such circumstances, be likely to assume. At any rate, without absolutely prohibiting any introduction of these people into British Colonies, and even the employment of British ships in the emigration, I do not see in what way the British Government can prevent such results.

7. Whether it is right, as a general principle, to permit the introduction of an inferior and uncivilized race into a British Colony, so strongly deprecated in the Queensland Memorial, is a question which I do not presume to discuss. As far as the immigrant is concerned, it would be useless to deny that it may be attended with some disadvantage; but that, on the whole, a race of so low a type as natives of the New Hebrides must derive great benefit from being brought into contact with a purer morality and a higher civilization cannot be questioned. The apprehension of the inhabitants of Queensland of the effect on the Colony of introducing so uncivilized a population would be not unreasonable, if large numbers were likely to be introduced; but that is altogether improbable, and the Executive would, under the proposed Bill, always have the power of placing a limit on the number.

8. As regards Queensland it appears to me that, if the proposed Bill is passed, the Government will have ample power both to protect the Colony against an excessive immigration of these people, and to protect the immigrants against ill-treatment by the Colonists. It would be desirable that the people should not be allotted to any employer in remote districts where they would be removed from the supervision of the Magistrates, and that licenses should not be granted for their introduction from any island where there are not either English or American Missionaries, or an English consul. This is to a certain extent implied, though not expressed in the Bill. If similar immigrants should hereafter be introduced into other British Colonies there would probably be no difficulty in obtaining from the Legislatures of such Colonies similar powers for the management of the immigration. But, as regards the immigration to other places than British Colonies, I do not see how the Government can interfere. The principal place to which immigrants from the New Hebrides are carried appears to be the Fiji Islands. I am not aware that Her Majesty's Government have any legal powers to prevent British ship-owners undertaking the conveyance of immigrants between those two groups of islands, and even if it were thought right to apply to Parliament for such powers, it would be very difficult to give them effect. To do so it would be necessary to keep vessels continually cruising in the neighbourhood of the New Hebrides, an arrangement which I apprehend neither the Government nor Parliament would be prepared to sanction, especially as this would only transfer the emigration to French and American vessels. Under such circumstances and with such results in view, nothing but clear proof of gross abuse would, I submit, justify the interference of the Government; and, as far as our information goes, no such abuse has yet been proved.

I have, &c.,  
T. W. C. MURDOCH.

## No. 9.

COPY of a letter from T. W. C. Murdoch, Esq., to Sir Frederic Rogers, Bart.

Emigration Board,  
16 June, 1868.

SIR,

I have to acknowledge your letters of 13th instant; the first enclosing an Act passed by the Legislature of Queensland, entitled "An Act to regulate and control the Introduction and Treatment of Polynesian Labourers;" the second enclosing a protest against this Act from the Committee of the British and Foreign Anti-Slavery Society.

2. The Act in its essential provisions is a transcript of the regulations attached to the Bill introduced into the Legislative Council in December last, on which it was my duty to offer some remarks in my Report of 6th ultimo.† The only new provisions are sections 2 to 4, which apply the Act to Polynesian immigrants already in the Colony; section 5, which authorizes the appointment of an officer for the proper inspection of labourers and the enforcement of the Act; section 7, which requires the master of a vessel to provide medicines, medical comforts, and other things necessary for the treatment of disease or accident on the voyage, &c.; section 17, which limits the numbers to be carried by the space on the upper deck for exercise; section 22, which requires a quarterly return of all cases adjudicated upon in relation to these immigrants; section 25, which places engagements made with such immigrants under the provisions of the Masters and Servants Act of 1861; section 28, which prohibits the removal of any of these immigrants from the Colony without his own consent and the written permission of the Government; and section 30, which forbids a deduction from wages on account of stores supplied to the immigrants.

3. These new provisions have evidently been introduced in the interest of the labourer, and are improvements. There appears, however, to be an error in the form of section 7, which will require alteration. By the 6th section persons desirous of importing South Sea Islanders are to obtain a license in a specified form, to the effect that

No. 9.

T. W. C. Mur-  
doch, Esq., to  
Sir F. Rogers,

16 June, 1868.

\*Page 33.

Correspondence  
between Colonial  
Office and Emi-  
gration Office.

that the person named there, or his agent, is licensed to recruit immigrant labourers, &c. Section 7 then provides that "the owner or charterer of any vessel so licensed" shall provide certain stores, &c. Nothing, however, had before been said about the licensing a vessel. It may be a question whether it would not be desirable to require that the vessel in which the people are introduced should be licensed for the service, as such provision would ensure her proper survey and equipment, would prevent the employment of casual vessels which might not meet the requirements of the Act, and would give the Colonial Government an opportunity of ascertaining the character of the master of any vessel that might be employed. As the clause stands at present it is inoperative, from the error of description. In other respects the additions to the Act appear unobjectionable. Unless, therefore, the importation of South Sea Islanders into Queensland is to be absolutely prohibited, I see no reason for withholding Her Majesty's assent to the Act. The Acting Governor reports that he did not reserve it for Her Majesty's pleasure, because a considerable number of the islanders were being introduced, and it was, therefore, necessary to bring the immigration at once under control. This appears to be a sufficient justification of the course he took. A return enclosed in his Despatch shews that the number of South Sea Islanders recently introduced has been 918, and that the ships which brought them carried a much larger number than their size would warrant.

4. But the Committee of the Anti-Slavery Society protest *in toto* against the Act, as "being illegal in principle." They also object to its provisions in detail.

First. They allege that members of the Legislature who were pecuniarily interested in the immigration voted for the Act. If this were so, it would be contrary to the rule and usage of Parliament; but the assertion is general and unsupported, and the Committee do not profess to make it from their own knowledge.

Second. It is said that the Act by declaring the introduction of Polynesian labourers, except in conformity with the Act, to be unlawful, declares the illegality of antecedent importations. It is scarcely worth while to notice such an objection. The illegality created by the law could not exist before the law was passed.

Third. The Committee remark that it is difficult to understand how a traffic, illegal under Imperial law and assimilated to piracy, can be declared legal by an inferior authority. Undoubtedly, if the immigration were illegal by Imperial law, it could not be legalized by Colonial statute. But it is not explained on what grounds it is assumed to be illegal. It evidently does not come within the scope of the Act, 5 Geo. 4, c. 113, inasmuch as that Act refers only to the dealing with persons who either are, or who are intended to be, employed as slaves. It is to be regretted that the precise law which makes the immigration "illegal," was not pointed out.

Fourth. It is assumed that the clause requiring returns from employers will be evaded, and that the penalty will not be enforced; because the friends of defaulters, or the Justices of the Peace, who themselves "may become employers of this new kind of slave labour," will not inform against them. It is of course impossible to say of any law that it will not be evaded. But the number of these immigrants introduced before the Act was so small that the Government could have no difficulty in tracing them, and those introduced after the Act are to be registered on their first arrival at the Immigration Office; and every subsequent transfer, death, or desertion, is to be registered also.

Fifth. An objection is taken to the clause authorizing the appointment of an officer to enforce the provisions of the Act, that it does not make him directly responsible to the Government for the performance of his duty. It seems almost unnecessary to point out that every executive officer is directly responsible to the Government for the performance of his duty, and removable in case of default.

Sixth. The sixth clause, which authorizes private individuals to recruit South Sea Islanders, is said to be opposed to the law and practice in respect to coloured immigration, and to be calculated to introduce a traffic which will merge into a slave trade. In respect to Indian and Chinese emigration, Her Majesty's Government have no doubt refused to allow the engagement of emigrants otherwise than through a Government officer. If the emigration from the South Sea Islands were to become extensive, the same restriction would become necessary in respect to it also; but at present the area from which the immigrants are drawn is limited, and the number of immigrants is small, and there can, therefore, be no great difficulty in ascertaining the manner in which they are recruited, and in discovering and arresting abuses. The Act, by implication, provides against the recruitment of the inhabitants of any island in which Europeans are not residents, by requiring the master to produce a certificate from a "Consul, Missionary, or other known person," that the emigrants have engaged voluntarily, and with a full understanding of what their engagement means.

Seventh. The committee point out a discrepancy between the Act and the form in the Schedule to it; the Act authorizing a licensee to import, while the form only authorizes him to "recruit" immigrants. I have already pointed out an error of the same kind in the 7th section. The intention of the Act is clear enough, but if it is allowed to go into operation it will be necessary that the 6th and 7th sections should be altered.

Eighth. It is alleged that this law affects the independence and liberty of the inhabitants of a foreign nation; that it would, therefore, be beyond the competence of the Imperial Parliament, and is, *a fortiori*, beyond that of a Colonial Legislature. In what way the law affects the independence or liberty of the South Sea Islanders is not stated. If there were no law at all on the subject it would, I presume, be competent to any British subject to enter into any contract he pleased with a native of the South Sea Islands or of any other country. The present Act, in the interest of the natives of those islands, places certain restrictions upon the liberty of the inhabitants of Queensland in this

this respect. In what way this can be described as affecting the independence and liberty of individuals of a foreign nation I do not understand.

Correspondence  
between Colonial  
Office and Emi-  
gration Office.

Ninth. Objection is taken to Section 7, that, while it requires that medicines, &c., shall be provided, no provision is made to secure a duly qualified medical practitioner. The reason is, no doubt, that duly qualified medical practitioners could not in all cases be found, and that in a voyage in a calm sea and low latitude, the maximum duration of which is calculated at thirty days for a sailing ship and fifteen days for a steamer, they would seldom be required. I may point out that the Imperial Passengers Act of 1855 does not require the presence of a medical practitioner in a vessel carrying fewer than 300 persons, where the voyage is calculated at less than eighty days for a sailing ship or forty-five days for a steamer.

Tenth. Several objections are taken to the 8th section, viz.:—(1.) That it authorizes the indenturing of labourers in the South Sea Islands to employers in Queensland. (2.) That such indentures are illegal, and would lead to irregularities of the gravest description. (3.) That the Legislature of Queensland have no power to authorize persons to recruit labourers in foreign countries. (4.) That the Government reserves to itself no power to interfere with the appointment of recruiting agents; and (5.) That it is objectionable to involve the Missionaries in the traffic. In respect to the first two of the above objections, I may point out that the indenturing of Indian emigrants in India to employers in Mauritius and St. Vincent, of Chinese in China to employers in British Guiana, Trinidad, Jamaica, St. Vincent, and Antigua, has for several years been authorized under laws passed with the consent of Her Majesty's Government, and the Government of India; that its legality has never been questioned, and that it has led, as far as we know, to no abuses; in respect to the third, that the Queensland law confers no new power, but places a power which previously existed under certain restrictions and conditions; as to the fourth, that the authority for the issue of a license is permissive only, not imperative; and that the Government may therefore, and would be bound to, satisfy itself as to the character of the licensee; and as to the fifth, that it will be for the Missionaries themselves to consider whether the function which the Act attributes to them is or is not inconsistent with the relations existing between themselves and the natives.

Eleventh. The penalty of £500 in the bond, to be given by the master of a ship is said to be insufficient to prevent kidnapping, since if he could kidnap and bring in a cargo of 250 immigrants, they would be worth to him £2,500. But the Committee ignore the fact that before the master could land a single immigrant he must produce the certificates required under Section 8, which could not possibly be procured in such a case.

Twelfth. A similar objection is taken to the fine of £10 for a breach of the regulations of the law, which is evidently not intended to apply to such an offence as kidnapping.

Thirteenth. The Committee allege that Section 26, which imposes a fine of £20 a head on Polynesian labourers introduced contrary to the Act, and in default of payment makes the ship liable to forfeiture, will make the traffic a close trade. It is not clear whether this is stated as an objection or not, but it is obvious that the closer the trade the easier it will be to control it.

Fourteenth. It is pointed out that the question of providing hospital accommodation for the immigrants is left open. If the immigration increases, it will hereafter be necessary to make some provision for the medical treatment of Polynesian immigrants similar to that required in the Mauritius and West Indies for Indians. But hitherto the number has been too small to make it necessary to require such a provision.

5. In conclusion, I cannot but observe, that throughout the letter from the Anti-Slavery Society it appears to be assumed that the South Sea Islanders in their own islands are in a condition of slavery, incapable of exercising an option as to whether they will enter into an engagement out of their country or not. It appears also to be further assumed that the settlers in Queensland will be disposed to treat these people on their arrival in the Colony as slaves, and that the local authorities will be unwilling or unable to protect them. Both assumptions, I venture to submit, are unjustified by anything that has hitherto occurred. The Polynesian Islanders, as a general rule, appear sufficiently able to understand the contracts into which they enter, and the advantages offered them, and the Government and Legislature of Queensland, by the promptitude with which they have acted in the matter, have shewn their anxiety, and by the provisions they have enacted, their confidence in their ability to afford these immigrants adequate protection. The general principles of the Act are the same as have been approved in respect to Indian and Chinese emigration; and although there are at present some omissions in the law which are sufficiently accounted for by the peculiar circumstances of the immigration, there is no reason to doubt that if this Act is allowed, the Legislature of Queensland will supply them hereafter, should the immigration attain important dimensions. The Anti-Slavery Society call on Her Majesty's Government to disallow the Act. It is clear, however, that the effect of disallowing the Act would be to leave the immigration altogether unregulated. Her Majesty's Government may disallow the Act of a Colonial Legislature, but they have no power to compel the Legislature to substitute another Act for that which is disallowed. Nothing short of the authority of Parliament would avail for that purpose, and it may be taken for granted that, except under a very clear and urgent necessity, Parliament would not interfere in such a matter with a Colony possessing a representative Legislature and a responsible Government.

I have, &c.,

(Signed)

T. W. C. MURDOCH.

COPY of a Letter from A. W. Bennett, Esq., and L. A. Chamerozvow, Esq., to His Grace the Duke of Buckingham and Chandos.

27 New Broad-street, E.C.

13 March, 1868.

MY LORD DUKE,

The Committee of the British and Foreign Anti-Slavery Society have received copies of a series of official papers relating to the introduction of South Sea Islanders into Queensland, and of "A Bill to Regulate and Control the Introduction and Treatment of Polynesian Labourers," which has passed the Legislature of that Colony. The committee have also received the copy of an Address from certain inhabitants of Brisbane to His Excellency Sir George Ferguson Bowen, the Governor in Chief of the Colony of Queensland and its dependencies, praying His Excellency to suppress and prohibit the traffic in South Sea Islanders now being carried on.

These official documents, and the reports of public meetings which have been held at Brisbane, appear to establish conclusively the following facts:—

1. That a considerable number of natives of the South Sea Islands have been imported to work professedly as contract labourers on certain plantations in Queensland.
2. That these people are engaged for terms of three years, at the rate of 2s. 6d. a week wages to be paid on the truck system at the expiration of their term of service.
3. That although certain of these people appear to have been engaged under some written form of agreement, considerable numbers of them have been kidnapped and forcibly brought into the Colony.
4. That the parties who bring these islanders into the Colony receive from £9 to £10 per head for them from the persons hiring them, an act tantamount to an actual sale.
5. That from the 18th August, 1863, to the 31st October, 1867, 1,267 of these islanders were introduced into Brisbane and the northern ports of the Colony, besides others not included in the official returns.
6. That although promises were held out to these people, that they should be restored to their homes within a given term, none have been sent back from the northern ports, and only 201 from Brisbane.
7. That this traffic though known to the Government, and not directly sanctioned by it, is carried on by private individuals without any public control or supervision whatever.
8. That persons occupying responsible public positions are engaged also in this traffic.
9. That the people who are thus brought into the Colony are unacquainted with our language, are wholly unprotected, and completely at the mercy of their employers.

The committee have been appalled by recent accounts of the massacre of white sailors frequenting some of these Polynesian Islands, and even of Christian Missionaries resident there. They are assured that these murders are the retaliation of ignorant savages for deeds perpetrated in the course of the trade insidiously growing up in the South Sea Islands, which threatens to become a powerful hindrance to Christian Missions, as well as to commercial and civilizing intercourse.

The committee respectfully beg to bring these facts under your Grace's consideration, and would suggest that as the new Governor of Queensland, His Excellency Major Samuel Wensley Blackall, will shortly take his departure for the Colony, the moment appears to be highly opportune for instructing His Excellency in relation to this subject.

The committee further submit that the Act lately accepted by the local Legislature, does not appear to them calculated to meet the exigencies of the case, the penalties being wholly inadequate to the offences enumerated. The committee are of opinion, that this trade in South Sea Islanders is a new form of the slave trade, and is illegal; and they venture to express the hope that Her Majesty's Government will prohibit its continuance, experience having lamentably proved that no amount of fine or penalty will suppress illegal traffic in human beings, so long as its gains hold out a sufficient inducement for its prosecution.

We have, &c.,

MY LORD DUKE,

In accordance with your Grace's request, conveyed in the communication from Sir Frederic Rogers, dated the 23rd current, to be furnished with the authorities upon which are founded the statements respecting the treatment of South Sea Islanders in Queensland, set forth in the Memorial to your Grace from the committee of the British and Foreign Anti-Slavery Society, I have the honour to refer your Grace to the annexed schedule, and—

I remain, &c.,  
L. A. CHAMEROVZOW,  
Secretary.

## [Enclosure in No. 3.]

## SCHEDULE.

- I.—Queensland.—Legislative Assembly.—Introduction of South Sea Islanders into Queensland. (Ordered by the Legislative Assembly to be printed, 15th October, 1867.)  
Return to an Address of the Honorable the Legislative Assembly of Queensland, dated 26th September, 1867, praying that His Excellency the Governor will be pleased to cause to be laid upon the Table of this House.  
“Copy of all Despatches and Correspondence in connection with the introduction of South Sea Islanders into this Colony.” (Dr. Challinor.)
- II.—Queensland.—Legislative Assembly.—Trade between Queensland and South Sea Islands. (Ordered by the Legislative Assembly to be printed, 15th October, 1867.)  
Return to an Order made by the Honorable the Legislative Assembly of Queensland, dated 9th October, 1867, That there be laid upon the Table of this House, a Return shewing:—  
“1. The number, names, and registered tonnage of all vessels engaged in trading between the several ports of this Colony and the South Sea Islands, from 10th December, 1859, to the present time.  
“2. The names of the owners, masters, and consignees of said vessels; also, the names of the persons by whom the same are chartered.  
“3. The date of arrival and departure of each vessel respectively, and the entries of the cargo inwards and outwards.  
“4. The number of South Sea Islanders brought by each vessel; the names of the persons by whom they were brought, and of those to whom they were consigned; also, the date of their arrival.  
“5. The number of South Sea Islanders who have been returned to their homes in said vessels; the date of their departure; and the names of the persons in whose charge they were sent.  
“6. A copy of the Government regulations under which this immigration has been conducted.” (Dr. Challinor.)
- III.—Anno Tricesimo Primo Victoriae Reginae.—Queensland. A Bill to regulate and control the Introduction and Treatment of Polynesian Labourers.

L. A. Chamerov-  
zow, Esq.  
27 April, 1868.

SIR,

I am directed by the Duke of Buckingham and Chandos to acknowledge the receipt of your letter of the 27th ultimo, enclosing a schedule showing the authorities upon which the previous statements of the committee of the British Foreign Anti-Slavery Society were founded respecting the importation of labourers into Queensland from the South Sea Islands.

I

## 40 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Correspondence  
between Colonial  
Office and British  
and Foreign  
Anti-Slavery  
Society.

I am desired by his Grace to request that the Society will furnish him with such proofs as they possess of the third and eighth statements made in your letter of the 13th ultimo, namely, that "considerable numbers" of these islanders had "been kidnapped and forcibly brought into the Colony;" and that persons "occupying responsible public positions are engaged in this traffic."

It will obviously occur to you that these statements, and the facts alleged in support of them, should be authenticated by the names of the persons who make themselves responsible for their truth.

I am, &c.,  
(Signed) **FREDERIC ROGERS.**

## No. 5.

No. 5.  
L. A. Chamerov-  
zow, Esq., to his  
Grace the Duke  
of Buckingham  
and Chandos.  
29 April, 1868.

COPY of a Letter from L. A. Chamerovzow, Esq., to His Grace the Duke of Buckingham and Chandos.

27 New Broad-street, E.C.,  
29 April, 1868.

MY LORD DUKE,

I beg to acknowledge the receipt of Sir Frederic Rogers' letter of the 27th current, in reply to my communication of the 27th ultimo, on behalf of the committee of the British and Foreign Anti-Slavery Society, on the subject of the illegal introduction into Queensland of natives of the South Sea Islands.

In answer to your Grace's request to be furnished with such proofs as the committee possess, of the third and eighth statements in the committee's communication of the 13th ultimo, namely, "that considerable numbers of these islanders had been kidnapped and forcibly brought into the Colony, and that persons occupying responsible public positions are engaged also in this traffic," I beg to refer your Grace to Nos. 2 and 3 of document No. 1 of the Schedule enclosed in the letter aforesaid of the 27th ultimo.

It would appear from the papers already referred to, and others in the possession of the committee, that the subject of the introduction of South Sea Islanders into Queensland was already under the notice of the Legislative Assembly in 1863. The committee, therefore, were under the impression that the whole circumstances of the case were known to Her Majesty's Government, especially as they are of great notoriety in the Colony; and, moreover, have recently been made the subject of a Petition to Her Majesty, which would, of course, be transmitted through His Excellency the Governor to Her Majesty's Secretary of State for the Colonies for the time being. A printed copy of this Petition is enclosed.

Your Grace will observe that some of the Members of the Colonial Legislature, including the Premier himself, the Honorable R. R. Mackenzie, are personally implicated as active promoters of this new slave trade. This statement has been made openly in public meetings held at Brisbane, has been published in the local papers, and has not been contradicted.

Irrespective, however, of the parties who are actually engaged in these nefarious proceedings, the committee respectfully submit that the system itself is utterly indefensible, and is carried on in violation of the principles which regulate the emigration of Coolies from India to other British possessions. In the latter instance a kind of official supervision exists, which in a degree guarantees the interests and personal safety of the Coolie emigrant; but in the case of the South Sea Islanders there is no such supervision, the assent of the Chiefs in authority to the expatriation of their countrymen does not appear to be even asked for, and the evidence of Captain J. P. Luce, the Senior Naval Officer on the Australian Station, warrants the assertion that many of the vessels trading to the New Hebrides are manned by very lawless individuals, who have recourse to fraud and violence to obtain these so-called labourers, of whom they make a market in Queensland.

The committee would further submit that the system which your Grace has been requested and seems disposed to legalize, is identical with that called "free African emigration," carried on some years ago under the sanction of the French Government, but which, on the representations made by that of Her Majesty, was prohibited by the Emperor on the 30th October, 1858. The opinion of the British Government on the French *engagé* system was thus conveyed by the Right Honorable the Earl of Malmesbury in a Despatch of the 15th of October, 1858, addressed to Her Majesty's Plenipotentiary at Lisbon, on the subject of the seizure of the French vessel the "Charles et George," confiscated by the Portuguese authorities at Mozambique, as being engaged in the slave trade. In that despatch his Lordship says, "You are aware that Her Majesty's Government have never altered their opinion as to the analogous nature of the French scheme for exporting negroes with that of the avowed slave trade."

Many years before Her Majesty's Government had relinquished the scheme of obtaining so-called free labourers from Africa, for the reasons alleged in the Earl of Malmesbury's Despatch, and the committee are convinced that no regulations whatsoever would prevent this so-called free emigration from the South Sea Islands degenerating at once into the slave trade. To legalize such a system of emigration, to be conducted as proposed by private individuals, who once beyond the boundaries of the Colony would be subject to no control, were to license a new slave trade on the most extensive scale.

The

Enclosure.

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 41

The traffic being officially sanctioned by the British Government, a free trade in Polynesians would immediately spring up, and by force or by fraud they would be carried away by thousands to Cuba, to Brazil, to the Peruvian Guano Islands, or to any other country where forced labour is in demand; and the committee therefore hope that your Grace will not only withhold assent to the new Bill which has recently passed the Queensland Legislature, but will absolutely prohibit the continuance of the traffic, and give instructions for the immediate restoration to their homes of the natives who have been already brought into the Colony.

## [Enclosure in No. 5.]

## Anti-slavery Petition to Her Majesty.

The following is a copy of the petition that was adopted by a numerous and respectable audience at the close of Mr. Short's lecture, at the School of Arts, North Brisbane, on the climate of Queensland. That lecture was delivered as a useful supplement to two previous lectures, having for their object to show that the introduction of coloured labour into Queensland was in every way inimical to the present and future welfare of the Colony; and not only so, but was, in its first initiatory stages, with difficulty distinguishable from slavery, with which, with all its horrors and abominations, it would rapidly and inevitably become identified. It may be remarked that the opposition to the introduction of this kind of labour have not recognized the jurisdiction of the Colonial Legislature to deal with a question of this kind, as it is one which involves Imperial interests and policy; and have also been influenced by the consideration of the well-known circumstance that some of the members of the Colonial Legislature, including the Premier himself, are personally implicated as active promoters of this traffic in human beings. A former Petition to Sir George Bowen, the late Governor of Queensland, praying him to use his best endeavours for the immediate prohibition of this "free emigration," falsely so called, was coldly received by His Excellency, and his reply was more than unsatisfactory. It was therefore deemed advisable, without further loss of time, to appeal directly to Her Most Gracious Majesty the Queen. The Petition has been forwarded to the Acting Governor of the Colony for transmission to Her Majesty by this mail.

"To Her Most Gracious Majesty Victoria, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, and so forth.

"The Petition of a Number of the Inhabitants of the Colony of Queensland, in Public Meeting assembled in the City of Brisbane.

"HUMBLY SHEWETH,

"That your Majesty's Petitioners have viewed with much anxiety the introduction into this Colony of a large number of natives of the South Sea Islands, by private individuals, to work as labourers on sugar plantations, cotton plantations, and on sheep and cattle stations.

"That these natives have been, and are still being, brought without the sanction of your Majesty's Government, without any Colonial law to control or regulate their introduction, to protect them afterwards, or to secure their return home on expiration of term of service.

"That your Petitioners have reason to believe that many of these natives have been kidnapped and brought forcibly here, and others under false and deceptive representations; while many have been induced to come by the promise that they should be conveyed home within 12 months; that this promise has not been fulfilled; but, on the contrary, that many of these natives have been detained in the Colony for periods of three years and upwards, on the allegation they had been engaged for that time.

"That this breach of faith, combined with the illegal manner in which those natives have been obtained, has led to the loss of several vessels, and to the murder of several Europeans at the South Sea Islands by the natives, in revenge for the abduction and detention of their kindred. These facts are confirmed by Captain J. P. Luce, of your Majesty's steamer "Esk," the Senior Naval Officer on the Australian Station, who communicated to Sir George Ferguson Bowen, on the 25th April, A.D. 1867, as follows:—"I have lately received reports of the loss of several vessels, and the murder of several Europeans at Hinchinbroke, and other islands of the New Hebrides group. I enclose an extract from a letter written by a trader in that group, wherein you will see that he is informed the natives say they are doing these atrocities in revenge for the loss of many of their countrymen, who were carried away, three years ago, to Queensland and Fiji Islands by Europeans, who hired them as labourers, and promised to return them to their homes in 12 months."

"Your Petitioners have regarded with dismay the introduction of an inferior and uncivilized race into this Colony, to supplant the British and European labourer, as it will have the effect of reducing to destitution and inactivity, the working classes of the Colony, who have been induced to emigrate here in large numbers by the hope of finding in Queensland an independent home and permanent employment; and they would earnestly advert to such introduction as irreconcilably opposed to the constitution of the Colony, and the intention of its foundation.

"Wherefore your Majesty's humble Petitioners most humbly pray that your Most Gracious Majesty will be pleased to prohibit this traffic in human beings, as being a development of the slave trade with its attendant evils in its most modern form.

"And your Most Gracious Majesty's Petitioners, as in duty bound, will ever pray.

"Signed by the chairman, at the unanimous request of, and on behalf of, the said public meeting.

"JOSHUA JEAYS,  
Chairman.

"Brisbane, Queensland, 16 January, 1868."

No. 7.  
L. A. Chamerov-  
zow, Esq., to His  
Grace the Duke  
of Buckingham  
and Chandos.  
23 May, 1868.

No. 7.

COPY of a letter from L. A. Chamerovzow, Esq., to His Grace the Duke of Buckingham and Chandos.

27, New Broad-street, E.C.  
23 May, 1868.

MY LORD DUKE,

The Committee of the British and Foreign Anti-Slavery Society have received by the last mail from Queensland a copy of the new "Act to Regulate and Control the Introduction and Treatment of Polynesian Labourers," recently passed by the Legislature of the Colony, assented to by the Acting Governor on the 4th March last, and which has been forwarded to your Grace for final approval.

13 Mar. 1868, p. 38.  
27 Mar. 1868, p. 39.  
29 Apr. 1868, p. 40.

Referring your Grace to my previous communications on this subject, the Committee beg respectfully to submit the following observations on the new Act.

The request to legislate on this question appears to have emanated from certain persons, amongst whom, as the committee are informed, were Members of both Houses of the Legislature, who were themselves importers and employers of these islanders. The unlawful nature of the transaction had been publicly pointed out, and the committee submit, that by voting in favour of a measure in which these gentlemen were directly and pecuniarily interested, they have violated a well-known constitutional law, and contravened the established usage and practice of Parliament.

The first clause, by declaring it to be unlawful to introduce Polynesian labourers, except in accordance with the Act, is a declaration of the illegality of all antecedent importations. It is difficult to understand how a traffic, illegal under Imperial law, and assimilated to piracy, can be declared legal by an authority inferior to Imperial authority.

Clause II. obliges employers of Polynesian emigrants to make a return within four months, of all such labourers in their employment. The committee entertain the conviction that the requirements of this clause will be evaded, and that the returns specified will not account for the people who may have died from natural causes, nor for those who may have been lost, starved, or killed. It ought to be made imperative to require the names of labourers who may have been, from the first, employed by the party making such return.

Clause III. imposing a penalty for failure in making returns, must, in the very nature of things, prove inoperative. It is not to be supposed that the personal friends and neighbours of defaulters, or that the Justices of the Peace for country districts, who under this Act may become employers of this new kind of slave labour, and therefore may also themselves become offenders, are likely to assume the office of a common informer. These country Justices of the Peace are almost, without exception, squatters, having with their class a community of interests; and experience in our West India Colonies, has proved that it is unwise and imprudent to permit employers, as Justices of the Peace, to adjudicate upon questions connected with their own labourers. In the absence of a public officer, whose special duty it might be to visit estates, and make returns, this unpleasant and invidious task will assuredly not be voluntarily undertaken by any one; and hence the clause will be of no effect. It is also obvious, that as the penalty for contravention is not to exceed a fine of £50, the smallest fine will, as a rule, be the maximum penalty.

Clause IV. gives the law an *ex post facto* effect, and will therefore be found impracticable in operation. The very wording that the Act shall, "so far as practicable," be applicable to certain individuals, points inevitably to this conclusion.

Clause V. would be less unsatisfactory, if it had made the officer proposed to be appointed, directly responsible to the Government for the due performance of his duty.

Clause VI. is directly opposed to both the law and the practice relating to coloured immigration into other Colonies. In none of the tropical dependencies of the British Empire are coloured labourers allowed to be introduced by private enterprise. In proposing, therefore, to legalize their introduction into Queensland by individuals, a new and most dangerous precedent is being established. This will inevitably lead to the grossest abuses. Under cover of it, a traffic in coloured people will spring up, which will rapidly assume the character and proportions of the slave trade, differing from it only in name. Your Grace has but to refer to the regulations under which Coolies are permitted to be introduced into the West Indies and Mauritius, to be satisfied that the Act under notice violates every principle which has hitherto

hitherto governed the importation of foreign labourers into the Colonies aforesaid. In none of these Colonies are the employers of immigrant labour permitted to make laws that are not strictly in accordance with the Imperial policy. If, therefore, Her Majesty's Government do not reject this Bill, it is difficult to perceive how it will be able to refuse to allow all the other Colonies to claim the same privileges as it confers.

Correspondence  
between Colonial  
Office and British  
and Foreign  
Anti-Slavery  
Society.

The Committee would further observe that there are also discrepancies pertaining to this clause, which wholly vitiate its effect. The applicant, that is to say, the employer, is to receive a license "in Form C," to import the number of labourers he may require. "Form C," however, does not purport to be a license to "import," but "a license to recruit labourers from the South Sea Islands." These terms have a widely different signification. The one takes effect in the Colony, the other beyond it. The license authorized by the Act confers on the employer the privilege of bringing into, or receiving in the Colony, a certain class of labourers; whereas the license in the form referred to gives him a right to recruit, that is, to enlist, engage, or collect these labourers in the South Sea Islands, for which no provision is made in the Act itself. It is clear that "Form C" is not in accordance with the provisions of the enabling clause, that no other form is provided or authorized to be used; that there is no provision authorizing the issue of licenses "to recruit," and therefore, in the absence of such authority, no such licenses can legally be issued.

There are certain important questions on constitutional and international law arising out of this clause, upon which, however, the committee do not desire to dwell at any length. It must, nevertheless, be obvious to your Grace, that no Colonial Legislature can usurp powers not possessed by the Imperial Parliament, and the Committee submit that it is beyond the province, even of the Imperial Legislature, to enact a law which, in its operation, shall affect the personal independence and the liberty of individuals of any foreign nation. It follows, therefore, that to give the Imperial assent to this Bill, would be to violate that great principle of international law which forbids interference with the independence of the citizens of other States, and at the same time would be an infringement of the equally great constitutional principle, that laws made by a subordinate Government in virtue of the powers conferred by the supreme legislature, must not be inconsistent with any law or rule of law, made or sanctioned by it in relation to the same subject-matter.

Clause VII strikes the committee as delusive. Whilst it is ordered that vessels shall be properly found in surgical instruments, medicines, and other things necessary for diseases or accidents incidental to sea voyages, no provision is made to supply a duly qualified medical practitioner to prescribe and use them. It is surely not employing too strong language to designate such legislation as delusive.

The eighth clause is objectionable in so many particulars that the committee do not feel it convenient to deal with them all; and, indeed, as the Committee take exception to the Act itself as being illegal in principle, it seems superfluous to argue against it in detail. Nevertheless, the committee would here record their chief objections to this clause.

In the first place it permits, by inference, certain things to be done, which are in themselves illegal; as for example the indenturing of the labourers in the South Sea Islands to employers in Queensland. This is opening the door to an endless amount of fraud, and is directly opposed to the principle established by the Imperial Government, for regulating the introduction of coloured labour into other Colonies.

In the second place, the committee object that agreements purporting to shew that certain labourers have been indentured before arrival in the Colony, or are to be indentured on arrival there, would be grossly illegal, and such a practice must inevitably lead to irregularities of the gravest description.

In the third place, as no authority is given by the Act "to recruit labourers in the South Sea Islands," and the license referred to in the clause is one "to recruit," not to import labourers, the master of the vessel cannot possibly comply with this self-contradictory regulation, for it is obvious that the form and the clause are at issue. Furthermore, the committee deny emphatically the power of the Legislature of Queensland to make a law authorizing persons to recruit labourers in foreign countries. Such a license is tantamount to issuing a roving commission to pick up natives wherever they can be found, and this without any previous treaty or negotiation with the insular authorities. This is not lawful immigration, but the illegal slave trade.

In the next place, the Government reserves to itself no power to interfere with the appointment of any recruiting agent, who, though he be duly licensed, may be a most unsuitable person, even of the worst character, over whose actions it would have no control. It is well known that a traffic such as the one it is proposed to legalize presents the greatest attractions to the most lawless characters, and if, therefore, it be legalized at all, the Government ought to exercise a direct control over these recruiting agents.

Fifthly, it appears to the committee highly objectionable to involve the Missionaries in this traffic. Such a course is calculated to lead them into disputes with the natives, to destroy their influence as Christian teachers in the islands, and in the event of anything going wrong with the people imported into Queensland, to expose them to personal danger in revenge.

Clause IX is open to the same objection as has been raised to the previous one, in so far as regards the facilities it affords for chicanery and oppression.

Clauses X to XIV inclusively, relate chiefly to matters of detail, and do not seem to call for comment. The same remark applies to Clauses XVI to XXIII inclusively.

The

## 44 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Correspondence  
between Colonial  
Office and British  
and Foreign  
Anti-Slavery  
Society.

The penalty imposed on masters of vessels by Clause XV, namely, of £500, ostensibly to prevent kidnapping, is, in the judgment of the committee, utterly inadequate to prevent that crime. The money value of a South Sea Islander landed in Queensland averages £10, which sum parties introducing them now actually receive. A cargo of 250, supposing it to be one of voluntary immigrants, would therefore realise £2,500; but if a similar cargo were kidnapped, and the master convicted, the fine on the whole would be £500, which, deducted from the value of the cargo in bulk, would still leave a profit large enough to encourage further enterprises of a like kind. The committee, however, would remind your Grace of the Imperial Statute, which declares the kidnapping of negroes to be a capital offence, under the name of piracy, punishable with penal servitude and the forfeiture of the vessel, and the committee are utterly at a loss to conceive how that which constitutes piracy in the one instance can by any legislation be transformed into a lawful traffic in the other.

The foregoing remarks apply with increased force to Clause XXIV, inasmuch as kidnapping is one of the offences punishable under it, the maximum penalty for which is, for the first offence, £10, and for every subsequent offence, £20.

The placing of engagements, by Clause XXV, under the Masters' and Servants' Act will afford very imperfect protection to the South Sea Island labourers, who, knowing nothing of the law, will seldom be able to seek redress under it, while their employers will have it in their power to use it as an engine of oppression.

Clause XXVI will operate to make the traffic a close trade.

Clause XXVII leaves open the question of providing hospital accommodation or medical treatment for the immigrants, an omission of the most serious character.

Clause XXVIII appears to be framed with a benevolent intention, but no provision is made for carrying it into effect; and the same remark applies to Clause XXX, for it does not appear how the employer is to be prevented from violating it, if he be so disposed.

The immediate object of the committee in addressing your Grace is to bring these comments promptly under your notice, in the hope that you will be pleased to give them your best consideration; and the committee venture to believe that your Grace will find in them sufficiently strong reasons to justify you in disallowing this Act.

## INTRODUCTION OF SOUTH SEA ISLANDERS INTO THE COLONY.

(1.)

Previous papers on the subject of the importation of South Sea Islanders into Queensland will be found in "Votes and Proceedings," Session II, 1863, page 397.

(2.)

The Senior Naval Officer on the Australian Station to His Excellency the Governor.

H. M. S. "Esk," Sydney,  
25 April, 1867.

Sir,

I have lately received reports of the loss of several vessels, and the murder of several Europeans at Hinchinbroke and other Islands of the New Hebrides group.

I enclose an extract from a letter written by a trader in that group, wherein you will see that he is informed the natives say that they are doing these atrocities in revenge for the loss of many of their countrymen who were carried away three years ago to Queensland and the Fiji Islands, by Europeans who hired them as labourers and promised to return them to their homes in twelve months.

The trader writes:—"I have been cautioned by several of the Chiefs, and told to keep a good look-out, as the natives be determined to have revenge on the white man, as he had taken the men of the islands and agreed to bring them back in twelve months, which is over three years. This I know to be the case with parties in Queensland and Fiji Islands."

I have sent H.M.S. "Falcon" to visit the islands; she sailed to-day, and has orders to communicate with Consul Jones at Fiji, and request him to inform me if natives are conveyed from the New Hebrides to the Fiji group as labourers, if the trade is carried on by Europeans, and under what license and superintendence.

I have the honor to request that you will cause me to be supplied with information on the subject of the admission into Queensland of Island natives.

What number actually arrive?

Where they come from?

What class of people engage them?

The length of time they are engaged for?

And what security the natives have that they will be restored to their homes when their engagements have expired?

And other information on the subject will be useful.

I know, from my own experience, that many of the vessels trading to the New Hebrides are manned by rough and very lawless men, who finding themselves beyond the reach of any civilized power, behave towards the natives with injustice. Now that the New Zealand war is over, it is to be hoped that vessels of the squadron may be able frequently to visit the islands, and to see that the trade is carried on with justice, and according to law. In the hope that you may be able to afford me valuable information, which I can compare with the accounts brought back by H.M.S. "Falcon" on her return to Sydney, I trouble you with this communication, and—

I have, &c.,  
(Signed) J. P. LUCE,  
Captain and Senior Officer.

His Excellency Sir George Bowen, G.C.M.G.,  
&c., &c., &c.,  
Governor of Queensland.

Society.

(3.)

EXTRACT from the Minutes of Proceedings of the Executive Council of Queensland.

At the Government House, Brisbane, on 3rd May, 1867.

PRESENT:

His Excellency the Governor in Council.

His Excellency the Governor lays before the Council a letter (dated 25th April, 1867), addressed to His Excellency by Captain Luce, R.N., now commanding Her Majesty's naval forces on the Australian Station.

This letter states that Captain Luce had lately received reports of the loss of several vessels, and of the murder of several Europeans at certain of the South Sea Islands; and that it appears from a letter written by a trader in those seas, that "the natives say that they are perpetrating these atrocities in revenge for the loss of many of their countrymen, who were carried away three years ago to Queensland and the Fiji Islands by Europeans, who hired them as labourers and promised to return them to their homes in twelve months."

Captain Luce asks for information on the subject from the Government of Queensland.

The Council deliberate. They observe that the first and principal importer of South Sea Islanders as labourers into this Colony is the Honorable Robert Towns, Member of the Legislative Council of New South Wales, and resident at Sydney, but the owner of a cotton plantation in Queensland. This gentleman can give Captain Luce more information on the subject than any other person; and they suggest that personal application should be made to him. Moreover, it is believed that the small number of South Sea Islanders who have hitherto come to work in Queensland, on the new sugar and cotton plantations, have all been landed from ships belonging to Sydney.

The Council further observe that the Masters and Servants Act (25 Victoria, No. 11), now in force in Queensland, provides for the due enforcement on both parties of labour contracts, whether made in this Colony or in foreign countries. Should it be proved that further legislation is required for the due protection of the South Sea Islanders, the Council do not doubt but that the Colonial Parliament will be ready to pass any measure which facts and documents, hereafter to be laid before them, may show to be absolutely necessary.

It need scarcely be said that the Responsible Ministers are anxious to punish all fraud and injustice whenever committed, and to secure the inhabitants of the Colony, of every class, in the full enjoyment of their rights.

The Council advise that the proper Government officers be directed to procure the information respecting the number of South Sea Islanders now in Queensland, &c., as asked for by Captain Luce, R.N., and also that the Police Magistrate of the district be ordered to inspect periodically the plantations on which any such islanders may be employed, and to report to the Colonial Secretary the result of such inspection.

A. V. DRURY,  
Clerk of the Council.

(4.)

His Excellency the Governor to the Senior Naval Officer.

Government House, Brisbane, Queensland,  
28 May, 1867.

Sir,

I received in due course your letter of the 25th ultimo, respecting the South Sea Islanders employed in Queensland.

2. You are, of course, already aware that the Governor of a Colony possessing Parliamentary Government is bound to act, in Colonial affairs, through his responsible advisers in the Executive Council. I accordingly took an early opportunity of laying your letter before my Ministers, and I request your attention to the enclosed Minute of Council, containing the views of the Government of Queensland on the entire subject.

3. I also transmit reports from the Collector of Customs of this Colony. It appears that in the aggregate only 382 South Sea Islanders have landed in Queensland, of which number 78 have returned to their homes. It is stated that those already sent back were under an engagement for one year only; and that most of the remainder are under engagements for three years, and will be provided with passages to their native islands when that period shall have expired.

4. The principal employers of these labourers are Captain Towns, of Sydney, and Captain Whish, formerly of the 14th Light Dragoons, and now the owner of a sugar plantation near Brisbane. As is pointed out in the enclosed Minute, Captain Towns can give you more information on this question than any other person; you will probably make a direct application to that gentleman. I annex the reply of Captain Whish to the queries addressed to him by my Ministers.

5. You are thus in possession of all the information which it has been in my power to procure for you here.

6. It will be seen from the Minute of the Executive Council, that the Government of Queensland, in common with myself, "are anxious to punish all fraud and injustice whenever committed, and to secure the inhabitants of the Colony of every class in the full enjoyment of their rights;" and that, "Should it be proved that further legislation is required for the due protection of the South Sea Islanders, the Council do not doubt but that the Colonial Parliament will be ready to pass any measure which facts and documents hereafter to be laid before them may show to be absolutely necessary;" and that, in the meantime, "the Police Magistrate of the district is ordered to inspect periodically the plantations on which any such islanders may be employed."

7. I have myself visited the plantations of Captain Towns and Captain Whish. The islanders employed there seemed to be healthy and contented, and they certainly made no complaints. You may rest assured that I shall not lose sight of this question. Should you visit Queensland yourself, I shall be glad if you will accompany me in a fresh inspection of the plantations referred to above.

Captain Luce, R.N.,  
Senior Naval Officer, H.M.S. "Esk," Sydney.

I have, &c.,  
(Signed) G. F. BOWEN.

Minute of  
Council, 3 May,  
1867.

22 May, 1867.

(5.)

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 47

(5.)

Captain Whish to the Honorable the Colonial Treasurer.

Oaklands, Cabulture River,  
22 May, 1867.Correspondence  
between Colonial  
Office and British  
and Foreign  
Anti-Slavery  
Society.

Sir,

In reply to your letter of the 9th instant, requesting information concerning certain South Sea Islanders in our employ, I have the honour to inform you that—

Thirty-three natives, all males, arrived on our plantation in December, 1865.

The agreement between us is, that they serve us for three years, and are then to be restored to their homes.

Their pay is 10s. a month, paid in kind, on their return home.

During their stay they are housed, fed, and clothed.

Besides this, they are supplied with pipes and tobacco, blankets, and pannikins, and are occasionally rewarded with beads, or allowed money to buy them.

They appear to be perfectly happy and contented, and have improved greatly in health and strength since their arrival in the country. One islander having died, there are 32 now on the plantation; and we have written to inquire about a fresh supply of them, as we wish to send our present hands home before the term of their agreement is out, that they may see, and tell their friends, that we are dealing fairly by them.

The more intelligent of the men are employed with horse teams, at the saw bench, in the sugar house, and on board the cutter, and these will in the end receive some additional remuneration according to their superior worth.

They all work cheerfully and well, indeed for some time past we have had no overseer over them, whereas with an equal number of Europeans an overseer would be indispensable.

The news of the massacre had reached us some time ago, and we know that natives are kidnapped to serve in the Fiji Islands; but the real cause of the massacre (and a most common one) appears not to have been put forward.

With the liability, however, to further disturbances, it might be to the interest of Government to undertake the supply, at cost price, of coloured labour suitable for sugar and cotton plantations; for, without some such importation, it is simply impossible for this country ever to rise from its present depressed state.

A rainy season, such as we have had for three or four months, would well nigh ruin a proprietor who had to keep a large gang of Europeans, who must be paid and fed, whether the weather allowed them to work or no. My experience in this matter has been dearly purchased; for three and a half years I employed white labour, and am perfectly convinced that it will never pay to cultivate cotton or sugar with white labour. We have had to import our own labour, and shall do so again as we require it. At the same time, if the Government is at all anxious for the development of the country, let them follow the example of the Mauritius and Natal Governments, and supply the Coolies to the planters; the latter will do the rest, and a very few years will prove the wisdom of such a course, and show that enterprise must command success under a Government that will do its duty.

The Honorable the Colonial Treasurer.

I have, &c.,  
(Signed) C. B. WHISH.

(6.)

The Senior Naval Officer to His Excellency the Governor.

Her Majesty's Ship "Esk,"  
Sydney, 4 June, 1867.

Sir,

I have the honor to acknowledge the receipt of your letter, dated 28th May, and its enclosures, containing information concerning the South Sea Island natives employed in the Colony of Queensland.

I am greatly obliged for the above information, and am now well satisfied that the South Sea Island labour traffic to Queensland will continue to be carried on with justice, and will be of great benefit to the natives themselves.

Consul Jones, of the Fiji, has also, I am informed, laid down regulations, and taken measures to enforce them, for the labour traffic between the New Hebrides and the Fiji group.

Her Majesty's ship "Falcon" is now on a cruise to the islands, and has orders to investigate any complaints made, either by Europeans or natives, and also to request the assistance of the Missionaries in investigating the circumstances attending the recent loss of vessels, and the reported murder of their crews at the island of Hinchinbroke, New Hebrides.

The new Commodore will thus have a clear statement of the whole case of the island labour traffic; and if the report made by the Captain of the "Falcon" contains matter likely to be of interest to you, I will request that such information may be forwarded to you.

His Excellency, Sir George Bowen, G.C.M.G.,  
&c., &c., &c.,  
Governor of Queensland.I have, &c.,  
(Signed) J. P. LUCE,  
Captain and Senior Officer.

(7.)

The Under Colonial Secretary to The Police Magistrate, Brisbane.

Colonial Secretary's Office, Brisbane,  
5 July, 1867.

Sir,

Representations having been made to the Government that much dissatisfaction prevails at some of the South Sea Islands at the protracted absence of many of the islanders who were induced to come to Queensland as labourers under promise of free return passages in 12 months, and this dissatisfaction having undoubtedly led to some, if not all, of the barbarous murders perpetrated upon Europeans visiting the South Sea Islands, I am directed to inform you that the Government deem it desirable to obtain information touching the condition and treatment of such islanders as may from time to time be brought to this Colony as labourers upon sugar or cotton plantations; and for this purpose it has been directed that the Police Magistrate of the district in which any such islanders may be employed shall periodically inspect all such plantations, and report to the Colonial Secretary the result of his observations.

## 48 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Correspondence  
between Colonial  
Office and British  
and Foreign  
Anti-Slavery  
Society.

observations touching the condition and treatment of the islanders. It is believed that, at the present moment, islanders will be found only on plantations in the Moreton Bay District, the principal ones being "Townvale," on the Logan, and "Redland Bay." To these plantations I am instructed to request you will make periodical visits, and, in terms of the Minute of Council, report fully to this office.

I have, &c.,  
(Signed) ROBERT GRAY,  
For the Under Colonial Secretary.

The Police Magistrate, Brisbane.

(8.)

The Police Magistrate of Brisbane to the Under Colonial Secretary.

Police Office, Brisbane,  
25 September, 1867.

Sir,

I have the honor to report, for the information of the Government, that, in accordance with the instructions conveyed in your letter of 5th July ultimo, relative to the South Sea Islanders employed on various establishments within the district of Brisbane, I proceeded, on the 12th instant, to the cotton plantation of Captain Towns, on the Logan River Reserve, where the description of labour referred to has been largely introduced.

2. Annexed to this report will be found the information given in the form of questions and answers by Captain Towns' present manager on the plantation, Mr. Walker, together with a return furnished me by that gentleman, showing—

The number of islanders brought into the country by Captain Towns, from the 18th August, 1863, to the present time.

The number of those returned to their respective islands in the same period.

The deaths that have taken place. And—

The number at present on the plantation; with other particulars.

3. It appears that, in the period named, 299 islanders have been introduced by Captain Towns, of whom 77 have been returned to their homes, 10 have been forwarded to Cleveland Bay, and 14 have died; leaving 198 at present employed on the plantation.

4. Of the whole number brought to this country (299), 67 only appear to have been engaged for 12 months, and to have been returned at the expiration of their agreement, namely, those who arrived in 1863 by the "Don Juan."

5. The rest have been engaged for a term of three years from the date of arrival.

6. Of the total number (134) brought here in 1864 by the "Uncle Tom," only 104 are left on the plantation; 10 have been returned; 10 have died; and 10 have been sent to Cleveland Bay, of whom no information could be given me by Mr. Walker.

7. The agreement of the first lot imported by the "Uncle Tom," in 1864, expired on the 8th June last; but up to the present time, of this number (54), 10 only, referred to in the preceding paragraph, have been allowed to return home.

8. The reason given by Mr. Walker for detaining these men beyond the time for which they had agreed to remain (which will be found in the answers to questions Nos. 10 and 11), is by no means satisfactory. The necessity of keeping faith with this peculiar race of people is too obvious to need any comment, and any breach of it may be attended with very serious consequences elsewhere.

9. The agreement of the second lot brought out by the "Uncle Tom" will not expire until 28th November, 1867; but, according to Mr. Walker's statement, a direct promise has been made to those men that they shall return in the present month with those whose agreement expired on the 8th June last. (*Answers to Questions 12, 13.*)

10. This promise should be strictly adhered to, and must be presumed to be made with Captain Towns' sanction.

11. Fourteen deaths are reported to have taken place out of the number brought to this country between 18th August, 1863, and 16th September, 1867 (299).

12. Of this number, three occurred on board ship after arrival in Moreton Bay; the other eleven deaths took place on the Logan River Plantation.

13. No magisterial inquiry has been held in any one case.

14. As the plantation where so many of these islanders are employed does not appear to be visited periodically, or even occasionally, by any medical man (*Question 24*), it would seem more necessary, than under ordinary circumstances, to have every death that occurs amongst them made the subject of a proper inquiry.

15. There are, at least, three Magistrates within a short distance of the plantation, to either of whom, in the event of a death taking place, application could readily be made.

16. I have only to add, that so far as can be judged from the manner and appearance of the islanders themselves, they are well cared for, and are amply supplied with wholesome food for maintaining their health and physical condition.

I have, &c.,  
H. H. MASSIE.

12 SEPTEMBER, 1867.

INFORMATION of Mr. Walker, Manager of the Logan River Reserve Cotton Plantation, respecting the South Sea Islanders employed in the establishment.

1. You are manager for Captain Towns, the owner of the plantation? Yes.

2. How long have you had charge of the establishment? About two years and three months.

3. Were any South Sea Islanders employed on the plantation before you took charge of it? Yes.

I see by a Custom House return, that sixty-seven islanders were introduced in 1863, and were returned in 1864. These were the first that were employed, and their term of agreement was only twelve months.

4. When you took charge of the establishment, how many islanders were employed? 114 (one hundred and fourteen). (*See Appendix.*)

5. What was the name of the ship by which they arrived, and the date of their arrival? Fifty-four were brought by the "Uncle Tom," on 8th June, 1864, and eighty by the same ship, 28th November, 1864.

6. Have you got a copy of the agreement made with these men at the time they were engaged? No, I have no duplicate in my possession. I believe Captain Towns has the original.

7. What was the term of their agreement? Three years from the date of their arrival.

8. Then the term of service of the fifty-four, who arrived on the 8th June, 1864, has expired? Yes.

9. Have they been returned since the expiration of their service to their respective homes, and, if so, by what ship? Of the whole number (134), introduced by the "Uncle Tom" in 1864, ten only have been

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 49

been returned up to the present time; one returned by the "Uncle Tom" after her first trip in June, 1864; seven Murray men were sent back in September, 1866, by the "Speck," Daly, master; and (2) two more (one a Tanna man, the other a Sandwich man), were sent back in May or June, 1867, by the "King Oscar."

Correspondence  
between Colonial  
Office and British  
and Foreign  
Anti-Slavery  
Society.

10. Can you give any reason why these men were kept beyond the time for which they had agreed to remain? The only opportunity that occurred of sending them back was by the "King Oscar," this month. They seemed unwilling to go back by her. It was explained to them that if they were willing to remain a little longer, they might all return together,—that is, both lots brought here by the "Uncle Tom," in 1864.

11. Were they satisfied with this arrangement; was it their own wish to remain? Yes, I believe so. I dare say they would be glad to get home, but they seemed unwilling to go by the "King Oscar."

12. Have any arrangements been made for sending them home at once? Captain Towns went down to engage a vessel in Sydney for that purpose. I believe she is on her way up now. As soon as she arrives, they will all be sent back to their respective islands at once.

13. That is, the men whose agreement expired in June last, and the rest whose agreement has still to run to 28th November, proximo? Yes; both lots will be sent home together as soon as Captain Towns' ship arrives.

14. What are the names of the islands to which they belong respectively? Yeissy men, 14; Tanna men, 52; My men, 18; Sandwich men, 20; total, 104.

15. Since you took charge of the establishment, what number of islanders have been introduced? Ninety-eight; of this number, sixty-three came by the "Speck," Daly, master, in September, 1866, and thirty-five by the "King Oscar," in August, 1867.

16. Have you got a copy of the agreement made with these men? No; but in each case the term of agreement was three years from the date of arrival.

17. Previous to your taking charge of the establishment, are you aware how many deaths occurred? I cannot state positively; I know there were several; I think I might be able to ascertain. (See Appendix.)

18. Is any proper record kept of the arrivals, departures, deaths, casualties, and other particulars connected with the islanders that are employed on the establishment? No; but I think it desirable that some such record should be kept.

19. How many deaths have taken place since you have been in charge yourself? Six in all.

20. Can you give me the particulars in each case? Two out of the six deaths have occurred among the late arrivals by the "King Oscar." One died on the 19th August, 1867, from diarrhoea; the other on the 2nd September, from bronchitis and lung disease; I cannot give the particulars of the other deaths.

21. Has any Magistrate ever been applied to to hold an inquiry? No; not in my time.

22. Have the deaths in each case been registered at the nearest registry office? Printed forms of returns have always been made to the head office in Brisbane.

23. Is the establishment ever visited or inspected periodically by any medical man? No; I have a supply of medicines, and I treat the cases as they occur myself.

24. Has a medical man ever been sent for on any special occasion? No; two men were sent to the Brisbane hospital for treatment, and they came back.

25. What is the general state of health of the islanders on the establishment? Very good indeed; they are remarkably healthy.

26. What is the prevailing form of sickness amongst them? Affection of the lungs, with occasional slight ailments, such as sick head-ache, proceeding from derangement of the stomach.

27. Has the establishment been visited by any minister of religion? Two visits have been made by Roman Catholic clergymen. Each visit was made on a Sunday, and Divine service was performed.

28. Have the islanders any form of worship amongst themselves; do they observe the Sabbath? No; they keep the Sunday, but only as a holiday.

29. What is the state of education amongst them; can any of them read or write? Those on the plantation at present are wholly uneducated.

30. Has any immorality ever been observed amongst them? No; I never had the slightest reason to suspect that any such existed amongst them.

31. Have any of them formed connections with European or Native women? No; they seem to have a special contempt for the aboriginal population of this country. They never associate with them at all.

32. What is the general nature of the services performed by the islanders? They are principally employed as field labourers in the cultivation of cotton. About fifteen of them have been taught since they came on the plantation to drive bullocks and horses, to split shingles and fencing stuff, and to act as stockmen, but there are none of them very skilful.

33. Are they generally intelligent, docile, and willing, in the performance of any duties required of them? Very few of them show much intelligence on their first arrival; they are very slow, and require a deal of teaching, but they are exceedingly tractable, and very willing to do all they are asked to do.

34. If they are idle and negligent, or refuse to work, how are they dealt with? We stop their tobacco, and on some occasions make them change their quarters from one part of the plantation to another. They seem to have a great dislike to be separated from those with whom they have been in the habit of associating, but it is generally sufficient to threaten them with this; the threat is very seldom carried out.

35. Have you any white overseers under you? Yes: two at present; but they only see that any orders that are given generally are carried out. They have no special authority; if they have any complaints to make, they must report them to me. No islander is ever allowed to be struck or beaten. Personal ill-treatment of any kind is strictly forbidden.

36. Are there any native overseers; and if so, what is the nature and extent of their authority? They generally look up to some one of their own number appointed by themselves as head man. He is generally the mouth-piece, and instructions are given through him to the rest of the gang under him; but he has no authority over the others from me.

37. Is there any interpreter who can thoroughly understand and explain their grievances or grounds of complaint if any such should arise? There is no regular interpreter; but after they have been here some time, most of them can speak pretty good English. The Sandwich men can generally speak good English on their arrival.

38. Have they ever expressed a wish to make their complaint to a Magistrate, or Missionary, or some person whom they suppose to have authority independent of their employers? No, never.

39. Have you ever had any experience yourself in the management of South Sea Islanders before you had charge of this plantation? No.

40. What European labour do you employ on the establishment? Is there any jealousy or ill-feeling between the two races? There are about twenty Europeans employed, principally as mechanics, engineers, and skilled labourers. Some of them have wives and families. There never has been the slightest disagreement between them and the islanders.

41. What are the working hours observed on the establishment? From six in the morning to six o'clock in the evening. During that time they are allowed one hour for breakfast, and two hours for dinner in the summer; and one hour for breakfast, and one hour for dinner in winter. That is the regular allowance, but in the hot weather they have, in addition, occasional short intervals of rest.

1867.

## QUEENSLAND.—LEGISLATIVE ASSEMBLY:

## TRADE BETWEEN QUEENSLAND AND SOUTH SEA ISLANDS.

(Ordered by the Legislative Assembly to be Printed, 15th October, 1867.)

RETURN to an Order made by the Honorable the Legislative Assembly of Queensland, dated 9th October, 1867, That there be laid upon the Table of this House a Return, shewing:—

- " (1.) The number, names, and registered tonnage of all vessels engaged in trading between the several ports of this Colony and the South Sea Islands, from 10 December, 1859, to the present time.  
 " (2.) The names of the owners, masters, and consignees of said vessels; also, the names of the persons by whom the same were chartered.  
 " (3.) The date of arrival and departure of each vessel respectively, and the entries of the cargo inwards and outwards.  
 " (4.) The number of South Sea Islanders brought by each vessel; the names of the persons by whom they were brought, and of those to whom they were consigned; also the date of their arrival.  
 " (5.) The number of South Sea Islanders who have been returned to their homes in the said vessels; the date of their departure; and the names of persons in whose charge they were sent.  
 " (6.) A copy of the Government Regulations under which this immigration has been conducted."

(Dr. Challinor.)

RETURN shewing the number of South Sea Islanders who have arrived at the Port of Brisbane, from the 10th December, 1859, to the present time—10th October, 1867—and other information on this subject, as moved for in the Legislative Assembly, by Dr. Challinor, as can be supplied by the Customs Department.

M.P., to L. A.  
Chamerovzow,  
Esq.  
19 June 1868.  
\* Page 44.

SIR,

I am directed by the Duke of Buckingham and Chandos to acknowledge the receipt of your letter of 6th instant,\* enclosing copies of the authorities on which you ground the third and eighth statements in your previous letter of the 13th March, on the subject of the introduction of South Sea Islanders into Queensland.

The third statement was, that considerable numbers of South Sea Islanders had been "kidnapped and forcibly brought into the Colony." The eighth was, "That persons occupying responsible public positions are engaged also in this traffic."

His Grace finds in the papers before him no ground for the allegation that the islanders or any of them had been kidnapped for the purpose of being sent to Queensland, or that persons occupying responsible public positions are engaged in this traffic. His Grace observes that the charges rest wholly on statements made by a person not named to Captain Luce of Her Majesty's ship, "Esk," who, on receiving authentic information from Queensland, withdraws those charges, and expresses his opinion that "the South Sea Island labour traffic to Queensland will continue to be carried on with justice, and will be of great benefit to the natives themselves."

You also stated "that although promises were held out to these people that they should be restored to their homes within a given term, none have been sent back from the northern ports, and only 201 from Brisbane;" leaving it to be inferred that a large number of such promises had been made and had not been kept.

With regard to this charge, it appears, from the authorities adduced by you, that on 25th September, 1867, there were on Captain Towns' plantation 198 islanders, of whom fifty-four had become entitled to return home on the 8th of the previous June, but had been unwilling to avail themselves of the opportunity which then offered. It was then alleged that their employer intended to send them home with another party of islanders, whose term of engagement was shortly to expire; and it appears in fact that 115 natives did leave Brisbane in October, 1867.

These being the facts, as alleged in the very papers tendered in support of the charges, His Grace cannot but express his extreme surprise that such charges should ever have been made.

His Grace desires me to add that the subject is receiving and will continue to receive, the careful attention of Her Majesty's Government.

The enclosures to your letter now under acknowledgment will shortly be returned to you.

I am, &c.  
(Signed) C. B. ADDERLEY.

Duke of Bucking-  
ham and  
Chandos,  
25 March, 1868.

MY LORD DUKE,

I have the honor to forward herewith a Memorial adopted by the committee of the Aborigines Protection Society, in which it is stated it has been the custom of certain British subjects in Queensland, to prosecute a traffic in native South Sea Islanders; that it appears no proper precautions have been adopted by the Government of the Colony to regulate this traffic, and that the natives of these islands state that the atrocities they have recently committed upon Europeans have been done in revenge for the loss of many of their countrymen, who were carried away three years ago to Queensland, by Europeans, who hired them as labourers, and who promised to return them to their homes in 12 months.

The Memorial also prays that your Grace may for the future withhold your sanction from the traffic in any form.

I have, &c.

## 54 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

Correspondence  
between Colonial  
Office and Aborigines  
Protection  
Society.

Encl. in No. 1.

[Enclosure in No. 1.]

To His Grace the Duke of Buckingham, Her Majesty's Principal Secretary of State for the Colonies.

On behalf of the Committee of the Aborigines Protection Society, we desire respectfully to call your Grace's attention to the traffic in native South Sea Islanders, which has been prosecuted for several years past by certain British subjects in the Colony of Queensland.

The traffic has existed wholly without the sanction of the law, for an act of the Colonial Legislature authorizing Coolie immigration from India, cannot possibly be made to legalize a traffic which is carried on with countries beyond British jurisdiction, and which is manifestly open to so many grave abuses. The same objection which proved fatal to the so-called immigration of negroes from the Coast of Africa applies with equal and irresistible force to the exportation of South Sea Islanders.

Even if this plea of illegality broke down, it yet appears that the Government of Queensland took no steps whatever to subject this species of imported labour to the regulations which the Duke of Newcastle's Despatch had rendered obligatory in regard to Coolies. It is true that the traffic scarcely admitted of regulations in the islands themselves, but it might easily have been placed under proper official control in the ports and plantations of Queensland. That such control was not exercised, is greatly to be deplored.

We greatly fear that an intimate relation will be found to subsist between this traffic and certain painful events which took place in 1865. In that year Commodore Sir William Wiseman destroyed several villages in the New Hebrides, in retaliation for outrages alleged to have been committed by natives on the persons of British seamen. Our impression that such a connection exists, is confirmed by a letter addressed by Captain J. P. Luce, of Her Majesty's ship "Esk," to Sir George Bowen, Governor of Queensland, and dated Sydney, 25th April, 1867. Captain Luce writes:—

"I have lately received reports of the loss of several vessels and the murder of several Europeans at Hinchinbroke, and other islands of the New Hebrides group. I enclose an extract from a letter written by a trader in that group, wherein you will see that he is informed, the natives say that they are doing these atrocities in revenge for the loss of many of their countrymen who were carried away three years ago to Queensland and the Fiji Islands, by Europeans, who hired them as labourers, and promised to return them to their homes in 12 months. The trader writes, 'I have been cautioned by several of the chiefs, and told to keep a good look-out, as the natives are determined to have revenge on the white man, as he had taken the men of the Islands, and agreed to bring them back in twelve months, which is over three years. This I know to be the case with parties in Queensland and Fiji Islands.'"

The gallant officer then puts some pertinent inquiries with reference to the introduction of natives from the New Hebrides into the Colony of Queensland, and adds:—

"I know from my own experience, that many of the vessels trading to the New Hebrides are manned by rough and very lawless men, who, finding themselves beyond the reach of any civilized power, behave towards the natives with injustice. Now that the New Zealand war is over, it is to be hoped that vessels of the squadron may be able frequently to visit the Islands, and to see that the trade is carried on with justice, and according to law."

We understand that a Bill for the regulation of the traffic is now before the Queensland Legislature. We venture to submit that this step is taken too late. The system has already produced strife and bloodshed in the South Sea Islands, and if persisted in, will probably entail still greater evils in time to come. We believe that no regulations that may hereafter be established, will be efficacious in allaying the distrust which has already been excited among the natives, or in preventing great abuses from taking place in the islands from which the labourers are obtained. We, therefore, venture to hope that a consideration of all facts now submitted to your Grace, will induce Her Majesty's Government to withhold its sanction from the traffic in any form.

We have, &c.,  
(Signed) ALFRED S. CHURCHILL, Vice President.

COPY of a letter from the Right Honorable Sir John Trollope, Bart., M.P. to the Right Honorable the Secretary for the Colonies.

Casewick, Stamford, 14 April, 1868.

SIR,

I have the honor to forward to you an inquiry by the father of a seaman of the "Mary Ida," of Sydney, supposed to have been murdered, with others of the crew of that vessel, by natives of one of South Sea Islands; and H. M. S. "Curaçoa" having been required to investigate the circumstances, your office or the Admiralty may be in possession of the facts of the case, and if so, you will have the goodness to communicate them to the Memorialist, whose statement I enclose, the father of one of the men supposed to have been murdered.

The Right Honorable  
The Secretary for the Colonies.

I have, &c.,

Encl. in No. 1.

Right Honorable Sir,

I respectfully beg to state, that in consequence of not having heard any further particulars relating to the fate of the schooner "Mary Ida," of Sydney, Unthank, master; the vessel on board which my son, John Percy, William Unthank, the owners, and Henry Collins, was murdered by the natives of Sandwich Island; I again humbly beg to request you will be so kind as to cause inquiry to be made at the Colonial Secretary's Office, or at any other department, to know the result of the investigation, if any, made by the Commander of H.M.S. "Curaçoa," which was said had been sent on to investigate the affair, and to know if any of the property have been recovered from the Chief of that island. I also beg to state, before leaving Sydney, the owners purchased goods to the value of about £500, on purpose for trading at the South Sea Islands, sold at New Caledonia goods to the amount of about £300, and then proceeded to the Sandwich Island with the remainder of cargo; also I wish to know if the vessel has been sold, with her stores, &c., which was recaptured by Mr. Havinden, and taken to Pueblo, New Caledonia, and left in charge of Mr. Henry.

Trusting you will excuse my freedom, not deeming it necessary to forward the above through the favor of Mr. W. Skelton, as you kindly offered to forward any other inquiry into this unhappy event.

Right Hon. Sir John Trollope, Bart., M.P.

I am, &c.,  
(Signed) E. PERCY.

T. Frederick  
Elliot, Esq., to  
Mr. E. Percy.  
29 May, 1868.

SIR,

I am directed by the Duke of Buckingham and Chandos, to inform you that your letter of 27th March, addressed to Sir John Trollope, was forwarded by him to this department, and that inquiry has been made by his Grace's desire, at the office of the Lords Commissioners of the Admiralty, whether any further information had been received, respecting the plunder of the "Mary Ida," of Sydney, and the murder of the crew by the natives of the New Hebrides.

It appears, that the Admiralty have no information beyond what has been already communicated to you, except that stated in a postscript to a report of Commander Blake, dated 4th August, 1867, to the effect that the money taken out of the "Mary Ida," to the value of £18 7s. 9½d., recovered from the Chief of Emel Island, is retained by that officer for the purpose of being delivered over to your agent and to the agent of Mr. Unthank, at Sydney.

I have, &c.,  
(Signed) T. FREDERICK ELLIOT.

## APPENDIX.

## QUEENSLAND.

ANNO TRICESIMO PRIMO VICTORIÆ REGINÆ.

No. 47.

## AN ACT to Regulate and Control the Introduction and Treatment of Polynesian Labourers.

<b>Preamble.</b>	WHEREAS many persons have deemed it desirable and necessary, in order to enable them to carry on their operations in tropical and semi-tropical agriculture, to introduce to the Colony Polynesian labourers: And whereas it is necessary for the prevention of abuses and for securing to the labourers proper treatment and protection, as well as for securing to the employer the due fulfilment by the immigrant of his agreement, that an Act should be passed for the control of such immigration: Be it therefore enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Legislative Council and Legislative Assembly of Queensland in Parliament assembled, and by the authority of the same, as follows:—
Not lawful to introduce Polynesian labourers, except according to regulations.	1. It shall not be lawful for any person or persons to introduce any Polynesian labourers into the Colony of Queensland, unless and except in accordance with the regulations contained in this Act and the forms thereunto attached.
Present employers to make returns within four months from passing of Act.	2. Within four months from the passing of this Act all persons who have in their employment any Polynesian labourers shall make a return to the Immigration Agent or other authorized agent of all such labourers in their employment, setting forth the number and names of such labourers, the nature and duration of their agreements, together with all such particulars as may be required.
Penalty for failure in making returns.	3. Any person employing any Polynesian labourers, who shall fail to make a return as required by the foregoing clause, shall, on conviction of the same before any two Justices of the Peace, be subject to a penalty not exceeding £50.
Act to apply to employers and labourers at the time of passing. Inspectors to be appointed.	4. The provisions of this Act shall, so far as practicable, be applied to all Polynesian labourers introduced into this Colony before the passing of this Act and to their employers.
Form of application.	5. The Governor, with the advice of the Executive Council, shall appoint from time to time such person or persons as shall be found requisite for the proper inspection of the said Polynesian labourers and enforcing the provisions of this Act.
Vessel to be properly found.	6. All persons desirous of importing labourers from the South Sea Islands shall make application to the Colonial Secretary at Brisbane, in the Form A. appended hereto, stating the number required and how they are to be employed; such application to be accompanied by a bond in Form K., signed by applicant and two sureties, to secure the return of the labourers to their native islands at the expiration of three years or 39 moons from date of arrival. A license in Form C. may then be issued, authorizing the applicant to import the number required.
Penalty.	7. The owner or charterer of any vessel so licensed shall provide for the use of the passengers a supply of medicines, medical comforts, instruments, and other things proper and necessary for diseases and accidents incident to a sea voyage, and for the medical treatment of the passengers during the voyage, including an adequate supply of disinfecting fluid or agent, together with printed or written directions for the use of the same respectively; and such medicines, medical comforts, instruments, and other things, shall, in the judgment of the emigration officer at the port of clearance, be good in quality and sufficient in quantity for the probable exigencies of the intended voyage, and shall be properly packed and placed under the charge of the medical practitioner, when there is one on board, to be used at his discretion. In case of non-compliance with any of the requirements of this section, the master of the ship shall for each offence be liable to a penalty not exceeding £50 nor less than £5 sterling.
Master of vessel to report arrival, &c.	8. The master of any vessel arriving with Polynesian labourers shall be bound to report, on arrival at any of the ports of Queensland, the number of such labourers and the names of the employers to whom they have been or are to be indentured, and shall not be permitted to land any of the immigrants until he has received the certificate (Form L.) of the Immigration Agent or other officer of the Government empowered to grant same, that the following regulations have been complied with:—
Master of vessel to produce certificate.	(1.) The production by the master of the vessel of a certificate in Form I., or certificate signed by a Consul, Missionary, or other known person, that the labourers have voluntarily engaged themselves, and entered into their agreements with a full knowledge and understanding of the nature and conditions of same, and that when they were embarked they were not known to be afflicted with any disease, and were neither maimed, halt, blind, deaf, dumb, idiotic, or insane.
Employers to produce certificate of Immigration Agent.	(2.) The production by the employers, or parties to whom the labourers are or are intended to be indentured, of the certificate in Form C. authorizing them to recruit.
Immigrants to understand the nature of their agreements.	(3.) That proper means have been taken, since the arrival of the ship, by the Immigration Agent or other officer, by explanations, questions, and inquiries, amongst the labourers themselves, to ascertain whether they have a proper understanding of the conditions of the agreements, and did voluntarily enter into same. That the agreements have been signed in the form prescribed, and the employers bound to observe the rules laid down for the treatment and management of the labourers.
Agreements to be completed on board ship, where practicable.	9. All agreements (Form D.) shall be completed on board the ship, if possible, and the immigrants taken from same by their employers; and should there arise a necessity for taking any of the labourers to the Immigration Depot, their maintenance there shall in all cases be borne by the employer.
Immigrants to be registered on arrival.	10. The arrival of the immigrants shall be registered in the Immigration Office, Brisbane, or at the Custom House in any other port; and, in the latter case, a copy of the register shall be forwarded by the Customs officer to the Immigration Office by following mail.
Scale of rations.	11. The scale of rations and wages shown in Form G., and printed on the form of agreement, shall in no case be deviated from.
Register to be kept by employer.	12. A register of hired Polynesian labourers shall be kept by each employer, in Form E., which shall be open for the inspection of any Magistrate, or other person appointed by Government for the purpose, who shall record his visit therein. No entry, except the state of muster at the expiration of each quarter, shall be made in the register of the employer, unless from a document of hiring, transfer, death, or desertion, countersigned by the Immigration Agent or other authorized officer.
Transfers, how made.	13. No transfer of an immigrant shall be made except with the full consent of the transferor, the immigrant, and the Government, in Form F.; and no immigrant shall be allowed to leave his employment under transfer until the same has been recorded in the books of the Immigration Office or other appointed office. All transfers shall be signed by the transferor and immigrant in presence of a Magistrate,

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 57

trate, who shall, before such signing, explain to the immigrant the full meaning and effect of such transfer; provided that every transferee shall enter into a bond similar to that of the transferor prior to any transfer being consented to.

14. All deaths or desertions shall be immediately reported to the nearest Bench of Magistrates, and to the Immigration Agent, by the employer; and, in case of death, a medical certificate of the cause thereof shall be forwarded, if possible. Deaths or desertions to be reported immediately.

15. All masters of vessels about to proceed to the South Sea Islands, in order to obtain labourers therefrom, shall enter into a bond, in Form B., with two sufficient sureties, for the prevention of kidnapping, and for the due observance of these regulations, so far as they are concerned. Masters of vessels to execute bonds prior to proceeding to hire labourers.

16. No ship shall carry a greater number of passengers than in the proportion of one statute adult to every 12 clear superficial feet allotted to their use; provided that the height between decks shall not be less than 6 feet 6 inches from deck to deck. When the height of the 'tween decks exceeds 6 feet 6 inches, an extra number of passengers may be taken at the rate of one for every 144 cubic feet of space. Each ship must be fitted with open berths or sleeping places, in not more than two tiers; the lowest tier shall be raised 6 inches from the deck, and the interval between the two tiers of berths shall not be less than 2 feet 6 inches. All passengers shall be berthed between decks or in deck-houses. Number of passengers. (Vide, Imperial Act, 16 & 17 Vic. c. 84.)

17. But no ship, whatever her tonnage or superficial space of passenger decks, shall carry a greater number of passengers on the whole than in the proportion of one statute adult to every 5 superficial feet clear for exercise on the upper deck or poop, or, if secured and fitted on the top with a railing or guard to the satisfaction of the emigration officer at the port of clearance, on any round-house or deck-house. Proportion of passengers to deck area.

18. The length of the voyage to or from the South Sea Islands shall be computed at thirty days for sailing vessels and fifteen days for steamers. Length of voyage.

19. Three quarts of water daily during the voyage shall be allowed to each adult, exclusive of the quantity used for cooking purposes. Water on the voyage.

20. Provisions shall be issued to each statute adult during the voyage, according to the following scale, namely:— Provisions on the voyage.

## DAILY PROVISION FOR STATUTE ADULT.

	lbs.	ozs.
Yams .....	4	0
Or rice .....	1½	0
Or maize meal .....	1½	0
Meat (pork or beef) .....	1	0
Tea .....	0	0½
Sugar .....	0	2
Tobacco (during good behaviour) per week .....	0	1½

The undermentioned clothing shall be supplied to each labourer immediately on embarkation, in advance:—

- 1 Flannel shirt.
- 1 Pair trousers.
- 1 Blanket.

21. Nominal returns of labourers shall be made by employers of South Sea Island labour to the Immigration Agent, at the expiration of each quarter, in Form H. Nominal return to be sent at expiration of each quarter.

22. At the end of each quarter the Police Magistrates, or Bench of Magistrates, in each district where South Sea Island labourers are employed, shall forward to the Colonial Secretary a return of all cases adjudicated upon in relation to Polynesian labourers employed under these regulations, such returns to include the names of employers and labourers, and the nature of the offences. Returns to be forwarded to Colonial Secretary each quarter.

23. All persons harbouring or employing Polynesian labourers, otherwise than under these regulations, without reporting the same to the nearest Bench of Magistrates, and to the Immigration Agent in Brisbane, shall be liable, on conviction thereof, to a penalty not exceeding £20. Penalty for harbouring runaway labourers.

24. All breaches of these regulations shall be punishable by fine, to be recovered in a summary manner before two Justices of the Peace; for the first offence, a fine not exceeding £10; for second and subsequent offences, not exceeding £20, nor less than £5. Breaches of regulations punishable by fine.

25. All engagements made or to be made with Polynesian labourers already in the Colony, or to arrive, are hereby expressly declared to be subject to the provisions of the Act 25 Vict. No. 11. Engagements subject to 25 Vict. No. 11.

26. A tax of £20 per head for every Polynesian labourer introduced contrary to the provisions of this Act shall be levied on all vessels in which such labourers may be brought to this Colony, and in default of payment of such tax such vessel shall be absolutely forfeited to Her Majesty. Tax on vessels in default of compliance.

27. All expenses incurred by the Government in affording hospital relief to sick Polynesian labourers, or by their detention in immigration depôts, shall be chargeable to the employers of such men, and may be recovered from them by summary process on the information of the Immigration Agent, or other authorized officer. Expenses incurred by Government chargeable to employers in certain cases.

28. Any person who shall, without the consent of the labourer and the written permission of the Government, remove or attempt to remove any such labourer out of the Colony of Queensland, except for the purpose of his return to his home, shall be liable to a penalty of £20 for every such labourer so removed or attempted to be removed; and it shall be lawful for the Government in any case to prevent the removal of any such labourer, except for the purpose of his return to his home as aforesaid. Labourers not to be removed out of the Colony without permission or consent.

29. Any person supplying Polynesian labourers with spirits shall be punishable, as at present in the case of aborigines under 51st section of "Licensed Publicans Act," 27 Vict. No. 16. Polynesian labourers not to be supplied with spirituous liquors.

30. It shall not be lawful for any employer of Polynesian labourers to charge such labourers with the payment of any moneys on account of stores supplied, or to deduct any sum in respect thereof from any wages due to them. Store accounts not to be deducted from wages.

31. This Act shall be styled and may be cited as the "Polynesian Labourers Act of 1868." Short title.

## FORM A.

Application for permission to introduce South Sea Island Agricultural or Pastoral Labourers.

I, \_\_\_\_\_, request to be allowed, in accordance with the Act now in force, to procure from the South Sea Islands \_\_\_\_\_ immigrants for agricultural or pastoral purposes to be employed in the \_\_\_\_\_ district.

A. B.,  
Applicant's signature.

The above requisition lodged with me this \_\_\_\_\_ day of \_\_\_\_\_ 186 .

G. H.,  
Immigration Agent, Queensland.

## 58 IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND.

## FORM B.

Bond to be entered into by Shipmasters.

Know all men by these presents that \_\_\_\_\_ of \_\_\_\_\_ and \_\_\_\_\_ of \_\_\_\_\_ are held and firmly bound unto our Sovereign Lady Victoria, by the grace of God of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, in the sum of £500 of good and lawful money of Great Britain, to be paid to our said Lady the Queen, Her heirs and successors, to which payment well and truly to be made we bind ourselves and every of us jointly and severally for and in the whole, our heirs, executors, and administrators, and every of them firmly by these presents.

Sealed with our seals.

Dated this \_\_\_\_\_ day of \_\_\_\_\_ one thousand eight hundred and \_\_\_\_\_.

Whereas by the "Polynesian Labourers Act of 1868" it is amongst other things enacted that all masters of vessels proceeding to the South Sea Islands in order to obtain labourers therefrom shall enter into a bond with two sufficient sureties for the prevention of kidnapping and due observance of the requirements of the said recited Act. Now the condition of this obligation is such that if the above bounden J.K., master of ship \_\_\_\_\_, about to proceed to the South Sea Islands to procure labourers, shall faithfully observe the requirements of the said recited Act, and shall satisfy the Government of Queensland, through its officer, duly appointed for the purpose, that no kidnapping was allowed, countenanced, or connived at, then this obligation to be void, otherwise to remain in full force and virtue.

Signed, sealed, and delivered, by the above bounden \_\_\_\_\_ [L.S.]  
and \_\_\_\_\_, in the presence of \_\_\_\_\_

I hereby certify that the above bond was duly signed, sealed, and delivered by the said \_\_\_\_\_, and in my presence, this \_\_\_\_\_ day of \_\_\_\_\_

186 .

Immigration Agent.

## FORM C.

License to recruit labourers from the South Sea Islands.

This is to certify that \_\_\_\_\_ [or his Agent] is hereby licensed to recruit immigrant labourers from the South Sea Islands for Queensland, in conformity with the Act passed regarding such recruiting. This license is to remain in force only until the number mentioned above have been recruited.

Dated this \_\_\_\_\_ day of \_\_\_\_\_ 186 .

Colonial Secretary of Queensland.

Immigration Agent, Queensland.

N.B.—This license is to be returned to the Immigration Agent when the labourers have been received.

## FORM D.

186 .

Memorandum of Agreement made this day between \_\_\_\_\_ of \_\_\_\_\_ of the first part, and \_\_\_\_\_ native of \_\_\_\_\_ per ship \_\_\_\_\_ of the second part. The conditions are, that the said party of the second part engages to serve to the said party of the first part as a \_\_\_\_\_, and otherwise to make \_\_\_\_\_ generally useful for the term of \_\_\_\_\_ calendar months, and also to obey all \_\_\_\_\_ or \_\_\_\_\_ overseer's or authorized agent's lawful and reasonable commands during that period; in consideration of which services the said party of the first part doth hereby agree to pay the said party of the second part wages at the rate of not less than six pounds (£6) per annum, to provide \_\_\_\_\_ with the understated rations daily, to provide suitable clothing and conveyance to the place at \_\_\_\_\_ proper lodging accommodation, and to defray the expense of \_\_\_\_\_ which \_\_\_\_\_ to be employed, to pay wages in the coin of the realm at the end of each year of the agreement, and provide them with a return passage to their native island at the expiration of three years. No wages shall be deducted for medical attendance.

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 61

Whereas by the Polynesian Labourers Act of 1868 it is amongst other things enacted, that all persons desirous of importing labourers from the South Sea Islands shall enter into a bond with two sureties to secure the return of the labourers to their native islands at the expiration of three years or thirty-nine moons from date of arrival, at the rate of £10 sterling for each labourer introduced. Now, the condition of this obligation is such, that if the above bounden A. B. shall pay to the Immigration Agent at the rate of 15s. per quarter for every Polynesian labourer in his employment for the purpose of providing a return passage for each and every South Sea Islander introduced by him under his application, and also all the charges or expenses incurred by the Government of Queensland in connection with the same, then this obligation to be void; otherwise to remain in full force and virtue.

Signed, sealed, and delivered by the above bounden A. B., C. D., and E. F. in the presence of [L. S.]

I hereby certify that the above bond was duly signed, sealed, and delivered by the said A. B., C. D., and E. F. in my presence, this day of 186 .

Immigration Agent [or Justice of the Peace.]

## FORM L.

I hereby certify that the master of the , arrived from on the day of 186 , has produced to me the necessary certificates (Form I.) that the whole of the labourers on board have voluntarily engaged themselves, &c., &c.

2. I further certify that the license (Form C.) has been produced in all cases.

3. I also certify that, by careful examination of the labourers, I have ascertained that they appear to have a proper understanding of the full meaning and effect of the agreements, and that they voluntarily entered into the same, and that the agreements have been signed in the form prescribed (Form D.).

COPY of a Despatch from the Officer administering the Government of Queensland to  
His Grace the Duke of Buckingham and Chandos.

(No. 43.)

Government House, Brisbane, Queensland,  
16 May, 1868.  
(Received 22 July, 1868.)

MY LORD DUKE,

I have the honor to enclose, for your Grace's information, a copy of a report addressed to me by Captain Bingham, R.N., the Officer in Command of Her Majesty's ship "Virago."

2. This report is the result of an inquiry undertaken by Captain Bingham, at the instigation of Governor Sir George Bowen, into the treatment and mode of engaging those South Sea Islanders who are employed on board of the vessels engaged in Beche-de-Mer fishing in Torres Straits and the neighbourhood of Cape York.

3. It is satisfactory to find that Captain Bingham has been enabled, from personal observation, to come to the conclusion that none of these people were brought away from their homes against their will, or maltreated.

4. I am enabled also to report to your Grace that, on inquiry from the Emigration Agent in this Colony (who is now, under the Polynesian Labourers' Act, charged with the supervision of these islanders in Queensland), I learn that the employment of these people continues to be very favourably thought of by those gentlemen who have engaged them; that the men themselves, on the establishments he has visited, are apparently industrious, contented, and happy; and that he has, up to the present time, had no complaint of ill-treatment of any kind.

I have, &c.,  
(Signed) M. C. O'CONNELL.

[Enclosure.]

## IMPORTATION OF SOUTH SEA ISLANDERS INTO QUEENSLAND. 63

[Enclosure.]

Her Majesty's Ship, "Virago," Gladstone,  
28 March, 1868.

Sir,

In reference to your enclosure, No. 1, in letter dated 24th December, 1867, I have the honour to inform you that I have made every inquiry possible into the matter of the South Sea Island labour from the schooners "Active" and "Isle of Thanet," as well as from different individuals whom I have met on my way to and from Cape York.

From Cape York I gave a passage to a Mr. John De Largey, to Lizard Islands, who is part owner of "Edith," "Active," and "Isle of Thanet," together with the fishing gear appertaining thereto. I closely questioned him as to the number of South Sea Islanders he had in his employ, the mode of engaging them, and also as to their treatment; he stated he had about 50, all told, and that they were volunteers, and well treated, generally engaged for a period of about two years.

On my arrival at Lizard Islands I sought out and interrogated the man in charge of the fishing party, in the same manner; his statement did not materially differ from De Largey's.

I then mustered all the people, having ascertained that none were absent; they numbered six article men, 40 South Sea Islanders and two women; I questioned them as to their food, and manner of treatment; a number of these men understand English, and they all appeared satisfied with what they received: viz., rice, fish, molasses, and flour, with a small portion of meat, and from all I could gather they appeared to be well cared for and happy, many of them coming up to De Largey, shaking hands warmly, and greeting him most cordially; I landed with him. On my questioning the men as to the length of time they had been employed fishing, they said 10 months, and expected to remain about 12 longer, when they would go back to their homes.

Taking an impartial view of the demeanour of these people, I do not imagine that any of them were brought away from their homes against their will, or maltreated.

I have, &c.,  
(Signed) HENRY M. BINGHAM,  
Commander.

His Excellency,  
The Governor of Queensland,  
&c., &c., &c.

IMPORTATION OF SOUTH SEA ISLANDERS INTO  
QUEENSLAND.

(FURTHER DESPATCH RESPECTING.)

---

Presented to both Houses of Parliament, by Command.

---

THE SECRETARY OF STATE FOR THE COLONIES to GOVERNOR THE EARL OF BELMORE.

(No. 87.)

Downing-street,

20 November, 1868.

MY LORD,

With reference to your Lordship's Despatch, No. 26, of the 29th of February last, enclosing a Petition addressed to your Lordship, from Missionaries representing the Presbyterian Church in the New Hebrides, relative to the deportation of natives of those islands, for the purpose of being employed as laborers in Queensland and other places,— I have the honor to transmit to you, for your information, the enclosed copy of a paper printed for Parliament, in return to an Address of the House of Commons, for copy or extracts of all Correspondence relating to the importation of South Sea Islanders into Queensland. P. P. H. of  
C.—391 of 1868.

At page 73 of that paper will be found an Act of the Legislature of Queensland, “to regulate and control the introduction and treatment of Polynesian Laborers,” which Act is still under the consideration of Her Majesty's Government.

I have, &c.,

BUCKINGHAM & CHANDOS.

[*Erratum.*—In the Memorandum of His Excellency the Governor, at page 23 of the papers laid before the Legislative Assembly, on 5th February, 1869, after the words “and to what extent,” there should be a full stop instead of a comma.]

1868-9.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## CULTIVATION OF ARROWROOT IN THE COLONY.

(PETITION—MR. WILLIAM COLE, RESPECTING.)

*Ordered by the Legislative Assembly to be Printed, 18 February, 1869.*

To the Honorable the Members of Legislative Assembly, in Parliament assembled.

The humble Petition of William Cole of Tomago,—

RESPECTFULLY SHEWETH:—

That your Petitioner, in 1855, commenced the growing of Arrowroot on his farm at Tomago, and has since—a period of fourteen years—devoted much labour, skill, and pecuniary means to that branch of industry.

That from 1863 up to the present time your Petitioner's Arrowroot has been invariably pronounced by competent judges to be greatly superior to imported Arrowroot, and has been consequently purchased extensively by chemists and druggists as well as by storekeepers and private families.

That, at the respective agricultural and other exhibitions held in New South Wales during the past eight years, and also at the Intercolonial Exhibition held in Melbourne in 1864, prizes have been awarded for your Petitioner's Arrowroot; and that, moreover, the late Governor of the Colony, His Excellency Sir John Young, had congratulated your Petitioner upon the success which had attended his efforts, and also highly recommended the growth of Arrowroot as an ordinary crop.

That your Petitioner has (as he is fully prepared to prove) succeeded beyond all doubt in establishing Arrowroot growing in New South Wales—a great public boon.

Your Petitioner, therefore, humbly prays that your Honorable House will take such steps as may seem best to promote the growth of New Industries in this Colony by a system of bounties or otherwise.

And your Petitioner, as in duty bound, will ever pray.

Tomago, Hunter River  
2 February, 1869.

WILLIAM COLE.

1868-9.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## DEEPENING OF PARRAMATTA RIVER.

(REPORT FROM ENGINEER-IN-CHIEF FOR HARBOURS AND RIVERS, IN REFERENCE TO.)

*Ordered by the Legislative Assembly to be Printed, 12 February, 1869.*THE ENGINEER-IN-CHIEF FOR HARBOURS AND RIVERS to THE UNDER SECRETARY  
FOR PUBLIC WORKS.Department of Public Works,  
Harbours and River Branch,  
Sydney, 12 February, 1869.*Minute Paper.*

HEREWITH I beg to hand, for the information of the Honorable the Secretary for Public Works, an estimate of the probable cost of deepening the Parramatta River, from Redbank to the Government Wharf at the township, to a depth of 10 feet at low water, and for a width of channel of 150 feet. The amount is £66,582.

To obtain a depth of 10 feet in the channel will involve the excavation of 198,107 cubic yards of sand and mud, and about 113,352 cubic yards of rock. As it would be necessary to use cofferdams for the rock excavation, a high price must be allowed for it. I have accordingly estimated it at 10s. a yard; and I do not think it could be safely put at a lower figure.

If a channel of only 6 feet in depth at low water should be considered sufficient, the cost would be considerably reduced. There would be only about 108,907 cubic yards of sand and mud, and about 27,292 cubic yards of rock; and the whole cost would be about £19,091.

It should be considered, however, whether, if the work be entered on at all, it would not be better worth while to undertake the larger scheme at once, than possibly have to enter on it at some future time, if the trade of the Parramatta River should ever develop to any considerable extent.

E. O. MORIARTY.

*Memorandum.*

DEEPENING the Parramatta River, from Redbank to the Government Wharf at Parramatta; distance, 9,000 feet.

Estimate No. 1, for making a channel 150 feet wide, and 10 feet deep at low water:—

		£	s.	d.

---

## WATER SUPPLY FOR TOWN OF LIVERPOOL.

(PETITION RESPECTING.)

---

*Ordered by the Legislative Assembly to be Printed, 24 February, 1869.*

---

To the Honorable the Legislative Assembly of New South Wales.

The Petition of the undersigned landed proprietors and residents of the Town and District of Liverpool,—

HUMBLY SHEWETH:—

That in order to secure a sufficient supply of Water in Liverpool, now becoming a manufacturing district and having great local advantages for manufactures, it is necessary to raise the present Dam-head. We therefore pray, your Honorable House may be pleased to take into consideration the said Petition, as being one of general importance.

Your Petitioners have to state, that at present there is already a Paper Manufactory here, erected at a considerable outlay of capital, and calculated by its consumption of fibre to benefit the agricultural interests of the Colony; likewise a large wool-washing establishment which, in a commercial point of view, is of importance in maintaining the character of our Wools in the Home market—both employing a considerable number of persons, and both dependent upon a pure and sufficient supply of water.

Your Petitioners beg to state, that the present Dam is both insufficient for the purpose of storing water against time of drought and insecure, as even the present supply stored is fast leaking into the salt water.

If the Dam were sufficiently raised to retain a larger supply of water, fresh manufactories would at once be commenced.

Wherefore, your Petitioners humbly solicit your Honorable House may be pleased to consider the same, and as in duty bound will ever pray.

## STATE OF THE WATER IN GEORGE'S RIVER, AT LIVERPOOL.

(REPORTS FROM THE COMMISSION APPOINTED TO EXAMINE AND REPORT UPON.)

*Ordered by the Legislative Assembly to be Printed, 25 February, 1869.*

THE SYDNEY WATER COMMISSION to THE COLONIAL SECRETARY.

5 February, 1869.

MEMO.—In accordance with your instructions, we proceeded to Liverpool, and inspected the river, both above and below the dam. We found the water above the dam perfectly good; below the dam the smell is very unpleasant, arising apparently from the mixing of the discharged water from the Woolwashing and Paper Works with the stagnant sea-water.

CHRIS. ROLLESTON.

E. O. MORIARTY.

THE SYDNEY WATER COMMISSION to THE PRINCIPAL UNDER SECRETARY.

Sydney, 6 February, 1869.

SIR,

We beg to submit the following additional report to that which we forwarded yesterday to the Honorable the Colonial Secretary, as to the state of the water at Liverpool.

2. Accompanied by Dr. Smith, the Medical Officer of the Government Asylum, we minutely inspected the river above the dam, in order to ascertain if there were any outlets, from either the Woolwashing or Paper Works, communicating with the river. From the Woolwashing Establishment there is no outfall or perceptible soakage whatever into the pure water above the dam; but from the Paper Works we observed a discharge of water—inoffensive as regards smell—used in the manufacture of the paper, and depositing a white, slimy substance, like fine clay, which the overseer informed us it really was. Whether this discharge is innocuous or not we are unable to say; but we think the discharge should be directed into the same channel as the outflow below the dam.

3. Below the dam the smell is very offensive, proceeding, as we think, from the mixing of the outflow from the two establishments before mentioned with the stagnant salt water of the river. The refuse from the Benevolent Asylum contributes, if at all, in a very trifling degree, to the stench complained of, which will doubtless disappear as soon as sufficient rain falls to flush the river.

We have, &c.,

CHRIS. ROLLESTON.

E. O. MORIARTY.

## LEGISLATIVE ASSEMBLY.

## NEW SOUTH WALES.

## ALEXANDER W. SCOTT.

(PETITION OF.)

*Ordered by the Legislative Assembly to be Printed, 19 January, 1869.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of Alexander Walker Scott, formerly of the City of Newcastle, in the Colony of New South Wales, presently of the City of Sydney, Esquire, one of the Trustees of The Newcastle Proprietary Grammar School.

RESPECTFULLY SHEWETH,—

That in or about the month of September one thousand eight hundred and forty, certain persons associated themselves together for the purpose of establishing, at Newcastle above mentioned, a School, in conformity with the provisions of the Established Church of England and Ireland; and that by subscription and other means funds were raised, available for the purpose of the Association, amounting to one thousand one hundred and fifty pounds.

That on or about the ninth day of September one thousand eight hundred and forty, certain waste lands of the Crown situated at Honeysuckle Point, adjoining the City of Newcastle, comprising twenty-one acres three roods twenty perches, were offered for sale there by public auction, and sold according to a plan exhibited at the said sale; and James Mitchell of Sydney, Esquire, acting as the agent of the said subscribers, attended at such sale, and purchased the whole of such lands at the several prices per acre following, that is to say: one acre one rood twenty perches, at the rate of fifty-eight pounds per acre; one acre, at the rate of eighty-five pounds; nine acres, at the rate of twenty-nine pounds per acre; and ten acres, at the rate of thirty-six pounds per acre; and the aggregate price of the said lands, amounting to the sum of eight hundred and three pounds fifteen shillings, was thereupon duly paid by the said James Mitchell, on behalf of the said associated subscribers, into the Treasury of this Colony.

That on or about the fifth day of February in the year of our Lord one thousand eight hundred and forty-one, the said parcels of land were duly granted by the Crown to the said James Mitchell, according to the ordinary and usual form of Crown grant consequent upon purchase then in use in that behalf.

That on or about the nineteenth day of July one thousand eight hundred and forty-four, the said James Mitchell, by the direction of the said subscribers, duly conveyed the said parcels of land to William Croasdill and your Petitioner, who thereupon acknowledged themselves Trustees for the said proposed School.

That on or about the fourth day of July one thousand eight hundred and fifty-four, the Hunter River Railway Company, incorporated by an Act of the Legislature of New South Wales, took and appropriated under the powers of that Act, for the purposes of their Railway, the whole of the lands conveyed as above mentioned, stating the quantity however at twenty acres two roods six perches only.

That on or about the twenty-ninth day of July one thousand eight hundred and fifty-four, the said William Croasdill and your Petitioner, by Henry Kerrison James their agent, demanded from the said Hunter River Railway Company compensation at the rate of one thousand five hundred pounds per acre for the land so taken as aforesaid, the same comprising a large extent of frontage to the Harbour of Newcastle of great value for wharfage and other mercantile purposes.

That before any agreement could be come to in respect of the compensation for the said land, between the said Hunter River Railway Company and the said William Croasdill and your Petitioner, the Government of New South Wales became, under the provisions of an Act of the local Legislature passed in the year one thousand eight hundred and fifty-four, the purchasers of the said Hunter River Railway Company's property,

property, and, by force of that Act; and of subsequent Legislation, all the property of the said Company was vested in the Commissioner for Railways as a corporation sole, and all liabilities devolved upon the said Commissioner.

That the question having arisen whether the whole of the lands taken by the said Hunter River Railway Company was, in fact, required for Railway purposes, a correspondence ensued between the said William Croasdill and your Petitioner and their Solicitors and the Commissioner, which resulted in the Commissioner informing the said William Croasdill and your Petitioner, by letter dated the fourth of August one thousand eight hundred and sixty-two, that the whole of the land taken must be retained for Railway purposes.

That the Commissioner for Railways having declined to pay to the said William Croasdill and your Petitioner the price per acre claimed by them, they, on the eleventh day of September one thousand eight hundred and sixty-seven, in pursuance of the provisions of the Act twenty-two Victoria number nineteen, by writing under their respective hands, appointed George Vindin of West Maitland, Esquire, an Arbitrator on their part, for the purpose of determining the amount of compensation to be paid to them in respect of the land taken, and of the damage sustained by them by reason of the execution of the Railway Works.

That the Commissioner for Railways, by deed poll under his hand and seal dated the twenty-seventh day of September one thousand eight hundred and sixty-seven, appointed William Downing Biden of Singleton, Surveyor, to be an Arbitrator on his behalf, for the purpose of determining the amount of compensation to be paid by him in respect of the land described in a plan attached to his appointment and thereon colored red, and which land was a portion of the land taken as hereinbefore mentioned.

That such proceedings were had in the matter of the said arbitration, that the said Arbitrators and an Umpire, duly appointed, met at Newcastle aforesaid, on the eighth day of June last; and, on that and the two following days, took certain evidence in the matter of the said claim of the said William Croasdill and your Petitioner, in the course of which evidence it was proved that the parcel of land described in the appointment made by the Commissioner for Railways, and to which in fact the inquiry was therein limited, contained fourteen acres three roods seventeen perches only—a deduction of seven acres and three perches having been made in respect of so much of the said lands so purchased by them as aforesaid as was situate within one hundred feet of high-water mark of the Harbour of Newcastle, which last-mentioned lands the Commissioner for Railways then deposed before the said Arbitrators had been about two years previously taken from him by the Department of Public Lands, in terms of the general reservation contained in the grants to the said James Mitchell.

That on the 24th day of June one thousand eight hundred and sixty-eight, the said Arbitrators delivered an award under their hands, in the matter so submitted to them as aforesaid, in respect of the said fourteen acres three roods seventeen perches, and found the sum of nine thousand eight hundred and twenty-two pounds eight shillings payable to the said William Croasdill and your Petitioner in that behalf; but the said William Croasdill and your Petitioner were, by the terms of the said submission, excluded from, and they are still left without any compensation in respect of the residue and most valuable portion of their land, purchased as aforesaid, and held by the Hunter River Railway Company and their successor the Commissioner for Railways from July one thousand eight hundred and fifty-four to the middle of the year one thousand eight hundred and sixty-six, a term of twelve years.

That the Commissioner for Railways, though a corporation, is in fact a Public Officer appointed and removable by the Governor and Executive Council, and holding the vast powers conferred on him by Statute only for the public good.

The said William Croasdill and your Petitioner are advised, and they very respectfully submit to your Honorable House, that the reservation in the grants in question was never contemplated to be made an engine of depriving purchasers of a third part of their estate without compensation, but was intended only to maintain a right of access to water for public purposes; and that they are entitled, as a matter of very right and justice, to receive compensation for the value of that of which they were deprived in the year one thousand eight hundred and fifty-four by the Hunter River Railway Company, and for the damages sustained by them, without any reference to the fact that the said seven acres and three perches of land were twelve years afterwards assumed by the Government under the reservation aforesaid, and that the measure of compensation payable to the said William Croasdill and your Petitioner, calculable under the Statute, with reference to the value at the time of the original taking by the Hunter River Railway Company, must be estimated by reference to the conditions at the same time subsisting, and is no way dependent upon *ex post facto* operations even of the Government itself.

That on the twelfth day of August last, the said William Croasdill and your Petitioner, desiring redress, presented to His Excellency the Governor-in-Chief their respectful Memorial setting forth the facts above detailed, and submitting their right to the payment of compensation for the value of the land of which they have been deprived, the receipt of which Memorial was acknowledged on the twenty-eighth day of that month by letter from the Honorable the late Colonial Secretary, in which letter the said William Croasdill and your Petitioner were informed that “the land alluded to in the Memorial has been resumed by the Government for public purposes in terms of the deed, and that the Government do not consider the Memorialists entitled to any consideration in consequence of such resumption.”

That

## PETITION OF ALEXANDER W. SCOTT.

3

That, by reason of the premises, the said William Croasdill and your Petitioner are injured in the loss of their land without any equivalent; and that they are without redress in the premises, and are therefore obliged to pray the consideration of your Honorable House.

Your Petitioner therefore humbly prays, that such inquiries may be made as to your Honorable House shall seem meet, and that your Petitioner may have appropriate relief in the premises.

And your Petitioner will ever pray, &c.

A. W. SCOTT.

## CLAIMS TO WATER FRONTAGE, PYRMONT BAY

(PETITION FROM CERTAIN OWNERS OF PROPERTY, IN REFERENCE TO THE CASE OF MR. THOMAS SMITH.)

---

*Ordered by the Legislative Assembly to be Printed, 15 December, 1868.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Owners of Property having water frontage to Pyrmont Bay,—

HUMBLY SHEWETH :—

That your Petitioners have learned, with deep regret, the conclusion arrived at by the Select Committee of your Honorable House appointed to inquire into the claim to water frontage of Mr. Thos. Smith.

That your Petitioners were not represented in that Select Committee, and that evidence was not sought to inquire into the real merits of the case.

That the interests of the residents at Pyrmont would be seriously prejudiced, by hastily adopting the Report of the Select Committee, without having your Petitioners' case also placed before your Honorable House.

That your Petitioners, on their own behalf and on behalf of the residents of Pyrmont, humbly pray to be heard at the Bar of your Honorable House, by counsel learned in the law, before adopting the said Report; and your Petitioners, as in duty bound, will ever pray.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## SALE OF LIQUORS LICENSING ACT AMENDMENT BILL.

(PETITION—CERTAIN LICENSED VICTUALLERS OF SYDNEY.)

*Ordered by the Legislative Assembly to be Printed, 2 March, 1869.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the undersigned Licensed Victuallers of the City of Sydney and its environs,—

RESPECTFULLY SHEWETH :—

That your Petitioners have ascertained that a Bill has been introduced into your Honorable House, intituled, “A Bill to limit in certain Districts the number of Licensed Public-houses, and to amend in other respects the Licensing Act of 1862.”

That your Petitioners, having had the said Bill under their consideration, are of opinion that its provisions are arbitrary, unjust, and impolitic, and, if passed into law, would be the means of entailing loss and ruin upon many who have, directly or indirectly, embarked large amounts of capital, on the faith and security of the existing law.

That the said Bill, if passed into law, would subject your Petitioners to an amount of police surveillance which would not be tolerated or endured by any other class of tradesmen in any free country, and which, if carried into effect, could only be the means of bringing your Petitioners, and others engaged in the trade of Licensed Victuallers, into constant collision with the police,—a thing neither desirable in itself, nor conducive to the public weal.

That while your Petitioners readily admit that the number of Licensed Houses in some Districts is greater than the necessities of the population may require, they are strongly of opinion that the existing law would, if properly administered by the Magistrates, be amply sufficient to repress this evil, without resorting to such unjust and oppressive measures as are contemplated in the Bill now before your Honorable House.

That your Petitioners feel bound to object, in the strongest possible manner, against the enactments contemplated by the first and second clauses of the said Bill, as being both unnecessary and impolitic, and merely a revival of the old law of 1849, when the state of the population of the Colony was vastly different from what it is at the present day.

That your Petitioners, viewing the said Bill as a whole, are of opinion that it is tyrannical and unnecessary, and calculated to interfere materially with their rights and liberties as subjects of the British Crown.

Your Petitioners, therefore, most respectfully pray that your Honorable House, taking the premises into consideration, and having regard to the varied and important interests involved in this question, will not pass the said Bill into law, but reject it altogether.

And your Petitioners, as in duty bound, will ever pray.

## ABORIGINES.

(REPORT FROM COMMISSIONER OF CROWN LANDS, DARLING DISTRICT, RESPECTING.)

*Ordered by the Legislative Assembly to be Printed, 9 March, 1869.*THE COMMISSIONER OF CROWN LANDS, DARLING DISTRICT, to THE CHIEF  
COMMISSIONER OF CROWN LANDS.Darling District,  
Crown Lands Office,  
28 January, 1869.

SIR,

The duty again devolves upon me to furnish the Annual Report of the state of the Aborigines within the district to which my commission extends.

2. It is just seventeen years since I furnished a Report on the state of the Aborigines within the Albert District, the greater portion of which is now within the Darling District, to which I have been recently appointed. I have been able to find a few of the men, now aged, who at that period were of considerable service to me. The then children have become men, but the customs and so to say accomplishments of their parents have been quite neglected. These youths are all in the service of the leaseholders, and can no longer earn their living in the bush. The whole tribes have become very much deteriorated by their association with Europeans, whose vicious examples they childlike follow. I find that, at shearing time, on many of the stations the whole, and on most stations much, of the necessary labour is performed by the Aborigines. They are most excellent if not rapid shearers; and in some cases I have seen them employed in classing the wool, under supervision of course—for this labour employing the women and even children. They are paid the high current rate of wages, but like the old style of European shepherd or shearer, the whole of these earnings are spent in drink. Many deaths occur in this way, *directly* and *indirectly*. These debauches lead to quarrels and murders. The liquors are supplied not only by publicans but by wholesale spirit merchants; the only precaution taken being, that the Aborigines retire to some remote bend of river with the spirit cases or kegs, and there carry out their revels unnoticed and unseen.

3. I find also that on such occasions as races or holidays the Aborigines crowd into the little towns, wherein on such occasions they offend all decent people by their conduct, the impropriety of which is stimulated to extravagancy by the spirits supplied to them by Europeans. It is dreadful only to think of the manner in which at such times all order and decency is outraged.

4. If the Government, instead of wasting a considerable sum of money yearly in supplying blankets to the Aborigines, who do not require them and never retain them, were to furnish their police officers with power to remove the tribes from the towns when any excitement is going on, I apprehend that the true interests of the Aborigines would be better served than they are at present.

5. However, no real change can ever be expected to take place in the morale of the Aborigines. Of late years temptations, in the shape of shanties and grogshops, have multiplied tenfold. All that can be done or hoped for, is to banish the dreadful scenes from the towns.

6. The Aborigines of the Darling still, in my opinion, stand first as to docility, aptitude for labour, and usefulness; and it must be always a subject of deep regret that they have been made as bad in many respects as themselves by the scum of the bush labouring population which floated out to these remote districts.

I have, &amp;c.,

CHARLES G. N. LOCKHART,  
C.C.L.

## SYDNEY PAVING BILL OF 1869.

(PETITION—CITY OF SYDNEY.)

---

*Ordered by the Legislative Assembly to be Printed, 23 March, 1869.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Property Holders, Tenants, and others,—

SHEWETH :—

(1.) That in the present depressed state of the Colony, such a measure as the Bill now before your Honorable House, intituled “A Bill to provide for Paving certain Streets in the City of Sydney,” is inexpedient, as putting your Petitioners to great and vexatious expense in a time of great depression.

(2.) When a former Paving Bill was before your Honorable House containing like provision, much objection was raised to its arbitrary clauses, but no action was taken therein, seeing that the Colony generally was in a flourishing condition and its provisions were confined to the principal thoroughfares in the City.

Your Petitioners, therefore, humbly pray that your Honorable House will take the foregoing premises into consideration, and not pass into law the Bill intituled “A Bill to provide for Paving certain Streets in the City of Sydney.”

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF  
THE LEGISLATIVE ASSEMBLY.

VOTES No. 47. TUESDAY, 2 MARCH, 1869.

9. Water Frontage at Blue's Point, North Shore:—Mr. Tunks moved, pursuant to Notice No. 2,—

(1.) That a Select Committee be appointed, with power to send for persons and papers, to inquire into and report to this House as to the necessity of the Government reserving from alienation sufficient Water Frontage at Blue's Point, North Shore, for a Public Wharf, with a view of dedicating the same to the public.

(2.) That such Committee consist of the following members, viz.:—Mr. Forster, Mr. Sutherland, Mr. Farnell, Mr. Tighe, Mr. Graham, Mr. R. Stewart, Mr. Hill, Mr. Neale, Mr. S. Brown, and the Mover.

Debate ensued,—

And Mr. Terry requiring that the said Committee be appointed by Ballot,—

Question,—That a Select Committee be appointed, with power to send for persons and papers, to inquire into and report to this House as to the necessity of the Government reserving from alienation sufficient Water Frontage at Blue's Point, North Shore, for a Public Wharf, with a view of dedicating the same to the public,—put and passed.

Whereupon, the House proceeded to the Ballot, and the Speaker declared the following to be the Committee duly appointed:—Mr. Tunks, Mr. S. Brown, Mr. W. Campbell, Mr. Neale, Mr. Phelps, Mr. Lloyd, Mr. Forster, Mr. Hill, Mr. Sutherland, and Mr. Gordon.

VOTES No. 59. MONDAY, 22 MARCH, 1869.

2. Water Frontage at Blue's Point, North Shore:—Mr. Tunks, as Chairman, brought up a Progress Report from, and laid upon the Table the Minutes of Proceedings of, and of Evidence taken before, the Select Committee for whose consideration and report this matter was referred on 2nd March, 1869; together with Appendix. Ordered to be printed.

PROGRESS REPORT.

---

The Select Committee of the Legislative Assembly, appointed on the 2nd March, 1869,—*“with power to send for persons and papers”*—*“to inquire into and report to this House as to the necessity of the Government reserving from alienation sufficient Water Frontage at Blue's Point, North Shore, for a Public Wharf, with a view of dedicating the same to the public”*—have agreed to the following Progress Report:—

Your Committee having been appointed at so late a period of the Session, have not been able to do more than initiate proceedings and examine one witness. They deem it inexpedient to attempt to proceed further at present. The question involved in this inquiry is of great importance, not only to the locality immediately concerned but to the public at large, as affecting the administration of the law regulating the alienation of the whole navigable water frontage of the Colony.

Your Committee, therefore, earnestly recommend the consideration of this subject early next Session.

WILLIAM TUNKS,

No. 1 Committee Room,

Chairman.

Sydney, 17 March, 1869.

---

# PROCEEDINGS OF THE COMMITTEE.

FRIDAY, 5 MARCH, 1869.

MEMBERS PRESENT:—

Mr. Tunks,		Mr. Neale,
Mr. W. Campbell,		Mr. Hill,
Mr. Lloyd.		

Mr. Tunks called to the Chair.

Committee deliberated as to their course of proceedings, and directed that P. F. Adams, Esq., Surveyor General, be summoned for next meeting.

[Adjourned to Tuesday next, at *Eleven o'clock.*]

TUESDAY, 9 MARCH, 1869.

MEMBERS PRESENT:—

Mr. Tunks, in the Chair.

Mr. Hill,		Mr. W. Campbell,
Mr. Phelps,		Mr. Lloyd.

P. F. Adams, Esq. (*Surveyor General*), called in and examined.

Witness handed in letter from William Tunks, Esq., M.P., to Minister for Lands, 12th March, 1866, respecting wharf accommodation at Blue's Point; and reply to same. (*Appendix, 1 and 2.*)

Witness also handed in Gorman's survey of Blue's Point; Huntley's survey of Blue's Point; and survey of Blue's Point in 1841 for road purposes. (*Appendices 3, 4, and 5.*)

Witness also handed in letter from the Under Secretary for Lands to the Surveyor General, 8th February, 1869, referring to Memorandum of the Surveyor General, and Engineer-in-Chief for Harbours and Rivers, of 4th December, 1868; and to reclamation of land and water frontage generally. (*Appendix 6.*)

Witness also handed in tracing from the plan referred to in the *Gazette* of the 25th July, 1839. (*Appendix 7.*)

*Ordered*,—That the tracings and documents handed in by the witness be appended. (*Vide Appendix 1 to 7.*)

Witness withdrew.

Committee deliberated.

Re-assembling of the Committee to be arranged by the Chairman.

[Adjourned.]

WEDNESDAY, 17 MARCH, 1869.

MEMBERS PRESENT:—

Mr. Tunks, in the Chair.

Mr. Neale,		Mr. Lloyd.
------------	--	------------

Committee deliberated.

Chairman submitted Progress Report.

Same read 1<sup>o</sup>, as follows:—

## " PROGRESS REPORT.

"THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 2nd March, 1869,—*"with power to send for persons and papers"*—*"to inquire into, and report to this House as to the necessity of the Government reserving from alienation sufficient Water Frontage at Blue's Point, North Shore, for a Public Wharf, with a view of dedicating the same to the public"*—have agreed to the following Progress Report:—

"Your Committee having been appointed at so late a period of the Session, have not been able to do more than initiate proceedings and examine one witness. They deem it inexpedient to attempt to proceed further at present. The question involved in this inquiry is of great importance, not only to the locality immediately concerned but to the public at large, as affecting the administration of the law regulating the alienation of the whole navigable water frontage of the Colony.

"Your Committee, therefore, earnestly recommend the consideration of this subject early next Session."

Progress

Progress Report submitted by Mr. Lloyd.  
Same read 1<sup>o</sup>, as follows:—

“PROGRESS REPORT.

“In the opinion of your Committee, ample provision for the present wants or future requirements of the inhabitants and business of that locality has been made by the Government, as is shown by the evidence taken of Mr. Surveyor General Adams, and the maps and tracings handed in by that gentleman on behalf of himself and the Engineer-in-Chief.”

Motion made (*Mr. Neale*), and Question,—That the Progress Report of “the Chairman” be the Progress Report of this Committee.

Amendment proposed (*Mr. Lloyd*),—To omit the words “the Chairman,” and insert the words “Mr. Lloyd” instead thereof.

Question put,—That the words “the Chairman” stand part of the Question.

The Committee divided.

Ayes, 1.

Noes, 1.

Mr. Neale,

Mr. Lloyd.

The numbers being equal, the Chairman gave his Casting Vote with the Ayes.

Original motion put and carried.

Chairman's Progress Report then read 2<sup>o</sup>, and agreed to.

Chairman to report to the House.

MR. HILL,	MR. PHELPS,
MR. TUNKS.	

WILLIAM TUNKS, Esq., IN THE CHAIR.

Philip Francis Adams, Esq., examined:—

1. *Chairman.*] What is your official designation? Surveyor General of New South Wales. P. F. Adams, Esq.
2. As such, you would be the custodian of all papers with reference to all matters connected with land? No, the papers are in the custody of the Lands Department—not of the Surveyor General's. 9 Mar., 1869.
3. Are you aware of the object of this Committee? I have seen it on the Notice Paper.
4. You produce some papers having reference to this case? I do.
5. Have you seen, among the correspondence between myself and the Lands Department, a letter from me, dated 12th March, 1866, calling attention to the encroachment upon the waters of the harbour at Blue's Point? I have. (*Vide Appendix No. 1.*)
6. Do you produce a reply to that from the Under Secretary for Lands, dated 18 May, 1866? I do. (*Vide Appendix No. 2.*)
7. Can you state whether, in consequence of that correspondence, a survey of Blue's Point was made at that time, or about that time. Yes.
8. Had this place been previously surveyed? A survey, at Captain Norie's application, was made about that time, either before or after your application.
9. Had it been previously surveyed many years before? There was a survey for road purposes as far back as 1841.
10. Can you recognize that (*handing a plan to witness—Appendix No. 5*) as being a copy of any plan in your department? It appears to be a compilation from several of our plans.
11. Is it within your knowledge that in 1866, when a survey was made with reference to this application, it was found to disagree with the previous survey? The survey of the road?
12. The road abutting on the water more particularly? No, I think there was no disagreement as far as it went.
13. Can you furnish the Committee with a copy of the old survey? I can. (*Vide Appendix No. 3.*)
14. As well as with a tracing of the present survey? Certainly. (*Vide Appendix No. 4.*)
15. You know the situation of the place alluded to? I do.
16. And the district? Yes.
17. Can you state to the Committee the nature of the district? It is extensively populated,

- P. F. Adams, Esq. ated, containing the village of St. Leonards; and a portion of the traffic from Lane Cove and the back districts of Manly, Pittwater, and Wiseman's Ferry, comes to Sydney along this road, although the greater portion goes by the other ferry at present.
- 9 Mar., 1869. 18. *Mr. Hill.*] You mean the private wharf? Yes.
19. *Chairman.*] There is a large district to the northward of the harbour generally? Yes, and this is one of the outlets to it.
20. From your knowledge of the neighbouring district, are you able to state whether there is any public wharf on the North Shore, either at St. Leonards or within miles of it? There is a public wharf at Milson's Point, and this is the other. There is also a wharf eastward of the Milson's Point landing, left in the subdivision of the Campbell Estate.
21. Is that dedicated to the public? Yes, between the property of Mr. Lassetter (now occupied by Mr. Beauchamp) and that of Mr. John Campbell.
22. These are left for access to the water on the subdivision of private property? The one at Milson's Point is a public wharf, left on the end of a proclaimed road.
23. Has that road been dedicated altogether? Yes.
24. Is the road from Milson's Estate completely dedicated? Yes.
25. Can you ascertain about the date? *Gazette Notice*, 25 January, 1867.
26. That is in the municipality of East St. Leonards? Yes.
27. Is there any other, situated in the municipality of St. Leonards, besides the wharf we are speaking about? There is no wharf erected. There are several sites left in the subdivision of Blue's Estate where a wharf can be erected, but at present there is none.
28. These have all been left on the subdivision of property for sale? Yes.
29. The ends of streets leading to the water? Yes, that is all.
30. Can you furnish the Committee with any idea of the width of these streets in Blue's Estate? Generally, 50 links; some may be more, but that, I think, is about the average.
31. Then, in your opinion, would it be expedient to provide a wharf at Blue's Point, with sufficient depth of water for commercial purposes? It would be desirable certainly.
32. As an outlet to a large district having communication with Sydney? Yes; there should be deep water wharf accommodation, by all means.
33. Can you state to the Committee the nature of the accommodation at present—I mean as regards the facilities for bringing vessels alongside? The silting up of the little bay where the wharf reserve was originally made has gone on for the last thirty years. Steamers have been in the habit of throwing out cinders and dirt, till it is so silted up that a vessel of any size can scarcely approach it.
34. Do you know the position of Capt. Norie's property in this matter? Yes.
35. If Capt. Norie be permitted to reclaim from the water the southern end, and other persons at the eastern side be permitted to reclaim, this wharf will be in a bight or angle? That would be rather an advantage to it than otherwise.
36. That will be the fact? It will be in a bight.
37. Then, to erect a jetty upon that, would appear to trespass on the land of a neighbouring proprietor? Yes, if such a thing were proposed.
38. That is, if it were to go eastward, it would seem to oversail the land of the proprietors on the eastern side of the bay? Yes; but I may add that the Engineer of Harbours and myself have already refused to recommend the alienation of this land on the north-eastern side of the bay.
39. Is there any finality in that refusal? No, it depends upon the decision of the Minister.
40. It would be competent for the owner of this land to apply again at any time? Yes.
41. You are one of a Board to whom questions of reclamation have been usually referred? The Surveyor General and Engineer-in-Chief of Harbours make a joint report.
42. Have you any instructions to guide you as to your duties in this particular? There were none until some time after I became Surveyor General, when the Engineer-in-Chief and myself asked from the Minister an expression of opinion to guide us.
43. The present Minister? The present Minister—to guide us in our recommendation, which he has accorded.
44. The recommendation to permit reclamations immediately adjoining this wharf had been so far decided without such instructions? Yes—action was taken in this matter before the expression of opinion was obtained.
45. Can you state about the date when this was originally surveyed? The road was surveyed in 1841.
46. Was preliminarily notified? Yes; but the preliminary notification took place in 1839.
47. But has never been completed? The proclamation lapsed, through the Government taking no further proceedings.
48. Is not that the case in numberless other such-like proclamations? Yes, a great many.
49. Are you aware whether the Government took possession and used the land from that time till now? It appears not; the bulk of the evidence is against it, although many people have said that they had had free access to the road along the beach; but it could never have been used for traffic, for it was a rugged shore, unfit for any kind of traffic.
50. The bulk of evidence, you say, has been against the using? Against the use of the road.
51. Who are some of the persons who have given the evidence you allude to? I could not specify them.
52. Have they been sought by any kind of authority? I refer to the evidence of the surveyors who have inquired into the matter. I cannot remember who else I have spoken to on the subject.
53. Who were the surveyors? Messrs. Huntley and Armstrong.

54. It is upon their reports you are now speaking—Have they furnished reports to this P. F. Adams, Esq.
55. The evidence you allude to as preponderating in a particular direction is merely the verbal statement of parties? Persons I have spoken to upon the matter, besides the 9 Mar., 1869. surveyors.
56. Is it within your knowledge that public meetings have been held of the inhabitants of the North Shore, and that petitions numerously signed have been sent to the Government with reference to this matter? Yes.
57. Have these surveyors, to your knowledge, applied to any of these people? I am not aware where they have got their information.
58. Would it be reasonable that they should apply to persons interested in the other side of the question, as well as to those who employed them to survey the land? If they were required to report upon the matter, it would be their business to make the best and fullest inquiry they could.
59. The plan referred to was furnished by Mr. Armstrong? Mr. Huntley surveyed the road; and this plan (*referring to plan, Appendix No. 5.*) is a compilation of Mr. Armstrong's and Mr. Huntley's surveys.
60. Mr. Armstrong is a licensed surveyor who was occasionally employed by private persons to survey? Yes, and Mr. Huntley also.
61. Mr. Armstrong has been employed to furnish the original of the tracing before the Committee? He furnished one portion of it, and Mr. Huntley furnished the road survey.
62. He was employed by private persons to survey the land, and has furnished a plan, which has been deposited in your office? Yes.
63. The person owning the land, in every case, pays the cost of the survey? Not in the case of an application to purchase land.
64. In the case of reclamation? The Crown pays for that.
65. The Crown furnishes plans for these reclamations? The Crown pays for the surveyor. The applicant furnishes a sketch, which he may get from any surveyor he may choose to employ not being a salaried surveyor of my department.
66. In every case in which an application is made to reclaim land from the water, the Government authorities pay for the survey? Yes.
67. Can you furnish the Committee with the instructions received for your guidance in this matter, as one of the Board? I can. (*Vide Appendix No. 6.*)
68. In examining these questions, do you take into account the probable requirements of the public before you accede to them? We do.
69. Has that been the case since the passing of the Act, do you know? I suppose so; the ex-Surveyor General was always very particular in that.
70. That is, in having a prospective view to the interest of the public? Yes.
71. The instructions you speak of as having received from the Minister are not before the public in any way? No, it is an expression of his opinion for our guidance.
72. *Mr. Hill.*] You reside on that side of the water? I have resided there for five years.
73. Then you are thoroughly acquainted with Blue's Point—its locality? Yes.
74. You have stated that it is your opinion a public wharf should be erected somewhere there? A public wharf, or better accommodation than there is now.
75. Do you believe Blue's Point is the best position in that locality for a public wharf? I think that Blue's Point has a greater claim for a public wharf for vessels discharging coal, and for the requirements of the district, irrespective of steam-boat and passenger traffic—transit traffic—than any other locality.
76. Does that arise from the population immediately surrounding? Yes.
77. Are you acquainted with the whole of that country leading from Blue's Point to Parramatta? I am not well acquainted with it. I have been over the road only once or twice.
78. I suppose you know it is becoming a place of great importance? It is, decidedly.
79. Are you acquainted with the road which leads from that point to Barrenjuey—the newly constructed road which goes away to Pittwater? I never travelled it, but I know it by plans and report.
80. You do not know that that part is becoming largely cultivated? I believe settlement is progressing there, but very little land is being alienated.
81. There is a great deal of private land there? Yes.
82. I suppose the whole or the greater part of the produce will come by Blue's Point, when the road is perfected there? At present all the traffic goes by Milson's Point.
83. But Milson's Point is a private wharf? The steamer's wharf is a private wharf.
84. Which can be shut? But the public wharf is open.
85. That is on the west side of the point? No, on the east side of the point. In my former answer as to the public wharves, I omitted to mention the one used by the watermen on the west side of Milson's Point. This has been dedicated to the public, in the sale of the adjoining land.
86. But I think you have said already that you believe Blue's Point is one of the most eligible positions you know of for a wharf? Yes, it is very approachable by roads; the gradients are good.
87. As a resident in that place, do you know anything of public opinion as to whether a wharf should be erected at Blue's Point? At present it is hardly necessary to increase the accommodation they have. I should imagine, if the Government dredge were employed for a short time in dredging out the silt that has collected there, the requirements of the public would be met for the next twenty years.

P. F. Adams, Esq. 88. Which do you think would be attended with the greater expense,—the dredging the immense quantity of silt that has accumulated there for a number of years, or the building of a new wharf at the point? The mere dredging would be a very small expense—far less than the erection of any wharf; however, if the dredging were continued, wharf walls must be erected.

9 Mar., 1869.

89. I suppose you know that there is a great depth of water at the point; and that if a wharf were erected there, vessels of almost any draft might lie there? Yes.

90. It is easily approached? Yes.

91. Is it your opinion that it would be a great injury to that portion of the public using the point, if the land you have spoken of were alienated to Capt. Norie? The opinion of the ex-Surveyor General and of the Engineer-in-Chief for Harbours, when dealing with that land, was, that the public interest would not be affected by it; and their opinion is so recorded on the papers.

92. *Mr. Campbell.*] Do you think it would interfere with the traffic of the harbour,—the proposed alienation of the land at the point to Capt. Norie? No, it would do no harm to the navigation.

93. Do you think it a more desirable place for a wharf than the inner side—the eastern side? I think a more desirable site would be further in, if the silt were cleared out—there would be better shelter; but there is very little difference.

94. Are you aware that at one time the ferry steamer ran from Windmill-street to Blue's Point? Yes.

95. Could you give the Committee any idea why the traffic was stopped there and taken to Milson's Point? The better steamer accommodation turned the scale.

96. Was it not because the approaches to the wharf were so much worse at Blue's than at Milson's Point? No; it was not so much on that account, as because there was better and more regular steamer accommodation at the other ferry.

97. It was not in consequence of the bad approach to Blue's Point—the hill? That had not much to do with it.

98. I think you said there is no doubt that it is the most central position of any on the North Shore for a wharf—that it is more accessible for the general inhabitants of the North Shore? I am hardly prepared to say that it is more central than the other. I think the advantages are nearly equal as between Milson's Point and Blue's Point; Blue's Point may be more accessible to the greater bulk of the population.

99. *Mr. Lloyd.*] If the question lay between Milson's Point and Blue's Point, which would you prefer? I should favour the erection of a public wharf at Blue's Point in preference to the other, if there were only one to be erected.

100. Do you think the public convenience would be as well served by the erection of a wharf here as at any other portion of the eastern side of this point? There is sufficient land reserved for a wharf at Blue's Point as it now stands.

101. Perfect accommodation could be given to the public at Blue's Point? Yes.

102. Supposing the dredge to be employed at the part you have indicated, would there not be a greater amount of accommodation in frontage there? Yes.

103. And it would afford more absolute shelter to colliers or other vessels lying there? Yes.

104. If steamers can land their passengers anywhere; but I suppose it is contemplated to bring colliers here to land their cargoes. For such a purpose, is not this as good a wharf as could be selected? Yes; I think the further up the bay the ground can be excavated to deep water, the better the shelter that will be afforded.

105. *Chairman.*] Will you describe what you mean by a public wharf? A wharf that would be placed under the charge of a municipality, subject to their laws and regulations.

106. Is the mere division of property by streets having access to the water, sufficient to justify your calling the extremities of those streets fronting the water public wharves? Yes.

107. It is not competent for owners of land to shut up such streets, and to take toll from persons passing? Not if the land has been alienated with a frontage to the street, or a right to the road.

108. Are you aware of the terms upon which the land, either at Blue's or at Milson's Point, was alienated? I am not.

109. It is within your knowledge that these main roads have been formally and completely dedicated? They are reported to be so by the municipal authorities. In asking the Government to align these, they state that they are properly dedicated.

110. Is not that with a view to their dedication? If they are aligned and proclaimed they are dedicated, without a doubt.

111. After you have surveyed them are they dedicated? After they are approved by the Executive Government.

112. Does not that admit of objections on the part of other persons? The Department of Lands puts the question, in the first instance, to the municipal authorities, on their desiring the alignment of streets, whether they are dedicated. If the answer is to the effect that they are dedicated, to the best of the knowledge of the municipal authorities, the streets are proclaimed under the Act 4 William IV, No. 11.

113. Then the initiative is taken by the Lands Department? Yes.

114. Has that been the case with St. Leonards? Yes.

115. It is curious that I should be the Mayor and not know it? You will find it so.\*

116. Are you aware of any Act of Parliament that regulates public wharves? There is such an Act.

117.

\* NOTE (on revision):—Mr. Tunks is right—the dedication being patent; and, to save delay, no reference was made to the Corporation.

117. Is it within your knowledge that either of the public wharves you have spoken of P. F. Adams, Esq. has been brought under the operation of that law? I think they have, but I am not sure.\*
118. Has the wharf at Blue's Point been handed over to the Corporation? Not yet, I 9 Mar., 1869. believe.
119. Are you aware whether any application has been made by the Corporation to have it handed over? I think not.
120. In your capacity as one of the Board, can you state whether the Crown has the right of refusing or of acceding to an application to reclaim and sell a water frontage? Yes, I think so.
121. That is one of the principles that would guide you, in your official capacity, in this particular? Yes.
122. That the owners of land have not the absolute right of purchase? I do not think they have.
123. Is it true, that when the owner of a waterside property applies, his application is referred to a Board, and that Board report upon the case before it is advertised, and before the public have any means of knowing what has been done in the particular matter? The Engineer for Harbours and myself report upon every application.
124. Is that before or after the public have any knowledge of the matter? Before.
125. Before the public know, you have given your decision? We make our report.
126. And to that extent have decided? I do not consider it a decision at all; for when the matter comes before the public, objections are invited; and, if good reason can be shown, I am not pledged in any way to my decision; nor do I consider that the Engineer-in-Chief for Harbours would be. We are open to conviction, if anything further can be shown than we knew at the time we reported.
127. You stated, in answer to Mr. Hill, that any further wharf accommodation is hardly necessary at present at Blue's Point? I did. I think no further erection of wharves is at present actually necessary, but the accommodation could be vastly improved by dredging and a trifling expense in walls.
128. That is, by making a channel continuously up the side of the wall? Yes, and by extending it far enough to deep water.
129. To what distance out could you get? I should think there is water enough there for a vessel of 500 tons, 50 or 100 feet from the wharf.
130. Will you state what would be the draft of water of such a vessel? About 14 feet.
131. At low tide, 100 feet eastward? There would be from 10 to 14 feet in the centre—the length of the public wharf.
132. At low tide? No, I do not think at low tide there would be so much.
133. Are you acquainted with the cost of the dredging machine, per day, to the Government? No, I am not; I could not say.
134. Then I suppose you intend that the dredging this out should be a charge upon the Corporation? If the Corporation asked it, perhaps the Government might allow the use of the dredge. I am not aware of the regulations.
135. What kind of vessel could haul alongside the late jetty at present, at low water? There is not above 4 feet at the present jetty at low tide, in consequence of the silting up, and the throwing out from the steamers of coals and ashes.
136. Then, if a steamer larger than a ferry-boat were to come at low tide, part of it would oversail the proposed limit for the wharf, and thereby trespass upon the neighbouring property? It would not interfere with any alienated land, but it would come within the limit laid down by the Engineer-in-Chief for frontage to the wharf; the line of limit for the wharf being a regular curve, generally beyond the present low-water line.
137. If a vessel longer than a ferry-boat were to go alongside at low-water, she would have to get her whole length further than the wharf? A vessel of 150 feet long would extend beyond the wharf in its present state; but a vessel of 200 feet long could be alongside the wharf without overlapping any property, if the silt were dredged out, although there may be rocks there which I do not know of.
138. You have stated that the wharf was merely bare rocks, and therefore never could have been used as a roadway out towards the point? That is beyond where the present jetty is—I mean southward of the present jetty.
139. It never has been used southward of the present jetty? Not to my knowledge.
140. Have you noticed the action of the wash of the tides and of steamers upon the wharf since it has been used and kept in order—immediately preceding the present improvements? The destruction is the greater, the further you go out towards the point.
141. During the last year, has not a considerable quantity of the old roadway been washed away by the action of the tides? A gale of wind took a portion of the loose stuff, but I do not think it extended to the solid masonry.
142. The earthy formation has washed away considerably the last few years—since it has not been in common daily use? I can hardly say that I have observed much change; the stuff that has been thrown in loosely has probably been washed away.
143. Have you seen, at low-tide, some 60 or 100 feet to the south of the present jetty, anything of the remains of a former jetty? There are some hewn stones between Captain Norie's boat wharf and the public wharf, at the extent of the proclaimed road, which is some 60 or 100 feet beyond the present wharf.
144. Have you any knowledge of the wharf, where the stones are now to be seen only at low-tide, ever having been used? Not as a public wharf.
145. Have any of the surveyors of whom you have spoken before as having given evidence ever mentioned this circumstance? They have not.

146.

\* NOTE (on revision) :—It has not been brought under the Act 5 William IV, No. 13.

- P. F. Adams, Esq. 146. The North Shore is divided into two municipalities, is it not? Yes.
147. The one you speak of at Milson's Point is East St. Leonards, and the other is St. Leonards? Yes.
- 9 Mar., 1869. 148. Can you furnish the Committee with any information as to the sort of material we have in that neighbourhood for making roads? The material is not good—it is too soft.
149. Then is it probable that we shall require to have our supply of good material water-wise in future years? Very probable.
150. Irrespective of our passengers' landing place, we should also require some place for a coal yard or coal wharf? For the storage of coal.
151. For the landing of coal? After the lapse of time, as population becomes thicker, additional wharfage will probably be obtained by extending jetties from the present frontage into the bay, but at present there is no necessity for it, nor will there be for some years.
152. Supposing we had a vessel with 500 tons of ballast on board, of such a character as would be useful for our streets, could we land it at such a wharf as the present? Not at the wharf in its present state, but I believe it could be landed if the limit laid down by the Engineer-in-Chief were adhered to, and the wharf were built out to that.
153. You say something could be done if something else were done; but, as a matter of fact, is there any limit known as the Engineer-in-Chief's limit? It is shown in this plan. (*Vide Appendix No. 5.*)
154. You have stated that a vessel having 500 tons of ballast on board could come along-side and discharge there now? If the wharf were built out to this line.
155. Without trespassing on the neighbouring proprietors? I think so.
156. Then, irrespectively of the requirements of this large district, would it be necessary that the municipality of St. Leonards should have a wharf of their own of a public character, in order that they might not be compelled to go to the wharf of a neighbouring municipality? I think that, as the importance of the district increases, it will be necessary that a wharf should be built out to the limit on this design.
157. Then, having regard to the prospective interests of the public at the North Shore, would it be wise to dispose of any land in the neighbourhood of this wharf, now in the possession of the Government? Certainly not.
158. I mean water frontage? Water frontage.
159. *Mr. Lloyd.*] Then, if you should be mistaken as to the depth of water and the facilities for forming a wharf there, it would necessarily follow that you would have to go to Milson's wharf to land materials for the purpose named? No, it would only involve the extension further out of the limit laid down by the Engineer-in-Chief.
160. That would depend upon whether some person chose to sell or not? No.
161. *Mr. Hill.*] You mean into that bay? Into that bay. I think it may be fairly assumed that the limit laid down by the Engineer-in-Chief is correct, and is the best position for a wharf.
162. *Chairman.*] I asked you before whether the limit had been defined? Yes, and shown on this tracing.
163. Are you aware of any other plan? I am not aware of any other plan than that from which this was taken having been prepared by the Engineer-in-Chief.
164. You are not aware that the Works Department authorized a survey at the instance of the Municipality? This design is the result of that survey.
165. What is the date of that survey? I have not the original plan with me, but I can add it on revision.\*
166. If that had been regarded as the plan, would the department have furnished me with such a letter as that (*handing a letter to witness*)? That letter appears to have been written immediately after the instructions were given to make the survey on which the limit for the wharf has been adopted.
167. The tracing you speak of as having been furnished at the instance of Captain Norie, was in 1866 or about that time? The portion tinted red on the plan is the portion measured at Captain Norie's application.
168. That was in 1866? Yes.
169. And this letter is addressed in 1868? The letter dated 1868 refers to another survey made in consequence of an application to the Works Department in the latter part of 1868.
170. Is it within your knowledge that a staff of officers came over from the Harbours, Rivers, and Navigation Department, to make an independent survey, in 1868? I am not aware of any other but this survey I allude to.
171. That wharf you speak of was preliminarily notified in 1839? The road from St. Leonards to Lane Cove, I think, commenced at this point.
172. The survey was made in 1838 or 1839? It was surveyed in 1838.†
173. And preliminarily notified in 1839? Yes.
174. Are you aware whether any provision was made in the grant to Blue, empowering the Government to make roads? A road.
175. Has that road been made and confirmed? It has been confirmed to a point about 100 feet beyond the present wharf.‡
176. Have you any records in your department which would give us information as to how this road became open, in the first instance, in 1838 or 1839? I scarcely think we have

\* ADDED (*on revision*):—10 November, 1868.

† NOTE (*on revision*):—I must here observe that, on subsequent examination of the plans, I find that the road was preliminarily notified in 1839. The parish map being deemed sufficient for the purpose of proclamation, the marking did not take place till 1841, which accounts for the date of the plan, Appendix No. 3, being subsequent to the preliminary notification.

‡ NOTE (*on revision*):—The confirmation has not actually taken place, but will, in the due course prescribed by the Act.

have any record. Some trace might be found in the Colonial Secretary's Office, but I think there is none in the Survey Office of any use, or of that road previous to 1839, although it undoubtedly was in general use long before that time. P. F. Adams, Esq.

177. Is it within your knowledge that the wharf we are now alluding to was made by prison labour, and at the public cost? I am not aware of any record of that; but if such were the case, you would find it in the records of the Colonial Secretary's Office. 9 Mar., 1869.

178. Should we also have to refer to the Colonial Secretary's Office to find who were the first trustees? I imagine so.

179. Is the tracing referred to in the advertisement in the *Government Gazette* of 1839 still in existence? It is. (*Vide Appendix No. 7.*)

180. Is it within your knowledge that several meetings have been held at the North Shore, at which petitions and remonstrances have been adopted in reference to this matter? I believe so.

181. Has the application of Mr. Norie, with reference to the reclamation and purchase of land, been altered? It has been considerably modified. The application, as far as I can recollect, included somewhere about 100 or perhaps 120 feet of what has since been considered requisite for a wharf, and proclaimed as such in the proclamation of the road.

182. When you speak of a proclamation, do you mean a preliminary notification? Yes.

183. A preliminary notification has been accepted as a proclamation? Not unless confirmed by the Executive. If not confirmed by the Executive, the notification lapses.

184. Is it within your knowledge that it has been accepted, many years ago, as a proclamation? It may have been accepted so far as the public are concerned, but not legally.

185. No further action has been taken, and persons have used these places in several instances? I think so, but cannot name a case in point.

186. I mean where there has been no objection? Yes. It is very probable there may have been cases; but there must have been some reason for the road not having been confirmed.

# WATER FRONTAGE AT BLUE'S POINT, NORTH SHORE.

## APPENDIX.

(To Evidence given by P. F. Adams, Esq., Surveyor General, 9 March, 1869.)

No. 1.

William Tunks, Esq., M.P., to The Minister for Lands.

St. Leonards, 12 March, 1866.

Sir,

I beg to bring under your notice a subject which is represented to me to be an encroachment on the water of the harbour. The encroachment alluded to consists of a fence erected between high and low water, at the southern end of the wharf at Blue's Point, St. Leonards. If the putting up of this fence is the assertion of a right, by the holder of the adjoining property, to reclaim land from the water eastward, and, in time, in advance of the wharf, or to prevent the public from landing there, in accordance with long usage,—and if, at no distant day, the owners of property northward, and adjoining the same wharf, should see fit to assert their right to reclaim land southward, or fence out the public,—this, the only landing-place at St. Leonards, will be closed in, or so far enclosed as to be useless for so large a district. I may also mention that there is no reserve of water frontage at St. Leonards permanently made by the Government, for any purpose whatever, except the end of one street (Walker-street); and that, at present, is impracticable for wharf purposes, without an outlay of money which there is no means of supplying until the place is incorporated, or the Government grant the amount from the public funds.

The present wharf accommodation is not in excess of the present, nor equal to the future, requirements of the district. I, therefore, respectfully request you will order an examination and an inquiry into this matter, with the view of protecting the interests of the public.

I have, &c.,

WILLIAM TUNKS.

No. 2.

The Under Secretary for Lands to William Tunks, Esq., M.P.

Department of Lands,

Sydney, 18 May, 1866.

Sir,

In reference to your letter of the 12th of March last, bringing under notice an encroachment that has been made on the harbour, by the running out of a fence at the southern end of the wharf at Blue's Point, St. Leonards,—I am directed by the Secretary for Lands to inform you that this fence—which was erected by Capt. Norie, the proprietor of Blue's grant—appears to embrace a portion of the tide-way, which will probably be required hereafter, as stated by you, for an extension of the existing wharf.

2. It is intended, therefore, to take the necessary steps for securing it to the public, and to have a fresh survey made (the old plan being imperfect), with the view of establishing the kerb and building lines of the street, under the Act 2nd Victoria, No. 2.

I have, &c.,

M. FITZPATRICK.

No. 6.

The Under Secretary for Lands to The Surveyor General.

Department of Lands,

Sydney, 8 February, 1869.

Sir,

In reference to the joint memorandum of yourself and the Engineer-in-Chief for Harbours and Rivers, dated 4th December last, in which you desire an expression of opinion from the Honorable the Secretary for Lands, as to the policy of the Act 25 Victoria, No. 1, so far as regards the reclamation of land from the harbours and rivers of the Colony, with a view to guide you in reporting upon applications under the 9th section of the Act referred to,—I am directed to state, for your information, that Mr. Secretary Forster is strongly under the impression that the Government will require, in future, to exercise the powers granted to them with greater caution and deliberation than appears hitherto to have been the case.

2. Mr. Forster cannot for a moment admit, nor can it, in his opinion, be admitted without great inconvenience and danger, that former cases of the exercise of these powers are to be regarded as precedents in all future cases, or that proprietors of land have acquired what are somewhat loosely termed "rights of reclamation," in consequence of the indulgence shown to other proprietors under apparently similar circumstances. In fact, unless the Government is prepared to sacrifice the interests of future generations, and to abandon irrevocably to neighbouring proprietors of land the most desirable thoroughfares and most obvious ways of access to the waters of the harbour, it will be necessary in future to deal with every case distinctly on its own merits; and, in doing so, to take in consideration many points which are at present liable to be overlooked, but may be very differently estimated in time to come. Mr. Forster thinks it advisable, therefore, that the following rules and principles should, as far as possible, be observed in future cases:—

- (1.) The powers vested in the Government by the 9th clause of the Alienation Act must be regarded as entirely discretionary. No proprietor, by reason of former decisions, or of the position of his property, can be admitted to have or claim any absolute right of reclamation over adjoining shores or waters. Such right may be, or may have been expressly granted or implied in a deed of conveyance, but otherwise the exercise of these powers should be recommended only as a matter of grace, or in consideration of some public benefit.
- (2.) Such recommendation should not be made in any case where any public inconvenience, loss, or danger, may be apprehended, or is likely to arise, however remotely, from the proposed reclamation or alienation of the frontage; and in any case of doubt, it is obvious that public interests ought to have the benefit of the doubt.
- (3.) It will be safer in general that such recommendation should not be made unless when some public benefit, direct or indirect, can be shown or presumed. But it may be that some indirect benefit might be fairly presumed by the reclamation of considerable areas of land or frontage not previously available for use or occupation, or by the erection of buildings, wharfs, jetties, machinery, &c.
- (4.) Authority to fill in and reclaim can scarcely with justice be applicable to cases where the water is too deep to admit of such filling in and reclamation beyond a few feet of high water.
- (5.) Authority to fill in and reclaim may not unreasonably be accompanied by and made subject to such conditions as may appear to the Government necessary for public purposes or the protection of the rights of neighbouring proprietors.
- (6.) In granting or recommending to be granted such authority, every care should be taken to preserve the symmetry and beauty of the harbour,—to prevent boat navigation from being intercepted or interfered with by awkward, inconvenient, or unnecessary projections,—and to avoid the possible danger of further increment of shallow water or silted deposit beyond or in place of the land filled in and reclaimed.
- (7.) Permission to erect a wharf or jetty must not be held necessarily to imply or involve authority to fill in and reclaim; or alienation of the adjoining shore to the person obtaining such permission, which may be, at the discretion of the Government, temporary or permanent, at pleasure, or for a term of years.

I have, &c.,

M. FITZPATRICK.
