1345. Can you state the cost of cleaning it out per cubic ton of matter? It was cleaned out the first time in March, 1874, and cost £16 5s., which was at the rate of 3s. 3d. per ton for 100 tons; it was cleaned out again in September, and only cost £10 9s., or 2s. 1d. per ton; but it was fine weather then, and the first time it was wet weather, and we had a good deal of trouble in baling out the water.
1346. Can you tell me what is the low-water level, as compared with the level of the bottom of the sewer, as indicated in this drawing? The high and low-water levels are not shown on this plan.
1347. Do you know, as a matter of fact, what it is? The outlet discharges I think about 2 feet 6 inches under high water.
1348. That is the bottom of the outlet? Yes, or it may be only 2 feet.
1349. Does the tide-water ever back up into these pits? No, it does not; there is a great fall from the outlet of the silt-pit to the harbour.
1350. Supposing the water did back up into these pits, would it seriously interfere with cleaning them out? Well, I think it would.
1351. The matter which is deposited in the first compartment you say is chiefly sand? Yes.
1352. Is the stuff deposited in the second compartment very offensive? It was very offensive when it was first taken out.
1353. But that in the first compartment was not? It was not so bad; not near so bad.
1354. Is there any arrangement of the same kind at the mouths of any of the other sewers? There is one, but it is very much smaller, near the foot of Slip-street—at the Patent Slip Wharf, in Lime-street.
1355. Is it the same construction? It has only one compartment.
1356. Is there any difference in the principle of it? Nothing different in the principle.
1357. Was that constructed by you? No. It was only timbered over at first, and I had it arched over because there was a very offensive smell from it.
1358. There is only a small drain there, I suppose? Yes, very small.
1359. Then there is no occasion to clean it out frequently? Every two or three months; it is a very small silt-pit—only about 6 feet long by 4 feet wide.
1360. Are you sure that it is cleaned out whenever it is full? Yes; Mr. Seymour has charge of it, and has it cleaned out at the same time as the gully-shafts.
1361. And it is then carted away? Yes.
1362. Have you any idea of the expense of cleaning out that pit? No, I cannot say what it costs; it is simply the labour of two men.
1363. I understand that you have some proposition of a similar kind for the main sewer which discharges its contents at Fort Macquarie? Yes. (*Plan produced.*)
1364. Are these silt-pits constructed on the same principle? They are not constructed—only proposed.
1365. Are they to be on the same principle as those we have been considering? Yes, on the same principle, except the outlet.
1366. How many feet are these silt-pits from the outlet of the sewer? The furthest is about 100 feet from the outlet.
1367. Is this a vertical section of these pits? Yes.
1368. Can you point out the level of low water? The bottom of the present outlet is a little above low water; the level of high water as indicated on the plan is about 18 in. below the top of the sewer.
1369. That is as appears by the plan considerably above your proposed receptacles for silt? Yes.
1370. The water then at very high tide would back up into those pits, I presume? Yes.
1371. It would only be, as far as I can see, and from what you have told me, during a very small portion of the twenty-four hours, that the water from the harbour would not be in free communication with these silt-pits? Only for a small portion of the time.
1372. Would not that very seriously interfere with the cleaning out this stuff? It would, except when the sand-pump was being used, and then of course the more water the better it would be.
1373. But there would be a great waste of labour in having to pump up salt water as well as sand? The sand-pump has to be lifted up each time it is discharged; it is submerged while it is being worked. This pump is one of the most efficient machines for removing sand, silt, or gravel I have ever seen. The method of working it is as follows:—It is lowered by the chains into the water (and must be submerged to work effectively) and allowed to rest on the bottom; the pump is then worked by a rope, which is fastened to the eye of the piston and passes over a pulley; thirty-two strokes of the piston will fill the chamber with sand when working freely, and when full the chamber contains 7 cubic feet or 7 cwt. of sand, and with five men at a moderate depth the pump was lowered, filled, hoisted, and the sand discharged in about from 4½ to 5 minutes, so that the cost per cubic yard at the present rate of wages would be about 1s. to 1s. 6d.
1374. What amount of silt are these chambers capable of containing, according to this plan? 400 cubic yards, or about 480 tons.
1375. Have you been able to make any estimate of the cost per ton of emptying the silt from these pits? I estimate the cost at from 1s. 6d. to 2s. per ton without the expense of removal.
1376. The area which is drained by this sewer is very much larger than the area drained by the sewer at Market Wharf? Yes, it is nearly fifty times as large.
1377. Have you any idea how long it would take in ordinary weather for these pits to become filled? If we take the others as a guide they would take about the same time. I designed this as sufficiently large to contain six months silting.
1378. You think the contents of these silt-pits would bear the same ratio to the contents of the silt-pit at Market Wharf as the area drained by this sewer, which empties itself at Port Macquarie, bears to the area drained by the Market-street sewer? Yes, I think so.
1379. Have you ever found that either of these existing silt-pits have got filled up after excessive rain?
No,

No, we have not; we tried the one at Market Wharf several times and we found that after a sudden storm it would fill in about a foot of stuff—not more. Of course it filled in more rapidly in rainy weather than in dry weather.

F. Bell, Esq.
9 July, 1875.

1380. With respect to this sewer, which discharges at Fort Macquarie, if the difficulty occasioned by the tide backing up into these silt-pits were found to be an insuperable obstacle to the removal of the contents, could any other plan be adopted;—how would you propose to alter it? I will show you with respect to Darling Harbour; the silt-pit there is now completed (*producing plan.*)

1381. Is it proposed to remove the stuff from these silt-pits from the man-holes as in the one at Darling Harbour? Yes, there are eight man-holes one for each of the silt-pits at Darling Harbour.

1382. You were instructed by the City Council to carry out this arrangement? I was.

1383. What was the precise object of this arrangement—Was it to prevent the pollution of the harbour water, or to prevent it from silting up? To prevent the silting up of the harbour.

1384. That was the primary object? Yes.

1385. Does it prevent both these evils? No, only the silting up; there is an immense deal of faecal and other matter which floats into the harbour, which cannot be arrested in these pits.

1386. You think if effectually carried out it would prevent the silting up of the harbour? Yes, a good deal of the faecal matter of course subsides in these pits but a great portion of it floats into the harbour.

1387. A good deal of it goes in in a liquid state? Yes.

1388. Does the backing up of the tide into these silt-pits remove the sediment—the solid portion of the sewage matter—in them? It does; it stops the current and allows the sewage matter to settle in the pits.

1389. Supposing the water backed up above the silt-pit, would that be likely to cause a deposit of solid matter above the silt-pit also? I don't think so, because the current above is very much greater than it is below.

1390. The chief advantage of the silt-pit then is to arrest the solid matter and prevent it from silting up the harbour? Yes.

1391. If that solid matter could in any other way be removed at less expense the other way would be better? Oh it would, certainly.

1392. You don't think these silt-pits very materially diminish the pollution of the shores of the harbour? No, I do not.

1393. And you are of opinion that these plans are the best that could be designed, generally, for improving the state of things at the mouths of the sewers? I think they are.

1394. You say they do not materially diminish the pollution of the shores, but you do not know of any other plan that would answer better? No; there is no other plan for arresting the solid matter from going into the harbour.

1395. Supposing it should be found that this solid matter could be removed better by dredges, don't you think that would be the best means of getting rid of it? Well, when the dredges come there frequently they are in the way of the vessels discharging, and in some places dredges could not work at all from want of room.

1396. At all events the cheapest way of getting rid of this stuff is the best? I should think so.

1397. What is the depth of the water where this sewer discharges? About 10 feet at high water, at the time these sections were made.

1398. *Mr. Moriarty.*] I wish to ask if you think the sand-pump would take out all the sand from these compartments—(*Fort Macquarie plan*)—working as it must do from the man-hole in the centre? No, I think we should require to modify the plan, so as to have more man-holes.

1399. What is about the weight of the sand-pump with the sand in it? About a ton weight.

1400. How do you propose to work it? By manual labour.

1401. And with regard to pumping out the water from this compartment (*Darling Harbour plan*)—how many tons of water would you have to pump out before the sand could be removed from it? There would not be very much water; we should take advantage of the tide and drop down these gates (*referring to plan*) completely closing in three of the compartments; the sewerage matter would still have a free passage through the other three compartments, and after the water was pumped out the operation of cleaning out could be commenced by manual labour, as at Market Wharf; the other three compartments could then be cleaned out in the same way. If the sand-pump were used, no pumping of the water would be required.

1402. What is the depth of the bottom of the silt-pit from low-water-mark—I am speaking of the silt-pit at Darling Harbour? The bottom of the pit is 14 feet under high-water-mark, and 8 feet 6 inches below the bottom of the sewer.

1403. Then the men could not work in them at any time below? Oh, yes; with these gates (*referring to plan*) it would be perfectly dry.

1404. What I want to arrive at is, how you can pump out the sand with such a large quantity of water to contend with? The water in the pit is rather advantageous than detrimental whilst using the sand-pump.

1405. Supposing an accumulation of sand were to take place in these silt-pits, would it not partially have the effect of blocking up the sewer? No, I think not; we should, of course, gauge them from time to time, and as soon as they were full we should have them emptied. I have just given instructions to have the Market Wharf silt-pit emptied.

1406. And you think there would be no leakage? There might be a little—not much.

1407. And the pump would be worked by manual labour? Yes.

1408. Did you find anything at all offensive in the silt or sand brought down by the Market-street sewer, or was it chiefly sand and street detritus? The stuff in the first compartment was principally street detritus, but in the second compartment it was more of the character of manure, and more offensive.

FRIDAY, 16 JULY, 1875.

Present:—

E. O. MORIARTY, Esq.,		F. BELL, Esq.,
W. C. BENNETT, Esq.,		DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Francis Bell, Esq., City Engineer, further examined:—

(Witness produced certain plans and drawings of silt-pits.)

- F. Bell, Esq.,
16 July, 1875.
1409. *Chairman.*] Have you any further information to give us on the subject on which we last examined you? In revising my evidence I have inserted the figures I omitted to give you at the time.
1410. *Mr. Moriarty.*] I think you described the intercepting pits you proposed to put at the mouths of the main sewers—Were there any sluice doors, or any other means of keeping out the tide, in the one at Fort Macquarie? No, there were not, excepting the present gates; they are bronze gates, and I propose to remove them to the outside, below the pits.
1411. And do you propose any means of keeping the constant supply of sewage water out of them, or would that be discharged at all times? While the sand-pump is being used the more water there is the better; it does not work well unless it is submerged.
1412. You still think you will be able to clean out the whole of the silt by means of this sand-pump? I do; the sand-pump would be purposely constructed for it; the piston would be rather low, so as to work in shallow water. I will bring a drawing of the sand-pump to the next meeting.
1413. Did I not understand you to say that the sand-pump was generally used to pump out cylinders? Yes.
1414. In that case the pump is the same size as the cylinder, I suppose? No; much less.
1415. For what purposes have you seen this sand-pump used? The sand from the cylinder at Randwick, on the watershed, was pumped out by it.
1416. What diameter was the cylinder? 5 ft. 6 in.
1417. And you pumped the sand out of the cylinder? Yes; we sank it 90 feet by means of this pump.
1418. And what was the diameter of the sand-pump? 3 ft. We sunk that cylinder as much as 7 ft. in the day. We tried it also at the Market Wharf, and it worked very well, and cleared away a good deal of the debris which had accumulated, but we found great difficulty in moving it from place to place.
1419. I presume you consider that the plan you subsequently adopted at Hay-street, of having a double chamber, is better? Yes, with doors and watertight compartments.
1420. *Mr. Bennett.*] There is a central man-hole to each catch-pit. Do you contemplate moving the sand-pump from one place to another? Yes.
1421. Then you will require three or four man-holes? In Hay-street there are eight man-holes.
1422. There is one man-hole in each compartment. Do you think that from that one hole you will be able to take up everything in that compartment? Yes, I think so; there might be a little left, but it would be very trifling. But with the watertight compartments it would not be necessary to use the pump at all, and I think it would be much cheaper to take the stuff up by hand labour. I may explain that the sand-pump, being suspended by a chain when it gets into the silt-pit, can be pushed into different places so far as the man-hole will allow.
1423. *Mr. Moriarty.*] It must be immediately under the man-hole,—must it not? The centre of the cylinder must be; the man-hole is 4 feet 6 inches square.
1424. Is not the sand-pump a much more expensive application of power than a direct single lift would be? It is the most economical way of pumping out sand I have seen.
1425. Has not the sand-pump to be lifted several times and dropped again before it is filled? No.
1426. Is not it jerked up and down? The sand pump itself is never moved. *(Witness explained the action of the pump by means of a diagram.)*
1427. What causes the piston to descend against the weight of water underneath it? It is very heavy and a partial vacuum is formed when the water escapes through the upper valves. I have never seen the piston go down, except very easily and suddenly, and there must be more than its own weight to cause that.
1428. *Chairman.*] When the cylinder is raised to the surface do you find it quite full of sand or nearly so? Quite full.
1429. Is the sand much charged with water? No, not at all.
1430. Is it so charged with water that you could thrust your arm into it? No, I could not. I may state that when we hoist it up we place planks under it to take the weight of it; then we knock out the keys which separate the pump from the false bottom and draw it up, when the deposit of sand left is just like a cheese, and as firm as possible.
1431. And you consider this a cheaper way of raising the sand than if the water were entirely removed, or at least run off to such an extent that the sand could be raised in large buckets? I think the cheapest way would be to do it by manual labour.
1432. That is to say if you could get rid of the water? Yes, with buckets or skips.
1433. Then you would only look upon this sand-pump as a last resource when the water could not be kept down, so as to clean out the pit by manual labour? Yes, and when we could not get men to go down; they are nasty places to go into, and we have to give the men higher wages to do it.
1434. *Dr. Alleyne.*] Have you had any experience in cleaning out sand or silt from any larger area than the cylinder you referred to? No, we tried this pump at the Market Wharf, but we found so much difficulty in moving it from place to place that we gave it up. It would only clear a certain space round about the spot where it was lowered.
1435. *Chairman.*] Would there be any difficulty in placing this catch-pit higher up in the sewer—further back from the water—and to have it completely above high-water-mark so as not to be troubled with water at all? It could be done if you could find a proper place to put it. My reason for selecting this place was, because there was plenty of ground round about it. It takes a great deal of room for a silt-pit to work it perfectly.
1436. Have you any idea of the cost of constructing this catch-pit? The cost is about £2,500.

1437.

1437. Have you had any knowledge of the use of these catch-pits anywhere besides in Sydney? No. F. Bell, Esq.
 1438. Will you give us an approximate return of the catchment areas of the several sewers which empty their contents into the harbour? Yes. They are as follows:— 16 July, 1875.

		n.	f.	p.
Main sewer, Fort Macquarie	6 feet brick, oviform	176	3	12
Tank stream	10 feet wide, brick	33	0	9
Hay-street, Darling Harbour	10 feet wide by 8 feet high, stone sewer	301	0	23
Blackwattle Swamp	6 feet brick, oviform	112	2	26
Woolloomooloo Bay	10 feet wide by 6 feet high	278	1	38
Queen's Wharf	4 feet brick, oviform	47	1	34
Devonshire-street	2 feet 6 inches brick, oviform	59	2	25
Erskine-street	2 feet brick, oviform	14	0	1
Market-street	2 feet do.	11	3	4
Kent-street, north	18 inch stoneware pipe	17	2	8
Druitt-street	18 inch do.	24	2	11
Washington-street	16 inch do.	6	3	39
Thomas-street	18 inch do.	11	3	25
Liverpool-street	12 inch do.	1	3	10
Elizabeth Bay Road	16 inch do.	30	1	19
Upper William-street, east	16 inch do.	14	1	34
Duke-street	16 inch do.	11	1	26
Crown Road	16 inch do.	2	3	22
Wentworth-street	12 inch do.	2	2	34
Clyde-street	12 inch do.	1	1	20
Pottinger-street	16 inch do.	6	2	17
Ferry-lane	2 feet 9 inches wide, stone	2	3	0
Margaret-place	16 inch stoneware pipe	17	0	16
King-street	16 inch do.	10	1	12
Bathurst-street	16 inch do.	4	2	23
		1,202	3	14

1439. We have it in evidence that in all the sewers, or at any rate in some of them which empty into shallow water, going in at a low level, a great quantity of filthy matter is deposited on the banks, which creates, in summer time especially, a great nuisance; and it has been stated that this nuisance would be in some measure mitigated if the sewage matter could be carried into deeper water. What is your opinion? I am certainly of opinion that it would be.

1440. By carrying it out into deeper water and where there would be probably a greater flow of tide? Yes, and if possible discharging it to a certain extent under water, as it would then become partially deodorised.

1441. *Chairman.*] Have you the means of telling us how far you would have to go up the Woolloomooloo Bay sewer to get a rise of 6 feet above low-water-mark? I have.

1442. Will you furnish it? Yes;—centre of main sewer, 1,540 feet; eastern branch, 1,260 feet; western branch, 1,800 feet.

1443. How many sewers are there which discharge into the harbour? About twenty-one or twenty-two.

1444. What are the dimensions of the Hay-street and Fort Macquarie sewers at their outlet? The Hay-street sewer is 10 feet wide by 8 feet high, and the Fort Macquarie is a 6-feet oviform brick sewer.

(See also questions answered by this witness in the course of Mr. Moriarty's examination, immediately following.)

E. O. Moriarty, Esq., Engineer-in-Chief for Harbours and Rivers, examined in his place:—

(Witness produced a plan shewing the outlet of the Fort Macquarie sewer, and his proposed mode of carrying the ordinary dry weather sewage into deeper water, to a distance of 120 feet from the present outlet.)

1445. *Chairman.*] What would be about the depth at which this sewer would be at the distance to which you propose to carry it? About 10 feet below the water-mark.

1446. Is there a much greater flow of tide there than at the point where the sewer now terminates? Yes, considerably greater.

1447. According to this arrangement, all the flood waters, or the greater portion of them, would go out of the mouth of the sewer in the usual way? Yes. E. O. Moriarty, Esq. 16 July, 1875.

1448. Where would all the silt go to? Most of the silt would go out through the pipe, but the storm waters would pass through the doors which I propose to make.

1449. What is the object of these doors? To allow the storm-waters to escape; but at ordinary times to impound the sewage matter, which at present, at all stages of the tide, flows out on the surface of the salt water in a filthy stream.

1450. To impound the sewage matter in the pipe? Yes.

1451. It is so constructed as to allow the flood waters to pass? Yes.

1452. It is not intended to prevent the tide from backing up into the sewer? No, there is a door further up which is intended to prevent that.

1453. Will that prevent the influx of air? That I do not propose to interfere with at all.

1454. Are there peculiar facilities at this point for carrying out an arrangement of this kind? No; no peculiar facilities, further than that there is a good run of tide which would be a great advantage.

1455. Can you give the Board any idea of the comparative cost of this arrangement? The estimated cost was £950, and a vote of money was taken to that amount, but the work was not carried out in consequence of

E. O.
Moriarty,
Esq.

16 July, 1875.

of the Municipal Council having claimed their right to deal with the matter. I thereupon recommended in the following report that the money should be handed over to them.

“RESPECTING DISCHARGE OF THE SEWAGE AT FORT MACQUARIE.

“The Engineer-in-Chief for Harbours and Rivers to the Under Secretary for Public Works.

“HAVING, in attention to your memo. of the 27th ultimo, carefully considered the subject of the best means of mitigating the nuisance arising from the discharge of the sewage at Fort Macquarie, I have now the honor to submit the accompanying plan for the approval of Mr. Secretary Sutherland.

“The arrangement I propose, which is somewhat similar to that which has been tried with a considerable degree of success at Brighton, consists in ‘trapping,’ as it is technically called, the outfall of the sewer, or in other words conducting the sewage matter by means of a cast-iron pipe to such a distance out into the harbour as will insure its being discharged some 12 feet below the surface of the salt water at low tide; so that the sewage which at present, by reason of its less specific gravity, floats on the salt water, giving out its poisonous and offensive gases into the air, will be diffused amongst, and in great measure deodorised by the large body of salt water with which it will become mixed.

“I believe by this means a great deal of the offensiveness of the sewer will be removed; but I do not wish to be understood as implying that this or any other make-shift plan will be effectual in wholly removing the nuisance. The present system, which makes the harbour the receptacle for the sewerage, is radically wrong, and no time should be lost in taking up and dealing in a comprehensive manner with the whole subject of its proper disposal.

“In the plan now proposed I only contemplate dealing with the ordinary or dry weather discharge from the sewer, which would be conducted at a distance of about 120 feet, and to about 12 feet below the low-water-mark, and discharge at the edge of the reef, which it will be observed at this point falls away into deep water, the solid matter, street detritus, and such like can be removed from time to time by the dredge, and sent out to sea.

“I do not propose to interfere with the discharge of the storm waters; to do so would involve the construction of a cast iron culvert of the full size of the sewer, which, besides being very costly, would be unnecessary, as the sewage is so diluted in times of heavy rains as to be almost inoffensive—the valves in the upper part of the cast-iron plate would allow of the free discharge of the storm water, as they would have the same sectional area of opening as there is through the inner valves, which were placed near the outlet of the sewer at the time of its construction, but which have since fallen into disrepair.

“If found desirable, the sewage might be impounded in the sewer (by means of the valves) during the period of flood-tide, and be allowed to discharge only at the beginning of the ebb-tide. It would thus be swept well down the harbour, and would not, as at present, oscillate backwards and forwards with the flood and ebb tides.

“I would here suggest that the attention of his Worship the Mayor be called to the condition of the valves, to which I have referred, and which are now lying unhooked in the bottom of the sewer.

“The cost of the work herein recommended will be about £950. There are no funds at present available for carrying it out. I would therefore recommend that the sum required be placed on the Additional Estimates for this year.

“The plan showing the proposed work is transmitted herewith.

E. O. MORIARTY, 14/1/75.”

1456. Taking another sewer;—do you know anything of the mouth of the sewer at Woolloomooloo Bay? Yes.

1457. Would a similar plan be practicable there? I doubt it; the sewer which discharges at Woolloomooloo Bay is of peculiar construction; it is a flat, elliptical sewer, about 12 feet broad and 7 feet deep.

1458. Could not a pipe be carried out from that in the same way;—what would be the difficulty? The principal difficulty would be getting the doors into the sewer.

1459. Are these doors a necessary portion of the plan? Yes, because if you don't have doors the sewage matter which is always discharging would float out on the surface of the water.

1460. Would not that be remedied by impounding the dry weather sewage higher up the sewer, out of the reach of the tide? The sewer is very flat, and you would have to go a considerable distance up it.

1461. But I understood you that the door which you propose to make in the Macquarie-street sewer would keep the tide out? No, I propose to allow the tide to come in through this pipe. Then on the return of the tide that water is impounded, and has to return through the sewer and discharge the whole of the sewage matter.

1462. The difficulty then in Woolloomooloo Bay would be in the size and form of the sewer? Yes, and you would have to go back a considerable way to put in large doors, and that would be an expensive arrangement.

1463. *Chairman to Mr. Bell.*] Do you remember what is the fall of the sewer at the lower part of it in Woolloomooloo Bay? It is very little indeed; I think about 1 in 400. (*Addendum by Mr. Moriarty.*) It rises rapidly when you go back about 700 feet, but it would be very difficult and expensive to go back as far as that.

1464. *Chairman to Mr. Moriarty.*] Would it be possible to make gates to this sewer to answer the same purpose as those you propose for the Fort Macquarie sewer? Oh yes, it would be quite possible.

1465. Which do you think would be the better plan;—to do that or to carry the pipe a sufficient distance up the sewer? It strikes me the better plan would be to make the gates at the outlet.

1466. *Chairman to Mr. Bell.*] Have you the means of telling us how far you would have to go up this sewer to get a rise of 6 feet above low-water-mark? I have.

1467. Do you know how many sewers there are which discharge their contents into the harbour? About twenty-one or twenty-two.

1468. *Chairman to Mr. Moriarty.*] To turn to the Hay-street sewer;—would this plan be applicable there? Yes, I think so, making due allowance for the cost of dealing with a larger sewer.

1469. Is it larger than the Fort Macquarie sewer? Oh yes, the outlet is a good deal larger.

1470. *Chairman to Mr. Bell.*] What are the dimensions of the mouths of the Fort Macquarie and Hay-street sewers? The sewer at Fort Macquarie is a brick oviform sewer, 6 feet, and the one in Hay-street, Darling Harbour, is a stone sewer, 10 feet wide and 8 feet high.

1471. *Chairman to Mr. Moriarty.*] With regard to the distance to which the pipes could be carried out—could you form any idea of that? About 60 feet from the outlet of the Hay-street sewer would be quite sufficient to take them into deep water.

1472. That would not be the distance which would be necessary in the Fort Macquarie sewer? No.

1473. Are you acquainted with the mouth of the Parramatta-street sewer at Blackwattle Swamp? Yes.

1474. With respect to these smaller sewers emptying into Darling Harbour, could anything of the same kind be done with them? I should think so.

1475. They are said to create a most excessive nuisance? They do. Many of these sewers are carried out to below low-water-mark by means of ordinary drain-pipes; but the joints are not tight, and the sewage matter rises and discharges through the joints.

1476. Would you propose to carry out these smaller pipes to a similar depth? I would carry them out to a sufficient depth to deodorise the stuff.

1477.

1477. This would only be a temporary arrangement? It would only be adopted temporarily to get rid of an intolerable nuisance.

1478. Do you think such a system as this would be an advantage if the ordinary dry weather sewage were disposed of, and the flood-water only went away? This was simply to deodorise the dry weather sewage.

1479. Would it be of any use in carrying silt into the harbour? It would take it into a more accessible place for dredging. At Fort Macquarie it is impossible to get within 150 feet of the shore in consequence of the rocks.

1480. In any of these cases would there be any practical difficulty in laying down these pipes so that they would not interfere with the shipping, or be exposed so as to be liable to injury? No, I do not think so.

1481. You don't think the expenditure would in any case be a total waste? No, I think not, because any works which might be determined upon for the purpose of intercepting the dry weather sewage-matter would take some time to complete, and in the meantime we are being poisoned by intolerable smells which must be got rid of at once.

1482. Of course in any system of sewerage the flood-water must go into the harbour? Yes; I don't see how it is possible to avoid it.

1483. The introduction then of any improved system which would intercept the sewage, and prevent it from going into the harbour, would not affect the amount of silt floating into the harbour? I do not think it would.

1484. Is there any other plan which has occurred to you, or of which you have heard, by which the silting up of the harbour could be prevented, except by intercepting the silt in catch-pits, or dredging it up after it has got into the harbour? No, I think those are the only two methods of preventing it. I think a good deal of it might be intercepted if we had a sufficient number of silt-pits constructed in the streets. I think the silt should be kept out of the sewers as much as possible, for if it once gets into the sewers it must go into the harbour.

1485. Then, if it has to be kept out of the sewers to prevent its going into the harbour, it must be got rid of artificially for that reason, and the cheapest way is the best? Yes.

1486. What is the cost of removing silt by means of the dredge? That depends upon circumstances. We found the dredging in Darling Harbour cost us 9½d. per ton. The expense will be in accordance with the following table:—

RETURN, showing approximate cost of Dredging, including interest of 5 per cent. on capital.

Name.	Where dredging.	Cost per ton.	Cost per ton interest on capital.	Total cost per ton.	Remarks.
"Samson"	Darling Harbour	s. d. 0 8 36	d. 2 33	s. d. 0 10 ½	All day work.
"Hercules".....	Darling Harbour, Fort Macquarie, Woolloomooloo, and Blue's Point, North Shore.	1 2½ and 7¼d. for landing.	1 98	1 4½	
"Hunter"	Newcastle (at cranes)	2 8½ rock	8 94 rock	3 5½ (rock)	All year dredging rock; half the year working night and day. Do. do.
"Vulcan"	Raymond Terrace Flats, Blind Channel, and Horse-shoe, Newcastle.	0 6	1 05	0 7	
"Fitz Roy" ...	Shark Island Flats and Mangrove Channel, Macleay River.	0 9½	2 03	0 11½	
"Pluto".....	Apple-tree Orchard Island, between Crookhaven and Greenwell Point, and Bomaderry Ferry, Shoalhaven River.	1 0¼	3 19	1 3½	
"Titan".....	Blackwattle Bay and Parramatta River.	0 10½, and 8d. for landing.	1 20	0 11½	
"Newcastle"...	Horse-shoe, Newcastle.....	0 3½ (about)	1 00 (about) ...	0 4½ (about)	Working day and night the whole year.

1487. I don't quite understand why you should say it would be desirable to catch some portion of the silt in the streets unless that was the least expensive way? My reason is this: That although dredging is undoubtedly the cheapest way of removing it, yet after heavy storms this stuff is usually swept so far from the mouths of the sewers that it is very difficult to get hold of a great portion of it. It is taken to places which are too far out to be worked by dredges, and we can only take up that which is near the mouths of the sewers; while the other portion, which is carried further out, is gradually silting up the harbour.

1488. Is there no way of preventing that? No, only by intercepting as much of it as possible in the street gully-shafts, and by means of these catch-pits which Mr. Bell proposes. A great deal may no doubt be intercepted in that way.

1489. Would not these catch-pits, of whatever kind they might be, chiefly and almost exclusively intercept matter which could be dredged up, and not the lighter matter which would be carried away? I dare say that will be the case to a great extent; still I think a great deal of silt might be intercepted in the gully-shafts in the streets.

1490. Is it not the case that the smaller the catch-pit the less likely it is to intercept the lighter silt? Yes, I think so.

1491. Don't you think these gully-shafts would intercept the grosser portions of it? Yes, I think the muddy water would all run off. I have noticed that the stuff taken out of these gully-shafts seemed to be nearly all of it gritty—street debris. Still I should like to see as much of the stuff as possible intercepted, because there is undoubtedly a good deal of it which is carried out to places beyond the reach of the dredge—it does not all settle within a convenient distance or depth for dredging. I believe some of the heavier particles are also washed out on to that sand bank off Fort Macquarie, for it is constantly forming, and we have to dredge it up, and that is a considerable distance out. I know that a portion of the

E. O.
Moriarty,
Esq.
16 July, 1875.

the stuff goes much further than that. I should therefore like to see as much as possible intercepted, and prevented from going into the harbour.

1492. Then you approve of having catch-pits of similar dimensions to those proposed by Mr. Bell? I would have arrangements for catching as much of the silt as possible—to keep it out of the harbour.

1493. Do you think it would be worth while to have surveys made so as to enable us to arrive at an estimate of the cost of treating these sewers in the way you propose? I think it would; they are a most intolerable nuisance in Darling Harbour, as I can testify from my own knowledge. The stench is frightful, and there are all sorts of abominations floating about in the water.

1494. *Mr. Bell.*] In the case of the Hay-street sewer, would not the pipes which would be laid from the mouth of the sewer down to deep water interfere with the vessels there, and with the dredging operations? I think there would be no difficulty in dealing with that. I would give 60 feet as the maximum distance. The pipe might terminate under the wharf, which is of open iron work. If the pipe were taken 40 ft. or 45 ft. out it would be in about 15 feet depth of water.

1495. Does not the dredge take up a small portion of the finer particles of silt? It takes up everything, either liquid or solid matter.

1496. Is not the water very much discoloured? At the mouth of the tank stream it certainly is; the mud and water we dredge up is perfectly black, but the stuff we dredge up is only of the consistency of thick cream.

THURSDAY, 22 JULY, 1875.

Present:—

HON. J. B. WILSON,
E. O. MORIARTY, Esq.,
W. C. BENNETT, Esq.,

DR. ALLEYNE,
F. H. GRUNDY, Esq.,
R. B. READ, Esq.,

HON. JOHN SMITH.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Hon. J. Smith, Chairman, and Messrs. F. H. Grundy, and R. B. Read, Members, of No. 1 Committee, examined in their places. (*Report of No. 1 Committee read*):—

Hon.
J. Smith.
22 July, 1875.

1497. *Chairman to Hon. J. Smith.*] Have you any remarks to make on the Report which has just been read? There is one point which requires explanation: We were led to believe that the drainage of the Destitute Children's Asylum passed down into Bird's Gully which leads into the Botany stream. We were told so on the spot, and looking from a little hill there it seemed to us at the time that it did so; it never occurred to us to doubt the statement. Mr. Bell, however, afterwards called our attention to the fact that the drainage of the Destitute Children's Asylum really passes down to Bunnerong, and that the drainage only of a certain number of contiguous houses, including some market gardens, passes into Bird's Gully, and thence into the Botany stream. He said that there was a slight rise of the ground, which divided the two waters. After receiving this information I went out myself to visit the ground, and I followed the stream down for about a mile and a half, but the ground then became too swampy to allow me to proceed further without a horse, and I returned without satisfying myself fully. I satisfied myself, however, that there were two separate courses of drainage—one from the Destitute Children's Asylum, and a small group of houses to the eastward, known as Irish Town; and the other from some houses called Struggle Town, and a few market gardens, which goes into Bird's Gully, and thence into the Botany stream. I understand that Mr. Read has followed the stream further down, and he will perhaps be able to give some additional evidence.

1498. *Chairman to Mr. Read.*] Have you any further information to give the Board on this subject? Yes. I made it my special business afterwards to look into this matter from the information supplied to us by Mr. Bell, and I traced the overflow of the cesspit or receptacle which receives all the drainage of the Randwick Asylum, and I satisfied myself that that drainage does not at present pass into the Botany Watershed by Bird's Gully but passes towards the Bunnerong Swamps. I must, however, call your attention to this: That when the water is pumped up—as it is proposed to be—then it will pass into the Botany Watershed by Bird's Gully. The dividing range is not much wider than the length of this room—say about 10 yards.

1499. *Chairman to Hon. J. Smith.*] From what I have understood in conversation with Mr. Bell, the contamination of the water in the Bore from these houses, which you describe in clause 4 of your report, beyond St. Matthias' Church, was far more serious than any other contamination, on account of its passing directly into the Bore without any filtration, and that the drainage from the larger number of houses which you mention at Waverley was not nearly so important, although the quantity of contaminating matter was much greater, because it was more distant, and was subject to some filtration before entering the Bore;—from what you have observed do you concur in that opinion? Only to a certain extent. It is quite true that the drainage from those houses near St. Matthias' Church has not much time to get purified, while the Waverley drainage has some distance to go; but the construction of the dams on the Lachlan Swamps has to a great extent destroyed the running stream; there is no running stream, in fact, now.

1500. You mean running towards the Bore? Yes; as soon as you get down to the dams you see no more of the running stream, and the consequence is that the Waverley drainage has now a comparatively short distance to run before it stagnates in these dams. Hence it was that we thought it advisable to recommend the removal of Fewing's Creek dam in order to lengthen the running stream.

1501. Do you mean that the drainage arrives there by soakage and not by running? We saw no direct communication between the dams—only sluices—and they do not give a running stream. The water of one dam goes right up to the embankment of the one above it.

1502. Now, on the day before Professor Liversidge took these samples of water at the mouth of the Bore, the drainage of the sixty houses mentioned in the 4th clause of your report had been diverted, as I am informed by Mr. Bell, and he thinks that the serious contamination of the water which was found to exist by Professor Liversidge was owing to this cause, which has since been removed; and I gather from the tenor of your report that you think there are other more serious sources of pollution, this one being comparatively harmless;—am I right? I think this drainage from the houses near St. Matthias' Church was

a bad kind of drainage; no doubt the same kind of drainage as from Waverley, but much less in quantity. 1503. Do you think that the mere cutting off that drainage, leaving all other sources of contamination unaltered, would produce any serious improvement in the quality of the water? No, I should think not, because, although it was a drainage of a bad character, it ran over a great deal of grass; it had no distinct, well formed, channel, but spread over a considerable surface of ground, and got well exposed to the sun and air. I am not, therefore, inclined to think that the cutting of this part of the drainage, although a good thing to do, would materially improve the character of the water.

1504. Do you think that, as a considerable time has now elapsed, it would be a good thing to have some fresh samples taken? I think it would be.

1505. I see you recommend that one dam, marked No. 2, in the Lachlan Swamp, should be removed merely for a purifying effect—for the purpose of keeping up the stream. Do you think that would be more effectual than allowing the water to remain in the dam? Yes, I think so. I may attach too much importance to the purifying effect of a running stream; but as it happens that this dam, which is narrow and of great length, though its storage capabilities are not great, does stagnate the water for a considerable distance, I think it would be better to remove it.

1506. Now, considering all the sources of contamination which exist in this swamp—its close contiguity to growing suburbs, and the great difficulty there must be in preventing and removing all sources of contamination—and taking into consideration the value of the land along the Water Reserve—do you think it is worth while to go to great expense to conserve this as an additional water supply, or anything more than a very temporary one? Well, I begin to be doubtful whether it is worth conserving it. I have had great faith in the Lachlan Swamp and the Botany watershed; but it seems to be excessively difficult to preserve the purity of the water. I can see that it is less pure now than it used to be; and I fear that the expense of turning aside all the sources of impurity would be very great; and I begin to be doubtful whether it is worth while to go to much expense with it, or whether it would not be better to give up the whole ground for building purposes or for manufactories, and to go at once to some other source of supply.

1507. We have a great deal of evidence before us that after the water has entered the Bore a very serious contamination occurs, and perhaps to about the same extent—according to analysis—as occurs in the Swamp itself. That, however, if this is a valuable source of supply, might be removed by putting down an iron pipe throughout its length, which appears to be the only remedy. But that would be very expensive, and this valuable piece of land would have to be reserved. The question is, whether it would be worth the money to do it. What is your opinion? I don't think it would be much use to lay down an iron pipe unless you cut off the drainage from Waverley, and if you did that, and by putting a pipe in the tunnel throughout its whole length, prevented any percolation of water from the adjoining ground, you would greatly diminish the supply of water. You would get much purer water from the tunnel, but much less of it.

1508. What was your opinion of the quality of the water for household purposes entering the Bore at the time you made your observations, as far as you could judge from mere observation? I think the water may safely be used. It is not so good as it used to be, but still I think it may be safely used. I should not myself feel any apprehension in using it, though I might take the precaution of having it filtered. But I should feel no alarm, and I don't think the use of it would materially affect the health of the inhabitants.

1509. That opinion is merely formed from the absence of colour, taste, and smell? A small amount of contamination is indicated by colour, taste, and smell.

1510. Are you aware that in the opinion of the highest authorities water may be of good color, taste, and smell, and still possess deadly qualities? Yes, and I suppose that opinion must be well founded; but, in such cases there have been special sources of contamination. For example, in the famous story of the Broad-street pump, which is continually quoted, the water was said to be clear and well tasted, and yet it seems to have been poisoned by cholera germs. I can imagine a case where water is clear to the eye and not unpleasant to the taste, and yet may contain some special poisonous germs, but such cases must be rare, and we have no reason to apprehend any such contamination in the Lachlan Swamp. And with regard to the taste of water a great deal depends on custom. I have very little doubt that a person not accustomed to the water from that Broad-street pump would not have chosen to drink it.

1511. You are aware, I suppose, that a large part of what is called London is supplied with Thames water, which is pumped up and filtered? Yes.

1512. That the water is considered unfit for use without filtering, taken from the Thames, which receives the surface and other drainage from a very large inhabited area? I am not aware that it is considered injurious to health without being filtered. It would be unpleasant to use.

1513. And you think such water as that would be desirable water to supply to a town without being filtered? No, it is desirable to filter it, if the filtration be properly performed.

1514. Of course that is understood? But it is pretty well known—at least it is frequently asserted—that the filtration by some of the London companies is imperfectly done.

1515. Suppose the water from Lachlan Swamp as it exists at present before it enters the tunnel were found—so far as contamination by animal matter is concerned—to be about the same quality as Upper Thames water before it is filtered, should you consider it desirable to supply the inhabitants of a town with it for drinking purposes, without filtration? The Swamp water appears to me to be of that kind that filtration would not greatly improve it.

1516. But supposing it to be of the same quality as the Upper Thames water before filtration, would you supply such water to the inhabitants of Sydney without filtering for household purposes? It is not easy to give an answer to that question, because it depends upon the character of the matter, whether filtration would remove it or not.

1517. We will suppose the filtration removes as much as the filtration of the London water removes, that is about two-thirds, reducing the water to what is called fair drinkable water. Do you think water such as the Thames water is before filtration would be the sort of water to supply to the inhabitants of a town like Sydney, without filtration? I am not in a position to say it would be injurious. I think the Thames water, even before it is filtered, would not be sensibly injurious to the health of the inhabitants—I mean the Thames water taken as high up as the Companies now take it; and it should be borne in mind that filtration has only been made compulsory within a limited number of years, and that water used to be taken pretty low down; London was not in an unhealthy state then; I am not aware that it has been proved to be more healthy now.

Hon.
J. Smith.

22 July, 1875.

Hon.
J. Smith.
22 July, 1875.

1518. Supposing we used this supply from Botany as it is, and for the sake of argument suppose the people of Waverley were attacked by cholera; in such case this water would be liable to be contaminated, from what we may call—for want of a better term—cholera germs; do you think that would be dangerous? I think it would be decidedly dangerous then, as you might get the specific poison into it.

1519. Then, whenever any communicable disease was prevalent it would be dangerous? Yes, if it were communicable by water.

1520. Do you think this land, if it were abandoned as a water reserve, would be valuable for other purposes? Yes, there are admirable building sites upon it, and the water would be very valuable for other purposes.

1521. *Chairman to Mr. Bell.*] What is about the area of the Water Reserve? 768 acres.

1522. Do you consider this Lachlan Swamp would be valuable if it were used for some other purpose, and not as a water reserve? Oh yes, I think so.

1523. Have you any idea what it would be worth if used for other purposes—if it were sold? It would be all suitable for building purposes.

1524. It could be reclaimed then? Yes.

1525. I suppose land is becoming valuable now in that neighbourhood? I think so, but I really cannot say what it is worth.

1526. *Chairman to Mr. Grundy.*] Have you any idea what would be the value of this reserve? I know that one allotment of land near the Paddington Barracks, not in at all a good position, recently fetched £30 per foot frontage,

1527. Fronting which street? Fronting the Old South Head Road. It was not in a favourable position, being some 10 feet below the level of the road, so that the foundations of any building put up on it would have to be raised 10 feet.

1528. Are you sure you are not mistaken, because land can be obtained at that price in Sydney—good city property? No, I am not mistaken; land fronting the South Head Road, further on, is worth £50 a foot, and fronting Oxford-street £40 a foot.

1529. The more remote parts of the Lachlan Water Reserve—are they of much value? Yes, as much as £10 a foot has been given for land in the neighbourhood of those houses which are mentioned in this report as draining into the reserve.

1530. But I am speaking of the water reserve itself, which is still the property of the Government? I do not mean land absolutely within the 768 acres.

1531. What is your opinion of the value of the reserve if it were turned to some other use? I think it would be chiefly valuable to manufacturers on account of the water. The land valuable for other purposes is on the watershed, and not actually within the reserve.

1532. *Hon. J. B. Wilson to Hon. J. Smith.*] You refer in your report to the possibility of turning aside the impurities which proceed from the drainage of Waverley and diverting them to Shea's Creek, or into the sea;—do you think that if those impurities were turned aside it would have a material effect in improving the water? Yes, I think it would.

1533. Then, with regard to the removal of this dam at Fewing's Creek, marked No. 2, supposing these impurities from Waverley were diverted, are you still of opinion that it would be desirable to take away this dam? If those impurities were cut off you might allow that dam to remain; it was only with a view of restoring the running stream to purify the water that we recommended its removal.

1534. Do you think there would be any great difficulty in diverting these impurities from Waverley, either into Shea's Creek or into the sea? I think you had better address that question to Mr. Grundy, as it is a question of engineering difficulties.

1535. *Hon. J. B. Wilson to Mr. Grundy.*] Will you be good enough to state whether there would be any great difficulty in diverting the impurities from Waverley, so as not to contaminate the Lachlan Swamp? As an engineering question there would be no difficulty in diverting the drainage from Waverley to Shea's Creek; but as to the expense I could not give any opinion at present. Nor can I tell you at present what would be the engineering difficulty of taking the drainage down to the ocean, because I have taken no levels, and I do not know what the length of the tunnel would be through the higher ground between Waverley and the ocean. There would be no difficulty in taking the drainage to Shea's Creek, because there is plenty of fall all the way.

1536. Then, if the impurities from those houses at Waverley were diverted, would there be much danger to the watershed from the rainfall which takes place at that point? I should think not, because the drainage would all go into the sewer, and I quite agree with Dr. Smith in saying that in that case it would be unnecessary to remove No. 2 dam.

1537. *Chairman to Hon. J. Smith.*] Does the drainage from this sheep station, referred to in your report, go directly into the stream leading to the tunnel mouth, or is it subject to filtration before it goes there? The drainage from the quarantine ground is first surface drainage running over the surface of the ground; then it collects into a watercourse, which has been formed artificially, leading to No. 6 dam, which communicates, I believe, with the dam that supplies the tunnel.

1538. *Chairman to Mr. Grundy.*] You have heard what Dr. Smith says of the water which you observed at the mouth of the tunnel as to its fitness for household use. Do you concur with him in his opinion of its quality? I have considerable diffidence in disagreeing with Dr. Smith on a question of chemical knowledge, but personally I do not agree with him. The water, as far as I can recollect it, had a sensible smell, and the taste, though not very bad, was disagreeable, and its appearance was not very good.

1539. Was there any scum upon it? I did not notice any scum upon it, but it had a disagreeable colour.

1540. From what you saw did you think there was any considerable quantity of water entering the tunnel—did you notice any commotion in the water? No, it was perfectly still, and I should have thought there was only a little—a very little—water entering the tunnel. I cannot conceive such a quantity as you describe to be delivered in Sydney, or anything approaching to it, could possibly have been coming in. I do think, moreover, that if there were any leakage from clay puddling, or anything of that kind at the mouth of the tunnel, it would have made a difference in the appearance and agitation of the water.

1541. Do you think it possible that any large quantity of water could enter there at that small depth of 7 feet or 8 feet without some very considerable agitation? I should imagine not.

1542. *Chairman to Mr. Read.*] What was your opinion as to the fitness of the water at the mouth of the Bore for domestic use? That it was not fit for domestic use unless filtered.

1543. What was your opinion as to the possibility of any large flow of water into the Bore? The water appeared to be perfectly still, and there was no appearance of any quantity of water going in at the time. (*Addendum by Mr. Grundy.*) It was so still when we were standing on the platform that we could gradually see the walls which were submerged below the stream, which we could not have done if the water had been disturbed.

Hon.
J. Smith.
22 July, 1875.

1544. Was there any sensible current? None whatever. There was a general discolouration of the water, which appeared to be throughout its whole depth.

1545. *Chairman to Hon. J. Smith.*] Did it occur to you in examining the watershed that it would be almost impossible to prevent foul matter from entering it? It is very difficult on account of the number of houses.

1546. I do not mean from the drainage, but the deposit of night-soil, dead animals, and so on. Is it not practically impossible to prevent impurities of various kinds from getting into it? No; I think it would not be difficult to prevent that.

1547. Supposing a man goes with his cart and deposits a load of night-soil or a dead horse, is there any way of preventing him? Yes; I think if watchmen were employed to keep a look-out that might easily be prevented. There are very few approaches to the Reserve.

THURSDAY, 29 JULY, 1875.

Present:—

HON. J. B. WILSON,
F. BELL, Esq.,

W. C. BENNETT, Esq.,
E. O. MORIARTY, Esq.,

DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Francis Bell, E. O. Moriarty, and W. C. Bennett, Esquires, further examined in their places:—

1548. *Chairman to Mr. Bell.*] Will you describe the nature of the last accident which took place at the dams on the Botany Watershed? Yes; if you will allow me, I will read the report which I sent in on that occasion. It describes the accident correctly, better than I could do so without referring to it. It is dated 21 May, 1874. (*Report read.*)

F. Bell, Esq.
29 July, 1875.

1549. I think you state in that report that No. 5 dam was the first which gave way? No, it was No. 4.

1550. How was that dam constructed; was it simply a bank of sand? You mean the old embankment?

1551. I am speaking of the one which gave way? There were two rows of piles in the centre of the embankment. This (*producing diagram of cross section*) will give you some idea of the way in which it was formerly constructed.

1552. Is there any material difference in the dams as they are now constructed from the way they were constructed formerly? We have no timber in them at all now.

1553. They are merely sand banks now, then? Merely sand banks, but they are considerably wider as well as deeper, and the slopes are not so steep.

1554. You say that the dams are merely sand banks, and that it was the waste weir which gave way? Yes.

1555. Did not the dam itself give way? It was the weir which gave way; the weir is in the embankment.

1556. How did it go—was it very suddenly? No, not very suddenly; the man who was watching there saw it going; the water carried the sand away from around the piles and gradually the holes got larger and larger.

1557. Is there a dam No. 3? That was carried away years ago, and it has never been repaired.

1558. And that came down to No. 2? Yes, and burst that too.

1559. When the water got to No. 1 dam, what happened? It went over it also for a depth of 4 feet 6 inches over the whole length of embankment.

1560. It came down very suddenly then? Yes.

1561. And still it did not destroy the dam? It did at last; it gradually made a breach in it, and at last a portion of it went, but the weir stood.

1562. And what happened when it got into the engine-pond? The engine-pond was not completed; we had only got the embankment up to high-water-mark, and the water went through the opening and carried away some houses.

1563. Did it injure the engine-pond dam? Only a little.

1564. No. 6 dam gave way also, did it not? It would have gone but we saved it, and we have made it secure since.

1565. You say that No. 4 dam contained 85 millions of gallons? Yes.

1566. Then am I right in supposing that the combined reservoirs, Nos. 4 and 5, contained 85 and 33 millions of gallons,—that is to say, 118 gallons on the whole? Nos. 4 and 5 dams with their embankments raised contain 135 millions of gallons.

1567. As against 85 millions formerly? Yes.

1568. If this No. 4 dam were to give way now suddenly what effect would it have on No. 2? No. 2 would go too; they would all go one after the other.

1569. And what would happen to the engine-pond in that case;—the danger would be much greater on account of the greater storage of water, would it not? Yes, if there was any danger.

1570. Do you think, if such a thing were to happen, there would be any danger of injury to the pumping works? No, none at all; it could not possibly affect them.

1571. However large the rush of water which might come down? No; they are situated behind a hill and completely protected from the rush of water. We have increased the width of No. 4 dam. The embankment is now 40 feet wide at the top, and we have constructed terraces to decrease and strengthen the slopes.

1572. Have you observed any stream forming below the dam and percolating through the sand? Yes; there is a little percolation but it is nothing to what it was. We sodded it and put a terrace at the base of

- F. Bell, Esq. of it and sloped and sodded it, and then put another terrace at the base of that, and sloped that again and covered it with sods so as to stop the percolation as much as possible.
- 2) July, 1875. 1573. You are quite sure that in all these cases the first thing which happened was the weir giving way? Yes; if you can prevent the water from over-topping the embankment there is no fear; it cannot possibly do that now.
1574. *Mr. Moriarty.*] I should like to ask you, Mr. Bell, whether you do not anticipate a considerable leakage through these sand dams, if there is no clay core or anything of that kind in the centre of the embankment to prevent it? There is some leakage from it, but not so much as when we first constructed it, and it is getting less every day.
1575. I think one of your proposals for supplying Sydney with water was to pump it up out of the sand or well? Yes.
1576. And you anticipated a large supply from the water which would percolate through the sand? Yes.
1577. Is there any reason why the water should not percolate through the banks of the dam as freely as through the sand outside the cylinders or wells which you proposed to sink? These dams are differently circumstanced altogether; they are sodded, and have terraces as well, which prevents percolation to a great extent.
1578. But would not the water be much more likely to percolate through an artificially constructed dam, than through sand which had been *in situ* for possibly millions of years? If the well were deep the pressure of the water would be greater, and you would have the water completely round it, whereas in a dam the water could only be on one side, and then the sods prevent a great deal of the percolation.
1579. Yes, on the upper side they may? On the upper and lower sides.
1580. Do you think these sods would have any effect if the water got through to the back of the embankment? Yes, we have proved it; there is always a little percolation, but it is trifling to what it was in the first instance.
1581. I think I understood you to say that these weirs were in the centre of the embankments constructed by the late Mr. Bell? They were in the very deepest part of the embankment; I know that the weir in No. 4 dam was in the deepest part. I have surveys of them all.
1582. No. 4 dam is below No. 5? Yes.
1583. So that when No. 4 gave way its only effect was to release the water from the lower side of No. 5, and thus No. 5 had a pressure on its upper side and no corresponding pressure on its lower side, and then it went too? Yes, but it showed symptoms of weakness before that round about the weir; they were always patching it up.
1584. Was that rainfall of 7 inches the heaviest ever known in Sydney in a given time? I cannot say; I don't think it was.
1585. Then about No. 6 dam;—how was that injured? The apron in the lower portion of the weir was swept away; it was gradually going, and we let the water off as fast as we could;—in fact the sluices were wide open.
1586. Is there anything above No. 6 dam? No, except the Randwick Road dam.
1587. Was that injured in any way? No, the water was flowing 6 inches over the weir.
1588. Then it was about 2 feet 6 inches below the top of the embankment? About 18 inches.
1589. There is a great deal more water in all the reservoirs now than there was before? Oh yes, much more.
1590. Then if they were all filled and a heavy rainfall took place, would not the water rush down much more freely, and if one of them went would not the danger be greatly increased? No, not with the increased width of the by-wash or escape weir. No. 4 is 100 feet wide and 4 feet 6 inches deep below the top of the embankment.
1591. With what depth? The water at No. 4 embankment is about 20 feet deep.
1592. And No. 6? No. 6 is not so deep; it has about 15 feet of water.
1593. Have you estimated the rapidity with which the water would run off the watershed if a heavy rainfall were to occur—have you estimated the time it would take to run down? It is so very difficult to say. At first when the rain falls you do not see any water running at all; the sand hills seem to absorb it all. The water does not come down at once, but it gradually increases, and begins to run only when the hills become charged with water, and after the rain has ceased for some time it continues to run.
1594. Do you think the whole of it would discharge in twenty-four hours? No; it may be some weeks before it diminishes at all. The flow of water now is very nearly as much as it was after the last heavy rain, and is discharging about five million gallons into the sea every day from the engine-pond dam.
1595. Are there iron pipes still through the centre of the dams? Yes.
1596. Is there any puddling, or anything of the kind, to prevent the water from passing along the side of the pipe? Yes, we first drive in two rows of piles with crossheads for the pipes to rest upon, and they are puddled for 3 feet round them.
1597. But there is no puddling in the dam itself? No.
1598. *Mr. Bennett.*] When No. 4 dam went and No. 5 dam burst, Mr. Bell, what was the difference of level between the waters—what head was on No. 5 dam? No. 5 dam water was about 2 ft. 6 in. higher than No. 4.
1599. How much did the water lower by the bursting of No. 4? I should say about 6 feet on the low side of embankment.
1600. Then there was about 8 ft. pressure on the embankment of No. 5 when it burst? About 7 ft. 6 in.
1601. 7 ft. 6 in. difference between the levels when No. 5 burst? Yes.
1602. You told us just now that there is 20 feet of water in No. 4 dam at present? Yes.
1603. Now what reason can you assign, except the thickness of the embankment, why No. 4 dam should not go, with so much greater head of water than No. 5 had when it went? It was a totally different construction. No. 5 was the original construction; it was very narrow and the slopes were very steep—about one to one.
1604. How do you account for the stability of No. 4 now with 20 ft. of water in it, when No. 5 went with 7 ft. 6 in.? No. 4 has been so much strengthened; it has been widened, and the slopes flattened. The top of the embankment is so much higher from the surface of the water than it was before—4 ft. 6 in. instead of 2 ft., and no weir in embankment as formerly, so that it is impossible for the flood waters to overtop it.

1605. Am I to understand that there is 20 feet difference of level at No. 4, between the water in the dam and the water below; in fact, that the effective head is 20 feet? Yes. F. Bell, Esq.
29 July, 1875.
1606. You say that provided these dams can be made so that the water does not go over them, they are perfectly safe. At what height, for of course there must be some limit to the height you can make these dams —? If they are higher and deeper they must be proportionally larger.
1607. Do you think you have arrived at a safe limit? Yes, I think so.
1608. Would you think a dam of this sort, 30 feet high, safe? Yes, if it were wide in proportion.
1609. Have you ever stood at the base of one of those dams when it was tolerably full of water — at the exterior base? Yes, I have.
1610. Have you ever felt the ground shake under you as if it were floating? Yes.
1611. Now when the pressure becomes sufficient to lift the peat at the bottom, don't you think the sand would be in a semi-liquid state? No. We removed the peat when we were making the embankment in No. 2, and in No. 4 there was no peat at all; it was all pure sand.
1612. Don't you find the sand become quick very soon? Yes, the lower portion of it is very soft indeed.
1613. And the upper part goes down quickly from its own weight? Yes.
1614. Don't you think that if the percolation decreases with a decreased head of water it may increase with such increased head to a rather dangerous extent? I may say that the percolation is decreasing below.
1615. With a decreasing head of water? No, with an increased head. I attribute that to the interstices being filled up with finer matter or peaty substances.
1616. When the head in a dam increases considerably is not the percolation likely to increase to a dangerous extent? No. If the dams are properly constructed, both as to height and width, there would be proportionally no more percolation through them than in smaller dams.
1617. Yes, but that would add increased force to this percolation, and quietly undermine the dam? I am speaking from my own observation. I find that when the dam is full the percolation is steadily decreasing.
1618. Did not the Randwick dam burst on one occasion? It did at one time, but the water went over the top of it; as it was not completed there was a gap in it. Alderman Green and I were on it at the time, and we were very nearly washed away.
1619. That was the time it carried away the approach to the bridge on the Bunnerong Road? Yes, it was not nearly completed; there was a gap in it and the water got through the gap.
1620. As you were on the spot, was it not possible to fill that gap up temporarily to prevent it from bursting? No, we did all we could, but it was just like working in silt or sand; the water rose so rapidly, about 6 inches an hour, and the embankment was not to its full width nor nearly its full height.
1621. *Mr. Moriarty.*] Perhaps you can tell me what is the fall at the waste weir of No. 4 dam—the one that is 100 feet wide by 4 feet 6 inches? As far as I can recollect there are two grades in it; one is level for about 200 feet, and then there is an inclination of 1 in 152.
1622. And what is the difference of level between the water above and the water below? I should say it was about 12 feet.
1623. And it flows gently down an incline in the waste weir of about 1 in 200? About that. I will ascertain the exact incline. 1 in 152.
1624. Have you computed the capabilities of the waste weir—how many cubic feet it discharges? No.
1625. What is the smallest waste weir in any of the dams? In No. 1 it is 40 feet wide.
1626. By? By 3 feet 6 inches deep.
1627. And what is the fall? It is constructed of brick, and the fall is the same as the slope of the embankment. I think it is 3 to 1, the same as in the waste weir at Randwick. The one at No. 4, which gave way, was only 18 feet wide by 2 feet deep, and the water never went over the embankment; it worked round the piles.
1628. These waste weirs are bedded in the sand I suppose? The brick ones?
1629. The whole of them, the whole thing is sand? Yes; those that are bricked have 3 feet of clay under them, with piles driven in.
1630. *Hon. J. B. Wilson to Mr. Bell.*] Have you not some of these waste weirs going over clay soil? No.
1631. *Chairman to Mr. Moriarty.*] What is your impression from what you have heard. Do you think there is any question as to whether these dams are perfectly safe? Well, I have some apprehension about them. I think if we had some of these unusual rainfalls some of them would go, and if one went the others would follow; and I think the danger is increased by the increased quantity of water stored.
1632. *Hon. J. B. Wilson to Mr. Moriarty.*] Do you think it is possible for any quantity of rain which could fall to fill one of these weirs 100 feet wide and 3½ feet deep? I do not know that it would—the mere rainfall; but I think that if one of the dams were to go the increased discharge brought upon them, added to the stream, would be likely to do so.
1633. Do you think water will percolate through dry sand with the same facility as through sand saturated with water? I think, of course, that it will not, until the sand becomes saturated; but if a dam is impounding water it is always in a state of saturation.
1634. It makes no matter what the width of the dam is? Oh yes, of course the greater the width of the sand the longer the time it will take to percolate through it.
1635. Do you think the bed of these dams would be saturated the same as the Lachlan Swamp? I think it is quite as much saturated now.
1636. Do you think if you were to dig down below one of these embankments you would find the sand saturated? Yes, and I don't think if the width of it were double or treble what it is with such material as sand it would greatly affect the percolation. I have never heard that water would not run through sand. I believe it will run freely through it.
1637. Suppose the sand is backed up with turf and faced with turf, would the water go through it in the same way? I do not consider turf on the lower side of the slightest use, except to prevent the ordinary rainfall from injuring the surface. Any water that goes through the sand will go through the turf also. I can understand turf placed on the upper side of an embankment preventing the water from getting through.
1638. But would not the turf placed on the lower side prevent the sand from being gradually washed away? I don't think it would have any such effect; a very little stream of water passing through would displace

F. Bell, Esq. displace it. Sand is a material I should never trust. I can easily understand that a sand backing to a dam which gives weight to it is effective, if you have a clay core; but if there is nothing but sand in an embankment it is only a question of time for the water to go through.

29 July, 1875.

1639. Do you not think that the coarse grass and reeds growing on the bank have a tendency to bind it together and make it more effectual? I do not think so. I think it is only a question of time. Besides, we know that turf will float, and every one who has been in Ireland has seen it; it will float in its own depth of water. I should doubt very much the effect of grass growing on the top of sand, for as soon as the water got under it it would carry it away bodily.

1640. *Chairman to Mr. Moriarty.*] Supposing the embankment were covered with turf on the lower side, would not that have the effect of turning the water downwards, more out of sight? I should doubt whether it would have that effect. I think the water would take the most direct course to the surface. The turf may have its good effect in retarding percolation if on the upper side of the embankment, but I don't think if placed on the lower side it would prevent the sand from passing out with the water.

1641. *Chairman to Mr. Bennett.*] Do you concur in the opinions expressed by Mr. Moriarty? Yes, and I speak from experience I have had in dams of this character; I have repeatedly seen them. Of course I am not prepared to say they were exactly like Mr. Francis Bell's dams as I have not seen them.

1642. There is not sufficient difference you think between Mr. Bell's dams and those you have seen to prevent them from giving way in the same manner? No.

1643. *Hon. J. B. Wilson to Mr. Bennett.*] Do you think no dam of similar construction, of whatever size or width, would be safe? Yes; that is to say, within any reasonable limit.

1644. Suppose it to be a mile wide? Even if it were a mile wide and composed of sand only I should not be at all surprised to see the water coming through it.

1645. And if it were noticed it might be prevented by proper attention? Yes.

1646. *Mr. Bell to Mr. Moriarty.*] I think you stated that you had seen the water in this embankment percolating through. Why does it not go through the top of the embankment as well as at the base? Because there is less pressure near the top, and of course the sand exercises some little effect, and the smaller the pressure to force the water back the slower the process will be.

1647. As a matter of fact, the water does not go through the top, but only at the base? Well, I have not seen these embankments for years, when the late Mr. Edward Bell was engineer, and I saw a strong stream passing through them. When Mr. Bell was asked by the Water Commission if he expected these sand dams would hold water, he said no—he never thought they would; his object had been merely to retard the flow of water to the Botany stream, and to saturate the sand. I have never seen them since, and I can only speak from what I saw of them years ago.

1648. If the water passed so freely through the embankment would it not be likely to carry the sand with it? Well, it was doing so, because the back portions of the dams had caved in in several places—not materially, but to some extent.

1649. If the water passed through it would it not naturally carry sand with it; and that would be easily observed at the base of the embankment, would it not? Yes, and I did observe that very circumstance, that the lower side of the dam had caved and dropped down in places. There was a little subsidence in the turfing on the lower side.

1650. Have you any idea what the embankments were constructed with—I mean the old embankments? Of sand and peat, I believe. I saw them once or twice only, and I remember asking Mr. Edward Bell the question: "Are you not afraid of your peat floating?" and he said, "No; it has been well rammed."

1651. As a matter of fact, we find that the dams constructed of sand are much better than those that have any peat in them; the weight of the sand is sufficient to sustain the embankment in its position.

1652. *Chairman to Mr. Bennett.*] The dams that you have seen burst;—were they made of sand, or was there a great deal of peat with them? Many of them were made of sand—sometimes with a good deal of peat in them and some clay.

1653. Have you seen one made entirely of sand burst? No, because we never tried it.

1654. *Hon. J. B. Wilson to Mr. Bell.*] How long have these dams been constructed? They have been about a year in existence. The Randwick dam has been constructed about two years.

1655. *Chairman to Mr. Bell.*] How long has this No. 4 dam been completed? I should say about a year.

1656. *Hon. J. B. Wilson to Mr. Bell.*] Have you been obliged to repair it on account of the sand being washed away from the under side? No.

1657. There has been no subsidence of the dam—it has not sunk at all during that time? Not at all.

1658. *Mr. Moriarty to Mr. Bell.*] There is a good head of water on the lower side of No. 4, is there not? There is no water there at all. If No. 3 dam had been in existence there would have been, but No. 3 was never repaired.

1659. And there are 20 feet above it? Yes. I may say that I am perfectly surprised at the stability of these embankments. I was prejudiced against them at first, but I must say I have entirely altered my mind about them. They are very easily strengthened at any time by putting on another layer.

1660. *Chairman to Mr. Bell.*] After hearing the opinions which have been given by the other engineer-members of the Board are you still satisfied of the security of these dams? I am perfectly satisfied.

TUESDAY, 3 AUGUST, 1875.

Present:—

HON. J. B. WILSON,
F. BELL, Esq.,

E. O. MORIARTY, Esq.,
W. C. BENNETT, Esq.,

DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

The Hon. J. B. Wilson examined in his place:—

The Hon. J. B. Wilson. 1661. *Chairman.*] Will you be good enough to state, for the information of the Board, the result of your inspection of the Crown-street Reservoir? On Thursday last, the 29th July, I was instructed by the Board to visit the Crown-street Reservoir, which I did on the following day. At the time of my visit they had just commenced to let the water run off at the northern division. I remained there till the place was dry, and till it was thoroughly clean; but before the cleaning operation commenced, I found there was about

3 Aug., 1875.

about 1 foot of sediment at the bottom of the reservoir. This sediment was composed apparently of two different and distinct substances, the one and of course the smallest portion being a very fine peaty deposit, easily diffused through the water, and causing a considerable discoloration, so much so, that when the men who were working at the reservoir stirred it up, the water became nearly as black as ink. The remaining and the largest portion was composed of very coarse sand, evidently showing that a larger quantity of sand had been originally received into the reservoir, the finer particles of which had been carried away with the water. In the reservoir there was found a large dead eel in a very putrid state, and exceedingly offensive. I examined the reservoir when it was emptied very carefully, with the view of discovering whether there was any possibility of sewage matter entering into it; but I made up my mind—as far as my opinion is worth—that it was absolutely impossible for any sewage matter to enter into that reservoir. One reason which operated largely upon my mind in coming to that conclusion, was this: that when the northern compartment was emptied, the water was standing in the southern compartment up to about 15 inches of the top, and there was not a single particle of exudation from the walls; the walls very soon—in much shorter time than I could have imagined—became apparently dry, and the roof of the reservoir, which is covered with earth, was absolutely dry. When there, of course I was thinking a great deal with regard to the analyses taken by Professor Liversidge, to see if I could devise any reason why the water in this reservoir should be more polluted than the water in the Botany Swamp; and I have come to the conclusion that this pollution has arisen in a great measure from the large quantity of peaty deposit in the reservoir, and not from sewage contaminations. My attention was drawn to it the more forcibly by the perusal of an article which appears in the "*Chemical News*" of the 28th May, 1875. In reporting the proceedings of the Chemical Society, that paper states, that at a meeting recently held, the well known Dr. Able being in the chair, a gentleman present—a Mr. W. H. Deering—read a paper "on some points in the examination of waters by the ammonia method," from which, with the permission of the Board, I will quote a few extracts:—

"An important fact also is that peaty waters give much ammonia by distillation with sodium carbonate, and much also on a subsequent distillation with permanganate solution, which, unless caution be used, might be regarded as evidence of sewage contamination.

"*The President* drew especial attention to the fact that peaty matters existing in potable matters interfere considerably with the indications given by this test; this was a point of very great importance.

"*Mr. W. Thorp* also stated that if the nitrogen in peat waters were estimated by the combustion process, it would be found that the carbon was large in proportion to the nitrogen as compared with sewage contamination.

"*Dr. Russell* could confirm *Mr. Deering's* observations on peaty water, for he had collected some at Dartmoor, which contained some ammonia as salts, and a considerable amount of albumenoid ammonia."

Seeing the large quantity of peaty matter that was in such a diffusible condition in this reservoir I thought this article would be of very great importance, as throwing a light upon the quantity of albumenoid ammonia obtained in these analyses, and I therefore thought it my duty to bring the matter under your observation. It throws a good deal of light upon Professor Liversidge's operations. As I think I previously stated, the men who were employed made the reservoir perfectly clean—particularly clean, when they had done with it. This division I may state had not been cleaned out for eighteen months previously. I was informed by the parties who were at work that the reason why such a length of time had been suffered to elapse since it was cleaned out before was, because there had been an interruption to the outlet of the reservoir into the sewer; in fact it was blocked up, and the water could not be run off. On Monday, 2nd August, I visited the southern division while it was being cleaned out, and found matters very much the same there as I found them in the northern division, with this exception: that there was not nearly the same amount of deposit—only about 5 inches; but the sediment appeared to be of the same character as that in the northern division—first the diffusible peaty sediment, and then the coarse sand; the two together making a deposit to the depth of about 5 inches. I may mention that the reservoir appeared to me to be very well constructed for keeping it clean, provided proper attention is paid to it. The floors are not level, but they slope into the centre of each compartment, where there is a large gutter which communicates with the sewer by a lock, so that the water can be run off; and the orifice where the service pipe comes through is on the higher portion of the floor, consequently a great quantity of sediment might be deposited in the bottom of the reservoir without affecting the supply of water to the city. The service pipe coming into the reservoir in both divisions empties itself within about 6 inches of the floor of the reservoir; consequently, when a rush of water came in the effect was to stir up this peaty deposit considerably, which would not have taken place if the reservoir had been perfectly clean. In my opinion this reservoir should be cleaned out as effectively as it was cleaned out on Friday and Monday mornings, regularly every three months. The facilities for cleaning it out are great and the expense small—it need not under any circumstances exceed £4 or £5. I have taken a little interest since in the examination of water supplied from this reservoir to different portions of the city; and I have been very much struck with the apparent purity of the water compared with what it was before.

1662. That is, since it was cleaned out? Yes.

1663. *Chairman to Mr. Bell.*] Do you concur in the report which the Hon. J. B. Wilson has brought up on this subject? I do—quite; I visited the reservoir with Dr. Wilson.

1664. Did you observe any fish there besides the eel which Dr. Wilson has mentioned? *Hon. J. B. Wilson:* There were a few fish, but the water became so black when it was stirred up that it was very difficult to see them.

1665. Professor Liversidge said there were a great many? *Mr. Bell:* They were some gold and silver carp which were put into the reservoir.

1666. Can you inform the Board when the reservoirs were last cleaned out? The south compartment of the Crown-street reservoir was cleaned out on the 13th January, 1874, and it was cleaned out again on the 7th July, 1874. On the 31st October we attempted to clean out the northern compartment, but were unable to do it. The last record I have of the northern compartment being cleaned out was on the 19th April, 1873.

1667. *Chairman to Mr. Moriarty.*] We will now proceed to the question of the sewers. Is there not, Mr. Moriarty, a continual silting up of the harbour by very fine matter, which is carried out in a diffused state, and deposits a sediment which cannot be arrested by any ordinary means? Yes, I do not see how it is possible to prevent it.

1668.

The Hon.
J. B. Wilson,
3 Aug., 1875.

E. O.
Moriarty,
Esq.
3 Aug., 1875.

1668. There is a great deal of that fine matter which goes into the harbour, not only through the sewers but from the natural streams which flow into the harbour? Yes, wherever the ground is disturbed.

1669. You think there is no artificial means of preventing this deposit? No, except by some elaborate means which could not be adopted immediately.

1670. What is the greatest depth at which you can practically dredge with any effect? Our Sydney dredge enables us to go to 30 feet; the other only goes to 23 feet.

1671. Does the greater depth of water greatly increase the cost of dredging? It increases the cost of constructing the dredge, but does not much increase the cost of dredging.

1672. But you think you can dredge to a depth of 30 feet easily for all practical purposes? Oh, quite.

1673. Then you can keep the harbour clean by dredging to that depth? Yes.

1674. Now if any matter from the mouth of a sewer is deposited in a shallow place—too shallow for shipping—so far it does no harm? It extends under the jetties and forms banks of silt and stuff which gradually rise to the surface, and at low water become offensive mud banks. That is particularly the case in Darling Harbour, where there are a number of timber jetties, which you cannot get under to dredge, and the spaces between them are so narrow that you cannot get the dredge in.

1675. Is there no contrivance by which you could dredge all these places? I think some plan might be devised, but I have never thought of taking the dredge under these timber jetties.

1676. But if you could dredge between these jetties the matter under them would not signify—in fact the dredge would get the most of it? Well, I think it is important that we should not have a deposit of this solid matter under a jetty, because when the water leaves it and it becomes exposed to the action of the sun, gases are given off from it which are very offensive and injurious to the public health.

1677. I am speaking more with regard to the silting-up than to the health of the inhabitants. If you could dredge between the jetties, any evil, as far as the silting-up is concerned, would be avoided? Yes, as far as navigation is concerned; but it is not possible to get the dredge between them; they are too close together.

1678. Do you think—I am repeating a question. I think, but you have had more time to consider it—that these silt-pits, which it is acknowledged do not produce any purifying effect on the waters of the harbour, would be practically beneficial in preventing the silting-up;—would not the matter caught in these silt-pits be just as largely caught in the harbour, and dredged out wherever it impeded navigation? Well, I should not like to give any evidence which would have the effect of inviting the discharge of that stuff into the harbour. I think the Corporation should be compelled to keep it out of the harbour; there are various ways of doing it. In the first place, if the streets are properly protected, and constructed of some material which will not disintegrate as rapidly as broken stone, a good deal of the mischief would be prevented, and a good deal of the stuff might be intercepted in the gully-shafts and silt-pits. I think it is the duty of the Corporation to prevent it from going into the harbour, and therefore, although it might be cheaper to dredge it up, I should be slow to recommend its going into the harbour.

1679. Should you be inclined to recommend the Government to incur any expenses in forming these silt-pits? No, I would not recommend the Government to do so.

1680. You would not interfere with the Corporation or dissuade them if they attempted to do it? No, I think it is their duty to prevent the stuff from going into the harbour.

1681. Supposing all these matters were in the hands of the Government instead of the Corporation, would you recommend the Government to construct these silt-pits? I do not know that I should, except in those parts of the harbour where a dredge cannot get at them; that is the case all along the eastern side of Darling Harbour.

1682. In case of the Fort Macquarie, for instance, or the Hay-street sewer, you would not recommend them under such circumstances? No, I don't think I should.

1683. *Dr. Alleyne.*] What do you think causes the sewage that comes down to sink? I suppose it is the silt which is mixed with it.

1684. Don't you think that if all the sewage matter were carried into the water without being mixed with the silt it would float about the harbour, and either be eaten by fishes or become decomposed? Well, as a matter of fact, we know that it does not, because the outlets of these sewers are invariably offensive.

1685. I mean that the reason why the harbours and rivers become polluted with animal and organic matter is that this matter is discharged along with a lot of sand and mineral matter, which entangles it and causes it to sink to the bottom and putrify. You can see that this is the case by the bubbles which are continually coming up. There is no sewage matter which of itself will not float, and these matters would not sink and form a deposit if they were not entangled and kept down by some heavier substance; they would either go out of the harbour or else be eaten up by fishes, and they would not create a nuisance. The main sewers catch both the contents of the water-closets and also the street washings, and they are mixed together, and the sewage matter, which would otherwise come up at once, remains at the bottom? At the bottom, near the outlet of these sewers, we find a great deal of putrid mud, which is very offensive.

1686. *Chairman to Mr. Moriarty.*] Do you think the dredging power at your disposal is sufficient? It is not sufficient to prevent the shoaling that is taking place at the heads of all the bays, and to pick up all the silt which is shot into the harbour from the sewers.

1687. It is not sufficient to take up all the coarse silt? No.

1688. You would require more power? Yes. It does not take up this fine stuff which goes all over the harbour.

1689. But that is an operation of nature which cannot be prevented in any way. If this stuff were to accumulate so as to be inconvenient for navigation there would be no difficulty in removing it by dredging? No.

1690. And that would be the cheapest way? Yes, I think the Corporation should be made to pave all the streets leading down to the water so as to prevent the silt being formed at all, and I think too that there are many places where silt-pits would be very useful. All along the eastern shore of Darling Harbour we cannot get the dredges in to work, and the result is a gradual shoaling up. Therefore I think if the silt which is causing that shoaling up could be intercepted before it gets to the harbour it would be better, although it would cost more. As you cannot get at the silt with the dredge the next best thing is to construct these pits.

1691. *Chairman to Mr. Bennett.*] Would you recommend the Government to encourage in any way the formation of silt-pits at the mouths of the sewers? I would at special places where they would be of service.

1693. At such places as Mr. Moriarty has recommended? Yes.
1694. Do you concur generally in the opinions he has expressed? Generally, there are some points of difference. W. C. Bennett, Esq.
3 Aug., 1875.
1695. Would you recommend the Government to encourage in any way the formation of a silt-pit at the mouth of the Fort Macquarie sewer? No. I think the stuff can be got out there so easily that a silt-pit is hardly necessary, and the silt-pits do not affect the contamination of the harbour, or very slightly.
1696. You heard what Mr. Moriarty stated on a former occasion relating to his plan for carrying the ordinary daily sewage matter flowing from the Macquarie-street sewer into deeper water? Yes.
1697. Do you think that plan is a good one so far as the mechanical arrangements are concerned? Yes; I had some little doubt about this little wooden pin for keeping back the flap; but after a conversation with Mr. Moriarty I think it is the safest and simplest thing that could be devised.
1698. You think it would work well? Yes; it would certainly not cause an accident or burst the sewer.
1699. That is to say, if the pin gave way there could be no accident, except of a very trifling character? No.
1700. And there is no possibility of the pin being strong enough to hold back the flap so long as to cause a serious accident, such as the bursting of the sewer? No.
1701. Do you think a similar plan would be applicable at the mouth of the Hay-street sewer? It would be applicable, but not attended with the same advantages, because there is no current at the Hay-street sewer, and the sewage would have to be let off in dead water at the head of the harbour.
1702. Still it would be applicable as far as these flaps are concerned? Yes, but the present arrangements at Hay-street do not necessitate anything of the sort.
1703. You think the silt-pit constructed there is all that is necessary? For the present I think so.
1704. What I want to ascertain is, whether you think that a similar system, modified according to circumstances, could be carried out at most of the sewers which have been creating such offence? Wherever there is a salient point with a good current, I think this system would be desirable; it diffuses the faecal matter through a greater body of water.
1705. Would this system be applicable to the smaller sewers, such as the Market-street sewer, and others like it? Yes, with some advantage, but not so much. The great advantage in Darling Harbour would be to prevent this offensive matter from being exposed to the sun on the banks at low-water, and becoming offensive.
1706. Do you think it would be worth while to carry out some such scheme, as a temporary expedient? Well, the cost of it would not be serious; it would depend upon the remoteness of any general scheme; if any general scheme were to be adopted, I should hardly recommend this.
1707. Not to provide against the offences created by these sewers for the next two or three summers? No.
1708. You do not expect that any organized system could possibly be carried out in less than three years? No, I do not think it could be done in that time.
1709. It would take about five years? Five years would be about the time.
1710. Well, don't you think it would be worth while to make some temporary arrangement of this kind, considering the great outcry there is about these sewers, and that the evil is getting worse every year? Well—yes; a part of the arrangement would be applicable to other purposes.
1711. *Chairman to Mr. Bell.*] Do you approve of this plan generally, as a plan for mitigating the nuisance at the mouths of the sewers, by carrying the offensive matter into deep water? I think it would answer very well at Fort Macquarie where there is a current to carry the sewage down; but I am afraid that at the heads of the different bays, where the water is perfectly still, it would involve a great deal of trouble in removing the stuff. F. Bell, Esq.
3 Aug., 1875.
1712. I am not speaking of the silting-up, but of this scheme as a means of preventing a nuisance? I think it would be very advisable.
1713. Have you studied at all carefully the mechanical arrangements suggested by Mr. Moriarty? No, I have not.
1714. Perhaps you will be kind enough to do so? Yes.

FRIDAY, 6 AUGUST, 1875.

Present:—

F. BELL, Esq.,	HON. J. B. WILSON,
M. CHAPMAN, Esq.,	E. O. MORIARTY, Esq.,
W. C. BENNETT, Esq.,	DR. ALLEYNE.

M. B. PELL, ESQ., B.A., IN THE CHAIR.

Francis Bell, Esq., City Engineer, further examined in his place:—

1715. *Chairman.*] There is only one ventilating shaft I believe? Only one.
1716. What sewers is that connected with? The principal one is the Pitt-street sewer, from Bridge-street up to Bathurst-street, and the Castlereagh-street sewer. F. Bell, Esq.
6 Aug., 1875.
1717. Is it the system of sewers that discharges at Fort Macquarie only? Yes.
1718. That one area only? Yes.
1719. Are there any other means of ventilation beyond that one shaft? None.
1720. Do you use charcoal to filter the gases at that shaft? We do.
1721. Complaints were made that the shaft had become choked by the charcoal being put into it in too fine a state? I never heard of those complaints; my attention was never drawn to them.
1722. You have made no inquiries about it since? No.
1723. I think you observed in your evidence that the charcoal put in was too large if anything? Yes, it was put in formerly in very large lumps, as large as 3 or 4 inches cube; but they have since been put in smaller.
1724. Are complaints often made in the neighbourhood of the escape of these gases? No, I think not.
1725. Not generally? Not generally.

- F. Bell, Esq. 1726. Do you think the existence of this shaft has had any effect in keeping the air within this system of sewers any purer? I do.
- 6 Aug., 1875. 1727. It is the highest point in that drainage area? Yes, all the sewers lead to it; it is the very highest point.
1728. Is there any other mode of ventilation in any of the other sewerage areas? No, none whatever.
1729. Do you think it desirable that the ventilation of the Fort Macquarie system of sewers should be improved? No, I think it is quite sufficient for it—this one ventilating shaft.
1730. Do you think it would be safe for a man under ordinary circumstances to go into that sewer? At the present time, when any repairs have to be made and it is necessary to go down into the sewers, the man-hole door is taken off to allow the foul air to escape before the man goes down.
1731. There is a dangerous amount of foul air always in these sewers, is there not? Yes.
1732. And that, under certain circumstances, is liable to get into the yards of the houses in the neighbourhood, and even into the houses? Yes.
1733. Then don't you think something should be done to get that system of sewers better ventilated? I have not had sufficient experience on the subject to be able to say. I think the men can go into these sewers, but I think they require to have a second man-hole opened to cause a current of air; there is no current of air in this system of sewers, on account of the self-acting gate at the mouth of the sewer, and the shaft at the other end.
1734. I believe that in a great many if not in the majority of cases the ordinary connections with the sewers from yards was an iron trap? Yes. Since I came into office, about four years ago, I have never signed any house connections without insisting upon the flap-trap being used.
1735. But you have not been instructed to interfere with previous arrangements? Well, that was the system before; but under the old system the trap opened into the sewer itself, and many of the flaps have been swept away.
1736. So that this foul gas is liable to escape, and to get into the yards and also into the buildings? Yes.
1737. Under what circumstances generally does this pressure within the sewers cause the gas to escape into the yards and houses? The foul gas escapes always where there are no flap-traps.
1738. You have not had time to consider this question fully, have you, or to make any proposal for ventilation? Well, I should like to see a ventilating shaft for each drainage area at the highest point, as the gases always ascend; and I am not altogether certain as to the advisability of closing the mouths of the sewers, which prevents the wind getting in and causing a draught of air up to this ventilating shaft.
1739. Don't you think that the existence of these doors, which prevent the influx of air into the mouths of the sewers, tends to diminish the escape of gases into the houses? I am not quite certain about it, and I should like to make some experiments before giving an opinion on the subject.
1740. *Hon. J. B. Wilson.*] In erecting that ventilating shaft was it ever intended that fire should be used in it? No, not at all.
1741. Would it not be an advantage to have in such a shaft a coke fire constantly burning;—would it not have the effect of consuming these noxious gases? I think so; I think it would answer very well.
1742. It would not only keep up a draught in the sewer, but would tend to the consumption of the noxious gases? I don't think there ever was a fire there.
1743. I believe it has been stated before the Board that there is another opening in the sewer, which disembogues at Fort Macquarie? I saw a hole at Fort Macquarie, about 120 to 130 feet from the mouth of the sewer, but I never understood what it was intended for.
1744. Is that hermetically sealed now do you know? I am not aware; the Inspector of Sewers will be able to tell you.
1745. *Mr. Bennett.*] Are you aware whether there are any private ventilating arrangements—any down-pipes—connected with the private sewers? There were some down pipes, but I think they have all been disconnected since.
1746. You have abolished them all? As far as we know I think we have.
1747. Did you ever notice when the man-holes were open whether the current from the man-hole went into the sewer or out of it? It was out of the sewer. If you stand over the sewer it would blow into your face; there is a strong current coming out of the sewer.
1748. Even in the highest portions of the city? Yes. I recollect in Cumberland-street once, when we were repairing the sewer and the men were down below, and we were standing overhead, the stench which came up was intolerable.
1749. What was the direction of the wind at the time;—do you recollect? It was fine beautiful weather at the time, and I think there was a north-east wind blowing, which would, of course, blow right up the sewer.
1750. *Mr. Chapman.*] Have you not at present gully-shafts in the city, which in dry weather you have to fill up with water, which you have to send round in a cart? Yes, I understand so.
1751. Then in dry weather the trap is of no use at all unless it is filled up by artificial means? No.
1752. Are not many of the houses in the city connected with the sewer by means of these traps? Yes, but then there are flap traps in addition.
1753. In flood times you have already stated that these flaps are washed away? Some of the old ones are and a good many of them have no flaps at all.
1754. *Chairman.*] Has it ever come under your notice, or have you ever heard of these water traps being forced by the pressure of gas within the sewer;—it has occurred elsewhere—that the water has been expelled by the pressure of the gas? There are too many outlets for the gas in this case.
1755. That would only occur where there is a very careful system of trapping? Yes.
1756. Have you heard frequent complaints of foul gases getting into the houses and annoying the inhabitants? Not lately. Whenever we have heard complaints we have recommended flap-traps to be put in, and the evil has been remedied, and we have heard no complaints afterwards.
1757. Still there is no doubt that there is all this large quantity of gas in Sydney confined in the sewers? Oh, there is no doubt about it.
1758. And that is liable, if any accident should occur, to escape somewhere? Yes.
1759. And the remedy you would recommend for this state of things is the erection of ventilating shafts, and trapping all connections? Yes.
1760. *Mr. Bennett.*] Do these escapes of gas, which you say you remedy by recommending flap-traps to be put in, occur more frequently in the higher or lower parts of the city? They have occurred more frequently

quently in the low parts of the city, where the sewers are very flat, and where they have a good fall the gas gets away much quicker than it does in the low places. We had more complaints about the lower part of Pitt-street, near the Exchange, than any other part of the city.

F. Bell, Esq.
6 Aug., 1875.

1761. Do you think these complaints might have been attributed to the flaps having been struck off by the violence of the current? That was the case in several instances.

1762. You think that might have been the cause of the complaints in the lower places as well as in the higher? Yes; still I think there is more gas generated there than higher up; the sewers are larger and deeper, and contain so much more sewage matter for the generation of the gases.

1763. *Mr. Moriarty.*] Is it possible to ascertain the parts of the sewers where there are flap-traps, in order to renew them in case of their being injured? That can easily be done in the main sewers.

1764. I am speaking of the whole of the city? It would be difficult to find them out in the branch sewers; the ground would have to be opened and the pipes examined; you could not very well get at them.

1765. Then I suppose it is a mere question of time—how long they will last—is any provision made for renewing them? They are at present of cast-iron and galvanized.

1766. And hung on wire hinges? Yes.

1767. Would there be any means of repairing these hinges on which the flaps are hung, in case of their being injured? I am afraid not; I am afraid the flap would have to be taken out and a new one put in.

1768. Would it not be judicious to make these hinges much stronger and heavier, seeing the great difficulty there would be in repairing them? Well, it might.

1769. These light iron wires are, of course, in a most unfavourable position for lasting? Being galvanized they will last a long time.

1770. I think the galvanized process is not estimated to last longer than three years;—did you estimate that they would last longer? I estimated them to last about twelve years. I know that some of them which were put in four or five years ago are quite perfect yet, but O'Doherty will be able to give you better evidence on that subject than I can.

Mr. John O'Doherty, Inspector of Sewers, called in and further examined:—

1771. *Chairman.*] We want to learn if you can give us any information respecting the means adopted for ventilating sewers and letting the foul gases escape. Is there within your knowledge anything more than the one ventilating shaft? No; I am not aware of anything.

Mr. J.
O'Doherty.
6 Aug., 1875.

1772. That is the only exit for the ordinary connections? Yes.

1773. Is the atmosphere in these sewers very foul? Well I find when I first open the man-hole a great gust of air comes out; but before going down into the sewer I always stop for half an hour, and when I get into it I don't find so much stench as I found on the top before I went down.

1774. Can you go any distance in the sewer? Yes, I have travelled from the main outlet at Fort Macquarie right up Pitt-street, to about opposite Alderman Macintosh's, and to a man-hole in Bathurst-street.

1775. What man-holes did you open to enable you to do that? At the corner of Bridge-street, opposite the Exchange, where it intersects Pitt-street, that runs right down to Fort Macquarie. Then I got the man-hole opened opposite to where Alderman Rennie used to live, in Pitt-street. Well, the next one I got opened was in Market-street, as near as possible to where Carroll used to keep a butcher's shop, and the next one was close to the Congregational Church, opposite Alderman Macintosh's place.

1776. What time was taken up in doing this? Well, I had a gang of men out opening the man-holes in different places, and I always have a man with me besides for fear of any accident. I started from Bridge-street, opposite the Exchange, and went right away down as far as the outlet, where the flood-gates are. Then I traversed back again and went right up Pitt-street as far as Mr. Rennie's place, and got up there and had a breathing. Then I went in and started again, and went right up to the end of the Pitt-street sewer, and I tried to get up in Bathurst-street, where there is a 3-feet sewer, but I found I could not turn in it, and after going along for a bit on my knees I came back again.

1777. You do not often make such journeys in the sewers? Well, I may say I am continually backwards and forwards in them—once or twice a month.

1778. But do you, as a matter of fact, frequently make such journeys? No, I do not.

1779. How long were you in that particular case? I think as near as possible about three hours.

1780. You did it as quickly as possible I suppose? Yes, I got out of it as soon as I could.

1781. Have you reason to think that these noxious gases escape in various parts of the city? Yes sir; for the last four years I have been doing nothing else with three masons and four or five labourers but attending to these gullys leading into the sewers requiring repairs.

1782. Complaints have been made that these foul gases have escaped and got into the yards and houses? Yes, I have often detected that where people have pulled the trap off themselves.

1783. What have they done that for? I have seen them taking the trap off and pushing the rubbish into the cesspit. Some of them, if the stench-trap in the yard gets stopped up with sand and won't receive the water, lift them up to clean them.

1784. Where are these man-holes—in the streets I suppose? Yes, right along the line of streets, over the sewers.

1785. And when you open them there is generally a strong draught comes up? No, but there is a great stench, and there is one thing I would like to mention that in these man-holes, especially in Pitt-street, we find a good current of air passing along the sewer.

1786. Which way does it go? It is going from the harbour.

1787. Does it go in different directions at other times? Yes, according to the wind.

1788. And there is no ventilation in these sewers that you are aware of, except that one shaft? That is the only one I know.

1789. Does that shaft do any good—does it keep that sewer purer than the others? Yes, it must do a vast deal of good.

1790. Have you found that sewerage area purer than the others? Yes. I have found very bad air once or twice when I opened a man-hole in the Macquarie-street sewer, opposite Sir Daniel Cooper's new house, and also in one close to the Library in Bent-street; that was in summer.

Mr. J.
O'Doherty.
6 Aug., 1875.

1791. Have you found, as a matter of fact, that this ventilating shaft has made the sewers with which it is connected purer than the others? Yes, Pitt-street is connected with it, and I find a much better draught in that sewer than in any of the others. But there is one thing I would like to mention: I have been in Pitt-street at times when we have been doing repairs; I have been sometimes an hour at the bottom of the sewer, and I have found my head to get giddy, and a feeling of faintness come over me which has lasted for the rest of the day.
1792. Do the men who are employed in this occupation work all the day? Yes, but I always give them instructions to come up whenever they want any fresh air.
1793. You think the air is better in the Pitt-street sewer than in the others? Yes, it is worse in the others.
1794. Are many of the private connections with the sewers without traps, do you know? I have never seen any of them connected without having a trap put in.
1795. That is the main sewers? Yes.
1796. Do you know whether there are traps in the private drains off the main sewers? During the last twelve years, to the best of my recollection, in new sewers or gullies, traps have always been put in. The drain is trapped where it enters the main sewer, and the private connections are also trapped where they enter the drain. Shortly after Mr. Bell came into office, in passing the main sewers occasionally, I noticed that when there was a great flood of water the flaps would be wrung off; and Mr. Bell made an alteration in the traps.
1797. Have those flaps been replaced? Yes, generally.
1798. Were these all private connections with the main sewers, or were they any of them connections with street drains? Some of them with street drains and some with private drains.
1799. You have been in office twelve years, have you not? Fifteen.
1800. What means have you of knowing whether any trap to a private connection is in order, or whether there is such a connection existing? That I could not say.
1801. You have no means of knowing? No.
1802. If any particular connection were pointed out to you from a private dwelling into a street drain, would you be in a position to say whether there was a trap there or not without opening up the ground? I would.
1803. What means have you of telling? The only way I could tell you would be by going into the sewer and seeing it.
1804. But supposing it was a drain you could not get into;—is there any book or record of these connections to show whether they are trapped or not? Yes, I have a record of all of them—so many connections made in my time.
1805. And whether they were trapped or not? Yes.
1806. But you have no means of knowing in what condition they are in at present? No.
1807. You are quite sure you have a book containing a record of them? I have a book stating that so many connections were made every year, and they were all made with traps.
1808. *Mr. Bennett.*] Did you ever happen to have two of these man-holes—the two nearest man-holes—open together? No, I have not. I have not gone to such extreme labour.
1809. Have you found a draught of air going up or down these branch sewers when you have been passing them? No.
1810. Do you find the stench greater in the lower or in the higher sewers? I always find the stench greater at the higher points.
1811. *Mr. Chapman.*] Have you not some 20-inch drain pipes emptying themselves into the harbour? Yes, we have 12-inch, 16-inch, 18-inch, 20-inch, and 24-inch pipes.
1812. Now how are the connections to these drains trapped? By D traps; but since Mr. Bell came into office he insisted upon the flap-traps being put in at the sewer as well as the D trap.
1813. Up to that time there were no flaps to these drain-pipes? No.
1814. When the Chairman asked you whether all these connections had been trapped in your time, did you mean that some of them had been trapped on the surface, and not at the drain? Yes.
1815. *Mr. Bell.*] When you were in the Pitt-street sewer do you recollect whether the doors at the mouth of the sewer were off or whether they were on, while there was a current passing, as you described? I always found the doors shut.
1816. Were the doors on at the Fort Macquarie sewer? Yes, the doors were shut.
1817. Was there any air going in from the mouth of the sewer? None. I found once where the door had been taken off altogether.
1818. *Hon. J. B. Wilson.*] And that current of air you spoke of, coming from the open man-hole when you were walking up that sewer, did it come from the open man-hole by which you had entered? Yes, I believe that gave me a current of air right away up.
1819. And you don't think there would have been any current if that man-hole had not been opened, and the gates had not been opened? No, I don't think so.
1820. Where does the tank stream empty into the harbour? At the old Queen's wharf, at the bottom of Pitt-street.
1821. Is not there a large sewer coming down Pitt-street? A brick sewer comes between Bridge-street and Pitt-street.
1822. And does the tank stream cross it? The brick sewer crosses the tank stream.
1823. Have you ever been up that tank stream? Oh yes.
1824. How is it constructed when it goes under the houses, say in Bridge-street and Hunter-street, is it built of brick and cement? The sides are built up with stone and it is covered with timber.
1825. Have you any idea of the state of that timber roof, whether it is sound or not? I know that some time ago a lot of it was washed away by Mr. Bloxsome's place, but they have been doing a lot of repairs to it lately. At Hunter-street the tank stream is in a very bad state.
1826. *Mr. Chapman.*] Are you aware whether any fire was ever used in the ventilating shaft for the purpose of consuming the noxious gases which arise from it? I am not aware of it; no fire has been used to my knowledge.

FRIDAY, 13 AUGUST, 1875.

Present:—

HON. J. B. WILSON,		E. O. MORIARTY, Esq.,
F. BELL, Esq.,		W. C. BENNETT, Esq.,

DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

W. C. Bennett, Esq., further examined:—

1827. *Chairman.*] I believe you have paid some attention to the ventilation of sewers? I have lately.
1828. From what you have learned of the subject do you find that the method of ventilating sewers by lofty shafts, such as that one in Hyde Park, is approved of? It is not generally approved of now.
1829. Do you approve of it? No; I think the reasons I have seen assigned against it are very good ones.
1830. Theoretically and practically? Yes; if the draught is sufficient to be effective at any distance from the ventilating shaft it will be so great under the ventilating shaft that it will untrap all the traps in the immediate vicinity.
1831. That is to say, it will open all the traps? Yes; it will reverse the action of the traps.
1832. It will draw the air from the traps near the shaft instead of drawing it from the remoter parts of the system? Yes.
1833. So that it will keep the air pure near the ventilating shaft, but will not affect the remoter portions of the system; in fact, it will only have a local effect? Yes.
1834. That opinion is based on scientific grounds, and is the result of observations you have made on the subject? Yes; on common sense grounds also.
1835. And if the draught up a shaft of that kind were increased by means of a fire, would not the same remarks apply, only with greater force? Yes, with greater force.
1836. Do you know, or have you heard, of any system by which any considerable extent of sewer could be ventilated by one shaft? No.
1837. On the grounds you have just stated, do you think it possible, in the nature of things, that this could be done? I do not think so.
1838. If, for instance, you had pumping machinery to pump the air out, would it be possible? The same result would take place; you would increase the air near the fan, or whatever arrangement you had for creating the draught, but you would be pumping the air from the portions of the sewer close to the shaft, and leaving the remoter portions unventilated. That system applies to a mine very well, but there the side drives are so regulated that they all draw the air from one opening; there are certain traps in the galleries which are shut, so as to turn the air towards the shaft, under manual regulation.
1839. If then it is impossible to ventilate sewers to any large extent by means of a single opening of any kind, it will be obviously necessary to have a number of openings? So it would appear.
1840. Does that appear to be the conclusion arrived at by European engineers as far as you know? Yes; it has been acted upon in London, Croydon, and other places—at Croydon with marked success.
1841. Is it not a fact that these tall ventilating shafts with and without fires have been experimented upon and finally condemned? Yes.
1842. In what way would you recommend then that the foul air should be drawn off from the sewers? I think the method adopted in London and Croydon, and proposed by Mr. Latham in his work on "Sanitary Engineering" might be adopted here with advantage. These gases being innocuous, or nearly so, if largely diluted, he recommends that they should be diluted and deodorised as often as possible by having a number of openings at intervals of 200 yards apart, immediately over the sewer, in the centre of the street, each hole to be provided with a charcoal apparatus.
1843. Charcoal, I believe, if kept perfectly dry, has the effect of permanently or almost so absorbing and destroying the noxious gases which pass through it; but it is necessary to keep it perfectly dry? Yes; it must be kept dry. Mr. Latham has patented an apparatus for that purpose, which seems to me to be a very good one.
1844. Have you carefully considered the arrangement which prevents this ventilator from being choked with dust from the street or soaked with water getting in? Yes.
1845. And you think it efficient? I think so, and Mr. Latham states that it has proved so in practice.
1846. Are you aware whether it has been attempted to ventilate sewers by means of water-pipes through which water is carried from the roofs of houses to the sewers? Yes, that has been abandoned. In Croydon it was found to produce a great increase in the death rate.
1847. There are obvious reasons why it should be deficient? Yes; to be efficient there should be a charcoal deodoriser on the top, and that would be manifestly impossible.
1848. It has also been suggested that the sewers should be ventilated by special pipes carried from the sewer under the road and up the sides of the houses so as to be beyond the reach of the windows; and there of course as they would not be used for discharging water you might have a charcoal filter. Do you see any objection to such an arrangement? Well, it is a question whether they would be so efficient as the openings in the streets, and they would be much more expensive, besides being unsightly.
1849. And they would have to be of much larger size to be of any use? Yes.
1850. Under what circumstances do you think the greatest pressure would be likely to arise of the gases within a sewer tending to force them into the houses and yards? In the tide locked sewers open to tide the greatest pressure would be at high water; in the ordinary sewers it would be at flood times.
1851. Suppose the tidal waters were kept out? Then it would be an ordinary sewer, and the greatest pressure would be in times of flood.
1852. What would take place when a heavy shower of rain came on in a sewer as to the pressure of the gases? The pressure of the gases would increase considerably, and until the side traps got sealed by the water rising over them, these traps being partially open, the gas would be driven in at the sides of the flaps; and would partially and perhaps completely untrap the sewers, and escape into the air and through the houses and yards.
1853. Under such circumstances, in case of a sudden rush of water into the sewers, and the consequent pressure, the mere flaps would only be a very partial remedy? I would not like to depend upon the flaps at any time to keep out the smell.

W. C.
Bennett, Esq.
13 Aug., 1875.

1854.

- W. C. Bennett, Esq.
13 Aug., 1875.
1854. You would approve of them as a mitigation of the evil? Yes, but they should be supplemented with water-traps.
1855. It appears as a matter of fact, as far as we can learn, that there is no great pressure of gas arising in the Sydney sewers, as we have not heard of many traps connected with water-closets being untrapped? It would not occur so much in the water-closet traps as the ordinary traps in yards and sculleries.
1856. At the same time during heavy showers the gas must escape somewhere? Yes.
1857. What is your opinion as to where it gets out? I think that as the water rises it is driven into the side pipes, and up those pipes perhaps to the outlet, or through any fissures in the earth, or through the man-holes.
1858. *Chairman to Mr. Bell.*] What is your opinion as to the way in which the gases escape from the sewers in case of pressure arising from the influx of flood water? I think they escape principally through the gully-shafts not being trapped, and also from many of the house connections not being trapped.
1859. The gas gets into the yards in that way? Yes.
1860. The fact of these gully-shafts not being trapped, and the gas escaping into the yards then, has been so far a benefit to the city, as the pressure would otherwise have untrapped the traps in many cases? There are numerous places in the city where the gully-shafts are entirely open for the flood waters to get in.
1861. Would it not be a dangerous thing, unless some very safe exit is made for the gas, to trap all these gully-shafts, and to make all these drains secure;—would it not have the effect of driving these gases more into the houses? I think so; yes.
1862. Until we have some better system of ventilation then it will be better to leave these things alone? Yes; except in some places where the stench is very bad.
1863. *Chairman to Mr. Bennett.*] It appears then that the only safety is in providing some easy exit for the gases in the sewers at more frequent intervals than must necessarily exist at present? Yes, some easy exit.
1864. And a safer exit? Yes; to make it really effective every opening to a sewer should have a charcoal filter for the gas to pass through.
1865. You mean every opening for purposes of ventilation, not every opening? Yes, for purposes of ventilation.
1866. And that should be secured against damp and dirt? Yes.
1867. How would you propose to have these ventilators placed—in the man-holes as far as it was possible to do so? It would be an economy to utilize the man-holes, but I do not recollect the distances between them so as to be able to say whether they would be suitable for that purpose. I think, as far as No. 1 section of sewage—as it is called—is concerned, that as many of these ventilators as possible should be placed at the intersection of streets, so as thoroughly to dilute whatever gases did escape.
1868. And in case of the side drain sewers running into the main sewers to provide against a case where the mouth of such a branch sewer should become stopped by the water in the main sewer rising above it—in which case the gas in the side sewer would be confined—then would it not be desirable to have for every such branch sewer, at its highest point, a ventilator of a similar kind? Yes, and it would be worthy of consideration whether the ventilation would not be as cheaply and effectively done by connecting the highest point of the branch sewer with the next higher main sewer, in section No. 1 especially, and possibly in other cases.
1869. *Mr. Moriarty.*] Don't you think that in connection with the ventilation of sewers the system of flushing the sewers is an important question? Very.
1870. At regular and frequent intervals? Yes.
1871. Might not the flushing process, if judiciously managed, not only have the effect of clearing out all the sediment that would otherwise remain in the sewer, but also, by being repeated at proper times during the day, have the effect of expelling most of the gas from the sewer? Yes, it is possible, on the principle of Gifford's injector; the friction of the water on the gas would expel the gas to the mouth of the sewer.
1872. You state in your evidence that the effect of floods is to expel the gas from the sewer—which of course it does by occupying the place which the gas formerly occupied;—of course the same effect would follow every time the sewer was filled with water, which would result from the flushing process? Yes; I never contemplated flushing the sewers to such an extent as would be done by a flood.
1873. But would any partial flushing have the effect of causing a partial escape of gas? Yes.
1874. And in that way the system of flushing the sewers must be conducive to the public health? Yes, unquestionably.
1875. Is it not a fact that in London the flushing process is an indispensable part of the system of sewerage? I am not aware whether it is done under the new system; under the old system flushing was indispensable for every sewer; I don't think it is under the present system in London on account of the pumping. A great many of the low level systems are pumped; they may flush the minor sewers, but not the main sewers; they do it very largely in Paris by means of barges. In my former answer I referred to the flushing of sewers by the influx of water in addition to the ordinary water going through the sewer.
1876. Is it not possible by means of proper flaps—either half, three-quarters, or full-sized flaps, to impound the water at various points in the sewer in such a way that the ordinary supply of a town may cause a flushing when and where it is desired? That has been done to some extent in Paris; that is their ordinary way of doing it.
1877. *Chairman.*] If the flushing of a sewer were conducted by means of flushing gates, without introducing any additional water into the sewer, that would not have the effect of expelling any gas by increasing the pressure in the sewer at all? It would increase the local pressure slightly where the flushing gate was, but it would have very little effect in expelling the gas.
1878. Would it not expel the gas at that point? Yes, it would to a certain extent but only slightly.
1879. *Mr. Moriarty.*] And the effect would also be to draw in purer air from those portions of the sewer from which the water had been drawn away, by causing a suction? Yes, it would cause a displacement of gas and some fresh air would come in to replace it, but I don't think the effect would be at all appreciable with the ordinary sewer water.
1880. *Hon. J. B. Wilson.*] Are you aware how often, under the old London system, the sewers were flushed? Very frequently; I could not say how often.
1881. *Mr. Bell.*] Would not the necessity of flushing the sewers depend greatly upon the grade of the sewer? Oh yes.
- 1882.

- 1882. Then, with a steep incline, there would be very little necessity to flush a sewer? Very little.
- 1883. Only the low-lying sewers, those that were very flat, would require flushing? Yes, and particularly near the foot of a steep grade, where there would be a tendency to deposit.
- 1884. With regard to the present ventilating shaft—with the means of fresh air coming in and foul air going out, the system being so incomplete—do you think that shaft is of any service? Yes, it is of service to a limited extent; I do not dispute that, in its immediate neighbourhood, but not at the remote end of the sewers.
- 1885. *Mr. Moriarty.*] Is it not a fact that with regard to these ventilating shafts the draught increases in the ratio of the square root of the height? Yes.
- 1886. Then, taking two shafts, one a tall shaft, of say 81 feet high, and the other a short one of only 9 feet high, the square roots of which are 9 and 3 respectively, which would represent the ratios of the velocities of escape of the gases, if the former have an opening of 1 foot square and the latter of about 1 foot 9 inches square, their discharging capacities will be equal, so that practically in such case there would be no advantage gained by the high shaft? Not much.
- 1887. *Hon. J. B. Wilson.*] Are these traps of Mr. Latham's on the level of the street? Yes.
- 1888. *Chairman to Mr. Bell.*] Can you furnish us with a tabulated statement showing the situation and size of the man-holes to the various main sewers in Sydney? I will bring the sections and show them to you.
- 1889. What size are the man-holes—about 2 feet 6 inches? Yes, about that; I think they are all the same size.
- 1890. Do you concur in the opinions Mr. Bennett has expressed generally on the subject of the ventilation of the sewers? Yes, I do.
- 1891. *Chairman to Mr. Moriarty.*] Do you also concur in Mr. Bennett's opinions? Yes, but I am disposed to attach more importance than he seems to do to the beneficial effects of flushing the sewers, in expelling the gases as well as the deposits.
- 1892. How would the flushing of sewers by flushing gates, or, if there were any such means, by introducing water into the sewers, affect the arrangement to carry the sewage into deeper water, which you propose to do at Fort Macquarie? It might be made to act rather beneficially in that respect, I think, by holding back some of the water in the sewers until the ebb of the tide, and then allowing it to discharge so as to sluice the whole sewer.
- 1893. You don't think it would injure the gates at all? Oh no, not at all.
- 1894. Do you think there would be any great expense attached to the construction of sluicing gates in the sewers, as they at present exist, with the present water supply? That is a difficult question to answer without some more complete knowledge of the depths of the sewers and their size than I at present possess. It would not add materially to the expense.

|--|---|
| HON. J. SMITH,
F. BELL, Esq.,
W. C. BENNETT, Esq., | HON. J. B. WILSON,
E. O. MORIARTY, Esq.,
DR. ALLEYNE. |
|--|---|

M. B. PELL, Esq., B.A., IN THE CHAIR.

Hon. J. Smith, M.D., M.L.C., Professor of Physics, University of Sydney, examined in his place:—

- 1895. *Chairman.*] You have read Professor Liversidge's report, and the opinions he has stated as to the quality of the water which enters the mouth of the Bore. You have yourself stated that you believe it is, as a matter of fact, to some extent contaminated by the drainage of the adjoining houses; and that in the event of any disease arising among the inhabitants of the watershed, communicable by water, serious danger would occur. Do you then think that this is a desirable or proper water in its present state to supply to the inhabitants of Sydney;—with the contingent risk you mention, do you think it is advisable to continue to supply the city from that source? On the whole I think not; and if it were to be continued I think a good deal should be done to improve it, by cutting off the sources of impurity.
- 1896. We are bound to report to the Government positively whether or not that supply of water should be continued. Professor Liversidge states that it is not safe to supply it without filtration; your colleagues on the Committee say the same thing. Do you concur in the opinions of these gentlemen? No, as a simple matter of opinion I think the water at present is perfectly safe.
- 1897. That is not the question. Admitting for the sake of argument that it is not dangerous at present, do you think it is a proper water to supply to the inhabitants of Sydney for any length of time? I repeat that, looking to the contingencies to which you have referred, it is not desirable; at present the water is sufficiently good.
- 1898. You state in your evidence that you would use that water as it is at present without any alarm? Yes, without any alarm.
- 1899. If there were any disease among the inhabitants of that watershed—any disease communicable by water—would you still use it without any alarm? No, I should not use it then.
- 1900. I understand then that we are so far agreed, that you would concur with us in reporting to the Government, in accordance with Professor Liversidge's recommendation, that this water, unless it can be effectually filtered, should not be continued to be supplied to the inhabitants of Sydney for any length of time? You have introduced the question of filtration, and I am doubtful how far you could improve this water by filtration; but I concur in the opinion that unless something is done effectually to preserve the purity of the water, it is not desirable to continue it as a source of supply.
- 1901. With you then it is merely a question whether the filtration would be effectual. You think that without some effective means of filtration to remove the dangerous impurities it would not be desirable to continue it? I look more to the cutting off the sources of impurity; I do not trust much to filtration.
- 1902. But without an effective system of filtration you would not recommend the water to be used as a permanent source of supply? I do not wish to express an opinion as to filtration; I say that unless the sources of impurity are removed I do not think it would be desirable to continue it.

Hon.
J. Smith,
M.L.C.
26 Aug., 1875.

Hon.
J. Smith,
M.L.C.

26 Aug., 1875.

1903. They can only be removed permanently by cutting off the drainage from all the private land contained in the watershed? Yes, from all the houses that drain into the watershed.

1904. Which would very greatly diminish the supply? It would considerably diminish the supply; but from this report which we have before us it would appear that it need not be so much diminished as I thought at first, because it appears that the water running down Spring Creek is really remarkably pure, and therefore that need not be cut off.

1905. Then again, in considering whether this is a desirable source of supply, we must go back to the question you have already answered respecting the contamination of the water in its passage through the Bore. If that were prevented—and the only effectual way of preventing it seems to be to lay down an iron pipe throughout its whole length—the supply again would be very materially diminished. Taking all these matters into consideration, would it be worth while, in your opinion, as you have examined the ground while the subject was under your consideration, to recommend the Government to go to any expense, or to encourage any large expense in conserving this comparatively small quantity of water for any length of time? No; I repeat what I said in my former evidence. I do not think it would be worth while to go to any great expense in conserving it. Something might be done—indeed, must be done—to improve it while it is used, for it must be used for some years to come, but it is not, in my opinion, desirable to incur any great expense to conserve it.

1906. There is one matter to which I am bound to refer, though I should much rather not do so. Reports have got about which tend to throw a doubt upon the correctness of the deductions which Professor Liversidge has drawn from his analyses. You are reported to have said that the public have made mistakes as to the inferences to be drawn from his statements. Now, there is no doubt about what Professor Liversidge stated—that the water as it enters the Bore is contaminated to a certain extent, and not fit for domestic use, and this appears to have created some alarm, which has been abated by what has been said outside, whether intentionally or not, as to the results of these analyses, about which so much trouble has been taken and so much expense incurred. It appears to me that if as you say this contamination, as shown by the analysis, is liable in certain cases to spread infectious diseases, that alarm in the minds of the people is the very thing we desire to create. Without such alarm we can never hope to carry any strong measures or to get the people to see the importance of the question. I should like to ask you if you have seen any reason to doubt the results of Professor Liversidge's analyses—that is to say, that they indicate sewage contamination, especially with respect to the water entering the Bore, of which he has made two analyses, the results of which are before us? I have not the slightest doubt of the correctness of Professor Liversidge's analyses; but every one of us must use his own judgment in drawing inferences from them. I entirely accept the accuracy of Professor Liversidge's analyses, but I differ with you in your opinion that it is well to create alarm. I think that such alarm is the very thing to spread disease. That has been proved over and over again. In the case of cholera that has been the chief source of danger. If we had an epidemic of cholera here—if there were cases of cholera at Waverley, and the drainage of the houses went into the Lachlan Swamp—there would be danger. I should be very sorry, however, to create a feeling of alarm in the minds of the people, although I would do what I could to remove the source of danger. We have nothing to fear at present. I have said that the alarm which has been raised was unnecessary, and that at present the water is fit for use. But I admit that there is the possibility of danger—that there is a contingent danger—and therefore I would give up the source of supply. But we know it cannot be given up for years to come, and I should be loth to create an alarm in the public mind. We have never had epidemic cholera here, and we have no reason to expect it.

1907. We are not speaking of cholera epidemic in particular? But there are comparatively few causes of disease communicable by water. We have never had an epidemic of typhoid fever either. I add this to my former answer—that although in cases where epidemic diseases are communicable by water every possible precaution should be taken, and no avoidable risk should be run, yet I do not know that there is any proof that the germs which convey these communicable diseases travel very far in water. I doubt whether if there were cholera or typhoid fever epidemic in Waverley, the poison germs would reach the tunnel mouth, especially if the running stream were restored, as recommended by the Committee; because I do not know of any evidence of poisoned germs having been carried for any considerable distance. In the cases recorded where disease has been clearly communicated by water, the poison germs have been traced to some source near at hand. So far as I know they have never been traced to any considerable distance; and I remember that it was stated on good authority during an epidemic of cholera in England as a remarkable thing that at Birmingham, which was supplied with water, contaminated by Bilston higher up on the same river, there was no cholera, while it was raging at Bilston. That I give as an example that the poison germs do not travel any considerable distance in water, since Mr. Rawlinson states that although the cholera was raging at Bilston there was none at Birmingham, though the same water supplied both places. There is no evidence that these poison germs are carried any distance, and even in the case of an epidemic at Waverley, if the running stream were restored, the probability is that the poison germs would not reach the mouth of the tunnel. I therefore will be no party to create any unnecessary alarm. At the same time I would adopt every precaution to preserve the purity of the water, and would seek a more unexceptionable source of supply. I would not seek it only or mainly for this reason, but because it is not sufficient; we require a better and more abundant source.

1908. Don't you think it is better to frighten the people a little, as they require a great deal, or at any rate some kind, of inducement to make them move in matters of this kind;—don't you think it better to frighten them into getting a better source of supply for themselves than to wait until the danger arises, and they have found it out by experience? Well, I think the authorities who would have to decide upon the source of supply are open to reason without being subjected to alarm. It is not the mass of the people who would have to provide the supply, but those who would be amenable to reason.

1909. Do you see any reason to doubt the correctness of Professor Liversidge's conclusions and the results of his analyses in respect to several matters which he mentions—such as the proportions of albumenoid ammonia and chlorine;—do you doubt that they indicate sewage contamination in the manner in which he states? I suppose they must come to a certain extent from sewage contamination, but there are other possible sources.

1910. Will you name any of them? Albumenoid ammonia, I understand, is obtainable from rain water, and it is stated to be obtainable from water in which there is peaty matter, or in fact any vegetable infusion.

1911.

1911. From the inquiries you have made do you think there is any likelihood or possibility of Professor Liversidge being much in error—in respect to his statements of the quantity of albumenoid ammonia in the water entering the Bore—in the inferences he has drawn from the substances existing in the water, or having been obtained from it—that they have been derived from sewage contamination, or that they indicate sewage contamination? I think he has not stated that all the albumenoid ammonia arises from sewage contamination. I think it is pretty clear that some of it arises from sewage contamination, but how much there is not sufficient evidence to show.

Hon. J. Smith,
M.L.C.
26 Aug., 1876.

1912. What steps then do you think should be taken to show it; that is a thing which should be cleared up? I do not think it is a thing that can be accurately ascertained.

1913. Then, if what you say is true—that it is impossible to say what proportion of these results is derivable from sewage contamination, and what proportion is due to other causes, the inferences drawn from the results of his analyses would be of no value whatever? What particular inferences do you mean?

1914. The inference he draws from the results, so far as he has arrived at them, is, that the water is contaminated by sewage matter; but if what you say is true—that it is impossible to determine what proportion of this albumenoid ammonia is derivable from sewage contamination, and what proportion from other perhaps innocuous sources, then I say his results would be of no value whatever. Is not that quite clear? No, I don't think that is clear. I think if you find albumenoid ammonia in considerable quantity, more than the usual average, then it is fair to suppose that that excess is owing to sewage matter. As in the case of No. 2 dam, I feel no doubt that there a considerable proportion of albumenoid ammonia must really have come from sewage contamination, because in that case we see that the water comes from a number of houses.

1915. Do you doubt then that the water which at its entrance into the Bore contains about '20 of albumenoid ammonia as against '30 in No. 2 dam indicates serious sewage contamination? I think we may fairly infer that at least the difference between '20 and '30 comes from sewage contamination.

1916. Have you any reason for stating these particular figures. If it be impossible to state from what these substances are derived, it is impossible to arrive at any definite conclusions? No. I use the number '20 because there are waters affording that proportion of albumenoid ammonia which I am convinced are not injurious.

1917. In what way are you convinced that they are not injurious. Professor Liversidge thinks they are dangerous? I should like to know on what grounds he considers them dangerous with '20 of albumenoid ammonia.

1918. You do not believe it is possible to determine whether this albumenoid ammonia comes from sewage contamination or not;—it is merely a matter of guess work, because you say you believe it to be present when you see the houses from which it comes? I think it is a matter of inference. I think it is impossible to determine what proportion of albumenoid ammonia is derived from sewage contamination and what from other sources.

1919. *Mr. Moriarty.*] If we find that there is a greater quantity of this supposed dangerous matter in the water from the upper part of the watershed than there is in the water from the lower part—that is to say, the proportion of albumenoid ammonia is greater in the Lachlan Swamp than in the water pumped up from Botany; and if we find that in the stream at Botany there is a greater proportion of peaty matter, would you consider it a reasonable inference that the presence of albumenoid ammonia is due to sewage contamination rather than to peat? I am inclined to think that the peaty matter is greater in the Lachlan Swamps than down below. I think that since the construction of these dams and the submersion of so much vegetable matter, the infusion of peaty matter is greater at the Swamps than it is further below.

1920. *Chairman.*] Have you any reason to suppose that any large proportion of this albumenoid ammonia is derived from peat? No; in fact as a mere matter of opinion I don't think much of it would be derived from peat. I think if it were the water would have a higher colour, because we know that peat has a highly colouring effect.

A. Liversidge, Esq., Professor of Geology and Mineralogy, University of Sydney, examined:—

1921. *Chairman.*] When we find that the water contains say '20 albumenoid ammonia, do we understand from your report that the whole of that is usually derivable from sewage contamination? No, I should not attribute the whole of the albumenoid ammonia to sewage contamination; but when the quantity is as great as '20 I should be inclined to think from my experience of these analyses that—all other things being equal—about one-half would be derived from sewage contamination, that is to say, from other than natural sources, because all natural waters contain a certain amount of albumenoid ammonia.

A. Liversidge,
Esq.
26 Aug., 1876.

1922. Some of this '10, which is not derived from sewage contamination, would be derived, I suppose, from peat or other vegetable matter? This '10 would include the whole of the albumenoid ammonia derivable from peat and from other vegetable sources.

1923. Have you any means of forming an opinion as to the quantity of albumenoid ammonia derivable from peat at the Botany Watershed—from peat alone? Yes, I have a certain amount of information; I have made some experiments, but I cannot say that they are at all complete. They are experiments which I made with water free from ammonia, which I coloured artificially with extract of peat to rather a deeper tint than the water taken from the Swamp. I then estimated the amount of free ammonia and also of albumenoid ammonia afforded by such artificially coloured water, and I found that the amount of albumenoid ammonia averages from '03 to '06 parts per million.

1924. Was the peat with which you coloured the water taken from the Lachlan Swamp? In two cases it was, and in the other cases it was a specimen from Scotland.

1925. And of the '10 of albumenoid ammonia which you found in the Botany water at the engine pond, you would suppose—speaking roughly—about one half to be due to peat? Yes, about one-half—rather less than one-half, '35 being the average.

1926. And the rest to other, what you would term ordinary or natural, sources of contamination? Yes, together with any slight sewage contamination which there might be; but I should state that the amount of albumenoid ammonia which I found in this artificially coloured solution is overstated, because I overcoloured the water purposely in order to see the very worst of it.

- A Liversidge, Esq.
26 Aug., 1875.
1927. Then, if anything, the amount you attribute to peat is less than you have stated? Yes.
1928. I think you found the water from dam No. 1 about the same quality as the Botany water—to contain .10 of albumenoid ammonia? Yes, about the same.
1929. That dam is not subject to the direct contaminating causes as dam No. 2? I cannot speak upon that point.
1930. That would appear in point of fact to be about the normal state of the Botany watershed; the immediately contaminating influences are partly derived from peat and partly from other sources? Yes.
1931. You would attribute the additional .10 in the water at the mouth of the Bore to direct sewage contamination? Yes, I cannot see any other possible cause for it.
1932. Is it generally known that river water, or other water used as a water supply, does contain a certain amount of albumenoid ammonia independently of any sewage contamination? There is hardly a river which has been examined that has not been polluted more or less; the average water supplied to London by the companies all contains a small proportion of albumenoid ammonia, but that, of course, is partly due to sewage and partly due to natural sources.
1933. You would expect water which undoubtedly had not been polluted by sewage contamination, to yield a certain amount of albumenoid ammonia? Yes, a very small proportion.
1934. It appears from your report that the quality of the water from two of the dams, which is mixed before it gets to the Bore, is about a mean between the two? Except in respect to the chlorine.
1935. As far as albumenoid ammonia is concerned, but the proportion of chlorine is not quite the same? Not quite.
1936. What would that indicate, supposing the quantity of water supplied by those two dams to be the same in amount? Supposing it received no fresh accumulation of sewage-matter in its passage along the swamp it would signify that the water underwent no appreciable change in that short distance.
1937. Suppose that the purer source was considerably larger than the impure one, what inference would you draw then? That the water in its passage down must be subject to contamination.
1938. If the purer source were larger of course the water when the two joined should be purer? Yes.
1939. Are you perfectly satisfied that the existence of albumenoid ammonia arising from peat does not interfere with the justice of your reports? Yes, I am perfectly satisfied that it does not, because the water from the Lachlan Swamps contains twice as much albumenoid ammonia as the water from Botany; and if anything I am inclined to think that the Lachlan Swamp water—certainly the last sample—is lighter in colour than the Botany water, and the only means of judging of the peaty matter is from the colour of the water. I should be very much inclined to think that there is rather less peat in the Lachlan Swamp than there is at Botany.
1940. *Hon. J. Smith.*] You mentioned an experiment that you made with peat;—did you allow the peaty matter entirely to subside before you examined the sample? You mean in the case of the artificially-coloured solution?
1941. Yes? I allowed it to stand until it was tolerably clear. Of course there would be some matter in suspension, but not much.
1942. But you allowed it to stand before you took the specimen? Yes, for about ten minutes.
1943. Whereas when you took the sample from the Lachlan Swamp you shook it up well before you took it? Yes.
1944. Does not that vitiate the comparison. I think the fair way would have been to have allowed the Lachlan Swamp water to settle also? When I compared the two waters—the artificially-coloured water with the Lachlan Swamp water—they were placed in flasks side by side, and the artificially-coloured water was stirred about, whereas the Lachlan Swamp water was not. But in making the strong solution of peat, with which I coloured the artificially-coloured water, of course I allowed it to stand, because it would have vitiated the experiment if I had got any solid matter in it.
1945. I observed that in all your experiments with Lachlan Swamp waters, you shook the samples well, therefore you must have had some solid particles in them, whereas in the artificially colored sample you had no solid particles? No, not worth speaking of.
1946. Therefore I think there is some doubt about the experiment, and that if we knew that the water from the Lachlan Swamp had been partially purified by standing, we should then be able to tell how much was due to peat and how much to other sources? Yes, but in estimating the ammonia by the decomposition of organic matter, the water was mixed up; in artificially coloring the water the swamp water was not agitated; in fact there was no reason for agitating it, because I wished to get its fair color.
1947. *Chairman.*] When you artificially colored the water with peat did you prepare a solution of peat? I prepared an extract of peat in a small vessel separately, and I added sufficient of that solution to impart to the water a color equal to that possessed by the Lachlan Swamp water.
1948. Equal to the Lachlan Swamp water when it was shaken up? The Lachlan Swamp water was kept quiet, and the other was shaken up to get the right colour.
1949. Would the artificially coloured water if allowed to stand have thrown down any sediment? No.
1950. *Hon. J. Smith.*] Have you tried rain water here with regard to the existence of albumenoid ammonia? Yes, some of it.
1951. What maximum amount of albumenoid ammonia has it furnished on any occasions? In one case the amount of albumenoid ammonia was .13; that was from a specimen collected on June 5th; then on June 6th another specimen of rain water was collected, and the amount of albumenoid ammonia was then .06; rain water collected in the under ground tank at the University after the rain, was examined on the 13th June, and it was found to contain .06 albumenoid ammonia.
1952. Then, if we were to add, say the maximum of albumenoid ammonia in rain water to the quantity supposed to be derived from peat, should we not arrive at the quantity contained in the water at the mouth of the tunnel? Yes; but I don't think we have any right to do that, because the first rain that falls has to pick up all the impurities which collect in the atmosphere, and these we know to be very great, as we perceive when a ray of light passes through a chink into a darkened room, and this has been shewn by examination.
1953. *Chairman.*] You say it is only the first fall of rain which contains comparatively a large amount of impurity? Yes.
1954. Have you made the experiment of taking two samples, one at the beginning and the other at the close of a heavy rain? These two samples were as nearly as possible collected under those conditions; one was taken on the 6th June, and the other on the 13th, after the rain.

1955. Before reporting the result of your analyses, did you fully take into consideration the fact which is well known to chemists that rain water itself contains a certain amount of albumenoid ammonia? Yes.
1956. You had made experiments, and had taken that into consideration? I had not made many experiments, because it is such a well known fact.
1957. But you had examined waters for that purpose? No; because I did not require confirmation—it is a well known fact. There was no real occasion to do it. I made a few experiments for the purposes of scientific inquiry, with the intention to proceed with them.
1958. *Hon. J. Smith.*] What is the maximum quantity of albumenoid ammonia which has been found in rain water in other countries? I could not say from memory—it would depend upon various circumstances.
1959. Do you know if there is any amount estimated as the average quantity? I cannot say that there is any average recorded; but it has been found from the examination of a large number of river waters and others supplied to towns that they contain from '05 to '08 parts of albumenoid ammonia. That albumenoid ammonia is partly derived from the atmosphere, and so long as the rivers, which are mainly composed of rain water, pass over land which is not polluted, they would not contain more than that. I don't think we need consider that rain water contains '20 on an average.
1960. *Chairman.*] You take the rivers which are not polluted as a fair sample of rain water? Yes.
1961. *Hon. J. Smith.*] Is it not understood that in the course of a river this source of albumenoid ammonia gradually disappears? Yes.
1962. Then you would expect to see more of it towards the source of the river? No, not materially; I don't think I should. When I concur with you that it gradually disappears, I mean that it undergoes a greater diminution in its passage over the land.
1963. Therefore you would expect to find more where the rain immediately falls than after it has run for a number of miles? Yes; but the difference would not be great.
1964. Still that would justify us in looking for more albumenoid ammonia in the Lachlan Swamp, where the water has not a distance to run? No, because we find that the water at the mouth of the tunnel contains '21. I take the water in dam No. 1 and the Botany watershed as an average water, and any proportion of albumenoid ammonia above '10 I take as due to sewage contamination.
1965. *Mr. Bell.*] To what do you attribute the difference in the analyses made in your first and second experiments of the water in the Crown-street reservoir? I stated in my second report that I was not prepared to give an opinion upon it without further investigation.
1966. *Chairman.*] It appears that the water taken from the plug at Hyde Park—Bore water—contained a greater amount of albumenoid ammonia than the water at the mouth of the Bore. Do you think that could in any way be accounted for by a larger quantity of peat in that water than in the water at the mouth of the Bore, from what you saw, taking everything into account; did the water appear to the eye to contain more peat? No, it was more turbid, but that turbidity would not be attributable to peat.
1967. *Hon. J. B. Wilson.*] Could it not be attributed to peat? It might be, but from the examination of the sample I should not be inclined to think so; and moreover, there was an increased quantity of chlorine; the amount of albumenoid ammonia is about one-fifth more, and the amount of chlorine I see is about one-eighth; but then the amount of chlorine in peat would be, I think, perhaps, only one-fiftieth part of the albumenoid ammonia, which peat would show. Therefore, I think that chlorine here indicates contamination; and in addition to that, there are nitrates present which show that there is nitrogenous matter undergoing decomposition—a greater quantity of nitrites than at the mouth of the tunnel.
1968. *Mr. Moriarty.*] And that you attribute to sewage contamination of the water during its course? Yes, I can see no other source.
1969. *Mr. Bennett.*] Do you consider the excess of nitrogen in the water at Hyde Park over that at the Lachlan Swamp due to sewage? Yes, I should be inclined to attribute it partly to that.
1970. *Hon. J. B. Wilson.*] In your report you state that chlorine is an indication of the highest value of sewage contamination. Now, in your analysis of the water in pond or dam No. 2 you give 51'80 parts of chlorine, and the water from the Hyde Park plug has only 29'00. Pond or dam No. 1 has 28'50, and the water at the tunnel mouth 26'60. We should gather from this result of the analysis that there was less sewage contamination at the mouth of the tunnel than even in pond No. 1? Yes, if you take that one element alone into consideration; but it would not be right to do that, because the chlorine may have been partly removed in its passage through marsh-loving plants, which contain a large quantity of chlorine in their composition.
1971. Well, but does not it mitigate the result when you see that as far as chlorine goes it shows an improvement? As far as chlorine goes, but perhaps there is an explanation of that; the chlorine may be arrested in its course or taken up by some of the plants I have mentioned.
1972. Is that chlorine in a free state? No, it is in the form of salts, and these might be arrested in their course by plants as I have stated.
1973. But would that be as likely to occur in a running stream as it would in a large reservoir or dam? Well, of course the water passing down from the upper dam to the tunnel mouth is in constant movement, and I think the plants would tend to remove a greater quantity if the movement of the water were slow than if it were fast.
1974. I suppose you are not aware whether there is a great amount of vegetation at the bottom of these dams? That I cannot say, but where the water passes down by the byewash you can see the vegetation.
1975. But none of that comes in contact with the water supplied to Sydney as far as I can understand; the water from the byewash escapes and does not form part of the supply. There is one other question I should like to ask—whether ordinary vegetable matter, other than peaty matter, gives albumenoid ammonia as one of the products of analysis? Yes, but in far less proportion than animal matter; that is to say, the amount of albumenoid ammonia furnished by water containing a given weight of vegetable matter would be far less than the albumenoid ammonia furnished by water containing the same weight of animal matter; the difference would be very great.
1976. What I want to ascertain is, whether water might not contain other vegetable matter such as might not discolor it, and yet might give albumenoid ammonia also as the result of analysis? It probably would, but nothing is known of such matter as far as I can ascertain.
1977. But if that were the case, it might have had an effect upon the water which you impregnated with peat, supposing this non-coloring vegetable matter produced albumenoid ammonia? Yes, supposing it were present, but in that case we should find other indications of its presence; it would have to be present
in

A. Liversidge,
Esq.
26 Aug., 1875.

A. Liversidge, Esq.
26 Aug., 1875. in such large proportion that attention would be at once directed to it. If there were certain vegetable matter not possessing tinctorial effects it would have to be present in such quantities that it would be at once detected; and that large amount of vegetable matter would be just as injurious as the small amount of animal matter yielding albumenoid ammonia.

1978. Perhaps so; but my object was to see whether we could account for this albumenoid ammonia in any other way than from the presence of peaty matter? It might be so, but there is no way of discriminating between the two.

1979. *Chairman.*] Are you satisfied that there was no other vegetable substance except peat which would account for the excessive quantity of albumenoid ammonia? Yes.

1980. *Hon. J. B. Wilson.*] But there might have been a certain amount of other vegetable matter which would add to the result? There might have been, but I really cannot see how it could have been there. We find the Botany water as 10 of albumenoid ammonia, and Spring Creek 10, both somewhat similar water, and then we have the Lachlan Swamp higher up, the main body of it also similar to the other—and the others are just as likely as it to contain vegetable matter—containing 20, or just twice as much.

1981. Is not the water that fills dam No. 1 in a great measure filtered through a sandhill before it gets into the pond, which would get rid of a great deal of that matter? I do not know.

1982. *Hon. J. Smith.*] One reason why I am doubtful about the effect of filtration is that we have no means of distinguishing between the mechanical and the dissolved impurity. Do you think we could have judged better of the possible improvement by filtration if you had given us two separate analyses of some samples, one with the sediment, as you have done, and one after the sediment had subsided, or after filtration? Yes, of course that would be an experiment directed to that end, but the investigation I undertook was simply to ascertain the quality of the water as it is delivered, and as to its quality at the watershed. I think the experiment you suggest might easily be made, and it would afford a good deal of information.

1983. You stated in your first report that in England it is considered that water supplied to a town should not contain more than 08 parts of albumenoid ammonia in a million. Do you know of any experiments or observations made in order to ascertain whether a larger quantity is unwholesome? Yes, several cases are recorded by Messrs. Wankland and Chapman, showing that, in all cases where waters have been examined after disease has broken out, such waters have contained an excessive amount of free and albumenoid ammonia; they give examples of known bad waters.

1984. Do you remember now what would be the least quantity of albumenoid ammonia which is supposed to produce injurious results? I think they state a case in which the proportion was as low as 15; I am not quite certain but I think that was the quantity. They quote other cases where the proportion ranged from 20 up to several parts per million.

1985. Can you account for the remarkable diminution in the quantity of albumenoid ammonia in the sample of water taken nearest to the Crown-street Reservoir? No.

1986. Don't you think that might be due to the deposition of the sediment? No, not wholly; it might be partially, but not in the main. I think there are other actions going on besides the mere deposition of sediment. The pipes contain a very thick deposit of hydrated sesqui-oxide of iron, which also contains organic matter. It is probably formed in much the same way as limonite at the bottom of peat bogs, which variety of iron ore is known as bog iron ore. The hydrated sesqui-oxide of iron is probably partially separated by low vegetable organisms as is known to be the case in bog iron ore deposits now in process of formation, as in Sweden and elsewhere.

TUESDAY, 7 SEPTEMBER, 1875.

Present:—

HON. J. SMITH,
C. WATT, Esq.,
F. BELL, Esq.,

W. C. BENNETT, Esq.,
E. O. MORIARTY, Esq.,
HON. J. B. WILSON,

DR. ALLEYNE.

M. B. BELL, Esq., B.A., IN THE CHAIR.

Hon. J. Smith, M.L.C., M.D., Professor of Physics, University of Sydney, examined in his place:—

Hon. J. Smith, M.L.C., M.D.
7 Sept., 1875. 1987. *Chairman.*] Professor Liversidge in his report states that the water supplied to the Bore contains according to his analyses about 20 per cent. of albumenoid ammonia; and he concludes, taking all the circumstances into consideration, that it may fairly be inferred that about one-half of that is due to sewage contamination. The question I wish to ask is, whether you concur generally in that conclusion? I am really sorry to appear to differ from Professor Liversidge in a case of this kind where I have nothing positive to place against his opinion; but yet I am not convinced that sufficient evidence has been adduced to show that half of that albumenoid ammonia is derived from sewage matter. I was in a fair way of being convinced after the analysis was made of the water from the two uppermost dams, when it turned out that one of them contained 10 and the other 30 of albumenoid ammonia. I was willing to admit that in the one containing 30 there was a certain amount of sewage contamination; and it looked as if the water in the tunnel-mouth was made up of about equal parts of those two waters. But after the explanation given by Mr. Bell, I have felt considerable doubt, and I think, if we wish to settle the question, we must have some further examination made. Mr. Bell pointed out that the No. 1 dam, which contains 10, is frequently emptied, having a sluice in it, while No. 2 dam is never emptied, having no sluice in it. The water in it is therefore comparatively stagnant, and affords an opportunity of dissolving more vegetable matter than the other dam. I was struck with this explanation by Mr. Bell, because it seems to me to account in a large measure for the impurity in No. 2 dam, without admitting that any part of it was necessarily due to sewage contamination. I went over the ground again yesterday, and it is a remarkable fact that of all the houses draining into those two dams, not more than one-tenth drain into No. 2 dam; No. 1, the purer dam of the two, receives nine-tenths of the drainage of all the houses.

1988. Are the houses draining into the impure dam, No. 2, in close proximity to that dam, or is there anything

anything which would lead you to suppose that the contamination is greater there from that or from any other source? They are in rather closer proximity, and there is one source of impurity which does not affect the other dam—there is a soap and candle manufactory near it; it does not appear to be at work at present, but no doubt it has polluted the ground to some extent. So that No. 2 dam has those two causes of impurity more than No. 1—the houses are nearer to it, and the manufactory may have polluted the ground. But when we find that nine-tenths of the houses, including several cow-yards and market gardens all drain into No. 1 dam, which still gives only .10 of albumenoid ammonia, I have some doubt about its origin. Because, as Mr. Watt has pointed out, the organic matter, if taken as pure vegetable matter, ought to give as much albumenoid ammonia as that. I have made a calculation as to the quantity of vegetable matter. Taking the first analysis of the tunnel water, sample No. 1 Lachlan Swamp, we find the following proportions:—

Total solids	97.00	parts per million
Loss on ignition	65.00	"
Fixed residue	32.00	"

Now it is admitted that part of the loss from ignition is from inorganic matter, and no one knows how much to allow for that. But I imagine that if we take fifteen parts out of sixty-five it would be a fair allowance, leaving fifty for organic matter. The albumenoid ammonia would then be only .4 per cent. of the organic matter. Now, supposing that organic matter to be purely from vegetable sources—entirely from the infusion of vegetable matter—I think any chemist would expect that quantity of .4 per cent. of albumenoid ammonia to be furnished.

1989. Do you mean any kind of vegetable matter? Such vegetable matter as would be found in these swamps. While, therefore, I am quite disposed to admit that some of this albumenoid ammonia may come from sewage matter, I feel at a loss to come to any distinct conclusion as to how much of it comes from sewage and how much from vegetable matter, and I have a strong impression that most of it at the tunnel mouth is derived from vegetable sources. But I think we ought to get a sample analysed as it comes from No. 2 dam; that is the water that flows towards the tunnel. I observe too now that this dam is acting as a filter, as Mr. Bell intended it to do. When the Committee visited it there had been a heavy rain, and it had overflowed, and was in our opinion doing more harm than good; now it is acting as a filter, and there is a clear stream running from it which goes to join the tunnel water. I think we ought to get a sample of the water flowing from No. 2 dam.

1990. I presume then your opinion is that the water in No. 2 dam, being in a stagnant state, and in contact with vegetable matter for some time, absorbs more of the matter which yields albumenoid ammonia. Now we know that a considerable deposit of peaty matter was found in the Crown-street Reservoir, and that water in that reservoir was pumped up from the engine-pond at Botany; therefore there must be a considerable quantity of peaty matter in the engine-pond; and as that is also in a quiescent state it seems probable that there is a large deposit of that matter at the bottom of it. Do you concur in that? Yes.

1991. Then if No. 2 dam at the Lachlan Swamp should be found impregnated with matter yielding albumenoid ammonia as you say, by stagnation, should not the same thing take place at Botany. Do you see any distinction between the two cases? Not a distinction sufficient to account for all the difference; but in the No. 2 dam you have a limited quantity of water in contact with a large quantity of vegetable matter only recently submerged, for No. 2 dam is not an old dam; and when vegetable matter is recently submerged we may conclude that more albumenoid ammonia will come out of it; but I would not say that is sufficient to account for the difference. The variations in the proportions of this albumenoid ammonia are puzzling on any hypothesis;—for instance, in the case of the engine-pond and the Crown-street reservoir.

1992. *Hon. J. B. Wilson.*] In your evidence given the other day, you stated that there was a considerable risk of contamination from the drainage of houses in the neighbourhood; do you think that risk of contamination could be easily removed by diverting all sewage matter? Mr. Bell has explained that; he has said that he can divert the drainage. I think the chief risk comes from the drainage of Waverley, and if that drainage could be diverted you would be able fairly to maintain the purity of the water.

1993. In fact you think that the risk of contamination arises from the drainage from Woollahra, Waverley, and Randwick, and if that could be diverted the risk would be removed? Yes, in the face of what we have discovered about No. 1 dam I have no hesitation in saying so; but we ought to keep out the drainage from those places.

1994. Have you any reason to suppose, if these sources of contamination were removed, that the Lachlan water would not be as good as it was formerly? I think it would not be quite so good, because, as I explained before, the water is now kept longer in contact with vegetable organic matter.

1995. You have stated in your evidence that you did not think, taking all the circumstances into consideration, it would be worth while for the Government to try and conserve this Lachlan water supply;—now, taking into consideration the number of years which must elapse before the city can be supplied from any other source, do you not think it is incumbent upon the Government or the Corporation to do everything in their power to maintain the purity of this water in the meantime? Yes, although as I think we ought to seek another source of supply, I would not be inclined to lay out any large amount of money in keeping out impurities.

1996. Do you not think, considering the number of years that must elapse before a fresh supply can be provided that it is all important to do everything that can be done? I would make it very much a question of expense. I said before, and I say still, I don't think it is worth while to go to any great expense to maintain the present supply.

1997. In your reply to question 1899, you state that if any disease should break out among the inhabitants on the watershed—a disease which would be communicable by water, you would not use that water; am I to understand that if the drainage from those houses were diverted you would even then object to use that water? I would not object to use it then.

1998. Have you made up your mind that to divert the drainage of those houses would have any effect in diminishing the water supply? Mr. Bell's surveys will probably furnish an exact answer to that question. I would rather not answer it myself.

1999. Do you think it would be proper, on the part of the Government or the country, to allow the drainage from the suburbs of Waverley, Paddington, and Randwick to run into the Lachlan Swamp even although that water should not be used for domestic purposes? If it were not used for domestic purposes I don't see that we need object to the drainage going into it.

Hon. J. Smith,
M.L.C., M.D.
7 Sept., 1875.

Hon. J. Smith, 2000. Do you not think it would soon get into a pestilential state like Shea's Creek, and, if surrounded by buildings, become injurious, and in short a nuisance? I would scarcely like to say what it might come to; but looking to its present condition, I would not go to any expense about it if it were not used for domestic purposes.

M.L.C., M.D.

7 Sept., 1875.

2001. There is one other question I would like to ask you as a distinct matter of fact: do you think the result of Professor Liversidge's analyses distinctly proves that the Lachlan water is dangerous to health? That is the point we have just been discussing, and I have expressed my regret at being obliged to differ from him; but I have given my opinion that the water entering the Bore is not dangerous to health.

2002. And you think the water entering the Bore is a tolerably good water? I think it is very fair water.

2003. Do you consider it dangerous water to supply to a town? Not at present.

2004. *Mr. Bennett.*] Would not that special danger of disease communicated by poison germs still exist if the first storm waters went into the catchment? I would say yes, with the qualification I gave to a previous answer—that so far as I know we have no proof that these poison germs travel far.

2005. But the danger would not be removed by taking the ordinary sewage away? If you did not prevent the first storm waters from being carried down you would not remove the danger.

2006. But if you did not remove the first storm waters these poison germs might be carried down by these waters? I think your question amounts to this: that if these poison germs get into the water it would be dangerous; I think it would.

2007. What I want to elicit is this: that the danger will still exist unless you provide for the entire removal of the storm waters? Such danger as there may be would still exist.

Charles Watt, Esq., Government Analyst, examined in his place:—

C. Watt, Esq. 2008. *Chairman.*] In reference to the conversation I had with you yesterday on the subject of these analyses, I understood you to say that in certain of the cases, more especially with regard to the water entering the Bore, the water in the engine-pond and some others which yield an excessive quantity of albumenoid ammonia, you found that they yielded a certain quantity of what we may call organic matter as shown by the ignition process, and you considered that quantity of organic matter, even if it were all vegetable or at all events of a peaty description, would be alone sufficient to account for the albumenoid ammonia present, or the greater part of it; and that you found the proportion of albumenoid ammonia to the quantity of this organic matter, as shown by the ignition process, was pretty equal. Is that what you stated? If you will mention any particular cases I shall be able to explain. Referring to Mr. Liversidge's report I find that to be the case with samples No. 1, No. 6, No. 8 which is rather more, No. 13, No. 15, No. 16, No. 20, No. 25, No. 27, and No. 29.

7 Sept., 1875.

2009. Then in those cases you feel some doubt whether this albumenoid ammonia has arisen from animal sources? I take seven analyses of the Bore water and I find that the mean quantity of volatile matter is in the proportion of 228 grains to 1 grain of albumenoid ammonia. Taking seven samples from the Botany low level service I find the proportion to be 339 grains volatile matter to 1 grain albumenoid ammonia. Taking 7 samples from the high level service I find the proportion to 275 to 1. From the best sources of information at my command I estimate that the volatile matter of the London Thames water as supplied to the inhabitants is about 160 grains to 1 grain albumenoid ammonia. In making these calculations I have not excluded some of the samples which show evidence of local contamination.

2010. Now if this organic matter, as shown by the ignition process, was ordinary vegetable matter, would you expect it to yield as much albumenoid ammonia as appears in Professor Liversidge's analyses? I should expect it to yield quite as much.

2011. *Mr. Bell.*] Is there a greater deposit from water which contains only a solution of peat than from water which is polluted entirely with sewage matter, both yielding an equal amount of albumenoid ammonia? I can hardly answer that question off-hand, but I should think the water containing the vegetable matter would have the greater deposit. What puzzles me is that water containing so much organic matter should yield so little albumenoid ammonia. There must be a large quantity of woody fibre from the grass in suspension; that is the only way I can account for it.

2012. *Chairman.*] Which yields very little of the albumenoid ammonia? Yes.

2013. *Hon. J. B. Wilson.*] With regard to the chlorine which has been discovered in the water in some of the analyses to a considerable extent, I should like to know whether you consider this a very reliable indication of sewage matter in the water? In some parts of the world I should take it as a very good indication indeed, but from our water supply being near the sea and other circumstances I am extremely doubtful about it.

2014. *Dr. Alleyne.*] I understand you to say that in this particular case you do not consider it an indication? I do not like to give an opinion about it; I have not been over the watershed very often.

2015. *Hon. J. B. Wilson.*] Have you any objection to give your opinion as to whether, after the consideration of Professor Liversidge's analyses, you consider the water from the Lachlan Swamp dangerous as a supply to the city? Well, I should much prefer that question to be handed over to the medical profession; I am not afraid to drink this water.

2016. *Hon. J. Smith.*] With regard to this loss on ignition—taking the first sample, No. 1, from the Lachlan Swamp, which is shown by Professor Liversidge's analyses to lose 65 parts per million on ignition, do you think fifteen parts would be a fair allowance for the inorganic matter? If the temperature used were not sufficient to volatilize any chloride of sodium, I think that would be a very liberal allowance.

2017. Then leaving 50 parts for organic matter, that 50 gives 20 of albumenoid ammonia, which is equal to 1 grain in 250 of organic matter? Yes.

2018. Suppose that organic matter were entirely of vegetable origin, would 1 grain of albumenoid ammonia in 250 be more or less than you would expect to find? Certainly not more. I have sought everywhere for analyses of Thames water, and as far as I can learn, the proportion of albumenoid ammonia is about 1 grain to every 160 of volatile matter.

2019. Don't you think that in this climate, with a pretty high mean temperature, we might expect a larger quantity of vegetable matter to be dissolved than would be dissolved under similar circumstances in Great Britain? Yes; especially from my own knowledge of the nature of the soil from which this vegetable matter is derived.

2020. Looking to this as a source from which the albumenoid ammonia may be obtained, you would expect C. Watt, Esq. to find more of it in the water here than you would in England? Yes.
2021. Would you therefore consider that the proportion of albumenoid ammonia could safely be taken in this country as a criterion of the wholesome or unwholesome condition of the water? I really do not think so, and it is my impression that this is a growing opinion in England at the present time. I find that Dr. Letheby in his reports is dropping the question of albumenoid ammonia altogether. 7 Sept., 1875.
2022. *Chairman.*] Can you support that statement by any authorities? [*Witness quoted from a report by Dr. Letheby in the Journal of Gas Lighting, Water Supply, and Sanitary Improvements, in which he gives "Nitrogen as Nitrates and Nitrogen determined as Ammonia."*]
2023. I understood you to say in conversation at our last meeting, that if you found, as Professor Liver-side did in analysis, that water contained 20 of albumenoid ammonia, you would look upon that water with suspicion, and that you would think it was desirable then to examine the sources of supply to see if it were contaminated? Decidedly—yes.
2024. You would consider it desirable to draw attention to it to see if it were contaminated with sewage? Precisely; it is the source of the albumenoid ammonia I want to know.
2025. *Mr. Moriarty.*] Have you read the Report of the Committee appointed to examine the present source of supply? I have.
2026. Coupling that report with your last answer, would you be inclined to attribute the contamination to sewage matter? I should have some difficulty in answering that question, because I do not know how far the sewage travels, and how much there is of it.

FRIDAY, 10 SEPTEMBER, 1875.

Present:—

HON. J. B. WILSON,
F. BELL, Esq.,W. C. BENNETT, Esq.,
E. O. MORIARTY, Esq.,

DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Messrs. Moriarty, Bell, and Bennett further examined:—

(The Report of No. 4 Committee on Busby's Bore read.)

2027. *Chairman.*] I have to report to the Board that on a day subsequent to the date of this report, when engaged on other business, Mr. Moriarty and I took the opportunity of again visiting the line of the Bore, and I observed that there was a very much larger stream of sewage matter going down the gutter from the houses on the west side of the Barracks—and sewage of a very marked kind, and of a slimy lead color. There was a much larger volume of it than before flowing down into the sand; and to my surprise—the body of water being so much larger—we still found that the pipe supposed to carry all this off was as dry as ever. Messrs. Moriarty, Bell, and Bennett. 10 Sept., 1875.
2028. *To Mr. Moriarty.*] Do you concur in what I have said? Yes, entirely.
Hon. J. B. Wilson suggested that it would be desirable to examine into the state of the tunnel at certain places.
2029. *Chairman to Mr. Bell.*] Would it not be a very serious inconvenience to let the Bore become sufficiently dry to examine it? It is nearly dry now; we are repairing the lock, and in a day or two the Bore will be perfectly dry.
2030. How do you supply the city in the meantime? We pump the water up from Botany.
2031. You turn it into the city mains from the Crown-street Reservoir? Yes.
2032. Then it will cause no special inconvenience to enter the Bore and examine it? No, no particular inconvenience.
2033. Do you take any exception to the statement I have made about this sewage matter going into the Bore? Yes, I do; I do not think any of it goes into the Bore.
2034. Where do you think it goes to then? I think it percolates through the ground from that old quarry-hole.
2035. But you must recollect that the hole is filled up with loose sand, so that the whole of this sewage matter is impounded in it? No, there is a drain to let it off under the road.
2036. There is no evidence of any such drain? You cannot see it; it is closed.
2037. But is it not impossible that this sewage matter could be carried off by a drain from the surface level when it goes into the sand in this old pit, the bottom of which is close to the Bore itself. There is no possibility of any outlet because the bottom of this hole is 25 or 30 feet below the surface of the ground, and any drain must be considerably above it? Mr. Bradridge knew that road before the embankment was formed, and he told me that that quarry-hole was drained, and that the drain had been filled with loose stones so as to act as a filter.
2038. We have it in evidence most distinctly from Mr. Stacey that there is no drain, and that the water soaks gradually away in dry weather, and Mr. Robertson's evidence confirms it? Mr. Bradridge has a section of the quarry-hole before the embankment was formed.
2039. *Mr. Bennett.*] One of the inspectors stated that there was an old jumper hole? That was high up in the shaft; I suppose it was 30 feet up the shaft where the water got in.
2040. We will leave that end of the Bore for the present and consider the entrance of flood waters into the Bore at the other end. Have you any objections to that portion of the report? Yes, because the Bore is a long way off the place you refer to. The large quantity of water that I found going into the Bore was about 150 yards from this road. But I should prefer to postpone the consideration of this report until I can bring a plan showing the position of the shafts, and the position of the road, and also a section showing the depth of the tunnel, and the spot where the water apparently goes into it.
2041. Where do you think all this quantity of water goes? I think it goes into the sand only.
2042. *Chairman to Mr. Bennett.*] Do you think it possible for all that water to disappear by simple percolation through the sand? No, I should think not.
2043. *Chairman to Mr. Moriarty.*] Do you think that this water could disappear by percolating through the sand as Mr. Bell supposes? No, and I could see no indication of that on the lower side.

TUESDAY,

TUESDAY, 14 SEPTEMBER, 1875.

Present:—

Hon. J. B. WILSON,
B. PALMER, Esq.,
F. BELL, Esq.,

W. C. BENNETT, Esq.,
E. O. MORIARTY, Esq.,
DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Thomas Bradridge, Esq., City Surveyor, called in and examined:—

- T. Bradridge, Esq., 14 Sept., 1875. 2014. *Chairman.*] We had some evidence from Mr. Robertson, and also from Mr. Stacey, as to the condition of a certain old quarry-hole which used to exist at the back of the Barracks; there seemed to be some difference of opinion respecting it, and it was suggested that you could give us some information as to its condition before it was filled up;—can you do so? I will do so willingly.
2015. Do you remember the place? I recollect it very distinctly; I lived in the vicinity of it for some time.
2016. When was it filled up? The work of filling up the quarry-hole was commenced in the early part of 1868, and completed at the latter end of that year, or the beginning of the next.
2017. Mr. Robertson says that this hole was about 30 or 40 feet below the natural surface of the ground before it was filled up;—does that agree with your recollections of it? Yes, it agrees with the sections which I have; that is to say, at the upper part of it, on the side next the Barracks, it was about 40 feet, but where the filling has taken place, where the ground was at a lower level than the upper portion, it was about 20 feet from the surface of the Park Road.
2018. I am speaking of the natural surface of the ground; it was stated to be 40 feet below the natural surface of the ground? It was so, as I have explained, at the upper portion, but where the filling-in has taken place it was about 20 feet deep. A part of it on the higher side may be seen now.
2019. This hole was made in the first place for the purpose of taking out stone? Yes, hence the name of quarry-hole, by which it was known.
2020. And it was filled up with sand? Yes, with sand and quarry rubbish.
2021. And the bottom of the hole was considerably lower than the natural surface of the ground? Yes. I will explain the position by means of a diagram. (*Witness made a sketch of the locality.*) I recollect the place in 1865, which was three years before the hole was filled up; there were traces of a drain in it which led to the Nannygoat Swamp. As far as my recollection carries me, the filling-up was done as part of the formation of the Park Road.
2022. Was it in a very filthy and disgusting condition? Yes, it was in rather a disgusting state; dogs and cats were drowned in it, and boys used to bathe there. It is possible that that might have originated the filling up; but as far as my recollection goes it was filled up for the purpose of making the road.
2023. That must have been a subsequent filling-up? No, I think not. I lived near the spot at the time: the filling-up was all done under one contract for the Corporation by Mr. Adam Sharp. I recollect the debris from the quarry being stacked up on the south-east side of it, and it had all the appearance of being in the condition in which the workmen had left it.
2024. There is no doubt that attention was called to that hole, because it was stated that the water in the Bore was contaminated, and that was the reason it was filled up; but I may be mistaken, or the filling up and the formation of the road may have taken place at the same time; at any rate it was filled in, drain and all? Yes.
2025. Have you brought with you a sketch or section of the quarry-hole? I have no sketch or section of it as it existed before it was filled up; but I have a longitudinal section which shows the Park Road, and the line where it was proposed to be before the diversion was made. (*Producing section and explaining.*)
2026. Then the drain to which you have referred could never have kept that hole dry? It left about 12 feet of water in it.
2027. *Mr. Palmer.*] When was that hole filled up? In 1868. The filling in was part of the formation of the Park Road.
2028. Was that the time you saw dead cats and dogs in it? Yes.
2029. What was it filled up with? With sand and with some of the ballast quarried from the higher part of the ground.
2030. *Hon. J. B. Wilson.*] Was the drain left in the same condition when the hole was filled up? Yes.
2031. *Mr. Bell.*] The water in the hole did not appear to run off? No, it always stood at one level. I never could see any change in it; it seemed as if there was no means of drainage except by overflow.
2032. Was there any drainage percolating into it from time to time? Yes, there was some subsoil drainage going into it.
2033. Would not that counterbalance any leakage that might pass from it? Yes, it might.
2034. *Hon. J. B. Wilson.*] That drain which was filled up with rubble was sufficient to keep the water at one level? Yes. I never saw any change in it.
2035. *Mr. Moriarty.*] The quarry was right over one portion of the tunnel was it not? Yes, the eastern portion of it goes over the tunnel.
2036. And your section shows that there is about 20 feet from the bottom of the hole to the roof of the tunnel? Yes, about that.
2037. *Chairman.*] Do you know how long Mr. Stacey has had charge of the Bore? Mr. Stacey was appointed in January, 1867.
2038. *Mr. Bell.*] Was it your opinion when you saw the water standing there that there was any leakage into the tunnel? No, the fact of the water standing there would lead me to suppose that it did not go into the tunnel.
2039. *Chairman.*] What did you suppose became of the leakage if it did not go into the tunnel? I suppose it would pass into this drain and go towards Nannygoat Swamp, which was much lower than the water in the quarry-hole.
2040. Was the water in dry weather frequently below the level of the drain? I will show you the levels (*pointing out levels on section*). The drain was a very long one, and filled with rubble stone, so that it was impossible to say where the water went to if it escaped, or whether it escaped at all.
2041. *Mr. Palmer.*] Was this quarry-hole filled in under your supervision? Under the supervision of Mr. Edwd. Bell, the late City Engineer.

2072. *Hon. J. B. Wilson.*] Have you been in the neighbourhood lately? Yes, about two months ago.
2073. Are you aware that on the south-eastern side of the Park Road, near the Rifle Range, there is a large open drain? Yes.
2074. Is there any connection between that open ditch and the drain from the old quarry? No.
2075. Where does that drain go? It passes under the road and takes the surface drainage of the land lying eastward of the Barracks—between St. Matthias' Church and the Barracks.
2076. There is no connection between that ditch and the drain from the old quarry? No, one goes to the western side of Nannygoat Swamp, and the other to the northern side. This sketch will shew you (*witness illustrated his meaning by a diagram.*)
2077. *Chairman.*] We are told that where the drain near the east end of the barrack-wall passes under the road a large quantity of water during flood time when it is backed up would seem to disappear into a hole there among the stones. One witness told us that more water appeared to escape there than through the pipe, and upon examining the opposite side of the road there was no appearance of any water escaping. Can you explain how such a large quantity of water could disappear without any apparent outlet? I think it would be very likely to pass under the road, which was constructed of pieces of ballast and stones from the quarry, varying from 3 cwt. to 4 cwt. to the size of your fist. It is very likely that the water passes through them under the road, and becomes absorbed in the sand below.
2078. I suppose all those cavities are pretty well filled up by this time with sand and rubble? I should think not at the bottom. We find in making excavations in material of this kind that although they may be filled in for some 3ft. or 4 ft. from the surface, consolidation does not so readily take place at the bottom.
2079. Have you examined this particular place since your attention was called to the alleged disappearance of a large quantity of water there? I have; the whole of that road is formed of similar material, and a large quantity of water might easily pass through the interstices at the bottom.

T. Bradridge,
Esq.

14 Sept., 1875.

REPORT

OF THE

COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD,

on the 25th May, 1875,

“To Inquire into the state of the Botany Watershed, and the appearance of the
Water,”

ADOPTED BY THE COMMITTEE, 3RD JULY, 1875.

THE Committee appointed to inquire into the state of the Botany Watershed, and the appearance of the water, having completed a careful inspection of the same, have now to submit the following Report to the General Board:—

1. Beginning with the northerly part of the area, we find that the drainage of the Barracks, and about 200 contiguous houses, finds its way, chiefly by open cuttings, into lagoons within Moore Park. Part of this drainage crosses the line of Busby's Tunnel, and may to some extent percolate into it. The lagoons in ordinary weather have no direct communication with the Botany drainage; and if they deliver any water into it by percolation it must be through such a thickness of sand as to effect perfect filtration. But after heavy rain the lagoons overflow and form a watercourse, which joins the Botany stream near the Racecourse. In such cases some pollution may be carried into the stream, but the water runs so far over grass that it must undergo a considerable amount of purification. It also forms some temporary lagoons on the way, and these will permit the heavier solid matter to subside. It should also be noticed that the lagoons in Moore Park appear to overflow but rarely; so that Mr. Seymour (who lives in the neighbourhood) was not aware of the fact until informed of it by the Committee. Our first visit to the place of overflow was on June 2nd, only three days after a fall of rain amounting to nearly 5 inches, yet there was no overflow at the time of our visit. Nearly 5 inches of rain again fell on the 4th, 5th, and 6th June. Our second visit to the spot was on June 8th, and the lagoons were then overflowing. Next day the overflow had all but ceased.

2. The drainage into the lagoons was not, as we saw it, offensive; but Mr. Seymour testifies that sometimes it is very offensive, especially in summer. Earth-closets are used at the Barracks, and it is only the house slops and surface drainage that pass down to the lagoons.

3. This source of contamination to the water is not in our view of much consequence at present, but as the houses increase it will get worse. Nearly the whole of this drainage, however, could be diverted and thrown into Shea's Creek at probably a moderate expense. (*See Mr. Grundy's Report to the Committee, appended.*)

4. Beyond St. Matthias's Church a group of houses, about sixty in number, on the north side of the South Head Road, have a natural drainage southward towards the Lachlan Swamps, but an embankment is being thrown up along the road by the Sydney municipality, which has the effect of diverting the drainage down Park Road, whence it disperses on the ground in front of the Rifle Butts. In heavy rain it will reach the lagoons above-mentioned. This drainage could of course be readily taken to Shea's Creek.

5. From this point round to Waverley we observed no material source of pollution; but at Waverley matters become serious. We counted about 180 houses, including two schools and a soap and candle factory, all draining to Lachlan Swamps; and a good deal of ground is still open for building purposes on the same slopes. Several herds of cows are kept here, and the cowsheds add to the pollution of the drainage. We followed down several of the streams that collect the Waverley drainage, and found that by the time they reach the first dam the water, although discoloured, was not particularly offensive to smell or taste. We saw these streams however under favourable circumstances. There had been heavy rain a few days before our visit, which no doubt had washed away a great bulk of the usual impurities, and left the channels tolerably clean. Mr. Seymour speaks in strong terms of the contaminations carried into the water-supply from this locality.

6. As this drainage may have an injurious effect on the health of the inhabitants who use the tunnel water, and seeing that the evil is increasing through the multiplication of houses, it would undoubtedly be advisable to divert the drainage, if it were found practicable without extravagant expenditure. It could be turned eastward towards the sea by tunnelling, or westward towards Paddington and Shea's Creek; and we would recommend that the Board should cause the necessary survey and sections to be made, in order to determine the approximate cost of the two methods. Further, in regard

to the Waverley drainage, we have to observe that the dams recently constructed in the Lachlan Swamps have the effect of checking the flow of water, and instead of the running streams which formerly existed, and which tended materially to purify the water, there is now a connected series of ponds, in which the water stagnates. The submersion of a large surface, covered by the usual scrubby vegetation, gives also an infusion of vegetable matter, which communicates some colour and taste to the water, though not to any marked or unpleasant extent. From these two causes, however, the stagnation of the water and the infusion of vegetable matter, the water at the tunnel mouth is obviously less pure than it was in the time of the Water Commission. We are so strongly impressed with the purifying power of a running stream that we think the uppermost dam in Fewing's Creek (marked No. 2) had better be removed, in order that the polluted water from Waverley may have a longer current, and thus a better chance of being purified. This dam has not a great storage capacity, but it stagnates the water for a considerable distance.

7. At Randwick the drainage of a few houses, and also that of St. Jude's Cemetery, passes down by the side of the Randwick Road, thence to some small lagoons on the Racecourse, and ultimately joins the Botany stream near the south-west corner of the Racecourse. We examined this drainage during and after heavy rain. The water in the upper part of its course was discoloured, but where it joined the Botany stream it was perfectly clear and bright, and quite free from taste or smell. We do not think that this drainage, even though it takes the surface water from the Cemetery, need be the cause of any uneasiness. Of course the mere idea of water from the Cemetery mixing with the town supply is unpleasant, and therefore it might be advisable to make a section from St. Jude's eastward, to ascertain at what expense the drainage could be turned towards the sea. It would probably not be great.

8. On the slopes west of Randwick we found a most extraordinary source of pollution—namely, the quarantine ground for diseased sheep. We say most extraordinary, because it seems to have been established here, close to the Lachlan Swamps, and draining directly into them, only two years ago, at a time when the municipal authorities were strongly impressed with the necessity of conserving the swamps, and when great efforts were being made to get rid of sources of pollution. The drainage from this quarantine ground (where poisonous mixtures are occasionally used for dressing diseased sheep) passes down to No. 6 Dam of the Lachlan Reserve, supplying the tunnel. After heavy rain, some of this drainage may overflow towards the Racecourse, and thence into the Botany stream. The whole of these slopes, although within the catchment area of the swamps, are outside the Water Reserve, and are liable to be built upon.

9. On the Racecourse the drainage from the grand stand and adjacent stables is entirely surface, and spreads eastward over the Racecourse reserve, collecting into two or three small lagoons about the middle,—the same lagoons that receive drainage from Randwick. We do not think that any possible contamination of the water supply from the Racecourse need excite apprehension.

10. The next point calling for attention is the Destitute Children's Asylum. This institution accommodates on an average about 700 children. Earth-closets are used, and their contents are spread from time to time on the cultivated land belonging to the asylum. Bed-room slops are emptied into the earth-closets. Kitchen and laundry slops are carried away to some distance by an earthenware pipe, and after the solid parts are separated by means of silt-pits the water is allowed to spread over a grass paddock and thence to Bird's Gully. It is intended to pump the water from the end of the drain to a higher level for the purpose of irrigation; and this will have the effect of further destroying the organic impurities in it. The houses contiguous to the asylum, about forty in number, besides two or three market gardens, drain also into Bird's Gully. The collected drainage passes down a sandy and rocky channel and empties into Dam No. 5 on the Botany stream. The length of this channel is such that we consider the water must be sufficiently purified before it mixes with the general supply.

11. Along the eastern edge of the catchment-basin we found no special sources of contamination. Towards Bunnerong we crossed several fine streams of clear water running towards Botany Bay. These could be intercepted, and turned towards the engine-pond of the waterworks. At Botany we inspected the enlarged engine-pond and other recent works. A great deal of vegetation is here submerged by the raising of the water-level, and tends to give a slight colour and taste to the water, but such vegetable infusion is not counted injurious to health.

12. Along the western border of the catchment area we found no permanent source of pollution beyond the abundant vegetation submerged by the dams. We observed, however, unmistakeable evidence of the recent deposit of night-soil by the side of the Bunnerong Road. This matter being under the consideration of the Board, steps will no doubt be taken to put a stop to the practice for the future. A good deal of the land on this side, within the drainage area, is private property, and liable to be built upon or otherwise made use of, so as to endanger the purity of the water.

J. SMITH,
Chairman of Committee.

Sydney, 3 July, 1875.

Evidence taken before No. 1 Committee.

SATURDAY, 19 JUNE, 1875.

Present:—

F. H. GRUNDY, Esq., | R. B. READ, Esq.

HON. JOHN SMITH, M.L.C., IN THE CHAIR.

Mr. R. Seymour, Inspector of Nuisances, called in and examined:—

1. *Chairman.*] Have you given any special attention to the drainage from the Barracks and the neighbouring houses? Yes.
2. Have you made any reports to the Municipal Council about that drainage? Yes.
3. Have those reports been made public, or can you communicate the substance of them to us? The reports have been made public, and proceedings have been taken against certain parties whose drainage proceeded into the watershed, some of whom were fined and some not fined. Some persons on the Woollahra side were fined for allowing the drainage of their premises to go into the watershed.
4. What do you mean by "on the Woollahra side";—does any part of Woollahra drain into the Lachlan Swamp? Yes, that portion of Woollahra from Piper-street to the South Head Road.
5. You say that proceedings have been taken against some of these people? Yes, and they were each of them fined at the Police Court.
6. On what account were they fined? For allowing offensive matter to flow on to the watershed.
7. And have any proceedings been taken against people living near the Barracks, where the drainage goes indirectly into the watershed? Do you mean on this side of the Barracks?
8. From the houses on each side of the Barracks? No, there have not. Several notices were served on the Colonial Architect in reference to the drainage from the Barracks going to the ground by the Rifle Butts and Moore Park.
9. And what was the result of those notices? Nothing was done whatever. They then commenced to erect water-closets in the officers' barracks, and they laid down a 12-inch drain and connected them with it; upon which I received instructions from the Mayor to go to the place, and as soon as they brought the pipe outside the wall, to break it, and stop the place up as soon as they opened it, which I did. The result was that they formed a large cesspool inside the Barracks, but where it drains to is a question.
10. That is the drainage of the officers' quarters? Yes.
11. And they have water-closets draining into that cesspool now? Yes.
12. But I suppose you are aware that in the men's barracks they use earth-closets now? I know they do.
13. How long have those earth-closets been introduced? They were introduced when the last Military Force was there, and it was on account of the horrible stench which came from the privies in the men's quarters that they were introduced.
14. Now that the drainage of the officers' quarters goes into that cesspool, and there are earth-closets in the men's quarters, do you think the nuisance from the drains outside the Barracks is as great as ever? Of course it is, because there is the same drainage going there—all the house slops and the drainage from the urinals. Previous to the introduction of the earth-closets in the men's quarters there were the ordinary closets, which could not drain there because they were cleaned out by nightmen.
15. Then as a matter of fact are the drains offensive now outside the Barracks? Very offensive in the summer. Of course now you can hardly perceive it, but in summer time the smell is almost unbearable, especially to a person living in the neighbourhood. The stench from that pond on a summer night is something dreadful.
16. To what pond do you refer? It is commonly called Billy-goat Swamp—at the back of No. 6 contract.
17. And in summer time the smell from that lagoon is very offensive? Very offensive. In summer time I have seen many of the Volunteers very ill indeed from the stench coming up from the Rifle Butts. My attention has been called to it thousands of times.
18. You referred just now [to the drainage from the Barracks;—do you think the drainage from the neighbouring houses is also offensive: I mean on each side of the Barrack enclosure? Of course it is.
19. I suppose all these houses have privies connected with cesspits, and not water-closets? Yes, ordinary privies. Some of them at Park Road have earth-closets; I myself have one.
20. In summer time, when that lagoon is very offensive, is there ever any overflow into the Botany stream? Very seldom; after very heavy rain the water rises very high and then goes into the Botany stream.
21. Then do you think that these lagoons are kept down by mere evaporation, or is there any other way for the water to escape? My own opinion is that that lagoon supplies the waterhole on the other side—Duck Pond.
22. If I remember rightly there are three principal lagoons, two on one side and one on the other? Yes; there is one known as No. 6 contract; another one opposite Stacey's; and one on the western side of the road—the ornamental one.
23. Is there any other way for the water in No. 6 contract lagoon to escape besides by evaporation? How else does that lagoon lose its water? My own opinion about that lagoon—No. 6 contract—is this, that when the water is decreasing in it, it is still keeping up in the Duck Pond, and as soon as No. 6 contract is dry, the Duck Pond begins to dry up. That is my opinion. I may be wrong.

Mr. R.
Seymour.

19 June, 1875.

- Mr. R. Seymour.
19 June, 1875.
24. And therefore you think the water from one percolates into the other? Yes, that is my opinion.
25. Do you think there is any likelihood of water percolating from these lagoons into the tunnel? I could not say. I think there is every likelihood of the drainage that goes across the Rifle Butts percolating into it.
26. Are you aware that after heavy rain these lagoons send a stream down to the Botany drainage? I am not. I have never seen a stream going down from what we call No. 6 contract; but I know there is from the other, below Stacey's, which we used to call Moore's Tunnel, nearer the toll-bar, where it goes under a culvert.
27. After that heavy rain which fell about a fortnight ago, we found an actual stream running down? It may be so. I should be sorry to say it is not, but I have never seen it myself. It must be after a very heavy rain, because, if you notice, the pond lies low.
28. *Mr. Grundy.*] That drain of which you spoke, crossing the road at Moore Park, and the water from which you say probably percolates to some extent, is that the offensive drain to which you referred as carrying away matter from the Barracks and the houses on either side? The houses on the eastern side only, because the other drainage goes down into the sand at the back of the military prison.
29. *Chairman.*] Have you given attention to the drainage from Waverley into the Lachlan Swamp? I have.
30. Does it fall within your duty as Inspector of Nuisances to attend to the Waverley drainage? No, there is an Inspector of Nuisances there, but it falls within my duty to attend to everything that is going into the watershed in the shape of pollution.
31. Have you ever observed offensive matters flowing into the water reserve from Waverley? Yes.
32. Can you describe more particularly the nature of those offensive matters? Yes; Mr. Allen's soap-boiling establishment at Waverley drains directly into the watershed. There was also a boiling-down establishment and a piggery belonging to Mr. Fewings which drained into the watershed. He was brought up at the Police Court and fined, and then he moved down to Coogee Bay I think. Then there is the drainage of all the streets right up to the church which makes its way to the watershed.
33. And you have observed that drainage to be offensive at times, have you? I have.
34. In how many cases have proceedings been taken against persons for allowing offensive matters to go into the water reserve? There were two cases.
35. Namely? Mr. Allen's and Mr. Fewing's. I think Mr. Allen was summoned twice.
36. And what was the result? The case was dismissed.
37. And in Mr. Fewing's case the result was that he was fined and left the locality? Yes, he was fined twice and then left the place, and shifted somewhere down towards Coogee.
38. There are several cow-keepers carrying on their vocations there; do you think the cowsheds are a source of much nuisance? I do.
39. I suppose in that neighbourhood the houses are supplied with common privies—there are no water-closets? Ordinary privies—no water-closets.
40. Connected with cesspits? Yes.
41. Do you think any polluted water from cesspits flows down into the water reserve? It may, but I have not seen it.
42. *Mr. Read.*] Mr. Seymour—I wish to know what grounds were given for dismissing the case against Mr. Allen; was not one reason given, that the drainage passed into what is a recreation ground, and that on that account no penalty could be enforced? Mr. William J. Allen, soapboiler, of Waverley, was summoned to the Water Police Office on the 10th and 17th March, 1873, and the trial came on before Messrs. Hale and Lester, who decided that Mr. Allen's drainage did not flow direct into the water reserve, but on to a piece of land which had been reserved as a public recreation ground for Waverley, over which the City of Sydney had no control. Both cases were dismissed on the ground of want of jurisdiction.
43. Does that nuisance still exist? It does.
44. And is still very offensive? Still very offensive.
45. *Chairman.*] Passing round from Waverley, can you indicate any other source of pollution on the eastern side of the watershed? Yes; there are several houses which stand between Waverley and Randwick, on the lower side, and there is a very large cow-keeping establishment there.
46. Still further round, what would you indicate as the next source of pollution? Further round you come to the Government sheep station.
47. Have you observed that station to be a source of contamination to the water? Yes, after a heavy rain I have traced discoloured water going from there, getting into the side of the fence, and running across the Racecourse to the Botany Reserve.
48. Do they wash sheep at the Quarantine sheep station? Yes, there were 322 sheep when I was there.
49. And you think discoloured water goes direct from that station to the Botany watershed? Yes, I am sure of it, because we sunk holes on either side of it, and found the water perfectly sweet.
50. Are there constantly sheep there? Yes, I am sure of it; I have never been on the place but I have seen a great number of sheep there. I can see them constantly with my glass.
51. Would there be any drainage from the Quarantine ground, towards the Racecourse, except after heavy rain? It must always go there after rain.
52. But, except after heavy rain, the drainage would sink into the sand? Yes, it would sink into the sand and then percolate through the sand and follow its own course.
53. Have you ever given attention to the drainage from Randwick, which goes down the Randwick Road and passes into the Racecourse? Yes.
54. Have you ever observed it to be offensive? I have.
55. Have you examined the drainage from the Destitute Children's Asylum which passes into Bird's Gully? I have, very minutely.
56. What is your opinion of that drainage? Well, it goes at the back of the Institution to the southward; goes down the public drain and then into an open drain, which I believe is carried straight off to Botany; at least that is what we were led to believe from our inspection.
57. But what is the character of that drainage. Was it, as far as your observation went, offensive? Very—very offensive; it seems to be that the whole drainage of the Institution goes down there.
58. Are you aware that they use earth-closets in that Institution? I am not. Still that would not prevent the drainage from being offensive, because where there is so much washing and house slops, and so many children, the drainage must be very bad; in fact it was so when I was there.
- 59.

59. Can you indicate any other sources of pollution to the water supply, except those we have enumerated? I do not think so, unless I were to give you the number of houses in each municipality. I could give you the number of houses, the number of inmates, and the number of cattle. I find in my report (*referring to report*) of 21st April, 1873, to the Mayor and Aldermen, that the number of houses sending their drainage to the watershed was — in the City of Sydney 33, inmates 159; in Paddington 82, inmates 481; in Randwick 11, inmates 42; in Woollahra 36, inmates 191; in Waverley 172, inmates 801, making a total of 334 houses and 1,674 inhabitants. There were also 77 cows, 39 horses, 10 pigs, and 322 sheep.
60. Do you know whether the number of houses has much increased since you made that report? Yes, it has.
61. Can you give any rough estimate of the present number? I could not; it is out of my jurisdiction. That was a special report, ordered by the Council, and I had to make it when I could spare time from my other duties; it occupied me a couple of months.
62. I suppose it has been no part of your duty to inspect the dams on the Lachlan Swamp? No, that belongs to the City Engineer's department.
63. *Mr. Grundy.*] I should like to know how long that sheep quarantine station has been where it now is? It was put there in the commencement of '73.
64. Do you know why it was put there within your catchment area? I do not know. I made a complaint of it once, which was forwarded to Mr. Yeo, and he reported upon it to the effect that no injury could be done to the watershed by that station, although we had seen some dry tobacco leaves, supposed to contain some chemical matter, going down in the drainage from the place where the sheep are washed.
65. And you do not know why that situation was chosen for the purpose? No.
66. And the Government selected that place? They did so, and in defiance of the Corporation. The Corporation did all they could to get it removed, but the Government would not consent to it. Mr. Road has met us there frequently going out to that place, and knows all about it. There are three classes of sheep there—bad, very bad, and much worse.
67. *Chairman.*] They use a wash of tobacco and other chemicals to dress the sheep with, do they not? Yes; and one of the chemicals Dr. Danséy said at the time would be direct poison if it got into the watershed.
68. And all these matters are liable to get into the watershed? No doubt the drainage must go there. Then there is the droppings of the sheep, which burns everything it comes across until it is a certain number of years old, and what can be worse than that?
69. There is no pollution that you know of entering the water supply about Botany? No, there is none; I have inspected it some dozens of times, and recently within the last few weeks. The drainage passes down by the south dam on one side, and to Shea's creek on the other.
70. *Mr. Road.*] Is it possible that percolation takes place from between Shea's Creek and the Botany water supply? It is impossible.
71. *Chairman.*] There was a dog-kennel, I believe, on the Bunnerong Road; has not that been removed? Yes, but the building remains; at least it was there when I went out some weeks ago.
72. After races at Randwick have you observed offensive matter flowing from the Racecourse into the Botany stream? No, I have not; I have not been out there lately. There can be no doubt there must be a great accumulation of matter on that ground, and that it must wash down there after rain, but I cannot say that it is so from personal observation.

Mr. R. Seymour.
19 June, 1875.

NO. 1 COMMITTEE—APPENDIX.

Francis H. Grundy, Esq., to Professor Smith, M.D.

183, Pitt-street, Sydney,
10 June, 1875.

Dear Sir,

Pursuant to your request, as Chairman of Committee, No. 1, of the Sewage and Health Board, I have made an examination of the ground from Shea's Creek to Paddington heights, and also from Moore Park Road and the Barracks across the Rifle Ground, &c., to the first lagoons, and thence to the culvert under the Randwick Road. I find, from flying levels I have taken—first, that the drainage from about 200 houses and the Barracks finds its way on to the Rifle and adjoining ground, and thence into the lagoons. I find that those lagoons are in direct communication with the culvert, under the Randwick Road, delivering, after rain such as that of last week, a somewhat rapid current, having a fall of 7 feet in one-third of a mile—the culvert we know to deliver the water passing through it on to the Botany watershed—so that such of the contamination from the Barracks and the 200 houses as is not got rid of by the way does add to the fouling of the Botany waters.

Secondly, I found (as I suggested to you would be the case) that there would be no difficulty whatever in cutting off all that contaminated water by a drain or sewer into Shea's Creek; it would be on the surface all its length, and might be made additionally useful in cutting off *most* of the house drainage of the Surry Hills, Crown, Bourke, and a number of other streets, which at present runs into the flat low land at the head of the creek, and stagnates there. This drain would be at a much higher level than the low ground mentioned, probably 30 feet, and would cut off a nuisance, delivering the water into the creek anywhere beyond. This drain would be about 8 feet below the houses opposite Moore Park, would have a fall from the Barrack-gate of 3½ feet, and contouring the new houses of South Paddington, would cut off all but two, having a nearly regular descent to the Park Gate of 12 feet in rather less than ½ a mile. The fall for the rest of the distance from Upper Paddington is rapid. If thought advisable, this drain could be continued to Waverley, and cut off the contamination there also, but that would interfere with the area of watershed. I think it might be well to make a more accurate section of this proposed scheme.

I am, &c.,
FRANCIS H. GRUNDY.

[No. 2 COMMITTEE.]

REPORT

OF THE

COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN
SEWAGE AND HEALTH BOARD,*on the 25th May, 1875,*

“To enquire into the Nuisance existing in connection with the Waterhole on the Sugar Company’s premises in Parramatta-street, or otherwise,”

ADOPTED BY THE COMMITTEE, 18TH JUNE, 1875.

THE Committee appointed by the Sydney City and Suburban Sewage and Health Board to examine certain ponds upon the Sugar Company’s premises adjoining Parramatta-street, having brought their duties to a close, have now to report as follows:—

The ponds in question are supplied by a creek or watercourse, which receives a large portion of the surface drainage from municipalities adjoining the city, the southern branch of the creek having its origin at the back of the Institution for the Deaf, Dumb, and Blind, in the Municipality of Darlington, and the eastern branch taking its rise in the Municipality of Redfern.

In all the localities which act as tributaries to the main creek there are at the present time a considerable number of habitations, and many more are being erected, so that the waters which enter the main creek are contaminated from the commencement.

As the creek proceeds towards the Sugar Works ponds it constantly receives fresh additions of foul matters from cesspits, cow-yards, and stables, which allow their fluid matters to leak into it, and other sources of pollution too numerous to detail; and there cannot be a doubt that the watercourse, in the present condition of its banks, is a serious nuisance, injurious to health throughout its entire course.

The water which passes down this creek is first impounded by the Sugar Company in a pond, from which it passes into a dam, and having been used for certain purposes is ultimately returned to its course to the harbour.

The water in the dam was found to yield about thirteen grains of organic matter per gallon. This quantity does not indicate such a degree of impurity as we should have expected in a water which had passed through such a locality. This we think may be accounted for in several ways:—1st. The water in the pond and dam is allowed to settle, and deposits much of its impurities as mud; a sample of which, taken from the pond and thoroughly dried, yielded 8 per cent. of organic matter. 2nd. The engineer of the Sugar Works informed us that during the times of heavy rains he allows the first rush of water, which brings down mud and filth from the banks of the creek, to pass down a by-wash instead of entering the pond and dam. 3rd. Many of the small supplies of foul fluids from isolated dwellings, cow-yards, &c., only just reach the banks of the creek, and there evaporate, yielding their fætid gaseous products to the surrounding atmosphere. 4th. We were informed that the condensed water from the vacuum pans, &c., is allowed to pass into the dam, which would of course dilute the less pure water entering the dam from the creek.

It is perhaps as well for us to state here, that our examinations of these localities took place shortly after very heavy rains, and during cool weather; it is therefore very probable that had our inspections been made during hot and moderately dry weather; we should have felt called upon to have used stronger language with reference to the nature of the fluid passing down the upper part of this water-way.

We now submit the following conclusions at which we have arrived, and the evidence that we have taken, for the consideration of the Board:—

- 1st.—That the watercourse, from its commencement to its termination in the harbour, may be regarded as little better than an open sewer; and upon its banks various foul matters are to be seen throughout its length.
- 2nd.—That as the population in its vicinity, both above and below the Sugar Company’s premises, is rapidly increasing—evidenced by the new buildings which are being erected—its condition must be continually getting worse.

3rd.—

- 3rd.—That in addition to the drainage from human dwellings, &c., within the city boundaries, receives a large amount of foul fluids from the surface drainage of various municipalities before it enters the city.
- 4th.—That it is possible some legislation may be required with reference to the surface drains of such municipalities as act as tributaries to the main creek.
- 5th.—That the Sugar Company use the water only for such purposes as refrigeration, &c., and that it is not brought into contact with the sugar, or any article used in the purification of sugar; for which latter purpose water supplied by the Corporation is employed, and for which the Company pay a large sum annually.
- 6th.—That the Sugar Company appear for some time past to have done, and still are doing all they can legally, to prevent visible foul matters, which they can trace to any particular source, from finding their way into the watercourse above their pond and dam.
- 7th.—That although the Sugar Company may be able to effect this in one or two particular instances, such as in the case of a manufacture yielding some waste products which can be identified so as to yield evidence in a Court of Law, still there are numerous contributions of foul matters which they cannot reach, and which, from their nature, are as bad, if not worse, than the former.
- 8th.—That the Sugar Company do not themselves in any way increase the impurity of the water they receive; their only offences in this respect being its storage and the elevation of its temperature; which latter must, of course, tend to promote the putrefaction of any organic matter which the water may contain, either in suspension or solution; as the temperature to which it is raised is that at which such changes most rapidly take place.
- 9th.—That the Sugar Company use the water as a necessity, because they cannot command sea-water within any reasonable distance, which would be of a much better quality than that which they now have; and the cost of the quantity, if obtained from the Corporation at the present price, would be almost a prohibitive tax upon their important industry.
- 10th.—That the Company might be fairly called upon to adopt some system of filtration for the water before it enters their pond; and that of a sufficiently effective character to remove, at any rate, the suspended organic matter; by so doing a much diminished quantity of foul matter would collect at the bottom of the ponds, and the nuisance of the storage of the water would be reduced to a minimum.
- 11th.—That the Company might also be required to take care that no foul mud be allowed to accumulate in the pond or dam, by having them efficiently inspected and cleaned out as often as requisite. In both of them we found much more deposit of foul mud than should be allowed to accumulate, especially in water which is being continually heated.
- 12th.—That the lower part of the drainage, commencing where the water leaves the Sugar Company's premises, requires early and serious attention, as here it receives many fresh pollutions, and persons passing on the footpath, especially on the north side, cannot fail to have their attention called to its disgusting state.
- 13th.—That houses are being built in the vicinity of this portion of the water-way on ground at a lower level than can be satisfactorily drained by any gravitation system which can be adopted. Residents in these houses must of necessity suffer in health.
- 14th.—That the whole of the districts that we have examined were found by us to be in a state to fully account for any rate of mortality, however excessive, and likely seriously to increase the rate of mortality of districts not in immediate contiguity.

CHAS. WATT,
Chairman.

Evidence taken before No. 2 Committee.

THURSDAY, 3 JUNE, 1875.

Present:—

G. F. DANSEY, Esq.,

F. H. GRUNDY, Esq.

CHARLES WATT, Esq., IN THE CHAIR.

Mr. Samuel Pohlman, Engineer to the Colonial Sugar Refining Company, called in and examined:—

1. *Chairman.*] Are you engineer to the Colonial Sugar Company? Yes.
2. I presume that your position as the engineer of the Company gives you a thorough knowledge of every circumstance connected with these waterholes, or reservoirs, or ponds;—what do you call them? Yes, they are dams or reservoirs.
3. There are two of them, are there not? Well, the outside one we scarcely call a dam.
4. You might say there is a dam and a waterhole? Yes.
5. Your position then is not what is usually called that of an engineer so much as that of superintendent of the works? It is part of my duty as the engineer to look after the water supply from these ponds.
6. Are these ponds, or is this dam and pond, in the exclusive possession of the Sugar Company? Yes.
7. No other person has any right-of-way of any sort into it? No, except the Government.
8. No private person has a right to hold land where that dam and pond are situated? No; the nearest approach to anything of the kind was the other day when we gave the Corporation the option of running a sewer through it. It was considered by them, I believe, as I told you the other day.
9. Then you can exclude the public from the dam and pond and prevent different matters from being thrown into them? Certainly we can.
10. But, as a fact, is the dam and pond used in any way now by the public? No.
11. Nothing is thrown into them by the public? No; it is securely fenced in.
12. It was not when I went up; I only saw one side fenced? A portion within the enclosure is fenced off on two sides for the purpose of making a bonded store. The whole property is enclosed by a 6-foot fence.
13. After the water enters your ground, any further contamination which it may suffer rests with the Company? Yes, and I may say that at the present time we have a suit going on —
14. I will ask you a question about that presently. Are you familiar with the drainage area from the houses, manufactories, stable-yards, and other sources which supply that pond with water? Well, I am familiar with the place, but I cannot speak as to the quantity of drainage.
15. Generally speaking, you know the localities? Yes.
16. Have you ever heard of, or have you yourself received, any complaints in reference to any disagreeable effluvia arising from the pond or dam? I never have myself.
17. You have received no complaints yourself or heard of any from other quarters? No complaints have ever been made to me, but while I was away from the works at one time I heard that Mr. Seymour had made a complaint about some water that was stored there being impure, and the water was let off at once, and there was an end of it.
18. I ask you the question, because being an officer of the Company you would know whether complaints had been made frequently? There have not, or else I should have heard of them.
19. Not by the Inspector of Nuisances or any other officer? No; Mr. Seymour made a complaint, as I have just stated, and we let the water away at once. That is the only time I ever heard of anything of the kind, and the thing has never occurred again. There was no means of letting anything pass away at that time. It was represented to Mr. Seymour, I believe, that there was something wrong there, and he went on to the ground, and the matter was rectified at once.
20. Then at that time all the water received along the water-course went into your pond or dam? Yes, everything.
21. And now you have some other arrangement, have you not? Yes, as I explained to you the other day.
22. Now what becomes of the surplus water. You have more water coming in than your pond and dam can take? Our pond is always full, and whenever rain falls, which is likely to cause a heavy stream for a day or two, we have a sort of storm-race, which is kept open for, perhaps, days together, and then when the creek is washed through the water-valve or gate is closed, and the surface-water goes on one side.
23. Then the only difference now is, that you have the means of stopping the water from coming into the pond which you had not before? Yes, exactly; and there is always a man in attendance day and night when the weather is at all bad at that floodgate.
24. Have you at any time taken steps, legal or otherwise, to secure the water going into the pond from pollution? Yes, we have.
25. Will you inform the Committee whether this has happened more than once, and whether what you have

Mr. S.
Pohlman.
3 June, 1875.

Mr. S.
Pohlman.
3 June, 1875.

have done has proved effectual? Yes, we have taken proceedings twice against the same person, and been successful, and a suit is now pending against him for the third time, and each time the result has been that we have had the water as pure as we could wish it to be,—nothing whatever to complain of.

26. Have these proceedings always been against the same individual, or different individuals? Against the same individual, as far as the Company were concerned, but there have been other proceedings by the municipality —

27. We shall have that from the municipal officers. Whatever proceedings have been taken have been against the same person? Yes.

28. Are you generally of opinion that the Company have done all they could to prevent the water coming into your ground from being polluted? I believe they have done everything they could do. They have spared no money in carrying out anything suggested either by myself or any one else to avoid a nuisance.

29. For what purpose do you use that water on your works? For condensing and working in connection with the pumps.

30. Do you feed your boilers with it? A portion of it only.

31. Have you perfect confidence that no portion of that water ever, at any time, comes in contact with the sugar, or with anything that has to be added to the sugar? No, it does not.

32. Not with the sugar itself, or with anything that is added to the sugar in any shape or form? No; with nothing that is added to the sugar, or could possibly mix with the sugar.

33. I wish to have this in evidence, because the public are anxious to know whether any portion of it is used either to purify the sugar or for any other purpose connected with the sugar? It is not used for the sugar in any way.

34. Is it possible that the water in this pond becomes polluted in any way by any drainage or anything in your paddocks? No, it is not.

35. Nothing lying about the banks which might cause the water to be contaminated, or from anything from which disagreeable and offensive vapours could arise on your premises? No.

36. No refuse matter of any kind, connected with your operations, are thrown into that water? No.

37. If the water is any worse after using it it must be from your operations and not from anything outside? Yes, if it is worse. With regard to its being used there is the washing of bags; they are washed in the water which is used for the vacuum pans. It is then at a temperature of perhaps 90° to 100°. After we have collected the matter from the bags they are thrown into this water, washed, and partially dried. We pass them through a regular machine for the purpose of drying them, so that nothing can come from them.

38. May I ask you what becomes of that solution which comes out of the bags? It goes out into the creek in the lowest level of our ground.

39. It does not find its way into the treacle? It would be impossible, unless mechanical means were used to lift the water, because it is the lowest level on our ground.

40. Is there at all seasons of the year a stream entering the pond, and permanently leaving it, sufficient in your opinion to prevent the water from becoming stagnant? Well, it has been my experience that it is so.

41. Sufficient to cause a circulation of the water, so that it does not become absolutely stagnant? Yes, that has been my experience.

42. At all seasons of the year? Yes; provided people on the creek, that is, the residents in the neighbourhood, do not run any offensive matters into the creek.

43. Then it is your opinion that there is such a quantity of water going into the dam and permanently leaving it at all seasons of the year as to prevent the water in that dam from being stagnant? Yes.

44. When were these ponds cleaned out last? I should say about two years ago was the last time.

45. Do you think that is sufficiently often to clean them out, considering the quantity of water you have to deal with? Well, it is sufficient for the inner one, that is the larger one.

46. You think it is sufficient for the dam? I do, for the dam.

47. And is it for the receiving pond? Yes, if we get nothing but good water from the creek into it. If I thought otherwise I would do it oftener.

48. As a fact you think that once in every year and a half is sufficient? I think so. The water has been made quite unfit for use by running things into it. It has been cleaned out about three times in four years.

49. Can you yourself suggest anything that could be easily done, or with moderate facility, to ensure that water from contamination previous to its entering your ponds—anything that could easily be done? There is no doubt it could be done, but I am not certain whether I could do it without the application of pumping power. It might be done to a certain extent without that, but to do it thoroughly I believe I should require a large filtering place and some pumping power.

50. Don't you think if you filtered off that suspended matter from the water it would become less objectionable and offensive in the summer time? Yes, perhaps so.

51. Should it become necessary to adopt some system of filtering before the water enters the pond, would the Company undertake it do you think? I have no doubt the Company would. I might take upon myself to say that they would carry out anything I made up my mind to recommend.

52. Do you know at all whether the water which passes out of your ponds, after it leaves your works and before it enters the Blackwattle Swamp, is used for any manufactories, or for any other purposes at all? Not to my knowledge, and I do not believe it is in any way.

53. Mr. Grundy.] You tell us that the water after entering your premises receives no further pollution of any kind? None whatever.

54. Did we not see certain decomposing sugar bags and other things which were thrown into your paddock and soaking into the pond, which gave out a very unpleasant odour? Not into our pond; that goes into the waste water creek.

55. You spoke of the comparative purity of the water in the dam? Yes.

56. You did not explain to us, I think, that that comparative purity arose from the pond being a sort of catchment area for the water that goes down the creek, where it has little or no motion left, and therefore purifies itself by depositing the debris that is carried down with it? No, we have gone down to the extreme end of our boundary, so that the water may go round and cool again.

57. But, besides that, it deposits the debris that comes down. Is not the water more pure in the dam than in the pond? Well, I don't know; I think not. You saw the water going from the creek into the pond.

58. *Chairman.*] You are aware that when we visited the Company's works on Tuesday last, after that heavy rain, we inspected the water. Was it better or worse then than usual, as the result of that heavy rain? It was not so clear as it will be in a week's time, and in a fortnight's time it will be still clearer. The dam will be purer in every way in a week or a fortnight. It was so in the middle of summer when there was no rain at all. You could take the water and boil it, and there was no smell whatever. All the mud and clay subsides during the dry weather.

59. *Dr. Dansey.*] Is the dam or waterhole, *alias* pond, supplied only by the drainage into it, or is it otherwise supplied? It is otherwise supplied—that is partially.

60. But the principal mass of water in the ponds comes from the drainage of the neighbourhood? It comes from the creek; the other supply is merely from the roofs of our buildings, and the city water when we have done with it.

61. What do you use the water from the city for before you send it back to the dam? For the animal charcoal, which has to be cooled down by water. It is in fact almost immersed in the city water. We have a hose to supply the water, and when it is put into the cistern, which is 20 ft. x 9 ft., there is a large quantity of fresh water comes from it. That goes back.

62. But that is not a large quantity? There is a good quantity of it.

63. After using the city water to wash the animal charcoal does it not take from that animal charcoal a certain quantity of saccharine matter to the pond? We could not afford that; we don't let it go as long as there is a particle of saccharine matter in it.

64. Then it goes back pure water? Yes.

65. Does not the filth coming from the creek into the pond settle in the bottom and sides of the pond? Well, there is some—there is bound to be some; but the creek is run through pretty frequently, and we avoid that as much as possible by attention.

66. In quiet, warm, and dry weather, does not the smell from the exposed sides of the dam become offensive? They are not exposed; they are always kept up to the same level—the dam is never sufficiently empty to expose a large surface of the banks. In addition to the water that comes in in dry weather I have a well of pure water from which I can pump 25,000 gallons a day if necessary, so that there is always some water going down the creek.

67. *Chairman.*] Have you ever seen faecal matter brought into your property by the creek before it enters the pond? I have not.

68. Have you ever seen soap-suds and such matters as that coming in? I have seen them in the creek, and also all such things as would be likely to come from the soap factory; but I have never seen them in the pond or dam.

69. And that would be likely to cause the actions of which you have spoken? Yes.

70. *Dr. Dansey.*] Have you ever been obliged to scoop this scum from the surface of the water? Yes, I have—soap refuse and grease. I might say it has almost been taken to the Town Hall in barrow-loads. I took a lump of it once when Mr. Chapman was Mayor, and I sent for him to see it. We had repeatedly to do the same thing.

71. Could not this pond be done away with and the works carried on as well with a supply of water from the city main? They could.

72. Do you think the city could supply you with water now? The works could be carried on if the city could supply us with a quantity at a reasonable rate, but I do not believe they could supply it.

73. *Mr. Grundy.*] Does your reply mean because the supply to other places in the neighbourhood on the same level as yours is insufficient, and there would not be enough for the additional supply you would require? Yes, both at the Glebe and Redfern; at neither place can they get it two feet above the ground floor, and that being the case they would never get it at all if we were supplied from the city, except on Sundays, when we were not working.

74. *Dr. Dansey.*] Have you any opening at the end of the dam towards Parramatta-street to let off the water? We have a surface outlet at the north-west corner, and a bottom outlet at the north-east corner.

75. *Chairman.*] I believe you use a large quantity of animal charcoal in your works, do you not? Yes.

76. Is this animal charcoal at any time prepared on the works? No, it is not made there—it is only cleaned.

77. Do you burn the bones there at any time for the purpose of making the charcoal? No, we have done so years ago.

78. When did that operation cease to be carried on in your premises in Parramatta-street? We have not done it for the last four or five years.

79. Do you stack any bones of any kind, either boiled or unboiled, in Parramatta-street? No, nothing of any kind comes into the yard.

80. Do your operations oftentimes give rise to any quantity of residuary matter—what may be termed rubbish? Nothing worse than sugar bags.

81. But in large quantities I mean. Could you make an estimate—so many tons per week of refuse, not including of course the usual scum from sugar, or anything of that sort? No, that goes away with the sugar bags; there is nothing else except perhaps some flakes of mats, such as you saw in the paddock, which was all the rubbish we have made for the last two or three years.

82. Then all residuary matters are of such a character as to admit of their being burnt up, and so as not to be a nuisance to the neighbourhood? Yes, and they will be in a very short time; there is a little clay and dirt, but that goes with the bags.

Mr. Richard Seymour, Inspector of Nuisances, called in and further examined:—

83. *Chairman.*] I believe, Mr. Seymour, your duties as Inspector of Nuisances cause you to be familiar with certain ponds or dams on the Sugar Company's land adjoining Parramatta-street? Yes.

84. When did you last visit those ponds? About a fortnight ago.

85. Have you personally inspected the various tributaries which supply those ponds with water? I have on two or three occasions.

Mr. S.
Pohlman.

3 June, 1875.

Mr. R.
Seymour.

3 June, 1875.

Mr. R.
Seymour.
3 June, 1875.

86. Do you know where that water leaves the Company's land—at what point, and where it runs into the harbor? It leaves the Company's land at the north-east corner of the pond, and then goes under the road where Pemell's Mills were formerly, alongside the Sugar-works, and then crosses Parramatta-street and goes down to Blackwattle Swamp.

87. Is that way from the Company's premises, where it meets the road, covered or uncovered? It is not covered until it gets to Parramatta-street, and it goes under the road, and then it is uncovered until it gets to Blackwattle Swamp.

88. Can you produce any plan showing the surface drains that lead into the creek or ditch which supplies the ponds on the Sugar Company's premises, of which we are speaking? No, I have nothing of the sort; that is not in my department.

89. Do you call it a creek or a ditch? It is a natural watercourse.

90. Where does this watercourse first come under the control of the Sydney Municipal authorities—first come within the city boundary? At the corner of Wattle-street, one portion of it, and the next portion at the junction of Cleveland-street, between Darlington Municipality and the Sydney Municipality.

91. Is that the first point at which the City Corporation have control over it? Yes, that is the first point.

92. And what are the other municipalities through which this watercourse passes before it enters the Sydney Municipality? Redfern and Darlington and a portion of Newtown.

93. Have you or any of the municipal officers made any report to the Mayor and Aldermen as to the condition of the waterway which runs the water into the Sugar Company's ponds? Yes, I have a copy of the report sent in to the City Council on the 22nd October, 1872, by Dr. Dansey, the City Health Officer and myself. This was the result of our inspection, and it gives you a description of the different tributaries. (*Report read as follows*):—

“ Office of Inspector of Nuisances,

“ Town Hall, Sydney, 22 October, 1872.

“ To the Right Worshipful the Mayor.—

“ Sir,

“ We have the honor to report that, in accordance with your instructions, we visited, on October 21st, the creeks complained of by the Sugar Company, one running from Redfern and the other from Darlington to Chippendale.

“ The head of the creek at Redfern is at the back of Mr. Mulcahy's Soap and Candle Manufactory, in the Botany Road, but the drainage of Redfern, from Pitt-street on the east and Redfern-street on the south, flows into this creek, which, near its confluence at Chippendale with the creek flowing from Darlington, is dammed up and is full of very offensive matter. The drainage of a portion of Chippendale and of the whole of Darlington and Shepherd's Paddock flows into the creeks.

“ In addition to the ordinary house and street drainage we find the following offensive matter running into the creeks, viz.: The drainage from Mr. Mulcahy's manufactory, above referred to; contents of a most filthy drain from water-closets and premises of Messrs. J. Coates, M'Call, and Forsyth, on the opposite side of the Botany Road; drainage from two double water-closets of houses in Yarnold-street, the property of Mrs. Jane Lloyd (this last as well as the street drainage of Yarnold and Hart streets flows across an open paddock for a distance of about twenty yards and is very foul); drainage from a cowyard and pigsty in Yarnold-street, in the occupation of Mrs. Foster; drainage from two water-closets of houses in Edward's lane, off Shepherd-street, Darlington, the property of Mrs. Coleman; and drainage from two water-closets of houses in Vine-street, belonging to Aaron Loveridge.

“ We were informed that a number of water-closets in Redfern also drain into the creek which supplies the Sugar-works.

“ We have, &c.,

“ G. F. DANSEY,

“ City Health Officer.

“ RICHARD SEYMOUR,

“ Inspector of Nuisances.”

(True Copy.)

94. That report was the result of certain complaints which the Sugar Company had made to the City Municipal Council, and they set the Council in motion? Yes, but I may say that we were in motion some two or three years previous to that.

95. Was there any other document that you know of in the possession of the city authorities in reference to this watercourse previously to this one? No, not that I am aware of. There was a letter in the Town Clerk's office, which could not be found, written some eighteen months before this.

96. But you used previously to call the attention of the municipal authorities to the state of this watercourse, did you not? Oh yes.

97. Did you do so on more than one occasion? Yes, on several occasions.

98. Are you aware whether the Mayor and Aldermen have examined the condition of this locality themselves? Yes.

99. On more than one occasion? I only know of one.

100. And that, I suppose, was in consequence of your previous statements to them? Yes; and then I received instructions to prosecute the Sugar Company.

101. But I thought you said the Sugar Company set you in motion, and in consequence of that you made a report of the water going into the Company's works? But what I am talking of was previous to that.

102. Previous to that you made a statement to the Corporation with reference to the Company's ponds? That's it.

103. And then the Mayor and Aldermen determined to prosecute the Sugar Company? Yes.

104. What was the result of that prosecution? We commenced a prosecution against them, but of course we had only our own witnesses, who did not reside in the locality.

105. We are speaking of the ponds only now? Well, to the best of my belief we commenced a prosecution against them on account of the pond and the burning of bones.

106. Well, what became of it? The case fell through; there was such a balance of evidence on their side—three witnesses to one against us, and all residing in the locality, that we had no chance. You will understand that we summoned them under the Police Act for not keeping their premises clean, and allow

an

an offensive smell to be created, and that summons was to include the state of the ponds, the burning of bones, and the heaps of bones on the premises.

107. Then, if I understand you, the Corporation have taken no separate action against the Sugar Company with regard to the state of that pond? No, it included them all; that was the only way we could summons them.

108. Do you think the Mayor and Aldermen are at present aware of the condition of that watercourse which supplies the Sugar Company's works with water? I could not say at the present time.

109. Altogether they have had sufficient information from the reports you made to them to place them in possession of the condition of the ponds? Yes, they were aware of it at the time of this report and before it.

110. Are you aware at the present time (for this is 1875 and your report was in 1872), whether there are cesspits, cowsheds, stables, or other sources yielding offensive matters, which drain into the watercourse? I am sure there are, because there is no alteration on the premises since I went out. The street drainage goes just the same way. There is no alteration, except in the drainage from the closets in connection with the city in Shepherd's Paddock, which we had stopped, and we had the parties prosecuted. That was on our own side, and we could interfere there. I believe Mr. Loveridge had his altered —

111. Then do you think there are any cesspits, or cowsheds, or places of that sort coming under the control of the city authorities, which drain into that watercourse now;—have you taken any action to prevent such drainage? We cannot prevent persons from throwing their house drainage in. It can only be remedied by a system of sewerage.

112. You could not prevent the drainage from cowsheds going in? No, we could not.

113. The closets for instance;—could you not prevent them from oozing out and polluting the watercourse? Yes, I could prevent the leakage from closets, but I could not prevent the ordinary drainage of stables or cowsheds from going there, because that is the ordinary drainage. I could prevent cow manure or stable manure in quantities from going into it.

114. Then you think the city authorities have done all that it was in their power to do towards keeping that watercourse free from contamination? All that we could do, considering our position with regard to these closets—all we have the legal power to do; but as far as the house drainage is concerned, which runs through these open gutters, we have no power to prevent it. That creek was formerly the original watercourse, and there is no sewerage in Chippendale or Shepherd's Paddock that we could make them connect to. There is nowhere else it can go.

115. Is the land through which this watercourse runs before it enters the Sugar Company's works the property of the City Municipality, or private property? Private property.

116. *Mr. Grundy.*] But although it is private property, if the city authorities chose to make a covered drain they have sufficient power to do so under the Municipal by-laws, have they not? No, I don't think they have—I am sure they have not.

117. If they wanted to make a covered sewer they have no power? I don't believe they have.

118. Then they have no control over that nuisance at all? No. The only way we can do is to prosecute owners of property when they allow anything offensive to collect on their premises.

119. *Chairman.*] When the watercourse leaves the road it goes into private property? Yes; but to keep the place in something like a healthy state the Corporation keep a staff constantly for cleaning out the old creek from Parramatta-street, and where it falls into Blackwattle Swamp.

120. Does the whole of that creek, from the time it first of all passes under Wattle-street bridge to the time it meets Blackwattle Swamp, pass through private property? Yes, except where it passes under the road at Parramatta-street. It was the old original watercourse.

121. You have, I suppose, in the course of your rounds, on duty, many a time stood on that bridge in Parramatta-street? I have.

122. Have you ever perceived any unpleasant odours when looking over that bridge? Yes, the smell is very bad.

123. Is it always the same in summer and winter? Yes, I may say I have heard hundreds of persons complain of it.

124. *Mr. Grundy.*] I think a little explanation is necessary about this creek. It divides into two creeks I believe. Is that on your property, or in the other Municipality? It divides at the boundary, and then forms two creeks, one of which goes to Redfern, and the other to Darlington.

125. And each of these creeks is equally objectionable and equally polluted by the slops and filth from the various houses and streets through or under which it passes? Yes.

126. *Dr. Dansey.*] In this large area, the drainage of which goes into the creek we have been speaking of, there are a great number of butchers' shop;—are there not? There are.

127. In which we believe there is a continual slaughtering going on—on the premises? There is no doubt of it.

128. And the washing and blood from those places must all run down into this creek? Yes.

129. Are you aware of any nuisance of any kind or shape connected with the Sugar Company's Works, other than those ponds, and that nuisance which we are informed has now ceased—the burning of bones? It is a question whether they have ceased to burn bones.

130. *Chairman.*] We have it in evidence stated positively that they have ceased to burn bones and do not accumulate any bones boiled or unboiled, and we wish to know whether, apart from that, you know of any other nuisance created by the Sugar Company on their premises—anything that would come within the scope of our investigation? No; there is nothing else that I know of.

Mr. R. Seymour.

3 June, 1875.

THURSDAY,

THURSDAY, 10 JUNE, 1875.

MEETING OF No. 2 COMMITTEE.

Present:—

F. H. GRUNDY, Esq., | G. H. DANSEY, Esq.

CHARLES WATT, Esq., IN THE CHAIR.

Thomas Bradridge, Esq., City Surveyor, called in and examined:—

- T. Bradridge, Esq.
10 June, 1875.
131. *Chairman.*] You are City Architect, I believe, and also City Surveyor? No, only City Surveyor.
132. Does your office as City Surveyor cause you to be possessed of any plans of the watercourse which feeds the ponds on the Sugar Company's works and goes to Blackwattle Swamp? I have plans which shew the locality to a certain extent, but not to the head of the watershed, because we have no plans beyond the boundaries of the city. I have a plan here which shows some of the suburbs (*producing plan*), probably as much as you want to see, but not in detail.
133. You submit a plan shewing the creek which supplies the Sugar Company's ponds with water? Yes.
134. We observe from these plans that a considerable portion of fluid comes from other municipalities, and enters into the city municipality? Yes, there is a considerably larger area without the city, and a larger number of houses.
135. There are two creeks which supply this water from other municipalities, and the junction takes place about 100 yards inside the city boundary;—is that correct? Yes.
136. As a matter of fact does not a large amount of water enter the city boundary from other municipalities by these creeks? It does.
137. What are the names of those municipalities? Redfern and Darlington. The drainage from the Deaf and Dumb Asylum goes into that creek, but I do not think it is within any municipality.
138. If so it would be in Newtown, would it not? I cannot say, as I have no jurisdiction beyond the city boundary.
139. Are you aware whether any steps have been taken by the municipal authorities to construct any sewer so as to carry off to the harbour the fluids which find their way into the Sugar Company's ponds? Yes. Some years ago plans were submitted by the City Engineer to effect that purpose, and the money was voted by the city to carry out the work, but their finances were in rather a bad condition, in fact there were no funds to draw upon for it. The plan proposed by the City Engineer was to construct a branch from the sewer in Abercrombie-street through the Sugar Company's land, and along the watercourse as far as the city boundary.
140. That would shut out the Sugar Company from the use of this water? Yes, it would have that effect.
141. Have the city authorities permission from the owners of land there to carry out a sewerage system of that kind? I do not know, the matter not being in my department, whether permission was given or not; but as far as the Act is concerned I do not think they have the power to enter upon private property. It was with the consent of the Sugar Company, and I think I have seen in the office an offer on the part of the Sugar Company to allow the construction of a sewer through their land.
142. But you say that would shut out the Company from the use of the water? Yes.
143. I wish to ascertain from you whether the city municipal authorities have any legal power to compel certain municipalities to join them in any system of sewerage of that kind? They have not; but I think from the wording of the Act, which says "sewerage of the city and suburbs," they might have power to enter the suburbs and to construct a sewer, although that may be a doubtful question, but they have no power to enter upon private property. They may under the Act construct sewers in "streets, ways, and places," but not on private property.
144. Do you think that in this respect the city authorities require more legal power? I think they should have power to construct sewers on private property if it were considered advisable to do so.
145. And to compel other municipalities, whose waters they have to receive, to contribute to the expense of those sewers? I think so, on a principle of equity.
146. Have you recently inspected this watercourse? I have not within the last month or five weeks.
147. That is sufficiently recent for my purpose. Will you kindly give us your opinion in reference to its condition at the present time as to its affecting the public health in any way? I certainly think it must be very prejudicial to the health of the inhabitants living in the neighbourhood; so much so, that I would not live in the vicinity of those creeks.
148. You think there is so much drainage from the habitations in that district as to cause the water passing down those creeks to be of a disagreeable and unhealthy character? I do, and I should say it was dangerous to health.
149. Did you observe when you were in that locality any closets which appeared to overflow, or any other foul matters which ran off into these creeks? No, I did not follow the course of the creek.
150. Still you are of opinion that there must be a good deal of that drainage? I believe there must be from privies.
151. I am speaking of this creek now after it leaves the Sugar Company's works. Have the city authorities taken any steps towards covering it in any way? What I mentioned in a previous answer the engineer proposed to do—to construct a sewer—was proposed for that creek also.
152. In that part of it? In the creek which is common to both.
153. And you think there would be no difficulty in that creek with regard to levels? There were difficulties which we overcame by intercepting the waters in the upper part of the watershed and carrying them off in another direction.
154. What was the nature of those difficulties? The main sewer from the upper part of the watershed would not have been available for the lower part during stormy weather, because it would be above the level of the ground on either side, and if you tried to drain the ground on either side into it by tapping the sewer, the water in the sewer would run out on to the land instead of the water from the land flowing into the sewer.
155. Can you state what is the catchment area within the city boundary, and also what are the catchment areas within other municipalities which drain into the Sugar Company's ponds—in fact the total area, showing the area which belongs to each municipality? I will furnish the information to the Committee.
156. There is one question I should like to ask you, Mr. Bradridge, whether the original devising of these sewers is in your department or in that of the City Engineer? In that of the City Engineer.

T. Bradridge,
Esq.

10 June, 1875.

157. I mean the first initiation of the work? It is not in my department.
158. It must first originate in the City Engineer's Office? Yes.
159. And you supply all the levels I suppose? No; each office takes its own levels.
160. *Mr. Grundy.*] But you would originate a suggestion, if you thought it desirable, for the consideration of the City Engineer? Oh yes.
161. I was going to ask you whether, when the plan to make a sewer which was to carry off the water from that creek was likely to be carried out, any protest against it was made by the Sugar Company, or did they agree to it? No; I think they acceded to it.
162. Was any protest made by any other landowner? No, I think not; the difficulty was that the Corporation had no funds to carry out the work, although the money had been voted for it.
163. There is a sewer which takes most of the water to Blackwattle Swamp, is there not? Yes.
164. Could not that be made use of to take a great portion of this drainage from the higher parts of both these creeks? It could be made use of no doubt; it was intended that it should be brought into operation; but the Sugar Company's dam burst at the time the sewer was being finished.
165. Then there is no reason why that scheme should not be revived, and that sewer be to a considerable extent, more or less, as the capabilities of the ground will allow, made useful? No reason whatever. I may as well tell you how it was that the Company resorted to this mode of supply: At the time their letter was written they were receiving a supply of water from the city, and were not taking anything from the dam as it had burst, but the Corporation, as custodians of the water, raised the assessment upon them, and made them pay a much higher rate. The Company were then driven to adopt some expedient to supply themselves with water, and then came the construction of this dam.
166. We have been told that the city authorities could not give the Company a constant and sufficient supply of water on which they could depend at any price? I cannot give you any information on that point, as it is out of my line, but the City Engineer will be able to tell you all about it.
167. *Chairman.*] Is there anyone who would interfere if the Corporation attempted to shut off the water from the Sugar Company's ground? The Company would protest against it, and I think they would have good reason to do so; they have been using it for a very long time.
168. *Mr. Grundy.*] It may be important for us to know, if this water should have to be taken to the main sewer, what is the flattest gradient per mile which it is proposed to adopt? That would depend in a great measure upon the size of the sewer. If it was a grand trunk sewer to take the discharge of the whole of the city, I should say from 3 ft. to 5 ft. per mile, but if it was only to take a main which was subsidiary to the main trunk, the gradients I should adopt would be 1 in 240.
169. But for a larger system you would have about 3 ft. per mile? From 3 ft. to 5 ft. per mile.
170. You would take 6 feet if you could get it, I suppose? That would of course depend upon the velocity which could be obtained at the head of the sewer to start with.
171. *Mr. Dansey.*] Is the dam a natural watercourse enlarged, or is the gully for the overflow of water to run off the natural watercourse? That is a question which probably no man living can decide. The dam has been there for fifty years, and I don't suppose anyone could tell where the watercourse was originally. It is on the Company's property, and they are at perfect liberty under certain legal rights to make any diversion they like, so long as the water enters the creek again where it leaves their property.

[No. 4 COMMITTEE.]

REPORT

OF THE

COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN
SEWAGE AND HEALTH BOARD,*on the 28th May, 1875,*

"To Visit and Examine the line of Busby's Bore."

ADOPTED BY THE COMMITTEE, 5TH JULY, 1875.

GENTLEMEN,

1. We have the honor to report that on the 25th day of June we visited and inspected the line of Busby's Bore, accompanied by Mr. Robertson, Inspector of Waste Waters, and Mr. Stacey, Inspector of the Bore. We took evidence on the spot which was not reported, but a portion of which has since been placed on record and is appended to this Report.

2. From Hyde Park to the Gaol we do not think that there is any danger of the water being seriously contaminated by percolation. It is hardly necessary to state our reasons for this opinion; they will be found in the evidence. Near the Ice House shaft, as it is called, at the junction of Dowling-street and the South Head Road, the Bore passes partly through soil, and is constructed in such places of loose masonry without mortar. A considerable area, having no sewers, is drained by what was originally a natural water-course, but which is now an open drain of a very disgusting appearance. It passes under the road, and over the Bore, and it can scarcely be doubted that percolation of offensive matter must take place from this drain into the Bore.

3. In this immediate neighbourhood also, and in close proximity to the Bore, and at a higher level, there are a considerable number of cesspits. It was considered necessary by the city officers carefully to caulk and cement the sides of the shaft immediately adjoining, in order to prevent the contamination of the water, but it seems to have been forgotten that, at a lower level, and adjoining the shaft, the roof of the Bore consists of loose masonry or slabs without mortar.

4. From this point to the Rifle Butts we do not think that any considerable percolation is likely to take place, but we have no doubt that at the back of the Barracks a very large influx of water occurs. That such influx does occur somewhere is proved beyond doubt by the evidence before the Board.

5. The Park Road forms an embankment at the back of the Barracks. For some distance, at a depth of about 40 feet, the line of the Bore coincides pretty nearly with that of the road. Between the road and the Barrack wall there existed many years ago a quarry hole reaching within a yard or so of the Bore. So near did the quarry approach to the Bore, that in the year 1872 Mr. Stacey in clearing out the Bore found at this point what appeared to be a shot hole, through which a large quantity of water entered, and which he stopped up. The Bore here passes through sandstone, which must have been much shaken by the operations, first, of making the Bore, and secondly, of excavating the stone from the quarry of which we are speaking. Some years ago this quarry-hole was filled up chiefly with sand, and when the road was made, pipes were laid under the road and over the Bore to carry off the drainage. We observed that all the drainage from the Barracks and from the houses recently built on the sandhill to the west of the Barracks flows into the sand which fills up the quarry hole. In fact, the whole arrangement is something between a sink and a filter. We observed the drainage trickling over the sand, appearing in some places and disappearing in others. The pipe under the road, which is supposed to carry off the drainage (into the Botany Watershed), we observed to be perfectly dry. We cannot doubt that the greater part of the every day drainage from this inhabited area finds its way into the Bore.

6. At the eastern side of the Barracks is another area consisting of sand and rock on a steep slope, and occupied by a very considerable number of recently built houses. The drainage from this area also is supposed to be carried off by a pipe under the road and over the Bore, which, at or near this point, as we are informed by Mr. Stacey, is formed of open masonry.

7. Mr. Allum, a bricklayer, who lives within a few yards of this point, and who appears to us a very intelligent and trustworthy witness, informed us on the spot, and afterwards in the Board Room, that all the houses on the area of which we are speaking have cesspits; that the water which comes down

during heavy rains is very offensive, he supposes from the overflow of cesspits. That the pipe under the road is quite insufficient to carry off the flood waters which collect in considerable quantity. That some months ago this flood water overflowed into his well, which thereupon became stinking and unfit for use. He pointed out to us a hole near the mouth of the pipe which is supposed to carry off the water, and through which he stated that as great, if not a greater, part of the flood waters passed than through the drain pipe. Being surprised at this singular disappearance of so large a quantity of water into a hole in the ground, he examined the other side of the embankment forming the road, but found that none of it escaped that way. There can be no doubt that the whole of this water found its way into the Bore.

8. Mr. Stacey seems to have firmly believed that he had succeeded in stopping all percolation into the Bore, and, as appears by his evidence, has persistently endeavoured to maintain that any such percolation is impossible. We told him on the spot that there is no doubt whatever that such percolation must take place somewhere, and called upon him to state at what point in his opinion, formed from his own knowledge and observation, he should think it most probable that this influx should take place. He answered without hesitation, either here, that is at the eastern end of the Barrack wall or yonder, that is, near the other end.

9. We do not feel called upon to report generally upon the subject of the supply of water from the Lachlan Swamps, but merely to state the results of our personal observations and inquiry, which satisfy us that a large quantity of contaminated water must find its way into the Bore at the points we have indicated.

I have, &c.,

M. B. PELL,

Chairman of Committee.

Evidence taken before No. 4 Committee.

FRIDAY, 25 JUNE, 1875.

Present :—

M. B. PELL, Esq.,

E. O. MORIARTY, Esq.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Thomas Bradridge, Esq., City Surveyor, called in and examined :—

1. *Chairman.*] We are told, Mr. Bradridge, that you constructed a road near the Park Road, at the rear of the Victoria Barracks? I saw it constructed; I was assistant surveyor at the time.
2. That road forms a sort of embankment, does it not, diverting the drainage from its original course to a certain extent? Yes; it concentrates it at a certain point.
3. There is a certain piece of ground on the western side of the Victoria Barracks—a sandy tract of land? Yes.
4. Where did the drainage from that land flow before this road was made? I forget which way it ran; I think in the direction of the watershed. But at that time there were not many houses in that direction, though there has been a good deal of building since.
5. There was an old quarry-hole at the back of the Victoria Barracks;—has that been filled up recently? It was filled up subsequently to the formation of the Park and previously to the formation of the road.
6. What state was that hole in at the time the road was constructed? The hole had to be filled before the road was constructed.
7. What state was it in; what was the size of it—was it a large hole? It was about six chains in length with a width of about one chain.
8. What was about its maximum depth? About 12 feet—shallowing off.
9. Was it a receptacle for any kinds of deposit from the drainage in that locality? I think not, beyond what came out of the Barracks—the subsoil drainage from the Barracks.
10. Did you observe in what direction the water flowed from this piece of hilly land (*indicating position on map of Sydney, showing the line of tunnel*) on the eastern side of the Barracks, between Regent-street and the Barracks? As nearly as possible in the direction it now flows—through the pipe drain.
11. Through this lagoon (*indicating position on map*)? Yes, towards Nannygoat Swamp.
12. These are the lagoons you can see from the road? Yes.
13. How long ago was it that this embankment was constructed? It was in '68 or '69.
14. Your duties do not lead you to observe specially how the water flows in these localities at present? Yes, I notice that they flow into the watershed. (*Witness produced a trial section of the Park Road.*)
15. *Mr. Moriarty.*] What is the vertical scale of this section? 20 feet to the inch.
16. Then it would seem that the level of the water from that quarry-hole is about 20 feet below the present level of the road? Yes, about that.
17. Then there would be about 7 feet or 8 feet of water in it? Yes, I think in some places it is deeper.
18. That would bring it down nearly to the level of the tunnel, would it not? The water level was about 25 feet above the top of the tunnel.
19. *Chairman.*] What exit was there for the water there? There was an open drain to the Nannygoat Swamp.

T. Bradridge,
Esq.
25 June, 1875.

Mr. D. C. Robertson, Inspector of Waste Waters, called in and examined :—

20. *Chairman.*] You remember accompanying us last Saturday along the line of the Bore? Yes.
21. Did you observe that the surface drainage from the portion of land on the western side of the Victoria Barracks, near Moore Park Road, goes down through a straight gutter along the Park Road? Yes, I did.
22. It flows into a mass of sand, does it not? Yes, a marshy place.
23. Did you observe, while we were there, that it was slowly trickling along the sand? I did.
24. How is that water supposed to be carried away? Well, it is supposed to percolate into the Nannygoat—that pond or lagoon on the side of the road.
25. By means of a pipe? Yes, there is a pipe which is supposed to take it away, nearly opposite the Park gate.
26. And did you observe at the time, while this drainage matter was slowly trickling along the sand, that the pipe which is supposed to carry it off was perfectly dry? I did; I put my hand into it, and it was perfectly dry.
27. You told us that that mass of sand—a great part of it—was used for filling up that old quarry-hole? Yes.
28. And that hole was so deep as to be in close proximity to the Bore itself? Yes, it was very deep.
29. It was filled up with sand? Yes.
30. And now it appears to act as a sink for receiving this drainage? It appears so.
31. Now where, in your opinion, does the water go to which does not flow through this pipe—what becomes of it? I can hardly say where it goes to.
32. Do you think it is likely that it goes into the Bore? Yes, I should think it would, as far as my experience goes; I don't profess to know much about the formation of the Bore itself.
33. Do you remember that quarry-hole before it was filled up? I do.
34. What was about its depth below the natural surface of the ground? To the best of my recollection it was about 30 or 40 feet.
35. Used it to become charged with water in rainy weather? Yes, I never saw it dry.
36. Did it overflow after heavy rain? Yes, the lower portion of it, where the carts used to go into the quarry to draw stone.

Mr.
D. C. Robert-
son.
25 June, 1875.

- D. C. Robert-
5011.
25 June, 1875.
37. And in dry weather the water would subside? Yes.
38. Which soaked away before? Yes, it would be full in wet weather, and would then gradually go down.
39. Do you remember that we observed another piece of ground on the other side of the Victoria Barracks—on the eastern side—with a considerable number of buildings upon it? Yes.
40. The drainage of which is supposed to be carried under the road by means of a pipe? Yes, there is a large pipe there for conveying the water under the road.
41. Have you ever observed this place yourself—I mean lately—after heavy rain? No, sir, I have not.
42. We have it in evidence from Mr. Stacey that this particular portion of the Bore is constructed of open masonry, without mortar; also that, in his opinion, that is the place, if any, where the large quantity of water, which undoubtedly gets into the Bore by percolation, must enter. You have no doubt then that the large quantity of water which goes in must be the drainage of this area to which I have referred, which is partially covered with houses? There can be no doubt of it, if it is the same formation as Mr. Stacey describes.
43. If you remember, we also visited a portion of the Bore near what is called the "Icehouse Hotel," on the South Head Road? Yes, there is a shaft there.
44. You are aware that what was formerly an open watercourse flows at present under the South Head Road at that point, and then finds its way down to Rushcutter's Bay? Yes.
45. Before it reaches the South Head Road it receives the surface drainage of a considerable district, does it not? Yes, there are a considerable number of houses there.
46. Having no other system of sewerage? No, that is the principal sewer which takes off the drainage.
47. Mr. Stacey informs us that the Bore in that locality through which this drainage flows for some little distance is formed of open masonry? That I cannot say.
48. Of course it is loose soil requiring masonry. Can you feel any doubt that some of this drainage matter must percolate into the Bore? Well, sir, there is a great depth between the bottom of that drain and the top of the tunnel. It is possible that the drainage may percolate through it. The drain has a very rough bottom—rough stones here and there with some clay over them. As far as I can judge the bottom of the drain is likely to let water through it.
49. Are you aware that in that neighbourhood, close to the Bore, there are houses with cesspits on a higher level than the Bore? Yes, the majority of the houses are higher than the Bore; in fact, I might almost say the whole of them.
50. Can you think of any other place where water is likely to percolate into the Bore? No, I can think of none, except between the Sacred Heart and the Rifle Range; that is the most likely place.

Mr. George Allum called in and examined:—

- Mr. G. Allum.
25 June, 1875.
51. *Chairman.*] You live on the Moore Park Road, I believe, on the eastern side of the Barracks? Yes.
52. On a low level close to the Moore Park Road? Yes.
53. You remember meeting us there on Saturday last? Yes.
54. There is an area which you pointed out to us, the drainage of which flows through a pipe close to your house, or is supposed to do so, under the Park Road? Yes.
55. It is a sandy soil in that locality, is it not? Yes, a sort of mixture of rock and sand.
56. About how many houses are there in that direction—speaking roughly? About 50 or 60.
57. All having cesspits? Yes.
58. Do these cesspits overflow after heavy rain? Well, I never saw any matter out of the cesspits, but the water is continually flowing there after rain, and it leaves a tremendous smell behind it.
59. Where do you suppose that smell comes from? I should imagine it comes from the water which flows down after the rain.
60. After the last rain some of that water, you told us, flowed into your well? Yes.
61. And you have now left off using it? Yes.
62. Is the water in your well disagreeable in taste and smell? It does not smell bad, but it tastes bad, and the people won't use it.
63. Did it smell badly after the last rain? Yes, for the first few weeks it smelt very bad, and then we cleaned the well out, but it didn't seem to do it any good.
64. Is that pipe under the road sufficient to carry the water off during heavy rain? Not half of it; the water backs up, and accumulates to a depth of four feet. The pipe would not carry off half an hour's rain.
65. You pointed out to us a certain hole on your side the embankment, through which a large quantity of water flows? Yes, it goes into that hole, the bottom water fills the pipe, and there is an overflow sufficient to fill a 4-inch or 6-inch pipe.
66. Where does it go to? That I could not say. I have been right down to the Shooting Range to see, but I can't say where it goes to.
67. Are you aware that the Bore is almost immediately underneath it? Yes.
68. Are you aware that it is made of loose masonry without mortar? I have been informed so.
69. Then where do you imagine the water goes to? I should imagine it finds its way into the Bore.
70. Can you imagine that it goes anywhere else? No; that is the opinion I gave my wife when we went on to the Rifle Range to see where it went to. I said then it must go into the Bore.
71. And that drainage is the overflow of cesspits and other foul matter? Yes, whatever goes down the hole must go down there.
72. Did you ever take notice how the drainage goes on the Sydney side of the Barracks? I don't know anything of that side of the Barracks.
73. I mean from that part fronting Moore Park, on the western side of the Barracks? I don't know how that drains at all. I know the place well, but I know nothing about the drainage.
74. Is there any other information you can give us on this subject? No, I am not aware of anything else. In my opinion the only way to protect the Bore from being contaminated would be to have a sewer along the Moore Park Road, with connections to the houses at the back, so as to carry off the drainage from the houses there.

[No. 7 COMMITTEE.]

REPORT

OF THE

COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN
SEWAGE AND HEALTH BOARD,*on the 16th July, 1875,*

“To examine and report upon the outlets of the City Sewers discharging into the Harbour.”

ADOPTED BY THE COMMITTEE, 16 SEPTEMBER, 1875.

RUSHCUTTERS' BAY.

1. On Wednesday, 21st July, we landed on the south side of the Bay, and saw that there was an extensive flat before the bridge, consisting of sand and stinking mud, brought down by and deposited from the water of the sewer over the foreshore. The mud, where the tide has left it bare and exposed to the action of the sun, is the source of effluvia offensive to the sense of smell, and possibly deleterious to health.

2. In addition to the large sewer under the bridge, there is another sewer discharging through the abutment on the western side of the Bay, and there is also much drainage by open water-courses, bringing down, among other things, feculent matter and other waste from the houses in the neighbourhood.

3. We understand that a survey of the Bay has been made by order of the Government, with a view to its speedy reclamation. But up to the present time no action seems to have been taken to provide for the proper drainage of the surrounding country.

WOOLLOOMOOLOO BAY.

4. We next visited Woolloomooloo Bay. On the east side of the Bay we observed a number of small sewers extending from Potts' Point to the large main sewer discharging into the centre of the Bay; this sewer was foul in the extreme. A large bank has been formed just at the outlet of the sewer by the silt and organic matter involved with it, and at the time of our visit a large stream of fetid sewage was flowing into the Bay.

5. This sewer being situated at the head of a Bay in which there is little or no current, the sewage matter, by reason of its somewhat lesser specific gravity, floats on the surface of the salt water, oscillating for a greater or less time backwards and forwards with the ebb and flow of tide.

FORT MACQUARIE.

6. From Woolloomooloo Bay we proceeded to the outlet of the main sewer at Fort Macquarie, and here as in the last case a considerable bank of silt has accumulated, the material of which consists for the most part of street detritus. By reason of the comparatively strong current at this point, the sewage matter is more diffused, but it is still offensive, and during the prevalence of certain winds the effluvia from it must be carried over a considerable area of the northern part of the city.

TANK STREAM.

7. The Tank Stream which discharges into the head of Sydney Cove was in an equally bad state as the sewer at the head of Woolloomooloo Bay; the water flowing from it was inky in colour, and apparently putrescent, and floated on the surface of the Bay to a considerable distance from the outlet of the sewer. Close to this is another large sewer, discharging the sewage from George-street North and its neighbourhood, and its condition is hardly better than that of the Tank Stream; both deposit dark coloured decomposing slimy matter which we are told is esteemed as a rich manure, and has been used for such purpose at the Botanic Gardens. But it is well to call attention to the abundant bubbles rising to the surface in this neighbourhood, the product of the continuous decomposition of the organic matter involved in the deposit.

DAWES' POINT TO HEAD OF DARLING HARBOUR.

8. From Dawes' Point to Miller's Point we observed several small sewers, but they did not attract our attention as being particularly offensive. Thence upwards to Erskine-street, King-street, and further on to the head of Darling Harbour, there are several sewers, discharging matter of the most offensive kind, which, in each case, by reason of the jetties either directly over them, or in very close proximity to them, has resulted

resulted in the accumulation of banks of filthy and putrid mud, extending to a greater or less distance from the shore. This mud is of the class of material well known to be a fertile source of noxious effluvia. We next examined the Market Wharf silt-pit, and found that it had been cleaned out but recently, and that a considerable quantity of stuff that had been taken from it—still remained on the wharf. On taking portions of this stuff into the hand, and bringing it close to the nose there was sufficient evidence of where it had last come from; but it was by no means offensive to a bystander. On gauging the pit we found about from 6 inches to 8 inches of sediment in the first compartment, and none in the second. There is no indication of silting up at the outlet of this sewer since the construction of the silt-pit. This pit contains when full about 100 tons, and we are informed fills about every six months. The area drained by it being about 11½ acres.

9. The main sewer at the head of the Harbour, which drains a very large area, cannot be said to be in a better state than those at Woolloomooloo Bay and Tank Stream; the sewage discharged is equally offensive and greater in quantity.

10. Silt-pits have been at this point constructed by the Corporation for the interception of the silt and other matter brought down with it, but they do not appear likely to have much, if any, effect in purifying the effluent water which must continue to flow into the harbour in much the same state in respect to its original impurities as hitherto.

BLACKWATTLE SWAMP.

11. On September 1st we visited Blackwattle Swamp, the reclamation of which is rapidly progressing; the sewage brought down by the Abercrombie-street sewer and by the open drain which joins it is at present carried off by an open channel and discharged under the causeway at Lyndhurst. There is a considerable area of unreclaimed land belonging, as we are told, to the Lyndhurst authorities, where the sewage stagnates, giving off effluvia bad in every respect; but it is reported by one of our Committee that the proprietors are about to remedy the nuisance without delay.

H. G. ALLEYNE,
Chairman of Committee.

Board Room,
Sydney, 16 September, 1875.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

MONDAY, 20 SEPTEMBER, 1875.

Present:—

HON. J. B. WILSON,		W. C. BENNETT, Esq.,
F. BELL, Esq.,		E. O. MORIARTY, Esq.,
DR. ALLEYNE.		

M. B. PELL, ESQ., B.A., IN THE CHAIR.

The Report of the Committee appointed to examine the outlets of the sewers discharging into the harbour having been read, the Chairman and Members of No. 7 Committee were examined in their places:—

1. *Chairman to Dr. Alleyne.*] In observing the mouth of the open sewer at Rushcutters' Bay did you notice the quality of the sewage as it appeared to the eye? Yes. Dr. Alleyne.
2. Was it clear or muddy? It was not clear; it was not of the same quality as the sewage coming out of Woolloomooloo Bay or the Tank Stream, but it was evidently tainted with organic matter of some kind. 20 Sept., 1875.
3. It was discoloured? Yes, discoloured.
4. Did you notice if there was much flow of water? Not any great quantity.
5. It is simply an open drain, without any artificial sewerage? No, it is a pipe-drain under the bridge at the head of the Bay.
6. *Chairman to Mr. Bell.*] Is there any system of sewers discharging into Rushcutters' Bay? Yes, there are two sewers draining into Rushcutters' Bay, one extending as far back as William-street north and south, and another going down by Judge Hargraves', which drains all the area at the back of Elizabeth Bay. Mr. Bell.
7. Those are earthenware pipes? Yes.
8. Do they carry off the flood waters? To a certain extent; there are gully-shafts connected with them.
9. Is there not a considerable catchment which drains into Rushcutters' Bay? Nearly all Paddington drains into Rushcutters' Bay; but I am speaking of the open drains within the city.
10. But at the main outlet into the Bay—under the bridge—there is no sewer? There is no general sewer above the bridge; in fact there is no general sewer at all; but there are two 18 or 20 inch pipes discharging into the lower part of the Bay. I gave the area and the size of these pipes in my former evidence.
11. *Chairman to Dr. Alleyne.*] At the Woolloomooloo Bay sewer you found very offensive matter discharging? Yes. Dr. Alleyne.
12. Was it black or of a dark colour? Yes.
13. And offensive to the smell? Yes.
14. But at Fort Macquarie you found the sewage was not so offensive? No, it was not offensive at all.
15. It does not create such a local nuisance? The deposit can be seen through the water to be chiefly clay and sand washed from the streets.
16. And at the Tank-stream you found it bad again? Abominable.
17. Black stinking stuff? Yes.
18. And you found it of a similar quality at the Queen's Wharf? Yes.
19. Did you find the smaller sewers along Darling Harbour discharging matter of the same offensive character, or were they not so bad? The sewage was of the same kind, but the sewers being smaller, it was less in volume and quantity.
20. Was there a large discharge of water from the Fort Macquarie sewer? There was not much in the evening when we passed it.
21. That was the ordinary dry outfall? Yes.
22. Still it was a continuous stream? Yes.
23. It was discoloured I suppose, though not dark or turbid? No, I don't think it was.
24. Was it clear? I don't think it was remarkably so at that time; the tide was nearly out, though it was not dead low water. I formed my opinion of the character of the sewage discharged there from the deposit seen at the mouth of the sewer.
25. At the head of Darling Harbour, at the Hay-street sewer, I see you found the matter discharging very offensive? Yes.
26. In spite of the silt-pits? Yes.
27. Was it as bad as that discharged from the Woolloomooloo sewer? Yes.
28. Was it as bad as that at the Tank Stream as to quality? Yes, pretty much on a par with it.
29. You make no mention in your report of the Abercrombie-street sewer, which discharges into Black-wattle Swamp;—did you observe that? Yes, it was as bad as any of them; the fact is, nothing could be worse than the open drain running almost parallel with it.
30. They both discharge together finally do they not? Yes, bringing down stuff of the same quality.

- Dr. Alleyne. 31. As bad as that from the Woolloomooloo sewer and the Tank Stream? Yes.
32. And worse than that discharged at Fort Macquarie? Infinitely worse.
- 20 Sept., 1875. 33. *Chairman to Mr. Moriarty.*] Do you concur in what Dr. Alleyne has stated? Entirely.
- Dr. Alleyne. 34. *Hon. J. B. Wilson to Dr. Alleyne.*] Do you think the difference in the character of the sewage discharged from the Fort Macquarie sewer from that discharged at Woolloomooloo Bay, the Tank Stream, and Darling Harbour, is at all influenced by the fact of the sewer at Fort Macquarie opening into a tidal current? No, I do not think so; in fact there is very little current at Fort Macquarie; of course, there is more there than at Woolloomooloo Bay. The current at Fort Macquarie is rather inwards, and probably there is as little of the solid contents of the sewage removed by the tide at that point as from the mouths of the other sewers; and on looking from the boat into the water, the deposit is seen to be large in quantity and of a different character from that at the mouths of the other sewers.
35. Have you any theory by which you can account for the difference in the sewage from the Fort Macquarie sewer and that discharged from any of the other sewers? I have not; but I may tell you that I remarked at the Blackwattle Swamp that the motion of the water was extremely sluggish; in some places it was hardly perceptible, and at the very commencement of the open water-course it was just as black, and filthy, and dirty, as at the entrance into the Bay, or worse. But at Fort Macquarie the stream is always actually running with more or less rapidity; there is a better fall there, and a more rapid discharge, and the sewage matter does not settle and ferment; that is probably the reason. In places like the head of Blackwattle Swamp, Rushcutters' Bay, and the Tank Stream, the water is sluggish.
- Mr. Moriarty. 36. *Chairman to Mr. Moriarty.*] Do you concur in the results which Dr. Alleyne has given—speaking generally, in all his evidence? Yes, I think so; I think the difference in the offensive character of the discharge between Fort Macquarie and the other sewers is sufficiently accounted for by the fact that the other sewers are simply elongated cess-pits, in which the sewage matter stagnates in a considerable portion of the pipe.
- Mr. Bell. 37. *Chairman to Mr. Bell.*] Do you concur in these statements and conclusions? I quite concur in them.
- Dr. Alleyne. 38. *Chairman to Dr. Alleyne.*] Do you think the evils at present produced at the mouths of the sewers would be mitigated by carrying the sewage into deeper water? I think it would mitigate them very much, but I think we should not lose sight of the necessity of dredging, so as not to allow any organic matter to accumulate, even in deep water. The expedient proposed would only be a mitigation of the evil by depositing the filthy matter in a place where it could be more easily and effectually removed.
- Mr. Moriarty. 39. *Chairman to Mr. Moriarty.*] Do you concur in that opinion? Yes; but I would like to go a little further. I do not regard the scheme to carry out the sewage into deeper water as a complete remedy for the evils existing, but I think it will mitigate them, though not entirely do away with them.
40. You think it will prevent the unsightly accumulation of foul matter on the banks at low tide? I do. There is one matter I think the Board might consider in addition, and that is whether the owners of water-side properties should not be compelled to remove the mud from under their jetties. Under many of these jetties in Darling Harbour, from the dirt which drops from the planking and other stuff washed in, banks are formed which are covered with black, stinking, putrid mud; and when the tide recedes they create an intolerable stench. Now I think these mudbanks should be cleared away; the question is, who is to do it?
41. What you propose amounts to this: that the deep water should be brought as near as possible to the mouths of the wharves; these people have brought shallow water to them? Yes. I think it would be a great thing to adopt some scheme to compel these persons to remove these offensive mudbanks, which are forming the same nuisance and are of the same character as the stuff at the Blackwattle Swamp. This matter was brought under my notice some years ago. At the outlet of the Fort Macquarie sewer the bottom was composed of rocky ledges. The consequence was that the filthy matter from the sewer flowed down and covered these ledges with a film some inches thick, and this created an intolerable nuisance when the tide receded and the matter became exposed to the sun. The result was that we found it necessary to reclaim that portion, and we covered it over, which removed the nuisance to a great extent. The same thing is occurring now at Darling Harbour.
42. *Hon. J. B. Wilson to Mr. Moriarty.*] Would there be much difficulty in compelling the owners of these properties to remove the nuisance; how do you think it could be done? I think it could only be done by hand.
43. Would not the same result be arrived at if each individual wharf were filled in; I do not mean the navigable space between the wharves, but under the wharves, between the piles. Would not that prevent the accumulation of filth in places where it is almost impossible to remove it? It might to some extent, but it might exaggerate the evil, and it certainly would restrict the water space.
44. *Chairman.*] But in such cases as you refer to, where the filth accumulates under the jetties, if the jetties were built of solid stone such a thing could not happen? Then the dredges would have to go between the wharves. I think the time will soon come when all these temporary jetties will have to be done away with, and good substantial jetties erected in their place. There is an intolerable nuisance there; it was represented to the Government last year, and it all arises from this very cause.
45. *Hon. J. B. Wilson.*] Would it not be better to compel the owners of these jetties to fill them up, so as effectually to get rid of the filth underneath them? Well, I am averse to restrict the water space; we must keep the harbor open. I think a different sort of jetty should be constructed in place of these little trumpery jetties, so that a dredge could get at them.
46. Then you would have to bring in a comprehensive measure to compel these people to build their jetties upon proper principles? Yes, it would be necessary to bring in a Bill.
47. And you would have to suggest the principle on which they should be constructed? There would be no difficulty about that.
48. *Chairman.*] Would you have solid stone wharves? No; I would have them of iron; I would have them built out a certain distance, and then constructed with long bays—30 or 40 feet—on iron piles, of such a form that a dredge constructed for the purpose could get under them, instead of the present trumpery wooden jetties with a whole forest of piles under them. I do not see why we should not recommend that a Bill be brought in for that purpose, as the Corporation are bringing in a Building Act which is quite as much an interference with private property.

TUESDAY, 21 SEPTEMBER, 1875.

Present :—

HON. J. B. WILSON,	W. C. BENNETT, Esq.,
F. BELL, Esq.,	E. O. MORIARTY, Esq.,
DR. ALLEYNE.	

M. B. PELL, Esq., B.A., IN THE CHAIR.

Mr. William Davies called in and examined :—

49. *Chairman.*] You have made an examination of the sewers in Sydney under Mr. Moriarty's direction? Yes.

50. We have your report, or a portion of it, before us, which will now be read; and if you have any particular remark to make, or anything to explain, you will have an opportunity of doing so. (*Mr. Davies' report read paragraph by paragraph. Vide Appendix.*)

Mr.
W. Davies.
21 Sept., 1875.

MAIN SEWER, FORT MACQUARIE.

Par. 1, read—"Outlet of Sewer."

51. *Mr. Bell.*] Is there any invert at the bottom of the first portion of the Fort Macquarie Sewer? It is a square-bottomed sewer, not oviform. I call the present bottom an invert.

Par. 2 read—"From flood-gate to Elizabeth street."

52. *Mr. Moriarty.*] You mention in your report that the invert opposite the junctions of Macquarie, Phillip, and Elizabeth Streets, is damaged by the great rush of water. Is it so much damaged as to require re-bricking, or does it only require re-rendering? I don't think it would be any use rendering it unless you put in invert blocks.

53. Then it would have to be taken up and re-set? Yes, the bricks are so much worn by the scour; the water comes rushing in so hard.

54. Would not a good rendering with strong hydraulic mortar, so as to form a strong concrete, answer the purpose? I don't see how you could keep the water back, but it might last some years so.

55. *Mr. Bennett.*] You state that the highest water-line at this point is 3 feet 6 inches above the invert. Do you mean to infer that it has never had more than 3 feet 6 inches water there; it is a 6-foot sewer? It is 6 feet high, and it may be higher, but that was the highest indication I could get.

Par. 3 read—"Elizabeth-street to Bridge-street."

56. *Chairman.*] Does this part of the sewer require immediate attention? No; the rendering is nearly as good now as it was originally; it never was put on properly.

57. *Mr. Bennett.*] Did you notice the flood height in that sewer in the neighbourhood of the Exchange? The height is the same all along that flat part; it is 3 feet 6 inches.

Par. 4 read—"From junction of Pitt and Bridge Streets."

58. *Chairman.*] Did it appear to you that comparatively few of the houses along this street can be connected with the sewer? As far as connections are concerned that sewer is perfectly useless. I may explain that there is a sudden fall from George-street into the Bridge-street sewer which causes the damage.

Par. 5 read—"Bridge-street to Hunter-street."

59. *Chairman.*] When you speak of connections along this length, do you refer to house-connections entirely or to all kinds of connections? Anything at all that opens into the sewer; if there is a flap on I open it, and if I see a pipe coming into the sewer I call it connected; if I see no pipe leading in I call it not connected.

60. Was that one from Spring-street connected? Yes, it was an open pipe; it had no trap on.

61. *Mr. Bell.*] Do you think, Mr. Davies, that re-rendering that portion of the sewer from Bridge-street up to Hunter-street would make it permanently better than it is at present; you say the bricks are good, but the cement is washed out from the joints? Yes, re-rendering would make it better, if practicable.

Par. 6 read—"Hunter-street to Market-street."

62. *Mr. Bennett.*] What is the size of these square holes in the sides? 2 feet square.

63. They were left open for some sewer or drain to connect? Yes, but there is nothing connected with them.

64. Do you think they ought to be bricked up? Yes, to make them water-tight.

65. *Mr. Bell.*] Do you think that portion could be re-rendered also, or should a part of it be taken up and re-made? If you ask my opinion I think it would be best to have your invert blocks.

66. Does the rendering go up to the spring of the arch? Yes.

67. Would you recommend invert blocks to be put in? Yes; wherever I have found them I have found the sewer in good order.

68. *Mr. Bennett.*] But don't you think, without going to such a great expense as that would entail, that 2 or 3 inches of good quick-setting cement would be sufficient? Yes, provided the water could be diverted to allow the cement to set.

Par. 7 read—"From Market-street to Bathurst-street."

69. *Chairman.*] How did you find the air in the sewer? It was good on the whole, except where there is a little depression opposite the Exchange.

70. Was the air bad there? Not very; we had a man opening the man-holes in advance, and one behind.

71. Was the air bad from the man-holes when they were opened? Well, I tried an air-lamp in every hole as it was opened according to my instructions, and the air had no effect upon the light at all.

72. Was there much stench when the holes were opened? Yes; there was more on the top than there was down below.

THE TANK STREAM.

Par. 8 read—"From Circular Quay to Queen's Place."

73. *Chairman.*] Where do the gases escape to from these square holes? Well, you can see daylight through them in many places.

74. *Mr. Bennett.*] Where do they go—into the yards I suppose? Into the yards; the whole neighbourhood of this sewer is made ground and the gas escapes through crevices in all directions.

Par. 9 read—"Queen's Place to Hunter-street."

75.

- Mr. W. Davies. 21 Sept., 1875. 75. *Mr. Moriarty.*] The people living in these houses must get the whole benefit of the smell from this sewer? The sewer is right alongside them. The row of houses goes down across the sewer, and the hole is exactly in a line with the front of them—about 3 ft. or so in front of them—and whenever the sewer is full in flood time the water goes right up and enters their houses.
76. The flood waters you mean? Yes, an ordinary fresh would do it.
77. *Mr. Bennett.*] An ordinary fresh fills the culvert up to the roof? No, not to bore; I think the water-line is about the same as in the other sewers—3 ft. 6 in.
78. That is to say, the water-line goes within 18 inches of the roof? In this place it would hardly do that because it is a very wide sewer.
79. You did not take particular notice of the height of the water-line there? I did not.
- Par 10 read—"Hunter-street to King-street."
- Witness.*] I beg leave to correct one remark in my report: "This chamber in the Tank Stream, to which I refer, is not made by the sewer; it was an old building, which had been left open years ago; it might have been a cellar.
80. *Chairman.*] You mean it was not formed by the sewer, but in the sewer? Yes.
81. *Mr. Bennett.*] Perhaps it was one of the old tanks? If it was intended for a tank it would have been a very indifferent one.
- Par 11 read—"King-street to Victoria Theatre."
82. *Chairman.*] Does the old sewer at the head of the Tank Stream carry off any sewage matter or water? No, not much.
83. Have you examined the Abercrombie-street sewer? Yes.
84. And the sewer in Hay-street? Yes, I have examined all the main sewers.
85. What is the mode of formation in the case of the old sewer at the head of the Tank Stream? 6 inch flagging on clay and square walls on each side. It is about 4 x 3 ft.; as it is an unused sewer I did not take particular notice of it. But I noticed that the flagging had been washed away and undermined and was dangerous; there might be houses just over it. It goes in a diagonal direction over to the Victoria Theatre.

FRIDAY, 24 SEPTEMBER, 1875.

Present:—

HON. J. B. WILSON,		W. C. BENNETT, Esq.,
F. BELL, Esq.,		E. O. MORIARTY, Esq.,

Dr. ALLEYNE.

M.B. PELL, Esq., B.A., IN THE CHAIR.

Correspondence in reference to sickness on board H.M. ships, lying at Farm Cove, having been read, H. G. Alleyne, Esq., M.D., Health Officer, was examined in his place:—

- H. G. Alleyne, Esq., M.D. 24 Sept., 1875. 86. *Chairman.*] I wish to ask you a few questions in reference to the letters which have just been read. It appears that on the 10th April, 1874, fever broke out on board the "Barracouta," which was attributed to the contamination of water by sewage. Was that the case? It was not on that date that fever first appeared on board the ship. I am aware that there were cases of fever on board of her before she sailed from Sydney on her cruise to Adelaide, Hobart Town, and Melbourne; but having heard that the number of cases had much increased, and that there was reason to believe that the disease had assumed an infectious character, I proposed to the Government that when she returned to Port Jackson she should be placed in quarantine, as there was no proper place in Sydney for the reception of her sick people. She arrived on the 10th April, and was detained in quarantine.
87. I think it was somewhere about that time, when the crews were said to be suffering from sickness, that you visited most of the vessels lying here? Yes; having heard the late Commodore express the opinion that the cases of fever which had lately occurred on board of H.M. ships were to be attributed to the fact of the ships lying within the influence of the effluvium arising from the discharge of sewage at Fort Macquarie, and not being quite satisfied of the correctness of that opinion, I visited all of the foreign-going vessels lying in harbour at that time in Sydney and in Darling Harbour, with the view of ascertaining the state of health of the crews. I found the crews of all those vessels healthy at that time, and I was informed that there had not been lately any cases of fever or other kinds of sickness on board of any of them. I did not visit the intercolonial traders, as I believe that the crews of such vessels for the most part live on shore. My inspection was made three or four days after the Barracouta had been placed in quarantine.
88. And these ships, many of them at least, were lying off the mouth of the sewer at Fort Macquarie? Not at Fort Macquarie. There was a vessel lying broadside on to the Tank Stream, which was discharging right on to her side, and stinking frightfully; other vessels were lying alongside, or in the immediate vicinity of exceedingly offensive sewers, but there was no case of fever on board of any of them, and their crews were healthy.
89. Do you think all those ships lying alongside the Circular Quay, Queen's Wharf, and Campbell's Wharf were as much exposed to the influence of the sewers? Yes.
90. More so than the men-of-war? Much more.
91. It was somewhere about that time that sickness broke out on board the Vernon? It was on the 7th April that I was instructed to make arrangements for removing certain cases of sickness from the Vernon to the Quarantine Station.
92. Where was she lying when the sickness broke out? She was lying between the Domain and Garden Island.
93. About the same place the men-of-war occupied? A little more towards Woolloomooloo Bay, between the Domain and Garden Island.
94. The Vernon was then removed to Mossman's Bay? She was removed to Mossman's Bay.

95. Do you know where the Vernon and the men-of-war lying at their usual anchorage drew their water from? They drew their water from the plug at the Government Jetty at Farm Cove.
96. Did any of the merchant-men draw their water from the same place? I believe not.
97. They have other plugs from which they obtain their supply? Yes.
98. Where did the Vernon get her water from after she left her place? From the main at Farm Cove, for two or three days.
99. Where did she get it from then? I advised that they should cease to water at Farm Cove, and the ship was then watered from the main at Sydney Cove.
100. Did the sickness on board her disappear when she went to Mossman's Bay? When she went to Mossman's Bay the sick were taken out of her and treated on shore; at the same time she ceased to water from the plug at Farm Cove, and the sickness soon disappeared from among her people.
101. Does it not appear then that the fever was caused by the water they drank, and not from the effects of the effluvia from the sewers? That was the conclusion that I came to.
102. Do you know whether the water they had been using on board the Vernon had been bad before the sickness occurred? I have been informed by the people on board the Vernon that some time before the boys began to get sick the water obtained from the plug at Farm Cove had been occasionally very offensive, often brackish, and sometimes stinking.
103. From what we know of the way in which Sydney water has been polluted, this offensive condition might have been intermittent—at one time it might have been pure, and at another time offensive? That is very likely to have been the case.
104. Might it not have happened that the water, though ostensibly clear and pure, contained the germs of enteric fever? That is my opinion. I do not think that chemists are yet able to detect such germs.
105. Can you give any opinion as to how far there was a probability that the bottom of the harbour, where these vessels were anchored, was contaminated by sewage? I do not think that it was at all likely to be polluted to the extent to which the statements made in the letter just read would lead one to believe was the case. We know that certain parts of the harbour are polluted by sewage deposits, and, as I am informed that it was the custom some twenty years ago or more to discharge the contents of the punts which had been filled by the dredging machines into the deepest parts of the harbour, and among others into that part between Garden Island and the Domain, it is quite possible that some of that stuff may have drifted over the bottom of Farm Cove. But I do not think that the anchorage has been polluted by the discharge of sewage matter at Fort Macquarie. The actual condition of the anchorage may be ascertained by a very simple and easily applied test.
106. Do you know anything of the bottom of the harbour about there? I have been told that it is blue clay.
107. Was there enteric fever in Sydney at the time this sickness occurred on board the men-of-war? There were cases of typhoid fever in the Sydney Infirmary at that time.
108. *Mr. Moriarty.*] Were there any cases of measles on board the ships at that time? It was reported that there were cases of measles on board the Vernon; but that did not create the alarm which caused the ships to be removed from their usual anchorage.

H. G. Alleyne,
Esq., M.D.

21 Sept., 1875.

MONDAY, 27 SEPTEMBER, 1875.

Present:—

HON. J. B. WILSON,
F. BELL, Esq.,

W. C. BENNETT, Esq.,
E. O. MORIARTY, Esq.,

DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

Mr. William Davies called in and further examined:—

109. *Chairman.*] When you speak of "connections" in your report, do you mean street or house connections—can you judge when you look at them whether they are house connections or street connections? In some cases—not always. I judge by the deposit of street-metal and sandy gravel.
110. Are the bulk of them—I am speaking of connections generally—house connections or street connections? They are house connections except at the corners of the streets, and then they are street connections.
111. From what you have seen of these sewers, do you consider that the great bulk of the matter which goes into them must come from the street connections? According to the present number of house connections the greatest portion of the matter comes from the street connections.
112. Did you find in the Woolloomooloo system of sewers any of the new traps with improved flaps? Yes. You will find that I have noticed them in my report—that the new flap-traps act well, and particularly those that are like the one produced. The flaps are let into the side of the trap, which protects them from being wrung off; but there are comparatively few of them.
113. *Mr. Bennett.*] Was the silt at Woolloomooloo different to the silt in the other sewers—was it coarser and more like street detritus? It is sand. I found where it was silted up to a depth of 2 ft. that about 1 ft. of it was hard sand, and on the top of that was soft sewage matter floating. I do not know what effect a heavy flood would have on that upper stuff; it might carry it all away.
114. But not the hard stuff which lies below? No, it would take a very heavy flood to do that; it is hard consolidated stuff with street-metal in it—quite hard. The present sewage-flow is not anything like sufficient to clear the matter out of the sewers.
115. You did not observe the silting-up so much in the oviform sewers as in the flat ones? No, except in places here and there where there was a slight depression in the bottom.
116. *Chairman.*] Did you observe the character of the sewage matter discharged from the main sewer in Hay-street? There is none at the mouth proper.
117. You did not examine the mouth of the sewer? No, the sewage has been diverted. I went as far as the broken part, where the men were working; I did not examine the other part.
118. Did you examine the silt-pits in the new portion of the sewer? No, I did not go so far.

Mr.
W. Davies.

27 Sept., 1875.

- Mr. W. Davies. 27 Sept., 1875. 119. In examining the sewer at Blackwattle Swamp you came out at Tooth's Brewery did you not? Yes, I could not get up any further, as the sewer diminished in size, and there was a lot of hot water coming down there. The water about there was very much discoloured—I suppose from the beer—and smelt very strongly, and the sediment from the brewery makes a lodgment on the sides of the sewer.
120. Did you find a good many of the connections choked up and inoperative? Yes, particularly along Pitt-street.
121. Speaking generally of all the sewers you have examined, were a great many of them choked up? Only those which had what I term the old Commissioners' traps fixed close so that they would not work.
122. Were there many traps like that choked up? No, not very many; where there are only open pipe connections there is nothing to choke them.
123. *Hon. J. B. Wilson.*] You state in your report that between Hunter-street and Market-street "there are eighty-nine connections nearly equally divided on either side; all the traps used are the Commissioners', but not a third of them are doing their work properly. The flaps were either fixed, open, or closed; the closed ones were forced open with crowbars, and the pipes were found filled with very offensive sewage matter. This length requires immediate attention, as it is in a very bad state." Now what you are asked is to state the number of those that were found filled with very offensive sewage matter—can you say how many there were? No, there were a good many.
124. *Chairman.*] Were there many where the traps were permanently closed? Yes, a good many along that length.
125. Could you form an idea how the sewage matter that ought to go down these pipes which were choked up was disposed of—what became of it? If the connection was choked up it would filter through the sides wherever it could—the fluid portion of it.
126. *Mr. Bennett.*] Have you examined the sewers in Macquarie, Phillip, Castlereagh, and Elizabeth streets? I have been examining Macquarie-street sewer to-day, and I find that instead of being one of the best connected sewers it is one of the most defective. I shall send in a separate report on this sewer from Hunter-street to the Mint.
127. Have you examined Phillip and Elizabeth streets? No. I shall examine Phillip-street to-morrow.

THURSDAY, 30 SEPTEMBER, 1875.

Present:—

HON. J. B. WILSON, | F. BELL, Esq.,
B. PALMER, Esq., | W. C. BENNETT, Esq.,

DR. ALLEYNE.

M. B. PELL, ESQ., B.A., IN THE CHAIR.

Mr. William Davies called in and further examined:—

Mr. Davies' report on Busby's Bore (*vide Appendix*) read paragraph by paragraph.

"Hyde Park to Shaft No. 4 at Ice Works.

Report read, paragraph 1. "From the iron mains at Hyde Park to near Riley-street the culvert is of stone, 9 feet x by 2 ft., covered with flagging.

"Along the bottom for the whole length there is a deposit, varying in depth from 9 to 21 inches, consisting of fine earthy matter. (*Sample No. 1.*)"

- Mr. W. Davies. 30 Sept., 1875. 128. *Chairman.*] Was it black peaty matter, or mud? It was not exactly black, but of a filthy colour. I wish to remark that I did not see any difference in the colour of the sediment right through the tunnel.
129. Was any water running into it when you were there? There was 2 ft. 5 in. at the bottom.
130. Was the water running when you were there, or was it stagnant? It was running, but very slowly; it was not stagnant.

"No water was observed percolating any part of this culvert.

"At Riley-street the tunnel is through shale rock. The roof and sides are dry; there is sediment along the bottom from 6 to 9 inches in depth. The shaft at this place is dry."

131. Do you mean dry at the top and at the sides? Yes, it was dry throughout.

132. Was there any water at the bottom? There was no water percolating even through the bottom—I am speaking of the shaft.

133. Was there any water in the tunnel? Yes, there was about 2 ft. of water at the bottom; the shaft comes in at the roof of the tunnel.

"Above Riley-street the tunnel is through hard sandstone. At the Court House shaft a little water passes through the bottom of shaft; it is clear and sweet.

"Between the Court House shaft and the Ice Works there is a pipe connecting with the gaol, branching off about 18 inches above bottom of tunnel. This pipe was perfectly clean."

134. Does the water running through this pipe supply the gaol? When the tunnel is in bore this pipe supplies it with water.

"After a minute examination of the tunnel between the Court House and the Sand Hills I was unable to discover traces of contamination by sewage matter."

135. You mean that you could not by yourself detect any contamination? No, I could not see any indications of it either on the roof or on the sides.

136. That is to say you did not perceive any smell or dirty appearance? No; generally, when sewage matter percolates, it leaves a deposit of offensive black matter on the sides, but if the water is clear it leaves the sides clean.

137. Then I understand that as far as you could judge the water percolating was free from contamination? Yes.

"The Ice Works shaft and the roof and sides of tunnel were dry.

"From

"From this shaft to the Provost's there is an accumulation of matter which, owing to the unevenness of the bottom, varies from 3 to 9 inches in thickness. There is a slight soakage of wholesome water through the roof and sides of tunnel, but this leakage only amounts to what is called 'bleeding.'

Mr. W. Davies.
30 Sept., 1875.

"No. 1, Park Road.

Paragraph 2 read. "In this shaft water percolates freely through a fissure in the rock 12 feet below the surface.

"There is only surface drainage to the houses in Park Road, and the surplus water and sewage matter finds its way to the old quarry-hole, and is there absorbed by the made ground. I have no doubt that it afterwards reaches the shaft, since there is nearly the same volume of water running off the drainage area as there is running into the tunnel through the shaft."

138. Mr. Palmer.] You state that you have no doubt the sewage matter reaches the shaft. Do you consider yourself competent to express an opinion upon it? I have not the slightest doubt in my own mind from the foul matter left on the sides, and I pointed this out to Mr. Bell. I say I have no doubt; that is the expression I use, but I do not say I am right—that is my opinion. There is a sample of the water which can be tested, and will prove whether I am right or wrong. I am merely stating my honest opinion about it.

139. Do you consider yourself competent to give an opinion on sewage contamination? Yes, I think I am. I am a practical man, and have had experience in many matters of this kind.

140. Well, I can only say that the evidence of Professor Smith directly contradicts your opinion. "The tunnel is sound and good, and no water runs in at any point except at the shaft alluded to above.

"The sample bottle (No. 5) is filled with water from this shaft.

"From Provost buildings there runs an old drain discharging into the quarry-hole opposite the shaft."

141. Is that at the back of the Barracks? It is from a building in the Barracks.

142. Mr. Bell.] Is it a surface drain? Yes, it joins the Park Road drain in the old quarry-hole.

"Sample No. 2 was taken from the bottom of tunnel, where there is a deposit from 3 to 9 inches thick.

"As far as could be ascertained the air in this portion of the tunnel was pure. The highest water line shown on sides is 8 feet, but at the time of examination, owing to the irregularities at the bottom, there was a depth of 9 inches of water on the bars and 4 feet 6 in the holes of the bottom of tunnel.

"Shaft No. 1, Park Road to Pound Paddock.

Paragraph 3 read. "This length is in good order. The roof is dry, with a slight filtration of clear water through the sides.

"The sediment is much the same as in other parts, varying in depth according to the unevenness of the bottom. At No. 12 shaft there are three culverts, 4 ft. x 2 ft., with a lodgment of sand and fine earthy matter at the entrance, and on the bottom from 12" to 15" in depth."

143. This part of the tunnel is chiefly rock, is it not? Yes, all through, except the weak part where the culvert is.

144. Are there any fissures or cracks in the rock, or is it quite solid? There are no fissures or cracks to be seen, but it has never been properly trimmed; it has just been cut out of the solid rock and left untrimmed; there is no percolation there through any part except where it is stated further on in my report.

"Pound Paddock Shaft to No. 20 Shaft at Rifle Range.

Paragraph 4 read. "In this length pure water freely passes through roof and sides. I was unable to go further than Shaft No. 16, as the water was up to full bore. At this shaft there is a culvert."

145. Was the water running in this part of the tunnel? It was running very slowly—you could just see the movement in it.

146. Mr. Palmer.] When did you make this examination—was it during the time that the tunnel was closed? Yes. The outlet locks were opened at the bottom of Hyde Park, and whatever surface water was running was running very slowly; and during the progress of repairing the lock at the mouth there was a certain amount of leakage going through there as well.

"At No. 17 Shaft I found 3 ft. of water. At No. 20 the bottom is uneven, and the tunnel is silted for a depth of 12 to 15 inches in the holes.

"Shaft No. 20 to the mouth of Tunnel.

Paragraph 5 read. "From No. 20 to 24 the roof of the tunnel is very low, and the water is to full bore. On the roof and sides clusters of vegetable matter (sample No. 4) are found, which emit an offensive peaty smell. Clear water percolates the roof and passes freely through the roof and sides.

"Along the bottom there is a sediment from 3 to 9 inches in thickness. Sample No. 3 was taken from here.

"There is a strong and offensive odour of decayed vegetable matter along the whole of this length.

"General Remarks.

Paragraph 6 read. "The tunnel throughout is most irregularly driven, being in a zigzag without any apparent lines.

"There is no fixed gradient, but the bottom consists of a succession of bars and hollows, so that the silt fills up the hollows from bar to bar with a depth of from 3 to 15 inches.

"The roof varies from 4 feet to 9 feet in height; the lowest parts are always in full bore when the lock is open, thus confining the foul air in the high chambers formed in the roof.

"If there were three or four ventilators on the shafts they would tend greatly to purify the water as well as the air.

"The sides are not trimmed, but form so many shelves and nooks, with a sediment of fine peaty matter lodging on them, from 1/2 to 1 inch thick.

Percolation.

Mr.
W. Davies.
30 Sept., 1875.

Percolation.

Paragraph 7 read. "From Hyde Park to Pound Shaft the percolation is very slight, only what is termed 'bleeding,' and the water is clear and sweet with exception of No. 1 Park Road. From Pound Paddock to No. 24 the percolation is stronger, but the water is in all cases sweet and clear."

147. *Chairman.*] In speaking of the water from No. 1 Park Road you did not I think explain to us what you saw to make you think it was contaminated? I judged by the discolouration of the stuff on the sides of the shaft.

148. Was there any smell about the water at the time you took it? Well I was down below, and it was not very easy to tell accurately because everything smelt the same there. I merely say that I took it as an indication of sewage matter when any water percolating discoloured the sides; clear water does not leave any discolouration.

149. *Mr. Bennett.*] Did there seem to have been any effort made in this No. 1 Park Road Shaft to point the fissure so as to stop the water from entering the shaft—had anything been done? Nothing had been done.

150. Did the water come in through a natural fissure of the rock? Yes.

151. Was there any trace of this fissure having been stopped before? No.

152. Could it be stopped and the water kept out? It could be by breaking into the solid rock, by caulking it, and then putting in good cement.

153. Do you think the water came out of any other fissure? Well, I cannot say; it is difficult to say where water may get through; it might lift up and come through some other fissure.

154. *Chairman.*] Do I understand you to say, then, that if this leakage was stopped it might perhaps break out in some other place? It could not be stopped unless the rock was solid, because if it was stopped in one place it would find its way out somewhere else.

155. Are there any other fissures? The nearer you got to the surface the more fissures there are.

156. *Hon. J. B. Wilson.*] Is there any other way for the water to escape? The whole of the ground is made ground, and of course I could not see into it; I could only judge from the indications in the shaft. I think this water could be diverted from the shaft and into the old watercourse—into the lagoon.

157. You are of opinion that this water could be diverted from the shaft? I think it could decidedly.

158. *Mr. Palmer.*] I should like to know, Mr. Davies, what position you hold and what experience you have had in these matters? I have been for the last sixteen years in the Harbours and Rivers Department.

159. *Chairman.*] What has been your employment latterly? I am still in the department, on the Wollongong and Kiama Breakwater.

160. What is the nature of your employment there? I have the superintendence of the Government works there.

161. Have you had any previous experience in underground workings such as this tunnel? Yes, I worked on the whole length of these tunnels in Sydney until they were finished, under Mr. Randall.

162. Then you have had a good deal of experience in underground workings? Yes, I have been mining in Wales since I was a boy.

163. *Mr. Palmer.*] You had the mouth of the Ice-house shaft in the tunnel left open the other day? The men were ordered to close each shaft as soon as I had passed it; I had no responsibility in the matter. With the permission of the Board I would like to examine the new part of the Darling Harbour sewer; I was examined upon it the other day, and I had not inspected it.

164. You gave evidence on the condition of the sewer up to where the break occurs; the rest is new work and not in use—Have you any reason to give why it should be examined? No; perhaps Mr. Bell could give you all the information you require about it.

Francis Bell, Esq., City Engineer, further examined in his place:—

F. Bell, Esq. 165. *Chairman.*] Did you examine the Bore, or any portion of it, while it was free from water? I examined one or two of the shafts that were opened.

30 Sept., 1875. 166. You did not go down into the Bore? No.

167. Which of the shafts did you examine? I examined the first one on the Park Road.

168. Did you go down the shaft yourself? No, I did not.

169. Then you can hardly judge of Mr. Davies' evidence whether it is correct or not? Mr. Davies was with me and I believe he went down on a subsequent occasion; we could easily see where the water was coming in, and that it was perfectly clear.

170. Have you any reason to differ from the report Mr. Davies has sent in as to facts? I was rather pleased with the report on the whole.

171. What I ask you is—have you any reason to believe that Mr. Davies is incorrect in his statement of facts or not? No, I have not.

172. Some weeks ago, Mr. Bell, I believe you discovered that some of the flagging at the mouth of the Bore had become displaced, and that the water was entering the Bore at that place instead of at the legitimate opening? Yes.

173. And in consequence of that displacement particularly you had the Bore emptied and repaired? I had.

174. Is it now so effectually repaired that the water can only enter by the sluice-gate through which it is intended to enter? It is.

175. Can you tell at all how long it was before the tunnel was emptied from the time this leakage was discovered? I should think it was about five or six months; it was from a depression of the sand on both sides of the lock that I suspected this leakage, and I also saw a slight eddy at those places.

176. If you remember when Professor Liversidge first visited the Bore, and also when the Committee of which Professor Smith was Chairman visited it, they both most distinctly stated that there was no sensible flow of water into the Bore at that time;—do you remember that; it is in evidence? Yes, I am aware they said so; but I do not agree with the inferences they drew. At that time the water was entering the tunnel through earthenware pipes, from the outside of the protecting sand bank to the lock in the mouth of the tunnel, and therefore there could not be any current observable at the surface.

177. Was the defect in this flagging so great as to render it possible that a large quantity of water—say half a million of gallons a day—could pass through? It was. F. Bell, Esq.
178. As much as that? Yes, I think so. 30 Sept., 1875.
179. *Mr. Bennett.*] When the tunnel was opened this last time, Mr. Bell, was all the water run off? As much as we could—in fact it was all run off.
180. All the water was stopped to the far end? Yes, we stopped all the water for about a day.
181. Did you notice what water was running out at this end—at Hyde Park? I think there was none at all.
182. Then there was no percolation? There is percolation through a good part of it. I may mention that we could not open the locks into the city. When the tunnel is not working we shut all the locks and turn the water from Crown-street Reservoir into these pipes; we have no other way of getting rid of the water in the tunnel but through the mains to the city.
183. You do not know whether the water increased in height when it was dammed up? No.
184. *Chairman.*] In the report dated 17 October, 1872, referring to the former occasion when the Bore was emptied, you say, alluding to Moore Park—"the remainder from that to the mouth of the tunnel in the Lachlan Swamp would have been nearly all under water had it not been for the three Californian pumps which were kept going night and day, in order to get rid of the large quantities of water which must have entered through fissures in the rock from springs in the tunnel itself, as the water was entirely shut off at the mouth by dams and sluices"? Quite so.
185. Are you not surprised to find that now there is not such a large quantity percolating as there appeared to be then? I believe there is the same quantity coming in now from the same place.
186. So much as to require the use of three Californian pumps day and night? Yes, that was the case. Of course they could not examine this place because the tunnel was full bore.
187. Still if the water had been going in at such a prodigious rate it would have been observed? Well I may say that if that hole was drained by the pumps there would be a much greater percolation than when it was full of water.
188. Are you aware that before this tunnel was completed—when it was originally made before they had reached the swamp—a considerable portion of Sydney was supplied from it, there being no doubt the same quantity of water percolating from springs? I was not aware of it.
189. It was a dry season when you examined it before, but the present season is drier, and therefore there would not be so much water coming in.
190. *Hon. J. B. Wilson.*] Would it not be advantageous in examining that leakage at No. 1 Park Road if you were to sink down outside the shaft; it is only about 12 feet deep? I think it would be advisable to divert the drainage from going near the shaft, and to have the fissures of the rock in the shaft itself thoroughly caulked and cemented so as to stop all percolation.

MONDAY, 11 OCTOBER, 1875.

Present:—

HON. J. B. WILSON,		F. BELL, Esq.,
B. PALMER, Esq.,		W. C. BENNETT, Esq.,
DR. ALLEYNE.		

E. O. MORIARTY, Esq., IN THE CHAIR.

Mr. William Davies called in and further examined:—

191. *Chairman.*] In your report on the Macquarie-street sewer from junction with main sewer to King-street, page 6, clause 29, you state that there is "a great scouring on the invert; in some places the bricks are worn half through the inner ring, and the rendering gone for 9 inches up the sides";—Do you think this sewer will require immediate repair, or will it do for some time longer without repairing? Where whole bricks are gone from the rings it requires immediately repairing; the gradients are very steep, which causes the scouring. Mr. W. Davies.
11 Oct., 1875.
192. You think that requires immediate attention? I do, sir.
193. Did you observe any offensive smell arising from that sewer between Bent and Hunter streets? No, nothing particular to distinguish it from any other part.
194. Was this sewer from Bent-street to King-street in pretty good order? The sewer on the sides and arch was in good order—it was what I call in good order on the whole.
195. It does not want anything doing to it? No.
196. Do you think there is fall enough in that sewer to remove the sand and sediment by means of flushing? Yes.
197. *Mr. Bennett.*] What has caused that deposit of sand and sediment—is there any particular reason why it should be there? There is no head of water to flush it down.
198. It has not drifted in from any of the side openings? No.
199. *Chairman.*] Are there any invert blocks in this part of the sewer? No, there are not.
200. Are the Infirmary buildings drained into the Macquarie-street sewer? Yes, that is where most of the sewage comes from.
201. Are there proper traps on most of the sewers? Yes, what I call Commissioners' traps.
202. Are they in good working order? No, the flaps have got fixed open in many cases.
203. Are the Infirmary buildings connected with the Macquarie-street sewer? Yes.
204. How many pipe drains are there? One large pipe drain.
205. With one of the old Commissioners' traps on it? Yes.
206. Which does not act well? No.
207. You say in the latter portion of your report on this sewer that all the traps are in good order? Yes, in the upper part of the sewer; the improved traps are in good order; on the right-hand side going up all the new connections are in good order.

- Mr. W. Davies.
11 Oct., 1875.
208. *Mr. Bennett.*] Did you find the Phillip-street and Macquarie-street sewers as bad as the Pitt-street sewer? They are not so bad taking them as a whole, but parts of them are quite as bad.
209. But generally they are better? Generally they are better. (*Flap with broken hinges produced.*) I find that the links of these flaps are not properly welded, and a very little forces them open. All the improved traps have flaps let into the sides.
210. *Chairman.*] In your report on the Elizabeth-street sewer, from junction of main sewer to Bathurst-street, you say "the invert is much worn in places"—is it so much worn as to require immediate repair? Yes, there is a hole in the invert at 30 feet from the outlet, and three bricks washed out, and further on there is another hole, 3 feet long, with both rings gone.
211. Do you think it would be worth while to take up these bricks where they are worn, and put in invert blocks? Invert blocks would be much better than the bricks.
212. *Mr. Bennett.*] Don't you think it would be much better to replace the bricks that are worn with good hard bricks of the same shape or with concrete—would not it be a most difficult job to put in invert blocks, as you would have to undermine the whole of the sewer? Hard bricks would do.
213. Would not it be far cheaper to put in hard bricks? That would depend upon the first cost of the blocks. I do not know what they cost.
214. *Chairman.*] From Park-street to Bathurst-street you say the sewer "is in a very bad state; a deposit of offensive sewage matter, 3 inches at Park-street, and increases gradually to 1 ft. 9 in. at Bathurst-street." What sort of material is this offensive matter—is it sewage, or what? It is sewage, nearly all of it; it comes from nearly the head of the sewer.
215. There is not much fall in this sewer, I suppose? No, not a great deal; the flow of water is very trifling; there is hardly any.
216. And this deposit of offensive matter arises, I suppose, from the want of flushing? Yes.
217. Do you think the surface water could be got into it to flush it? Yes, water should be got into it in some way to flush it.
218. Do you think the bulk of the houses are connected or unconnected with this sewer? I should say that, on the whole, there is not one-third or perhaps one-half of them connected. I have taken particular note of the number of connections, and if you count the houses you will find there are very few connected. If it would be of any service, I could furnish details from my notes, and show you the number of connections all along, but it would take a good deal of writing.
219. This report applies to the whole length of the street? Yes.
220. From the junction of the main sewer up to Bathurst-street? Yes. There may be two or three houses connected with the same pipe.
221. Then we come to Castlereagh-street, from junction of main sewer to Bathurst-street. At the head of it there is a deposit of silt of the same description as that you mentioned in the other sewer? Yes.
222. And arising from the same cause? Yes.
223. This occurs where the gradients are flat, and there is no flow of water to flush the sewer? Yes.
224. Is there anything else you would like to state in reference to these sewers? No, I do not think of anything more. I have given you my opinion as far as I can. The great thing is the want of flushing the sewers, but this has been a remarkably dry season.
225. And that might account for a great deal of this deposit? Yes.
226. Here is a letter you have sent in, dated to-day, which I will read.

"Sydney, 11 October, 1875.

"The Chairman of the Sydney City and Suburban Sewage and Health Board,—

"Sir,

"On the 8th instant the City Engineer made remarks touching the veracity of my report on the 'Busby's Bore,' to which I give a most direct contradiction.

"The City Engineer said that he was informed 'that the sample bottle No. 5 was not taken from the place indicated in my report, but that it was taken from the bottom of the shaft'. Now, sir, whoever the informer was, he has stated what is not true.

"In my presence, and in the presence of Mr. Gillespie (who stood on the top of the shaft the whole time), the sample was taken by two of the Corporation men named Gregory and Sullivan from the spot named in my report. If you have any doubt in the matter, I would much like for the above persons to be examined.

"W. DAVIES."

227. Did you take the sample now produced yourself? I took the first sample myself, but the bottle was broken in transmission.
228. Who took the sample sent to the Board—the sample now produced? Gregory and Sullivan.
229. How is that indicated—is there any number on the bottle? It is marked and labelled.
230. Describe to us how they took it? The water does not percolate sufficiently to form a stream, and the hand has to be held against the wall so as to make a spout, and the sediment that is in it came from the hand held against the wall, so (*placing his open hand at right angles to the wall.*)
231. Did you scrape it down with your hand? No, there was no scraping; only the hand held against the wall to throw the water off.
232. Just describe how you took the first sample? I took it in exactly the same way.
233. Did you take it yourself? I took it myself.
234. Describe how you did it? Just as I have shown you. I gave the men directions to lower me down, and between 12 and 15 feet down where the water was percolating through I laid my hand against the wall just to divert the water and make it run off the wall into the bucket.
235. And did you scrape the dirt from the wall into the bucket? Oh no.
236. Have you got any of the water you took? No; the bottle was broken.
237. Now describe how this sample was taken—by whom was it taken? By Gregory. I sat on the top of the shaft, and Mr. Gillespie was there; I did not know who he was—I had never seen him before; but seeing him take particular interest in it I thought he might be one of our aldermen, and I said to him "Do you take notice of my taking this sample?" and he said "Yes"; I then asked him his name, and he said he had no objection to give it. There were two men on the top besides, carters, all Corporation men.
238. What distance from the top did that water come in? As near as possible, about 12 feet from the surface.
239. On which side of the shaft did it come in? On both sides, but mostly on the side next the Barracks.
240. Was there any coming in on the other side? Yes, but less of it.
241. Was it coming in all round the shaft? No; only through fissures in the rock.
242. Fissures in the natural rock? Yes.

SEWAGE AND HEALTH BOARD—MINUTES OF EVIDENCE.

243. Were these fissures in the rock well marked—could you trace them? Yes; they were about $\frac{1}{4}$ inch open—what we call slack-backs.
244. Were they vertical or horizontal fissures? They were diagonal.
245. Is that shaft wholly in rock or is it backed—has it got any masonry lining? There are 3 or 4 feet of masonry lining on the top.
246. Then it is 6 or 8 feet from the surface rock where this water comes in? Yes, about that.
247. Did you see the sample taken by these men? Yes.
248. And you saw them lay their hands against the wall? Yes.
249. *Mr. Palmer.*] Did you take the sample, or did Gregory? Gregory took the last one.
250. And you took the first one? Yes.
251. And if any one states that you drew your hands down the wall and drew dirt into the bucket he says what is not true? Yes; if he calls my holding my hand against the wall to make a spout for the water scraping the dirt down, he certainly does.
252. *Chairman.*] Are you quite certain that there is no mistake about the water, and that this bottle is not the one you took? Yes, because it was never out of my possession until I brought it to the office.
253. How did the other bottle get broken? It got broken in transmission from the Park Road to your office.
254. And all the water was lost then? All the water was lost of course.
255. *Mr. Bennett.*] Were you low enough down to see that the men took the sample exactly as you took yours? Yes, exactly in the same place, and in the same way.
256. And you did not drag your fingers along the wall? No.
257. And they took the second sample in the same manner? Yes, in the same manner. I beg to add one word:—The two men who took the last sample were with me when I took the first, and lowered me down the shaft. I had only two men all along; they went through the tunnel with me. I do not know who the men on the top were.
258. *Chairman.*] Have you Mr. Gillespie's address? I asked him where he lived, and he said somewhere up in Paddington.
259. Had you any object in bringing muddy or dirty water to this Board? Not the slightest.
260. Are you interested in any way in bringing in muddy water? Not in the slightest degree.
261. Was there much moss or other vegetable matter on the sides of the shaft near where this water was percolating through? There was a black slimy discoloration; it was highly discoloured.
262. The side of the shaft you mean? Both sides of the shaft, just where the water ran in through these fissures.
263. Did the water seem to be dirty when you took it? No, it appeared when first taken to have a whitish hue on it.
264. Was it as clear as it is now when it was first taken? No, it had to settle down—it was thick at first.

Mr.
W. Davies.

11 Oct., 1875.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY CITY AND SUBURBAN SEWAGE
AND HEALTH BOARD.

SEVENTH PROGRESS REPORT

OF THE

BOARD APPOINTED ON THE 12TH APRIL, 1875,

TO INQUIRE INTO AND REPORT AS TO THE BEST MEANS OF DISPOSING OF THE
SEWAGE OF THE CITY OF SYDNEY AND ITS SUBURBS,
AS WELL AS OF PROTECTING THE HEALTH OF THE INHABITANTS THEREOF ;

ADOPTED BY THE BOARD ON THE 3RD JANUARY, 1876 ;

TOGETHER WITH THE

REPORT OF COMMITTEE AND MINUTES OF EVIDENCE,

AND CORRESPONDENCE ARISING OUT OF STATEMENTS THEREIN.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,

3 *March*, 1876.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

SEVENTH PROGRESS REPORT.

To the Honorable the Colonial Secretary,—

SIR,

1. We have the honor to draw your attention to the accompanying Progress Report of a Committee appointed to inquire into "the crowded state of dwellings and areas in the City of Sydney."

2. The Committee have very properly selected the state of the City watch-houses as the subject of their first Report, not because it is under existing arrangements attended by evils at all comparable in extent to those arising from other causes brought under their notice, but because it is a matter under the control of the Government and capable of being speedily and effectually set right.

3. In the recommendations of the Committee we cordially concur. The evidence which they have taken on this subject is so mixed up with that relating to other and more serious matters, on which the Committee have not yet been able to report, that it cannot conveniently be laid before you at present. The greater part however of the evidence relating to the particular subject under consideration is quoted in the Report itself—certainly quite enough fully to bear out all their conclusions.

4. In calling your attention particularly to some of the most glaring evils brought under our notice by the Committee, we cannot refrain from expressing our surprise, as we have had occasion to do with respect to several other matters, that the state of things disclosed in this Report, should have been so long suffered to exist in the midst of a wealthy, civilized, and humane community. Mr. Chapman, who has long been an active member of the City Council and was twice Mayor, informs us that he had no idea of the horrible state of the watch-houses until he visited them as a member of the Committee. It is not surprising then that the public generally are equally ignorant. It is obvious to us, and it seems to be the growing opinion, that there should be some permanent sanitary authority, willing and able to drag all such abuses to light without fear or favor, and to keep them constantly and prominently before the public until a perfect remedy is applied.

5. The evils connected with the existing state and management of some of the City watch-houses are explained in detail in the Report of the Committee, and are comprised under the following heads:—

- (1.) Grossly inadequate accommodation.
- (2.) The almost total want of ventilation whereby the inmates frequently suffer partial suffocation.
- (3.) The absence of any system of classification of prisoners, except according to sex.
- (4.) The absence of suitable arrangements to provide for the necessities of prisoners, and to secure any approach to decency and cleanliness.
- (5.) The absence of any systematic attendance upon those suffering from prostration or debility, caused by drunkenness or other causes.
- (6.) The improper situation of some of the watch-houses.

6. Before making any observations upon these several heads, we must remark that we learn with much pleasure that the Committee are satisfied that the prisoners are treated by the Police with humanity, and that their comfort is as well attended to as is practicable with the grossly inadequate accommodation and appliances provided. In no case did the Committee receive from the inmates any complaints against the police.

7. With respect to the first and second heads, it is sufficient to remark that the members of the Committee who visited the Central Police Station compare the sufferings of the inmates of one of the cells to those of the captives in the black hole of Calcutta, or to those of negroes in the hold of a slave ship; and that Dr. Smith,
speaking

speaking of a cell at the same station measuring $11\frac{1}{2}$ by $8\frac{1}{2}$ ft. and 13 ft. high, where 17 females had been huddled together in a promiscuous mass on the floor, states as his deliberate opinion that the inmates would have been suffocated except that the door was occasionally opened to admit a fresh victim.

8. In this cell an old woman was moaning for a drink of water and Mr. Chapman assures us that although there was a vessel of water in the cell it was impossible for her to get at it in the crowd and the darkness.

9. It is really surprising, whilst so much attention has been paid to the health and well-being of convicted criminals in the regular prisons, that there should have been such a total neglect of the watch-houses, which are intended for the reception of persons guilty of trivial offences, or arrested on suspicion only. The law provides that a drunkard under certain circumstances shall be punished, but it could hardly have been intended that his punishment should commence until after his full restoration to consciousness and reason. Until that takes place common humanity requires that he should, if taken into custody, be treated at all events with ordinary care, and not be thrust with a number of others, more or less in a similar state, into a dark and filthy den without even a breath of fresh air to revive him.

10. We are informed also, that it happens not unfrequently and without any fault of the Police, that a person suffering from some kind of fit or faintness which is mistaken for intoxication, and requiring care and attention, and above all things fresh air, is thrust into one or another of these pest houses, and being supposed to be merely dead drunk, is left to lie on the floor amongst vagrants and drunkards to recover (or die) as best he can. Dr. Dansey tells us that on one occasion he was sent for to attend upon an inmate of the Cumberland Police Station who was unconscious and supposed to be dying; upon being removed into the open air the patient immediately recovered consciousness.

11. It is a fact not pleasant to think of, that perfectly innocent and respectable persons, arrested by mistake, for mistakes must of course be made sometimes, are occasionally doomed to pass the night, or possibly two nights, in these horrid places in the company of vagrants and drunkards sometimes reeking with filth and swarming with vermin, sometimes suffering from loathsome diseases.

12. The following improvements should be made at once:—

- (1.) The existing cells should be better ventilated, if it were only by knocking holes in the tops of the walls, and making openings in the lower parts of the doors and walls.
- (2.) The cells should be kept constantly lighted from without, so as not to increase the heat and closeness within.
- (3.) Prisoners should be classified as far as practicable, and better arrangements should be made to provide for their ordinary necessities.
- (4.) Proper attendance should be provided for prisoners requiring it, and arrangements should be made that they may have a sufficient and accessible supply of water to drink.

13. Finally, we recommend that a sufficient sum be placed on the Estimates to build commodious watch-houses in the best available situations to supersede those in George, Cumberland, and Parramatta Streets, and to make additions and improvements at Darlinghurst.

14. In conclusion we beg to draw your attention to the very objectionable practice of confining persons arrested by the Police on suspicion of being of unsound mind in the cells at the Central Police Station. We are informed by Dr. Alleyne that the Receiving-house at Darlinghurst was intended for such cases, but that it was diverted from its original purpose by being proclaimed as a place for the reception of the insane, so that it is available at present for those only who have been legally pronounced to be insane, and not for those arrested on suspicion, as was intended. We are of opinion that a portion of the Receiving-house at Darlinghurst should be reserved for the immediate reception of persons thus arrested.

M. B. PELL,
Chairman.

Board Room, Sydney,
3rd January, 1875.

PROGRESS REPORT

OF THE

COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN SEWAGE, AND HEALTH BOARD,

on the 26th October, 1875,

“To inquire into the crowded state of Dwellings and Areas in the City of Sydney and Suburbs so far as it affects public health.”

ADOPTED BY THE COMMITTEE, 22 DECEMBER, 1875.

SIR,

1. In carrying out the inquiry into “the crowded state of dwellings and areas in the City of Sydney,” the members of this Committee, in the course of their personal inspections, have discovered that some of the City watch-houses afford at times notable examples of overcrowding; and as they believe that this overcrowding, coupled as it is with bad ventilation and other sanitary defects, must prove a serious though unintended aggravation of the punishment involved in simple confinement, and is not only a great physical discomfort for the time, but is likely to create ill-health and to spread disease, they think it advisable to report the matter at once to the Board, with the view of having it brought forthwith under the notice of the Government.

2. There are five Stations in Sydney where the Police may lock up offenders for the night,—the Central Police Station, the Water Police, the Parramatta-street, the Cumberland street, and the Darlinghurst.

3. The Central Police Station has been visited three times by members of the Committee—twice at night and once by day; the Parramatta-street twice—one night visit and one day; the Cumberland-street three times—two day and one night; the remaining two stations had each a night visit. The following extracts from the evidence tendered to the Committee by the visiting members will convey to the Board some idea of the present condition of these various Stations:—

4. *Central Police*—Messrs. Read and Chapman report that they found it on their first visit “in anything but a creditable condition, owing to the wretched ventilation, the overcrowded state of the cells, and the almost total absence of the necessary provision for health and cleanliness.” * * *
No. 5 cell contained eighteen prisoners. It measures 18 ft. x 15 ft., giving 270 feet floor space and 3,510 cubical feet air space, or 15 ft. floor space, and only 195 cubical feet air space to each inmate. This is frequently considerably reduced as the number of prisoners is increased, which is not unfrequently the case, for the police did not seem to think the room contained at all an unusual number. No. 6 cell was occupied by 11 females. It is about 11 ft. by 8 ft. 6 in., giving 93.5 ft. floor space and 1,209 cubical feet air space, or 8½ ft. floor space and 109.8 cubical feet air space to each confinee. A comparison between these dimensions and those enforced by the English Legislature in lodging-houses will shew that it is no light punishment to be locked up, especially during the summer, even for one night in a Sydney watch-house. In London it is required that in Metropolitan lodging-houses there should be 30 ft. of floor space and 240 cubical feet of air space for each inmate; any quantity less than that indicates overcrowding. It will be seen that the only distinction made in this place is that of sex. All persons locked up for the night, whatever may be the charges preferred against them, or whatever the class to which they belong, are thrust indiscriminately into the same place, where for the next twelve hours they are compelled to breathe the foul atmosphere of a dirty overcrowded prison. There are no gratings let into the walls to supply fresh air where it is most needed, except in No. 5 cell, where there are eight gratings on the same side of the wall—four above and four below—and none on the other side, so that for purposes of ventilation they are nearly useless. A faint ray of light comes in during the day through a pane of glass about 6 in. wide high up in the wall, and there is no ventilation, except through the centre of the ceiling, where, as in all the cells, a ventilator is fixed communicating with a central ventilator in the charge-room, above which the gas is occasionally employed in some way to produce a current of air. We doubt much whether this system of ventilation is effectual at any time; when we visited the place it was not in operation, or if so the result was imperceptible. In No. 6 cell the small pane of glass had been taken out, and the atmosphere was much less oppressive. The floors of the cells are of cement, and in one corner of the cell was a galvanized-iron bucket which served as a urinal, and smelt most offensively.

offensively. The doors fit, as a matter of course, very closely, and as there are no windows in the cells, with the exception of the pane of glass mentioned which does not open, it is evident that the means of ventilation described are insufficient, and that there should be some mode adopted of admitting air in the lower part of the room. There appeared to be no reason for crowding so many persons into such a limited space; there were several empty cells, among which they might have been distributed, and which would have afforded an opportunity of classifying them to some extent; the clean might at least have been separated from the unclean. That this is absolutely necessary was suggested to us rather unpleasantly just after we had left the room, by the sound of a person vomiting within the cell—one of the eighteen crowded into the cell, 18 ft. x 15 ft. We could only express a hope that if among the other seventeen there should happen to be any youth inclined to intemperance, who was here expiating his first offence, the horrors of a night in such a place would have its due effect upon him, and that the Magistrate before whom he would appear in the morning, would be lenient towards him, in consideration of punishment already received. * * * We scarcely think it would be worth while to attempt to repair and improve this building. It has been a long time in use, and is utterly unsuited to the purposes required. It is time now that it should be pulled down and a more commodious watch-house erected upon an improved plan, and with special regard to proper ventilation and appliances for cleanliness. In the meantime the present cells require daily effectual purification, and they certainly should not contain more than six inmates each."

5. After a second visit they report further:—"We have already mentioned the size of the cells, of which there are six. We examined them again very carefully, and satisfied ourselves that the ventilators in the ceilings, which are all connected with a central ventilator in the charge-room, are quite insufficient to purify the rooms; in short, the means of ventilation are entirely inadequate to the purposes for which they are required, especially in a hot climate, and considering the overcrowded state of the cells. No. 4 cell—18½ ft. x 10 ft., and 13 ft. high—was occupied on Sunday night by ten male occupants. No. 5, which is 18½ x 14 ft. 9 in. x 13 ft., had twenty-four inmates, and I can fancy that their sufferings during the whole of that hot night must have been almost equal to those of the captives in the memorable black-hole at Calcutta, or those of a gang of negroes in the hold of a slaver enduring the horrors of the Middle Passage. Alderman Chapman, unsuspecting of the reception which awaited him, walked boldly into the room, note-book in hand, but was met with such a foul blast of hot polluted air—such a combination of atmospheric impurities—that he was obliged to seek safety in flight, and to rush into the open yard, which he reached with the same haste and the same intention as passengers on board ship unused to the sea, seek the side of the vessel in bad weather at the commencement of a voyage. The inmates of this cell, as far as we could see from the glimpse we obtained of their position, were lying on the cement floor in two rows packed closely, and with a narrow space between them. They were pretty quiet on the whole, having probably no breath to spare for unnecessary talking. Here and there however curses, not loud but deep, gave evidence of their supreme dissatisfaction with things in general, and with the Central Police Court watch-house in particular. No. 6 cell is only 11½ x 8 ft., and 13 ft. high. Yet in this limited floor-space there were no less than fourteen females shut up, all apparently huddled together in one promiscuous heap of motley humanity. Never did I witness human beings so closely packed, except in an Arab slave dhow on one occasion near Aden. The temperature of the room was hot and close to the verge of suffocation. Some of these women were moaning, others crying for water—all in a pitiable state of discomfort. The Police, although used to this sort of thing, are evidently of opinion that the accommodation for prisoners at this place is wretchedly defective. The flooring of all the cells is made of cement and from it a stream of offensive matter trickles into the passage right under the door; the whole arrangement is disgusting, and bad as we found the condition of the place on Sunday night it must be still worse in rainy weather, when the wet clothes of the prisoners send forth a steam which displaces a certain amount of air and diminishes the quantity considerably for the inmates. A simple calculation will shew that in No. 4 cell containing ten prisoners, each inmate had 18½ ft. only of floor space; in No. 5 cell where there were twenty-four prisoners, each inmate had less than 12½ ft.; and in No. 6 cell, occupied by fourteen females, the floor space to each individual was under 7 ft.; the regular space for each person required by the Lodging-house Act in England being 30 ft. floor space."

6. On a subsequent day visit by Professor Smith and Dr. Read, they were informed that on the night of December 19th there were seventeen women in No. 6 cell; and that frequently the women have young children with them, who cannot be left at home. They were also informed that lunatics are occasionally locked up for a night in these cells. They also satisfied themselves that the means of ventilation in the cells are utterly insufficient.

7. *Parramatta-street Station*.—Messrs. Read and Chapman report of it as follows:—"Here there are 5 cells; No. 1 is 13 by 8 ft. and 13 ft. high, open windows as before, but no gratings or ventilation at bottom; there were no occupants in this cell. No. 2 is 18 by 12 ft. 6 in. and 13 ft. high, and has besides windows

windows three ventilators in the shape of openings in the wall, which however are altogether unequal to purify the atmosphere of the room when so many persons are thrust into it. At the time of our visit there were ten male prisoners confined in it. No. 3 is a small cell, 4 by 8 ft. and 13 ft. high, having two ventilators or openings in the wall, but no windows. Into none of these cells does any light penetrate at night. There is a trap in each door which if let down would to a slight extent relieve the obscurity of the place, and would also materially assist in the work of ventilation, but it does not appear that it is ever opened, except to allow of an occasional peep into the cell from the outside. No. 4 cell is 12 feet square and 13 feet high, and contained when we inspected it seven females. No. 5 cell is 4 ft. 4 in. by 12 ft. 4 in. and 13 feet high, and has one ventilator at the top of the wall and one over the door; hardwood floors all through. No. 6 is 5 ft. x 12 ft. 3 in., and 13 ft. high; has one ventilator at the top of the wall, and one in the wall separating it from the passage; this is used as a store. The arrangements for the convenience of the inmates of these cells are of the rudest kind. In one corner is a tub, from which they can obtain water for drinking with a tin-dipper beside it; in another corner a tub in which they can make water when necessity compels them to do so, or for other necessary purposes. There is no closet accommodation of any kind in connection with the cells, and the consequence is that the floors of the occupied cells are foul and filthy in the extreme. The police have frequent occasion to complain of the stench, and there can be no doubt that a good deal of the offensive matter soaks into the drains through the interstices of the flooring. Rats, too, abound in numbers, and were described to us as being 'just like a lot of chickens.' This police-station is in a very exposed situation, and the doors and windows have to be kept pretty close to keep the dust out."

8. *Cumberland-street Station*.—Messrs. Dansey and Palmer report:—"To the right of the entrance is the charge-room, 11 ft. x 10 ft., and to the left the Sub-Inspector's room, which is about 7 ft. x 10 feet. On the right-hand, a little further on, we were shewn a cell 12 ft. x 9 ft., with level floor, having a wooden bolster running the whole length of the room; a brick has been taken out in one place, and half a brick in another, for purposes of ventilation; there are iron bars over the door. This cell reeked with ammonia, and was very offensive; it is washed out every day with a mop and water, and lime-washed once a quarter, but no disinfectant is ever used to purify it. A room facing it, on the left hand, 10 ft. x 10 ft., we found equally offensive. Here we found the resting-board for the head, a wooden bolster as before, and no ventilation except over the door, an opening for this purpose previously made having been blocked up by buildings adjoining; the floors are all flat and of wood, and the accommodation altogether bad. The atmosphere is so polluted by the stench which comes from a closet in the yard that prisoners can only be kept in these cells at the risk of their lives. It does not appear to us that anything can be done to improve the building as it stands; it should be entirely reconstructed."

9. And on a second visit they add as follows:—"The charge-room was very clean, but the ventilation is deficient in consequence of the place being blocked in on all sides by private dwellings, which exclude the air. The Sub-Inspector's room was also clean when we inspected it, but imperfectly ventilated from the same cause. The females' cell, 12 ft. x 9 ft., is a very bad place for the purpose, and quite unfit for any person to be shut up in. It has no ventilation whatever; there have been gratings in the walls, but private dwellings have been built up against the walls, and blocked them up, so that the only air which enters the cell comes in from the door. There were no inmates in this cell. We were informed that when a number of men are arrested the women have to be sent or taken to the Water Police Station, in consequence of the want of accommodation at this place. There is also a small cell in which we found one person confined, and although Saturday night had intervened between his apprehension and our visit, no one else had been sent to bear him company. We ascertained from the charge-book, that in October last 187 persons had been arrested, and in November (last month) 153. It is evident that the station in Cumberland-street is quite unfit for the purpose for which it is required, and the sooner it is removed the better it will be not only for the persons confined in it, but for the health of the police who are in charge of it. The deficiency of yard space, the position of the closets which are close to the walls, and the great want of ventilation, all combine to render the place unfit to be used as a prison, more especially in a hot country."

10. Professor Smith and Dr. Read subsequently visited this station and corroborated the above account as to the want of ventilation, and the confined position of the premises. They found the closet very offensive, not from any neglect on the part of those in charge, who indeed evidently do their best to keep the place wholesome, but because of the faulty arrangements.

11. *Water Police Station*.—Messrs. Read and Chapman report:—"We found two cells, one of which was empty, and the other contained only two occupants. No. 1 cell is 13½ by 8 ft. and 13 ft. in height, and has in it what is termed a soft wood sleeping place, or in other words a deal bench extending the whole breadth of the cell for the prisoners to lie down upon, with which we had no fault to find, except that it appeared

appeared a little too high, being nearly 2 ft. from the ground, to be safe as a resting-place for drunkards. This cell being empty was seen at an advantage; it appeared to be fairly ventilated by openings in the wall about 2 ft. wide and 6 in. high, protected by iron bars, but there were no gratings below. No. 2 cell, in which there were two occupants, is $13\frac{1}{2}$ by 9 ft., and the same height; the floors of both cells being hardwood. The drainage appeared to be good, and the condition of the closets satisfactory, with plenty of water laid on. We were informed that the greatest number of persons confined in these two cells at one time was twenty, and some new cells with various modern improvements are being constructed here."

12. *Darlinghurst Station*:—Messrs. Dansey and Palmer report:—"Upon entering the Third division through the yard, we came to the charge room, 12 ft. x 16 ft., which was very clean; on the right is the Inspector's room, 12 ft. x 12 ft., which we found also in clean order. These rooms are 14 ft. in height. There are two cells at this station, one for the male and the other for the female prisoners. The first, 18 ft. x 12 ft., contained seven inmates, and would have contained fifteen, but eight were out on bail. Here there were two openings in the wall cut horizontally about 3 ft. long, and, as near as I could guess, about 8 in. deep. There are also two chinks or loop holes, such as are used for rifles on the other side, but they only open on to the passage. On the opposite side of this passage is the cell for females, 12 ft. x 12 ft. which had only one inmate at the time of our visit. Considering the large area of this Police District, and that it only provides one station, we think the accommodation offered by these two cells to be utterly inadequate. The ventilation is deficient, and the space is altogether too limited. In other respects there was nothing to find fault with, and the inmates appeared to be made as comfortable as circumstances permit. We think, however, that some greater regard might be paid to health as well as decency in the arrangements within the cells. At present there is a bucket in the corner, which serves the purposes of a closet, and when a prisoner wants a drink a policeman comes and takes him out. Would it not be better to have the drinking water inside, and the closet outside the cell?"

13. From the foregoing evidence it will be seen that three of the stations are in very urgent need of improvement; and a fourth (*Darlinghurst*) although not in such bad condition still requires some attention.

14. The Central Station requires the cell accommodation to be largely increased, in order that more space may be available for each prisoner, and that better classification may be rendered possible; but instead of merely enlarging and improving the present premises it would we think be decidedly a more judicious plan to rebuild them entirely, along with the adjacent Police Court, and if possible in a less conspicuous position. Under existing arrangements, prisoners being taken to the lock-up and afterwards to the Police Court, are too much of a public show,—crowds frequently blocking up the footway in George-street on such occasions.

15. In regard to the Parramatta-street Station we think that it also should be rebuilt in a less exposed situation.

16. The Station in Cumberland-street should certainly be removed, as the site is far too confined to admit of proper sanitary arrangements.

17. At *Darlinghurst* it would appear to be sufficient to enlarge the premises somewhat, and make better provision for ventilation and cleanliness.

18. As a temporary measure in all these Watch-houses, we think that a greatly improved ventilation might be obtained by the use of double tubes passing through the roof—one inside the other—and of considerable diameter. A grated opening at the bottom of each door could also be introduced without much difficulty or expense.

19. In some of the cells we have examined the provision made for the egress of foul air near the top might be sufficient if there were equal provision for the ingress of fresh air near the bottom; but in most cases special inlets for fresh air are wanting or are altogether inadequate. Human beings cooped up in confined spaces ought to be supplied with at least one thousand cubic feet of fresh air per hour for each.

20. We wish it to be understood that we do not attach blame to any persons in charge of the Watch-houses. They appear to keep the places as clean as circumstances permit, and to do their best with the imperfect appliances at their command.

J. SMITH,
Chairman of Committee.

Board Room, Sydney,
22 December, 1875.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

Board Meeting.

WEDNESDAY, 22 DECEMBER, 1875.

Present:—

R. B. READ, Esq.,		G. F. DANSEY, Esq.,
M. CHAPMAN, Esq.,		B. PALMER, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Progress Report of No. 11 Committee read. Hon. J. Smith, Chairman, and Messrs. Read and Dansey, Members, of the Committee, examined in their places.

1. *Chairman to Professor Smith.*] Can you tell us whether persons who are locked up in these watch-houses and remanded from day to day are sent back to the watch-house each night? It did not occur to us to ask that question.
2. *Dr. Dansey.*] A prisoner who is properly remanded is sent to Darlinghurst, but occasionally when there is any irregularity he is retained in the Police Station cells; but then he is generally kept in a separate cell which contains a bed.
3. *Chairman to Dr. Dansey.*] Then, except on such occasions, it does not happen that a person is confined for more than a night in one of these abominable cells? No, unless he is locked up on Saturday, when he has to pass Sunday night in it also. I knew a case where there was some irregularity in the committal, and a man was kept at the Central Police Court until the next day, until his papers were properly signed; but I understood that he was placed in a small cell by himself, where a bed was provided. If a prisoner is properly remanded he is sent up to Darlinghurst and brought down again the next morning, or whatever day he may be remanded to. He is sent to Darlinghurst at 4 o'clock, but he is kept in the cell at the Police Station up to that time.
4. *Chairman to Professor Smith.*] I understand that there is no attempt to classify the prisoners except with regard to sex—they are all locked up together indiscriminately? Yes.
5. I believe it is stated in the evidence that when members of the Committee visited one of the cells some of the women confined there were clamouring for water? *Mr. Chapman.*] Yes, I assisted one of them to some water while I was there.
6. *Chairman to Mr. Chapman.*] You say there is no blame attached to the people in charge,—surely they could have supplied the inmates of these cells with water when they required it on hot nights; is there any difficulty on the part of the police in attending upon these people and supplying them with water for drinking purposes? There is no difficulty, and the water is there in a bucket; but when we were there the inmates were jammed together so close that they could not get at it; the room was quite dark and they could not get to where the water was without tumbling over one another. One old woman asked me for a drink and I reached across for a pannikin and gave it to her. It is very hot and oppressive in the cell and they seem to pull their clothes nearly off—many of them.
7. You have been connected with the city for many years;—can you inform us whether any representations have ever been made in any quarters as to the state of things existing in these watch-houses? No. Although I was Mayor of the city for two years, and have punished scores of people brought up for drunkenness, yet I must confess I knew nothing about it, or I should have been very sorry to punish them.
8. Although you were Mayor of the city for two years it never came under your notice? No.
9. *Chairman to Professor Smith.*] Is it the impression of the Committee from what they have seen that the Police act, as far as circumstances admit, in a humane manner towards the prisoners confined in these cells? Yes, that was the impression we received. *Dr. Dansey.*] I may state, having been for some years attached to a police division in London, that the police here are much more considerate to their prisoners than they are in London.
10. *Chairman to Dr. Smith.*] It did not come under your notice that any of the prisoners complained of having been illtreated by the police? No.
11. Don't you think that if they had been illtreated they would have taken that opportunity of complaining? I think it is very probable; they only complained of the want of ventilation.—
12. Did you happen to ask whether they are supplied with any food if they require it—in the morning for instance? I could not say; I did not ask the question.
13. *Chairman to Dr. Dansey.*] Do you happen to know whether they are supplied with any food? The police generally give them something hot in the way of a cup of coffee and a piece of bread if they have no money to get anything with; if they have money their friends get them provisions.

Professor
Smith,
R. B. Read,
Esq.,
G. F. Dansey
Esq.

22 Dec., 1875

- Professor Smith, R. B. Read, Esq., G. F. Dansey, Esq., M. Chapman, Esq.
- 22 Dec., 1875.
14. Does it often happen that persons suffering from want are locked up in these cells? No, I believe not; in such cases the police give them something to eat. In the case of two destitute children brought up about a fortnight ago the Inspector ordered some refreshments to be taken to them.
15. I think you said you had had some experience in London in connection with these arrangements? Yes. I was Surgeon to the S Division of the Metropolitan Police, and had charge of the station in Charington-street, and I consider that the Police Stations in Sydney compare favourably with the London stations, except perhaps that the benches on which the prisoners sleep are a little too high and rather dangerous on that account.
16. But how do the other Sydney stations compare with the London watch-houses? The accommodation is not to be compared with that of the London stations; especially considering the difference of climate; there is a classification of the prisoners at the London stations.
17. And they have better arrangements for the prisoners at night? They have.
18. Will you state from your experience what sort of arrangements they have? I have had no recent experience.
19. Have they closet accommodation? If I remember rightly they had, but not inside the cell. They had to be taken out and brought to a closet. There were drinking arrangements inside.
20. In London I suppose there is always a constable in attendance? Yes; and also one or two emergency men; but here I am sorry to say the only emergency man is the one in charge of the cell, and they have often to wait half an hour for him.
21. Is there any constable whose services are immediately available? There is only the emergency man, and if a prisoner wants him immediately to go outside he has to wait sometimes for half an hour. There ought to be an extra man to attend to the cells.
22. *Mr. Moriarty to Professor Smith.*] Do you think there is any reason why the same amount of cubical space should not be allowed in these lock-ups which is considered necessary for each person at Home—at Portland for instance, and other places? I think they ought to be supplied with as much cubical space here, or rather more, considering the climate.
23. Do you know what is the space allowed for each inmate in the Portland Prison? I do not know.
24. It is 13 x 7 x 10 ft. for each individual. You are decidedly of opinion that there ought to be as much cubical space allowed here as there is in the Portland Prison? At least as much.*
25. *Chairman to Mr. Moriarty.*] That is the space allowed for convicted criminals, and not for persons arrested on suspicion? Yes, for criminals.
- Professor Smith.*] That is what struck us especially—that persons who are merely suspected should be subjected to such horrible punishment.
26. *Chairman to Professor Smith.*] Is there not a great difference between persons who have committed an offence against the law and who are taken *flagrante delicto* and those who are merely suspected; should not a distinction be made in such cases? I think so.
27. *Mr. Moriarty to Professor Smith.*] In any case, whether a person be taken *flagrante delicto* or on suspicion, you think he should be allowed as much space as is allowed to each individual in the recently constructed prisons at Home? Yes.
28. *Chairman to Professor Smith.*] Do you not think it must be extremely deleterious to the health of persons taken up, either for intoxication or possibly on account of fits which may present the appearance of intoxication, to confine them in close cells containing so much foul air? Yes, and my surprise is that some of these people do not die.
29. Did the Committee hear of any cases of prisoners having died in the cells? I do not think any members of the Committee made inquiries in that direction; I have not heard of any.
30. *Mr. Bennett to Professor Smith.*] Don't you think arrangements should be made without a day's delay to give air, water, and light to the persons confined in these cells? Whatever is done should be done at once.
31. You think there would be no difficulty in doing this? I would not say that; there need be little difficulty in providing the prisoners with fresh air at once, but it would not be so easy to give them light.
32. Could not they be supplied with artificial light? To use gas inside these cells would be to consume the oxygen in them. I quite agree with you that light, air, and water, as far as possible, should be provided.
33. *Chairman to Professor Smith.*] Would there be any difficulty in making holes in the walls of the cells, and putting bars across them, so as to ventilate them during this hot weather? No, except in Cumberland-street, and there you might introduce air into the cells by means of double pipes through the roof, and by making grated openings in the doors.
- Dr. Dansey.*] I may mention that last Sunday week I was sent for to the Central Police Station to see a man who had been locked up there on Saturday night for drunkenness, and was supposed to be dying. I had him brought out into the open air and he recovered, and it was my belief that his illness was simply caused by the foul air inside the cell; he was sent to the Infirmary.
34. *Mr. Chapman.*] The night we visited the cells there I noticed a number of good shawls and articles of women's attire hanging up in the passage, and I asked to whom they belonged. The Inspector told us they were the property of respectable persons who had asked the police to take care of them; and when I looked into the cell I saw a respectable looking woman cuddled up close to a horrible looking old woman, covered with scabs. I remarked that it was a great pity to put clean people with such dirty wretches, and the Sergeant said—"What can we do?"
35. *Hon. J. B. Wilson to Mr. Chapman.*] You mentioned that the rats were very numerous at the Parramatta-street Station—I should like to ask whether they are also a nuisance at the Central Police Station? No; the floors are cement there.
36. *Chairman to Mr. Chapman.*] Would there be any difficulty in getting rid of this rat nuisance if proper lock-ups were erected;—could they be constructed so as to make it very unlikely that they would be infested with rats? Oh yes, it is quite possible.

* NOTE.—Considering that persons are confined in watch-houses for only one, or at most two nights, a less space than that indicated above might suffice—at least on emergencies; but the space allowed to each individual should never, I think, be less than that mentioned by Dr. Read as being required in metropolitan lodging-houses. In order that persons might never be confined more than one night, the authorities should consider whether, in the case of those locked up on Saturday night, some arrangements could be made to deal with them on Sunday morning.—J.S.

37. After they have once got into a building I believe it is very difficult to get them out? It is quite possible to get rid of them, but the stench for the first week or so is very bad.

38. Don't you think it would be very desirable, and only humane, to have some person to attend to the people who are locked up in these cells—to give them water when they require it, and to look after them if they should be suffering from exhaustion or illness? I think so; I think a person should be in charge of the females—watch and watch—at night time, and should see them every fifteen minutes.

G. F. Dansey,
Esq.,
M. Chapman,
Esq.

22 Dec., 1875.

Dr. Dansey.] There should be constant attendance, because you never know when a man is going to drop down who is suffering from drink.

39. *Chairman to Dr. Dansey.*] Don't you think it is very probable that the police may occasionally make a mistake and think a person is drunk when he is merely suffering from illness? I think so; I have often seen it in London.

40. And they are all locked up indiscriminately and get no attendance? Yes.

41. Do you not think that all these persons, whatever they may be suffering from, should be attended to regularly? I think so.

Mr. Chapman.] The first night we visited the Central Police Court I noticed that there was one very old man in a crouching position, and when we went out this man was discharging the contents of his stomach; he was dreadfully ill. Now, if he had been taken out he might have recovered; as it was the cell was so closely packed that he must have vomited over some of the others; he could not well have avoided it.

42. Can you at all account for the fact upon which you have remarked, that this disgraceful state of things has never been brought under your notice as an Alderman, and as having been twice Mayor of the City? No, I am not at all astonished, because the Mayor and Aldermen have no control whatever over the police. The Mayor is Chief Magistrate of the City, but it appears that his duty is only to open the Police Court, and get rid of the drunkards.

43. Then, if it has not been brought under your notice, either in your capacity as Alderman, or as Mayor of the City, we may presume that the great bulk of the people are quite unaware of it? Of course they must be quite ignorant of it. I feel satisfied that the Inspector General of Police has no idea of it.

CORRESPONDENCE arising out of statements in foregoing.

No. 1.

THE INSPECTOR GENERAL OF POLICE TO THE PRINCIPAL UNDER SECRETARY.

Police Department,
Inspector General's Office,
Sydney, 20 January, 1876.

SIR,

In returning the papers No. 76-134, accompanying your B.C. reference dated the 7th instant, and the Honorable the Colonial Secretary's minute thereon, respecting the Minutes of Evidence and Seventh Progress Report of the Sydney City and Suburban Sewage and Health Board, I do myself the honor to report for the information of the Honorable the Colonial Secretary that I have attentively perused the Report in Chief Sub-committee's Report, and Minutes of Evidence, and have spared no pains to obtain full information on the subject for the consideration of the Government.

The accompanying reports from Superintendent Read, the Police Surgeon, and the members of the Force named in the margin, may be relied upon as fairly representing the actual state of affairs, from long observation by experienced and intelligent officers.

Sub-Inspector
Anderson, Sub-
Inspector
Waters, Sergeant
Dawson, Senior
Constable Dobbs,
and Constable
Philip Sweeney.

I have thought it necessary to enter into the subject exhaustively and at some length, as in my view the Report of the Board reflects most seriously upon the management of this department in a most important particular, and I must confess myself unable to follow the Board in their conclusions as expressed in clauses 5 and 6 of their Report,—as if sections 3, 4, and 5 (clause 5) be admitted then the police could not be exonerated from all blame as they are by clause 6 and section 20 of the Sub-Committee's Report.

About two years ago, upon the representation of this Department, the Central Police Watch-house was entirely remodelled and added to at a considerable cost, under the supervision of the Colonial Architect. The accommodation is now fairly adequate, but some improvements are still desirable. The plans as originally drawn were I believe considered by the Minister for Works of the day too expensive and were consequently altered.

It will be seen from the attached copy of my memorandum of the 24th February, 1875, addressed to the Colonial Architect, that the question of ventilation was not lost sight of.

The site of the No. 2 Lock-up, George-street South, I have always considered very unsuitable, being too exposed, but the accommodation is ample.

The No. 3 Lock-up, Darlinghurst, fairly meets the requirements of the Division, but some additions were applied for in September last which when provided will allow of improved arrangements.

No. 4 in Cumberland-street is badly situated and the site is too confined. A commodious new building in that part of the city near the Commissariat stores would be of the utmost advantage, but I suppose a site would have to be purchased.

The Water Police Station is under the control of the Water Police Magistrate; it has recently had considerable additions made to it.

These stations I have visited at all hours of the day and night, and I can therefore endorse the reports of Superintendent Read and his subordinate officers, that the cells and other portions of the buildings are uniformly kept in a state of cleanliness and good order.

A very limited knowledge of Police matters would be sufficient to enable a witness to afford information on the subjects touched upon by the Board, and to materially affect the conclusions arrived at. I am therefore surprised that without taking evidence from any officers of competent experience they should have arrived at the conclusions they have so decisively expressed.

No buildings or appliances which could be devised would have the effect of keeping watch-house cells at all times free from foul odours and nuisance, and a comparison between a lock-up and cells in a gaol is manifestly out of the question.

The Colonial Architect will, I have no doubt, be able to give an opinion when called upon as to the means he has adopted for ventilating the various buildings, and will probably be able to suggest improvements, additions, and new watch-houses whenever funds are provided for such purposes, though I am acquainted with many other far more pressing requirements of the kind in Country Districts.

I think I am fairly entitled to take exception to the opinion expressed by the Board that, "it is obvious to them, and it seems to be the growing opinion, that there should be some permanent sanitary authority willing and able to drag all such abuses to light without fear or favor."

It may be asked what abuses?—who is afraid to seek a remedy? The Police would be the first to desire better buildings, and appliances for their own health and comfort, and even the Board exonerates them from blame; they are said "to do their best"; to whom then does the censure apply?

I beg to suggest that these papers may now be referred to the Colonial Architect for his observations.

I have, &c.,

EDMUND FOSBERY,
Inspector General of Police.

The Colonial Architect should have an opportunity of commenting upon this Report, and his attention should be called to the state of the Watch-houses, &c., as desired in the Report.—JOHN R., 24/1/76. The Under Secretary for Public Works.—H.H., B.C., 25 Jany., /76. Very Urgent. Colonial Architect,—J.R., B.C., 25/1/76.

[Enclosures to No. 1.]

Sub-Inspector Anderson to Superintendent Read.

No. 1 Police Station,
Sydney, 12 January, 1876.

SIR,

Having read the Seventh Progress Report of the Sewage and Health Board, I beg to make the following observations on the subject:—

The ventilation of the cells of this station is very defective, and will be so until proper openings are made in the walls of the cells to admit fresh air and let the foul air escape.

The prisoners are classified as far as circumstances will permit, and respectable looking persons are kept, as far as possible, in cells by themselves. All the cells are thoroughly washed out once a day, and the floor, being of a very inferior kind of cement, absorbs a great quantity of water, and consequently take a long time to dry, so that at times all the males have to be kept in one cell, and all the females in one cell, while the floors of the other cells are drying.

With regard to foul air, mentioned by Mr. Chapman, I have often known one drunkard to cause a more offensive smell than a dead body in an advanced state of decomposition. One drunkard in such a condition would poison the atmosphere of a place ten times the size of the largest cell.

There is a constable in constant attendance on the prisoners, and he visits them very frequently, examines them carefully, and supplies them with water. I have always selected men of a humane disposition for this office, and they are instructed to call the attention of the sergeant on duty to any prisoner that appears to be ill. When a prisoner is taken ill the sergeant sends for the police surgeon, or if it is a bad case he sends the person at once to the Infirmary in a cab. The doctors at the Infirmary have complained of the police taking prisoners there that were only suffering from intoxication. There has never a prisoner died in a cell during the nine years I have had charge of a subdivision, and no prisoner ever complained of unkindness on the part of the police, or want of proper attention while in the watch-house.

The sergeants have imperative instructions to see that every person brought to the station charged with being drunk is really in that condition, and if he has any doubt on the subject to discharge the prisoner; or if he considers it a case of illness instead of drunkenness to send the person at once to the Infirmary.

The whole of the station receives two coats of lime-wash once in four months, and once in three weeks the walls of the cells are lime-washed 7 feet from the floor. Every day there is chloride of lime sprinkled about the passages and cell doors to purify the atmosphere.

I have, &c.,

ROBERT ANDERSON,

Sub-Inspector.

Forwarded to the Inspector General of Police.—GEO. READ, Superintendent, 18/1/76.

Senior-Constable Dobbs and others to Superintendent Read.

A Division, No. 4 Station.

14 January, 1876.

SENIOR-CONSTABLE Dobbs begs to report for the information of the Superintendent in charge, that he was on station duty at No. 4 station on Sunday, the 12th December ultimo, when a prisoner named John Crane, aged 70 years, who had been confined from 9:40 o'clock the previous night for drunkenness took ill with fits; about 8:45 o'clock p.m. a little brandy was given him and Constable Sweeney removed him from the cell into the passage, where he remained until the arrival of Doctor Dansey (20 minutes), who accompanied by Sergeant Dawson visited him and ordered his removal to the Infirmary, where he was conveyed and admitted.

The senior-constable further states there had been ten male prisoners confined during Saturday night and Sunday evening, of which six were admitted to bail, the last being let out at 3 p.m., leaving but four in the cell when Crane took ill.

This man is of intemperate habits and had been evidently suffering from the effects of drink during the day.

He had been previously locked up for drunkenness.

JOHN DOBBS, Senior-Constable.
JOHN DAWSON, Sergeant.
PHILIP SWEENEY, Constable.

Sub-Inspector Waters to Superintendent Read.

No. 3 Station,
16 January, 1876.

SIR,

Having seen the Seventh Progress Report of the Sydney and Suburban Sewage and Health Board, I beg to make a few remarks respecting clause 12 of the Report, which refers to Darlinghurst Police Station.

This station, although perhaps not quite so commodious as might have been, will, I think, bear comparison as regards cell accommodation with any lock-up in the Colony. There are three (3) cells, two good-sized ones, described fairly in the Report, and one small one, which appears to have been overlooked. I have so far found these cells to be sufficient for the number of prisoners confined in them during the year, about 1,500, or an average of about four per day. I think too that the cells are well ventilated, and very little improvement is necessary in that respect. Every attention is paid to persons confined in the station. A night-tub to serve as a closet is constantly kept in each cell, and emptied as often as occasion requires; a bucket of fresh water is also put in each cell occasionally, but at this station there is a constable continually in attendance in the passage, whose duty is to answer every call. The prisoners are generally supplied with water for drinking purposes by tin dippers, from a tap which is close to the door. Dr. Dansey and His Worship the Mayor must have misunderstood the information given them when they visited the station, as the prisoners are not taken out when they require a drink.

As

As regards the classification of prisoners, I think the only classification which can be practically carried out in lock-ups is that of sex. Youths, however, of tender age are never put in the same cells with adults. I wish to mention as regards clause 10 of the Report, that I have never myself during my twenty-one years experience in the Sydney Police, known a person brought into the watch-house and detained as a drunkard, when it was afterwards proved that the person was not drunk, but suffering from some other complaint. Persons, however, have been found in the streets, and taken to the station, suffering from fits or faintness, insensible, and having the appearance of being drunk, but when in that state they are never put into the cell without first being carefully examined by the sergeant or officer on duty, who takes care to satisfy himself that it is a *bonâ fide* case of drunkenness, and if there is any doubt the Police Surgeon is at once sent for, or the person is removed to the Infirmary forthwith.

I beg to add that previous to my connection with the Police in this Colony I served between four and five years in the Metropolitan Police, London, and the station of the subdivision to which I belonged there contained but two ordinary-sized cells. I cannot say as to the number of persons arrested during the year, but there must have been a good many, as the station was situated in a very busy part of the Metropolis—Islington Green—and had 120 men attached to it. My memory does not serve me sufficiently to speak as to how the cells were ventilated, but I believe it was from the roof.

I have, &c.,

GEO. WATERS,

Sub-Inspector.

Forwarded to the Inspector General of Police.—GEO. READ, Superintendent, 18/1/76.

The Police Surgeon to The Inspector General of Police.

17 January, 1876.

SIR,

Referring to the Progress Report of the City Sewage and Health Board, complaining of the unhealthy condition of the Sydney Police Stations,—

I have the honor to report for your information that I have been very frequently called upon night and day to visit prisoners when ill in the cells, and have no recollection of any instance in which the illness of a prisoner could be fairly attributed to defective ventilation or want of proper care or attention.

I have, &c.,

M. EGAN,

Police Surgeon.

Superintendent Read to The Inspector General of Police.

Superintendent's Office,

Sydney, 17 January, 1876.

SIR,

Referring to the Progress Report of the City Sewage and Health Board, of the 22nd ultimo, respecting the condition of the City Watch-houses,

I have the honor to report for your information, that all the cells at the Central Police Station are provided with tube ventilators; they have possibly been less efficient than they would have been had the means existed of admitting air into the cells near the floors. So long ago as February last I reported the necessity for increased ventilation at this station, and an officer from the Colonial Architect's Department visited the station, to whom I pointed out the want of openings near the foundation. When this improvement which is now being carried out is completed I think this station will compare favourably as regards ventilation with most police stations either in this Colony or in England.

Previous to the year 1874 this watch-house contained only two large moderately well ventilated cells, and three very small ones, about 7 ft. by 4½, which had neither light nor air. On the recommendation of the Police Department the interior has been almost entirely reconstructed, and there are now two large and four moderate-size cells, five being used for prisoners and one as a store-room. The average number of prisoners in the cells per day during the whole year is about eighteen, for whose accommodation five cells should be ample. The cells, however, possess one very grave defect. The floors are cemented, and when wetted for the purpose of being cleaned, which is necessary every day, the cement, from some cause which I cannot explain, is so absorbent that it requires a whole day, and in damp weather even longer, to get thoroughly dry. This serious defect frequently necessitates the crowding of prisoners into one or two cells while the others are drying.

No doubt cement has the advantage of effectually excluding vermin, but I consider hardwood floors, well ventilated underneath, and caulked in the manner of a ship's decks, far preferable for watch-house cells in which a large number of prisoners are confined.

In London, where a large experience has been acquired in the construction of lock-ups, wood, I am credibly informed, is now invariably used. The cement floors at the Central Station have now had a fair trial, having been in use nearly two years, and they continue as absorbent as when they were quite new. I therefore recommend that they be removed with as little delay as possible.

The No. 2 Station, situated at the junction of George and Pitt Streets, no doubt occupies a very undesirable site for a police station. It is perhaps the most dusty locality in the whole city, and it is for this reason exceeding difficult to keep clean. The cell accommodation is ample. There are no openings through the walls near the floors of the cells, but those near the ceiling are quite sufficient, and no complaint has ever been made by prisoners that the ventilation is bad.

I cannot understand upon what ground the Committee assert that the openings through the doors appear to be kept closed, as they are almost invariably kept open, except when the prisoners are very noisy; on such occasions, for the sake of the quiet of the neighbourhood, it is found necessary to close them. The average number of prisoners confined at this station is about seven a day during the whole year, for which five cells should be ample.

The No. 3 Station contains three cells, two only of which are in use, it having been necessary for some time to use one as a store. The ventilation is similar to that at No. 2, there being no openings near the floors. Its situation is all that could be desired, but some additional accommodation will have to be provided

provided before very long. The average number of prisoners per day during the whole of last year was about four; there cannot therefore be much suffering from overcrowding.

The No. 4 Station, situated in Cumberland-street, occupies a very unsuitable situation. There is no yard sufficiently large even to dry a blanket. There are two cells in use, which have no openings near the floors, but it has much better ventilation through the walls than the Committee's Report would lead one to suppose, there being no less than four openings in one cell, and three in the other. From the ground sloping towards the front there is sometimes a slightly offensive smell from the closet. It was formerly very bad indeed, but on the recommendation of the Police Department it was, about five years ago connected with the sewer; there has since been a very marked improvement.

Fully 90 per cent. of the prisoners confined at this station are arrested in George-street and its vicinities; they have therefore to be escorted up a very steep hill,—a very laborious undertaking in the case of those who are helplessly drunk. It has been built, I understand, about forty years, and the allotment is so small that a really healthy and well-ventilated Police Station could not be built upon it.

With regard to the general question of ventilation at most of the metropolitan stations, prisoners more frequently complain of draught and cold than of want of air, and during the winter season apertures near the floors of cells make them exceeding cold; and considering that many of the prisoners as a consequence of dissipation are in a very debilitated state of health, and peculiarly liable to take severe cold, this method of improving the ventilation may be easily carried too far. The Committee's Report appears to me calculated to create the impression that the generally unhealthy condition of the metropolitan watch-houses must necessarily have caused a considerable sacrifice of human life; it will therefore probably occasion some surprise that although about 70,000 persons have been confined in these buildings during the last ten years, only four deaths have occurred, the circumstances of which are as follows:—The first was that of a man found lying ill in the street, who was taken to the station for protection; medical aid was immediately sent for, but before it arrived he had expired.

The second was that of an old man who had been removed from his hut in the suburbs at the time of a threatened flood; he was taken to the station, and was at the time in the last stage of consumption; while taking his breakfast in a large airy room (not in a cell) he was seized with a fit of coughing and expired.

The third was that of a man who was found lying drunk in the streets, and locked up on this charge; he expired soon after being placed in the cell, it was subsequently ascertained, from injuries received by being knocked down by an omnibus, of which, however, he did not complain, although able to speak.

The fourth was that of an habitual drunkard who was placed in a cell with one other prisoner, and expired very suddenly of heart disease. It thus appears that not a single death has occurred during the period stated from defective ventilation.

Considering that very many of the persons apprehended by the police are not only in delicate health but absolutely ill, it appears pretty evident that the Sydney police stations are not in quite so bad a condition as the Committee's Report would have one to suppose.

Complaint is made that there is no classification of prisoners. There certainly is no systematic classification, simply because such classification is impracticable, and is never attempted in any police station.

In the London police, in which I had five years' experience, it was the practice, if a prisoner arrested for any petty offence appeared clean and respectable, and there happened to be a vacant cell, to place him by himself or with a prisoner of the same class. This was the only classification ever thought of, and is precisely the sort of classification carried out in Sydney. It frequently occurs that a prisoner who is comparatively respectable, and has never been in a watch-house before, is in a worse condition as regards filth than many of those who have been in custody scores of times; one such prisoner often causes a stench that renders the atmosphere of a police station almost intolerable for a considerable time; occurrences of this nature take place daily at all police stations in cities, and cannot be avoided.

No such absurd practice obtains as that described by Dr. Dansey of taking a prisoner out of the cells to get a drink. Each cell door has an aperture, and if a prisoner wants a drink it is, as a rule, handed to him through the aperture; but if prisoners are exceptionally quiet, and are not likely to upset a bucket of water, one is occasionally placed in the cells in order that they may help themselves. If a prisoner is being taken out of one cell to be transferred to another, or for any other purpose, he may at the same time be given a drink, and possibly some occurrence of this nature has misled Dr. Dansey.

Night tubs are placed in all the cells when occupied, and the prisoners themselves are employed to empty them as occasion requires. It would no doubt be an improvement if this system of convenience were superseded by self-acting waterclosets, which would, however, require to be of great strength, to prevent them being destroyed by prisoners maddened by drink; but whatever system of convenience may be adopted, offensive smell in cells can never be prevented, many of the prisoners being so helplessly drunk as to be unable to intimate when they require a convenience.

All cells that are in use are washed out daily, and are also lime-washed as often as appears necessary to the officer in charge.

The statements of the Committee's Report appear to be intended to create the impression that prisoners while in the cells receive but little or no attention. At every station in the city there is a sergeant or senior-constable and one constable constantly on duty. The constable's sole duty is to attend to the wants of the prisoners and clean out the cells. If he has occasion to go into the yard, the sergeant or senior-constable remains in the station; and the statement that prisoners have to wait half an hour before their wants are attended to is totally untrue. In consequence of the large number of prisoners at the Central Station two constables are employed from 6 till 10 in the morning while the cells are being cleaned, and no reasonable request of a prisoner is ever disregarded. A constable treating a prisoner with unkindness or neglect would subject himself to severe punishment.

Formerly, the cells of the London Police Stations were unprovided with seats, but I am informed by a constable who has recently left that Force, that they have now a bench about 15 or 18 inches wide on one side, and at the end of every cell and underneath the bench is a wood frame, about 8 or 10 inches wide and raised about 4 or 5 inches above the level of the floor, which is used as a pillow. I think similar fittings in the Metropolitan Station cells would be an improvement.

I have, &c.,

GEORGE READ,
Superintendent.

Superintendent

Superintendent Read to The Inspector General of Police.

Superintendent's Offices,
Sydney, 23 February, 1875.

SIR,

I have the honor to report for your information that the ventilation of the cells at the Central Police Station (in which alterations were recently made) is so defective that it can scarcely fail to seriously injure the health of the very large number of prisoners frequently confined there. It is also a cause of discomfort, and probably sometimes of illness, to the police performing duty at the station. I think a competent person from the Colonial Architect's department should be requested to examine the building, with a view to remedy the evil complained of. There will, I think, be no difficulty in improving the ventilation of those cells opening into the yards.

I have, &c.,
GEO. READ,
Superintendent.

Very urgent.

Referred to the Colonial Architect.—The number of prisoners confined in this building being sometimes very considerable, it is necessary to take every precaution to prevent fatal consequences by placing sick and infirm persons in damp or unventilated cells.

The cement floors absorb the moisture, and I think it will be desirable to supply sloping sleeping boards of such construction that they can be readily taken out and cleansed. Ventilators can be easily placed in the cells on the east and west.—EDMUND FOSBERY, I.G.P., B.C., 24/2/75.

The Colonial Architect.

No. 2.

THE COLONIAL ARCHITECT to THE UNDER SECRETARY FOR PUBLIC WORKS.

Respecting Report on Watch-houses by Sydney and Suburban Sewage and Health Board.

Department of Public Works,
Colonial Architect's Office,
Sydney, 9 February, 1876.

SIR,

I do myself the honor to return the Report of the Sydney and Suburban Sewage and Health Board on the condition of the Sydney Watch-houses, with Report of the Inspector General of Police, and other documents, forwarded to me under blank cover, on 25th ultimo.

2. Having read the Report of the Board I must express my astonishment at the tone adopted; if this were alone for the purpose of attracting public attention it might perhaps be justified if based on sufficient grounds, but as an official document, professing to present a temperate statement of facts and proposing remedies, it is to those conversant with the facts obviously highly coloured and exaggerated both in language and statements.

3. Watch-houses are quite exceptional and are not to be compared with gaols or London lodging-houses; they are required for the reception of varying numbers of persons, mostly of the very lowest class and of filthy habits, and I cannot conceive any practical plan by which offensive smells could be avoided, and even of the model, which seems the desideratum of the Board, single cells at all watch-houses. I am sure a casual inspection would disclose sufficient foul odours to afford apparent justification for a similar report. The necessity for keeping the persons apprehended on Saturday and Sunday, and collected there from the various watch-houses to the Central Stations early on Monday morning to await trial, seems to require that these stations should have greater accommodation than at present provided, especially in the summer months, or that other provision be made for dealing with prisoners cases to prevent the accumulation of filthy men and women, and consequent danger to health. If this cannot be done a lock-up gaol, with sixty separate cells, will be required at the Central Police Stations to meet the views of the Board.

4. As regards the sufficiency of accommodation, that is a matter which can only be judged of by the police. When application for additional space has been made it has always, as far as circumstances would admit, been provided, and the arrangements have been made, as far as possible, to accord with the views of the police authorities. The matter of ventilation has not been overlooked, many experiments having been tried at various times; but the conditions are influenced by police considerations, which render it most difficult to provide an effectual method. Large apertures must be avoided to prevent facilities for escape; none by which intercommunication or intercourse with persons outside are permitted, and other restrictions are imposed.

The Board classifies the evils of which it complains under six heads.

1.—“Grossly inadequate accommodation.”

This is a matter which concerns the Police Department, and the Inspector General says of the various stations,—that the Central Police Station (No. 1) is fairly adequate; at the Pitt-street Station (No. 2) the accommodation is ample; at the Darlinghurst Station (No. 3) some additions were applied for in September last which, when provided, will allow of improved arrangements.

Cumberland-street (No. 4) Station:—A new building is required. The Water Police Station is now receiving large additions. There is no doubt that the Cumberland-street Watch-house is unsuitable; it is surrounded by private dwellings, and although the drainage and ventilation have been improved it can never be made what it should be, and a new building in a more convenient situation is required. The additions to the Darlinghurst Station, before referred to, comprise a verandah at front entrance, a store-room, a coal-shed, and a door in passage,—for which, when applied for, there were no funds available; these improvements, however, will now be made at an early date.

2.—“The almost total want of ventilation, whereby the inmates frequently suffer partial suffocation.”

The following account of what has been done in the way of ventilation, and that of the Inspector General of Police, in this branch of the subject, will show how little justification there is for this sensational statement. The Central Police Station is the most censured. Messrs. Read and Chapman report: “There are

are no gratings let into the walls to supply fresh air, where it is most needed, except in No. 5 cell." As a matter of fact there are six cells in this station, all ventilated at ceilings, capable of accommodating twenty-six prisoners, according to the London Lodging-house Act, and four of them have gratings at the bottom of the wall for the admission of fresh air.

The cell No. 1 is 12 ft. by 8 ft. and 13 ft. high, and has a window opening 3 ft. by 9 in. near the ceiling, a zig-zag ventilation at the level of the floor with 10 in. by 6 in. outside grating, and an extracting tube in the ceiling 6 in. in diameter, connecting with a central gas stove in the roof. This pipe with current of one mile an hour would cause a complete change of air in the cell once in an hour, independently of any air that might escape by the window or by another opening in the ceiling 14 in. in diameter.

Cell No. 2 is 18 ft. by 6 ft. 6 in. and 13 ft. high, has a similar extracting tube and two 14 in. openings in the ceiling, and four zig-zag ventilators, two at floor level and two at ceiling level.

Cell No. 3, the same size as No. 2, is used as a store, and is dependent for ventilation on the extracting tube and openings in the ceiling.

Cell No. 4, 18 ft. by 10 ft., and 13 ft. high, has ceiling ventilation like Nos. 2 and 3, and two 9 in. by 6 in. gratings at floor level in the wall, dividing it from the charge room.

Cell No. 5, 18 ft. by 14 ft., and 13 ft. high, has two tubes and four openings in the ceiling, and four zig-zag ventilators like those already described, and additional 9 in. by 6 in. openings at floor and ceiling level have recently been added.

Cell No. 6 is of the same size, and in all respects like No. 1, but it has just had two 9 in. x 6 in. gratings let in at the floor level.

Each of these cells is thus provided with an extracting pipe, capable of changing the air of the cell once for every mile per hour the current moves, and these pipes connect with a gas stove, entirely dependent on them for its supply of air, and capable, when the gas is burning, of changing the air in each cell five or six times in an hour.

That these cells, filled as they generally are with drunken men and women, in many cases unable to help themselves, and careless of what mess they may make, will be very offensive, is a necessary consequence of their use as watch-house cells; but from the details given above it will be seen that they are provided in all cases with outlets for foul air, and in every case, except that of No. 3 (which has never been used for any purpose but as a store), with numerous inlets for fresh air.

When this building was altered and partially rebuilt about two years ago the ventilation was rendered more difficult by the stipulation of the Police that there should be no openings in the walls next the street; no openings into the charge room, and none in the walls between the cells; thus in all cases confining the available position for openings to one side, and in some cases to the ceiling only.

The offensiveness of some of these cells, No. 6 for instance, is manifestly caused by overcrowding, and this is clearly shown by comparing No. 6 with No. 1, with the same provision for ventilation, and of the same size. No. 1, which is reserved for prisoners of a better class, and commonly occupied by only one or two people, is always in a fairly pure state, whilst No. 6, into which are frequently crowded fifteen or more women, many of them in a filthy state, is of necessity foul and less wholesome. I believe, however, that it is beyond the power of the science of ventilation to purify the air defiled by such a mass of filth. The gathering together, on an equal space in the open air, of the same number of equally dirty people would be almost as offensive.

As a proof that the ventilation is more effective than either the Sewage Board or the Police seem inclined to admit, I may mention that when the gas apparatus was fixed, the policeman in charge of the Station acknowledged that the cement floors, which before had taken a whole day to dry after being washed, then dried in from three to four hours; if they now take, as is said, more than a day to dry, it must be because the gas is not lighted, or because the floors are left too wet, not being properly mopped off after washing.

Station, Pitt-street (No. 2), has six cells, capable of accommodating twenty prisoners, according to the requirements of the London Lodging-houses Act. The provision for ventilation at this building is such as the report describes, but is not so inefficient as is represented. No complaints of it have been received or no doubt improvements could be effected.

Darlinghurst Station (No. 3):—Additions have been applied for but they were not represented as of urgent necessity; the ventilation at present is the usual kind, and it has hitherto been considered sufficient by the police, who alone could be cognizant of the requirements in that respect. If additional ventilation be considered desirable no doubt it can be provided.

The persons in the cells, when visited by Dr. Dansey and Mr. Palmer, seem to have had more floor space and 80 per cent. more cubical space per man than the Board considers necessary.

Watch-house Cumberland-street (No. 4):—This building is admitted to be unsatisfactory, and in an unsuitable position, the erection of private buildings around it having obstructed the ventilation and added to the offensive odours inevitable in such a watch-house. I would suggest the erection of a new police station nearer the water.

Water Police Station:—This building is now being altered and enlarged, and the means taken to improve the ventilation, will, I believe, be found sufficient.

(3.) "The absence of any system of classification of prisoners, except according to sex."

This has been dealt with by the Inspector General of Police, but I may say that there are in the Central Police Station, in that at South Sydney, and at the Water Police Station, four or six cells each; these, I should suppose, would suffice for such classification as is practicable; but Superintendent Read reports that "there is no systematic classification, simply because such classification is impracticable, and is never attempted in any police station."

(4.) "The absence of suitable arrangements to provide for the necessities of prisoners, and to secure any approach to decency and cleanliness."

This, I presume, points to the absence of closets in the cells; the necessities referred to are provided for at present by night-tubs placed in the cells. These are no doubt offensive, but I do not think it would be possible to construct closets inside the cells for use by such a class of persons that would be much less so; if closets or portable conveniences were placed outside, other evils would be substituted. At present I do not see that any other arrangement would be better than that which now exists, attention being given to removal of the tubs as often as necessary.

(5.)

(5.) "The absence of systematic attendance upon those suffering from prostration and debility caused by drunkenness and other causes."

(6.) "The improper situation of some of the Watch-houses."

These are subjects which come properly under consideration of the Inspector General of Police. It would no doubt be desirable to change the sites of some of the watch-houses, but I believe that any other situations chosen for them would be with equal propriety characterized as improper. The present sites are, I believe, in most cases very convenient, however unsightly the buildings themselves may be in important thoroughfares.

The cement floors of the Central Police Station are referred to as a cause of offence. The Board does not make any suggestion on the subject, but the Police reports ascribe the overcrowding partly to the circumstance that the cement floors are long in drying, and suggest that wooden floors, caulked like a ship's deck, be substituted. The time of drying it appears to me would be much shortened if in cleaning the cells care were taken to mop up all superfluous water, and the gas jets were used for heating the atmosphere. This question of flooring has many times been under my consideration; and of all available materials it seems to me that cement is the best for the watch-houses. Asphalt would be impervious to moisture, but it would be slippery and dangerous, and from its dark colour there would be less assurance that perfect cleanliness was obtained. The wood floors, suggested by Mr. Superintendent Read, I consider would be more objectionable—the boards would be equally absorbent and would retain foul matters, and any defect of the caulking would allow of the percolation of impurities to saturate the soil underneath. Stone or brick are quite as absorbent as cement and would take longer to dry.

As to the improvements suggested by the Board—

1. "Ventilation of cells":—It would seem, from the phrasing of this paragraph, that the cells were destitute of openings at the top and bottom, or means of increasing the ventilation, which is not the fact— attempts have been and are still being made for its improvement.

2. "Lighting the cells":—None of the cells are lighted inside, and the question of illuminating from the outside is a matter for consideration of the police.

3. Classification of prisoners, and—

4. Attendance for prisoners are also matters for the police.

If it be decided to provide single cells, it will of course be necessary to erect new watch-houses, and the question of sites will be for the consideration of the Government and Police Department.

I have, I believe, dealt with all the parts of the Board's report upon which I can offer an opinion; there is *no doubt* that improvements in the watch-houses are desirable, but I do not think the statements of the Board have been borne out, or the language in which they are conveyed justified by the facts of the case.

I have, &c.,
JAMES BARNET,
Col. Archt.

No. 3.

THE PRINCIPAL UNDER SECRETARY TO THE PRESIDENT OF THE SYDNEY SUBURBAN SEWAGE AND HEALTH BOARD.

Colonial Secretary's Office,
Sydney, 17 February, 1876.

SIR,

With reference to Mr. Barlee's letter of the 6th of January, transmitting the Seventh Progress Report of the Sewage and Health Board, with the Progress Report of a Committee appointed to inquire into the crowded state of dwellings and areas in the City of Sydney, I am directed by the Colonial Secretary to transmit to you, for the perusal of the Board, two reports which have been obtained from the Inspector General of Police and the Colonial Architect on the statements and comments contained in the said Progress Reports with regard to the Sydney Watch-houses.

2. I am desired to request that the enclosures may be returned to me.

I have, &c.,
HENRY HALLORAN.

No. 4.

THE SECRETARY TO THE SYDNEY SUBURBAN SEWAGE AND HEALTH BOARD TO THE PRINCIPAL UNDER SECRETARY.

Sydney City and Suburban Sewage and Health Board,
(Office, Colonial Secretary's Department),
Sydney, 21 February, 1876.

Sir,

I have the honor to state, for the information of the Honorable Colonial Secretary, that the enclosed reports from the Inspector General of Police and Colonial Architect, sent to the Sewage and Health Board for perusal on the 17th inst., were considered at a meeting of the Board held this day.

I am directed to state that the Board find nothing in the correspondence to induce them to modify their opinion of the disgraceful condition of the Sydney Watch-houses.

Their Report was based upon evidence given, after personal inspection, by Hon. J. Smith (Chairman), His Worship the Mayor, Alderman Chapman, and Drs. Read and Danscy, members of a Committee appointed to inquire into the matter, whose competence to form a correct opinion no disinterested person will question.

The Board are glad to learn that several of their recommendations are being carried out.

I have &c.,
CHAS. H. BARLEE,
Secretary.

No. 5.

Returning re-
ports. Insp.
Genl. Police, 2a
Jan.; Col. Archt-
tect 9 Feb., 1876.

No. 5.

MINUTE OF THE COLONIAL SECRETARY.

SOME days ago I wrote a memorandum on the subject of country gaol lock-ups, and requested the Inspector General of Police or the Comptroller General of Prisons to inform me speedily of the expenditure that would be required to enable the Government to make provision for such cases as Orange, Tamworth, Wentworth, and others of the kind (if there be any), in order that the Government may consider the desirability of providing for them on the Additional Estimates.

The Sewage and Health Board in their Seventh Report on the Sydney Lock-ups, commented upon by the Inspector General of Police and by the Colonial Architect, make it apparent that alterations and additions should also be made to them. The Inspector General should give his attention to the matter as an urgent one.—JOHN R., 1/3/76.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY CITY AND SUBURBAN SEWAGE
AND HEALTH BOARD.

EIGHTH PROGRESS REPORT

OF THE

BOARD APPOINTED ON THE 12TH APRIL, 1875,

TO INQUIRE INTO AND REPORT AS TO THE BEST MEANS OF DISPOSING OF THE
SEWAGE OF THE CITY OF SYDNEY AND ITS SUBURBS,
AS WELL AS OF PROTECTING THE HEALTH OF THE INHABITANTS THEREOF;

ADOPTED BY THE BOARD ON THE 8TH FEBRUARY, 1876.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,
3 *March*, 1876.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1876.

* 227—A

THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

EIGHTH PROGRESS REPORT.

To the Honorable the Colonial Secretary,—

SIR,

1. At an early stage of their inquiries the Sewage and Health Board had their attention pointedly drawn to certain localities within the City of Sydney, and in some of the Suburbs (more particularly in the neighbourhood of Surry Hills and Shea's Creek) in consequence of their notorious unhealthiness, their high death rate, the virulence which characterizes every form of epidemic disease which makes its appearance within their limits, and their (in many cases) rapid and fatal termination. The Board therefore appointed Sub-committees of their body—one with Mr. Bennett as Chairman—to examine and report as to the state of sewerage and drainage of the watershed of Shea's Creek; and the other—with Dr. Alleyne as Chairman—to inquire into the prevalence of scarlet fever. Both reports, with their attached evidence, are transmitted herewith.

2. It is now a fact too well understood by all persons who have given any consideration to sanitary questions to need much comment at our hands, that defective ventilation, drainage, and sewerage, and a low condition of health, a predisposition to every form of epidemic disease, and a high death rate are all intimately and closely associated as cause and effect, and follow one another in as inevitable sequence as night follows day. As might have been anticipated therefore the Reports of the two Committees to which reference has been made strongly confirm and illustrate one another in this respect.

3. Mr. Bennett's report and the evidence taken before the Committee of which he was Chairman in reference to Shea's Creek, state—

“That the whole of the subsoil of the low ground appears to be saturated with the sewage, giving out the most offensive fumes.”

“Many of the houses have been constructed in what are now green fetid pools, and complaints of illness and mortality during the hot weather of last summer were general; no language can adequately describe the foul and noisome filth of the drains in the immediate vicinity.”

4. That the total absence of all sanitary precautions here disclosed has made its mark in the mortality table of the district is clearly shewn in the Registrar General's returns, and that the extreme virulence which is so marked a feature in the scarlatina and other epidemic cases is directly traceable to the same cause is as clearly set forth in Dr. Alleyne's report.

5. Referring to the cases of scarlatina which had occurred in Mrs. Solomon's family, when at the time of their first visit, in addition to the loss of two children and the illness of a third whose death was hourly expected, there was also a servant girl in the house ill with erysipelas, Dr. Alleyne's Committee found on inquiry that

very

very offensive smells were continually arising from the drain in the yard, and they state that it is scarcely possible to avoid coming to the conclusion that the house was contaminated by foul air from that source. Their Report goes on to say—

“ We subsequently visited a number of houses in Bourke-street and the neighbouring streets, and inspected the open spaces adjoining them, and found that the existing conditions were such as, in our opinion, would cause such a disease as scarlet fever to be developed in its worst and most fatal form—the damp ill constructed houses, the total neglect of all provisions for ventilation or drainage; the state of Bennett’s paddock—which may be described as a swamp of putrid organic matter, supplied by the houses adjacent to it,—the filthy condition of the so-called street to which Blanche Terrace faces, which is so saturated with waste material of various kinds from the residences in its vicinity as to be converted into a bog, together with the accumulation of decomposing animal and vegetable substances, almost everywhere around, are the efficient causes of the reported unwholesomeness of a locality which, under proper sanitary conditions, would be undoubtedly one of the most healthy and delightful in the City.”

6. It is not necessary to quote further from the Reports, or to multiply proofs that the most prompt and energetic steps should be taken by the Corporation to introduce an efficient system of sewerage and drainage in this and other districts of the city. Some of these works can—we are informed—be immediately carried on, and in such cases not a day should be lost in commencing them. In regard to others it has been alleged that larger powers are required by the Corporation to enable them to deal effectively with the existing evils, more especially to construct sewers through private property and neighbouring Municipalities. If such be the case we would most respectfully and earnestly urge upon the Government that no time be lost in conferring such powers as may be required, and putting the Corporation in a position to abate the frightful evils disclosed by the accompanying Reports.

7. But as it is clear that the Corporation cannot be expected to provide houses as well as sewers for the city, and as it is also pretty clear from Dr. Alleyne’s Report that the houses in which many of the poorer people are compelled to reside are utterly unfit for human habitation, certainly unfit abodes for those suffering from scarlatina, erysipelas, or other forms of contagious disease, the Board would strongly urge upon the Government the propriety of establishing a suitable hospital for the reception of such cases in the neighbourhood of the city.

8. The Board are of opinion, and such is also the opinion of the medical gentlemen who have given evidence on the subject, which is also appended, that a building constructed of weatherboards would answer every purpose, and would indeed be more suitable than one of stone or brick.

E. O. MORIARTY,
Vice-Chairman.

*Board Room,
Sydney, 8th February, 1876.*

REPORT
OF THE
**COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN
SEWAGE AND HEALTH BOARD,**

on the 24th November, 1875,

“To inquire into the prevalence of Scarlet Fever.”

ADOPTED BY THE COMMITTEE, 25 JANUARY, 1876.

To the Chairman of the Sydney City and Suburban Sewage and Health Board,—

SIR,

The Committee appointed, on the 24th November, 1875, “to investigate the special cases of Scarlet Fever of a malignant type, which are reported to the Board to have taken place in the City and Suburbs, and also any other cases which may come under their notice, and to report generally to the Board as to the causes which may have occasioned the prevalence of that disorder,” have agreed to the following Report:—

1. Our attention having been specially directed to the cases of scarlet fever which had occurred in Mrs. Solomon's family, then residing in Bourke-street, we first paid a visit to their house, and found that, in addition to the loss of two children and the illness of a third, whose death was hourly expected, there was also a servant girl in the house ill with erysipelas. Our report and recommendations on this case are already before the Board. We had not at that time an opportunity of inspecting the premises, but we have since ascertained from a person who was attending the children that very offensive smells were continually arising from the drains in the yard, which were no doubt improperly trapped, and it is scarcely possible to avoid coming to the conclusion that the house was contaminated with foul air from that source. It must also be taken into account that this house is situated on the highest point and at the extreme end of the sewerage system for this district, and is therefore exposed to the full influence of the noxious gases which escape from it.

2. We subsequently visited a number of houses in Bourke-street and the neighbouring streets, and inspected the open spaces adjoining them, and found that the existing conditions were such as in our opinion would cause such a disease as scarlet fever to be developed in its worst and most fatal form—that the damp, ill-constructed houses; the total neglect of any provisions for ventilation or drainage; the state of Bennett's Paddock—which may best be described as a swamp of putrid organic matter supplied by the houses adjacent to it; the filthy condition of the so-called street to which Blanche Terrace faces, which is so saturated with waste material of various kinds from the residences in its vicinity as to be converted into a bog; together with the accumulation of decomposing animal and vegetable substances almost everywhere around, are the efficient causes of the reported unwholesomeness of a locality which, under proper sanitary conditions would be undoubtedly one of the most healthy and delightful in the city.

3. Guided by the returns furnished by the Registrar General we inspected houses in various parts of the city in which scarlet fever had been the reported cause of death, and found in all of them to a greater or less extent the same defective arrangements for ventilation and drainage. In one tenement in Lower George-street the only ingress for air and light was through the door leading into the dwelling and a second door leading to another portion of it, the said doors being only 5 feet high, and unusually narrow; in the yard attached to this house there was a large accumulation of rubbish.

4. In another house immediately adjoining, the water-closet was in such bad order that the contents of the closet were washed into a passage leading to one of the rooms of the house.

5. In the same neighbourhood there are two establishments for curing hides, which are kept as clean as the nature of the work will admit of; but large volumes of foul water are being continually discharged from them into the sewers.

6. In another house in the same locality containing three small rooms in which five persons live the only means of access for air and light are the small door of entry to the dwelling, and a very small window in the roof of one of the up-stair rooms.

7. In the yard of a house in Elizabeth-street, in which a child, previously to all appearance healthy, died after a single day's illness from scarlet fever, there was found an open drain, which was foul and stinking in the extreme. And on the premises of another house in the same street the same conditions were present, the yard being badly paved and the drain without stench-trap. Here too occurred a case of scarlet fever, which terminated fatally; the patient, a child four years of age, having died after twenty-four hours illness.

8. The occupant of No. 123, Duke-street, who has recently lost a child three years old, after four days' illness, from scarlet fever,—her husband having died about two months' before of a sickness said to be English cholera—complained greatly of the stench from the sewers; and at No. 5, Bourke-street, near Cowper's wharf, where a case of scarlet fever ended fatally after a week's illness, we were informed that the smell from Woolloomooloo Bay was at times so horrible that the inmates "were obliged to leave the house and to go into the street to obtain fresh air."

9. Upon visiting a house in Hopewell-street, Paddington, we ascertained that the family had just left in consequence of the loss of all their children—three in number—after a week's illness from scarlet fever, and that the same kind of sickness has been very prevalent in Gipps-street, which is close by. Some idea of the drainage in the neighbourhood may be gathered from the following facts:—At the commencement of Glenmore Road, immediately in front of a butcher's shop, is a drain at all times very offensive, which is without stench trap. This drain receives all the drainage from the houses up the hill, extending nearly to the reservoir. There are also two butchers' shops higher up, the blood and refuse from which run into the same drain. At the corner of Campbell-street and Glenmore Road there is a heap of rubbish consisting of dead fowls and other animals and of house and street refuse deposited there with the sanction we presume of the Municipal Council.

10. We also learn from a medical practitioner in one of the suburbs, where one case of scarlet fever occurred which terminated in convulsions five days after the appearance of the eruption—"The house is low and slightly built, consisting of a grocery store, and one room about 14 x 12 x 8 ft., in which three children and two adults slept; the boy lying along the north-west side, on a small sofa, he at one end and his sister at the other." The houses in the locality where that case occurred have all surface drainage.

11. The returns from St. Leonards and the surrounding country during the scarlet fever epidemic afford a striking contrast to the returns from Sydney during the same period. Scarlet fever has been commonly met with in the town and district of St. Leonards during the last two years; but in 1874 there were only two cases of death from that disease reported from St. Leonards. In one of these cases, which had not been seen by a medical man, the immediate cause of death is stated to have been dropsy, supposed to have been the result of an attack of scarlet fever some time previously. During 1875, while scarlet fever was a fertile source of mortality in the metropolis, the returns from St. Leonards shew only one death from that cause. In comparing the vital statistics of St. Leonards with those of Sydney, it is to be remarked that in St. Leonards, although there are many habitations by no means so good as could be desired, and where there is no system of drainage, there are no large areas covered with closely-packed houses so arranged as to defy the entrance of fresh air. There is no crowding together of large masses of people in such a way that they pass the greater part of their time deprived of that without which there can be no vigorous life—pure air.

12. Instances of cases of scarlet fever proving rapidly fatal in neighbourhoods having defective sanitary arrangements could be greatly multiplied, but we think it will be sufficient for us to state that notwithstanding the admitted fact that there have been rare cases of deaths from scarlet fever after a short illness in dwellings and localities affording apparently the most favorable conditions for health; we have during our inquiry so generally found that where there were streets containing houses badly constructed, ill-ventilated, and without proper drainage, there were the dwellings where there had been fatal cases of scarlet fever, that we are forced to the conclusion that it is in such localities, among a population predisposed to disease and with depressed vital powers less able to resist its attacks, an epidemic finds its ready victims.

13. We have to add, that it has been brought under our notice that parents are in the habit of sending their children to school and to other public places, and that adults go to their ordinary avocations and mix with the general public at that stage of their convalescence when desquamation is taking place, and take their seats in public conveyances of all kinds in the same state of health. This tends greatly to spread the infection of the disease, and if possible some means of checking the practice should be adopted.

Board Room,
Sydney, 27 January, 1876.

I have, &c.,
H. G. ALLBYNE,
Chairman of Committee.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

MONDAY, 20 DECEMBER, 1875.

Present:—

HON. J. B. WILSON,
F. BELL, Esq.,

W. C. BENNETT, Esq.,
E. O. MORIARTY, Esq.,

DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

H. N. MacLaurin, Esq., M.D., and R. D. Ward, Esq., Surgeon, M.A., called in and examined:—

1. *Chairman.*] We have called a conference of medical men to advise the Board on a matter which will be better explained by a letter, which the Secretary will now read. (*Letter read as follows*):—

Colonial Secretary's Office,
Sydney, 24 November, 1875.

H. N.
MacLaurin,
Esq., M.D.
20 Dec., 1875.

Sir,

I am directed by the Colonial Secretary to address you in your position of Chairman of the Board, instructed to advise, amongst other things, as to the health of the city, and to invite your attention to the extraordinary deaths from scarlet fever and the illness still prevailing at the house of Mrs. Solomons, the widow of an auctioneer, in Bourke-street.

2. It may be, Mr. Robertson thinks, that the Board by conferring with Dr. Alleyne and Mr. Dansey, or other gentlemen of the medical profession, may be able to make some recommendation in this matter.

I have, &c.,
HENRY HALLORAN.

Professor Pell, B.A.,
Chairman of the Sydney City and Suburban Sewage and Health Board.

We wish to obtain the advice of medical men as to what further steps—for we have already taken some steps—should be taken to carry out the wishes of the Government in this respect;—can you give us any advice Dr. MacLaurin; I address myself to you as you are sitting nearest me? I should like to know what steps you have already taken.

2. We have found that there are several cases of infectious diseases in the city, and that these cases are not admitted into the Infirmary at present;—it seems to us very undesirable that persons suffering from diseases of this character should be allowed to remain in private houses;—what course do you think should be pursued? It is impossible that cases of this kind should be admitted into the Infirmary, because there is no accommodation there for isolating them from the other patients. There would be a great risk of infection to persons suffering from other diseases, and it would interfere with surgical operations. At the same time some proper provision should be made for isolating such cases from the persons residing in the houses where they exist. Some accommodation should be provided at a convenient distance from town, to which patients could be removed at once.

3. Provided especially for that purpose? Especially for that purpose.

4. What would you call a convenient distance? Considering that persons suffering from the graver forms of scarlet fever are extremely ill and from erysipelas also—though persons suffering from erysipelas are, as a rule, not quite so ill as those suffering from severe scarlet fever—I should say that the place provided should be as near town as possible—not more than half an hour's drive.

5. Do you think the removal of such cases to a considerable distance would involve much pain or danger to the patients? No doubt of it; in the graver forms of scarlet fever the patients suffer great pain. The most severe cases are not of longer average duration than from twenty-four to thirty-six or at the most forty-eight hours, when death generally terminates their sufferings; I am speaking of the worst cases, and it would be a serious drawback to the chance of recovery if they were subjected to a long transport from one place to another.

6. Should you consider it a good arrangement to provide for such cases of infectious disease by erecting tents to receive them? I think it would be a very good arrangement, except that there is a strong prejudice in the public mind against the treatment of sick persons under canvas. The public know very little about it, but they have an objection to this course. Although there are no doubt many advantages connected with the treatment of sick people in tents, still the administration of a camp of that sort for sick people presents certain difficulties. The principal objection is, however, that the public mind is strongly set against it.

7. And that would interfere with the carrying out of such a plan? Yes.

8. You think it is of vital importance that these cases should be removed at once to some convenient place? I think it is absolutely necessary, especially with respect to cases of scarlet fever and erysipelas.

9.

H. N.
MacLaurin,
Esq., M.D.
20 Dec., 1875

9. With regard to a camp as a temporary hospital for cases of this kind. If there were a suitable house attached to it for the accommodation of the medical men and the nurses, would that remove the objection? I am not thinking so much of the personal convenience of the medical men and the nurses as the conveniences for treating the sick persons themselves. In stormy weather a tent is very unpleasant and the rain often gets into it, which is a great drawback. And besides this, the nurses have to go to and fro from tent to tent which they would at such times find disagreeable, and it is of great consequence to make the duties of the nurses as little irksome as possible; otherwise the tendency would be to make them neglect their work especially at night. It is very easy for a nurse to go from one ward to another inside the Hospital, but not so easy to go from one tent to another, particularly in wet weather. It is not therefore desirable to throw any obstacle in their way. Still there are many advantages in the treatment of sick persons under canvas.

10. Do you think there would be any unnecessary suffering and danger to health in removing by road to so great a distance as Parramatta, patients suffering from these infectious disorders? I think it would be very undesirable. Even if we take the milder of the two diseases—erysipelas—the patient suffers a great deal of pain, especially if the disorder attacks one of his legs. If in addition to this he is subjected to a great deal of jolting and jarring it wears him out and tends to exasperate the disease, and of course the longer the jarring and jolting continues the greater the injury to the patient.

11. You disapprove then of removing patients to such distance? I think it is too far, provided a convenient place can be obtained at a less distance.

12. Can you give us any other advice towards carrying out the wishes of the Government in this matter, beyond taking steps to isolate the patients? I think it should also be provided that the clothes used by these patients and the bed linen should be destroyed and the room in which the disease has occurred should be thoroughly fumigated, and also that the drainage of the house which has been so infected should be most carefully looked to in every case. But the first and most important point is to isolate the patient; that is of more importance than all the others put together.

13. It does not require any great medical skill to treat these cases, does it—I mean that no particular complications are involved? I should hardly like to say that, because I think that no disease requires more attention than scarlatina in a bad form.

14. I thought it was a disease so well known that there was no doubt about the mode of treatment? Scarlatina in its bad form produces death in different ways; in fact it is a term which comprises very different pathological states, and the treatment must accord with the particular kind of symptom which occurs. Sometimes death proceeds from the severity of the fever; sometimes from affection of the brain. Sometimes there is a tendency to dissolution of the blood, and sometimes death arises from special local affections. All these have to be taken into consideration, and therefore I should not like to say that it is a disease which does not require a great deal of skill in the management.

15. *Mr. Moriarty.*] Do you think a weatherboard house would be a good place as a temporary hospital? Very good, I think.

16. A building of that sort would not cost much—it could be cheaply put up? Yes, it need not cost much; though some weatherboard huts we had put up for us at the Infirmary cost us a great deal more than we expected. They do not possess all the advantages of tents; but there would be no objection to them on the part of the public.

17. *Dr. Alleyne.*] Don't you think a weatherboard building—a sort of pavilion—could be made quite as comfortable as any house in the world; it could have large windows and be as perfectly ventilated as if it were built of brick or stone? I quite agree with you and for many reasons it is better, because after using it for a certain time you could burn it and get rid of the possibility of infectious diseases being handed down to other persons.

18. It could also be washed out more effectually? Yes, it could be washed out with lime, and disinfected.

19. *Hon. J. B. Wilson.*] Considering the great heat of this climate during the summer months, when scarlet fever has been so prevalent, would you be inclined to recommend that any patient of your own should be removed to Parramatta under any circumstances? Certainly not; under no circumstances would I recommend a patient of mine to be removed by road to Parramatta, suffering from a malignant scarlet fever; in fact there could scarcely be any such case in which I should recommend it.

20. I suppose you are aware that the Government have given instructions that no patient suffering from infectious diseases should be removed by public conveyance, either by land or by water, consequently there are no other means of transporting them, except by road; and considering the distance you think that would be very undesirable? Certainly with regard to bad cases; I should certainly never recommend a patient of mine suffering from malignant scarlet fever to be taken there.

21. Supposing such patients were removed to a camp, isolated from other persons—don't you think it would be desirable to select medical attendants for them, other than the ordinary practitioners of the town? If practicable it would be better to have special medical men set apart to attend these people. For instance, in the Children's Hospital in London it was determined to have special wards for scarlet fever, measles, small-pox, and other infectious diseases. They thought it so necessary to isolate these cases that they appointed a paid medical officer to take charge of these wards, and to have nothing to do with the other wards. Also, in Queen Charlotte's Lying-in Hospital in London a similar arrangement was made. When I was house surgeon there I was not allowed to attend any other hospital, lest I should introduce infection.

22. Then supposing the Government were to determine, notwithstanding the advice you have given, to send such patients to Parramatta, it would be injudicious to allow medical men attending the other establishments to attend these patients? It would certainly be better to have special medical men if possible; but if the medical men who attend other patients attend these also special precaution should be taken.

23. *Dr. Alleyne.*] For instance, the medical men at Parramatta have to attend the Orphan Schools and the Asylum;—you think it would be injudicious for them to attend both establishments? Yes.

24. *Chairman.*] It appears that the people in Parramatta object to patients suffering from infectious diseases being sent there—to such a populous district—and they object especially on account of the medical men who attend the hospital in which these cases are treated also attending the Orphan Schools and the Asylum for the Infirm and Destitute, besides having a large private practice;—do you think the people of Parramatta have good ground for their complaints? I think they have good grounds.

25. Especially as to medical men who have a large private practice attending these cases of infectious disease? Yes, I think that medical men having to attend cases of confinement in their private practice, who

who also attend the hospital, ought to be relieved from the risk of conveying infection to their patients, because there is no doubt that a man who is in the habit of attending numerous erysipelas patients may very possibly convey it to his other patients.

26. *Chairman to Dr. Ward*] Do you concur generally in what Dr. MacLaurin has stated? I concur so entirely that it would almost appear as if we had been talking the matter over together outside; he has fully expressed my views. Perhaps I might have objected a little more strongly to the system of treating the sick in tents on account of the very great heat, amongst other inconveniences. I know what it is to be in a tent in hot weather, and unless the tent is very large with a double roof the temperature inside is very high.

27. But you quite agree with Dr. MacLaurin in the danger of removing patients to so great a distance as Parramatta? Yes, I might go further and say it is positively cruel.

28. Have you any further advice you can give us? No, I think Dr. MacLaurin has almost exhausted the subject in answer to your questions. Perhaps I might not go so far as he has done with reference to the medical men at Parramatta. I think it would depend in a great measure on the number of patients a man has got. If it is only a question of four or five patients in the hospital, and almost every medical man has as many as that, I think there would be very little danger. If the place were pretty well filled and the atmosphere likely to be charged with the effluvia of the disease it would be very dangerous, but so long as there are only a few cases I do not exactly join with Dr. MacLaurin in thinking that any great danger would arise.

29. *Dr. Alleyne*] What Dr. MacLaurin means is this: that there is undoubtedly a risk in a doctor going from a patient suffering from erysipelas to a woman in child-birth? Yes, no doubt there is a risk, and no medical man ought to do it. It would of course be better if special medical men could be provided, properly trained and duly qualified; still I do not think under present circumstances it is wrong for medical men to attend the few cases which exist at present, and I think they might be allowed to use their own judgment in the matter.

H. N.
MacLaurin,
Esq., M.D.;
R. D. Ward,
Esq., M.A.

20 Dec., 1875.

TUESDAY, 21 DECEMBER, 1875.

Present:—

Hon. J. B. WILSON,
F. BELL, Esq.,
W. C. BENNETT, Esq.,

E. O. MORIARTY, Esq.,
F. H. GRUNDY, Esq.,
H. G. ALLEYNE, Esq., M.D.

—M. B. PELL, Esq., B.A., IN THE CHAIR.

Drs. A. Moffitt, R. Schuette, W. Marris, and L. T. Lauré called in and severally examined:—

30. *Chairman to Dr. Moffitt*] We have asked you to attend this afternoon in order to obtain your advice as to what steps, in the opinion of the medical profession, it is desirable to recommend in order to carry out the wishes of the Government, contained in a letter which will now be read to you by the Secretary. (*Letter read; vide p. 7.*) I will ask you a few questions in order to elicit your opinion as to the course to be pursued in consequence of the spread of infectious diseases in this city, especially with regard to scarlet fever, which has appeared in a malignant form, and erysipelas. What steps, Dr. Moffitt, would you recommend us to advise the Government to take? My opinion on the subject of scarlet fever and erysipelas is, that a sick quarantine should be established wherever they exist. It should be indicated to the public that wherever these infectious diseases exist a yellow flag should be hoisted.

Drs. Moffitt,
Schuette,
Marris, and
Lauré.

21 Dec., 1875.

31. Do you think that would be practicable among the poorer classes of inhabitants, where a number of persons, besides those who were sick, would be living in the same house;—would it not be better to remove the patients from such houses to some isolated place? If you had an hospital prepared for that purpose of course that would be the best plan; but if the patients are to be allowed to remain on the premises I think they should be placed under sick quarantine.

32. The main object in either case would be to isolate the patients? Yes.

33. And do you not think that the most convenient way of doing so would be to remove them to some convenient place where they might be treated by themselves? Yes, of course.

34. What kind of place would you recommend for that purpose; we did make a suggestion to the Government that they should be put into a camp under canvas somewhere in the neighbourhood of Sydney;—do you think that would be a good plan? I don't think it would answer for cases of scarlet fever, because in such cases a certain temperature must be kept up, which could not be done in a tent, and the consequence of a patient getting chilled might be very serious.

35. But you think the best plan would be to have a temporary hospital to which they could be removed at once? Yes, decidedly, for all who would wish to go there, and those who would not should be placed in sick quarantine, and it should be imperative that a yellow flag be hoisted with "scarlet fever" printed upon it.

36. *Hon. J. B. Wilson*] You could not institute quarantine regulations of that sort without an Act of Parliament, and that would entail considerable delay? It would be necessary to have a Bill for it.

37. *Dr. Alleyne*] The present quarantine law makes provision for that, if the Government consider it desirable to put it in force.

38. *Chairman to Dr. Alleyne*] Have you the power to declare a certain house in quarantine? The Government have, and for that reason we wanted to have an hospital or place of reception to which patients suffering from infectious diseases of this character could be taken.

39. *Chairman to Dr. Moffitt*] What kind of arrangements do you think it would be desirable to make for the accommodation of such patients? In case of a temporary hospital being prepared it would be necessary to have special cabs or carriages provided to remove them, as they have in London.

40. You think it would be desirable that they should be taken to some place in vehicles specially appointed for the purpose? Yes, in properly appointed carriages they might be taken to any distance; the carriages would of course shut up.

41. Do you think that the distance would be no object? No, I mean for a mile or two.

42. You think they should be taken to some place not in a populated district? Yes.

- Drs. Moffitt,
 Schuette,
 Morris, and
 Lauré.
 21 Dec., 1875.
43. Do you think that to remove such patients to a distance beyond a mile or two would be objectionable? Yes, it would fatigue them too much.
44. You think that fatigue and danger to the patient would result from taking them to a greater distance? In cases of scarlet fever I certainly would not take them further; in erysipelas it would not matter so much.
45. Would you object to have a patient of your own removed to such a distance as 14 or 15 miles from Sydney? I certainly should.
46. You would object on account of the fatigue and danger to the health of the patient? Yes.
47. Are you aware that the Government have made arrangements to send persons suffering from infectious diseases to an invalid asylum at Parramatta? I would not send any cases of scarlet fever there; with cases of erysipelas there would not be so much risk.
48. You think the distance is too great? Yes, it is a great deal too far.
49. It appears that the inhabitants of Parramatta object to receive such patients, and they base their objection: first, on the ground that Parramatta is a thickly populated place;—do you see any objection to it on that ground? Yes, there is some force in that objection.
50. They make another objection: That the Government Medical Officer, who would have the superintendence of this invalid asylum, also attends the Orphan Schools and the Asylum for the Infirm and Destitute, besides having a large private practice;—do you think that is also an objection? I think it is a very good objection. I know that for my own part I always make it a practice to see all my private patients first and the infectious cases afterwards.
51. Then you think there is validity in both objections? Yes, certainly.
52. And you think that some place nearer to the city would be more suitable? Yes, Victoria Barracks would be a suitable place.
53. Do you think a weatherboard building put up as a temporary accommodation would answer? Yes, you could make a weatherboard house very comfortable, especially at this time of the year.
54. In cases of erysipelas, although you do not appear to consider that the danger of removing the patients to a considerable distance would be so great as in cases of scarlet fever, do you not think that a long journey would cause them unnecessary fatigue and pain? It certainly would; but I do not look upon erysipelas as anything at all so dangerous as scarlet fever.
55. Do you think there would be positive danger to the life of the patients in some cases of scarlet fever in removing them to such a distance as 14 or 15 miles from Sydney? I do; I think it would be too much altogether; they would not bear the removal many of them.
56. *Mr. Moriarty to Dr. Moffitt.*] Do you not think that the seeds of these diseases might remain in such a building as the Victoria Barracks and render it dangerous for future occupation by troops, or for other purposes? Yes, there is no doubt of it; they do hang about the walls for some time.
57. Would it not be better then to have some temporary hospital put up which might afterwards be pulled down? It would be better.
58. *Dr. Alleyne.*] But the infectious properties which adhere to the walls might be removed by repeated lime-washing and other modes of purification? No doubt of it, if done effectively.
59. But it would be desirable if possible to have a temporary place for the purpose which could be cleaned away afterwards? Yes. There is no doubt this disease could be stamped out if energetic measures were taken, if a sick quarantine were established wherever scarlet fever broke out, and the inmates of the house were compelled to hoist a yellow flag, and the police saw that it was not taken down until a certificate was produced. Scarlet fever is spread in a great measure by means of these petty little shops where butter and milk are sold; milk is about the readiest mode of conveying the disorder. I remember some years ago a woman who used to supply milk to the neighbourhood. Her children had scarlatina and the milk was kept in the very bedroom where they were, and wherever she supplied milk she left the disease. I happened to have one of my patients attacked with it in a very virulent form, who died from scarlatina conveyed to the house by this milkwoman; so I think it requires energetic measures to suppress it, and that we shall not succeed in doing so without adopting some such plan as I have suggested, so as to keep the patients from mixing with other people. I have met persons in the streets suffering from scarlet fever. If you happen to get into a bus you may have a person sitting next to you with the disease on him. I have seen them even in the worst stages, even when the skin is peeling off them. If you go into one of our scientific institutions, the School of Arts for instance, you may be sitting alongside of a person in the most dangerous stage of the fever. I had a patient, Mr. William B. Allen, who caught it in a very violent form from sitting next to a person in the School of Arts. I think a very heavy penalty should be inflicted on any person suffering from scarlet fever appearing in any place of public assemblage.
60. *Hon. J. B. Wilson.*] Are you aware that scarlet fever is very prevalent in some of the suburbs at the present time? I am aware of it.
61. And that the water supply is very bad in some of those suburbs? Yes.
62. Would you attribute the presence of scarlet fever in those localities to the bad supply of water? The bad supply of water lowers the system; it brings on a low state, and when a person gets the disease he takes it in a more violent form.
63. *Chairman.*] That is from the bad quality of the water? Yes.
64. And deficiency in the supply of water would have the same effect? Yes; the system gets lowered, the disorder assumes its worst character and becomes dangerous.
65. *Hon. J. B. Wilson.*] With regard to vehicles for the removal of patients is there any particular kind of carriage used in London for that purpose? They are painted a certain color.
66. Are they made in any particular way? No, I believe they are made in the ordinary way; they are simply street conveyances appropriated for that purpose, and painted in a certain way to distinguish them as conveyances for the sick.
67. Don't you think that the Government in providing these carriages should have them made in the most convenient form possible for the patients? Yes, they should be comfortable, and made so that the patients could recline in them.
68. *Chairman to Dr. Schuette.*] Do you concur generally, Dr. Schuette, in the opinions expressed by Dr. Moffitt? I do, most decidedly.
69. Have you any further advice to give us on this subject? No, I think it is a very good plan—in fact it is the only plan—to have a temporary building of wood for the reception of these cases.
- 70.

70. At a moderate distance from Sydney? Yes.

71. You would object to a long transport by road for the patients? In certain cases it could not be done; in the commencement of the disease it would not matter so much.

72. Don't you think the removal of patients to such a distance from Sydney would deter persons from availing themselves of the accommodation? Yes, of course they do not like to leave their homes for any great distance. 21 Dec., 1875.

Drs. Moffitt,
Schuette,
Morris, and
Laurè.

73. *Chairman to Dr. Morris.*] Do you concur generally in what has been stated by Dr. Moffitt and Dr. Schuette? Yes.

74. *Chairman.*] Have you any further advice to give us as to the steps we should recommend the Government to take? No, I think Dr. Moffitt's advice is very good—to get a portion of the Victoria Barracks to be used as a temporary hospital.

75. You think it should be within a moderate distance of the city? Yes.

76. Don't you think there would be some objection to the Victoria Barracks to be used for such a purpose? Well, if it is an old site of typhoid fever it would be an objection, and we must take care what we are doing.

77. Don't you think it would be better to have some temporary building which could be burnt down after it was done with? Yes, it would be better.

78. *Dr. Schuette.*] That is what we always do on the Continent. A building especially built and set apart for the purpose, to which all the poor people are sent for treatment, and it is burnt down afterwards.

79. *Chairman to Dr. Laurè.*] Have you anything to add, Dr. Laurè? Nothing beyond giving my opinion that a temporary building, within a moderate distance of the city, would be the most suitable. I think it would be better than the Barracks.

80. A temporary wooden building? Yes, one that could be destroyed afterwards.

81. *Dr. Alleyne to Dr. Laurè.*] What do you consider a moderate distance? From 4 to 6 miles.

82. You would not consider from 10 to 15 miles a moderate distance? No, it would be too far.

83. *Hon. J. B. Wilson to Dr. Moffitt.*] You stated, I think, that the removal to any distance, of patients in the early stages of the fever, would not be attended with so much danger, but I suppose these cases are pretty well marked before you are called in, especially among poor people? Yes.

[No. 6 COMMITTEE.]

REPORT

OF THE

COMMITTEE APPOINTED ON THE 13TH JULY, 1875, BY THE SYDNEY
CITY AND SUBURBAN SEWAGE AND HEALTH BOARD,*To examine into the condition of Shea's Creek,*

ADOPTED BY THE COMMITTEE, 20 DECEMBER, 1875.

The Chairman of the Sydney City and Suburban Sewage and Health Board,—

SIR,

The Committee appointed to inquire into the state of Shea's Creek, and to investigate Mr. Grundy's proposal for intercepting the sewage from Paddington and the Barracks, and conveying it into the head of Shea's Creek, have to report:—

1. That they have examined very carefully the whole length of Shea's Creek, from Blanche Terrace, Moore Park, to its junction with Cook's River, and also the heads of all its affluents round to Redfern, and the various manufacturing establishments on its course.

Description of District.

2. The eastern head of Shea's Creek is the immediate recipient of the drainage from Moore Park, and from a low-lying swampy neighbourhood between Moore Park and Bourke-street, now being rapidly covered with houses. The drainage water stagnates in pools on private ground, as well as on the water-tables and unformed portion of Blanche Terrace, Jamison and Arthur Streets, in front of many of the dwellings.

3. The whole of the subsoil of the low ground appears to be saturated with the sewage, giving out most offensive fumes. Many of the houses have been constructed in what are now green, fetid pools, and complaints of illness and mortality during the hot weather of last summer were general. No language can adequately describe the foul and noisome filth of the drains in the immediate vicinity.

4. There is a total want of all sanitary precaution in the placing and construction of the small houses, which are crowded together without order, with scarcely any back premises,—the privies and other offices quite close to the dwellings. These houses are chiefly owned by capitalists; in very few instances are they inhabited by the owners.

5. Attempts have been made to drain Arthur-street by cutting wide shallow drains, which, from want of fall have only made matters worse as they serve simply as evaporating pans to give out stench.

6. This watercourse—the eastern head of Shea's Creek—receives the drainage of the valley extending west to Crown-street and north to Albion-street, embracing an area of 83 acres of the city mostly covered with houses, 34 acres of Redfern also pretty closely populated, together with 52 acres of Moore Park unpopulated—a total of 169 acres.

7. The drainage from the houses east of Botany-street, fronting Randwick and Park Roads, extending from Albion-street to the Barracks, is now being diverted by the Corporation through a pipe into the Nanny-Goat Swamp.

8. South of Arthur-street the drainage passes on the surface through low land, on which are being constructed some very large houses fronting Bourke-street. The water is dammed back on this land by a pipe put in by a Mr. Jones to carry the drainage. This pipe is at much too high a level and of inadequate section, and the proprietor should be obliged to lower it and give it a proper fall. From Mr. Jones's pipe drain the stream crosses Thurlow-lane and then through Wimbledon Park, and by a 21-inch pipe drain now being laid through a garden, also the property of Mr. Jones, to the culvert under Cleveland-street, at the city boundary. This pipe drain is also of inadequate section and at too high a level.

9. From Cleveland-street culvert, the section of which is ample, to Messrs. Alderson's tannery, the water flows over a flat surface watercourse nearly on a level with the low-lying land westwards to Bourke-street. It is here, though very bad, by no means so offensive as at Jamison or Arthur streets. At Chelsea-street the water-surface is nearly on a level with the stone guttering of street.

10. Passing through Messrs. Alderson's premises in a well defined channel (at one time covered over) the stream is joined by the refuse water from the tannery, consisting of tan and lime liquor. This establishment is complained of in a letter to the Sewage Board, referred to the Committee for report. The complaints are chiefly from the persons living near the stream below the tannery, on the following grounds:—

- 1st. The contamination of air by the bad smells from the fresh hides and the pits, and the offensive fumes from the furnace, in which is consumed the waste animal matter.
- 2nd. The fouling of the water by the intermittent flow of matter from the pits.
- 3rd. The vibration of the engines.

11. It was stated to us that the tan and lime liquors neutralize each other, and do not make the stream very much worse than when it enters the premises, but we were informed, and have it in evidence, that whenever the pits containing the puer or "bait," as it is called, are emptied, the stench is overpowering for some hours at a time; that the fresh hides are also very offensive, as well as the smoke from the chimney, more particularly when the offal of the establishment is being consumed. The complaints as to vibration of engine we consider frivolous.

12. Down stream from Alderson's tannery is Magill's Nursery, the owner of which complains most of the nuisance from the tannery. He has also complained of damming back of the water by a culvert in Bourke-street, built by the Redfern Municipality at too high a level and of insufficient capacity. We think the culvert is at too high a level and too small, but that the injury from flooding to Mr. Magill is chiefly caused by the encroachments of a sand hill on the stream, which, in dry weather, it completely blocks up. This will be obviated by the means proposed for drainage.

13. West of this culvert the stream passes along the south boundary of Mr. Baptist's garden, where it unites with another stream coming from the Strawberry Hills, draining the basin south of Devonshire-street, between Crown-street and Goodlet's pottery. On this Mr. Baptist has a small water-wheel working a pump to raise water for irrigation. This stream, within the memory of every member of the Committee, has been sullied very much by the sewage from the new buildings which are chiefly drained on the surface. One range of houses in Bourke-street has a most offensive water-table in front, the stream crossing under the road being also sewage.

14. The united streams, after a course of a quarter of a mile through cultivated gardens, with bamboos and thick vegetation growing along the margin, are dammed at Mr. Alderson's wool-washing establishment, where there is a fall of 10 feet. The water in this dam is comparatively pure, though a very offensive stream joins just above the dam, draining the Albert Ground and the intervening flat, up to Pitt-street, Redfern, including the houses recently built on the sand-hills north and south of the Albert Ground.

15. The next dam descending the creek is at Johnson's wool-washing. Here the creek is joined by a small affluent from the eastward, rising near Forsyth's rope-walk. Below the junction the creek expands, and passing through some low-lying ground, the original creek is dammed back by the old Waterloo mill dam, and diverted in a race parallel to the Botany Road to the dam of Mr. Hinchcliffe's wool-washing establishment, where it meets and unites with the waters coming from the Waterloo swamp. This dam is continuous and over 20 feet high. That portion near Mr. Hinchcliffe's is not very secure, and is a standing menace to the country below, which is fast filling up with houses.

16. The mill here was short of water in 1871, when the surface in dam was $2\frac{1}{2}$ feet below the weir. Above this point, on the subsidiary stream running from the vicinity of the water supply, are Mr. York's wool-washing works. The water from the swamps being as yet uncontaminated, might, if the Shea's Creek upper waters were conveyed in a sewer, be economized and used for manufacturing purposes as at present; but the leases having almost expired, in all probability this portion of the catchment will ere long also be built over.

17. At Hinchcliffe's dam is a decided evidence of the purifying power of sun, air, and motion on water. The sullied water is run off in a shoot parallel to the dam for a distance of some chains, and then allowed to flow into the end of the reservoir remote from the factory, to which it returns to be used again, being purified by aeration and precipitation. A much larger quantity of work is done at this establishment, where the water is used over and over again, than at the Waterloo mill, where it is only once used. The water from the main bye-wash of these dams flows under the Botany Road through a 20-ft. bridge, with stone abutments and concrete invert. From this point downwards there is much less fall in the creek. After passing through some gardens of rich black alluvial soil, the creek reaches York and Walsh's tannery. They use very little water.

18. Below the tannery is a considerable extent of land used as market gardens, with the occupiers and owners of which no doubt arrangements could be made for the disposal of sewage, when the advantages to be derived from its use had been clearly demonstrated.

19. Below these gardens is Mr. Lupton's tannery, which does not use much water. Down stream is a wide expanse of 60 or 70 acres, on east side of creek, very suitable for an irrigation ground to utilize sewage. It has just sufficient undulating inclination to be easily adjusted to the fall required for such purpose, is well above the levels of the outfalls of creeks, so that it can be drained as deeply as may be desired, and is of a light sandy soil of considerable depth. This ground is quite unoccupied; it belongs to the Cooper Estate, and though not as remote from Sydney as might be desired for a sewage farm, yet if no more suitable site can be found on less valuable land, with proper management this might be used for some years for the purpose, to be ultimately abandoned when the further extension of the City would require it and justify the expense of extending the sewage conduit. Even should the sewage be at once conveyed beyond this point, for many years to come, the most profitable use to which this ground could be turned would be market gardening, for which purpose there will doubtless be a great demand for sewage irrigation arise.

20. Opposite this ground, on the right bank of creek, is Mr. Bell's Bone-crushing Establishment, also held under lease. They complained here of the scarcity of water in 1871, and stated that it got very offensive in summer from pollution by various industries up stream.

21. Lower down is Mr. Robertson's Woolwashing establishment. The dam is in excellent order, the tail race not very much above tide at low water, and at about the same or slightly lower level of head is Mr. Haighs' Woolwashing and sorting establishment.

22. Those dams partially submerge a considerable extent of swamp. From this point the creek is subject to tidal influence; the banks alluvial 3 or 4 feet over high water, with mangrove swamps near junction.

Summary of existing evils.

23. The chief evils complained of in this watershed are therefore :—

- 1st. The risk of injury to the water in the Bore from the drainage of the new houses at corner of Park and Randwick Roads.
- 2nd. The want of drainage at Arthur and Jamieson Streets, and generally in that locality, an immediate remedy for which is most desirable.
- 3rd. The alleged offence from Alderson's Tannery.

24. In consequence of the difficulty of dealing with the first two items, apart from the general sewage question, we have until now refrained from making any recommendation pending the further consideration of the entire subject by the general Board.

Immediate remedies.

25. With respect to immediate relief we do not see how anything can be done in the present state of the law, which has hitherto prevented the Corporation taking action. If allowed, much benefit would result from taking up the pipes laid down by Mr. Jones, and deepening the drains across his paddock, to lower the water in the Arthur-street channels, and sinking these channels in the centre, to reduce the surface exposed. Thus a fall of 3 feet could be gained, and the outfall up to Jamison-street be deepened to that extent. We do not recommend any more expensive temporary measure, as anything done here would inevitably cause a considerable increase in the nuisance below the work, and perhaps lead to litigation; but we are of opinion that the further operations recommended for the more permanent relief of the district should be commenced without delay.

26. With respect to the tannery much immediate relief may be given by general care, use of carbolic acid with the fresh hides, and if found possible, as suggested by Mr. Watt, also in the pits; the offensive fumes from the furnace may be decreased by increasing the supply of air, and by more gradual feeding with the refuse other than the animal matter, none of which should be burned. Arrangements might be made by Messrs. Alderson with the Corporation for using the animal matter as a manure on the western slope of Moore Park, which adjoins the tannery.

27. We are of opinion that Messrs. Alderson should be restrained from discharging the *very* offensive matter into the stream; a simple settling tank and wire-gauze strainer would render the effluent water quite as good as it is on entering the tannery. With reference to the general question of the removal of this and other tanneries, we can only quote the Report of the Rivers Pollution Commissioners on the subject, which is equally applicable in this case, though the number of employes is not so great :—

“ Outside the tanning community itself, from whom we have no right to ask an unfavourable verdict, there is but one opinion, which is, that the refuse matters from a tanyard are disgusting in a high degree, and should on no account be allowed to pass into the river.

“ In

"In Leeds and other similar towns the disposal of the refuse of tanyards will naturally be into the sewers, and so on to land; and when this cannot be accomplished, arrangements must be made for its direct application after sufficient dilution. Mr. Nichols has stated that if the tanners of Leeds were deprived of an outlet for the refuse waters it would shut up the entire trade, and throw perhaps 20,000 people out of bread. Such a contingency we cannot of course contemplate for an instant, but we believe that the pollution of the river, which is undoubtedly very considerable, from tannery refuse, may be prevented without injury to this very important industry."

Permanent improvement.

28. For that portion east of the Randwick Road we consider that the temporary measures adopted by the Corporation should suffice until the general scheme of sewage is determined on, when some immediate works to harmonize with it can be carried out. The sewage can be conveyed into Shea's Creek without difficulty; but it is questionable whether more than that of the block east of the Barracks should be so dealt with, as it is possible such drainage might be taken direct into the suggested sewer to Bondi, should that proposal be adopted.

29. The general main drain of the district, at head of Shea's Creek, should not we consider follow the present watercourse, which interferes so much with private property, and is, to a certain extent, at one side of the area to be drained. A sewer at a sufficiently low level in Bourke-street—would be central to the house property—would be nearly straight—would intercept the greater and most offensive portion of the drainage now gravitating to the natural watercourse, and would allow of ample fall for lateral pipes to drain such watercourse, and, being to some extent away from the polluted soil, would not give rise to the offensive exhalations when being built, which a sewer *in situ* would do, and would require no legislation to enable it to be carried out at once; it would also be in more solid ground.

30. The surface waters from Moore Park would therefore for some time flow as at present through the creek from Cleveland-street downwards, and would ultimately be carried in the western water-table of Dowling-street. The clearing out of the sandy channel below Magill's, and lowering of culvert in Bourke-street, would remove all cause of complaint on that score, and the water being delivered nearly pure to Messrs. Alderson should not be sullied by their operations on pain of restraining them from using the creek as an outfall at all.

31. The sewer in Bourke-street might commence at Jamison-place, and following Bourke-street to Thurlow Terrace could receive the drainage from all the lateral streets in pipes. At Thurlow Terrace the sewer might either continue along Bourke-street (passing under the culvert through which Shea's Creek now crosses that street) and under the sand rise at bend, to a suitable position for diversion to site of proposed filter; or, if the streets which must ultimately be made through Baptist's Gardens were determined on and opened, the sewer might follow their line most likely near the site of the present watercourse, receiving on route the drainage from the Strawberry Hills. The *approximate* cost of the sewer in Bourke-street, with pipe drains in the side streets and exclusive of gully-shafts or ventilating arrangements, and not including filtering beds or purchase of Mr. Alderson's interest in the woolwashing establishment, would be £15,000, calculated at prices given by Mr. Bell to save time.

32. Whatever permanent and general scheme for the drainage of the city may be determined on, this sewer will be required, if only for the storm and surface waters, and should it be resolved to convey the sewage to Botany it will harmonize thoroughly with that proposal.

33. The most difficult point is the disposal of the outfall sewage at end near Baptist's, until the general scheme is adopted to convey it to Botany or the sea.

34. It is a general opinion that precipitation and filtration should be tried in this climate. In none of the cases dealt with by the Board has there been sufficient fall to admit of such trial, but in this instance, by having the outfall sewer below Messrs. Alderson's dam, an ample fall can be had, by either obtaining Messrs. Alderson's interest by treaty or Act of Parliament, and doing away with this woolwashing, or by keeping the sewage separate from the water from Moore Park (which could be carried over it), and the western or storm waters, and discharging the sewage at one side of and below the dam.

35. In view, however, of the immediate necessity for the drainage of the Strawberry Hills and the Redfern basin, we are of opinion that the whole site of this establishment should be obtained for a term of years, and trial works be constructed to purify the sewage sufficiently to allow of its being discharged into the dams below.

36. As a filtering and partial precipitating and deodorizing material, we are of opinion the refuse shale from the Kerosene Works would be likely to furnish a cheap and tolerably effective medium, and should be tried, in the first instance, in as cheap a way as possible consistent with a trial of sufficient magnitude, to thoroughly test the action of this material, which is now being tried in England.

37. The filtration should be, in the first instance, through a wire-gauze strainer, then through sand for the silt and smaller impurities, and finally through one or two beds of the kerosene refuse, which is to be had in large quantities at not more than a mile from where required. The refuse from the strainers and filters could be all removed to the adjoining gardens as manure by the carts returning from delivering the shale.

38. We wish it to be clearly understood that we only make this recommendation on account of the pressing nature of the case. *Something* must be done for the relief of the vicinity; drainage alone will suffice. We are not prepared to recommend the immediate construction of a conduit to the sea for this district only; so the alternative is to purify the sewage as far as possible, and turn it into Shea's Creek. We are not prepared to state the cost of the proposed filtering arrangement, for which detailed drawings would be required. We recommend the refuse shale as a filtering medium because it is to be had so near, in any quantity, and at a nominal cost.

39. Should this not succeed, the ordinary sewage might be temporarily conveyed by an earthenware pipe (available for other uses afterwards) into one of the low-lying basins to the left of the road, and there be used for sewage irrigation, the land being acquired *pro tem.* by legislation. The entire discharge to be turned into the creek in flood time, as the sewage would then be so diluted as not to be more offensive than it is at present.

40. This would afford an opportunity of cheaply determining how far the sewage could be utilized with advantage on the sandy soil in this warm climate; to what extent such utilization would purify the effluent water; and whether it would prove offensive or not to the inhabitants of the adjacent districts.

41. Pending the drainage of this district we think the construction of water-closets should be discouraged as much as possible, and that a temporary provision for the abolition of cesspits and the introduction of a modification of the pail system in use in Melbourne, might be introduced with advantage.

42. As the City is rapidly extending in this direction, we are of opinion that a regular system of detail drainage should be devised and the persons building be made to conform to it; the sewage works could then be carried out from time to time as the buildings extend.

43. The separate municipal jurisdictions have hitherto prevented the adoption of any comprehensive sanitary works on this southern slope; so fettered was the Corporation here, that the City Engineer contemplated draining this locality by a tunnel into the already overburthened harbour.

44. The general interests of these localities being identical with those of the City, we think the time arrived when the Municipalities, say of Paddington, Redfern, Waterloo, and Alexandria, at least, should merge in the City. Separate accounts might be kept of the expenditure for local or general purposes, so that while having the power given by union, the rating would be in proportion to the expenditure.

45. That portion of the City laws relating to tanneries and similar industries might be modified for the annexed area in order to avoid the hardship of compelling the removal of such valuable industries as Mr. Alderson's, which gives employment to 700 persons of both sexes, and is conducted in a very creditable manner.

I have, &c.,

W. C. BENNETT,
Chairman of Committee.

Board Room,
Sydney, 20 December, 1875.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SYDNEY CITY AND SUBURBAN SEWAGE AND
HEALTH BOARD.

THURSDAY, 30 DECEMBER, 1875.

Present:—

F. H. GRUNDY, Esq.,
F. BELL, Esq.,
M. CHAPMAN, Esq.,W. C. BENNETT, Esq.,
E. O. MORIARTY, Esq.,
HON. J. B. WILSON,

DR. ALLEYNE.

M. B. PELL, Esq., B.A., IN THE CHAIR.

The Report of No. 6 Committee appointed to inquire into the condition of Shea's Creek having been read, Messrs. Bennett, Chapman, and Grundy, were examined in their places.

- W.C. Bennett, Esq.,
M. Chapman, Esq.,
F.H. Grundy, Esq.,
30 Dec., 1875.
1. *Chairman to Mr. Bennett.*] In clause 4 of your report, you state that "These houses are chiefly owned by capitalists; in very few instances are they inhabited by the owners"? Yes.
 2. How did you ascertain that to be the case? By making inquiries on the ground.
 3. *Mr. Grundy.*] I believe we thoroughly sifted the question and proved it. I was not satisfied about it myself and I raised the question.
 4. *Mr. Bennett.*] When I use the term capitalists, I mean to say that they are not freehold properties occupied by the owners.
 5. *Chairman to Mr. Bennett.*] In clause 15 you state that the dam near Mr. Hinchcliffe's, which is over 20 ft. high, is not very secure, and is a standing menace to the country below, which is fast filling up with houses—do you think there is much danger? Not very much.
 6. You do not think that any serious consequences would result if that dam were to give way? No, I don't think the consequences would be very serious, but I wish to note the fact in order that it may remain on record that the property is not very valuable.
 7. Now I come to the really important question which I wish to put to you: Supposing this sewer were constructed in Bourke-street to take the sewage into Shea's Creek; and supposing it were finally determined to adopt the plan of constructing a tunnel to carry it to the ocean, which I fancy would follow something like the line of the Old South Head Road, how would that harmonize with your scheme? Not well, but I have stated in paragraph 32 that "Whatever permanent and general scheme for the drainage of the city may be determined on, this sewer will be required, if only for the storm and surface waters."
 8. Then supposing this sewer were made which you propose as a temporary measure, and it were finally determined to carry the sewage to some place on the coast, separate works would be necessary to convey this sewage to the tunnel? Yes, the upper part above Jamieson-street might be available, but you would require another sewer to take the sewage into the main tunnel.
 9. Supposing it were finally determined to carry the sewage to the sea, and supposing the tunnel to follow the old line of the South Head Road? Well I have so made up my mind that that plan will never be carried out, that I have never directed my attention to that view of the question in this instance.
 10. Supposing such a tunnel were determined on, would not the slope of your tunnel have to be reversed? Yes, the sewage would have to be conducted to the main tunnel by supplementary conduits.
 11. Supposing it were finally determined to carry the sewage in some way generally by the line of Shea's Creek to Botany, would the sewer you propose harmonize with that scheme? Yes, perfectly.
 12. There would be no difficulty at all about it? None whatever.
 13. And you think that nothing could be done which would have any effect in relieving this district from the abominable evils from which it is suffering, except the construction of this sewer in Bourke-street? No, I have given the subject careful consideration, and have conferred with my colleagues about it, and we are entirely agreed that that is the best thing to be done.
 14. You can think of nothing else to be done beyond what you have pointed out in clause 25? No.
 15. You say in paragraph 41 that, pending the drainage of this district, you would recommend a temporary provision for the abolition of cesspits? Yes.
 16. *Chairman to Mr. Grundy.*] Do you concur with Mr. Bennett in what he has stated? Mr. Bennett has so completely expressed my opinions that I have really nothing to add.
 17. The really important questions are, first, whether there is anything that can be done temporarily, short of making the sewer, to relieve the district? I do not think so.
 18. And secondly: how far this scheme would harmonize with the proposed scheme to take the sewage to the ocean? I quite agree with Mr. Bennett. I had a strong feeling that Shea's Creek should take a large portion of the sewage of the city.
 19. *Chairman to Mr. Chapman.*] Do you concur in what has been stated by Mr. Bennett? Yes. I may mention that I was speaking to Mr. Alderson the other day, and he told me that he was making preparations to erect precipitation pits to purify the waste water from his place, so that it will not be so offensive going through M'Gill's garden.

18. He is taking steps to abate the nuisance? Yes, he is very anxious to do whatever the Board recommends. W.C. Bennett, Esq.
19. *Hon. J. B. Wilson to Mr. Bennett.*] You state in paragraph 19, "Downstream is a wide expanse of 60 or 70 acres on east side of creek, very suitable for an irrigation ground to utilise sewage." Do these 60 or 70 acres comprise the whole of the ground in the neighbourhood suitable for the purpose? M. Chapman, Esq., F.H. Grundy, Esq.
- All the most suitable ground.
20. But I do not suppose you would expect the Government to erect sewage works on that site? This report only deals with Shea's Creek directly, and I believe 60 or 70 acres would be ample for utilising the sewage there. I should prefer the land across Cook's River for a sewage farm. 30 Dec., 1875.
21. Are these 60 or 70 acres all the land available? There is more, I think, but that is the unoccupied land between the hills and the creek.
22. Don't you think the lower part of Shea's Creek must always be utilised as a sewer? No, I don't think that follows. If the sewage were conveyed to Botany it would not go into Shea's Creek at all.
23. Supposing it were taken to Bondi, would you not be obliged to use Shea's Creek as an outlet? Yes, if the city extended in that direction, unless you pumped it into the Bondi tunnel.
24. *Chairman.*] A certain portion of the northern slope, if the sewage were taken to Bondi, could, I suppose, be diverted into this tunnel? Yes.
25. *Hon. J. B. Wilson.*] If the lower part of Shea's Creek must be utilised, the sewer you propose in Bourke-street would be a necessary work under any circumstances? It would be a useful work under any circumstances.
26. Consequently there would be no imprudence in recommending to the Government that such a work should be commenced at once, considering the exigencies of the case? I should have no hesitation in recommending it, because I am certain the other scheme will not be adopted.
27. *Chairman.*] Supposing, for the sake of argument, it were determined now to make this tunnel to Bondi generally along the line of the Old South Head Road, would you recommend that this sewer in Bourke-street should be inclined the opposite way to what you propose in order to convey the sewage into the tunnel? I should recommend that the sewage of Bourke-street be brought into the tunnel to as low a level as possible, and in order to do so it might be desirable to divert the storm waters, and you might carry the sewage to the level of the tunnel into this sewer also; so that I am decidedly of opinion that this sewer would be a useful work under any circumstances.
28. You propose to make a sewer in Bourke-street, inclining to the south, and discharging into Shea's Creek? Yes.
29. Now I want to know whether, supposing a tunnel were constructed generally along the line of the Old South Head Road—a capacious tunnel to carry the sewage to the ocean—you would be inclined to recommend that the sewer in Bourke-street, or in that neighbourhood, should incline the other way, that is towards the tunnel? I should convey as much of the sewage into the tunnel as its level would admit of, decidedly.
30. *Mr. Moriarty.*] I would like to ask you whether, seeing that the scheme of general drainage is immature, it would not be better to postpone this part of the question altogether for the present? Perhaps so, if the large scheme is to be carried out at once, which is not likely.
31. Would not the whole system of sewerage have to be recast if this sewer were reversed and brought into the tunnel at Bondi? The system would have to be reconsidered with a view to an economical arrangement, but if this sewer is made I think the additional cost will be more than compensated by the improvement in the health of the district.
32. *Chairman.*] Then your final recommendation, after hearing what Mr. Moriarty has said, is, that this work be carried out at once? Yes, but I do not wish to make myself directly responsible for the success of the filtering apparatus at the mouth of the sewer; that, I wish it to be understood, is an experiment. There are two experiments which I have suggested should be tried—the one is filtering, the other irrigation.

Evidence taken before No. 6 Committee.

FRIDAY, 30 JULY, 1875.

Present:—

F. H. GRUNDY, Esq., | M. CHAPMAN, Esq.

W. C. BENNETT, Esq., IN THE CHAIR.

W. M. Alderson, Esq., called in and examined:—

1. *Chairman.*] I believe you are the proprietor of a tannery in Bourke-street, Mr. Alderson? Yes.
2. And also of a wool-washing establishment lower down the stream? Yes.
3. How long have they been established there? Somewhere about twenty-five or thirty years.
4. You are aware, I presume, of the object of this inquiry;—the Board is appointed to recommend measures to promote the public health, and to consider the question of sewerage? Yes; I suppose this inquiry refers to Surry Hills in particular.
5. Yes, to examine into the condition of Shea's Creek;—do you find that the buildings on the watershed above have injured the creek, and the water passing through your tannery? Yes; when we first went there we used to drink the creek water, but when they began building above us that became impossible.
6. Would you object to a sewer being constructed there to pass through your place? That would depend upon how it was constructed.
7. Do you think the construction of a sewer there would be likely to injure the water in your dam, lower down, for the purposes you require it? I am afraid it would; but then I suppose if the sewer were constructed, the water that flows over the land would still go down the sewer as usual. You must understand that there was always a stream of water going down the creek.
8. The sewer would, of course, contain the water, both flood and sewage? Then I don't know that it would injure me. There is one thing I would like to mention: if a sewer were constructed, I think it ought to have a flat bottom.
9. That would be a question for the Engineer to consider? I allude to it because it would help to purify the stream that goes through there.
10. Are you ever short of water at your wool-washing establishment? Sometimes in dry weather.
11. Have you ever had occasion to complain of the character of the water? Sometimes we have in dry weather.
12. How long has the lease of that place to run—the wool-washing establishment? I can hardly tell you from recollection; the last lease was for ten years, and I think two or three years have run out of it; it belongs to Sir Daniel Cooper.
13. And the tannery is freehold? Yes.
14. You are aware, I suppose, that complaints have been made of injury to the water, and of offensive smells arising from your tannery? From none but my neighbour Magill.
15. The offensive effluvia is said to be greater on some days than on others, and occasional rushes of very offensive water are complained of; how do you account for this annoyance being intermittent—being greater at one time than another? I suppose we are like other householders or manufacturers; when we throw our dirty water away it must smell more at one time than another.
16. There is no offensive process employed in your manufacture at one time more than at others? No, there is nothing disagreeable, though it may be disagreeable to some.
17. Will you be good enough to explain, Mr. Alderson, the circumstances under which you removed your establishment out there? We removed our premises out there because there was a law passed to compel us to go out, and giving us ten years notice. I think that was passed in 1851; that was the only compensation we received. And the reason I went there was on account of the stream of water running down Shea's Creek; it was for the sake of the water which we used for some years and for the sake of the lot off. Then, in the course of years, the water failed to a certain extent. We had some very dry seasons one after another, and I was the first to get the Corporation to lay down pipes to the end of Bourke-street, by guaranteeing them so much a year certain, so as to get fresh water there. The reason I got the water laid on was because the water in the creek was not fit for the men to use on account of the buildings put up above us and the sewage that was coming down the stream.
18. When did you get the water laid on? The City water was laid on to the tannery at the end of 1862.
19. Will you proceed with your statement? When we got the City water laid on we still had to use this stream as a sewer, the same as the people up above us did; that was merely to let the flood-water run off in its natural course, and anything we had to throw away, such as lime-water; we threw away a great deal of lime-water, but we never threw any tan-liquor away, because we use that over and over again; all we threw away was from the waste.
20. Do you use in your manufacture any material likely to cause an offensive smell other than the hides themselves—I do not call the tan offensive? We use lime, and you must understand that in a tannery there are a large quantity of hides and skins brought in in the same condition as they are brought to the auctions at the Circular Quay, and they have a very offensive smell in the summer time.
21. Then, except the hides, the bark and the lime, you have no offensive material employed? There is what is called the "pewer," which is used merely to kill the lime in the hide.
22. Do you use any large quantity of that? No, very little. I must tell you that when we tan kangaroo skins, of which we tan thousands every year, and they are put into soak they stink more than any other skins we have—the blood that comes out of them.

W. M.
Alderson,
Esq.
30 July, 1875.

- W. M. Alderson, Esq.
30 July, 1875.
23. Are the hides very offensive when they come in first? No, not if we can avoid it; sometimes they are in spite of us.
24. How long do they remain on the premises before they are operated upon? No time at all. They are at once put into water to soak and are cleansed and then into lime which takes all the smell away. Then we get a great many fresh hides from the butchers as well.
25. What becomes of the refuse? The gardeners and the glue boilers come every day and take it away. There is a glue boiler who takes the cuttings from the heads and fleshings, and the gardeners take the rest away for manure.
26. I suppose you use a large quantity of water? A very large quantity.
27. How is it supplied? Partially by the Corporation and partially by a tube well, which we have sunk. We pump the water into iron tanks, and the water is laid on all over the yard from them.
28. Do you use the water from the creek at all in the tannery? Oh no, we could not do that, on account of the refuse which comes down the creek from above us.
29. Have you ever tried to adopt any precautions to prevent these offensive smells? There never is any smell; we take all the precautions we can to keep the place clean for our own benefit.
30. Have you taken any steps to prevent the pollution of the water, or to decrease it, as it is to your own interest to do so on account of your woolwashing establishment? No, we try to avoid it as much as possible; we throw as little away as we can.
31. I presume that if you were called upon by the Government to adopt any precaution which would involve a reasonable expense for the purification of your tan-pits you would not object? Well, if the Government would show us how it is to be done we should be very glad. We are very particular now, and we are doing nothing to annoy our neighbours. If our neighbours were only as particular as we are to keep the creek clean there would be no complaints. There is nothing about our place which is any nuisance at all.
32. How many men do you generally employ? Between 300 and 400; my wages list comes to about £700 every week.
33. Is there much illness among your men? No, very little. We have been rather astonished lately because we have had three deaths, and that has not happened for years. We generally make a boast of the health we enjoy there.
34. Do you think, from your long experience, that persons employed in tanning establishments live the average length of time? I think they live over it. When I went to London the last time I met a number of old people who had been employed all their lives in the tanning business, and they all seemed as jolly as could be.
35. *Mr. Grundy.*] You have told us that at a certain time your men left off drinking the water in the creek? Yes.
36. But you did not tell us that they had been drinking it before. I suppose up to that time it was the water they drank habitually? Yes; they made their tea with it; in fact, I must tell you it was their complaints about the water that caused me to think about getting water from the city.
37. It was gradually getting worse? Yes, on account of one building after another going up above us.
38. Then you chose that particular place because the water was so pure? We did not care about its being so perfectly pure; we went there for the sake of the water for our business.
39. And you think a great proportion of the population came there because of your going out? Yes, and they cannot get houses there now suitable for them.
40. We have been told that what you call "pewer" is poultry dung to a great extent? I said it was pigeon's dung—fowls dung will do; we buy it in fact. As regards the pewers in our business, it is a question which has been before the tanning fraternity in England and all over the world for a long time. They have tried to find some substitute for it, but they have never been able to do so. When I was last in England I made inquiries wherever I went, and they all said they could find nothing else. You must understand that lime and tan-liquor are great enemies—very great enemies—chemically speaking; so that we wash as much lime out of the hide as we can get for sole leather, but with the hides that are turned into upper leather we have to kill the lime as much as possible, which is done by a sort of semi-decomposition, and the only chance of doing that is with these pewers; and then you must understand there is nothing but the smell, for it is so impregnated with lime that it cannot be injurious to health.
41. *Mr. Chapman.*] Would you have any objection to have the surface-water and sewage intercepted and taken into a sewer across your premises, provided you were allowed a get-away through it for your refuse from the tannery. If we intercepted the sewage we should also have to intercept the surface-water. Would you object to that? I should object to it until I understood thoroughly what was going to be done, because we could not do without a let-off.
42. We should provide that in any case. Do you know the culvert in Bourke-street, beyond your premises? Yes.
43. Is it sufficiently large to take away the surface water and sewage that comes into your premises? I think it is sufficiently large to take away all the surface water or the sewage either, but it is not deep enough. When that culvert was built the bottom, which was constructed of flat stones, was made too high, and it keeps the water and sewage above standing in a stagnant state to some extent below a certain level; it does not scour the bottom of the creek.
44. *Mr. Grundy.*] When I took some levels there once, I found there would be ample fall beyond your fence to permit of that culvert being 3 feet lower. Would that abate the nuisance of which you have just spoken? Yes, it would be the means of scouring the creek. Some years ago, before that culvert was made, the only occasions when that water was dammed back upon us was in dry weather when the wind would blow the sand into this gutter, as I may call it, and shut it up until a heavy rain came and washed the sand away; and then the stream would run for months after that.
45. *Chairman.*] Is there anything else you would like to add for the information of the Board? No; I don't know of anything else. I know we have done all we can to prevent any unpleasantness; we are continually cleaning the place out on our own ground. I have been in a good many places in England, and I think ours is a pattern to them.

Mr. John Baptist called in and examined:—

46. *Chairman.*] Do you ever find the water from Shea's Creek—from the eastern branch, which goes under Bourke-street—offensive? There are two waters which go under Bourke-street.
47. I mean the water which goes to the south of your place? Yes, frequently, very offensive.
48. Is it more offensive at some times than at others? On particular days—yes.
49. For only an hour or two? Yes, about that time, but occasionally longer.
50. And to what do you attribute that? I believe, speaking for myself, that it must proceed from the emptying of some pits from some factory higher up. The water appears to be used for certain purposes and allowed to accumulate and kept there until it becomes offensive, and only run off when a fresh supply becomes necessary.
51. Has this offensive character of the water increased very much of late years? I think I may safely say that it has; there is more water and it seems to get worse.
52. To what do you attribute the increased offensiveness of the water? It must be to those operations which are carried on higher up becoming more extensive and more varied.
53. Do you think it is in any measure attributable to the greater quantity of sewage coming down the creek—from the increase of the pollution above? There is no doubt that the water at all times is dirtier in color and more offensive than it used to be. I attribute that to the sewage coming from the town, and to the emptying of these pits of which I was speaking on occasional days, where the water has been stored for some purpose, and allowed to run off at intervals. For instance, to-day at 1 o'clock the water appeared to be completely impregnated with tan.
54. Tan is not offensive, is it? Well, I don't consider that water very offensive, but it is not pleasant. And then, at other times, when we find the water most offensive, it seems to be impregnated with lime and animal matter—small pieces travelling through the water; they seem at least to be pieces of animal matter, but I have not watched the water particularly as I should have done if I had had a week's notice.
55. Does the effluvia from the water damage you in any way in your professional operations? We do not use this water at all.
56. It does not damage the plants? I think not. It would not do of course to use that water for watering the plants, and I may inform you that we used to do so.
57. Has it injured the health of your family. Is there a greater mortality in the district than there was formerly? I would not like to say that; but there are many complaints about it, and I know the doctors say that it ought to be stopped; our own medical attendant says so; and I learn from one of my gardeners that his doctor told him he wondered that any one living near the place could be healthy at all.
58. The second stream joins this below you, does it not? Yes, at the south-west extremity of my grounds.
59. Has it become offensive of late years? Yes.
60. How long has it been so? I should say that we have noticed it to be offensive for about 8 years altogether; that is when it commenced to be offensive.
61. To what do you attribute that? I attribute it to more sewage coming from the city, and from the high ground above us, which has been built upon lately.
62. Do you consider that stream dangerous to health also? I do.
63. If either of these streams were converted into a sewer would you be disposed to utilize the sewage for manure for irrigating your land? I think it would be useless for any of my present purposes; my business is changing altogether from vegetables to trees.
64. Do you use any of the refuse from Mr. Alderson's tannery as manure, or did you ever use it? No, with the exception of an occasional load of bark, which I presume has been used for tanning purposes.
65. Do you buy large quantities of manure? Not now.
66. Did you find any great difficulty in getting it when you did require it? At times; but my experience in that line is not great, as I do not require much manure for my present operations.
67. Do you know whether much manure was used on your ground when it was a vegetable garden? Yes, but not in its raw state.
68. How was it obtained, and at what price? Well the only night-soil used I have heard my father say he used to buy of a man who had a contract to keep the cesspits clean; it had been mixed with street sweepings.
69. Do you know what he paid for it? I believe about 2s. 6d. a load, and he carted it; he commenced at 6d.; the seller watched the effects on the garden and raised the price. In speaking of night-soil I am alluding to say twenty years ago; recently we only used stable and cow manure for vegetables which we bought in Sydney at 2s. a load.
70. *Mr. Grundy.*] The occasional worse days of which you complain so very much, when the offensive smell lasts for an hour or so, are they worse than they used to be? Yes, far worse.
71. To what do you attribute that? To the operations above being carried on in a more extensive and varied manner. The worst smell is from the water which seems to be impregnated with lime, and these small pieces of animal matter travelling down with the stream. What makes me think—for I have never examined them—that they are animal matter is, that we continue to see the rats picking them up and running away to the sides of the creek with them; they seem to delight in that stream.
72. *Chairman.*] Is there anything further you would like to add? There is another matter which I mentioned yesterday. The smoke from Mr. Alderson's chimney is decidedly offensive, more particularly when we want to enjoy the north-east breeze; then we get a nice taste of it; and at other times when we get a southerly freshener we get this effluvia from the drain on the other side.
73. It has been stated that that culvert which crosses Bourke-street is not at a sufficiently low level;—what is your opinion? My opinion is that if the watercourse above is left as it is, the culvert is large enough. I have never seen it run full yet; the fact is the water cannot get quickly enough down to the culvert because of the obstructions above.
74. Do you think it is at a sufficiently low level? I think it is at the present time.
75. There is a considerable fall from the mouth of the culvert down towards your fence, is there not? Yes; the culvert extends to my fence, and there appears a good fall inside the fence.
76. *Mr. Grundy.*] Do you think that—there being sufficient fall below—if that culvert were lowered 3 feet it would take the water more rapidly from Magill's, Alderson's, and the other places. You say it is sufficient

Mr.
J. Baptist.

30 July, 1876.

Mr. J. Baptist.
30 July, 1875.

sufficient for the water at present, but it would get away more rapidly, and not be so likely to back up if it were 3 feet lower; the very fact of making the culvert lower would tend to scour the creek and take away the water which has a tendency to accumulate? If the culvert is lowered 3 feet and kept at its present dimensions, I think the result will be the reverse of beneficial, as it will probably get choked with sand and water during a sudden downfall of rain.

77. Would you object to the whole of the storm and sewage water being carried in a sewer through your land? I am not prepared to give you a definite reply, further than that I most decidedly object to the creek being as at present, very much contaminated with sewage, and made the medium for carrying away dirty and stinking water from the factory before alluded to.

Mr. Michael Magill called in and examined:—

Mr. M. Magill.
30 July, 1875.

78. *Chairman.*] You have had a garden in the vicinity of Bourke-street for a number of years, have you not? Yes, for thirty-seven years.

79. I believe you complain of the stench and offensive matter from Mr. Alderson's factory? I do.

80. How long have you experienced this offensiveness? Ever since he came there.

81. How long is that? I think it was in 1848; there was a person of the name of Wiess washing wool there, and there was a man named Hall there before him.

82. Has this offensiveness increased lately? Yes; I cannot get a man to work for me near the creek, not if I gave him £1 a day.

83. Do you attribute the increased offensiveness to the increase in Mr. Alderson's operations? I do.

84. May not some of it be attributed to the sewage which comes from the additional number of houses up the stream? There were none when I went there; I went there on purpose for that water.

85. But that would necessarily make the water more offensive? Well, it must all come from Mr. Alderson's.

86. But it is not all due to Mr. Alderson? Oh yes it is.

87. There were no houses there before? I have felt it worse since Mr. Alderson has been there than at any other time. There must be drainage from those houses, but there is so much sand that before the water gets to Alderson's it is mostly purified. There is a large lagoon of water on the city side which is becoming as bad as Blackwattle Swamp.

88. Have you lately been in Arthur-street? I have come by it.

89. Did you experience any offensive smell? Yes, on this side; it is in the city a good way.

90. Is the stench constant or intermittent? It is constant; we are never a moment without it; we cannot open a door without feeling it, but it has been kept down more since our letter was sent in.

91. Does this offensive smell, or bad water, interfere with your business? Yes, so far that I cannot get any men to work for me, and I cannot work myself either.

92. You object also that it deteriorates the value of the ground for building upon? Certainly, no one will come to live there.

93. How long is it since the land became very valuable there? I have seen it as dear before Mr. Alderson came there; I have known it fetch £5 a foot in 1839, and that was long before he came there.

94. You also complain of your land being flooded? Yes, all through the culvert that is there.

95. You attribute that to the culvert? Yes, I have seen it flooded before, but then it would go away without injuring anything.

96. How often, and to what depth, has your land been flooded? It was flooded last February two years, 2 feet over the whole of it; I lost £500 by it.

97. For what length of time does the flood remain on the land? Three or four months.

98. Was it ever flooded before the culvert was built? Yes; but then it would injure no one because it went away, but now there is a 3 ft. 6 in. dam or culvert to prevent it.

99. Has the sand above the culvert obstructed the water more of late than it used to do? Yes it has; because, when the watercourse was open, the sand used to be carried away by the floods that came down.

100. What is the nature of the damage done by the flood—does it kill all the plants? It kills all the plants.

101. Do you use much manure in your operations? Not so much as I used to do since the culvert was there. I have used three loads a day for twenty-five years.

102. Would you be disposed to utilize the sewage by irrigating your garden with it, if a sewer were made there? No, I would not go to the expense of it. I have tried that; I tried night-soil before.

103. Did you find night-soil good manure? No, very bad manure; the rankest weeds grow after it, and I took a great deal of trouble with it.

104. Then you would prefer not to use the sewage? I would. It might be useful in some cases. It might do for herbaceous plants, but it does not answer for vegetables, or for fruit trees.

105. Do you ever use any of the refuse from the tannery for manure? Never.

106. *Mr. Grundy.*] Your plants are of a very fine nature, are they not? Yes.

107. Such as would be much more easily injured by a strong manure than grass crops? Yes.

108. Then this sewage might be useful for a lower sort of vegetation? It might.

109. *Chairman.*] Does the smoke from Mr. Alderson's chimney injure you at all? Well, I would forgive that but for the stench, and then there is the shaking.

110. What does that proceed from? From the vibration of the engines; it shook one of my walls down.

111. Would you object to the whole of the storm and sewage water being carried in a sewer through your land? Certainly I would. I have reason to remember this creek, because I lost one of my boys through it, and Dr. Bellamy, who attended him, said that it would bring a cholera, and Dr. Macfarlane said the same thing, and said it arose from the gases which came out of the pipes leading from Alderson's tannery into the creek.

MONDAY,

MONDAY, 2 AUGUST, 1875.

MEETING OF No. 6 COMMITTEE.

Present:—

C. WATT, Esq.,		M. CHAPMAN, Esq.,
F. H. GRUNDY, Esq.,		G. F. DANSEY, Esq.

W. C. BENNETT, Esq., IN THE CHAIR.

E. A. M'Pherson, Esq., called in and examined:—

- 112. *Chairman.*] You have property in the vicinity of Bourke-street, I believe, Mr. M'Pherson? Yes, just on the other side of it—the western side.
- 113. How long have you had that property? I think since 1856—about that time; it belonged to my father before—it was purchased in 1844.
- 114. How long has this tannery been complained of? I recollect complaints about it for many years; I could not fix any particular time. I think that since Mr. Alderson came there it has been extended, the operations have been greater, and no doubt the nuisance has become greater than it used to be.
- 115. What do you chiefly complain of? The stench is very bad, arising, I believe, from the pits and drains.
- 116. Have you had any reason to complain of the smoke or of contaminated water from the tannery? The water is very much contaminated that comes from the tannery.
- 117. Have you had reason to complain of it yourself? I have felt the nuisance from the stench, but the water does not reach me; it passes along towards the south.
- 118. Is the stench constant or intermittent? At times it is rather subdued, and at other times it is quite the other way.
- 119. You do not characterize the smell of the tan as a stench? There is the smell of the tan, and there is another kind of stench which is intolerable.
- 120. Do you attribute this smell entirely to the tannery? I think so—yes.
- 121. Your chief objection is that the value of the land for building purposes is deteriorated? Yes, especially that in the immediate vicinity.
- 122. It is only lately the ground has become valuable for building? Since the Park has been established it has become valuable, and it will become still more valuable as soon as Dowling-street is opened.
- 123. Have you had any reason to complain of the inefficiency of the culvert in Bourke-street? When I was living in Wimbledon Hall, in Bourke-street, Surry Hills, I have seen the water in the drain which runs from Arthur-street backed up in flood time 4 and 5 feet above the ordinary level and unable to get away on account of the small outlet at Baptist's.
- 124. Do you know whether the Redfern Municipality have taken any action in the matter at all? I have not heard whether they have or not.
- 125. Has the Inspector of Nuisances ever interfered in the matter? Not that I am aware of.
- 126. Did you ever bring the subject under his notice, as he is the proper officer to look after it? Not with reference to the tannery.
- 127. *Mr. Grundy.*] Will you be good enough to tell us whether this backing up of the water in flood time on the Wimbledon grounds was since the construction of that culvert in Bourke-street, or did it occur before the culvert was there? Well I can only speak of that for about three years or three years and a half. I have noticed the flooding for that time, and I can attribute it to no other cause than the small outlet down by Baptist's.
- 128. Then you think it did not occur before the culvert was there? No. I think it must be the culvert that stops the water, because I have seen it in flood time 4 or 5 feet above the ordinary level of the drain; so that there must be some obstruction further down.
- 129. Then you do not know the property sufficiently to be able to say whether it was flooded before the culvert was there;—you do not live there now? I have lived in Bourke-street since I was a boy; but about four years ago I went to live further down, at Wimbledon Hall. From the inspection I had of the place it was evident to me that the culvert was far too small. Now, the culvert in Cleveland-street is ample for all purposes, but the one at Baptist's is far too small; and I believe if it were larger it would allow all the flood water to go down.
- 130. You think if it were lower and wider there would be no backing up? I think not. As for the drain, the matter that runs from the tannery is really very bad; and anyone who goes to Magill's on business, as I have done, must perceive it at once; there is a kind of scum on the water which, if it were analyzed, I believe would be found to contain myriads of insects and much other objectionable matter.
- 131. *Mr. Chapman.*] Mr. Alderson employs a large number of workmen, does he not? Yes.
- 132. I suppose the majority of them live round about the place? I dare say a number of them do; but a great number of them live further on towards Sydney, for I see a great many persons passing by in that direction. There is another thing, the shaking caused by the engine, which is like an earthquake; but I don't know whether that can be called a nuisance or not.
- 133. Before Mr. Alderson enlarged his operations there, Mr. Macpherson, did you notice that a great number of the houses there were without tenants,—there are a great many houses there, and as you have lived in Bourke-street since you were a boy you must remember them—Mr. Head's property for instance, and all about there? I do not know. I think they used to let pretty well; but there were very often complaints. Thurlow Terrace is inhabited more by tradesmen now; middle-class people used to live there.
- 134. Then you don't think that Mr. Alderson's coming there has improved the locality at all? I hardly think that would deteriorate its value.
- 135. But has it not improved it rather than injured it? It might have improved it so far that a number of small houses have sprung up there; but I don't think the tannery has been the means of increasing the value of the land. I think that is rather due to the extension of the city in that direction, and the fact that a large park has been opened, which will be, in fact is now, one of our largest recreation grounds.

E. A.
M'Pherson,
Esq.
2 Aug., 1875.

William

William Teece, Esq., M.L.A., called in and examined:—

W. Teece,
Esq., M.L.A.
2 Aug., 1875.

136. *Chairman.*] You have had considerable experience in the management of tanneries, have you not, Mr. Teece? Yes.
137. Are they generally complained of as offensive and injurious to health? I think not.
138. What is the most offensive part of their operations—the really offensive part? If there is anything offensive at all I think the offence consists in the bad smell from the hides when they first enter the yard, and I may state that this offence is to be found about the Circular Quay every week, if it is to be considered an offence.
139. And do you think that evil can be mitigated? I think not.
140. Are not the scrapings and parings taken from the inside of the hides very offensive? Well, they may be offensive, but they consist chiefly of fatty substance, which in tanneries is usually burnt in the furnaces as fuel.
141. Does it not give off an offensive odour? I have never known it to be offensive.
142. Do you know whether tanneries at Home are allowed to exist in the centres of population—in cities? Yes, they are.
143. Where? In the centre of London, for instance.
144. Are they complained of there, or do they use any greater precautions in the tanneries at Home to avoid this offence? That I cannot say, but I know they do exist in the centre of London and in the largest cities in the world.
145. Is this particularly offensive process which has been referred to—this use of pigeon's dung—indispensable. Has it ever been tried to substitute anything for it? Yes; in many tanneries they substitute bran for it, but we find that bran is still more offensive than the fowl or pigeon manure.
146. Are tanners generally a long-lived and healthy class of men? Yes.
147. Their occupation is not considered injurious to health? No, rather the reverse, according to Shakespeare. I believe statistics will show that tanners live the longest lives.
148. Are you aware that the reason assigned why tanning is offensive here is that, while in London the hides are fresh when they are taken to the tanneries, here they are brought down from the country salted and in an offensive state? That is not the case; there are more salted hides than fresh received at the tanneries in London. They get salted hides from these Colonies, America, and other places in large numbers. The salt preserves the hides, and when you get a fresh hide you get the only thing that can be considered a nuisance. For instance, we use bran, fowl manure, or pigeon manure; but there is another thing we can substitute for these substances, and that is the blood from the hide.
149. *Mr. Watt.*] You use both the manure and the blood, do you not? Yes, we make the bait with both of them. The lime is used for taking the hair off the hide. There may be a lot of hides which are light and not suitable for sole leather, and it becomes necessary to reduce these hides, which is done by baiting them, and then we put them into bran mixed with warm water, which reduces the substance of the hide.
150. Do you consider this bait a nuisance? I do not.
151. Has it an offensive smell? I admit that it has at first, but with the use of plenty of fresh water the offensive smell is removed, and the bait becomes a valuable manure. For instance, in our tannery, in Goulburn, the bait which is left is used on the land as manure; the people come and cart it away, as also the hair and the refuse lime.
152. Is this bait in constant use in tanning, or is it only occasionally used? It is only used in tanneries where they dress goods. I could point out plenty of tanneries where this bait is never used at all,—where they dress nothing but sole leather, and do not require it to reduce the hides.
153. *Mr. Chapman.*] Does not this bait cause a softness in the leather? Yes, and it reduces it.
154. Don't you think that if this refuse bait were allowed to remain on the premises it would smell very badly? Undoubtedly it would.
155. For instance, if you were living next to a tannery, and this stuff were allowed to go through your garden through an open sewer or waterway, would it not cause a nuisance? Well, that could be obviated by the use of lime and water. I remember one case at Goulburn, the only case in which our tannery was offensive at all. The creek was not running, and we were forced to let the lime water run off with the refuse bait.
156. But if there were tufts of grass and shrubs growing on the sides of the watercourse, and some of this stuff caught in them, would not that be a nuisance? Not more so than could be found in any fowl-house near a person's residence.
157. Have you been over Mr. Alderson's premises? Yes, on several occasions—three or four.
158. Do you think it is a cleanly, well-conducted establishment? I think it is a pattern of cleanliness. I have only been there three or four times.
159. And you think any tannery may be prevented from becoming a nuisance if proper precautions are adopted? Yes, I don't see why we should be the exception. There are tanneries carried on in all large cities in Europe and in America.
160. And you think any nuisances arising from their operations may be prevented by the infliction of a heavy fine? Yes. I have never heard any complaints on that score.
161. Is fellmongering a portion of the tanning business? It is not. It is carried on in connection with the tanning in some establishments; but it is not a portion of the tanning business—it is a separate and distinct business. I would like to mention—as I understand that the result of this Commission will probably be the passing of some Act of Parliament—that we have at present an Act of Parliament which was passed into law on the 12th October, 1849, entitled "The Slaughtering Act," and I took the trouble to copy out a clause of that Act, which I will read:—"Clause 7. And be it enacted that the business of a soap-boiler tallow-melter tripe-boiler tanner or currier shall not be now established or carried on in any building or place within the said limits of the said City after the passing of this Act and that from and after the first day of January in the year of our Lord one thousand eight hundred and sixty the business of a soap-boiler tallow-melter tripe-boiler tanner or currier which has been already established shall not be continued or carried on in any building or place within the said limits of the said city and whosoever offends against this enactment shall be liable to forfeit and pay on conviction for every such offence before any two or more Justices of the Peace in a summary way any sum not exceeding fifty pounds and a further penalty of forty shillings for each day during which the offence is continued." On account of this Act a
tannery

tannery in Goulburn was removed and the proprietor ruined, because it was within the precincts of a municipality. Why, I have never heard of a tannery that was out of a municipality. The fact is, if you look into the question, that the tanneries are the chief means of producing municipalities. Yet you see by the clause I have read that since this Act of Parliament was passed any tannery within a municipality can be removed without any nuisance being proved at all. I took legal advice on this subject. I went to the late Mr. Charles Hamilton Walsh, and he said there was no redress whatever—a tannery could be removed at once. Any tanner may be brought up under this Act and he has no alternative—he must remove. And a subsequent Act has applied this to the Towns Police Act. There is the village of St. Mary's, which is solely dependent upon tanneries, and any person can bring a charge against a tanner there and compel him to remove the very establishment which has created the village, and that is the position of every tanner in the Colony. I may mention another thing: In our own case we proposed to build brick sheds, which became necessary, because we were increasing our business; but as this is the law, and we might be forced to remove, we put up slab sheds, covered with bark, instead.

W. Teece,
Esq., M.L.A.
2 Aug., 1875.

162. I thought actions in such cases could only be taken by civic bodies? They can be brought by private individuals. This Act has no reference to Corporations, and you have no occasion to prove the tannery to be a nuisance.

163. It also includes soap-boilers and candle-makers? Yes.

Charles Watt, Esq., Government Analyst, examined in his place:—

164. *Chairman.*] You have examined Mr. Alderson's tannery to-day, I believe, Mr. Watt? I have.

C. Watt, Esq.
2 Aug., 1875.

165. Did you notice the character of the continual drainage into the stream? When I was there there was very little fluid running into the stream; but, as far as I could make out, the fluids from the tannery would be sent out spasmodically, at particular times; there would be no continual flow.

166. Did you notice anything particularly offensive in the smell there? Yes; there are two fluids—one the lime water steep, in which the hides are placed, and the other a solution of what I was told was pigeon's dung and fowl's dung. The latter is far more disagreeable than the former; in fact the odour is disgusting, especially when the hides are taken out and the fluid is moved about.

167. Did you see both these fluids unite in the stream? No, they were not running away then.

168. Do you think the lime water would tend to deodorise the other at all? I don't think it would much.

169. Do you think the tan—the solution of bark—tends to decrease the danger of these substances? I do not, because only the smallest possible quantity of tan is allowed to escape; in fact they hardly let any tan escape.

170. Nothing but the refuse bark? That does not go into the creek; they have been in the habit sometimes of letting this spent liquor away when they have not had room to store it, but they generally store it to make a fresh steeping; so that practically by-and-bye they will have no spent liquor go away.

171. Can you suggest any means of mitigating the nuisance which you saw or thought was likely to arise? I am inclined to think that with reference to the lime water a little crude carbolic acid might possibly be used in the vats or tanks for that part of the operation, which would destroy the offensive odour; but I am not quite sure whether it would in any way affect the character of the leather. Mr. Alderson expressed his willingness to make some experiments on a small scale, and if these experiments should succeed to try them on a larger scale. That is in reference to the lime water tanks.

172. With reference to the other and more offensive solution? I don't think anything could be added to that offensive solution without probably injuring the action which it has upon the hides, and I think that efforts should be made to find some other substance capable of producing the same action, and not having the same highly offensive smell which these substances have. And I think that will be possible.

173. Of course it would be possible to deodorise the refuse from these two substances—from the "power," as they call it, and the lime? Yes, that would be quite possible, but I fancy the chief portion of the nuisance consists in moving the solution about, and taking it out of the tanks.

174. Not in taking it away? No.

175. There are two nuisances complained of—one is the water, and the other is the contamination of the air. If this refuse were deodorised before it was taken away into the creek, would not that be removed? Yes, with reference to the surplus solid stuff they take away; and they are very willing to do all proper filtration; but I am inclined to think the chief cause of complaint is in the stirring up of these fluids.

176. Would it be possible to have these fluids in a house with a filtered ventilator? Well, I am not sufficiently practically acquainted with the operation of tanning to be able to say. Possibly the exclusion of a current of air might be worse for the men.

177. Do you know if similar operations are conducted in other cities among large populations? I think they are, in the worst parts of London; and I think there are incessant complaints about them; but these operations have been carried on for such a length of time that the authorities have no power to remove them. I believe that is the explanation. They are not allowed to be established afresh, but they cannot remove those that exist.

178. Would you be inclined to recommend the removal of the establishment in question? Well, if Mr. Alderson were compensated for it, certainly I should recommend him to take it away.

179. But you think if it were carried on by Mr. Alderson the nuisance might be greatly diminished? Oh, I am sure of that, especially with these tanks. If any success attends the experiments we are going to make, the nuisance in these tanks will be removed—nine-tenths of the nuisance will be done away with.

180. Did Mr. Alderson undertake to make experiments with this power? His son told me he would be glad to make any further experiments, but I did not speak to Mr. Alderson himself about it, as I was not prepared at once to suggest anything else as a substitute, especially after he told me that so many attempts had been made and had failed. But I think something might be done, and that is only a small portion of the operation, and a great many of the hides do not go into that solution at all. I believe some substitute might be found, and I am sure if all the tanners had been compelled to find a substitute or remove, they would have found one long ago.

181. You noticed that the water was not at all pure before it came to Mr. Alderson's? It was very impure indeed, and I don't think it is much worse when it leaves his place, except spasmodically, at certain periods.

- C. Watt, Esq. 182. *Mr. Grundy.*] We were told by one of the gentlemen who have given evidence on this subject that the smoke from the chimney is very offensive; and it was suggested that that might be chiefly on account of the burning of refuse matter, scrapings, and fatty substances inside the hides? It occurred to me when I was there that this would be likely to be very objectionable. I observed that the scrapings of leather and portions of organic matter were placed quite wet in front of the fire, and of course that must damp the fire and prevent the thorough combustion of the matter. Such matters should only be burnt when there is a bright red fire at the back of the grate.
- 2 Aug., 1875. 183. And these matters not being thoroughly burnt would be more objectionable than ordinary fuel? More disagreeable certainly. Altogether, the way in which I saw these matters burning was not what I think it should be. They are not burned with the same amount of intelligence which I should expect from such a firm. I did not observe any holes in the door, or anything calculated to produce a thorough combustion, and I said so to the men. Mr. Alderson was not there. I suggested that they should burn these matters in a retort, and collect the ammonia, and let the gases go into the fire.
184. *Chairman.*] Would that be much more effectual? Yes, it would be effectual if it were properly done, because the waste gases could be carried into the fire and the ammonia could be collected; it could be done easily.
185. Would it be more expensive? No, I don't think so. Looking at the whole question, I do not see anything that is likely to give any trouble except this solution of pigeon's dung.
186. You have been over establishments of this sort before? Yes, many of them.
187. You found this one tolerably well conducted? Very well kept, and very cleanly and creditably conducted altogether.

G. F. Dansey, Esq., City Health Officer, examined in his place:—

- G. F. Dansey, Esq. 188. *Chairman.*] Your name is attached to this memorial from the residents in Bourke-street, complaining of Mr. Alderson's tannery? Yes; I think if you read it through you will find it is not so much about Alderson's tannery as the general drainage of that horrible neighbourhood.
- 2 Aug., 1875. 189. Have you had personal experience of the evil complained of here? I used to visit the place two or three years ago when I attended persons living in the neighbourhood, when I was connected with the Odd-fellows and other societies.
190. Is there an unusual amount of illness or excessive mortality in that neighbourhood? There used to be considering the paucity of the inhabitants.
191. Can you speak of it more recently from your own experience? No, I cannot.
192. Did you at the time you visited the neighbourhood attribute the illness which existed there to the offences proceeding from the tannery? I thought it arose from the water running in front of those houses and some of it behind the houses, but whether it was caused by the tannery or by the drainage I could not say.
193. The drainage above the tannery and generally in the vicinity is rather bad and offensive? Yes.
194. Have you been lately in Arthur-street or Jamison-street? I have.
195. Do you think it is bad there? Very bad.
196. Did it come within the province of your duty to recommend the sewerage of these places to the Corporation? I have directed their attention to the open drainage, but I left it to them to consider whether they would put a sewer there or not.
197. Did you inspect the tannery yourself? Yes; I went round it one afternoon, about three weeks ago.
198. Did you find much to complain of in it? I found the smell from the drainage above the tannery not so bad as that below it.
199. Did you find any other offence in the tannery besides the drainage from it? At the time I visited it there was nothing else offensive; it was about 5 o'clock in the evening.
200. Did you consider it a tolerably well kept establishment of the sort? Yes, as far as my knowledge of these places goes. Years ago, about three or four years—when I was visiting the establishment—when I attended a patient who was in Mr. Alderson's employ, on one occasion I had to get out of my carriage because the horse stopped and refused to go by the place—at the time when I myself perceived an objectionable smell.
201. Are you of opinion that such establishments should be compelled to remove from time to time beyond the centres of population? My own opinion is that a tannery confined to the tanning of fresh hides and properly looked after would not be objectionable—not thoroughly objectionable; but the difficulty is to keep them clean.
202. Do you consider that any nuisance arising from such places might be abated by some filtering or deodorising process, or by greater care in the operations carried on? By greater care in carrying on the operations.
203. Do you wish to make any further remarks on this subject? I do not; I have not had time to consider how the nuisance might be abated. I know they used to manage to do it at Home. In a Borough town in England—Blandford, in Dorsetshire—where they tanned fresh hides with oak bark, I have never heard of any nuisance complained of.
204. *Mr. Watt.*] Do you think the stirring up of the solution they are said to use in these tanneries—a solution of pigeons' dung and faecal matter from fowls—would be likely to be injurious to health in a crowded neighbourhood? I think it would. When I spoke of tanning being carried on in a proper manner, I was always under the impression that the hides were put into bark; I had no idea that any of these substances were used.
205. It has been stated to me that some tanners use dogs' excrement, some use human excrement, and others pigs' excrement, and that these are to be found in the tan-pits? I know dogs' excrement is used in some manufactories—in cloth manufactories, I believe.
206. Can you inform us what is the principal or the prevailing form of disease in that vicinity? It is always of a typhoid nature.
207. *Mr. Grundy.*] You said that the smell you experienced was very offensive, but you could not say whether it was caused by the drainage or the tannery? I found it worse below the tannery.
208. But if you had been told that an abominable stench arose somewhat suddenly and lasted for an hour

or two, would you not think it come from the operations carried on at this manufactory? Mr. Baptist and Mr. Magill told me that they noticed at intervals, and without any apparent cause—such as heavy rain or anything of that kind—a very offensive smell, and they supposed it was the lime coming down from the tannery, when the water was let off.

G. F. Dansey,
Esq.
2 Aug., 1875.

209. *Mr. Chapman.*] With reference to the sickness prevailing in and about the tannery—you say you have had some cases of sickness there? Yes, some years ago.

210. Have you not had quite as many cases about Arthur-street and Jamison-street? Yes, quite as many up there; they all belong to the same drainage.

211. The sickness up there could not be caused by the tannery? Oh no—the whole of that part is badly drained; it is a great mass of open drainage which I believe causes a great deal of sickness.

212. Do you not consider that with such a number of persons—between 300 and 400—employed in the tannery, there is very little sickness there? Among the men there is very little, for I used to attend them—a great many of them live at some distance from the place, at Waterloo and other parts of Redfern, and I must say the men themselves are not an unhealthy lot. I used to find more illness among the children than among the men.

213. *Mr. Watt.*] I am told that these effects are more noticed by persons who sleep in the place? Yes, it is very bad for a person to live there; when a man goes away and gets a breath of fresh air he is less liable to feel the effects of it.

1875-6.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY CITY AND SUBURBAN SEWAGE
AND HEALTH BOARD.

NINTH PROGRESS REPORT

OF THE

BOARD APPOINTED ON THE 12TH APRIL, 1875,

TO INQUIRE INTO AND REPORT UPON THE BEST MEANS OF DISPOSING OF THE
SEWAGE OF THE CITY OF SYDNEY AND ITS SUBURBS,
AS WELL AS OF PROTECTING THE HEALTH OF THE INHABITANTS THEREOF;

ADOPTED BY THE BOARD ON THE 4TH APRIL, 1876;

TOGETHER WITH THE

REPORT OF COMMITTEE AND APPENDICES.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,
26 *May*, 1876.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

NINTH PROGRESS REPORT.

To the Honorable the Colonial Secretary,—

SIR,

1. We have the honor again to draw your attention to the dreadful condition of the open drain extending from Moore Park through the Surry Hills, forming the upper part of Shea's Creek. The Report of a Committee, of which Mr. Bennett was Chairman, appointed to inquire into this subject, has been already laid before you, being appended to our Eighth Progress Report.

2. In consequence of the complaints of the inhabitants the same Committee have again visited the locality with the special purpose of reporting upon the nuisances arising from Messrs. Alderson's Tannery. Their Second Report is appended (*Appendix A*), and discloses a state of things requiring immediate attention. There is but one way of setting things right, and preventing the continuance, or more probably an aggravation, during next summer of the disease and excessive death rate which have prevailed during the present; and that is to provide at once the necessary funds for the construction of the sewer recommended in the former Report of the Committee. Such a work will require time as well as money, and we beg to urge upon you the necessity of taking immediate steps towards carrying out our recommendations.

3. We do not know how far the law admits of immediate steps being taken to abate the gross nuisances in connection with Messrs. Aldersons' tannery, but we beg to recommend that the opinion of the Law Officers of the Crown be taken as to whether an indictment might not be laid by the Attorney General against the proprietors.

4. The whole question of tanneries, boiling-down, and other offensive establishments in the neighbourhood of inhabited districts, requires a careful investigation which, subject to your approval, we are ready to undertake.

5. It will probably be found that most of these usually offensive operations can under legal compulsion and under vigilant surveillance, in many cases be carried on under such improved conditions as to render their removal unnecessary.

6. In our Sixth Progress Report, dated 8th November, 1875, we gave you the results of a most exhaustive inquiry into the condition of the existing sewers. We drew your attention especially to the condition of some parts of the Tank Stream and of the Woolloomooloo Bay sewers. We beg again to call your attention to the condition of these sewers.

7. We are sorry also to say that the provisions of the Nuisances Prevention Act appear to have been almost entirely neglected. Cesspits are still, as heretofore, emptied by the nightmen, who dispose of the contents as seems best to themselves. The defect in the Act rendering it impossible for the municipal authorities to compel landlords to pay the cost of these operations has not been remedied, and appears to have been entirely overlooked.

8. We are still strongly of opinion that the Government should adopt our former recommendation that a portion of Webb's grant, at the mouth of Cook's River, should be made available as a general place of deposit for the city and suburbs, and also for disposing of the blood and other refuse from the Abattoirs. The present mode of dealing with the blood cannot be long continued for reasons into which it is not necessary to enter particularly. The distance to Webb's grant is much greater than to Callan Park, but on the whole the expense of disposing of the blood by conveying it to the former place would be less than that incurred at present.

9. We are convinced that the practice of feeding pigs upon offal cannot under the most stringent regulations be carried on without creating excessive nuisances.

nuisances. We again recommend therefore that the opinion rather doubtfully expressed by the Crown Solicitor respecting the legality of the new regulations respecting the disposal of offal be tested, as he suggests, by legal proceedings in the Supreme Court.

10. Steps have been taken both by the Government and the City authorities for the construction of sewers which will abate the nuisance at Blackwattle Bay as far as is possible, until a general system of sewage is in operation. Several months however must elapse before these sewers can be completed, and in the meantime the excessive nuisance arising from the pool of stagnant sewage matter adjoining the Lyndhurst Estate, forming part of the area, the right of reclaiming which was granted to the proprietors of that estate, remains as bad as ever, no efficient steps having been taken for its removal, in spite of the remonstrances addressed from various quarters, and in spite of the injurious effects which must be produced upon the health of the inmates of Lyndhurst College, and in a lesser degree upon that of the inhabitants of the whole neighbourhood. A report from Mr. Williams on this subject is appended. (*Appendix B.*)

11. We are glad to be able to state that the provisions of the "Water Pollution Prevention Act of 1875" are being actively enforced by the City Council. We learn from his Worship the Mayor that the number of direct closet connections which have been cut off or rendered safe by the introduction of cisterns, under the direction of the Municipal authorities, since the passing of the Act to the 28th of last month, is 3,391. We are informed that a considerable saving of water has been thus effected.

12. We beg again to call your attention to the expediency of at once passing an Act empowering the Government to make or authorize to be made sewers through private property as well through public places in every part of the City and Suburbs, under such conditions as may be considered necessary. Without such an Act sewers most urgently required cannot be constructed before the next hot season.

13. We are sorry to say that little if anything has been done to remove the nuisances on the Sugar Company's Works, to which your attention was drawn in our Sixth Progress Report.

14. The Committee, appointed on the 20th October last to inquire into the crowded state of dwellings and areas in the city and suburbs, are now bringing their inquiry to a close. The evidence they have taken discloses a terrible and dangerous state of things existing in certain parts of Alexandria, Redfern, and Waterloo, in connection with the scarcity of water and the pollution of wells by fæcal matter. So urgent do the Committee consider the necessity for immediate relief to the residents in those suburbs that they have requested the Board to anticipate the Progress Report they will shortly bring up, by recommending the Government to take prompt and immediate steps to provide a supply of water for the inhabitants of that district, and in the meantime to caution the public against using water from wells liable to be contaminated by percolation from cesspits.

15. The more important subjects included in our instructions, which appear still to require investigation, are—

- (1.) Offensive manufacturing establishments.
- (2.) Slaughtering in the City and neighbourhood.
- (3.) The adulteration of food and drink.

16. The latter is obviously within the scope of our instructions, but as the inquiry would be troublesome and expensive, we do not propose to enter upon it without your express sanction.

17. We beg to draw your attention to the report of our Committee upon Common Lodging Houses, transmitted to you on the 9th of February last.

18. In conclusion we beg to solicit your consideration of the propriety of establishing a permanent Board of Health and Works, as without some such permanent and *independent* authority the reforms which the Government appear so anxious to effect will probably not be carried out.

M. B. PELL,
Chairman.

Board Room,
Sydney, 4 April, 1876.

APPENDIX A.

REPORT

OF THE

COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN
SEWAGE AND HEALTH BOARD,

“To examine and report upon the state of the creek conveying the refuse water discharged from Messrs. Aldersons’ Tannery, Surry Hills.”

ADOPTED BY THE COMMITTEE, 31 MARCH, 1876.

To the Chairman of the Sewage and Health Board,—

SIR,

In accordance with the request of the Board, we on Saturday, the 11th March, re-examined that portion of Shea’s Creek passing through Messrs. Alderson’s and Magill’s premises.

In consequence of the letters referred to us, herewith returned, our special attention was directed to the course of the stream through Magill’s garden.

Mr. Magill, with four other residents of the neighbourhood, Messrs. Dymoke, Fagan, Nelson, and Glynn were present.

We found through the length of Magill’s ground a brown stream of very offensive water travelling sluggishly along a bottom covered with a red layer of deposit overlying a filthy black mud, about eighteen inches in depth. The smell was most overpowering, and the deposit, when closely examined, especially the portion on top, was found to consist of a mixture of animal refuse, hair, putrid flesh and skin, and human and animal excrement. Outside the fence a stagnant pool of similar material was even more offensive, bubbles of gas escaping all over the surface. The stagnation was caused by the drift from the sand-hill further down; the channel had been a few days before our visit cleared out partially so as to lower the contents of this pool about 1 foot. We were informed, and it was evident that the offence must if possible have been much greater before the lowering.

It was also stated to us that at times when the pits containing the “baits” were emptied the stench; was far greater than when we experienced it, and extended over a much larger area.

The conclusions of the English River Pollution Commissioners, as quoted in our previous Report, have an “*a fortiori*” application in this Country, on account of the dry tropical character of the climate.

The drought and unusually hot weather have together produced a state of things much worse than anything we could have expected from our previous examination, which was made last winter; and it is very much to be regretted that Messrs. Alderson have not ere this adopted some of our many suggestions for abating the more serious evils.

From Mr. Magill’s we proceeded to the tannery, but unfortunately, as none of the proprietors were present we were unable to obtain all the information we would have wished, as to their intentions respecting this question; after a cursory examination no improvement was apparent, but a mason, who said he was instructed to prepare for the construction of filter-pits, produced a plan, from which he stated they were to be executed, which if carried out would certainly tend to decrease the nuisance; but the drawing was not in sufficient detail to enable us to state if it would entirely remove it.

This man also informed us that he was the only person employed on the work, which, considering the crying nature of the evil, evinced, to say the least of it, very great apathy on the part of Messrs. Alderson.

We have nothing to add to the recommendations contained in paragraphs 26, 27, 28, 29, 30, and 31 of our former report on Shea’s Creek drainage; but we are decidedly of opinion that Mr. Alderson should either proceed vigorously with the filter arrangements and the other improvements suggested—to be compelled within a reasonable time to be fixed by the Board,—or that the penalties provided by the law against nuisances ought to be enforced.

We should, however, point out that whatever steps Messrs. Aldersons’ may take, the complete purification of this drainage water will only be effected when the sewer in Bourke-street, recommended in our report, is carried out, as the drainage is foul sewage before it reaches Messrs. Aldersons’.

20 March, 1876.

WILLIAM C. BENNETT.

Since the date of the above report, and in accordance with arrangement made with Mr. Magill on a suitable occasion, when the offence was at its maximum, the water was dammed back for inspection, and was inspected by Messrs. Grundy and Chapman, whose report is appended.

Board Room, Sydney,

31 March, 1876.

WILLIAM C. BENNETT.

On Wednesday, 22nd instant, upon receiving notice from Magill we visited his garden, leaving town at 3 o'clock; Mr. Bennett being out of town when Magill's messenger arrived was unable to accompany us. Several persons residing in the vicinity of the Tannery, who had met us there on a previous occasion, were waiting to receive us, and we immediately commenced our inspection.

We found the creek dammed up in three places, the first dam being 167 ft. from the fence which divides Magill's ground from Aldersons'. This dam measured 6 ft. across, was about 18 in. wide, and the liquid matter retained about 18 inches in depth; this emitted such an abominable stench that it was impossible to remain near it for any length of time, even for those present who were more or less habituated to the smell. We estimated the quantity of foul liquid matter to be about 5,000 gallons. The second dam was 110 ft. from the last; it was 4 ft. across; depth of water about 6 in. This was also very offensive; it smelt strongly of urine, colour reddish brown.

The third dam was 138 ft. further down; this was 4 ft. across; depth of water 18 in., or thereabouts. The stench here was offensive, but the water was not quite so dark in colour and the odour proceeding from it not quite so bad as that at the other dams.

Below this third dam, just outside the fence where the creek emerges from Magill's garden and takes a turn in the direction of Bourke-street, the stagnant water and filth were infinitely more offensive than when the Committee inspected it on the 11th instant.

While we were at this point the three dams were let off, and the stream of filth which came down with a rush was so intolerably disgusting that we may safely say it exceeded anything of the kind within our experience.

We took samples of the water at the different dams marked 1, 2, and 3, in the order we have described them. We returned to town at 6:15 p.m.

F. H. GRUNDY.
M. CHAPMAN.

Sydney, 30 March, 1876.

APPENDIX B.

29 March, 1876.

HARBOURS AND RIVERS—BLACKWATTLE SWAMP.

MEMO. to the ENGINEER-IN-CHIEF,—

I BEG to report that the Lyndhurst portion of this swamp is now in much the same state as when you inspected it four months ago. The filling in during this time has been chiefly in making two causeways about 30 feet wide across the unreclaimed portion of the Lyndhurst property. The upper causeway is pouring back all the drainage from the Glebe, which has now no outlet to the Bay. This stagnant sewage water covers a large area and is daily increasing.

Two men only have been employed for the past eight weeks barrowing debris from the quarry, and the work done by these men has not decreased the nuisance.

I have, &c.,

ALFRED WILLIAMS.

1875-6.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY CITY AND SUBURBAN SEWAGE
AND HEALTH BOARD.

TENTH PROGRESS REPORT

OF THE

BOARD APPOINTED ON THE 12TH APRIL, 1875,

TO INQUIRE INTO AND REPORT UPON THE BEST MEANS OF DISPOSING OF THE
SEWAGE OF THE CITY OF SYDNEY AND ITS SUBURBS,
AS WELL AS OF PROTECTING THE HEALTH OF THE INHABITANTS THEREOF;

ADOPTED BY THE BOARD ON THE 2ND MAY, 1876;

TOGETHER WITH THE

SECOND AND THIRD PROGRESS REPORTS OF THE COMMITTEE ON
CROWDED DWELLINGS AND AREAS.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,
4 July, 1876.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

[1s.] F 712—A c 95— 1876.

THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

TENTH PROGRESS REPORT.

To the Honorable the Colonial Secretary,—

SIR,

1. We have the honor, in this our Tenth Progress Report, to draw your attention to the accompanying Second and Third Progress Reports of the Committee appointed by this Board on the 26th October, 1875, "to inquire into and report upon the state of crowded dwellings and areas in the city of Sydney and suburbs, so far as it affects public health."

2. We do not think it necessary to add anything to the recommendations of the Committee, except the expression of our entire concurrence.

M. B. PELL,
Chairman.

Board Room,
Sydney, 2 May, 1876.

SECOND PROGRESS REPORT

OF THE

COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD,

on the 26th October, 1875,

“To inquire into the Crowded state of Dwellings and Areas.”

ADOPTED BY THE COMMITTEE, 4 FEBRUARY, 1876.

To the Chairman of the Sydney City and Suburban Sewage and Health Board,—

SIR,

The Committee appointed on the 26th October, 1875, to inquire into the crowded state of dwellings and areas in the City of Sydney and Suburbs, so far as it affects public health, in bringing up a Second Progress Report for the consideration of the Board, have selected the subject of Common Lodging-houses.

2. From the personal inspection of members of the Committee it does not appear that the overcrowding of common lodging-houses is an evil of very great magnitude in Sydney, that is to say, the number of cases that seem to call for interference is not great; but still there are particular cases where the evil has reached such a degree of intensity as, in our opinion, to endanger health, and where therefore the intervention of the Legislature may justly be invoked.

3. To illustrate the nature and extent of the evils complained of, and the imminent risk to health arising from overcrowding, bad ventilation, and filth in some at least of the common lodging-houses of Sydney, we beg to call the attention of the Board to the following portions of the evidence collected by the Committee:—

Dean Cowper, in answer to question 2, states,—

I believe that in Clarence-street, from what I have seen in the common lodging-houses, there must be at times a great deal of overcrowding. Some fifteen months ago I endeavoured to obtain correct information with regard to some houses of that character, and I found that the number of persons lodging in them was considerably larger than could be consistent with health, the houses themselves being generally in a very filthy condition, and many of them without any proper ventilation. I think that out of twenty-three houses, the condition of which I inquired into, there were thirteen where the ventilation was bad or very defective. Many of the houses were at the same time exceedingly filthy, and I could not but believe, and I believe now, that a good deal of disease must be generated by the foul air and the impurity of the rooms thus occupied.

Mr. Bowmaker (City Missionary) states in answer to question 124,—

There are two classes of lodging-houses—those which offer board and lodging, for which the lodgers pay fifteen shillings, sixteen shillings, or a pound a week, and those in which beds are let at 6d. a night. In the latter there is a great deal of overcrowding, but in the former I have scarcely noticed any.

Senior-Sergeant Larkins, of the Police Force, states, beginning with question 164,—

I have had great experience of lodging-houses, particularly in the central portion of the city—houses where working-men, diggers, and men of that class lodge at night; some of them strangers, and others men who work on the wharves, and I have invariably found them in small rooms, about 12 ft. square, perhaps ten or twelve of them crowded into one room. I have visited houses of that kind from 10 o'clock at night to 5 o'clock in the morning, and have frequently found the smell proceeding from them most offensive.

166. At present the police have no more control over a lodging-house than they have over a private house? No, none whatever. I have seen some instances of overcrowding even in the better sort of lodging-houses, where people pay really a fair rate for board and lodging.

167. *Chairman.*] What do you call a fair rate? From 18s. to £1 week.

168. And in houses of that kind what have you observed? I have seen a great deal of filth and overcrowding—five or six beds in a small room, 14 x 12 ft.

169. Even in houses where £1 a week is paid by the lodgers? Yes, from 18s. to £1; and I have sometimes seen it in public-houses.

The houses where I have seen the most overcrowding have generally been six-penny lodging-houses; they sometimes put ten or twelve persons into one small room.

Sergeant Dawson, of the Police Force, states,—

In the lodging-houses in Clarence-street, near King-street, there is no limit whatever to the number of lodgers; they take them in at all times, and they lie on the floor or anywhere where they can find a place. Some of them sleep with their clothes on for fear they should lose them. These are what are called six-penny lodging-houses. I have lived in that neighbourhood myself for the last fourteen years, and I know them well.

4. From the evidence tendered by members of the Committee, as the result of personal inspection, we extract the following:—

A lodging-house in Clarence-street is thus spoken of,—

In one room, 14 feet square and 10 feet high, there were six beds; in another, 11 feet square and 10 feet high, five beds; in another of the same dimensions, five beds; and in an upstairs room 11 feet square, and averaging about 6 feet in height, there were five beds,—in all twenty-one. The charge for a bed is 6d. per night. The ventilation is of the old-fashioned

fashioned kind and very defective, the closet is directly connected with the main; the yard was not clean, and the passage leading to it only 3 feet wide. This yard opens on to the back of Jacob's lane, and the open drains running through it are very offensive. We noticed that the kitchen is not only used for domestic purposes during the day, but converted into a bedroom at night, whilst one of the lodgers is accommodated with sleeping quarters under the stairs, in a close narrow receptacle, where he can only pass the night in a crouching position.

As to another in the same street,—

The rooms are about the same dimensions as those in the first house we visited—one room containing six beds, two others four beds each, and in the attic there were six beds. We may remark here that in almost all the houses we entered we found the attics crammed; these are generally close enough, but they afford a slightly better chance for fresh air to enter, which is probably the reason they are in greater favour. In none of these lodging-houses is any provision made for the toilet; we saw no signs of lavatories and no towels; the bed and nothing but the bed is provided. Some of the inmates turn in with all their clothes on, probably for security sake, as we observed in one of these houses a notice that the landlord was not responsible for the goods and chattels of his lodgers; others who find the temperature unpleasantly close lie in a state of absolute nudity, while we noticed one man who had hit the happy medium by going to bed with a pair of Hessian boots and a cap on, but no other article of attire. Attached to this house there was no water-closet—only a common cesspit, exceedingly offensive; we were told that it had not been cleaned out for four months; we should have judged it to have been four years.

In "Niagara House,"—

In one room, 13 ft. 6 in. square, and about 10 ft. high, we found seven beds; on one of them a man was lying *in puris naturalibus*; in another room of similar dimensions there were six beds; and in the attic, which is not more than 6 ft. 6 in. in height at the outside and only 13 ft. 6 in. square, there were eight beds.

Kilkenny House, Clarence-street, makes up six beds, three in each room, besides the individual who has been crowded out and who lodges under the stairs; the temperature in this house was very close from want of ventilation. The closet in the yard was very offensive, and is directly connected with the main. The landlord again was the theme of objurgation—"he won't do nothing" said the occupier to us emphatically. The Sydney and Melbourne lodging-house, owned by the same person, provides beds at 6d. a night. In one room were three beds, in another seven, while in the attic, which is only 12 ft. 6 in. square, and not averaging more than 4 ft. 6 in. in height, with sloping roof, there were eight beds; these numbers are greatly increased during the winter; many persons of the class who use these houses sleep in the open air in sheltered places in Hyde Park and elsewhere, preferring in warm weather to lie "under the stars" instead of "under the stairs." The yard and closet of this house were exceedingly offensive, the closet being directly connected.

In the Glasgow boarding-house, we found eleven beds in a room 13 ft. square, and six in the attic. No water for the closet, and both closet and yard very offensive.

Other houses of a similar character are described in the same neighbourhood; but the visitors found an agreeable surprise in the "Temperance" lodging-house in the same street, which is spoken of as,—

An entire contrast to any of the houses previously inspected. Here cleanliness everywhere prevails; the beds have clean sheets; there is a nice lavatory, well supplied with jack towels, and every attention seems to be paid to the comfort of the inmates. That this superior accommodation is appreciated is evidenced by the fact that a higher scale of charges is made, and a superior class of lodgers obtained. The two houses which comprise the hotel are let at 30s. a week; in one house twenty-three beds are made up, and in the other sixteen,—the price of a bed in the latter being 9d.

A weatherboard building in Gloucester-street is described as containing four rooms,—two 16 ft. x 16, and two 10 ft. x 8—occasionally accommodating thirty lodgers.

In a house in Sussex-street, "usually occupied by a large number of lodgers," the visitors found

Nearly all the beds empty, the reason assigned for this being that there were two men in the house suffering from erysipelas, who had been refused admission into the Infirmary, and there was no other place to which they could be sent. It is much to be regretted that some kind of isolated accommodation should not be available in cases of this dangerous character. There was literally no ventilation in the rooms where these men were lying—the windows being boarded up.

5. Several Chinese workshops were visited, where the men employed sleep on the premises, which are often much overcrowded. These places, although not common lodging-houses, ought to be brought under similar regulations, and might be dealt with in any enactment affecting lodging-houses. Such places are referred to in the evidence tendered by Messrs. Read and Chapman on December 3rd.

We next visited Ah Toy's workshop in Queen's Place, where there is a large loft over the workshop, about 60 ft. x 30 ft., in which nineteen persons sleep—at least so we were told—but the numbers given us were probably incorrect in most cases, for we never found the beds to correspond. The bedroom of a Chinaman is a square compartment with room for two occupants, in which he keeps all his belongings, and which serves him as a smoking-room, sitting-room, and bed-room. The rooms are generally boxed off in this way into compartments which represent so many separate dwellings under one roof. The workshop referred to was crowded in every part of it not occupied by beds with unfinished furniture, leaving only a narrow passage in the centre. No attempt seemed to have been made to clean the place, nor could we see any lavatories or appliances used in other houses; if these people ever wash themselves they do it by stealth. The attic room in Ah Toy's house, fronting George-street, is 7 ft. high, and as near as we could guess about 14 ft. x 10 ft.; it is divided into eleven compartments, is without ventilation, and very dirty. The closet attached to the house was in a frightful state. At the back of the house is a store used as a workshop, and on the upper floor of this building we saw a number of beds—apparently double beds—and several opium benches containing lighted lamps, pipes, &c., ready for use at a moment's notice. Everything in this apartment was in confusion, and in a filthy state, articles of unfinished furniture piled up in every available space. The closets in all these houses are in a horrible state; they discharge into an opening over some drain, probably a tributary of the Tank Stream.

Lee On Chong, who is also a furniture maker, employs thirty-two workmen, who all sleep on the premises, and have the same dirty habits which we have noticed among all their countrymen. There is plenty of water available, but the use of it for purposes of cleanliness does not seem to occur to them. In the attic room of this house there were sixteen sleeping compartments partitioned off, entirely without ventilation, and anything but clean. Others of the workmen who are unable to pay for their beds sleep on benches or on the floor wherever they can find a corner to lie down in.

Way Hap is also a maker of furniture, and his rooms are as dirty, as badly ventilated, and overcrowded as his neighbours'. In one room, 28 x 13 ft., with a coved roof and not averaging over 4 ft. 6 in. in height, we saw eight beds, four on each side, and placed end to end, with a vacant space of 5 ft. in the centre. The stench proceeding from this room was most revolting. There were some smaller rooms with beds in them, and there was one room, a sort of loft, over the workshop approached by a batten ladder—an awful hole, 4 ft. 6 in. high and 10 ft. long, containing three beds; it is a wonder that during this hot weather anyone could breathe in such a place; there was also a bed on the stair landing, and two beds in the kitchen, which is a mere open shed, boxed off from the fire-place; the closet was too bad to inspect; we dare not go near it.

In the evidence given by Messrs. Dansey and Palmer on December 10, they describe a similar place in Park-street:—

A wooden house containing eight rooms, occupied by Wah Lee Ong, a Chinaman, who is a carpenter, employing a number of men. There are seventeen persons who sleep in the house, all countrymen of the proprietor. In one room, 14 x 12 ft. were eight beds—the room being partitioned off into bunks like the steerage of a ship; bedding of a very varied kind. In some of the bunks were mattresses, in others only rags and clothing; mosquito curtains black with dirt. In another room

room over the shop there were five beds of a similar description. We looked into the kitchen downstairs, which was dirty and smoky. The whole place stinks aloud, the horrible and sickening opium smell prevailing all through it. Every corner of the building was crowded with timber or furniture in an unfinished state, rendering it highly combustible; and though the removal of such places is very necessary it is hardly desirable that it should be done by fire.

And one in Castlereagh-street, occupied by Att Lee, another Chinese carpenter. Nineteen persons live on the premises, all single men; also one married man who goes home to sleep. In a room on the ground floor, 12 x 10 ft., we saw four beds. There is no ventilation in this room. The air can only enter it through the door; and it has very little light, there being only a small pane of glass looking into the shop. The proprietor was sick in a room or compartment on the ground floor. Upstairs over the workshop were four beds in one room and three in another. Ventilation wretched throughout, the windows being shut in by adjoining buildings; rooms dirty; kitchen very dirty; and the usual disgusting smell of opium smoking from basement to roof. The closet reeking with urine—the boards and the floor being positively saturated with it—a stream proceeding from the floor of the closet into the yard. Against the side of this closet we noticed a large heap of shavings highly dangerous in case of fire.

6. In connexion with common lodging-houses we may mention the case of the Soup Kitchen and City Night Refuge, in Kent-street, visited by Messrs. Read and Chapman on November 10th. Here a night's lodging is afforded gratuitously, so far as space will allow, to any one not actually in a state of intoxication. We regret to learn that this charitable institution is not kept so clean and airy as it might be, and that the homeless poor who are not utterly degraded are thereby deterred from taking advantage of its friendly shelter. The difficulty, however, of keeping such a place clean must be very great, as pointed out in the evidence of Senior-Sergeant Larkins, quoted below.* In the absence of further information we are not disposed to impute blame to any one in charge; nor do we recommend at present that this charity should be brought under the same regulations as common lodging-houses, except perhaps so far as concerns free entry to any properly authorized sanitary officer, and the necessity of notifying to the proper authorities the presence of any person suffering from infectious or contagious disease.

7. Finally, as to the regulation of common lodging-houses, so as to prevent as far as possible injurious overcrowding, and to secure in them a reasonable amount of cleanliness and fresh air, we would recommend that an Act of the Legislature be obtained, embracing the following as its chief provisions:—

1. Every common lodging-house to be registered, and placed under the supervision of (say) the Inspector General of Police.
2. Inspector General of Police to frame regulations, to be approved by the Governor and Executive Council—
 - (a.) For determining the number of lodgers who may be received for a night into any one room.
 - (b.) For promoting cleanliness and ventilation.
 - (c.) For the giving of notices, and taking precautions in the case of any infectious disease.
 - (d.) Generally for the well ordering of such houses.
3. Free access to be given to any authorized sanitary officer for the purpose of inspection.

In fixing the number of persons who may be lodged in any one room we would recommend that a minimum space of 300 cubic feet be allowed for each. A valuable suggestion thrown out by the Rev. G. Sheppard in his evidence on November 19th should be kept in view in framing regulations to prevent the spread of disease. Question and answer 87 run thus:—

87. Does your experience lead you to the conclusion that much ill health arises in Sydney from the bad ventilation and filth you have witnessed? Yes, it does; I cannot see how persons living in such places can be healthy; if there are not positive symptoms of disease there is a weakening of the system rendering it susceptible to disease. There is another matter to which I should like to be allowed to call the attention of the Committee, and that is the non-disinfecting of the beds in our lodging-houses, which is a very important matter. In London there is a small establishment containing two rooms used for the purpose of disinfecting beds and articles of clothing or furniture. It was established I believe under the supervision of Professor Leoni. One of the rooms is used as a disinfecting room, and the other, in which the temperature is between 240° and 250°, is for the purpose of killing parasites. During two years there were 2,583 articles of clothing disinfected in this place very successfully. I think in Sydney there should be some place of the kind, and that our lodging-house-keepers should be compelled to take their bedding there. Mr. H—, a lodging-house-keeper, told me the other day that when he attempted to use disinfectants his lodgers became suspicious, and as it was not to his interest to quarrel with them he did not continue it.

Considerable difficulty may be experienced in defining a "common lodging-house," so as to embrace all that ought to be regulated and no more. If the just and proper medium cannot be struck we think it would be prudent to make the definition rather too wide than too narrow, and trust to a wise discretion on the part of those who administer the law not to use it vexatiously.

J. SMITH,

Chairman of Committee.

Board Room, 4 February, 1876.
Sydney.

* "186. Have you frequently visited the Soup Kitchen at night? I have visited it at night, but not very frequently.

187. You are aware that a great many persons sleep there at night? Oh yes.

188. What is your opinion of the ventilation and the cleanliness of that place? The ventilation, or part of it at least, does not appear to be very good, but I have come to the conclusion that the cleanliness is fair for the accommodation afforded. The persons who go there are very offensive; their clothes are offensive as well as everything about them. They are people who are addicted to drink; they lounge about low public-houses all day and come to sleep at the Soup Kitchen at night, covered with all kinds of filth.

89. So that it must be almost impossible to keep the place clean? It would be impossible where forty or fifty of such persons sleep in one room. I have been there several times, and I have certainly experienced an offensive smell, but I have come to the conclusion that with the class of people who go there it is very hard to keep the place clean."

[No. 11 COMMITTEE.]

THIRD PROGRESS REPORT
 OF THE
**COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN
 SEWAGE AND HEALTH BOARD,**

On the 26th October, 1875,

“To inquire into and report upon the state of Crowded Dwellings and Areas in the City of Sydney and Suburbs, so far as it affects public health.”

ADOPTED BY THE COMMITTEE, 22 APRIL, 1876.

To the Chairman of the Sydney City and Suburban Sewage and Health Board,—

SIR,

The Committee appointed on the 26th October last, “to inquire into and report upon the state of crowded dwellings and areas in the City of Sydney and Suburbs, so far as it affects public health,” have agreed to the following Third Progress Report:—

1. Before proceeding with our General Report we desire to bring prominently before the Board a matter which we have already mentioned verbally, and which, being of an urgent nature, has been briefly alluded to in the Ninth Progress Report of the Board to the Government—the contamination of well-water by soakage from privies and cesspits in the Boroughs of Alexandria, Redfern, and Waterloo.

2. In the districts indicated the Botany water has not been laid on, except in places, and the inhabitants mostly depend upon wells sunk to an average depth of 25 ft. The soil is chiefly sand to the full depth of the wells, and it is kept from falling in by a lining of bricks without cement. There being no underground sewers in the district, the privies are placed over cesspits dug in the same sandy soil; and these pits being usually shallower than the wells, the foul soakage gravitates naturally into the latter. It is frequently the case that only a few feet of loose porous sand intervene between a well, and not one privy merely but sometimes half-a-dozen or more. The necessary consequence is that there are few, if any, wells in the district not obviously contaminated with filth, and it is not surprising that the death rate of the district has generally been high.

3. During the recent dry weather the direct drainage from the cesspits to the wells has been reduced to a minimum. Many of the wells, in fact, were entirely dry, but as soon as they begin to fill again the most serious consequences may be apprehended.

4. Recent researches have made it appear highly probable that typhoid fever, diarrhœa, and dysentery are propagated almost exclusively in one of two ways, either by persons drinking water which has been poisoned by the diseased excretions of patients suffering from these maladies, or breathing air poisoned by gases emanating from the same diseased excreta.

5. These diseases may also originate from drinking water charged with ordinary fœcal matter, or from breathing sewer gases, even though not specifically poisoned. In the case before us the danger of such diseases being either originated or propagated through the medium of drinking water must be extreme, and no time should be lost in applying the simple and easy remedy of laying on pipe water.

6. In order that the effect of our representations may not be lost in generalities, we call attention to the following cases out of many that have been personally examined and reported upon by members of the Committee:—

Speaking of the Public School in Botany Road, which is attended by from 200 to 220 children, they say:—

“We inspected the well which is unusually small in circumference and the water in it very low. We drew up a bucketful of it and found it filthy and quite unfit for drinking, yet this has been the only supply up to within about a month of the present time. There is no water supply now, and the children depend upon the water which the proprietors of neighbouring wells give them, and it is a very scarce article hereabouts, most of the wells having given out. The closet used by the children is a large double closet having three seats in each division, built over a cesspit 10 by 7 ft., which was absolutely full and stank abominably. This place is on about the same surface level as the well, and as the soil is all porous sand it is not to be expected that the water should be free from pollution. It did not seem to occur to the master that it was his duty to report this state of things, nor did he know to whom it should be reported.

We requested him at once to call the attention of his Board to it. A butcher residing in the immediate vicinity of the school told us that his well was dry, and he believed most of his neighbours were in a similar state. We were also informed by the occupant of a house on the Botany Road, two doors north of the school—a coal and timber dealer, and a very intelligent man—that the water throughout the neighbourhood is quite unfit for use, but as he said, *it has to be used*; it is also so scarce that those whose wells are dry have to beg it by the bucketful from their neighbours who are fortunate enough to have some left. This informant stated that he had a house in Bullanaming-street where there is a well as deep as any in the district, which has lately been cleaned out, but is still empty. He attributes two-thirds of the mortality which has taken place there to the bad quality and scarcity of the water. He further stated that he amongst others had signed a petition to the City Council praying to have the water laid on, and that it had been frustrated by a counter-petition got up by owners of property in the neighbourhood, many of whom were non-residents.”

Again in their report upon Wyndham-street, Alexandria, they state :—

“There are seven houses in this cluster, the occupants of which are or have been till lately all dependent upon one well for their water supply; that well has given out and they have now to buy water, all but Mrs. P., who says she cannot afford it, and continues to scrape up as much as she can get from the bottom of the well in question at the imminent risk of her health. Within 14 ft. of this well are two closets over common cesspits, mere holes in the sand, and there are at least ten similar closets within 30 ft. of it.”

* * * * *

“In these yards is a cluster of privies, six in number, so close together that the distance between the two outside closets is only 24 ft., the two allotments on which they are placed being 12 ft. wide each. There are two wells between the cottages and these closets; none of these closets are further than 27 ft. from the first well, or more than 35 ft. from the second, the nearest being within 20 ft. of a well.”

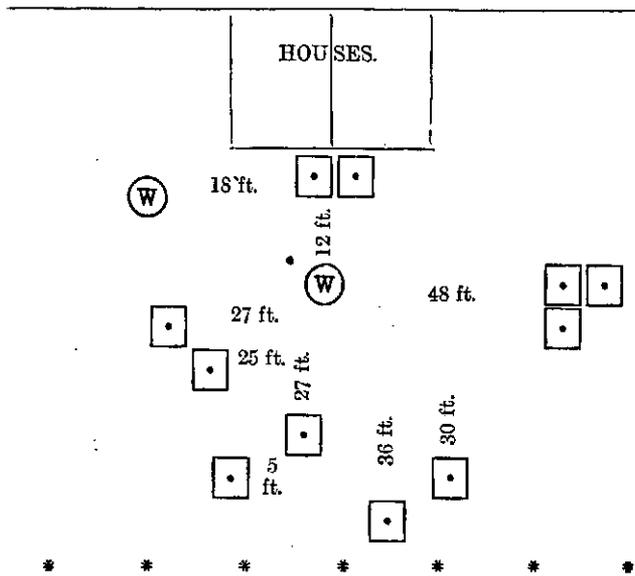

* * * * *

“The sanitary conditions in this street (Wyndham-street) on either side so far are exceptionally bad even for this district where all is bad, and it is fearful to contemplate the result if such a state of things be allowed to continue. When the rain comes the effect it will have will be to dilute these large accumulations of faecal matter in the closets and spread them over the surface of the ground, which will become so contaminated that wholesome water in any wells sunk in it will be an impossibility.”

* * * * *

“Imagine two wells not far apart from each other, containing the water supply for all the residents, and no less than eleven closets in close proximity, the nearest being 12 ft. and the most distant 48 feet from a well; no cement used in the lining of the wells, and the closets mere holes in the ground, which, being all porous sand, absorbs the liquid portion of the closet matter, and is necessarily drained by the wells, and you will see that in all these cases the water supply must be directly contaminated.”

WYNDHAM-STREET.

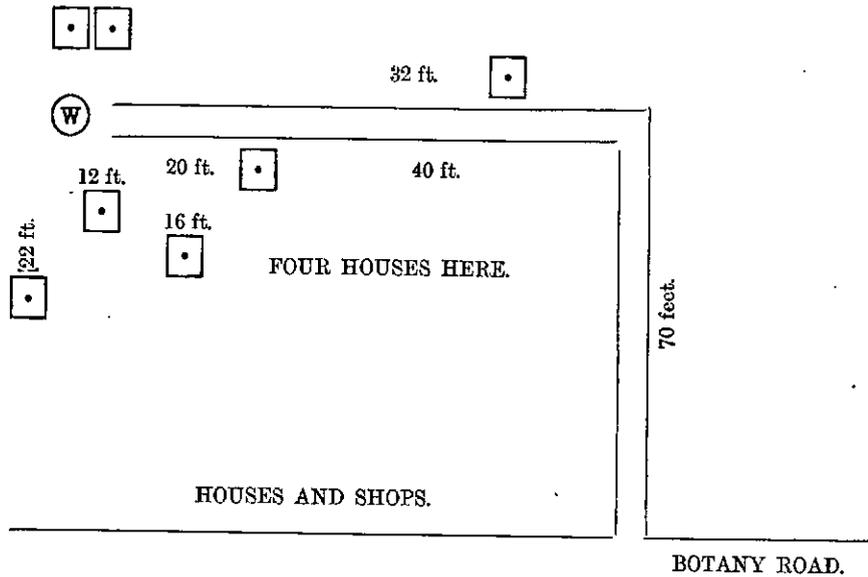

“In one place, where the well is very near the fence, there are three closets distant from it respectively 14, 18, and 20 ft., the well being sunk in the lowest portion of the ground. In another place there is a closet on about the same level as the well, which is barely 6 ft. from it. In short, this passage of 80 yards length has a number of wells close to it, with no less than twenty-six closets abutting upon it. Most of these closets have either never been cleaned out or cleaned out at some remote period; indeed, it is a question whether the process of emptying is ever resorted to in this locality, the usual practice being to dig a fresh hole and shift the closet to another part of the yard or allotment.”

In describing a certain part of Botany Road, the Report goes on—

“The blind lane I am now describing after extending westward 70 ft. into these allotments turns at right angles to the south for a distance of 40 ft.; it then opens out to a width of 10 ft. (from 3½ ft.) and encloses a well which is used in common by the occupants of the six houses put up on the strips of land into which

which this 60-ft. centre block is cut up. This well is encircled by the six closets belonging to these houses at distances varying from 12 to 30 ft., as will be seen by the annexed diagram. The well is 24 ft. deep, and from the nature of the soil and the conditions which exist, described in several of our reports

upon the properties in this district, it must receive the soakage from them. No further proof of this is necessary than a repetition of the fact that the closets are for the most part full of hard faecal matter, all the moisture from them being absorbed by the sand. We got into conversation with one woman here who had had the common sense to reason out the necessary consequence of this unwholesome juxtaposition of closets and wells. She said the water was quite unfit to drink, and that during her residence in the locality for some months she had never used it in her house at all, except for "slopping about."

* * * * *

"The closet pertaining to this dwelling is just 6 feet from the well, and the soil is sandy. This dangerous proximity, however, is no more than we have noticed in many instances in this quarter. Sometimes there are half a dozen closets within 20 ft. of the only water supply for a number of persons. We were at a loss for some time to account for the number of cesspits which abound in this suburb, so far exceeding the number of closets in other suburbs of equal population; but it is easily accounted for, the soil being soft and sandy it is very easy to sink a pit; indeed it is easier to sink a new cesspit than to clean out an old one. In Waterloo no nightman could make a living; when a closet is full—so full that the occupants of the house can no longer make use of it—the remedy is very simple: they scoop out another aperture a few yards from it, and shift the closet from one hole to the other."

In Pitt-street South, Waterloo, six cottages are described with but one well (25 ft. deep) amongst them:—

"The water from it is filthy. Within 50 feet from this well are no less than eight cesspits, several of them being on much higher ground, while there are two cesspits within 15 ft. of the well on either side. The soil is pure sand, and the cesspits mere holes in the ground without any water-tight lining; the inference is obvious—the liquid matter from the closets must percolate into the well and pollute the water supply. A woman living in one of these houses told us that she and her husband and their four children were all sick, that they were continually retching, and that she attributed it to the water. She said further, that the occupants of the third house from hers were also sick in the same way.

7. We are informed by His Worship the Mayor, that in laying on the city water to Suburban Boroughs it has been customary for the City Council to await an application from the inhabitants desiring the supply; and that if such application be followed by a counter-petition, signed by a certain number of ratepayers, no action is taken. In the boroughs specified petitions for water supply have been received by the City Council, and also counter-petitions; so that the Council, although quite ready and willing to afford the supply, felt their hands tied; for it appears that the customary procedure of petition and counter-petition had come to be looked upon as in accordance with the law. The Mayor, having consulted the City Solicitor, now informs us that the City Council have full power to lay on water to any Suburb, and thereupon to levy the customary rate, irrespective of any local action for or against.

8. We trust then that no mistaken opposition on the part of non-resident landlords, or of ratepayers who may be advantageously situated with regard to water, will any longer delay this very necessary work; and that the city authorities will be urged to take the initiative, not only for the health of the inhabitants who are at present compelled to use polluted water, but for the safety also of the rest of the city, which will not escape the evil consequences should an epidemic of typhoid fever once be originated.

1876.

THE SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

ELEVENTH PROGRESS REPORT.

To the Honorable the Colonial Secretary,—

SIR,

We have the honor to present this our Eleventh Progress Report, the principal object of which is to call your attention to the appended Report and Evidence of the Committee appointed by this Board “to enquire into the state of Crowded Dwellings and Areas in the City of Sydney and its suburbs, so far as it affects public health,” of which Dr. Smith was Chairman.

The chief points requiring additional legislation are briefly stated in the tenth page of their Report, and on these points in particular we submit the following remarks:—

BOARD OF HEALTH AND WORKS.

We think that a Central Board of Health and Works should be constituted as soon as possible, as without such it is quite impossible for anything effectual to be done to remedy the sanitary condition of Sydney. In England, Health and Works are separated, but for obvious reasons one Board would be sufficient here; and to make it efficient, we suggest:—

- (1.) That the Board should consist of a small number of members, who should not be directly subject to popular control. It has been abundantly illustrated during the last year that sanitary laws will not be stringently administered by a body who have any dread of unpopularity.
- (2.) That the Members of the Board should have a secure tenure of office, and sufficient power, subject to the approval of the Government, to carry out necessary works and to compel the observance of sanitary laws.

CHINESE.

The evidence taken by the Committee abundantly proves that some steps are necessary to put down with a strong hand the evils connected with the residence of Chinamen in this City. What is taking place in California, as reported in the public press, suggests the necessity of fully considering what shall be done with respect to these people. Certainly the houses occupied by Chinese in Sydney should be subject to special supervision, in the same manner as has been recommended for common lodging-houses.

M. B. PELL,
Chairman.

Board Room,
Sydney, 10th August, 1876.

FINAL REPORT

OF THE

COMMITTEE APPOINTED BY THE SYDNEY CITY AND SUBURBAN
SEWAGE AND HEALTH BOARD,*on the 26th October, 1875,*

“To inquire into the state of Crowded Dwellings and Areas in the City of Sydney and Suburbs, so far as it affects Public Health.”

ADOPTED BY THE COMMITTEE ON THE 7TH AUGUST, 1876.

To the Chairman of the Sydney City and Suburban Sewage and Health Board,—

SIR,

This Committee was constituted on the 26th October last, under the following Minute:—

No. 11 Committee—Crowded Dwellings and Areas. On motion of the Chairman, M. B. Pell, Esq., the following resolution was agreed to *nem. diss.*:—

“That a Committee be appointed to inquire into the state of Crowded Dwellings and Areas in the City of Sydney and Suburbs, so far as it affects public health, such Committee to consist of Hon. J. Smith (Chairman), Messrs. Palmer, Chapman, Dansey, and Read.

INSTRUCTIONS TO COMMITTEE.

1. Two to form a quorum.
2. To take the evidence of persons acquainted with the city.
3. That personal inspection shall in all ordinary cases be made by a sub-committee of two, who shall submit written notes of their observations to the Chairman at short intervals.
4. To send in Progress Reports to the Board at short intervals.
5. To suggest remedies for evils brought under their notice and coming within the scope of their inquiry—

- (1.) With respect to areas already built upon and overcrowded;
- (2.) With respect to similar evils growing up on areas not fully occupied in the city and suburbs;
- (3.) To obtain information as to what steps have been taken in Europe for the purpose of remedying the evils under the above headings.”

2. We commenced the important enquiry entrusted to us by taking verbal evidence from gentlemen who from long and intimate acquaintance with Sydney were in a position to give valuable information. We examined the Very Rev. Macquarie Cowper, Dean of Sydney; Richard Wynne, Esq., J.P., Rev. G. Sheppard, and Messrs. M. Bowmaker, M. Hodgkinson, and C. Tilly, City Missionaries. From the three witnesses last mentioned we had hoped to obtain more minute details than any other persons could supply, and we were somewhat disappointed to find that these gentlemen, while fully appreciating the value of our inquiry, were unwilling to give other than general evidence, from the fear that their usefulness would be hindered if they were to furnish information which would identify any of the persons benefited by their ministrations [*vide* p. 17]. While regretting their decision, we could not but respect their scruples, and further information has satisfied us that those scruples were well founded.

3. In the matter of verbal evidence it soon became apparent that we were not likely to obtain much of a sufficiently minute and exact character, as we could find very few persons possessing an intimate knowledge of those neglected and filthy parts of the city which came specially within the scope of our inquiry. We proceeded therefore to make arrangements for carrying out a system of house to house visitation by means of two sub-committees—No. 1 consisting of R. B. Read, Esq., and Mr. Alderman Chapman, and No. 2 consisting of B. Palmer, Esq. (Mayor of Sydney), and G. F. Dansey, Esq. When Dr. Read resigned in February in order to proceed to England, Mr. F. H. Grundy was appointed to fill his place. The sub-committees having roughly apportioned the city and suburbs into two divisions, proceeded diligently with their work of personal inspection, a duty which has not been performed without great

discomfort

discomfort and considerable risk to health, their visits bringing them into contact with much repulsive moral and physical degradation, and with scenes of filth and wretchedness of which it is impossible to convey any adequate idea by mere verbal description however forcible.

4. In the early stage of house to house visitation the crowded and unhealthy condition of some of the Sydney watch-houses was brought to light, and we considered it advisable to bring up a Progress Report to the Board on this subject, which was adopted by the Committee on the 22nd December, and by the Board on the 24th December, 1875. This report was the result of a careful and minute investigation into the accommodation afforded in each lock-up, verified by subsequent inspections.

5. Another question which seemed to us of sufficient urgency to call for special report was the state of the common lodging-houses of Sydney. In addition to visits of personal inspection to a number of these houses, made by the Sub-committees by night as well as by day, we took evidence from Senior-Sergeant Larkins and Sergeant Dawson, of the Metropolitan Police Force. [*Vide* pages 21 and 30.] Our recommendations on this subject are comprised in the Second Progress Report of the Committee, adopted on the 4th February, and by the Board on the 8th February, 1876.

6. We have also had occasion to submit a Progress Report on the contamination of well water in certain suburban districts by percolation and overflow from cesspits. This matter being within the control of the city authorities, we were enabled to obtain the prompt co-operation of his Worship the Mayor, and we are glad to learn from him that steps are in progress to remedy the evil. Our Third Progress Report was adopted by the Committee on the 22nd April, and by the Board on the 2nd May, 1876.

7. It remains for us to bring under one view the remaining portions of the evidence collected by the Committee and now submitted in full to the Board. It became evident to us at the outset that in order to carry out fully the inquiry committed to us we should have to go beyond the strict letter of instructions, and to include in our investigations bad drainage, deficient ventilation, dilapidation of buildings, general uncleanness, and any other physical conditions that might be supposed injurious to health. But it will be understood, that intemperance and other prevalent vices, potent causes of disease and death, do not come within the scope of our enquiry; although occasionally touched upon in the notes of the visiting members. We have classed the various subjects treated of in the evidence under different heads, and shall now proceed to report upon them *seriatim*.

8. *Crowded Areas.*—We have found the worst form of overcrowding to consist in the closely packed rows of small badly-constructed tenements at the back of large dwellings and in courts and lanes leading out of the main streets. In many cases these are mere *cul-de-sacs*, and are so hemmed in by the walls of large buildings on three sides as to allow no chance of ventilation. The noxious gases arising from the closets and drains, always more or less filthy, are thus restrained from diffusion, and the atmosphere becomes contaminated and unhealthy. It is scarcely to be wondered at that these places exist, since the legislation in this direction in Sydney has been of a very imperfect character. An amended Building Act is imperatively necessary, and it should embrace regulations not only in respect to the character of the houses but to the dimensions of the allotments, size of the yards, proper drainage, and privy accommodation, as well as the width of the thoroughfares; a certificate of fitness for occupancy should be given in each case by some recognized officer. Power should also be given under Act of Parliament to some permanently established sanitary authority to deal with existing evils, and to inspect and close or cause to be pulled down if necessary all buildings erected under improper conditions. We call especial attention to the following cases of crowded areas, two of which are illustrated by plans accompanying the evidence:—

“Garrett’s Buildings (Clarence-street) contain ten houses, having two rooms each, 10 ft. by 10 ft. and 9 ft. high, rented at 6s. a week each; they are very badly ventilated, the back walls having no opening or air-hole of any kind. These ten houses occupy a piece of ground in the form of a parallelogram; five houses on either side with a space of 14 feet in the centre. Of this 14 feet space 4 ft. 6 in. is fenced off right and left and partitioned into yards for each house, leaving a passage of 5 feet—exact measurement—down the middle, from end to end of the row as a thoroughfare. The houses are hemmed in on all other sides by surrounding buildings, so that nowhere except in front can a mouthful of air be had for love or money. But, shocking to relate, this narrow passage which intervenes between the two rows receives all the drainage of the court, being nothing more or less than an open drain covered loosely with boards, not so effectually as to prevent the escape of foul gases, or with that object at all, but to allow the inmates of the houses ingress and egress to their dwellings without breaking their shins. At the end of the lane or court there are three closets or cesspits in such a stinking condition as to be unapproachable as well as indescribable.” p. 20.

“The plan adopted in the construction of cheap dwellings in Sydney is a very simple one. A wall is run up on the extreme back boundary of the allotment, and extending to either end of the ground. This is intersected by a number of partitions, at right angles, at an average distance of (say) 8 ft. apart; a couple of cheap sashes for the upper and lower room, and one door on the ground floor for each house, and lo! the buildings when roofed are completed; and a property yielding good returns is created at a minimum outlay. It is no use to have doors and windows at the back, because the extension of the building to the boundary of the allotment also saves the cost of fencing at the back and sides. It is however indispensable that there should be some apology for a yard, where the women may wash and hang out their clothes to dry, and therefore a space is reserved in front for this purpose, which is frequently only 5 or 6 feet wide. It will be seen that this arrangement takes up a width of, at the outside, 16 feet. Now, supposing the available area to be 40 feet wide, a similar row of houses can be erected on the opposite side, and there would be 10 ft. to spare between the two terraces. This vacant space is not without its use also; there being no provision for drainage, and no room for it, except in front, it follows as a matter of course that all the house-slops and refuse find their way into this unoccupied space and run along it in a surface drain. Add to this description three or four stinking cesspits, all occupying prominent positions in front of both rows of houses, and you have a sketch of a block of cheap houses in the back-slums of Sydney. These properties are generally in some yard or court off the street, and hidden from public observation, or they would not be allowed to exist. The picture I have drawn is not a fanciful one, as will at once be admitted by those who have taken the trouble to read our previous reports.” p. 58.

“Some

"Some steps ought, we think, to be taken to prevent people from crowding these narrow streets and lanes with buildings. The attention of the Government should be called to this matter at once, for delay is not only dangerous but fatal. These are not small right-of-ways leading out of large streets, which afford a certain amount of ventilation, but narrow lanes running parallel to each other, in which the houses are crowded together in such numbers as to render health to the residents impossible; it is overcrowding in its worst form." p. 64.

"The practice has been to purchase or lease one of the double allotments and then disposing of the frontage with a diminished depth of 70 ft. instead of 100 ft. to each street, to leave a centre block of some 60 ft. in width still for sale or lease, approached by means of a narrow dirty passage of 3, 4, or 5 feet in width. These centre 60-ft. allotments are then cut up into little bits just large enough to contain a cottage, a closet, and a well; sometimes however with only one well for all the cottages. In the present instance the block is cut up into six allotments, so that the original allotment of 200 by 50 ft., with four street frontages, has upon it ten dwellings without drainage, ten closets, and from five to ten wells. Sometimes the economy of space even in this recently inhabited suburb is carried out to a still further extent, for we have met with instances where some of the 50-ft. lots fronting streets have been subdivided into four frontages of only 12½ feet each. There would thus be fourteen dwellings and the consequent accommodation, or the want of it upon the original allotment of 200 by 50 ft., besides the addition occasionally of cowsheds, stables, and outbuildings; these tenements having at the ordinary average of five to a house, seventy inmates. Surely Legislative interference is called for to prevent this unseemly and unwholesome overcrowding." p. 92.

"*Arthur-place* (p. 29) is approached from the west side of Kent-street. This court is 19 feet wide, and the nine houses in it, which are 15 feet wide, occupy a length of 120 feet; they are two-storied buildings with metal roof. There is no ventilation at the back or on the west side, where the court is closed in by a blank wall; on the south is the Ragged School and grounds, and there is a blank wall on the front or north side."

Miller's Buildings (p. 14): This place is reached from the east side of Kent-street by a flight of stone steps, the street at this locality having been lowered several feet by the Corporation. The width of the court is 22 feet and its length 84 feet, terminating in a blank wall. There are seven old two-storied brick and shingle houses on either side, which have a depth of 12 feet—blank walls on the north, south, and east sides, the only opening being into Kent-street on the west side, and the ventilation from that quarter is obstructed by the houses fronting the street, which project in front of those in the court on account of the difference in height."

"*McCrory's Court* (p. 21): This court is approached from the east side of Clarence-street; it is 72 feet in length and 18½ feet in width. It opens upon Market-row, a place little better than itself, and contains two houses on either side, with a privy in the centre of the block, the width of the court between the houses being 5½ feet; it has a blank wall at the end of it." p. 105.

9. *Crowded Dwellings*.—The house to house inspection carried out by the Committee has shewn that, in addition to the injurious crowding together of houses treated of in the last paragraph, there is a considerable amount of overcrowding of house occupants in parts of Sydney. Where this has been found to occur, the houses have been generally lodging-houses, and upon this subject the Committee have already reported. There are, however, cases where tenants sub-let, and where each room, however small, accommodates a separate family. A Health Act should provide for the inspection of all lodging-houses at stated intervals, and we recommend that the plan be adopted which is carried out in large towns in England, viz., that all houses in which rooms are sub-let be registered and subject to regular inspection. One of the worst cases of overcrowding of this kind exists in the very centre of the city, in a court which connects two of our principal streets, formerly Brougham-place, but now Rowe-street, between Pitt and Castlereagh streets:—

"The houses contain for the most part four rooms each, of very moderate size, and in very many instances each room is occupied by a separate family who wash, cook, eat, drink, and sleep in the same apartment, all their family arrangements being confined within four walls, which are seldom more than 10 or 12 feet apart. It has been well said that half the world does not know how the other half lives. Neither Dr. Read nor myself, although we have both of us lived a great many years in Sydney, could have credited without ocular inspection the terrible state of overcrowding which we witnessed in this locality. A simple description of the dimensions of the rooms, with the number of inmates they contain, will at once show the danger to the health of the community which must ensue from such a state of things." p. 36.

Then follows a description of the houses in detail. They add—

"The limited space in which whole families crowd together in these buildings is still further restricted by the fact that they keep their firewood as well as all their other possessions in the one small room; in fact there is no other place to keep it."

"No. 5 is also let to Mrs. Ryan, who sublets the rooms to separate families. The front room on the ground floor, let at 6s. a week, was occupied by a sick man, his wife, a daughter 15 years of age, and an adopted orphan boy nearly as old. This man was very ill, and urgently in want of medical advice. Seeing the necessity of the case, and that he required immediate attention, I gave his wife an order at once for medicine and advice at the Infirmary. The room in which this family were cooped up was in the same disjointed state of repair as the others I have noticed. A great portion of the ceiling had fallen down; the walls were in a filthy state; and the old-fashioned sash-windows precluded all chance of ventilation. Health for so many people in such a limited space, under such conditions, is physically impossible. This description will apply to the back room on the same floor, rented at 5s. a week, and occupied by a man and his wife, with a further cause of discomfort that it was swarming with bugs." p. 37.

"No. 6—Forbes owner—agent or lessee, McCormack—rented at 11s. a week and sublet. The front room down-stairs—10½ x 11 feet, let at 5s. a week—was very filthy and out of repair. This room was occupied by five persons, male and female—the youngest being a girl of 17 years of age. Such a small apartment would offer but very confined accommodation for five persons even in a cold country, and supposing it to be unused and ventilated by day; but when it is understood that the whole indoor life of five adults is spent in such a limited space, and that all their belongings in the shape of furniture, cooking utensils, and household appliances, as well as firewood, are crowded within the four walls, and that there is no other place for cooking and washing, it will be seen how essentially necessary to the preservation of health are thorough cleanliness and free ventilation, neither of which requisites were present. On making inquiries next door we were positively informed that occasionally nine or ten persons sleep in that room at night; in fact the neighbours called our particular attention to the disgraceful state of overcrowding in that particular apartment—and when the inhabitants of Rowe-street themselves complain of overcrowding, the fact may be accepted without further evidence. The back room down-stairs, let at 4s. a week, was in a tumbledown condition, close, and filthy; it was occupied by a man and his dog. The front room up-stairs, let at 5s. a week, was occupied by three Germans, and although clean was very much overcrowded, its dimensions being 14 x 11 ft., considering that half the available space was filled with firewood, cooking utensils, tubs, old clothes, &c., besides a box of very suspicious looking fruit, and that there was scarcely any ventilation. The back room, let at 4s. and occupied by a woman, was just as close and much dirtier; walls and ceilings much broken; passage and staircase filthy and very much out of repair; yard, 6 ft. 10 in. x 13 ft. 6 in., very badly drained, and containing a quantity of dirty soap-suds and a lot of old bricks; as usual, an obdurate landlord and no prospect of repairs." p. 41.

10. *Filthy Premises*.—There can be no doubt that the filthy condition of premises described in the evidence is due in many instances to intemperance, but on the other hand many tenements are in such a state as to render cleanliness almost impossible. Much may be done to remedy the evils coming under
this

this heading by stringent inspection, by attention to drainage arrangements, the removal of refuse, and also by enforcing upon the owners of properties the duty of keeping their premises in repair. That this duty is greatly neglected will be seen by a reference to our remarks in clause 14 of this Report. The following extracts will show a state of things calling for prompt interference:—

“The two upper houses in Clyde-street, owned by Mr. James Campbell, are in a shockingly unhealthy state; the closets are placed under the steps, and the stench from them is frightful. This has caused and is still causing a great nuisance; this is one of the most dangerous places as far as health is concerned we have met with as yet, and some immediate steps should be taken to improve it. At Nos. 14 and 16, Clyde-street, there is only one closet for twenty persons; the condition of the closet may be better imagined than described.” p. 30.

“We next proceeded to Miller’s Buildings, owned by Mr. Dickson, undertaker. There are fourteen houses in the court, containing two rooms each, 11 x 11 ft., with a small attic above, and let at 6s. a week; there are four water-closets for the fourteen houses. From one of these houses two children were removed the same morning by the police, almost in a state of nudity, unwashed, uncared for, and literally covered with vermin. The filthy condition of the room from which these unfortunate little outcasts were rescued may be better imagined than described. We were strongly advised by the residents in the court not to enter it, and we contented ourselves with peeping in. Some rags, the colour of dirt, scattered about the place, a rickety chair, and a pretence for a stretcher, constituted the furniture of the apartment. The bare walls and floors, begrimed with dirt, completing the dismal picture. On the door-step was a heap of human excreta, covered with an old straw hat. More wretched objects of destitution than these poor little children, who were in such a filthy state that while their case was being considered they had to be kept in the police shed, being unfit to enter the precincts of the Court, can scarcely be imagined.” p. 14.

Describing a house occupied by a cab-driver in Abercrombie-lane, the Committee state:—

“The scene which was exposed to our view in this hovel almost baffles description. The evils of intemperance showed themselves here in the most revolting form. Ryan, a man about thirty years of age, and a woman, a year or two younger, who we supposed to be his wife, and three children, were in a room below stairs. The polluted condition of the atmosphere may be imagined when it is understood that no fresh air goes through the room, and that there were heaps of human excreta on several parts of the floor. The man and woman both drunk, the latter sitting on a box with a child in her arms; the mother and child quite naked. As we entered she drew up an old skirt from the floor and held it in front of her. These people were too stupefied to give us any information, and we did not question them. The empty bottle at their side told the whole story! The furniture consisted of an old table, a broken chair, and a box on which were a few cups and glass alongside the rum bottle. We were rash enough to penetrate into the kitchen, and the result was that in two minutes we were swarming with fleas. Up-stairs there was a heap of rags, old and filthy, and what appeared to have been once a mattress was nothing more than a bundle of rotten flock and rags. Two drunken women were lying asleep upon it.” p. 44.

“Near Wells-street, on the west side, is a wide vacant space, forming part of a block extending to the Botany Road, the property of Mr. Woods, which seems to be a deposit for much of the filth of the neighbourhood. Where the vacant eastern part of this block joins the occupied western part, is a cluster of three closets built over one cesspit. This pit is about 12 x 12 ft.; depth unknown; and has not been emptied for four years at least; one of the occupants of a building close by, fronting George-street, who has lived there for that period, having assured us that it has never been cleaned out in his time; it is in a very foul and stinking condition. Two of these three closets, besides being legitimately used by thirty persons, are quite open to the residents in Bullanaming-street, and to any one else.” p. 76.

“Attracted by the dirty appearance of the second house (Bowman-street, Denison Ward) we entered it to make a closer inspection. The tenants informed us that it was a stinking hole, and that vermin abounded in it. We saw no reason to doubt either statement but everything to confirm it. The closet at the back is in a broken down dilapidated condition and in a filthy state, as was also the closet in the adjoining yard; we were obliged to leave hastily—we could not stand the smell. The drainage from these houses runs down along the surface gutters to a vacant piece of land close by, the stench from which is something frightful. The closet belonging to the house at the end of this row is in a shocking state of repair; the door is broken down, and a log of wood is placed over the seat to prevent the children from falling into the pit. The tenants of these houses all complained of ill health, and no doubt their dwellings are very unwholesome. The floors rest on solid earth, there being no excavation under them.” p. 78.

11. *Buildings unfit for habitation.*—Under this heading we comprise houses which are so out of repair as to be unfit for human habitation. At present there is no power vested either in the Corporation or any other body to compel the repair or removal of any dwelling-house, or other building, however dangerous its condition may be. No Building Act will have retrospective powers, and a special clause should be introduced into the Health Act to deal with such cases, similar to the 97th clause of the Imperial Health Act 38 and 39 Vict. ch. 55, which provides as follows:—

“Where the nuisance proved to exist is such as to render a house or building, in the judgment of the Court, unfit for human habitation, the Court may prohibit the using thereof for that purpose until in its judgment the house or building is rendered fit for that purpose; and on the Court being satisfied that it has been rendered fit for that purpose the Court may determine its previous order by another, declaring the house or building habitable, and from the date thereof such house or building may be let or inhabited.”

Such houses are unfortunately very numerous in Sydney. The following are some of the worst cases:—

“No. 143, Clarence-street, is an old weatherboard house, containing five rooms (Macdonald, owner), rented at 12s. a week; the closet is an old cesspit and in a filthy disgusting condition, and the yard about 8 ft. square. The rooms in this house are in such a tumble-down state that they are quite unfit to be occupied—in fact they are positively dangerous. The tenant informed us that the rain comes through the roof as through a sieve, and that there is a continual stench and moisture rising from the floor. The rooms upstairs are 6 ft. 2 in. high, and very badly ventilated; the closet, an old cesspit, filthy in the extreme; the stench from this place was sickening. No. 139, Clarence-street, same owner, same rent, is in a similarly dilapidated and dirty condition, with the same want of ventilation, and having an old cesspit for a closet, in an equally filthy state, with an old sack hung up in front in place of a door. The drainage from these houses finds its way under the floor, through a pipe, and empties into the street outside the curb-stones. All these houses seem to have been built by piecemeal, and vary in the number and size of the rooms. No. 137, also belonging to the same owner, rents at 15s. a week, has the same style of closet with the same frightful stench proceeding from it, and is in every respect an equally forbidding abode. These four houses may be classed as so out of repair, so badly ventilated, and so deficient in accommodation, as to be utterly unfit for human habitation, and as the land on which they are situated fronts Clarence-street, and is therefore valuable property, steps should at once be taken to compel the owners either to pull them down or to put them into repair, and to drain the locality.” p. 20.

“On the opposite side in Market-street, at the corner of Clarence-street, are six weatherboard buildings in the very last stage of decay (Lynch, agent). Any one who may be curious to know how long Colonial timber will last, until, by the combined action of the elements, white ants, and other sources of destruction it becomes triturated into powder, can satisfy their curiosity by ascertaining the date on which these houses were constructed. The corner house is occupied and used as a butcher’s shop; it is a filthy, stinking place, without any proper drainage, and in a most dilapidated condition, though rented at 21s. a week. The next house, occupied by a wire-worker, is just as bad; it obtains a rental of 10s. a week, and the two adjoining houses occupied by a manufacturer of Colonial ovens—one being used as a workshop and the other as a residence—rents at 21s. The same description will suffice for these: there is just enough solid timber about them to keep them up, but nothing to spare. The house adjoining the Colonial oven repository, however, deserves

deserves a more detailed description, since it represents the *ne plus ultra* stage of dilapidation. It contains two small rooms on the ground floor, with a ladder in the back room leading to a bed-room under the roof. Originally a weatherboard building it is now very difficult to say what it is, or what material in its composition predominates, so much patchwork has been necessary from time to time to keep it together. Here and there a board has been completely eaten out apparently by white ants, and the vacant space has been covered over with tin, paper, or anything else which was handy. The upstairs room has had a great deal of paper bestowed upon it during its days of respectability, but the paper has obstinately refused to adhere to the walls, though the process has evidently been repeated a great many times. The successive layers, which embrace a variety of patterns, now hang down from the walls in festoons, a sort of tapestry a quarter of an inch thick, and form a receptacle for dust, cobwebs, and other impurities. An old mattress lay on the floor of the room, and the tenant had adopted a very simple method of keeping the bed-clothes from contact with it during the day, by hanging them upon a batten placed against the wall at an angle of 45 degrees, just sufficiently high to keep them out of the dust. This house has also another peculiarity: it contains no furniture of any kind. Indeed there is no room for it, the entire available floor space being crowded with the stock-in-trade of the proprietor, who is a dealer in old clothes. Piles upon piles of garments of all sorts are stowed away below and aloft, which, like the house, appeared to be considerably the worse for wear. These may possibly be renewed to a certain extent by some artificial process, but no renovation is possible for the house itself. It is almost needless to recommend that no further efforts to prevent this house from falling down should be permitted. It occupies a valuable site, and should be replaced by a building of a more substantial character." p. 25.

"Quitting this neighbourhood (Wright's Wharf, next to Market Wharf) for obvious reasons as quickly as possible, we came to a two-roomed house facing Sussex-street, the back of which is 8 feet below the level of the street. This was in such a tumble-down dilapidated state that it must be positively dangerous to live in. Then to another shanty of similar style, which seemed even in a more dangerous condition; and then to a third, in which I should scarcely have considered it safe to take shelter during a shower of rain. These hovels obtain a rental of 5s., 5s., and 6s. respectively. They are utterly unfit for human habitation, and no one who is not afraid or ashamed to sleep out in the open air would ever venture to seek a night's rest in them. They are positively dangerous to live in and should be pulled down with the least possible delay; the wonder is that weatherboard houses should hang together so long. The tenants made the usual complaint that the landlord will do nothing. It appeared to us however that there was very little that he could do, except in the way of total annihilation." p. 36.

"The last two houses in this lane, before it joins Riley-street, are built of brick and shingle. The upper room of the first we entered was destitute of anything in the shape of furniture, the lower sash of the window gone and the upper one immovable. On the banister of the stairs were two pillows, some sacking, a few rags, and an old blanket. The walls of the room were besmeared with candle-smoke and grease, the ceiling was damp with the soakage from the rotten shingles of the roof; and, to add to the discomfort of the place, bugs were present in legions, running all over the walls. The place was in such a dirty and dilapidated condition as to be unfit for habitation. The kitchen at the back was in a similar state; the shingles on the roof were as rotten as could be, and patched here and there with pieces of old galvanized iron; the ceiling mildewed with damp, and part of the wall down." p. 45.

"We then went back to Queen-street, which is a continuation of Broughton-street, although diverging in a different direction. On the west side of Queen-street is a sort of court containing three two-roomed weatherboard houses, roofed partly with shingles, partly with iron, and other materials. These houses are almost tumbling down; they have been designed by the dead wall architect referred to so often. The occupants did not seem disposed to be at all communicative, but we saw enough to satisfy ourselves that the houses are unfit for habitation. The closet was as bad as any we have seen, and so exposed, being in the centre of the court, and facing the houses in Queen-street, that no one can approach it without being seen by the inmates of at least a dozen dwellings." p. 64.

"In a lane off this street (Harwood-street, Denison Ward), on the west side, are five brick and shingle tenements, owned by Mr. Kettle, containing two rooms, one over the other. These are unoccupied with one exception, and they are all, including the one occupied, utterly unfit for dwellings for human beings. The windows are gone in four out of the five, and the walls bulge out and threaten to fall on the passers-by. They ought to be pulled down immediately." p. 71.

"We next inspected Cuthill's Yard, which contains six houses on the east side and three on the west, built of brick and shingles, containing two rooms each and let at 6s. a week. Those on the eastern side are in a state of extreme dilapidation, every part except the bare walls the picture of ruin. Here as in all tenements of this class the back wall has no opening of any kind, and the only vacant space is the yard in front. The houses on the west side have only a ground floor; one of them is roofed with iron and the other two with zinc, the roof of the end house being retained in its place by heavy stones placed upon it. There was at one time a railing in front of these houses, intended to enclose a garden, but only enough of it remains to show what it was put there for; flowers do not bloom in localities like this. Almost all the windows in this court, especially those on the east side, are without glass or nearly so, brown paper and old rags being the principal substitutes; the drainage in the gutter was very offensive and the privy in a disgusting state." p. 76.

12. *Deficient Ventilation*.—This arises in most cases from the defective construction of the houses, many of which are placed back to back, so as to prevent a current of air from passing through them, or built against a dead wall, having no aperture for the ingress of air except the door and a solitary window in front, the upper sash of which is generally a fixture. In other cases small and low houses are placed in the immediate vicinity of lofty buildings, which form a complete blockade to light and air. In the houses occupied by Chinamen it has been found that these two requisites to healthy living are carefully excluded by boarding over the windows. A few structural alterations would in many cases convert what are now unwholesome tenements into healthy dwellings, but a number of these houses must be demolished before any sanitary amelioration can be expected. We quote a few instances in which the want of ventilation is especially noticeable.

The Dean of Sydney states, in answer to question 11:—

"I have just called to mind four houses in this city, in which I visited some sick persons some years ago, and I find they are still occupied. These houses are situated at the back of the 'Post Office Hotel,' and so closed in that it is scarcely possible for any fresh air to enter them. I paid a visit to a sick man who was in a room up-stairs in one of these houses, and I found there was no ventilation whatever; here was no fire-place; the window would scarcely open, and it appeared to me marvellous that the man did not actually die for want of air. There is only a space of about 4 feet between the 'Post Office Hotel' and this house, and now I observe it will be shut in still more by that fine block of buildings between York and Barrack streets. I could mention other houses which I have noticed in different parts of the city, which are blocked in a similar way—blocks of buildings existing in lanes and several *cul-de-sacs*, where I think the buildings should be removed as the ventilation in them must be exceedingly defective." p. 2.

In their inspection of Little George-street, the Committee say:—

"We paid a visit to Miss Gibbons, who occupies a two-roomed house round the corner. The peculiar features of this and the adjoining house is the Lilliputian character of the back premises and the ingenuity displayed by the architect in closing up all ingress to fresh air. One of the yards or passages is 5 ft. x 6 ft., and the other 4 ft. x 4 ft. On three sides of these yards there is a wall 20 ft. high, and if any ventilation were possible it could only be afforded by means of a windsail, which is quite as necessary here as in the hold of an immigrant ship. As for the closets it is indispensable that persons using them should back into them as a horse backs into the shafts of a cart, since there is no room to turn round at the end of the passage." p. 18.

"In the adjoining yard (Queen's Place), which is portion of the same property, we inspected a row of cottages, which, in a sanitary point of view, are quite unfit for human habitations. The front doors were open, and we could see that the lower rooms were not more than 6 or 8 ft. wide. We could also perceive a ladder leading to a very small apartment above; but the window upstairs does not open, and there can be no ventilation of any kind. Some light may enter from the small panes

of glass in front, but there is no sash to raise or let down, and the ingress of fresh air is impossible. Just in front of the doors and running parallel with the row of cottages, of which there are six, is an open drain which discharges into a large hole in the wall enclosing the yard, direct into the Tank Stream. When this sewer is full a regurgitation takes place, so that the inmates of these hovels have in front of their doors, within 3 ft. of them, a sort of tidal stream of filthy drainage, polluting the atmosphere and inviting pestilence and disease. These cottages should be pulled down at once and should not be replaced by any others. The closets used by the inmates are beyond description. This was our second visit to this place, which, it must be remembered, is in the centre of the business part of the city, not more than fifty or sixty yards from the Exchange, and some attempt had been made to give it a cleaner appearance. The above description may therefore be taken to represent the place at its best." p. 19.

Speaking of houses in Waine's Lane, off Druitt-street, they say:—

"No. 2.—Deering agent—is built of stone, and was at one time apparently a three-storied store, now converted into dwellings of three rooms one over the other. The rooms are 12 by 18 ft. and 7 feet high, but are so wretchedly ventilated, there being no openings in the back wall of any kind, that living in them must be very unhealthy. They are occupied by a workman, his wife, and a number of children. This man told us that he found it impossible to sleep at night on account of the closeness of the atmosphere, and expressed his satisfaction that some kind souls were taking an interest in his welfare. The next two houses, Nos. 3 and 4, were very similar to the last as far as ventilation is concerned, No. 4 being smaller and let at only 6s. a week. There is no window at all in the lower room, and when the door is shut the inmates are in total darkness." p. 46.

13. *Drainage and disposal of refuse.*—The drainage of Sydney is in a wretchedly defective state. A great deal of the evil will be remedied when a complete system of underground sewers has been carried out, and as that question is under investigation by another committee of the Board we have no recommendations to make on the subject. The members of our committee in carrying out their personal inspection of the different wards of the city have, however, thought it right to record their impressions of badly drained localities. That much ill-health is caused by the collection of refuse in places where there is only surface drainage there can be little doubt. The removal of this refuse is a matter directly in the province of the Municipal Councils, and we have nothing to do with it. We may, however, remark that the neglect in respect to these matters, disclosed by the evidence, points strongly to the necessity of appointing some supervising body, such as a Board of Health, to compel the local authorities to do their duty. Examples of this neglect will be found in the following quotations from the evidence. Describing a lane between Union and Sussex streets, the Committee say:—

"All the drainage of these houses runs along the surface; there are no stench traps to the drains, but any amount of stench. These are all four-roomed brick-houses, rented at 13s. a week, and owned by Gregory Board. They might be made healthy if steps were taken to compel the owner to connect them at once with the sewer, and to substitute water-closets for the horrible and disgusting privies which now contain the accumulation of years and convert the place into a complete fever den. The prevalence of sore throats in this spot induces us to call the immediate attention of the Scarlet Fever Committee to the locality. The harbour is only 100 yards distant, and if a 9-inch pipe were laid down from this property to the Bay, the evil, if not entirely removed, would be greatly mitigated." p. 35.

Robin Hood Lane and Hamilton-street, Bourke Ward, are apparently in no better condition.

"There is no proper provision for drainage. Just immediately under the window of the bedroom, and not 3 ft. from it, is a large hole apparently without any trap, which receives a greater portion of the drainage from this and the adjoining yards. From this hole flows, under the houses a stream of filth, carrying with it fever, sickness, and disease. The stench from the neighbourhood of this drain is something frightful. Close by, but on the next property, there is a heap of yard rubbish, the accumulation of years, as high as the eaves of this house, which sends forth a most offensive smell; and yet so suffocating is the temperature in No. 6 that the tenant said she preferred to sleep with the window open, directly in face of this nuisance, to suffering the heat inside. The question is literally one between slow poison and suffocation. This poor woman, who is very intelligent, when informed of the object of our visit, exclaimed—"Thank God somebody has taken the matter in hand, and not before it was needed." There was evidence in one or two flower-pots about the yard of her desire to have things clean and tidy about her; but cleanliness, as well as health, is absolutely impossible in such a wretched hole." p. 43.

"All the people in this yard (Seale's yard, off Goulburn-street, Philip Ward), without exception, complain of the horrible stench in the place, and no wonder, for there is a surface drain running down the centre of it, which discharges into an open gully without trap; this is within 2½ ft. of the window of one of the houses. The closet is an open cesspool, 16 ft. long and 4½ ft. wide, and nearly full, the contents of which kept bubbling up as if in a state of fermentation: the stench proceeding from it was horrible. This pit has four closets or compartments built over it, and is used not only by all the tenants in the yard but by the occupants of three houses fronting Goulburn-street. On one occasion we were told a man was found dead in one of these closets: whether he died from the effect of the closet itself we did not learn; the place is bad enough to cause death indirectly if not suddenly. Just inside the entrance to this yard is a large heap of horse refuse, which the tenants informed us is cleared away once a fortnight. The dustman came with his cart while we were there, and would fain have persuaded us that his visits were made weekly, but it was clear that such was not the case, except perhaps theoretically." p. 48.

"There are from forty to fifty persons residing in this court (Blake's buildings, off Haymarket), and they all complain bitterly of the impurity of the atmosphere, the closeness of their tenements, and the discomfort of the place generally from the absence of covered drains and the want of proper closet accommodation. They say they cannot sleep at night, and no wonder in such ill ventilated quarters. The owner of this property should be compelled to connect his houses with the public sewer which runs within a few yards of them. No better test of the unhealthy character of these dwelling places could be afforded than in the sickly and squalid appearance of the children. With no covered drain to carry off the drainage, with house slops and refuse thrown about in all directions, and with one filthy closet, used by nearly two score individuals, tainting the whole atmosphere, how can they be expected to thrive? The residents in this overcrowded place stated, as a sort of apology for the uncomfortable condition of their dwellings, that it was impossible to find other quarters without going a long way out of town." p. 57.

"I cannot conclude my account of to-day's inspection without calling special attention to the state of the gutters in Queen-street (Glebe) and the streets running parallel to it. Every provision seems to have been made for the drainage of the yards directly into these gutters, but nothing further has been done, and there the refuse lodges and remains. It comprises dead dogs and cats, dead fowls, bones, decayed vegetable matter of all sorts—in fact, rubbish and waste material of every kind. There it lies for weeks at a stretch. The liquid portion of it finds its way down Bay-street to a vacant piece of ground off that street about 60 ft. square, from which it seems to percolate between and under the houses in the direction of Blackwattle Bay. Many of the persons with whom we got into conversation complained of the continued neglect of the Glebe Municipal Council in not having the gutters swept out for months. One gentleman told us that Dr. Markey had been attending his family for two months, all of them being sick with scarlet fever, and that the doctor had stated that the illness was caused by the filthy state of the gutters in the street. Queen-street is a narrow street only about 20 ft. wide." p. 64.

"In a narrow lane about 12½ ft. wide, running from Norton-street to Denham-street (Glebe), are five houses built of wood, and containing two rooms each—Bennett owner; rent 4s. 6d. a week—the rooms, which are 12 x 10 ft., are badly ventilated, there being no windows at the back. In front of these houses at the edge of the lane are an equal number of closets belonging to the houses in the neighbouring street—common cesspits, stinking badly. These with their own closets—also stinking cesspits—which are in the yard at the back, 15 ft. wide, place the unfortunate residents in this lane as it were between two fires; they have the same stench back and front, and no matter which way the wind blows it is a foul wind for them." p. 65.

"Taking

"Taking the whole of this westerly portion of Cook Ward, from Cooper-street to Gipps-street, we noticed that the drainage is in a disgraceful state, and there can be no doubt that the health of the residents in it suffers just in proportion to the neglect of this important question. It appears that the architect or builder, in erecting a new building, in nine cases out of ten makes no provision whatever to carry off the house slops, which are thrown down in the yard, and run according to the inclination of the ground into the street, or on to some piece of vacant ground, where they stagnate and become a fertile source of fever and disease." p. 84.

14. *Neglect of property by owners.*—A perusal of the accompanying evidence will show that disinclination on the part of landlords to go to any expense in keeping their property in repair, even to the extent of an occasional coat of whitewash or paint, is the rule rather than the exception in Sydney. This argues a certainty of finding tenants to occupy the houses, whatever may be their condition, which would not be the case if dwellings for the working classes were not so scarce. This scarcity is proved by the fact that the rent of such houses has of late considerably increased. The evil referred to under this heading is intensified by the absence of any authority to compel the owners of properties to keep their tenements in habitable condition. Full powers should be given to the local sanitary authority to serve notice on owners so offending, and in default of remedy by them to make the necessary improvements at their expense.

The accompanying extracts will show how general is the complaint on the part of tenants that "the landlord will do nothing."

"What struck us most forcibly during our visit to these crowded localities was the total absence of any attempt on the part of the owners or landlords to do anything in the shape of repairs, or to improve the sanitary condition of the dwellings. We noticed no signs of lime, or white-washing, paint, or any attention paid to the drainage of the allotments. These essentials to the preservation of health do not appear to have engaged their attention at all, and there can be no doubt that the water used for domestic purposes in such abodes of filth and wretchedness must in many cases be polluted. The want of some sanitary authority, whose special business it should be to interfere in these cases, and to compel, where necessary, landlords to provide such accommodation as will render health and cleanliness at least possible, seems to us very urgent." p. 6.

The Dean of Sydney states in his evidence, in answer to question 4 :—

"But I attribute a great deal of the bad condition of the dwellings to which I have alluded, to the landlords, who appear to leave them without any repairs or any purification whatever from year's end to year's end. I have known houses which have never been whitewashed or painted or improved in any way for many years. Not long ago I visited one family, and I learned from the mother, a respectable woman, who had lived there for thirteen years, that not the slightest repair had been done to the house since they came into it; the plaster had fallen off the walls and the floor was ripped up in several places. I asked why she lived in such a place, and she said she was applying continually to the landlord, but he would not so much as put a single nail into the floor. I believe that it has since been in some measure repaired; but that is only a sample of hundreds of houses which I have visited in this city." p. 1.

Referring to certain tenements in Clarence-street, the Committee say :—

"The tenants all state that the landlord positively declines to improve them; these people occupy them while in this condition solely because if they were to leave they would not know where to find other houses to live in, decent houses at a moderate rent being very scarce in the neighbourhood." p. 20.

"We examined another old brick house in Union-street, also owned by Walsh, containing two rooms, 10 x 10 ft. and 8 ft. high, occupied by a mangle-woman. This was also in a filthy state and badly ventilated. The tenant stated that she had lived there six years, and that during that time the house had never been cleaned out or whitewashed. The landlord positively refused to do anything." p. 32.

"The tenant of this house (Wexford-street), who has six children, told us that although she had lived there for five years the landlady had done nothing towards cleaning or repairing it." p. 54.

"Paradise Row, off Abercrombie and Myrtle streets: This property consists of twenty-four weatherboard houses with slate roofs, owned by Thomas Broughton, Esq.—Carter, agent. The houses are chiefly two-roomed tenements, rented at 4s. per week. The neighbourhood in which they are situate bears about as bad a reputation as any we have yet visited; the houses are in a very dilapidated state, many of them being empty on account probably of their uninhabitable condition. The agent, a well-known character, with one arm, would persist in following us about during our examinations, and inciting the tenants to resist our entrance into their houses. I am sorry to say that in many cases he succeeded; his language was not of the choicest description and his conduct was very obstructive. He told us he had been fined on account of these places a short time ago, and 'he'd take (strong adjective) good care that he would not be sucked in again.'"

15. *Deficiency of closet accommodation.*—The disgraceful condition of the back yards and closets attached to houses in many parts of Sydney, brought to light by the close inspection carried out by members of this Committee, should alone be sufficient to show the necessity for sanitary legislation. So inadequate and of such a wretched nature is the privy accommodation provided in some quarters, that as many as forty or fifty persons have to make use of one closet, and it is almost impossible to convey an adequate description of the repulsive character of these structures. Such a state of things is not only prejudicial to health but is repugnant to all ideas of decency and morality. We call especial attention to the evidence collected on this point, from which we quote some glaring instances. The Imperial Public Health Act, from which we have already quoted, not only provides that a penalty of twenty pounds shall be enforced, in case of any house being built or re-built "without water-closet, earth-closet or privy, and an ashpit furnished with proper doors and coverings," but it authorizes the local sanitary authority, on the report of their surveyor or inspector of nuisances, to require the owner or occupier of every house to provide them within a reasonable time. Similar power should be given to a like authority here, and rigidly enforced. (*Vide* 38 and 39 Vict. ch. 55, clause 36.)

We are glad to learn from His Worship the Mayor that the City Council have been actively carrying out the provisions of the "Nuisances Prevention Act of 1875," passed on the recommendation of the Board, and that from the passing of the Act up to the 27th ult., 450 new closets have been constructed, 3 ft. square and 4 ft. deep, properly bricked and cemented, the brickwork being raised to 2 ft. above the level of the yard and that 423 old privies have been pulled down and re-built in like manner. We also learn that the City Corporation are now removing from 90 to 100 tons of night-soil weekly; the Act giving the Corporation power which they did not possess before, to compel the thorough emptying of the closets, instead of just so much of their contents as would abate the nuisance.

"We

"We next inspected a block of buildings at the corner of Syllas-lane and North-street, and spent some time in examining a group of houses and cottages at the back, which we may class as entirely unfit for human habitation. The rooms are low, not more than 7 feet high, and in a small yard, 5 feet x 6 feet, there is one closet for six houses. In another, two closets, one of which is out of order, for about forty houses, and there is an absence of water to keep them clean. We also inspected some houses in St. John's Place, Sussex-street, which were in very bad condition, the ventilation being exceedingly deficient, and there being only one closet, without any door, for four houses; the stench from this closet was unbearable. Health under such circumstances is simply impossible." p. 4.

"In this property (North-street and Syllas lane) there are altogether twenty-one houses, or cottages, containing two rooms each, and rented at 6s. a week. It will hardly be credited that for these twenty-one houses, which contain at an average five tenants each, there are only three water-closets, one of which is out of order and the others without doors or with broken doors. Such a state of things requires no comment." p. 5.

"We inspected seven houses up an entry from the street at this point (Cumberland-street Watchhouse), which are also very badly ventilated; there is only one closet for twenty persons." p. 8.

The following is the description of a house in Cowper-street, Glebe :—

"The next house, built of stone and brick, containing three rooms, and is in the same ruinous condition; the floors are broken, and there is scarcely a pane of glass in any of the windows. The tenants of the house just described are without a closet, but the occupants of this house are not quite so badly off, for they have an apology for one. A great portion of it, including the seat, is broken down, and is fallen into the pit; it has no door, the usual substitute, an old gunney-bag, not even being provided, and any person making use of it must necessarily crouch over the place where the seat used to be, and hold on by the door-posts which still remain. In this position, the boards on either sides having long ago disappeared, he affords a spectacle of indecency to the occupants of all the adjoining houses. This closet occupies a prominent position in the back premises, and thus the whole neighbourhood becomes privy to the visits to it. The cesspit is in a most filthy condition, and there is no sewer to carry off the drainage." p. 63.

"The next house (for which Pile is also agent) was occupied by five persons, and is in the same state of repair; there is no opening in the back wall, and consequently no ventilation. The closet, built of paling, is erected over a common cesspit, which was quite full so that the stuff oozed out at the back. The door of this place has long since disappeared, and there is evidently no intention to replace it. The tenants of the house who make use of the closet have, however, some slight regard to decency, and they make a feeble attempt to close themselves in by means of a sugar-basket which the occupant holds up before him until he comes out, when it is thrown down on the ground outside, to be picked up and made use of in the same way by the next comer." p. 63.

16. *Chinamen's Quarters.*—A special and very rigid inspection of all tenements occupied by Chinamen should be instituted. These people may be inoffensive so far as any overt breaking of the laws is concerned, but it is a question whether the state of moral and social degradation in which they live is not a greater offence to the well-being of the community. We append a paper on "Opium and Opium Smoking" (*vide Appendix A.*) which will give some idea of the prevalence of vice and depravity induced by this enslaving and degrading practice. It will be seen by the extracts from the evidence quoted below that this habit is not confined to the Chinamen, but that numbers of European women haunt their smoking dens, and become slaves to its use. This results in fearful immoralities which do not come to light, but which are far more frequent and wide-spread than would appear. A great deal of overcrowding takes place also in most Chinamen's houses, and the midnight orgies which are carried on in some of the upper rooms, from which all light is carefully excluded, no doubt exceed any of the scenes witnessed by the members of this Committee in their visits of inspection. A stringent enforcement of the provisions of a good Health Act, combined with frequent inspection, will, however, do much to remedy this state of things, but it may be worth while for the Legislature to consider whether special legislation should not be directed to this growing evil.

Describing a Chinaman's den in Queen's Place, not more than 50 yards from the Exchange, the Committee state :—

"It is 37 ft. long and 11 ft. high, and divided into three rooms, in each of which is an opium bench, with all the appliances necessary and ready for use at once. Charley is a seller of opium and an inveterate smoker as well, or his appearance greatly belies him. J.E., a white woman, aged twenty-two, who lives with him, also indulges in this demoralizing habit, and their place is an accommodation house of the worst character, for it is impossible to say what diabolical offences are not committed through the agency of this pernicious drug. Of this more hereafter. The woman told us that sometimes their customers were so numerous that they had to wait their turns to enter the room. This unfortunate creature appeared to be completely under the bondage of opium, and the police assured us, and she herself admitted, though her paramour stoutly denied it, that other white women frequent the place, and that the most revolting and immoral scenes are of frequent occurrence. In corroboration of this statement, she mentioned among the names of her visitors some of the most disreputable prostitutes in Sydney. If half the stories we heard were true, it is more than time that this and other similar foul dens of Chinese depravity should be cleared of their occupants and thoroughly purged, for their existence is a blot upon the character of a city like Sydney." p. 18.

"The bedroom of a Chinaman is a square compartment with room for two occupants, in which he keeps all his belongings, and which serves him as a smoking-room, sitting-room, and bedroom. The rooms are generally boxed off in this way into compartments, which represent so many separate dwellings under one roof. The workshop referred to was crowded in every part of it, not occupied by beds with unfinished furniture, leaving only a narrow passage in the centre. No attempt seemed to have been made to clean the place, nor could we see any lavatories or appliances used in other houses; if these people ever wash themselves they do it by stealth. The attic-room in Ah Toy's house, fronting George-street (the owner of which is Mr. Redman), is 7 ft. high, and as near as we could guess about 14 ft. x 10 ft.; it is divided into eleven compartments, is without ventilation, and very dirty. The closet attached to the house was in a frightful state. At the back of the house is a store used as a workshop, and on the upper floor of this building we saw a number of beds—apparently double beds—and several opium benches containing lighted lamps, pipes, &c., ready for use at a moment's notice. Everything in this apartment was in confusion, and in a filthy state—articles of unfinished furniture piled up in every available space. The attention of Insurance Societies and Fire Brigades should be called to this place, for if a fire were to take place in this part of Sydney the result would be disastrous, and the loss of life and property great." p. 19.

Speaking of premises occupied by a Chinese carpenter in Castlereagh-street, the Committee state :—

"Nineteen persons live on the premises, all single men, except one married man who goes home to sleep. In a room on the ground floor, 12 x 10 ft., we saw four beds. There is no ventilation in this room. The air can only enter it through the door; and it has very little light, there being only a small pane of glass looking into the shop. The proprietor was sick in a room or compartment on the ground floor. Upstairs, over the workshop, were four beds in one room and three in another. Ventilation wretched throughout, the windows being shut in by adjoining buildings; rooms dirty; kitchen very dirty; and the usual disgusting smell of opium smoking from basement to roof. The closet reeking with urine—the boards and the floor being positively saturated with it—a stream proceeding from the floor of the closet into the yard." p. 28.

"We visited and inspected several other hovels of various dimensions occupied by Chinamen, for which Turner is agent; but as they all present the same characteristics it is not worth while to particularize: they have no windows or openings, except the doors, and are therefore unfit for human habitation.

"In

"In one of them we found another white girl, about 20 years of age, living with a Chinaman. Both were on the smoking bench, inhaling the fumes of opium, when we entered; the girl denied that she lived there, and said she was only on a visit. This woman when we entered was lying in the inner room, on the smoking bench, which in a Chinaman's house is also the bed, in a state of partial stupor, under the influence of the pernicious drug; her eyes had a glassy look, the pupils were dilated, and she was altogether in a perfectly helpless state. We roused her for a few moments, and obtained one or two answers to our questions, when she again relapsed into insensibility, and it is doubtful whether she would remember our visit at all. She said she was not married to the Chinaman; and it appears that when once white women become subject to the tyranny of opium administered by a Chinaman, the latter care very little to avail themselves of the marriage rite. A woman in this state is at the mercy of any Chinaman who may enter the house. One of these places, occupied by two Chinamen, we found to be only 7 ft. x 4 ft., and about 6 ft. high." p. 50.

The following extract is from a description of Chinamen's quarters in a court between Pitt and Castlereagh streets:—

"The next house we inspected was also a two-roomed tenement occupied by Chinamen, sellers of charcoal and firewood. The place, like the others, was very dirty, and the dirt, which had accumulated on the floors was so full of fleas that we were covered with them at once; there was no mistaking their presence. In all other respects there was no difference—the same careful exclusion of light and fresh air, the same style of smoking-benches or beds, and in place of any other furniture a large quantity of firewood and charcoal. In the upstairs-room I counted twenty-four bags of charcoal, but there was one peculiarity in this room which we have not observed before in a Chinaman's quarters—a bed, properly made up with sheets and blankets; that was, however, the only evidence in the house, of a regard for cleanliness or comfort, as we understand the terms; everywhere else we could see nothing but dirt, firewood, and charcoal. In the yard, and running through the middle of it, was a filthy open drain, while the water-pipe discharges its contents so that a stream of water runs under the house, and materially adds to its unhealthiness. The water-cask was green and slimy from neglect, and as for the closet—an old cesspit—I have no term in my vocabulary sufficiently strong to describe it. I have frequently been obliged to use the word stinking when speaking of closets attached to houses occupied by Europeans; applied to closets used by Chinamen this word must be understood in its superlative sense. Tenements occupied by persons of such filthy habits, and kept in such a dilapidated as well as dirty condition, should not be allowed to remain as they are. The owners should be compelled to have them properly ventilated and to keep them in decent repair, and some supervision should be exercised over the people who occupy them, for there can be no doubt that a great deal of overcrowding takes place. I feel satisfied that in scarcely any instance did we obtain reliable information as to the number of persons who resort to these places at night. At the time of our visit on Tuesday we had a glimpse of several women who were evidently coming to pay their daily visit to one or other of these Chinese dens, but who slunk away on seeing us." p. 53.

17. *Additional sources of ill-health not included in the above headings.*—Among these must be reckoned the noxious effluvia from sewage matter along the shores of the harbour, and the diffusion of sewer gases in the streets and in houses from imperfect drains and trapping. Also nuisances connected with cow-yards, with clandestine slaughtering, and with certain manufacturing operations. Although we are aware that these matters do not come strictly within the scope of our enquiry, yet they are such crying evils, and have presented themselves so often and so prominently before us in the prosecution of our work, that we have thought it necessary to mention them, and to give the following extracts:—

"At midnight we found ourselves at the foot of Liverpool-street, at which place the stench from the head of Darling Harbour was offensive to a degree which we could scarcely have credited without personal experience of it. It appeared to us a matter of surprise that any persons could live at all in the immediate vicinity of this nuisance. It was low-tide at the time,—the whole of the foreshore was exposed, and the air reeked with poisonous exhalations from the drainage polluting the harbour. Suffice it to say, that nothing that has been said or written on the subject of this horrible nuisance can equal the foul reality." p. 4.

Describing a cow-yard in Market Row, off York-street, the Committee state:—

"Although the yard is kept clean there is an abominable stench, which, the tenants say, is always the case. We searched the neighbourhood carefully to find out the source of the stench, and we strongly suspect that it emanates from a cow-yard close by, in which there are stalls for nine cows. The wife of the owner of this yard (Mrs. Corry) told us that it had been established there for seventeen years. It is paved with brick, and although it is said to be washed out twice a day, the bricks seemed to be so saturated with the droppings and filth from the cows that we felt convinced the stench complained of must proceed from this place." p. 25.

"On one side (referring to an allotment in Castlereagh-street) is an old shed about 20 feet long, in which were six dirty dejected-looking cows, three of which were lying down, and three standing up. I suppose they take it in turn, for there certainly is not room for them all to lie down at the same time. On the other side of the yard was a large heap of cow-dung, and a filthy water-cask. If that is the source from which the milk is watered as well as the cows the customers have just cause for alarm. We can only express our surprise that such a state of things should be allowed to exist on ground fronting a main street, almost in the heart of the city. There were a number of ducks and fowls about the place which did not help to make it cleaner." p. 58.

"We examined a cow-yard in Francis-street. The cows which are milked here must be of the poley breed, for the only entrance to the yard is a passage between two brick walls, just 2½ feet wide. We found stalls for three cows, which were filthy in the extreme. This place is owned and occupied by Mrs. Ryan, a milkwoman, and it certainly reflects no credit upon her. The house is built of weatherboard and contains two rooms, 15 x 11 feet, one over the other; there is no opening in the back wall, except where some of the boards have tumbled down from sheer decay and have not been replaced. This place cannot fail to be very unhealthy, and the place allotted to the cows, which is very small, is close to the door of the dwelling." p. 65.

"At the bottom of this street (Chambers-street, Denison Ward), runs the creek which carries off the waste water from the Colonial Sugar Company's Works. This creek is the subject of bitter complaints; every one seemed to denounce it as a nuisance; yet strange to say, allotments of land on its very banks are fenced off and have nice looking cottages recently erected upon them. Decidedly there must be a suicidal tendency among the residents of this neighbourhood when such poisonous places are selected as building sites. This part of Sydney requires immediate attention, especially in reference to its drainage; unless some improvement takes place in this respect it is liable at any moment to the outbreak of some deadly epidemic. The conditions which exist must at least so predispose the inhabitants to receive disease that when it does make its appearance it will assume its worst and most fatal form. The deposit on all sides on the surface of deleterious matter in the shape of drainage and house refuse is continually generating gases which are most inimical to health." p. 70.

In a lane off Merrion-street, Waterloo, the Committee inspected some very suspicious looking premises:—

"Upon inquiry we were informed that the premises in question are used for slaughtering at night—that sheep and pigs are constantly killed there at night time when there was no fear of detection, and that the pipe in question is used to carry away the blood and waste liquid matter. This accounted for the dead silence which reigned over the place during the busiest hour of the twenty-four. The presence of a few sheep nibbling at the tufts of grass inside the gate seemed to add testimony to the truth of this statement. The existence of this nocturnal slaughterhouse does not say much for the activity of the municipal officers, though no doubt there is a difficulty in catching the offenders, as the Act requires, *in flagrante delicto*." p. 82.

18. From the evidence now submitted it will be apparent that there can be no difficulty in accounting for the high death-rate which has unhappily obtained in Sydney for some years past; the wonder is that with so many predisposing causes to disease, including intemperance and other vices not treated of in this report, the epidemics which have visited us have not been more severe. The sanitary supervision of Sydney is obviously insufficient, and it is clear that the health of the community is greatly endangered by preventible nuisances.

19. It appears to us that the remedies should consist in,—

(1.) The appointment of a Health Board for the whole Colony, with local Boards in all Municipal districts, under Act of Parliament.

(2.) The passing of a Building Act, which should be put in force with as little delay as possible, before the rapidly extending suburbs of Sydney are spoilt by the present system of cutting up the allotments.

(3.) Giving extended powers to Municipal Corporations, or to Boards of Health, to enable them to run drains and sewers through private property where expedient; to take charge of courts or lanes which are private property as if they were public streets; and to buy up unhealthy tenements and crowded areas so as to open up broad thoroughfares in closely packed quarters of the city, and to prepare the way for more wholesome dwellings.

(4.) *Improved dwellings for the working classes.*—The measures we have suggested, if carried out effectively, will necessarily cause some displacement of the population, and as we are convinced that no other remedy will meet the evil, we think the Board should recommend the Government to take into consideration the necessity of providing improved dwellings for workmen. This question has received of late years much attention in the larger centres of population in Europe. The Corporation of the City of London not long ago set apart a valuable plot of ground, near Farringdon Road, Clerkenwell, and voted £120,000 towards the erection of houses expressly for working-men. The buildings comprise shops, and separate and distinct tenements for families. Each tenement has a washhouse, with water supply, sink, water-closet, coal place, copper, and dust shoot. All the rooms in the building are provided with fire-places, and the living rooms have ranges, oven and boiler, cupboards, dresser, &c. The rules for the tenantry are simple and excellent; thus the 5th rule directs that “no tenant will be permitted to under-let any of the rooms in his occupation, without express permission.” The tenements are let by an agent of the Improvement Committee of the Corporation, and preference is given to the artisan class. The rent charges are fixed, but their amount varies, according to position, from 6s. to 7s. 6d. a week for three rooms and separate wash-houses, and from 4s. 6d. to 6s. for two rooms. The receipts are satisfactory, being sufficient to indicate a return of about 5 per cent. on the outlay. The same plan has been adopted in Liverpool, Glasgow, Lambeth, Newcastle-on-Tyne, and other large towns in England and Scotland. In other places companies have been formed for the purpose of buying up properties on which to erect improved dwellings, combining all the sanitary conditions of adequate space and thorough ventilation, with proper domestic conveniences; and it has been found that these can be erected to meet the requirements of artisans at a cost which allows a fair per centage upon the money invested. From the rents obtained for the dilapidated and unhealthy buildings described in the evidence it is clear that in Sydney such investments would prove equally safe.

20. In comparing the density of population in different cities, or in different portions of the same city, it is customary to state the number of inhabitants per acre, and in a general way it may be shown that under like conditions, the average mortality is proportional to the density; but the comparison is liable to be deceptive, and the rule is by no means of uniform application. In Sydney, for example, the inhabitants of Bourke Ward are said to be at the rate of only 21·8 to an acre, and of Brisbane Ward 85·1, yet the death rate, recently published, gave 89·5 per 1,000 to the former, and only 34·8 to the latter. The fact is, that Bourke Ward, lying east of George-street, and north of King-street, contains the Infirmary and some of the most unwholesome houses in Sydney; but it also embraces in its area the Outer and Inner Domains, and the Botanical Gardens. The population of the city is said to be at the rate of 51·3 per acre, and the death rate for 1875 was 29·76 per 1,000. London is said to have 39 persons per acre, and a death-rate of 26; Liverpool 94 per acre, and a death-rate 30. In the experience of the Metropolitan Association for providing improved dwellings for the labouring classes in London, it has been found that the rate of mortality has been greatly diminished, although the number of persons per acre has been much increased.

21. In conclusion, we desire to impress upon the Board the urgent necessity for speedy sanitary legislation. To make Sydney the wholesome city which with its natural advantages of climate and position it ought to be, we consider it necessary to confer upon an independent Board very large powers; so large as only the magnitude of the evils before us could justify, and as only a wise discretion in their exercise will save from being arbitrary and tyrannical, or will cause them to be tolerated by the citizens generally. Without such powers, exercised firmly and discreetly, we are hopeless of ever seeing any general amelioration of the low sanitary condition of Sydney. To settle all the details of the Acts we have indicated will require much wisdom and care, but the legislation of other countries already affords excellent models, and in this as in most other human affairs—"Where there is a will there is a way."

Board Room,
Sydney, 7 August, 1876.

J. SMITH,
Chairman of Committee.

Evidence taken before No. 11 Committee.

FRIDAY, 12 NOVEMBER, 1875.

Present:—

B. PALMER, Esq.,
G. F. DANSEY, Esq.,

R. B. READ, Esq.,
M. CHAPMAN, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

The Very Rev. Macquarie Cowper, Dean of Sydney, called in and examined:—

1. *Chairman.*] This is a Committee, Mr. Cowper, of the Sydney Sewage and Health Board, appointed to inquire into the overcrowding which is believed to prevail in Sydney, so far, of course, as that overcrowding affects the general health of the inhabitants. It appears to me that in the course of your experience of the city you must have come across a great deal of this kind of thing, and I shall be very glad if you will give us the benefit of that experience? In the visits which I have been in the habit of paying, for many years, to the different parts of the city, of which I have had the spiritual oversight, my attention has often been drawn to the evil effects of overcrowding; and, although I am not prepared at the present moment with any particular facts respecting it, inasmuch as I was not aware of the special points upon which the Committee would desire to examine me, still I am aware of many localities in which this overcrowding takes place. My attention has been drawn to several alleys and courts in which a great deal of this overcrowding occurs, and in which the ventilation is very defective, and where, from these causes, very injurious effects upon the health of the inhabitants must be produced.

The Very Rev.
Macquarie
Cowper.

12 Nov., 1875.

2. Can you indicate some of the worst places you have met with in this city? I should say that Clarence-street and parts of Sussex-street are about as bad as any: Goulburn-street also is very bad. My attention has been directed much more to the moral than to the physical evils resulting from this cause. I believe that in Clarence-street, from what I have seen in the common lodging-houses, there must be at times a great deal of overcrowding. Some fifteen months ago I endeavoured to obtain correct information with regard to some houses of that character, and I found that the number of persons lodging in them was considerably larger than could be consistent with health, the houses themselves being generally in a very filthy condition, and many of them without any proper ventilation. I think that out of twenty-three houses, the condition of which I inquired into, there were thirteen where the ventilation was bad or very defective. Many of the houses were at the same time exceedingly filthy, and I could but believe, and I believe now, that a good deal of disease must be generated by the foul air and the impurity of the rooms thus occupied.

3. I suppose you have found that filth and overcrowding invariably go together? Yes, they must do so. The smell in many of these houses, when as clergymen we are called to visit them, is hardly bearable.

4. I suppose you have found in your experience that the class of people who inhabit houses of this kind have a singular aversion to fresh air, because it is generally cold air? Yes, that is the case. There was a lane which, I dare say, you will recollect—it may be remembered as being rather notorious—Syrett's-lane, in Sussex-street—which was occupied by prostitutes to a large extent. I was informed that there were not less than fifty-seven prostitutes in that lane not less than two years ago. I made it my duty to visit all the houses in that lane—myself and my curate—and we found a terrible state of physical as well as moral impurity existing there; but I believe that has been somewhat improved since by the purchase of two of the houses in that lane, and of six houses in Liverpool-street adjoining, by a gentleman who is going to rebuild. The effect of the movement which took place at that time was the removal of most of the prostitutes from that spot. Persons so demoralized have generally very filthy habits, and their houses are often unclean. But I attribute a great deal of the bad condition of the dwellings to which I have alluded, to the landlords, who appear to leave them without any repairs or any purification whatever from year's end to year's end. I have known houses which have never been whitewashed or painted or improved in any way for many years. Not long ago I visited one family, and I learned from the mother, a respectable woman, who had lived there for thirteen years, that not the slightest repair had been done to the house since they came into it; the plaster had fallen off the walls and the floor was ripped up in several places. I asked why she lived in such a place, and she said she was applying continually to the landlord, but he would not so much as put a single nail into the floor. I believe that it has since been in some measure repaired; but that is only a sample of hundreds of houses which I have visited in this city.

5. I believe it is generally understood that the rent of such houses is really comparatively high—that they are rather profitable property? Many of these houses let for 10s. or 12s. a week.

6. With what accommodation? With perhaps four rooms, but then the houses are in such a dilapidated state that they are scarcely, I should consider, fit for occupation.

7. But the rents charged for them are such as ought to and would fairly pay for better accommodation? Oh yes. Some landlords, I have noticed, have pulled down their old houses and erected new ones, which are occupied by tenants of a superior class, and I think the rent is only a few shillings higher.

8. In such cases, where tenants of a superior class replace the others, what becomes of the original tenants? They move off to localities similar to those they have left.

9. Then, if we undertake to cleanse or improve houses in bad condition, what is to be done with the lower class of inmates? I think some very stringent regulations are required with regard to the building and also with regard to the occupation of houses. There should be power to insist upon houses being kept in proper repair, and that if they are not fit for occupation, persons should be prohibited from occupying them. The law should give power to some authority in the city to shut up any houses which are in such a dilapidated state that they are liable to breed disease, or are otherwise unfit for occupation. In the course of time the standard would be raised if it were made prohibitory for persons to occupy houses of that class, and thus a better state of things would be brought about.

The Very Rev.
Macquarie
Cowper.
12 Nov., 1875.

10. Have you ever thought of the details of such a measure as would be necessary to secure proper space and ventilation in buildings? I have not given sufficient attention to it to enable me to express decided opinions, but I have noticed that in England it has been suggested—I think at a meeting of the Social Science Congress, about two years ago—that it should be made compulsory that every new building should at least have a space of 100 feet square, either at the back or at the side of it. I noticed also another suggestion made by a gentleman, who read a paper on that occasion, that every street should be 40 feet wide, and that no houses should be erected in a street which was higher than the width of the street.

11. And the vacant space ought to bear some proportion to the height of the house? Yes. I have just called to mind four houses in this city, in which I visited some sick persons some years ago, and I find they are still occupied. These houses are situated at the back of the "Post Office Hotel," and so closed in that it is scarcely possible for any fresh air to enter them. I paid a visit to a sick man who was in a room up-stairs in one of those houses, and I found there was no ventilation whatever; there was no fire-place; the window would scarcely open, and it appeared to me marvellous that the man did not actually die for want of air. There is only a space of about 4 feet between the "Post Office Hotel" and this house, and now I observe it will be shut in still more by that fine block of buildings between York and Barrack streets. I could mention other houses which I have noticed in different parts of the city, which are blocked in in a similar way—blocks of buildings existing in lanes and several *cul-de-sacs*, where I think the buildings should be removed as the ventilation in them must be exceedingly defective. I have in my mind's eye one place in Sussex-street, which I think goes by the euphonious name of St. John's Place; it had formerly another name at which people used to shrug their shoulders. There are three rows of houses in it, and the back row, in which I think there are five or six houses, is shut in by a wall in such a manner that fresh air can hardly get down to these buildings. Such places as these I think are hardly fit for occupation.

12. Do you think there are many such houses in Sydney, where there is not a sufficient space allowed for purposes of ventilation? I think there are a good many scattered about the city. I have been surprised myself sometimes in the course of my visits to find such a number of close lanes of this nature not visible from the street.

13. Are the cases of overcrowding found chiefly in the cheap lodging-houses, or do you often find houses occupied by private families much overcrowded? A good deal of overcrowding takes place in private families as well. Houses are taken by one person and portions are sublet to others, so that you sometimes find two or three families in one house.

14. But I imagine that in these cheap lodging-houses there must be some very bad cases of overcrowding—a number of persons sleeping in one room? Yes.

15. From your own observation are you satisfied that much ill-health arises from bad ventilation and overcrowding? I am not aware of a great number of cases of that kind, but I think it is in the general deterioration of health that the effect is seen; the miserable and squalid appearance of the persons residing in such houses is very striking, and I am quite sure that the consequences must be very injurious.

16. *Mr. Palmer.*] Do you recollect, Mr. Cowper, if that portion of Sussex-street—St. John's Place—which you mentioned just now, is the place known as Fowler-square? No, Fowler-square is in existence now; that is also one of those narrow places into which fresh air has a difficulty in finding its way.

17. Where is St. John's Place? It was formerly Sussex Court; perhaps you know it by that name; it is between Liverpool and Bathurst-streets—on the left hand going southward.

18. And your experience of the city is chiefly in that portion of it about Sussex and Clarence streets? Yes, for some years past—for the last seven years; formerly I had experience in the northern portion of the city.

19. *Dr. Read.*] Do you think it would be advisable to pass an Act compelling the erection of suitable houses in place of these uninhabitable dwellings—that it would conduce to the health and comfort of the population? I have no doubt of it.

20. Are you at all acquainted with the working of the Landlord and Tenants' Act? No, I am not.

21. Do you think that if there were some more summary means of ejection than that provided under that Act, and a greater pressure could be brought to bear upon the landlords, we might hope for a considerable improvement in the character of these buildings? I am decidedly of that opinion; there is a great difficulty in getting rid of bad tenants. I have frequently complaints made to me by respectable persons of houses being occupied by prostitutes, in consequence of which the neighbourhood is made the scene of disorder and annoyance, and there is no remedy in such cases.

22. *Mr. Palmer.*] You have a copy of our Building Act; I think I sent you one? Yes, but I have not had time to read it yet.

23. There is a clause in it which, if adopted by the Parliament, will empower the City Council to enter, and even, if necessary, pull down houses of that character? The part of that Act to which I should have objection, for I have cast my eye over that portion of it, is that it is left to the decision of several officers of the Council whether a house is fit for occupation or not. I think there should be something more definite than that.

24. I think it states, "in the opinion of the Mayor and the City Surveyor." We must leave the power in somebody's hands? It appears to me that there should be something definite as to the number of cubic feet which should be provided for each occupant of a house.

25. We are going to have a Committee meeting of the Council next week, and shall be very glad to receive any suggestions with which you may favor us? I should like to say, in reference to the observations I made about the landlords, that a great many of them are absentees, and let their houses through agents, who are much more to blame than the landlords, who probably know but very little about their property. I have known a great deal of that. The agents are very rigid in exacting the rent, but very unwilling to do anything in the shape of repairs, because I suppose that would interfere with their percentage.

26. *Mr. Chapman.*] Do you think it would be beneficial to pass an Act authorizing a regular inspection of lodging-houses, so that they would be under proper supervision? I think it ought to be done; it is a question in reference to which I hold a very strong opinion indeed.

27. *Mr. Palmer.*] There is one place which perhaps you recollect—Wallace-lane—which Mr. Wentworth pulled down, and on which some substantial buildings have been erected? Yes, that was a great improvement, and I hope the same plan will be carried out in other places.

28. *Chairman.*] Then what becomes of the tenants who are ejected when superior houses are erected which are let to a better class of tenants? They go to some other parts of the city where they can obtain similar

similar accommodation. For instance, we have seen them going to Syrett's-lane, and from that to Woolloo-mooloo Bay. My curate and I have been the means of removing batches of these prostitutes, but we find that they only betake themselves to some other part of the city. Mr. Wynne's property has been frequently occupied by persons of this class, and now he will not let it, except to a manufacturer, he has had so much annoyance. The moral character of that part of Castlereagh-street is very bad and so is that of Pitt-street. It has often struck me that if the city were better lighted it would have a very salutary effect; that is a question which I think ought to receive consideration.

The Very Rev.
Macquarie
Cowper.

12 Nov., 1875.

29. With regard to the number of cubic feet of space to be allotted to each person, it would seem not to be difficult to make a regulation of that kind with regard to lodging-houses, but do you think it could be made applicable to private houses—could you say that each resident in a private house must have so many cubic feet? I think it would be possible to enact that a house should not be occupied by more persons than could obtain within the compass of that house a certain number of cubic feet for each resident. It seems to me that we could not enact any regulation as to the number of persons who might be there, either as visitors, or who might be present at an entertainment; but the regular occupants should have a certain number of cubic feet of space.

30. Does not that seem to you rather an infringement upon the liberty of the subject? I think that these subjects are receiving more attention now than they have hitherto, and I believe that in some of the papers read at the Social Science Congress some of the views I have mentioned have been advocated strongly. I have not had time to make myself acquainted with them, but I believe that is the case.

31. I observe in the efforts made to improve the dwellings of the poor at Home, there are two methods employed—one is to give large powers to the municipalities, and the other is the purchase of such properties by Societies who clear away the old houses, and put up new buildings in place of them;—which of the two methods do you think would be the most efficacious here in Sydney? I should think it would be better to give the municipalities power to regulate these improvements.

32. You would not trust to the efforts of individuals or societies? I understood you to ask me whether I thought it preferable to entrust these powers to municipalities or to societies.

33. I observed that there are two methods of going to work—one is through the municipalities by their Building Acts, and by giving them larger powers; and the other, which is greatly in vogue at Home just now, is by means of societies which purchase the properties, pull down the old houses, and rebuild. That has been done to a large extent in London where, I believe, there are seven or eight of these societies? Those are mere philanthropic efforts, the success of which depends upon the amount of energy as well as philanthropy brought to bear; whereas if you give powers to municipalities you have bodies who are responsible for carrying out the improvements, and in this way I think the operation would be rendered much more certain. But then if societies undertake work of this kind they would render the action of municipalities unnecessary.

34. And the work, if done by societies, would be more likely to be desultory and partial? Yes, I think so. Some two years ago I had some communication with an engineer who was anxious to establish a Building Society for artisans. These artisans had formed their own plan generally, and I put them in the way of obtaining the legal assistance of a gentleman who took the matter up, and drew up an Act for them. But the difficulty they were placed in was that they could not get any trustees of position in the city to come forward and be responsible, and they failed in carrying out their plan. I believe it was a well devised plan, something like one of Lord Shaftesbury's, but it fell through for that reason.

35. *Mr. Chapman.*] In speaking of the owners of property, who are absentees in England or elsewhere, you mentioned that they generally appoint an agent to act for them;—have any cases come under your notice where these agents have appointed sub-agents who have been of the same class, and quite as bad as those who occupied the houses? Yes, I have known that to be the case.

36. And from that cause the rents have been twice as high as they ought to have been? Yes. There are two or three points, in addition to those which have been dwelt upon, to which I should wish to draw the attention of the Committee. First,—drainage. I believe that for want of proper drainage in the city, a good deal of feculent matter is absorbed in the soil, tending to germinate disease and to produce much unhealthiness. And not only is this the case in the older parts of the city, and as regards premises which were erected long ago. I observe new erections in various quarters without any sufficient, or even pretended, provisions of this character. And I would venture to suggest that it should be made imperative upon the owners of property to arrange for such drainage, in regard to the sanitary condition of the population, under well defined regulations, which could leave no doubt as to the work required to be done. I feel sure that for want of this the soil often becomes impregnated with poisonous gases most detrimental to health. Secondly,—it has often struck me that in the erection of the inferior class of houses, and especially those occupied by the labouring population, no precautions are taken to prevent the rising of damp in the walls; and hence you will find the damp rising, and with the damp, in localities not drained, noxious qualities the effects of which may be most injurious to health and life,—especially when so little attention is paid to ventilation as is generally the case. Thirdly,—with regard to ventilation, I attribute a great deal of importance to a due attention to it—much more than to the number of persons who may be the occupants of a dwelling for a time. In one house which I was visiting lately, in which several families were located, I found one family, consisting of the father, mother, and four children, occupying a single room which was used for every purpose, with scarcely any ventilation. They ate, slept, and lived in it. An infant was born, healthy enough as it seemed, but it lingered about five weeks and then died. The rest of the children, in such a nursery! looked squalid and miserable. Ventilation should be provided for in every habitation, in such a way that it should be not a mockery but a reality. All windows should be made to open at the top as well as from the bottom. It would be well also if there were a fireplace in every room. Dr. Arnott says: "An individual, the offspring of persons successively breathing foul air, will have a constitution decidedly different from one who has inhaled pure air; and the race would, to a certain extent, continue to degenerate." Fourthly,—it is known that diseases of some kinds are often propagated by means of clothing. How often is the bedding in the common lodging-houses cleansed? How often do persons arriving by steamers from the various ports along the coast bring disease with them? And may not the germs of typhoid and other fevers be left in the bed-clothes, to be taken up by others who may become the occupants for a night or two? It appears to me that some preventive is required, greater than at present exists, against these evils. Stringent regulations are required, to be enforced under penalties sufficient to ensure their observance.

Personal Inspection of the City and Suburbs

By No. 1 Sub-Committee, consisting of,—

R. B. READ, Esq., M.R.C.S., | M. CHAPMAN, Esq.

*Kent, Clarence, and Sussex Streets, from Liverpool-street to Druiitt-street.*37. *Dr. Read*, on behalf of the Committee, gave evidence as follows:—R. B. Read,
Esq.
12 Nov., 1875.

Met at 9 p.m., on Wednesday, the 10th instant, at the Volunteer Club, and proceeded to inspect a portion of Brisbane Ward. Mr. Fosbery, the Inspector General of Police, kindly placed at our disposal the services of Sergeant Larkin and Constable Mulqueeny, of the Detective Force, who rendered us valuable assistance. The night was remarkably cool, with a light southerly breeze blowing. Barometer, 29.72. Temperature in the open air 51, in a well ventilated room 57. We commenced our inspection by examining the "Star of Peace" and "Mill Hotels," in Kent-street, which we found in fairly clean condition, the ventilation, however, being of an unsatisfactory character, as indeed was the case in almost every house we inspected, the old fashioned sash-windows being in use, which open only at the bottom, while the upper portion is immovable. The "Globe Hotel," which we next visited, we found ventilated in the same way; the rooms in this hotel were very low, and the closet in the yard exceedingly offensive. At the "Coachman's Arms," Clarence-street, we found the ventilation very deficient; the rooms are only 6 feet 6 inches in height; two children have recently died in the family; the yard was very clean. A similar state of things exists at the "Brisbane Inn," the ventilation being very deficient; one of the rooms being only 7 feet high; the water was off from 6 a.m. to 6 p.m. We visited the Soup Kitchen in Kent-street, and inspected the four dormitories. No. 1 dormitory has an area of 1,730 cubic feet, and contains ten beds, giving 173 cubic feet for each sleeper. No. 2 has an area of 2,470 cubic feet, with sixteen beds, giving 155 cubic feet to each sleeper. Both these rooms are very badly ventilated. The two upper rooms, in which there are forty-three beds altogether, are well ventilated; there is a large hole in the ceiling in which ventilators are fixed. The "Royal Forester Hotel" and the "Builders Arms" we found in fair order, but ventilated with the old-fashioned sash-windows; the rooms are, however, very low. We next inspected a block of buildings at the corner of Syllas-lane and North-street, and spent some time in examining a group of houses and cottages at the back, which we may class as entirely unfit for human habitation. The rooms are low, not more than 7 feet high, and in a small yard, 5 feet x 6 feet, there is one closet for six houses. In another, two closets, one of which is out of order, for about forty houses, and there is an absence of water to keep them clean. We also inspected some houses in St. John's Place, Sussex-street, which were in very bad condition, the ventilation being exceedingly deficient, and there being only one closet, without any door, for four houses; the stench from this closet was unbearable. Health under such circumstances is simply impossible. We visited three houses in Sussex-street, Nos. 200, 188, and 174, which we found in fairly clean condition, but like all the others very imperfectly ventilated. In the house last mentioned, which is usually occupied by a large number of lodgers, we found nearly all the beds empty, the reason assigned for this being that there were two men in the house suffering from erysipelas, who had been refused admission into the Infirmary, and there was no other place to which they could be sent. It is much to be regretted that some kind of isolated accommodation should not be available for cases of this dangerous character. There was literally no ventilation in the rooms where these men were lying—the windows being boarded-up. The adjoining house, No. 176, was in every respect in a similar condition. In none of the houses we visited was the ventilation of a satisfactory character, and in many of them, in addition to this deficiency, the accommodation afforded for human beings is inferior to that provided for cattle and horses. At midnight we found ourselves at the foot of Liverpool-street, at which place the stench from the head of Darling Harbour was offensive to a degree which we could scarcely have credited without personal experience of it. It appeared to us a matter of surprise that any persons could live at all in the immediate vicinity of this nuisance. It was low-tide at the time,—the whole of the foreshore was exposed, and the air reeked with poisonous exhalations from the drainage polluting the harbour. Suffice it to say, that nothing that has been said or written on the subject of this horrible nuisance can equal the foul reality.

We concluded our inspection at 12.35, and did not reach our homes until 2 a.m.

No. 2 Sub-Committee, consisting of,—

G. F. DANSEY, Esq., F.R.C.S., | B. PALMER, Esq., Mayor.

*From Margaret-street along Lower George-street.*37. *G. F. Dansey, Esq.*, on behalf of the Sub-Committee, gave the following evidence:—G. F. Dansey,
Esq.
12 Nov., 1875.

On Thursday evening, the 11th instant, we visited Gipps Ward, accompanied by Sergeant Dawson, and commenced our inspection by calling at 215, George-street, a Chinese lodging-house. On going up-stairs the first thing that struck us was the absence of beds in the small partitions which we supposed to be bed-rooms. On inquiry, we found them to be smoking and lounging rooms—the house being a kind of public-house, frequented by opium-smokers and tea-drinkers. The lounges consisted of bare boards covered with mats, with a piece of board on which to rest the elbow. These rooms were very close and badly ventilated, besides being strongly impregnated with the odour of opium smoke. Throughout the house the rooms were tolerably clean, gas is laid on, and the walls are decorated with pictures of Chinese design. On going up-stairs we found one lodging-room occupied by two persons, and two smoking-rooms. The lodging-room was clean and comfortable and the bed-room nicely furnished. There we saw a Chinese woman, who was exceedingly polite. The kitchen and yard were clean and in good order. This house is also a shop for the sale of opium, and there is a joss-house within the building, with lights burning; there were three rooms on the same floor. The number of inmates given us was fourteen, but we understood that forty or fifty or even more persons can be accommodated when necessary. We next visited a Chinese cooking-shop, kept by Ah Young, No. 211. The front room is used as a shop, and the adjoining room as a smoking-room. Besides these there are three coffee or tea rooms,

rooms, and a kitchen at the back, with Chinese grate—small but comparatively clean. Here we learned that the average cost of opium for a good smoker is 4s. per day. The ventilation in these rooms was very bad, the only fresh air entering them finding its way through the broken panes in the windows. On the first floor we saw a bedroom with two persons sleeping in it; then a room, 10 ft. x 12, divided into three compartments, to accommodate two persons each, lit by gas in every part. From this house we proceeded to Sun Wah's lodging and smoking house, No. 167, George-street, which contains six actual rooms, but one room is divided into five. Here we found the kitchen and back premises offensive from the smell of ammonia, showing that the inmates make use of the kitchen in the same way as the yard or closet. On the first floor there are two rooms, one of which was empty, because, as we were informed, of the death of Dr. Sin Ling, a Chinese doctor. The body had been taken away and buried, but we were told that bad spirits were expected to come and take away his ghost, and in the interim nobody cared to occupy the apartment. In a small back room, very badly ventilated, were three beds, and the house was altogether too much overcrowded to be healthy. We found here, too, unquestionable signs of want of cleanliness in the floors, &c.

G. F. Dansey,
Esq.
12 Nov., 1875.

We then called at 24, Cambridge-street, which is also kept by a Chinaman, and is used for an eating or boarding house, as well as a resort for opium-smokers. Here too the ventilation was exceedingly defective, and the yard was offensive from the strong smell of ammonia. The bedrooms were very dirty and close.

It may not be out of place to mention a singular custom which we observed in nearly every Chinese house we visited. We found pieces of paper hung on the walls in the principal rooms, which are handed to visitors. We asked for an explanation, and were told that they meant "a happy new year."

It was half-past 11 o'clock when we quitted the last house.

FRIDAY, 19 NOVEMBER, 1875.

Present:—

B. PALMER, Esq.,		M. CHAPMAN, Esq.,
G. F. DANSEY, Esq.,		R. B. READ, Esq.

HON. J. SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By Sub-Committee No. 1, consisting of,—

R. B. READ, Esq.,		M. CHAPMAN, Esq.
-------------------	--	------------------

SECOND DAY, MONDAY, 15 NOVEMBER, 1875.

Sussex-street, from Liverpool to Margaret Streets.

39. *Mr. Chapman* (on behalf of the Sub-Committee) gave the following evidence:—

Met at the Volunteer Club on Monday, 15th instant, at 3 o'clock p.m., and resumed our inspection of Brisbane Ward along Sussex-street, between Liverpool and Margaret Streets. The first house we visited, owned by a man named Deering, was an old tumbledown dilapidated wooden building, containing eighteen rooms, and let, as we were informed, at a rental of 25s. per week. The tenants state that it is used as a lodging-house, but we ascertained that the first floor is converted into a dancing-saloon, and that, instead of a few lodgers being accommodated weekly, the place is little better than a brothel. It is in a wretched, filthy state, both with regard to the drainage and the yard and privy accommodation. The ventilation is deficient, and the rooms are low—not exceeding 8 feet 6 inches in height anywhere. On the basement floor is a well, from which flows over the yard a stream of water, the stench from which is offensive, and must be very unwholesome. The whole place is unfit for human habitation, and should be pulled down. We next went to Washington-place, at the end of which is a gully shaft, which is the subject of numerous complaints. The stench from it is stated to be very offensive at night, more especially when the wind is from the direction of Darling Harbour. In the report of our first day's inspection we alluded to some houses and cottages in North-street and Syllas-lane. These we examined more particularly. The property belongs to the Treve's Estate, and the rents are collected on account of Mr. Slade, the solicitor, by an old woman who lives in one of the houses rent free. In this property there are altogether twenty-one houses, or cottages, containing two rooms each, and rented at 6s. a week. It will hardly be credited that for these twenty-one houses, which contain at an average five tenants each, there are only three water-closets, one of which is out of order and the others without doors or with broken doors. Such a state of things requires no comment. We can only add that, apart from the impossibility of preserving habits of cleanliness and decency under such circumstances, the houses are unfit for human habitation; they are rickety and out of repair—some with and some without back doors and windows, and without any proper ventilation. No effort seems to have been made by the owner to prevent them from falling into utter decay, and we think that the sooner they are pulled down the better. In Syrett's-lane we noticed one peculiarity in the houses, which we took as an indication of the disorderly character of the tenants—the lower panels of several of the doors were broken, having apparently been kicked in. These houses are also in a very dilapidated condition, and the sooner they are razed to the ground the better it will be for the neighbourhood. We inspected some two-roomed cottages in Ashton's-court, off Sussex-street, let at 6s. 6d. a week each, which we found very close on account of the deficient old-fashioned ventilation, but not in an otherwise bad or unhealthy condition. Complaints were made to us by some of the tenants of the horrible stench from Darling Harbour at particular times. We found that complaints of this nature were by no means uncommon; in this quarter of the city they are the rule rather than the exception. Fleming's-court, Sussex-street, next engaged our attention. The court takes its name from the landlord, Fleming, a tailor, and the property consists also of two-roomed tenements, built of brick or wood, or a mixture of both, and wretched comfortless hovels. The whole space of the houses fronting Sussex-street and the lane at the back is 60 feet x 137 feet. In this limited area are five houses, in which forty people are residing; the adjoining land has just been sold, as a site for a Public School, at £12 per foot. These cottages are greatly in want of repairs, and very dirty. Everywhere we heard the same complaint—

M. Chapman,
Esq.
19 Nov. 1875.

"the

M. Chapman, Esq.
19 Nov., 1875.

"the landlord will do nothing." Potts'-buildings, off Sussex-street, also consists of cottages having two rooms each, and rented for 6s. 6d. weekly. The average number of tenants is five persons for each house, and there is the same absence of privy accommodation which we noticed as especially characteristic of North-street and Silas-lane, there being only two water-closets for twelve houses, or in other words for sixty persons. Great complaints were made to us here of the effluvia arising from the cesspits and closets on Lord or Lady Lisgar's property, which we alluded to in our first report as St. John's-place. We crossed over to the group of houses rejoicing in this aristocratic appellation, and we found that these complaints were not without foundation. There is no system of sewerage here, and the drainage is in a horrible state. The closets and cesspits at St. John's soak into the drains, and when they overflow—which is not an unusual occurrence—the neighbours in Pott's-place get the benefit of it. No wonder the latter, who have filth enough of their own to contend with, are indignant, and complain that this dirt at least is "matter in the wrong place." Yet in spite of these palpable obstacles to their physical comfort, the residents in this ill-drained locality appear anxious to uphold the moral purity of the atmosphere, for we observed a notice affixed to the door of one of the houses—"None but respectable persons will be allowed to reside here." From St. John's-place we proceeded to Fowler-square, off Sussex-street. The houses comprised in this property belong to several landlords. Three of them are owned by Mr. Donovan; they have two rooms each, and are let at 5s. per week. The only ventilation is from the front, there being no ingress for fresh air at the back, where there is neither door nor window; they are in a filthy neglected condition. Five of the houses belong to Mrs. Boyd, and the tenants when the state of the place was pointed out to them had the same answer to give—"The landlady will do nothing"; yet these two-roomed uncomfortable tenements appear to let readily at 7s. per week. Another house, belonging to a man named Murphy, also consisting of two rooms, and let at a rental of 7s. a week, appeared to be occupied by persons of loose character, and was in a filthy state. We also visited and inspected Piper's-lane, leading out of Sussex-street. The houses in it we were told belong to Mr. Hancock, for whom Mr. Cross is agent. Here we found the old-fashioned ventilation; but except that the houses are from this cause very close, there was nothing especial to call for comment. They were in a tolerably clean condition.

This concluded our inspection, except that we went along Rafferty's Rocks, which at one time were the centre of a bad neighbourhood. The houses have now all been pulled down. We returned at 6 p.m.

What struck us most forcibly during our visit to these crowded localities was the total absence of any attempt on the part of the owners or landlords to do anything in the shape of repairs, or to improve the sanitary condition of the dwellings. We noticed no signs of lime, or white-washing, paint, or any attention paid to the drainage of the allotments. These essentials to the preservation of health do not appear to have engaged their attention at all, and there can be no doubt that the water used for domestic purposes in such abodes of filth and wretchedness must in many cases be polluted. The want of some sanitary authority, whose special business it should be to interfere in these cases, and to compel, where necessary, landlords to provide such accommodation as will render health and cleanliness at least possible, seems to us very urgent. The deficiency in privy accommodation calls for especial notice, as also the condition of the roadways into courts and lanes, such as we have noticed, which being private property are beyond the control of the Corporation, and can only at present be repaired at the will of the owners. We reserve our recommendations upon these and other points until the experience of further visits to other parts of the City shall have placed us in a position to form a better judgment as to the nature and extent of the remedy required.

THIRD DAY, WEDNESDAY, 17TH NOVEMBER, 1875.

Clarence-street.

40. Dr. Read gave the following evidence on behalf of himself and Alderman Chapman:—

R. B. Read,
Esq.
19 Nov., 1875.

Met at the Volunteer Club at 10 o'clock on Thursday, 17th instant, and continued our inspection of Brisbane Ward,—Sergeant Larkins and Constable Mulqueeny accompanying us as before. Proceeded to Clarence-street and first inspected a lodging-house known as the "Lancashire Lass," originally portion of Irvin's estate, but since purchased by the Hon. John Frazer, a brick house, rented at 21s. a week. In one room, 14 feet square and 10 feet high, there were six beds; in another, 11 feet square and 10 feet high, five beds; in another of the same dimensions, five beds; and in an upstairs room 11 feet square, and averaging about 6 feet in height, there were five beds,—in all twenty-one. The charge for a bed is 6d. per night. The same complaints met us here—"the landlord will do nothing to keep the place in repair." The ventilation is of the old-fashioned kind and very defective; the closet is directly connected with the main; the yard was not clean, and the passage leading to it only 3 feet wide. This yard opens on to the back of Jacob's lane, and the open drains running through it are very offensive. We noticed that the kitchen is not only used for domestic purposes during the day but converted into a bedroom at night, whilst one of the lodgers is accommodated with sleeping quarters under the stairs, in a close narrow receptacle, where he can only pass the night in a crouching position. This sleeping apartment reminded us of the cell called "Little Ease," in which, in old times, refractory prisoners used to be placed in the Tower of London, and in which they could neither sit, stand, or lie at full length.

No. 116, Clarence-street, belonging to the same owner, is rented at 22s. 6d. a week. The rooms are about the same dimensions as those in the first house we visited—one room containing six beds, two others four beds each, and in the attic there were six beds. We may remark here that in almost all the houses we entered we found the attics crammed; these are generally close enough, but they afford a slightly better chance for fresh air to enter, which is probably the reason they are in greater favour. In none of these lodging-houses is any provision made for the toilet; we saw no signs of lavatories and no towels; the bed and nothing but the bed is provided. Some of the inmates turn in with all their clothes on, probably for security sake, as we observed in one of these houses a notice that the landlord was not responsible for the goods and chattels of his lodgers; others who find the temperature unpleasantly close lie in a state of absolute nudity, while we noticed one man who had hit the happy medium by going to bed with a pair of Hessian boots and a cap on, but no other article of attire. Attached to this house there was no water-closet—only a common cesspit, exceedingly offensive; we were told that it had not been cleaned out for four months; we should have judged it to have been four years.

No. 122, known as Shea's, rents at 20s. a week, and makes up twelve beds altogether; in the attic one of the windows was boarded over and the other was open. The yard of this house was tolerably clean; there

there was a closet-pan but no water laid on. Repairs were needed as usual, but again the whole blame was thrown on the landlord. R. B. Read,
Esq.

No. 124, called Niagara House (why we were unable to ascertain) rents at 22s. 6d. per week. In one room, 13 ft. 6 in. square, and about 10 ft. high, we found seven beds; on one of them a man was lying *in puris naturalibus*; in another room of similar dimensions there were six beds; and in the attic, which is not more than 6 ft. 6 in. in height at the outside and only 13 ft. 6 in. square, there were eight beds. In a small tenement attached to this house, and opening into Jacob's lane, having two rooms, there were six beds—three upstairs and three below; no water laid on to the closet, which is continually being stopped up. 19 Nov., 1875.

We next inspected the Queensland lodging-house, belonging to Irvin's estate, which also obtains a rental of 22s. 6d. per week, and makes up eighteen beds; this house was in much the same condition as the last, and the same remarks will apply to the sleeping accommodation. One of the new cisterns is attached to the water-closet, but it is defective in its action.

Kilkenny House, Clarence-street, belonging to the same owner, makes up six beds, three in each room, besides the individual who has been crowded out and who lodges under the stairs; the temperature in this house was very close from want of ventilation. The closet in the yard was very offensive, and is directly connected with the main. The landlord again was the theme of objurcation—"he won't do nothing" said the occupier to us emphatically. The Sydney and Melbourne lodging-house, owned by the same person and rented at 22s. 6d. a week, provides beds at 6d. a night. In one room were three beds, in another seven, while in the attic, which is only 12 ft. 6 in. square, and not averaging more than 4 ft. 6 inches in height, with sloping roof, there were eight beds; these numbers are greatly increased during the winter; many persons of the class who use these houses sleep in the open air in sheltered places in Hyde Park and elsewhere; preferring in warm weather to lie "under the stars" instead of "under the stairs." The yard and closet of this house were exceedingly offensive, the closet being directly connected.

In the Glasgow boarding-house, same owner, same rent, we found eleven beds in a room 13 feet square, and six in the attic. No water for the closet, and both closet and yard very offensive.

The Temperance lodging-house, which was the next place we visited, afforded us an agreeable surprise, and we only mention it to state that it was an entire contrast to any of the houses previously inspected. Here cleanliness everywhere prevails; the beds have clean sheets; there is a nice lavatory, well supplied with jack towels, and every attention seems to be paid to the comfort of the inmates. That this superior accommodation is appreciated is evidenced by the fact that a higher scale of charges are made and a superior class of lodgers obtained. The two houses which comprise the hotel are let at 30s. a week; in one house twenty-three beds are made up, and in the other sixteen,—the price of a bed in the latter being 9d.

From the Temperance Hotel we went to Mrs. Connelly's lodging-house—owner or agent, Mr. Alderman Day—rented at 15s. 6d. a week. The landlady of this house, who had evidently been regaling herself in company with three or four friends, was in a blissful state of semi-consciousness, and unable to give us much information. We noticed in one room with a flagged floor there were six beds occupied by women. The closet in the yard was directly connected and very offensive. On the same side of the court, off Clarence-street and next to Smith's picture-frame factory, is a sixpenny lodging-house, occupied by Mrs. Doolan—owner or agent, Mr. Alderman Day; there were three beds down stairs and four in the attic—old-fashioned ventilation—rooms very close. From this house we went to the "Full and Plenty," a sort of eating-house, at the corner of Clarence and King Streets, rented at 50s. a week, recently purchased by Macarthur & Co. It contains four rooms but only two or three beds are made up in the attics. We were told that from ninety to one hundred dinners are served here daily.

No. 156, Clarence-street, owner, Jones, North Shore, contains only double beds, the price of which is 2s. 6d., being in fact a brothel. Here again we found the provisions of the Water Pollution Prevention Act evaded by the construction of the cistern for supplying the closet; it had no compartment in it, the closet being therefore still in direct connection with the main.

No. 158 is a house of the same character, provided with double beds only, and used for the same purpose; the yard was clean and the closet provided with patent cistern in good order.

This was the last house we visited, our day's inspection being over at 12 p.m.

Personal Inspection

By Sub-Committee No. 2, consisting of,—

B. PALMER, Esq., | G. F. DANSEY, Esq.

From St. Phillip's Church, Cumberland-street, to Dawes' Point.

SECOND DAY, MONDAY, NOVEMBER 15, 1875.

41. *G. F. Dansey, Esq.* (on behalf of the Sub-Committee), gave evidence, as follows:—

Met at my house on Monday, 15th instant, at 4 p.m., and proceeded, accompanied as before by *G. F. Dansey, Esq.* Sergeant Dawson, to inspect Cumberland-street, where the public-houses appear to be well managed and clean. Turning down Essex-street, at the rear of 127, Cumberland-street, we found a yard containing three or four tenements in a very bad condition, with regard to ventilation, drainage, and privy accommodation. This property was sold to Mr. Daly about three weeks ago. The other houses we inspected in Essex-street, as far as Gloucester-street, were clean and tolerably well ventilated, the windows opening at top and bottom. The butcher's shop at the corner of Gallows Hill was particularly clean. No. 173 is a lodging-house containing six rooms, two at the top of the house, occupied by seven lodgers, and one on the ground and front floor, with two lodgers in each; the front room being occupied by the proprietor. In most of these rooms we found the old-fashioned ventilation. Nos. 171 and 169, containing six rooms each, are ventilated in the same way. No. 167 is a lodging-house of eight rooms, and appeared to be clean and well looked after. We next inspected the Watch-house; to the right of the entrance is the charge-room, 11 ft. x 10 ft., and to the left the Sub-Inspector's room, which is about 7 ft. x 10 ft. On the right hand, a little further on, we were shewn a cell 12 ft. x 9 ft., with level floor, having a wooden bolster running the whole length of the room; a brick has been taken out in one place, and half a brick in another, 19 Nov., 1875.

G. F. Dansey, Esq., another, for purposes of ventilation; there are iron bars over the door. This cell reeked with ammonia, and was very offensive; it is washed out every day with a mop and water, and lime-washed once a quarter, but no disinfectant is ever used to purify it. A room facing it, on the left hand, 10 ft. x 10 ft., we found equally offensive. Here we found the resting board for the head, a wooden bolster as before, and no ventilation, except over the door, an opening for this purpose previously made, having been blocked up by buildings adjoining; the floors are all flat, and of wood, and the accommodation altogether bad. The atmosphere is so polluted by the stench which comes from a closet in the yard, that prisoners can only be kept in these cells at the risk of their lives. It does not appear to us that anything can be done to improve the building as it stands; it should be entirely reconstructed. We inspected seven houses up an entry from the street at this point, which are also very badly ventilated; there is only one closet for twenty persons. Nos. 137, 135, 133, 131, 129, and 127, have all the old-fashioned ventilation; Nos. 85 and 81 the same; in Nos. 71 and 69 the windows were fixed. With the exception of the ventilation these houses appeared to be as clean and well cared for as circumstances permit. Returned at 8:45 p.m.

THIRD DAY, TUESDAY, 16 NOVEMBER, 1875.

Met as before, at 4 p.m., and commenced by inspecting Gloucester-street; the property at the corner of Gallow's Hill is in a dilapidated state, and should be condemned and pulled down. No. 125, Gloucester-street, is badly ventilated; the windows do not open, the rooms (three) are 8 ft. high. No. 112, a weather-board building, is a lodging-house containing four rooms—two 16 ft. x 16 ft., and two 10 ft. x 8 ft., and occasionally accommodating thirty lodgers. We went into Maloney's cab-yard, on the west side, near Little Essex-street; here a decided improvement is required, especially with regard to drainage, and there is plenty of room to make alterations. No. 99 is badly ventilated, the windows only opening at the bottom; Nos. 89, 91, and 93, containing two rooms and a cock-loft, belonging to Mr. Young, are also ventilated in the same way. In Long's lane there are eight houses, the property of Mr. Long, having two rooms each; the water which supplies the closet comes straight from the main; the yards are excessively small; the ventilation is bad, and health is almost impossible.

Nos. 87 and 85 are also lodging-houses containing six rooms and kitchen, and making up eight beds. The drainage from these houses runs into the streets, and causes the neighbourhood to be unhealthy; there is a sewer just above them. A house two doors from the "Whalers' Arms," (owner not known), is not in a habitable condition, and ought to be pulled down. Nos. 61, 63, and 57 (owner not known) are in a similar condition, and should be destroyed, the roofs are dilapidated, and the whole building falling to pieces. The drainage from all the lower part of Gloucester-street, owing to the formation of the land is very defective, otherwise the houses, which are principally occupied by mechanics, are as clean and in as good condition as could be expected. The frontage of these houses appears to receive all the refuse thrown on the rocks from the houses in George-street. Those in Union-street are well-built houses, with all modern improvements. We returned by Lower Fort-street, where we found nothing calling for remark, and concluded our inspection at 7:30 p.m.

FOURTH DAY, WEDNESDAY, 17 NOVEMBER, 1875.

Met at 4 p.m. Inspected the hotel at the corner of Clarence and Margaret streets, which we found in clean order; there are seven bedrooms, occupied by twelve lodgers, but there is no yard whatever attached to the hotel. Other houses in the immediate neighbourhood, though old and badly ventilated, were as clean as could be expected, till we came to Canary Row, alias the Twelve Apostles, alias John-street, owned by Captain Smith, of McDonald, Smith, & Co. This property consists of twelve houses, with a narrow passage behind; there are six closets. The houses are let at 6s. a week, and have one room above and one below. They are in the most filthy condition, and are not occupied by the best class of inhabitants, especially at night time. One of them is an oyster-shop. It is difficult to ascertain the number of inmates, which varies according to the hour. All the slops from these buildings drain along the surface of the ground to the Grafton Wharf, and are very offensive. In Fleeton's Buildings (owned by Mrs. Fleeton, who resides in one of them) there is the old style of ventilation, and the drainage is also very bad, and the closet in the yard stinking. These houses are not let out as lodgings, but occupied by the families of seafaring men; they are close, unhealthy, and utterly unfit for human habitations. James' "Temperance Hotel," at the corner of Crescent-street, which we next visited, offers a marked contrast to most of the houses in its vicinity, the beds and everything about the house being remarkably clean and nice. We saw the tea-table laid out, which was everything that could be desired; there is also a reading-room for the accommodation of the lodgers. No. 88, Kent-street, is an iron shanty, owned by Mrs. Glover. Here the ventilation in all directions is excessive, and ought to be remedied at once. Nos. 72, 74, 76, and 78 have all the old style of ventilation. The houses in Kent-street North, as far as Clyde-street, are a better class of buildings, more recently constructed, and better ventilated. The two upper houses in Clyde-street, owned by Mr. James Campbell, are in a shockingly unhealthy state; the closets are placed under the steps, and the stench from them is frightful. This has caused and is still causing a great nuisance; this is one of the most dangerous places as far as health is concerned we have met with as yet, and some immediate steps should be taken to improve it. At Nos. 14 and 16, Clyde-street, there is only one closet for twenty persons; the condition of the closet may be better imagined than described. We visited two cow-yards in Windmill-street, the first of which is occupied by Edwards, who has six cows and one bull. There was a large accumulation of cow-dung, and the yard is not kept so clean as it should be. The other is kept by Bridgment, and he has twelve cows and one bull. This, we were informed, is washed out twice a day, and we believe it, as it was in a very clean state. The other houses in Windmill-street, which are chiefly occupied by the families of seafaring men and mechanics, appeared to be clean, well-conducted, and not badly ventilated. We returned at 7:40 p.m.

Richard

Richard Wynne, Esq., J.P., called in and examined:—

42. *Chairman.*] We have been told that you have had some experience in letting small tenements in Sydney; and that you have also experienced the difficulty of preserving proper decency among your tenants? Yes. Some years ago I entered Richardson and Wrench's auction-room: there was a property in Castlereagh-street put up for sale; not knowing anything of it, I asked a friend if it was substantial; he replied in the affirmative; I therefore asked him to bid for me, and I became the purchaser; I went to see it after I had bought it and found an agent in charge, who had looked after it for the former owner; I employed him to look after it for me. After a time I found that the tenants did not suit me, and I reprimanded the agent for allowing persons of improper character to get into the houses; he said he could not help it—it was impossible to prevent it. I got another person to take the agency, who felt confident that he would be able to carry out my instructions in letting the houses only to decent working people; in this he also signally failed. The last person who had charge of the property was Mr. Glue, and I thought of all people he would be the one to keep the houses respectable; but he found the same difficulty, although he used all the precautions that could be suggested. When I first got the property there was only one cesspool closet for the use of thirty or forty persons; I immediately thoroughly drained the whole of the property, and put in seven patent water-closets; besides ventilating the whole of the houses, I was quite prepared to put in baths, or do anything I could to make decent tenants comfortable. I thought I could, in this way, effect a thorough reform amongst the smaller class of tenants, but have been hopelessly disappointed, and have in consequence, altogether closed up the property as tenements.

R. Wynne,
Esq., J.P.
19 Nov., 1875.

43. You found you could not control the tenants? I could not control them.

44. Where is the property you speak of? In Castlereagh-street, between Liverpool and Bathurst Streets. About the same time that I bought the last property I lent money on mortgage on properties in Dowling-street and Exeter-place. At the expiration of the term of mortgage the owners could not redeem, and I was compelled to take the property. I found the Exeter-place property occupied by improper persons, who gave me a good deal of trouble to eject them. I then put the property in thorough repair, in hopes of getting decent tenants, in which I at first succeeded, but the drunken brawls in the neighbourhood soon caused them to leave. I next applied to Captain M'Lerie to assist me by allowing one of the police to live in one of the houses which I would give him rent free for the purpose of promoting decency and order. This also failed, as the policeman left three weeks after going into the house. I therefore made up my mind to get rid of the property at any loss, and sold the six three-roomed brick houses, with separate yards, water laid on, &c., for the sum of £180; I heard that the Building Society valued it at £750 and advanced the purchaser the sum he required to pay me. It was originally bought for £1,500, so that the improper class of persons inhabiting the neighbourhood depreciated its value to the extent of 200 per cent.

45. But they obtained good rents? No; I don't think they did; my experience has been the reverse. Perhaps persons with easy consciences, who agree to accept such disreputable persons as their tenants, may find it different.

46. Do you think it would be better if greater powers were conferred on landlords? Yes; under the Landlord and Tenants Act it takes three weeks to get a tenant out (let him be ever so bad) and may take more.

47. *Dr. Read.*] You would lose the rent during those three weeks? Yes; you cannot take any rent after you give notice to quit. I would not have property consisting of small houses if I were compelled to let them as tenements.

48. *Chairman.*] In consequence of the difficulty in dealing with these people? No; from the difficulty of keeping them select. I have had a great many very decent, honest, and upright people, living in small tenements.

49. *Mr. Chapman.*] I suppose in your capacity as a Magistrate, and otherwise, you are aware that there are numbers of prostitutes in the city of Sydney? Yes.

50. And I suppose they must have some place to reside in? Certainly; they must have houses to live in; we cannot expect them to live under the trees, and thereby have public modesty shocked to a much greater extent than it is at present.

51. In your capacity as a Magistrate, and from your general experience, don't you think they ought to be under some proper supervision in the city? Yes, my impression is that they ought to be removed from our streets, where they are nightly and even daily to be seen carrying their trappings of prostitution as proudly as if they were the rewards of virtue, and thereby drawing many of our innocent young girls (whose only fault may be a love of dress and perhaps idleness) into a similar course of life. This, as well as the temptation that awaits our young men at every turning in our streets to sin and perhaps to ruin, moral and physical, has led me to the conclusion that it should be the business of the State to place these unfortunates under police as well as medical supervision, and it is my opinion that this could best be done by removing them outside of our cities to some such place as the Victoria Barracks, which would entirely seclude them and their sins from the rest of society, and would make them more amenable to reformation, particularly if intoxicating drinks were excluded from the establishment.

53. You think it important that an Act should be passed to deal with this class of persons? I do. In France they do not allow their abandoned women as we do to ply their avocations in the public streets. I know, by my experience as a Magistrate, that the language made use of in our streets by this class of women is horribly disgusting.

54. *Mr. Palmer.*] Did you pay any attention to this subject during your visit to London? No. I suppose your Board is appointed to consider questions affecting the health of the people as well as other matters therewith?

55. *Chairman.*] I fear we are wandering from the subject. This is a Committee appointed by the Board expressly to inquire into overcrowding and bad ventilation as affecting health? I think the Government should not allow land jobbers to cut up estates for sale to suit their own avarice and greed only; they should be compelled to pay due regard to the health of those who may build thereon, and to make their allotments of sufficient size, with streets of sufficient width. I also think that the Government should bring in a Bill to prevent the overcrowding of houses on insufficient spaces of land. I think the Govern-

R. Wynne,
Esq., J.P.
19 Nov., 1875.

ment should insist upon all houses being properly ventilated and drained, which could be seen to by the City Surveyor. Architects should be conservers of the public health, and provide for a more enlightened and certain mode of ventilation than that obtained through doors, windows, and fire-places—the two former being generally closed by delicate persons to keep the draught out.

56. You would recommend the passing of a Building Act conferring full power to prevent such overcrowding as you speak of? Yes. I will give you an instance of the necessity of such an Act: Adjoining some land of mine in Elizabeth-street, a person has lately erected on an allotment with 20 feet frontage, by 100 feet deep, ending at a back lane, three dwelling-houses, *i.e.*, two two-storied brick houses, and fronting the back lane one two-storied weatherboard house.

57. *Dr. Read.*] Don't you think that a regulation might be advantageously introduced to this effect: that there should be for every house erected, either at the front, at the back, or at the side, a certain vacant space of ground, upon which it should not be permissible to build, either in the shape of a fore-court, a side-court, or a back-yard? I quite agree with you. I think that for every cubic foot of space occupied by a building there should be a proportionate superficial space of court, yard, or garden left unbuilt on. I think there should only be a certain height of building allowed, say three stories from the street-level.

58. *Chairman.*] But if a house were over that height you would increase the vacant space? Yes.

59. Because you could scarcely restrict a person in the height of his house, but you could insist upon a proportionate space of ground being reserved? I think there should be a restriction as to height, if it was only for the sake of city uniformity. In some of our finest cities in England, Ireland, and Scotland this is the case, where you will see beautiful ranges of buildings a quarter of a mile long, all built on the same plan, and consequently the same height.

60. *Dr. Dansey.*] Would not that be interfering with the rights of the citizens. In America there are large hotels and other public buildings six or seven stories high, where the accommodation required is provided within, the drying, &c., being done on the roof of the house? It would to some extent interfere with the liberty of the subject, but my impression, as a person who has travelled over a good deal of the world, is, that we possess too much liberty when we have liberty to injure our fellow-creatures, and when we exercise that liberty to jeopardize the health of our neighbours, which we are allowed to do in adulteration, want of cleanliness, and in building human habitations without providing for drainage, ventilation, or bath accommodation, it should be taken away.

61. But would a large hotel, with a quadrangular court in the centre, and windows on all sides, require a vacant space round it proportionate to its height and size? Not if the building had more than one side with street frontage; allowances should be made for such circumstances. The quadrangular court to which you allude would necessarily count as vacant space against the cubic measurement of the building.

62. What I mean is, that so long as there is plenty of air round a building you should not limit it to three stories? In such cases exceptions might be made; but I think, as a rule, in a new country like this, where land is not a tenth of the cost of what it is in Europe, we should spread ourselves out rather than make our buildings so very high. With respect to drainage there is a great want of proper provision being made in a great many of the municipalities, as I find that they are forming and metalling streets, laying down kerbing and guttering without first having the proper levels taken, with the view to a comprehensive system of drainage. Those who come after will have to suffer for this neglect. I therefore think it the duty of the Government to amend the Municipalities Act to the extent of making it compulsory that one of the first things to be done in any newly formed borough should be to employ a duly qualified surveyor to take all the levels and to make a plan of the same, which plan should be hung up in the Council Chamber to afford information to the ratepayers as to drainage and building levels. I think that the use of cesspool closets should be put a stop to, and earth-closets used in their stead. The material taken from the latter would be found very valuable for garden purposes, whereas the wretched cesspools now used are nothing but a nuisance, causing sickening smells, as well as percolating into and poisoning the water used for domestic purposes. I look upon all smells from the decomposition of vegetable and animal matter, as well as those arising from undrained swamps, as so many reproaches to the Government, Corporation, and people amongst whom they exist, in destroying life with that very material which, if intelligently used, would be the means of producing health and plenty, instead of dealing out misery and death.

63. *Dr. Read.*] I think you mentioned, with regard to your property near the Haymarket, that you asked some of the neighbouring proprietors to co-operate with you in shutting up the property? Yes.

64. May I ask who those landlords were? I should not like to mention names.

65. *Dr. Dansey.*] You mean earth-closets in those suburbs where there is plenty of garden ground? Yes; there would be no necessity for carting, because each person would have sufficient material on his own property for the purpose. I may mention that although I have a water-closet in my house it is seldom used; we use earth-closets in preference, the contents of which are used in the production of the best of vegetables. It appears to me that we bring most of the miseries which surround us on ourselves by our ignorance of the laws of life. It therefore occurs to me that the quickest way to get rid of these miseries would be to instruct our children in the Public Schools in physiology and the laws of life. The children would go home and enlighten their parents as well as instruct future generations.

Rev. G. Sheppard called in and examined:—

Rev.
G. Sheppard.
19 Nov., 1875.

66. *Chairman.*] You have heard, Mr. Sheppard, that this Committee has been appointed to inquire into overcrowding, and the filth which accompanies it, and the bad ventilation of houses in Sydney. We understand that you have had opportunities of seeing a great deal of such overcrowding and filth, and we shall be very glad if you will give us the benefit of your experience on the subject? So far as the ventilation

tion of the lower class of houses is concerned, I believe there is scarcely a house of the third or fourth rate in the city which is ventilated. Most of such houses in St. Andrew's Parish have a blank wall at the back, and open sashes simply in the wall in front. Very few of them have back yards; I suppose not more than one in twenty.

Rev.
G. Sheppard.
19 Nov., 1875.

67. No back yard at all? No back yard of any kind, and no opening in the back wall, so that there is really no ventilation at all. I should think there are at least a hundred such houses in St. Andrew's Parish.

68. Can you indicate to us the locality of some of these houses, that we might be able to inspect them personally? St. John's-place is one and Gobden's Buildings is another. My friend, Mr. Wynne, has just closed fourteen or fifteen such places in Belmore-place. Then there is Yeend's Buildings, in Pitt-street; there are two Yeend's Buildings, and they are both of them of the same character; Jilk's Buildings in Kent-street, and Fowler's-square in Sussex-street. There are a number of yards in Kent-street—the names I cannot give you—and one in Sussex-street, near to Willow-terrace, with six houses in it, owned by a Mrs. Ashton. Several houses in Christ Church parish have the dead wall I speak of—notably, ten in Dixon-street, adjoining Mr. Harris' flour mill in Goulburn street.

69. And in these places the ventilation, as a general rule, is very bad? Very bad indeed—worse than I have seen it in London. In the year 1860 I was connected with the survey of some of the underground dwellings in St. Giles' and St. George's in the Fields, and I do not hesitate to say that some of the houses in Sydney are worse than those underground dwellings.

70. In cases where the only ventilation is from the windows, I suppose the class of people who live in these houses have often an indisposition to open the windows? They have; the filthy habits of some of the poor are very noticeable to anyone who visits their houses; at many times the stench is intolerable in these places.

71. They do not make use of the small means of ventilation which do exist? They do not.

72. And in addition to bad ventilation, your experience is that these houses are mostly in a filthy condition? In a filthy condition; I believe there are nearly 400 houses in Sydney, which if they were in London the Corporate body, vested with powers to deal with these matters—the Metropolitan Board of Works—would close at once.

73. Has the Metropolitan Board of Works, in London, power to close buildings they consider unfit for habitation? Yes.

74. And what action is taken then—is the proprietor compelled to pull the houses down and build better ones? No; the Metropolitan Board of Works first asks for a report from the District Surveyor; this report states the size of the rooms, the dimensions of the open or fixed sashes, and the general condition of the dwelling; if unsatisfactory, then a notice is affixed to the door, stating that the house is considered unfit for human habitation, and if the landlord does not turn out his tenant within a certain period mentioned in the notice, the police make a raid upon the place and the inmates are forcibly ejected—at least that was the case in 1860.

75. What would be the next step after the tenants are thrust out? Most of them would go away into the country or to some other similar place.

76. I mean what would be done with the building? It would be simply closed; I could not tell you what would be the next step taken by the Board. There is a provision in the "Sanitary Act of 1866," to which I should like to draw your attention; it came into force, I believe, shortly after the ejection of these persons was authorized. Section 67, "Cellars in courts not to be let as human dwellings," states:—

No person may let, or occupy, or suffer to be occupied separately, as a dwelling, any vault, cellar, or underground room, built or rebuilt after the passing of the "Public Health Act of 1843," or which had not been so let or occupied before the passing of this Act.

No vault, cellar, or underground room whatever, must be let or occupied separately as a dwelling unless it measures in every part at least 7 ft. in height from floor to ceiling, and at least 3 ft. of its height is above the surface of the street or ground adjoining or nearest to it. It must have outside and adjoining and extending along its entire frontage, and upwards from 6 inches below the level of the floor to the surface of the street or ground, an open area at least 2 ft. 6 inches wide in every part. It must be effectually drained by means of a drain the uppermost part of which is one foot at least below the level of the floor. There must appertain to it the use of a water-closet or privy, and an ashpit with proper doors and coverings.

It must have a fire-place with a proper chimney or flue.

It must have an external window of at least nine superficial feet in area clear of the sash-frame and made to open as the surveyor may approve (except in the case of an inner or back vault, cellar, or room, let or occupied, along with a front vault, cellar, or room, as part of the same letting or occupation, in which case the external window may be of any dimensions not less than four superficial feet in area clear of the sash-frame, &c., &c.)

77. Are all the places you mentioned just now within St. Andrew's Parish? All with the exception of the property in Dixon-street, which is just outside the parish. Persons apply to us from all parts of Sydney to send clergymen to visit them, and we go.

78. But these places which have come under your personal observation are within the Parish of St. Andrews? Yes.

79. What I mean is that there may be many equally bad places in other parts of the city, which have not come under your special notice? Yes, I believe there are some worse places in St. Luke's Parish; in Sussex-street, during the last two years, several of these places, and a good deal of bad property, has been altered or pulled down. In Liverpool-street, six houses which were very bad have been pulled down, and in Syrett's-lane five houses have been shut up in order that they might be improved and some proper ventilation effected. In Sussex-street also we have had a considerable number of houses altered.

80. *Dr. Dansey.*] Mr. Wentworth has made great alterations, has he not? Yes, but not in our parish.

81. Have you come across any very bad cases of overcrowding in your parish? No, I have not. I believe there is a great deal of overcrowding in some of the sixpenny lodging-houses, and I have known many of these houses sublet to different persons; but I have come across no such cases within the parish.

82. You have not met with cases where for instance a room is let to a man who has a wife and perhaps four or five children? No; I have seen that in London and worse in Sydney; I have seen three families living in one house.

83. *Chairman.*] As I understood you, you have seen worse cases of filth and bad ventilation here, but not such bad cases of overcrowding as in London? Yes.

84. Then in your experience overcrowding is not a marked feature in Sydney? No.

85. Are the houses you have visited chiefly occupied by private families? Yes, private families, not lodging-houses; I was in a lodging-house yesterday containing twenty-one beds, but I saw nothing objectionable

Rev.
G. Sheppard.
19 Nov., 1875.

objectionable in that house. In Sussex-street there are many worse houses than that I believe; there is the "Full and Plenty" in Clarence-street.

86. Have you met during your visiting with any instance of a family occupying only one room? No, they have two rooms generally.

87. Does your experience lead you to the conclusion that much ill health arises in Sydney from the bad ventilation and filth you have witnessed? Yes, it does; I cannot see how persons living in such places can be healthy; if there are not positive symptoms of disease there is a weakening of the system rendering it susceptible to disease. There is another matter to which I should like to be allowed to call the attention of the Committee, and that is the non-disinfecting of the beds in our lodging-houses, which is a very important matter. In London there is a small establishment containing two rooms used for the purpose of disinfecting beds and articles of clothing or furniture. It was established I believe under the supervision of Professor Leoni. One of the rooms is used as a disinfecting room, and the other, in which the temperature is between 240° and 250°, is for the purpose of killing parasites. During two years there were 2,583 articles of clothing disinfected in this place very successfully. I think in Sydney there should be some place of the kind, and that our lodging-house-keepers should be compelled to take their bedding there. Mr. H—, a lodging-house-keeper, told me the other day that when he attempted to use disinfectants his lodgers became suspicious, and as it was not to his interest to quarrel with them he did not continue it.

88. *Dr. Danscy.*] I think it was at the time when the cholera broke out in London that these disinfecting rooms were established? Yes, there were over 2,000 articles of clothing disinfected.

89. *Chairman.*] Where is that place? I cannot tell you where it is. There is an article in, I think, the *Medical Gazette* of 1873, by Dr. Letheby "on the use of disinfectants," which shows the advantage derived from the establishment.

90. I suppose you are of opinion that there ought to be much greater control exercised over lodging-houses here—that there ought to be an Act passed, placing them under the control of some competent authority? Yes, I think so; I think also the Corporation should have much larger powers to enable them to shut up houses not considered fit for human habitation.

91. Such powers as you have referred to under the Metropolitan Building Act? Yes, I find there are three obstacles to closing these houses—in some cases they are used for improper purposes and bring in an enormous rental; in some cases the owner or occupier has not a good title; and in others the property is held in trust.

92. Do you think that in many cases these low kind of houses obtain a high rent? When used for immoral purposes they do. Mr. Chadwick, a short time ago, was offered 10s. a week for a house that was not worth more than 3s. 6d.

93. But the rents paid by laborers and artisans living in the houses you describe are not high? About 6s. or 7s. a week.

94. For what accommodation? Two rooms.

95. Can you make any special suggestion in connection with the improvement of the city beyond those you have made—a more perfect control over lodging-houses and the use of disinfectants which you described? I think that every house should have a certain area of ground attached to it, and that no house should be erected or used as a human habitation which has not a thorough draught of air through every room.

96. You think then that ventilation should be provided over and above that supplied by doors and windows? Yes.

97. Ventilation not within the control of the occupants? Yes, I think there should be a fire-place in every room and ventilators as well. The property in Dixon-street has ventilation in the upper rooms caused by the removal of three bricks from the back wall, and as I was passing the place this morning I noticed that one of the tenants at least had put up a board to stop the air from going through; she told me afterwards that when the rain came she was obliged to shut up the hole.

98. Is it within your experience, that people inhabiting houses of that kind are adverse to the admission of night-air—is there not a prejudice against letting the night-air in? Yes, there is; and in many cases there is a prejudice against opening the window in a room where a patient is lying.

99. *Dr. Read.*] Have you noticed as a common thing that the sashes in those windows do not open? In most of the windows I believe there are open sashes.

100. But while the lower part lifts up the upper part is fixed? I cannot say; I think in the majority of cases the upper part is fixed.

101. You were speaking of Syrett's-lane;—you know it very well? Yes.

102. That is one of the places members of this Committee have visited. Do you consider the buildings there are fit for human habitation? I do not think so.

103. You think they had better be pulled down and more suitable ones erected? Yes; we have been trying to get them into our hands with a view to have them pulled down—at least Mr. Chadwick has.

104. You stated that in London the Metropolitan Board of Works have the power to do this. Do you think it would be desirable to have the same powers here? Yes.

105. Has it come under your notice that under the Landlord and Tenants Act, owners or agents of houses have great difficulty in ejecting undesirable tenants. Mr. Wynne has told us that it takes three weeks to evict an improper tenant;—have you heard of any cases of that sort? I have heard of cases where it has taken six weeks to get a person out.

106. And in the meantime that person would be doing moral injury to the neighbourhood? Yes. With regard to ventilation, I think no room ought to be occupied which has not a sash of 3 feet square at least. The privy accommodation in many houses is very bad, but I suppose that will be remedied now.

107. You have noticed the defective supply of closets? Yes; in Syrett's-lane I think there are only three closets to thirty houses.

108. And no attention paid to decency at all? None whatever.

109. The boards of the closets are left entirely open? Yes, and I must be allowed to say that I think there ought not to be such a thing as a cess-pit in the City of Sydney. They should all be closets and be connected with a main sewer.

110. *Dr. Dansey.*] Does not property of the character you have described often belong to rich persons— influential persons, occupying a high position in the City? Yes; the property in St. John's-place belongs

belongs to Lady Lisgar; and there is a great deal of property in St. Luke's Parish which belongs to Justices of the Peace. When we find houses in such a state that they are unfit for habitation we write at once to the owner if we can ascertain who he is.

111. *Chairman.*] But these properties are generally managed by agents, and the owner probably has no knowledge of the condition they are in? Yes. Mr. Wynne has twice cleared his court, and now he has closed it and put up gates to prevent its further use for human habitation.

112. *Dr. Read.*] Have you often been annoyed by the smell from Darling Harbour? Yes, when going home late at night, I have.

Rev.
G. Sheppard.

G. F. DANSEY, Esq.,

M. CHAPMAN, Esq.,
R. B. READ, Esq.

HON. J. SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 1 Sub-Committee.

FOURTH DAY.—*Central Police Station, Brisbane Ward.*

113. *Dr. Read* gave evidence on behalf of himself and Alderman Chapman, as follows:—

Met at the Volunteer Club at 10 p.m. on Sunday, 21st instant, which we thought would be a favourable opportunity for inspecting crowded dwellings. Unfortunately, in consequence of delay in the delivery of a letter to the Inspector General, we were deprived of the valuable services of the two officers who accompanied us in our previous rounds, and we found our knowledge of the localities, especially at night-time, considerably at fault. Our inspection from this cause was confined to the Central Police Station, which we found to be in anything but a creditable condition, owing to the wretched ventilation, the overcrowded state of the cells, and the almost total absence of the necessary provisions for health and cleanliness. There are altogether six cells or compartments. No. 1 measures 11 ft. by 8 ft. 6 in., giving 93.5 ft. of floor space and 1,209 cubical feet of air space. No. 2 cell is 6 ft. 9 in. by 15 ft., or 101.3 square feet, and 1,316.3 cubical feet of air space. These two cells were unoccupied at the time of our visit. No. 3 cell, which is used as a storeroom, measures 6 ft. 6 in. x 15 ft., giving 97.5 ft. of floor space, and 1,267.6 cubical feet air space. No. 4, formerly a passage, measures 10 x 15 ft., giving 150 feet floor space and 1,950 cubical feet air space. There were three or four prisoners confined here. No. 5 cell contained eighteen prisoners. It measures 18 ft. x 15 ft., giving 270 feet floor space and 3,510 cubical feet air space, or 15 ft. floor space—and only 195 cubical feet air space to each inmate. This is frequently considerably reduced as the number of prisoners is increased, which is not unfrequently the case, for the police did not seem to think the room contained at all an unusual number. No. 6 cell was occupied by 11 females. It is 11 ft. by 8 ft. 6 in., giving 93.5 ft. floor space and 1,209 cubical feet air space, or 8 ft. 6 in. floor space and 109.8 cubical feet air space to each confinee. A comparison between these dimensions and those enforced by the English Legislature in lodging-houses will show that it is no light punishment to be locked up, especially during the summer, even for one night, in a Sydney watch-house. In London it is required that in Metropolitan lodging-houses there should be 30 ft. of floor space and 240 cubical feet of air space for each inmate; any quantity less than that indicates overcrowding. It will be seen that the only distinction made in this place is that of sex. All persons locked up for the night, whatever may be the charges preferred against them or whatever the class to which they may belong, are thrust indiscriminately into the same place, where for the next twelve hours they are compelled to breathe the foul atmosphere of a dirty overcrowded prison. There are no gratings let into the walls to supply fresh air where it is most needed, except in No. 5 cell, where there are eight small gratings on the same side of the wall—four above and four below—and none on the other side, so that for purposes of ventilation they are nearly useless. A faint ray of light comes in during the day through a pane of glass about 6 in. wide high up in the wall, and there is no ventilation, except through the centre of the ceiling, where as in all the cells a ventilator is fixed, communicating with a central ventilator in the charge-room, above which the gas is occasionally employed in some way to produce a current of air. We doubt much whether this system of ventilation is effectual at any time; when we visited the place it was not in operation, or if so the result was imperceptible. In No. 6 cell the small pane of glass had been taken out, and the atmosphere was much less oppressive. The floors of the cells are of cement, and in one corner of the cell was a galvanized-iron bucket, which served as a urinal, and smelt most offensively. The doors fit, as a matter of course, very closely, and as there are no windows in the cells, with the exception of the pane of glass mentioned, which does not open, it is evident that the means of ventilation described are insufficient, and that there should be some mode adopted of admitting air in the lower part of the room. There appeared to be no reason for crowding so many persons into such a limited space; there were several empty cells, among which they might have been distributed, and which would have afforded an opportunity of classifying them to some extent; the clean might at least have been separated from the unclean. That this is absolutely necessary was suggested to us rather unpleasantly just after we had left the room, by the sound of a person vomiting within the cell—one of the eighteen crowded into the cell, 18 ft. x 15 ft. We could only express a hope that if among the other seventeen there should happen to be any youth inclined to intemperance, who was here expiating his first offence, the horrors of a night in such a place would have its due effect upon him, and that the Magistrate before whom he would appear in the morning, would be lenient towards him, in consideration of punishment already received. No light is provided for these cells at night, which perhaps is after all, a blessing, as one of the senses, at least, thus receives no shock during the period of confinement; the others must be offended every moment. Yet this is considered the watch-house *par excellence* in Sydney, at the present time, as well as the best ventilated. We were informed that at least two-thirds of the inebriates brought to this place of penance are victims to the seductions of stringybark or tanglefoot, which we ascertained to be terms employed to designate Colonial ale. We scarcely think it would be worth while to attempt to repair and improve this building. It has been a long time in use and is utterly unsuited to the purposes required.

R. B. Read,
Esq.
26 Nov., 1875.

It

R. B. Read, Esq.
26 Nov., 1875.

It is time now that it should be pulled down and a more commodious watch-house erected upon an improved plan, and with special regard to proper ventilation and appliances for cleanliness. In the meantime the present cells require daily effectual purification, and they certainly should not contain more than six inmates each.

In the absence of our usual guides we did not inspect any other building, and we left Sydney at 12:30 p.m.

FIFTH DAY, MONDAY, 22 NOVEMBER, 1875.

Alderman
Chapman.
26 Nov., 1875.

114. Alderman Chapman gave the following evidence on behalf of himself and Dr. Read:—

Met at the Volunteer Club at 3 p.m.; commenced our inspection by visiting two houses close to the corner of Kent and Margaret streets, Nos. 190 and 192, the property of Mr. Samuel Lyons, of Woollahra. These houses are 18 inches below the level of the ground in front, and about 4 feet below it at the back; each contains two rooms on the ground floor and a small attic in the roof, and rents at 11s. per week. There is one closet for both houses, with water laid on, but with direct action; the bedrooms are hot and close in consequence of deficient ventilation. One of the tenants told us she had been unwell for some time and that she attributed her ill-health to damp, arising from the floor, from which there was an unmistakable stench, proceeding from some collection or other of offensive matter, or from some foul surface drainage. These houses were not in good repair or at all in a tidy condition, and, as usual, we were told that the landlord would not lay out a penny upon them. We inspected the "Morpeth and Hinton Hotel," the corner house, which is let at 65s. a week. We were told that there were eight rooms in this house, but there appeared to us to be more. The floor was very damp, and the place not in good condition; but the landlord said he had only been there a fortnight, and had not had time to get it into good order. We found the closet of this hotel back to back with the closet belonging to the two houses just described, both being directly connected with the main. We next proceeded to Miller's Buildings, owned by Mr. Dickson, undertaker. There are fourteen houses in the court, containing two rooms each, 11 x 11 ft., with a small attic above, and let at 6s. a week; there are four water-closets for the fourteen houses. From one of these houses two children were removed the same morning by the police, almost in a state of nudity, unwashed, uncared for, and literally covered with vermin. The filthy condition of the room from which these unfortunate little outcasts were rescued may be better imagined than described. We were strongly advised by the residents in the court not to enter it, and we contented ourselves with peeping in. Some rags, the colour of dirt, scattered about the place, a rickety chair, and a pretence for a stretcher, constituted the furniture of the apartment. The bare walls and floors, begrimed with dirt, completing the dismal picture. On the door-step was a heap of human excreta, covered with an old straw hat. More wretched objects of destitution than these poor little children, who were in such a filthy state that while their case was being considered they had to be kept in the police shed, being unfit to enter the precincts of the Court, can scarcely be imagined. Deserted by an unnatural mother, who it appeared has gone off with some man other than her husband, and objects of utter indifference to their father, they were dependent upon the charity of the residents in the court, who kept them from starving, until one woman, more humane than the rest, attracted the attention of the police to their case. We call especial notice to this court, and to all groups of houses similarly situated; they are utterly unfit for human dwellings, a disgrace to any civilized community, and should not be permitted to exist. In London they would be closed at once by the sanitary authorities and the area upon which they stood purged of all such sources of filth and pestilence. Water is not wanting here, but it is not applied to purposes of cleanliness; it is laid on to a tap in the centre of the court; the overflow goes into a barrel, into which the residents dip their cars, and which has the appearance of being cleaned out at very remote intervals.

In Murphy's Buildings, also in Kent-street, and also consisting of two-roomed tenements, let at 8s. a week, the accommodation is scarcely if at all superior. The rooms are close and badly ventilated, and the tenants complain of a stench coming up from the floor, which is not to be wondered at, considering that the houses adjoin a stable, and that the floor of the latter is a foot higher than that of the houses, which receive all the drainage. This is not the only place where we found human habitations below the level of the brutes. Here the closet was a common cesspit, which emitted a most insufferable stench. This horrible place is used by the inmates of three houses. In one of these houses we saw a sick child, about three years of age, suffering from marasmus; whether its recovery under happier auspices was possible we could not say, but it was certainly impossible in such a vitiated atmosphere. Even were the court purified of all external sources of pollution, the deficient ventilation of these houses would render health almost impossible. The only air which can enter comes through the door and window, the latter covering an area of not more than 4 ft. x 3 ft., the lower sash only capable of being opened; blank walls on the other three sides, and no current of air under any circumstances.

From this place we crossed over to Sussex-street, and inspected the Harbour View Terrace, a property consisting of six houses, owned by a man named Wincks. The first house in the court has a water-closet to itself, which is just 6 feet from the front door, about half that distance from the corner of the house, and stinking frightfully. The rooms are 11ft. x 11ft. and 8ft. high. In one of these rooms a sort of baby-farming on a small scale seems to be carried on. We saw a woman feeding an infant of three months old with a bottle, its mother being "out too often to attend to it." The whole atmosphere of this area was sickening, and the habits of the occupants so slipshod and dirty that any newcomer could scarcely fail to become speedily demoralized; the ventilation bad in consequence of the faulty construction of the tenements which, like others already described, have only a blank wall at back and a very limited ingress for fresh air in the front. Occasionally we found a grating in the back wall, but this was the exception and not the rule. All houses of this character we class as unfit for human habitation. We took a cursory view of Fowler's-terrace, formerly known as Jagelman's Buildings, which was as clean as the neighbouring courts were dirty. Fowler, the owner, a builder and a man of industrious habits, lives in one of them, and is continually doing something to keep them in order. We learned that he purchased this property for £2,000, and that he has already expended £300 in repairs. Our visit to this group somewhat restored our confidence in human nature which, however, received another shock when we entered a court belonging to Mrs. Smith, of Pymont, containing a couple of two-roomed houses, rented at 8s. a week each, badly constructed, wretchedly ventilated, and utterly unfit for any human beings to live in. The cask into which

the

the tap is turned which supplies those houses with water was so dirty that the purest water must be polluted by it.

In Baldock's-lane the occupants of the eight houses, or shanties, for the term "house" is a misnomer applied to hovels of this kind, have to support life under equally embarrassing conditions. The rooms are about 8 ft. x 7 ft., and 6 ft. high, badly ventilated, close, and filthy to an extreme. Four of the houses on one side are the property of Mr. Hodges, who resides in one of them; the four on the other side are owned by Mr. J. Long, who was intensely disgusted at our venturing to express an opinion that these were the worst specimens of dwellings we had come across. The drainage, which percolated through an old cesspit partially filled up, made us positively shudder. The place formerly used as a closet appears to have been determined by chance. A space of about 3 feet had been left between two of the houses, which, with the addition of a few boards at the back, and no door in front, had been turned into a closet; a board on the other side alone separating it from the living rooms in the shanties adjoining. These two blocks of houses may be described as resembling the letter H without the connecting line in the centre. There are no yards at the back or side, the only vacant area being in the front of the houses which face each other, represented by the space between the two downstrokes of the letter, and this is how they economize it. We noticed, however, that a new closet was being built.

Lawrence Buildings, the property of Mr. Robert Murray, J.P., of Enmore, consists of four two-roomed brick houses, obtaining a rental of 7s. a week each, and having one closet between them—a common cesspit—an abominable filthy place, enough in itself to breed a fever in hot weather; the rooms are badly ventilated, and altogether unfit for human habitations. Complaints were made to us by the people living here of the smoke from the tin-smelting works belonging to Milne Brothers, and we were surprised that with so many objects to engage their senses at home they should have paid any attention to such a slight cause of annoyance. These houses are also designed on the letter H plan, and the front court, the entrance to which is about 5 feet wide, and comprises the only area available to the occupants for recreation, exercise, or thoroughfare, was almost blocked up by the deposit of a heap of horse dung, comprising not less than a couple of cart loads, here collected, we presume, for sale. All these evils notwithstanding, there was no sign of actual poverty in these buildings; indeed one of the tenants assured us that she and her sons earned between them 65s. a week. We visited a court off Kent-street, called Ellis' Court, containing three two-roomed tenements, one of which is let at 8s., and the others at 6s. a week each, in one of which the rooms are only 9 feet x 9 feet and 6 feet high, badly ventilated, and in dirty order,—evidently having been guiltless of paint or whitewash for twelve months or two years at least—landlord as usual declining to do anything in the shape of repairs. A family, consisting of father, mother, and five children, occupy this house. We concluded our round by inspecting six houses called Ritchie's Buildings, the rent of which is collected by Mr. Vaughan, each containing two rooms, and let at 8s. a week. For these six houses there are two closets, but the water had not been on for some days in consequence probably of the pipe being stopped up, as the people next door had plenty of water; old ventilation as before, and an obdurate agent, deaf to all entreaty for repairs. Finished our visiting at Market-street, at 6 p.m.

By No. 2 Sub-Committee.

FIFTH DAY, MONDAY, 22 NOVEMBER, 1875.

Gipps Ward.—From St. Phillip's Church to Miller's Point.

115. *Dr. Dansey* gave the following evidence on behalf of himself and Mr. Palmer:—

Met at my house at 4 o'clock, and proceeded, accompanied by Sergeant Dawson, to inspect the Crescent-street property. This consists of about 8 houses, built on the top of high rocks, and reached by an ascent of twenty steps. These houses, which are constructed of brick, we found to be in very good order, except that they are badly ventilated with the old-fashioned sash windows. Proceeding along Kent-street we noticed that an open drain, near the Gasworks, which has been the cause of numerous complaints for some time past, has been covered with brick and cement. In this street a number of new houses are being erected, which appear to be comfortable dwellings, and are well drained. We then visited Jenkins-street and Cureton's Buildings. The houses in Jenkins-street are a much better class of dwellings than those in Cureton's Buildings, but they all require proper drainage to be provided; at present the pipes which convey the slops and refuse from them discharge their contents over the rocks down to Miller's Wharf, and create a daily nuisance. Thence we went along Miller's Road, and inspected the late Mr. Cuthbert's property, which comprises ten small tenements, containing two rooms each; the ventilation, as usual, is very deficient; otherwise the houses are in good order and well exposed to the sea breeze. In Moore's Road, close by, we looked at some houses, which, except that they are very old, are not in bad order; they are clean, but are all imperfectly ventilated. We went next to Miller's Point, where there are thirty new houses all well drained and with closets fitted up with cisterns in accordance with the new regulations. Along Merriman-street or Crown Road, where there are some new houses all clean and well ventilated. Thence to Rodin Place, where the houses are very old but kept clean; and from Crown Road to Smith's Paddock, where there is a small shanty in front, splendidly clean, and with flower garden attached, the picture of neatness. At the corner of Cambridge-street we inspected a number of wretched wooden shanties which must have existed for a great number of years—small frail tenements, of the lowest style of Colonial architecture, which are falling to decay and should be pulled down and replaced by more substantial buildings. On the right hand the rocks afford a camping ground for goats, which were present in great numbers. We inspected a lodging-house at No. 5, Harrington-street, occupied by a man named Woodbury, which he told us afforded accommodation for twenty lodgers, but on an emergency as many more. This is evidently a sailor's lodging-house. In the yard we saw some men engaged in sail-making, and a number of monkeys. Everything, however, was very clean, and the premises well ventilated. Nos. 10, 12, and 14 in the same street were also very clean and well kept, being a better class of houses than are usually found in this neighbourhood. In Harrington-lane there are six small houses, for which there are closets with pans, but without water laid on. In Harrington Place there are five containing two rooms each and rented at 5s. a week each, belonging to Mr. Reynolds, of Parramatta, which are badly ventilated, although most of the windows are broken. We entered and inspected three out of the five, which represented the positive, comparative, and superlative conditions of unwholesomeness. The first was dirty, the second was filthy, and

Alderman
Chapman.

26 Nov., 1875.

G. F. Dansey, Esq.
26 Nov., 1875.

and the third and last was so disgustingly offensive that we were not sorry to beat a retreat from it. On the ground floor several drunken women were making a great uproar, and as we commenced our ascent to the regions above they made a rush at us and attempted to pull us down the ladder. We managed, however, to get a peep at the attics, where there appeared to be no bedding or sleeping accommodation of any kind but a number of filthy rags scattered over the floor, thrown down by some nocturnal visitor. The other two houses were occupied by families and kept clean and in good order; there is only one closet for the five houses. In O'Neil's-lane, which we next visited, there are some 3-roomed houses owned by M'Clelland, and rented at 9s. a week each, and three owned by Mr. Kell. In front of three of the houses the lane is only 4 ft. wide; it is shut in by a brick wall; the end house was occupied by a coloured family, who were evidently respectable; the next by a man and his wife and her sister, whose respectability was not so evident. These three were clearly under the influence of liquor. As for the sister, who was the most demonstrative of the three, she made certain overtures, which were seconded by her relatives, but declined. The character of these houses, apart from the dirt, is sufficiently evidenced by the paintings which adorn the walls; suffice it to say that they are neither chaste in design or execution.

We returned at 7.15 p.m.

SIXTH DAY, TUESDAY, 23 NOVEMBER, 1875.

G. F. Dansey
Esq.
26 Nov., 1875

Met at the same place and hour, Sergeant Dawson accompanying us as before. We first visited Sutton's Tobacco Factory in Harrington-street, where there are fifty hands employed; seven of them sleep on the premises. There are two closets for the use of the men, with depressible seats, and one urinal. Everything about the place was very clean. On a piece of open ground on the east side of the street is Mr. Golston's Factory for making clothes, the front of which faces George-street; here we found in a large room, 20 ft. x 18 ft., twenty-five girls and one boy; at the time of our visit the windows were open, and there was a current of air passing through the room, but there is no other mode of ventilation, and from the answers we obtained from some of the girls it appears that the windows are not always opened. The accommodation at the back is bad, there being at present only a common privy; the landlord, however, promised that this should be replaced by a water-closet within the fortnight. At Nos. 100 and 102, Harrington-street, there are two closets; the closet at No. 102 was partly pulled down; the pit was full of excreta and stank horribly; that at the back of No. 100 was in a very dilapidated condition and not fit to be used; it had only an apology for a door, which would neither open nor shut. The next house we entered (No. 100), one of two tall brick buildings, which belong to the Wentworth Estate, is occupied by a Frenchwoman—Madame Bethen—who has the privilege of living in it as long as she can; the ventilation is all in her favour, for there is hardly a pane of glass in any of the windows, and Madame gets plenty of fresh air, but the house is greatly dilapidated and in a very dirty state. Two other women, having two or three children each, are the only other occupants of the two houses. No. 86, Harrington-street, also pertaining to the Wentworth Estate, we found pretty clean, but the water-closet was in a very dirty condition. In the cottage at the corner of Gallows Hill there are five rooms; it is rented at 18s., exclusive of taxes; No. 2, adjoining was empty and filthy; the other houses in the row are tolerably clean. The next houses we inspected were occupied by Chinese; they are in Hanson's Buildings, and comprise four two-roomed buildings, rented on a scale running in proportion to the accommodation they afford. Lah Kew (the names are not inscribed over the doors, and I give them phonetically), is a hawker; the tenement he occupies is in a very dilapidated condition, but he pays 7s. a week for the use of it; his next door neighbour, also a hawker, Ah Lang, has obtained a reduction of 2s., his home being to that extent more uncomfortable; while the third hawker, Ah Foo, pays the maximum amount of 7s. On the east side of Hanson's Buildings as you enter there are four three-roomed houses, two rooms on the ground floor and one above. In each of them, leading out of the back room and part and parcel of it, is a water-closet, and under the floor is a sort of cellar, from which, the floors of those houses being sufficiently broken to admit it, comes the odour from a cow-house belonging to Mrs. Smith, a green-grocer, in George-street, and pervades the whole block. There are altogether thirteen houses in this property, for which there are six closets besides those inside; these are kept padlocked for fear any stranger should intrude upon the privacy of the inmates. But in the yard are a couple of two-roomed shanties, the occupants of which are excluded from the privilege of possessing a key to the situation, and for them no accommodation whatever is provided. Under one of these houses, a Chinese store, we found to be in such a frightful state that in my capacity as Health Officer I gave instructions to have it immediately cleaned out, lime-washed, and thoroughly disinfected. We next visited Kidman's grocery store, at the corner of Essex and George streets, which we found clean and well ventilated, but the supply of water for the closet was deficient. At No. 171, George-street, occupied by the said Mrs. Smith, green-grocer, who keeps a cow and fowls, there was no water for the closet laid on, and she informed us she had been without any for a fortnight; the pan was, however, kept tolerably clean by water carried by hand. We also inspected Mr. Heeney's public-house at the corner of Globe-street (landlord, Mr. Riley, of Liverpool). Here we found some bad cases of scarlet fever, four members of the family out of six being sick with it. In order if possible to ascertain if there were any local cause predisposing persons in that locality to the attack of this disorder, we visited Atkins', the butcher's shop at the corner, but everything there was very clean, no bad smells of any kind, and the water-closet supplied with the improved cistern apparatus, though defective in its action in consequence of the insufficient supply of water. In the Factory behind the butcher's shop, however, kept by Hanson and Oliffe, we found a large quantity of hides, which emitted a most offensive odour. Upon our return we called the attention of the Inspector of Nuisances to this fact, and he has no doubt ere this paid a visit to the locality.

We concluded our afternoon's work at 7 p.m.

FRIDAY, 26 NOVEMBER, 1875.

Messrs. M. Bowmaker, M. Hodgkinson, and C. Tilley, City Missionaries, called in and examined:—

116. *Chairman.*] Which of you gentlemen has had the longest experience of Sydney? *Mr. Hodgkinson:* Mr. Bowmaker.

117. *Chairman to Mr. Bowmaker.*] I suppose you have been informed of the general nature of our inquiry. This Committee has been appointed to inquire into the overcrowding, bad ventilation, and the consequent ill-health prevalent in this city, and we shall be glad to have the benefit of your experience on the subject? I should like to ask first if it is intended that the information given by the City Missionaries is to be made public?

118. *Chairman.*] Yes? Then I must certainly decline to give evidence, unless I am compelled to do so. I must do so for this reason, and I feel sure you will appreciate my motives: That we have spent a considerable time in obtaining the confidence of the people who live in these places, and if we were to lose that confidence we should have no chance of regaining it. If a report were circulated through the city that the City Missionaries had been making statements about them which were published, it would shut us out altogether. I spoke to my superintendent and he left me to use my own judgment in the matter. I have therefore attended at your invitation as a matter of courtesy, but that is the position in which we are placed; we do not wish to lose the influence we have gained.

119. I think there is great force in what you say, and I am sure we should be very sorry to ask you to do anything which would impair your usefulness. But would it not be possible for you to make some statements in a general way without giving names or even indicating localities? It would be known that we gave the information. We have frequently made statements at our meetings which have been published in the *Evening News*, and although we have only stated actual facts, the people, when they saw the paper, know very well where the information came from, and we have had great difficulty in getting to them after that. Although they are sunk so low they are fearfully sensitive.

120. *Mr. Hodgkinson.*] We have gained a little influence over these people, and we should be very sorry to lose it. Our object is to gain souls to Christ, and we must not do anything to lessen our power to do good. The only way I can see by which you could attain your object would be to invite some gentlemen who are members of our Committee to come, and they could give evidence if they liked. I hope you will excuse me for speaking so plainly. I have met Dr. Dansey on one occasion at one of these places, and I was very glad to see him under the circumstances. At the house where I met him there was an insane person who was very noisy and violent, and I believe would have killed her husband. The police would not interfere without a certificate, and Dr. Dansey being there, I thought it my duty to speak to him.

121. *Chairman to Mr. Bowmaker.*] I think we might pursue a middle course: You have now an opportunity of doing some permanent good to these people by exposing abuses, and giving us an opportunity of placing a case before the Legislature, and if you could help us without committing any breach of confidence—without using any names, or even being specific as to localities—you would, I think, do good service. I will just ask you a few general questions, and if you find that they trench upon forbidden ground you can say so. Your work lies chiefly I suppose among the poorer classes in Sydney? Yes.

122. And you have of course seen a great deal of their homes. Now, speaking generally, have you had occasion to notice much overcrowding in the homes of these poorer sort of people? Yes, a good deal.

123. Do you think the overcrowding exists to such an extent as materially to injure health? Yes, that is my opinion.

124. There are two classes of houses with which I dare say you are familiar—those occupied by private families and as lodging-houses;—have you seen cases of overcrowding in both of these classes of dwellings? Yes, there are two classes of lodging-houses—those which offer board and lodging, for which the lodgers pay fifteen shillings, sixteen shillings, or a pound a week, and those in which beds are let at 6d. a night. In the latter there is a great deal of overcrowding, but in the former I have scarcely noticed any.

125. But you have frequently observed overcrowding in the sixpenny lodging-houses? Yes.

126. And in houses occupied by private families have you noticed much overcrowding? Yes.

127. Have you often been struck with the bad ventilation in these houses? Yes.

128. Have you felt that the atmosphere was really injurious to health? Yes.

129. And have you observed that the houses are often kept in a filthy condition? I have.

130. Do you find among the poorer people that they are often averse to use the simple mode of ventilation at their command—that they do not even like to open their windows? Yes, it has often struck me.

131. Do you feel at liberty to indicate some of the localities you have in view, so that the Committee may visit them? Yes, in confidence, so long as it does not appear in print I have not the slightest objection.

132. *Chairman to Mr. Hodgkinson.*] You have heard what Mr. Bowmaker has said? Does your experience coincide with his? Yes, but part of my district is somewhat more respectable.

133. What is your district? Parramatta-street and part of Redfern.

134. But, even if your district is not so bad as Mr. Bowmaker's, you have no doubt come across cases of overcrowding of somewhat a similar character? Yes, I have.

135. Have you found that overcrowding and bad ventilation prevail? Yes, there was a very bad place in my district—Linden-court—but it has since been pulled down.

136. Do you think that overcrowding and bad ventilation prevail to such an extent as materially to affect the health of the residents? Yes, in that locality, decidedly.

137. *Chairman to Mr. Tilley.*] Does your experience, Mr. Tilley, correspond with that of Mr. Hodgkinson and Mr. Bowmaker? Yes, it is pretty much the same; my only wonder is that people can live under such conditions. I have frequently experienced a violent headache from merely visiting them, and I have often told them, when they wanted a doctor, that God's pure air was the best doctor they could have.

138. Then in your experience you have found that bad ventilation really affects health? Of course it does.

139. We know it does, but we wish to have your experience on the subject? Yes, the smell on entering one of these places is frightful, but after a time it is not so perceptible, and I suppose the people get used to it. There is one thing which requires to be remedied. There are a number of low public-houses, which are the worst curse these people could have. There is one in Goulburn-street, aptly named the "Slaughterhouse," and there are many others of the same class; they do an immense deal of harm.

140. *Mr. Hodgkinson.*] There is much we could say upon these subjects, which we should like to say, but it would not be to the interest of those we are trying to serve that it should come from us. There is one

Messrs. thing, however, I may mention, in reply to your questions about the want of ventilation, and that is that a great mistake is made by those who build these small houses in constructing the windows in such a way that the upper sash will not let down. This prevents the fresh air from getting into the rooms, and is very injurious.

[Witness proceeded to detail the particulars of several distressing cases of want and misery which had come under his notice, but which he objected to tender in evidence to be published. The other witnesses also gave in confidence details of similar cases occurring in their districts.]

FRIDAY, 3 DECEMBER, 1875.

Present:—

G. F. DANSEY, Esq.,
B. PALMER, Esq.,

R. B. READ, Esq.,
M. CHAPMAN, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By Sub-Committee No. 1.

SIXTH DAY, WEDNESDAY, 24 NOVEMBER, 1875.

Little George-street and along New Pitt-street.

141. *Dr. Read* gave evidence on behalf of himself and Alderman Chapman as follows:—

R. B. Read,
Esq.
3 Dec., 1875.

Met at the Volunteer Club at 10 p.m. on Wednesday, 24th instant,—Sergeant Larkins, Sergeant Dawson, and Constable Hogan, being in attendance. We first visited Little George-street, and went to O'Brien's house; the owner's name given to us was Marks. It is a brick house rented at 12s. a week. It contains two rooms downstairs and two upstairs, 10 ft. x 9 ft., and 8 ft. high, having the old-fashioned sash-windows and therefore badly ventilated. There is a watercloset in this house with patent cistern, but the house itself is in a filthy state, and the open drainage very offensive. The stairs appeared as if they were swept about once a month, and in the yard we noticed tubs full of soapsuds, which must have been standing there unemptied for some days.

Mrs. Reece lives in a house of similar capabilities, and let at the same rent; watercloset and patent cistern as before; walls damp, and an offensive smell proceeding from the floor, evidently from some old sewer, probably a tributary to the Tank Stream—stinking soapsuds and dirt *ad libitum*.

We paid a visit to Miss Gibbons, who occupies a two-roomed house round the corner. The peculiar features of this and the adjoining house is the Lilliputian character of the back premises and the ingenuity displayed by the architect in closing up all ingress to fresh air. One of the yards or passages is 5 ft. x 6 ft., and the other 4 ft. x 4 ft. On three sides of these yards there is a wall 20 ft. high, and if any ventilation were possible it could only be afforded by means of a windsail, which is quite as necessary here as in the hold of an immigrant ship. As for the closets it is indispensable that persons using them should back into them as a horse backs into the shafts of a cart, since there is no room to turn round at the end of the passage.

Mrs. Andrews lives a few doors off, where she follows the occupation of a washerwoman, but although the washing entrusted to her is no doubt done on moderate terms, she labors under the same disadvantage as her neighbours in having no "drying ground." In the front room, 14 ft. x 10 ft., and occupying one-third of its space was a mangle. The only available space for the family to cook, eat, and drink in was about six square feet; the mangle monopolized the remainder of the room. We penetrated to the upper regions and found the walls in a dirty state and guiltless of any colouring or whitewashing. This tenant complained bitterly that the landlord would not incur the slightest expense to keep the house in repair. The adjoining house contained also two rooms, and a back yard, 7 ft. x 8 ft., shut in in the same way by high walls, which was equally unwholesome. The occupants of the house opposite attributed the unsavory odour which pervaded the premises to the existence of a neighbouring fish-shop, which we immediately inspected, but we found everything very clean and sweet. From this place we went to a Chinese opium-shop and to several other places, which we decided to visit again during the day. A description of these places will be comprised in Alderman Chapman's evidence.

We concluded our inspection at midnight.

SEVENTH DAY.—THURSDAY, 25 NOVEMBER, 1875.

Bourke Ward.—Along Pitt-street, commencing at Queen's Place.

142. *Mr. Chapman* gave evidence on behalf of himself and Dr. Read, as follows:—

M. Chapman,
Esq.
3 Dec., 1875.

Met at the Volunteer Club at 3 p.m. on Thursday, 25th instant, and commenced our round of visits by calling upon Ah Loon, a Chinaman, known in the neighbourhood as "Lousy Charley," who occupies a three-roomed stone cottage off Queen's-place, for which he pays 10s. a week—the agent for the property to which this tenement belongs being M. Kenzie. It is 37 feet long and 11 ft. high, and divided into three rooms, in each of which is an opium bench, with all the appliances necessary and ready for use at once. Charley is a seller of opium and an inveterate smoker as well, or his appearance greatly belies him. J. E., a white woman, aged twenty-two, who lives with him, also indulges in this demoralizing habit, and their place is an accommodation house of the worst character, for it is impossible to say what diabolical offences are not committed through the agency of this pernicious drug. Of this more hereafter. The woman told us that sometimes their customers were so numerous that they had to wait their turns to enter the room. This unfortunate creature appeared to be completely under the bondage of opium, and the police assured us, and she herself admitted, though her paramour stoutly denied it, that other white women frequent the place, and that the most revolting and immoral scenes are of frequent occurrence. In corroboration of this statement, she mentioned among the names of her visitors some of the most disreputable prostitutes in Sydney. If half the stories we heard were true, it is more than time that this and other similar foul dens of Chinese depravity should be cleared of their occupants and thoroughly purged, for their existence is a blot upon the character of a city like Sydney. Opposite the building in question was a place which was formerly a cow-shed, and several stalls are still remaining. On one of these lay a sick Chinaman. In the adjoining yard, which is portion of the same property, we inspected a row of cottages,

cottages, which, a in sanitary point of view, are quite unfit for human habitations. The front doors were open, and we could see that the lower roomswere not more than 6 or 8 ft. wide. We could also perceive a ladder leading to a very small apartment above; but the window upstairs does not open, and there can be no ventilation of any kind. Some light may enter from the small panes of glass in front, but there is no sash to raise or let down, and the ingress of fresh air is impossible. Just in front of the doors and running parallel with the row of cottages, of which there are six, is an open drain which discharges into a large hole in the wall enclosing the yard, direct into the Tank Stream. When this sewer is full a regurgitation takes place, so that the inmates of these hovels have in front of their doors, within 3 ft. of them, a sort of tidal stream of filthy drainage, polluting the atmosphere and inviting pestilence and disease. These cottages should be pulled down at once and should not be replaced by any others. The closets used by the inmates are beyond description. This was our second visit to this place, which, it must be remembered, is in the centre of the business part of the city, not more than fifty or sixty yards from the Exchange, and some attempt had been made to give it a cleaner appearance. The above description may therefore be taken to represent the place at its best.

M. Chapman,
Esq.
3 Dec., 1875.

We next visited Ah Toy's workshop in Queen's-place, where there is a large loft over the workshop, about 60 ft. x 30 ft., in which nineteen persons sleep—at least so we were told—but the numbers given us were probably incorrect in most cases, for we never found the beds to correspond. The bedroom of a Chinaman is a square compartment with room for two occupants, in which he keeps all his belongings, and which serves him as a smoking-room, sitting-room, and bedroom. The rooms are generally boxed off in this way into compartments which represent so many separate dwellings under one roof. The workshop referred to was crowded in every part of it, not occupied by beds with unfinished furniture, leaving only a narrow passage in the centre. No attempt seemed to have been made to clean the place, nor could we see any lavatories or appliances used in other houses; if these people ever wash themselves they do it by stealth. The attic room in Ah Toy's house, fronting George-street, the owner of which is Mr. Redman, is 7 ft. high, and as near as we could guess about 14 ft. x 10 ft.; it is divided into eleven compartments, is without ventilation, and very dirty. The closet attached to the house was in a frightful state. At the back of the house is a store used as a workshop, and on the upper floor of this building we saw a number of beds—apparently double beds—and several opium benches containing lighted lamps, pipes, &c., ready for use at a moment's notice. Everything in this apartment was in confusion, and in a filthy state, articles of unfinished furniture piled up in every available space. The attention of Insurance Societies and Fire Brigades should be called to this place, for if a fire were to take place in this part of Sydney the result would be disastrous, and the loss of life and property great. The closets in all these houses are in a horrible state; they discharge into an opening over same drain probably a tributary of the Tank Stream—as in almost every case the tenants complain that the landlord will do nothing for them.

Lee On Chong, who is also a furniture maker, pays £180 per annum for his house (Laidley, agent) and employs thirty-two workmen, who all sleep on the premises, and have the same dirty habits which we have noticed among all their countrymen. There is plenty of water available, but the use of it for purposes of cleanliness does not seem to occur to them. In the attic room of this house there were sixteen sleeping compartments partitioned off, entirely without ventilation, and anything but clean. Others of the workmen who are unable to pay for their beds sleep on benches or on the floor wherever they can find a corner to lie down in.

Way Hap's house (Laidley, agent) rents at 30s. a week. He is also a maker of furniture, and his rooms are as dirty, as badly ventilated, and overcrowded as his neighbours'. In one room, 28 x 13 ft., with a coved roof and not averaging over 4 ft. 6 in. in height, we saw eight beds, four on each side, and placed end to end, with a vacant space of 5 ft. in the centre. The stench proceeding from this room was most revolting. There were some smaller rooms with beds in them, and there was one room, a sort of loft, over the workshop approached by a batten ladder—an awful hole, 4 ft. 6 in. high and 10 ft. long, containing three beds; it is a wonder that during this hot weather anyone could breathe in such a place; there was also a bed on the stair landing, and two beds in the kitchen, which is a mere open shed, boxed off from the fire-place; the closet was too bad to inspect; we dare not go near it. I omitted to mention that in the course of our inspection of Ah Toy's premises we peeped down a dark underground cellar, into which the light of day never penetrates, and were at a loss to know to what purpose it was devoted; to our astonishment we found it was the sleeping apartment of the cook. This man rushed in in a state of great excitement and forcibly protested against our taking his money from him; probably he took us for officials armed with the terrors of the law, and expected to be mulcted in a heavy fine by the barbarian. In passing from this place to George-street by the ground which was the site of the late fire, now used as lumber yard, we noticed a number of young girls of various ages playing about, and from what we have learned of the character and habits of these Chinese opium smokers we do not hesitate to say that they should be warned not to approach such dangerous precincts. (*Vide Appendix A.*) This day's inspection was not performed without serious fatigue and risk to health to Dr. Read and myself. For the next forty-eight hours, and that of the previous night, the horrible sickly smell of opium smoking which pervades all the Chinese quarters seemed to adhere to us, to say nothing of the fear of infection, which is not a pleasant sensation. We have witnessed in the several visits we have made a great many disgusting scenes, the existence of which in such close contiguity to our main thoroughfares we could not otherwise have credited—and we may fairly state that since we undertook the duty entrusted to this sub-committee we have not been able to enjoy a single meal. We concluded the day's work at 6 p.m.

Personal Inspection

By No. 1 Sub-Committee.

EIGHTH DAY.

Clarence-street to Market-street.

143. Mr. Chapman gave evidence on behalf of himself and Dr. Read, as follows:—

Met at the Volunteer Club at a quarter to 4 o'clock on Monday, the 29th instant, and having secured the attendance of Sergeant Larkin, whose intimate acquaintance with the crowded quarters of Sydney is of the greatest service to us, we proceeded to the "Post Office Hotel," in York-street, at the rear of which we inspected two houses belonging to the Irwin Estate, which contain two rooms each, 10 ft. x 11 ft. and 8 ft. high, and are rented at 5s. a week each. For these houses there is no privy accommodation of any kind, and the inmates have to manage as best they can. One of these houses was used

M. Chapman,
Esq.
3 Dec., 1875.

M. Chapman, Esq., used as a smithy and the other as a dwelling. We spoke to a woman who lived in it, and she complained bitterly of the stench pervading the place, and the unwillingness of the landlord to do anything to improve its condition. Her husband is a fruit vendor. The yards were in a filthy state; the drainage, which is all on the surface, finds its way into the street gutters, and during its sluggish course contributes its share to the pollution of the atmosphere. At the back of the houses, in a spot common to all the houses, for the fences have long since ceased to distinguish one yard from another, is a central depot of filth and refuse, amounting to several cart loads, which is enough in itself to breed a pestilence in the neighbourhood.

3 Dec., 1875.

We went through to Erskine-street, and entered a court at the corner of that street and Clarence-street, owned by Ellis. This court was reached by a descent of nineteen steps from Clarence-street; it contains three two-roomed brick houses, rented at 7s. a week each; there were two closets with the water laid on, but with direct action. The yards are shut in on three sides by lofty buildings so that no ventilation is possible, and the atmosphere must be fearfully close during the hot weather, when the sun, which can rarely be visible here during the winter, sends its scorching rays into the centre of this boxed-up locality. Continuing our route along Clarence-street southward, we inspected several other houses. No. 135, Clarence-street, owned by Farrell, is a very old wooden tenement, rented at 10s. a week. The closet is an old cesspit, and there is no drainage. There are three houses at the back, each containing two small rooms; closets, old cesspits, and close to the doors of the houses, very filthy, and the premises altogether very badly ventilated.

No. 143, Clarence-street, is an old weatherboard house, containing five rooms (Macdonald, owner), rented at 12s. a week; the closet is an old cesspit and in a filthy disgusting condition, and the yard about 8 ft. square. The rooms in this house are in such a tumble-down state that they are quite unfit to be occupied—in fact they are positively dangerous. The tenant informed us that the rain comes through the roof as through a sieve, and that there is a continual stench and moisture rising from the floor. The rooms upstairs are 6 ft. 2 in. high, and very badly ventilated; the closet, an old cesspit, filthy in the extreme; the stench from this place was sickening. No. 139, Clarence-street, same owner, same rent, is in a similarly dilapidated and dirty condition, with the same want of ventilation, and having an old cesspit for a closet, in an equally filthy state, with an old sack hung up in front in place of a door. The drainage from these houses finds its way under the floor, through a pipe, and empties into the street outside the curb-stones. All these houses seem to have been built by piecemeal, and vary in the number and size of the rooms. No. 137, also belonging to the same owner, rents at 15s. a week, has the same style of closet with the same frightful stench proceeding from it, and is in every respect an equally forbidding abode. These four houses may be classed as so out of repair, so badly ventilated, and so deficient in accommodation, as to be utterly unfit for human habitation, and as the land on which they are situated fronts Clarence-street, and is therefore valuable property, steps should at once be taken to compel the owners either to pull them down or to put them into repair, and to drain the locality. The tenants all state that the landlord positively declines to improve them; these people occupy them while in this condition solely because if they were to leave they would not know where to find other houses to live in, decent houses at a moderate rent being very scarce in the neighbourhood. The yard or court leading from Clarence-street to Smith's picture-frame manufactory has been previously noticed. In a gateway connecting this with an inner court we saw an old woman, apparently one of the tenants, lying on her back hopelessly drunk. In this yard there are two houses, rented at 7s. a week each; one of them was locked up, the tenant being absent; the other, which we entered and examined, contained three rooms very badly ventilated and very low, the extreme height from floor to ceiling being only 6 ft., altogether a most unwholesome place; a woman who lives in it complained that she felt sick every morning from the foul atmosphere; the closet is an old cesspit, emitting an awful stench.

Mr. Aitken's court, off Clarence-street, contains five houses, close, badly ventilated tenements, having two closets or cesspits very foul and in bad repair. Garrett's Buildings contain ten houses, having two rooms each, 10 ft. by 10 ft. and 9 feet high, rented at 6s. a week each; they are very badly ventilated, the back walls having no opening or air-hole of any kind. These ten houses occupy a piece of ground in the form of a parallelogram; five houses on either side with a space of 14 feet in the centre. Of this 14 foot space 4 ft. 6 in. is fenced off right and left and partitioned into yards for each house, leaving a passage of 5 feet—exact measurement—down the middle, from end to end of the row as a thoroughfare. The houses are hemmed in on all other sides by surrounding buildings, so that nowhere except in front can a mouthful of air be had for love or money. But, shocking to relate, this narrow passage which intervenes between the two rows receives all the drainage of the court, being nothing more or less than an open drain covered loosely with boards, not so effectually as to prevent the escape of foul gases, or with that object at all, but to allow the inmates of the houses ingress and egress to their dwellings without breaking their skins. At the end of the lane or court there are three closets or cesspits in such a stinking condition as to be unapproachable as well as indescribable. How life can be supported under such painful conditions seemed to us almost a mystery, and our hearts felt sore within us as we noticed the squalid appearance and attenuated forms of the poor little hollow-eyed children scattered about the place, and felt how small was the chance of their blossoming into healthy plants in the pestilential atmosphere of this abominable hole. We were told that there were, or had been, several cases of scarlet fever in the court, and this statement required very little confirmation, for it seemed to us to be a perfect fever den. A visit to this spot will be sufficient to convince the most sceptical that we have not exaggerated its unhealthy condition.

Nor can we speak in much more favourable terms of Lynch's court, also off Clarence-street, where we inspected two weatherboard hovels, one containing two rooms and rented at 5s. a week; the rooms are badly ventilated, have a skillion roof, average height 7 feet, area of rooms 8 feet x 7 feet. Here we witnessed a scene of great distress. In one of the houses was a woman, middle aged, with two children, apparently 5 and 7 years of age, almost naked. One room contained two old tables, on one of which was some pieces of dry bread, and an old sofa; no cooking utensils of any kind, and one or two cups or mugs without handles. In the other room, a dark place without windows or any ventilation, and borrowing its light from the door in the adjoining apartment, was an old mattress with a few dirty rags to serve as bedding. On every side dire misery stared us in the face. The house next to it contains three rooms, and is let at 8s. a week to a Chinaman. We could have dispensed with this information, for the sickly opium smell which pervaded the premises had already warned us what to expect.

expect. The occupant's name is King; he has a white woman for his wife—and a child. We were informed that he is employed as cook in some eating-house in the city. The place was not unclean, and the woman appeared to keep it in a tidy condition, but the stench was exceedingly offensive. Both houses are greatly out of repair, and as the landlord refuses to do anything to improve them, steps should at once be taken to remove them. So bad are they that they are scarcely fit for dog-kennels.

M. Chapman,
Esq.
3 Dec., 1875.

In Clarence-street, near Market-street, we entered an old weatherboard and weather beaten tenement, the property of Mr. Wickham, rented at 15s. a week. It contains four rooms on the ground-floor, which are just 6 ft. 3 in. high. Several smaller rooms in the upper part of the house are not in a habitable state, and not occupied, except by the rats who have it all their own way upstairs, and amuse themselves downstairs at night by eating the boots of the lodgers. This house is badly ventilated; besides being a dirty stinking place, and is in such a dilapidated state that it may fairly be said to be used up. The tenant informed us that whenever he applied to the landlord for repairs he was invariably served with a written notice to quit. He had a number of these documents on a file, which he exhibited in triumph as a full and sufficient excuse for any shortcomings, past, present, or to come. Down a passage at the back are two 2-roomed houses belonging to the same owner, evidently brothels; the rooms in them are 8 ft. x 8 ft. and 7 ft. high. These houses are rented at 6s. a week each; they are badly ventilated—no opening whatever in the back wall. The drainage from the back yards finds its way, without the assistance of any artificial drain, under the floor of the houses, but where it goes to finally we could not ascertain—probably to some adjacent well into which it percolates, and so contributes its share to the unhealthy influences of the locality. These houses were very dirty, the yard and surroundings were dirtier still, and the old cesspit in the yard in the foulest condition; while the cask, from which the tenants draw their water for domestic purposes, looked as if it had not been cleaned out for months—there was actually moss growing on it.

In a lane off Clarence-street, at the back of the Masonic Hall, and belonging to some trust estate, the name of which we did not ascertain, for which Miss O'Connor is the agent, are four two-roomed houses, each room being 10 ft. x 10 ft., and 8 ft. high, rented at 7s. a week each. The rooms are without any ventilation, very close and unwholesome; there is one closet for the four houses, with the water laid on, but with direct action. We have noticed a great many instances where the closets are directly connected with the watermains, and we would suggest that this source of ill health at least might be avoided by a little more prompt enforcement of the provisions of the Water Pollution Prevention Act, passed during the last Session. We inspected M'Crory's court or lane, which also leads out of Clarence-street. The width of this lane is just 5 feet, and in front of the houses is a high blank wall. The houses it contains are four in number, each room being 10 ft. x 10 ft., and 8 feet high, and very badly ventilated. The owner of them only charges his tenants 5s. a week, in order to keep his property clear of prostitutes, from whom he could obtain higher rates; it may therefore be considered a respectable if not an eligible place of residence. There is one closet for the four houses with direct action. This closet is in the centre of the row, and presents the same external appearance as the houses on either side of it, so that there is nothing about it to warn visitors not to knock at the wrong door. In a court off Clarence-street, and near Druitt-street we inspected three houses—Farquhar, agent—rented at 9s. a week each. For these three houses there are two closets or cesspits, very foul and stinking; the place is also badly drained. As in the majority of cases which we have noticed, the landlord of this property refuses to do anything to put it into repair.

We have spoken strongly of the condition of Macdonald's houses and those in Lynch's-lane, but not, I think, more strongly than the occasion requires. It may be months and months before the Building Act framed by the Corporation passes into law, and even then it will only apply to houses not yet erected. In the meantime, hundreds of persons are located in courts and lanes under conditions which are to say the least strongly provocative of disease, and in direct opposition to the regulations as to air and floor space which obtain in almost every civilized country. The only remedy appears to us to be the appointment of some sanitary authority whose business it should be to deal with cases of overcrowding of this character, and to condemn and close, or where necessary for the health of the neighbourhood, cause to be pulled down, all such wretched tenements as we have referred to as unfit for human habitation, and prevent as far as possible the occupation of any building which does not come up to a minimum standard as far as air and floor space, and ventilation, &c., are concerned. We concluded our inspection at twenty minutes past 6.

Senior-Sergeant Larkins, Metropolitan Police Force, called in and examined:—

144. *Chairman.*] I suppose you are pretty well acquainted with what are commonly called the back slums of Sydney? Yes, pretty well.

145. Have you found in your experience that there is much overcrowding in the houses in those localities? Yes, there is a great deal of it in parts of the city.

146. And I suppose that overcrowding is usually accompanied by bad ventilation and filth? Yes, bad ventilation and bad dwellings in many instances.

147. Will you tell us what you consider to be some of the worst places used as human habitations in Sydney? There is Syrett's-lane; Harbor-street, which is at the west end of Syrett's-lane, and runs into Liverpool-street; Liverpool-street, in that vicinity; North-street, Fleming's Square; St. John's Place, where there are fourteen houses in the Court; and there are several houses in Sussex-street, between that and Market-street, some of them 4 or 5 feet below the level of the street.

148. You think those are about the worst places in Sydney used as human habitations? There are several other places that I have not mentioned but those are all in Sussex-street; then there is Kent-street, between Druitt-street and King-street; Druitt-street; Clarence-street; and several rights-of-way off Clarence-street, between Market-street and Druitt-street; there is Goulburn-street also.

149. Those are all in the western parts of the city. Do you know of any bad localities in the eastern portions of Sydney? On the east side there are various places. There is Belmore-place, off Castlereagh-street, on the west side near Liverpool-street; then there is Quigley's-lane, off Goulburn-street; and a great portion of Goulburn-street, off George-street; Exeter-place, and a portion of Campbell-street; there is Yeend's Court, off Pitt-street, on the east side; there are several houses in Roxburgh-place, off Wilmot-street; then in Phillip-street there is a place called Paine's Buildings.

150. Is that towards the south end? It is near King-street.

151. On the east side of the street? Yes, near the Transit Commissioners' Office. There are several houses on the west side of the street; and there is Wentworth-place, which is very poorly ventilated;

Little

Senior-Sergeant
Larkins.

3 Dec., 1875.

Senior-Sergeant Larkins.

3 Dec., 1875.

Little George-street; Robin Hood Lane; Abercrombie-lane; Queen's-place. Those are about the worst places I think; there are several others which I cannot think of just now; there is Brougham-place, now Rowe-street.

152. Are there not similar places about Woolloomooloo; not so bad perhaps as those you have mentioned, but where there are crowded lanes and courts of the class you have referred to? Yes, but the class of houses in Woolloomooloo is much better.

153. The buildings are newer, I suppose? Yes; the ventilation in Woolloomooloo is not particularly good. I am not so well acquainted with the names of the lanes and streets there, though I know them all very well.

154. Do you know of any places more to the southward towards Parramatta-street, and in that direction? Kensington-street and Paradise-row are two very bad places.

155. In these streets and lanes which you have named, are there numerous houses badly adapted for human habitation? Yes.

156. It would be safe, I suppose, to say that there are hundreds of such houses in Sydney? Yes. I did not mention Market-street; there are several houses there scarcely fit for any one to live in—in fact they are not safe.

157. Have you observed that much ill-health prevails in houses of that class? A great deal, especially amongst the children, who seem to be delicate. Of course there is a great deal of drinking and debauchery going on amongst the people who live in those places.

158. *Mr. Chapman.*] With regard to your remark about drinking and debauchery in these places;—you believe as a matter of course that such things do exist and must exist in Sydney? Yes, it is quite certain they do.

159. Do you think it would be desirable to have a law passed for the proper supervision of brothels? I believe it would be a great service, and I always have thought so. One reason is that there are always a number of young fellows loafing about who live on these girls. If some such law were passed that sort of thing would be prevented, and they would be compelled to get an honest livelihood.

160. You mean that they live upon the earnings of these women? I am certain of it. If there were more protection for these women, and a better class of dwellings for them, these young fellows would not be able to live upon them.

161. These men are protectors, or pretend to be protectors, of the girls? Yes, there is a class of women who roam about King, Pitt, and Castlereagh streets, and take men home with them, and in many instances decoy respectable men who may happen to take too much drink to their dwellings, when they are robbed by what is commonly called their "fancy men." The sober man gives them 5s., 10s., or 20s., as the case may be, and when he enters the house 2s. 6d. or 5s. more is demanded by the woman who is in charge of the house for the use of a bed; one of those loafing fellows makes his appearance, ejects the visitor, asking him how dare he have the impudence to interfere with his wife; or perhaps she makes an excuse to go to the public-house for some drink, and does not come back again for the night. This is what is called "bilking." If there was a law giving the police a stricter supervision over those houses and women, men who feel disposed to visit those places, together with their property, would be much safer, and many assaults and robberies would be prevented. In many instances when men are "bilked" in the way I have mentioned, they become infuriated, assault the persons in the house, or perhaps destroy what property they can, and the upshot will be it is likely to become a matter for investigation before the magistrates next day.

162. That is to say if proper protection were given to these women they would have no occasion for the protection of such men? Yes.

163. With reference to lodging-houses—you have had considerable experience of overcrowding in such houses;—do you think it would be an advantage if an Act of Parliament were passed as a Lodging-house Act—for their proper supervision? I do.

164. Do you think that is really necessary for the comfort and well-being of the community? Yes; I have had great experience of lodging-houses, particularly in the central portion of the city—houses where working-men, diggers, and men of that class lodge at night; some of them strangers, and others men who work on the wharves, and I have invariably found them in small rooms, about 12 ft. square, perhaps ten or twelve of them crowded into one room. I have visited houses of that kind from 10 o'clock at night to 5 o'clock in the morning, and have frequently found the smell proceeding from them most offensive.

165. You think such overcrowding ought not to be allowed? I do.

166. At present the police have no more control over a lodging-house than they have over a private house? No, none whatever. I have seen some instances of overcrowding even in the better sort of lodging-houses, where people pay really a fair rate for board and lodging.

167. *Chairman.*] What do you call a fair rate? From 18s. to £1 week.

168. And in houses of that kind what have you observed? I have seen a great deal of filth and overcrowding—five or six beds in a small room, 14 x 12 ft.

169. Even in houses where £1 a week is paid by the lodgers? Yes, from 18s. to £1; and I have sometimes seen it in public-houses.

170. And in what you would call a respectable class of house? Yes.

171. I mean in houses where they do not pay a higher rate for any particular reason? Yes; the houses where I have seen the most overcrowding have generally been six-penny lodging-houses; they sometimes put ten or twelve persons into one small room.

172. *Dr. Read.*] At the time you accompanied Alderman Chapman and myself to several of these six-penny lodging-houses, being summer time, a good many of the beds were not occupied? Yes, in a number of cases.

173. Was not that owing to the time of the year and to the demand for labour in various parts of the country? I could not account for their not-being occupied on that particular night; we might have gone there the next night and found them all full.

174. At any rate you have seen them all occupied? Yes.

175. And the beds so close together that there was scarcely room to pass between them? Yes, I have never made notes of any particulars about them. I am speaking from personal observation, having had considerable experience of these houses. I have been thirteen years in the city.

176. Do you find that in almost all these places where the houses are bad and the ventilation deficient, the people who live in them are of a corresponding class? They are inhabited by the lower order of people—persons out of employment. The houses are generally let at a cheap rate.

177. And do you think that if respectable persons were compelled through unfortunate circumstances to occupy one of these houses, they would long remain respectable? I am satisfied that they would not if they remained there any time.

178. You think that they must lose all sense of decency and morality? Yes, gradually they would, because all the people living in these courts associate and drink together.

179. *Dr. Dansey.*] Do you find much distress, especially for want of medical attendance, at times among this poorer class of people? Yes, I have continually occasion to bring cases of that kind under the notice of my own authorities, and we have sometimes had to move them to the Infirmary, and very often they would not admit them there. I have seen a good deal of distress of this kind.

180. *Dr. Read.*] You recollect on one occasion when you accompanied Alderman Chapman and myself, seeing two cases of erysipelas in one of the lodging-houses? Yes.

181. At that time the lodging-house was otherwise empty, the reason assigned being those two cases of erysipelas? Yes, I was told so by the landlord himself.

182. Those cases had been refused admission into the Sydney Infirmary, and the police had to take charge of them? Yes.

183. And they were left with you, and I believe afterwards some provision was made for them? Yes, some place was found for them.

184. *Chairman.*] In fine weather, such as the present, do you think a great many persons sleep in the open air at night? I don't think so.

185. Then the number of persons sleeping out of doors would not materially diminish the number in one of these lodging-houses at night? No; the number varies considerably; you might go to one of these lodging-houses one night and find no one there, and you might go the next night and find it crowded.

186. Have you frequently visited the Soup Kitchen at night? I have visited it at night, but not very frequently.

187. You are aware that a great many persons sleep there at night? Oh yes.

188. What is your opinion of the ventilation and the cleanliness of that place? The ventilation, or part of it at least, does not appear to be very good, but I have come to the conclusion that the cleanliness is fair for the accommodation afforded. The persons who go there are very offensive; their clothes are offensive as well as everything about them. They are people who are addicted to drink; they lounge about low public-houses all day and come to sleep at the Soup Kitchen at night, covered with all kinds of filth.

189. So that it must be almost impossible to keep the place clean? It would be impossible where forty or fifty of such persons sleep in one room. I have been there several times, and I have certainly experienced an offensive smell, but I have come to the conclusion that with the class of people who go there it is very hard to keep the place clean.

190. I suppose every morning after the lodgers have gone out the whole place is cleaned? I do not know; I could not say that it is; the mess-room where they take their meals is always cleaned out. There are a great many other places in Sydney which I cannot think of at this moment, which are almost as bad.

191. If you think of any other places perhaps you will point them out to members of the Committee that they may have an opportunity of personally inspecting them? I will do so.

FRIDAY, 10 DECEMBER, 1875.

Present:—

M. CHAPMAN, Esq.,
R. B. READ, Esq.,

B. PALMER, Esq.,
G. F. DANSEY, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 2 Sub-Committee.

SEVENTH DAY, TUESDAY, 30 NOVEMBER, 1875.

Gipps Ward.—Lanes and Courts off Gloucester, Kent, and Margaret Streets.

192. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer, as follows:—

Met at my house at 4 o'clock and proceeded—accompanied by Sergeant Dawson—to Frog's Hollow, now known as Hart's Buildings, where we found thirteen houses from 15 to 20 ft. below the level of the street—most of them two-roomed tenements, with the old-fashioned sashes and badly ventilated; nothing in the shape of a yard to any of them except the square in front. On the east side they are all brick houses, with the exception of one weatherboard building at the south-east corner, containing three rooms and rented at 7s. a week; on the south four two-roomed houses, partly brick and partly weatherboard, rented at 8s. 6d. Here we found French windows, those on the ground floor opening at top and bottom on to a verandah; on the west side are three-roomed houses with the old-fashioned windows, rented at 8s., and two others containing two rooms each, at 7s. a week. These are only two or three feet from the retaining-wall of the street at the back, the intervening space being covered in and used as a store room. The front doors are reached by an ascent of three or four stone steps, and between the steps are a number of large boulders, which must be continual stumbling-blocks to grown up people and a source of considerable danger to children, two of whom were spilt and sent head over heels from one of them as we approached. In the south-west corner of the block is a closet tolerably clean but without any water laid on; on the north-east corner a double closet over a cesspit, which was in a stinking condition but deep, having evidently been recently emptied. This was a proof of the necessity for some purifying process, without which the ground retains the stench and becomes saturated with fecal matter.

Adjoining this property southward, and still on the same level, are some houses known as Carrier's Buildings, formerly a part of Frog's Hollow, but now fenced off. The first house we inspected contained two rooms, the front room 16 x 12 ft., and the bedroom 12 ft. x 6 ft. The window in the latter is what is termed an Irish window—it neither opens nor shuts, but can be taken out bodily. The drainage of the yards attached to these houses has been greatly improved during the last twelve months; formerly there was a large open drain running across them of a most offensive character, which has now been covered in. This has been probably the result of visits paid to the locality by the officers of the City Council. The next house in Carrier's Buildings has also two rooms, the front room 15 x 12 ft., with a window which we forced open with a violent effort, and a back room with an Irish window; it rents at 8s. a week. Then there is another house with three rooms above, and a small shed used as a kitchen below, rented at 12s. a week.

We inspected several other courts and lanes in the same neighbourhood, but found nothing particularly worthy of remark until we came to Kent-street, near Margaret-street. Here we paid a visit to

Senior-Sergeant Larkins.

3 Dec., 1875.

G. F. Dansey, Esq.

10 Dec., 1875.

G. F. Dansey, Esq.
10 Dec., 1875.

to Ward's-buildings, belonging to Mr. Ward. There is an entrance to this property from Kent-street, on either side of a grocer's shop kept by Mrs. Bolger. Upon entering on the north side we found two nice stone buildings, and at the end of the court a wooden building divided into two houses, one containing two rooms, and rented at 8s. a week, and the other containing only one room, rented at 5s. This property has lately been sold, or is about to be sold, to Ellis and Mackinnon. Mr. Long is the agent. On the south side of it are two weatherboard cottages containing two rooms each, and let at 8s. each. An open gutter of the rudest construction runs through this property from end to end; part of it is made of brick, part of wood, and the rest is a mere ditch; the sink is stopped up, and the tenants stated that the stench was most offensive.

We then proceeded to Abbott's boarding-house in Margaret-street, in which we found three lodging-rooms, one dining-room, and one private bed-room. About twelve lodgers, on an average, are accommodated here. I have several times had occasion to visit this house professionally, and have always found everything very clean, tidy, and comfortable, and the lodgers have always spoken well of it.

We finally went round by the A.S.N. Company's wharf, and inspected some lodging-houses at the bottom of Sussex-street, which we found also to be in good order.

This concluded our day's inspection. The houses we have visited to-day, except those specially referred to as lodging-houses, are mostly occupied by small families, and were generally speaking in clean condition.

We returned at 6:45 p.m.

EIGHTH DAY, THURSDAY, 2 DECEMBER, 1875.

Buildings off Cumberland-street, and in adjoining streets and lanes.

193. Dr. Dansey gave evidence on behalf of himself and Mr. Palmer, as follows:—

Met at my house at 4 o'clock, and accompanied by Sergeant Dawson as before; inspected a court called Carragher's Court, off Cumberland-street, just opposite the watch-house. The drainage from the seven houses in this court flows into one sink, to which there is no trap, only a grating; the houses are built of brick, and contain three rooms each; rent 10s. a week. Here we met with a sad case of distress. In one of the houses lives a man with his wife and a family of seven children. The mother of this family expressed herself very anxious to have her children educated, but said she was unable to send them to school any longer for want of decent clothing, shoes, and stockings. She had kept them at school as long as she could, but her husband, who is a lumper working on the wharves, had been out of employment for nine or ten weeks, being one of the sufferers from the strikes, and the children had been refused admittance at a Public School, because they had no shoes. The eldest daughter is thirteen years old, and we advised her mother to put her out to service, but she objected to part with her. In another house there was a family of three children, but only one of them went to school for similar reasons.

We next visited a place called Smedmore's Buildings, belonging to Mrs. Smedmore, which comprises seven two-roomed brick cottages, rented at 7s. per week each. There is one closet for these houses, but the tap would not turn, and there has been no water for seven or eight months. The tap in the yard, for general use, was turned on, and the water was running to waste. These cottages are separated by a passage from Cumberland-street. The corner house in that street, abutting on this property, has two rooms and a kitchen, and rents at 9s. a week; the closet is in the kitchen, there being no yard whatever; the reason assigned for this was, that a fence had been put up to increase the size of the yard, which rendered it necessary to close the entrance to the closet from the other side. To this closet there was no water laid on; it had all to be carried by hand.

No. 82 Gloucester-street, the old "Ship and Mermaid Hotel," now let as a lodging-house to Mr. Johnson, makes up twenty-four beds. It is a stone house, containing eleven rooms, which are fairly ventilated; the windows open at top and bottom. In a room on the first-floor, 25 ft. x 12 ft., and about 12 ft. high, we found eight beds; and in other smaller rooms from three to five beds, with French windows on the first floor, looking over the harbour. There was not much to find fault with here; the beds, although close to each other, were very clean.

We next went to 27, Cambridge-street, which is a sort of old-fashioned rubble shanty, containing two rooms, occupied by three females, one of whom was 76 years of age; old-fashioned sash in the front room, and no window at all in the back room. At the side of the house is a small room 6 ft. x 3 ft., having no light or ventilation of any kind, which serves as an apology for a kitchen. There is no closet at all, which may account for the utensils full of stagnant urine and slops which we noticed in the kitchen, and which the inmates were probably waiting for an opportunity to empty into the street. The place rents at 3s. a week and is a brothel of the lowest order. Mr. Josephson is the agent, and Mr. Hanson the owner.

Nos. 25 and 23 are houses of the same character—have two rooms each, and rent at 6s. each; the inmates are apparently fond of liquor. The closet in the yard of No. 23 can only be used by the tenants of the other house by permission to enter it through the kitchen, should they require to do so after the gate is shut. This probably accounts for the quantity of slops which find their way into the street late at night and early in the morning.

Nos. 19 and 21 are owned, as we were told, by Mr. Wm. Long, Reitch is agent. The yards are very small and the closets smell badly.

No. 57, Cambridge-street, owned by Mr. William Long, rents at 5s. a week, and contains two rooms. The furniture consisted of a bed on the floor, one sofa and a table, no chairs. From its appearance we should class this house as just tenable.

No. 55 was in much worse state of repair, so much so that we considered it perfectly untenable. Nevertheless there was an old woman living there, who had no other account to give of herself or the house than that she was 76 years old, and she supposed it would last her till she died. We expressed a hope that it might, but left under the impression that she had overrated the capabilities of the building.

Beneath these two houses we visited a sort of underground story, inhabited by Peter Casey, consisting of four rooms, for which he pays 10s. a week. There were two closets here with water laid on, but with direct action. One of them was in a most filthy state, being evidently open to all comers; the other was locked and reserved for the private use of Casey and family.

Passing by these two offensive closets we entered what appeared to be a cellar, as dark as pitch, which we found occupied by a man who was sleeping off the effects of a debauch; it was secluded but stinking, and most disgustingly dirty.

On emerging into Harrington-street we took a glance at the back of the house we had just quitted. One out of three windows at the top was broken; on the first floor there were eight panes of glass smashed out

out of twelve, and a door which had evidently at one time opened on to a balcony, shattered in the centre. The sashes of another window on the same floor were broken. The inmates thus get a supply of fresh air in spite of themselves. This was the last place we inspected, our round of visits terminating at 7 p.m. G. F. Dansey, Esq.

I have only to add that accustomed as I am in the pursuance of my official duties as City Health Officer to visit all sorts of places, I have found this house to house inspection very trying to the health; while the Mayor has on one or two occasions been very near succumbing to the influence of the unwholesome odours which have met us at every turn. The open drains have been probably more offensive than usual in consequence of the diminished rainfall. 10 Dec., 1875.

Personal Inspection

By No. 1 Sub-Committee.

NINTH DAY, 2 DECEMBER, 1875.

Market-street.

194. Mr. Chapman gave evidence on behalf of himself and Dr. Read, as follows:—

Met at the Volunteer Club at 10:30 a.m. on Thursday, 2nd December, and proceeded, accompanied by Sergeant Larkins, to inspect a house owned by Mr. Pope and situated in Market-row, off York-street. The house is built of stone and contains two rooms; it is rented at 7s. a week. The yard, which is 5 ft. 4 in. wide, is enclosed by a very high wall, and the ventilation is very imperfect, there being no windows at the back of the house. The lower room is 12 ft. x 11 ft. and 9 ft. high, the upper or attic room not averaging more than 6 ft. in height; upper portion of the window-sash fixed. The tenants complain that the place is very hot and close, and no wonder. There is one closet for this and the adjoining house, with water laid on, but with direct action. M. Chapman, Esq. 10 Dec., 1875.

Still in Market-row we inspected two houses belonging to Bartlett. These houses contain three rooms each 9 ft. x 11½ ft. and 8 ft. high, and are let at 10s. 6d. a week each. The yard is 5½ ft. wide, and the water-closet, which is directly connected with the main is exactly 3 ft. from the window of the back room. Although the yard is kept clean there is an abominable stench, which, the tenants say, is always the case. We searched the neighbourhood carefully to find out the source of this stench, and we strongly suspect that it emanates from a cow-yard close by, in which there are stalls for nine cows. The wife of the owner of this yard (Mrs. Corry) told us that it had been established there for seventeen years. It is paved with brick, and although it is said to be washed out twice a day, the bricks seem to be so saturated with the droppings and filth from the cows that we felt convinced the stench complained of must proceed from this place.

We next visited a small brick house, also in Market-row, owned by the Hon. John Lackey, rented at 8s. a week. The floor of this house is 18 in. below the level of the lane; rooms 8 ft. high; very badly ventilated; walls and ceiling very dirty; "landlord refuses to do anything." Here again the tenant complained of a continual bad smell, which is not at all to be wondered at, considering that the side wall of the fire-place forms a portion of the back wall of the water-closet of the next house.

We then inspected five old worn out buildings in Market-street, owned by Mr. Bray, of Concord. This property has been for many years an eyesore and a nuisance to the citizens. Some of the buildings project to within a few feet of the curb-stones, and they are all such worthless dilapidated tenements that the wonder is that any one can be found willing to occupy them.

No. 39 is tenanted by a person who administers galvanic baths, and he pays 10s. 6d. a week, exclusive of taxes, for the house. There is nothing the matter with the bath itself and the apparatus connected with it, which all looks bright and shining, and in strange contrast to the building in which it is placed. This is a wretched dirty apology for a house; the place is reeking with filth. One bed-room is 10 ft. x 6 ft., with a skillion roof of an average height of 6 ft.; another room 8 ft. square and 9 ft. high, without any ventilation; there is no opening except the door, the window being a fixture; water-closet with direct action. The whole of the drinking water is supplied through a series of leaden pipes. The house adjoining, tenanted and used as a butcher's shop, and rented at 12s. a week, is in a similarly worn out and dilapidated condition, and equally dirty; the drain in the yard is without grating or stench-trap, and was apparently choked up with refuse from the shop. Opposite to and almost touching it, was a cask for salting meat—meat of which we should be very sorry to partake; the yard very dirty; the whole premises being in a filthy state. The roof of this house is quite a curiosity, only a vestige of the material of which it was originally composed remaining. The shingles have gradually rotted and crumbled to pieces, and been replaced by pieces of tin, apparently from kerosene tins. A small portion only remains to be tinned over, and that part of the house must be pretty damp since there is nothing to keep out the rain.

Three other houses in the same line appeared to be used for storing rooms for ironmongery, and are in an equally tumble-down condition. All these houses should be removed at once and replaced by others, the ground being close to George-street in its busiest part, and very valuable.

On the opposite side in Market-street, at the corner of Clarence-street, are six weatherboard buildings in the very last stage of decay (Lynch, agent.) Any one who may be curious to know how long Colonial timber will last, until, by the combined action of the elements, white ants, and other sources of destruction, it becomes triturated into powder, can satisfy their curiosity by ascertaining the date on which these houses were constructed. The corner house is occupied and used as a butcher's shop; it is a filthy stinking place, without any proper drainage, and in a most dilapidated condition, though rented at 21s. a week. The next house, occupied by a wire-worker, is just as bad; it obtains a rental of 10s. a week, and the two adjoining houses occupied by a manufacturer of Colonial ovens—one being used as a workshop and the other as a residence—rents at 21s. The same description will suffice for these: there is just enough solid timber about them to keep them up, but nothing to spare. The house adjoining the Colonial oven repository, however, deserves a more detailed description, since it represents the *ne plus ultra* stage of dilapidation.

It contains two small rooms on the ground floor, with a ladder in the back room leading to a bedroom under the roof. Originally a weatherboard building it is now very difficult to say what it is, or what material in its composition predominates, so much patchwork has been necessary from time to time to keep it together. Here and there a board has been completely eaten out apparently by white ants, and the vacant space has either been covered over with tin, paper, or anything else which was handy. The upstairs room has had a great deal of paper bestowed upon it during its days of respectability, but the paper has

M. Chapman, Esq.
10 Dec., 1875.

obstinately refused to adhere to the walls, though the process has evidently been repeated a great many times. The successive layers, which embrace a variety of patterns, now hang down from the walls in festoons, a sort of tapestry a quarter of an inch thick, and form a receptacle for dust, cobwebs, and other impurities. An old mattress lay on the floor of the room, and the tenant had adopted a very simple method of keeping the bed-clothes from contact with it during the day, by hanging them upon a batten placed against the wall at an angle of 45 degrees, just sufficiently high to keep them out of the dust. This house has also another peculiarity: it contains no furniture of any kind. Indeed there is no room for it, the entire available floor space being crowded with the stock-in-trade of the proprietor, who is a dealer in old clothes. Piles upon piles of garments of all sorts are stowed away below and aloft, which, like the house, appeared to be considerably the worse for wear. These may possibly be renewed to a certain extent by some artificial process, but no renovation is possible for the house itself. It is almost needless to recommend that no further efforts to prevent this house from falling down should be permitted. It occupies a valuable site, and should be replaced by a building of a more substantial character. Next door to it is a fruit-shop—the same style of tenement, which we did not care to inspect as closely.

No. 18, Market-street, is also an old weather-board tumble-down place, the property of Mrs. Simmons, rented at 14s. a week. Like its neighbours it is completely worn out, and wants pulling down badly. The back yard is 4 feet above the level of the floor; average height of the bedroom above 5 feet 9 inches; badly ventilated, and altogether unfit to live in; landlady will do nothing.

No. 233, Sussex-street. We visited this house at the request of the Health Officer. The owner's name is Atkinson, and it rents at 15s. a week. There are five rooms in it, and in these five rooms three families reside. On the basement story a sick man was lying suffering from dropsy. On the first floor one room was occupied by a woman, who was sitting on a box and looking very miserable. She had broken her ribs, so she told us, by falling down the narrow ladder leading from one story to the other, a most awkward and perilous means of ascent, more like the steps leading to the lubber's hole at the mainmast of a ship than anything else I can compare it to. The next room was occupied by children; there was some old bedding on the floor, but no furniture, and the place was very filthy and unhealthy. This house seemed to be the abode of want and misery.

We terminated our morning's work with this house, and returned at 1 p.m.

Personal Inspection

By No. 1 Sub-Committee.

TENTH DAY, SUNDAY, 5 DECEMBER, 1875.

Sydney Watch-houses.

195. Dr. Read gave evidence on behalf of himself and Alderman Chapman as follows:—

R. B. Read,
Esq.
10 Dec., 1875.

It having been considered desirable by the Chairman of this Committee (Professor Smith) that a final inspection of the different lock-ups in Sydney should be made at once, in order that a progress report on the subject might be made to the Board, it was arranged that this task should be undertaken by the two Sub-committees simultaneously, and that Alderman Chapman and I should inspect the lock-ups at the Water Police Court, Parramatta-street, and the Central Police Station, leaving the watch-houses at Cumberland-street and Darlinghurst to be visited by No. 2 Sub-committee. We therefore met at the Volunteer Club on Sunday evening, 5th instant, at 10 p.m., and proceeded to the Water Police Court; here we found two cells, one of which was empty, and the other contained only two occupants. No. 1 cell is 13½ by 8 ft. and 13 ft. in height, and has in it what is termed a soft wood sleeping place, or in other words, a deal bench, extending the whole breadth of the cell for the prisoners to lie down upon, with which we had no fault to find, except that it appeared a little too high, being nearly 2 ft. from the ground, to be safe as a resting-place for drunkards. This cell, being empty, was seen at an advantage; it appeared to be fairly ventilated by openings in the wall about 2 ft. wide and about 6 in. high, protected by iron bars, but there were no gratings below. No. 2 cell, in which there were two occupants, is 13½ by 9 ft., and the same height; the floors of both cells being hardwood. The drainage appeared to be good, and the condition of the closets satisfactory, with plenty of water laid on. We were informed that the greatest number of persons confined in these two cells at one time was twenty, and some new cells with various modern improvements are being constructed here.

We next went to the Parramatta-street station, which we reached at 10:45 p.m. Here there are 5 cells; No. 1 is 13 by 8 ft. and 13 ft. high, open windows as before, but no gratings or ventilation at bottom; there were no occupants in this cell. No. 2 is 18 by 12 ft. 6 in. and 13 ft. high, and has, besides windows, three ventilators in the shape of openings in the wall, which however are altogether unequal to purify the atmosphere of the room when so many persons are thrust into it. At the time of our visit there were ten male prisoners confined in it. No. 3 is a small cell 4 by 8 ft., and 13 ft. high, having two ventilators or openings in the wall, but no windows. Into none of these cells does any light penetrate at night. There is a trap in each door which if let down would to a slight extent relieve the obscurity of the place, and would also materially assist in the work of ventilation, but it does not appear that it is ever opened, except to allow of an occasional peep into the cell from the outside. No. 4 cell is 12 feet square and 13 feet high, and contained, when we inspected it, seven females. No. 5 cell is 4 ft. 4 in. x 12 ft. 4 in., and 13 feet high, and has one ventilator at the top of the wall and one over the door; hardwood floors all through. No. 6 is 5 ft. x 12 ft. 3 in., and 13 ft. high; has one ventilator at the top of the wall, and one in the wall separating it from the passage. This is used as a store. The arrangements for the convenience of the inmates of these cells are of the rudest kind. In one corner is a tub, from which they can obtain water for drinking, with a tin-dipper beside it; in another corner a tub in which they can make water when necessity compels them to do so, or for other necessary purposes; there is no closet accommodation of any kind in connection with the cells, and the consequence is that the floors of the occupied cells are foul and filthy in the extreme. The police have frequent occasion to complain of the stench; and there can be no doubt that a good deal of the offensive matter soaks into the drains through the interstices of the flooring. Rats, too, abound in numbers, and were described to us as being "just like a lot of chickens." This police-station is in a very exposed situation, and the doors and windows have to be kept pretty close to keep the dust out. This, and the fact that a warm wind had been blowing all day, may account to some extent for the close atmosphere inside on Sunday. We were also informed

informed that occasionally, when a prisoner is brought in, a crowd of idlers, sometimes from 100 to 200, collect round the door of the station, and it is necessary to close the door in their faces. The largest number of persons confined in these cells at one time has been 30.

R. B. Read,
Esq.

10 Dec., 1875.

Leaving Parramatta-street we went straight to the Central Police Court, which we inspected for the second time. We have already mentioned the size of the cells, of which there are six. We examined them again very carefully, obtaining corrected measurements, and satisfied ourselves that the ventilators in the ceilings, which are all connected with a central ventilator in the charge-room, are quite insufficient to purify the rooms; in short, the means of ventilation are entirely inadequate to the purposes for which they are required, especially in a hot climate, and considering the overcrowded state of the cells. No. 4 cell—18½ ft. x 10 ft., and 13 ft. high—was occupied on Sunday night by ten male occupants. No. 5, which is 18½ x 14 ft. 9 in. x 13 ft., had twenty-four inmates, and I can fancy that their sufferings during the whole of that hot night must have been almost equal to those of the captives in the memorable black-hole at Calcutta, or those of a gang of negroes in the hold of a slaver enduring the horrors of the Middle Passage. Alderman Chapman, unsuspecting of the reception which awaited him, walked boldly into the room, note-book in hand, but was met with such a foul blast of hot polluted air—such a combination of atmospheric impurities—that he was obliged to seek safety in flight, and to rush into the open yard, which he reached with the same haste and the same intention as passengers on board ship unused to the sea, seek the side of the vessel in bad weather at the commencement of a voyage. The inmates of this cell, as far as we could see from the glimpse we obtained of their position, were lying on the cement floor in two rows packed closely, and with a narrow space between them. They were pretty quiet on the whole, having probably no breath to spare for unnecessary talking. Here and there however curses, not loud but deep, gave evidence of their supreme dissatisfaction with things in general and with the Central Police Court watch-house in particular. No. 6 cell is only 11½ x 8 ft., and 13 ft. high. Yet in this limited floor-space there were no less than fourteen females shut up,—all apparently huddled together in one promiscuous heap of motley humanity. Never did I witness human beings so closely packed, except in an Arab slave dhow on one occasion at Aden. The temperature of the room was hot and close to the verge of suffocation. Some of the women were moaning, others crying for water, all in a pitiable state of discomfort. The Police, although used to this sort of thing, are evidently of opinion that the accommodation for prisoners at this place is wretchedly defective. The flooring of all the cells is made of cement and from it a steam of offensive matter trickles into the passage right under the door; the whole arrangement is disgusting, and bad as we found the condition of the place on Sunday night it must be still worse in rainy weather, when the wet clothes of the prisoners send forth a stream which displaces a certain amount of air and diminishes the quantity considerable for the inmates.

A simple calculation will show that in No. 4 cell, containing ten prisoners, each inmate had 18½ ft. only of floor space; in No. 5 cell, where there were twenty-four prisoners, each inmate had less than 12½ ft.; and in No. 6 cell, occupied by fourteen females, the floor space to each individual was under 7 ft.; the regular space for each person required by the Lodging-house Act in England being 30 ft. floor space.

I can only repeat what we said on a former occasion in reference to this watch-house: it is impossible to improve it; it should be pulled down and rebuilt *de novo* with the customary conveniences and appliances for the health of the persons confined in it, which are found in all similar institutions in London.

The accommodation required of this character at the Central Police Court is very great. When we visited it at 11.25 p.m. there were fifty-one prisoners in the different cells; one was brought in while we were there and five were received afterwards. The entire number on the charge sheet on Monday morning was ninety-four. Of these fifty-seven, as I have shown, came from the Central Police Court, twelve were out on bail, and the remaining twenty-five came from the Parramatta-street Police Station.

We concluded our inspection at midnight. On our way from the Central Police Court my companion remarked in a very feeling manner that had he, during the two years in which he was Mayor of Sydney, been at all aware of the punishment inflicted upon persons confined in these cells by the mere incarceration for one night under such unhealthy conditions he would not have inflicted a fine in one case out of ten upon the drunkards brought up before him for punishment.

Personal Inspection

By No. 2 Sub-Committee.

NINTH DAY, SUNDAY, 5 DECEMBER, 1875.,

Sydney Watch-houses.

196. Dr. Danscy gave evidence on behalf of himself and Mr. Palmer, as follows:—

Met at the Volunteer Club at a quarter past 10 o'clock on Sunday evening, 5th December, and proceeded to the Cumberland-street Police Station. The charge-room was very clean, but the ventilation is deficient in consequence of the place being blocked in on all sides by private dwellings, which exclude the air. The Sub-Inspector's room was also clean when we inspected it, but imperfectly ventilated from the same cause. The females cell, 12 ft. x 9 ft., is a very bad place for the purpose, and quite unfit for any person to be shut up in. It has no ventilation whatever; there have been gratings in the walls, but private dwellings have been built up against the wall, and blocked them up, so that the only air which enters the cell comes in from the door. There were no inmates in this cell. We were informed that when a number of men are arrested the women have to be sent on to the Water Police Station, in consequence of the want of accommodation at this place. There is also a small cell in which we found one person confined, and although Saturday night had intervened between his apprehension and our visit, no one else had been sent to bear him company. We ascertained from the charge-book, that in October last, 187 persons had been arrested, and in November (last month), 153.

G. F. Danscy,
Esq.

10 Dec., 1875.

It is evident that the station in Cumberland-street is quite unfit for the purpose for which it is required, and the sooner it is removed the better it will be not only for the persons confined in it but for the health of the Police who are in charge of it. The deficiency of yard space, the position of the closets which are close to the walls, and the great want of ventilation, all combine to render the place unfit to be used as a prison, more especially in a hot country.

We

G. F. Dansey,
Esq.
10 Dec., 1875.

We next proceeded to Darlington, and inspected the police station there. Upon entering the Third division, through the yard, we came to the charge room, 12 ft. x 16 ft., which was very clean; on the right is the Inspector's room, 12 ft. x 12 ft., which we found also in clean order. These rooms are 14 ft. in height. There are two cells at this station, one for the male and the other for the female prisoners. The first, 18 ft. x 12 ft., contained seven inmates, and would have contained fifteen, but eight were out on bail. Here there were two openings in the wall, cut horizontally, about 3 ft. long, and as near as I could guess, about 8 in. deep. There are also two chinks or loop-holes, such as are used for rifles, on the other side, but they only open on to the passage. On the opposite side of this passage is the cell for females, 12 ft. x 12 ft., which had only one inmate at the time of our visit. Considering the large area of this Police District, and that it only provides one station, we think the accommodation offered by these two cells to be utterly inadequate. The ventilation is deficient, and the space is altogether too limited. In other respects there was nothing to find fault with, and the inmates appeared to be made as comfortable as circumstances permit. We think, however, that some greater regard might be paid to health as well as decency in the arrangements within the cells. At present there is a bucket in the corner, which serves the purposes of a closet, and when a prisoner wants a drink a policeman comes and takes him out. Would it not be better to have the drinking water inside, and the closet outside the cell?

We returned to town at 12:15 a.m.

Personal Inspection

By No. 2 Sub-Committee.

TENTH DAY, TUESDAY, 7 DECEMBER, 1875.

Park-street and Macquarie Ward.

197. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer as follows:—

G. F. Dansey,
Esq.
10 Dec., 1875.

Met at the Town Hall at 4 o'clock on Tuesday, 7th December, and went first to Park-street, where we inspected several boarding-houses, which we found all in clean and orderly condition. In the same street is a wooden house containing eight rooms—the street number we could not make out—occupied by Wah Lee Ong, a Chinaman, who is a carpenter, employing a number of men. There are seventeen persons who sleep in the house, all countrymen of the proprietor. In one room, 14 x 12 ft. were eight beds—the room being partitioned off into bunks like the stowage of a ship; bedding of a very varied kind. In some of the bunks were mattresses, in others only rags and clothing; mosquito curtains black with dirt. In another room, over the shop, there were five beds of a similar description. We looked into the kitchen downstairs, which was dirty and smoky. The whole place stinks aloud, the horrible and sickening opium smell prevailing all through it. Every corner of the building was crowded with timber or furniture in an unfinished state, rendering it highly combustible; and though the removal of such places is very necessary it is hardly desirable that it should be done by fire. Among the workmen at this joinery establishment were several apprentices. The workmen on wages we ascertained earn from 10s. to 15s. a week and their food. Here we were told that in China it is a rule for people to walk in the streets in single file, and not abreast of each other. A man and his wife are rarely seen together in the day time, and never walk arm-in-arm.

We next went to the "Bushman's Hotel," which was formerly the Bushman's Club, got up by Captain Scott. This house contains five rooms, and makes up about twenty beds; but there were only four lodgers at the time of our visit, and there was nothing to call for observation in the condition of the house.

We visited several other houses in the neighbourhood, in which we found nothing out of the way, until we came to one in Castlereagh-street, occupied by Att Lee, another Chinese carpenter. This house belongs to Edward Flood, Esq., J.P., and is rented at £2 5s. a week. Nineteen persons live on the premises, all single men, except one married man who goes home to sleep. In a room on the ground floor, 12 x 10 ft., we saw four beds. There is no ventilation in this room. The air can only enter it through the door; and it has very little light, there being only a small pane of glass looking into the shop. The proprietor was sick in a room or compartment on the ground floor. Upstairs, over the workshop, were four beds in one room and three in another. Ventilation wretched throughout, the windows being shut in by adjoining buildings; rooms dirty; kitchen very dirty; and the usual disgusting smell of opium smoking from basement to roof. The closet reeking with urine—the boards and the floor being positively saturated with it—a stream proceeding from the floor of the closet into the yard. Against the side of this closet we noticed a large heap of shavings highly dangerous in case of fire. Four vent-holes were made in a room over the yard, containing four beds, by knocking out bricks in the wall. Here we found a half-caste boy, about 16 years of age, who told us that he was born in Melbourne and that his two sisters were born at Beechworth, but there was no female, white or black, living on the premises. This place was in a wretchedly dirty state and in very bad repair. We recommend the Insurance Companies to look after such places, and endeavour to get them pulled down and removed.

We reached home at half-past 6 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

ELEVENTH DAY, MONDAY, 6 DECEMBER, 1875.

198. *Mr. Chapman* gave evidence on behalf of himself and Dr. Read, as follows:—

M. Chapman,
Esq.
10 Dec., 1875.

Met at the City Club at 10 o'clock on Monday 6th December, and, accompanied by Sergeant Larkins, proceeded to Kent-street, where we inspected some houses in Magrath's Lane, owner Magrath. The first was an old stone house, occupied by Mrs. Jones, containing only one room 13 ft. x 8½ ft. and 6½ ft. high, rented at 4s. a week. The tenant was not at home; the place seemed to be crowded with furniture and badly ventilated; a goat and a number of fowls and ducks were in possession.

The next was a brick house, also with but one room 14 ft. x 12 ft. with coved roof, average height not over 6 ft., and badly ventilated, occupied by a lamplighter named O'Loughlin, who, with his four children, the eldest a girl fourteen years and looking much older, all live, cook, and sleep in this room.

The

The next was also a one-roomed house, and about the same size as the last and as badly ventilated; occupied by Newell, who pays 4s. a week. There are four other houses in this lane, making seven altogether, all of the same character as regards ventilation, and having no openings in the back walls; there are two closets with water laid on but with direct action; the yard in a filthy state, with a quantity of old timber, bricks, and stones scattered about.

M. Chapman,
Esq.
10 Dec., 1875.

We then inspected Ann's Place in Kent-street, owned by the Hon. G. W. Allen. (Harris, agent). In this lane there are six houses let at 6s. a week each; the rooms, of which there are two in each house, are $11\frac{1}{2}$ ft. x $10\frac{1}{2}$ ft. and $8\frac{1}{2}$ ft. high, and badly ventilated. At the end of the lane or court there are two other houses about 3 ft. below the level of the court, let also at 6s. a week; the lower rooms are very close, not being more than 6 ft. high; an open drain runs down the yard. The tenants complain of the awful stench arising from this drain: as usual the complaint was "the landlord would do nothing."

We also inspected a two-roomed house fronting Kent-street, belonging to the same property, 18 inches below the level of the street; the walls are lined with wood and very damp. The tenants complained of the want of air; there was an ashpit next to the water-closet, about 4 ft. square, which is only cleaned out once a fortnight; it was nearly full of decayed vegetable matter and other refuse and was very offensive.

We visited Arthur-place in Kent-street (Burnell owner). This place comprises nine houses, two rooms each, $10\frac{1}{2}$ ft. x 13 ft. 8 in., and $8\frac{1}{2}$ ft. high, rented at 6s. a week. Ventilation indifferent; tenants complain that when the doors are closed the place is like an oven; there is no stench trap to the drain.

No. 443, Kent-street (Smith, agent), is an old two-roomed weatherboard badly ventilated building, close and hot, and almost suffocating at night; rented at 7s. a week.

No. 445 is an old weatherboard house of similar character, rented at 8s., and very filthy; tenant complains that besides being suffocating at night the house is swarming with bugs.

We inspected three or four other old wooden tenements of the same description in a lane at the back, let at 4s. a week each. One house was 15 ft. x 6 ft., and the average height 6 ft. Also one which was only 8 ft. square and 5 ft. high, just large enough to accommodate its sole occupant, an old woman of 74, who objected forcibly to the stench proceeding from the closet, the free ingress for the rain through the roof, and the broken condition of the door, which would neither open nor shut.

We looked into another house which had two rooms, one occupied by a vendor of watercresses; the large heap of crosses under the table looked anything but inviting. The tenant of the other room was not in, and we felt no desire to await his return. We inspected three more houses in this lane, and it is sufficient to say that they were about on a par with those we have already described. The closet accommodation for this place is very bad. It consists of a large pit, about 8 ft. square and 4 or 5 ft. deep, with seats erected over it. It is situated within a few feet of the end house, and the stench which proceeds from it is atrocious. The whole of this property it is alleged belongs to the Wentworth Estate; and as Mr. Wentworth has already made great improvements on his estate by pulling down several old uninhabitable buildings, application should be made to him to remove these houses, which are quite unfit for human beings to live in.

The next place we went to was Brisbane-place, in Kent-street (owner, J. J. Parker). It consists of three two-roomed houses, about 8 ft. square and 5 ft. 6 in. high each room, and rented at 6s. These are wretched filthy hovels, having no opening in the back walls, with one small water-closet of the worst description—narrow and dirty. A deep drain has been made under the centre of the gateway, which no doubt was intended to carry off the storm waters. This property should be pulled down, as it is quite unfit for human beings to live in.

No. 473, Kent-street (Shaw, agent), is an old weatherboard house, containing two rooms 10 x 12 ft. and 7 ft. high, rented at 6s. a week, which may be described as being thoroughly worn out. Underneath, being in fact the foundation of the house, and approached from the back, is an open cellar, which the tenants of the house state is occupied at night by a lot of low filthy old men and women, the refuse of metropolitan humanity, who find here a night's shelter free of charge. This nocturnal camping ground is a great offence to the occupants of the building above.

No. 475, Kent-street (Shaw, agent) is a house of the same description as the last, consisting of two rooms, and rented at 6s. a week; tenant complains bitterly of want of ventilation. When asked why she lived in such a place she said it was quite impossible to get another house, the rent of which would be within her means.

At the back of these premises is Shaw's Court, which consists of two houses. One is an old weatherboard tenement, let at 3s. a week, the full size of which is $11\frac{1}{2}$ x 8 ft. and 5 ft. high, in which a man his wife and three children live, cook, and sleep—a perfect hovel. The closet is a filthy old cesspit, which serves for the front houses and the houses in the court, and is within a few feet of the latter, and very disgusting. The place is without ventilation, and must be very unhealthy. The children of this family looked very sickly. One little girl of 5 years in particular presented such a deplorable appearance that Dr. Read, moved with compassion, gave the mother some money to provide her with immediate nourishment. Even the dumb animals here seemed to be demoralised. Cats as a rule are creatures of very clean habits and usually contrive to present a sleek and respectable appearance even under adverse circumstances, but no cat can withstand the depressing influence of Shaw's Court. The few specimens of the feline tribe which we noticed in this locality had a listless woe-begone look; their coats were dank and dirty, and they seemed to have lost all respect for themselves. The other house in this court is a two roomed tenement, let at 5s. a week, badly ventilated, and containing five inmates. The whole of this property is in a wretched state and dirty from floor to ceiling, and the yards without drainage. It should be pulled down at once.

We next visited "Jacob's Ladder" in Kent-street (owner, Doering.) We fear that none but fallen angels ascend and descend the thirteen steps which lead from Kent-street down to the four houses of which this property consists. One house having only one room 13 by 13 ft. and $7\frac{1}{2}$ ft. high, and let at 3s. a week is let to a manglewoman; it is in a very dilapidated state, badly ventilated and very filthy; the plastering tumbling off. The tenant stated that she had lived there for four years, and that the landlord had persistently refused to do anything to repair it. The adjoining house, apparently of a similar character, was shut up and we did not see the inside of it. On the opposite side of the yard are two brick houses, let at 5s. a week each, in the same neglected tumbledown condition.

We finished at Union-street at 12:45 p.m.

Sergeant Dawson, of the Metropolitan Police Force, called in and examined :—

Sergeant
Dawson.

10 Dec., 1875.

199. *Chairman.*] Are you well acquainted with the poorer portions of the City—what are commonly called the back slums of Sydney? Yes, very well indeed, for the last fifteen years.
200. Have you met with much overcrowding in the course of your experience? Yes, I have seen it in a great many places.
201. Do you find that bad ventilation exists in the houses occupied by private families as well as in the lodging-houses? In both.
202. Do you find also a great deal of bad ventilation and filth? Yes, in the poorer localities where the poor people reside—in the back lanes and alleys of the city.
203. Will you name some of the places which you consider the worst in respect of filth and bad ventilation? Queen's-place is one; then there is Canary-row, commonly known as John-street; there is also a place which used to be called Brougham-place, but I believe it is now Rowe-street, between Pitt and Castlereagh Streets; I have known that place for a number of years and have constantly visited it at night on duty.
204. *Dr. Read.*] Is it safe for you to go there alone? Yes, but I generally have someone with me. I have known several families to be living in one house there.
205. How much space would they have? Two rooms, very small, badly ventilated, and very dirty. There was no bedding; I have seen the children lying on the floor without any clothing on them.
206. *Chairman.*] Can you think of any other places? There is another place known by the name of O'Neil's-lane.
207. What street is it off? It lies between George-street North and Harrington-street.
208. The places you have named are mostly in the northern and western portions of the city. Do you know of any places further south—towards Parramatta-street? My district does not extend so far as that.
209. Do you know any places of that sort westward—about Woolloomooloo? I am not much acquainted with Woolloomooloo.
210. Do you think it desirable that greater control should be exercised over the cheap lodging-houses, so as to regulate the number of inmates? I think it would be very desirable. In the lodging-houses in Clarence-street, near King-street, there is no limit whatever to the number of lodgers; they take them in at all times, and they lie on the floor or anywhere where they can find a place. Some of them sleep with their clothes on for fear they should lose them. These are what are called sixpenny lodging-houses. I have lived in that neighbourhood myself for the last fourteen years, and I know them well.
211. Do you think there are many cases of over-crowding in private families? Yes, there is a good deal of it in Brougham-place; that is about the worst place I know. One person takes a house and then sublets the rooms to several others.
212. Have you observed the condition of the watch-houses in Sydney at night—whether the cells are often overcrowded with people locked up for the night? In Cumberland-street, which is the station to which I am attached, I have seen frequent overcrowding. On several occasions we have had to remove the people to the Water Police Station.
213. Do the people themselves complain and feel this a great source of discomfort? They don't complain, but I know it is a great discomfort to them.
214. Your experience is confined to the Cumberland-street station? Yes.
215. Has it occurred to you that there is much ill-health in Sydney in consequence of the overcrowding, filth, and bad ventilation? Yes, indeed; it must be the case.
216. Have you observed it yourself? I have observed it in the northern part of the city; the rents have become so enormously high in that part of Sydney that it is impossible for a poor person to get a house in a respectable locality. People who are respectable but not very well off are forced to go and live close to brothels and houses of bad repute.
217. You think that the high rents really drive respectable people into these places? I do.
218. Have you noticed the condition of rooms occupied by workpeople—in clothing factories for instance? I have been in one in George-street north, kept by Mr. Golston.
219. Have you observed that more persons are crowded into one of these rooms than is compatible with comfort? Yes, I believe these places are overcrowded, and that the accommodation is bad as well.
220. What have you observed in the place you have mentioned? There is only one closet for fourteen or fifteen females; in fact I have seen as many as twenty females come out from that factory.
221. What is the size of the room they have to work in? I think the room is about 18 x 20 or 22 ft.
222. Is that the only workroom you have looked into? That is the only one, except Mr. Sutton's factory in Harrington-street.
223. But your experience has not lain much among these workrooms? No, there are not many in the district I am attached to.
224. *Mr. Palmer.*] Do you know much of Macquarie Ward—that part of the City commencing at King-street and going down to Liverpool-street? I have not been round there lately, and I could not say much about it.
225. *Mr. Chapman.*] Is there a place called Abercrombie-lane? Yes; it is a very bad place—bad houses, bad ventilation, and bad closets.
226. *Dr. Read.*] And the people who live in it are equally bad? Yes, several brothels have been removed from there lately.
227. *Mr. Chapman.*] Do you also know a place called Robin Hood Lane? Yes; that is a very bad place too.
228. *Chairman.*] You spoke of high rents driving respectable people into these places. Do you think there are many really respectable families living in these filthy portions of Sydney? There are—respectable working men.
229. Do they remain respectable, or do they become demoralized? They become demoralized. I have known several children go to the bad, especially females. When a respectable family lives next to one of these brothels, where they are continually sending to the public-house for beer, and cursing and swearing, the children have a bad example always before them. There is Abercrombie-lane—another very bad place. There are only two small rooms in each house, and the rent for each room is 6s. a week. I know men who pay 11s. a week for three rooms in the district I am living in, and one house of four rooms in Little Gloucester-street is let at 16s. a week. Also a house of three rooms—a sort of double house, the upper part of which, fronting Gloucester-street, rents at 11s. a week, and the lower portion in the hollow at 16s. a week.
230. *Dr. Read.*] Is not that property chiefly occupied by lumpers? No; they could not afford the rent.

231. *Mr. Chapman.*] Do you know anything about Wentworth-place? I do.
 232. Have you observed anything objectionable about it? I don't think it is kept very clean.
 233. Do you know the lane nearly opposite to it? Yes, Paine's-lane; that is a very bad place.
 234. *Dr. Dansey.*] Do you know of any houses which appear respectable externally, but are very bad inside—doubtful houses, in Macquarie Ward? I visited a house in Queen's-place about a week ago, and found four men in bed with four women in a room 10 x 10 ft., lying on the floor. The ceiling was only 5 ft. 4 in. from the floor, and a hole was made in the ceiling to allow an iron bedstead to be put up. There are a number of Chinamen too who live with European women, to whom they claim to be married.
 235. *Mr. Chapman.*] I suppose they are married in some cases? Yes, in some cases. But the Chinamen are very quiet, and generally very clean, except when their wives get drunk and let the places get dirty.
 236. *Dr. Read.*] Do you know any European women who are opium smokers? Oh yes, a great many, especially about Goulburn-street; I have seen as many as ten white women smoking opium there.
 237. *Chairman.*] Taught to smoke opium by Chinamen? Yes.
 238. *Dr. Read.*] And I suppose they then become in the power of the Chinamen who teach them? Yes.
 239. And are common to other Chinamen? Yes; many of them smoke two shillings worth of opium in the course of a day.

Sergeant
Dawson.

10 Dec., 1875.

FRIDAY, 17 DECEMBER, 1875.

Present:—

R. B. READ, Esq.,
M. CHAPMAN, Esq.,G. F. DANSEY, Esq.,
B. PALMER, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 1 Sub-Committee.

TWELFTH DAY, SATURDAY, 11 DECEMBER, 1875.

Kent and Union streets.

- 240.
- Mr. Chapman*
- gave evidence on behalf of himself and Dr. Read, as follows:—

Met at the Volunteer Club at 10 o'clock on Saturday 11th instant, and found Sergeant Larkins in attendance. Proceeded in the first place to Hegarty's Court, which we found to consist of three two-roomed stone houses, each room 12 ft. x 12 ft., and 7 ft. 6 in. high, rented at 6s. a week. The floor of these houses is 12 in. below the level of the yard. They are very close, and badly ventilated, there being no windows or openings at the back to allow a current of air to pass through; the sewer in the yard was without any grating, and full of dirt. Inspected two old weatherboard houses, fronting Kent-street, and belonging to the same property, also very badly ventilated, and having also very filthy yards. For these five houses there are two closets, water laid on, but with direct action.

M. Chapman,
Esq.

17 Dec., 1875.

We next went to Mallon's buildings, Kent-street. In the yard are two four-roomed houses, built of stone; rooms on the ground floor 9 ft. 7 in. x 12 ft., and 7 ft. x 12 ft., and 7½ ft. high, and the same up-stairs; rent 9s. a week. The next house is of the same dimensions, but let at 9s. 6d. a week to a new comer, the rent having been raised on account of the scarcity of houses for poor people, and not because of any additional accommodation. These houses are very badly ventilated; there are no windows at the back, and the tenants complain that the rooms are frightfully hot at night and stinking. That they have ample ground for these complaints was painfully evident to us. An open drain runs along the base-course of the house, the contents of which occasionally find their way through some broken ground under the floors, and no doubt give forth noxious gases, and render the place unhealthy.

There are two other houses, portions of the same property, fronting Kent-street,—originally one house, consisting of six rooms, but now divided in the centre, and let as two tenements with three rooms in each. The portion fronting the yard is let at 9s. a week. The two rooms on the ground floor are 10 ft. x 5 ft. 10 in., and 10 ft. x 10 ft. respectively, and 8 ft. high; the attic or up-stairs room averages the height of 4 ft. 6 in., with coved ceiling. The portion fronting Kent-street is of similar capacity, and is let at 10s. a week, the only difference being the frontage to the street. The walls and ceilings of these two tenements are very filthy indeed, and as in many other cases the landlord refuses to repair.

Another house, fronting Kent-street, is let out in apartments, and is well ventilated and clean.

We next proceeded to Wentworth-lane, leading from Kent-street to Sussex-street. Off this lane, up a narrow passage, and then along another narrow passage, we came to a weatherboard house, which no doubt at some remote period put forth its claim to respectability, but is now in a sad filthy state. It is hemmed in on all sides with old fences, old cess-pit closets of the most filthy description, and other sources of dirt and discomfort. This building was also originally a six-roomed house, but has been converted into two three-roomed tenements. One portion of it is occupied by a tailor and his wife, with an old woman, and a number of children looking anything but healthy, and exceedingly dirty; the agent's name is Fagau. We did not succeed in effecting an entrance into the other portion of the building, as the tenant was not at home; the tailor informed us that the landlord refused to repair.

Fronting Wentworth-lane are three small two-roomed weatherboard cottages, let at 5s. a week (agent, Lacey, under Richardson and Wrench). One of these was occupied by a bill-sticker, who seemed to have had the caution "Stick no Bills" impressed upon him to some purpose, for the ashes under the grating showed that he had just boiled his billy with this material, and there was pretty strong evidence in the fireplace and about the room that the bills he brings home with him are the only fuel he uses. In this way they still become "flaming posters," without any offence to decorum. In the inner or bedroom we noticed a large heap of placards of all colours ready for the next day's consumption. The rooms are 10 ft. x 9 ft. and 9 ft. x 5 ft. 6 in. respectively and 6 ft. high. The other three houses are of the same description and very badly ventilated; no water; only one closet for the whole community; a small yard; a very filthy drain without a stench trap, and a general want of repairs. This property should be pulled down.

We

M. Chapman,
Esq.
17 Dec., 1875.

We took Union-street next. This street runs from Kent-street to Sussex-street. Up a gateway on the north side are two small tenements, (Cox, agent—owner, Twemlow). Each of these tenements is approached by a narrow staircase or ladder, about 2 ft. wide. The floor room is 13 ft. x 8 ft. and, 7 ft. 6 in. high, and is used as a kitchen, dining, sitting, and sleeping room, and is close, badly ventilated, filthy, and stinking. The room on the upper floor is the same size and approached by a ladder; that also is close but better ventilated. One of these houses is evidently a brothel. We saw two girls *en déshabille* who were trying to sleep off the last night's debauch. They did not hesitate to inform us that they had taken too much overnight, and addressing us alternately as "old boss," and asked us to "shout" for them. The other was occupied by a coloured woman with a family, who told us that her husband was a labourer working on the wharf; she complained very much of the want of ventilation. Both these places are quite unfit for habitation and should be pulled down.

We inspected three other houses fronting Kent-street, and part of the same property, which are in a similar old worn-out condition and just as badly ventilated. Underneath them is a basement story or cellar, approached from the yard previously spoken of, and occupied at night by a number of vagrants, chiefly old men and women of the very worst character. There was one old prostitute who had been on the streets of Sydney for the last twenty-five years. This place was filthy in the extreme, and although Cox, the agent, states that he does all in his power to keep out this class of persons, he finds it impossible to do so.

On the south side of Union-street there is also a gateway leading to a couple of two-roomed brick houses (Ferrier, agent), rent 7s. a week; rooms 12½ ft. x 8½ ft. and 6½ ft. high, very close and badly ventilated; closet an old cesspit; yard and gateway almost full of old timber and other building materials.

We also inspected a two-roomed brick house in Union-street (Cox, agent), rented at 6s. a week, badly ventilated, and with a common cesspit, the size of the rooms are 13 ft. x 9 ft. and 6½ ft. high.

At the back of the last-mentioned house and up a narrow passage is another two-roomed brick house (Cox, agent) of a still inferior description, the rooms are only 10 ft. x 8½ ft. and 7 ft. x 8½ ft. respectively and but 6 ft. high, rented at 6s. a week, entirely without ventilation, there being no opening in the back wall. A filthy stinking place, unfit for any human being to live in.

The next was a house off Union-street (owner, Walsh), built of brick and containing two rooms, 12 x 10 ft., and 8 ft. 6 in. high, occupied by a cobbler; very close and without ventilation. The tenant complained that a stable against the back wall, occupied by a butcher, emitted an intolerable stench; there is an open drain in the yard which was in a very foul state.

We examined another old brick house in Union-street, also owned by Walsh, containing two rooms, 10 x 10 ft. and 8 ft. high, occupied by a mangle-woman. This was also in a filthy state and badly ventilated. The tenant stated that she had lived there six years, and that during that time the house had never been cleaned out or whitewashed—the landlord positively refusing to do anything.

The same description will apply in every particular to the house alongside, belonging to the same owner, and rented at 7s. 6d. a week.

We returned at 1 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

ELEVENTH DAY, SATURDAY, 11. DECEMBER, 1875.

Castlereagh-street.

241. Dr. Dansey gave evidence on behalf of himself and Mr. Palmer, as follows:—

G. F. Dansey,
Esq.
17 Dec., 1875.

Started in company with the Mayor, and attended by Constable M'Mackin, from the Town Hall at 11 o'clock on Saturday morning, 11th instant, and proceeded to inspect the west side of Castlereagh-street, north of Park-street.

Visited a lodging-house, No. 271, a brick building, containing six rooms, belonging to Mrs. Cargo, and rented at £1 per week. The ventilation to this and the adjoining house, No. 273, was the old-fashioned style, and the privy accommodation very bad and offensive; the water used for drinking purposes is supplied through leaden pipes.

No. 261 is a wooden building having two rooms below and one above, occupied by a hawker of fruit, and rented from Mr. Gibson. This place was very dirty. The vendor of fruit gave us a long account of the width of the street in old times and other information for the benefit of the Civic authorities, which showed an intimate acquaintance with the locality, and then informed us that he had only lived there a few months. We went into the back room, which is 7 ft. x 4 ft., having a small window with fixed upper sash. In the rear we found a building constructed partly of iron and partly of wood, occupied by a man who seemed to be plunged into a deep reverie and took no notice of our presence. This place, the size of which is 12 ft. x 10 ft. and 6 ft. high, was disgustingly dirty and badly ventilated, with the old-fashioned sash window. On one side of the room was a sack of straw on a box, apparently intended for a child's bed or a seat, and on the other side a kind of stretcher covered with bags and old rags to serve as bedding. This wretched hovel is let at 12s. 6d. a week. In the adjoining tenement, which was formerly no doubt a portion of the same building we found a statue maker at work making busts and statues, whether intended to represent distinguished Colonial celebrities, or ideal figures of great statesmen and poets, we could not ascertain. The tenement he occupies consists of four rooms on the ground floor, and is rented at 16s. a week. The father, mother, and three children live in these rooms, and from what we could see of the place we came to the conclusion that statue-making in this country is not a paying trade. We learned from Mr. Gibson that this building is shortly to come down—as soon as one of the owners comes of age. We could not learn when that event was likely to occur, but we credit the proprietor with good intentions, and suggest that a statue to his honor would not be out of place.

We then went on to Hayes' Court, where we found four three-roomed brick houses. The first window has the old-fashioned sash-window, and there is no opening at the back nor is there anything in the shape of a yard. In the upstairs room there is a window back and front, but of the old-fashioned style, with upper sash immovable. Three of these houses are occupied by families, the fourth is rented by a woman who owned that she took in occasionally four or five lodgers, whether male or female she did not

SAY.

say. Here again the water supplying the houses was laid on through leaden pipes. The agent for these premises is Joseph Clayton. G. F. Dansy, Esq.

We inspected No. 239, Castlereagh-street, rented at 32s. 6d. a week, and owned by Mr. Fairfax, of George-street. The back premises are in great want of repair, and the water here also comes through leaden pipes. Several other houses which we entered in this locality, although outwardly presenting a clean and respectable appearance, must be very unhealthy from the want of ventilation, the old-fashioned sash-windows prevailing in all.

17 Dec., 1875.

We then came to three shops on the ground-floor—no rooms overhead—built partly of wood, iron, and rubble, occupying a large and valuable plot of ground. Here we found the privy full and emitting a frightful and sickening stench. One of these shops is a printing office, in which eleven hands are employed; in the other two shops a much smaller number are engaged. Mr. Deerin, coal merchant, collects the rents.

The next place worthy of notice is commonly known as the Scandinavian Alley. On the right hand is a public-house containing six rooms, which appeared to be much cleaner than we expected to find in this locality, but on penetrating into the yard we came to a pipe-drain leading to the sewer, from which proceeded such a horrible stench that coming suddenly upon it we were quite overpowered and forced to retch, after which we got back to the open air as quickly as possible; the opening to this drain is just under the kitchen window. In this alley there are nine houses built of brick, containing each two rooms and an attic. We went into No. 6, which was very dirty and out of repair; rent 6s. a week. No. 7 was occupied by two families, a man, his wife, and two children down-stairs; a man and wife up-stairs, and the proprietress of the establishment, who showed a well-marked black eye, in the room at the back. No. 8 presented an awful picture of filth and disorder. There was scarcely a particle of furniture in it, and it was occupied by a man and his wife, sister, and three children. The last three houses are rented at 9s. a week to a Mr. King, who lives in the corner house; Mr. Gray is the owner. There is no ventilation or opening of any kind to let in air at the back of any of these houses, and three closets for the use of the alley, locked to keep out intruders.

We returned at a few minutes past 1 o'clock.

TWELFTH DAY, MONDAY, 13 DECEMBER, 1875.

Castlereagh-street.

Met the Mayor at 4 o'clock on Monday, 13th inst., at the Town Hall, and proceeded, accompanied by Constable Dawson, to Castlereagh-street, and commenced our afternoon's work by inspecting Lawler's Buildings, which comprise eight four-roomed brick houses, rented at 9s. a week each. These houses abut, on the north side, on to the Chinaman's premises in Park-street described on a former occasion, which entirely shut out all chance of ventilation. Some of them are occupied by more than one family. In No. 3 there were six persons—husband, wife, and child upstairs; husband, wife, and child downstairs—besides the landlady. On the ground floor the windows are the old-fashioned sort, opening only at the bottom, but on the upper floor they are partly opened at the top as well as the bottom. This has been managed by cutting out a piece of wood which lets the window drop about an inch. On the south side of No. 7, lives a man and his wife, two boys and one girl, the back room on the ground floor is completely shut in by the Guild. It is a wretched cell in appearance, begrimed and disfigured with smoke and dirt. No. 8, in which there are two men living, is just as badly off for air and light at the back.

Nos. 327, 325, and 323, Castlereagh-street, except that there is the old-fashioned ventilation in all three houses, are in good order.

No. 333, the north end of which has given way, is in a cracked and tumbledown, and what we considered a dangerous condition, besides being very dirty. The back of this house, or rather an addition to it at the back, is constructed of weatherboards, battens, and shingles, and in a very bad state of repair. One window at the back is gone altogether, and the window on the north side is stopped up with bags to fill up holes. The dimensions of the rooms are as follows:—Front room, 12 x 15 feet; back room, 6 x 12 ft.; attic, 5 x 9 ft., and 6 ft. high. The rent, which is collected by Mr. Wade, is 13s. a week. In some of the rooms the ceiling is made of matting, and bulges out in a most inconvenient fashion. There was also a sort of den, 3 x 6 ft., or thereabouts, which was occupied by a blind man who plays the violin at public buildings. All these rooms were in a most filthy and disgusting state.

We concluded our inspection at 6:15 p.m.

THIRTEENTH DAY, TUESDAY, 14 DECEMBER, 1875.

Met at the "Royal Hotel" at 9 o'clock, and proceeded thence to Castlereagh-street, Constable Spronl accompanying us. We commenced with No. 228, which is a brick building containing six rooms besides the kitchen, and let as a lodging-house at a guinea a week; Mr. Forbes is the landlord. The kitchen is in a very bad state of repair, especially the flooring, and requires a great deal to be done to it to make it comfortable. The ventilation is fair, the windows opening at top and bottom, and the house does not appear to be overcrowded. Only about six beds are made up here.

No. 230 is another lodging-house also owned by Mr. Forbes and obtaining the same rental. Here only two rooms are let to lodgers; the others are occupied by the family.

No. 232 contains nine rooms, including the kitchen, and is let at 35s.—the tenant to keep the house in repair. Three of the rooms are let to married couples, and six single men occupy the others. Here we found the closet in direct connection with the watermain. We next inspected Simpson's Buildings, which consist of four three-roomed brick houses, occupied by private families, and in clean condition.

No. 342, Castlereagh-street, contains eight rooms, six of which are let to lodgers. In the front room on the first-floor there are three beds, and two in the back room; on the ground-floor, two in the front room and two in the back, but more beds can be made up if necessary. This property belongs to Daniel Cooper and Company, and is let at 25s. a week.

G. F. Dansey,
Esq.
17 Dec., 1875.

We then inspected No. 240, same street, which we were informed is a lodging-house for single girls out of employment. It appeared to be a sort of registry office, and we saw no reason to doubt that it was a respectable place, and that the inmates were servant girls waiting for situations.

No. 252, belonging to Mr. William Long, and rented at 15s. a week, was in a very dilapidated state, and should be pulled down as soon as possible. All the houses I have enumerated are connected with a main sewer, and there was nothing to find fault with in the drainage arrangements. A room at the back of the house last mentioned used as a kitchen, was in a shocking condition—the flooring broken and rough, and the ceiling of corrugated iron with broken supports, the walls of rubble-stone; a sort of store-room attached to this kitchen was in a similar condition. Here the water was running to waste. The allotment on which this house is placed is worthy of a much better building.

No. 266 Castlereagh-street consists of one brick and two weatherboard houses occupying a frontage of 68 ft. (owner, William Long—Reitch, collector). The houses stand back from the street, contain three rooms each, and are let at 12s. 6d. a week each.

Nos. 294 and 296 belong to the same owner, and are now converted into one house and used as a lodging-house, the lodgings being of a more permanent character, for families or persons having some occupation; no chance lodgers are accommodated. Except that the ventilation was defective we saw nothing in this house calling for especial notice.

No. 298, occupied by Mrs. Norris, is a grocer's shop, and was formerly a ginger-beer manufactory. At the back of this house, and attached to it, is a small shanty containing two rooms, occupied by a tailor, wretchedly close and unhealthy, and in the immediate vicinity of a very foul closet—an old cesspit. We asked the tenant how he could possibly live in such a place, and he said it was enough to kill anyone. In all cases like this, where we have come across palpable nuisances which can be remedied at once, Mr. Palmer has taken a note of the locality, and the Inspector of Nuisances has proceeded at once to the place and taken active measures to remove it, and issued summonses if necessary. We hope, therefore, that our house to house inspection, independent of the fruits which we trust it will bear in the shape of improved legislation, has been productive of some immediate benefit to the community. We concluded our morning's work at half-past 11 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

THIRTEENTH DAY, MONDAY, DECEMBER 13, 1875.

242. *Dr. Read* gave evidence on behalf of himself and Alderman Chapman, as follows:—

R. B. Read,
Esq.
17 Dec., 1875.

Met at the City Club at half-past 10 o'clock on Monday, 13th December, and proceeded, accompanied by Sergeant Jarkins, to visit Frying-pan Flat, which is in close proximity to the A. S. N. Company's Wharf, Sussex-street. Here there is a large piece of open ground, one part of which extends to the foreshore of Darling Harbour.

At the corner of Sussex-street near the wharf is an isolated building, 5 feet below the level of the road, and only 5 feet from the retaining-wall of the street, containing two rooms, 12 x 13½ feet and 12 x 9 feet respectively, and 8 feet high—Speer, owner or agent—rent, 6s. a week. The ventilation of this house is very defective and the tenants complain of a terrible stench from the harbour. This flat is a great resort for the kurrikins of Sydney, and the firewood belonging to the residents has to be kept in doors for safety.

Thence we went to the American Coffee-house, a brick one-storied building facing Sussex-street, with a lower or underground room below the level of the street. This portion of the building is 24 x 11 feet and 6 feet high; and the front portion 16½ x 17 feet and 8½ feet high. The front of the house is divided into two rooms of equal size. A shocking smell arises from the floor of the underground apartment, being evidently a stench from the adjoining closet; old-fashioned ventilation; very close and unhealthy.

Nos. 49 and 51, Sussex-street, are two wooden cottages containing two rooms, each 10 x 10 feet, and averaging 6 feet high; both of these cottages are 3 feet below the level of the street, and are reached by descending some very dangerous steps.

We then inspected the "Dove Inn" and found the house and yard clean and the closets with patent cisterns and in good order.

Turning down Erskine-street into Frying-pan Alley we inspected four wooden houses at the bottom of the place, rented at 7s. 6d. a week—owner or agent, Harrap—containing two rooms each; front room 13 x 12 feet, bedroom 7 x 12 feet and 7½ feet high; old-fashioned sash windows, badly ventilated and very close.

The next was a wooden shanty adjoining, belonging to the same owner, rented at 4s. 6d. a week, containing only one room 11 x 12 feet and 6 feet high, very close and badly ventilated, there being no ingress for air except through the door and a small window in front.

Adjoining this was another wooden shanty, 9 x 10 feet and 6 feet high, offering accommodation of an inferior character, inasmuch as the room contained no ceiling, and rented at the reduced price of 3s. 6d. In this small room there were four inmates. A third wooden shanty close to it, of the same dimensions, and obtaining the same rent, we did not care to inspect minutely.

We also examined a two-roomed house, rented at 6s. a week, rooms 10 x 8 feet and 9 x 8 feet respectively, and 7 feet high; and another one-roomed shanty, rented at 4s. The same description will apply to all the miserable hovels which we have noticed in this locality; they are in a tumble-down dilapidated state; the walls are crumbling to pieces and the roofs patched up with pieces of tin, iron, old bags, and any other materials at hand, which have the effect of keeping out the rain and confining the foul air. For all these houses there are only three closets, two of which have patent cisterns. The inhabitants complain bitterly of the awful stench which comes from Darling Harbour at night, and at times when the tide is out and the foreshore near the A. S. N. Company's premises is uncovered with water. To appreciate properly the wretched state of ruin and discomfort which these buildings present, it is necessary to visit the place; no description can convey a true impression of their utter unfitness for human habitation. Like all other tenements of this class, there are no back yards to any of the houses, the only open space being in front, where they have an available area of 20 feet wide, fenced off but not subdivided. The ground beyond this fence is at present unoccupied, but will no doubt be built upon before long.

We

We next proceeded to Union-street, off Sussex-street. A good deal of the yard drainage from the houses in this locality goes into the gutters. Between Union-street and Sussex-street is a narrow lane or passage; this lane again is intersected at right angles by another lane or passage, which divides the back yards of the two streets. We counted no less than twelve common cesspits of the foulest description in this lane, side by side, only a few yards from each other, and stinking frightfully. Will the Nuisances Prevention Act do anything to mitigate the horrors of this locality?

In this crowded and unhealthy place we saw an extraordinary number of children; indeed the supply seemed to be in excess of the demand, for one woman offered as a Christmas present to Mr. Chapman, an infant of about 12 months old, and seemed rather hurt at his refusal. This is not the first startling offer which has been declined by the members of this Committee. All the drainage of these houses runs along the surface; there are no stench-traps to the drains, but any amount of stench. These are all four-roomed brick houses, rented at 13s. a week, and owned by Gregory Board. They might be made healthy if steps were taken to compel the owner to connect them at once with the sewer, and to substitute water-closets for the horrible and disgusting privies which now contain the accumulation of years and convert the place into a complete fever den. The prevalence of sore throats in this spot induces us to call the immediate attention of the Scarlet Fever Committee to the locality. The harbour is only 100 yards distant, and if a 9-inch pipe were laid down from this property to the Bay, the evil, if not entirely removed, would be greatly mitigated.

We went on to Rafterty's Rocks; on a former occasion we reported that the houses had been removed from this place. There are however two houses left, the inspection of which we put off until we could visit them by day, and find the inmates at home.

The first of these is an old brick or rubble house, containing two rooms, and rented at 6s. a week—owner, Lyttle. We reached this house by going up a hill through a gateway to the rocks at the back, and entered by a verandah into the lower room, the dimensions of which are 7 x 8½ feet, and 5¾ feet high; the upper room being 7 x 10 feet, and 7½ feet high, excessively hot and close; as usual, only ventilated by a door and a small window in the front. This house is in the last stage of dilapidation, dirty to excess, and positively alive with bugs. It was a matter of great surprise to us how any human beings could voluntarily live in such a hole; and this surprise was greatly increased when the woman informed us that her husband was head cook at an hotel, and earning £3 a week.

The other house is occupied by a West Indian. We peeped in and saw the occupant wrapped up in a dirty rug, and lying on a still dirtier floor, over which no broom, mop, or any other cleansing apparatus could have passed for months at least. In this room, which was 8 feet square and 5¾ feet high, there was no furniture of any kind, no bed or bedding, no cooking or other utensils, no household goods of any description—nothing but the Indian, the rug, and the dirt.

We asked the woman next door if the Indian was married, and she said, "Yes—to so many wives," holding up the fingers of both hands. Both these houses should be pulled down, and the sooner the better, as they are utterly unfit for human habitation. We examined the closet, which has a pan and water laid on, but with direct action. The woman complained that it was occupied at night by a lot of "Johnny Warders." This term is derived from one Johnny Ward, who at one time kept a low public-house at the wharf, where he dispensed cheap rum to his customers. The frequenters of this public-house were mostly vagrants of the lowest class, and hence the term "Johnny Warden." We have seen a good many specimens of the genus, but shall no doubt have to describe them more particularly in a future report.

We examined a court off Sussex-street, at the back of Bradley and Perry's ironworks. It contains one wooden house, then five brick houses, and then another wooden house—seven in all. The privy accommodation for these houses consists of one closet with two seats; water laid on, but with direct action. In all of the houses the ventilation is very bad, there being no opening in the back walls, and the tenants complain greatly of the closeness of the atmosphere; no back yards, but plenty of open space in front. Bradley and Perry, owners.

From this court we went to Charlton's-lane, a steep paved court, leading from Sussex-street to Market Wharf. It contains two houses besides the "Dundee Arms," which are owned by Robertson the landlord of the "Arms." These two houses are designed with great ingenuity so as to retain on the premises all the impurities which should properly escape through the air and the gutters. They are built on a lower level than the public-house, the cellar of which forms the back yard of these houses. A drain-pipe is provided to carry away the drainage; but as neither sun nor air can penetrate into this covered yard to purify it, the atmosphere is damp and unhealthy, and the soil wet and slimy and exhaling noxious gases. These houses are small two-roomed tenements, the rooms being 12 feet square and 9 feet high. No current of air can enter except through the open doors, and they should not be tenanted until some proper appliances for ventilation and cleanliness are provided. Rent, 8s. per week.

We proceeded to Wright's Wharf, next to Market Wharf, in Sussex-street, where there is a very large block of valuable ground belonging to Hughes' Estate, dotted over with sundry blocks of old dilapidated weatherboard buildings for which Mr. Lyons is agent. We first examined two houses on the right, containing small rooms 10 or 11 feet square, very close and badly ventilated. The occupants complained that the rooms were very hot at night. They were literally swarming with fleas and bugs; a woman who lived there, remarking this peculiarity, said that when the property was pulled down "there would be more lives lost than there were at the Crimea." These buildings are quite unfit for human habitation and should be pulled down. Our informant pointed with pride to her own residence a few yards off, which only differed from the other houses from the fact that there was any amount of ventilation through the roof. "Thank Heaven," said she, "Every drop of rain that falls from the blessed Heaven comes through on my face and washes me clean." It was a wretched place altogether, and the only furniture a sofa and a table; a horrible ammoniacal smell proceeded from the floor, which is below the level of the door-sill; every heavy rain floods the place. The whole of the ground in which these houses are built appears to be made ground containing a good deal of street refuse and detritus, and no doubt retains a certain amount of poisonous property. The houses are rented at 5s. per week each. This locality was the site of the old Sydney slaughter-houses.

On the opposite side of the street there is a block of buildings in such a rotten tumble-down condition that if a rope were attached to them two or three strong men would have no difficulty in pulling them down. The roofs are too far gone to keep out the rain, and in the absence of drainage the least fresh covers the floors with an inch or two of water. One woman told us that when her husband was not at home to look to the drains she was generally flooded out. The ground appears to retain the moisture, and in rainy weather

R. B. Read,
Esq.
17 Dec., 1875.

weather it oozes out from the floors. Another woman told us that she had buried two of her children who died there two months ago. At the further corner of the square are two closets, close together, erected over a large open cesspit 8 ft. x 5 ft., which was in an awfully disgusting state. This is the only privy accommodation for the whole of the houses on Wright's Wharf, but the inhabitants are not very particular in availing themselves of the accommodation it offers, and visitors have to be very careful where they tread. We were informed that this property is held in trust for some minors, and we were unable to ascertain the names of the rightful owners. Mr. Lyons is the agent.

Quitting this neighbourhood for obvious reasons as quickly as possible, we came to a two-roomed house facing Sussex-street, the back of which is 8 ft. below the level of the street. This was in such a tumble-down dilapidated state that it must be positively dangerous to live in. Then to another shanty of similar style, which seemed even in a more dangerous condition; and then to a third in which I should scarcely have considered it safe to take shelter during a shower of rain. These hovels obtain a rental of 5s., 5s., and 6s. respectively. They are utterly unfit for human habitation, and no one who is not afraid or ashamed to sleep out in the open air would ever venture to seek a night's rest in them. They are positively dangerous to live in and should be pulled down with the least possible delay; the wonder is that weatherboard houses should hang together so long. The tenants made the usual complaint that the landlord will do nothing. It appeared to us however that there was very little that he could do, except in the way of total annihilation.

We returned at 1 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

FOURTEENTH DAY, SATURDAY, DECEMBER 18, 1875.

Rowe-street or Brougham-place.

243. Mr. Chapman gave evidence on behalf of himself and Dr. Read as follows:—

M. Chapman,
Esq.
17 Dec., 1875.

Met at the City Club at half-past 10 o'clock on Saturday morning, 18th instant, and proceeded, Sergeant Larkins being in attendance, to inspect Rowe-street, formerly Brougham-place, which consists of 26 houses occupying a large and valuable piece of ground between Pitt and Castlereagh streets, and about half way between King-street and Hunter-street. The width of the lane between the houses is 16½ feet. It was originally paved but the paving is now much broken up, and as it is private property the Corporation have no control over the roadway. The houses contain for the most part four rooms each, of very moderate size, and in very many instances each room is occupied by a separate family who wash, cook, eat, drink, and sleep in the same apartment, all their family arrangements being confined within four walls, which are seldom more than 10 or 12 feet apart. It has been well said that half the world does not know how the other half lives. Neither Dr. Read nor myself, although we have both of us lived a great many years in Sydney, could have credited without ocular inspection the terrible state of overcrowding which we witnessed in this locality. A simple description of the dimensions of the rooms, with the number of inmates they contain, will at once show the danger to the health of the community which must ensue from such a state of things. To proceed to detail: The first house on the south side of the lane, which is a four-roomed brick house—owner, Gooch—is let at 13s. a week to Mrs. Vaughan, who sublets portions of it to other tenants; the front room on the ground floor which is 10½ x 11 feet and 9 feet high is occupied by the lessee and her family, and a smaller back room on the same floor is let to a tenant at 3s. The front room up-stairs, 15 x 11½ feet, and 8 feet high, let at 6s. a week, is occupied by a man, his wife, three dogs, and a cat; and the back room on the same floor is occupied by an old woman, the mother of the lessee. There are nine persons in this house altogether. The yard is 24½ feet x 11 feet 7 inches, and very filthy; there is a cistern to the closet, but no water. The house itself from basement to roof is disgustingly dirty, badly ventilated, and in a wretched state of repair. The walls and ceilings are broken in a number of places, and the whole building is falling to decay. On the staircase we observed a number of gigantic cobwebs, the finest specimens I have seen since I visited the underground cellars in the London Docks, in the year 1859. The landlady, to whom we ventured mildly to suggest that the removal of these cobwebs would conduce to the comfort of her lodgers, was very indignant, and said it was quite as much as she could do to look after her own room. She told us that she had lived there for four years, and that the landlord had never done anything to put the house in repair, and still refused to do anything.

The next house—No. 3, owner or agent, Harkness—is let at 13s. a week to Mrs. Ryan, who again sublets to others. The front room down-stairs let at 5s. a week, is occupied by an old man named Palmer, about 60 years of age, who at the time of our visit was lying stupidly drunk on an old sofa, with an empty rum bottle beside him; whilst his better-half, who is about the same age, was crouching down at the foot of the stairs in a vacuous state, lost to all sense of decency, with a stream of urine proceeding from her along the floor. Beside her was a pannikin with a mixture of rum and Colonial ale, which we were told is her favourite beverage. The old man, it appears, is a vendor of cabbages. The room in which we found this drunken couple was in a filthy state, and crowded with old bottomless vegetable baskets, old boots, empty bottles, articles of furniture, &c., &c., with a chamber vessel full of filth in one corner. The walls and ceiling tumbling down, no ventilation to purify the room, the upper sash of the solitary window being a fixture; the whole a picture of dirt, drunkenness, and degradation from which we were not sorry to escape. The back room on the same floor let at 4s. 6d. a week, and 8½ x 11 feet and 9 feet high—mark the dimensions—was occupied by a man, his wife, and four children. The walls and ceiling of this room were in the same dilapidated condition, the latter being nearly all down, and the temperature equally close and unhealthy; a very small yard at the back. Up-stairs there are two rooms of similar capabilities, each occupied by a family, but there was nobody at home, and we could learn no particulars about them. These houses seem to be kept together by strong iron bars running from front to back and secured on the outside, which perhaps will account for their existing so long. We looked into the yard, which was in a filthy state; the drain is an open cesspit without trap, full of filth, and close to the door; the water laid on through leaden pipes; tubs of dirty clothes in soak; the water-cask positively green with filth. Part of the drainage from this yard finds its way under the houses, and even the tenants complain of the stench which

which arises from it. I may add that the limited space in which whole families crowd together in these buildings is still further restricted by the fact that they keep their firewood as well as all their other possessions in the one small room; in fact there is no other place to keep it.

No. 5 is also let to Mrs. Ryan, who sublets the rooms to separate families. The front room on the ground floor, let at 6s. a week, was occupied by a sick man, his wife, a daughter 15 years of age, and an adopted orphan boy nearly as old. This man was very ill and urgently in want of medical advice. Seeing the necessity of the case, and that he required immediate attention, I gave his wife an order at once for medicine and advice at the Infirmary.* The room in which this family were cooped up was in the same dis-jointed state of repair as the others I have noticed. A great portion of the ceiling had fallen down; the walls were in a filthy state; and the old-fashioned sash windows precluded all chance of ventilation. Health for so many people in such a limited space, under such conditions, is physically impossible. This description will apply to the back room on the same floor, rented at 5s. a week, and occupied by a man and his wife, with a further cause of discomfort, that it was swarming with bugs. We ventured up a rickety flight of stairs, where we found the front room, let at 6s. a week, occupied by a colored woman, who said her husband was a sailor, and that she expected him home in a few days. She told us that she did not care for him personally, but she wanted his money. In this room was also a well-known prostitute, against whom the police had failed to obtain a conviction a few days ago; she was under the influence of liquor, and her conduct was not at variance with her calling. The back room up-stairs, rented at 5s. a week, was occupied by widow Smith; was also very filthy and badly ventilated, one half of the sash of staircase window had been, fortunately for the health of the inmates, removed bodily. There was no water attached to the closet belonging to this house. The next house—owner, Harkness—is let to Mrs. M'Cormack, who sublets portions of it. This house is also badly ventilated from the same cause, and is also kept from tumbling down by iron bars running its whole length; the yard is in a very filthy state; the drain an open cesspit without stench-trap; and as in almost every case the tenants complain that the landlord will do nothing. The persistent determination on the part of the owners of these properties to ignore their tenants upon every question, except the payment of rent, seems, as far as our experience goes, to be the prevailing characteristic in the relations between Sydney landlords and tenants.

M. Chapman,
Esq.
17 Dec., 1876.

No. 9, which is the property of Mrs. Ryan, who appears to have farmed the previous houses to some purpose, and to have purchased a couple of houses out of the proceeds, is a house of similar dimensions, and in a similar state of dilapidation, badly ventilated, and equally filthy. There are seven inmates in this house, crowded into small rooms, and in the same state of discomfort. There is no water to the closet, and the drainage is very offensive. The lower room is used as a shop, in which the proprietress sells lollipops, soap, candles, and such other articles as her customers are likely to require.

Mrs. Ryan also owns No. 11, and lets the lower front room to a man and his wife for 5s. a week, and the back room to a family at 4s., but she refuses to repair the building, though the walls and the ceiling are tumbling down; no ventilation as usual. The two up-stair rooms are let at the same figure, but the tenants were out. We peeped through a broken panel of the door; the room we were told belonged to a fruit vendor; we saw a large quantity of apricots and plums strewed upon the floor. Here everything was very dirty, the room exceedingly close, and blocked up with heaps of rotten fruit and a heterogeneous collection of odds and ends; yard very small and filthy; closet without water; and a number of fowls and ducks looking dirty and disreputable, and evidently unfit to take part in the festivities of the season.

No. 13—owner, Thomas Ryan—was occupied by Lake, a French polisher, and was tolerably clean and well ventilated. We complimented this tenant on the improved appearance of his place, on which he said, "No thanks to the landlord, I have had to do it all myself." He pays 13s. a week; the yard is small but clean; the water from the closet has been cut off by the Corporation for the last three or four weeks.

No. 15 is owned by Desmond, and the lower front room is let at 4s. a week to Mrs. Janet Hunter and her dog, a turnspit of very doubtful pedigree. Her apartment, which is only 12 x 10 feet, is occupied by a large mangle, a sofa, and a table. Probably she sleeps on the sofa, as there is only 3 feet space unoccupied by these three articles of furniture. In this confined area she washes, cooks, cats and drinks, and mangles. The room is in fact a *veritum in parvo*. Where the linen is disposed of after the process of mangling is gone through it is difficult to conjecture. The up-stair rooms in this house are very badly ventilated, and the tenants complain terribly of the bugs; the yard was tolerably clean, but there was no water to the closet.

No. 17, occupied by Cook—Hardy, owner—rents at 12s. a week; the front room on the ground floor is 10 x 10 ft. and 8½ ft. high. This and the next house are not so old as those we have noticed, as they were partially burnt down by the fire which levelled the Prince of Wales' Theatre some years ago, and re-built. The rooms in this house are let at 3s. and 5s. a week respectively, and are tolerably clean, but badly ventilated; the yard is small, and contained a dozen fowls and a mangy cur. We noticed as a singular fact that nearly all the dogs in this locality are mangy; indeed there is a striking consistency in the general family arrangements. The rooms in every house are sublet; every room occupied by a family also provides quarters for one or more dogs, the majority of which are mangy.

No. 19—same owner—obtains a rental of 11s. a week. The front room is occupied by a very aged couple, who seemed to be quite unequal to exertion of any sort, and we forbore to ask them any questions—rent 5s. a week. The back room is let at 4s. to an old fiddler, who was very anxious to give us a specimen of his musical ability, but this, among other tempting offers, was declined with thanks. This room was awfully dirty and wretchedly ventilated, besides being crowded with old clothes, boots, and miscellaneous articles of furniture and household appliances, until there was scarcely room to breathe in it. The back room up-stairs is rented at 3s. 6d. a week by a fruit vendor, and was, if possible, in a worse state of dirt and discomfort; old baskets, fruit-cases, and lumber of all sorts, nearly filled it up, and the bedding was rolled up and stowed away in a corner; no furniture, the fruit-cases serving for tables and chairs. The front room up-stairs is let at 5s., and occupied by a blind man and his wife, who both looked very miserable and destitute, so much so that both Dr. Read and I gave them a contribution to relieve their immediate wants.

No. 21—Forbes, owner—is rented to M'Veigh, who sublets it. The front room on the ground floor is occupied by the owner, and the back room—a small, close, and badly ventilated apartment, 10½ ft. x 9 ft.—rented at 6s. by a man and his wife. At the time of our visit the woman was washing, there was a large fire

* NOTE.—Upon a second visit to this place, two days after, we learned that the man had been buried the same morning.

M. Chapman, Esq.
17 Dec., 1875.

fire burning, and the place was like an oven; it was also very dirty. Up-stairs the back room, tenanted by an old woman, we found in a very bad state of repair—the walls and ceiling broken, and scarcely any ventilation. A cobbler occupies the front room, and pays 4s. for it; his only companion was a mangy cur of the terrier tribe. This house was altogether in a filthy and disgraceful state, and the tenants say that when the landlord is appealed to he puts on an indignant air and positively declines to do anything. The yard was as dirty as the rest of the premises; the closet had a patent cistern, but no water laid on.

No. 23—same owner—is rented by Dickson, who occupies two rooms below; the front room—10 x 12 ft.—as a sleeping and sitting room for husband, wife, and two children; and the back room as a kitchen, both very close and badly ventilated. While we were there a woman was ironing some muslin dresses before a large fire, and we got away as quickly as we could for the heat was stifling. The up-stairs rooms, rented at 5s. and 3s. respectively, were quite as close and in an equally bad state of repair. The lessee, who has occupied this house for the last three years, said the landlord had never done anything to it, and refused even to have the chimney swept. There were seven persons living in this house.

No. 25—owned by Mrs. Brown—rents at 14s. a week, and was occupied by a bottle-washer; there were bottles washed and unwashed all over the premises—in the yard in heaps, piled up in the passage in tiers, stuffed under the bed—bottles under the stairs and on the stairs—bottles everywhere; and in the yard a drain, loosely covered over with boards, running from the bottle tubs across the back premises. This house, like all the others, was very imperfectly ventilated, the upper sashes of the windows being fixtures.

We returned at 1 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

FOURTEENTH DAY, DECEMBER 17TH, 1875.

244. *Dr. Dansey* gave evidence on behalf of Mr. Palmer and himself as follows:—

G. F. Dansey, Esq.
17 Dec., 1875.

Met at 9 p.m. and proceeded to Castlereagh-street, where we expected to find between Bathurst and Liverpool streets some of those cheap lodging-houses where casual lodgers are received and accommodated for the night at low rates, but found that the character of that neighbourhood has completely altered within the last few years, and the houses which used to be cheap lodging-houses are now, for the most part, let to respectable families at a weekly rental. This was the result of our inquiries, and they were confirmed by the statements of a Mr. Irons, a resident in the locality for sixteen years, to whom we applied for information. We found only a few houses of slightly questionable character. Not having found what we set out to look for we proceeded to inspect some of the lanes and courts leading out of Castlereagh-street; we, however, resolved to visit for the future places of this description by day-time, when it is easier to obtain admittance and to obtain all necessary particulars.

At 141, Elizabeth-street is a very old dilapidated brick building, uninhabited, all the windows without glass, and covered almost all over with placards. This is at the rear of the "Albion Hotel," at the corner of Castlereagh and Market streets. The ownership of this property we were told is disputed.

Nos. 345, 343, and 341, Castlereagh-street, brick houses, have all the old-fashioned ventilation, otherwise they are in good order.

We next inspected Galliot and Christie's Buildings, also in Castlereagh-street, which consists of five houses, three of brick in one block, and two weatherboard buildings rented at 7s. and 6s. a week—Ray, agent. Here too we found the old-fashioned sash windows, and no ventilation at the back of the houses; there are no back yards to these houses at all. Upon entering at the back of No. 345, out of Galliot and Christie's yard, we found a shed used as a boot manufactory. It is built of bricks in timber frames; attached to it was a shed full of leather and rubbish. In the back room of the house, on the ground floor, the ceiling had given way; it had consisted of paper. All these houses were very dirty, and they require a good deal of repairing.

We went then to South's Buildings, which comprise three houses, containing two rooms, attic, and kitchen, with a small yard behind; old-fashioned ventilation as before. These houses were occupied by mechanics, and let at 9s. week. To our great surprise the tenants declared that they were quite comfortable, and had no fault whatever to find with the landlord.

No. 351, Castlereagh-street, a peculiar looking weatherboard building, attracted our attention and we inspected it. We learned that this building was a public-house forty-five years ago. It contains four rooms and kitchen, and is now the property of Mrs. Aiken, and let at 15s. a week. Considering the antiquity of the house it is in fair condition, but the large plot of ground in which it and Nos. 353 and 355 stand is worthy of better buildings.

No. 355 is a wooden shanty, at present empty; it was formerly occupied by Mrs. Bird, who owns the court behind it. In this court or lane are three weatherboard houses. The first to the right has two rooms on the ground floor; it has no ventilation at the back, and the roof being corrugated iron the heat must be very oppressive. The second house appears to be constructed of corrugated iron, but is so discoloured with rust and dirt that it is difficult to say of what material it is composed. The sides of this house are raised about 2 ft. from the ground on wooden supports which are rotting away fast; attached to it a room of wood with iron roof used as a kitchen; there is plenty of ventilation here as the window has been removed bodily. The third house in this lane is built of brick with zinc roof; it contains two rooms and a kitchen and is let at 8s. a week; the kitchen is in very bad condition, the door-posts being so rotten that if a single brick were to be displaced the whole arrangement would fall to the ground.

This was the last place we visited, the greater portion of our time having been consumed in travelling over ground in search of cheap lodging-houses.

We returned at 11:20 p.m.

Personal Inspection

By No. 2 Sub-Committee.

FIFTEENTH DAY, MONDAY, DECEMBER 20, 1875.

By-lanes between George and Pitt streets, from Bathurst-street to Liverpool-street.

245. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer, as follows:—

Met the Mayor at the Town Hall at 4 o'clock and proceeded, accompanied by Constable M'Kay, to G. F. Dansey, Esq. inspect some of the by-lanes and courts leading from George-street to Pitt-street, between Bathurst and Liverpool streets.

17 Dec., 1875.

We first went to Wilmot-street, where we found on the right-hand side a corrugated iron shed with a tiled roof used as a joinery; dimensions, 16 x 10 ft., in a very dilapidated state, rented at 10s. per week, and belonging to Modini, who lives in the premises fronting George-street. On the same side of the street there are six brick houses, with a weatherboard building at the bottom of the lane, used as a closet, and smelling very offensively, although the water is laid on.

The first house, belonging to Hordern, is in very bad repair internally, and is fitted up with the old-fashioned ventilation. The next house has a verandah in a most tottering condition, as if it must pitch headlong into the street with the smallest impetus. The occupant told us that he did not care about repairs, as it answered him very well for a workshop. This house contains seven rooms, and is rented at 20s. per week—Modini, owner. There are also fifteen brick houses in this street belonging to M'Nab, which appear to be in fair order. Leading out of Wilmot lane or street is Roxburgh-place, which comprises nine houses—six on the southern side and three at right angles to them, on the opposite side. For the use of these nine houses there are three closets at the end of the court, connected with cisterns, but in very dirty condition. Each house contains two rooms, and is rented at 7s. per week; ventilation very imperfect, there being no back windows; owners or agents, Bluck and Steel. No. 5 in this row is tenanted by a Chinaman (Ah Lee) who lives entirely alone and shuns all company, in order to have the undisputed possession of the premises. At No. 6 we found the ceiling falling down, but the house was otherwise very clean. Three young girls live here, who stay with Mrs. Cavanagh *alias* Wilmot, the occupant, at least so we were informed, but whether the number of inmates is occasionally increased we could not ascertain as the family were not at home. The next house, rented at 5s. per week, was occupied by another Chinaman (Ah Sam), who also appeared to appreciate the charms of solitude, as he lived entirely alone. His place was very clean, and there was no evidence that opium-smoking was one of his failings. No one was at home at No. 9, and we took the liberty of peeping into the front room, in which we saw one broken table, one broken chair, and one chair not broken, and no other article of furniture, except an imposing picture of Whittington over the fire-place, in which that illustrious individual was represented with a carpet-bag and walking-stick slung over his shoulder, trudging along the highway to London to seek his fortune. All these houses have the old-fashioned sash windows in front, and no windows at all at the back. There are no back yards attached to them, and but a limited space in front. The three houses at the corner are also deficient in back yards and back windows, these accessories to ventilation not having been comprised in the architecture of Roxburgh-place. One resident had however managed to support life under these distressing conditions for twenty-eight years.

We inspected Stewart's cedar yards, facing Pitt-street, which, considering the quantity of timber and inflammable material in them, are in dangerous proximity to a number of houses in case of fire.

We then proceeded to Yeend's Buildings—there are two places of this name; the first consists of three brick and shingle houses, the windows all in front and having the old-fashioned sashes. For these houses, and for two others in Pitt-street, at the back, each occupied by a family, there are two closets. These closets have pans but the taps do not work. The rent of these houses is 6s. per week. The two houses referred to as being in Pitt-street, are Nos. 427 and 429, and contain each two rooms and a kitchen. Over the kitchen of 429, which has a zinc roof, is a temporary erection of timber to protect it from the effects of the sun. The floor of the kitchen at No. 427 is in a very bad state of repair. These two houses stand back from Pitt-street, and are reached by an ascent of seven steps to the front door.

The other Yeend's Buildings is lower down. At the west end of the yard is a two-roomed weatherboard house occupying about 16 ft. x 12. The ceilings of the rooms are made of paper, which allows the rain when it does fall to come in freely; rent, 6s. per week. On the north side there are a couple of two-roomed brick houses, also rented at 6s.; then there is another weatherboard house with three rooms, rented at 8s. The yards in this place were very dirty. We found two open closets at the foot of the court, and were told by the inmates that every morning they had to turn a man and woman out of each of them.

Nos. 439, 441, and 443, Pitt-street, are two-roomed houses belonging to Mr. Bray, and have all the old-fashioned ventilation.

Crossing over to the other side of Pitt-street, we went to 382 and claimed admission at the front door, upon which a Chinaman popped his head out of the upper window and said his name was Charley Hung, and he could not come down to let us in, as he was not allowed to do so by a Jew lodger, who lived on the ground floor and kept the door locked. The first floor of this house at the back being on a level with the ground, in consequence of the excavations having been conducted on an economical scale, we managed to effect an entrance into the celestial region on the first floor, which we found in a very bad state of repair, and very imperfectly ventilated. The drain in the yard of this house, although connected with the sewer, had no trap, and was in a foul and stinking condition. Mr. M'Grath, the letter-carrier, is owner. At the end of the court, standing a little back from it, we found a closet with the water laid on. In one of these houses, which was in a very dilapidated state, the inmate said she had resided for fifteen years, and she hoped nothing would be done to it, as she had no wish to leave it; however humble, she appeared to think, there was no place like home. Owner, Andrews. This house, to which the tenant was so much attached, is badly ventilated with the old-fashioned sash window, and the roof is by no means impervious to the rain. In the back room is a small window, which is such an unusual feature in houses of this description that it appears to have attracted the attention of a thief, who by means of it got into the house a few nights ago and stole a watch. To prevent any future depredations of this sort the occupant had placed across the window several iron bars an inch and a half broad and half an inch thick. On emerging from this yard into Pitt-street again we were struck by the appearance of a room built over the right-of-way leading into the street. It appeared to be in the act of falling down, and we did not attempt to enter

G. F. Dansey, enter it. Possibly, however, this apparent instability was only another peculiarity in the architecture of this locality.

Nos. 318 and 319, Pitt-street, also belong to Mr. Andrews, contain four rooms, and are in such a dilapidated state in all respects, that they ought to be removed.

Crossing Pitt-street again, we went to Union-lane, and inspected two cottages built of weatherboard, with shingle roof, containing one room and one kitchen each—in such a ruinous condition that they ought to be pulled down. These shanties obtain a rental of 5s. per week each; there is a closet but no cistern. Owners, Hardy and Mitchell.

Nos. 20 and 22, on the right hand side of this street, each contain two rooms besides kitchen and attic, and rent at 8s. per week. Owner, Wilshire. They are in equally tumble-down condition. Here in place of a closet there is only a common privy. The other houses in Union-street do not require any special notice.

We returned at 6:30 p.m.

WEDNESDAY, 22 DECEMBER, 1875.

Present:—

R. B. READ, Esq.,
M. CHAPMAN, Esq.,

G. F. DANSEY, Esq.,
B. PALMER, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection of Sydney Watch-houses.

By Dr. READ and the CHAIRMAN.

246. Dr. Read gave evidence on behalf of himself and Professor Smith as follows:—

R. B. Read,
Esq.

Met the Chairman by appointment in the Board room, at 10 o'clock on the morning of Tuesday, 21st instant, and proceeded to inspect the Watch-house at the Cumberland-street Police Station.

22 Dec., 1875.

The site of this watch-house is by far too small, and the ventilation very imperfect; what ventilation there was originally having been completely cut off by the wall of adjoining buildings, erected since the watch-house was constructed. At the time of our visit the cells had all been cleaned out and were perfectly empty. They were, therefore, seen at their best; but there was no disguising the fact that they were still very offensive. They do not get a sufficient quantity of fresh air to purify them. Here we inspected a closet which, although constantly flushed with water, gives forth a most disgusting stench. It is evidently nothing more than an old cesspit with a seat constructed over it.

We saw quite enough of this lock-up to enable us to confirm in every particular the description given of it by No. 2 Sub-Committee.

We next went to the Central Police Station in George-street. Here we were informed by the sergeant in charge that the overcrowding witnessed by No. 1 Sub-Committee during their visit to the place on the 5th inst., was considerably exceeded on the night of Sunday last when, instead of fourteen females being crowded into No. 6 cell, which is only 11 ft. 6 in. x 8 ft. 6 in., there were no less than seventeen unfortunate women locked up in it, two of them having children with them of the respective ages of about 4 and 2 years. This gives just 5½ feet floor space to each inmate without allowing any for the children. We were further informed that this is by no means an unusual occurrence, both with regard to the number of women cooped up in such a confined space, and the fact that children of tender ages have frequently to go through the same ordeal. At present there is no other provision, the accommodation being altogether inadequate to the requirements of the place. There was also a lunatic locked up here on Monday night—that is to say, a man who was supposed to be of unsound mind—locked up for protection. He was placed in a cell by himself, but as it is impossible to say what phase of lunacy may be developed in such cases, or whether it may take a suicidal tendency, it is obvious that very little protection is afforded in such cells as we have described. It appears that a person arrested on the ground of lunacy cannot be sent to the Receiving-house until he has been examined by two medical men and before two Justices of the Peace.

The demands upon the space at the Central Police Station are evidently far greater than the capabilities of the place. The same remark applies to the offensive odour proceeding from the different cells at this lock-up on Tuesday, when we visited it, after they had been thoroughly washed and cleaned out. They were not all empty when we went there, for in the females cell (No. 6) there were six women, who told us—I use their own words—that “they were famished for a breath of air.” We corroborate the evidence given on the state of this watch-house by No. 1 Sub-Committee.

We proceeded thence to the Parramatta-street Station, and our inspection of that lock-up quite confirmed the impression given by the evidence of the Sub-committee.

We returned at 1 p.m.

FRIDAY, JANUARY 7, 1876.

Present:—

R. B. READ, Esq.,
M. CHAPMAN, Esq.,

G. F. DANSEY, Esq.,
B. PALMER, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 1 Sub-Committee.

FIFTEENTH DAY, TUESDAY, 21 DECEMBER, 1875.

Rowe-street or Brougham-place—continued.

247. Mr. Chapman gave evidence on behalf of himself and Dr. Read, as follows:—

M. Chapman,
Esq.

Met at the City Club at 4 o'clock on Tuesday, 21st instant, and proceeded, accompanied by Sergeant Larkins, to inspect the north side of Rowe-street, formerly Brougham-place.

7 Jan., 1876.

The first house we inspected—No. 2—was a four-roomed brick building—Stuart, owner. Vaughan, who is the agent or lessee, sublets it. The front room on the ground floor—11½ x 11½ feet and 9 feet high, let

let at 4s. a week—was occupied by an old man and woman; we found it very close, badly ventilated, and the walls much broken. The back room, which was much in a similar state, was let to a blind woman at 3s. 6d.; the passage and staircase very filthy, and in bad repair. The front room up-stairs—let at 4s. 6d.—just as badly ventilated, and the occupant complained of the suffocating heat at night. The back room—let at 3s. 6d.—was occupied by a fruiterer, his wife, and two children, and was equally deficient in ventilation.

M. Chapman,
Esq.
7 Jan., 1876.

No. 4—Forbes, owner—is let at 11s. a week to Mrs. Aikin, who sublets. The front room down-stairs—let at 5s., and occupied by a man and woman—was very filthy, badly ventilated, and very much out of repair; the back room—let at 4s.—and also occupied by a man and woman, was in a still worse state of repair, and positively dangerous to live in; the ceiling actually tumbling down. This room contained a heap of firewood, a quantity of old clothes, which apparently served as bedding, a tub of stinking soap-suds, sundry other articles for household use, and dirt *ad libitum*. The tenant of the front room up-stairs was out, and the door was locked. The back room up-stairs—let at 3s. 6d. a week—only 11½ x 8½ feet, and very badly ventilated, was occupied by a man and woman with three children; it was in a wretchedly filthy state, and very much out of repair; the passage and staircase very filthy; walls and ceilings broken down; yard, 13 x 8½ feet, dirty and badly drained; tenants complain that the landlord will do nothing.

No. 6—Forbes owner—agent or lessee, McCormack—rented at 11s. a week and sublet. The front room down-stairs—10½ x 11 ft., let at 5s. a week—was very filthy and out of repair. This room was occupied by five persons, male and female—the youngest being a girl of 17 years of age. Such a small apartment would offer but very confined accommodation for five persons even in a cold country, and supposing it to be unused and ventilated by day; but when it is understood that the whole indoor life of five adults is spent in such a limited space, and that all their belongings in the shape of furniture, cooking utensils, and household appliances, as well as firewood, are crowded within the four walls, and that there is no other place for cooking and washing, it will be seen how essentially necessary to the preservation of health are thorough cleanliness and free ventilation, neither of which requisites were present. On making inquiries next door we were positively informed that occasionally nine or ten persons sleep in that room at night; in fact the neighbours called our particular attention to the disgraceful state of overcrowding in that particular apartment—and when the inhabitants of Rowe-street themselves complain of overcrowding, the fact may be accepted without further evidence. The back room down-stairs, let at 4s. a week, was in a tumbledown condition, close, and filthy; it was occupied by a man and his dog. The front room up-stairs, let at 5s. a week, was occupied by three Germans, and although clean was very much overcrowded, its dimensions being 14 x 11 ft., considering that half the available space was filled with firewood, cooking utensils, tubs, old clothes, &c., besides a box of very suspicious looking fruit, and that there was scarcely any ventilation. The back room, let at 4s. and occupied by a woman, was just as close and much dirtier; walls and ceilings much broken; passage and staircase filthy and very much out of repair; yard, 6 ft. 10 in. x 13 ft. 6 in., very badly drained, and containing a quantity of dirty soap-suds and a lot of old bricks; as usual, an obdurate landlord and no prospect of repairs.

No. 8—Farrell owner—rented at 13s. a week by Vaughan, who sublets. The front room on the ground floor, 11½ x 9¾ ft., is let to a barrowman at 4s. 6d. a week; back room, 10½ x 8½ ft., let at 3s. 6d. a week; and there are two rooms up-stairs of similar dimensions, obtaining the same rental. All these rooms are in a wretched state of repair, the walls and ceiling falling to pieces. One of the tenants told us that nothing had been done in the way of cleaning or repairs for seven years. In the upper back room, which is 11½ x 8½ ft., and rented at 3s. 6d. per week, lives a man named Shea, with his son and two daughters, aged 16 and 12. These four persons all eat, drink, live, cook, and sleep in this miserable little hole, which, besides being out of repair, is filthy, close, and badly ventilated. We were credibly informed that Shea, who is employed in the Botanical Gardens, earns 2 guineas per week, and his son 15s., and that one of the girls when she is not out of place gets 6s. These people ought to be compelled to seek healthier quarters. The yard attached to this house is 14 ft. x 6 ft. 10 in., very filthy and badly drained; the water-closet supplied with cistern, but the closet itself in a tumbledown condition—a miserable dirty hole, with a doorway only 4 ft. 10 inches high.

No. 10 belongs to the Treeve's Estate. It is occupied by six persons, and is tolerably clean, but the yard was very filthy, and the water-closet in a tumble-down condition.

No. 12—Desmond owner—is rented at 13s. a week. The front room of this house, which is about 10 x 12 feet, is occupied as a shop, in which are exposed for sale a few sickly-looking cabbages, fruit, pipes, and the usual stock in trade of a small green-grocer. The shop-keeper lives in a little back room in which his lungs must be tested to the utmost, as there is very little ingress for air. Up-stairs the front room is let at 6s. a week, and the tenants were out. A small back room is let at 4s. This house was in a filthy state and badly ventilated, the stair-case broken, and on the landing a heap of human excreta some days old; the yard 6 ft. 2 in. wide and very filthy; the closet without water.

No. 14 belongs to the Treeve's Estate, and is let at 10s. a week to Mrs. Rose, who sublets it. Although this house has been lately papered, and was much cleaner than many others we visited, it must be very uncomfortable in consequence of its imperfect ventilation and smoky chimneys.

No. 16—Petersen owner—is rented at 12s. a week by Lake, French polisher, who sublets it. The front room on the ground floor is used as a Congregational meeting-house, and the back room is let at 3s. a week; the tenants of this room were not at home. Up-stairs there are two rooms, let at 4s. and 3s. 6d. a week, one occupied by an old woman and her cats, and the other by a sick woman—both very close and unwholesome.

No. 18 was occupied by a policeman and his family, and seemed very clean; we did not examine it.

No. 20 is owned by Mrs. Brown, and sublet. The front room on the ground floor, which is 11½ x 10½ feet, let at 5s. a week, was very close and badly ventilated; it was occupied by four persons, who eat and drink, cook and sleep, and carry on all their household arrangements within it. When we visited it it was washing-day; there was a large fire and the heat was almost unbearable. The back room is let to a single woman at 4s. a week. The two rooms up-stairs are occupied by the lessee, who has four grown-up children living with her; they seem respectable, but they can hardly be healthy in such overcrowded and badly ventilated quarters.

No. 24 is also owned by Mrs. Brown, and let at 13s. a week. It is occupied by a bricklayer's laborer, who has a family of ten children. It is tolerably clean, but is wretchedly deficient in ventilation.

M. Chapman,
Esq.
7 Jan., 1876.

No. 26 also belongs to Mrs. Brown. The front room on the ground floor, which is 11 ft. x 12 ft., and 9 ft. high, is occupied by four persons. The back room belongs to the bottle-washer referred to in our last report. Up-stairs the front room rented at 5s. a week is occupied by an engraver, and is very dirty and badly ventilated. The furniture in this room consists of an old sofa, with a heap of something which looked like bedding on it, a work-bench, some tin pots, and a few odds and ends. The place looked very forlorn and miserable. The landlord who went up-stairs with us seemed impressed with the genius of his lodger, and accounted for the poverty of his surroundings by informing us that he was fond of a drop. The back room up-stairs, 11 x 9 ft., and 7½ ft. high, is let at 3s. a week to an old fruit woman, who lives there with her dog, a dirty, sour-visaged, broken-haired, ugly-looking brute, who put his head on one side and barked at us with one eye open as we entered into the room. Upon asking the woman if he would bite, she looked at him with an air of intense affection, and said it was only his play. This house differed in no respect from the others we have noticed in regard to filth and bad ventilation. Indeed, I fear that we have been able to convey but a faint impression of the actual state of overcrowding in Rowe-street, our inspection of which ended here. The number of human beings crowded into small rooms under one roof, and the absence of any provision for the passage of fresh air, the fact that the yards are so small that the tenants are obliged to take their firewood up with them, to say nothing of the dilapidated state of the buildings from top to bottom, should be sufficient to show the necessity of some sanitary regulation which would reach such cases. It is not too much to say that these tenements do not offer even moderate accommodation for half the number of people living in them.

Two things struck us forcibly during our inspection of this place—the unusual amount of dirt and the number of neglected children idling about the door-steps—children who, if allowed to grow up without education, will only live to swell the dangerous classes of society. At any moment of the day, look whichever way you may, you can count from fifteen to twenty children. This spot is in itself a strong argument in favor of ragged schools and the compulsory system.

We next went to Payne's Buildings in Phillip-street—owner, Goold. The first house on the south side, built of stone and containing two rooms, 13 x 10 ft. and 8½ ft. high, is rented at 8s. a week, and is occupied by prostitutes; it is badly ventilated, there being no opening in the back wall. One of the occupants tried very hard to make me a prisoner in her room, and I had not only to exert all my strength but to summon Larkins to the rescue. The next house, which is about the same size, rents at 10s. a week, and is also badly ventilated; six persons live in it. There are five other houses of the same style in this court, the character of which the agent—Thornicroft—appears to have endeavoured vainly to improve. He has allowed two of them to remain empty in order to get rid of the objectionable characters who frequent it, but so far his efforts have been fruitless. The houses have been whitewashed, but from their faulty construction they cannot be healthy, as no current of air can pass through them; the floors are damp and there is a sickening smell all over the place. At the entrance into this court from Phillip-street there is a weatherboard cottage containing four rooms and a kitchen belonging to the same owner, and let at 20s. a week, which is a brothel. The front room is 12½ x 11½ ft. and 6½ ft. high, and there are three other rooms about the same size, all badly ventilated, and in a wretched state of repair. At the back is a weatherboard building, originally intended for a kitchen but now used as a bed-room and requiring a smaller premium for admittance. We looked into it, which was not difficult as there was no door, and saw that it contained an old bedstead and bedding, and that the floor was very much broken; the closet in the yard emitted a frightful stench. The house on the north side of the entrance is also a weatherboard building of similar description, and also a brothel, rented at 20s., but containing a spare room—a very spare room, 5½ x 4½ ft., containing an equally spare bed. Nothing could exceed the filthy and disreputable appearance presented by the yards of these two houses; dirty old rags, portions of cast-away clothing scattered about in all directions; no attempt to preserve an appearance of ordinary cleanliness or decency. There can be no doubt from the character of the occupants that these houses are at times very much overcrowded.

We concluded our day's inspection at 1 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

SIXTEENTH DAY, WEDNESDAY, 29 DECEMBER, 1875.

Robin Hood-lane and Hamilton-street.

248. *Mr. Chapman* gave evidence on behalf of himself and Dr. Read as follows:—

M. Chapman,
Esq.
7 Jan., 1876.

Met Dr. Read and Sergeant Larkins at the City Club at half-past 2 o'clock on Wednesday, 29th instant, and proceeded to inspect Robin Hood-lane and Hamilton-street, off New Pitt-street. Fronting Hamilton-street is a brick house, No. 5, containing two rooms, and let at 8s. a week—Greer, lessee or agent. The front room is 12 x 11½ ft., and the inner room 12 x 9 ft., both 8½ ft. high. This house is occupied by Widow Ryan, a washerwoman, whose husband was drowned at the Albion Wharf about six months ago. This poor woman was lying sick in bed; she has six children living with her in these two rooms. The house is 3 ft. below the level of the street, and is about as worn out and badly ventilated a tenement as could well be found; it is covered with iron which appears to have been tarred, and it makes the place frightfully hot as well as stinking. This tenant states that she has been living there five or six years, and that the agent has refused either to repair or clean out the premises.

The next house, No. 6, also containing two rooms, and let at 8s. a week—Greer, agent—is 3 ft. 6 in. below the level of the street, and is equally hot and badly ventilated. It was occupied by a man, woman, and two children. The woman, who was sick in bed, told us that she felt quite faint from the heat of the place. These tenements appear to have been originally four-roomed houses, which the greed of the owner has induced to subdivide by closing up the doorway connecting them, so that they now represent four two-roomed tenements, two fronting Hamilton-street, and two fronting a court off Robin Hood-lane at the back.

The result of this subdivision is that the tenants in the two first-mentioned cottages have their yard accommodation cut off, and have to go round the court off Robin Hood-lane to the closet, a wretched filthy looking place, which does duty for ten houses.

The

The two cottages, facing the court just mentioned, originally the portion of houses fronting M. Chapman, Hamilton-street, are of similar size and rented at 7s. a week, and are very hot and badly ventilated—Greer, Esq.

7 Jan., 1876.

No. 10 is occupied by a man named Parker, a woman, and six children, who have lived there for eighteen months. The children all look very sickly. The man is a lumper and has been fifteen weeks out of employment in consequence of the strikes by the Union men. This place was very damp, the moisture rises from the foundation and in rainy weather is very striking and offensive. No wonder the children are sickly. The family appear to be very poor, and this wretched hovel to be the best accommodation they can afford.

The adjoining house facing the court, which was also originally a part of No. 6, Hamilton-street, is similar in all respects; it was occupied by a washerwoman and two other persons. At the time of our visit she had a large fire in the room and a boiler with clothes on. The roof was covered with iron which had been tarred, and under the hot sun the heat inside must be terrible. Here again the tenants complain that the damp rises from the floor and makes them sick. There is no proper provision for drainage. Just immediately under the window of the bedroom, and not 3 ft. from it, is a large hole apparently without any trap, which receives a greater portion of the drainage from this and the adjoining yards. From this hole flows under the houses a stream of filth, carrying with it fever, sickness, and disease. The stench from the neighbourhood of this drain is something frightful. Close by, but on the next property, there is a heap of yard rubbish, the accumulation of years, as high as the eaves of this house, which sends forth a most offensive smell; and yet so suffocating is the temperature in No. 6, that the tenant said she preferred to sleep with the window open, directly in face of this nuisance, to suffering the heat inside. The question is literally one between slow poison and suffocation. This poor woman, who is very intelligent, when informed of the object of our visit exclaimed—"Thank God somebody has taken the matter in hand, and not before it was needed." There was evidence in one or two flower-pots about the yard of her desire to have things clean and tidy about her; but cleanliness, as well as health, is absolutely impossible in such a wretched hole.

Robin Hood lane consists of five houses, four of which, like those we have just described, originally had four rooms each, but are now divided into two-roomed tenements. Those fronting Robin Hood lane are without any yard; the other portion of the division, fronting a lane or court at the back. Underneath the whole of these houses is a large cellar, which was at one time connected with an old weatherboard building fronting George-street, occupied as a Rectifying Distillery some years ago. I can recollect the seizure of an illicit still which was at work there. This cellar does not appear to be used, except as a receptacle for all the drainage and filth of Robin Hood lane, and other places. The tenants complain very much of this nuisance. During our visit we saw a woman empty a large tub of soap-suds into it, and upon our speaking to her about it she said—"We always does it; we have no other place." This cellar cannot be less than 40 yards long, and we could only suppose that the drainage which goes into it percolates into the Tank Stream, as it does not seem to get full and overflow into the gutters. This nuisance is a very serious one, since it affects every one in the neighbourhood, except apparently the landlord.

No. 4 in Robin Hood lane is a two-roomed brick tenement, rented at 8s. a week—Greer, agent. The outer room is 11 ft. x 11 ft., and 8 ft. high, and the inner room 13½ ft. x 8 ft., and the same height. This house was in a wretched state of repair, terribly close, and filthy in the extreme, besides swarming with vermin; about as bad in fact as well could be described. It was occupied by women of the lowest type, who were more or less drunk and stupid; nevertheless they managed to complain of the sickening stench of the cellar referred to, especially at night; and as there are no openings in the back walls of any of the houses of this class, the wonder is that people can sleep in them at all in hot weather. The above description applies generally to Nos. 2 and 3 Robin Hood lane.

No. 1,—a weatherboard four-roomed house, and rented at 13s. a week—agent, Greer—was occupied by an electro-plater, and used as a workshop; it was in a frightful state of dilapidation; very filthy and unhealthy. The cobwebs fell in festoons from the walls and ceilings, and the room was crowded with all sorts of odds and ends, until it looked like an old curiosity shop.

The three houses at the back, originally portions of the houses which I have just been describing, in Robin Hood lane, are now separate tenements, containing two rooms, 13½ x 11 ft. and 8½ x 11 ft. respectively and 8 ft. high. The first of these was occupied by a labourer, his wife, another woman, and four children—seven persons in all. It was equally close and badly ventilated, there being no opening in the partition which subdivides this property; through the lower sash of one solitary window only can a breath of air enter the room. The roof is out of repair, and the rain pours through it. One of the women said to us—"We try to keep ourselves clean, but it is almost too much for us." She said also,—“That the stench at night was something frightful.”

The next house is a tenement of the same size and style—Greer, agent. The door was opened to us from the outside by a little boy of about 5 years old. On the floor of one of the rooms, with a few old rags about them, were two drunken men, in about as filthy a state as human beings could well be. Their faces were reeking with perspiration from the heat of the room, and were literally black with flies. To say that the place was filthy and stinking, and entirely without ventilation, is to give but a faint picture of the repulsive aspect it presented. There was no furniture, except an old chest and a few rags scattered about.

The next house (same size and rent, same agent) was occupied by a man, woman, and two children; the woman said they were obliged to live there in order to be near her husband's work; she complained that her children were always ill from the heat and stench of the place, and that the back wall by which these houses are subdivided, being only a wooden partition, she was compelled to listen daily to the coarse and disgusting language of some disorderly characters who lived in the house at the back, which she said was "horrible at times." We consoled with this poor woman in her anxiety to free her children from such evil influences, and could only express a hope that this property would soon be pulled down and rebuilt; the allotment is a valuable one, and close to the Exchange.

We next visited Abercrombie-lane, off George-street North. At the back of the lane is an old four-roomed weatherboard building. We asked who the agent was, and were told Mr. Manning, solicitor. The front room on the ground floor is 12 x 12 ft. and 8½ ft. high; and the back room, 12 x 8½ ft. They are occupied by a man, woman, and five children, and so out of repair as to be scarcely tenable, very filthy and badly ventilated. We took the rooms down-stairs as a sample of

M. Chapman, Esq.
7 Jan., 1876.

of them all, and did not penetrate into the upper regions. The tenant, a working man, when we asked how he could live in such a place, said—"I am a poor man and can't afford anything better." I could not help thinking what a blessing it would be if the railway extension into the city were made the means of removing some of these unfortunate families into a more healthy locality. Speedy legislation of some sort is absolutely necessary.

The next house was also a weatherboard tumble-down tenement, containing four rooms, renting at 5s. a week, same agent, and occupied by three or four men, fruit-sellers. I have no other terms to use in describing this wretched hovel, except those which I have almost worn threadbare—wretched, filthy, and stinking. At the back is another wooden shanty, rented by the tenant of this house; which was, however, so much worse in its capability of resisting the elements that the occupants had actually erected a tent inside it to protect them from the sun and rain; a few mats constituted all the furniture and all the bedding.

The whole of this property and its surroundings are disgusting in the extreme. There is a filthy water-closet without water, old bricks and rubbish scattered about everywhere.

The owners of these premises should visit and inspect them personally, and blush with shame for allowing such a fever den to exist in the heart of the city.

Still in Abererombie-lane, we inspected a two-roomed brick tenement with a skillion kitchen attached to it, occupied by a Mr. Mackay, rented at 8s. a week (Greer agent, Mrs. Simmons owner). The rooms below stairs are 9 x 9 ft. and 7 ft. high; kitchen very small; yet this place forms a home for a man and his wife and five children; there is no ventilation, and the building is in a tumble-down condition. Mackay's wife is a washerwoman, and the ground floor apartment was crowded with dirty clothes; the family all sleep up-stairs, where in summer time they must be almost suffocated. The yard, which is used by four other houses, is very filthy; there is an open cesspit in the centre, apparently without trap; into a hole near it is running a stream of filth issuing from an opening 2 x 2 ft. under Peate and Harcourt's store, supposed to take its source somewhere at the top of Jamieson-street. The closet stank so frightfully that we could scarcely think it possible for any person to go into it and shut the door after them.

This horrible nuisance is in itself enough to poison the atmosphere of the whole neighbourhood.

The next house (owner Mrs. Simmons, Greer agent) was occupied by Mrs. Fitzgerald, a washerwoman, who pays 8s. a week; it is the same size as the previous one, and as badly ventilated and unwholesome. When we arrived the tenant was plying her vocation, and had a large boiler on the fire. On the subject of repairs she told us that she had lived there for four years, and that the agent had never put a hand to it during that time. She added that whenever she applied to him he always gave her the same answer, "If you don't like it you can leave it." This description will apply in every respect to the next house, occupied by Mrs. Mahoney (Greer agent) and obtaining the same rent. Mrs. Mahoney said she had lived here twenty years, and had paid rent to several agents, but this one was the "worst of the lot." She also told us that she had buried her husband and several children from this place, and supposed she should be taken away herself some day or other.

The next house is the same size and in the same condition; it is rented by Ryan, a cab-driver, at 7s. a week (Greer agent). The scene which was exposed to our view in this hovel almost baffles description. The evils of intemperance showed themselves here in the most revolting form. Ryan, a man about thirty years of age, and a woman, a year or two younger, who we supposed to be his wife, and three children were in a room below stairs. The polluted condition of the atmosphere may be imagined when it is understood that no fresh air goes through the room, and that there were heaps of human excreta on several parts of the floor. The man and woman both drunk, the latter sitting on a box with a child in her arms; the mother and child quite naked. As we entered she drew up an old skirt from the floor and held it in front of her. These people were too stupefied to give us any information, and we did not question them. The empty bottle at their side told the whole story. The furniture consisted of an old table, a broken chair, and a box on which were a few cups and glass alongside the rum bottle. We were rash enough to penetrate into the kitchen, and the result was that in two minutes we were swarming with fleas. Up-stairs there was a heap of rags, old and filthy, and what appeared to have been once a mattress was nothing more than a bundle of rotten flock and rags. Two drunken women were lying asleep upon it.

The last house we visited (Greer agent) rented at 8s. a week, and in a similar condition, was occupied by a man named Davison and his wife, who were both half drunk.

We finished at 5 p.m., and a few minutes after I was in a bath endeavouring to get rid of some of the impurities to which we had been exposed.

Personal Inspection

By No. 2 Sub-Committee.

SIXTEENTH DAY, TUESDAY, 4 JANUARY, 1876.

Macquarie Ward.

249. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer as follows:—

G. F. Dansey,
Esq.
7 Jan., 1876.

Met the Mayor at the Town Hall at 4 p.m. on Tuesday, 4th January, and proceeded, accompanied by Constable Milne, to Yurong-street, Macquarie Ward. The first house on the left-hand side of the street contains two rooms on the ground floor and three above, and is very badly ventilated, there being no openings in the back wall. There are nine other houses in this street containing four rooms each, all of which have back and front ventilation. They are chiefly occupied by mechanics, and appear to be kept in a cleanly state; they are all connected with a sewer. No. 1 (owned by Burdekin), a nice-looking Gothic building, rented at 20s. a week, is built on a triangular piece of ground against the wall of the Public School, but the closet at the north end of the allotment is a dirty, stinking, place, close to the footpath, and so situated that no person can enter it without being seen by the occupants of the houses on the opposite side of the street.

The next house we entered was No. 18 (owned by O'Grady, of Palmer-street), rented at 10s.—a two-roomed tenement, one room below and the other above, built of weatherboards with zinc roof. There was nothing especially noticeable about this house, except that the water had been cut off from the closet.

In

In No. 16 there was a pan to the closet but no water, and the water supplied for drinking purposes was laid on through leaden pipes. This house is owned by Callaghan (Gorman, agent) and rents at 14s. a week, having four rooms. G. F. Dansey, Esq.

7 Jan., 1876

No. 20 (owned by O'Grady, a four-roomed house, same rent) has also a closet without water. The drain from the yard has two gratings, but the pipes are without traps, and emit a most offensive smell.

We went next to Stanley-street. On the left hand, coming from Yurong-street, is a stone house, containing two rooms 12 x 10 ft., with windows back and front, of the class called "Irish windows," which have to be taken out bodily whenever it is necessary to make use of the aperture to admit air, or for any other purpose. This house, which belongs to Flanagan, of the National School, Fort-street, rents at 7s. a week. There is a closet in the yard, at the end of the fence, with cistern, but exposed to all the passers-by. At the side of the house is a rough shed or stable, which is in a very dirty condition.

On the right hand of this street or lane is a two-roomed weatherboard tenement with zinc roof, the room on the ground floor being 10 x 10 ft., and the up-stairs room 10 x 8 ft. There is also a singularly shaped kitchen, 20 ft. long and 4 ft. wide. This house, which is owned by Flanagan, possesses the general fault of bad ventilation, but is not otherwise in want of repair.

Further on is a brick building, standing off the street, with skillion shingle roof, 20 x 9 ft., divided by a partition not reaching to the roof into two rooms, in a very bad and dilapidated condition. The inmates of this house have to go round into the next yard to obtain access to the closet. The water is laid on, but with direct action.

We next inspected No. 2, Stanley-lane, which until four months ago was used as a dancing-saloon for the public-house at the corner. It is a stone house with shingle roof (owner, Ryan), front room 20 x 12 ft. and 7 ft. high. The kitchen is constructed of battens, and is in wretched repair; the closet, an old tumble-down place and very offensive; the water for drinking purposes supplied through lead pipes. Mrs. Noonan is the occupier, and pays 5s. a week.

The last two houses in this lane, before it joins Riley-street, are built of brick and shingle. The upper room of the first we entered was destitute of anything in the shape of furniture, the lower sash of the window gone and the upper one immovable. On the banister of the stairs were two pillows, some sacking, a few rags, and an old blanket. The walls of the room were besmeared with candle-smoke and grease, the ceiling was damp with the soakage from the rotten shingles of the roof; and, to add to the discomfort of the place, bugs were present in legions, running all over the walls. The place was in such a dirty and dilapidated condition as to be unfit for habitation. The kitchen at the back was in a similar state; the shingles on the roof were as rotten as could be, and patched here and there with pieces of old galvanized iron; the ceiling mildewed with damp, and part of the wall down. We could not ascertain who the occupant of this house was; but as with the exception of the bedding on the banister above, which I have already noticed, the furniture in it consisted of one table, one chair, and in the kitchen one saucepan and one gridiron, we came to the conclusion that he or she was living here alone without any family or friends. We ascertained that the house belonged to Ryan, a cooper in Clarence-street.

In the next house, which belongs to the same owner, we found in the upper room one four-post iron bedstead, a box, and a portmanteau. On the bedstead was a dirty sheet, but no blankets or other bedding. The room itself 11 x 11 ft., and 7 ft. high. In this room and in this bed sleep the owner—Wynch, a stable-keeper—his wife, a son nine years old, a daughter seven years, another daughter six years old, and a baby of eighteen months. We ventured to ask where the blankets were, and one of the children said their father had taken them to the stable in Phillip-street, where he employs men to drive buggies. The absence of the blankets is probably not of much consequence during the present weather, for the temperature of the bedroom was close almost to suffocation, there being no opening in the back wall, and no ventilation whatever. The down-stair room was more comfortably furnished, but one of the little ones told us that they had had nothing to eat since the day before because of "mother having been turned out of the house by father."

We concluded our day's inspection at twenty minutes to 7 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

SEVENTEENTH DAY, TUESDAY, 4 JANUARY, 1876.

250. *Mr. Chapman* gave evidence on behalf of himself and Dr. Read as follows:—

Met Dr. Read at the City Club on Tuesday morning, the 4th instant, and, accompanied by Sergeant Larkins, proceeded to Druiitt-street, where we commenced our inspection with No. 78, a weatherboard house containing two rooms—Ward, owner. The front room, which is lined with wood, is 11 x 10 ft., and 7 ft. high, and the inner room 11 x 7 ft., and averaging 5½ ft. high, and very badly ventilated, was occupied by four persons. M. Chapman, Esq.

7 Jan., 1876.

The next house at the corner of Druiitt and Clarence Streets—same owner—rented at 12s. 6d. a week, contains four rooms and a kitchen. The front room down-stairs is used as a huxter's shop, and contains a variety of articles for sale, such as soap, red-herrings, carrots, lollypops, brooms, pipes and tobacco, and so on. The shop is close and filthy; and in the doorway sat the proprietor with his head done up with surgical bandages. The inner room, 11 x 9 ft., was equally close and considerably dirtier. The kitchen was in a filthy state, and crowded with firewood, heaps of dirty clothes, tubs of soapsuds, and other articles of lumber to the exclusion of cooking operations, except upon a very limited scale. The front room up-stairs, 11 x 13 ft., and 8 ft. high, was sublet to an old woman at 5s. a week. The ceiling and walls much broken and so dirty that years must have elapsed since they were subject to any cleaning process. The back room on the same floor, 9 ft. x 9 ft.—as dirty and as close as any room could well be imagined to be—was the sleeping apartment of the shopkeeper. The windows in this house appeared as if they were never opened, although from ten to twelve people constantly resided in it; they do not appear to utilise even the imperfect ventilation at their command. The water-closet, which is common to both houses, is simply in a disgusting state, and equally out of repair.

The

M. Chapman,
Esq.
7 Jan., 1876.

The next house in Druitt-street, No. 58, is a two-roomed brick tenement, rented at 7s. It is a portion of the Wentworth Estate—Lang, agent or lessee. The front room is $15\frac{1}{2}$ x 11 ft., and 6 $\frac{1}{2}$ ft. high, the back room 10 x 7 ft., and the kitchen 10 x 7 ft., covered with iron. This house is also very badly ventilated, and fast falling into decay. There is an open drain in the yard, and a filthy tumble-down closet—an old cesspit—with the seat much broken, and an old sack for a door.

No. 60, Druitt-street, also a portion of the Wentworth Estate—Lang, agent—is a two-roomed brick tenement. The front room, 14 x 11 ft. and 7 feet high, is used as a shop and stocked with a heterogeneous collection of household requisites; and the inner room, 10 x 7 ft., with skillion roof, averaging 5 $\frac{1}{2}$ feet high, and nearly filled up with a family bed, in which the shopkeeper, a female, and two other women sleep. The temperature of this room was dreadfully close, the entire floor space being covered by the bed, chest of drawers, and two chairs; no fresh air seems allowed to enter the chamber. In the yard is a filthy surface drain, and the closet an old cesspit of the usual disgusting description.

No. 56 is a four-roomed weatherboard house, occupied by Mrs. Dwyer—Richardson and Wrench, agents. The front room is 12 x 12 ft. and 6 $\frac{1}{2}$ ft. high, and the bedroom 12 x 7 ft., and the same height. The kitchen, 14 x 6 $\frac{1}{2}$ ft., with skillion roof, averaging 6 ft. high, the back room 5 $\frac{1}{2}$ x 5 $\frac{1}{2}$ ft., and 6 ft. high. This house is badly ventilated, close, and unhealthy. The closet—an old cesspit—full to the brim, and stinking frightfully. The tenant said it was only water; if so, it must have been water in the last stage of putrefaction.

No. 54 is a three-roomed brick house—Lindsay, agent—rent, 8s. 6d. a week. The front room 11 $\frac{1}{2}$ by 8 $\frac{1}{2}$ ft. and 6 $\frac{1}{2}$ ft. high. The inner room 11 by 7 ft. and 6 $\frac{1}{2}$ ft. high, bed-room 7 $\frac{1}{2}$ by 7 $\frac{1}{2}$ ft. and 5 $\frac{1}{2}$ ft. high; occupants, a man, woman, and four children. The woman stated that her husband and children had been sick for some time from the heat and close atmosphere inside the house; it is not to be wondered at, since from its construction no current of air goes through it to purify it. The place was also swarming with bugs, she said, and only the day before she had killed three large centipedes in her bed. Undaunted by these difficulties, this tenant appeared resolved to make the best of her bargain, and at the time of our visit, armed with a piece of soap, she was engaged in resisting the inroads of the enemy by soaping the walls and filling up the chinks. In the yard was a filthy stinking drain and a dirty closet over a common cesspit.

No. 52 is a three-roomed weatherboard house, occupied by Mrs. Jones, mangle-woman, who astonished us by expressing praises of her landlord—"Although the rent is 5s. a week" she said, "he always gives me back 1s." The rooms are 10 by 10 ft.; one of them is appropriated to the mangle which so nearly fills it that the process of mangling had to be suspended to allow us to squeeze into the other room. There is a small room at the back 6 by 3 $\frac{1}{2}$ ft., 5 ft. high, which is occupied by a young man eighteen or nineteen years of age, who was lying on the bed reading, apparently unmoved by the noise of the mangle, the suffocating heat, or the presence of bugs on all sides of him. When we asked him how he liked it he said he had only been there a week, and as he said it in a very cheerful tone we could only infer that he had nothing to find fault with.

We next inspected Waine's lane, off Druitt-street. The first house in this property fronts Druitt-street, and is about 3 ft. below the level of the street. It is built of weatherboard and consists of three rooms; rent 7s. a week—Deering, agent or lessee—very close and damp in wet weather; the closet an old cesspit. It was occupied by a man, his wife, and four children.

No. 2—Deering agent—is built of stone, and was at one time apparently a three-storied store, now converted into dwellings of three rooms one over the other. The rooms are 12 by 18 ft. and 7 ft. high, but are so wretchedly ventilated, there being no openings in the back wall of any kind, that living in them must be very unhealthy. They are occupied by a workman, his wife, and a number of children. This man told us that he found it impossible to sleep at night on account of the closeness of the atmosphere, and expressed his satisfaction that some kind souls were taking an interest in his welfare.

The next two houses, Nos. 3 and 4, were very similar to the last as far as ventilation is concerned, No. 4 being smaller and let at only 5s. a week. There is no window at all in the lower room, and when the door is shut the inmates are in total darkness.

No. 5 (same agent), rented also at 5s., is a three-roomed weatherboard tenement occupied by a man, woman, and two children. This tenant also complained of the stench and the heat of the place.

No. 6 is a weatherboard house of the same size, rented at 6s. a week, and No. 7 containing only two rooms obtains the same rent. Both are very close from deficient ventilation as well as damp. The tenants complain of the stench from the closet and from the stables next door. They are greatly out of repair, and as usual the answer was—"The landlord won't do anything." Deering is agent for these houses as well as for Nos. 8, 9, 10, and 11, which are all brick buildings obtaining a rental of 7s. a week, having all the same dead wall at the back, shutting out the pure air which would render them habitable. No wonder the inmates complain that they cannot sleep at night. These small tenements were all in a dirty state, which is scarcely to be wondered at when it is considered that nothing in the shape of whitewashing, painting, or any of the ordinary aids to cleanliness are afforded by the proprietors. Scarcely an instance do we meet with in our rounds of inspection where the landlord has endeavoured by a small outlay which would improve his property to turn the attention of his tenants in that direction; it seems to be sufficient for the owners to know that whatever may be the condition of a house *it will let*. In this spot in particular the apathy of the proprietors to the well-being of the residents is especially culpable. The houses are within a very short distance of the harbour, and there would be very little difficulty or expense in providing effective drainage or in replacing the foul and disgusting cesspits scattered over the property with decent and substantial closets. How is it that the Nuisances Prevention Act of last year does not reach this locality? A strict enforcement of its provisions would remedy a great portion of the evils we have encountered, but no results from the passing of that measure are forthcoming.

The last two houses we inspected were a couple of two-roomed weatherboard tenements in Kettle's-lane, off Druitt-street; the rooms in each house are 11 x 9 feet and 8 feet high and 11 x 11 feet and 7 feet high. Rent in each case 6s. a week—Cross, agent or lessee. They are much dilapidated and very dirty—landlord as usual refuses to repair. The yards are in front of the houses and are intersected by open drains giving forth noxious gases; the closet over an old cesspit is occupied, so we were informed by the tenants, by vagrants of the lowest description, who are either driven by poverty, drunkenness, or by their filthy habits to use this abominable place as a sleeping apartment to the great annoyance of the rightful occupiers.

I take this opportunity of stating that in giving as far as we have been able to obtain them the names of the owners or agents of properties, without which our inquiry would be valueless, we have been very anxious to avoid mistakes. We presume, that as a rule, the occupant of a house knows very well the name

of his landlord, but it may be that in some cases the information we have obtained has been incorrect, in which case it will be easy to rectify the error. We feel sure that many landlords who have entrusted their properties to agents will thank us for calling their attention to the existence of abuses of which they have possibly no conception; while those who are cognizant of nuisances affecting health and life, will do well to take immediate steps to remove them, as we intend to discharge the important duty entrusted to us without fear or favour in the interest not of individuals but of the community at large.

We returned at 1 p.m.

M. Chapman,
Esq.

7 Jan., 1876.

Personal Inspection

By No. 2 Sub-Committee.

SEVENTEENTH DAY, WEDNESDAY, 5 JANUARY, 1876.

Macquarie Ward.

251. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer as follows:—

Started from the Town Hall, accompanied by the Mayor, at 4 o'clock on Wednesday, 8th instant, and proceeded to Riley-street, south of William-street. We did not take a policeman with us, the locality we proposed to visit being a very respectable one and there being no especial necessity for an escort.

G. F. Dansey,
Esq.

7 Jan., 1876.

Went down Riley-street to Yurong-lane, where we inspected two brick houses, owned by Wood-ward, which we found in good condition and fitted up with all the modern conveniences. We found no fault with the interior of these houses, but the yards attached to them which are triangular shaped are far too small to allow of proper cleanliness and domestic arrangements.

Turning up Stream-lane, so called because a surface stream of sewage, now diverted into a sewer, used to flow along it. We found, on the right-hand side of the lane four houses, built of brick and shingled, two facing the south and two facing the north, having two rooms each—Dimmock, of Newtown, owner. There is no yard or opening of any kind at the back of these houses, the only open space being in front and there is no ventilation, the back wall having no aperture and the windows with upper sash immovable.

On the opposite side of the lane are two houses placed back to back with the same deficient ventilation, which we could not examine internally, the doors being locked and the tenants absent. A little higher up the lane is a building consisting of two rooms and a cellar, apparently portion of the house in front, built of stone and rubble, and in a very ruinous condition. On going round to the front we found there was a door of communication with the back premises we had just left, but the steps appeared so rickety that we did not care to venture upon them. These premises are owned by Mrs. Carroll. The occupier of the two rooms in front states that he has lived there for seventeen years, and the landlady will do nothing in the way of repairs, but being a painter himself he has touched up the walls and given them an occasional coat of paint, the effect of which is to render the contrast with the unpainted portions of the house stronger than ever, every portion of the house except the walls looking the picture of ruin and decay. The two rooms at the back are let, at 8s. the front room, and 4s. the back room, to separate tenants; there is an open drain in the yard, loosely covered over with stones. We were glad to observe in this lane that several new closets with patent cisterns had been constructed to replace the original wooden privies.

We then turned into Riley-street and inspected some iron shanties, two containing two rooms each 8 x 10 and 10 x 12, rented at 6s. a week each and two containing only one room each 14 x 10, rented at 2s. 6d. and 2s.; they were in a very dilapidated condition, being patched up with old broken pieces of rusty iron in all directions. The closet used by the occupants of these five houses was in a very bad state of repair, but it had been fitted up with a new cistern nevertheless, which is the main point as far as health is concerned.

We next visited Liverpool-street and Burnell-lane where we saw nothing calling for especial notice, except that the yards might have been kept a little cleaner.

From Liverpool-street we proceeded to Chapel-lane, between Crown and Riley streets. At the back of No. 32, Chapel-lane, there are two four-roomed houses, owned by Stephen Long, where we found the water laid on for drinking purposes through leaden pipes. There is no yard behind, the closet being placed in the open space in front and within 6 ft. of the door of one of the houses—rent 9s. a week.

No. 32, Chapel-lane, also obtains the same rent and has also four rooms, two of which are 11 x 12 ft., one 8 x 12 ft., and one still smaller. This place is very unhealthy. We were told by the occupier of one of the back houses that he had lived there for twelve months, and that his family had never been free from sickness, and we were not surprised to hear it, in view of the deficient ventilation and the presence of a closet in such close contiguity to the rooms they live in.

We inspected two houses in Stanley-lane, between Riley and Crown streets which do not call for any remark. Then we took the length of Crown-street as far as Liverpool and William streets where we found the houses of better construction and comparatively new. In some of them the old-fashioned sash windows afford only imperfect ventilation, but on the whole there was little to find fault with.

We returned to town at about 25 minutes past 6 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

EIGHTEENTH DAY, WEDNESDAY, 5 JANUARY, 1876.

Goulburn-street, Phillip Ward.

252. *Mr. Chapman* gave evidence on behalf of himself and Dr. Read as follows:—

Met at the City Club at 4 o'clock on Wednesday, 5th inst., and proceeded, accompanied by Sergeant Larkins, to Goulburn-street, and commenced our round of visits by inspecting Seales' yard. The house fronting Goulburn-street and abutting on to the yard, is a weatherboard building—Seales owner or lessee—containing four rooms, and rented at 7s. a week. It is 5 ft. below the level of the street. The back portion of it has a skillion roof, and is divided into two rooms, one of which, 8½ x 7½ ft. and about 6 ft. high, is let to a man at 3s., and the other, 10 x 8½ ft. and the same height, is used as a kitchen. The front rooms are about 10 x 12 ft., and were very much crowded with old furniture, dirty clothes, &c. The walls and ceilings are in a very dilapidated state, the rooms close and unsavoury, and without ventilation, unless the term can be applied to a door and small window, to all appearance hermetically sealed, both on the same side of the rooms.

M. Chapman,
Esq.

7 Jan., 1876.

The

M. Chapman,
Esq.
7 Jan., 1876.

The next house is also a weatherboard building of the same size—Scales owner or lessee—and also 5 ft. below the level of the street, rented by a Chinaman at 8s. a week. This tenant is a furniture maker, and the rooms were crowded with unfinished furniture, besides being in a filthy state and horribly close for want of ventilation. Both these houses are utterly unfit for habitation and should be pulled down. From their low situation they receive all the moisture from the streets, and the floors are, as a matter of course, damp and unwholesome. The tenants as usual complained that the landlord would do nothing.

No. 1, on the east side of Scales' yard, is a two-room brick tenement—same owner or lessee—let at 5s. a week. The lower room is $11\frac{1}{2} \times 11\frac{1}{2}$ ft., and about 7 ft. high, and was very close as well as filthy. Like most houses of this class there are no openings in the back wall, and no current of air can pass through them to purify them. The upper room, which is of similar dimensions, was if possible closer and more stifling, besides being positively alive with fleas, as we found to our cost before we had been one minute in it. The only article it contained in the shape of furniture was the remains of an old flock bed with a few old rags for bedding.

No. 2—same size, same owner, and same rent—was in just as bad condition and as badly ventilated. In the lower room of this house we saw a woman lying on a sofa who, we were informed, rejoices in the soubriquet of "Annie the novice." It was evident from her surroundings that she was passing her noviciate in penance, but equally evident that such penance did not include abstinence from strong drink, for she was thoroughly drunk, as was also a man occupying the up-stairs room, who was sleeping off the effects of a debauch on the bare boards of the floor. There was no furniture in this house with the exception of the sofa on which the "novice" was asleep, and nothing else in the shape of household appliances except an assortment of paint pots. Whether they had been left there by some departed painter, or formed the stock-in-trade of the sleeping individual up-stairs, we did not stop to inquire.

No. 3 is a tenement of the same size, belonging to the same owner, and obtaining the same rental of 5s. a week. It was very dirty both inside and outside, and the temperature inside was stifling. The rays of the sun pour down upon these houses for three parts of the day, and as there is no opening in the back wall to afford ventilation it must be a very unhealthy abode. The tenants complain that they cannot sleep for the heat and stench, and that the landlord will do nothing to improve the property.

No. 4, belonging to the same owner, contains three rooms, and is rented at 6s. a week. This house is occupied by eight persons. The front and back rooms are 8×10 ft., and $7\frac{1}{2}$ ft. high. In the latter we found a little boy, about five years old, nearly naked, crouching in a corner. We asked his mother why the little fellow was in such a wretched state, and were told that he was undergoing punishment for stopping out at night. This we could hardly credit, and a horrible suspicion crossed my mind that the child's clothes had been pawned; I hope it was not the case. In the back room or kitchen, which has a skillion-pitched roof, averaging about 5½ ft. high, on the damp brick floor we found several old beds with a number of old rags to take the place of sheets and blankets. There is a very small yard at the back, only 4 ft. 6 in. wide, ankle deep with mud, in which is a filthy closet over an old cesspit.

No. 5—same owner—is a four-roomed brick house, rented at 7s. a week. The lower rooms are 10×11 and 10×8 ft. respectively, and $7\frac{1}{2}$ ft. high, and very close as well as dirty. The upper rooms, which are about the same size, are approached by an upright ladder in bad repair fitted with a side rope. In one of them was a sick man in bed, no furniture in the room besides the bed; in the other there were two canvas clothes bags, containing probably sailors' kits; no windows or openings in the back wall; temperature close and unhealthy. This house is occupied by six persons.

No. 6—same owner—is built of brick, and contains two rooms; rent 5s. a week. This house was clean, but badly ventilated. We remarked to the tenant that it was much cleaner than the other houses in the yard, and he gave us a similar reply to one we received on a former occasion—"No thanks to the (strong adjective) landlord; it is all my own doing." This house was occupied by an old man and woman, and two or three dogs, and presented altogether a very clean and tidy appearance.

No. 7—same owner—is a two-roomed brick tenement, rented at 5s. a week, and occupied by Chinamen, one of whom was sick in bed. It was very filthy and without any ventilation.

All the people in this yard, without exception, complain of the horrible stench in the place, and no wonder, for there is a surface drain running down the centre of it which discharges into an open gully without trap; this is within 2½ ft. of the window of one of the houses. The closet is an open cesspool, 16 ft. long and 4½ ft. wide, and nearly full, the contents of which kept bubbling up as if in a state of fermentation; the stench proceeding from it was horrible. This pit has four closets or compartments built over it, and is used not only by all the tenants in the yard but by the occupants of three houses fronting Goulburn-street. On one occasion we were told a man was found dead in one of these closets; whether he died from the effect of the closet itself we did not learn; the place is bad enough to cause death indirectly if not suddenly. Just inside the entrance to this yard is a large heap of house refuse, which the tenants informed us is cleared away once a fortnight. The dustman came with his cart while we were there, and would fain have persuaded us that his visits were made weekly, but it was clear that such was not the case, except perhaps theoretically.

Taking into consideration the neglected and dilapidated condition of this property, the disorderly habits of the occupants, and the bad language indulged in by the female portion of the community, which we heard in the course of our inquiries, we came to the conclusion that a good many very indifferent characters collect here at night, and that there is probably at times a good deal more overcrowding than we witnessed.

We went next to Quigley's-lane which is reached from the same entrance, but diverges in a different direction from Scales-yard. It consists of four houses which are also considerably below the level of the street. No. 1 is a two-roomed brick tenement, rented at 6s. a week—O'Brien, agent or lessee. The front room is 10×11 ft. and the inner room $10 \times 7\frac{1}{2}$, height 6½ ft. Both are filthy, out of repair, and badly ventilated. This house consisted originally of three rooms, but has been subdivided in order to obtain another tenant; there are no openings to admit air at the back. It was occupied by two women and one man. The woman said they could not sleep for the heat and the rows which were continually arising among the people in the next lane, but it seemed to us very much like the kettle talking to the frying-pan. Here as usual, the landlord came in for a good deal of vituperation—"he would do nothing in the way of repairs."

No. 2, also a two-roomed brick house, belonging to the same owner and rented at 6s. per week, was in the same filthy tumbledown condition; this was also originally a three-roomed tenement and has been subdivided.

subdivided. There was scarcely any furniture in it—only a few old rags for bedding. We could obtain no information as to the number of tenants; the only occupants at home being an old woman and peculiarly ugly dog. M. Chapman,
Esq.
7 Jan., 1876.

No. 3, same owner, same rent, is a four-roomed brick tenement, the front rooms of which are 10½ x 10 ft. and 8 x 10 ft. respectively, and 7 ft. high. At the back there are two rooms with skillion roof 10½ x 5½ ft., and having an average height of 5½ ft., all very close and badly ventilated. The tenants complain greatly of the stench proceeding from the closet and drain.

No. 4 is a weatherboard shanty, originally the kitchen of Nos. 1 and 2. It is 19 ft. long and 5 ft. 10 in. wide, with a door 4 ft. 10 in. high and 2 ft. wide, skillion roof averaging 6 ft. high, let at 2s. a week. This is also a very close and unhealthy place. On a sofa in this room was a little boy four years of age, lying sick with the scarlet fever, and although he had been ill for two days his mother had not sent for medical advice. We expostulated with her and she promised to fetch a doctor to see him the next day. There is an open drain in the yard attached to this house without trap and within a few feet of the door, and a common cesspit stinking frightfully close to it, the door of which was off the hinges. This closet does duty for the four houses in the yard as well as for the public-house fronting Goulburn-street. No wonder that fever breaks out in such a place. There was also an accumulation of house refuse in the yard, which is only cleaned away once a fortnight. Immediate steps should be taken to clean and ventilate this lane and Seales-yard.

Nos. 51 and 53, fronting Goulburn-street belonging to Moffitt's estate, and containing seven rooms, are let as one house at 15s. a week, and are used as a Johnny-all-sorts shop. The four rooms down stairs are occupied by the dealer, and the three up-stair rooms are prepared for sub-letting. The house is very close and badly ventilated.

No. 55 which is 5 feet below the level of the street, contains four rooms, let at 10s. a week—Long agent. It is occupied by persons who carry on washing and mangling. The front room below stairs 10½ x 10 ft. and 8 ft. high, contained a large mangle and a table; it was crowded with clothes; there was a large fire burning in the room; the back room which is about the same size, is used partly as a bedroom and partly as a workroom; they are both very close, badly ventilated, and in wretched repair. The two attic rooms are approached from the outside by means of a step ladder with broken hand-rail; they are 13½ x 11½ ft., with an average height of 5½ ft. The tenants complain greatly of the heat and the bugs.

No. 59, Goulburn-street, is a stone house containing 3 rooms and also 5 ft. below the level of the street—owner, Turner—who lives in it and uses the lower room as a shop. This place is in a frightful state of dilapidation and filth, crowded with old furniture, tubs, fiddles, old iron, second-hand tools, &c.; the walls and ceiling tumbling down, and the floors very dirty. The back room is occupied by Tommy the tailor, aged about 60 years, whose companion was a young woman 19 or 20 years of age. She said she did not live or work there, but merely came occasionally as a visitor. This room was particularly filthy; it contained an old sofa, the tailor's work-board, and a heap of old clothes; atmosphere sickening for want of ventilation. The top or attic room of this house, approached from the outside by a step-ladder about 6 ft. high, is let at 3s. a week, and occupied by four Chinamen opium smokers; one man was smoking as we entered. The plastering had nearly all fallen down; the house, in short, is in such a state of dilapidation that it may be said to be entirely worn out.

The next house—same owner—contains 2 rooms 14 x 11, and 11 x 11 ft., and 8 ft. high, and is let at 5s. a week, to a man who lives in it with his wife and seven children. His house is also 5 ft. below the level of the street, and is in an equally tumbledown and uninhabitable condition. The landlord, as usual, will do nothing in the shape of repairs.

We finished our afternoon's work at 6 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

NINETEENTH DAY, MONDAY, 10 JANUARY, 1876.

Phillip Ward.

253. *Mr. Chapman* gave evidence on behalf of himself and Dr. Read as follows:—

Met at the City Club at 4 o'clock on Monday, 10th instant, and proceeded, accompanied by *M. Chapman, Esq.*, Sergeant Larkins, to Goulburn-street, with the object of inspecting that portion of it which lies between George and Pitt streets. 7 Jan., 1876.

Durand's-alley is a lane running south from Goulburn-street for about 50 yards, and then at a right angle for about the same distance into Pitt-street. The first house we examined was a four-roomed stone building, having two rooms below and two above—Turner, agent—11 x 9½ ft. and 9 x 9 ft., and 7 ft. high. It is in a wretched state of repair, the walls and ceiling broken, and the whole place dirty and close for want of ventilation. One of the up-stair rooms was empty, and the other contained nothing but a bundle of old bedding.

The next was a one-roomed stone tenement, 9 x 9½ ft. and 6½ ft. high, rented by a Chinaman, at 3s. a week—Turner, agent. This was a stinking den, having no opening in it, either for air or light, except the door; the room was filled up with the Chinaman's bed, a chair, table, and some firewood; close and unhealthy; and roofed with iron.

Adjoining it is another one-roomed tenement, still smaller, the interior being only 9 x 6 ft. and 6 ft. high, also built of stone and roofed with iron, occupied by an old woman; awfully hot inside for want of ventilation, there being no opening in the back wall.

The same description will apply to several other one-roomed tenements, occupied chiefly by Chinamen, and only varying slightly in size. There are no windows to them, and when the doors are closed the occupants are in total darkness, and must in hot weather be in danger of suffocation. In one of these hovels, containing two rooms, the front room 10½ x 9½, and the inner room 10 x 7, with skillion roof, occupied by a Chinaman and a white woman apparently about 22 years of age, both opium-smokers. This woman was a sickly-looking pale-faced creature, fit apparently to be the inmate of an hospital.

Great complaints were made to us by the occupants of the adjoining house—a two-roomed weather-board building, belonging to Blakeney—of the annoyance to which they were subjected by the goings on

M. Chapman, at the Chinamen's quarters, and especially at the horrible and disgusting language used by the women who frequent them.

7 Jan., 1876. We went into a one-roomed house or box next to Blakeney's, constructed entirely of sheet-iron, 7 ft. x 7 ft., and about 5½ ft. high, rented by a Chinaman at 2s. 6d. a week. This place was literally like an oven, and no wonder, for a large fire was burning inside it, at which the occupant was engaged in cooking. In none of these boxes, for they can scarcely be called houses or even cottages, is there any window or opening of any kind except the door. Turner appears to be the agent for them all.

The next place—also a one-roomed tenement, built of stone, iron, and wood—is only 7½ x 6, and 6 ft. high, and was occupied by two Chinamen, opium-smokers; and the adjoining one, 6 x 9 ft., and 6 ft. high, had also two Chinamen as occupants, each place renting at 2s. 6d. There is an open drain running down the lane in which these tenements are situated, which empties into a large hole having no stench-trap, and exceedingly offensive.

We next inspected a four-roomed brick house, owned and occupied by Blakeney, very clean and well-ventilated. This man complained very much of his Chinese neighbours, who, he said, harboured some of the most disreputable prostitutes in the city. He added that the most disgusting scenes were enacted there every night. The police, we think, should have an eye to this locality.

Alongside of this house is a lane about 3 ft. wide, which forms the entrance to a piece of ground 25 x 70 ft., containing seven houses or hovels, including the one which faces Durand's Alley—Turner, agent. These are also one-roomed tenements, of a similar character to those I have already described, pervaded with the sickening smell of opium-smoking, and entirely without ventilation, there being no opening whatever except the door. In one of these places we saw a Chinaman standing over a fire cooking some food which appeared to be white, and very much like jelly. We were at a loss to imagine what it could be, but in another Chinaman's place we found several bags of bones, and it occurred to us that this compound might be made out of pulverized bones. There is one closet—a stinking cesspit—for the inmates of these seven houses.

We visited and inspected several other hovels of various dimensions occupied by Chinamen, for which Turner is agent; but as they all present the same characteristics it is not worth while to particularize; they have no windows or openings, except the doors, and are therefore unfit for human habitation.

In one of them we found another white girl, about 20 years of age, living with a Chinaman. Both were on the smoking bench, inhaling the fumes of opium when we entered; the girl denied that she lived there, and said she was only on a visit. This woman when we entered was lying in the inner room, on the smoking bench, which in a Chinaman's house is also the bed, in a state of partial stupour, under the influence of the pernicious drug; her eyes had a glassy look, the pupils were dilated, and she was altogether in a perfectly helpless state. We roused her for a few moments, and obtained one or two answers to our questions, when she again relapsed into insensibility, and it is doubtful whether she would remember our visit at all. She said she was not married to the Chinaman; and it appears that when once white women become subject to the tyranny of opium administered by a Chinaman, the latter care very little to avail themselves of the marriage rite. A woman in this state is at the mercy of any Chinaman who may enter the house. One of these places occupied by two Chinamen, we found to be only 7 ft. x 4 ft., and about 6 ft. high.

The weatherboard house fronting Durand's Alley, contains two rooms, 12 ft. x 8 ft., and 8½ ft. x 8 ft., and 8 ft. high, and is rented at 4s. a week. It is occupied by a bottle dealer, and crammed with bottles of all sizes, colours, and shapes; it is badly ventilated, having no opening in the back wall, and very close.

Emerging from this yard, we proceeded along Durand's Alley, and inspected another Chinaman's house, containing two rooms, with the usual smoking-bench in each, [and] [scarcely anything else in the way of furniture, except a few saucepans; place very filthy and close.

We also looked over a couple of brick houses, owned by Blakeney, which were in clean condition, and well drained, but close for want of ventilation. The same complaints met us here of annoyance from the Chinese quarters, in consequence of the drunken and immoral scenes occurring there nightly. Complaint was also made to us of the abominable stench proceeding from a closet in the yard attached to the next house—a two-roomed brick tenement—Burns, owner. The stench was beyond the slightest possibility of question; the house itself was damp and unhealthy; the tenant said he would not stop in it a day longer if he could help it; but he did not know where to find another at a reasonable rent.

The next house is one of three rooms, rented at 6s. a week; Macpherson, owner. The rooms were originally 12 ft. x 12 ft., but have been subdivided by a wooden partition, and are now 12 ft. x 6 ft., and 7 ft. high. This house is in bad repair, the stairs broken, and the rooms filthy and badly ventilated.

The adjoining house also belongs to Macpherson, and is rented at 4s. a week; it contains two rooms, 12 ft. x 12 ft., and 9 ft. x 12 ft., and 6½ ft. high; it is very damp, the moisture arising from the foundation in consequence of the imperfect drainage, and there being no current of air through the house to counteract it; no opening in the back wall; an open drain in the yard which runs under the house, and contributes alike to the damp and the stench.

A house of similar dimensions, belonging to the same owner, adjoins this one, and is occupied by a man, his wife, and four children, who all sleep in the smaller of the two rooms, and must suffer greatly from the want of ventilation. There is one closet, an old cesspit, stinking frightfully and without a door, for these three houses.

Most of the houses I have described above, in Durand's Alley, and those in the adjoining courts and lanes occupied by Chinamen should be pulled down, as they are quite unfit for human beings to live in, and if half we heard was true they are the resort of all the bad characters in the neighbourhood.

We finished our afternoon's work at 6 p.m.

Personal Inspection

By No. 2 Sub-Committee.

EIGHTEENTH DAY, MONDAY, 10 JANUARY, 1876.

*Denison Ward.*254. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer, as follows:—

Started from the Town Hall at 4 o'clock on Monday, the 10th instant, accompanied by Constable G. F. Dansey, Milne, and proceeded to Bathurst-street. Went along that street past the fire station, close to which we noticed a large cedar-yard full of timber, shavings, and combustible materials, which in the event of fire might cause the destruction of a great number of houses, those in its neighbourhood having for the most part shingle roofs. G. F. Dansey,
Esq.
7 Jan., 1876.

At the corner of Bathurst and Kent streets we commenced the inspection of a number of old-fashioned buildings, chiefly built of weatherboard, occupying altogether a space of ground somewhere about 400 feet square, between Kent and Sussex-streets, belonging, we were informed, to Mr. Potts, and known generally as Potts' Buildings. These houses were built in the early days of Sydney, in the most primitive style of architecture, and are placed here and there at irregular distances without any regard to order.

At the corner of Kent and Bathurst streets are five houses, four weatherboard buildings with shingle roofs, and one constructed of battens and roofed with zinc. They are not overcrowded and are kept tolerably clean, but are unhealthy tenements in consequence of their faulty construction, which allows no chance of ventilation. They have all the same dead wall at the back with no opening of any kind, and in front the door and a small old-fashioned window with upper sash immovable.

Close to these houses, at the corner of Bathurst and Kent streets, is a three-roomed building used as a shop, built partly of brick and partly of wood, with a fruit-stall at the side of it, both in a very dilapidated condition; the ceilings appeared to be falling. These places we think should be pulled down, as they are unfit for occupation. The landlady, as usual, declines to repair.

Nos. 317, 319, and 321, Kent-street, are two-roomed tenements with kitchens attached; the rooms are 12 x 9 ft., and the kitchens 8 x 6 ft., with skillion roof; they are all in a bad state of repair, but we noticed that there were clean window curtains in one of them, and they appeared to be kept as tidy as circumstances would admit, and in spite of the proprietor's neglect.

At the rear of the last-mentioned house we found a building made of iron, weatherboard, and slabs, put together so loosely that there was ventilation in all directions. It appeared to be a sort of marine store, and contained a variety of second-hand articles. There was a carpenters' bench, evidently used as a bed; a grindstone and a sailors' chest stowed away on the top of a meat safe; the flooring of this store was in very bad repair.

Adjoining this place is an old-fashioned house, built with bricks on studs in front and weatherboard at back, containing two rooms, one 12 x 14 ft., and the other 12 x 9 ft., the latter with skillion roof, used as a bed-room, with a yard 6 ft. wide. This house appeared to have been a stable originally. We noticed nothing worthy of special remark in this locality, except the bad style of tenement and the want of ventilation. The drainage is carried away by a sewer which gives the residents a chance of health, as they have only the close atmosphere inside their rooms to contend with; there are no open drains to poison the atmosphere outside the dwellings. We were surprised at the number of children who came out of the different cottages, like rabbits out of their burrows, to stare at the intruders. We had indeed a pretty strong following of youngsters of all ages, who escorted us from lane to lane and from house to house, with evident enjoyment.

No. 65, Bathurst-street, is a weatherboard building with shingle roof, in a very bad state of repair. Washing is taken in here, and the operation is carried on at the back, but the place was so dirty and dilapidated that we could scarcely imagine anything in the shape of clean linen coming out of it.

No. 71, also a brick and shingle building, is in such a state of dilapidation as to be quite unfit for habitation. The roof is so rotten that the shingles crumble to pieces when touched, but the landlord has no intention of replacing them. This house was very dirty, but with all its discomforts it rents at 6s. 6d. per week.

We also inspected a house marked No. 7—probably the second figure had been obliterated—containing two rooms, in a shocking state of repair, the ceiling actually falling to pieces.

At the back of this house there is a cabinet-maker's shop, to which the attention of insurance companies should be directed. It contains a large quantity of combustible material, and no one sleeps on the premises.

We finished our afternoon's work at 6:30 p.m.

NINETEENTH DAY, TUESDAY, 11 JANUARY, 1876.

Started from the Town Hall at 4 o'clock, accompanied by Constable Milne, and went to No. 527, Kent-street. This house was in very bad repair; the paper hung in festoons from the walls, and everything about the place spoke of neglect and decay. The furniture consisted of an American chair without any back, an old sofa and a table which appeared very old and infirm. There was also a wooden bedstead without any bedding, except a few rags. Upon this bed a man, his wife, and four children sleep. The woman told us that her children were never sick, and they certainly looked healthy enough. Eddy is the landlord of this house, which is rented at 7s. a week. There is a cellar underneath it, which is used as a store by the landlord, a leather cutter, when he is at home. At present he is in England, and has taken the key with him. The wife of this tenant appeared in great distress—her husband drinks a great deal of his wages. G. F. Dansey,
Esq.
7 Jan., 1876.

No. 527 is a stone house with verandah, let at 27s. a week, very badly ventilated, with a dirty closet, an old cesspit, emitting a terrible stench, and in very bad repair.

We went next to Wexford-square, belonging to Henderson, a coal merchant. On the north side of the square are two houses—brick and shingle—having two rooms each on the ground floor, badly constructed, without any opening for ventilation at the back, and with the yards in front. In the end house

we

G. F. Dansey, Esq.
7 Jan., 1876.

we found a case of scarlet fever. A sort of slab outhouse is attached to this house, converted into a bedroom, and in a state of great dilapidation. The privy in the yard emitted such a fearfully sickening stench that Mr. Palmer, although he did not approach nearer to it than about 8 ft. or 10 ft., was quite overcome, and had a fit of vomiting from the nausea it occasioned. In one of the houses on the south side of the square we found that two children out of four were also suffering from scarlet fever. The rooms in these houses are 10 x 10 ft. and 10 x 7 ft. The occupants of this house informed us that the language they were compelled to listen to at night was frightful. There appears to be a good deal of drunkenness in this locality.

Dear's-terrace, which was the next place we visited, contains six four-roomed houses, on which we saw nothing calling for special notice, except that the cistern in the closet was a very defective one—a fact to which we called the attention of Mr. Robertson, the Inspector of Waste Waters to the City Council, the next morning.

Leaving Dear's Terrace we came into Liverpool-street and inspected a two-roomed brick and shingle tenement belonging to Mrs. Brown, very close and badly ventilated—the rooms only 9 x 8 feet and 9 x 6 feet respectively; ceilings broken, and a general want of repairs; no furniture beyond a table and chair and a few rags for bedding.

We next went to Mr. Hamilton's property and visited a two-roomed house up a passage rented at 6s. a week; the bed-room is 6 x 12 ft., with skillion roof. In this room the father, mother, and two children sleep, and so close is it for want of ventilation that they are obliged to keep the window open in all weathers for fear of being suffocated. The place was as clean as could be expected considering the confined space, except the closet which is an old cesspit emitting the most abominable stench. My companion, warned by the consequences of his rashness on a former occasion, kept at a respectable distance; indeed it is not necessary to go nearer than fifty yards to it to be able to swear with a clear conscience that the place is a horrible nuisance. The lane in which this property is situated will not easily be forgotten by the members of this sub-committee, as offering the greatest trial to the senses which we have as yet had to encounter. It is important, lest an epidemic should be the result, that this evil be remedied with as little delay as possible; it would be less injurious to the health of the community to carry this stuff into the harbour than to suffer it to accumulate month after month in the centre of a thickly populated locality.

A little lower down Liverpool-street we inspected three small two-roomed brick and shingle tenements up a court leading from the street; the rooms are only 7 x 6 ft. and without ventilation; one closet of the usual stinking condition does duty for five houses.

At the corner of Sussex-street is a public-house in a dirty condition, and with stable, cowshed, and other outhouses in a most dilapidated and filthy state.

We also inspected a cow-yard close by, a few yards off Sussex-street, which we were greatly surprised to find clean and well looked after.

We returned at 6.15 p.m.

FRIDAY, 21 JANUARY, 1876.

Present:—

G. F. DANSEY, Esq.,
B. PALMER, Esq.,

R. B. READ, Esq.,
M. CHAPMAN, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 1 Sub-Committee.

TWENTIETH DAY, TUESDAY, 11 JANUARY, 1876.

Phillip Ward.

255. *Mr. Chapman* gave evidence on behalf of himself and Dr. Read as follows:—

M. Chapman,
Esq.
21 Jan., 1876.

Met Dr. Read and Sergeant Larkins at the City Club at 4 o'clock on Tuesday, the 11th instant, and proceeded to Goulburn-street. We commenced by inspecting a court containing four houses up a gateway, half way between Pitt and Castlereagh streets. These houses are occupied by Chinamen of the lowest class. One of them, the boss (we could not find out the Chinese term), rents the houses and sublets to others. Abutting on to this court is a house occupied by a plumber (European) which appeared to be so much cleaner than the others that we did not inspect it internally. Yah Kee, the occupier of the first house in the Court, which contains two rooms, calls himself a doctor of medicine, and is an inveterate opium smoker. We found him in company with a white girl, who said her name was Annie. She admitted that she lived with the Chinaman, but when asked if she were married to him she said "No fear." She is also an opium smoker, which may perhaps account for her pale, sickly, and haggard appearance. The lower room of this house is 9 x 8 ft., and 7 ft. high, very filthy, close, and out of repair. It has positively no ventilation—the solitary window through which fresh air might enter being boarded up; the room contained a table, a smoking-bench, and a few cooking utensils; a large fire was burning, at which the Chinaman was making some soup. The up-stair room, 9 x 8 ft., with skillion roof, average height 4½ feet, is approached by a rickety step ladder, and was equally close, filthy, and out of repair; it also contained a smoking-bench or bed. Here again the window was boarded up, the Chinamen evidently preferring darkness to light; and I fear, from what we subsequently witnessed in the Chinamen's quarters, the last part of the passage might be quoted with great truth. We had occasion to revisit this house after an interval of half-an-hour, when we were told by another Chinaman that the occupants were up-stairs smoking opium. This seems to be the favourite hour for the indulgence of this practice, for whenever we have visited Chinamen between the hours of 4 and 6 we invariably found them engaged in it,—some commencing to smoke, others who began early perfectly unconscious, and the rest in a state of partial stupor.

The next is a four-roomed brick house with two rooms above and two below. The front room down-stairs is 14 x 12 ft. and 8 ft. high, and was nearly empty, with the exception of a table and a few vegetable baskets. We went into the back room, which is of similar dimensions, where we found a large square table

table covered with matting, used, as we were informed, for gambling purposes. All light was carefully excluded from this room, the solitary window, which is only 3 ft. x 18 inches, being carefully boarded over. We were informed by the police that thirty or forty Chinamen assemble here nightly. The atmosphere of this apartment was actually suffocating; what must it be then about 10 o'clock at night, crowded, when gambling is in full swing, and each player brings with him more or less the odour of opium smoking! Under the stairs is a sort of locker, half filled with dirt and house refuse, which adds to the poisonous atmosphere inside the house. The up-stairs rooms are also 14 x 12 ft., with coved ceiling averaging 4½ feet high. In the inner room at the time of our visit there were eight Chinamen in various stages of opium stupor. No ventilation of any kind, the one small window being nailed up; it evidently had not been opened for many a day. The stench in this room was something to talk about—it was sickening in the extreme. Six of the men were reclining on three double smoking-benches, the other two were evidently in the land of dreams sprawling on the floor; nothing else but a table and some old clothes. In the adjoining room, which is the same size, there were also three double smoking-benches, a table and a box; the room greatly out of repair, and the window nailed up. Here we found three Chinamen, one perfectly unconscious, and the other two fast approaching the same state. The stench pervading the whole of this house, combined with the deadly odour from the opium pipes, was so overpowering that we rushed from the place in haste to inhale a breath of fresh air.

M. Chapman,
Esq.
21 Jan., 1876.

The next is a two-roomed brick house, lower room 14 x 11 ft. and 8 ft. high, very filthy, in bad repair, and without any ventilation. The floors appeared as if they had never been swept, and dirt had accumulated in every corner. The window, as usual, was boarded up, so that when the door is closed the occupants are in total darkness, which appears to be one of the conditions necessary to the full enjoyment of opium. In this room were two Chinamen on the usual smoking-bench, with their pipes in full swing, a table, a chair, some firewood, and some cooking utensils, besides a filthy looking poodle dog. Hearing a gurgling noise apparently proceeding from the staircase, I approached the spot in order to ascertain the cause of it, and found it proceeded from a Chinaman who had constructed a bench or bed for himself in a small recess under the stairs 4 x 2½ ft.; the gurgling noise proceeded from the tube of his pipe, at which he was sucking; it was clear from his condition that a few more puffs would settle his business, as he was fast approaching a state of oblivion.

We had an opportunity of watching the process of smoking; the smoker after two or three whiffs discharges the smoke through his nostrils. Upon each opium-bench is usually a small oil lamp, lit and placed near the head of the bed or bench ready for immediate use; the wonder is that when they become unconscious, which appears to be always the case after a good smoke, accidents from fire do not more frequently occur. We found it impossible to ascertain from these tenants the terms of their tenancy, or the amount they paid for rent. Whatever question we put to them the answer was invariably "no savvy;" I believe they understood us very well nevertheless. The up-stair room was in total darkness, so that you could not see your hand before you, all light as well as air being excluded by boarding up the window. With the aid of a match I managed to get a peep at it. It is the same size as the room below, but not so high, and boxed off into two compartments, containing each a smoking-bench. This room was very close and stank horribly.

We have scarcely inspected a single room occupied by a Chinaman which appeared to have been cleaned or swept out for weeks at least.

The next house we inspected was also a two-roomed tenement occupied by Chinamen, sellers of charcoal and firewood. This place, like the others, was very dirty, and the dirt which had accumulated on the floors was so full of fleas that we were covered with them at once; there was no mistaking their presence. In all other respects there was no difference—the same careful exclusion of light and fresh air, the same style of smoking benches or beds, and in place of any other furniture a large quantity of firewood and charcoal. In the up-stairs room I counted twenty-four bags of charcoal, but there was one peculiarity in this room which we have not observed before in a Chinaman's quarters—a bed, properly made up with sheets and blankets; that was, however, the only evidence in the house of a regard for cleanliness or comfort as we understand the terms; everywhere else we could see nothing but dirt, firewood, and charcoal. In the yard, and running through the middle of it, was a filthy open drain, while the water-pipe discharges its contents so that a stream of water runs under the house, and materially adds to its unhealthiness. The water-cask was green and slimy from neglect, and as for the closet—an old cesspit—I have no term in my vocabulary sufficiently strong to describe it. I have frequently been obliged to use the word stinking when speaking of closets attached to houses occupied by Europeans; applied to closets used by Chinamen this word must be understood in its superlative sense. Tenements occupied by persons of such filthy habits, and kept in such a dilapidated as well as dirty condition, should not be allowed to remain as they are. The owners should be compelled to have them properly ventilated and to keep them in decent repair, and some supervision should be exercised over the people who occupy them, for there can be no doubt that a great deal of overcrowding takes place. I feel satisfied that in scarcely any instance did we obtain reliable information as to the number of persons who resort to these places at night. At the time of our visit on Tuesday we had a glimpse of several women who were evidently coming to pay their daily visit to one or other of these Chinese dens, but who slunk away on seeing us. The owner or agent of this property is Haines.

At the corner of Goulburn-street and Wexford-street is a small iron tenement; walls as well as roof of iron without any lining, about the warmest kind of domicile I have seen in Sydney. It was about 5 o'clock when we inspected it, and the sides were so hot that we could scarcely lay our hands upon them. It contains two rooms 10 x 9½ ft., is rented at 4s. a week—owner, Beyers—and is occupied by a man and his wife; how they manage to live and sleep in it passes my comprehension. There is a yard attached to it which is at the side of the house, and is reached by a passage from the front door, 18 inches wide; the tenant complained that she could scarcely get along it, although she was not very stout. She also said that the heat made her sick, a statement which required no further corroboration. This place is quite unfit for human beings to live in in its present state; it might, however, be ventilated and be made habitable; a back door would be a desirable addition.

In Wexford-street or Market-lane is a three-roomed stone house belonging to O'Rourke, rented at 7s. a week; the front room is 14 x 12½ ft. and 10 ft. high, and the back room 14 x 12½, with coved ceiling averaging 4½ ft. high. This house is badly ventilated with the old-fashioned sash windows, and very close. The cellar, which is about the same dimensions, is occupied by a washerwoman, very damp and in a dilapidated state, the walls tumbling down. This tenant told us that no one remained in it for any length of time.

We

M. Chapman,
Esq.
21 Jan., 1876.

We next visited a stone house belonging to Simpson, containing three rooms about the same size as those last mentioned. We noticed that the walls and ceiling were much broken, but there was a sick woman lying on a sofa in one of the rooms, and we did not make a further inspection of it.

The last house we went over was a stone building, containing eight rooms—Campbell, owner—rented to a person at £4 10s. per month, who lets six of the rooms to three different families at 17s. a week. The occupants of this house were not at all communicative, and we could not obtain the total number of inmates; it was tolerably ventilated, but very dirty, and the yard full of rubbish.

We finished our day's inspection at 6 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

TWENTY-FIRST DAY, THURSDAY, 13 JANUARY, 1876.

Market-lane, off Goulburn-street.

256. Mr. Chapman gave evidence on behalf of himself and Dr. Read, as follows:—

M. Chapman,
Esq.
21 Jan., 1876.

Met Dr. Read and Sergeant Larkins at the City Club, at 3.20 p.m. on Thursday, 13th instant, and proceeded to Market-lane, where we inspected two brick houses containing two rooms each, owned by Campbell, rented at 5s. a week each. One was occupied by a mangle-woman; the lower room 12 x 10½ ft. and 7½ ft. high, and the up-stair room same size, with coved ceiling 5½ ft. high. Both these rooms were in bad repair, and very imperfectly ventilated,—the window up-stairs being fastened up. A large mangle stood in the centre of the lower room, which, with a table and two or three chairs, a number of clothes, and some irons, almost filled it up. The room above was in the same crowded state and the yard was regularly blocked up with tin pots and old baskets, apparently the accumulation of years. The neighbours, in reply to our inquiries respecting the tenant of this house, said she lived like a hermit and would not speak to any of them.

The next house—same size and rent—was in an equally bad state of repair and as badly ventilated; both houses are infested with rats. The landlord has several times promised to clean and repair them, and has as often failed to carry out his promise.

We next inspected a four-roomed brick house in Goulburn place, off Market-lane; front room 13 x 10 ft. and 8 ft. high, and the back rooms 4 x 9 ft. and 5 ft. high; Burton, owner. The tenant of this house, formerly a Corporation labourer, was lying drunk on a sofa, his wife having sought shelter on the door-step of a neighbouring house in consequence of illusage received at his hands a short time before our visit. A rum bottle on the table, and a broken gin bottle under it, the contents of which were trickling across the floor, were pretty strong evidence as to the cause of the strife. This woman told us a harrowing tale—how that they had at one time possessed considerable property in Woolloomooloo, which had all been squandered away by her husband since he took to drink. She said her heart was almost broken by his ill-treatment of herself and children. Out of five children, four had left their home, and she had to struggle with her remaining child under misery and harsh usage to make a living. In all these cases of intemperance the punishment falls very heavily on the wife and family of the drunkard.

Near this house we noticed two weatherboard buildings in a very dilapidated state. They are not occupied by regular tenants, but are the resort of larrikins during the day and at night afford shelter to a number of vagrants.

Next were two weatherboard houses owned by Moore. The first contains two rooms 14 x 10½ ft. and 6 ft. 3 in. high, and 14 x 5½, same height, rented at 5s. 6d. per week, and occupied by a man, his wife, and seven children. The second house contains three rooms, rent 6s. 6d., and is occupied by six persons. In the yard was an open drain, very filthy. These houses are generally in bad repair and badly ventilated; landlord refuses to do anything. Decent houses for working people, at a moderate rental, we are told everywhere are not to be had, and respectable persons of this class are consequently driven to occupy these objectionable tenements. What a fine opportunity exists for some rich philanthropist to buy up some of these properties and put up on them houses or cottages built with some regard to comfort and ventilation; I am much mistaken if independent of the benefit he would confer upon his fellow creatures, he would not find the investment a profitable one.

On the west side of Market-lane are four houses called Sellar's Buildings. Three of them are built of brick, and contain three rooms each, and are rented at 6s. a week; the fourth is a weatherboard house, rented at 7s. a week. The tenants of these houses complain greatly of the offensive smell which proceeds from the closet—an old cesspit—and the open surface drain in the yard; the whole of the roadway in this court is very rough and in bad repair.

Up a narrow passage off Market-lane are four houses, owned by Mrs. McLean; the roadway and fence belonging to this property are much broken, and must be dangerous to those who are not acquainted with the premises. The first of these houses is a two-roomed tenement, let at 6s. a week; the lower room, 15½ x 9 ft. and 7 ft. high, is in a very worn-out condition; walls and ceiling falling down; no opening in the back wall, and consequently no ventilation. The up-stair room, which is very much in the same state, is sublet to a female at 3s. All that this room contained was an old worn-out mattress with a few rags for bedding, and an empty bottle; the yard, 4½ ft. wide and 16ft. long, with an open drain running through it; the whole place filthy and stinking.

The next house was one of weatherboard, apparently of the same size and in the same condition; the tenant was out and we did not examine it, but we inspected the house adjoining it, which contains two rooms, 10 x 10 ft. and 8 ft. high, rented at 5s. a week, very close and badly ventilated; the tenant of this house, who has six children, told us that although she had lived there for five years the landlady had done nothing towards cleaning or repairing it. Through the yards of these houses, which all belong to Mrs. McLean, runs an open drain; the closet, which is a common cesspit, in a very stinking condition, appears to drain into an old well half full of refuse, and insecurely covered over with a few boards. The residents in the neighbourhood complained bitterly of the stench which proceeds from both these places.

Fronting Market-lane is a four-roomed brick house belonging to the Linden Estate, rented at 12s. a week. The tenant was lying drunk on a sofa, and, although very noisy, was unable to move from it;

this

this gave us an opportunity of examining it, which he seemed inclined to object to. The rooms are 12 x 10 ft. and 7½ feet high, and in a very bad state of repair; the paper was falling off the walls. There is no opening in the back wall, and consequently no ventilation. The yard has an open drain running down it close to the foundation of the house; the stench from this drain is very offensive, and must be very injurious to health, especially in the case of children who are playing about all day close to it. This nuisance is greatly aggravated by the closet in Mrs. M'Lean's property adjoining; the tenant also stated that he had lived there five years, and the landlord would do nothing in the shape of repairs, though very prompt in exacting payment of his rent every week. The main sewer, which discharges into Darling Harbour, cannot be more than twenty or thirty yards from both these properties, and the owners should be compelled to lay down pipes to carry the drainage into it.

M. Chapman,
Esq.

21 Jan., 1876.

Off Market-lane, and on the side of a hill approached by stone steps, are two brick houses—Allum owner—containing four rooms each, in tolerably good condition, one house is badly ventilated, there being no openings in the back wall; it was occupied by six persons. The first has a kitchen attached to it, and rents at 12s. a week; the other rents at 10s., and is but tenanted by a man, his wife, and eight children who had recently arrived from the country. The yard to this house, which is 15½ x 13½ ft., is very rough and full of stumbling blocks; the woman said "The childher were kilt with it already"; it was also very dirty, and contained a large accumulation of rubbish.

We finished our inspection at 6 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

TWENTIETH DAY, WEDNESDAY, 12 JANUARY, 1876.

Denison Ward.

257. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer, as follows:—

Met the Mayor at the Town Hall at 4 p.m. on Wednesday, 12th instant, and proceeded to Liverpool-street with Constable Milne in attendance. In the upper part of the street, next George-street, and adjoining the ground occupied by Chadwick's timber-yard, we found two houses encroaching on the alignment, but in other respects not calling for notice.

G. F. Dansey,
Esq.

21 Jan., 1876.

We proceeded to Union-lane, and inspected No. 2, a four-roomed weatherboard and shingle house, belonging to Mr. Beaver, of George-street Markets, rented at 7s. a week. This house is in a most dilapidated condition—the laths and plaster are tumbling down from the walls and ceiling. Up-stairs one of the windows is out altogether; in the other there are three panes of glass wanting, and in the lower rooms the windows are in a similar condition; the rooms are about 12 ft. x 12 ft. At the rear of the house is a yard used by three houses, containing an old privy which has lately been cleaned out; the sitting accommodation of the rudest kind.

We next went to Victoria-place, where there are six houses, all in tolerably good order, and in habitable condition; but with all the apparent comforts and improvements the old-fashioned sash windows are adhered to, and the ventilation is very defective.

We inspected several houses in Sussex-street, running up that street as far as Goulburn-street, but found nothing calling for special notice until we came to Walton-lane, where there is a property lately purchased by Mr. Israel from Mr. Moore of 34 Upper William-street. Here we found a very offensive odour arising from the closets which in this neighbourhood are all common privies, there being no sewer near with which the houses could be connected; in all these tenements the same old-fashioned style of ventilation prevails.

In Goulburn-street we noticed several old wooden houses which are in as good order as can be expected, considering their age, and that the owners never think of preserving the woodwork by an occasional coat of paint.

Mr. Cape's property, at the corner of Goulburn and George streets, is a stone building, stuccoed in front, with a weatherboard building attached with skillion roof, used as a saddlery store, owned by Scarwell, solicitor, Braidwood; the stone-work is sound, but the internal arrangements require repair. The landlord we were told refuses to do anything to keep the place in order. The closet, an old privy, is in a very dilapidated tumbledown condition.

Adjoining this house is the site of a well known public-house, in former days the "Jew's Harp." There are now five houses used as shops, all on the ground floor, occupying what used to be the verandah of the inn, and a very valuable site.

We returned by George-street, but found nothing particularly calling for attention.

Finished at 6:30 p.m.

TWENTY-FIRST DAY, SATURDAY, 15 JANUARY, 1876.

Denison Ward.

Started with the Mayor from the Town Hall at 10 o'clock on Saturday, 15th instant, accompanied by Constable Flynn, and proceeded to pay a second visit to Denison Ward. Commenced with No. 2, Duncan-street, which is a four-roomed brick building—owned by Mr. Golden, of Glebe Point—rented at 10s. a week. The ceilings in the lower rooms are falling down, and the place is altogether in a bad state of repair; it is also badly ventilated, having the old-fashioned windows with upper sash immovable. The yard is very small. The tenants informed us that the landlord would do nothing to keep the house in good order.

G. F. Dansey,
Esq.

21 Jan., 1876.

Turning the corner of Barker-lane we came upon a batten wall on the left-hand side, covered with tin, which we found to be the wall of stables at the rear of houses in Bathurst-street; this stable blocks up the whole of one side of the street.

On the right-hand side are Monk's Vinegar Works; we inspected the machinery which was at work at the time, and found everything conducted in a very clean and wholesome manner.

From

G. F. Dansey,
Esq.
21 Jan., 1876.

From Barker-lane we came to Duncan-street, and inspected six brick houses belonging to Mr. Monk, which appeared in good condition, but the smell from the privy was exceedingly offensive; the yard is also far too small. We strongly advised Mr. Monk to lay down pipes to the sewer, and he promised to do so, and to apply at once to the Town Hall to get it done.

On the west side of Duncan-street are five houses, containing two rooms, called Golden's Buildings, belonging to Mr. Golden of the Glebe. In front of each house is a piece of ground from 5 ft. to 5½ ft. deep, with a frontage of about 15 ft. There is no back door; back yard, or opening of any kind at the rear of these houses—nothing but a dead blank wall, which prevents any possible ventilation. These cottages are rented at 7s. a week each. In the centre of the five tenements is a water-pipe with one tap to supply the whole community, which is evidently at times the occasion of a good deal of dissension, for while we were there we heard the voice of one woman telling another in angry tones to "bide her turn." Between Nos. 9 and 11 is a closet opening directly on to the street; it is supplied with a cistern, but is in such an exposed situation as to be a continual offence to decency. No one can enter or leave it without being seen by the tenants of all the houses opposite, besides the employes at the flour mill at the corner, where there are a number of men at work. Some of the women told us that their husbands were so ashamed to make use of that closet in the face of so many persons that they went away and found accommodation elsewhere. No less than twenty-two individuals have to make use of it. The landlord of these cottages has promised to have them done up by Christmas. Most of the children in this neighbourhood go to the ragged school.

No. 3 in this street, belonging to Mr. Purchase of Parramatta, was the picture of cleauliness; the tenant informed us that he was the best of landlords, and that he always did anything he was asked to do.

We then turned down Barker-lane westward to Duncan-street, and came to a batten gate which led up to the front door of a house, the ground floor of which was unoccupied and had a notice "To let; apply to Mrs. M'Nab, 14, Steam Mill-street," in one of the windows. The Venetian shutters outside the windows were in a very shattered condition and greatly in need of repair. In the yard at the rear we found an earthenware pipe leading to a sewer, without any stench trap. We mounted some steps at the back of the house leading to the upper floor, which is divided by the landing into two sets of apartments—two rooms and an attic on one side and two rooms on the other—let at 8s. and 6s. 6d. a week respectively. One of these suites was occupied by a family—the other was empty. We were told that 1s. a week had been added to the rent of the up-stairs rooms, and 1s. a week to the rent down-stairs, and had been paid for the last two months. This addition had been enforced to meet the expense of supplying a cistern for the closet, but the cistern has not yet been furnished.

No. 29 is a house of similar construction, belonging to Mrs. Brown, and let, the upper portion of it containing three rooms and attic, at 7s., and the lower part at 6s. a week; in bad repair; the closet a common privy.

No. 27 is a brick house containing six rooms—four below, one of which is a grocer's shop; and two above, reached by a ladder from the back room, belonging to Mr. Neale. The lower rooms, occupied by a widower and four children, are let at 6s. a week, and the upper rooms occupied by a man, his wife, and three children, at 8s. Here again there was no stench-trap to the drain in the back yard, only a sunken stone with holes bored in it for the water to drain away; the closet, an old cesspit, emitting a very offensive smell.

No. 21, belonging to Mrs. M'Nab, has two rooms below and three above, approached by steps from the back yard. The rent of this house had also been raised to pay for a cistern attached to the closet. All the houses in this lane have the same old-fashioned ventilation.

No. 19 gave promise of a better state of things, for in the front door was a letter-box with brass facings. We did not however find the interior at all comfortable or in clean condition, while the stench from the privy at the rear was something horrible to remember.

The landlord of No. 17 had evidently had an eye to economy of space, the house being built with its gable fronting the street like the houses in the north of Scotland, and in Shetland and the Orkney Isles, where the architects endeavour to place them in such a position that they offer the minimum amount of resistance to the elements.

At the side of the houses last-mentioned is a three-roomed tenement, containing one room below and two above; the ceiling of the lower room is in bad repair, and requires attention from the landlady—Mrs. M'Nab; it is let at 8s. a week; ventilation also very bad.

There are four other houses, Nos. 9, 7, 5, and 3, belonging to Mr. Barker, each consisting of two rooms and a kitchen, rented at 8s. a week, chiefly noticeable on account of the disgusting state of the closets, which are old common privies; otherwise the houses are in good order.

We also inspected a two-roomed house on the north side of No. 22 with kitchen attached, rented at 7s. a week—owner, Mrs. Brookes. The closet belonging to this house emitted such an abominable stench that it caused an involuntary fit of vomiting on my part, and very nearly upset the Mayor. It had the effect of bringing our labours for the day to a sudden termination.

We returned at 1 p.m.

Personal Inspection

By No. 1 Sub-Committee.

TWENTY-SECOND DAY, TUESDAY, 18TH DECEMBER, 1876.

Phillip Ward.

258. *Mr. Chapman* gave evidence on behalf of himself and Dr. Read as follows:—

M. Chapman,
Esq.
21 Jan., 1876.

Met Dr. Read and Sergeant Larkins at the City Club on Tuesday, 18th inst., and proceeded to Campbell-street, Haymarket. Up a narrow lane or entrance from this street, about 4 feet wide, is a row of seven houses, built of stone, containing two rooms each, 14 by 12 feet and 7 feet high, called Blake's Buildings—owned by Bowman. These houses are in very bad repair, and in a dirty condition. Some of the tenants stated that they had been living there for seven years and the owner had refused to do anything in the shape of cleaning or repairing. The rent ranges from 7s. to 5s., according to the state of repair; ventilation

ventilation very deficient, there being no opening in the back wall to afford a passage for fresh air. The yard is rough and very filthy; the space in front of the houses, about 10 feet wide, appeared as if it were swept or cleaned only at very remote intervals, and as there is no provision for drainage it must be a complete pool of mud in wet weather. At the end of the lane is a closet—an old cesspit—7 x 6 feet, nearly full, and emitting a most abominable and sickening stench. There are from forty to fifty persons residing in this court, and they all complain bitterly of the impurity of the atmosphere, the closeness of their tenements, and the discomfort of the place generally from the absence of covered drains and the want of proper closet accommodation. They say they cannot sleep at night, and no wonder in such ill ventilated quarters. The owner of this property should be compelled to connect his houses with the public sewer which runs within a few yards of them. No better test of the unhealthy character of these dwelling places could be afforded than in the sickly and squalid appearance of the children. With no covered drain to carry off the drainage, with house slops and refuse thrown about in all directions, and with one filthy closet, used by nearly two score individuals, tainting the whole atmosphere, how can they be expected to thrive? The residents in this overcrowded place stated, as a sort of apology for the uncomfortable condition of their dwellings, that it was impossible to find other quarters without going a long way out of town.

M. Chapman,
Esq.
21 Jan., 1876.

We next visited Malcolm's yard, which runs parallel to the court just described, and is reached from the Haymarket. It consists of two iron houses in tolerably good repair, but badly ventilated and fearfully hot, especially during such weather as we have experienced lately; the yard is very rough and broken, and must be positively dangerous to traverse after dark.

Symons'-buildings, running north from the Haymarket, comprise seven houses, having each two rooms and kitchen, let at 9s. a week, in a fair state of repair, but without any opening in the back wall for purposes of ventilation, although the existence of a yard at the back affords every opportunity to the proprietor. Fresh air, however, in connection with sleeping apartments, does not seem to be a desideratum, either with the landlords or the tenants, and the only ventilation these rooms appear likely to get will be in the evidence given about them by the members of this Committee; the light of publicity may possibly do something to improve them.

Elizabeth-place, off Elizabeth-street, between Campbell and Goulburn streets, consists of six houses, belonging to Plummer's Estate—Harris, agent. Four of these contain two rooms each, and are in pretty good condition, but very badly ventilated, having the usual dead wall at the back. One of these houses which we examined was occupied by persons of very doubtful repute. In the lower room which is 12½ x 11 ft. and 7½ ft. high, was a man on a chair with a woman on his knee in a state of *déshabille*; there was no other furniture in the room except an old bed in the corner. In the upstairs room, a woman was lying undressed on another old bed; no bed-clothes and no furniture of any kind in the room. The tenant of one of three houses adjoining stated while complaining of the want of ventilation, that close as the room in which she slept was she was obliged to close the shutters at night and exclude the fresh air, because there was such a lot of rowdy people about.

The next was a one-roomed tenement, 10 x 9½ ft. and 7½ ft. high, let at 3s. 6d. a week, and occupied by a man, his wife, and four children, who eat, cook, sleep, and pass all their in-door life in this confined space. As may be imagined, it was very hot and close.

There is a house close to it containing two small rooms, but the tenant was out and we did not enter it.

Another house connected with the same property contains nine rooms and is rented by an old man and his wife, who sublet four of the rooms to different persons at 16s. a week. This house is in a frightfully dilapidated state, and unfit for habitation. Even the occupier, who makes a profit of 4s. a week out of the rent and gets free quarters for himself, says it is not fit for a dog-kennel. This place should be pulled down or else put into proper repair.

We went from this place to the same side of Castlereagh-street, and inspected No. 420, a brick house containing four rooms and let at 6s. a week. The rooms are 10 x 10 ft. and 8 x 10 ft., and 6 ft. high, back and front in very bad repair; in fact they are almost tumbling down, and although let at a low rental are dear at the price. The landlord as usual will not repair.

On the west side of Castlereagh-street, nearly opposite to the house last mentioned, is an old rookery with a shed in front of it used as a fruit-shop. The fruiterer and his family live in another old shed at the back containing two small rooms, while in another portion of the yard is a third shed, built of packing cases, and covered with iron about 6 x 4 ft. and 5½ ft. high, occupied by an old woman. The remainder of the yard is nearly full of old fruit cases and lumber sufficient for the construction of a fourth or even a fifth shed if necessary. This property belongs to Asher, and is certainly not a credit to him.

On the same side of the street is a house containing two rooms and a cockloft, let at 10s. a week—Gibson owner. This house, which is occupied by a vanman, is very filthy and in bad repair; the closet, a common cesspit, is within a few feet of the door, and stinks frightfully, the stench being increased by a large heap of stable manure in the yard. The landlord does nothing to improve his property.

Young's-buildings, off Castlereagh-street, on the west side, consist of seven houses, situate in a yard at the back of a terrace fronting that street (Ramsdent agent.) These are two-roomed brick tenements, let at 7s. a week; greatly out of repair and badly ventilated, having evidently been designed by the architect in whose plans the blank dead wall running the whole length of the block is the leading feature. We entered one of them, occupied by a sick woman, who said it was damp and uncomfortable—very mild terms considering that the ceiling was down, and the rain poured through the roof as through a sieve. The other houses are all more or less in the same condition, and want renovating badly. One of them is occupied by a Chinaman, a vendor of opium, which is smoked on the premises. He has three smoking benches for the use of his customers, which were occupied at the time of our visit by six Chinamen, two of whom had had their quantum and were in a state of unconsciousness. We noticed four half-caste children strongly resembling the Mongolian race running about the place. This house was clean in comparison with some of the Chinese smoking-houses we have visited, but the sickening smell of the opium pipes is sufficient to disgust any one except a Chinaman.

The next house we inspected belongs to the same property, and fronts Castlereagh-street. It consists of two rooms, and is let at 9s. a week; very close and hot. The tenant complained very much of having no drain and no water. We did not wonder at the last complaint, as the water-pipe had burst at one of the closets, and had been so, we were told, for months; the agent turns a deaf ear to all appeals. This property, we were informed, has lately been purchased by Dr. Morris; we therefore hope that there will soon be a better state of things, and that the comfort of the tenants will be looked after. No.

M. Chapman,
Esq.
21 Jan., 1876.

No. 396, Castlereagh-street, east side, is a two-roomed brick house, let at 8s.—M'Guire owner—occupied by a man and wife and seven children. The rooms are 11 x 10½ ft., and 11 x 8 ft., very close and unhealthy, designed by the dead wall architect, and without any ventilation. This house is built on the back of the allotment, the front of which is used as a cow-yard. The place was filthy in the extreme. On one side is an old shed about 20 feet long, in which were six dirty dejected-looking cows, three of which were lying down, and three standing up. I suppose they take it in turn, for there certainly is not room for them all to lie down at the same time. On the other side of the yard was a large heap of cow-dung, and a filthy water-cask. If that is the source from which the milk is watered as well as the cows the customers have just cause for alarm. We can only express our surprise that such a state of things should be allowed to exist on ground fronting a main street, almost in the heart of the city. There were a number of ducks and fowls about the place which did not help to make it cleaner.

The next house—same size, same owner, same rent—is occupied by six persons. They complain greatly of the heat of the place; these houses have a westerly aspect; the sun is on them for three parts of the day; and they are absolutely without ventilation.

On the same side of Castlereagh-street, a few yards further north, up a passage 2½ ft. wide, and then up about a dozen steps, are two weatherboard houses, owned by Steele, and rented at 7s. a week. They contain three rooms each, 14 ft. x 11 ft., 13 ft. x 8 ft., and 13 ft. x 5 ft., and 7½ ft. high. Like a great many of the tenements we have examined since we commenced our house to house inspection there is no opening in the back wall in the shape of door or window, and no back yard. The plan adopted in the construction of cheap dwellings in Sydney is a very simple one. A wall is run up on the extreme back boundary of the allotment, and extending to either end of the ground. This is intersected by a number of partitions, at right angles, at an average distance of (say) 8 ft. apart; a couple of cheap sashes for the upper and lower room, and one door on the ground floor for each house, and lo! the buildings when roofed are completed; and a property yielding good returns is created at a minimum outlay. It is no use to have doors and windows at the back, because the ground at the rear belongs to another proprietor, and experience shows that houses without ventilation let readily. The extension of the building to the boundary of the allotment also saves the cost of fencing at the back and sides. It is however indispensable that there should be some apology for a yard, where the women may wash and hang out their clothes to dry, and therefore a space is reserved in front for this purpose, which is frequently only 5 or 6 feet wide. It will be seen that this arrangement takes up a width of, at the outside, 16 feet. Now, supposing the available area to be 40 feet wide, a similar row of houses can be erected on the opposite side, and there would be 10 ft. to spare between the two terraces. This vacant space is not without its use also; there being no provision for drainage, and no room for it, except in front, it follows as a matter of course that all the house-slops and refuse find their way into this unoccupied space and run along it in a surface drain. Add to this description three or four stinking cesspits, all occupying prominent positions in front of both rows of houses, and you have a sketch of a block of cheap houses in the back-slums of Sydney. These properties are generally in some yard or court off the street, and hidden from public observation, or they would not be allowed to exist. The picture I have drawn is not a fanciful one, as will at once be admitted by those who have taken the trouble to read our previous reports.

The occupants of the last house described complained very much of the stench from the adjoining cow-yard. The closet of these premises we found occupied by an old female vagrant, who lay on the seat coiled up like the letter Z. She was thoroughly drunk, and slept like a top. The tenants assured us that this old creature persists in taking possession of the closet every night in spite of all they can do, and they are almost afraid to make use of it themselves for fear of vermin.

We returned at 6:30 p.m.

Personal Inspection

By No. 2 Sub-Committee.

TWENTY-SECOND DAY, MONDAY, 17 JANUARY, 1876.

Denison Ward.

259. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer, as follows:—

G. F. Dansey,
Esq.
21 Jan., 1876.

Met the Mayor at the Town Hall on Monday, 17th inst., at half-past 3 o'clock, and, with Constable Milne in attendance, proceeded to Barker's lane to complete the inspection which came to such an unsatisfactory termination on Saturday last.

We commenced with No. 24, a brick house rented at 8s. a week, having one room and a kitchen on the ground floor and two rooms above. The yard attached to this house is very small, and the privy which is very offensive is close to the kitchen window; owner, Bittern.

The next house, constructed on the same pattern, and belonging to the same owner, accommodates a family of five—husband, wife, and three children. All the children attend Pidgeon's school in Sussex-street. The proximity of the closet to the kitchens of both these houses must be very injurious to the health of the inhabitants, especially as the kitchens are built of weatherboard which cannot keep out the stench. The houses themselves are in fair repair, but in none of the yards is there any stench-trap to the sewer. We were unable to inspect Nos. 28 and 30, the doors being locked and the tenants not at home.

We next went to Steam-mill-street. No. 30 in this street is divided to accommodate two families, two rooms above and two below, with two kitchens underground; it belongs to Mr. Brown, of the Glebe; the upper portion is rented at 6s., and the lower one at 7s., each division being occupied by five persons. This house is not in bad condition, but has scarcely sufficient accommodation for ten persons. The landlords in this neighbourhood have shown great ingenuity in dividing their houses in order to obtain extra tenants. Here we also noticed that the water is supplied through leaden pipes.

No. 28 contains three rooms, two above and one below, occupied by one family, a widower, and six children, the mother having died recently; and No. 26, owned by Neale, and rented at 9s. a week, has four rooms, in which a man, his wife, and six children live; the rooms are very small, and the ventilation imperfect. We were glad to hear that all the children go to school. The kitchen is constructed of battens, which are half-inch apart, and let the air in freely.

No.

No. 24—same owner and same size; accommodates a family of four, two being children who attend school; old-fashioned ventilation and a stinking privy. G. F. Dansey, Esq.

No. 20 is owned by M'Nab; it contains two rooms, one above the other, and an attic, and rents at 6s. 6d. a week. The woman of this house complained greatly of the heat and closeness of the place, and considering that there is generally a fire in the lower room for cooking and washing purposes and no ventilation in the upper room, there can be no doubt her complaint was well founded. 21 Jan., 1876.

Nos. 18, 16, 14, 12, and 8, owned by the residents themselves, were all in very good condition; upon inquiry we found that nearly all the children in this locality go to school, some to Fort-street, some to Pidgeon's school, and some to St. John's. We remarked to one woman that Fort-street was a long way to send her children, "Yes," she said, "but it is the best school." We find, as a rule, that wherever a house is kept clean and tidy the children of the family are invariably school goers; it is only in the abodes of dirt and drunkenness that the little ones are neglected.

We next inspected a small house at the end of Steam-mill-street, where live a man, his wife, and three children; two of the children are nearly grown up, and are employed at tailoring; the youngest one is at home. We asked if this child went to school, and her mother said she could not afford to pay the school fee, which is 9d.; at the same time she admitted that her husband obtained constant work as a stonemason. This is one of the cases of wilful neglect which our educational reformers will have to deal with.

No. 7 in the same street, rented at 10s. a week, is a four-roomed house, which accommodates two families; in the lower part of the house there are five persons living. We were anxious to see how they were housed in such limited quarters. The mother of the family was anxious to give us all the information she could, but her husband, who had been indulging in strong liquors, was obstructive as well as abusive, and told us to clear out.

Nos. 11, 13, 15, and 17, are all occupied by persons living on their own property, and in clean good condition.

We next proceeded to James-street, where we found nothing deserving of particular attention; but on entering Sussex-street a woman rushed across from Fleming's court and asked us to visit a woman who was drunk and in a miserable condition. Entering the court we were directed to a two-roomed wooden shanty, being the back portion of another house, occupied by Mrs. Murray, who was lying on a sofa in a drunken state. The stench of the room, which was 8 x 12, and destitute of any other furniture, was horribly offensive. After a few minutes she roused herself sufficiently to explain that she felt much better. Two sickly-looking neglected children were in the room with her, and a more forlorn appearance than they presented it would be difficult to imagine. This state of dirt and wretchedness is all the result of drink. In these cases the children are the sufferers. There is no law to reach parents whose neglect stops short of actual cruelty. We can only record the fact as a proof among others that the back slums of Sydney afford an ample field for philanthropists.

There are five other tenements in Fleming's court, one of which is occupied by Mr. Eastwood, who has lived there for nineteen years; it contains three rooms, and is let at 7s. a week.

On the opposite side of the court is a wooden box just large enough to house one person, which was secured by large padlocks; the occupant, we were told, had gone to Manly Beach before Xmas, and had not yet returned.

We inspected in the same court a two-roomed brick house, occupied by a labourer named Tooney, rented at 6s. He has a number of children who all go to school. The drainage and water supply for this court are good. As we left it we met the owner, who had evidently been drinking, and was inclined to be abusive. He followed us for some time while we were continuing our inspection. We visited several other houses in Sussex-street, but found nothing which calls for particular notice.

We returned at 6:30 p.m.

FRIDAY, 28 JANUARY, 1876.

Present:—

R. B. READ, Esq.,
M. CHAPMAN, Esq.,

G. F. DANSEY, Esq.,
B. PALMER, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 1 Sub-Committee.

TWENTY-THIRD DAY, 19TH JANUARY, 1876.

Phillip Ward.

260. Mr. Chapman gave evidence on behalf of himself and Dr. Read, as follows:—

Met Dr. Read and Sergeant Larkins at the City Club at 4 o'clock on Wednesday, 19th January, 1876, and proceeded to inspect Paradise Row, off Abercrombie and Myrtle streets. This property consists of twenty-four weatherboard houses with slate roofs, owned by Thomas Broughton, Esq.—Carter, agent. The houses are chiefly two-roomed tenements, rented at 4s. a week. The neighbourhood in which they are situate bears about as bad a reputation as any we have yet visited; the houses are in a very dilapidated state, many of them being empty on account probably of their uninhabitable condition. The agent, a well-known character, with one arm, would persist in following us about during our examinations, and inciting the tenants to resist our entrance into their houses. I am sorry to say that in many cases he succeeded; his language was not of the choicest description and his conduct was very obstructive. He told us he had been fined on account of these places a short time ago, and "he'd take (strong adjective) good care that he would not be sucked in again." The rooms average about 10 x 10 ft. and 7 x 10 ft., with a height of 6½ ft. 28 Jan., 1876.

One house is occupied by an old man, apparently a cripple, who was lying on an old bed on the floor, the only furniture being a table and a bundle of old clothes in the corner. The rent of this house was

M. Chapman, Esq.
28 Jan., 1876.

was only 3s. We might have obtained some information from this tenant but for the obstructive conduct of the agent, whose noisy vociferations had collected a large number of the inhabitants, the majority of whom seemed as anxious for a row as he was. Disgusted with this conduct we ceased to make any further attempt to inspect the houses. This was the first time since we commenced our house to house inspection, in the course of which we have visited a large number of houses in various parts of the city, that the tenants have offered any opposition to our endeavours to serve them. The occasional peeps into the interior of these tenements which we obtained were sufficient to show that the premises are generally in a filthy condition and in very bad repair.

At the end of this row is an old house built of brick and slate, which in its earlier days must have put forth strong claims to respectability, but is now in such a tottering state that it is a matter of surprise that people should be found so venturesome as to live in it. Nevertheless there are four rooms occupied by different tenants; one of them is used by Mr. Hodgkinson, one of the City Missionaries, as a meeting-house. It is appropriately furnished, and we feel convinced that this worthy man, whom we met immediately afterwards, has been the means of doing much good among the residents of this disreputable locality. There is one redeeming feature in connection with this property; there is a large paddock at the back of the row, which is open to the tenants; but on the other hand the closet accommodation is wretched in the extreme. It consists of three cesspits, 6 x 4½ feet, filthy, stinking, and much out of repair; doors and seats broken, and no regard whatever to decency. From the number of persons we saw about the premises, and from what the police told us, we feel satisfied that there must be a good deal of overcrowding here. The owner of the property can scarcely, we think, have any idea of its wretched condition, or he would, in his own interest, put proper tenements upon it. It is a very large and valuable piece of land in a good situation, well adapted for working-men's dwellings, and might be made to yield an excellent return.

In Parramatta-street, near Abercrombie-street, up a gateway, is a place called Moss' court. It consists of five houses, four of which are in a row, the other at right angles to them at the end of the court, forming a figure like the letter L. They consist of two rooms each, one over the other, 11 x 11 feet and 7 feet high, and are rented at 5s. a week (owner, Mrs. Seales). They are in a dirty state and badly ventilated; no opening in the back wall; the windows in the front with the top sash a fixture. The tenants complain very much of the heat and the filthy state of the yard. This is an open space in front about 10 feet wide, and common to all the houses. There is no drainage, and in wet weather it is impossible to get to the closet except by going through water ankle deep. This closet is at the end of the court, close to the house described as at right angles with the others. It is a common cesspit, by no means clean, and as there is a fall of about 18 inches to this end of the court, the unfortunate tenant in the end house has, in addition to the stench from the closet, which is sickening at times, to contend with an accumulation of impurities which collect at this spot.

Carlton-street, off Parramatta-street, consists of about twenty-four brick houses (owned by Carlton), all in a good state of repair and apparently well ventilated; they presented a marked contrast to the houses in the court we had just quitted.

We next visited Lombard-place, Parramatta-street, formerly Liuden-lane. This place was at one time one of the worst in the city; but by pressure from the Corporation the owner was induced to pull all the houses down, with the exception of three fronting Parramatta-street; it is a great pity these were not pulled down at the same time. One of them was originally a bakery, but is now in too dilapidated a state for any trade to be carried on in it; it did not appear to contain any tenants, at least we could see no signs of occupation.

The next, which is on the other side of Lombard-place, consists of three apartments, a shop, a bark skillion, and a sort of cock-loft. The shop, which is of the smallest dimensions, contained the usual stock-in-trade of a huckster—pipes, lollies, onions, &c., &c.; the skillion seemed as if it were rarely used; the cock-loft we did not examine; there was scarcely any furniture in the place—the whole a picture of poverty and neglect. The house is in a ruinous state, and the tenant stated that when it rains there is not a dry place in it. She pays 7s. a week, and has a husband and seven children living with her.

The next house is occupied by a tailor, who pays 7s. 6d. a week. It appeared to be in the same ruinous condition—the yard small and filthy, with an open drain running through it.

Charles-street, Parramatta-street, consists of about thirty-four houses, built of brick, containing three to four rooms each, and let at 8s. a week; the roadway is about 12 feet wide. The houses seem in tolerable repair, but are not connected with any sewer; the drainage runs down the gutter on either side of the street and discharges on to a vacant piece of land at the end, ultimately finding its way into an opening in the main sewer, which appears to have been kept open in order to connect this property. The stench which proceeds from this opening and from the open drains is atrocious. The people at the lower end of the street complain of the filth oozing from Green's lane. We were informed that the children who average about five to each house are often ill with sore throats, and there can be no doubt that the noxious gases given off from the sewage are the cause of it. This street must be unhealthy, and immediate steps should be taken to compel the proprietor to connect, the sewer being only a few yards from his property. We noticed when leaving this street a very filthy open drain running into it from the yard of a public-house called the "Clare Castle," fronting Parramatta-street.

We next visited Green's lane, which contains one house on the right-hand side and seven on the left, named Wellington Terrace, built of brick and belonging to the estate of Raynes, Treeve, & Co. These houses contain four rooms each and are let at 8s. a week; they are close and unhealthy; no opening in the back wall; the yard, which is in front, is partitioned off to each house, every one of which has a closet, a common cesspit, on its own ground, occupying a prominent position in front; the stench of these places is sickening. The tenant of the house we examined—a very intelligent woman—has succeeded in training a lot of vines over the window. She said that although they excluded the light they mitigated the nuisance of the closet, and she preferred darkness to stench. This woman has a family of six children, and she believed that to be about the average to each house; some of them, however, are always ill. When asked if she sent her children to school, she said, "Yes, she had done so up to Christmas time. They had been to a Church of England school, and she had had to pay 5½d. a week for each child, which was more than she could now afford, her husband's wages being only 35s. a week." We examined the end of the lane in order to ascertain if possible the cause of the nuisance complained of by the residents in Charles-street, and found that a large quantity, more than a horse-load of sewage in a liquid state, had accumulated in a corner, which no doubt was the cause of the offence complained of. Immediate steps should be taken to clean and drain this property.

We concluded our inspection at 6 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

TWENTY-THIRD DAY, WEDNESDAY, 19 JANUARY, 1876.

Denison Ward.

261. *Dr. Dansey* gave the following evidence on behalf of himself and Mr. Palmer:—

Started from the Town Hall with the Mayor and Constable Trewecke at 4 o'clock on Wednesday, 19th instant, and proceeded to Denison Ward, where we commenced our inspection by visiting No. 277, Sussex-street, occupied by Collins & Co., which is used for the sorting of rags collected from dust-heaps, street gutters, and various other places; some of these are utilized by the Colonial Paper Factory, and others exported to England and to the neighbouring Colonies. We were informed that from thirty to forty bales are exported weekly. Some 500 or 600 rag-pickers bring their collections here for sale, and twelve persons are regularly employed in the work of sorting. We found the effluvium arising from the different heaps which lay on the floor of the shed so offensive that we retreated into the street every time we wanted to take notes. The building, which is in good repair and well ventilated, is between 70 and 80 ft. long, and consists of two long rooms or warehouses one over the other. Despite the unpleasant odours arising from the rags we were assured by Mr. Collins that no disease had occurred among his employes which could be traced to this source. We inspected several other houses in Sussex-street in good order, and not calling for any remarks.

G. F. Dansey,
Esq.
23 Jan., 1876.

We went next to North-street, and inspected several houses built of weatherboard and slate, belonging to the estate of Raynes, Treeve, & Co., in a most ruinous state of repair—walls and ceilings falling down, and altogether unfit for human habitation, and greatly deficient in closet accommodation.

No. 7 is a stone tenement 10 x 8 feet, occupied by a bird-cage maker, who does not live in it but uses it as a workshop; it is in a very bad state of repair—in fact a complete ruin.

No. 5, the occupant of which was not at home, was singularly well ventilated, nearly all the windows being out. A bird's-eye view of the interior from the street showed us that the ceiling was falling down, and that repairs were needed generally.

No. 8, on the north side, is a two-roomed tenement, rented at 8s. a week, and also in a dilapidated condition. A batten partition divides the house into two rooms. A most abominable stench proceeded from the apartments.

No. 4 has also two rooms, 12 x 10 and 12 x 8, with skillion roof. The ceiling in the front room is constructed of tin; the ventilation is of the old-fashioned kind; the closet a common cesspit, offensive when approached, and the drain without any stench-trap. This was one of the most unhealthy abodes we have yet visited.

No. 10 is a weatherboard and shingle tenement, containing three rooms, belonging to Mrs. Matthews, let at 10s. a week—the sitting-room 12 x 10, and the bedroom 12 x 8 ft. Here there is a common privy in a stinking condition, with a pit extending 5 ft. outside of it.

No. 18 is a brick house with a window in front which is a fixture; it has a very small yard, and a privy—a common cesspit—in a very bad state of repair.

The whole of the buildings in North-street are in a most dilapidated condition and unfit for human habitations.

We went from this to Harbour-street. No. 21 is a brick and shingle building of a very eccentric order of architecture. To the right of the door is a small window which opens at the bottom; to the left is another window which does not open at all, but can be taken out bodily; this is what is termed an Irish window. Six inches above this is a third window. On going up-stairs we found the last-mentioned window on a level with the floor of the room, the shingle roof sloping down to the top of it. The house is tenanted by a woman who takes in washing, and who owns a number of goats; these animals were all round her, and it was singular to observe how carefully they avoided trampling on the linen which lay about on all sides.

We were much annoyed during the examination of these houses by the conduct of a man and woman, who persisted in following us wherever we went. We were at last obliged to threaten to give them in charge. We returned at about a quarter past 6 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

TWENTY-FOURTH DAY, MONDAY, 24 JANUARY, 1876.

Phillip Ward.

262. *Dr. Read* gave the following evidence on behalf of Mr. Chapman and himself:—

Started from the City Club at a quarter past 5 o'clock, Mr. Chapman having had to attend a meeting of the Board at 4 o'clock, and proceeded accompanied by Sergeant Larkins to Union-street, off Regent-street. Went to a brick house on the left-hand side of the street and observing it to be fairly ventilated back and front, did not enter it. In the yard we noticed a cesspit 7 ft. square, used by the inmates of this house and the two houses in front; it was in very bad repair and the tenants complain greatly of the stench which proceeds from it. The owner of this property, McEwan, should be compelled to connect with the public sewer, which is only a few feet from his property, especially as he also owns the two houses in front facing Regent-street. The upper sashes of these houses are fixtures, and should be properly hung so as to admit of being lowered when necessary. A wooden house belonging to Dwyer, rented at 4s. a week, and a brick house owned by Renwick, let at 5s., were also fairly ventilated and in good order; the rent of the last-mentioned house two years ago was 6s., which is the first instance we have met with where the rent has been lowered.

R. B. Read,
Esq.
23 Jan., 1876.

The tenants of a two-roomed brick house opposite, owned by Dwyer, complained much of its unhealthy condition for want of ventilation, there being only a window in front and no opening in the back wall. For a wonder they spoke in praise of the landlord, who they said was ready to do anything that was required. We suggested as a practical proof of his sincerity that he should be asked to connect this property with the sewer which runs close by.

We examined two houses in a court up Union-street, and five houses fronting Kensington-street—owner, Renwick. This property offered a marked contrast to many others we have visited; the houses were

R. B. Read, Esq.
28 Jan., 1876.

were in good order and well ventilated back and front, the yards clean, the drains connected with a sewer, and the closets fitted with patent cisterns.

A weatherboard house fronting Kensington-street, belonging to Mrs. Kelly, was also in fair condition, and the closet in the yard had a patent cistern, but the windows were fitted with the old-fashioned sash window. Considering how easily and inexpensively the alteration can be made, we can only wonder that the tenants themselves do not hang the sashes so as to allow of the ingress of fresh air at the top.

No. 9, Kensington-street, is owned by Anderson, and rents at 10s. 6d. a week; it is about 15 inches below the level of the street and contains two small rooms not more than 6½ ft. high; the roof is of iron and the temperature inside very close and unhealthy; the closet is fitted with patent cistern.

Nos. 11 and 13 were both in fair condition with patent cisterns to the closets.

On the opposite side of the street is a weatherboard cottage belonging to Hunt, containing three rooms and a kitchen, all very close and unhealthy for want of ventilation; patent cistern as before. The cottage adjoining—Barrett, owner—had nothing about it calling for special notice, except that the water-pipe was broken. Next to that is another cottage built of weatherboard in front and iron at the back and sides with iron roof, very close for want of ventilation, there being no opening in the back wall, but in a fair state of repair.

The next house is owned and occupied by Mrs. Morgan, who has lived there for thirty-two years; there are several small tenements in the yard of this house, which are occupied by members of her family. She told us that three of her grand children had been ill with scarlet fever, but had recovered.

At the end of a narrow passage, not more than 3 feet wide, a little further on, we came to a brick building, owned by Long, rented at 5s. a week, containing the same deficiency of ventilation, a dead back wall, and the upper sash of the windows a fixture. To add to the unhealthiness of this abode there was no drain in the yard to carry off the house slops; in wet weather the place must be a complete puddle. The backs of the two houses fronting Kensington-street open on to this house; an open drain in one of the yards runs into the gully-shaft of a sewer in the other.

No. 37, on the opposite side of Kensington-street, is a weatherboard house, owned and tenanted by Redman. Then comes a vacant space, which would be occupied if the row of houses were continued, at the back of which are two houses built of iron with slate roofs, occupied by Mr. Redman's men, who drive his drays. The back wall of these houses is the boundary-wall of Kent Brewery, and as there is no opening of any kind in it the houses are without any proper ventilation, and excessively close.

No. 41, owned by Murtoch, is similarly situated, being built of brick and shingle, and having as a back wall the boundary-wall of the brewery just mentioned, an ingenious application of the principle of economy by the dead-wall architect, whose designs have been more or less the subject of our descriptions throughout. Here again were two objectionable but very common features—immovable sashes to the windows, and an offensive cesspit in the back yard. The sewer is at no distance from this property and the owner should be compelled to connect.

The dwellings generally along Union and Kensington streets, comprised in this day's inspection, are of a much better class than a great many we have had to describe, and much more suitable for occupation by the manual labour classes; it was quite a pleasure to us to pass by so many houses, which evidently were in fair habitable condition. We did not notice any symptoms of overcrowding, and have not therefore thought it necessary to give the dimensions of the rooms or the number of inmates in most cases; the neighbourhood also appears to be quiet and orderly.

We inspected two houses in Junction-street, which runs from Kensington to Regent street, owned by Long, and rented at 6s. a week, which, however, were rather below the average in respect to cleanliness and ventilation. The up-stair rooms have a small window or sky-light in the roof, there being no ceiling. In hot dry weather the solar heat must make these rooms almost unbearable, while in wet weather when the skylight is let down they must be in total darkness. There is a closet in the yard of one of these houses which was tolerably clean, but the drainage from the adjoining houses runs into the yards, and in rainy weather it must be difficult to step out of the back doors without being ankle deep in mud and filth.

We went into Fitzroy-street, where the houses appear to be of a better class than usual, and fairly ventilated, with the exception of two, Nos. 24 and 25, small iron shanties owned by Lane, and rented at 6s. a week. The tenant of one of these places said the houses were "killing." She told us also that she had lost one of her children, which she attributed to the heat of the rooms. The number of children we noticed to-day quite astonished us; they seemed healthier than we usually find them.

We concluded our afternoon's inspection at a quarter past 7 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

TWENTY-FIFTH DAY, THURSDAY, 27 JANUARY, 1876.

The Glebe.

263. *Mr. Chapman* gave evidence on behalf of Dr. Read and himself, as follows:—

M. Chapman, Esq.
28 Jan., 1876.

Having now completed our inspection of Brisbane, Bourke, and Phillip Wards, in Parramatta-street, which separates the last-mentioned ward from the Borough of the Glebe, we considered it desirable to push our investigations in the direction of the Glebe at once, leaving Fitzroy Ward to be inspected at a later period. We are aware that the members of No. 2 Sub-Committee in their inspection of Denison and Cook Wards, which comprise some of the worst places in Sydney, will find matter sufficient to engage their attention for some time to come; and we propose therefore, with the sanction of our Chairman, to obtain evidence in reference to the most glaring cases of overcrowding and its concomitant evils in the Borough of the Glebe, which we have had repeated invitations to visit; then to give a short description of Fitzroy Ward, and afterwards to inspect and report upon the worst portions of the Municipalities of Redfern and Waterloo. Our task being so far completed, we believe that we shall be in a position, in conjunction with our fellow labourers on No. 2 Sub-Committee, to give a tolerably exhaustive report upon crowded dwellings and areas in those portions of the city and suburbs which are palpably provocative of pestilence and disease, and which, in the interest of the community at large, call for immediate attention on the part of the powers that be.

With

With this programme in view, Dr. Read and I, accompanied by Sergeant Larkins, proceeded on Thursday, 27th instant, to Bay-street, Glebe, which runs down to Blackwattle Bay, and thence up a narrow street, the name of which we could not ascertain, at the commencement of the reclaimed land, into Cowper-street. M. Chapman,
Esq.
28 Jan., 1876.

The first house we examined in this street was a weatherboard building containing two rooms, owned by Mrs. O'Brien, and rented at 5s. a week; it was occupied by a boot finisher. This tenement was in a most ruinous state, almost tumbling down, and very dirty; there was not a single whole pane of glass in the windows, and scarcely any furniture in the rooms. The occupant, his wife, and three children live in it; they all looked very dejected and miserable; something must be wrong, as the trade of a boot finisher is a good one, and workmen find ready employment. The fence which used to enclose the yard of this house is nearly all gone, and the closet, erected over an old cesspit, has either been blown or thrown down, and the materials of which it was composed are fast disappearing, probably being devoted to the same use as the fence—for cooking purposes. There is no sewerage here, and the contents of the closet percolate through the soil into an open trench at the back of the premises. The whole place was filthy in the extreme, stinking, and unfit to be a dwelling-place for any human beings. I may mention here, as a singular fact, that in the course of our inspection to-day we did not find any firewood in the yards of the houses we visited. This may perhaps account for the dilapidated condition of the fences and out-buildings.

The next house, built of stone and brick, containing three rooms, is also owned by Mrs. O'Brien, and is in the same ruinous condition; the floors are broken, and there is scarcely a pane of glass in any of the windows. The tenants of the house just described are without a closet, but the occupants of this house are not quite so badly off, for they have an apology for one. A great portion of it, including the seat, is broken down, and is fallen into the pit; it has no door, the usual substitute, an old gunny-bag, not even being provided, and any person making use of it must necessarily crouch over the place where the seat used to be, and hold on by the door-posts which still remain. In this position, the boards on either side having long ago disappeared, he affords a spectacle of indecency to the occupants of all the adjoining houses. This closet occupies a prominent position in the back premises, and thus the whole neighbourhood becomes privy to the visits to it. The cesspit is in a most filthy condition, and there is no sewer to carry off the drainage.

We inspected another house alongside, which was in all respects similar to the last, including the privy. The rain comes through the roof freely. The landlady promised to put the place in repair, so we were informed, two years ago, but has not yet found time to do it. This house is occupied by six persons; the building and surroundings are in a filthy neglected state.

We next visited a brick and slab tenement containing two rooms, $9\frac{1}{2} \times 8\frac{1}{2}$ ft. and $9\frac{1}{2} \times 6\frac{1}{2}$ ft. (Pile, agent), rented at 3s. 6d. a week. This place is filthy, close, and ill-ventilated. The closet, originally built of paling, and erected over an old cesspit, is like a great many others we saw to-day, thoroughly worn out; as usual it occupies a prominent position, and affords to all the neighbours a clear view of the persons who make use of it.

We then examined a three-roomed weatherboard building, rented at 5s. (Pile, agent), in a similarly neglected state, without any ventilation, and having a closet of the worst description over an old cesspit; the yard appeared as if it had not been cleaned out for years, and the wood is fast disappearing from the fence which used to enclose it.

The next house (for which Pile is also agent) was occupied by five persons, and is in the same state of repair; there is no opening in the back wall, and consequently no ventilation. The closet, built of paling, is erected over a common cesspit, which was quite full so that the stuff oozed out at the back. The door of this place has long since disappeared, and there is evidently no intention to replace it. The tenants of the house who make use of the closet have, however, some slight regard to decency, and they make a feeble attempt to close themselves in by means of a sugar-basket which the occupant holds up before him until he comes out, when it is thrown down on the ground outside, to be picked up and made use of in the same way by the next comer.

Sugar-baskets are a great institution in this portion of the Glebe. The Colonial Sugar Company's works are close by, and the baskets are to be had for nothing; consequently you see them converted to all sorts of uses besides that which I have just mentioned; they form roofs for fowl-houses and dog-kennels, are used for repairing fences and out-houses, and will no doubt, in course of time, if the supply continues the same, be employed in building houses.

We inspected another weatherboard house—same agent—for which the above description will answer—no ventilation, and no windows except in front. The inside of this house was pretty clean, but that was owing to the tenant and not to any exertion or outlay on the part of the landlord. The closet was very foul, and in a peculiarly exposed condition. We did not see a sugar-basket near it, but there might have been one lying about, which is probable, as there was no door of any kind.

At the corner of Cowper and Broughton streets there is a piece of land about 66 ft. square, having a frontage to each street, on which is a house—Pile, agent—containing four rooms, the two front rooms built of wood and the back ones of brick. The tenant of this house stated that she had lived there for seven years, and that at one time it was in good repair and commanded a good rent, but it had been allowed by the landlord to fall into such a state of dilapidation that it now only rented at 2s. 6d. a week. It is dirty, close, and without ventilation. All the furniture in the front room was a table and an old box; in the inner room a few old rags for bedding; the fence is all gone, not a vestige of it left; the closet over an old cesspit stuck in the centre of the allotment without any roof, and with scarcely any sides; the back patched up with pieces of tin and iron—without any door—not even a sugar-basket; the whole place denoting misery in its worst form. The rain pours through the roof of the house, so the tenant informed us, as through a sieve. Altogether the premises are totally unfit for occupation, and should be replaced by a substantial dwelling, the ground being a valuable corner allotment.

On the east side of Broughton-street are three weatherboard houses roofed with iron, containing each two rooms with a small skillion at the back used as a kitchen and rented at 3s. 6d. a week. The rooms, which are 10×9 ft. and 10×6 ft., are very close and unhealthy; the tenants complain of the heat, and the stench which proceeds from the closets. These are built over common cesspits, which are nearly full. The fences are broken and repaired with old sugar-baskets; the filth appears to run from the yards into the closets, which after a shower of rain must always be full to the brim and spread their contents all

M. Chapman, all over the place. We can scarcely wonder at the many complaints about Blackwattle Swamp when we consider the mass of impurities from these sources which it must receive after a heavy fall of rain.

Esq.
28 Jan., 1876. On the west side of Broughton-street, some distance further down, there is a brick house containing two rooms occupied by a man and his wife, who is bed-ridden. The rooms are very close and unhealthy, the customary dead wall at the back preventing any ventilation. It appears that this house is without an owner, and has been taken possession of by the present tenant, who assured us it was all right.

We then went back to Queen-street, which is a continuation of Broughton-street, although diverging in a different direction. On the west side of Queen-street is a sort of court containing three two-roomed weatherboard houses, roofed partly with shingles, partly with iron, and other materials. These houses are almost tumbling down; they have been designed by the dead wall architect referred to so often. The occupants did not seem disposed to be at all communicative, but we saw enough to satisfy ourselves that the houses are unfit for habitation. The closet was as bad as any we have seen, and so exposed, being in the centre of the court, and facing the houses in Queen-street, that no one can approach it without being seen by the inmates of at least a dozen dwellings.

On the west side of Queen-street, and south of the last-mentioned premises, are two iron tenements, owned by Smith. One contains two rooms, and is rented at 4s. a week—a very close and ill-ventilated place; the other, originally the kitchen, but now let as a separate tenement, being just 8 x 8 ft., with a skillion roof—an awful hole, rented at 2s. 6d. This small close room is occupied by two women, one of whom told us she was 82 years old. She was a very lively old woman, and did not seem to care much about ventilation or drainage, though she objected strongly to the stench from a neighbouring cow-yard. At the time of our visit she was just starting, jug in hand, to the neighbouring public for some beer. We examined the cow-yard of which the old woman complained, and found stalls there for six cows. In the centre of the yard is a large pool of liquid filth, which must accumulate to a depth of 2 feet before it can reach the surface-drain intended to carry it off. As there has been no rain lately, and the pool in question was over a foot deep, we may conclude that this is a permanent nuisance, contributing its fair share to the unhealthiness of the neighbourhood.

I cannot conclude my account of to-day's inspection without calling special attention to the state of the gutters in Queen-street and the streets running parallel to it. Every provision seems to have been made for the drainage of the yards directly into these gutters, but nothing further has been done, and there the refuse lodges and remains. It comprises dead dogs and cats, dead fowls, bones, decayed vegetable matter of all sorts—in fact, rubbish and waste material of every kind. There it lies for weeks at a stretch. The liquid portion of it finds its way down Bay-street to a vacant piece of ground off that street about 60 ft. square, from which it seems to percolate between and under the houses in the direction of Blackwattle Bay. Many of the persons with whom we got into conversation complained of the continued neglect of the Glebe Municipal Council in not having the gutters swept out for months. One gentleman told us that Dr. Markey had been attending his family for two months, all of them being sick with scarlet fever, and that the doctor had stated that the illness was caused by the filthy state of the gutters in the street. Queen-street is a narrow street only about 20 ft. wide.

Some steps ought, we think, to be taken to prevent people from crowding these narrow streets and lanes with buildings. The attention of the Government should be called to this matter at once, for delay is not only dangerous but fatal. These are not small right-of-ways leading out of large streets, which afford a certain amount of ventilation, but narrow lanes running parallel to each other, in which the houses are crowded together in such numbers as to render health to the residents impossible; it is overcrowding in its worst form.

We have just had an opportunity of reading the Report of No. 13 Committee on the prevalence of scarlet fever, which states in clause 12 that it is in such localities as we have described "among a population predisposed to disease, and with depressed vital powers less able to resist its attacks, that an epidemic finds its ready victims."

Each day's inspection only serves to deepen the conviction that the conditions under which a large portion of the inhabitants exist in the crowded areas in Sydney—viz., want of ventilation and proper drainage, and insufficient air and floor space—are the real provocatives of fever and disease. Publicity is said to be a panacea for all evils, and we have every confidence that these evils at least only require to be generally known to ensure the passing of a thorough measure of sanitary reform.

We finished at 6:30 p.m.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 1 Sub-Committee.

TWENTY-SIXTH DAY, MONDAY, 31 JANUARY, 1876.

Borough of the Glebe.

264. Mr. Chapman gave the following evidence on behalf of himself and Dr. Read:—

M. Chapman, Esq.
4 Feb., 1876. Met Dr. Read and Sergeant Larkins at the City Club at 4 o'clock on Monday, 31st January, 1876, and proceeded to visit that portion of the Glebe Borough abutting on to Blackwattle Swamp. We passed down Bay-street, and turning into Crown-street, which is 24 ft. wide, examined that part of it which intercepts Cowper-street. The houses in this locality are of a mixed character, many of them being in a ruinous state and much overcrowded; the roadway is very rough. The water channels or street gutters receive all the sewage and filth from the yards, and are full to the brim; the closets are erected over common cesspits, and in many instances their contents drain into the street gutters, which emit a most unwholesome stench. This mode of getting rid of the offensive liquid matter is frequently a contrivance on the part of the tenants of the houses, who lay down at a depth of about a foot from the surface

a small pipe drain leading from the closet in the direction of the gutters; and this is done, it would appear, without the sanction or knowledge of the Municipal Council; but as the houses are not connected with any sewer to receive the drainage the residents can scarcely be blamed for adopting this method of discharge.

M. Chapman,
Esq.
4 Feb., 1876.

We next examined Mitchell-street, which runs from Broughton-street to the Glebe Road. This street is about 66 ft. wide. Some of the houses in it are very good, and some in a wretched state of dilapidation. Very little attention seems to have been paid to the question of ventilation, and from the number of persons we observed about the houses there must be a great deal of overcrowding. There is a large sewer running down the centre of the street, which takes a great portion of the storm water and yard drainage from the upper part of the Glebe and Forest Lodge. This sewer runs under Broughton-street and empties on the east side of that street on to a vacant piece of land, from which it finds its way down an open creek for about 150 yards on to the reclaimed land at Blackwattle Bay, where, no doubt, it adds materially to the abominable stench which has lately been the subject of so many complaints.

In a narrow street running into Mitchell-street from Norton-street we noticed a filthy stream of a most objectionable character trickling down at the side, which goes when it is sufficiently high into the water channel of Mitchell-street. It is not high enough at present to get away by means of that channel, and there it remains stinking, festering, and poisoning the atmosphere around. Tracing this stream to its source we found that a great portion of it comes from houses and closets at its head.

We went thence into Glebe-street, which, between Mitchell and Norton-streets is only 17 feet wide. One side of it is built upon, the houses are very old, and in many instances in a most dilapidated condition, some of them almost tumbling down. One of those we examined was a weatherboard building containing three rooms, the largest 15 x 9 ft., and the other two 8 ft. square, with a height of 8½ ft. This house was hot almost to suffocation, having no ventilation or ingress for air except the door; it was also in a ruinous and filthy state, the yard small and full of rubbish. The closet, built over an old cesspit, is 3 ft. square and 4 ft. 2 in. high; the seat is about 8 in. high, the whole structure having apparently sank several inches bodily into the pit; there is no door to this closet, which is without exception the smallest we have come across. The sewage and filth in the street-gutter at this point were very bad; the gutter looked as if it had not been cleaned out for months.

In a narrow lane about 12½ ft. wide, running from Norton-street to Denham-street, are five houses built of wood, and containing two rooms each—Bennett owner; rent 4s. 6d. a week—the rooms, which are 12 x 10 ft., are badly ventilated, there being no windows at the back. In front of these houses at the edge of the lane are an equal number of closets belonging to the houses in the neighbouring street—common cesspits, stinking badly. These with their own closets—also stinking cesspits—which are in the yard at the back, 15 ft. wide, place the unfortunate residents in this lane as it were between two fires; they have the same stench back and front, and no matter which way the wind blows it is a foul wind for them.

The next lane, running parallel to the one just described, is 14 ft. wide, and is occupied by small houses of a similar description badly ventilated, and having cesspits of the same kind in the yard; there is no drainage, and the houses and closets all seem to be huddled together in a most indiscriminate fashion. We counted no less than ten of the latter in a space of 3,000 ft. square. The lane itself, besides being rough is filthy and actually stinks. There was a general outcry against the Glebe Municipal Council for not having it cleaned out.

We next proceeded to Campbell-lane, which is 15 ft. wide, and is also very rough and very filthy. The drainage from the adjacent yards runs into it. This part of the Glebe seems to be composed of tumbledown fences, narrow streets and lanes, stinking cesspits, and surface drains and gutters choked up with house refuse.

In Mitchell-street we noticed six houses recently built, called Swiss Terrace, which seemed to be nicely finished, and very suitable residences for working men, but no provision has been made for drainage, and all the filth runs from the back yards into Campbell-street, whence it finds its way into a hole where it accumulates, stinking horribly, until it reaches a head of 2 or 3 feet before it can get away; ultimately it goes into Blackwattle Swamp.

We then followed the course of the Glebe Road and into Francis-street and Franklin-place, where we found the same unwholesome conditions existing—common stinking cesspits and no drainage. One house, built of brick, and covered with iron, containing two rooms 12 ft. x 7 ft., and 11 ft. x 6 ft., with skillion roof; average height 5½ ft.—Hanshaw, owner—was occupied by a woman and two children. This tenant told us that she had lived there for nearly twelve months, and had been sick almost all the time. There is no opening of any kind in the back wall of the house, which is alone enough to make it a close unhealthy tenement; and a stream of filth from the neighbouring houses runs down within a few feet of the door. The heat and stench of this place were positively sickening; the sun is on it for the greater part of the day, and there is nothing surprising in the fact that the occupant is continually sick; the wonder would be that she could live at all in such quarters. This is altogether a very crowded locality.

We examined a cow-yard in Francis-street. The cows which are milked here must be of the poley breed, for the only entrance to the yard is a passage between two brick walls, just 2½ feet wide. We found stalls for three cows, which were filthy in the extreme. This place is owned and occupied by Mrs. Ryan, a milkwoman, and it certainly reflects no credit upon her. The house is built of weatherboard and contains two rooms, 15 x 11 feet, one over the other; there is no opening in the back wall, except where some of the boards have tumbled down from sheer decay and have not been replaced. This place cannot fail to be very unhealthy, and the place allotted to the cows which is very small is close to the door of the dwelling.

Before concluding this cursory description of the lower portion of the Glebe Borough I wish to call attention to the urgent necessity of having some proper system of sewerage provided. The streams of filth and sewage which run down the narrow streets and lanes in that locality are disgraceful, and must be strongly provocative of disease. If such a state of things exists now, after a long continued drought, what must it be when rainy weather sets in. The closets are almost without exception in a neglected and disgusting condition, and it is pretty certain that a large amount of the nuisance at Blackwattle Bay has been contributed from these sources. The system of scavenging adopted here is a very ingenious and perhaps an economical one, but the residents must suffer greatly from it. The refuse is all swept or scraped together into small heaps on to the roadway, and there left for an indefinite period. During this time the wind winnows the heaps, and carry the dust and finer particles of matter back into the yards of the houses, so that when the Council carts come round there is only a minimum portion to remove, and one

M. Chapman, Esq.,
4 Feb., 1876.

cart can do the work of ten. The heaps are then of a very solid consistency, and have to be dug up and shovelled into the carts. In short the only system adopted for cleansing these streets appears to be a system of studied neglect. We were informed by several residents that these heaps of waste material sometimes lie untouched for months at a stretch, and that the occupant of a house putting out a lot of refuse to be taken away can form no calculation as to the time when the Glebe Corporation cart will call for it.

We finished our day's inspection at 6:30 p.m.

WEDNESDAY, 16 FEBRUARY, 1876.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 2 Sub-Committee.

TWENTY-FOURTH DAY, THURSDAY, 27 JANUARY, 1876.

Denison Ward.

265. Dr. Dansey gave evidence on behalf of himself and Mr. Palmer as follows:—

G. F. Dansey,
Esq.,
16 Feb., 1876.

Started with the Mayor from the Town Hall at 4 o'clock on Wednesday, 27th January, and proceeded, accompanied by Constable Milne, to Victoria-street, leading out of George-street by the "Steam Engine Hotel." Inspected two brick and shingle cottages, owned by Mr. Bates, containing two rooms each, 10 x 10 ft. and 10 x 8 ft., in one of which we saw a female apparently dying. There is no ventilation, there being no opening, either door or window, in the back wall; the yard is in front. The house nearest to George-street, which is in a most dilapidated condition, is let at 6s. a week. The ceilings threaten day and night to fall on the heads of the occupants; there is one closet for these houses, a wooden shanty about 4½ ft. high, with the back part broken down, and exposed to every passer-by in the street.

We next came to ex-Alderman Linsley's houses, which are all provided with patent cisterns and are in admirable condition.

Nos. 90 up to 106 are owned by Mr. Smart, and contain four rooms each; the closets are very old and one of them has no door; they are all erected over common cesspits; most of them are full and in a bad state of repair. The houses are good but want painting and doing up.

At the bottom of Smart's houses is a flour mill belonging to Penell, at the rear of which is a weatherboard shanty covered with zinc, tin, iron, and wood, with weights to keep the roof on. The occupant, to whom the house formerly belonged, now pays 5s. a week rent for it; it is in very bad repair and very damp in wet weather as the rain comes through the roof. This house occupies a valuable piece of ground 60 x 60 ft. We were told that at one time it was impossible to pass by this place on account of the water; it has now been filled in with rubble.

We next inspected a stone house encroaching on the alignment of the street, containing a front and back room with skillion room attached; the ceilings are tumbling down and the place altogether in bad repair; the privy a common cesspit of the most primitive construction, which was covered at one time but is now without any roof. In this house live a man and his wife and six children; the front room is 10 x 8 ft. and the back room 16 x 8 ft.

Behind it is a stable of a very eccentric order of architecture; the sides are enclosed with battens and the roof of a variety of materials, including slabs, zinc, iron, &c., and kept in their places by heavy stones placed upon them.

Near the Railway, on the east side, covering a space of about 20 yards square, is a collection of shanties, some built of wood, others of rubble and stone, dotted irregularly over the area without any regard to order, each facing a different point of the compass, apparently constructed on the free selection principle in the early days of Sydney. They are mostly two-roomed tenements, occupied by working men, draymen, and others, renting at 7s. or 8s. a week. We entered two or three of them and found them pretty clean and not overcrowded but wretchedly ventilated; the rooms average about 10 x 8 ft.—Stinson, owner.

We entered one house standing back from the street, built of weatherboard, zinc, battens, and slabs, and occupied by a milkwoman, who told us that formerly it used to float whenever the rain fell heavily and the tide rose; she said it used to be lifted up bodily. The ground is low and was reclaimed when Darling Harbour was filled in. In the centre of this lot of houses we found a closet without any door and in very bad repair, the roof apparently about to fall.

In Engine-street, Nos. 62 and 64, are stone and shingle tenements, having two rooms and a kitchen each, but no yard. Here we found a closet used by the inmates of ten houses. Taking the average number of inmates to each house to be four, there would be forty individuals thus accommodated. The tenant of one of these houses said there was no lock to her door, and the landlord would not supply one, and so she was obliged to stop at home.

We passed a number of other houses which were in good condition, but the closets, almost without exception, were full and very offensive. The houses have all the old-fashioned sash-windows, and common privies which have evidently not been cleaned out for months, or perhaps years.

Proceeding along Engine-street we came to a weatherboard and shingle residence, which spoils the appearance of the street by being placed out of the line, besides preventing the passage of a current of air for ventilation.

We next inspected the Castlemaine Brewery, owned by Prendergast & Co., where there are thirty-five men employed. Here we found that the old closets were being removed, and new ones erected in their places. The latter are not supplied with cisterns, but all the waste water from the brewery is laid on to them so as to wash their contents into the sewer outside, the said sewer being properly trapped. Everything on these premises appeared to be clean, and to show good management. The only complaint made to us was of the smell of the Hay-street sewer, and indeed to any one passing down Hay-street this is unbearable.

In

In this neighbourhood there is a large amount of surface drainage running from the houses and yards on to unoccupied ground, which should not be allowed, as the houses could easily be connected by pipe-drains with the sewer. G. F. Danscy, Esq.

We inspected Nos. 82 and 84, Quay-street, where we saw nothing calling for notice, except that the closet belonging to one of the houses—a common cesspit, not in a clean condition by any means—is within 6 ft. of the back door. They contain each two rooms and an attic, and belong to Mr. Harris. 16 Feb., 1876.

Close by we came to a large piece of ground used as a cow pasture, in which were thirty cows chewing the cud of reflection, and possibly ruminating on the probability of rain and a fresh supply of green food, there not being a blade of grass in the paddock.

We returned at about a quarter-past 6 o'clock.

TWENTY-FIFTH DAY, SATURDAY, 29 JANUARY, 1876.

Started from the Town Hall with the Mayor and Constable Wirrel at half-past 10 o'clock on Saturday, 29th January, and went first to Goulburn-street West, off Sussex-street, where we inspected three stone houses owned by Mrs. Crighton, which have all the old-fashioned ventilation; the drainage is also very defective. G. F. Danscy, Esq. 16 Feb., 1876.

We then turned into Chard's buildings, owned by Mr. Chard, of Newtown, which comprise five two-roomed tenements. Edward Bruce—a resident in this place for the last nineteen years—collects the rents. Four of these houses are rented at 6s. and one at 6s. 6d. a week. They are badly ventilated, having no opening of any kind in the back wall—the rooms are about 12 x 10 ft.; three closets over common cesspits belong to them, but are used also by the inmates of four houses in Goulburn-street, and one facing Dixon-street. We noticed a great number of children in this locality in all stages of dirt and neglect, and were surprised to see so many half-clad girls from 14 to 16 or 17 years old idling about the houses and yards, who might be getting good wages and a comfortable home if they went out to service. All this property is in a frightful state of dilapidation, and the place cannot fail to be unhealthy on account of the surface drainage.

Nos. 17 and 19, Goulburn-street, belonging to Kinsela, are old-fashioned but tolerably substantial houses, though in great want of repairs. The railings are broken down and the pillars supporting the verandah are falling to decay. They are badly ventilated, and the closet is over a common cesspit.

Crossing over to the right of Goulburn-street, below No. 8, we came to Stedman's-place, in which there are three houses—one empty but occupied twice a week by the City Missionaries as a meeting-house. The shingles were partly off from the roof of this house, which is built of weatherboard, and is in the last stage of decay. The other two have stone gables with weatherboard fronts, and are also in bad repair and fitted with the old-fashioned sashes, one window, presenting a surface of zinc. They were both locked up and the inmates away with the exception of a little child in one of them, so that we could obtain no further information. We noticed, however, that the water is supplied to these houses by means of leaden pipes.

Nos. 1, 3, and 5 on the opposite side are two-roomed houses, belonging to Shuttleworth, rented at 5s. a week. The rooms are 12 x 10 ft., fitted with old-fashioned sashes, and having no opening of any kind in the back wall and no yard in front, the doors opening into the street. The house slops are emptied directly into the gutter, and the solid refuse placed in a heap to be taken away by the Corporation carts. The inmates have to come out of their houses into the street and go down to the bottom of a row of houses, six or seven in number, in Dixon-street, to go to the closet which they make use of, which is one of three built over common cesspits. The closets are however in fair repair and were locked, which showed a desire to keep them as clean as possible; but they comprise all the privy accommodation afforded for the occupants of nine houses.

In Dixon-street there are six two-roomed tenements, belonging to Shuttleworth. In one there is a family of six persons, in another four, in another three, in another four, in another two, and one is empty. This is the row of houses just referred to.

On the left hand side of Dixon-street is a court containing two 2-roomed tenements, rented at 6s. a week each (owner Watson), occupied to all appearance by persons of very doubtful character. They are without proper ventilation, having no opening in the back wall. There is an old closet, a common cesspit at the end of the court, which is used by the occupants of these houses and by those of two others in the same street—at least twenty persons.

We also inspected in this street a weatherboard building in a very bad state of repair, belonging to Gregory Board, who also owns three houses in a very dilapidated condition up a court close by. With regard to ventilation however these houses surprised us, for they had actually a small window at the back in both the upper and lower storeys. There is no yard attached to them, the court in front serving the purpose of a yard. At the entrance to the court on the other side of it there is another tumbledown shanty of the same description. These tenements we understood are let on a lease from the owner to Mr. Lennon.

We went along the whole length of Dixon-street and noticed several new houses in course of erection, and were glad to observe signs of improved ventilation in the style of building, and also provision for drainage.

In Harbour-street and Little Harbour-street the houses have been recently built, and are in good condition. In all of them the windows are made to open at top as well as at bottom; many of them have French windows opening to the ground, and where possible the water-closets are fitted with cisterns. There is no sewer along the street, and the house slops and refuse go into the gutters and find their way into the nearest gully-shaft as best they can.

There are also new buildings going on in Darling-street, which has lately been named Burns-street.

Since we commenced our house to house inspection we have visited and described as well as we could the crowded dwellings and areas in Gipps and Macquarie Wards, and we have now nearly finished Denison Ward, which towards Parramatta-street and the head of Darling Harbour comprises a great number of small tenements for which there is only surface drainage, and where there must necessarily be a good deal of sickness, especially among the children and their mothers who are almost always at home and

G. F. Dansey, Esq., and do not get fresh air as the men do, who go to work elsewhere. Our next duty will be to inspect Cook Ward, which comprises some most unwholesome, ill-drained localities, which have contributed greatly to the mortality of the city during the scarlet fever epidemic. It is also proposed that we should inspect the various factories and workrooms, in order to find out if any evils exist in connection with them in the shape of overcrowding and insufficient ventilation, and also to ascertain the ages of the children employed in them, and the number of hours they have to work.

We returned at about a quarter to 1 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

TWENTY-SEVENTH DAY, WEDNESDAY, 2 FEBRUARY, 1876.

Redfern and Waterloo.

266. *Dr. Read* gave evidence on behalf of himself and Mr. Chapman as follows:—

R. B. Read,
Esq.
16 Feb., 1876.

Started from the City Club at 4 p.m., on Wednesday, 2nd instant, accompanied by Alderman Chapman and Senior-Sergeant Larkins. Entered the borough of Redfern in Pitt-street and proceeded along it from Cleveland-street to Buckland-street, into a portion of Waterloo. At the commencement of Cleveland-street, on its eastern side, we noticed a great deal of surface drainage from the houses abutting thereon.

Between Cleveland-street and the Albert Ground is a large swamp, originally Morehead and Young's property, and the quondam receptacle of all the night-soil of the city. On this area buildings are already in course of erection, but when it is built over it will be a very unhealthy site. With very little trouble this swamp might be drained into Shea's Creek, its natural outfall.

Facing Elizabeth-street is a row of fifty-two houses of a good description, but the yards at the back are small, and the closets erected over common cesspits, the soakage from which percolates into the bog of which the soil in this locality is composed. At the back of these yards, separated by what will hereafter be a lane 18 ft. wide, is a considerable space of dry bog scored with channels which convey the slops and filth from these houses and give off a very offensive smell. In one part of this ground the channels converge and form a foul stinking pool. We noticed that some person had fenced in the ground at this spot, evidently with the intention of building upon it. The principle adopted here, as in a good many other places, of disposing of the sewage, is very simple—get it off your own land on to your neighbour's and let your neighbour do as he likes with it. Several yards attached to these houses have large midden heaps in them. The amount of refuse lying about in this way is very large, for there appears to be no system of scavenging carried out in Waterloo. The closets were many of them brim full and disgustingly offensive and preparations had been made to empty them. This is done by sinking a second pit about a couple of feet from the closet into which the contents of the old pit are made to run by tapping the wall. The result of this mode of disposal will be that when rains set in a great deal of water will become contaminated on the surface of the bog, and the health of the residents in the locality will suffer. If the proposed Shea's Creek sewer is carried out it will be a great benefit to the district. Fortunately the inhabitants of the houses in this street are not dependent upon wells for their water, but are supplied by the city.

Wellington-street, at its eastern end, is terminated by Alderson's fellmongering establishment, on Shea's Creek. Proceeding westward on the southern side we came to two houses, one built of weatherboard and the other of weatherboard and brick. Between the two is a narrow passage leading to what may be called a court, containing three weatherboard cottages belonging to Smith's Estate. There is no water supply, and in this court are six cesspits all full and quite close to each other. There is a well there also which is fortunately empty, otherwise the water would infallibly be contaminated by the percolation of fecal matter from the closets.

We next inspected a two-roomed brick house in a very dilapidated state; here also there is no water supply; all these houses and a great many more hereabouts obtain water from holes on the banks of Shea's Creek. One which we examined was 5 ft. deep and contained 10 inches of water, this water being on a level with the water in the creek, which flows from Alderson's fellmongering establishment, and which also receives all the drainage from the houses in Surry Hills and a portion of Redfern. We can only attribute the fact that the population of this district is not decimated by fever to the large air breathing spaces they enjoy.

Immediately at the back of Mount Carmel is a block of dilapidated weatherboard houses with very defective ventilation. One of them is a miserable three-roomed cottage belonging to M'Pherson, which is let out for night lodgings.

On the north side of Wellington-street are two semi-detached brick houses—owner, Schimmel—rented at 10s. a week. We examined the water drawn from the well which supplies these houses and found it to be disgusting; one of the tenants, a very intelligent woman, said she was obliged to boil the water before she could use it; she actually shuddered when she spoke of it. This well is 45 ft. deep and is plainly polluted by the percolation of matter from cesspits full to the brim situated higher up, through the sandy soil.

We examined a large number of houses in this locality for which a general description may suffice. Facing Pitt-street and having Wellington-street on one side and Raglan-street on the other is a huge sandhill. The houses are generally built facing these streets, but some are placed on the crown of the hill, and between the latter and the houses in front are numerous cesspits. The wells are between the cesspits and the houses in front, and the soil being sandy the sewage must find its way into them from the closets. When the autumnal rains set in and this deleterious matter is carried, as it will be, wholesale into the wells, we fear greatly that a most serious mortality will result. The present drought, though inconvenient to most people, is a positive blessing to the people of this district, whose motto should be "let well alone."

We measured one of the houses on the top of the sandhill; it is built of brick, semi-detached, and has no opening in the back wall. It contains two rooms 12 x 11 ft. and 8 ft. high, with a kitchen, skillion roof, at back, 8 x 6½ ft., and averaging 6½ ft. high. It is badly ventilated throughout and very close.

In

In front of this house is the closet and back yard of a house fronting Pitt-street; in the yard is a well about 26 ft. deep which—it is no use mincing the matter—receives the drainage from five closets, with which it may be said, considering the nature of the soil, to be directly connected. Adjoining this is another yard containing a well between two cesspits situated at a distance of $11\frac{1}{2}$ ft. on either side of it; the soil is sandy, and the closet matter in that short distance can only be imperfectly filtered by the time it reaches the well. This is horrible!

We finished our inspection at a quarter past 6 o'clock.

R. B. Read,
Esq.
16 Feb., 1876

Personal Inspection

By No. 2 Sub-Committee.

TWENTY-SIXTH DAY, MONDAY, 31 JANUARY, 1876.

Denison Ward.

267. *Mr. Palmer* gave evidence, on behalf of himself and Dr. Dansey, as follows:—

Started from the Town Hall with Dr. Dansey at half-past 2 o'clock on Monday, 31st January, unaccompanied by a policeman. Acting upon the suggestion of our Chairman, Professor Smith, that we should take an early opportunity of inspecting the various factories and work-rooms in the city, we paid a visit to Mr. Vicars's (late Barker's) tweed manufactory in Sussex-street. We had previously informed Mr. Vicars of our intention and had received an invitation from him, and I take the opportunity of acknowledging his courtesy in showing us over his establishment, and affording us all the information in his power.

B. Palmer,
Esq.
16 Feb., 1876.

The establishment affords employment to 100 work-people—twenty men, thirty women, and fifty children, the latter being chiefly occupied in picking up and sorting the small pieces of waste material. The building which contains the machinery for carding, spinning, and weaving is a large shed, about 200 x 100 ft., divided into separate work-rooms, freely ventilated, and affording plenty of light as well as air; and taking into consideration the heat and smell, necessarily belonging to machinery, was as clean and wholesome as could be expected, the only portion of the establishment which seemed deficient in light and ventilation being an underground compartment set apart for the operations of an instrument termed "the devil," which is used to tear up the wool into shreds; this destructive work it performs with great rapidity. Three lads of the average age of fourteen years, who, in the obscurity of the place, looked like veritable imps of darkness, were employed to work and feed this machine. The washing and scouring department is much better lighted and ventilated, as is also the sorting-room, which looked particularly clean and comfortable. We also noted the process of dyeing, which is done in a separate compartment, and appears to be conducted, in common with the other portions of the work, with every regard to the health of the operatives. The only objectionable point we observed in connection with this undertaking was the number of children employed, who are of all ages down to ten, who are thus deprived of the opportunity of going to school which would otherwise be afforded them.

Mr. Vicars informed us that only one accident had occurred in four years on the establishment. It is a matter of surprise that such a large and important industry should be carried on in the heart of the city and be comparatively so little known.

The inspection, although I have but briefly described it, occupied a couple of hours.

We visited several other places in the neighbourhood, but did not find anything calling for special notice, except the unaccountable efforts of the residents, in many of the houses by no means well ventilated, to exclude every breath of fresh air from their dwellings by closing their windows and doors. This is the case in almost every court or lane which we have had occasion to inspect.

We returned at 6 o'clock.

TWENTY-SEVENTH DAY, TUESDAY, 1 FEBRUARY, 1876.

Denison Ward.

268. *Dr. Dansey* gave evidence on behalf of Mr. Palmer and himself, as follows:—

Started from the Town Hall with the Mayor, but without any police escort, at 4 p.m. on Tuesday, 1st instant, and proceeded to the west end of Denison Ward to Bay-street, which divides the City from the Glebe. Going down Bay-street from Parramatta-street we came to three houses, in good repair, alongside of which, on the north side, is a lane flanked by a wall, in which there is a large hole with a fall of about 10 ft. on to a piece of vacant ground, which is highly dangerous to children playing about.

G. F. Dansey,
Esq.
16 Feb., 1876.

Passing the corner of Victoria-street we came to a nameless street, in which all the drainage ran along the surface and was very offensive.

Thence to M'Phee's-buildings, which consist of fourteen houses containing each two rooms and a kitchen, and let at 7s. a week; all fitted with the old-fashioned sashes and having common privies. The children living in these houses all go to school—some to St. Barnabas's and some to St. Benedict's. The cellars in the last six houses are occasionally full of water. In one of these houses we found an old man, eighty-six years of age (Thomas Hart), who told us he had been living in Sydney for sixty years, looking hearty for his age, and holding his own despite the surface drainage, want of ventilation, water pollution, and other drawbacks, under which conditions he must by this time be thoroughly acclimatized.

Close by is a place called Terry's-buildings, consisting of four houses. On the left of them is a large vacant space, on which the drainage of all the houses in the neighbourhood seems to have accumulated, which stinks abominably. This place, and others like it, appear to be designed to support the medical profession, for they comprise almost every source from which fever and disease are fed; the stench from the open surface drains is positively poisonous, and there is not sufficient air space to carry off the noxious gases from the houses.

We next went to Athlone-street, where we examined a peculiar-looking structure covered with galvanized iron, tin, shingles, and other materials. It has the appearance of having been originally a stable, but has since been converted into a human habitation, and a lean-to of a similar grotesque style

of

G. F. Dansey, Esq.
16 Feb., 1876.

of architecture added to it, and used as a shed for either horses or cows. On the left-hand side of the street is a weatherboard and shingle tenement belonging to Mr. Fanson, which is noticeable chiefly on account of the disgusting old privy in the yard, and the fact that all the drainage from it runs along the surface down to Athlone-place.

Opposite to the last-mentioned house, on the other side of the street, is a house occupied by Mr. Garsed (owner, M'Quinn), which appears to be built of pine, resting on supports of brick and stone, with shingle roof. It is in a most dilapidated condition. The tenant said she could see daylight everywhere, and it suited her during the present hot weather. During the rainy season it must be very damp and unhealthy. As a specimen of utter dilapidation this tenement is worthy the pencil of an artist. We found great difficulty in obtaining any information from the residents in this locality in answer to our inquiries as to the owners of properties, the alignments, or even the names of the streets. One woman, to whom we addressed ourselves, confessed that she had lived there for fifteen years, but she did not know to whom the house belonged or what street it was in. We did not ask her own name in case she might have forgotten that also. "Where ignorance is bliss 'tis folly to be wise."

In Athlone-place we found a row of four-roomed tenements called Elphinstone's buildings, built of brick and slate. Here the ventilation was good, there being windows at the back as well as the front. All the houses in this locality are apparently occupied by persons who cannot afford to pay much rent; some of them are very badly shingled, and they are crowded together in very confined spaces.

We went on to Owen-street where the houses are built of brick and shingle and are mostly two-roomed tenements with a small kitchen to each. The houses at the west end of this street are flooded in wet weather by the drainage from Bay-street and the surrounding localities. This portion of the city is supposed to have been originally a Government grant to a person named Owen, and since transferred—how we could not ascertain—to Messrs. Hardman and Carter.

At the bottom of Athlone-place are a number of small tenements—brick and shingle—all having the old-fashioned ventilation, i.e. windows on one side only with fixed upper sash, and common privies. All the drainage runs along the surface of the ground in open gutters, and the streets being very narrow the occupants of the houses get the full benefit of the poisonous exhalations.

In Ultimo-street, starting from the east end, we found the houses and cottages to be of a better description, but on the left-hand side we noticed two wooden shanties which require a good deal of repairing.

Further on we came to ten very nice cottages, owned by Capt. Charles, containing three rooms each and kitchen, let at 8s. a week. These are well ventilated, having windows which open at top and bottom, but all the drainage is on the surface.

In coming into Bay-street again we found six houses belonging to Mr. Hunter. In front of these houses the Glebe drainage pours into the street in a regular stream which stinks horribly, and is sufficient, taken in conjunction with the proximity of Blackwattle Swamp, to give rise to diseases of all kinds.

Chambers-street, belonging to Mr. Hunter, contains twenty-four houses, having each two rooms and a kitchen, and rented at 6s. a week. The occupants of these tenements were loud in their complaints of the horrible and continual stench. Here we saw a number of children who do not go to school; the parents do not like to send them, but we could not get out of the latter any sufficient reasons for keeping the little ones at home. At the bottom of this street runs the creek which carries off the waste water from the Colonial Sugar Company's works. This creek is the subject of bitter complaints; every one seemed to denounce it as a nuisance; yet strange to say allotments of land on its very banks are fenced off and have nice looking cottages recently erected upon them. Decidedly there must be a suicidal tendency among the residents of this neighbourhood when such poisonous places are selected as building sites.

This part of Sydney requires immediate attention, especially in reference to its drainage; unless some improvement takes place in this respect it is liable at any moment to the outbreak of some deadly epidemic. The conditions which exist must at least so predispose the inhabitants to receive disease that when it does make its appearance it will assume its worst and most fatal form. The deposit on all sides on the surface of deleterious matter in the shape of drainage and house refuse is continually generating gases which are most inimical to health.

We returned at about a quarter past 6 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

• TWENTY-EIGHTH DAY, SATURDAY, 5 FEBRUARY, 1876.

Denison Ward.—From Parramatta-street to Blackwattle Swamp.

269. Dr. Dansey gave the following evidence on behalf of Mr. Palmer and himself:—

G. F. Dansey, Esq.
16 Feb., 1876.

Started with the Mayor from the Town Hall at 10 o'clock on Saturday, 5th instant, accompanied by Sergeant Attwell, and proceeded to May-street, in Denison Ward. On entering this street at the south end we found a weatherboard shanty, roofed with shingles, occupying a space of 15 x 20 ft., and containing two stories, with a window in each. The upper sash of one window was covered with tin and rags, and in the other window there were two panes of glass, the rest being tin; the lower sash of both windows was boarded up. The inmates of this dilapidated tenement were not at home, and we could not make a closer inspection of it. We were told that on Saturday night or Sunday morning they were generally to be found there fighting and drinking. On a vacant piece of ground, and apparently belonging to this dwelling, is one of the oldest and most tumble-down privies we have seen yet. Nothing more wretched could be imagined; it is 3½ ft. high, leaning over at a considerable angle, and shored up with a couple of palings to keep it from falling. The back is enclosed with an old gunnybag. The seat has long ago been destroyed, and nothing remains but a rail across where it should be. The roof is partly gone, and what is left of it is composed of pieces of iron, tin, bags, and paling. It has a door in front without fastening, and hung on a chain; it is open to all comers, being about 12 ft. from the street, and not enclosed by a fence. As a matter of course it is very offensive, and adds its share to the nuisance in this neighbourhood, caused by the filthy open drainage.

We

We next came to a two-roomed brick and shingle house, rooms 10 x 12 ft., and 10 x 8 ft., with a small kitchen attached, belonging to Mr. Goddard and rented at 7s. 6d. a week. Here there is an old privy about 5 ft. from the kitchen, which is in a very stinking condition. The roof of the kitchen is much broken. From the surroundings of this tenement, which is occupied by a man and his wife, and two children, we concluded it to be a most unhealthy abode, but we were assured in answer to our inquiries that they were hardly ever ill, and we could only suppose that after a time people get acclimatized to this sort of thing, and can live under conditions which are usually considered to be destructive to health.

G. F. Dansey,
Esq.
16 Feb., 1876.

The next three houses belonging to Mr. Cowper are in good repair, but have all of them the old-fashioned ventilation and common privies. All the drainage from these houses runs into the street gutters.

Then we came to three houses containing three rooms each, owned by Mr. Grogan. In one of these houses we found the roof of the back room much out of repair, so that the rain comes in during the slightest shower; half of the back window is glass and half tin. In another of the houses there was no furniture in two of the rooms, all the household goods of the family being contained in the skillion room at the back. These tenements are all in a sad state of repair, and the inmates told us that they intended to leave them as soon as possible. We were much struck with the dirty and half-nude state of the women, old and young, in this locality; we scarcely saw a girl or woman with boots or shoes on.

The next house we inspected was a two-roomed brick and shingle tenement, belonging to Mr. Farrell. Here again tin supplied the place of glass in one of the back windows. In the yard we found a large hole full of dirty water and soapsuds, and an old and stinking closet over a common cesspit. Three cows are kept here, which do not add to the cleanliness of the place. In the back room, which is 13 x 8 ft., there are two four-post bedsteads, with just sufficient room to pass between them; the ceiling of this room is tumbling down, and the walls are excessively damp. In all these places the drainage runs into the street gutters, either along open drains with a pipe under the footpath, or under the houses in irregular channels in the same direction.

We inspected another house in the same street, belonging to Mr. Farrell, which is also in a very dilapidated state. The closet attached to this house, which appears to have been without a roof until very recently, has now a patched-up covering composed of tin, iron, and other materials. We could only wonder that landlords in their own interest could allow their property to fall into such utter decay. In this house lives a man, his wife, and five children, and we looked round in vain for any signs of bedding and conveniences appropriate to such a family. This man is a quarryman, and from what we could learn in constant work except when he is "on the burst." None of the children go to school.

The closet belonging to the adjoining house, also owned by Mr. Farrell, is broken down and exposed to public view, being without any fence or enclosure; a small sheet of tin does duty for a roof.

No. 28, in this street, is a wooden building owned by Wallace, a plumber; it is unoccupied, being in such a state of decay that it is quite uninhabitable; it should be pulled down and removed at once.

No. 26 is a two-roomed tenement, let at 5s. a week, in a poor state of repair. The back room has a skillion roof with a ceiling of Hobart Town palings, in which a square hole has been cut for the purpose of ventilation; it is about 7½ ft. high. The privy belonging to this tenement is in a very shaky condition; it leans over very suspiciously, and a good push would send it over. The smell from this closet was most offensive. The drainage, as that of all the houses comprised in to-day's inspection, goes into the street gutters. An unusual number of children were congregated at this spot, making mud pies in the gutters, which contain all the stinking matter from these houses and those in Athlone-place; we could hardly tell whether they looked healthy or not—they were so dirty.

At the corner of May-street and Adelaide-street is a space where a house has anticipated our inspection, and fallen down from sheer decay. The house at the opposite corner from its appearance is about to retire from the scene in the same way; the door has already taken its departure, and part of the roof is gone; what is left of this building belongs to a person named Jackson. At this corner is a collection of filthy matter from the drainage, formed by a sort of elbow in the gutter.

In Adelaide-street we found some very respectable-looking houses, and in spite of the offensive odours from the open gutters and filthy privies in this neighbourhood we were assured by Mrs. Goddard, who said she had lived here for twenty years, that she had always experienced good health, and she certainly looked very hearty. The houses herabouts are certainly better ventilated than many others we have had occasion to inspect, which may in some degree account for the absence of sickness; otherwise the nuisances we have described and the proximity of Blackwattle Swamp are quite sufficient to produce it.

At the rear of the houses in the adjoining street—Harwood-street, formerly Brisbane-street—on the east side—runs the creek which carries off the waste water from the premises of the Colonial Sugar Refining Company, which gives off a terrible stench.

Nos. 46 and 48, houses belonging to Mr. Hamburger, containing two rooms each, and let at 6s. a week, are in a very bad state of repair. The Venetian shutters to the windows are so broken that they have to be tied together with string; the ventilation is old-fashioned, the windows having fixed upper sashes; the water is supplied through leaden pipes, and the drainage—to use the words of one of the occupants—"is enough to kill a parson." The landlord they say will do nothing. There is plenty of ventilation in most of the upstairs rooms, there being scarcely a whole pane of glass in any of the windows; these houses are in a very dirty as well as dilapidated state.

Landlords, however, differ in their ideas on the subject of repairs. The owner of seven nice looking cottages on the opposite side of the street, containing two rooms and a kitchen each, and let at 7s. a week, evidently takes great pains to keep his property in good order; the only drawback we could find to the comfort of the inmates were the closets at the back, which in the absence of a sewer are necessary evils.

In a lane off this street, on the west side, are five brick and shingle tenements, owned by Mr. Kettle, containing two rooms, one over the other. These are unoccupied with one exception, and they are all, including the one occupied, utterly unfit for dwellings for human beings. The windows are gone in four out of the five, and the walls bulge out and threaten to fall on the passers-by. They ought to be pulled down immediately.

After we left Brisbane-street we proceeded along George-street until we came to Wattle-street, late Darling-street. We went there at the invitation of Sergeant Attwell, who wished us to inspect the residence of an old woman, named Sarah O'Neill, who dwells in a one-storied brick tenement, 15 x 9 ft., and whose habits and mode of living are somewhat eccentric. The first proof of this eccentricity is noticeable

G. F. Dansey, Esq.,
16 Feb., 1876.

noticeable in the permanent closing-up of the door and one of the windows, which are nailed and covered over with bits of galvanized iron, so as effectually to exclude light and air. The other window is minus the lower sash, and through this opening, which is the only means of ingress, the old woman and her fowls hop in and out. Heaped up between the door and window is a miscellaneous collection of odds and ends, such as old kerosene tins, tin linings of cases, iron hoops, and a variety of other rubbish. We peeped in at the window and saw a number of old bags, mats, and rags on the floor, and several fowls who are the occupant's sole companions, and whose convenience she has consulted by knocking out some bricks at the back to allow them to pass in and out either way. We were told by a man who was working in an adjoining shop, that Mrs. O'Neill's sole means of subsistence consists of scraps contributed by the neighbours, which are left on the window-sill, and serve to support her and her family of fowls; and that sometimes she does not emerge from her dwelling for weeks, and even months at a time. Upon Sergeant Attwell putting his head into the window and calling out "Sally," the wild-looking uncombed head of an elderly woman was visible, and the next moment we heard a voice indignantly objecting to be taken to the Asylum, for which purpose Sergeant Attwell said he had come. None of the O'Neill's she said ever saw the inside of an asylum. She told us she came from the swatest island in the world; that she was born in Kilfintona, two miles from Limerick Castle; and that she was connected with the Macnamara family; and that she had been in the colony for twenty years, having come out in a ship called the "James," which had got broke (*alias* wrecked). She said she had lived for nine years out of the twenty in this hole. We could see nothing about the place indicating the existence of a water supply, nor was there any appearance of a closet, either inside or outside the building. Upon the Sergeant's repeating his offer to take her to the Asylum, she offered him a young cock and three new laid eggs, which were declined, and we left the old woman in peace. This place is, we understand, the property of Mr. John Harris, of Shane Park, near Penrith, who allows the present occupant to live in it rent free.

In Wattle-street, proceeding further down, we found several houses belonging to Mr. Harris, which are in good repair, but are built below the level of the street, on the same level as the Sugar Company's Creek. We found the stench proceeding from this creek very offensive, in spite of the improvements in the Company's operations, which we were led to believe resulted from the inquiry made by a Committee of this Board.

We concluded our inspection at 1 p.m.

Personal Inspection

By No. 1 Sub-Committee.

TWENTY-EIGHTH DAY, MONDAY, 7 FEBRUARY, 1876.

Waterloo and Redfern.

270. Dr. Read gave evidence, on behalf of Mr. Chapman and himself, as follows:—

R. B. Read,
Esq.

16 Feb., 1876.

Started from the City Club at 10 o'clock on Monday, 7th instant, accompanied by Mr. Chapman and Sergeant Larkins, to resume our inspection of the Boroughs of Redfern and Waterloo.

On the west side of Pitt-street south off Buckland-street are six cottages containing two rooms each, five built of weatherboard and one of brick, the floors of which are below the level of the street. At the back of them are small rooms with skillion roof used as kitchens, which are still lower than the floors of the dwellings and are reached by a descent of several steps. The end house has, in addition to this, a stable at the rear of it, the back wall of the house being also the back wall of the stable. There is but one well to supply all these cottages, which is 25 ft. deep; the water from it is filthy. Within 50 feet from this well are no less than eight cesspits, several of them being on much higher ground, while there are two cesspits within 15 ft. of the well on either side. The soil is pure sand, and the cesspits mere holes in the ground without any water-tight lining; the inference is obvious—the liquid matter from the closets must percolate into the well and pollute the water supply. A woman living in one of these houses told us that she and her husband and their four children were all sick, that they were continually retching, and that she attributed it to the water. She said further, that the occupants of the third house from hers were also sick in the same way. The yards of these houses are small, and there appears to be no system of scavenging carried out.

At the corner of a large piece of vacant ground close by is a small hut, about 8 ft. square, roofed with Hobart Town palings, occupied by an old man and his wife. Opposite to this is a row of detached cottages, in the centre of which is a well which supplies them with water. This water is very bad and unwholesome. There are a lot of closets at a little distance from the well, and one, which is on higher ground, only 12 ft. from it. The residents who use this water say it is not fit for washing purposes, it is too hard. All these tenements are very deficient in ventilation; they are in most cases owned by the occupants who rent the ground from the Cooper Estate.

Down a narrow passage at the back of some houses near this place we came to another well, 30 ft. deep, also surrounded by cesspits, and no doubt receiving contamination from them.

In Botany-street are six semi-detached brick cottages—owned by Fisher—containing two rooms and a kitchen each, and rented at 5s. a week. One of these which we examined is occupied by seven persons; the kitchen is separated from the house by a narrow passage 2 ft. wide. All these cottages have old-fashioned ventilation. This neighbourhood swarms with children.

At the corner of John and George streets we noticed a well between a house and a closet, the latter being 15 ft. distant from the house. We examined here two semi-detached brick houses in course of erection. A well had been dug close to the back wall, and about 24 feet from this well a large hole had been sunk for a double privy; there are two other cesspits at the respective distances of 25 and 30 ft. from the same well. These houses face George-street. At another house facing the same street we found a well 20 feet from a cesspit, and one only 12 ft. from a cesspit. From the well last-mentioned we examined some water which was very offensive, having a strong taste of alun, and being besides thick and clammy, and of a bluish black color. It appears that in sinking wells in this district they get through the sand at from 20 to 30 feet, and come to pipeclay, which is pierced for a few feet sufficient to retain a supply of water. It follows, as a matter of course, that this floor of pipeclay receives all the drainage from the sand, and when this drainage is impregnated with deleterious matter the wells must be contaminated

even

even if the closets are at some distance from them, especially if the stratum of pipe-clay inclines in the direction of the wells. We strongly recommend that steps be taken without delay to lay on water-pipes to this locality, and it is desirable for obvious reasons that this should be done if possible before the rainy season sets in.

R. B. Read,
Esq.
16 Feb., 1876.

We next entered Bullanaming-street, from Buckland-street. This should properly be called a lane and not a street, for it is only 21 ft. wide; it is very badly laid out. The houses in it which are chiefly weatherboard tenements are of a very indifferent description, and are all fitted with the old-fashioned sash windows.

We then turned into John-street, where we examined a house owned by Woolley. Here we found a well 20 ft. deep, which was empty, fortunately for the occupants of the house, although they have to fetch water from a considerable distance. I may observe here that every person to whom we addressed ourselves on the subject of water supply admitted that it is polluted by the cesspits; this seems to be accepted as an unpleasant but unavoidable fact peculiar to the locality. We can only hope the evil is counterbalanced by some corresponding advantage, for it is a very serious one.

Passing into Botany-street we noticed a crock which crosses Mitchell-road, and ultimately discharges into Shea's Creek. This creek is now dry, but in wet weather it is no doubt a great nuisance.

Thence we went up Buckland-street back to the starting point, taking Bullanaming-street on our way. We inspected several houses here and found the same conditions existing in connection with the closets and the water supply. In the course of conversation with some of the residents we learned that several attempts have been made to get the water laid on, which have been frustrated in one way or the other. It appears that this accommodation is only obtained by petition to the Sydney Corporation. Several petitions have been got up for that purpose which have been opposed by some alderman of this borough or large householder, and the pipes have not yet been laid on. One person informed us that he had been instrumental in getting up a petition, and the very persons who opposed him were now obliged to come and draw water from his well; the retribution seemed to be just but severe. The rents of the tenements in this part of Bullanaming-street average about 7s. a week. Generally there is a great deal of filth in the yards. We noticed one single-roomed tenement, 12 x 12 ft. and 7 ft. high, occupied by a woman and her daughter, at the back of which is a closet constructed entirely of tin, but much broken, without any door and over an old cesspit, full to the brim. In the adjoining yard there is also a closet in a dilapidated state, without roof, and exposed to every passer-by. The water drawn from a well in front of these dwellings had exactly the appearance of weak pea-soup.

We finished our inspection at 1 p.m.

FRIDAY, 17 MARCH, 1876.

Present:—

G. F. DANSEY, Esq., | M. CHAPMAN, Esq.,
B. PALMER, Esq., | F. H. GRUNDY, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 1 Sub-Committee.

TWENTY-NINTH DAY, WEDNESDAY, 9 FEBRUARY, 1876.

Waterloo and Redfern.

271. Mr. Grundy gave evidence on behalf of Dr. Read and himself, as follows:—

Having been requested by the Sewage and Health Board, in the absence of Mr. Chapman, to accompany Dr. Read in his rounds of house to house inspection, I met that gentleman at the City Club at 10 o'clock on the morning of Wednesday, 9th instant, and we proceeded, escorted by Sergeant Larkins, to the junction of the Botany Road with John-street, Waterloo, thence northwards along Botany Road to Buckland-street, and eastward to Botany-street. Throughout the whole of this area the buildings are of a very inferior class, being chiefly low weatherboard and shingle cottages, containing three or four small rooms, in most cases very much out of repair, but not crowded together quite so closely as some of the tenements of similar character in the poorer parts of the city already described. The allotments are nevertheless very small, and it is to be regretted that some Act regulating building areas was not in force at the time the Waterloo Estate was so eagerly inquired after.

F. H. Grundy,
Esq.
17 Mar., 1876.

Proceeding up Botany-street northwards we inspected a cottage on the east side containing two rooms 8 x 8 ft., in a most dilapidated condition, open to the roof, which is about 12 ft. at its highest point, and is constructed of patchwork, comprising palings, pieces of tin, iron, &c. There being no ceilings or linings to the walls, the interior is well ventilated, but in cold or wet weather it must be about as cheerless a dwelling as can well be conceived. This shanty is owned by an old couple who reside in it, and who have each some 768 cubic feet of air space irrespective of the gaps in the building.

Two doors further northward stand a couple of two-roomed huts, built of Hobart Town palings, with roofs of same material, much out of repair and very little better than the one just described. The owner, an old man named Ramsay, lives in one of them, and lets the other to a family of five;—the window of this house was fastened up. Here the air space is little if anything above the minimum recommended in the last report of this Committee. In the yard, which is about 15 ft. from the house, is a well almost dry, but with a little water low down in it scething in the heat and exhibiting a thick glazed scum, discoloured and utterly unfit to drink. Beyond this well are two closets, one about 12 ft. and the other about 18 ft. from it, both full to the surface and disgustingly offensive. The slope of the ground is from the closet to the well. We examined a great many of these wells, and found that they nearly all occupy similar positions in relation to the closets. All those we inspected are lined with unset bricks, no mortar or cement being employed, so that the percolation of liquid matter to them is as it were invited.

A few doors further north is a sadly dilapidated hovel of a similar class, occupied by a woman whose husband she told us is "out of his mind"; she has six children with her in the house. Her well is also dry, which is fortunate if it compels her to obtain wholesome water elsewhere, for about 15 ft. above it is

F. H. Grundy, a closet full to the brim, in a very stinking condition, besides being in the last stage of decay. This woman pays 4s. 6d. a week to the landlord, a Mr. Crocus, who declines to repair, and "doesn't mind her complaining."

Esq.
17 Mar., 1876.

Following the west side of this street (Botany-street) to Raglan-street, from Raglan-street to Botany Road, and from Raglan-street to Bullanaming-street, we found the houses generally of a similar construction, but decidedly in better keeping and repair than those previously noticed. Among them are stone and brick cottages presenting a clean and comfortable appearance, but in all of them the same dangerous conditions appear to exist—closets full to the brim, and wells close at hand gaping to receive their contents, and heaps of garbage in the yards and about the dwellings waiting for the rain to wash them in and over the sandy soil to taint the drainage which forms the water supply. Throughout all these streets, with few exceptions, there is at present almost a water famine, and a strong agitation is I believe going on to get the city water laid on.

About 200 or 300 yards north of Raglan-street, still in Bullanaming-street, we found the water laid on. We found also where the supply was derived from wells, that the water was more plentiful and seemingly of better quality towards the top of the hill. Some of the residents in the higher ground have even objected to the presentation of the petition to the City Council. A Mr. Buss, the proprietor of a neat cottage with a garden and other improvements round it, on the east side of Bullanaming-street, drew for us out of a well which supplies his family and his neighbours on the other side of the street, a bucket of water which looked invitingly; it was cool, clear and sparkling, and palatable, but rather brackish. Here also the closet is above the level of the well and not more than 20 feet distant from it, and there are other closets in its immediate vicinity. The superiority of the water is probably due to the greater attention paid to cleanliness and the more frequent emptying of the closet, which may also be better lined.

Opposite to Mr. Buss' cottage we found two semi-detached weatherboard tenements containing two rooms, one 12 x 12 ft. and 8 ft. high and the other smaller. Mrs. —, the owner, lives in one of them; the other she lets at 4s. 6d. a week, but is not very particular about collecting the rent; in her own words, "She doesn't bother." We were rather surprised at this unusual trait in the character of a landlady, but it occurred to us afterwards that there might be good reasons for it in this particular instance, for upon entering her house somewhat suddenly we surprised the old lady hurriedly but unsuccessfully endeavouring to throw a bonnet and shawl over a pack of cards on the table, whilst a respectable young woman to whom those articles of attire evidently belonged or had belonged, stared at us in utter bewilderment. The cards were in several small packs, and Mrs. — had under her hand either the king of hearts or the king of diamonds, representative no doubt of some illustrious individual destined to influence the career of the young woman at her side. In short we interrupted what seemed to be a scene of fortune telling which does not however appear a very remunerative calling. Upon returning to the house a few minutes after to put some further questions we noticed that the cards had disappeared. This happened at 12:45 p.m.

We next proceeded to Turner-street and following that street in an easterly direction came to George-street, Redfern, where we saw nothing calling for special report. The houses are generally in a fair state of repair though deficient in ventilation, but the water being laid on the danger to health arising from the percolation of offensive matter does not exist.

From George-street to Pitt-street Turner-street is only 15 feet wide. The first cottage in it above George-street is built partly of brick and partly of weatherboard, and is in an extremely dilapidated condition; it has no back windows, and is very indifferently ventilated. This cottage is occupied by a pensioned policeman and his wife, and finding it to be Government property, and that it is to be pulled down to make room for a proposed new watch-house, we did not consider it necessary to make any further inquiries.

We finished our day's inspection, and returned to Pitt-street at about half-past 1 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

TWENTY-EIGHTH DAY, WEDNESDAY, 9 FEBRUARY, 1876.

272. Mr. Palmer gave evidence on behalf of Dr. Dansey and himself, as follows:—

B. Palmer,
Esq.
17 Mar., 1876.

Left the Town Hall at 10 o'clock on Wednesday, 9th instant, in company with Dr. Dansey, and proceeded to the corner of Wattle-street. Working northward from that street we came to Kennedy's buildings, and inspected two houses at the back of a butcher's shop, belonging to Mr. Kennedy, and occupied by the men employed by him. Considering that they are very old buildings they are in a fair state of repair and kept in decent order.

We then went to Williamson-place, late William-lane, where there are three weatherboard cottages on the right hand, containing two rooms each 10 x 10 ft. and 8 ft. high, with skillion kitchen at the back. Two of these are used as store or lumber rooms for the grocer in front, and are full of old candle-boxes and empty cases; the other is rented at 4s. a week to a woman who lives alone. There is nothing to find fault with in these cottages except that the ventilation is deficient, the closet is offensive, and all the drainage is on the surface. The property belongs to Mr. Lonan.

We next went to Ultimo-lane, where there are no houses to inspect. I only mention the place to call attention to the fact that this lane being what is termed pitch-paved can easily be kept in a state of cleanliness. In dry weather it can be swept, and in wet weather the rain washes and cleans it effectually.

In Maitland-place there are six houses on the west side and three on the east. The end house, which is occupied—so we were told by a woman in charge of it—by a man and his wife, covers an area of 12 x 14 ft., and was no doubt at one time clean and in good repair, but now the walls and ceilings are so begrimed with dirt and smoke and in such a dilapidated condition that the place is scarcely habitable. The tenants say it is impossible to keep the houses decently clean, and the landlord will do nothing. One woman told us she should leave her house as soon as she could find another place to put her head in.

We were prevented from entering the next house by a woman who blocked up the doorway and defied us, but we inspected the third, which was in a most filthy state. In this house we saw four children at dinner. An old tin containing boiled potatoes was on the table, and some salt, to which they were helping themselves without any ceremony. They looked very dirty and neglected.

On

On the opposite or eastern side the corner house is occupied by a plasterer, who is a bachelor; he only comes there at night. Considering that plasterers, if good workmen, can get 12s. a day, it is somewhat surprising that this man should choose such a place to sleep in; it is in a most dilapidated state—the windows broken, one of them without a sash, and the whole building in a state of dirt and decay. B. Palmer,
Esq.
17 Mar., 1876.

The adjoining house, containing two rooms, is equally out of repair; the ladder which serves as a mode of access to the upper room was gone, and the windows, walls, and every part of the building in a dilapidated state. There were two young children here who said "Mother was out." A person on the other side of the street told us this was a brothel of the lowest description, and that sometimes five or six women made it their haunt at night. It is rented at 2s. a week. There was little or no furniture in the room; an old sofa and a few rags were all we could see; the children were in a wretchedly dirty state. There are two closets on the west side and one on the east side of Maitland-place—all very offensive. We tried to find out the owner of this property. One woman said he was a very handsome gentleman, but she did not know his name. Another person said his name was Reynolds, and he lived in Eveleigh-place, Redfern; another referred us to the woman who keeps the shop at the corner. On our way to the shop we met a man who assured us that the landlord's name was Frost. The shop-woman did not know his name, but said the rent was left at her shop for him and he called for it. She further informed us, in reply to our remarks upon the disgraceful condition of some of the houses, that the landlord had commenced legal proceedings to get rid of the tenants in the house last described, and had served them with an "injection" paper.

From this place we went to New-street, where we saw nothing calling for remark, except that on a spare piece of ground at the end of the street there is a stagnant pool of filthy drainage from the surrounding houses, which emits a most offensive smell and taints the atmosphere.

Turning into Parramatta-street again we came to two houses let on lease to ex-Alderman Roseby, both in a most dilapidated condition, but remarkably well ventilated, almost all the glass having disappeared from the windows. In the yard at the back is an old closet, which has no door, but in place of it some nondescript article of female attire, folded like a shawl point downwards; the internal fittings of this closet are all to pieces, and in addition to this it is in a very exposed position, and no person can enter it without being seen by the men at work on Mr. Roseby's premises. Here we noticed that a sewer which runs from the Railway under George-street is uncovered and open for a length of about 10 yards; from it a poisonous odour proceeds, which must be very dangerous to health; this sewer runs close to the closet above-mentioned, but is not connected with it.

We went on to Hancock's Square, which contains eight houses, built of stone and shingle, containing two rooms, each 12 x 10 ft., and rented at 6s. a week. The tenants complain that Mr. Hancock, the owner, will do nothing to keep them in repair. There are also two wooden shanties on either side of this square near its entrance from Parramatta-street, which were formerly occupied by disreputable characters, now tenanted by decent working people. In none of these houses is there any window or opening at the back for purposes of ventilation, the yard to each house being the square in front. It struck us that if the heaps of oyster-shells which were scattered about the place—one of the houses being an oyster-shop—were burned and the lime used for cleaning the place the residents would be considerably more comfortable. All courts and lanes of this description off main streets should, in our opinion, be cleared of these wretched tenements which would not be allowed to exist if they were not thus hidden from public observation, and the ground devoted to its legitimate use, the erection of substantial stores and warehouses. Surrounded as they are on all sides by high buildings they afford no air breathing space sufficient for the number of persons crowded into them; the drainage is invariably neglected, and the style of architecture includes no appliances either for ventilation or cleanliness.

We next inspected Cuthill's Yard, which contains six houses on the east side and three on the west, built of brick and shingles, containing two rooms each and let at 6s. a week. Those on the eastern side are in a state of extreme dilapidation, every part except the bare walls the picture of ruin. Here as in all tenements of this class the back wall has no opening of any kind, and the only vacant space is the yard in front. The houses on the west side have only a ground floor; one of them is roofed with iron and the other two with zinc, the roof of the end house being retained in its place by heavy stones placed upon it. There was at one time a railing in front of these houses, intended to enclose a garden, but only enough of it remains to show what it was put there for; flowers do not bloom in localities like this. Almost all the windows in this court, especially those on the east side, are without glass or nearly so, brown paper and old rags being the principal substitutes; the drainage in the gutter was very offensive and the privy in a disgusting state. We noticed a great number of children about the door-steps, and upon inquiry we found that with very few exceptions they do not attend any school. This property belongs to Mr. Austin.

We returned to town at 10 minutes to 1 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

THIRTIETH DAY, THURSDAY, 10 FEBRUARY, 1876.

Redfern and Waterloo.

273. *Mr. Grundy* gave evidence on behalf of Dr. Read and himself as follows:—

Met Dr. Read at the City Club at 4 p.m., on Thursday, 10th instant, and proceeded to the junction of Turner-street and Botany Road, where we were joined by Sergeant Larkins. Thence we proceeded to Bullanaming-street and northwards along that street to Redfern-street. Except the now unalterable narrowness of Bullanaming-street, there is nothing so far requiring special mention, the houses generally being rather favourable specimens of dwellings for those of the poorer classes, such as draymen, cabmen, and others, whose occupation permits them to live outside the city. We found that wherever the water is laid on the use of wells is almost entirely abandoned; so much so that some tenants when asked about the water in their wells did not know whether there was any water in them or not. Nothing can mark more decidedly than this fact the importance attached by the people to the easy attainment of an ample water supply. However abundant the quantity of well water may be, the labour of pumping, fetching, F. H. Grundy,
Esq.
17 Mar., 1876.

F. H. Grundy, Esq. ing, and carrying will always limit that free even careless use of water which is so necessary in a climate like this.

17 Mar., 1876.

We have specially to notice the offensive character of the contents of the gutters, surface drainage only existing here. To the streets running north and south there is usually fall enough to carry off the drainage with sufficient rapidity, but many of the cross streets east and west are at a dead level, and the foul water remains and stagnates in the gutters. We noticed this particularly in Redfern-street. Here, proceeding northwards, the character of the soil seems to change from sandy to clayey, and of course the water, clean or dirty, is longer in disappearing from the surface.

We followed Redfern-street westerly to Botany Road, and found on the south side of Redfern-street two semi-detached buildings half brick, half weatherboard, and wholly inferior, each containing two rooms 9 x 9 ft., with a height of 6½ ft. Attached to the eastern one is a dilapidated shed, in which the occupant, who is a laundress, was washing. The yard is small, unflagged, unpaved, without any drainage, and with scarcely any fall in any direction. Here all the dirty water is thrown daily until the ground is saturated and the place is one dirty puddle. This cottage is rented at 7s. a week, and contains four inmates, who do not appear to suffer in health; but here at least the means of ventilation are available, and as the houses stand close to the street, and have a higher elevation, access to the surface drainage would be easy. We did not ascertain the name of the landlord.

Returned to Bullanaming-street, and continued northward to Wells-street. Here the buildings do not require special report; they are, however, nearer together, and there is less vacant land for air space. The surface gutters are still offensive, and a variety of disagreeable smells, including usually that of the closets, proceed from the rear of these premises; but the most serious evil—the contamination of the water in the wells—existing in the more southern portions of this Municipality, is here avoided by the water being laid on.

From Wells-street eastward to George-street. Here we inspected a long row of one-storied weatherboard cottages having two rooms each, small, with low ceilings, but fairly ventilated by windows back and front. Each cottage is enclosed in its own fence, and each cottage has a separate closet, and is in tolerable repair. Nothing short of stringent measures to ensure the frequent emptying and constant cleanliness of the swarms of closets prevailing in this neighbourhood will ever clear the atmosphere of the continually recurring closet odour.

Back to Bullanaming-street, and again northward. Near Wells-street, on the west side, is a wide vacant space, forming part of a block extending to the Botany Road, the property of Mr. Woods, which seems to be a deposit for much of the filth of the neighbourhood. Where the vacant eastern part of this block joins the occupied western part, is a cluster of three closets built over one cesspit. This pit is about 12 x 12 ft.; depth unknown; and has not been emptied for four years at least; one of the occupants of a building close by, fronting George-street, who has lived there for that period, having assured us that it has never been cleaned out in his time; it is in a very foul and stinking condition. Two of these three closets, besides being legitimately used by thirty persons, are quite open to the residents in Bullanaming-street, and to anyone else.

Nearly opposite to this vacant space, on the eastern side of Bullanaming-street, is a large cesspit, over which are four double closets, which are exceedingly offensive, although the tenant of a house close to it declared that it had recently been emptied. The occupant of the next house, however, complained much of the stench. These persons stated that no officer of any corporation had been round to inspect these premises for three years; the pit is 20 ft. or so from the houses, which are of fair average character. The landlady is Mrs. Smith, a widow, whose husband died lately.

Thence on the west side of Bullanaming-street to James-street. The tenements in this quarter do not call for particular mention, except that they are below the level of the street, which has been raised since they were built; their position, close under this embankment, must render them very damp and unhealthy; surface drainage still offensive.

From James-street to Botany-street, from James-street to George-street, and from James-street to Cleveland-street, the character of the buildings improves, and there is little to remark except the surface drainage, the narrowness of the streets, and the closet arrangements.

Returning to Regent-street we examined the east side of Botany Road to Cleveland-street. The buildings in this portion of Botany Road are generally old and of inferior construction; the rooms are small and badly ventilated, presenting a comparatively fair shop-frontage to Botany Road, to which everything else is sacrificed. Among the worst may be mentioned a second-hand clothes-shop, kept by a man and his wife, an old dilapidated two-storied brick and slate building. The shop is 8 x 8 ft., with low roof, choked with second-hand garments of all sorts, through which we had to clear our way with outstretched arms; they hang from roof to floor and effectually obstruct the ventilation; the whole house smells of them; a very small yard and a closet some 12 or 15 ft. from the house. This closet seems to act as a catchment to receive the water from the ground at the rear, which is much higher than the floor of the house, and when it overflows the filth descends into the yard to a drain, which is without stench-trap and out of order, so that the water is generally standing in the yard. The landlord, so the occupants say, will do nothing.

Further on is another shop of similar character, occupied by Short, draper and general dealer. The back premises contain a jumble of sheds, old metal, poultry, ducks, closet, and rubbish.

Miss Goldsmith, Berlin wool dealer, next door, complains of the smell arising from this yard. Her own place is scrupulously neat and tidy, but as the wall of the kitchen forms one side of the closet the small tenement she occupies must be invaded by many a stench on its own account.

The soap factory is of course a nuisance in so crowded a locality, but the numerous weatherboard buildings seem to be kept as clean as the nature of the business will allow, and no large stock of material for manufacture is ever kept on the premises we were told, being dear and the market to hand. Perhaps the considerable addition to the fouling of the Blackwattle Swamp streams is as important a nuisance as any connected with this factory.

We returned to Sydney at 6:30 p.m.

Personal Inspection

By No. 2 Sub-Committee.

TWENTY-NINTH DAY, MONDAY, 14 FEBRUARY, 1876.

Pymont.

274. *Dr. Dansey* gave evidence on behalf of Mr. Palmer, and himself as follows:—

Left the Town Hall in company with the Mayor and Sergeant Attwell at 4 o'clock on Monday, 14th instant, and proceeded to that large and expanding suburb, Pymont, which being, from its situation, freely exposed to the sea breeze, is generally a much healthier locality than those which we have hitherto visited.

G. F. Dansey,
Esq.
17 Mar., 1876.

The first property we inspected after crossing the bridge was a row of weatherboard houses, five in number, of a red colour, standing on the right-hand side of the street, and some 12½ ft. above it, the Corporation having cut away the roadway in front of them; the entrance to four of them is now at the back; the other is approached by a flight of steps; they are very old and badly ventilated but not otherwise noticeable.

There are three houses further down in the same street belonging to Mr. Goodlet, also built of weatherboard with zinc roof with rubble foundation, let at 10s. a week each, which are very much in want of repair.

At the bottom of this street are Messrs. Goodlet and Smith's timber-yard and Mr. Billyard's bone factory, which adjoin each other. We were glad to find that there was nothing offensive about the last-mentioned establishment, there being no collection of bones or other material on hand likely to create a nuisance. Here we were overtaken by a violent thunderstorm, which forced us to take shelter for three quarters of an hour.

The houses in the next street we went to—Edward-street—were in good repair, but the effluvia which rises from Darling Harbour at low tide is here very offensive. This is also much complained of by the residents in Helena-terrace.

In Marian-street we found everything in clean and good condition.

We then proceeded to Pymont-street, and inspected Webb's cottages, six in number, built of stone with corrugated iron roof, which contain four rooms and an attic, and are let at 12s. 6d. a week each; they are built a little above high-water-mark on Darling Harbour; several hundred cedar logs are moored here which rest upon the mud and filth at low tide and have the effect of stirring it up and causing it to emit a frightful stench.

Nos. 55, 53, and 51, Pymont-street, owned by Downes, are two-roomed brick and shingle tenements, having the old-fashioned ventilation, and being a few inches below the street level, so that the floor of the houses receives all the moisture. From this cause they are very damp and unhealthy and unfit for human habitation; the landlord, we were told, will do nothing to improve them; a leaden pipe supplies these houses with water; the closet is stinking, besides being so dilapidated as to be almost tumbling down.

On a vacant piece of ground at the rear of these premises are two wooden houses belonging to the same owner, containing three rooms, and let at 6s. a week each. One of them contains a family of eight—father, mother, and six children. The floor is in such a ruinous state that it is not safe to walk upon it in places, and look where you will you may see daylight through the walls and roof. This tenement is in short in a frightful state of dilapidation. The other house has had its gable blown away and the landlord says he cannot get a carpenter to restore it.

On the west side are five brick and shingle houses, belonging to Mrs. Ward, containing four rooms each, and let at 9s. a week, which are badly ventilated, and have a closet over an offensive cesspit at the back. Here, as also in Bay-view-terrace, where the houses are all clean and in good order, the tenants complain bitterly of the stench from Darling Harbour. We found that most of the children go to school, either to St. Bede's or to the Church of England school.

We returned to town at 6 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

THIRTIETH DAY, TUESDAY, 15 FEBRUARY, 1876.

Denison Ward.

275. *Dr. Dansey* gave evidence on behalf of Mr. Palmer and himself, as follows:—

Met the Mayor at the Town Hall at 4 o'clock on Tuesday, 15th instant, and went to Pymont to finish our inspection; Sergeant Attwell accompanied us. We went first to Walworth's-buildings, which are situate off John-street. Upon entering, on the right-hand side, are three two-roomed houses belonging to Mr. Lamb, built of rubble and shingles—Mr. Day, agent. These houses are badly ventilated, being without opening of any kind at the back, and old-fashioned sash windows in front; there is no yard attached to them.

G. F. Dansey,
Esq.
17 Mar., 1876.

Ascending half-a-dozen steps we came to three more houses of a similar description, rented at 5s. a week each. These six houses were in a very dirty state, and greatly out of repair.

At the rear of these, being still a portion of Walworth's-buildings, are twelve houses, also containing two rooms and an attic each, five rented at 4s. a week, built back to back, so as to preclude the possibility of proper ventilation. The rooms are about 12 ft. square and 7 ft. high, and from what we could learn there is an average number of five inmates to each house. All the privy accommodation for these sixty persons consists of two closets very much out of repair, and stinking frightfully, the nuisance which they create being aggravated by the small amount of air breathing space which the court affords. Blocks of houses of this character, when seen at a little distance, give very little indication of the discomfort within; they appear to comprise half the actual number of tenements. A closer inspection shows that

G. F. Dansey, Esq.
17 Mar., 1876.

that a dead wall in the centre divides the block into two rows, facing different ways, both of which have but one door of entrance, and only such ventilation as can be afforded in front. We came to the conclusion this was about as dirty a hole as we have met with in Pyrmont.

We went next to Mount-street, where the houses are of a somewhat better class, but all of them fitted with the old-fashioned sash windows, and therefore badly ventilated; the closets are over common cesspits, but that cannot be avoided as there is no sewerage here.

We inspected a Public School in this street, which is in bad repair, the windows broken, and the weatherboards also in places. In the front room, which is 42 ft. x 26 ft., there is an average attendance of 110 children; and in the back room, 22 ft. x 16 ft., used for infants, there are between eighty and ninety. The floor is in such a broken state that a child might easily put his foot through the boards and get hurt; the building in fact is not in a proper state of repair to be used as a school.

Near this school are two houses, one built of brick and shingle, and the other of stone, with galvanized tile roof, containing each two rooms and a kitchen. In the stone house the solitary window in front has a fixed upper sash. In the brick house there is a family of seven; the closet is out of repair, and very offensive. This property belongs to Mrs. Brothwell.

In the front of these houses, at the corner of the street, is a building which has evidently been a butcher's shop, in a dilapidated state and falling to pieces; close by is a stone house which attracted our attention, but the tenants were out, and we could not enter it.

At the top of John-street, to which we returned, there is a cow-shed, the drainage from which was lying in pools in the yard, stinking, and creating a nuisance.

On the north side of this street we looked at a number of tenements, which are chiefly noticeable on account of the dirty and dilapidated condition of the back premises; they are mostly owned by Mr. Robinson. Here we found a two-roomed house, tenanted by a man and his wife and two children, and rented at 5s. a week, which must be a damp and unhealthy abode from the fact that the floors rest on the ground. The house is in bad repair, the roof being patched up with a variety of materials, and is a place which poverty alone would compel a man to live in. The children we were told are "middling healthy"; they go to St. Bede's School.

At the rear of John-street is a stone and shingle tenement in a shocking state of dilapidation, in the yard of which is a closet of the most wretched description, without any door, and almost tumbling down.

Close by is a house above which is painted—"Agent, Sydney Empire." No. 6 is on the door, but this does not tally with the street numbers. The tenant was not at home, and we could not make a closer inspection.

In Bowman-street we came to four houses built of rubble, with corrugated iron roofs, belonging to the Hon. G. Wigram Allen, rented at 7s. 6d. a week each. Attracted by the dirty appearance of the second house we entered it to make a closer inspection. The tenants informed us that it was a stinking hole, and that vermin abounded in it. We saw no reason to doubt either statement but everything to confirm it. The closet at the back is in a broken down dilapidated condition and in a filthy state, as was also the closet in the adjoining yard; we were obliged to leave hastily—we could not stand the smell. The drainage from these houses runs down along the surface gutters to a vacant piece of land close by, the stench from which is something frightful. The closet belonging to the house at the end of this row is in a shocking state of repair; the door is broken down, and a log of wood is placed over the seat to prevent the children from falling into the pit. The tenants of these houses all complained of ill health, and no doubt their dwellings are very unwholesome. The floors rest on solid earth, there being no excavation under them.

Thence we proceeded to Chowne-street, which is a street of recent construction, and the houses are in a good state of repair but badly ventilated; the back premises especially show the necessity of some law to compel owners of property to build in accordance with hygienic rules.

We next visited in rotation Point-street; Hill-street, the ascent to which is very steep; and Church-street, where we found the houses generally to be good and in clean order, being for the most part occupied by engineers and other employés of the A.S.N. Co., and presenting a very respectable appearance internally as well as externally.

We also paid a visit to Way's Terrace, where the houses are also in good order, the only point of objection being the limited space attached to each house, and the too close proximity of the closets to the windows.

We went over a great deal of ground in looking for symptoms of overcrowding and other unhealthy conditions in other parts of Pyrmont, but found nothing further calling for special notice, and we therefore concluded our inspection of this part of the city and of Denison Ward. We propose, after inspecting the various factories which we have undertaken to visit, to go through Cook Ward, and when that is done to wind up with one or two visits to Newtown, &c., which we observe, by the Registrar General's returns, has contributed the largest share to the mortality of the past year.

We returned to town at 6.45 p.m.

Personal Inspection

By No. 1 Sub-Committee.

THIRTY-FIRST DAY, THURSDAY, 17 FEBRUARY, 1876.

Factories and Workrooms.

276. Dr. Read gave the following evidence on behalf of Mr. Chapman and himself:—

R. B. Road,
Esq.
17 Mar., 1876.

Met Mr. Chapman at the City Club at 11 o'clock on Thursday, 17th instant, and proceeded, accompanied by Sergeant Larkins, to a clothing factory in Clarence-street, connected with the firm of Macarthur and Co., and at the back of their premises in York-street. Ascending the stairs to the first floor, we entered a room 65 x 30 ft. and about 12 ft. high, which is used as a cutting room, and contained, at the time of our visit, only about twelve or fifteen male occupants, two or three being boys apparently at least 14 years of age. This room has eight windows, four on one side and four at one end, leaving two blank walls,

walls, and is, notwithstanding its size and the eight windows aforesaid, but imperfectly ventilated, considering the number of employes who are at times assembled in it. In the room above this, against the blank wall, is a stove used for heating the pressing irons, which does not tend to improve the atmosphere. A profuse perspiration came over me while I was in this part of the room, there being here no current of air to ventilate it. At the end of the room where there are no windows, at each corner, is a narrow staircase which leads to a closet, one for the women, the other for the men, the closets being some feet above the level of the work-room, an arrangement which is so far objectionable that it obliges the men engaged in the lower part of the building to pass through the women's department whenever they have occasion to make use of their closet. In the large room just described we found about eighty women and girls, besides three or four men occupied in pressing the clothes, and we observed that they took great pains to get as near the windows as they could. None of the girls, as far as we could judge, were under 13 or 14 years of age. This place seems to be very well constructed, and good order seemed to prevail. We were informed that not very long ago as many as 400 persons were employed in these two rooms, but the numbers are considerably reduced under the present management, encouragement being given to employes to take home work, a practice which should be encouraged, as the young girls who are engaged in the work are thus more under the care of their parents. This building is an old store of Macarthur and Co.'s converted into a workroom.

R. B. Read,
Esq.
17 Mar., 1876.

Opposite to this factory are Garraty's Buildings. We reported some time ago on this property, and called attention to the very filthy closet on the premises; we went on this occasion to see if any improvement had taken place since our last visit, and found that the closet had been emptied, but was nearly full again, and in a horribly stinking condition—in fact it was quite unapproachable. This is the only privy accommodation for all the people in the court, numbering somewhere about fifty persons, occupying about a dozen houses.

Then we went to a building originally occupied as a school-house, and known as Dr. Lang's School, in Jamieson-street, now used as a clothing factory by Mr. Pettit. There were only thirteen persons engaged in this factory, work being slack. The building, being an old schoolroom, is well ventilated. The closet attached to it has a cistern but it is not connected, both pan and piping being wanting to the closet. Mr. Pettit informed us that he had taken another place on the opposite side of the street, as he expected to remove shortly, and we went over to inspect the premises in question—No. 17, Jamieson-street, known as Richmond House—which are in the meantime sublet. We found the building to be very poorly ventilated, and in very bad repair. In the yard is a closet over a common cesspit, which was emptied three months ago, and is now nearly full again. The smell from this closet was so offensive that we perceived it the moment we entered the front door from Jamieson-street. There are a number of children in this house, and some attention should be paid to this nuisance. The tenants complain of the offence caused by the existence of an old disused well in the cellar, and there can be no doubt that a good deal of the sewage and drainage from the house finds its way into this well, through the joints of the flooring, and that noxious gases from it find their way into the house from this source.

We next inspected Pascoe and Co.'s factory, in Wynyard-lane, owned by J. Marks. Here we found two rooms each 50 x 25 ft. and 8½ ft. high. The upper room only was occupied at the time of our visit, when there were about eighty workpeople in it, chiefly women and children, none of the latter being of tender age, certainly not under 12 years. This room has a dead wall at the back, and is imperfectly ventilated; the roof is composed of slate, and the heat was sickening. We were told that sometimes not less than 200 persons were employed in these two rooms.

We went downstairs, and passing through a passage came to a solitary closet, which is all the privy accommodation for the employes; there were three women in it, two of them *waiting their turn*; the closet is about 4 ft. square. We pointed out this deficiency to Mr. Pascoe, who expressed himself glad to receive any suggestions and to do anything he could to promote the comfort of his workpeople.

We returned at 1 o'clock.

THIRTY-SECOND DAY,* FRIDAY, 18 FEBRUARY, 1876.

Started from the "City Club" at 10 o'clock on the morning of Friday, the 18th instant, in company with Mr. Chapman and Sergeant Larkins, and proceeded to inspect a building in Macquarie-street North, formerly a Presbyterian Church, and a well ventilated, lofty, and commodious building. On approaching it we found, instead of the notice usually seen on church doors having reference to the hours for divine service, the following inscription—"No admittance except on business." Considering ourselves from this notice entitled to enter, we marched in and accosted the manager, Mr. Friedman, who showed us over the place. There are two galleries upstairs, one on either side, which are used for cutting rooms and for the storage of clothing. At either end of these galleries there is a shoot by which cloths ready for manufacture into clothing are shot down to the floor of the building. Here were between seventy and eighty girls sewing, some with machines and others by hand. Upon examining the back premises we found one very objectionable feature. Attention has been paid to the comfort of the girls by providing a nice little copper in the yard to boil water for tea. The closet for their use is in too close proximity to the store, and there is no separate entrance to it. There are two closets, side by side, marked respectively "Boys" and "Girls," erected no doubt for the accommodation of Sunday scholars when the main building was used for more reverent purposes, and now used by the girls employed in the lower room, and the men engaged in the cutting department up stairs, who have to pass through the lower workroom to go to their closet. We do not consider this decent, and we think a separate closet should be erected for the men on the other side of the yard.

We next went to Moore, Henderson and Boucher's factory in Bank Court off King-street, which is at the back of their premises in Pitt-street. This building has been an old store and is in a very tumble-down condition; it has already been shored up and strengthened with additional tie-beams to keep it from falling. It contains one large room 40 x 20 ft. and 9 ft. high, and one smaller room. The ventilation is very imperfect and the heat which comes from a stove in the room adjoining the large workroom and about 3 feet below its level, makes the place very close and unhealthy for the employes.

From this workroom we proceeded to Messrs. David Jones & Co.'s establishment in George-street, which we inspected under the guidance of Mr. E. Jones, who said he was very glad to find that some steps were being taken to promote the comfort of the workpeople of Sydney. The rooms in this establishment are small but the ventilation is exceedingly good, one of the rooms presenting an especially cool and

R. B. Read,
Esq.
17 Mar., 1876.

and comfortable appearance, the French windows being thrown back to their full extent and the space occupied by Venetian shutters. This building is being remodelled, and the proprietors expect that when the proposed alterations are carried out their workrooms will be second to none in the City. In none of the rooms in this establishment did we find more than from twelve to fifteen persons.

Cohen's Factory was the next place we visited. This is also in Bank Court, off King-street. Here there is one large room used as a sewing-room, 55 x 30 ft. and about 10 ft. high, in which about sixty work-people, principally women, were busily employed. There is a great want of ventilation in this apartment, chiefly on account of the old-fashioned windows, the upper sashes of which are fixtures. We strongly recommended the proprietors to remedy this at once. Our attention was drawn to the state of the closets below, and also to a collection of refuse behind the door of entrance to the workroom; where there is also a tap which supplies the women with water; the tap leaks apparently and saturates the rags and rubbish collected at this spot. The manager promised to attend to this at once. Descending some seven or eight steps by means of a ladder we came to a cellar about 9 ft. square, the floor of which was ankle deep in mud. At the end of this cellar, which is very dark and derives its only light from a small aperture protected by iron bars and partly filled up by refuse from the houses in Bank Court, are two closets side by side having no distinguishing marks for male and female employes. They were both in clean condition and supplied with cisterns, but their use indiscriminately by persons of either sex does not tend to the preservation of decency or morality. We pointed this out to the proprietor as an arrangement which was not at all to the credit of his establishment.

Thence we went to the clothing factory of Peapes & Shaw in George-street, where the proprietors also did the honors of the place for us. In two rooms which we inspected we found about thirty women, fifteen in each room, most of them sewing by hand. The rooms are very clean and tolerably well ventilated. Every effort seems to be made here to promote the comfort of the workpeople; the closet below was in a thoroughly clean and efficient state, and a lavatory with all proper appliances is provided.

We also visited Shipway's factory in Margaret-street, which is carried on in a building formerly occupied by Morris, Alexander, & Co. It was then one large room, to which the present proprietor has added another of equal size with separate roof, so that it has the appearance externally of two buildings. The workroom, with this addition, is now 21 x 50 ft., but it is very close and badly ventilated, there being no windows in it except at one end, the stove used for heating the irons for pressing contributing greatly to the heat of the place. This room is approached by a smaller room in front, used as a cutting room, attached to which is another small room where there were a few persons at work. The closet accommodation here is very deficient, there being only one closet for the employes, used by men and women indiscriminately; the proprietor said he was going to put up others and we urged him to do it without delay.

Upon the whole we found the conditions existing in the different factories we have visited much better than we expected. The overcrowding which no doubt took place at one time in some of them has been done away with mainly by the practice of giving out work. We think more attention should be paid to the all important subject of ventilation and that the proprietors should see that there should at least be a separation of sexes in the provisions made for closet accommodation. In comparison with other places where overcrowding exists we must however give a favourable report upon the Sydney workrooms, so far as our inspection has extended. In every instance the proprietors have courted inquiry and evinced a desire to receive suggestions from us and to make any improvements tending to render their employes more comfortable.

We returned at 6 o'clock, p.m.

Personal Inspection

By No. 2 Sub-Committee.

THIRTY-FIRST DAY, THURSDAY, 17 FEBRUARY, 1876.

Factories and Workrooms.

277. *Mr. Palmer* gave evidence on behalf of Dr. Dansey and himself, as follows:—

B. Palmer,
Esq.
17 Mar., 1876.

Started from the Town Hall at 2 o'clock on Thursday, 17th instant, accompanied by Dr. Dansey, and without any police escort, to visit Messrs. Farmer and Painter's establishment in Pitt-street. We made a long and careful inspection of the various workrooms, which occupied us for an hour and a half, and found them well ventilated and supplied with all requisite appliances for the health and comfort of the employes. There being no symptoms of overcrowding, or indeed any conditions existing injurious to health, we do not consider it necessary to give a detailed account of our inspection. The total number of workpeople employed on the premises is between 300 and 400. The closets are all fitted with patent cisterns, and there are lavatories for the use of the women. On the roof are seven 400-gallon tanks, to which a 2-in. hose is connected in case of a fire breaking out on the premises.

We next visited Thompson and Giles' establishment in George-street, where we were told in busy times as many as 300 women, 60 men, and a watchman are employed; at present the number is considerably less. Here, as at Messrs. Farmer and Co.'s, we were courteously escorted over the various departments, and although the back portion of the premises some of the rooms do not bear favourable comparison with those in front in respect to light and ventilation, there was little or nothing to find fault with, and so far the evils we were led to believe existed in the workrooms of Sydney, in the form of overcrowding and the employment of children of tender age, appear to have no existence; on the contrary, we have been surprised to find such excellent accommodation and good management.

Personal

Personal Inspection

By No. 1 Sub-Committee.

THIRTY-THIRD DAY, TUESDAY, 22 FEBRUARY, 1876.

Workshops and Factories.

278. *Mr. Grundy* gave evidence on behalf of Mr. Chapman and himself, as follows:—

Met at the City Club at a quarter to 4 o'clock on Tuesday, 22nd instant, and started, accompanied by Sergeant Larkins, with the intention of making a further inspection of the Boroughs of Redfern and Waterloo; but on arriving at the corner of George and King streets the rain commenced to fall heavily and continued for such a length of time that we decided, instead of proceeding to such a distance, to finish our inspection of workshops. Accordingly we turned our steps to Mr. Stephen's clothing factory in George-street West, near Liverpool-street. We were shown over the place by a brother of the proprietor. The principal workroom is a large apartment on the first floor, extending from front to back, which was originally two rooms, but the division has been removed—it is 60 ft. x 20 ft., lofty, well lit and ventilated. The average number of girls employed in this room is between forty and fifty, none of them being under 14; most of them much older. Although the day was close and hot they all looked healthy and comfortable, every attention being paid to their comfort. Closet with patent cistern, bath, and lavatories, being provided. There are a few men employed below, for whom separate accommodation in all respects is provided. Upon descending to the ground-floor we met the Mayor and Dr. Dansey, who had come with the intention of inspecting the same factory.

We had intended to proceed from this place to Myers and Solomon's boot factory, but found they had just left it. Referring to a list of the various factories in the city, with which the Mayor was provided, we determined to visit Sands' bookbinding and printing establishment in George-street. Here we found three rooms occupied by the different branches of the business, 20 x 16 ft., well lit and ventilated, and not overcrowded. From the nature of the work, which requires that sheets of paper should be hung up in rows to dry, which would be displaced by a current of air, it is not always possible to keep the windows open, but the means of ventilating the rooms are always available. We found nothing to complain of in this establishment, either in this respect or in regard to closet accommodation for the employées, who are chiefly men, averaging about fifty in number. For this reason we have not given a detailed description of it, it being evident that no conditions injurious to health exist on the premises.

We returned at 6 o'clock p.m.

Personal Inspection

By No. 2 Sub-Committee.

THIRTY-SECOND DAY, TUESDAY, 22 FEBRUARY, 1876.

Factories and Workshops.

279. *Dr. Dansey* gave evidence on behalf of Mr. Palmer and himself, as follows:—

Left the Town Hall in company with the Mayor at 3 p.m. on Tuesday, 22nd instant, and proceeded to the establishment of Messrs. Myers and Solomon, No. 542-544, George-street, in Macquarie Ward, which has a frontage to George-street of 60 ft., with a depth of about 200 ft. We found nothing about this establishment in the shape of overcrowding or deficient ventilation; the rooms are sufficiently commodious, and will be much more so when the alterations now going on are completed. We noticed four closets fitted with patent cisterns, and we also observed that every attention is paid to health and cleanliness in the lime-washing of the walls of the rooms. The large room at the top of the store, at the back, is rendered cool and comfortable by having an uncovered space of about 4 ft. on either side of the ceiling the whole length of the room, extending to the skylight, besides having four windows on either side and one at the end, which are always kept open, except in bad weather.

Messrs. Myers and Solomon employ altogether ninety-eight men and one woman, and we must do them the justice to say that their establishment appears to be very well conducted.

We then left Macquarie Ward and proceeded to the other premises belonging to the same proprietors in Albert-street, off George-street, which consists of two brick stores, occupying a space of 50 x 60 ft., and divided into three flats each. This factory turns out, so we were informed, 2,000 pairs of boots per week. We inspected the rooms in which the different branches of the bootmaking trade are carried on. In all these rooms there are ample means of ventilation, and it appeared unaccountable to us that the workmen in many cases do not avail themselves of them, and do not care to open windows, which would admit a continual supply of pure air. We have no complaint to make of this establishment, but on the contrary have much pleasure in giving our opinion that everything is done which is necessary to ensure the health of the workpeople employed in it.

We then returned to Macquarie Ward, and went over Messrs. Cameron and Dunn's tobacco factory at the corner of Pitt and Liverpool streets. This is a four-storied building, having a frontage of 110 ft. to Liverpool-street and 80 ft. to Pitt-street.

We were shown over the various departments of this factory, but had not an opportunity of witnessing the machinery at work. We were told that the full complement of hands employed in the establishment is 300, but that in consequence of the uncertain action of the Government in reference to the tobacco duties the greater portion of the employées have been recently discharged. Of these 300 we ascertained that about thirty are under the age of 15.

In consequence of the slack nature of the operations at this time, for the reason given, we made a more cursory inspection of this establishment than we should otherwise have done. We saw enough, however, to convince us that the management of the factory is conducted with every regard to the health and comfort of the men and women employed in the various branches of work. The closets are clean, fitted with patent cisterns, and supplied with abundance of water. On the first floor is a hose connected with large tanks at the top of the building, for use in case of fire breaking out, but this is almost a superfluous precaution, inasmuch as a fire in any part of the establishment could be steamed out at any moment. We are indebted to the courtesy of the proprietors, Messrs. Dickson and Gillyat, for the great pains they took to afford us information upon all points of interest. We promised to pay them another visit, and to make it at an earlier hour so as to see the machinery at work.

We returned to town at 6:30 p.m.

Personal Inspection

By No. 1 Sub-Committee.

THIRTY-FOURTH DAY, MONDAY, 28 FEBRUARY, 1876.

*Redfern and Waterloo continued.*230. *Mr. Grundy* gave the following evidence on behalf of *Mr. Chapman* and himself:—

F. H. Grundy,
Esq.
17 Mar., 1876.

Met *Mr. Chapman* at the City Club at a quarter to 11 o'clock on Monday, 28th instant, and proceeded, accompanied by Sergeant Larkins, to the junction of Botany Road with Redfern-street, and thence along Redfern-street westward. The first cottage in this street, off the Botany Road, is an old one-storied weatherboard and shingle tenement 20 x 10 ft., having two small windows 2 ft. square, both in front, which do not open; no windows or aperture of any kind at the back, and consequently no ventilation. We could not get inside this hut to make a closer inspection as it was locked up, and the tenants absent, but we noticed that the door was much worn away at the bottom, and a peep into the room showed us that the flooring was very open, having probably rotted away from damp, the whole building being from 3 to 4 ft. below the level of the street. *Mr. Osfield* is the landlord, and the place is rented at 4s. 6d. a week; it is occupied by three inmates.

At the back of this is another cottage of a similar character, but in rather a better state of repair, with a kitchen of Lilliputian dimensions attached, occupied by a man and his wife and four children.

Along this side of Redfern-street for some distance the tenements are very similar in size and construction to those just described, some of them being in better condition, but a good many of them below the street level. The street itself is in excellent order, but the liquid sewage stagnates in the gutters on the north side, and the residents, who complain greatly of the stench arising from it, affirm that the scavengers only visit it once a month. Near Rosehill-street on this northern side is a vacant allotment which, having a lower level than the street, receives and holds all the drainage from the gutters, and is a standing nuisance to the neighbourhood. We asked permission to examine the back premises of a cottage in this part of Redfern-street, and were told to call again in half an hour, upon which the door was shut in our faces; it appeared from the glimpse we obtained of the yard that an inspection would not have induced a very favourable opinion of the cleanliness of the place.

We then followed Rosehill-street southward, and found nothing calling for special notice. The tenements in this quarter are much of the same character, small one-storied weatherboard and shingle buildings, varying in condition according to the time they have existed as dwellings. They do not remain long in good repair, being constructed of inferior materials.

We next went to Merrion-street, and along that street westerly to Little Moon-street, where the same class of habitation prevails. In this street, which is what is commonly termed a blind street, that is to say it is not a thoroughfare, the cottages are much more closely packed, and apparently in much worse condition; they are smaller also, and the ventilation is still more defective; the closets too are numerous and packed together very closely. We went into the last cottage on the west side, which was untenanted and "to let," and found that the water was not laid on, but there is a well into which we peeped, and saw a foot or two of water covered with scum and quite unfit for use. Just 11 ft. from this well is a closet, built over what has also at one time been a well, but is now apparently a bottomless pit, or at any rate sunk to the same level as the well so close to it. It is fortunate that the house is without tenants when such dangerous conditions exist; probably the absence of a tenant is due to the polluted state of the water supply.

Returning to Rosehill-street, and proceeding thence along Merrion-street eastward, we came to *Mr. Davis's* workshop. *Mr. Davis* is a steel and copper engraver, and his productions are chiefly patterns for type for printing purposes, and of brands required under the Brands Act, and work of a similar kind in which we understand he is engaged for the Government of this Colony and that of Queensland. His shop is a weatherboard and shingle building, 22 x 12 ft.; it has small windows in front but only a door at the back opening into the yard; in it were three small furnaces but only one of them was lit; even then the place was very hot and close; the men who assist him do not, however, sleep on the premises, which are only used as a workshop. *Mr. Davis* showed us some beautifully executed samples of his work, consisting of pattern brands not more than one-third of an inch diameter, from which enlarged brands for use are designed.

Continuing along Merrion-street we crossed Pleasant-street, which, under present circumstances, is about as unpleasant a thoroughfare as could well be imagined from the fact that the drainage from all the houses in the neighbourhood lodges persistently in the gutters, where it remains and stinks frightfully. The surroundings of this street are not pleasant either, for leading into it in a north and south direction are a couple of blind lanes, altogether about 130 yards long; the roadway in that to the north is very soft and absorbs a great deal of filthy drainage from the yards and closets which adjoin it; it is also fed with foul matter discharged from a 6-in. pipe which runs along a roughly formed gutter until it reaches Merrion-street, where it lodges and stagnates. We followed up this pipe in order to ascertain its source, and traced it to the end of the lane, where a gate closes the thoroughfare. Inside this gate we noticed a number of small wooden buildings, but they all appeared to be closed, and no one was about. Upon inquiry we were informed that the premises in question are used for slaughtering at night—that sheep and pigs are constantly killed there at night time when there was no fear of detection, and that the pipe in question is used to carry away the blood and waste liquid matter. This accounted for the dead silence which reigned over the place during the busiest hour of the twenty-four. The presence of a few sheep nibbling at the tufts of grass inside the gate seemed to add testimony to the truth of this statement. The existence of this nocturnal slaughterhouse does not say much for the activity of the municipal officers, though no doubt there is a difficulty in catching the offenders, as the Act requires, *in flagrante delicto*.

Mr. Chapman remarked that he had known similar instances in the city where night slaughtering has been systematically carried on in defiance of the authorities. The occupants of the houses near the slaughter-yard complain much of the nuisance caused by the discharge of the pipe leading from it. The corresponding blind lane is in respect to the drainage it receives from yards and closets in as bad or in a worse condition, but it has not the additional contamination of the slaughterhouse refuse.

We

We found the accumulation of house and yard drainage in the gutters of the streets we inspected to-day very great. No doubt until some system of sewerage is carried out, the surface drainage will be more or less offensive, but some greater frequency and regularity in scavenging would greatly lessen the evil.

F. H. Grundy,
Esq.
17 Mar., 1876.

We finished our inspection at 1 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

THIRTY-THIRD DAY, WEDNESDAY, 1 MARCH, 1876.

Factories and Workrooms.

281. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer, as follows:—

Met the Mayor at 4 o'clock, and proceeded to inspect Hardie and Mitchell's biscuit manufactory in George-street. The manufacture is carried on in six large rooms, three on the ground and three on the first floor. Forty-five hands, all men, are employed in this establishment, and they appear to be as comfortable as the nature of their occupation will admit of. There is decent closet accommodation for them at the rear of the building.

G. F. Dansey,
Esq.
17 Mar., 1876.

Further on in Brickfield Hill is another bakehouse belonging to the same proprietors, in which seventy-six hands are employed, which we also visited. There was nothing to find fault with here; the place is fairly ventilated and sufficiently commodious for the number of employes. The third establishment in Hunter-street is only used as a retail shop.

We next visited Mr. Leigh's engraving establishment in Hunter-street. Here the rooms are much smaller, and appeared to us to be close and oppressive in spite of the means of ventilation which exist; but it was explained to us that it is necessary, as far as possible, to close the windows so as to keep out the dust which would injure the stone engraving. In this place thirty-seven men find employment. The building has a frontage to Hunter-street of 17 ft. with a depth of 20 ft.; in front there are three flats, but only two at the back. We can only say with regard to the ventilation that it would be well enough if the windows were opened.

We went next to Gibbs and Shallard's printing establishment in Pitt-street, where there are seventy hands employed, sixty-four males and six females. It contains seven printing-machines and nine presses. The size of the lower room is 85 x 30 ft.—this contains the machinery. Above is a room of similar size now undergoing great alterations for the purpose of increasing the ventilation and general accommodation. At present there are only two closets which have cisterns, but we were assured that the alterations now going on will comprise the erection of four more.

From Gibbs and Shallard's we proceeded to the premises of Elliott Brothers, chemists, where there are thirty-six men and two women employed. Everything here appeared to be clean and comfortable, and we therefore forbear to give a detailed description of the place.

We returned at about a quarter past 6 o'clock.

We have now examined a number of factories and workshops, and have found in each case that the conditions existing are favourable to the health and comfort of the persons employed in them. We do not therefore propose to push our inquiries any further in this direction, but to turn our attention to the condition of Cook Ward.

THIRTY-FOURTH DAY, MONDAY, 6 MARCH, 1876.

Cook Ward.

282. *Dr. Dansey* gave the following evidence on behalf of himself and Mr. Palmer:—

Met the Mayor at the Town Hall at 4 o'clock on Monday, 6th instant, and proceeded without police escort to commence the inspection of Cook Ward, taking the corner of Cooper-street, opposite the Devonshire-street burying-ground, as our starting-point.

G. F. Dansey,
Esq.
17 Mar., 1876.

We first examined Toohey's Brewery, which is being newly fitted up. There are twenty-six hands employed in this brewery, which used to be in a very filthy condition, but when the improvements now going on in the shape of additional closets and other conveniences are completed there will be nothing to find fault with in the accommodation. At the rear of this building is a large pool of stagnant drainage, which creates a great offence, and is calculated to breed fever and disease. This pool is situate in a sort of lane at the back of the houses in Sophia-street, and is an accumulation of house drainage lodging in this low level. The occupants of the houses near it told us that when a cart passes through this pool, which is of frequent occurrence, and stirs it up, the stench is frightful. The pool itself is 40 ft. long and 8 ft. wide. There is a great deal of sickness in the immediate neighbourhood of this nuisance, and no wonder. The lane is private property, and the owners should be compelled to lay down a drain connecting with the sewer in Elizabeth-street, and this should be seen to at once, or the sickness in this locality will be alarming.

Passing this lane we came to Foveaux-street, which extends from Surry Hills down to Elizabeth-street. This portion of it is little better than a continuation of the poisonous quagmire we have just described, and it is an imperative necessity that this street should be filled up with ballast and drained as soon as possible, for if this is the condition of the roadway after six months dry weather what will it be when the rain sets in?

At the edge of this street on the north side is a large accumulation of drainage from the houses situated on the rise of the hill. This is a surface drain, a mere ditch without lining of any kind, and there being scarcely any fall to it the stream of filth moves sluggishly along, poisoning the air all around it.

Outside the "Blue Lion" public-house in Elizabeth-street is a gully-shaft, which has no trap, and emits an abominable stench; and below this is an open hole leading into the street sewer. The escape of noxious gases at this point causes a horrible odour, of which we had personal experience. In spite of these obnoxious conditions new buildings are being erected on all sides. The drainage arrangements in all the houses hereabouts, with scarcely an exception, are very defective.

In

G. F. Dansey,
Esq.
17 Mar., 1876.

In Mary-street, from Albion-street to Gipps-street, the drainage is also very bad, there being no underground sewer in it. We were informed, however, that there is a sewer laid down in the two last-mentioned streets.

Taking the whole of this westerly portion of Cook Ward, from Cooper-street to Gipps-street, we noticed that the drainage is in a disgraceful state, and there can be no doubt that the health of the residents in it suffers just in proportion to the neglect of this important question. It appears that the architect or builder, in erecting a new building, in nine cases out of ten makes no provision whatever to carry off the house slops, which are thrown down in the yard, and run according to the inclination of the ground into the street, or on to some piece of vacant ground, where they stagnate and become a fertile source of fever and disease.

We returned at 6.15 p.m.

Personal Inspection

By No. 1 Sub-Committee.

THIRTY-FIFTH DAY, THURSDAY, 2 MARCH, 1876.

Alexandria.

283. Mr. Grundy gave the following evidence on behalf of Mr. Chapman and himself:—

F. H. Grundy,
Esq.
17 Mar., 1876.

Met at my office in Pitt-street, at 11 o'clock on Thursday 2nd instant, and proceeded, accompanied by Sergeant Larkins, to Waterloo Road in order to inspect certain nuisances complained of by Mr. Williams in a letter to the Board, which we had been specially instructed to inquire into. We were, however, unable to trace the complainant from the address given in his letter, and we were obliged to postpone the investigation to another day.

We then went to the corner of Botany-road and Buckland-street, where there is a Public School attended by from 200 to 220 children. The school-room is built of weatherboard, open to the roof and unlined, and is 40 x 20 ft. with a height of 13½ ft. to the wall plates. There are six large windows and two doors in it which would appear to be ample means of ventilation, but the room was nevertheless exceedingly close and uncomfortable from the number of children crowded into it. The head master admitted that it was extremely close, but said he lived in hopes of having a larger building erected, in which case there would be a considerable increase in the number of children attending. We inspected the well which is unusually small in circumference and the water in it very low. We drew up a bucketful of it and found it filthy and quite unfit for drinking, yet this has been the only supply up to within about a month of the present time. There is no water supply now and the children depend upon the water which the proprietors of neighbouring wells give them, and it is a very scarce article hereabouts, most of the wells having given out. The closet used by the children is a large double closet having three seats in each division, built over a cesspit 10 by 7 ft., which was absolutely full and stank abominably. This place is on about the same surface level as the well, and as the soil is all porous sand it is not to be expected that the water should be free from pollution. It did not seem to occur to the master that it was his duty to report this state of things, nor did he know to whom it should be reported. We requested him at once to call the attention of his Board to it. A butcher residing in the immediate vicinity of the school told us that his well was dry, and he believed most of his neighbours were in a similar state. We were also informed by the occupant of a house on the Botany Road, two doors north of the school—a coal and timber dealer, and a very intelligent man—that the water throughout the neighbourhood is quite unfit for use, but as he said, *it has to be used*; it is also so scarce that those whose wells are dry have to beg it by the bucketful from their neighbours who are fortunate enough to have some left. This informant stated that he had a house in Bullanaming-street where there is a well as deep as any in the district, which has lately been cleaned out, but is still empty. He attributes two-thirds of the mortality which has taken place there to the bad quality and scarcity of the water. He further stated that he amongst others had signed a petition to the City Council praying to have the water laid on, and that it had been frustrated by a counter-petition got up by owners of property in the neighbourhood, many of whom were non-residents.

Hence to Raglan-street the character of the dwellings varies but little; they are mostly one-storied weatherboard and shingle tenements, with well and common cesspits at the usual distance from each other; the former being lined with unset bricks; we did not observe a single well in which the brickwork was cemented. We found here as in other streets parallel to Raglan-street that the supply of water, though still insufficient, improved in quality with the ascent of the ground. This may be due to the fact that the wells in the higher ground are nearer to the city main and receive a portion of the waste water, or to a difference in the depth and inclination of the substratum.

From Raglan-street to Garden-street South, where there are only about twelve houses, there is a slight improvement in the character of the buildings. At the junction of these two streets is an old dilapidated brick and shingle cottage, with a well in which the water is very low and very bad, the well in the adjoining yard having given out long ago. The closet is about 20 ft. from it, quite full, and exceedingly offensive.

The fifth house in Garden-street South, occupied by Mr. Barry, is a very old one-storied brick tenement, with an old metal roof coated with tar—outside measurement, 20 x 12 ft. This house was locked up, and we could not get into it. It has two windows in front, which were closely fastened, and had the appearance of having been so for months; no windows or openings at back for purposes of ventilation; the height of the rooms, judging from the pitch of the roof, cannot be more than 6 ft.

The next six cottages are all one-storied weatherboard and shingle tenements of the average class. Some distance further down we came to a cottage, 14 x 10, which was also shut up. Like the one last described it has two sashes in front, apparently never opened, and no windows at back; attached to it is a kitchen 4 x 8 ft., having a small window 18 in. square. The closet is at the furthest corner of a very small allotment, and is 4 x 2 ft. and about 4 ft. high. There is no well at all that we could discover, but we saw a water-cask, and the water is probably brought from some well not far off.

At the rear of this allotment, and some 10 ft. from the closet, is an open brick drain about 18 in. wide, in which about 6 in. of filthy matter was standing, evidently the drainage of the adjoining yards and closets.

closets. The filth in this drain or that portion of it which is sufficiently liquid has to travel over 70 ft. of open sand till it reaches a 12-in. pipe laid under the footpath of the street, which ultimately discharges into Shea's Creek, but it cannot flow into that pipe until it accumulates sufficiently to have a head of 2 ft., and in the meantime it stagnates in the open drain and is offensive in the extreme. Both Mr. Chapman and I experienced a severe headache, which lasted all the afternoon, the result of our examination of this drain. The yards which supply it are very filthy in all respects, and three of the six closets mentioned above are within 2 or 3 ft. of each other. All of them appeared to be full.

We crossed a vacant allotment and came to several cottages of a very superior kind, built chiefly of brick and stone, with metal roofs, having nicely kept gardens and other signs of attention to comfort and cleanliness about them.

The last of these cottages brought us to the corner of Buckland-street. Proceeding east along that street we found the houses generally of a superior character, including a row of brick and shingle cottages in a good state of repair, each with its separate yard and closet.

We then came to Wyndham-street. At the junction of this and Buckland-street a large open drain (bringing the drainage from the Botany Road and a great portion of Waterloo) goes under the roadway, where it is of square shape, 3 ft. x 3 ft. Beyond the crossing it is again an open drain and continues in a south-west direction until it becomes finally a tributary to Shea's Creek. Just now it is dry from Buckland-street, and the bottom of it is covered with a thick black and strong-smelling deposit. From the east side of the junction of the two streets the open drain takes a north-east course across an allotment of land about 120 ft. square. Here we found a sluggish stream running along it containing that portion of the filth of the district which had so far escaped spilage and evaporation. The drainage in this part of the drain was more foul than in the other part, and contained its complement of dead animals, old shoes, bones, and garbage. At the far end of the vacant allotment the drain reaches the fencing of the yards and houses facing Botany Road, and is covered in with stone to the further side of Botany Road, where we left it for the present.

Returning to the vacant piece of ground we came to a well in the middle of the allotment, apparently a public well; it is fenced in with hardwood paling; there appeared to be about 2 ft. of water in it, which was not very inviting in appearance. This well is 30 feet from the large open drain just mentioned and about the same distance from several closets; it is lined with open brickwork as usual, and is of course much deeper than the floor of the drain or the bottoms of the cesspits—the inference is obvious.

Continuing along Buckland-street we came back to the school from which we started, which is in the immediate vicinity, and probably not more than 50 or 60 yards from the drain, well, and closets just described.

Each day as our examination of this district progresses we become more and more convinced of the absolute necessity of providing a plentiful supply of water for this locality, for that which is now used for drinking and domestic purposes is in nine cases out of ten palpably unfit for use. We think this is a case of such extreme urgency that not a day's unavoidable delay should be allowed to occur in having the water laid on from the city, and that the authorities should if necessary depart from their usual rule and supply the residents with water at once, without waiting for compliance with the usual custom which requires two-thirds of the inhabitants to be represented by petition. Mr. Chapman assures me that the City Council are anxious to lay on pipes to this district, and are only deterred by the apparent want of unanimity among the residents.

We returned at 2:30 p.m.

Personal Inspection

By No. 1 Sub-Committee.

THIRTY-SIXTH DAY, SATURDAY, 4 MARCH, 1876.

Alexandria.

284. *Mr. Grundy* gave the following evidence on behalf of Mr. Chapman and himself:—

Met Mr. Chapman at his office in George-street at half past 10 o'clock on Saturday, the 4th instant, and proceeded, Sergeant Larkins being in attendance, to the junction of Wyndham and Buckland streets. We then went along Wyndham-street northwards examining the houses on either side, which are chiefly weatherboard and shingle. We saw nothing inviting a closer inspection until we had passed three or four on either side; but upon entering the yard of a cottage of rather more pretention than the others, which we found to be occupied by Mr. Poppenhagen, lately a publican in the city, we found the well apparently dry, and were told by the wife of the occupant that for some time past she had been obliged to depend upon her neighbours for water, and they were themselves badly off for it. She was very indignant that anyone should have opposed the application to the City Council for a supply of the city water.

Opposite this house, on the west side of the street, are some cottages, the back yards of which are extremely filthy. In these yards, which are those referred to at the end of my last report, is a cluster of privies, six in number, so close together that the distance between the two outside closets is only 24 ft., the allotments on which they are placed being 12 ft. wide each. There are two wells between the cottages and the closets; none of these closets are further than 27 ft. from the first well, or more than 35 ft. from the second, the nearest being within 20 ft. of a well. Most of the cottages in Wyndham-street are below the level of the roadway, some of them as much as 3 ft., and many of them are also below the level of the yard or garden ground at the back; probably this is due to the accumulation of ashes and refuse thrown out from the house, with which the occupants have literally banked themselves in. There is thus no possible escape for the drainage which must either go into the house or under it, and remain there. The soil which is of a sandy character, absorbs the greater portion of it, but the health of the occupants must necessarily be affected by it; the lowest of these cottages is 3 ft. below the street level, and the floors are rotting away on account of the moisture beneath them.

Further up Wyndham-street, close to No. 67, is a narrow back passage which leads to a collection of tumbledown one-storied weatherboard and shingle tenements. We examined one of these occupied by Mr. Pallott, consisting of two rooms 10 x 10 ft. and 8 ft. high with a skillion room at the back. The rooms have one window each in front and none at the back, and the residents complain very much of the heat. Mrs. Pallott informed

F. H. Grundy,
Esq.
17 Mar., 1876.

F. H. Grundy,
Esq.
17 Mar., 1876.

F. H. Grundy, Esq., informed us that she has never been well since she came there, and that if she could afford to leave the place she would go away at once. There are seven houses in this cluster, the occupants of which are or have been till lately all dependent upon one well for their water supply; that well has now given out and they have to buy water, all but Mrs. Pallott, who says she cannot afford it, and continues to scrape up as much as she can get from the bottom of the well in question at the imminent risk of her health. Within 14 ft. of this well are two closets over common cesspits, mere holes in the sand, and there are at least ten similar closets within 30 ft. of it. The people living here now pay 1s. per cask for their water, which is brought to them by water-carts from a pipe at the far end of the main on the Botany Road. The well I have referred to is lined with unset bricks without cement, as are all the wells in the neighbourhood.

It may be remarked generally that throughout our examination of the whole of this district we have found the closets full, so full that it is a mystery to us how the occupants can continue to use them. The sand absorbs all the moisture, leaving only a hard compact mass behind. This absorption no doubt takes away a good deal of the offence which is probably the reason why clearing them out is so much neglected. In many cases the contents of the closet were above the seat, so that the closets could not be used in the ordinary way.

In the immediate vicinity of the cottages we have just referred to is a four-roomed tenement which has a closet just 2 ft. from the bedroom window. The sanitary conditions in this street (Wyndham-street) on either side so far are exceptionally bad even for this district where all is bad, and it is fearful to contemplate the result if such a state of things be allowed to continue. When the rain comes the effect it will have will be to dilute these large accumulations of fæcal matter in the closets and spread them over the surface of the ground, which will become so contaminated that wholesome water in any wells sunk in it will be an impossibility. We propose to obtain in the course of our next visit to this place a few samples of the well water in this district for analysis, to show that it is totally unfit for use. In addition to the accumulation of fæcal matter, the closets themselves are most of them in a ruinous state of dilapidation. One of these closets I must notice to show the small amount of attention paid to decency or comfort. The closet in question has no door; that has gone long ago with other portions of the structure, but a green calico curtain has been hung up in its place, from which strips have been torn off by the occupants of the closet from the inside, day by day, until nothing but a remnant is left beyond their reach.

Arriving at Raglan-street, we proceeded eastwards along it. The second house is an old hardwood and shingle building, containing several rooms, in a wretched state of repair, the roof weighted with stones to keep it on—Gough, landlord. The closet is absolutely in ruins; the roof, which is composed of Hobart Town palings, has fallen in, the sides are rotting away, and the back which is made of sheets of old iron is full of holes; door there is none, but the front side is shut in by sugar baskets; the closet is full to the seat, and is 5½ ft. distant, and 2½ ft. above the curiously dilapidated old weatherboard cottage just mentioned. When the rain comes, and the closet overflows, this cottage must necessarily receive the overflow; there is no other place for it to go to. The occupant of the cottage was not at home, and we had not an opportunity of inspecting the interior. On the allotment upon which it is erected—on that portion of it which faces the entrance to Wyndham Grove—is a well lined with casks, one over the other. This well is situate at such a low level that it cannot fail to receive a good deal of drainage percolation from the different closets in the neighbourhood. The Committee will see by the diagram which I submit, the position of these closets; the water notwithstanding, is clear and good in appearance, and people come from all quarters to take it away. We propose to take a sample of this water also.

A few yards further eastward in Raglan-street we came to a fenced passage, about 100 feet long and 12 ft. wide, which opens out to a square about 60 ft. wide. On the left hand side of this square is a row of four cottages, containing four rooms each, two of them built of brick and two of hardwood, all of them having metal roofs; the sheets of iron are kept in their places by heavy stones placed upon them. These roofs have all a skillion pitch, being 10 ft. high in front and 7 ft. at back; the houses are old and dilapidated. Although this place is comparatively in the country, with plenty of open space around it, the owner has only contrived to allow the limited width of 4 ft. 6 in. for the back yards in which the closets are placed, where a close paling fence cuts off the property. Along the whole length of the four cottages—80 ft.—runs irregularly, within a foot or two of the back doors, an open drain, which receives the slops and refuse of all kinds, and probably takes away a good deal of the closet drainage, especially in wet weather. At the angles formed by the two end cottages two open pits have been sunk to receive the contents of this drain, which percolate slowly through the sand, leaving an offensive residue at the bottom of the pits. The closets inside the small yards—4½ ft.—are of course close to the houses; the whole place gives forth an abominable and unhealthy smell. Nevertheless, a row of cottages of similar design, and apparently with the same extent of back yards, is being put up on the opposite side of the "Grove." In the centre of the vacant space between the two rows, which is about 20 ft. wide, is a well, which forms the water supply for the residents. We examined this well; the water was apparently about 1 ft. deep, and quite black. The landlord accounted for this by saying that the well had just been cleaned out. A similar fence encloses the property on the south side. This description will be sufficient to show that Wyndham Grove possesses none of the attractions of a pleasant suburban retreat such as its name would indicate. No shady trees or sparkling streams with verdant banks, but in place of them a foul open drain, a filthy well, and a row of stinking closets close to the kitchen doors. The Grove is bounded by a gate which leads to some open garden land fronting a cottage old and built of weatherboard, but of rather pretentious appearance. It has a length of probably 30 to 40 ft., and a verandah with ornamental pillars; this is the residence of Mr. Burns, the landlord of the Grove. We noticed that the children living in these houses had a very unhealthy appearance, but we only heard of one case of positive illness, which was in the landlord's house, the patient being his son, a boy about 6 years of age, who is suffering from dropsy after fever. This property forms a sort of natural basin, the well being in the centre, and the drainage from the houses is at too low a level to be run off into the street gutters. The closets, however, should be moved further back, for it seems monstrous that in a comparatively open suburb only 4½ ft. can be spared for the width of the back yards in which they are placed, these yards being already sufficiently poisoned by the open surface drainage running through the centre of them. We expressed ourselves pretty freely on this subject as we returned, the sergeant giving his opinion that the landlord ought to have seven yards at least.

We came back to Sydney at 1 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

THIRTY-FIFTH DAY, WEDNESDAY, 8 MARCH, 1876.

Cook Ward.

285. *Mr. Palmer* gave evidence on behalf of *Dr. Dansey* and himself, as follows:—

Left the Town Hall at 4 o'clock in company with *Dr. Dansey*, and went to Cook Ward to the corner of Oxford-street, and thence as far as Bourke-street. The houses in this locality are of modern construction, many of them recently built, and after inspecting several of them we satisfied ourselves that they were in good and clean condition.

B. Palmer,
Esq.
17 Mar., 1876.

Entering Bourke-street we proceeded in the direction of Hill-street, which we also inspected with an equally satisfactory result.

Along Hill-street to the Botany Road the houses also appeared to be in good order. Being desirous of tracing the drainage area of the Surry Hills we followed the natural fall of the land to Little Hutchinson-street, and thence to Hutchinson-street proper, which I may say, from previous observations, has for many years contributed a large share of offensive matter to the neighbouring streets. The drainage from this street goes through Jamieson-street and Marshall-street into Arthur-street through an allotment which is private property. This prevents the Corporation from laying down a proper drain with flat bottom, which might be swept frequently and kept clean. At present the filthy matter trickles slowly along a surface drain which is a mere ditch. If the Corporation had the same powers which are accorded elsewhere this allotment would be valued and purchased for the purpose of making a proper passage for the offensive matter, and the whole neighbourhood would be benefited by it.

From Hutchinson-street we went to Fitzroy-street, and then examined part of Dowling-street, opposite Moore Park, which is at present unformed, but is being gradually made. It is at present some 10 or 15 ft. below the level of the Park, and being at such a low level it receives the drainage of all the upper part of Crown-street, Bourke-street, and other streets of Surry Hills. During the present dry weather the offence caused by this drainage is comparatively slight, many places which have been complained of as standing nuisances being now almost dry, but in wet weather a much worse state of things will occur.

We passed through a street which appeared to have no name but which I will call McElhone-street from a terrace of comfortable looking houses in it called McElhone Terrace. This street is also unformed on one side.

We then went to Bennett-street where there is a row of four-roomed houses, about twenty in number, called Blanche-terrace, renting at from 11s. to 14s. a week, the property of *Mr. Eyles*, a builder. Here also there is no arrangement for drainage and the street is not kerbed or guttered. One person with whom we got into conversation, who claimed to be the oldest inhabitant, informed us nevertheless that although there was so much sickness in other parts of the city no deaths had occurred here. A few minutes afterwards we met *Dr. Renwick*, who assured us that there was a good deal of sickness in that particular locality, that he had several cases of fever, and that *Dr. Marshall* was also attending other cases.

We next examined Bennett's Paddock, which is intersected by an open unformed gutter or ditch which emits a fearful stench. The filthy matter in this ditch is almost stagnant for want of rain, and there it remains poisoning the atmosphere on all sides. This nuisance might be remedied by bringing the drainage through Bennett and McElhone streets, and if the property were drained it would be of considerable value. It appears to us that the Corporation in the interest of the citizens generally should have power to effect these improvements, and not only that, but to compel the owners of such properties to pay a portion at least of the expense in consideration of the increased value which the land would possess. The allotment in question if properly drained would be worth twice as much as it would fetch now.

We returned to Marshall-street, and passed some five cottages, the property of *William Taylor*, old-fashioned in style but in apparent good condition. In Jamieson-street there are some nice looking cottages going up in spite of the offensive open drain. Here the nuisance does not arise after settlement but the people come voluntarily to it. The small price of land is presumably the attraction and the hope that when the streets are formed and the drainage provided for it will rapidly increase in value. From Marshall-street to Jamieson-street and then along Dowling-street to the Park gate, which terminated our day's inspection.

We were glad to note a considerable improvement in the state of the drains which are looked after by the Corporation. This is due to the more frequent visits of the men whose duty it is to sweep out and clean them. Under the present improved arrangement, instead of sending the men with carts once a week or thereabouts to each ward, they go two or three times, and the accumulation of offensive matter being much less they get through the work quite as quickly and with less labour.

We returned at a quarter past 6 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

THIRTY-SEVENTH DAY, WEDNESDAY, 8 MARCH, 1876.

Alexandria.

286. *Mr. Grundy* gave evidence on behalf of himself and *Mr. Chapman*, as follows:—

Met *Mr. Chapman* at his office in George-street at 4 o'clock on the afternoon of Wednesday, the 8th instant, and proceeded, accompanied by *Sergeant Larkins*, to the corner of Raglan and Wyndham streets, and thence up Wyndham-street northerly. On the corner allotment, at the junction of these two streets, is a fairly constructed, rather superior-looking, brick house, with iron roof, containing probably six rooms. The occupant of this house told us that although the city main extends as far as Raglan-street, that

F. H. Grundy,
Esq.
17 Mar., 1876.

F. H. Grundy, Esq.
17 Mar., 1876.

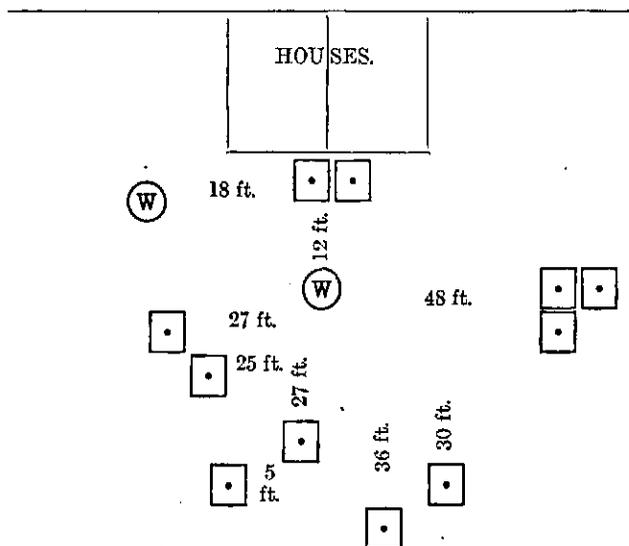

that is to say, opposite to the wall of her house, the landlord absolutely refuses to lay the water on, notwithstanding that the well is dry, and that the house would rent at a higher rate if connected; the consequence is that she is obliged to beg water from her neighbours. At the end of the same allotment is an open shed with a few broken Hobart Town palings as an apology for a roof. From this shed proceeded an unceasing sound of winnying from a miserable half-starved horse, who was thus making a pathetic appeal to the passers-by against the misery of his lot. This sound had attracted the notice of the woman just referred to as the occupant of the last house, who was in the act of going with a bucket to the house of a neighbour to obtain a drink for the poor animal. She informed us that the horse belonged to a drunken man who sold fruit, and who frequently left it all day without food or water; close by was a cart containing a quantity of fruit and vegetables rotting in the sun. This unfortunate quadruped, in addition to his privations, is forced, from the position of the shed, to stand with his head over a closet, the odour from which must be anything but pleasant on an empty stomach. We commend this case to the consideration of the Society for the Prevention of Cruelty to Animals.

With regard to the difficulty of persuading or compelling landlords of houses in the vicinity of a main to lay on water, I may mention that it is by no means unusual. We were told repeatedly by the occupants of houses in this street, where the wells are nearly all empty, that the landlords refuse to pay the small sum necessary to connect their properties with the main, although they are compelled to pay for the water in the shape of a water rate. Even resident owners, if their wells happen not to be dry, will not lay the water on for their own convenience, and sometimes they are too poor. One woman told us she was trying to save up the necessary funds—which amount to some £2 or £3. It seems rather an anomaly that landlords of houses should have to pay for the water and decline to make use of it.

By the side of the shed just mentioned is an unformed sandy lane or track 12 feet wide, leading to four cottages standing slightly apart from the other houses, and fenced round. Our attention was specially directed to these cottages, which appeared to be in a very dilapidated condition. The gate, however, leading to them was closed, and we were unable to inspect them, but we were informed that there is another entrance from Botany Road, and we shall take an opportunity of revisiting them.

Exactly opposite to this sandy lane on the other side of Wyndham-street are some of the usual style of one-storied cottages, presenting a fair exterior to the street, but showing a very different state of things at the rear. Imagine two wells not far apart from each other, containing the water supply for all the residents, and no less than eleven closets in close proximity, the nearest being 12 ft. and the most distant 48 feet from a well; no cement used in the lining of the wells, and the closets mere holes in the ground, which, being all porous sand, absorbs the liquid portion of the closet matter, and is necessarily drained by the wells, and you will see that in all these cases the water supply must be directly contaminated.

WYNDHAM-STREET.

Following Wyndham-street we came presently to a passage 3 ft. 6 in. wide on the left side of the street, running westward to Garden-street, a distance of 200 feet. Half-way down this passage where the 100-foot allotments on either side join, a similar passage extends for 80 yards southward in the direction of Raglan-street. It appears that 1 foot 9 in. off each of these 100 ft. allotments, making a passage of 3 ft. 6 in. wide, is all that could be spared for a back entrance to the houses. This passage, as a matter of course, is made the receptacle for house refuse of all kinds, and the ground being about level there is no drainage whatever from it except into the wells, into which the slops must gradually find their way by percolation through the sandy soil. In one place, where the well is very near the fence, there are three closets distant from it respectively 14, 18, and 20 ft., the well being sunk in the lowest portion of the ground. In another place there is a closet on about the same level as the well, which is about 6 ft. from it. In short, this passage of 80 yards length has a number of wells close to it, with no less than twenty-six closets abutting upon it. Most of them have either never been cleaned out or cleaned out at some remote period; indeed, it is a question whether the process of emptying is ever resorted to in this locality, the usual practice being to dig a fresh hole and shift the closet to another part of the yard or allotment.

On the east side, opposite this narrow passage, is another unformed sandy lane, 12 ft. wide, which seems to have been left as the back entrance to the houses to be erected on a similar row of allotments, but on account of its additional width it does not create such a nuisance, although it is bad enough; it extends half-way to the Botany Road.

Proceeding north, we looked into a yard where there is a cesspit, over which there has been originally a double closet. One portion of the closet has been removed, and put up in another part of the yard; the other portion, which is in the next allotment, is left; the pit, which is full and running over, remaining uncovered.

Arriving

Arriving at Boundary-street we followed it westward to Garden-street. Up to this point there are no houses in Boundary-street with the exception of one formerly known as Boundary House, a two-storied brick and shingle building in fair repair. Immediately opposite to it is a market-garden and a cow-shed, close to which is an open drain which brings down some of the drainage from the upper portions of Wyndham, Boundary, and other streets, and ultimately finds its way into Sheca's Creek. This drain is very offensive and unwholesome, especially in hot weather.

F. H. Grundy,
Esq.
17 Mar., 1876.

Returning by way of Garden-street to Raglan-street, the first three or four allotments, which are 200 ft. deep, have not been subdivided, and have only one cottage upon each allotment. Passing these we came to six cottages in tolerably good order, which brought us again to the narrow passage previously described as being 3 ft. 6 in. wide, the closets and wells mentioned as abutting upon this passage being those pertaining to the remaining houses as far as Raglan-street. These houses or cottages are clean and neat to the eye when seen from the street, but are like whitened sepulchres, and will not bear inspection. The casual passer-by can see nothing amiss in them, but it is only necessary to go to the rear of them to see that no provision whatever is made to secure health or cleanliness. A great improvement would be effected by the introduction of a clause in the new Building Act to prohibit the cutting up of outlying estates into such very small allotments. A minimum width should be fixed for lanes forming back entrances; they should be not less than 20 ft. wide as in the city, and they should always be thoroughfares. All these properties belong to the Cooper Estate, and are let on 99 years' leases.

We returned to town at 6 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

THIRTY-SIXTH DAY, MONDAY, 13 MARCH, 1876.

Cook Ward.

287. *Mr. Palmer* gave the following evidence on behalf of Dr. Dansey and himself:—

Left the Town Hall with Dr. Dansey at a quarter to 4 o'clock on Monday, the 13th instant, and proceeded to Liverpool-street, and thence to Pelican-street, which consists of about thirty houses, which in appearance and after we had inspected several of them we found to be in fairly good order and condition. They are for the most part connected with a sewer, and one result of our inspection will be that those which are not connected will receive a visit from an officer of the Corporation requiring that this be done without delay.

B. Palmer,
Esq.
17 Mar., 1876.

We next examined four brick houses containing four rooms each, belonging to Mrs. Drinkwater, which are also connected with the sewer, and have closets fitted with patent cisterns. There was nothing to find fault with here.

A number of houses on the western side of the street are connected with a sewer which runs down Robin Hood-lane, but from the junction of Edward-lane there is no sewer, and the houses on the eastern side are not connected and have closets over common cesspits, while on that side we found one closet which might be connected, and singular to relate the property belongs to a plumber whose principal occupation is to fit up closets with patent cisterns; his excuse was that he was so busy connecting other people's closets that he had no time to look after his own. I told him that he would have fourteen days notice, and he promised to have it done at once.

We then entered into Goulburn-street, and examined four new brick houses, having four rooms and a kitchen, each the property of Alderman Green, whose civic experience is evident in the cleanly and comfortable appearance of his houses.

In this street is an open drain pipe; there was no water in it at the time of our visit or the least appearance of moisture, but the sediment deposited in it was very offensive and must be injurious to health. In wet weather we were told by residents in the neighbourhood it is a continual source of offence; at present the nuisance is comparatively slight.

We inspected an old two-roomed brick cottage belonging to Mrs. Gibson, occupied at present by one Phil. Gearin, an individual who claims to be the oldest inhabitant, and is said to be 90 years of age. This youth was not at home and we had not the pleasure of making his acquaintance.

In our examination of house properties, especially in back streets and lanes, we have usually a considerable following of juveniles. During this day's inspection our escort was unusually large; they followed us persistently from house to house, apparently in a state of intense wonder and enjoyment. The last houses we inspected in Goulburn-street were Nos. 182 and 184, which contain four rooms each, the closets being fitted with patent cisterns. One cottage is occupied by Mrs. Ticken, who, as we were told by a little girl left at home to mind the place, was out selling fruit in the city. In front of it is a stable which, for the variety of building materials it comprises, is quite a novelty, hardly two pieces of wood being of the same kind, size, or quality, the roof being a collection of pieces of old iron and tin.

From Goulburn-street we went into Riley-street and inspected a number of houses of modern construction, which we found clean and in good repair. It may be well to mention here that the lower part of Campbell-street has for years drained into a low and vacant piece of land between that street and Goulburn-street which has been a standing source of complaint. On account of the late unprecedented weather it is now thoroughly dry, but when the wet season sets in the nuisance will recur. The only effectual remedy is to lay down a large oviform sewer which would pass through this ground.

Continuing our inspection of Riley-street we entered and examined a number of comfortable looking houses, and found that the internal arrangements did not belie their external appearance. They are all connected with a sewer. Six of these houses belong to a Mr. Moore, two to Mr. Baptist, and eleven to Mr. Seymour. We found nothing amiss with either in respect to ventilation or closet accommodation.

Proceeding along Riley-street southward, near Corben's-terrace, there is a sudden fall in the street which has caused an accumulation of house refuse to collect at that spot. This requires attention, as in rainy weather it must be a serious nuisance. A very little labour in levelling the street would remedy the evil.

B. Palmer,
Esq.
17 Mar., 1876.

Along Riley-street to Campbell-street, and on to Gipps-street, where we found most of the houses connected with the sewer, and noted those which were not, in order that the necessary steps may be taken to compel them to connect. In none of these houses did we find any conditions existing injurious to health. The proprietors of Nos. 271 and 272, which are not connected with the sewer, will receive the usual notice of fourteen days.

From Gipps-street we went to Albion-street, and from Albion-street to Fitzroy-street, where we saw nothing calling for special notice, and on to Foveaux-street. In this street there are houses of modern style and of much better description than usual, but they are not connected with any sewer, and have only the ordinary closets over cesspits, which were, however, tolerably clean. Though these houses are in good order a nuisance appears to be created by the practice adopted by the occupants of throwing house refuse, containing vegetable matter, bones, &c., into the lanes at the back, instead of collecting it in heaps or vessels to be taken away by the Corporation carts. The land on which the houses on the eastern side of the street are built has a steep incline to the west, and the drainage from them—the back yards being the highest portion of the allotment—goes under the house straight into the street gutters in front, while the drainage of the houses on the western side finds its way into the cross streets at the back of them. This state of things can only be remedied by an effective system of sewerage. We propose to make a further inspection of this locality with the object of discovering if possible some means of effecting a temporary remedy.

From Foveaux-street we went to Sophia-street, from Sophia-street to Collins-street, then to Cooper-street, from Cooper-street to Adelaide-street, and thence to Devonshire-street. The houses in all these streets are built chiefly on the western side, and consequently they drain into the cross streets at the back of them, which are at a still lower level. These streets we had not time to inspect.

We went from Devonshire-street towards Goodlet's mill, through a street which is only partly formed, and we found ourselves on a mountain of sand. We saw nothing especially noticeable in this direction, and it being half-past 6 o'clock we turned our steps homeward.

Personal Inspection

By No. 2 Sub-Committee.

THIRTY-SEVENTH DAY, WEDNESDAY, 15 MARCH, 1876.

Cook Ward.

288. *Mr. Palmer* gave evidence on behalf of Dr. Dansey and himself, as follows:—

B. Palmer,
Esq.
17 Mar., 1876.

Met Dr. Dansey at my house at half-past 8 o'clock on the morning of Wednesday, 15th instant, and went to Riley-place, which is at the first turning on the left hand from Oxford-street, and leads to Crown-street. There are about fourteen houses in Riley-place, and the gutters being very rough and broken a great deal of filthy liquid matter collects in them. Upon examination we found that some of the houses are connected with the sewer and some are not. Many of the closets having been directly connected with the watermain the water has been cut off by the officers of the Corporation; and the landlords, taking advantage of the extension of time allowed by the Water Pollution Prevention Act, have declined to put in patent cisterns until the expiration of the twelve months allowed. The tenants are thus compelled to carry water themselves to flush the closets, which is a subject of great complaint among them.

We next inspected Bissaker-row, which adjoins Riley-place, and consists of seven old-fashioned and badly-ventilated houses. The first or corner house contains four rooms and is rented at 8s. a week; the other six have three rooms only and rented at 7s. In all these the drainage and sanitary arrangements are very deficient; the pipes are without trapping, and a very offensive effluvia arises from the drains. We found out that the pipes are choked up with old rags, bags, and broken bottles, and the water is cut off. The only remedy we could suggest for this state of things, taking into consideration the extreme dry weather, would be to flush the drains with a copious supply of water and to wash and clean them out thoroughly.

On the south side of Riley-place are two houses belonging to Miss Golden, containing two rooms each, and rented at 6s. a week. There are patent closets, but they have no cisterns, and the same complaint is made by the tenants, that the landlady will not supply them. The water being cut off, in the interim they flush the closets with buckets when they consider it necessary to do so, but this is generally done at the eleventh hour, and not until the closet has become choked and offensive.

We then proceeded to Edward-lane, which has six small houses on the south side, and three on the north side, owned by Mrs. Gread, all containing two rooms, rented at 6s. a week, and all of them old dilapidated, dirty, and uncomfortable tenements. The ventilation is of the old-fashioned kind, afforded by small windows in front only, but as these are almost all broken there are plenty of openings for the air to enter. The closets open to the street, and are in a very filthy condition, the water being cut off and no cisterns furnished for reasons already given. The latitude allowed to house owners by the Act is the cause of a considerable nuisance, for it appears that in these small dwellings very little regard is paid to cleanliness in connection with the closets, which are only flushed when they are full to the brim.

On the opposite side there is an old dilapidated cottage, containing two rooms, and occupied by a man and his wife and six children, rented at 6s. a week. The husband and wife and one of the children sleep in one small room about 12 x 10 ft., and the other children in the other, which is 12 x 12 ft., and is used as the sitting or living room during the day. Although crowded in such a confined space, the family appeared to be healthy, and the woman told us she had lived there six years and they never had anything the matter with them.

We next went to Craddock's Lane, which is only 12 ft. wide and contains about a dozen small houses—eight or nine on the east and three or four on the west side, some built of stone, some of brick, and some of weatherboard, belonging to Mrs. Hegarty, and rented at 6s. a week. These houses have all common closets, there being no sewer near, and the yards are very small and confined. We noticed here as in many other places that instead of collecting the house refuse in heaps to be taken away by the Corporation carts at a certain hour, the occupants of the houses sweep their rubbish indiscriminately into the street gutters. We know as a fact that these gutters are frequently cleaned, but the efforts on the part

part of the Corporation to prevent nuisances of this kind are frustrated by this practice. Increased supervision would do much to remedy the evil, but that is not practicable under present arrangements, and it may be worth while to consider whether it would not be desirable to follow the example set by other and older communities and to organize a body of city police, whose duty it should be to see that the necessary sanitary arrangements are carried out and who would be directly under the control of the Municipal Council.

B. Palmer,
Esq.
17 Mar., 1876.

We passed on to Robin Hood Lane where five very nice looking houses are being built, but although they look comfortable the wretched accommodation afforded at the back of them must render them very undesirable residences, the yards being only 6 ft. deep. This property affords another instance of the urgent necessity of a Building Act, in which provision for a minimum amount of air-breathing space to each house should be compulsory.

Thence we went to Little Brisbane-street, which contains about eighteen houses, and does not call for special notice, except that they are all connected, but some of them are without cisterns and the landlords are taking advantage of the latitude afforded by the Act, and are in no hurry to provide them.

We then re-entered Edward-lane and inspected some decent looking three-roomed cottages, rented at 9s. a week with one exception where the rent is 8s. This cottage labours under the disadvantage of having a gully shaft on each side of it, which may perhaps account for the 1s. reduction. The occupant of this house told us that the effluvia arising from these shafts was so bad that at times she could not put her head outside the door.

We then entered Lower Campbell-street and found on the south side four weatherboard houses with a sort of Elizabethian roof of shingles, containing two rooms below and one above, rented at 7s.—agent, Ramsay. Here also the closets have been directly connected with the main and the water has been cut off. There is another very offensive gully-shaft at this corner. We inspected several houses in this street, some of which belong to Mr. Simmons, of Parramatta, renting from 10s. to 14s. a week. Lower Campbell-street has one peculiarity; it comprises almost every variety of Colonial architecture, and the houses front every point of the compass as if they were ashamed to look each other in the face, besides which no two tenements are of the same size. I except, however, two rows, one of which containing seven four-roomed houses, built of brick with slate roofs and with kitchen attached, rented at 12s. a week, the property of Mr. Gregory Board, looked very clean and comfortable.

From Lower Campbell-street we proceeded to East-street, where there are some nice looking houses built of brick and stone, with cement fronts, slate roofs, and ornamental windows, and all with patent closets.

Then to Leist-street or lane, between Lower and Upper Campbell streets, which is about 10 or 12 ft. wide. There is an open drain in the centre of it full of very offensive matter. In this lane, which is somewhere about 250 yards long, there are only three houses renting at about 8s. 6d. a week, but to make up for this deficiency there are closets *ad libitum*. The street is in short a perfect arcade of closets belonging to the houses on either side in Upper and Lower Campbell-streets. It is not a very pleasant walk up this lane on account of the effluvia which arise from these places. I do not think we have seen a more unwholesome locality since we commenced our house to house inspection. These properties are all very badly drained. As I have stated there is a drain or gutter, whether natural or artificial we could not easily determine, in the centre of the lane, which receives the drainage of numerous streets, and possibly more or less offensive matter from the closets. The proper thing to do would be to pitch pave this lane and to wash it down thoroughly twice a week at least, but this would entail a considerable expenditure.

From this lane we went to Smithers-lane, which runs between Upper and Lower Campbell streets, where we found only three small three-roomed weatherboard cottages, rented at 5s. a week each. Upon examining the closet we found the water cut off and the closet quite full and very offensive, the process of flushing which would get rid of the nuisance being considered by the occupants the greater nuisance of the two. This closet was so offensive that upon our return I instructed the Inspector of Nuisances to pay a visit to the place.

We then went to Upper Campbell-street, and along that street to Edward-street. As there is no sewer here the closets are all ordinary privies.

At the bottom of this street Mr. Leist has gone to the expense of laying down a drain to meet the sewer which leads to East-street in order to connect his four houses.

Then to Seymour-street, where we inspected several old and dilapidated houses. The greater part of this property, which belongs to Mr. J. S. Smith, M.P., is let on leasehold, and the leases will expire in about two years; for this reason the agent declines to expend any money in repairs; the houses are in a wretched condition, and have all the old-fashioned closets.

Thence to Rose-lane, where there are several old houses—nine altogether—averaging about four rooms each, and renting at from 8s. to 10s. a week. Then to Gipps-street, where the houses having been recently built in modern style, are in good order, and do not call for any notice from us.

Having been now about three hours on our legs, and being thoroughly tired, we returned at 11:30 A.M.

Personal Inspection

By No. 1 Sub-Committee.

THIRTY-EIGHTH DAY, TUESDAY, 14 MARCH, 1876.

Alexandria.

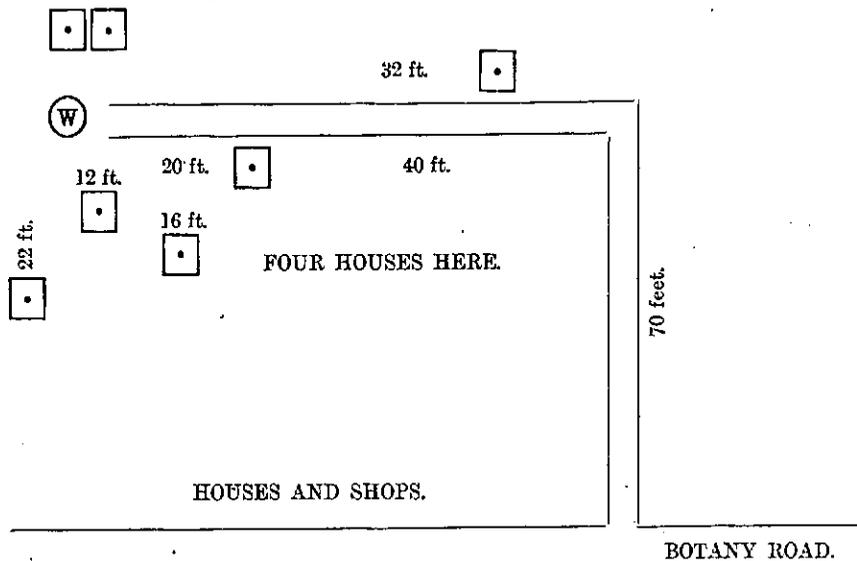

289. *Mr. Grundy* gave the following evidence on behalf of himself and Mr. Chapman:—

Met Mr. Chapman at his place in George-street, at 2 o'clock, p.m., on Tuesday, 14th instant, and proceeded, accompanied by Sergeant Larkins, to the junction of Raglan-street and Botany Road, and thence along Botany Road northwards.

F. H. Grundy,
Esq.
17 Mar., 1876.

Passing some six or seven houses, which call for no particular notice, we came to a blind passage 5 ft. wide and 66 ft. in length, penetrating to the centre of the double allotments fronting Botany Road and Wyndham.

F. H. Grundy, Esq., Wyndham-street. This mode of subdividing them, although an ingenious arrangement on the part of the original leaseholder to make the most of his speculation, is a very injurious one in a sanitary point of view. The practice has been to purchase or lease one of the double allotments and then disposing of the frontage with a diminished depth of 70 ft. instead of 100 ft. to each street, to leave a centre block of some 60 ft. in width still for sale or lease, approached by means of a narrow dirty passage of 3, 4, or 5 feet in width. These centre 60-ft. allotments are then cut up into little bits just large enough to contain a cottage, a closet, and a well; sometimes however with only one well for all the cottages. In the present instance the block is cut up into six allotments, so that the original allotment of 200 by 50 ft., with four street frontages, has upon it ten dwellings without drainage, ten closets, and from five to ten wells. Sometimes the economy of space even in this recently inhabited suburb is carried out to a still further extent, for we have met with instances where some of the 50-ft. lots fronting streets have been subdivided into four frontages of only $12\frac{1}{2}$ ft. each. There would thus be fourteen dwellings and the consequent accommodation, or the want of it upon the original allotment of 200 by 50-ft., besides the addition occasionally of cowsheds, stables, and outbuildings; these tenements having at the ordinary average of five to a house, seventy inmates. Surely Legislative interference is called for to prevent this unseemly and unwholesome overcrowding. The blind lane I am now describing after extending westward 70 ft. into these allotments turns at right angles to the south for a distance of 40 ft.; it then opens out to a width of 10 ft. and encloses a well which is used in common by the occupants of the six houses put up on the strips of land into which this 60-ft. centre block is cut up. This well is encircled by the six closets belonging to these houses at distances varying from 12 to 30 ft., as will be seen by the annexed diagram. The well is 24 ft. deep, and from the nature of the soil and the conditions which exist, described

in several of our reports upon the properties in this district, it must receive the soakage from them. No further proof of this is necessary than a repetition of the fact that the closets are for the most part full of hard faecal matter, all the moisture from them being absorbed by the sand. We got into conversation with one woman here who had had the common sense to reason out the necessary consequence of this unwholesome juxta-position of closets and wells. She said the water was quite unfit to drink, and that during her residence in the locality for some months she had never used it in her house at all, except for "slopping about."

Ten feet from this well are two old brick cottages with iron roofs, owned by Mr. Harwell, containing each two rooms and a kitchen, rented at 5s. 6d. a week; the rooms are 10 by 9 ft. and $7\frac{1}{2}$ ft. high, the kitchen being still smaller; there are no windows or openings at the back, and the rooms are consequently very badly ventilated; in one of them a woman lay dying; the tenants of these cottages complained greatly of the heat and closeness of the rooms.

Opposite to this passage, on the other or eastern side of Botany Road, are four old and dilapidated weatherboard cottages some 4 or 5 feet apart from each other. A description of one of them will answer for all, as they are all nearly the same. The first is occupied by Mrs. Macintosh, who makes her living by washing, which she finds it rather a difficult thing to do under present circumstances; her well has been dry for the last fourteen weeks, and she has to buy all her water; she only holds on to her present quarters in anticipation of rain, and in the secure possession of a good drying ground. Her cottage is a low one-storied weatherboard tenement, roofed with old iron; it was originally a two-roomed cottage, with verandah, 5 ft. wide and 20 ft. long; this has been enclosed, but the floor of it is 5 or 6 ft. below the floor of the rooms, and it must be very damp and unwholesome. She inveighed loudly against the heat inside, especially at night, when the doors were closed. The closet pertaining to this dwelling is just 6 feet from the well, and the soil is sandy. This dangerous proximity, however, is no more than we have noticed in many instances in this quarter. Sometimes there are half a dozen closets within 20 ft. of the only water supply for a number of persons. We were at a loss for some time to account for the number of closets which abound in this suburb, so far exceeding the number of closets in other suburbs of equal population; but it is easily accounted for, the soil being soft and sandy it is very easy to sink a pit; indeed it is easier to sink a new cesspit than to clean out an old one. In Waterloo no nightman could make a living; when a closet is full—so full that the occupants of the house can no longer make use of it—the remedy is very simple: they scoop out another aperture a few yards from it, and shift the closet from one hole to the other.

Passing several houses similar to those I have described, we came to another passage, about 3 ft. wide, leading from Botany Road to Botany-street. On either side of this lane are a number of small wretched tenements, some built of brick and some of weatherboard, very low and damp, and from their situation almost shut in from the purifying effects of fresh air. The residents had an unhealthy look about them, and as a matter of fact we ascertained that there has been a great deal of sickness among them.

them. One woman told us that the closeness of the place was so unbearable that although she would have the greatest difficulty in finding a cottage, the rent of which was within her means, she was determined to leave her present quarters under any circumstances. With all these disadvantages it is a rare thing to find one of these hovels without a tenant. The rents in this locality average about 5s. a week; Miss Shepherd is the landlady. F. H. Grundy, Esq.
17 Mar., 1876.

Back to Botany-street, passing through the toll-bar to Boundary-street, and from Boundary-street to Wyndham-street, where we found nothing of sufficient importance to record.

Returning to the Botany Road, and continuing north, we passed a row of small dilapidated cottages, mostly of weatherboard roofed with iron, having small windows in front only, which in most instances appeared to be hermetically sealed; during the present weather it must be torture to live in them.

A little further on, on the west side of the road, is a Wesleyan Chapel, a one-storied soft-wood structure, having a frontage to the street of 20 ft., with a depth of from 40 to 45 ft.; the height of the boarded ceiling being about 12 ft. As far as we could judge of it from the outside this building is in very poor repair, and if the congregation is a large one they must be nearly suffocated in hot weather.

The yards of the cottages hereabout present a very dirty and disreputable appearance; but the residents have one advantage—the city water is laid on, and from our experience of adjacent buildings this must be a source of great sanitary improvement.

We returned at 4 o'clock, as I had to attend a meeting of the Engineering Committee at that hour.

FRIDAY, 24 MARCH, 1876.

Present:—

M. CHAPMAN, Esq.,	B. PALMER, Esq.,
F. H. GRUNDY, Esq.,	G. F. DANSEY, Esq.

HON. JOHN SMITH, M.L.C., M.D., IN THE CHAIR.

Personal Inspection

By No. 1 Sub-Committee.

THIRTY-NINTH DAY, SATURDAY, 18 MARCH, 1876.

Alexandria.

290. *Mr. Grundy* gave evidence on behalf of *Mr. Chapman* and himself as follows:—

Met at *Mr. Chapman's* office at half-past 10 o'clock on Saturday, the 18th instant, and proceeded, accompanied by *Serjeant Larkins*, by the *Waterloo omnibus*, to the extent of its journey, a short lane leading to the stables of the *City Omnibus Company*. These stables are built entirely of soft wood, roofed with *Hobart Town palings*. The principal stables consist of three compartments, each 20 ft. wide, and about 240 ft. in length. Two of them are constructed with high pitched roofs, meeting in the centre so as to form a lofty and well ventilated stable with a loft above it; the third is a lean-to on the south side of the others, and has no loft over it. 50 or 60 ft. north of the block on which these are erected is a similar stable, only smaller. The number of horses usually kept on the premises varies from 120 to 150; they seem to be well fed and attended to, and the place altogether looks clean and comfortable. We could not help noticing the absence of the stale smell which is so often found in flagged or paved stables; this is attributed to the fact that the stalls have only the natural earth for a flooring on which the horses are comfortably and plentifully littered down with sawdust and shavings, replaced every day. The animals are watered from two wells which are both full; the water is clear and uncontaminated by closet drainage or other source of pollution. Taking into account the usually lean condition and woe-begone appearance of the *Sydney omnibus* horses, this enumeration of the comforts provided for them would seem to be a contradiction, but it is accounted for by the explanation which we have frequently heard, that the horses are overfed—their mangers are never empty, and the fodder supplied to them is sweet and good, but they are not fed at regular intervals, and with a regular allowance. A smaller amount of food given to them at stated periods would probably put them in better condition. In these stables twelve men are permanently employed; there is no closet provided for them, and they go down to a creek some distance off—a tributary to *Shea's Creek*. We were told that a closet was going to be put up as soon as time could be found to do it, but the process is likely to be a tardy one, considering that the stables have been there for over three years. As far as the stables were concerned however we left with the conviction that what might have been a serious nuisance was so managed as to be no nuisance at all. I omitted to mention that about 20 or 30 ft. south of the main stables is a hay-shed, where a chaff-cutting machine was at work. The fodder seemed to be of the best quality. F. H. Grundy, Esq.
24 Mar., 1876.

Adjoining the grounds of the *Omnibus Company*, which are not extensive, are a number of market gardens, which extend towards and along *Shea's Creek*. We inspected the first of these, which appeared to be about 3 acres in extent, and is occupied by a *Chinaman*; the vegetables looked particularly green and flourishing. There are two wells, each containing an abundant supply of clean looking water. One *Chinaman* was watering some lettuces with two large watering-cans slung over his shoulder with a bamboo rod, one at each end. At each step, by bending his body forward and tilting up the cans, he managed to water two of the plants, and in this way soon got through the row. Two other *Chinamen* were distributing liquid manure to some plants—a measured quantity to each—and from the stench which proceeded from it we set it down as undeniably diluted night-soil; we recognized the closet odour. We asked what it was, and where they got it from, but although they were quite ready to tell us all about the price of vegetables, on all other subjects we could get nothing out of them beyond “no savee” and “new chum.” We peeped into the residence of the proprietor of this garden, which externally is a dilapidated looking place, sadly in want of proper ventilation, but seemed clean and tidy, and fairly furnished within. I saw a white bull dog of formidable appearance guarded the outside, while a cross-looking, but otherwise rather pretty looking little Chinese woman, defended the threshold. She frowned at us and said, “What do you want?” As a preliminary inquiry we asked whether the dog would bite; she replied “Yes;” and on our repeating the question nodded her head. Our inquisitiveness went no further, and we retired, casting a backward glance now and then until we were clear of the premises. This Chinese woman was clean, plump, and tidy, with white hands, and nails about an inch long; it is clear that none of the work of the place falls to her share. Just outside the fence we found a drain

F. H. Grundy, Esq.
24 Mar., 1876.

drain where some night-soil had been turned in and some sand thrown over it. We had been assured by the men at the stables that the Chinamen use this kind of manure, but we could not find where it came from.

We now returned to Botany Road, and a few steps southward brought us to M'Evoy-street, which runs easterly from the east side of Botany Road. In this street, and also in Botany Road, immediately before coming to it is a block of twenty-three houses, the property belonging to Mr. Maloney, who lives in one of them. These houses have been supplied with water from two wells, but one of them has long been dry, and the water for 130 persons, half of them children, has since been drawn from the other well, which is 21 ft. deep. We peeped down it, and saw something which looked dark and thick; that was the water. The bucket when let down strikes the bottom hard, and when drawn up is about one-third full of a liquid which very much resembles that which flows down a street gutter where the children have been amusing themselves by making mud pies. For the chance of a draught of this delectable compound the women have to wait their turn. Sometimes, we were told, the children have to wait an hour or two to get a drink, which, however, no doubt improves a good deal by standing. None of these women appear to have thought of manufacturing anything in the shape of a filter of the simplest kind, though they do not appear as if the slight expense which it would involve would be an object to them, being most of them the wives of men employed in the neighbouring stables and woolwashing establishments, who are in regular employment. Around this well are five full closets at distances varying from 15 to 30 ft., and there are a number of others at a slightly greater distance. The landlord's house is rather a handsomer one-storied weather-board cottage, and is at the south-east corner of the block, near the dry well, and about the most distant from the other well. The other houses are of much the same character—mostly weatherboard and shingle cottages, containing four rooms, and tolerably comfortable inside; two of them are built of metal, and three of brick, with iron roof.

On the west side of M'Evoy-street, passing the end of George-street, Waterloo, and to some seven or eight houses further on to vacant land terminating the present line of building; then northward to John-street, and from John-street west to George-street. Here are in all some thirty-eight houses, all of them superior to those we have just described, and requiring nothing further than a supply of water laid on and improved closet accommodation.

We were surprised to find that throughout the length of the three streets last mentioned there was not a single public-house to be seen.

Personal Inspection

By No. 2 Sub-Committee.

THIRTY-EIGHTH DAY, MONDAY, 20 MARCH, 1876.

Cook Ward.

291. Dr. Dansey gave evidence on behalf of Mr. Palmer and himself, as follows:—

G. F. Dansey, Esq.
24 Mar., 1876.

Met at the Supreme Court at half-past 3 o'clock on Monday, 20th instant, and commenced our inspection in Gipps-street at its junction with Elizabeth-street. On the right hand there is a vacant piece of ground, with a stream of drainage from the adjacent houses running across it from east to west. At the east end of this ground is a lane running east about 12 ft. wide. Near the entrance on the right hand is a tumble-down wooden shanty; part of it has actually fallen, and the other is in a very tottering condition. The drainage of the upper part of this lane runs along in a surface gutter, which empties into a gully-shaft lower down. All the houses in this neighbourhood belong to Mr. Page; the land has been let for about twenty years at a ground rent, and the leases are now falling in one by one; in about two years they will all have expired. This may to some extent account for the dilapidated condition of many of the tenements. They are for the most part two-roomed cottages, some of them having kitchens attached. The average rent is 6s. a week. We noticed one larger 4-roomed weatherboard house, which in former days was no doubt a respectable dwelling; it is now falling to pieces; the windows are broken, and it is quite unfit for habitation; it is, however, occupied by "Tom the Fisherman." Tom was not at home, and we had no opportunity of making a closer inspection. This lane is called Mary-lane, and leads to Mary-street.

We then turned into Gipps-street. The surface drainage about here is very offensive; in some of the yards it is lying in stagnant pools.

In Macquarie-lane, south of Gipps-street, we inspected five houses, some built of wood and some of brick, which though small appeared to be tolerably comfortable, every man we were told being his own landlord; there was nothing to find fault with except the surface drainage. The two closets nearest to the entrance into Gipps-street are fitted with cisterns, but higher up the street the closets are too far from the sewer to be connected, and are only common privies. This lane receives all the drainage from the back of the houses in Macquarie-street South and Leader's-lane, in which there are four houses each containing two rooms and a kitchen, rented at 6s. a week and belonging to Mr. Page.

On the west side of Riley-street and next to Ann-street is a vacant piece of ground covered with house refuse and slops and waste material of all kinds, which must during the present hot weather especially be a serious nuisance to the neighbourhood; the residents were loud in their complaints of it. One woman told us that although her house had been tolerably free from sickness, fevers had been very prevalent in this locality. The surface drainage appears to concentrate in Ann-street and runs down to join the gully-shaft in Smith-street.

On the south side of this street is Kidd and Kelly's flour mill. Here the drainage goes southward and empties into a creek at the back of the mill. Some of this sewage comes from as far as Crown-street through a lane at the back of the old "Star and Garter" public-house in open drains on to vacant ground near the mill.

Off Little Albion and Ann streets is a vacant piece of ground having an open drain running through it, which emits a most offensive odour. It is covered over a little further on opposite to a few houses in the street, but is open again after it passes them. Scarlet fever has been very prevalent here. This being private property, the Corporation it appears cannot under present arrangements interfere, which is to be regretted as the large stagnant pools of filth which abound here must be very injurious to health. A considerable nuisance must also arise from the open mouth of a large sewer at the bottom of the land, which appears to lead to Macquarie-street South.

In Macquarie-street South, between Campbell and Gipps streets, we still found the houses which belong to Mr. Page in a very bad state of repair; they are mostly two-roomed houses with kitchen, renting at

at 8s. a week; the surface drainage is very bad. The first house we came to is built of a heterogeneous collection of materials, consisting of stone, brick, rubble, pieces of iron, and zinc, boards and palings, or as the tenant described it "built of anything that would hold a nail." G. F. Danscy,
Esq.

Nos. 401, 402, 403, 404, and 405, Macquarie-street South, are uninhabited and uninhabitable and ought to be pulled down. Off this street, on the opposite side, is a portion of the ward known as Foster-ville and Sheriff's Gardens, where we found the houses fairly built and ventilated, but crying loudly for reform in respect to drainage. 24 Mar., 1876.

We then went to Hunt-street, and Upton-street, late Hill-street, where there is the same offensive surface drainage.

In Junction-lane there are no houses, but the back yards of the houses in Junction-street abut on to it, and along its whole length to East-street there is a perfect forest of privies smelling very offensively.

At the north end of East-street, leading towards Goulburn-street, is a vacant piece of ground belonging, as far as we could learn, to Gregory Board, which receives all the drainage from Riley-street and the back of Lower Campbell-street.

In Little Hill-street and Wemyss-street the houses were clean and kept in good order by the tenants, but the streets themselves are in a very dirty condition.

In a lane between Wemyss and Macquarie streets we found that some of the houses have cisterns fitted to the closets and others have not. As there is a sewer to which they could all be connected, the Mayor made a note of the locality in order to have the matter inquired into.

This day's inspection has revealed a horribly dirty state of things in connection with the drainage from a number of small back streets and lanes for which no effectual remedy can be provided until a general system of underground sewerage shall have been planned and carried out. It is also very necessary that the Corporation, who are doing their best to keep the streets clean and to put down nuisances, should have enlarged powers to compel owners of property to conform to more stringent sanitary regulations in respect to the disposal of their drainage and house refuse.

We returned at a quarter to 7 o'clock.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 2 Sub-Committee.

THIRTY-NINTH DAY, WEDNESDAY, 22 MARCH, 1876.

Cook Ward.

292. Mr. Palmer gave evidence on behalf of himself and Dr. Danscy, as follows:—

Met at the Town Hall at 3-30 p.m. on Wednesday, 22nd instant, and proceeded to the bottom of Elizabeth-street, which is the end of Cook Ward. On each side of this street at this point there are large pieces of vacant land, having fully 500 ft. frontage to each side of the street. B. Palmer,
Esq.

Passing the residence of ex-Alderman Murphy we entered into Belvoir-street. There are eight houses in this street built of stone, brick, and wood, in a fair state of repair, but having the old-fashioned sash windows, and therefore imperfectly ventilated; the closets are common privies, and all the drainage is on the surface. 12 April, 1876.

We next went to Wilton-place, which is a street running north and south, containing several small houses of a similar character, and having the same disadvantages in respect to the closets and surface drainage.

Then to Macquarie-lane, where there are fifteen houses of a very motley description, comprising almost every variety of Colonial architecture. It comprises one very nice row of houses, built of brick and shingle, and containing four rooms each, belonging to Mrs. Walker, rented at 10s. a week. As there is no sewer here all the drainage runs away in open gutters, and the closets are all common cesspits; in other respects there was nothing to find fault with.

From Wilton-place we went to Wilton-street, which is only partially formed, being situate on a sand hill known as the old Strawberry Hill; the sand is gradually being removed for building purposes. Several new houses have been erected here which contain all the latest improvements. The houses though small are comfortable and well arranged.

The original proprietor of this property has determined that his name shall not be forgotten in the neighbourhood, for the next turning we took brought us into Wilton's lane, where we found four stone houses,—two containing four rooms and let at 10s., and two containing two rooms, rented at 5s. a week. Upon inquiring the name of the landlord we were first informed that it was Morrison; a second informant assured us it was Cashman; a third told us that he was commonly called "Leather Jack"; while a fourth stoutly asserted that his proper name was John Brown. Further inquiry convinced us that this man of many aliases was identical with an individual who had been fined a few days before for allowing his closets to become a nuisance. Inspection of the closets showed that they had since been cleaned out. These houses are very old and badly ventilated, and the drainage is very offensive.

On the opposite side of the street are two weatherboard cottages, but the tenant of one of them was out, and a woman living in the other said the house was her property and she was very well satisfied with it. The roof of this cottage is a novelty; it consists of Hobart Town palings in an advanced stage of decay, patched over with pieces of tin and allowing a clear view of the sky from the interior of the dwelling. The owner asserted, in the face of this peculiarity, that there was no leakage in rainy weather, and resented our imputations with scorn.

We

B. Palmer,
Esq.
12 April, 1876.

We did not make any inspection of the closet, the odour from which we found sufficiently offensive without nearer approach. The adjoining house belonging to Mrs. Grout, which was locked, appeared to be similar in every respect.

At the corner of Wilton-lane is a closet which backs up close to the corner of the roadway, and is very offensive indeed; it is constructed of small pieces of wood, bits of tin, and other waste materials just large enough to afford sufficient space for a person to back into it. In all cases of this kind we take care that the attention of the Inspector of Nuisances is directed to the spot, so that our inspections are not without immediate results.

Thence to Sarah Ann Place or Street, which contains 30 or 40 houses tenanted by small freeholders, and dotted about the allotments in most eccentric order, some close to the kerbing, staring unblushingly into the thoroughfare, others peeping out unobtrusively from the back of the allotment; some with gardens, and some without; some facing north and some south, some east and some west; no two houses designed by the same architect, or built upon the same plan, or of the same materials, each being apparently put up by its owner according to his peculiar taste, and to suit his special requirements. At the upper end of this street there are several weatherboard tenements so small that the proverbial cat if swung by the tail in the interior of one of them would have an unusually hard time of it.

The occupants, however, are perfectly satisfied; indeed they seemed proud of their dwellings, so great is the charm of freehold possession. The occupant of one house, who was very communicative, informed us that a well known solicitor had resided in this street, and from the frequency with which this gentleman's name cropped up in the course of her remarks it was evident that, in her opinion, a halo of respectability still hung over the place which had once been so honored. Some of these houses appeared to us to be very damp, which may probably be caused by a process of silting up, the surface being loose sand, which prevents the drainage and moisture from escaping. The drainage in this street, which points directly to a large sand-hill, we found more offensive than that of any other street in the neighbourhood. This appears to arise in a great measure from the indiscriminate scattering of house refuse and slops all over the surface, and the absorbent nature of the soil, which does not allow them to run off in a stream. Here we found five small stone houses ticketed for sale.

We then re-entered Elizabeth-street and went along that street; inspected several houses which do not call for special notice.

Then to Devonshire-street, which runs from Elizabeth-street to Crown-street. Here the houses have all been built of modern style, and appear to be tolerably comfortable, each home being occupied by one family as a rule.

In a lane off Holt-street, which was formerly a source of the greatest nuisance to the Corporation on account of its imperfect drainage, the property belonging to three or four persons, who declined to lay down the necessary drains. Several cases have been brought before the Police Court, and the street is now properly drained, and the nuisance entirely done away with. The residents in this locality expressed their great satisfaction and the comfort they had derived from the improvements.

We returned to town at a quarter past 6 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

Alexandria and Waterloo.

FORTIETH DAY, TUESDAY, 21 MARCH, 1876.

293. Mr. Grundy gave evidence on behalf of himself and Mr. Chapman, as follows:—

F. H. Grundy,
Esq.
12 April, 1876.

Met Mr. Chapman at his office at 4 o'clock on Tuesday, 21st inst., and, accompanied by Sergeant Larkins, took the omnibus to the junction of Botany Road with Wellington-street, and then proceeded south along the Botany Road. At the corner of these two streets is the "Cauliflower Hotel," a building of somewhat pretentious appearance, and apparently in a tolerable state of repair. The closet at the back is within 3 ft. of an inferior brick and shingle building, 18 x 40 ft., which was built and has been used for a dancing saloon, but on the suppression of these places of amusement has been converted into a skittle-alley. The closet consequently has been used by a large number of persons, and it is a perfect exemplification of the course pursued in this district, for there were evident signs that several holes had been sunk round it, into which its contents had been tapped. This was apparent by the depression of the ground, and the existence of a brown film on the surface, which showed that the sand was saturated with closet drainage. This retention of poisonous matter near the surface of the soil must tend to the injury of the health of the residents in the immediate neighbourhood.

The next five houses on the east side of the road are of the usual class of one-storied weatherboard and shingle oven-like little buildings, so often described. The sixth is built of brick, but similar in other respects, and this led us to a vacant piece of ground where the suburb of Waterloo may be said to terminate.

On the west side of the road the class of houses are decidedly better; there are several brick and slate houses, two stories high, leading also to a vacant piece of ground on this side. Under the Botany Road at this spot, beneath a wooden bridge, is a large drain or sewage course, ordinarily carrying the drainage from Mount Carmel and its neighbourhood into Shea's Creek. When viewed by the Shea's Creek Committee a considerable quantity of water and sewage matter was going down this watercourse, which is now quite dry. This channel must be some 4 ft. across at the bottom, and perhaps rather more than that in depth. It is now simply a dry ditch, but the nuisance created by it is infinitely greater than when the water was running in it; it sends forth a constant and very noxious smell under the hot sun, and dead animals and other foul things lay rotting in it. Immediately under the bridge was a batch of four dead cats, which stank horribly. We traced this creek through the vacant allotment for 20 or 30 thirty yards, until it enters the frontage to a back street not yet inspected. Here, without disguise, were closets standing within a foot of the creek, discharging each of them, black stinking liquid matter, which percolates slowly down the slope of the cutting, till it loses itself in the sand at the bottom. We saw three closets in this position, when our progress was stopped by the fences.

We returned to the junction of the creek with the Botany Road. On the next allotment on the west side stands, and it is singular that it does stand, a one-roomed tenement, in which exist an old couple, the man bent and decrepid, and almost past work of any kind, and the woman fast approaching the same state
of

of life. The house is a rotten old weatherboard tenement, roofed with Hobart Town palings, in an advanced stage of decay; its outside measurement—25 ft. x 10 ft.; little or no ventilation; the old woman said she dare not venture to open the solitary window lest the panes should fall out, there being no putty left to keep them in the frame. Attached to this cottage is something which represents a kitchen, 15 x 10 ft., and under 6 ft. high, built of similar materials, and in an equally ruinous state. 10 ft. further on is what may be called a closet, but as it has no door, no back, no roof, and scarcely any seat, it would be perhaps more conducive to decency to remove what is left of it. For these desirable premises the occupants pay 2s. a week, and the old woman remarked that how she contrived to get these two shillings and two or three more shillings to keep them alive she really did not know. The old man is or was by trade a maker of velocipedes, but time has out-paced him and he now occupies himself in feeble attempts to convert his remaining materials into hand-carts. A butcher's shop adjoins this hovel, and adjoining the shop is another weatherboard and shingle cottage; these might have been the subject of some remarks if we had not just inspected one so much inferior. Several brick and shingle cottages follow. The wells in this locality still contain water, but it is rapidly decreasing in quantity. On the east side of the road opposite these cottages is a vacant piece of ground, at the end of which is St. Silas' Church of England School. This is built of hardwood weatherboard, with shingle roof and lined with soft wood; it is 59 x 21 ft., and 13 ft. to the wall-plates; 100 children attend this school. The well here though not quite dry is so low that it is beyond the power of the pump to draw any water from it. The building was exceedingly hot when we entered it, although the children had been gone from it an hour and a half, and the windows which should have been opened to ventilate the room after the day's attendance were all closed; there are seven of them, and three only seem to open; the others, at any rate, could not have been opened for months, as they were covered with cobwebs outside. The fencing around the allotment is broken down in every direction. There is a double closet over a cesspit 8 x 4 ft., in a very foul state, insufficient accommodation under any circumstances for so many children.

We returned at 6 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

FORTIETH DAY, SATURDAY, 25 MARCH, 1876.

Cook Ward.

294. *Dr. Dansey* gave evidence on behalf of himself and Mr. Palmer, as follows:—

Started at half-past 10 o'clock from the Town Hall with the Mayor, and proceeded to the end of Bourke and Crown streets in Cook Ward. The drainage in this locality is all on the surface, and this is the chief feature to be noticed, the houses being in fair order. Going southward out of Bourke-street we came to Pawley-street, where the surface drainage is still offensive. The houses here are recently built, of modern architecture, and well ventilated.

Then to Edgeley-street, where there are thirteen houses, eleven on the west side and two on the east. The drainage again is the most objectionable part of the arrangement; all the slops from the back yards are conveyed in pipes under the houses to the front and discharge into the street, where there is no kerbing or guttering except for a short distance opposite four of these houses. This mode of drainage by earthenware pipes close to the surface and to the floors of the house is a very unsatisfactory one owing to the imperfect fitting of the joints and the certain escape of noxious gases. The rough channel which receives the drainage from these pipes stinks horribly; a number of ducks were puddling about in it and stirring up the filth. The landlord is doing what he can to make his property more valuable by filling up the street with brick rubble, as it appears that it does not come under the supervision of the Corporation until the street is made. In the lanes at the back of the houses on the west side, in fact on both sides, the surface drainage is very offensive. These lanes are only from 12 ft. to 15 ft. wide, and all the closets belonging to the houses in front abut on to the alignment; they are all primitive looking badly constructed wooden buildings. At the back of Edgeley-street the lane is 20 ft. wide; it does not differ in any other respect from the others.

Off Bourke-street is Whittell-street, which contains no houses, but receives the drainage from Richie-street, which is a *cul-de-sac*. Then to Esther-street, where we caught a man wasting water in a most extravagant fashion. He said he was trying to swell a cask in order to save water in it in the event of scarcity; the cask was an ordinary cask, made to hold bottled beer, which no amount of swelling would render watertight; we traced the stream to this spot all the way from Bourke-street. This man has since been fined at the Police Court. The drainage in Esther-street was peculiarly offensive.

We then went to Wilshire-street, another *cul-de-sac*, which has undergone a marked improvement during the last two years; the drainage formerly ran along the surface across the road, and was a great nuisance. Now it is taken in pipes under the road on to a piece of vacant ground away from the houses.

Then to Charles-street, which is about 20 ft. wide, where the drainage was all dried up; there being only two houses on the south side and a vacant piece of ground on the other side, where a house once stood which has since tumbled down.

Almost opposite Charles-street is Little Devonshire-street, where the houses are generally good and the drainage very bad.

Then southward to Wilshire-street where the drainage is, if possible, worse. On the south side of Pawley-street, where the houses are fortunately not too closely packed, or it would be impossible to prevent fever from breaking out; as it is scarlet fever has been and is now very prevalent in these localities.

At the south end of Wilshire-street, on the west side, is a vacant piece of ground, 48 ft. long, upon which are four cottages, known as Day's-terrace, or Day's Cottages—Mr. Day, agent. Two of them are two-roomed tenements, the other two have small garrets above, but in such a bad state of repair as to be unfit for habitation; the cottages are built of weatherboard and shingles, and let at 4s. 6d. a week each. The closet which serves for them all is in front in a paddock exposed to the full view of passers-by in Crown-street, the only fence to the paddock being a stone wall about 4 ft. high, evidently the retaining-wall of the footpath in Crown-street. There are sixteen persons living in these four cottages. The boards in the closet are broken, and the floor is unsafe to stand on; the pit is full and stinking, so much so that upon our return we called the attention of the Inspector of Nuisances to it.

We returned at a quarter to 1 o'clock.

THURSDAY, 13 APRIL, 1876.

DAY, SATURDAY, 25 MARCH, 1876.

*Borough of Alexandria.*295. *Mr. Grundy* gave the following evidence on behalf of *Mr. Chapman* and himself:—F. H. Grundy,
Esq.

13 April, 1876.

Met at *Mr. Chapman's* office at half-past 10 o'clock on Saturday, 25th instant, and proceeded, accompanied by *Sergeant Larkins*, to the junction of *Simpkins street* or lane with the west side of *Botany Road*.

Our attention was at once drawn to the premises of a butcher situated at this junction; the shop was fairly clean and tidy, as well as the frontage to *Botany Road*. The allotment which extends 100 ft. on the northern side of *Simpkin-lane* is, however, anything but clean. Upon it are built a number of very inferior slab or weatherboard tenements, roofed either with shingle or old iron. We found most of these buildings padlocked, and no desire was shown to afford us an entrance to them; indeed we were pretty closely watched by two or three persons during the whole time we were in the neighbourhood. The last building, which is of a specially inferior character, is only 12 ft. square; the stench from this place was very strong, being exactly the odour which proceeds from a slaughter-house. Feeling convinced that slaughtering was carried on here clandestinely we endeavoured to obtain some proof by peeping through the slabs, and while so engaged a strong confirmation of our suspicion came to us unexpectedly in the feeble lowing of a calf. This sound was repeated at intervals while we remained there, and having contrived to obtain a glimpse of the interior of the building we saw the ill-fated animal fastened up in a corner close to its final destination—a sausage-machine; there was not a drop of water near it, although the day was one of the hottest days of the season. *Simpkin-lane* is 14 ft. wide, and has a gutter of considerable size in the centre which receives the drainage of the houses in *Pleasant-street* and other streets, and passes thence into the *Botany Road*. There is very little fall in this lane, and a great portion of the drainage stagnates in the gutter.

Thence to *Pleasant-street*, and along the east side of that street—where there is nothing calling for notice, except that the gutters are full, which is the case more or less in all the streets about here running north and south—to *Merrion-street*. Returned on the west side of *Pleasant-street*, and after passing the first allotment we came to a passage 3½ ft. wide and 100 ft. in length, backing the allotments in *Merrion-street*. These allotments are only 15 ft. wide, and the closets are as a matter of course crowded closely together, the yards having also a number of old wooden buildings and rubbish in them.

The day being unusually hot, and there not being the vestige of a breeze, the (to us) well-known closet-scent offended our nostrils at each turn; indeed it could scarcely be otherwise, for we were passing through two narrow rows of closets, all in a most neglected and dirty state.

Returned to *Simpkin-lane*, and followed it to *Rosehill-street*, entering that street at its junction with *Pleasant-street*.

The two streets last-mentioned join at an acute angle, and the yards become smaller by degrees and beautifully less; the last two or three houses are almost without any yard at all.

The houses in this locality are also very closely packed, and are of the usual order of tumble-down wooden tenements so frequently described. On the east side of *Pleasant-street* the buildings, although by no means superior in character, are erected upon allotments three times as large as those on the opposite side, and the occupants have the advantage of a much larger air breathing space. The water is not laid on in this part of the street and the wells are in the usual condition; some of them have given out long ago; some are giving out, and others have water in them which is, however, generally very low.

We returned by *Wyndham-street* to *Raglan-street*, and thence to *Botany Road*, taking the opportunity of revisiting *Wyndham Grove*; and this being Saturday we found the state of things existing slightly worse than when we first inspected the place—the holes at the angles of the 4 ft. 6 in. yards seethed with the slops and soap-suds and waste water used on this cleaning day. We satisfied ourselves as to the accuracy of our former description of the place; and we discovered another foul closet close to one of these holes, which, being hidden by a paling fence, escaped our notice on the first occasion. We also examined the well on this property; the water, which was nearly black on the occasion of our first visit from the fact that the well had just then been cleaned, looked fairly clean and tolerably plentiful.

We then went to the dry creek referred to as being only partly examined on our first visit, and we found that beyond the point where we left off our inspection it is being enclosed in a square hardwood culvert, which extends to the end of the properties built upon. We were specially requested by some of the residents in the neighbourhood to inspect one of the market gardens next to the *Chinaman's* garden described in our last report. We were told that night-soil was used largely in this garden, and that about twenty loads of it had been brought there the night before. We could not, however, discover where it came from, but the fact was undisputable; we saw the manure on the ground and some men employed in covering it over with earth. They said it was usually covered over at once and that then there was no smell from it, but for some reason or other on this occasion it had been suffered to remain all the morning uncovered. The distance of the nearest cottage to this heap of night-soil was from 150 to 200 yards.

This terminated our inspection of the Borough of Alexandria.

In closing our reports upon the Boroughs of *Redfern*, *Waterloo*, and *Alexandria*, we must once more express the astonishment with which we have viewed the collections of abominations with which they abound. Every day's progress has convinced us more and more of the absolute necessity that some sanitary measures should be adopted without delay and of the urgent need of a supply of water from the city. The state of things at present existing in these municipalities cannot continue much longer without severe and fatal consequences to the residents who number several thousands. Such improvements as can

be

be made should be put in hand and if possible completed before rainy weather sets in, as the effect of a heavy downfall of rain will be to dilute and spread over the surface and into the wells the accumulations of filth which are to be found in the closets and yards.

The "Nuisances Prevention Act of 1875" gives full power to the Municipal Councils to regulate the disposal of night-soil and to allow persons to utilize it under proper conditions; they are empowered to make by-laws for this purpose, but there appears to be no authority to compel these municipal councillors to do their duty. This shows the want of a permanent institution in the form of a Board of Health appointed under Act of Parliament, under whose control all these matters should be placed.

We returned at 1 o'clock.

F. H. Grundy,
Esq.

13 April, 1876.

Personal Inspection

By No. 2 Sub-Committee.

FORTY-FIRST DAY, THURSDAY, 25 MARCH, 1876.

Municipality of Darlington.

296. *Dr. Dansey* gave the following evidence on behalf of Mr. Palmer and himself :—

Met at 11 o'clock on Thursday, the 25th instant, at the Central Police Court, and proceeded to make an inspection of the Municipal District of Darlington, adjoining that part of the City formerly known as Shepherd's Paddock and Chippendale, and separated from the City by Cleveland-street, one side of that street being in the City and the other in Darlington.

G. F. Dansey
Esq.

13 April, 1876.

We commenced at the east end of this street where it is bounded by an open channel, very filthy and stinking abominably, which is a tributary to the stream described in the report of the Committee who were appointed to inspect the premises of the Colonial Sugar Company. On going up Cleveland-street we found that the drainage, which is all surface drainage, runs into this channel which extends to the Newtown Road. All the houses in this street are remarkably clean and well kept; they are of modern style, and are almost all tenanted by their owners.

In a lane at the rear of Cleveland-street, between the Old Newtown Road and Rose-street, which is only 12 ft. wide, the drainage still goes easterly with the fall of the ground, and discharges into the creek abovementioned.

Returning to the Old Newtown Road and proceeding south we came on the right hand to Alma-street which leads towards the Blind School. Here the drainage takes a southerly turn instead of going straight down Ivy-street to the creek. The channel at the south end of the Old Newtown Road abuts on to some property which belongs to no municipality; it is neither in Redfern nor in Darlington. The owner of this property has dammed back the ditch which conveys this drainage to it and diverted the refuse water into a paddock where he has formed a pond for his cows. As this water must be largely contaminated with sewage matter it can hardly be good for cows to drink, and it is very doubtful whether the milk from the cows can be good for human beings. Here we learned from the mayor of this municipality that there are within his district 700 children for whose education, religious and secular, there is no provision either by church or school. Close by we come to a vacant piece of ground where the residents hope before long to have a public school erected. It was formerly designed as the site of a Roman Catholic Seminary, but the time for the fulfilment of the necessary conditions has lapsed, and it is now available.

Shepherd and Ivy streets are two streets containing very respectable looking houses, and the streets themselves are clean and well looked after; indeed we could not help remarking the unusual absence of bad smells as we walked along them. This may partly be accounted for by the fact that at the time of our visit a westerly breeze was blowing which would have the effect of wafting all unpleasant odours in the direction of Redfern; the University Reserve is also to the westward of Darlington. The natural drainage of this municipality is good, and if a sewer were laid down there would be no difficulty in connecting every house in the district with it, and we think this would be done after the startling announcement was made to us that the Darlington Municipal Council are out of debt, and are therefore in a position to devote the rates they collect to the improvement of the place. The names of most of the streets in Darlington appear to have been taken from the gardeners' vocabulary; probably the vicinity of Shepherd's nursery is the cause of this. The sweet-smelling titles given to them are not so inappropriate as they would be to many larger and more pretentious thoroughfares, for they are kept as clean as circumstances admit of; the gutters are swept out and the house refuse carted away twice a week.

Vine-street, off Shepherd-street, leads towards Redfern by a bridge over the creek; on the south side of this street there are some nice comfortable looking cottages which would be more pleasant dwellings if they did not face a row of closets some eighteen or twenty in number close to the fence on the opposite side, the front of the houses in one street facing the back premises of the houses in the next.

I have remarked upon the comparative cleanliness of the streets, but I cannot say as much for the closets, and during the present dry weather they are much less offensive than they will be when the rain comes. We were informed that the "Nuisances Prevention Act of 1875," which has been proclaimed in this Municipality, will not be in operation for another two months, the time having been extended to allow the Council to prepare by-laws and to make the necessary preparations for disposing of the night-soil. They are waiting also to see what steps the City Corporation will take in dealing with this question, and it is high time their final decision should be made.

All the streets in Darlington have lanes at the rear, each lane dividing the back premises of two parallel streets, except Cleveland-street, in which the closets and back yards abut on to Ivy-street.

Vine Grove, off Shepherd-lane, contains six houses, three on either side; this is another *cul-de-sac*, only 10 ft. wide, and therefore affording very limited air-breathing space, the thoroughfare being cut off by the fence which encloses the creek leading to the Sugar Company's premises.

Dean-street, another street leading from Shepherd-street, is about 12 feet wide; it has no houses in it, but the back premises of about eight houses in Cleveland-street abut on to it. This was the only place where we found offensive drainage running across the street in any part of the Municipality.

This inspection embraced the whole of the Municipal District of Darlington, and we must do the Council the justice to say that they have not neglected the interests of the ratepayers.

We propose next to pay two or three visits to Newtown, and then to bring our labours to a close.

We reached town a little after 1 o'clock.

Personal

Personal Inspection

By 'No. 1 Sub-Committee.

FORTY-FIRST DAY, SATURDAY, 1 APRIL, 1876.

Fitzroy Ward.

297. *Mr. Grundy* gave the following evidence on behalf of *Mr. Chapman* and himself:—

F. H. Grundy,
Esq.
13 April, 1876.

Met at *Mr. Chapman's* office at a quarter past 10 o'clock on the morning of Saturday, 1st instant, and having arranged with *Sergeant Larkins* to meet us at the corner of *Crown* and *William* streets, we proceeded to that place.

Thence going easterly up *William-street* we found the frontages of the buildings in that street, which are all shops, presenting a fairly clean and tidy appearance. Out of eleven of them between *Crown* and *Palmer-streets* three are butchers' shops.

Proceeded along *Palmer-street* north to *Robinson-lane*. The corner allotment is occupied by *Robinson's* public-house, the "*Fitzroy Arms*." *Robinson-lane* is just 15 ft. wide from wall to wall, including a narrow foot-way about 18 inches wide on either side. Projecting into this lane, and about 3 feet from the corner of the hotel building is a soft wood open-topped closet and urinal, which is a very objectionable feature, not only because it is an encroachment of the most offensive kind upon a passage already sufficiently narrow, but because from its position in an apparently unfrequented lane close to a busy thoroughfare it becomes a recognized urinal for every passer-by; this was evident from the appearance of the place, and the stench which proceeded from it. *Robinson-lane* forms the back entrance to the houses fronting *William-street*, and the general appearance of the yards, which abut on to it, is very different from what might have been expected from the frontages. The yards one and all present a picture of dirty untidiness and insufficient space; they are for the most part crowded with stables and outbuildings, and the manure from the stables, ashes, and other refuse are scattered about the lane. From the cursory view of these places to which we were restricted by the resolution of the Board requiring us to close our inquiries we saw at least enough to lead us strongly to the belief that slaughtering is carried on in one if not all three of the butchers' premises referred to in *William-street*.

Thence to *Crown-street* and back to *Middle-lane* which trends northward from *Robinson-lane* half-way between *Crown* and *Palmer* streets, and this forms a back entrance to the yards of the houses in those streets. It is 15 ft. wide, kerbed and guttered, the paved roadway in the centre being 11 ft. with a pathway of 2 ft. on either side. There are no houses fronting the first part of this lane, the allotments from the main streets mentioned above running the whole length of it; these allotments are larger than those in *William-street*, and there is consequently not such close jumbling together of back yards, closets, and out-houses. The three last houses in this lane on the west side having their frontage to *Crown-street* are the property of *Mr. Chapman*, and I may be allowed to say that these, and some ten or fifteen others belonging to that gentleman in the neighbourhood, present an appearance of cleanliness and order which contrasts very favourably with that of other houses in this ward. Were the same amount of care taken by landlords generally in keeping the drains open, the closets empty, and the houses painted and repaired, there would have been much less occasion for the appointment of this Committee.

We then went to *Johnson's-lane*, which is 10 ft. wide and runs from *Crown* to *Palmer* streets, and back to *Middle-lane*. From this point to *Woolloomooloo-street* there are rows of cottages fronting *Middle-lane* on either side; thus, as a matter of course, the yards of all these houses and those fronting *Crown* and *Palmer* streets are reduced in size by one half, and the number of closets and outbuildings increased in the same proportion. The yard of the last house facing *Palmer-street* and *Middle-lane* is paved and fitted up for a cowkeeper's establishment, having twelve stalls in it; at the time of our visit there was only one cow and calf in it; it is covered over with old iron on a wooden frame. The yard was scrupulously clean, but the proprietor has been repeatedly fined for the nuisance created by his cows, and we certainly think there should be provision in the Municipal by-laws to compel cowkeepers to carry on their avocations further out from the thickly populated parts of the city.

A similar condition of houses and yards appears to exist from *Crown-street* to *Woolloomooloo-street* and along *Woolloomooloo-street* back to *Palmer-street*. I may here mention once more in reference to the supply of water that although there is enough to complain of in this ward in the restricted space and want of cleanliness in the back yards, and the closets are packed more closely together than is the case in many of the suburbs, yet the offensive smell which proceeds from these closets in places where the water is not laid on is here entirely absent. Walking along narrow streets with closets on either side of us we experienced no unpleasant odour whatever; they are all connected with a main sewer.

In accordance with the instructions we received we made only a cursory inspection of the dwellings in the localities visited to-day, but from the dilapidated appearance of many of them it is probable that an unfavourable opinion of them would have had to be recorded if we had made as minute an inspection as we have made in the other parts of the city.

We returned at half-past 12 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

FORTY-SECOND DAY, MONDAY, 3 APRIL, 1876.

Newtown.

298. *Mr. Palmer* gave evidence on behalf of *Mr. Palmer* and himself, as follows:—

B. Palmer,
Esq.
13 April, 1876.

Left the Town Hall with *Dr. Dansey*, at half-past 3 o'clock on Monday, 3rd instant, and proceeded along *Regent-street* to the *Botany Road*, with the intention of making a short cut to *Newtown*, having made an appointment with *Mr. Bailey*, the Mayor of that Municipality, who had expressed himself very glad to have the opportunity of pointing out to us the necessity of a system of sewerage for *Newtown*, and a more plentiful water supply. The direction we took instead, however, of bringing us out on the *Newtown Road*, brought us to *Pleasant-street*, where we had to walk between two rows of as unpleasant looking structures,

structures, in the shape of closets as could well be imagined. They are of all shapes and sizes, built of varied materials, though principally of Hobart Town palings, some of them lean to, some, but very few of them, perpendicular, and most of them in a tottering and insecure state; the smell from these places was very offensive. The drainage from the neighbouring houses goes into unformed gutters, which have very little fall, and there it lies and stagnates, polluting the atmosphere. A quantity of sand blown into these gutters during the late high winds had absorbed a quantity of this foul matter, and formed a standing nuisance at one point.

B. Palmer,
Esq.
13 April, 1876.

Retracing our steps we reached the Newtown Road by a somewhat circuitous route, and shortly after arrived at the Town Hall, where we found the Mayor, and Mr. Banks, the Council Clerk of Newtown, waiting to receive us.

We commenced our inspection by visiting O'Connell Ward, which we were told is the most crowded locality in that part of the municipality. We found the houses, twenty or thirty of which we examined, to be in fair condition as to cleanliness and ventilation, but the drainage is all on the surface, and the wells are in dangerous proximity to the closets, frequently within a very few feet. We saw nothing in the shape of overcrowding, the houses in this quarter being mostly occupied by the owners—one family to each house. They are of all sizes and styles of architecture, but as a rule, small and of recent construction, being built of wood, brick, or stone, according to the fancy or the means of their owners.

We next went to Charles-street, in Kingston Ward, where the drainage is also in open gutters. At one time these gutters received the drainage from the cemetery, which created a great offence, but since the cemetery has been closed it has not been so offensive.

From this street we proceeded to Brick-street. Here there are very few houses, and the drains which are still on the surface are particularly well formed and lined with stone.

Then to Hordern-street, where the same remarks will apply to the drainage. In this street we noticed that the closets were unusually close to the wells, and there can be little doubt that from the percolation of liquid closet matter the water in the latter is more or less contaminated.

We noticed in every back lane between two rows of allotments—these lanes in many cases not being more than 6 ft. or 8 ft. wide—a stone gully running down the centre the full length of the lane, and we must certainly give the Council of Newtown great credit for the very clean condition of these lanes which are looked after and swept down when necessary by their men.

In Prospect-street we found the same conditions existing in regard to houses, drainage, &c.

Thence we proceeded to Egan-street. The drainage from this street goes into Brown-street through Mr. Crockford's property, which we were told is a source of great annoyance to that gentleman. Mr. Bailey observed that in consequence of the fall of the land the drainage of this part of Newtown will have to be taken through Camperdown and be conveyed ultimately into Johnson's Bay. In conversation with this gentleman, who was anxious to give us all the information and assistance in his power, we learned that in his opinion the excessive death rate which has existed in Newtown is mainly to be attributed to the foul surface drainage and the limited supply of water. He expressed himself highly gratified at the action of the City Council in supplying water to Newtown, but he said that a great number of persons did not avail themselves of it. A piece of ground has now been promised by the Government as a site for a reservoir at the south-east corner of the Deaf and Dumb Institution, and the City Engineer is preparing plans for it.

Nearly every house in Newtown has a well belonging to it; few of these are lined; in fact nine out of ten are mere holes in the ground.

We made an appointment with Mr. Bailey to meet him again on Wednesday next, when he will show us such other portions of his municipal district as may present features deserving of especial notice.

We returned to town at about 7 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

FORTY-THIRD DAY, WEDNESDAY, 5 APRIL, 1876.

Newtown.

299. *Mr. Palmer* gave evidence on behalf of Dr. Dansey and himself, as follows:—

Left the Town Hall with Dr. Dansey at half-past 3 o'clock on Wednesday, 5th instant, and proceeded to the Town Hall, Newtown, where we met Mr. Bailey, the Mayor of that Municipality, who told us that in consequence of the late dry weather we should find the streets in much better condition than they had been, the surface drainage from the yards and back premises after rain being very offensive.

We visited Denison-street, Regent-street, Albemarle-street, Wellington-street, Oxford-street, Australia-street, and Baltic-street in succession, and in none of these streets did we find any special conditions existing injurious to the health of the residents, except that the water is scarce and of indifferent quality, and that the drainage is all on the surface.

The Municipal district of Newtown is divided into three Wards—O'Connell, Kingston, and Enmore Wards, the latter being much the largest, and comprising a considerable area as yet unoccupied. The number of houses in the Municipality is 1,600, and the population in round numbers may be set down at 10,000.

Having pointed out to Mr. Bailey that we wished more particularly to inspect such localities as in his opinion were overcrowded, he took us to two or three places, rather thickly populated, but not shewing symptoms of overcrowding such as we have had occasion to notice in various parts of the city. The chief cause of ill-health in this suburb appears to be in the quality of the water, of which we made careful examination. We inspected a number of wells and had water drawn from them. Dr. Dansey tasted most of them, and I was quite willing to trust to his judgment and to the appearance of the samples, some of which were tolerably clear; some resembled milk and water, and others might have been taken for thin pea-soup. There can be no doubt of the contamination of the wells in many cases, especially in the poorer neighbourhoods, where the land is cut up into small allotments. Even where the owner of a cottage has placed his closet at the extreme corner of one of these small pieces of ground, and sunk his well close to the house at the other end of the allotment, he has no security against the pollution of his well from the closet on his neighbour's ground, where probably there is exactly the opposite disposition of closet and well—a few feet

in

B. Palmer, Esq.
13 April, 1876.

in very many instances separates the two. In reply to our questions on the subject of water supply, several of the residents said that they never used the water from their wells for drinking purposes, only for cooking and washing; others however did not appear to be so particular.

Kingston Ward is bounded on the west by Camperdown, where the drainage of O'Connell Ward and part of Kingston Ward would naturally go easterly through Leichhardt Creek. The drainage of Enmore Ward would have to be conveyed through Marrickville towards Cook's River.

To sum up our inspection of the Newtown Municipality, which has been necessarily of a cursory nature, as the Committee were restricted to a couple of visits, I may state that we found no overcrowding in either of the three Wards. All that is required is a sewerage system to carry off the closet matter, and a plentiful supply of water to make Newtown one of the healthiest suburbs of Sydney. The ground is high and the natural drainage good. When some general sewerage plan is adopted, and certain trunk sewers are laid down by the Government, if the Council are empowered to levy a sewerage rate, which at present they are not, the great source of ill health may very soon be removed. With regard to the water the result of our conversation with the Mayor of Newtown will probably be the erection of standpipes by the City Council for the supply of water to different portions of the district.

Meantime it appears to us that the Council of Newtown are doing everything in their power, with the means at their command, to preserve health and cleanliness among the inhabitants.

We returned at 6 o'clock.

Personal Inspection

By No. 1 Sub-Committee.

FORTY-FOURTH DAY, WEDNESDAY, 5 APRIL, 1876.

Fitzroy Ward.

300. Mr. Grundy gave evidence, on behalf of Mr. Chapman and himself, as follows:—

F. H. Grundy,
Esq.
13 April, 1876.

Met at Mr. Chapman's office at 3.30 p.m. on Wednesday, 5th instant, and proceeded, accompanied by Sergeant Larkins, to the junction of the east side of Crown-street with the north side of Woolloomooloo-street. Here commences the well-known Burdekin's paddock. Its fences bound Woolloomooloo-street to Palmer-street and Crown-street respectively, almost to the harbour, and must comprise an area of fully 2 acres. This piece of ground is under the charge of a watchman who is, however, said to be absent from it during the day. The residence provided for him is a small wretched hardwood and shingle cottage, containing two rooms, and considerably below the level of Woolloomooloo-street. The whole paddock lies very low, and receives a large portion of the drainage of the neighbourhood. Its western side adjoins Crown-street on the course of the old Woolloomooloo stream, and is not now drained, being, even after ten months of drought, an accumulation of filth. The south side of Woolloomooloo-street is also very offensive to the sense of smell from the stagnant water, which must stagnate, being below the levels of all the adjoining streets. Although a main sewer passes down this paddock, within easy access of the old Woolloomooloo Creek and also of an old tumble-down cesspit closet, neither of them is connected with it. This paddock is further contaminated by rubbish collected in quantities upon it, especially near its long frontage to Palmer-street, and also from the rows of houses on the opposite side of that street. These nuisances are loudly complained of by the residents in the neighbourhood. In the paddock is a large quantity of building lumber, old bricks, and debris of all kinds—one old dilapidated shed alone is 80 x 30 ft. Altogether the appearance of these 2 acres is disorderly in the extreme; and, viewed from this paddock, it was no longer a matter of surprise to us that two old melancholy looking houses, known as "Alexandria Houses," built here, and fronting Woolloomooloo-street, should be notorious as being almost always unoccupied. The only other buildings in the paddock are a grocer's shop, and the "St. Kilda Hotel," at the corner of Woolloomooloo and Palmer streets.

Turning into Palmer-street we continued northwards. There are, as I have previously stated, no buildings on the west side of this street, which is bounded by the Burdekin paddock. On the east side we passed Junction-lane, Junction-street, and on to Harmer-street, where the houses are mostly two-storied buildings containing from four to six rooms each, and presenting a sufficiently fair appearance in front. The back yards are confined as to space, and the closets are mostly common cesspits, but as the water is laid on the great evil of water pollution to wells is avoided.

From Harmer-street to Griffiths-street the character of the buildings is not so good; they consist of a row of ten two-storied two-roomed houses, built of brick and slate, each having a frontage of 10 ft. and a depth of 18 ft., with a skillion kitchen 10 ft. wide at the back; they are owned by Miss Brown. The ventilation is imperfect, the windows being of the old-fashioned style, opening only at the bottom; the back yards are small, having a most offensive open gutter common to them all running through the centre; the closets are not connected with a sewer and smell very badly, and the whole place is crowded with old metal or wooden sheds, stables, and out-buildings; nevertheless there are formed drains close by leading to a main sewer, and it is surely extraordinary that the closets are not connected with it, some of them being only a few yards from it.

Again, following Palmer-street to Plunkett-street we found a row of houses at the corner. The closets and out-buildings belonging to these houses are some 2 ft. below the level of the street, and there seems to be no escape for the drainage, which goes into an open drain similar to the one just described, and there stagnates. There is a back passage to these houses about 8 ft. wide, which appears to be the general receptacle for filth of every kind. However, it is useless to complain of this,—the filth collected in an 8 ft. passage being an insignificant nuisance in comparison with that of the large areas of ground openly receiving—as "rubbish may be shot here"—every description of offensive refuse in the shape of yard scrapings, stable sweepings, oyster-shells, decayed fish and vegetables, bones, bottles, &c., &c., by scores of loads daily. One of these areas we have already described; another is a large well-placed piece of vacant land opposite, on the north side of Plunkett-street, which is in full and constant receipt of the deposits above mentioned. As it is now admitted that to raise the level of the ground with this kind of refuse is not only immediately offensive, but that houses built on such foundations are always thereafter inferior in a sanitary point of view, it is, we think, desirable that something should be done to restrict this indiscriminate shooting of rubbish to inoffensive substances.

Arriving

Arriving at Bourke-street we went southwards along the west side of that street to Harmer-street and then along the north side of Harmer-street. The second house in this street is an old dilapidated hovel, built partly of brick and partly of patched weatherboards, roofed with old iron and having only one story; it has one low close sitting-room entered from the street and 18 inches at least below its level, as is the whole cottage; this room is 12 x 9½ ft. and 7½ ft. high. Behind it is a bed-room 11 x 8 ft., open to the roof; another bed-room at the side is 8 x 8 ft. The rooms are very close, having the old-fashioned sash windows. The cottage is also very damp in wet weather and apparently inhabited by a class of persons who pay very little regard to sanitary conditions.

F. H. Grundy,
Esq.
13 April, 1876.

Returned to Palmer-street and proceeded along the north side of that street, where we found nothing calling for notice, except that the yards are small and untidy, the fences for the most part broken, and the general appearance of the places close and muggy. These yards seemed to be in a state of transition; the water has been cut off from some of the closets; others are still over common cesspits, some are fitted with patent cisterns, and some are having cisterns fitted to them.

We were here accosted by a Mr. Murray, who resides at No. 66, Palmer-street, who informed us he was an artist in wood. He inveighed bitterly against the Burdekin Paddock nuisance, which is immediately opposite to his house.

Returned to Bourke-street, and again proceeded southwards to Junction-lane; along the north side of Junction-lane past a few cottages of the ordinary kind to a blind passage 10 ft. wide and about 80 ft. long, known as Kidman's Terrace, but now owned by a Mr. Mathews. On the west side of this passage is a row of seven two-storied houses, containing four rooms each, and renting at 10s. 6d. a week. They seem kept in fair order, but are so entirely shut in that scarcely any fresh air can get to them. In front of them is a blank wall, and behind it the closets of the Bourke-street houses; on their north side is another blank wall, and behind it the closets of the houses in Harmer-street; on the south a row of cottages in Junction-lane, and on the west the yards (just 12 x 12 ft.) of the houses fronting Palmer-street, with their usual complement of closets and sheds. We noticed an excess of overcrowding in this portion of Fitzroy Ward. The channel which should carry the rain-water into the lane from these houses was choked up, and in wet weather the residents state that the water backs up to the houses and renders them damp.

On the south side of Junction-lane is a back entrance to the Woolloomooloo-street yards. The general appearance of these yards is extremely bad, and they are overcrowded with buildings. One of the worst is the yard of the "Shamrock Hotel," which is almost entirely taken up with out-buildings; these include a skittle alley, 35 x 12 ft., built of Hobart Town palings, and a long low building opposite to it, apparently used for a dining or drinking room, which was very dirty; here we noticed six or seven men loafing about, young men from 22 to 26 years of age, evidently following no certain avocation, whom I may perhaps not inaptly describe as grown-up larrikins, belonging to the dangerous classes of society.

In the next yard but one we noticed some abominable heaps of filth. The house is occupied by a fish and oyster vendor. On one side of the yard was a large collection of oyster-shells; on the other a quantity of house and yard refuse and a lot of dead and stinking fish. In the centre is a drain running to an open and very filthy entrance to a sewer having no stench-trap, and very offensive from the stagnant sewage. We entered the house of the fish vendor, and passing through a sort of shanty, which appeared to be the kitchen, came to a small room about 10 x 12 ft., the doors and windows of which were both closed, so that it was nearly dark. On a sofa lay a woman thoroughly drunk, so drunk that it was impossible to arouse her, and seated in a chair beside her was a man, of doubtful appearance, equally drunk, and fast asleep; two women who were in the room when we entered were sufficiently sober to make their escape upstairs; there were also two young men loafing about the place of the same stamp as the frequenters of the hotel close by just described. The whole atmosphere of this den was so sickening that we could only remain long enough in it to observe the general arrangement of the interior. There were two or three ragged and dirty curtains representing stalls or compartments for oyster eaters, and a small heap of oysters was to be seen in one of the windows, but there was no shop front, a card in the window setting forth that fresh oysters were to be had every day, being the only indication of the business carried on. This place disgusted us very much, as it seemed to be a haunt of vice. Even the Sergeant who accompanied us could not avoid remarking that it was a house which should be specially looked after by the police. The number of this house is 148, Woolloomooloo-street.

We returned at 6 o'clock.

FRIDAY, 21 APRIL, 1876.

Present:—

M. CHAPMAN, Esq.,
F. H. GRUNDY, Esq.,

G. F. DANSEY, Esq.,
B. PALMER, Esq.

HON. JOHN SMITH, M.D., M.L.C., IN THE CHAIR.

Personal Inspection

By No. 1 Sub-Committee.

FORTY-FIFTH DAY, SATURDAY, 8 APRIL, 1876.

Fitzroy Ward.

301. Mr. Grundy gave the following evidence on behalf of Mr. Chapman and himself:—

Met at Mr. Chapman's office at half-past 10 o'clock on Saturday, 8th instant, and accompanied by F. H. Grundy, Sergeant Larkins proceeded to the junction of Crown and William streets, and made a cursory examination of that part of Fitzroy Ward, which is bounded by William, Crown, Bourke, Palmer, and Woolloomooloo streets. The allotments respectively fronting Palmer and Bourke streets are divided by Spencer-lane, which forms a back entrance to them. Those fronting William-street by Oatley-lane, and the allotments which front Woolloomooloo-street, are backed in a similar way by St. Kilda-lane. Throughout this part of Fitzroy Ward the general appearance of the yards and back premises is fairly good; the yards, as a rule, are tolerably clean; the closets have the water laid on to them, and there exists none of the overcrowding which is to be found in other parts of the ward, none of the allotments being subdivided.

F. H. Grundy,
Esq.
21 April, 1876.

Crossing

F. H. Grundy,
Esq.
21 April, 1876.

Crossing Woolloomooloo-street, we continued down Bourke-street on its east side, the character of the houses becoming rapidly inferior. It is noticeable that a marked change in the general appearance of the ward takes place from its division by Woolloomooloo-street, the size, character, and class of premises between William and Woolloomooloo streets being very superior to the average of those north of Woolloomooloo-street, between it and the harbour.

We paid a visit to No. 76, Bourke-street, a house which is still receiving the special attention of the police. This was the place from which two starving children were taken by them the day before our visit. These children were found in such a state of filth, destitution, and exhaustion that it was feared they would not survive. The house had been hurriedly cleaned and whitewashed, but sufficient evidence remained of the state of things which must have previously existed. The furniture consisted of two or three boxes and some old blanketing, positively reeking with filth and vermin. These remains of wretchedness were hanging over the fence and could not, it seemed, be destroyed, as they belonged forsooth to the late occupant. We were told that the practice of this individual was to lock his helpless children in at some early hour, and then take himself off for the day, and often for the night, leaving them to starve. The swarms of fleas were not to be denied, except by leaving them in undisputed occupation of the premises. We found, however, before we left that the inhuman father of these helpless girls had not altogether neglected them, for in the back room or skillion the floor has at some remote date been laid down with cement, and here he had dug for them a round hole about a foot deep, and this was their closet!! The house itself is a small brick and slate tenement, one of many of similar class, and capable of being made moderately comfortable. But there is a closet in the yard over a common cesspit, which serves this and the adjoining house, very foul and offensive, and also tumbling to pieces. The landlady, we learned, had been unable to obtain any rent since the year began, and it was in serving some ejection process that the children were discovered.

The adjoining hovel on the north side belonging to the same owner (Mrs. Vernon) is an old weatherboard structure 15 ft. x 11 ft., containing two rooms; it is filthily dirty. On the floor of the front room lay a pair of old blankets, brown with dirt, which comprised all the bedding, and about all the furniture of the place; the nastiness and destitution which it presented are not easy to describe. A woman suffering a severe recovery from the previous night's debauch accompanied us over her premises; she complained loudly as she went of the indignity she suffered from having the filthy blankets before mentioned thrown over her fence. Her occupation, we were told, is the too well known one of a night-walker; her wretchedness moral and physical seemed to be complete.

We then followed Bourke-street to Harmer-street, then to Bay-street, and back to Junction-lane. Here we were met by the police, and specially asked to go with them to examine a house in Charles-street, the property of a man who is known by the name of Cock Robin, once a well known boatman, a man of property, and respectable in his station, now apparently a hopeless drunkard. He too was suffering a recovery, and nothing was to be got out of him beyond a bewailment of his woes and a repetition of "He knew he had done wrong, and what were we going to do with him." This place, the last we have inspected in our visitations, was also about the worst; the tenement had an indescribably wretched appearance. Viewed from the outside it showed a one-storied rubble and shingle cottage almost in ruins; the yard at the rear dirty and disreputable looking; the fencing gone and the whole place open to Charles-lane; the closet fast disappearing, and in full view of the lane. Upon entering the house a pitiable state of neglect presented itself. The eye was first caught by quite a startling anomaly: hanging at all angles from the sodden plaster of the walls were the remains of several oil paintings, the subjects not recognizable from dirt and decay, but the stained and broken frames still retaining traces of elaborate carving and gilding. For the rest the floor, if there ever were one, was gone; the ceiling consisted of sheets of brown paper, black with dirt, hanging in strips from the rafters. Under the one window stood the commonest of wooden sofa-frames; on it was a mattress wet, sodden, and filthy, and upon the mattress Cock Robin sleeping off the effects of his last debauch. There was literally nothing else in the place but filth and vermin, with the exception of the back of an old side-board, about 4 ft. long and 3 ft. wide; but such as it was, the sergeant who accompanied us said he had seen it occupied by a woman and a girl, lying doubled up on it, using it as a substitute for a bed. Altogether the place fitted the man, and the man the place, and worse could not be said of either.

We passed through the yard into Charles-lane. This lane is 10 ft. wide, and has an open stone gutter in its centre, which extends from Junction-lane to Bay-street, a distance of (say) 200 yards; the contents throughout are stagnating, and giving out a strong offensive smell. This gutter receives the drainage of perhaps twenty or thirty houses, and the drainage from the yards in Charles-street, crowded as they are with cow-sheds, stables, fowl-houses, &c., &c.; we were told by some of the residents that they could not sleep with their doors or windows open, because of the stench.

We continued from Charles-lane to Charles-street, and back through the length of that street, where having pursued our investigations until the afternoon we ceased our inspection. We cannot, however, avoid expressing our regret that our examination of Fitzroy Ward should have been brought thus abruptly to a close by the decision of the Board, as there are some very bad places left unvisited in the lower portions of the ward, which we should have been glad to include in our report.

Personal Inspection

By No. 1 Sub-Committee.

FORTY-SIXTH DAY, MONDAY, 1 MAY, 1876.

302. Members of the Sub-Committees having been requested by the Chairman to obtain measurements of certain crowded areas not stated in their previous evidence, Mr. Grundy, on behalf of himself and Mr. Chapman, gave the following additional particulars:—

Met at my office at 10 o'clock on Monday, 1st May, and proceeded to,—

Brisbane-place, p. 29: This place is entered from the east side of Kent-street, through an arched way, $7\frac{1}{2}$ ft. wide and 41 ft. in length, passing under the upper story of a house facing Kent-street. Brisbane-place is 12 feet in width, and the houses fronting it are 12 ft. deep, having a blank wall at the rear; they were originally four in number, but are now occupied as three houses, occupying a length of 65 ft. From the position of these dwellings there can be no ventilation from the back, and in front within 12 ft. of them are the back walls of the houses in Kent-street. F. H. Grundy,
Esq.
21 April, 1876.

Arthur-place, p. 29, is approached from the west side of Kent-street. This court is 19 ft. wide, and the nine houses in it, which are 15 ft. wide, occupy a length of 120 ft.; they are two-storied buildings with metal roof. There is no ventilation at the back or on the west side, where the court is closed in by a blank wall; on the south is the Ragged School and grounds, and there is a blank wall on the front or north side.

Miller's Buildings, p. 14: This place is reached from the east side of Kent-street by a flight of stone steps, the street at this locality having been lowered several feet by the Corporation. The width of the court is 22 ft. and its length 84 ft., terminating in a blank wall. There are seven old two-storied brick and shingle houses on either side, which have a depth of 12 ft. Blank walls on the north, south, and east sides, the only opening being into Kent-street on the west side, and the ventilation from that quarter is obstructed by the houses fronting the street, which project in front of those in the court on account of the difference in height.

McCrory's Court, p. 21: This court is approached from the east side of Clarence-street; it is 72 ft. in length and $18\frac{1}{2}$ ft. in width. It opens upon Market-row, a place little better than itself, and contains two houses on either side, with a privy in the centre of the block, the width of the court between the houses being $5\frac{1}{2}$ ft.; it has a blank wall at the end of it.

Gaddis' or Ganaty's Buildings, p. 20, contains five houses on each side, the whole length of the place being 52 ft.; it is shut in by blank walls north and south, and is without ventilation. The yards in front of the houses are 4 ft. 6 in. wide, and the passage in the centre 5 ft. In this passage is a gutter which receives the drainage from either side. Upon making inquiries this time as to the health of the residents in this locality we were told that a good deal of sickness prevails.

We are unable to define with any accuracy the number of persons living in the above mentioned localities. We find on enquiry that the day population, which is very large, is greatly exceeded at night, and that a great deal of overcrowding then takes place.

Returned at 1 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

FORTY-FOURTH DAY, MONDAY, 1 MAY, 1876.

303. *Dr. Dansey* gave evidence on behalf of Mr. Palmer and himself, as follows:—

Met the Mayor at the Town Hall at 11 o'clock on Monday, 1st May, and proceeded to the following places:— G. F. Dansey,
Esq.
21 April, 1876.

Gipps Ward, Canary-row, p. 8, consists of two blocks containing six houses each. It is 71 ft. in length and 13 ft. 4 in. to the outer wall. The rooms on the ground-floor are 6 ft. 10 in. high and those on the first-floor are 6 ft. high in the centre and 4 ft. 6 in. on either side. They have no back yard, and the court in front is $12\frac{1}{2}$ ft. in width.

Denison Ward, Shuttleworth's Buildings, corner of Dickson and Goulburn streets, p. 67: The frontage of this place is 41 ft. 9 in. in length with a depth of 14 ft. 9 in. It contains nine houses. The rooms on the ground-floor are 7 ft. 2 in. high, and those on the first-floor 6 ft. 10 in. in the centre and 5 ft. 6 in. at the sides. These houses have no yard, and all the refuse is emptied into the street.

Same ward, *Hancock's Square*, p. 75, has a frontage of 57 ft. 9 in. and contains eight houses. The rooms on the ground-floor are 7 ft. 10 in. high and those on the first-floor 7 ft. 3 in. There is no yard to these houses except the square in front.

Same ward, *Cuthill's Buildings*, p. 75, contains six houses on the east side, comprising a length of 73 ft. with a width of $13\frac{1}{2}$ ft. The ground-floor is 8 ft. high and the first-floor 7 ft. On the west side there are three houses, extending to a length of 63 ft. and a width of $12\frac{1}{2}$ ft., and having only one story $6\frac{1}{2}$ ft. high.

Same ward, *Maitland-place*, p. 74, has six houses on the west side, which have a frontage of 72 ft. to the court with a depth of 15 ft. The ground-floor is 7 ft. 5 in. high and the first-floor 7 ft. On the east side there are three houses, extending to a length of 43 ft. 6 in. and a width of 16 ft. 6 in.

Returned at 1.15.

Personal Inspection

By No. 1 Sub-Committee.

FORTY-SEVENTH DAY, THURSDAY, 4 MAY, 1876.

Rowe-street, late Brougham-place.

304. *Mr. Grundy* gave the following evidence on behalf of Mr. Chapman and himself:—

Met at my office at 10.30 a.m. on Thursday, 4th May, 1876, and proceeded to make a further inspection of Rowe-street, late Brougham-place. This street consists of twenty-six houses in two rows, thirteen on either side, divided by a court 14 feet wide at the west end near Pitt-street, and 19 feet at the east end near Castlereagh-street, with yards at the rear containing twenty-six closets. Upon making a more minute inspection F. H. Grundy,
Esq.
21 April, 1876.

F. H. Grundy, Esq.
21 April, 1876.

tion we found that this place or street really extends to a distance of 78 feet on the Pitt-street side, and 84 feet on the Castlereagh-street side, beyond the space actually occupied by these twenty-six houses, that is to say, the court continues the same width for that distance further, the extensions on either side being blocked in by the high blank side walls of shops and stores, so that the want of ventilation is not confined to the area occupied by the dwellings above-mentioned. Rowe-street is built upon an irregular piece of ground, the total width of yards, houses, and street at the west end being 81 feet, whilst at the east end it is 100 feet, therefore the houses being all of the same size the diminished width on the east side is provided against by the diminished size of the yards, the yard of the last house westward, north side of Rowe-street, being only 7 feet wide; the yard of the similar house on the south side of the street 12 feet. The 7 feet wide yards on the north side of the street continue for seven of the houses, when they suddenly widen to 12 feet, continuing of that width to the end. The yards on the south side increase regularly from 12 feet to 21 feet. The yards on the north side are backed by a high wall, forming a portion of stabling and out-buildings of other properties. The yards on the south side are backed by the walls of the Prince of Wales Theatre, and to some extent by the yards of buildings facing Pitt-street, a 5-foot paling fence intervening. It may be well to mention that the first examination of Rowe-street was made six months ago. Since that time the period prescribed by the Water Pollution Prevention Act has expired, and direct connection with the mains has been in all cases cut off. Patent cisterns have been provided to all but four or five of the twenty-six closets; from the rest the water has been cut off and they are at present very offensive; however they will no doubt be fitted up as the others before long. The buildings are of brick, shingled roof, and two stories high, each containing four small rooms. Each of these rooms contains frequently an entire family, with all their effects which sometimes so lumber up the available space with beds, boxes, &c., as to leave barely room for moving about. The rooms are some 11 ft. square by 10 feet high to the ceiling. This would give an air space of 1,210 feet, which would be diminished by (say) one-third by the impediment, making 800 cubic feet of air space. Many of the rooms have three to five occupants, one at least had nine, so that in addition to the whole place being walled and crowded in almost to the exclusion of ventilation, the cubic quantity of air, vitiated as it must be, is lamentably below the minimum fixed by this Committee in their Second Progress Report, at 300 cubic feet per head. (*Vide Plan.*)

Personal Inspection

By No. 1 Sub-Committee.

FORTY-EIGHTH DAY, TUESDAY, 9 MAY, 1876.

Durand's Alley.

305. *Mr. Grundy* gave evidence on behalf of *Mr. Chapman* and himself, as follows:—

F. H. Grundy, Esq.
21 April, 1876.

Met at my office in Pitt-street at 11 o'clock on Tuesday, 9th instant, and proceeded by way of Goulburn-street to Durand's Alley; proceeding half-way down the alley and noticing the wretched state of things described in our former report of this locality (p. 50) we came to a portion of it only 12 ft. wide, on the east side of which is the entrance to a court. This we propose to describe in detail. Here to the east branches off an allotment which is 3 ft. wide for a distance of 12 ft., and afterwards widening out to 24 ft. 6 in. On this allotment are seven hovels, including one facing Durand's Alley, which is three times as large as any of the others, being 21 ft. x 12 ft. 3 in. and 7½ ft. high, and in a very dilapidated state. The east side of this court is bounded its entire length by a wall partly of wood and partly of iron, enclosing Robertson's coach factory, and having an average height of 20 ft.; against this wall five of the remaining six tenements are built, and as they have no openings except the doors and are of the smallest dimensions it may be imagined that being thus shut in no ventilation is possible; the rooms are so stifling that it is difficult for any person accustomed to breathe fresh air to remain more than a few minutes at a time in them. The occupants appear to have got used to this state of partial suffocation. Each of these hovels is occupied by one or more Chinamen. In one of them we saw two young women (European), the younger of whom could not have been more than 17 years old—the other about 21. It being day-time when we were there the man or men were absent, and the girls were seated and engaged in some kind of worsted-work, as if they were quite at home. The younger of the two girls admitted that she had been in the habit of taking opium for two or three years, and that she could not live without it. The sketch appended will show more clearly than I can describe the character of these tenements; they are marked A to F; they are wretched hovels, patched up with wood and iron, and present a fearful state of dirt and discomfort. (*Vide Plan.*) The cottage in which we found the girls is the one marked E. The dimensions of the six dwellings are as follows:—A is 10½ x 6 ft. and 5½ ft. high; B, 16 x 6½ x 6½ ft.; C, 17½ x 6½ x 6 ft.; D, 14 x 7 x 6½ ft.; E, 13 x 5½ x 6½ ft.; F, 8½ x 6 x 6 ft. Between E and F is the only closet in the court; it is about equidistant from these two cottages—7 ft. each. The last cottage F is scarcely in a better condition than the others, although considerably larger, nor has it much better chance of ventilation, being backed on the east side by the high wall of Robertson's coach factory, although it has the advantage of being detached a few feet from the others.

We returned at 1 p.m.

Personal Inspection

By No. 2 Sub-Committee.

FORTY-FIFTH DAY, WEDNESDAY, 10 MAY, 1876.

306. *Mr. Palmer* gave evidence on behalf of *Dr. Dansey* and himself, as follows:—

B. Palmer, Esq.
21 April, 1876.

Met at the Town Hall at 11 o'clock on Wednesday, 10th instant, and proceeded to obtain more exact measurement of the undermentioned crowded localities—
Caraker's buildings, off Cumberland-street—external measurement 18 x 21½ ft.—contains one house, with three rooms on one floor 7½ ft. high, one of them only 6 ft. wide. Number of inhabitants, eleven.
Smidmore's

Smidmore's buildings, also off Cumberland-street, contains seven houses, having two rooms each, external measurement, $72\frac{1}{2} \times 21$ ft.; only one floor; rooms 8 ft. high; yards, $10\frac{1}{2} \times 10$ ft., from which the space occupied by the closet— $3\frac{1}{2} \times 3\frac{1}{2}$ ft.—must be deducted. Number of inhabitants, twenty-seven.

Hart's buildings, off Gloucester-street, commonly called Frog's Hollow, contains thirteen houses, which are built in a hollow 11 ft. below the level of Gloucester-street; area covered by houses and available for yards 85×70 ft. Number of inhabitants, fifty-three.

Caraher's buildings (No. 2) consists of two two-roomed houses; external measurement of the first $26\frac{1}{2} \times 15$ ft.; only one floor; room, 8 ft. high. Second house, external measurement, 26×24 ft.; one floor; rooms 8 ft. high. Number of inhabitants in both houses, eleven.

Returned at 1 p.m.

B. Palmer,
Esq.

21 April, 1876.

Personal Inspection

By No. 1 Sub-Committee.

FORTY-NINTH DAY, THURSDAY, 11 MAY, 1876.

307. *Mr. Grundy* gave the following evidence on behalf of himself and *Mr. Chapman*:—

Met *Mr. Chapman* at my office, 183, Pitt-street, at 11 o'clock on Thursday, 11th instant, and proceeded to *Foxlow-place*, which has not been described in our previous reports. This place or lane extends from Pitt to Castlereagh streets, and although its dwellings are on the north side of the place only they are peculiarly shut out from air freedom. The entrance from Pitt-street is 11 ft. in width and continues at this width for a distance of 27 ft. 9 in. It is enclosed by the high wall of the City Bank on the north side and by a close paling fence 10 ft. high on the south side, and leads to *Foxlow-place* proper. Here it narrows to 8 ft., continuing at that width to Castlereagh-street. On the south of this passage, for it is nothing more, is a lofty blank wall about 20 ft. in height, and on the north a row of houses extending 138 ft. in all, giving a frontage of 16 ft. to each house; their depth is 26 ft. to the yards at the back, each of which is $8\frac{1}{2}$ ft. to a 10 ft. brick wall, and each yard in this place contains a closet. The houses are three-storied, built of brick or stone, slated, and the rent varies from 16s. to 17s. 6d. a week, according, as stated by one of the residents, to the length of tenancy or the respectability of the occupant. The wife of the tenant of No. 1, in which are twelve persons, described the place as close and very unwholesome, and what she called "a very bad court," meaning, I suppose, as to the character of the inhabitants. This place, 8 ft. wide, further extends 62 ft. to Castlereagh-street, blocked in on each side by the walls of lofty three-storied buildings, the entire distance from Castlereagh-street to Pitt-street being 198 ft. 9 in. Presuming that the air space in these buildings is nominally sufficient for the minimum requirements laid down by this Committee in their Second Progress Report, it is utterly impossible that there can be sufficient ventilation for a climate like this, walled in on all sides as the place is. But the fact is that the inside measurement of each of these houses is 15×26 ft., enclosing on each floor two rooms; therefore 15×13 ft. is the square foot space of one room; this equals 195 square feet. Many of these rooms contain the entire property of the occupants, including perhaps a mangle, one or more beds, boxes, heaps of fire-wood, kitchen utensils, &c. These will reduce the air space at least one-third; the height of the ceiling is from 7 ft. to $8\frac{1}{2}$ ft.; two-thirds of that, say 5 ft., multiplied by the 195 square ft., equals 975 cubic ft.—the minimum space for three occupants. But many of these rooms have five, six, seven, or even more occupants.

F. H. Grundy,
Esq.

21 April, 1876.

We next proceeded to *Blake's Buildings*, opposite the Haymarket. Entering northward from Campbell-street, from what appeared to be a vacant allotment some 20 ft. wide, we arrived at a dirty passage 4 ft. 3 in width and 84 ft. long. At the end of this passage *Blake's Buildings* commence. Here the lane or passage widens to 14 ft.; the length of this filthy court-way is 99 ft. when a brick wall separates it from the back portion of *Durand's Alley*. The court-way on the east, *i.e.*, the length of it, is also shut in by the paling fence of a dirty stable-yard; and on the west are *Blake's Buildings*, a row of seven houses, all of two stories, and all of two rooms only—stone built with iron roofs. There are no back yards to these buildings and no windows or openings of any kind—the walls of adjoining stables abutting against the rear of them; there is consequently no ventilation. The rooms, inside measurement, are $12\frac{1}{2} \times 12\frac{1}{2}$ ft., and the ceiling 7 ft. high, and calculating as for *Foxlow-place*, each room would afford the minimum air space for two people. How few of these rooms have only two occupants—how many have five or six or more? We have computed the average in other places at five and none of them are worse in their wretchedness than this. The place is filthy, and how such buildings can have been allowed to be put up at a time when space was comparatively valueless is beyond our comprehension.

We have reason to believe that the crowding at night-time in this locality is much worse than we have described it.

We returned at 1 o'clock.

Personal Inspection

By No. 2 Sub-Committee.

FORTY-SIXTH DAY, FRIDAY, 12 MAY, 1876.

Mr. Palmer gave evidence, on behalf of *Dr. Dansey* and himself, as follows:—

Met *Dr. Dansey* at the Town Hall at 11 o'clock on Friday, 12th inst., and proceeded in the first place to *Hanson's Buildings*, off *Queen-st.* (*Gipps Ward*), page 16: This block of buildings, a sketch of which is attached to this evidence (*vide Plan*), consists of fifteen houses. The eastern block, marked A, which is $57\frac{1}{2} \times 28$ ft., consists of four houses containing three rooms each, without back yards. In these four houses nineteen persons reside. There is an open court in front, 16 ft. wide, half of which is available for the occupants of the four houses immediately opposite (block B.) This court is approached by a passage only 8 ft. wide, which is the only approach to the three blocks, A, B, and C. Block B has a frontage of $57\frac{1}{2}$ ft., and consists of four two-roomed houses. The occupants of this block have the use of a portion of the open court at the rear of their houses, which is $78 \times 4\frac{1}{2}$ ft., and this space is the only yard accommodation provided

B. Palmer,
Esq.

21 April, 1876.

B. Palmer,
Esq.
21 April, 1876.

provided for the tenants of eighteen houses. In this block there are twenty-two persons living. Block C consists of six two-roomed brick houses and two wooden buildings, having a frontage of 78 ft. There are twenty-one persons living in this block. There are also two persons living in a wooden shanty at the southern end of the court, seven persons occupants of two Chinamen's residence at the north end, and four living in a house without yard which has a back entrance to some other street, so that the total number of persons residing in this place and using the yard is seventy-five.

North's Buildings, off Castlereagh-st. (Macquarie Ward) p. 33, consist of eight houses without back yards, having an open court in front, which is the only available space for that purpose. The size of the place is as follows:—Outside measurement, 55 x 14½; size of buildings, 51¾ x 22½; number of residents, 32.

St. George's Lane, alias Scandinavian Alley, off Castlereagh-st. (Macquarie Ward) p. 33: This place consists of nine houses having no back yards but an open court in front, which is 77½ x 23½ ft. The houses are in two blocks; the south block contains four houses 72½ x 19 ft., each having two rooms 7½ ft. high, and a garret; the north block has four houses also, with two rooms and a garret each, rooms 8 ft. high, measuring in all 66 ft. 8 in. x 16½ ft. The number of persons residing in the nine houses is thirty.

Personal Inspection

By No. 1 Sub-Committee.

FIFTIETH DAY, SATURDAY, 13 MAY, 1876.

Swan-street, off George-street, between Goulburn and Liverpool Streets. (Phillip Ward.)

309. Mr. Grundy gave evidence on behalf of Mr. Chapman and himself, as follows:—

F. H. Grundy,
Esq.
21 April, 1876.

Met at 183 Pitt-street at half-past 10 o'clock on Saturday 13th instant, and proceeded to Swan-street. This street trends eastward from the east side of George-street, south of Liverpool-street, and is 19 ft. in width, the roadway being 12 ft., with a footpath of 3 ft. 6 in. on either side; its total length is 241½, and it terminates at a vacant piece of ground dividing it from the back of houses in Pitt-street; it has no thoroughfare to Pitt-street, being simply a *cul-de-sac*.

On the south side of Swan-street the first thirteen houses from George-street are faced by the side walls of the outbuildings of 670, George-street, occupied by Mr. Turner, bookseller; they are chiefly high blank walls, well calculated to impede ventilation. The next five dwelling-houses, having each a frontage of 15 ft. to Swan-street, are two stories high, built of brick, and shingled. Each house contains four rooms, two of them being 12 x 9 ft., and two 8 x 8 ft. Next to these is a passage 4 ft. 4 in. wide, and beyond that two brick and slate two-storied houses, having a frontage of 20 ft., and a similar depth to the others. We shall presently return to describe the rear of these houses.

On the north side of Swan-street are eleven houses, in all respects similar to the five above-mentioned, to which some of them are opposite, and the street ends with two brick and slated houses, larger and of better appearance, as on the south side; these have five rooms each. These four best houses—as far at least as regards appearance—are opposite each other, and the last buildings in Swan-street eastward. The first 40 ft. from George-street, on the north side, is fronted by the side walls of the outbuildings of a public-house, known as the "Honest Lawyer." Then come eleven houses, similar in size and condition to the five already described on the south side. The yards of the houses on the north side are tolerably deep, being about 30 ft. in length, but having an outbuilding or kitchen of one story taking up one-fourth of the space, and being almost entirely closed in at the back by a number of inferior buildings, probably the back premises of houses in Liverpool-street. The overcrowding and accompanying evils in Swan-street may be considered on a par with other places recently described. Children there are in swarms, but they are small and sickly-looking, evidently preparing a generation stunted in growth, morally and physically.

Returned at 1:15 p.m.

Personal Inspection

By No. 1 Sub-Committee.

FIFTY-FIRST DAY, MONDAY, 15 MAY, 1876.

Swan-street—(Phillip Ward)—continued.

310. Mr. Grundy gave the following evidence on behalf of Mr. Chapman and himself:—

F. H. Grundy,
Esq.
21 April, 1876.

Met at my office in Pitt-street at 10:15 on Monday, 15th instant, and paid a second visit to Swan-street.

Started with Mr. Chapman from my office in Pitt-street at 3 o'clock on Monday, 15th instant, and proceeded again to Swan-street and along Swan-street to the 4 ft. 4 in. passage mentioned in our last report. This passage is just 200 ft. from George-street; it leads down through the houses on the south side of Swan-street, which have to be strutted from wall to wall across this 4 ft. 4 in. space at the height of about 12 ft. or so to keep the gables standing. The passage continues the length of the houses and 8 ft. beyond them, this 8 ft. representing the extent of the yards to the Swan-street cottages on this part of the ground, and then it turns right and left, continuing the same width for 29 ft. westward to a 10 ft. paling fence, and for 36½ ft. eastward to a paling fence of the ordinary height—about 6 ft. The passage is faced on its north side by the 8 ft. wide yards of the Swan-street buildings, and on the south side by a row of four more buildings of brick, shingled, and two stories high, very much dilapidated and having an extremely poverty-stricken appearance. These houses contain four rooms each; the yards at their rear are 5½ ft. deep only, each having a closet in it; all the closets are directly connected with the main. Doubtless from their utterly shut in and most unexpected position they have been overlooked altogether by the Municipal Inspector. The Swan-street houses are bad enough; their back yards are foul and dirty, and it is quite reasonable that this passage should have been thought to lead to these yards only as a back entrance.

entrance. Indeed a similar looking passage on the opposite side to Swan-street actually does so. It could not be expected that this passage should lead to a still lower depth of discomfort and impurity. These back houses are necessarily very damp as their roofs are nearly rotten and the buildings generally in bad repair. The 4-ft. passage already described is so arranged that the water accumulating in it during wet weather must either go under or over the flooring boards of the houses to get away at all, and thus what from above and what from below the four rooms all get their fair share of damp. The inhabitants seem to be of the very poorest class—one woman unable to work, and in a room which appeared to be positively without furniture of any kind; another with nearly all her household goods sold by a drunken husband as she said, and so on; nevertheless swarms of children greeted us everywhere. But the climax of misery to the unhappy residents in these houses must be the arrangement of the closets. Those for the Swan-street houses are built at the furthest extremity of the yards already described as 8 ft. wide. This brings them to the point nearest to the 4 ft. passage, which alone separates them from the back houses—that is to say, the closets for the front houses to Swan-street are distant from the bedroom windows of the back houses 4 ft. 4 in. and are very considerably above the floors of those houses in level. Two of these closets are falling to pieces and are propped up from the back houses themselves, otherwise they would long ago have fallen either into or on to them. Then at the rear come the closets proper to these back houses. These are—the furthest of them— $3\frac{1}{2}$ ft. and the nearest $1\frac{1}{2}$ ft. distant from the back bedroom windows of these unfortunate habitations, so that the occupants of the houses are favoured with a double row of closets front and rear, at an average distance from their various sleeping apartments of 3 ft. The residents complain greatly of the extreme damp, closeness, and unhealthiness, and no wonder. So far as we could discover, throughout the whole of Swan-street and its adjoinments the average number of inhabitants is from ten to twelve per house. It will be useless to enter into a detailed calculation of the air space here, as the conditions closely resemble those in other places which have been described several times. It may be curious to state that since the removal along with certain old buildings and rubbish of the 6 ft. ordinary paling fence which did until lately end Swan-street, and thus giving access to a vacant allotment, the children in Swan-street—as we were told not by one woman only but by several—have become quite unmanageable. The unaccustomed freedom which the vacant space affords them has inspired them with a spirit of rebellion and resistance to maternal authority, and they become deaf to the summons to return to their closer unwholesome quarters in Swan-street.

We returned at 1 p.m., having now brought our visits of personal inspection to a close.

F. H. Grundy,
Esq.
21 April, 1876.

APPENDIX.

OPIUM AND OPIUM SMOKING.

OPIUM is reduced from a solid to a liquid form by boiling it with water before it is consumed by the Chinese. This process for the retail market requires considerable skill and care. When prepared for smoking, it looks very much like thick, dark-coloured molasses. It is often sold in very small quantities—as small as one-hundredth of an ounce. An ounce of this prepared opium is worth about eleven hundred cash. A hundredth part of an ounce is sufficient for a beginner, who can smoke but a few whiffs. After being accustomed to it, the smoker can use from one-twentieth to one-third of an ounce daily.

The smoker of opium invariably lies down, and gives his whole attention to the process while inhaling its fumes.

The inveterate opium-smoker seldom emits the smoke from his mouth—generally through his nostrils, after “swallowing” it, as the Chinese say—after inhaling it into his lungs. Beginners emit more or less of the fumes from the mouth. Some inveterate smokers, it is affirmed, by practice acquire the power of retaining or absorbing in the system a considerable portion of the fumes, emitting the rest through the nose.

Tobacco can be lighted by contact with a coal of fire, or with anything already ignited, but the opium-smoker always uses the steady, constant flame of a small oil-lamp. The opium is introduced into the bowl of the pipe through a small orifice in the projecting point of the bowl. He holds this point steadily in the flame of the lamp until the opium within is ignited and partially volatilized. During this lighting process the smoker gently inhales the fumes which arise from the burning opium, the suction of his mouth always causing some of the flame of the lamp to enter the orifice of the bowl.

If one smokes opium at stated intervals, as every morning or every evening, or once regularly in two days, he acquires in a short time the habit, so that he must smoke it at just such a time, or suffer the disagreeable consequences of not smoking. This condition causes an incessant thinking about it, and a longing or hankering after it, which in a great degree incapacitates the victim for effort, intellectual or physical, unless he has recourse to the drug again. The habit becomes fixed in a period of time varying from ten to fifteen days to one or two months, according to the constitution of the person and the circumstances of the case. It is not determined so much by the quantity he consumes as by the regularity of his resorts to the pipe. If he smokes at irregular periods, as once in a week, and then once in a day, and then goes for a longer or shorter period before he smokes again, he will not feel this ardent and intolerable longing. He does not become addicted to the vice; he is still his own master.

Some originally resort to the drug in order to cure the toothache, or headache, or dyspepsia, under the advice of friends. The pain is usually relieved for the time being, but at the expense of acquiring the habit of smoking opium. When this habit has fastened itself on the victim, the usual quantity will not long assuage the pain as at the beginning, and, in order to relieve it, larger and still larger quantities must be used from time to time.

Opium-shops are always provided with platforms, which the buyers of the prepared drug may occupy while consuming the quantity purchased. Here two friends often meet, and, reclining on these platforms, facing each other, with the burning lamp and apparatus between them, and their heads resting on pillows, treat each other, usually each preparing for the other to smoke the pipe which is furnished for their common use. Most of the poorer and many of the middle classes prefer, for convenience sake, to consume the opium at the shop where it is purchased. In the case of some of the middle class, and of most of the wealthy and the higher classes of Chinese, the opium is bought at the retail shops already prepared in a liquid form for smoking, and taken home to be consumed. Sometimes, however, they procure the drug in the solid form, and prepare it by boiling in their own houses. Perhaps one-half or more of the quantity imported and used here is thus consumed at the homes of its buyers. Many officers, merchants, literary men, the wealthy, and generally all those who have their time at their leisurely disposal, buy the drug by the ball or in smaller quantity, and prepare it at their residences, where they smoke it whenever they please.

Extensive native mercantile firms sometimes keep it on hand for their large customers or their personal friends who may call. The best Chinese physicians oftentimes depend upon being invited to smoke at the houses of their patients, and take it unkindly if not “treated.” The official employes connected with mandarin establishments, such as policemen and constables, of which class there is a large number, delay or decline to proceed to the transaction of their business unless first treated with opium when called to one’s house, even on the most urgent and important affairs. Many wealthy private families keep the opium-pipe and fixtures in readiness for the demands of fashion.

It is comparatively a very costly vice, the expense being graduated by the circumstances of each case, ranging from a dollar or two to ten or fifteen dollars per month, even in regard to persons not of the highest and the most wealthy classes. The lowest mentioned rate, taking into consideration the low price of labour among this people compared with the price of labour in Western countries, is relatively larger and burdensome. With all smokers, however, the effect of this vice on their pecuniary standing is by no means to be estimated by the actual outlay in money for the drug. Its seductive influence leads its victims to neglect their business, and consequently, sooner or later, loss or ruin ensues. As the habit grows, so does inattention to business increase. Instances are not rare where the rich have been reduced to poverty and beggary as one of the consequences of their attachment to the opium-pipe. The poor addicted to this vice are oftentimes led to dispose of everything saleable in the hotel where they live. Sometimes even men sell their own children and their wives in order to procure the drug, and finally end their career by becoming beggars or thieves.

In the second place, the smoking of opium injures one’s health and bodily constitution. Unless taken promptly at the regular time and in the necessary quantity, the victim becomes unable to control himself and to attend to his business. He sneezes. He gapes. Mucous runs from his nose and his eyes. Gripping pains seize him in his bowels. His whole appearance indicates restlessness and misery. If not indulged in smoking and left undisturbed, he usually falls asleep, but his sleep does not refresh and invigorate him. On being aroused, he is himself again, provided he can have his opium; if not, his troubles and pains multiply. He has no appetite for ordinary food; no strength or disposition to labour. Diarrhoea sets in of a dreadful and most painful description, peculiar to opium-smokers; and if still unable to procure opium, the unhappy victim not unfrequently dies in most excruciating agonies. Few, comparatively, recover after the diarrhoea has become virulent, unless they have access to opium, and not always then.

The Chinese, in describing the effects of opium-smoking on the individual, dwell with peculiar emphasis on the weakness and indolence which it induces. The victim is described as unwilling, and usually physically unable, to perform anything requiring muscular strength or mental application, except under the excitement of opium. His habits of sleep are changed, it being impossible oftentimes, owing to the overwrought mental excitement induced by the drug, for him to fall asleep in the early part of the night, as others do. Frequently it is nearly or quite morning before he is able to compose himself to rest, waking only late in the forenoon or early in the afternoon. The Chinese have a common saying that the smoker of opium “makes the day night, and the night day,” alluding to his unnatural hours of waking and of sleeping. His features almost always become strikingly changed, being of an unhealthy, pallid, death-like cast. His shoulders not unfrequently become permanently elevated above their natural level, much as when one shrugs them up, at the same time drawing down his head. Such an opium-smoker is expressively described as “having three heads,” from the high and unnatural appearance of his shoulders. His eyes become glaring and without expression. Most inveterate smokers become spare and thin, owing in part to the direct effects of opium on the human system, and in part to the fact that nutritious food is taken in less quantities and at more irregular intervals, through loss of appetite, than is usual in the case of persons not addicted to this habit. They are styled “opium devils.”

The vice of opium-smoking has long since become a gigantic obstacle to the welfare and the prosperity of this people. The consumption of opium is rapidly on the increase in this city as in other parts of the empire, and its ravages are becoming more and more common. Its unhappy victims are becoming more and more manifest and more awful. Shops where the drug is offered for sale are becoming more and more numerous. The nation is becoming poorer and poorer.

One of the most common inquiries made by confirmed smokers, as well as by young beginners, of those foreigners who express a hatred of the vice, and who urge them to break away from it, is, “Have you medicine which will cure it?” The Chinese entertain the opinion that, since the drug comes from a foreign land, foreigners must know some infallible remedy which will counteract its bad effects, or destroy an acquired taste for it. Accordingly the Chinese have opium medicines in abundance, professedly of foreign origin.

There seems to be a bewitching influence connected with opium-smoking which renders it almost impracticable to break away from the habit when once formed. The peculiar pains and sensations which accompany attempts to desist from smoking it also have, doubtless, a great influence in discouraging such attempts.

A strange infatuation impels annually many of the Chinese who have never smoked this drug to begin its use, and, after they have been bound fast in the fetters of the habit they have induced, they seemingly arouse themselves to the fact of their thralldom. They know perfectly well that if they smoke regularly the bewitching pipe they will certainly soon come within its power; and yet many yearly voluntarily become its fresh victims. With their eyes open to the inevitable consequences of indulgence, they blindly do what will enslave them for life.

How noble and well worthy being held in lasting remembrance are the sentiments of the aged heathen Emperor Tau Kuang, uttered in 1842, relating to the proposition to legalize the trade in opium, made by Sir Henry Pottinger, the minister of "her most gracious and religious majesty," Queen Victoria: "It is true, I cannot prevent the introduction of the flowing poison; gain-seeking and corrupt men will, for profit and sensuality, defeat my wishes; but nothing will induce me to derive his revenue from the vice and misery of my people." But his degenerate son, Hien Fung, who is said to have been himself a smoker of opium before he came to the throne in 1851, gave way in the fall of 1858 to the overwhelming pressure from the Ministers of England, France, and America, strongly seconded, doubtless, by the want of an adequate revenue for the support of his tottering throne. He legalized, by his Commissioners, the nefarious traffic, fixing the import duty as thirty taels of silver per chest of opium. How much credit and glory should be awarded to the representatives of those Christian and civilized governments for the influence they exerted, directly and indirectly, officially and unofficially, towards bringing about this result, is a question not clearly understood by those who are uninitiated in State secrets. In a moral, benevolent, and Christian point of view, their sentiments and their actions certainly fall far below the views and the conduct of the heathen and the idolator, Tau Kuang.

But, in the expressive language of another—"Opium is as much legalized now as the Gospel." Those who import opium are no longer to be included under the epithet smugglers, provided they pay the duty leviable according to the stipulations of the treaty. In the eye of the law they are engaged in as honourable and respectable a business as those who import rice or cotton goods. The opium importer and the opium seller are now placed on the same legal platform as the Gospel messenger and the Bible distributor. The receiving-ships for opium are often moored by the side of tea-ships. The tares grow along with the wheat.

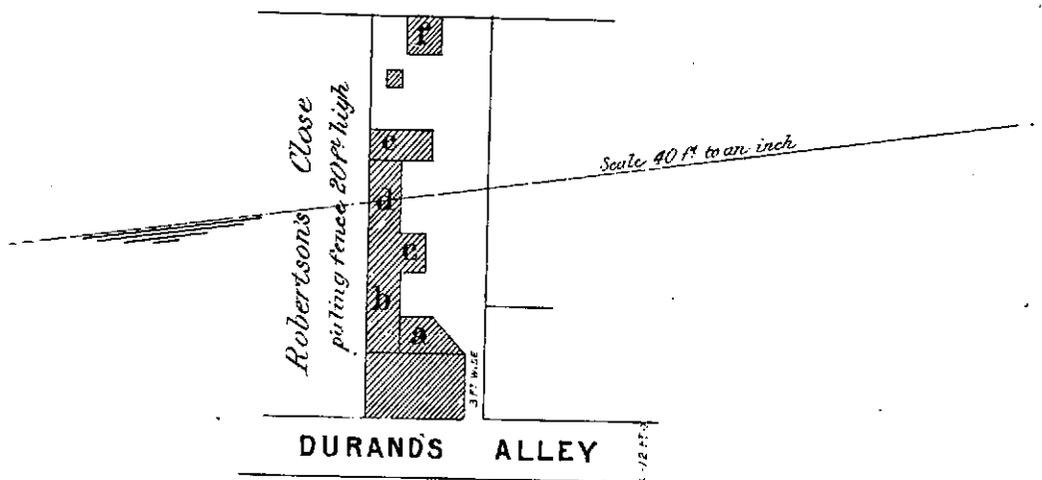

What will be the full practical effect of the legalization of opium on the Chinese is as yet, to a great extent, an unsolved problem, involving most momentous interests. Will the Chinese engage in the cultivation of the poppy more extensively than in previous years? Will they consume more opium than they would were it to continue prohibited? Will it be imported in larger quantities, and will it become cheaper than before, thus coming within the means of more people? These, and other questions relating to the cultivation, importation, and consumption of opium are often the subjects of reflection and discussion on the part of foreign residents. Some discuss the probabilities in the case, so that they may, according to the maxims of trade, invest or refrain from investing their capital in the drug, in order to make the greatest possible percentage on their money. Others discuss these questions because the religious interests and the social and the national welfare of the Chinese people are most intimately concerned in the practical results, present and prospective, of the legalization of the opium trade.—*Social Life of the Chinese.*

The Rev. George Smith, Church Missionary for many years in China, says: "Facts of daily occurrence, brought to the knowledge of the missionaries, and frequently gained through the medium of the missionary hospital, reveals the prevalence of the most fearful immoralities among the people, and furnish a melancholy insight into the desolating horrors of Paganism. Female infanticide, openly confessed, legalized by custom, and divested of disgrace by its frequency—the scarcity of females, leading as a consequence to a variety of crimes habitually staining the domestic hearth—the dreadful prevalence of all the vices charged by the Apostle Paul upon the ancient heathen world—the alarming extent of opium indulgence, destroying the productiveness and natural resources of the people—the universal practice of lying, and suspicion of dishonesty between man and man—the unblushing lewdness of old and young—the full unchecked torrent of human depravity bore along in its tempestuous channel, and inundating the social system with the overflowing of ungodliness, prove the existence of a kind and degree of moral degradation among a people, of which an excessive statement can scarcely be made, and of which an adequate conception can rarely be formed."—*Narrative of an Exploratory Visit to the Consular Cities of China.*

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SYDNEY CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.
(STATEMENT OF EXPENDITURE, AND REPORT RESPECTING FURTHER MONEY REQUIRED BY.)

Ordered by the Legislative Assembly to be printed, 26 July, 1876.

THE SECRETARY, SYDNEY SEWAGE AND HEALTH BOARD, to THE PRINCIPAL UNDER SECRETARY.

365/74.

Sydney City and Suburban Sewage and Health Board,
(Office, Colonial Secretary's Department),
Sydney, 21 July, 1876.

SIR,

I have the honor to submit, for the information of the Honorable the Colonial Secretary, a detailed statement of expenditure by the Sydney City and Suburban Sewage and Health Board, from the 12th May, 1875, to the 30th June, 1876.

With respect to the further sum of £1,500 asked for by the Board, I am instructed by the Chairman to inform you that it is required—

- (1.) To replace the sum of £331 7s. 2d. expended by the Board in excess of the money voted by Parliament, as shown by the accompanying return.
- (2.) To defray the expenses of the current month.
- (3.) To enable the Board to complete plans, estimates, and specifications, and to report a general system of sewerage for the City and Suburbs, the Board having been specially appointed, on the 12th April, 1875, "to inquire into and report as to the best means of disposing of the Sewage of the City of Sydney and its Suburbs, as well as of protecting the health of the inhabitants thereof."
- (4.) To enable them to bring up their final Report and Evidence on the state of Crowded Dwellings and Areas in the City and Suburbs,—an inquiry upon which they have been engaged, with the sanction of the Government, since the 26th October last.
- (5.) And lastly, to enable the Board to inquire into and report upon the following subsidiary matters detailed in their Ninth Progress Report, clause 15, viz., (1) Offensive manufacturing establishments, (2) Slaughtering in the city, and (3) The adulteration of food and drink,—which the Honorable the Colonial Secretary declined to authorize until the necessary funds were voted by the Parliament.

I am desired to add that very elaborate plans and surveys have been made, and long continued inquiries and discussions have been held, as to the best system of sewerage for this city; and that it will be a matter for regret if the labours and expenditure of the Board should lose a large part of their value for want of final revision and report.

I have, &c.,

CHAS. H. BARLEE,

Secretary.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

SECOND REPORT

TO THE

SEWAGE AND HEALTH BOARD,

UPON THE

SYDNEY CITY AND SUBURBAN WATER SUPPLY.

BY

A. LIVERSIDGE, F.C.S., F.G.S.,
PROFESSOR OF GEOLOGY AND MINERALOGY, UNIVERSITY OF SYDNEY.

ORDERED BY THE CHAIRMAN OF THE SYDNEY CITY AND SUBURBAN SEWAGE
AND HEALTH BOARD ON THE 3RD AUGUST, 1875.

ORDERED BY THE LEGISLATIVE ASSEMBLY TO BE PRINTED,
23 *November*, 1875.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

ADDITIONAL ANALYSES.

TUNNEL OR BORE WATER.

University,

August 17th, 1875.

ACCORDING to the instructions received from the Chairman of the Sydney City and Suburban Sewage and Health Board, I proceeded, on July 27th, to collect some additional samples of the Lachlan water—four in number—which I have since submitted to chemical analysis and microscopical examination, the results of which are set forth in the following pages.

All the samples were collected in the presence of Professor Smith, and Mr. Bell, City Engineer.

Sample No. 1—Hyde Park Plug.

This sample of water was obtained from the plug-hole in Hyde Park, used for gauging the depths of water in the tunnel. This point was chosen by Mr. Bell for the purpose of ascertaining the quality of the water in the tunnel at the greatest practicable distance from the swamp, and before it had been connected with any houses,—the object being to ascertain whether the tunnel water had become contaminated during its course through the town by soakage. The water in the gauge-hole at the time was 86 inches. On account of the narrowness and depth of the aperture the specimen was brought up by means of a small bottle lashed to a pole, from which it was transferred to the glass-stoppered collecting bottle. This sample was obtained about twenty-minutes earlier than the following one, No. 2.

Colour, &c.—This sample was turbid, and possessed the usual brownish tinge.

Smell.—The usual faint earthy odour of the swamp water.

Chlorine 29·00

Free ammonia '07

Albumenoid ammonia '26

Nitrites present—more than traces.

Nitrogen existing as nitrites and nitrates '69

Microscopical examination of sediment.—The amount of solid matter deposited by this specimen was greater than usual. It was found to consist of brown flocculent matter, containing vegetable fibres and tissues, some grit, small worms, a filamentous colourless fungoid growth, entomostraca cases, small acari, amoeba, paramæcia, &c. And in addition to these minute forms were one or two small water beetles, the largest being about $\frac{1}{8}$ inch in length.

Sample No. 2.—Lachlan Swamp.

This sample was collected at about 3 p.m. on the afternoon of Wednesday, July 28th, and was taken from about the same spot as the one obtained on May 11th, viz., from close by the lock between the stone-work in front of the tunnel mouth. At the time the surface of the water was particularly bright and clear; a strong movement could be seen in the water, the lock at the time being up "eight turns." As on my previous visit, the water was up to within 5 to 6 inches from the top of the stone-work; but since that time the water had evidently occupied a much higher level, had overflowed the stone-work, and had undermined and carried away some of the earth in front of the tunnel mouth, and had thus evidently gained access to the tunnel.

As heretofore, to avoid any impurities floating on the surface, the mouth of the bottle was depressed beneath the surface of the water while being filled.

Colour, &c.—When viewed in a large clear colourless glass flask it was seen to have a brown tinge, and to be somewhat turbid—much the same as in the previous case, but in addition a few green filamentous confervæ were seen to be present.

Smell.—The usual faint earthy odour.

Free ammonia '12 parts per 1,000,000

Albumenoid ammonia '21 " "

Chlorine 26·60 " "

Nitrites traces.

Nitrogen, existing as nitrites and nitrates... .. '33 " "

Microscopical examination.—Under the microscope the solid matter in this specimen did not differ materially from the sample collected May 11th, but with the brown structureless matter, diatoms, desmids, entomostraca, and other organisms then observed, long green filamentous confervæ were present in addition.

Sample

Sample No. 3.—Pond or Dam No. 2.

Obtained from Pond or Dam No. 2, also known as Fewing's Creek, and taken from a spot about 6 or 7 chains up the creek, *i.e.*, measuring from the embankment.

Colour, &c.—Had brownish tinge, with considerable turbidity. After exposing some of the water in a clear glass cylinder to the light for a day or two it became greenish in colour probably from the development of a low vegetable growth.

Smell.—A slight earthy odour, rather stronger than from water of Pond No. 1.

Chlorine 51·80 parts per 1,000,000

Free ammonia '22 " "

Albumenoid ammonia '30 " "

Nitrites present in quantity.

Nitrogen, existing as nitrites and nitrates... .. '40 " "

Microscopical examination of sediment.—The deposited matter consisted principally of dark brown flocculent matter, with which were the usual living *parmæcia*, diatoms, *amœba*, and other organisms.

Sample No. 4.—Pond or Dam No. 1.

This sample was obtained from pond or dam No. 1, from a spot about 3 chains above the dam, and some feet from the bank, by one of the workmen quietly wading out to where the depth of the water was about 2 feet 6 inches deep. Every care was taken to avoid gathering any of the disturbed sediment, and successfully, as was seen on subsequent examination, for this water was found to be the least turbid of any.

A large number of workmen were at the time employed upon new earthworks at this pond.

Colour, &c.—Had but a faint tinge of brown, only the slightest turbidity.

Smell.—Not worth mentioning.

Chlorine 28·50 parts per million.

Free ammonia '09 " "

Albumenoid ammonia '10 " "

Nitrites absent.

Nitrogen existing as nitrates '22 " "

Microscopical Examination of the Sediment.

Sediment of a grey colour, of not so unpleasant a nature as in the other cases; almost free from organisms.

Tunnel or Bore Water.—Samples collected July 28th, 1875.

Parts per 1,000,000 or Milligrammes per litre.

No.	Locality.	Chlorine.	Free Ammonia.	Albumenoid Ammonia.	Nitrogen as Nitrates and Nitrites.	Nitrites.
3	Pond or dam, No. 2.....	51·80	·22	·30	·40	Present in quantity.
4	Pond or dam, No. 1.....	28·50	·09	·10	·22	Absent. New earthworks in hand.
2	Tunnel mouth	28·60	·12	·21	·33	Traces.
1	Hyde Park Plug	29·00	·07	·28	·60	Present; more than traces.

REMARKS.

The above tabular statement of the results of the second examination of the Lachlan Swamp water is arranged with the localities in the order of the course taken by the water as it travels down from the upper part of the swamp, so that the changes in quality may be easily traced.

We see that water from pond No. 2, or Fewing's Creek, contains an excessive amount of chlorine—in such cases as this we must regard the large amount of chlorine as one of the exponents of sewage contamination, in fact it is an indication of the highest value and importance—of free ammonia, and albumenoid ammonia, and in addition it contains a large quantity of nitrites, and more nitrogen existing as nitrates, and nitrites, than any of the others, except the water from the tunnel at Hyde Park. These large amounts all clearly and strongly indicate sewage contamination, and the water as it exists in this pond is decidedly unfit for domestic purposes.

The water in pond or dam No. 1 is far better in quality, it does not contain more albumenoid ammonia than the water from the Botany area, as observed on May 26th and 31st. It does not contain so much chlorine by nearly one-half as the former; the amount of free ammonia is less than one-half; the albumenoid ammonia also is only one-third, while the nitrogen existing in the oxidised form as nitrates is also only about one half, so that altogether there is a most marked difference for the better.

The

The water from the above two ponds or dams makes its way down to the tunnel, where we find that its quality is about a mean between the two, 21 parts of albumenoid ammonia per million, is, as I have already stated in my previous report, more than a drinking water should contain, as it is more than can be accounted for from natural sources; but it admits of a ready explanation, for I understand, the access of sewage matter to the watershed can be traced; both by direct drainage from many houses and other tenements into pond No. 2, or Fewing's Creek, and by the former deposition of night-soil upon the area. The oxidised nitrogen and free ammonia are also in mean proportion.

The greater proportionate amount of sewage matter which it is known to gain access to the Lachlan watershed than to the Botany watershed is quite sufficient to account for the difference in the qualities of the waters, for in other respects the areas are very similar.

The sample collected at Hyde Park corroborates the results previously obtained, viz., that contamination of the water during its passage through the tunnel does take place. Comparing the water at the mouth with that at the Hyde Park end we find that the latter contains a greater quantity of chlorine a much increased proportion of albumenoid ammonia, and of nitrogen as nitrates and nitrites; the latter which one is the most unfavourable symptoms, as it may be taken as an indication of matter undergoing decomposition, being present in well-marked quantity. The free ammonia will be seen to be somewhat less.

The above analyses were made in the manner described in my previous report, and every determination also was made in duplicate.

The water was not filtered before analyses, both for the reasons already given, and for others which it is, perhaps, unnecessary to now specify.

Archibald Liversidge, Esq., to Professor Pell, B.A., Chairman of the Sydney Sewage and Health Board.

The University,
Sydney, 18 August, 1875.

Sir,

I have the honor to inform you that in accordance with your request, dated the 30th ultimo, I visited the Crown-street Reservoir on the morning of Monday, the 2nd of August. At the time of my visit, 9:45 a.m., compartment No. 3 was being cleaned; compartments 1 and 2, I was informed, had been cleaned out on the Friday previously, and had again been filled.

I found this portion of the reservoir (compartment No. 3) empty of water, and the deposit had for the most part been removed, the workmen then being engaged in cleaning out from the central gutter the last portions of the black, mixed slimy and sandy, deposit.

The walls were still more or less coated with a slimy matter, which was to be brushed off and flushed out before the admittance of the water.

I examined the interior of this compartment as carefully as was possible under the circumstances and as minutely as the imperfect light of a candle carried in the hand would admit.

I did not notice any sign of leakage into the reservoir, except of water from the Botany main through the imperfectly closed or badly fitting inlet lock.

The chamber appears to be constructed of brick, without any external coat of cement (I speak on this point from memory and am therefore subject to correction), so that an insensible soakage through the porous brick might easily remain undetected unless the reservoir were left empty for some time.

I may mention that I was shown a few small fish (6 or 7 inches in length) which had been caught in the reservoir as it was emptied.

I much regret that owing to other duties my examination was necessarily of so meagre a character.

I have, &c.,
ARCHD. LIVERSIDGE.

The University,
19 August, 1875.

FURTHER ANALYSIS OF THE CROWN-STREET RESERVOIR WATER.

Sample No. 33—Collected 9th August, 1875.

COLLECTED at 10 a.m. on the morning of August 9th from a few inches below the surface of the water and as near to the outlet mains as possible.

The water at the time was some 5 or 6 inches deep over the top of the causeway. The surface of the water was clean, and the air of the reservoir had not the close and earthy smell noticed at my visit on May 26th last.

Colour, &c.—Of the usual brown shade, but it contained a smaller quantity of matter in suspension *i. e.*, was less turbid.

Smell.—The usual faint earthly odour.

<i>Chlorine</i>	25·90 parts per 1,000,000
<i>Free ammonia</i>	·09 " "
<i>Albumenoid ammonia</i>	·19 " "
<i>Nitrites</i>	absent.
<i>Nitrogen, existing as nitrates, &c.</i>	not estimated.

Microscopical examination.—Nothing calling for special comment. Some woven flax fibres were present; they may either have been borne in by the mains, or they may have been derived from a portion of a workman's clothing.

It will be observed that the free ammonia is present in much larger proportion than was found in the water taken from the Botany pumps on May 26th and 31st last respectively, the amount being equal to that contained by this same reservoir water before the recent cleansing.

The amount of albumenoid ammonia has undergone a diminution to the extent of about one-half, but even now the water contains just upon twice as much as that collected at Botany on the above dates; and as there is no reason to suppose that the Botany water has itself undergone any change since then, we must look for some other explanation of the matter.

This increased amount of impurity deserves serious attention, and requires further investigation; comment at the present stage would, taking all the circumstances into consideration, be premature.

ARCHIBALD LIVERSIDGE.

1875-6.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.
(PARTICULARS OF.)

Ordered by the Legislative Assembly to be printed, 14 March, 1876.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 7 March, 1876, That there be laid upon the Table of this House,—

“ A Return showing the names of the persons who have been appointed to
“ the Sydney City and Suburban Sewage and Health Board; the dates of
“ their appointments, and the rate per day or per sitting they are paid;
“ the total cost of the Commission up to 29th February last; the amount
“ of money voted to pay the Commissioners; the amount paid to each
“ Commissioner respectively; the period for which the Board was appointed,
“ and when.”

(Mr. McElhone.)

CITY AND SUBURBAN SEWAGE AND HEALTH BOARD.

RETURN.

Names of the persons who have been appointed to the Sydney City and Suburban Sewage and Health Board.	Dates of their appointments.	Rate per day or per sitting at which they are paid.	Total cost of the Commission up to the 29th of Feb., 1876.	Amount of money voted to pay the Commissioners.	Amount paid to each Commissioner.	The period for which the Board was appointed, and when.

Colonial Secretary's Office,
Sydney, 13th June, 1876.

BOROUGH OF PADDINGTON.

BY-LAWS.

THE following By-laws made by the Council of the Borough of Paddington, under the "Nuisances Prevention Act, 1875," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of that Act.

JOHN ROBERTSON.

BY-LAWS of the Borough of Paddington, made under and for carrying into effect the several provisions of the Nuisances Prevention Act of one thousand eight hundred and seventy-five.

1. Every person who shall be about to erect a closet or form, excavate, or make a cesspit shall, before he shall commence to erect such closet or to form, excavate, or make any such cesspit, deliver to the Council Clerk of the said Borough of Paddington a notice in writing of the intention of such person to erect such closet or form, excavate, or make such cesspit, and of the place or position in which it is intended that such closet shall be erected or such cesspit formed, excavated, or made; and if any person shall commence to erect any closet or to form, excavate, or make any cesspit within the said Borough without having given such notice in writing as aforesaid, and before the expiration of seven days after the delivery of such notice (except by the written authority of the Inspector of Nuisances for the said Borough, or other officer for the time being appointed by the Council of the said Borough in that behalf), he shall forfeit and pay a penalty of not less than one pound nor more than five pounds.

2. No person shall erect or commence to erect any closet or to form, excavate, or make any cesspit, except in such places or position as shall be approved by the said Inspector of Nuisances or other officer as aforesaid; and any person who shall erect or commence to erect any closet or to form, excavate, or make any such cesspit without having obtained the approval of the said Inspector or other officer, or in any other place or position other than the place or position approved of by the said Inspector or other officer as aforesaid, shall forfeit and pay a penalty of not less than ten shillings nor more than forty shillings. But any person who shall feel aggrieved by the decision of such Inspector or other officer may appeal against the same to the Council.

3. Every cesspit shall be at least 4 feet long by 3 feet wide by internal measurement, and shall be at least 4 feet (but not more than 6 feet) below the surface of the ground, and the top of such cesspit shall be at least 6 inches higher than the highest part of the surface of the ground immediately adjoining such cesspit, and every such cesspit shall have walls on each

side of brick or stone of at least 4½ inches thick, and such walls shall be built in cement and rendered at least ½ an inch thick inside with cement in such manner as to make such walls thoroughly watertight, and no cesspit shall be formed, excavated, or made under any dwelling-house, nor at a less distance than 6 feet therefrom; and if any person shall form, excavate, or make any cesspit which shall not be in accordance with the provisions of this By-law, or shall form, excavate, or make any cesspit under any dwelling-house, or at a less distance than 6 feet therefrom, he shall forfeit and pay a penalty of not less than one pound nor more than five pounds.

4. Every closet shall be built with walls 7 feet high, and shall not be less than 3 feet 6 inches wide and 4 feet 6 inches long, and shall be provided with a door capable of being fastened inside; and every person who shall build or erect any closet which shall not be in accordance with this By-law shall forfeit and pay a penalty of not less than ten shillings nor more than forty shillings.

5. Where two or more closets adjoin each other there shall be a sufficient dividing wall not less than 4½ inches in thickness between every two closets, and such wall shall extend from the bottom of the cesspit through the roof of the closet, so as to effect a complete separation; and if any person shall erect any two or more closets adjoining each other and not in accordance with this By-law he shall forfeit and pay a penalty of not less than ten shillings nor more than forty shillings.

6. A separate closet shall be provided for each tenement, and any person offending against the provisions of this By-law shall forfeit and pay a penalty of not less than two pounds nor more than five pounds.

7. In schools, factories, or other places of business where a number of persons exceeding twelve shall ordinarily reside, or be occupied, or employed, one closet shall be provided for every twenty persons, with a cesspit of a capacity of not less than 80 cubic feet, and separate closets shall be provided for each sex; and every owner, occupier, or tenant of any such school, factory, or other place of business and every other person who shall offend against this By-law or fail to provide the number of closets and of the capacity in this By-law mentioned, shall forfeit and pay a penalty of not less than one pound nor more than five pounds.

8. If any alteration shall be requisite in the opinion of the Inspector of Nuisances or other officer appointed by the Council in their behalf, for preserving public health or decency in the case of any existing cesspit or closet, and the Council shall adjudge such cesspit or closet to be injurious to the health or opposed to decency by exposure or otherwise, and the owner or occupier shall not make the necessary alterations after receiving fourteen days notice from the Council Clerk, it shall be lawful for the Inspector of Nuisances or other officer appointed by the Council to remove the said nuisance, and any expense incurred thereby may be sued for and recovered in a summary way in any Court of competent jurisdiction.

9. The place of deposit for night-soil shall be in such locality as may be from time to time determined upon by the Council.

10. Until otherwise provided for by the Council all night-soil shall be removed from cesspits, by contract, in watertight covered vehicles, between the hours of eleven o'clock in the evening and five o'clock in the morning; and if any person shall remove from any cesspit any night-soil in any other manner or at any other time than as provided by this By-law he shall forfeit and pay a penalty of not less than one pound nor more than five pounds.

11. In case the Council shall sell or give away any night-soil, the same shall be removed in the same manner and between the same hours as above provided, and on being removed from the vehicles in which it is carried, shall be deodorized by chemicals or in some other effective manner, or covered with earth so as to prevent any offensive smell arising therefrom; and if any offensive smell shall arise therefrom, the person or persons to whom the said night-soil shall be sold or given shall forfeit and pay a penalty of not less than one pound nor more than five pounds.

12. The Inspector of Nuisances, or other officer appointed by the Council, may visit and inspect any premises, or do any work authorized by the "Nuisance Prevention Act of 1875" therein, on

all days except Sundays and public holidays, between the hours of ten o'clock in the morning and four o'clock in the afternoon; and any person who shall hinder or obstruct any Inspector of Nuisances or other officer as aforesaid upon any such visitation or inspection, or in the doing or performing of any work, shall forfeit and pay a penalty of not less than ten shillings nor more than forty shillings.

13. Any person desirous of erecting an earth-closet, shall be at liberty to do so after giving notice of his intention to the Inspector of Nuisances or other officer appointed by the Council, but all night-soil shall be removed therefrom once in four days or oftener, and buried in the earth; and every person infringing or not complying with this By-law, shall forfeit and pay a penalty of not less than one pound nor more than two pounds.

14. Every person shall be at liberty to use, on his own premises, by burying the same at least two feet in the earth, all night-soil which shall be made thereon, but he shall not allow any nuisance to arise therefrom; and if any nuisance shall arise therefrom he shall forfeit and pay a penalty of not less than one pound nor more than five pounds.

15. No person shall be at liberty, without the permission of the Council, or of the Inspector of Nuisances or other person appointed on their behalf, to use on his own premises any night-soil brought from elsewhere; and in the event of his so doing, he shall forfeit and pay a penalty of not less than two pounds nor more than ten pounds.

16. The Council may recover in any Court of competent jurisdiction such sums for the emptying of cesspits as may be decided upon from time to time by resolution of the Council.

(L.S.) JAMES OATLEY,

Mayor.

CHARLES HELLMRICH,
Council Clerk.

1875-6.

NEW SOUTH WALES.

NUISANCES PREVENTION ACT OF 1875.

(BY-LAWS—BOROUGH OF WOOLLAHRA—UNDER)

Presented to Parliament, pursuant to Act 39 Vict. No. 14, sec. 18.

Colonial Secretary's Office,
Sydney, 13th June, 1876.

BOROUGH OF WOOLLAHRA.

BY-LAWS.

THE following By-laws made by the Council of the Borough of Woollahra, under the "Nuisances Prevention Act, 1875," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of that Act.

JOHN ROBERTSON.

By-Laws for the Borough of Woollahra, for carrying into effect the provisions of the Nuisance Prevention Act, 1875.

1. Every person about to erect a closet or form a cesspit shall, before he shall commence any such work, give to the Council Clerk seven days notice in writing of his intention, and of the proposed position of such closet or cesspit; and in default thereof or in case of his commencing such work without such notice he shall be liable to a penalty of not less than £1 nor more than £5.

2. No closet shall be erected or cesspit formed except in such position as shall be approved by the Inspector of Nuisances or other officer appointed by the Council, or shall be approved by the Council; and any person being guilty of a breach of this By-law shall be liable to a penalty of not less than £1 nor more than £5.

3. No cesspit shall be less than 4 feet long by 3 feet wide, internal measurement, nor of a less depth than 4 feet nor greater than 6 feet below the ground surface, with a fall of 1½ inch per foot to the man-hole hereinafter mentioned; and any person having or making a cesspit contrary to this By-law shall be liable to a penalty of not less than £1 nor more than £5.

4. Every cesspit shall have a man-hole of the clear internal dimensions of 2 feet wide by 2 feet long, with a depth extending 1 foot below the cesspit, and shall be closed at the top with a slab of hardwood not less than 2½ inches thick, or of stone not less than 4 inches thick, or of metal not less than ½ an inch thick, and shall be connected with the cesspit by an opening at the bottom thereof not less than 1½ feet high and 1½ feet wide; and any person having or making a cesspit or man-hole contrary to this By-law shall be liable to a penalty of not less than £1 nor more than £5.

5. The walls of every cesspit and man-hole attached thereto shall be built of brick or stone of a thickness of not less than 9 inches, and shall be built in cement and rendered ½ of an inch thick with cement inside, in such manner as to make it perfectly water-tight; and any person having or constructing a cesspit contrary to this By-law shall be liable to a penalty of not less than £1 nor more than £5.

6. Every closet shall be built with walls 7 feet high, and shall not be less than 3 feet 6 inches wide and 4 feet 6 inches long, and shall be provided with a door capable of being fastened from the inside; and every person having or building a closet contrary to this By-law shall be liable to a penalty of not less than £1 nor more than £5.

7. When two or more closets adjoin each other there shall be a sufficient dividing-wall not less than 9 inches in thickness between every two closets, and such wall shall extend from the bottom of the cesspit through the roof of the closet so as to effect a complete separation; and every person having or building closets adjoining each other contrary to this By-law shall be liable to a penalty of not less than £1 nor more than £5.

8. The top of every cesspit shall not be less than 6 inches higher than the highest part of the ground immediately adjoining it; and every person having or building a cesspit contrary to this By-law shall be liable to a penalty of not less than £1 nor more than £5.

9. A separate closet shall be provided for every tenement; and a breach of this By-law shall make persons using a joint closet liable to a penalty of not less than £1 nor more than £5.

10. In dwelling-houses where the number of persons who shall ordinarily sleep therein shall exceed twelve, the capacity of the cesspit shall be increased by 4 cubic feet for every person beyond the number of twelve, or else a separate closet shall be provided for every twelve persons or fraction of twelve; and any persons guilty of a breach of this By-law shall be liable to a penalty of not less than £1 nor more than £5.

11. In schools or in factories, or other places of business where a number of persons exceeding twelve shall reside or be occupied or employed, one closet shall be provided for every twenty persons with a cesspit of a capacity not less than 80 cubic feet, and separate closets shall be provided for each sex; and the proprietors of such schools or factories or other persons being guilty of a breach of this By-law shall be liable to a penalty of not less than £1 nor more than £5.

12. No cesspit shall be built under any dwelling-house, nor at a less distance than 6 feet therefrom; and any person having or building a cesspit contrary to this By-law shall be liable to a penalty of not less than £1 nor more than £5.

13. Every cesspit shall be built in such a position that the same may be emptied without the contents thereof being carried through any dwelling-house; and every person having or building a cesspit contrary to this By-law shall be liable to a penalty not less than £1 nor more than £5.

14. If any alteration shall be requisite, in the opinion of the Inspector of Nuisances or any officer appointed by the Council in that behalf, for preserving public health or decency in the case of any existing cesspit or closet, and the Council shall

adjudge such cesspit or closet to be either injurious to the health or opposed to decency by exposure or otherwise, the same shall be altered by such Inspector of Nuisances or other officer, and the cost of such alteration shall be paid by the owner or occupier of the premises whereon the same shall be.

15. The place of deposit shall be in such locality as may be from time to time determined upon by the Council.

16. Until otherwise provided by the Council, all night-soil shall be removed from cesspits by contract, in water-tight covered vehicles between the hours of 11 o'clock in the evening and 5 o'clock in the morning.

17. Until and unless otherwise provided by the Council all night-soil shall be disposed of by burying it in the earth.

18. In case the Council shall sell or give away any night-soil, the same shall be removed in the same manner as above provided, and on being removed from the vehicles in which it is carried shall be deodorized by chemicals or in some other manner, or covered with earth so as to prevent any offensive smell arising therefrom; any person guilty of a breach of this By-law shall be punishable by a penalty of not less than £1, nor more than £20.

19. The Inspector of Nuisances or other officer appointed by the Council may visit and inspect any premises, or do any work authorized by the "Nuisances Prevention Act, 1875," therein, on all days except Sundays and public holidays between the hours of 10 o'clock in the morning and 4 o'clock in the evening.

20. Any person desirous of erecting an earth-closet shall be at liberty to do so after giving notice of his intention to the Inspector of Nuisances or other officer appointed by the Council, but all night-soil shall be removed therefrom once in four days or oftener, and buried in the earth; and every person infringing this By-law shall be liable to a penalty of not less than £1 nor more than £2.

21. Every person shall be at liberty to use on his own premises all night-soil collected thereon, but if any nuisance shall arise therefrom he shall be liable to a penalty of not less than £1 nor more than £5.

22. No person shall be at liberty, without the permission of the Council or of the Inspector of Nuisances, or other officer appointed in that behalf, to use on his own premises any night-soil brought from elsewhere; and in the event of his so doing he shall be liable to a penalty of not less than £2 nor more than £10.

23. The Council may recover such sums for the emptying of cesspits as may be decided upon from time to time by resolution of the Council.

The above By-laws were adopted at a meeting of the Council of the Borough of Woollahra, held at the Council Chambers, on Wednesday, 9th February, 1876.

(L.S.) J. V. BARNARD,
Mayor.

NEW SOUTH WALES.

NUISANCES PREVENTION ACT OF 1875.

(BY-LAW UNDER—BOROUGH OF REDFERN.)

Presented to Parliament, pursuant to Act 39 Vict. No. 14, sec. 18.Colonial Secretary's Office,
Sydney, 18th July, 1876.

BOROUGH OF REDFERN.

BY-LAW.

THE following By-law, made by the Council of the Borough of Redfern, under the "Nuisances Prevention Act, 1875," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, is published in accordance with the requirements of that Act.

JOHN ROBERTSON.

Borough of Redfern,
9th June, 1876.

At a Meeting of the Municipal Council of the above Borough, duly convened and held on the above date, the following resolution was passed unanimously:—

That the general depôt for the deposit of night-soil removed from this Borough shall be on a parcel of land containing twenty-two acres, being a portion of Routledge's grant of one hundred and sixty acres, situate at Mudbank, Botany, and all the night-soil shall be removed thither from this Borough by a contractor under the direction of the Inspector of Nuisances, and there buried by said contractor at least nine inches under the surface, within six hours after deposit, or in default said contractor shall forfeit and pay a penalty not exceeding four pounds nor less than one pound sterling.

W. S. WARDROP,
Council Clerk.(l.s.) PATRICK STANLEY,
Mayor,

1875-6.

NEW SOUTH WALES.

NUISANCES PREVENTION ACT OF 1875.

(BY-LAWS UNDER—BOROUGH OF CAMPERDOWN.)

Presented to Parliament, pursuant to Act 39 Vict. No. 17, sec. 18.

Colonial Secretary's Office,
Sydney, 18th July, 1876.

BOROUGH OF CAMPERDOWN.

BY-LAWS.

The following By-laws, made by the Council of the Borough of Camperdown, under the "Nuisances Prevention Act, 1875," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of that Act.

JOHN ROBERTSON.

BY-LAWS made by the Municipal Council of the Borough of Camperdown, for the suppression of certain nuisances prejudicial to public health, and improving the sanitary condition of the Borough, in accordance with the provisions of the "Nuisances Prevention Act of 1875."

1. That all water-closets hereafter to be made shall be constructed as follows, that is to say:—The cesspit of each shall not be less than four feet in depth; and, if, from the nature of the ground, a greater depth is required, then the cesspit shall be of such a depth as the Council or an authorized officer thereof may determine. Each cesspit to be of brick, and plastered with cement.

Each water-closet for dwelling-houses shall occupy an area of not less than four feet by three feet, and shall be of sufficient height from floor to wall-plate, the situation and construction thereof to be under the supervision and subject to the approval of the Council.

The construction of water-closets for factories and other places of business where a number of people are employed shall be with strict regard to decency and separation of the sexes; a partition wall shall be erected between each closet in front thereof. The number of closets shall be in the proportion of one to every twelve persons in the factory or place of business, and of dimensions, &c., each equal at least to those for dwelling-houses.

2. That for the removal of night-soil, the night-carts shall be properly constructed and made water-tight. That the work of removal shall be by contract, or as the Council may consider most expedient, and the hours for removal shall be between 10 p.m. and 4 a.m. each day (Sunday excepted).

3. The contractor for the removal of night-soil shall convey the same to such place as the Council may agree upon and provide as a dépôt for such night-soil, and the manner of its disposal shall be as the Council may direct.

4. The Inspector of Nuisances, or other officer or officers appointed by the Council, may enter for inspection upon any premises during or for any work authorized by the "Nuisances Prevention Act," between the hours of 10 a.m. and 4 p.m. on each day (Sundays excepted).

5. That in the case of existing water-closets the Inspector of Nuisances or other officer appointed by the Council in that behalf shall submit to the Council in writing such alterations as in his opinion are requisite for the preservation of public health and decency, and shall take such action as the Mayor or Council may direct.

6. That the contractor or nightman appointed for removing night-soil, when required to empty any cesspit or cesspits, shall without any delay perform the work thoroughly clean and well to the satisfaction of the Inspector of Nuisances.

7. The maximum penalty for a breach of any of these By-laws shall in each case be twenty pounds, and the minimum penalty shall be forty shillings.

8. Any person wilfully allowing filth of any kind or accumulation thereof, or any substance or substances from which noxious effluvia arises, to remain upon his premises shall, upon conviction thereof before any two Justices of the Peace, forfeit and pay any sum not exceeding five pounds.

9. The Inspector of Nuisances shall be furnished annually with a list copied from the Rate Book of the Council showing the names of owners and occupiers of all household property or business premises within the Borough. The list to be furnished within three months after the filling up of the said Rate Book in each year.

10. The Inspector of Nuisances shall be furnished by the Council with a supply of printed forms of notices or other documents (as by the Act prescribed) from time to time when required for service upon owners or occupiers of premises.

11. The Inspector of Nuisances shall obtain from the contractor or nightman a list showing the names of occupiers or owners of premises where water-closets have been emptied and the situation of such premises, and shall submit the said list to the Council, quarterly, viz., at the end of March, June, September, and December in each year, with a view of carrying out the 10th section of the "Nuisances Prevention Act."

12. The Inspector of Nuisances shall report to the Mayor for the time being or to any authorized officer of the Council where any water-closet is connected with any drain or sewer, and take such action as may be directed by the said Mayor or officer with a view of carrying out the purposes of the Act.

13. It shall be the duty of the Inspector of Nuisances to report the existence of any gutter, drain, or filthy premises, that may be brought under his notice, and take such action as may be directed by the Mayor or authorized officer of the Council in accordance with the provisions of the "Nuisances Prevention Act."

14. It shall be the duty of the Inspector of Nuisances to report without delay the existence of any nuisance arising from dead animals of any kind or species within the Borough, and to give notice to the owner or owners thereof to remove and destroy the same (if very offensive) within a period of six hours, and if not removed or destroyed within that period to cause the removal and destruction of the said nuisance without delay; and the owner or owners in default, and on conviction thereof before any two Justices of the Peace, in each case shall forfeit and pay any sum not exceeding ten pounds and not less than forty shillings in addition to all legal and other expenses incurred in the proceedings and in the removal and destruction of said nuisance.

15. It shall be the duty of the Inspector of Nuisances to furnish the Council every three months with a list of persons who have been proceeded against and fined for nuisance within the Borough, together with the dates and amounts of such fines respectively.

16. The Inspector of Nuisances shall make himself thoroughly acquainted with the "Nuisances Prevention Act of

1875" and these By-laws, together with the Municipal By-laws of 6th October, 1870, in order to the efficient discharge of his duties.

Form of Notice for Removal of Nuisance.

To Mr. _____ street, Camperdown,
I, _____, Inspector of Nuisances for the
Borough of Camperdown, do hereby give you notice to remove
_____ such being a nuisance
and endangering the public health; and in default of removal
of said nuisance within the space of _____
proceedings will be taken against you for breach of the
"Nuisances Prevention Act of 1875" and the By-laws made in
accordance therewith.

Inspector of Nuisances.

Date of service,

187

Made and passed by the Municipal Council of the Borough
of Camperdown, the twenty-fifth day of January, one
thousand eight hundred and seventy-six.

(L.S.) MICHAEL M'GRATH,
Mayor.

WILLIAM PIDCOCK,
Council Clerk.

1875-6.

NEW SOUTH WALES.

NUISANCES PREVENTION ACT OF 1875.

(BY-LAWS UNDER—MUNICIPAL DISTRICT OF MACDONALD TOWN.)

Presented to Parliament, pursuant to Act 39 Vic. No. 14, sec. 18.

Colonial Secretary's Office,
Sydney, 18th July, 1876.

MUNICIPAL DISTRICT OF MACDONALD TOWN.

BY-LAWS.

The following By-Laws, made by the Council of the Municipal District of Macdonald Town, under the "Nuisances Prevention Act, 1875," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of that Act.

JOHN ROBERTSON.

MUNICIPAL DISTRICT OF MACDONALD TOWN.

BY-LAWS for regulating the proceedings and good government of the Municipality of Macdonald Town, in conformity with the "Nuisances Prevention Act of 1875."

1. Any person in the Municipality who intends to construct a closet or cesspit shall give notice to the Inspector of Nuisances of his intention, and the Inspector shall within forty-eight hours inspect the premises on which it is to be constructed, and shall report to the Mayor the size, breadth, depth, &c., nature of soil, how situated, and if such closet is sufficient accommodation for the premises; and the Mayor shall, on approval, give permission for the construction of the said closet in writing within seven days of inspection. Any person constructing a closet or cesspit without giving such notice and receiving such permission shall be liable to a fine not exceeding ten pounds nor less than one pound.

2. Should the Inspector of Nuisances or other officer of the Council appointed on that behalf, represent to the Mayor and Aldermen that alterations are required to be made in any closet, cesspit, or drains, the Mayor and any two Aldermen shall inspect the same, and may order such alterations to be made as in their judgment may be required for the due preservation of the public health within such a time as they may appoint, and the said alterations shall be made at the expense of the owner of the premises; and if the owner of the premises fails to make the said alterations within the time appointed he shall be liable to a fine of not more than ten pounds nor less than one pound, and the Council may order the said alterations to be made and may recover the expense from the owner by levy and distress under warrant from the Mayor.

3. All night-soil taken from any closet, cesspit, or elsewhere, shall be deposited as the Mayor may direct; and any person emptying any closet, cesspit, or other place in which night-soil is deposited, shall first give notice to the Mayor, who shall appoint where the said night-soil is to be deposited. Any person infringing this By-law shall be liable to a penalty not exceeding five pounds nor less than one pound.

4. All persons removing night-soil shall take due care to use a proper vehicle and that it shall cause no offence in the transit or deposit, under a penalty of not more than five pounds nor less than one pound.

5. The Council may from time to time as may be necessary appoint the time and hours of inspection of any or all premises in the Municipality and also for doing any work required.

6. Any person impeding the Council or their duly appointed officers in the execution of their duty shall be liable to a fine not exceeding ten pounds nor less than two pounds.

Made and passed by the Municipal Council of Macdonald, this 10th February, 1876.

(L.S.) CHARLES B. HENDERSON,
Mayor.

1875-6.

NEW SOUTH WALES.

NUISANCES PREVENTION ACT OF 1875.

(BY-LAWS OF BOROUGH OF NEWTOWN, UNDER.)

Presented to Parliament, pursuant to Act 29 Vict. No. 14, sec. 18.

Colonial Secretary's Office,
Sydney, 18th July, 1876.

BOROUGH OF NEWTOWN.

BY-LAWS.

THE following By-laws, made by the Council of the Borough of Newtown, under the "Nuisances Prevention Act, 1875," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of that Act.

JOHN ROBERTSON.

BOROUGH OF NEWTOWN.

BY-LAWS.

In re "Nuisances Prevention Act of 1875."

1. Every person who shall erect any building or buildings within the boundary of the Borough of Newtown, shall, before commencing such building or buildings, give notice in writing to the Council Clerk of the said Borough of his or her intention of so doing, in order that the proper officer of the Council may inspect the site for the proposed building or buildings, for the purpose of directing the positions of the drains, cesspits, or closets required to be erected on the said site, and no person shall lay, dig, or construct any drain, cesspit, or closet, except in the line or position authorized in writing by the officer appointed in that behalf. Any person offending against this By-law shall be liable to a penalty not exceeding ten pounds.

2. No person shall be allowed to dig or construct any cesspit within the boundary of the said Borough the depth of which shall be more than four feet or less than three feet from the surface of the ground, or the length or breadth of which shall be less than two feet nine inches or more than four feet in the clear when finished, and no cesspit shall be dug or constructed, except of the size or dimensions notified in writing, by the officer appointed in that behalf, to the owner or occupant of the premises in which it is proposed to dig or construct such cesspit, or his or her agents; every cesspit to be hereafter made or built in accordance with any such notification, or directed so to be, shall be constructed of either brick or squared stone bedded in Portland cement, the top of every such cesspit shall be built or raised at least six inches above the surface of the ground, and all such cesspits shall be cemented inside throughout; and any person refusing, neglecting, or failing to comply with this By-law, shall be liable to a penalty not exceeding ten pounds nor less than two pounds.

3. Any occupant or owner of any premises within the Borough shall, within seven days after receiving a written notice to that effect from the Inspector of Nuisances, or other officer appointed for that purpose by the Council, remove any gutter, drain, closet, cesspit, or well, which shall be adjudged by the Council to be a nuisance, and shall make and construct the

necessary cesspit, drain, or closet in the position that shall be marked out by the officer appointed for that purpose, and in accordance with By-law No. 2, or in default shall be liable to a penalty not exceeding twenty pounds nor less than two pounds.

Depôt for the deposit of Night-soil.

4. The Council may from time to time, as found to be necessary, appoint a place as a depôt for the deposit of night-soil, and if approved of by the Governor, all night-soil removed from this Borough shall be deposited therein.

Removal of Night-soil.

5. Any night-soil required to be removed from time to time from any cesspit or closet, shall be conveyed to the depôt appointed for that purpose by proper night-carts approved of by the Council, and such removal of night-soil shall, subject to the provisions of section 9 of the Act 39 Victoria No. 14, be effected by the contractor under any contract in that behalf for the time being in existence, in such manner as may from time to time be decided by the Council; and the contractor for the time being, or other person who may be authorized under section 9 of the said Act to remove any night-soil, shall be held responsible for duly and carefully conveying the whole of the night-soil entrusted to his care to the depôt appointed, and in the direction and to the position ordered by the proper officer appointed by the Council, and no night-soil shall be removed from any cesspit or closet except between the hours of 10 p.m. and 5 a.m. Any person guilty of a breach of this By-law shall be liable to a penalty not exceeding twenty pounds nor less than two pounds.

Disposal of Night-soil.

6. A trench shall be made of sufficient size and depth, as ordered by the Inspector of Nuisances, or other officer appointed by the Council, for the purpose of depositing therein the night-soil that shall from time to time be brought to the depôt, and the whole of such night-soil shall as deposited be covered with earth to prevent any nuisance arising therefrom, and the person who shall be appointed to this duty shall be held responsible for duly carrying out this By-law, and in default shall be liable to a penalty not exceeding ten pounds nor less than two pounds.

7. It shall be lawful for the Inspector of Nuisances, or other officer appointed by the Council, to inspect any premises within the Borough for the purpose of carrying out the provisions of the Act, between the hours of 10 a.m. and 4 p.m. on any lawful working day.

8. The Inspector of Nuisances, or other officer appointed by the Council, is hereby authorized, subject to any notices in that behalf required by the Act 39 Victoria 14, to enter upon any premises, and to employ workmen thereon for the purpose of carrying out any work contemplated by the said Act, on any lawful working day, between the hours of 7 a.m. and 5 p.m., and any person who shall wilfully obstruct the officers of the Council or their workmen in carrying out this By-law, shall be dealt with in accordance with the said Act.

9. Where two or more closets adjoin each other there shall be a dividing wall between each two closets of not less thickness than nine inches, commencing from the bottom of the

pit and extending to the ceiling or roof as the case may be, in order to effect a complete separation between each two closets.

10. A separate closet shall be provided for each tenement.

11. In the event of any person wishing to use the earth-closet instead of a cesspit, such closet may be used if proper provision be made for that purpose to the satisfaction of and if it be constructed in accordance with instructions in writing which shall be given by the Inspector of Nuisances or other officer appointed by the Council in that behalf.

The Corporate Seal of the Borough of Newtown was hereto affixed by order of the Council.

(L.S.)

W. BAILEY,
Mayor.

C. J. BANKS,

Council Clerk.

Newtown, 14th February, 1876.

1875-6.

NEW SOUTH WALES.

NUISANCES PREVENTION ACT, 1875.

(BY-LAWS UNDER, OF BOROUGH OF DARLINGTON.)

Presented to Parliament, pursuant to Act 39 Vict. No. 14, sec. 18.

Colonial Secretary's Office,
Sydney, 10th August, 1876.

BOROUGH OF DARLINGTON.

BY-LAWS.

THE following By-laws, made by the Council of the Borough of Darlington, under the "Nuisances Prevention Act, 1875," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of that Act.

JOHN ROBERTSON.

BOROUGH OF DARLINGTON.

BY-LAWS made by the Council of the Borough of Darlington, in accordance with the provisions and directions of the "Nuisances Prevention Act of 1875," for the better prevention of Nuisances and the promotion of health and cleanliness within the said Borough.

1. All cesspits to be hereafter constructed shall be built of nine inch brick-work in cement, floor as well as walls, and rendered $\frac{1}{2}$ -inch thick with cement, in proportion of one of cement to three of clear sharp white sand, free from all earthy matter, and in no case (where practicable) shall any cesspit be situate within twenty feet of a dwelling; in cases where there is not sufficient area to admit of this being done, the Council or Inspector may determine the site.

2. Houses of not more than four rooms and out-house, the cesspits shall not be less than three feet six inches by four feet and three feet six inches deep (inside measurement); and for houses containing more than four rooms and out-house, the cesspit shall not be less than three feet six inches by four feet and four feet deep (inside measurement).

3. When any existing closet or cesspit shall, in the opinion of the Inspector of Nuisances or the Council, be injurious to public health or opposed to public decency, the owner or occupier shall upon receiving seven days notice, make such alterations as may be ordered by the Inspector of Nuisances with the sanction of the Council, within the time prescribed by such notice; and in default, the Council may make the required alteration at the costs of the owner or occupier.

4. There shall be a separate closet or cesspit for every tenement.

5. Owners or occupiers of premises where such closets or cesspits shall exist, shall alter or improve them in such manner as the Council or Inspector shall require, so as to bring them into conformity with these regulations, on notice being given by the Inspector; and if the parties shall neglect to make the alteration or improvements within one month after notice they shall be liable to a penalty of not less than £1 nor more than £5 for each and every week after such notice.

6. The Inspector shall have power to visit and inspect on all days except Sundays and public holidays between the hours of 10 a.m. and 6 p.m.

7. The night-soil shall be removed by contract, in properly constructed water-tight covered vehicles, between the hours of 10 p.m. and 6 a.m. from the 1st of April to the 30th of September, and from the hours of 10 p.m. and 5 a.m. from the 1st of October to the 31st March.

8. Written notice shall be left at the Council Chambers by all persons intending to build closets, giving full particulars as to proposed site, under a penalty of one pound, and for emptying closets or cesspits like application must be made for permission to do so, under a penalty of ten shillings.

Made and passed by the Municipal Council of the Borough of Darlington, this second day of March, in the year of our Lord one thousand eight hundred and seventy-six (1876).

(L.S.) HENRY HARGRAVES,
Mayor.

1875.

NEW SOUTH WALES.

SYDNEY WATER SUPPLY.

(PAPER SENT TO COLONIAL TREASURER RESPECTING.)

Presented to Parliament, by Command.

No. 1.

THE COLONIAL SECRETARY TO THE COLONIAL TREASURER.

Colonial Secretary's Office,
Sydney, 20 October, 1875.

SIR,

The question of Water Supply to Sydney continues one of so much interest to the whole community that I avail myself of your visit to London to obtain your aid in the matter.

2. You are aware that the sum of £2,000 was voted with the view of inducing an engineer of eminent reputation in his profession to visit the Colony to consider the various schemes proposed for supplying Sydney with water and to give his advice on the question.

3. The Government wish that the matter should rest no longer in abeyance, and I shall be therefore very glad indeed if you would make it a special object to seek the advice of the President of the Society of Civil Engineers, and obtain his aid in selecting a gentleman fitted for the duty required, who will be willing to visit this Colony for the sum voted for the purpose; should the President require it, a suitable fee should be paid to him for such advice and aid.

4. The sum of £2,000, which had lapsed, has been re-voted, but should you find that amount insufficient, it is desirable that you should at once so inform me by cable, and of the additional amount which it may be requisite to provide by supplementary vote. The engineer to be chosen should be of such unquestionably high repute in his profession as to mitigate greatly, if not wholly silence, any reasonable objections of our own engineers, and should be informed that his opinion and aid will be sought with regard to the very important question of sewerage as well as of water supply.

5. It is probable that documents may be in the Agent-General's Office on the questions of water supply, and of sewerage of this City, and for greater certainty I shall forward by the present mail various documents relating to them, which however are so voluminous that it is hoped the matter may not be delayed for the purpose of their full digestion.

List herewith.
Papers under
separate cover.

I have, &c.,

JOHN ROBERTSON.

SCHEDULE.

Progress Report of the Sydney City and Suburban Sewage and Health Board.

Second Progress Report of do. do.

Third do. do. do.

Fourth do. do. do.

Fifth do. do. do.

Report upon Sydney City and Suburban Water Supply, by Professor Liversidge.

Second Report do. do. by the same.

Copy of "The Water Pollution Prevention Act of 1875," 39 Vict., No. 14.

Copy of the "Nuisances Prevention Act, 1875," 39 Vict., No. 7.

Letters of Messrs. Moriarty and Bennett, respecting resolution as to obtaining the services of an engineer to advise upon water supply.

Extracts relating to Metropolitan Water Supply.

Diagram shewing rainfall at Sydney, Milton, and Cordeaux, and quantity of water measured as passing down Nepean and Cataract Rivers, from September, 1868, to December, 1874.

Map of Port Jackson and the City of Sydney, shewing adjacent Municipalities.

Sydney Water Supply (Commission 1867-1869)--Report--Plans.

No. 2.

THE COLONIAL SECRETARY TO THE COLONIAL TREASURER.

Colonial Secretary's Office,
Sydney, 30 October, 1875.

SIR,

27 October, 1875. With reference to my letter of the 20th instant, I have now the honor, at the desire of Mr. James Manning, to transmit to you the enclosed copy of his paper on "Sydney Water Supply by Gravitation," with a map of his trial survey, made with a view to the scheme set forth in the paper. A copy of Mr. Manning's letter on the subject is also enclosed.

I have, &c.,
JOHN ROBERTSON.

[Enclosure.]

James Manning, Esq., to The Colonial Secretary.

Milsom's Point,
27 October, 1875.

Dear Sir,

I was at the Clyde River when the deputation from the Royal Society waited on you, and I was sorely grieved when I read the report in the papers and saw how sadly those gentlemen overstepped their duty by reading a sort of paper to you as from and under the approval of the Society, whereas none of us had seen a word of it nor could we have approved of it.

I was specially sorry that any one of those gentlemen should have used my name as recommending Mr. Ritter; it was the last thing they should have done on the occasion. The translation of Delabar's paper on Ritter's great works had been open to them to form their judgment of his great merits as an hydraulic engineer, equally so as with me; then why have saddled his nomination on me?

I quite bow to the answer you gave the deputation under such circumstances, and to your instructions to Mr. Forster as a probable consequence, but I am very sorry that our chances of our having that able man out here is now probably quite lost to us; because I feel sure that there is no one in England of equal practical ability for the development of the new system of hydraulic water supply whereby the water power derivable might alone be equal in value to the interest on the total cost of the new system available from the Illawarra Mountains.

I called to day at your office to ask that you should kindly send Home my map and my first paper to the Royal Society so that my plan of water supply should have equal fair play with the other systems reported upon so fully in the large blue book. I trust you will concede this justice to the new cause, and let my documents go to Mr. Forster by the outgoing Suez Mail. I left them with Mr. Goodman. Pray excuse my troubling you thus.

I am, &c.,
JAMES MANNING.

No. 3.

THE COLONIAL SECRETARY TO THE COLONIAL TREASURER.

Colonial Secretary's Office,
Sydney, 15 November, 1875.

SIR,

4 Nov., 1875. With reference to my letters of the 20th and 30th of October, I have now the honor, at the desire of the Honorable Thomas Holt, M.L.C., to transmit to you the enclosed copies of a pamphlet on "George's River as a source of Water Supply for the City of Sydney and its suburbs." A copy of Mr. Holt's letter on the subject is also enclosed.

I have, &c.,
JOHN ROBERTSON.

[Enclosure.]

The Honorable Thomas Holt, Esq., M.L.C., to The Colonial Secretary.

The Warren, near Sydney,
4 November, 1875.

My dear Mr. Robertson,

As you are sending, I believe, the papers connected with the water supply to the Agent General, I suggest that you should also be so kind as to send the accompanying pamphlets to Mr. Forster. I think some of the facts connected with the George's River as a source of water supply should be known to the engineer who may be consulted.

It is by no means a new scheme, for it was recommended by the late Sir Thomas Mitchell nearly twenty-six years ago. It is a sandstone reservoir for a distance of more than six miles from a point known as Tom Ugly's Point; the whole of both sides of the river are almost exclusively of solid sandstone. This river has a watershed of 240,000 acres, which Mr. Moriarty, C.E., describes as a barren plateau of sandstone rock with scarcely a fragment of soil * * * * * There is no tendency, he says, to deposit anything. If you go over the George's River after a flood you would not scrape as much mud as would cover your knife. Is it possible to find a better reservoir than that of the George's River, excavated by nature out of sandstone rock, or a better watershed than that of the Illawarra Mountains, so graphically described by Mr. Moriarty, C.E.

The width of the river at Rocky Point is 1,850 feet, at Tom Ugly's 1,600, and at Kangaroo Point only 1,500 feet. The average depth of the river at the three points is only about 40 feet, and the greatest depth at any one of the said points is 57.6 to the rock bed, and that only for a very short distance.

If we had had a civil engineer on the late Water Commission worth a rap this grand scheme of the late Sir Thomas Mitchell's would have been adopted long ago, and Sydney would now have, as he expressed it, the finest supply of water in the world. As the Illawarra railway will cross the George's River, why not have a good impervious dam, which would answer the triple purpose of impounding the fresh water from the mountains, and thus making a grand fresh-water lake, a viaduct for the railway, and also a viaduct for vehicles, stock, passengers, &c.? If the able Engineer-in-Chief for Railways in this Colony were consulted I think it very probable that he would convince the Government that the thing is *practicable*, and that he could, whilst providing a viaduct for the railway, provide at the same time an ample supply of fresh-water for millions. I have the greatest faith in Mr. Ritter, who has executed such wonderfully useful hydraulic works in Switzerland, but I have equal confidence in Mr. Whitton, who has executed such wonderful engineering works in this Colony. There is almost any quantity of stone, sand, and clay in the immediate neighbourhood, natural projecting points of solid sandstone rock for weirs, so that not a drop of water would ever run over the dam at any of the three points.

What more could be required?

If this grand work be carried out by the Robertson Government we may say of it, as Suwaroff once said to the Empress Catherine (or rather in similar terms) after he had taken and entered a large city:—"Glory be to God and praise to the Robertson Ministry, the George's River is dammed, and Sydney has the finest supply of water in the world."

Yours, &c.,
THOMAS HOLT.

GEORGE'S

GEORGE'S RIVER, AS A SOURCE OF WATER SUPPLY FOR THE CITY OF SYDNEY AND ITS SUBURBS.

"What a splendid thing it would be for this city if the question of water were finally terminated, and if the power of distributing it everywhere were so increased that manufacturing uses might be encouraged rather than depressed. A country that is to grow in manufacturing power first of all requires fuel for engines, and water to supply them."—*S. M. Herald.*

I.—THE NATURE OF THE SCHEME.

The George's River, rising to the south of Sydney, drains an area of 375 square miles, or 240,000 acres, of which by far the greater proportion is unpeopled, and likely for a considerable time to remain so. The whole of its tributaries converge into an estuary through which its waters discharge into Botany Bay. A dam thrown across the river near its mouth, and such as would effectually keep the salt water from the fresh, would turn the lower part of the river into a large fresh water reservoir of from 3,000 to 4,000 acres in extent, according to the site selected for the dam. The tidal influence at present reaches as far as Liverpool, a distance of not less than twenty-six miles by the stream from Sans Souci. At Liverpool a dam was, in the early days of the Colony, constructed to keep the salt water from the fresh, in order to furnish the township of Liverpool with fresh water, and which it has been quite successful in doing. The project now suggested is, in reality, nothing more than doing the same thing on a larger scale, namely, making another dam, lower down, to store a larger quantity of water for the supply of a larger population.

There are several sites on the river at which dams could be constructed. At three of them, namely, at Sans Souci, at Tom Ugly's Point, and at Kangaroo Point, there is the very great advantage of a natural rocky weir, over which the surplus waters could be discharged. The peculiar shape of the river, with its jutting headlands and bays, is most happily adapted by nature for the construction of reservoirs, for these promontories serve the double purpose of narrowing the river so as to diminish the work in the construction of a dam, while at the same time they offer the greatest facilities for the formation of a waste weir. Two other points, lower down the estuary, have also been pointed out as admitting of the construction of dams, namely, from Stripper's Point to Pelican Point, and from Doll's Point to Towoah. At these points the estuary is very much broader than higher up, but the depth is proportionally shallow, and the banks are low and sandy. The advantage of making the dam at either of these places would be that a larger reservoir would be enclosed; the disadvantages would be twofold:—First, that the lowness of the banks would not admit of the water being raised materially above high-water mark; and secondly, a considerable area of salt marsh would be included in the basin, and a longer time would be required for the water to become sweet. The banks are highest at Kangaroo Point, and though by making the dam here, the area of the reservoir would be smaller than if it was made lower down, still it is more feasible at this point to give the dam great elevation, and so, by increasing the depth of the reservoir, to compensate for the diminution of area. Which site would, on the whole, be the best for a dam is a matter requiring more minute investigation than has hitherto been given to the subject; but the general scheme of turning the lower part of George's River into a fresh water basin is not necessarily identified with any one particular mode of its execution. There are several ways of doing it, and the detailed inquiry has yet to be wrought out as to which would prove the cheapest, the safest, and the most efficient.

II.—THE ADVANTAGES OF THE SCHEME.

"1st. The necessity of an extensive conduit to bring the water near to Sydney is avoided.

"The existing channel of the river furnishes that conduit ready made. The cost of making and maintaining artificial works is, therefore, to that extent superseded, and the water is brought, free of cost, to a point within not more than ten miles of the suggested reservoir on the high land at Petersham, or of the mains which at present supply Sydney. That distance is all that will require an artificial conduit, and even that length will be largely utilised, because the pipe will pass through suburbs of rapidly-growing population in which the demand for water will furnish a revenue. The more westerly suburbs of Petersham, Ashfield, and Burwood, along the line of railway, which are fast thickening with population, could also be easily supplied from the George's River basin, as the course of the railway towards Parramatta runs roughly parallel with the channel of the river. If made simply tributary to the Botany scheme, all that would be required beyond the dam and its appurtenances would be a pipe to the Engine Pond, leaving the pumping to be done as at present.

"2nd. The reservoir will be sufficiently capacious to hold an ample supply even for a long drought.

"A dam at Sans Souci would create a reservoir of about 4,000 acres in extent, and if the fresh water were raised only a foot above high-water mark it would store not less than 8,000 million gallons, and for every foot that the dam was raised there would be an increase of the storage to the extent of 1,000 million gallons.

"3rd. This reservoir, so capacious, would be constantly supplied.

"The proportion of the rainfall that runs down the Nepean and Cataract Rivers was measured by the Commissioners, who estimated that one-third of the rainfall was available, and applying their observations to the somewhat larger watershed of the George's River, the quantity that would have passed out at its mouth would, in 1869, the year of their observations, have been 92,500 millions of gallons. That year, however, was rather a dry one, and the quantity would be larger in an average year. The quantity passing down the river during the first six months of the year 1871, would, on the same basis of calculation, have been about 265,540 millions of gallons. But that season was most unusual, if not unprecedented. Even in a year of absolute drought, such as has never yet been known on the coast, the reservoir would not be unsupplied. Several of the tributary streams have never yet been known to cease running, and out of the large watershed of 375 square miles some water will always be discharged. And whatever the watershed yields, and that is not absorbed or evaporated, must pass into the reservoir, so that even a day's rain would make a perceptible contribution. A very slight rainfall over so large an area would be sure to send something into the basin. The probabilities of a reservoir so supplied ever becoming exhausted are almost infinitesimally small; but if such an event ever could happen, the basin would be replenished by the first day's rain. The area of the watershed, and the fact that all the water that drains off the surface must pass into the reservoir, and can only run to waste when the reservoir is full, is a consideration of great advantage where long droughts have to be provided against. It ought also to be borne in mind, that in dry weather the showers are mostly along the coast. It often rains smartly on the coast, when it is dry at Parramatta or Penrith. A large part of the George's River watershed is close to the coast. The Commissioners estimated that the George's River watershed embraces an amount of surface capable of affording more than 15 millions gallons per day if only one inch of rain per annum were impounded from the whole area.

"The present actual supply to Sydney is 1,500 millions of gallons. It is estimated that if there were no stint the city would use 2,000 millions gallons. The possible consumption for a year, however, is estimated by the Commissioners at 12,000 millions gallons. The capacity of George's River to meet any imaginary demand may be seen by a comparison with the above figures, the discharge down the river in the dry year 1869, and in the first half of the year 1870, thus:—

	GALLONS.
Present consumption	1,500,000,000
Present maximum demand	2,000,000,000
Future anticipated demand... ..	12,000,000,000
Discharge down George's River, 1869	92,000,000,000
Ditto ditto for the first six months of 1870	265,540,000,000

These figures may serve to show how well the reservoir would be kept full, and how little chance there would be of the water in it ever getting stagnant.

"4th. The necessary works are simple and comparatively cheap.

"They consist of a dam, a pumping engine, and perhaps a distributing reservoir, about 10 miles of piping, and nearly the whole of the latter may be laid along roads. The cost of a suitable dam has been variously estimated at from £60,000 to £140,000. The cost of the pumping machinery, of the 10 miles of piping, and of the incidental works, might bring up the whole outlay to £250,000, but, of course, at present, all estimates are rough.

"5th. The outlay necessary to make the experiment is small compared with the saving on the Nepean scheme, and a dam would give the advantage of a roadway to Illawarra and the southern coal fields.

III.—

III.—OBJECTIONS CONSIDERED.

In the course of an interesting and prolonged discussion of this subject, at meetings of the Royal Society, several objections were urged, and more or less replied to. The principal of these are as follows:—

"*Objection 1.*—The salt water would not be effectually washed out, or, at any rate, not for a long time.

"*Answer.*—The objection takes no sufficient account of the enormous quantity of fresh water annually rolling down the river. A dam could not possibly enclose more salt water than the reservoir could contain up to the level of high and spring tides, and assuming this to be 7,000 million gallons, this would be mixed in the course of even a moderately dry year with thirteen times its bulk of fresh water. During the first six months of 1870 it would have been mixed with thirty-five times its bulk of fresh water. The process of sweetening would, therefore, go on with great rapidity.

"*Objection 2.*—The soil, especially that of the fore-shores at the head of the bays, is saturated with salt.

"*Answer.*—These salt marshes will either give out the salt that is stored in them, or they will not. If they do not, no harm will be done to the water—if they do, the salt so given out will be carried away.

"*Objection 3.*—One-third of the area of the watershed consists of Wainamatta shale. Wells sunk in that shale yield very brackish water, and the water drawn from waterholes in creeks traversing that shale is also, in dry weather, very brackish.

"*Answer.*—This estimate of one-third of the area is guess-work, and may, on inquiry, prove to be excessive. The water that drains off it into the river will be mostly flood waters passing rapidly over the grass-covered surface, and will not have come sufficiently in contact with the shale to be appreciably injurious. Only that portion of the water will be contaminated which percolated through the shale, and this will not be very much, as the shale is not very pervious, and does not readily absorb or discharge water. Samples, taken from the waterholes during a dry season, that have been subjected to prolonged evaporation, are not fair specimens of the average quality of the water that will run into the river during the year, as they furnish a concentrated solution of shale water. The water above the dam at Liverpool receives the drainage of the Bunbury Curran Creek, which has been specially objected to as strongly impregnated with shale. Yet the water at Liverpool has never been found unfit, either for the purposes of the paper-mill, or that of the wool-washing establishment, neither of which could carry on satisfactorily if the water were bad. The town of Liverpool has always been supplied from the George's River above the dam, as have also the railway locomotives, and this water, therefore, has stood the double test of its fitness for manufacturing and for domestic purposes."

In discussing the purity of water it is necessary to distinguish between the quality best fitted for lavatory, and that best fitted for alimentary purposes. For mere washing, water cannot be too soft, as every increase of hardness involves a waste of soap. But for use as a beverage, water may be too pure. The *Encyclopædia Britannica*, in an article contributed jointly by Drs. Letheby and Lankester, describes a good water as follows:—"A water which contains about 20 grains of saline matter in the gallon, of which about 12 or 13 are carbonate of lime, from 2 to 3 sulphate of lime, from 2 to 3 common salt, and with not more than 2 grains of organic matter, is generally well suited for domestic purposes."

That portion of the George's River water which comes off the sandstone area would be very pure—that which comes off the grass lands overlying the shale might be slightly affected by the qualities of the soil—and that far smaller proportion which had percolated through the shale would be impregnated with the earthy matters the shale contains. The South Creek runs almost entirely through shale country, and its water furnishes a fair sample of what may be called shale water. An analysis by Professor Smith shews that it contains the following ingredients:—"The creek was in its average condition. The water was clear and colourless, no smell, taste faintly saline, but not unpleasant. The components of the dry residue may be represented as follows:—

	Grains per gallon.
Chloride of sodium (common salt)	25·72
Chloride of magnesium	3·45
Carbonate of magnesia	2·48
Carbonate of lime	2·40
Sulphate of lime	1·10
Silica and peroxide of iron	1·10
Total inorganic matter	35·85

The total solid matter found on evaporation was 38·7 grains; subtracting the above 35·8 from this, leaves 2·85 for organic matter. There may, however, be a little potash in this matter, but it was not looked for, and if present it would go in the above analysis to the credit of the common salt. The hardness was 9°."

The South Creek not only drains a shale district, but a district occupied for agricultural and grazing purposes. The proportion of salt contained is under 26 grains to the gallon. Nor does lime or oil exist therein in undesirable quantities. The exceptionable element is the magnesia, but this would not be injurious for alimentary purposes, and does not exceed 6 grains to the gallon.

It must be remembered that in the George's River the shale water will be very largely diluted by sandstone water, and that the general average quality of the water at the point from which it would be drawn for city supply, would be quite satisfactory. It would be a waste of money to finesse too much about the quality of the water, and to go to an enormous expense simply to attain to a theoretical degree of purity. The water from the Trafalgar fountains in London, and which, by the advice of Her Majesty's physician, was laid on to the palace, contains 68·94 per cent. of saline matter. The water at the Royal Mint contains 4½ grains per gallon of solid matter; that of the New River Co., 19½; the East London Waterworks, 23½; the Kent Waterworks Co., 29½; the Hampstead Water Co., 35½ to 40 grains per gallon of solid matter.

"*Objection 4.*—The river receives the sewage from the Paper Works, the Woolwashing Establishment, the Benevolent Asylum, and the town of Liverpool, in addition to the drainage from the homesteads on the watershed.

"*Answer.*—The paper-mill is not a serious objection. The pollution from this particular kind of manufactory has been especially inquired into in England, because there are several paper-mills on the Thames, from which the greater portion of the London supply is drawn. Dr. Macadam Stephenson, in a paper read before the Social Science Association, says:—"Sewage differs from the discharges from mines and many chemical works and other manufactories. Thus, a stream having many paper works on its banks, and having discharged thereinto much liquid containing organic matter, does not putrify or exhale noxious gases, provided the water is in motion."

At the Asylum the earth-closet system is in operation satisfactorily. Only the surface drainage from the town of Liverpool passes into the river, as there is no subsoil system of drainage. The Woolwashing Establishment certainly discharges into it undesirable matter, but this is a valuable liquid manure, and ought to be employed for irrigation. The population at present settled on the watershed is scattered, and is mostly remote from the river banks. The sewage that has been found so injurious to rivers in England is the concentrated sewage from towns; but there is nothing of this kind on the George's River. The contamination at present is exceedingly small, and can be kept so; and if it existed in far greater quantity than it does, its effect would be inappreciable when diluted with the large quantity of water that comes down. Mr. Johnston, the analytical chemist of the Victorian Government, when called upon lately to report as to the corruption of the water of the Yau Yean by animal matter, stated that it would require 3,000 bullocks to be decaying to affect in any appreciable degree the large body of water in that reservoir.

In England the evil has been that great towns pour their arterial drainage into little rivers, and rivers with only a languid current. Here the case is altogether reversed. We have only a little village discharging merely its surface drainage into a large river, subject to the cleansing influence of heavy floods.

"*Objection 5.*—This scheme loses the advantage of gravitation, and involves the perpetual cost of pumping.

"*Answer.*—The great merit of gravitation is that it maintains a constant pressure. This advantage is equally conferred if the water is pumped into a reservoir sufficiently elevated to give the desired pressure. The continuity of a supply on a gravitation system is dependent on the permanent maintenance in good order of the conduit in its entire length. This involves a risk quite as great as that of the maintenance of pumping engines in good order, especially as duplicate engines can be constructed, thus maintaining always a reserve of power in case of accident. It is easier to have a reserve engine than a reserve conduit. Mr. Bell estimates the cost of pumping at present at under £2 per million gallons, and that by engines by no means adapted to the work.

"*Objection 6.*—A dam could be constructed that would withstand the force of the floods, and be impervious, except it were made of solid masonry, the cost of which would be enormous.

"Answer

"Answer.—Dams of rubble stone and earth have been constructed both in India and Italy to withstand more violent shocks than those to which one on the George's River would be subjected, and such dams are safe, provided their weirs are so constructed as to give ample discharge for the waste water which could be easily done in the George's River. The town of Philadelphia is supplied by fresh water by a scheme very similar to that proposed for the George's River. A navigable river, the Schuylkill, which has a strong current, and in which the tide rises six feet, had a dam thrown across it, and the fresh water banked up six feet. The bed of the river is partly mud and partly rock. On the muddy portion, loose rubble stones were thrown to make the dam. On the rocky part the dam was formed by crib-work, and the whole backed up by rubble stone and earth. The construction was comparatively cheap. It has lasted now several years. It has been found to answer its purpose excellently. Some differences in detail would be necessary in constructing a similar one in George's River, but the precedent is sufficient to prove the practicability of such an undertaking.

"Objection 7.—A dam would close the navigation of the river, and give rise to serious claims for compensation.

"Answer.—The navigation is at present useless, being confined to a few wood boats, or an occasional fishing or pleasure party. The advantage of making the water fresh would, to most landholders, be more than a compensation for closing an unsuited navigation; but if such claims should arise, a lock could be constructed, as at Philadelphia, if the cost of the lock would not be greater than the cost of compensation."

IV.—TESTIMONIES.

The following testimony, in favour of the George's River scheme, as a source of water supply, is worthy of consideration:—

"Sir Thomas Mitchell, in the evidence he gave before the special committee of the City Council, 12th March, 1850, says, 'The weakest point in the character of this great city—for a great city it is likely to be—is the present insufficient supply of water. The basin of George's River contains 150 square miles; its highest sources are *always flowing*, and are elevated 2,200 feet above the level of the sea, at Madden's Plains, on the range at the back of the Illawarra. The basin of a river extending 150 miles superficially, and having sources 2,200 feet above the sea, flowing over rocky beds, not encumbered with mud, or where there could be much absorption, would form the finest supply of water in the world.'

"Mr. John Young, the contractor for the Exhibition Building, New Post Office, &c., who has had considerable experience as an engineer, in embanking navigable rivers, constructing canals, weirs, &c., in England, said, in a letter addressed to the *Herald*, 'he considered it quite practicable to construct a dam across George's River, at Tom Ugly's Point, or Kangaroo, at a moderate cost, and both safe and secure. A sluice could be formed (not in the dam) that would scour all the salt water out of the reservoir above the dams before they are completed, and as the salt is in solution it would go out with the water. He has examined the plans and sections of the Nepean scheme, and it presents to him all the features of a very costly and, after all, a doubtful one; while the George's River is not a complicated or doubtful one, and he believes would not cost more than one-third of the expense of the Nepean scheme.' He adds, 'the absence of mud flats and swamps, cultivation, or dwellings of any kind, or in fact anything to contaminate the water, while the steepness of the sandstone banks, and their uselessness for any purposes of trade, point it out as a great national reservoir, already made to hand, which should be taken advantage of to give an abundant supply to this and the future population.'

"Mr. Lennox, a veteran engineer, 82 years of age, who has executed works of considerable importance in England, this Colony, and Victoria, substantiates Mr. Young's views. He says he 'can see no difficulty in making a dam on the lower part of George's River for the purpose of securing a plentiful supply of good water for the city of Sydney. Neither the floods nor the tide rise there to a great height. There is no difficulty comparable to works that he (Mr. Lennox) has been engaged upon. At the entrance to the Gloucester and Berkeley Canal, on the Severn, where the tide rises forty feet in three hours, they had walls to keep out the water while the basin was being excavated, the locks built, and afterwards to hold the water until the ships could enter the canal. The wall facing the river was a mile long; the end wall about 300 yards in length, with an entrance gate for ships at the angle. If at any time the water in George's River is found insufficient, they might (he says) turn the Nepean water into George's River.' With respect to the salt water, Mr. Lennox says:—'A sluice (not in the dam) would scour all the salt water out of the reservoir above the dam before it is completed, and as the salt is in solution it would go out with the water. When the Liverpool dam was being constructed, he (Mr. Lennox) allowed the salt water to run off at low tides, so that before the dam was completed the water was fresh and good, but the people were afraid to use it until Dr. Hill, the Colonial surgeon, tested it and said it quite good. This accounts (Mr. Lennox says) for the water being longer salt, after the dam was repaired, than it was when it was first made.' And 'the site for the Liverpool dam was,' he says, 'selected more for a *crossing-place* than a dam.' (A dam at either of the three points, Cummins, Tom Ugly's, or Kangaroo, would shorten the distance to Illawarra and the southern coast districts about twenty miles.)

"Professor Smith, President of the Water Commission, said, 'the scheme looked much more tempting after having seen the George's River. There was no doubt that it would be a most magnificent reservoir.' And, in a letter to a friend, Dr. Smith said, 'I think the Government made a great mistake in not getting Colonel Sankey up to Sydney, to look specially into the George's River scheme. I cannot help regretting that the George's River scheme has not been more thoroughly sifted. I think (as I said at the Royal Society) we might chance the quality of the water, and let the question be decided on engineering grounds.'

"Mr. T. S. Mort said, 'since they became acquainted with the George's River they were amazed at its capacity for storage, sufficient to furnish an abundance of water to the largest city ever congregated together.'

"Mr. A. K. Smith, C.E., of Melbourne, said that, 'twelve months since he had had occasion to visit George's River, and to speak in its favour before the Sydney Water Commission, and from what he had since seen he was more than ever convinced of the feasibility of the scheme.'

"The Rev. Dr. Lang said, 'it was his conviction that the George's River scheme ought, by all means, to be tried before we went to the Blue Mountains for water, or to the Nepean. There would be an abundant supply in these splendid lakes. He had great apprehension of the danger likely to accrue to the community by the immense dams, such as the Commission contemplated, at Prospect, or higher up.'

"The Hon. S. Samuel said 'I believe the water in George's River, above the dam, at Liverpool, is excellent; in proof of which I need only refer to the fact that the Benevolent Asylum—containing between 500 and 600 persons—is supplied from that river 'and although most of the inmates are aged men and invalids, I have not heard of any sickness in consequence of the quality of the water, or complaints on that account, and were the water not of good quality this would speedily be discovered, as I imagine it could not fail injuriously to affect the health of those using it. If the water was not of good quality we could not scour wool with it, and produce the necessary colour and 'soft handle.' Wool scoured at my establishment will bear favourable comparison, in these respects, to that of any other, and has realized amongst the highest prices in the London market. If the water contained salt, as has been stated, and was not almost chemically pure, the manufacture of white paper would not be possible.'

"Professor Watt said, 'In England they considered water pure if it was free from sewage matter. With regard to various analyses of water, he found that the water used by one brewery—whose ale was drunk in this Colony—contained saline matter largely. The water at the fountains, Trafalgar-square, contained 68.94 per cent. per gallon of saline matter, and had been laid on to Her Majesty's palace by the advice of her physicians. The total quantity of saline matter in the water of South Creek was, 38.7 grains per gallon, of which 25 grains were chloride of sodium, so that those who drank it took no more than was taken by Her Majesty. The shales gave very little water, as it rapidly ran off them. He did not see why we should be driven a long way up the mountains to have water free from saline matter. Some objections were raised to the George's River scheme on account of the population and traffic. Now, he had travelled some twelve miles up and only saw four horses, two cows, a goat, and three men, and there was not the slightest indication of traffic.'

"Major Christie, who had the superintendence of the prisoners who built the dam at Liverpool, says, 'His impression is that within one week of the salt-water tide being altogether arrested, the water above the dam was used by the inhabitants—very much to their surprise—as many people had previously given it as their opinion that it would remain brackish and undrinkable for many months.'

"Sir Daniel Cooper said, 'If they could carry out the George's River scheme, instead of wanting the use of water, merely to supply Sydney for drinking, they should have sufficient for all purposes.'

"Dr. Garran, at the conclusion of his speech before the Royal Society, on the 21st September, said, 'The best natural protection we could give manufacturing industries in Sydney, was an abundant supply of water. We must have a supply from which we could afford to waste, and until we had that we should not have a supply on which manufacturers could rely. He thought there were three things that manufacturers wanted,—*cheap coal, cheap water, and a rapid method of discharging refuse*, which would not be likely to bring them into Law Courts under indictments for nuisances. He did not know any place where these three things could be so well obtained as at Botany Bay.'

1875.

NEW SOUTH WALES.

SYDNEY WATER SUPPLY.

(FURTHER PAPER RESPECTING.)

Presented to Parliament by Command.

[Two Enclosures to No. 2 of Papers laid on Table on 16th November, 1875.]

SYDNEY WATER SUPPLY BY GRAVITATION.

BY JAMES MANNING, ESQ.,

Read before the Royal Society, 9 December, 1874.

IN coming before this Society with a paper having the above designation, I beg to say that the origination of this subject occurred when I was engaged twelve months ago with the railway engineer, Mr. Stephens, in making a reconnaissance survey of the Port Hacking Valley and rivulet for a railway route to the southern coal mines and to Illawarra. On passing up the higher parts of that rivulet I was struck with the natural facilities which presented themselves in the neighbourhood of Bulgo to avail of the great geological north-westerly dip of the country, for the benefit of a water supply for Sydney by gravitation. I perceived that the waters of this rivulet could be supplemented with extra waters from the western slopes of the south coast and coal range, by reason of the great facilities that would be afforded by the northerly dip of 40 to 41 feet to the mile, and by the westerly dip of 60 feet to the mile along the whole of the coast range south of Bulgo and Coalcliff for twenty miles and more.

By the natural facilities produced through such gradients I foresaw that it would be a simple matter to divert all the upper waters of the great south coast range from their present courses down the Cataract and the Cordeaux Rivers into the Nepean, and to bring them all out north, towards Sydney, by an open aqueduct to the head of the Loddon River, and on through the obstructing cross range by means of a tunnel of no formidable nature, and to lead them, if required, into the Port Hacking River, which runs north throughout its main course.

The barometrical elevations of the countries all along and about the south coast range, behind Stanwell Park, Bulli, Wonona, Mount Kiera, and Mount Kembla, were known to me through the valuable researches in 1845, 1846, &c., of the Rev. W. B. Clarke, our venerated V.-President, and partly also through my own aneroid measurements on the south and east side of Madden's Plains, which I made during each of my two journeys there when in quest of the Illawarra Railroad. By these I made reasonable deductions of what could be done by canalling and tunnelling. The more I dwelt upon the subject the more firmly was I convinced of the soundness of my theory and premises, and I felt that it only required a survey of those parts to establish my assertions and belief in the availability of the whole of that country to bring about a grand water supply for Sydney by gravitation.

Such being my first thoughts of obtaining a rich supply of water by a very short cut, I determined to be reticent on the point until the regular survey of the Illawarra Railway should have progressed far enough to satisfy me that it must be an approved success. I waited for the issue for six months after the survey had commenced. My reason for this was that the establishment of the Illawarra Railway would be almost indispensable to my water supply scheme, not only by reason of the means it would afford of bringing up heavy pipes and large supplies of Portland cement and other materials for the waterworks, but also by reason of the bridges that would necessarily cross George's River and Cook's River, and which would become the immediate means of conducting the water mains over those broad rivers on their course to Sydney.

All practical difficulties in the development of the Illawarra Railway line being apparently at an end, and being so firmly convinced that it would be adopted, by reason of its own immensely intrinsic value to the Colony, I resolved at once, and in May last, to register my thoughts for the gravitation water supply, by writing an official letter to the Colonial Secretary, in which I set forth my project in the form I expected it would so assuredly result, after I should have made a survey of the adjacent country. The season of the year being then too inclement for a survey in the exposed region of Madden's Plains, I resolved to wait for the spring months before I made the attempt. Accordingly I started in October with a fully equipped party. I was kindly assisted by the Deputy Surveyor General with all requisite instruments for my survey. I formed my own party, and engaged the services of an experienced surveyor to assist me in the important work.

I made the starting point for my survey at that spot on the Bottle Forest Road, near Bulgo, where the head waters of the Port Hacking rivulet take their rise, and which position I made by aneroid measurement to be 1,050 feet over the sea, and distant about 28 miles from Sydney. Here we drove our first starting-peg or "bench mark," and carried on the survey of traversing and levelling with the proper instruments. My course of starting maintained a dead level, nearly south, over an easy but scrubby country for two miles. At

that distance we touched on the side of the upper part of the Woronora Creek, which was running with a fair stream. Here we were interrupted in our level course by the obstruction of the rising hill of the Bulgo, or Madden's Plain plateau, which forms the barrier between the George's River on the north and the Loddon and the Cataract Rivers on the south. We continued our course nearly south for some 60 chains, in which short distance we proved (for my purposes) the favourable elevation of 220 feet 6 inches, to the intersection of the road that leads from the Bottle Forest Road over Madden's Plains to Rice's free selection, which track runs from east to west. We then traversed that road west to its junction with Madden's Creek, and continued the survey along the creek by its nearly due west course for a mile and a half from where we intersected the road to where this upper and main source of George's River is precipitated over a deep fall of 55 feet perpendicular. In this short distance the levels proved the fact of the advantageous fall of no less than 150 feet 9 inches.

This sudden rise to the south and sudden dip to the west seemed to me to be at once a convincing proof of the correctness of my preconceived theory, that it must become a very easy matter to lead a large source of water supply to the northward by means of a tunnel that should pierce the high land between the deflections on the south-west of Madden's Plains and the level on the north-west, and from as far back to the south as would be practicable with the required gradients to give the full velocity of waters to be conducted through such tunnel. To this end I knew that the south and permanent affluents of Madden's Plains must be close at hand, where they unite into a respectable stream to form the upper source of the Loddon and Cataract Rivers. The survey was continued to those parts, and it immediately opened out the grandest results. We came upon the various small affluents of the Loddon River, where they unite at a spot that seemed to be formed for the express use of man to intercept the waters by one easily constructed dam of 46 feet high, that would throw back in times of freshes a lake of water equal to from 1,200 to 1,400 acres, of an average depth exceeding* 22 feet. This supposed large acreage of water was arrived at by the aneroid and not by the levelling instruments, for reasons I will explain later; but I may here say that I believe that I rather under-state than over-rate the size of this one magnificent basin, which could be made at a comparatively small expense by means of a dam in cement concrete, at a most favourable spot, defined and marked out by myself. But not only can this immense reservoir be obtained at this grand spot, but there are positions above the back of this one intended dam, applicable for raising other embankments on the south side of Madden's Plains, which would give a total of several hundred acres more water. The country where these reservoirs would be is nearly free from timber, and is wholly constituted of barren sandstone, covered with corneas, water weeds, epacridae, and such-like scrubby low-growing plants, whilst in the various creeks I perceived the evidence of perpetual streams in the presence of familiar water plants. This country is unfit for any purpose for man or beast, and is suitable only for its own special and high value as a great gathering ground for supply waters. It is there seemingly and essentially as the great water-sponge and filter whereby Sydney might be supplied to a very large extent in all seasons. My proposed dam being made the storage of water within such one dam alone would be so enormous that it would hold enough water probably to supply Sydney with its present population for more than a whole year. It would be quite as large, if not larger, than the Prospect dam that was proposed to be made in connection with the Upper Nepean scheme; and as, by my proposed plan, the whole of the water could be drawn out from under the bottom of the dam for transmission below it into the Loddon tunnel, so it would represent the same depth of storage water available for Sydney as the Prospect dam, the upper 25 feet of which would only have been available for gravitation, as admitted. The supply in all seasons off the Madden's Plains swamps would be more than enough to keep pace with the evaporation from that reservoir, even if I had no other proposed and available source of supply to keep it up and overflowing.

The elevation at the lowest spot of this proposed lake would be at the level of the bottom of the dam, and that would be sufficiently high to admit of the whole of its waters being drawn off and conducted by a tunnel of 3 miles and 35 chains, to come out north, at the head source of the Port Hacking River, whilst such flowing waters would have a fall of $4\frac{1}{2}$ feet to the mile all the way for seven miles to the intake of my proposed gravitation mains for Sydney direct, from 1,050 feet elevation.

Besides this large storage of water by this one dam and by its available tributary dams on the south side of Madden's Plains, I found that I could secure between 800 and 900 acres more water on the north side of same Plains and on the ever running Madden Creek. This could be most easily and economically effected by the formation of three small dams at suitable sites: the first to be 9 chains wide and 25 feet high, which would give 400 acres of water; the second to be 7 chains wide and 15 feet high, to yield 230 acres of water, and the third to be 9 chains wide and 15 feet high, to give 200 acres of water; in all here 830 acres of extra storage. All the fine and permanently running water of this creek, together with its own storage waters, could be lowered by means of a sluice into the Loddon tunnel through a shaft of 73 feet—such shaft to be cut out of the solid sandstone; and then all these cumulative waters of the Loddon and of the Madden River streams would pass on north-easterly by the tunnel, and on afterwards by the open canal of nearly 4 miles on to the intake at the mains, such waters being further supplemented on their way thither by the head sources of the Woronora River.

Thus I show means of obtaining storage ground equal to more than 2,000 acres, with power of still further supplementing such storage very considerably and to an almost unlimited extent from the grand upper slopes behind Bulli, Wonona, Mount Kiera, and even Mount Kembla, and for more than 20 miles southwards if required; all which supplies can be made to enter the proposed artificial lake at the Loddon swamps. All these waters, even from the furthest point south and at the inlet of the Loddon tunnel, would be within seven (7) miles of the intake of the high delivery mains. I believe that with such splendid catchment grounds, which would ever be supplied by nine (9) constantly running streams and by the frequent freshes, that we should secure water enough from thence alone for the full supply of Sydney in all seasons. But by the sequel it will be shown that the abovenamed supplies are not more than one half, or perhaps more than a quarter, of the waters that I propose to secure for leading into Sydney when required.

At this stage of my paper I deem it to be desirable to state that, having been over forty years uninterruptedly a resident in this Colony, I have witnessed the most frightful droughts, some of nearly three years duration; I have repeatedly seen the Nepean River, at the Cowpasture or Camden River bridge, nearly

* Later survey proved this estimate to be wrong, as shown by my subsequent papers to the Royal Society of August 4, 1875, and also as shown in my map.

nearly dry. I have seen hundreds of water carts in Sydney, filled at the Ultimo Estate waters of former days, at the cost of 3d. per bucket prime cost; and during the great drought of 1839 I crossed the usually fine Murrumbidgee River dry-footed, at the ford above its junction with the Tumut River; therefore, I hope I may be trusted for not advancing any measure for a water supply for Sydney that should not be safely ready to meet the worst of such contingencies under such parallel circumstances which may at any time recur.

With such long experience before my mind, I cannot, therefore, be satisfied with the running waters and immense storage supplies of the before-named sources at the head of the Loddon, the head of George's River, and the head of the Woronora Rivers; we must have far more. In ordinary seasons we should be able to deliver not less than about 3,000,000 gallons daily into Sydney from the head sources of Port Hacking River alone, and this supply can practically be supplemented to almost any extent by the surplus and over-flow waters which might be made to pass the high delivery mains. The total amount from this united source need not be less than 6,000,000 gallons daily. In order to effect the above-mentioned increase of supply from the more southern outlying country, I propose that we should avail ourselves still further of the grand north-westerly dip of the long coast range to the south and south-east of the Loddon Swamps. As the advantageous dip of 40 to 41 feet to the mile from south to north gives us a complete command of draining the upper parts of the western slopes of that range, therefore we should adopt this *gift of Nature* to our own uses, and cut a deep and narrow aqueduct through the sandstone country along such range, by such gradients as may be deemed to be most compatible for quick delivery, and cut such canal as far as may be expedient for the additional requirements. That aqueduct would intercept all the head waters of the Cataract River, and further on, in times to come, and by the aid of a comparatively short tunnel, all the head waters of the Cordeaux could also be led through the Loddon tunnel, and onwards by high and low delivery mains into Sydney.

In my proposal to cut the aqueduct deep and narrow, I wish it to be understood that my object in this is to intersect as much of the north-westerly stratifications of the range as possible, so as to open out as many fissures of the sandstone formation as may be made available to give off into the aqueduct a large supply of pure water. To this supply too would be added all that we should obtain into such aqueduct from the swamps and tributary streams of the Cataract River that would be coming down the high range from above the level of the aqueduct, and which aqueduct we should throughout its course so contrive to keep up high enough to keep it clear of the broken gullies and deeply furrowed watercourses.

Besides the above additional resources for water, I would propose to make dams along the topside of this aqueduct, wherever the features of the country about the swamps and sources of streams admitted favourably of such action. All such supplementary dams could be lowered by their respective sluices into the canal, whenever there might seem to be any occasion for their adoption to keep the one great Loddon reservoir constantly full and overflowing; and thereby reduce the surface evaporation in dry seasons as much as possible.*

By such measures for the upper water supplies, I think I show, here alone, ways and means of providing the purest of waters in excessive quantities for all seasons, for a future population in Sydney that may number more than 1,000,000 people. But again, and in addition to all the abovenamed sources, comprising constantly running streams and storage supplies of probably some 3,000 acres of deep water, averaging about 15 feet mean depths, I propose to have another immense storage supply in the Port Hacking River itself, by means of another large cement concrete dam, to be erected at a well-suited spot on the river where the level of the waters (before the dam would be erected) is 149 feet above high-water spring tides, and where the features of the country present extraordinary advantages for forming a fine dam across a very narrow gorge in this mountain valley, and where there is such an extent of level ground up the river

* At this part of my paper I would desire to attract more and special attention to the great advantages that we have at our command by the valuable north-westerly dip of the immense Sydney coal basin, and quite apart from our appreciation of all its vast coal-bearing importance.

In the hopes, then, of conveying to your minds the full force of our geological advantages for the production of an immense and constantly running supply of the purest of waters, I would wish to point out facts which are probably unknown to many who are present.

Our sandstones which overlie our coal on the Illawarra ranges are the same as the *grès houiller* of the French, and the *kohlen sandstein* of the Germans; they not only dip inland and towards Sydney, but they possess (for us) the additional advantage of being more stratified and not so compact as are the *Old red*, the *Essex red*, and most other sandstones and conglomerates; and therefore our formation can readily give off its accumulation of waters constantly and slowly by its easy fall of 2 degrees west, when the stratifications would be intersected by my proposed supply aqueduct, and by the delivery tunnel and delivery aqueduct as far as to the iron mains at 1,050 feet elevation.

In order that we should appreciate fully the immense value of the stratifications, and of the extremely light north-westerly dip of our Illawarra ranges, for the benefit of a grand water supply for Sydney, we should do well to compare our own good fortune in this respect with that of other extensive countries on the coast of the Mediterranean, and especially along the northern parts of Palestine.

The dip of the formations there is the same as ours (westerly), only that there the sea is on the west of Palestine, whilst we have it on the east; and their stratifications are probably much steeper than ours, and dip into the sea, whilst ours dip inland; at the same time the formations of those parts do not belong to our close and stratified sandstone class, but belong to the Jurassic formation, which is chiefly composed of strata of marls and of porous and oftentimes cavernous limestones of the oolitic kind, with steep and sometimes almost vertical inclinations. The consequence of this great difference is, and as we are told by the Syrian missionary, Dr. W. M. Thomson, in his work entitled "Land and the Book," (at page 181), that along the northern coast of Palestine, especially by Sidon and Tyre, "the waters during the rainy months pass off by the strata into the sea by innumerable streams, and with such peculiar force that at Rhad, the Arvad of the Bible, a fountain bursts up from the bottom of the sea, of such enormous size and power as to make the whole surface to boil like a cauldron."

Should not, then, this comparison cause us to rejoice at our great and superior advantage of having our stratified coal sandstones at high elevations over the sea, receiving the rains open-mouthed from even the extreme easterly projecting cliffs towards the ocean, and from whence the pure waters are slowly conveyed to the opposite inland, and western side of the coast range, by Nature's own gravitation principle in these parts, and through the north-westerly dip by an angle or easy gradient of only two degrees!

Here, then, in the long and high coast range of Illawarra, would be our greatest storage reservoir, where our supplies would be so well retained for us, and be ready in boundless quantities for our future Sydney use, by the adoption of my simple principle of tapping our enormous sandstone filter for miles and miles when required, along a base line and section that we could cut at such elevation as would suit our own gravitation scheme for conducting a new river that might thus be formed and sent into the great Loddon Reservoir.

I sincerely trust that this elucidation of my supply, storage, gravitation, and water power scheme may go far to settle your convictions of the magnitude and value of Nature's great gift within your reach.

river that a proposed dam of 35 feet in solid concrete would render the most effective service, in throwing back an extraordinary amount of further storage water of no less than 1 mile and about 8 chains in extent, which, with the upper waters from Madden's Plains, would bid defiance to all exhaustion from every cause.

By my proposed water supply scheme, I do not pretend to supply waters for irrigation, beyond supplying gardens abundantly. In my opinion no system of irrigation can be safely depended upon, unless where canals can be fed from large rivers or proximate mountain streams, which are more or less fed by melting snows, and where iron mains can be dispensed with.

And now allow me to say a little as to the quality of these waters in the sandstone country. They are of the purest kind, perhaps unsurpassable even by the waters of Loch Katrin, which supply Glasgow so satisfactorily, and which emanate from a granite country entirely. The sandstones overlying our coal formations in that high region are about 800 to 900 feet over the coal seams, and are free from all coally and other shales. In my survey I observed no departure from the one uniform sandstone formation, and quite free, as far as I could see, from those occasional dykes of trap rock which are to be found in this formation nearer the ironstone ore seams which overlies the coal seams at some 500 to 600 feet, and which might, if present, tend to discolour and to make the waters hard and impure. But I saw nothing of this in the Madden's Plains region; and, for the sake of practical evidence of their brightness, I would inform this Society of a little crucial test I adopted on these waters. I was so struck with their extraordinary clearness in all the running creeks of that region that I tried the effect of tying a coin to a long piece of thread, and lowered it into a waterhole, 5 feet 6 inches deep. The day was clear, the coin at the bottom of the waterhole was of course magnified by being seen through the medium of water, and it was illusively thrown forward a long way by the angle of refraction, but when settled at the bottom the stamp impressions continued to be as clear to the eye as if it were on the surface.

These waters, from coming in contact with nothing but clean and filtering sandstones, are perfectly free from all hardness for washing or for household purposes. It was estimated some time ago in London, that if the waters brought to that city from the calcareous country around were as free from hardness as the Glasgow waters obtained from the granite country, there would be an annual saving to the Londoners of £250,000 worth of soda and soap extravagantly lavished there every year beyond the relative proportions of same ditivents used in Glasgow.

As the Madden Plains and Port Hacking River and all the other streams of the regions comprised in my scheme have no abominable Wainamatta shales to pass through, nor ever touch clay soils, so would they all enter my proposed high and low delivery mains for Sydney and its suburbs in precisely the same beautiful condition; and even their transmission through the iron mains would not affect them, as I should propose to coat the mains inside by a bright, effective, and inexpensive enamel, composed of certain resins dissolved in cheap methylated wood spirit, and burnt on to the inner surface of the mains.

For ocular demonstration of the purity of such waters, I have the pleasure to lay upon the table a bottle of this water, bottled six weeks ago, and from it the Society may judge whether I have extolled those waters more than they deserve.

So much then for the water supply generally. From all I have seen of the watersheds above alluded to in my respective trial surveys for the Illawarra Railway and for the water supply, but more particularly from the astounding positions I have lately seen for the making of grand artificial deep-water lakes, and with the facilities presented of leading large extra supplies of waters into them, there is not the slightest question in my mind as to our means of possessing the grandest and cheapest water supply that any city in the world might covet, either by reason of its quantity, its quality, or of its availability for hydraulic power.

There remains, therefore, I think, nothing to be considered but the expense of my proposed method of supplying all Sydney and all its suburbs with a superabundance of the purest waters by direct gravitation, in wrought-iron or perhaps wrought-steel piping for the high delivery mains, and in iron mains for the low delivery; also to consider the expenses of the two large concrete dams at the Loddon and in Port Hacking River, the other smaller tributary dams, the one tunnel and the open canal of about four miles from the outlet of such tunnel to the high-delivery inlet of the mains for Petersham and Waverley, and say 6 miles more of open aqueduct for the north-westerly acquisition of waters from the higher parts of the south coast range.

The above enumeration of works constitutes the whole source of expenditure as far as Sydney, where suitable reservoirs would have to be made at Waverley and at Petersham in the onset for the high deliveries, and anywhere else in lower Sydney for the low delivery from Port Hacking Valley, but which latter might be postponed for a few years until the Botany works might fail to be sufficient to supply the lower demands of the city, although assisted from Waverley or Petersham to relieve the rapidly increasing wants on the higher levels and the distant suburbs in every direction, or perhaps only until the monthly increasing evil of pollution of the Lachlan swamps will make it compulsory to shut off that source of supply, excepting for the commonest of purposes—such as for mill uses and the watering of the streets.

Let us now consider the few works under my scheme separately. And first as to the means of great storages, and of leading the extra waters into the one large reservoir on the Loddon. The open aqueduct would be run to the back of Wonona, or say 6 miles (for present times) from the Loddon swamps and reservoir. I propose that such aqueduct should be cut 10 feet deep, 6 feet wide, and tapered down in the sandstone rock to 1 foot width at the base. The expense of this would be nothing formidable as a national work, even at present prices of labour, and it would be calculated at so much per cubic yard.

Secondly, comes the great Loddon dam, in solid cement concrete, to be made, by my proposal, precisely in the manner adopted by the famous engineer Mr. Ritter, in his splendid waterworks at Freiburg, in Switzerland. The spot I have selected as the position for this work is admirably adapted for such an operation. The gorge of the valley that constitutes the natural egress for the waters of the great basin above is so narrow here that it is only eight chains in width across the rivulet at an elevation of 30 feet; but in order to store far more water than would be obtained by a 30 feet high dam, I have marked it off to the top level of the abutting ridge, which would make the dam 46 feet over midstream, and where the waters run over a plateau of bare sandstone rocks admirably adapted for sinking a deep concrete foundation. Consequently, to carry the top level of this dam for these extra 16 feet, it would be necessary to elongate the whole work from end to end to 18 chains to where the levels on both sides would taper off to nothing.

The object I have in view for proposing to raise this dam so high and to be in solid concrete is—first, to be able to turn the overflow flood waters over the side of the eastern ridge into a hollow that leads into another creek, and thus save the risk of damage by the flood waters going over the dam itself. Secondly,

to

to gain immense additional catchment waters, which would create an artificial lake, at a cost that would pay for covering with deep water from 1,200 to 1,400 acres of country free from timber, and which lake would be at the mean depth of 22 feet. This lake would be about 1,120 feet over the sea.

With regard to the expense of this most important structure, I have one practical guide only, and that is the work of a similar nature built at Freiburg. That dam is 590 feet long and 72 feet high, whereas the one I propose would be only 46 feet high (plus the sinking and erections for a perfect foundation), but proportionately so much longer that it would probably contain about the same number of cubic yards of work, and which at Freiburg is 83,714 cubic yards. The expense of that concrete dam was computed at £14,600, including its sluices in cast iron, &c. Now, *ceteris paribus*, and allowing for the great difference in the price of labour, the Loddon dam of same structure might reach from £20,000 to £25,000, and a similar dam in Port Hacking Valley, at 35 feet high, and about 500 feet across, might be estimated at £15,000 at most, with its sluices built in.

The other and minor dams, with only concrete cores, would be of comparatively very small expense, and the whole set of them might be estimated at £15,000.

Next to these dams, costing some £65,000, but which may be far short of the cost here, comes the one tunnel of 3 miles and 35 chains, which would be all cut out of solid sandstone, and would be available for excavation by shafts at five different spots, besides at the two ends; hence the advantage of the westerly dip, which reduces depth of sinkings. As the velocity to be given to the waters in the tunnel would be by a gradient of $4\frac{1}{2}$ feet to the mile, besides the head of water at the inlet, there would be no necessity of using cement or masonry anywhere along its course. What the cost of this work would be I know not, and must leave to others to determine.

To many this underground work of $3\frac{1}{2}$ miles may seem to be very great; therefore it may be desirable to mention that in the Nepean scheme, which was adopted by the Water Commission, they start at 63 miles from Sydney with one tunnel of 4 miles and 49 chains, and have in all ten tunnels aggregating 10 miles and 7 chains, besides 10 miles of 46-inch diameter iron mains, and over 3,000 feet of iron aqueducts in the first 17 miles of the total 63 miles to Sydney; whereas, by my short-cut scheme on the high levels, I have only the one tunnel, and do not require a single foot of iron aqueducts in the ranges before the waters enter the long mains of about 28 miles to Sydney.

Following my proposed work comes the open aqueduct for 4 miles, to the delivery mains on the Bottle Forest Road, at 28 miles from Sydney. This aqueduct would be constructed like the north-west feeding aqueduct to the great reservoir, and would be all cut out of solid sandstone, with a gradient of 5 feet to the mile. The expenses of this work would be a matter for tender.

Beyond the above simple works, as compared with other water schemes, and viewed as a national undertaking and for such an achievement, there would remain the large and chief cost of the two high delivery over-ground mains, in wrought-iron or in steel, of 18 inches diameter—these to run side by side as far as Cook's River, on their way to deliver respectively 4,270,891 gallons daily to the Petersham and Canterbury heights, and 4,029,143 gallons daily to Waverley, with the respective heads of water of 850 and 750 feet, as computed by Eytelwein's formula; and these two high delivery mains to be coupled together by union joints above where they would part company at Cook's River, so that in case of necessary repairs to either pipe the other could go on serving both Petersham and Waverley alternately; and then would remain also the low delivery main from about 24 miles from Sydney in the Port Hacking Valley. This main is proposed to be of 36-inch diameter, estimated to deliver 5,407,533 gallons daily to some reservoir of nearly the same level as Crown-street, if not into that reservoir itself. In all 13,717,567 gallons.

Here again, for these mains, I am unable to arrive at any satisfactory estimate. All I know is that there are engineering firms here that would be ready to contract for the manufacture of all the mains as fast as they can be wanted. But this much I think I may venture to say, that as three such pipes as I propose for adoption would deliver say twelve (12) millions of gallons of water per day, this would be making provision for a supply and delivery to a population of 300,000 at 40 gallons per head per day, besides having storage and means of supply (less the additional mains) for a full million of a future population, in the works at the sources of supply, and supposed to be completed under my estimate.

However, let us charge the whole of the proposed works on a population of only 300,000, which Sydney and its suburbs may have in perhaps less than ten years more; and let us charge that population with an expenditure on these works of only 40s. per head, and we have the sum of £600,000, which I should think would be quite equal to the total expenditure on my scheme for a delivery of 12,000,000 gallons of water daily, with means to increase the supply to a very much larger extent. But admitting the possibility of any under-estimate in the cost of my proposed water scheme, we may be satisfied to pay more for the development of a scheme which will give us a pure and abundant supply of water by direct gravitation, and which will also afford immense hydraulic power, besides having the means of trebling the supply. Let it be remembered that in London, where material and labour is or was cheap, there the cost of the various water supply works represented a capital, before the great rise in iron and labour, equal to £10,137,000, a sum which represented an expenditure of 60s. and not 40s. a head upon the then population of that great city, and to which population filtered water is delivered at the rate of £26 per 1,000,000 gallons, or at an average cost of *about the fortieth part of a farthing per gallon*, or say $\frac{1}{4}$ d. per day, or 7s. $7\frac{1}{2}$ d. per annum, for the average consumption of even 40 gallons per day; and yet the eight Water Companies in London return handsome interest of money on their works and capital invested. Whereas, in Sydney, our water rates, for unfiltered and impure supplies, are preposterously in excess of this; and the cheap blessing that is or should be at our command is denied to us, and is still rendered prohibitory for most manufacturing purposes, and weighs heavily upon the population, by reason of the high rates of 5s. charged on every room of every description attached to every dwelling, even whether water be laid on or not; and of no less than $7\frac{1}{2}$ d. per 250 gallons, or at the rate of £125 per 1,000,000 gallons by meter measurement, as against £26 in London for same quantity of filtered water.

And now I would wish to say a few words here on the subject of the value of the hydraulic pressure and power which will be available by the adoption of my water scheme. My plan is wholly a gravitation scheme; and having learnt by the development of the Nevada Waterworks, as published in the *Engineer* of the 3rd of April last, and copied into the *Sydney Mail* of the 18th July, that wrought-iron pipes there of only $\frac{5}{16}$ ths of an inch, in boiler-plates worked into pipes of $11\frac{1}{2}$ inches diameter, bear the before unheard of pressure of 750 lbs. to the square inch,—so I have considered that we should avail ourselves here of the high pressure at our command, from near Madden's Plains, with 1,050 feet head of water at sea level, as against

1,720 at the Nevada Waterworks; as we should be enabled to use smaller pipes and cheaper pipes, by reason of the great velocity that would be given to the waters under such a tremendous head of water, and yet to be quite safe from bursting when made of boiler-plates of iron, but better still in steel for the lower levels, and varying according to elevation and pressure from 2-16ths to 3-16ths and 4-16ths of an inch in thickness only.

With such hydraulic pressure for quick delivery we could avail ourselves in Sydney and in Port Hacking Valley of this valuable force, and turn it to account in various ways for hydraulic lifts, turbines, &c., but most advantageously so in part by applying it to the compression of air as the indirect motive power to send the sewage and waste waters of the city on to suitable positions for irrigation outside the city, in same manner as you will find partially described in Delabar's paper on Ritter's great works. Ritter was the inventor of this method, and applied it for the first time at Freiburg quite recently. I may mention here that his method of freeing cities or towns from sewage and waste waters seems to be superior even to Capt. Liernur's admirable plan of effecting much the same results, and whose system now is so extensively adopted in many large continental cities. The difference between the two systems is that Liernur draws away all sewage by forming a partial vacuum in the sewers by a steam-engine acting on a large air-pump, which brings away the sewage at will to certain centres, for its evaporation into *poultrette*, which is packed in casks and sent off into the country, where it is bought with avidity by the farmers, who have discovered that it is more valuable than the best guano. This system is found to answer very well, and it pays to produce this now highly prized manure, at the same time that it keeps the towns which are treated by Liernur's process, in a perfect state of purity and salubrity.

Ritter, on the other hand, produces the same results in a far superior way, by collecting the sewage and the waste waters as they come away from the houses; they are brought to two centres in the town, wherefrom and by a valuable application of a part of the great hydraulic power which he has at his command he rids the city of everything both liquid and solid from the sewers, and sends it all to a great distance outside the city and high up on to lands in two different directions, where systematic irrigation is constantly maintained with important results. This enterprise is found to pay those interested there in Ritter's grand application of the compression of air through hydraulic force.

Practically we might compare the two systems to the principle of the syringe. Liernur's system *draws* the sewage into the partial vacuum, whilst Ritter's is the counterpart of the action of the same syringe, and *drives* all before it by the action of the piston compressing the air.

I should apologize for the above digression from the direct subject under consideration did I not conceive that my proposed high pressure delivery of the waters, which would constitute a large portion of my proposed supplies, has a most significant bearing on the value of my scheme for giving such valuable motory power without any necessary waste of the waters used to create such action; whilst, at the same time, the high pressure would give such quick delivery of pure water into the city that pipes of less than half the size and weight would deliver as much water from my proposed in-take elevation (of 1,050 feet) as could be delivered by the low-level operation from the large and heavy main out of the Port Hacking River from an elevation there of only 170 feet over the sea, or (say) to 34 feet above the level of the Crown-street Reservoir, from whence I propose to take in those lower waters.

In connection with such proposed available water-power, as well as for the diffusion of useful and interesting knowledge, I have the pleasure of laying on the table of this Society my recent translation from the German of Mr. Engineer Delabar's most interesting paper on Ritter's Waterworks at Freiburg; it is taken from *Dingler's Polytechnical Journal*, a work of celebrity in Germany. I would propose that this translation be attached to this water supply paper as an appendix to the same, and taken as read, because I consider that whatever thought I have given to the development of my water scheme I owe much of its origination to my having been favoured with the possession and reading of such a valuable paper—a paper which gives evidence throughout its every page of the power of the great master mind that designed and carried into execution the noble and varied works recently undertaken, and now in full operation at Freiburg.

I would gladly read the paper to this Society as an appendix to my own present lecture, so entirely is it fraught with matter that would interest you much on the present occasion, but it would occupy too much time to do so, and I fear I may have already trespassed on your patience. But there is so much in that paper which has helped me to think out my present water supply scheme, that I consider it to be, in a measure, as inseparable to the proper understanding of my present paper as I must consider the affiliation of the proposed Illawarra Railway to be as indispensable to the easy development of the Sydney water supply by gravitation.

With these papers I also leave on the table a copy of the map of my late survey for the water supply, which will facilitate the understanding of my whole scheme very materially. I have tried by such map to make it so clear to intelligent minds that it should require no further explanations than what I have shown and written on its face. All the works required in my design are mainly shown on the breadth of the map, which represents only 7 miles of country. The other works that are proposed and which are not upon it, are simply the extension of the north-westerly canal or aqueduct for 6 miles towards the direction of the western slopes of Wonona, and the great concrete dam proposed to be erected where the waters pass through a level and narrow gorge in the Port Hacking Valley, and where they are at an elevation of 149 to 150 feet over the sea level at high-water-mark, and which position would be some distance below the lowest free selections on the river.

In presenting my map to this Society, I desire to explain why there should be any elevations shown upon it to have been taken by the aneroid, and not with the level and staff. Fortunately nearly all the levels were taken with the proper instruments; but when the survey was almost completed, my assistant in the work and I both became disabled from illness; therefore, and to save useless expenses, I disbanded my party, sent the heavy instruments back to Sydney, and postponed the completion of the work; but we finished it later by means of an excellent aneroid, a prismatic compass, and a tape line.

In submitting this paper to the free discussions of this Society, I desire to say that in all I have advanced, either for the Illawarra Railway development or for this proposed water supply, I have been actuated by no interested motives. I have only had the good of all in view, and therefore I hope I may be excused if I avail myself of this opportunity of saying that, having given so much thought to the consideration of these matters, I may be supposed to have thoroughly digested the subjects, and that I do hope that no pressure of petitions from interested parties will be allowed to bear with the public or on the Government for any departure from the prescribed route of the intended Illawarra Railway in its direct course to its only true and legitimate terminus for a future great coal trade, namely, at North Balmain, as now surveyed,—any deviation from which would I feel sure be a fatal mistake.

I also desire to repeat my belief and hope, publicly expressed in my first paper on "Our Coal and Coal Ports" (read before this Society on 6th August, 1873), that the northern connection of the Maitland, Newcastle, and Lake Macquarie trades with the harbour of Port Jackson, at the North Shore, opposite Cockatoo Island, may speedily follow in the present awakening spirit of progress.

And now with reference to this water supply scheme. I trust it will not be thought that I am actuated by any ungenerous motives towards the designers of the other grand designs. When the Water Commission prosecuted their labours several years ago, the Illawarra Railway was not thought of, and consequently the Port Hacking River, north of Bulgo and east of the Illawarra Road, was never visited by the Commission, nor was any union of those waters or those of the head of George's River and of the Warauora with the south coast waters then contemplated. It is therefore to the development of the Illawarra Railway that we owe that natural enlightenment which has led to the discovery of a most valuable water supply for Sydney, wholly to be brought about by availing ourselves of Nature's simple laws, and of following her own gravitation principle of the north-westerly dips of her great coal basin at our doors.

Such are my ideas towards the designers of the other water schemes and towards the gentlemen who constituted the Water Commission of 1869. And on my own behalf, I rely confidently on the language of the Commission, towards the end of their Report to the Government, when they made the following remarks:—"We now invite the closest scrutiny of our results, sensible that if our scheme (the Nepean) be in the main the best attainable, it will be improved by passing through the ordeal of enlightened criticism; while if any better scheme still lies undiscovered, this same criticism will, we trust, bring it to light."

Finally, then, with such high-minded remarks from the gentlemen of the Water Commission, I need not hesitate to say that, in advancing my own gravitation water supply scheme before this Society and before the public, I rely upon its substantial excellence by reason of its being based on geological deductions. I rely on the natural features of its locality for abundant water supply and abundant storage, far more than on any useless amount of excessive watershed in a droughty climate. I rely on its value for hydraulic motory power. I rely upon its comparative inexpensiveness; on its perfect freedom from all harassing compensations; on the unsullied purity of its waters for delivery; on its short cut course for Sydney; and on its great simplicity, which may cause the works, if my scheme be adopted by the Country, to be completed within the same time that the Illawarra Railway,—if simultaneously undertaken,—can be ready for traffic to Wollongong.

APPENDIX.

[Translated from the German, by James Manning, Esq.]

THE WATERWORKS AND INDUSTRIAL OPERATIONS AT FREIBURG IN SWITZERLAND. By G. DELABAR, C.E., OF ST. GALLEN, with plates.

As a member of the Swiss Society of Arts, which had its annual meeting at Freiburg, on the 19th, 20th, and 21st August, 1872, I visited the prettily situated town of Freiburg, on the Saane River, and by such opportunity I became acquainted with the highly interesting waterworks and industrial enterprises which had been undertaken there in the last three years.

It is as well to remark, at once, that the soul of these undertakings was in the person of its one director (Mr. Engineer Ritter), who is a highly educated and is at the same time a very genial and enterprising man.

This gentleman has not only concluded a contract between the city of Freiburg and himself, most favourable to both parties, but he has also succeeded in gaining the confidence of the capitalists of Freiburg and of other parts of Switzerland, particularly of Basel and Winterthur, to aid him in the development of his projects.

On the 4th of October a contract was entered into between the Town Council of Freiburg and Mr. Engineer Ritter, which was confirmed on the 12th of January, 1870, by the higher Council of the Canton of Freiburg, and by which the town of Freiburg sold a part of their forests, about 1,400 English acres, to Mr. Ritter, for the sum of 1,400,000 francs, equal to £56,000, and gave him at the same time authority to erect waterworks and hydraulic motive works on the river Saane; but with this proviso, that he was to supply the inhabitants of the town with an ample quantity of drinking water, as well as to furnish sufficient water power for various industrial mills and works; but of course for a corresponding consideration. Upon this Mr. Ritter formed a Company, which was called the "Société Générale Suisse des Eaux et Forêts." This Company allotted to Mr. Ritter no less a sum than 500,000 francs (£20,000) in paid-up shares. The Company was duly formed and incorporated by statute in Freiburg, and at which place it was to hold its future meetings. The direction of these technical and commercial works was thereon given over entirely to Mr. Ritter. In the onset the Society determined upon carrying on the following operations:—

1. The economical farming of the forest purchased from the town of Freiburg.
2. The water supply for the town.
3. The building of a dam and sluice on the river Saane, and the utilization of the water power to be thereby produced.
4. The erection of a saw-mill, and of a large workshop for the same, with a branch railway to connect it with the Freiburg Trunk Railway Line.

For the development of these works the Company's capital was required to be 2,000,000 francs (£80,000), composed of—

1,000 promoters' shares of 500 francs each	=	500,000 francs.
3,000 preferential shares at 500. „	=	1,500,000 „
		2,000,000

These

These shares were taken and allotted with the understanding that during the four building years (1870-73) the shares of both classes should bear interest at the rate of 6 per cent. and the probable profits should be so applied that 75 per cent. of these should go towards a reserve fund, and 25 per cent. of the same should go for the declaration of dividends on both classes of shares.

Attached to the original or parent Company, Mr. Ritter brought about the formation of branch Companies for the development of fish culture, of gathering ice, and of irrigation, called the "Société de Pisciculture, Glaciers et Irrigation," which are obliged to have their centre in the town of Freiburg, and which branch Companies determined on carrying out the following projects:—

1. The erection of an establishment for fish culture, and therewith the stocking of the waters of the canton for a circuit of about "60 hours."
2. The building of several ice-houses for the commercial development of ice from the river Saane.
3. The irrigation and the manuring of the lands on both the high elevations of the neighbouring places, called Perolles and Neigles, by means of the waste waters and the sewage of the town.
4. The erection of a bathing establishment, of a bleaching and washing establishment, of a swimming school in summer, and of a skating-place in winter; besides the utilization of the so-called "Lake of Perolles" and of its approaches and banks for the formation of pleasure grounds for the public.

For the development of these several undertakings an additional capital of 400,000 francs (£16,000) was required and was allotted in—

200 promoters' shares of 500 francs each	100,000 francs.
600 preferential shares do	300,000 "

In the first two years (1872 and 1873) only the preferential shares received 5 per cent. interest. After those two years have passed, the promoters' shares will have interest also at 5 per cent. The probable rest of profits will be apportioned at the rate of 20 per cent. towards a reserve fund, 20 per cent. for the directors and management, and the remaining 60 per cent. for dividends to both classes of shares.

Besides these there are other works in progress, and which are held under special arrangements with the parent Company, and which are situated on the heights of Perolles, above Freiburg, and these are:—

1. An iron foundry and engineering establishment.
2. A large railway carriage manufactory.
3. A chemical manure factory.

Besides these there are other factories in contemplation for immediate building, namely,—a paper-mill, a pottery and gypsum factory, a barley-grinding mill, and stone-cutting works, and there is no doubt that other undertakings will soon follow.

The operations herein specified are of such importance and of such general interest that I may venture to say that a fuller description of them will be gladly accepted. I shall therefore try to describe them as nearly as it is possible to do so without detailed drawings and representations. For a general outline of the works, figure 1, showing a ground plan of Freiburg, will be of service, wherein the projected new works are given in dark lines, and the sectional plans also, figs. 2 to 4, will help to demonstrate the dam and sluice works, the turbines and the pumping gear, and the filtering works.

The description will extend to the following works:—

1. The great dam and sluice works on the Saane.
2. The waterworks for the hydraulic motors.
3. The filter and pumping works.
4. The telodynamic cable and wire rope transmission.
5. The saw-mill and large carpentering works, and the other industries on the plateau of Perolles.
6. The conduit of water and the reservoir of Quintzet for supplying Freiburg with drinking water.
7. The canal conduits for the irrigation and for manuring the heights of Perolles and Neigles on both sides of the Saane.
8. The establishment of the fish culture, and the bathing places, and the ice-houses on the lake of Perolles.
9. The utilization and farming of the forest which was purchased from the town of Freiburg; and
10. The erection of a branch railway line to connect the great timber and other works with the main trunk line.

1.—THE GREAT DAM AND SLUICE WORK.

(Figs. 2 & 3.)

The starting point or pivot of the whole operation forms the dam on the Saane. This is a truly grand structure, entirely constituted of cement concrete, and made for the express purpose of stopping and of backing up the waters a little above the town, south, to dam up the waters of the river to a sufficient height, and to utilize the motoric power thus obtained.

This gigantic monolith is built entirely of cement concrete, is erected straight across the river for 590 feet; over the surface of the water it is $39\frac{1}{2}$ feet high, and from the foundation of the dam at most 72 feet; the ground floor foundation is 98 feet broad, and the top of the dam is 19 feet $8\frac{1}{2}$ inches broad or thick; it has a cubic measurement of 64,000 cubic metres—equal to 83,714 cubic yards. This work was commenced in the year 1870, and was nearly finished in 1873. By these colossal dimensions and by this gigantic dam we are reminded of the Roman works. Neither expense nor trouble was spared to complete the same in such a manner as to hold it harmless for many years against all natural influences of such as the water-pressure on the foundation, or atmospheric action and changes from heat to cold, which might favour the decrepitation of the side wall rocks on either side of the dam or shores of the river. The geological formation of the Saane, in the neighbourhood of the dam, is similar to that of our own neighbourhood here at St. Gallen, on the Sitter. Underneath there is a sandstone molasse which is certainly easily decomposed in the open air, but hardens and becomes durable under water; above this appears a tolerably firm conglomerate, and uppermost a loose swampy alluvium. Luckily, however, and exactly at the required spot for the dam on the river's bed, there

there was cropping out of rocks and of harder stone for a height of 19 feet $8\frac{1}{4}$ inches on the most water-wearing side of the river, and gave a most excellent foundation for the work (as may be seen by looking at sectional plan, figures 2 and 3), so much so that it justifies the hope that the dam will last for a great many years.

A further foresight was exercised in that the surface of the rock upon which the foundation of the dam had to come, after the floor of the river was laid dry by pumping, was so hewn or picked as to present a succession of steps, upon which the cement work of the dam would be raised and united with the foundation rocks, so as not only to secure the greatest possible strength to the structure but also to insure its impermeability from water pressure. This work of cutting, or rather of picking out, was considered to be of the greatest consequence, as may be imagined when we find that the surface of the foundation exceeded 1 acre.

An idea of the difficulties that were attendant on the building of this dam may be formed, when we are told that in getting the foundation alone built there were five locomotive engines and eight centrifugal pumps kept going night and day, and every day, for a long period, in order to pump the waters outlifted and diverted from the foundation by means of a tunnel through the range at the side. It is a source of congratulation that the system adopted for this cement work has proved itself admirably. The sand and pebbles obtained from the river were worked upon the spot with the cement. The cement came in the usual form of casks of cement, whilst the pebbles, the stone, and the sand were obtained from the bed of the river in any required quantity. Last winter, and under the severest cold, but assisted by some warming appliances, the work was carried on uninterruptedly and prosperously.

The sluice-gate with the inlet canal for the outflow and for the occasional cleaning out of the new lake of Perolles is now finished. A casting, weighing about 6 tons, which is 23 feet long, 8 feet 2 inches broad, and 8 to $11\frac{1}{2}$ inches thick, serves for the basis of the same. It is formed into one vertical cast-iron frame, made from four pieces of T-formed shape, in which a guideway wall is set, and which is made out of 7 inch square timbers of oak. The tunnel, which is cut through the rocks on the left side of the dam, was for the purpose of diverting the waters of the river whilst the dam was building, is now about to be closed again.

Through this damming up of the Saane the waters which have a flow equal to 30 cubic metres, equal to 6,617 $\frac{1}{2}$ gallons per second of time, are raised $34\frac{1}{2}$ feet to $39\frac{1}{2}$, and thereby a disposable water-power is obtained which is equal to 2,600 and up to 4,000 horse-power.

By this embankment the water is at the same time thrown back over a considerable surface, much in the same way that we observe the formation of Lakes in our Alpine country; and through the swelling and backing up of the waters a new lake has been formed which Mr. Ritter has named the "artificial lake of Perolles"; but it is expected that the present depth of the lake at starting will not be maintained, because of the sediments of sand and earth masses, which in course of many years will be sure to affect its depth. However, the flow of water per second of time through the artificial fall will not thereby be altered, and therefore the disposal power will remain unchanged.

The upper surface of the lake is about 3,280 yards long and 197 yards wide, and it covers an area of over 774,715 square yards, or about equal to 160 English acres. The whole cost of the dam and sluice works was estimated at £14,600, and the estimate is not likely to be overstepped by the actual expenditure. Up to the end of last year's balancing of accounts, and when the work was nearly completed, the expenditure on the same had been only £13,247. This fortunate calculation of the estimates is owing to the foresight and knowledge of the director, as well as to the fact mentioned before, that the building material, stone, pebbles, sand, &c., could be obtained in sufficient quantity on the spot, so that the cubic metre 1.334 cubic yards of cement concrete as used did not exceed 5s. 10d. to 6s. 8d.

2.—THE WATERWORKS FOR THE HYDRAULIC MOTORS.

(Fig. 3.)

By reason of the above described dam and sluice work, as already stated, the raising of the Saane water to from 33 to 39 feet, the enormous force of from 2,600 to 4,000 horse-power is obtained. For the perfect utilization of this enormous water-power a number of turbines, after the system of Girard, are adopted, in which the water is led through the canal A, B, C, D (fig. 2), which is 54 feet 1 inch broad. Up to the present time only two turbines are laid on. These as well as the other driving machinery were made at Winterthur. The other waterspace or room, now in progress of building, is planned to carry four turbines, and in all probability it will soon become necessary that the other and further intended two turbines should also be carried out.

From the 1,200 horse-power which will be obtained through these turbines, 600 horse-power will be taken for the driving of those works which are already in progress of erection, and 600 horse-power will be reserved for the lifting of the drinking water into the high-level reservoir at Quintzet, which is 525 feet above the dam. For the commencement, and as long as there are only two turbines at work, there will only be the half of this disposable power given to these undertakings.

For the transmission of the mechanical driving power of those industrial works which are now getting ready, and for others that are in contemplation, the so-called telodynamic cable will be brought to bear; these we shall describe more particularly in our fourth division of this paper. For the lifting of the drinking water to the high-level reservoir at Quintzet, four of Girard's double pumps will be applied, besides the cast-iron piping which we will describe more closely in our 6th division. The abovenamed four pumps will be made at Vevey, on the lake of Geneva, and the piping at Solothurn.

The building for the turbines and pumps will be $152\frac{1}{2}$ feet long and 73 feet broad, and is to be entirely brought up from a rocky foundation. It will be attached immediately to the east end of the dam (see sectional drawing in fig. 3), by which you may see the relative position of the turbine and pumping-house, with the inlet canal and the inlet pipes, besides the other leading pipes of the dam and sluice works. By reason of the floods which took place in the spring of this year (1872) the erection of this building was very much delayed. During the late summer the works have made great strides, and it is hoped to have this important building for the water-works covered before the cold winter sets in. Besides this it is confidently expected that the mounting of the turbines and the wire-ropes transmissions of power will be completed this year (1872). The pumps and the iron piping for the water supply must be completed according to contract, by next spring, and be in actual working order.

Thus by these measures the inhabitants and the industries of the town of Freiburg have been most specially cared for, with pure drinking water for their houses, and with water-power for their industries,

given them to such an extent that their great advantages will become the envy of far more important towns. In fact nothing more noble can be conceived than these waterworks which are perfected for the sole purpose of making water subservient to man's use—for his home, for his fields, and for his industries in life.

According to the estimates, the two turbines, the four pumps, the inlet canals, and the double buildings were rated in the first instance at 175,000 frs. (£7,000). Up to the present time the cost by the balancing of accounts gives only 68,272 frs. 27 cents. (£2,730 17s. 10d.) for the buildings, £1,840 for the two turbines, and £314 for the four pumps, or, altogether, not quite £4,880,—so that the estimate for these are not likely to be overstepped by actual expenditure. This favourable result has been very much brought about by the fact that the waterworks could be entirely based on a rocky foundation, and that the required hewn blocks of stone for the building were easily obtained on the spot. These, for instance, were to be had from the excavation of the outlet canals and of the turbine house, and generally out of the excavations that were necessary to be made in connection with the works.

3.—THE FILTER AND PUMPING WORKS.

(Fig. 4.)

In the dammed-up waters of the lake, and behind the dam and sluice works, there is a large tower-like vessel, made out of sheet iron, which contains the filter for the water intended to pass through it. This iron vessel has a diameter of $19\frac{1}{2}$ feet, and is $16\frac{1}{2}$ feet deep. It is set up on the gravel beds of the Saane. Inside it there is a circular casing of 1 foot $11\frac{3}{8}$ inches thickness, which is made of cement, in order to protect the inner filtered waters from coming in contact with the outer waters. The remaining vacant space is filled up with the filtering medium, which is composed of various layers of coarse and fine gravel and of sand, whilst above is the filtered water of the Saane and the clear spring water which was discovered by the building of the dam and sluice works. That clear water from the spring, which is led in by a cement pipe of peculiar shape, forms no inconsiderable part of the supply of drinking water for the town. A further part of the supply required for the use of the town is obtained by filtering the waters of the Saane, which have to pass through the various levels of coarse and fine pebbles and of sand, and become perfectly pure. In order to arrive at this issue more easily the tower-shaped vessel is surrounded with suitable stone and gravel beds, and these are supported by a horizontal bed of cement, from the under parts of which they are made impervious. (See section sketch, fig. 4.) In the same manner the piping through the underground canal is connected with the filtering works and with the pumping work in the south-west wing of the turbine house, where there is a shaft, in which the water comes in by natural pressure from the lake and where the pump sucks it up. All this is well made, and the further introduction of discoloured water is guarded against. In order to prevent the cloudy water of the lake from entering the filter, the upper part of the arrangement is closed, but in order that the level of the purified waters may rise and fall inside, there is a long open pipe (see fig. 4) placed on the filter, which in this way keeps up a constant connection with the outer air. By means of the pumps when the works are all finished, the drinking water that is collected in the water vessel will be forced up 160 mètres, 525 feet, to the high reservoir at Quintzet, the highest point of Perolles, from whence it will afterwards be conducted by its own gravitation to all parts of the town of Freiburg.

The filtering works, with the connecting canal of the pumps, have been finished for a long time; and the experience of this spring during the thawing weather, and the freshes in the river which produced much muddy water, goes to prove how very excellent have been the arrangements for the filtering, inasmuch as only water as clear as crystal, and no discoloured water, is delivered into the town. But how long this present perfect working of the filter may last is another question which the future will only be able to determine. However, it is certainly fair to suppose that the filtering works, with their most appropriate arrangements, are not likely to lose their efficacy for a considerable period, and that therefore it will not be necessary to renew them for a very long time. The whole estimate for the filtering works was £2,000 at the commencement, whilst the actual cost of the same, from the last statement of the director (Mr. Ritter) only came to £1,366 8s. 10d.

4.—THE TELODYNAMIC, OR WIRE-ROPE TRANSMISSION.

(Figs. 1 and 3.)

For the present the first telodynamic cable of 765 mètres (2,510 feet) is ordered to be made after the pattern of that one which the firm of Rieter & Co., of Schaffhausen, made, and of which sort others have been in use elsewhere for many years. This cable is to communicate motive power from the turbines, to the extent of 300 horse-power, on to the plateau of Perolles, for the use of the various industrial establishments that are already erected or in progress of erection. For this purpose the cable is made out of very strong wires, and is to be an endless cable, which will play over suitable iron rollers fastened on to strong stone pillars, which will have cast-iron bed plates (fig. 1). These will be put in motion by the turbines (fig. 3); and by this means the motive power will be carried forward wherever wanted for driving the machinery of the various industrial operations. The whole length of the cable, from the turbine-house in the valley up to the saw-mills on the heights of Perolles, is divided into five stations, of 153 mètres each (510 feet). The cable itself is a wire rope of 3 centimètres (1 1-6th inch), and runs over bearing rollers of 4.5 mètres (14½ feet) in diameter. The supporting pillars for the rollers are built of massive stones, and are of different lengths, according to the various depressions or elevations on the line; the highest of these, which is at the 4th station, is 80½ feet high. In consequence of the great slope or declivity on which it was necessary to conduct the wire rope transmission from the valley of the Saane up to the various works, it became necessary to fill up some depressions, and to make excavations for the even course of the transmission power; and even for some distance the transmission had to be conducted through rocks by means of a parabolic tunnel. By these precautions it was rendered possible to have the traction on an even gradient of only 10.7 per cent.

The first bearing roller is directly in the turbine-house, and is at an elevation of $10\frac{1}{2}$ feet over the surface of the water at the outlet canal. The pillar of the first station, as may be seen by the plan and fig. 1, was built on the rocks, between the old and the new bed of the river Saane, and indicates an elevation of 29½ feet. The support of the bearing roller of the second station is borne by the rocks of the tunnel itself. The pillar of the third station, although of an unimportant height, is being built on a projecting rock; the same of the pillar of the fourth station, which is, as already stated, the highest of the whole, and is 80½ feet. The bearing roller for the fifth station is brought direct into the building of the saw-mill.

The bearing rollers and pillars for the three first stations are intended for a second cable, and are reckoned to produce an effect of 600 horse-power. From the third pillar the transmission branches off in

two lines; the first, as stated, goes over No. 4 pillar to the saw-mill; and the other passes along to the railway carriage manufactory. These two end stations are connected by a third line, which stretches from the saw-mill downwards to the ice-houses on the Saane, and on the other side of the carriage factory on to the foundry and engineering shop, and thence to the chemical manure making works.

A second cable, for which the pillars are already erected, is planned for the direction of the lower town, and next to the projected paper mill, &c.

The whole erection of the cables, together with the turbines, are given by contract to the firm of Rieter & Co., of Winterthur, and are already nearly finished. The cost was at first estimated at £2,000. This sum is however considerably overstepped, inasmuch as the director's last statement of accounts showed the cost of the cables to have already reached £2,662 17s. 2d. These extra costs beyond the estimate arose in this way: that it was determined during the progress of the work to start the foundations of the pillars directly upon the rocks themselves, instead of building them as first intended upon the alluvial formation which overlies the rocks; but this proves to be money well spent, because so much of the well-maintained transmissive power by the cables depends upon the solidity of the under structures, and consequently would be so much more economical and satisfactory for the driving of the machinery of the different operations carrying on upon the plateau of Perolles, and in the valley of the lower town.

5.—THE INDUSTRIAL WORKS ON THE PLATEAU OF PEROLLES.

We have now more specially to speak of the various industrial works, which are ready, and of others that are nearly ready, for operation, and which are situated on the heights of Perolles, and close to the Freiburg Railway which leads to Lausanne.

- a. The saw-mill and great carpenters' shop.
- b. The railway carriage manufactory.
- c. The foundry and engineering works, and—
- d. The chemical manure works.

The first of these factories is the mechanical saw-mill and carpenters' shop, and this is retained in the interest of the parent Company (*Société Générale Suisse des Eaux et Forêts*) in order that they may have under their own control the economical use of their own forest timber, besides having at their own command the profits to arise out of the sawing and the cutting up of the timber. The building that they have erected for this purpose is 282 feet long, 131 feet broad on the ground floor, and where the saws and the other machines are erected it is 24½ feet high; on the west side there is a building attached 32½ feet broad, which is for the offices and stores. The distance of this factory from the railway is 2,296 feet, and 2,510 feet from the turbine-house, as already stated. The first cable is used for driving the saws and other carpentering machines, and which cable up to this station has an effective power equal to 300 horses, and is availed of as required.

Out of the number of the twelve saws and cutting machines with which this factory is to be provided, the large breaking down saw was finished, and was in full work all last summer, and for the then and present working of which, two locomotive engines were used. It is expected that in November next (1873) the building and all the erection of the machinery will be finished; and as these latter gradually get into work, so will the returns from the Company's forest lands come in more and more. Already, it may be thought, from this brief notice, that this special factory will be of the greatest consequence to the whole undertaking, and with these expectations it has undergone such expansion as is probably not equalled by any other similar establishment.

The next factory lies a little nearer the railway. This is the railway carriage factory, and was erected by a branch Company. This establishment is not of less importance than the first-named one. For the driving power of the various machines for these works a part of the power of the first or saw-mill cable is used, besides the direct application of the second cable to this factory. According to contract, lately entered into between this branch and the parent Company, a motive power of 50 to 150 h.p. is provided, and the contract embraces the annual sale of from 2,000 to 3,000 cubic metres (2,616, to 3,924 cubic yards) of sawn timber from the saw-mills for the express use of this railway carriage factory—a quantity that will take one-seventh part of the whole year's production of the forest. This establishment has also a most promising future before it, not only from its profitable purchases of timber from the adjacent saw-mills, but also from its prospects of great returns by the sale and transport of their finished railway carriages, under the very advantageous position of being immediately by or on one of the most frequented railways on the Continent.

In like manner are the prospects of the next or third establishment, namely, the foundry and engineering works. This is situated still nearer the railway station and on the junction line. Its operations will be a great necessity for the carrying out of the various new industrial works at Freiburg. For this reason these engineering works have already been nearly a year in full operation, and when the wire-rope transmission power is in full working order it will demand a motive power from it equal to twenty horses.

The price of the motive power, for the present, is at the rate of 150 to 200 francs (£6 to £10) per annum for each horse power, according to the greater or lesser power demanded by each individual establishment. Beyond the four abovenamed works, others are in contemplation in the so-called "Undertown" of Freiburg on the Saane, namely, a paper manufactory; further on a gypsum and pottery factory; and on the heights of Perolles a stone-sawing mill and a barley-grinding mill; and I am convinced that when once the abovenamed works get into full operation many others such will follow.

In connection with the gypsum works, which, as well as the clay pottery, are situated in the valley of the Saane and near the ice-houses, it may be mentioned here that the Company have discovered a rich deposit of gypsum, the raw material from which is converted into use by both pulverising it for manure and by calcining it for making plaster of Paris of it. The gypsum fabric is connected with clay pottery works, so as to keep the regular staff of men continuously employed—the gypsum for the winter, and the pottery works for the summer.

6.—THE WATERWORKS AND RESERVOIR ON THE HEIGHTS OF QUINTZET FOR THE SUPPLY OF DRINKING WATER FOR THE TOWN OF FREIBURG.

The waterworks for supplying Freiburg with good drinking water is divided into the lifting and into the delivery transmission. The lifting work extends from the pumping at the hydraulic workshop on the Saane to the reservoir on the highest point of Perolles; whilst the delivery starts downwards from the Perolles reservoir to the remotest parts of the undertown of Freiburg. As already stated, this lifting operation

tion of sending waters from the Saane up to the reservoir at Quintzet is done by four of Girard's double pumps, which will be driven by either one or two of the turbines. From the reservoir on the heights of Perolles or Quintzet down to the remotest parts of the town, the operation will be simply by the gravitation and the pressure of the water itself.

The quantity of water which these four pumps will deliver every minute is estimated to reach 3,100 litres (682 gallons). This quantity of pure drinking water will be equal to a quarter of the total water consumption of the town, when once the whole population avail themselves of this new method of water supply, but which may probably not be very immediate.

The pumps were made by Roy & Co., of Vevay, and are of the same construction as those which that firm delivered for the waterworks in Zurich and at Penay, near Geneva, to the entire satisfaction of those who ordered them. In connection with the water conduit is an air reservoir, by which the motion of the water in the main is regulated.

The reservoir on the heights of Quintzet is dug out of compact clay, which is coated with cement. Its dimensions in the clear are respectively 36 ft., 20 ft., and 300 feet, the contents of which will equal 1,307,537 galls. The surrounding walls measure below $3\frac{1}{4}$ ft. in thickness, and above 2 ft. only.

With reference to the cast-iron mains, the quantity required measures 12,467 ft. Of these, 7,218 ft. are required for the lifting, and 5,295 ft. for the downward conduit. There were five tenders for contracts to make these, but the one from the firm of L. V. Roll, in Solothurn, was accepted, under the following special conditions: The pipes for the uplifting are to have a diameter in the clear of 0.40 metre (16 inches), and those for the downward conduit are to be 0.43 metre (17 inches) in the clear; and the thickness of the pipes are to be relatively in proportion to the pressure, in three series.

To this end the first series (A) for the uplift mains is to be for 3,444 ft., with a thickness of two-thirds of an inch; the second series (B) is for 1,968 $\frac{1}{2}$ ft., with a thickness of half an inch; and the third series (C) for 1,804 $\frac{1}{2}$ ft. of 0.45 inches. And for the downward piping, the first series D, is for 984 ft., with a thickness of 0.43 inch; a second series (E) is for 984 feet and 0.45 inches; and a third series (F) to be 3,281 feet with a thickness of 0.59 inches. This arrangement for the piping is after the same system as that adopted by Mr. Ritter in his waterworks erected at Neufchatel. This system of coupling the pipes together admits of their expansion and contraction, according to the changes of temperature, without risk of separation or of leakage.

Before the pipes are to be laid, every separate pipe is to be tested for pressure, and besides this the contractors are placed under a bond to guarantee their soundness for three years. The delivery is, by contract, to be made in January, February, and March, and must be completed by the 15th of April, 1873. For every day that the contractor may be behind time he has to endure a penalty of £4, and until the expiration of the three years guarantee time the sum of £200 will be kept back from the payments, but such sum is to bear 5 per cent. interest when paid. With respect to the prices paid, a uniform rate was given for both calibres, of 46 francs (£1 16s. 9d.) for the running metre of the piping, and 300 francs or £25 per ton for the union flanges, delivered free in Freiburg. The cost of the main pipes comes, therefore, to £7,000.

The branch piping will be laid on by degrees, and in proportion to the growing demands of the population. By the contract entered into with the town authorities, the whole of the waterworks are to be finished and to be ready for use by the 1st of October next, 1873, at the latest; and by the same contract the price for the water is never to exceed 50 francs (£2) for each 1,000 litres (220 gallons), delivered within each twenty-four hours, per annum.

7.—THE CANAL CONDUIT FOR IRRIGATION AND MANURING.

(Fig. 1.)

Independently of the supply of drinking water, there is another and much more extensive system of canalling for the purposes of irrigation and manuring the fields and meadows on the heights of Neigles, on its north-west side on the plateau of Perolles, on the south and west with the sewage and waste waters collected at two points of the lower town—the one in the neighbourhood of the projected paper mill, the other near the great suspension bridge. This is to be the undertaking of a branch Company, as before stated. And this second conduit will be as important to the inhabitants of Freiburg and its neighbourhood for sanitary conditions as for economical results, and it speaks forcibly for the vast foresight and the well directed enterprise of the ingenious promoter of these works for the general good. In the plan, fig. 1, the canals may be observed by their dotted lines. These canals will terminate in proportionably large receiving tanks, from which the irrigation and manuring of the neighbourhood are pointed out by the radiating dotted lines.

The raising of this waste water and sewage is brought about by a new method, discovered by Mr. Ritter, and applied here at Freiburg for the first time. This method is based, as is also Capt. Lierneur's system, on the application of compressed air, which will be applied in a direct manner on the half liquid matter that will be gathered together in the tanks for the up delivery, and will leave nothing behind. All this will be done without the aid of pumps as hitherto in use elsewhere.

8.—THE ESTABLISHMENT OF FISH-CULTURE, THE BATHING ESTABLISHMENT, AND THE ICE-HOUSES OF PEROLLES.

About 1 mile behind the dam, and on the left side of the newly formed lake of Perolles, and at a pleasing and picturesque spot, may be seen the establishment for fish-culture, the bathing establishment, and the ice-houses, &c., all joint undertakings of the one branch Company, as before stated. (Fig. 1.)

The establishment of *fish culture* was formed for the praiseworthy intention of stocking afresh the waters of the canton for a circuit of about 60 hours around Freiburg. For this reason this branch Company, or more properly speaking, Mr. Ritter (who sold the concession to the Company for £4,000), received from the Council of the canton of Freiburg the right of fishing for 50 years.

The *bathing establishment* is connected with a *swimming school* for the summer, and a *skating school* in the winter. There is also a washing and a bleaching establishment here, besides a hotel, at which, in summer especially, every agreeable and refreshing luxury can be obtained. This spot consequently is likely to become a favourite resort for tourists, and is already one of the most attractive places in the whole neighbourhood for the inhabitants of Freiburg.

In the winter season a temporary residence there will give a fair impression of the severity of an Alpine climate; but notwithstanding such a drawback the place will be much frequented in winter for the purposes of skating.

The

The *ice-houses* are also immediately in the same neighbourhood, and are built in the steep and shelving sides of the bank on the left side of the Saane. There are already two or three dug out, and it is intended to have ten such ice-houses, each of which is to hold 200 waggon loads of ice. As it is intended immediately to have a branch railway from the shores of the upper part of this lake, to be connected with the main Freiburg line, for the special purposes of bringing their forest timber into the saw-mills, and the ice for transportation to all parts, so it may be counted upon that this ice business also has the promise of a flourishing future.

9.—THE UTILIZATION AND FARMING OF THE FORESTS PURCHASED FROM THE TOWN OF FREIBURG.

In consideration of the advantages to arise to the town of Freiburg by the creation of this parent Company, as brought about by Mr. Ritter, and more especially as an equivalent for the important benefit of the new water supply, those authorities made over to Mr. Ritter a large forest in the valley of the Saane above the dam on that river. The specification of this contract forms therefore one of the greatest ground-works of the whole enterprise, and affords a guarantee from the very first that the whole affair will be carried out to the satisfaction of both contracting parties. Against the great costs which the parent Company have been subjected to, through the building of the dam and sluice works, through the turbine arrangements and other waterworks, through the wire-rope transmissive power, and through the other industrial works, it will be mainly recouped through its timber which it purchased from the town, and which the Company will sell to the best possible advantage to the saw-mill, and the railway carriage manufactory, besides selling timber at good prices to purchasers from the south of France.

As already stated, this purchased forest comprises no less than 1,446 acres, and was estimated by forest experts at the time to be capable of yielding 6,071,250 cubic feet, and was therefore valued at 164,000 cubic metres. Until now timber cutting in this forest has been postponed, and particularly for this reason, because the branch railway line for the transport of the products of the forest and of the saw-mill and the carriage factory were not yet finished. In the meantime the value of the timber has become very much enhanced, and the Company has not only received no damage by the delay in the use and sale of the timber, but on the contrary it will derive considerable advantages, independently of the fact that the timber has taken a considerable growth since the date of the Company's purchase.

The farming of the same by careful culture, cleaning, and fresh planting, was not in the meantime neglected. Besides the timber used from this forest for the erection of the Company's buildings, there have been in this year (1872) no inconsiderable receipts through contracts for the supplying of railway sleepers. But now they have begun in good earnest to bring the timber into the saw-mill, and are fast preparing this business for deliveries to the railway carriage manufactory, and for the use of the other industrial works. Next year, when the saw-mill and large carpenters' shop shall have been connected with the place of delivery for the timber on the Saane by the junction railway (fig. 1) with the trunk line at Freiburg, there will be great gain from the forest, and energy will be exerted to convert the timber into money; inasmuch as sawn timber, in form of boards, is paid for at the rate of 60 francs per cubic metre, and building timber in beams and posts, at the rate of 45 to 65 frs. (£1 16s. to £2 12s.) by deliveries for export to the south of France; and as the charges against the timber, for cutting, sawing, and for the transport of the sawn timber, will only reach 30 francs, and for building timber 20 frs., so will there remain to the profit of the Company about 30 frs. for every cubic metre sold (equal to £1 4s. on 36 feet of our English measurements); and at this rate the whole stock of timber at their command would represent 5,000,000 francs (£200,000). Of course this large sum would not come in at once, and the Company will take good care not to use up the gains of their forest in after years, inasmuch that if they did do so they would destroy their future by thus sapping the life-blood of the whole enterprise. But by the present prudent use of the growing timber, the Company will keep a just balance of the returns from their forest with their other profitable undertakings; and therefore the capital embarked in that forest must prove to be a safe investment.

10.—THE LAYING OF THE BRANCH RAILWAY JUNCTION LINE.

The timber from the forest of the parent Company will be floated down and across the Saane to the landing-place on the Lake of Perolles near the artificial fishery, and will be conveyed from thence to the saw-mill by means of a special railway or tramroad, where it will be worked up into boards, into building and other timber, or in form of some finished product from the large carpentering shop, and from thence be further conveyed to the railway station at Freiburg (fig. 1). This branch railway line is about two kilometres long (2,187 yards), and its gradients, from the saw mills to where the logs are landed from the opposite side of the Saane, do not exceed 14.5 per cent., and from the saw mill to the Freiburg railway station only 5 per cent. The railway trucks, which will be used for the transport of ice and timber, as well as for the other wares and raw materials, will be driven by a special wire rope transmission, which will have its motive power given to it by that cable that drives the saws.

The construction of this railway is now nearly finished. Beech was used for the sleepers of this line, and these were creosoted by a new plan, from which very good results are expected. According to the last rendering of accounts, the cost of this railway amounts already to £1,437 7s. 1d., and that sum does not cover all its expenses. Added to this, it should be understood that small branch lines or sidings will have to be attached to each of the separate works, as the promising establishments on the Lake of Perolles require such approaches. The incomings from this department of the works will, for some time to come, do no more than balance the expenditure. But when all the buildings are finished, all works in motion, and all the undertakings in full and satisfactory operation, the capital expended on this railway will doubtlessly yield good returns.

By this paper I have tried to describe to my readers, in the concisest possible manner, all the new creations that have taken or are taking place at the old town of Freiburg, and I am convinced that they will acknowledge with me that it is to the great genius and enterprising spirit of the leading director, to whom the special honor is due for the development of this magnificent and very important work. I think, also, that great credit is due to the finance gentlemen, and to the official persons and others who supported him so powerfully in his great undertaking.

On reviewing all these creations, which are the result of original genius, and of mutual trust and confidence, we may be well disposed to agree with the elevating idea of the reporter of the Basel newspaper, who, on writing upon this interesting subject of Mr. Ritter's great works, says—"The people of no city need

fear its destiny, when the fruitful intelligence of man is ably supported by willing financiers, and that such intelligence otherwise meets with the acknowledgment and the co-operation of a whole population which cannot be influenced in the least by party spirit, or by any hateful political passion."

Lastly, it may be remarked, that for the completion of the various buildings and works, besides the original capital, it became necessary to issue debentures for one and a half millions of francs (£60,000), bearing interest at 5 per cent. ; and that the preferential shares of £20 (500 francs) at present stand at £22 (550 francs), from which it may be determined what good credit and confidence the whole undertaking enjoys in the financial world.

[Taken from the *Augsbury (German) Dingler's Polytechnical Journal*, February, 1873, No. 23.]

[Three Plans.]

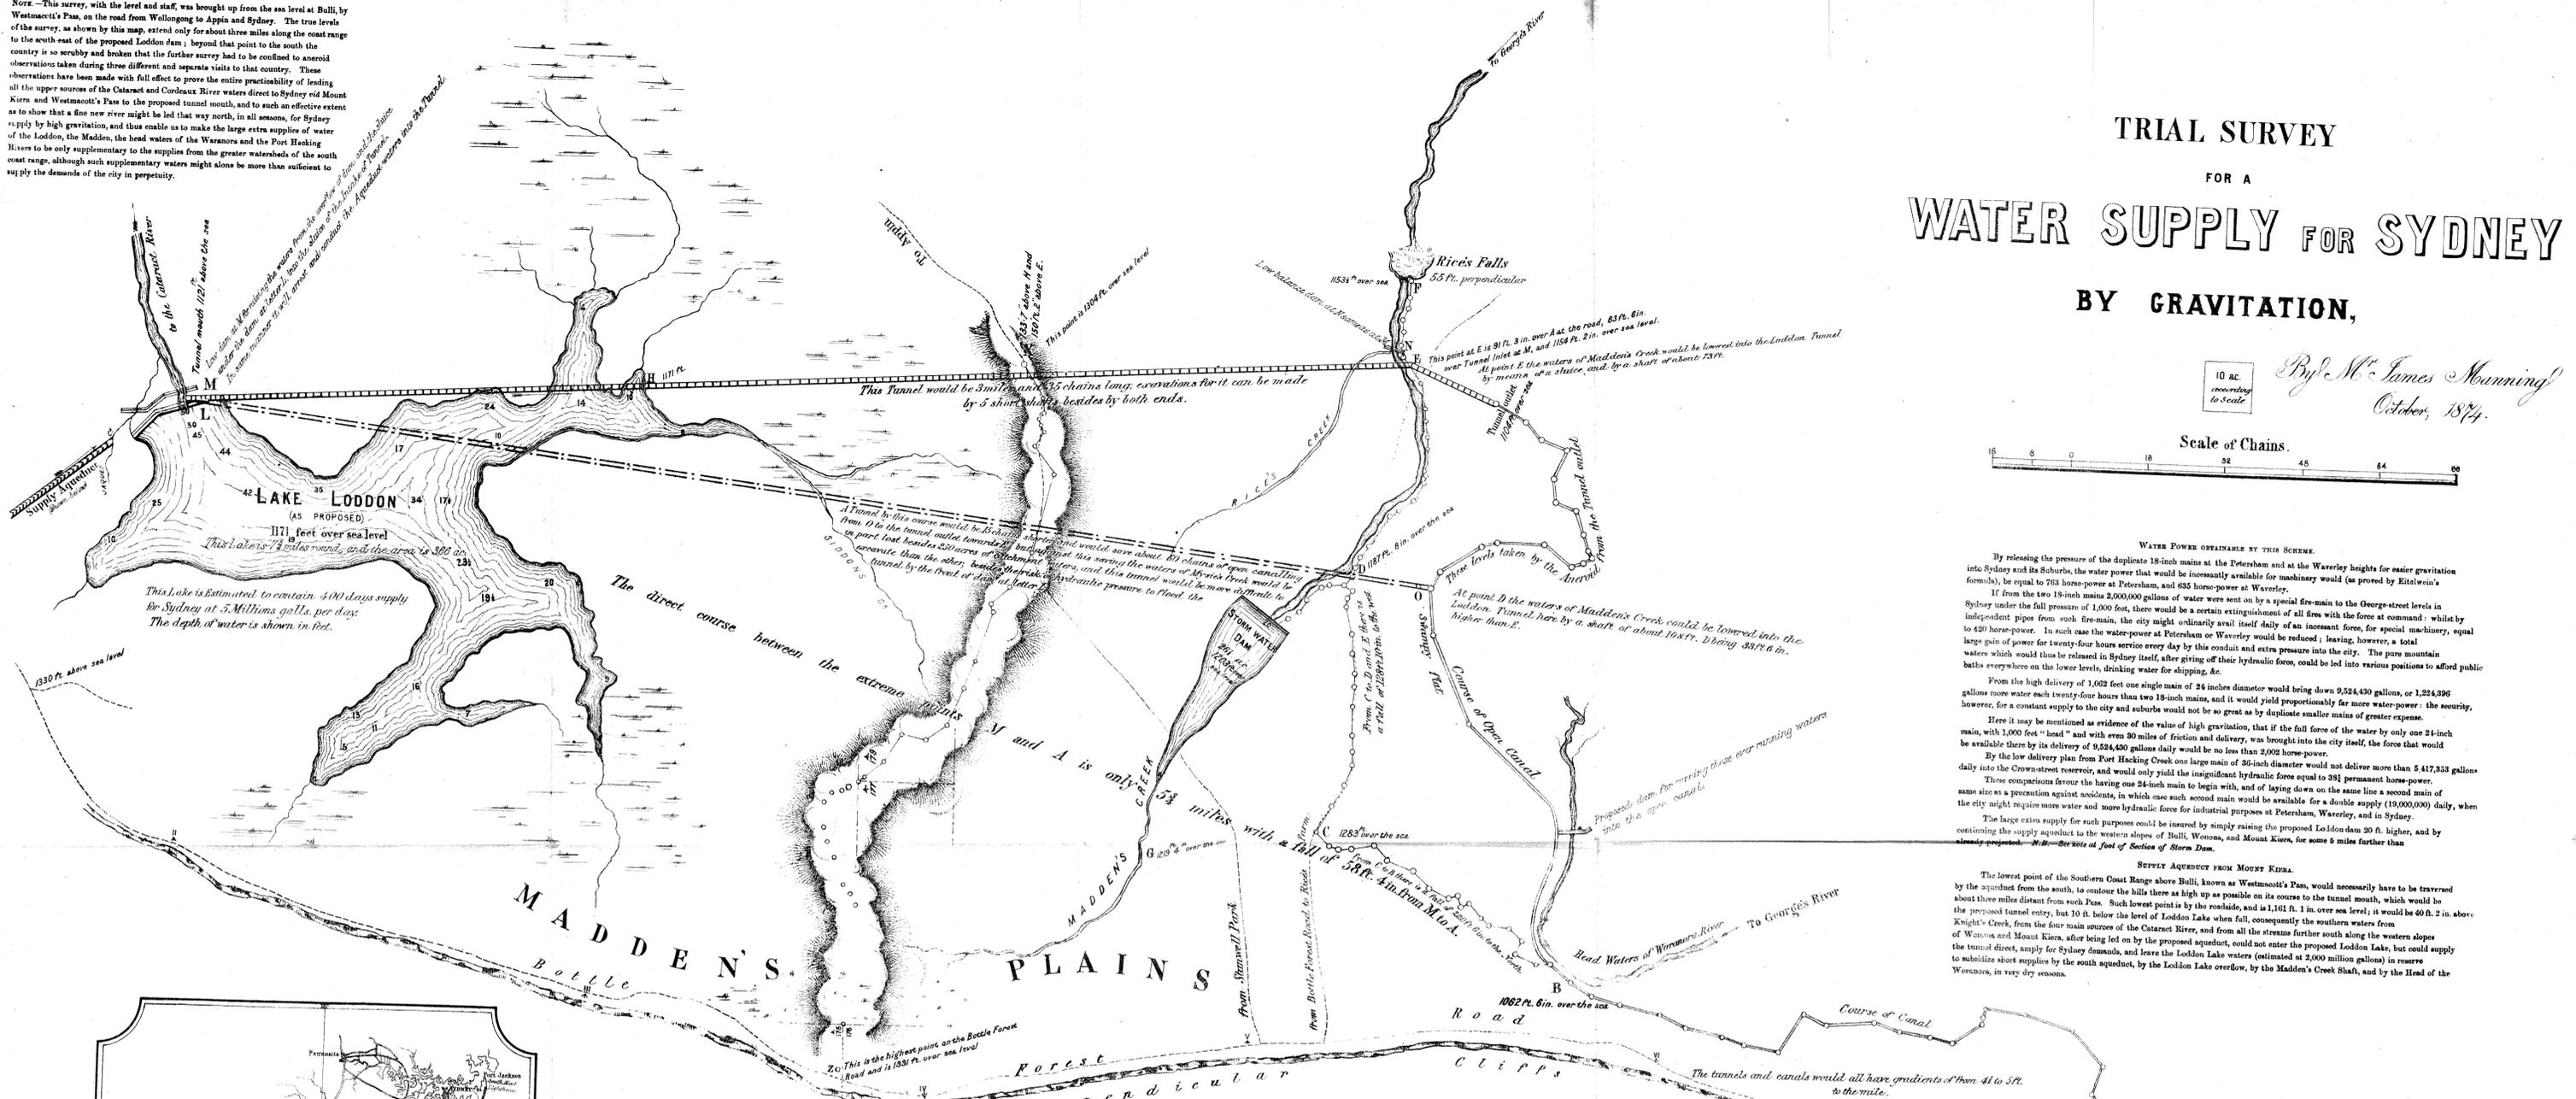

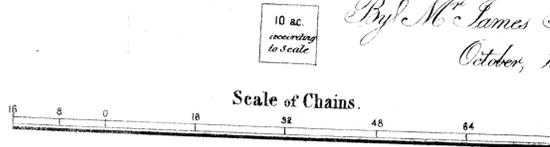

[2s.]

Sydney: Thomas Richards, Government Printer.—1873.

Note.—This survey, with the level and staff, was brought up from the sea level at Bulli, by Westmacott's Pass, on the road from Wollongong to Appin and Sydney. The true levels of the survey, as shown by this map, extend only for about three miles along the coast range to the south-east of the proposed Loddon dam; beyond that point to the south the country is so scrubby and broken that the further survey had to be confined to aneroid observations taken during three different and separate visits to that country. These observations have been made with full effect to prove the entire practicability of leading all the upper sources of the Cataract and Cordoba Rivers direct to Sydney via Mount Kiara and Westmacott's Pass to the proposed tunnel mouth, and to such an extent as to show that a fine new river might be led that way north, in all seasons, for Sydney supply by high gravitation, and thus enable us to make the large extra supply of water of the Loddon, the Madden, the head waters of the Warrawong and the Port Hacking Rivers to be only supplementary to the supplies from the greater watersheds of the south coast range, although such supplementary waters might alone be more than sufficient to supply the demands of the city in perpetuity.

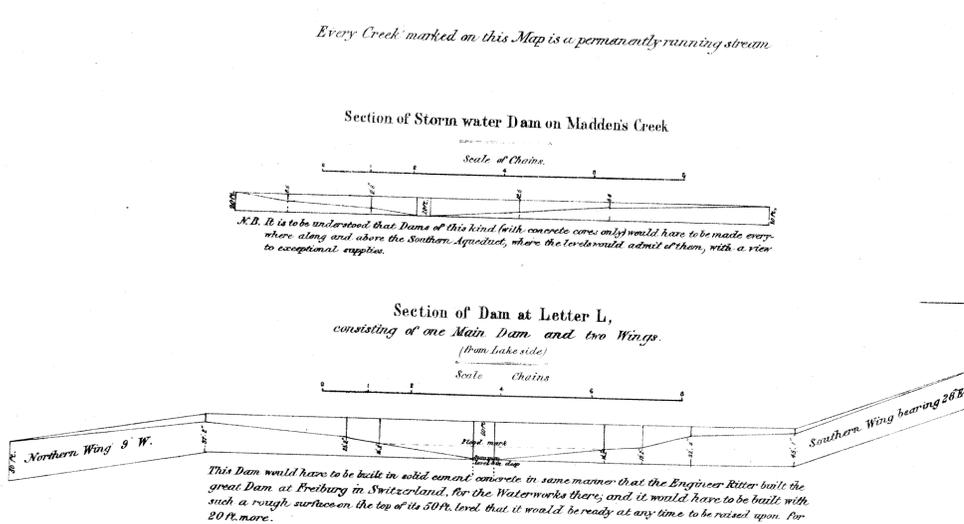

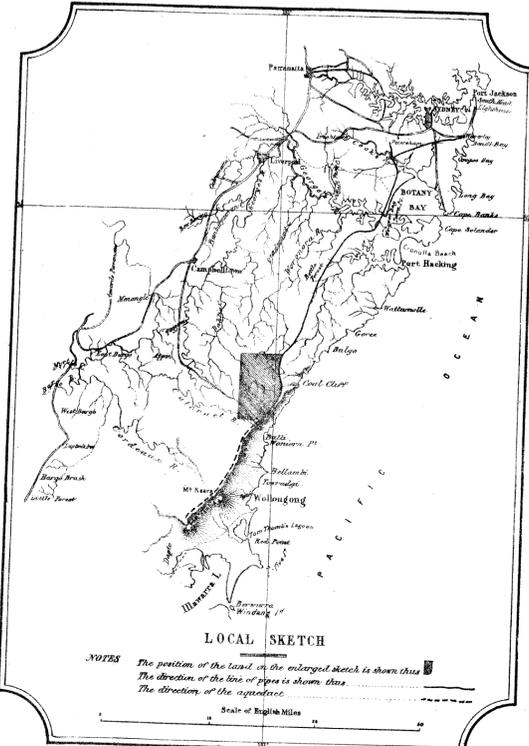

TRIAL SURVEY FOR A WATER SUPPLY FOR SYDNEY BY GRAVITATION,

By J. Mc James Manning
October, 1874.

WATER POWER OBTAINABLE BY THIS SCHEME.
By releasing the pressure of the duplicate 18-inch mains at the Petersham and at the Warley heights for easier gravitation into Sydney and its suburbs, the water power that would be necessarily available for machinery would (as proved by Eutaw's formula) be equal to 765 horse-power at Petersham, and 635 horse-power at Warley.
If from the full pressure of 1,000 feet, there would be a certain extinguishment of all fire with the force at command; while in Sydney under the full pressure of 1,000 feet, there would be a certain extinguishment of all fire with the force at command; equal to 430 horse-power. In such case the water-power at Petersham or Warley would be reduced; leaving, however, a total large gain of power for twenty-four hours service every day by this conduit and extra pressure into the city. The pure mountain waters which would be released in Sydney itself, after giving off their hydraulic force, could be led into various positions to afford public baths everywhere on the lower levels, drinking water for shipping, &c.
From the high delivery of 1,022 feet one single main of 24 inches diameter would bring down 9,524,430 gallons, or 1,224,390 gallons more water each twenty-four hours than two 18-inch mains, and it would yield proportionally far more water-power: the security, however, for a constant supply to the city and suburbs would not be so great as by duplicate smaller mains of greater expense.
Here it may be mentioned as evidence of the value of high gravitation, that if the full force of the water by only one 24-inch main, with 1,000 feet "head" and with even 30 miles of friction and delivery, was brought into the city itself, the force that would be available there by its delivery of 9,524,430 gallons daily would be no less than 2,002 horse-power.
By the low delivery plan from Port Hacking Creek one large main of 36-inch diameter would not deliver more than 5,417,333 gallons daily into the Crown-street reservoir, and would only yield the insignificant hydraulic force equal to 381 permanent horse-power.
These comparisons favour the having one 24-inch main to begin with, and of laying down on the same line a second main of same size as a precaution against accidents, in which case such second main would be available for a double supply (19,000,000) daily, when the city might require more water and more hydraulic force for industrial purposes at Petersham, Warley, and in Sydney.
The large extra supply for such purposes could be insured by simply raising the proposed Loddon dam 20 ft. higher, and by continuing the supply aqueduct to the western slopes of Bulli, Womona, and Mount Kiara, for some 6 miles further than already proposed.—See note at foot of Section of Storm Dam.

SUPPLY ACQUIRED FROM MOUNT KIARA.
The lowest point of the Southern Coast Range above Bulli, known as Westmacott's Pass, would necessarily have to be traversed about three miles distant from such Pass. Such lowest point is by the roadside, and is 1,161 ft. 1 in. over sea level; it would be 40 ft. 2 in. above Knight's Creek, from the four main sources of the Cataract River, and from all the streams further south along the western slopes the tunnel direct, supply for Sydney demands, and leave the Loddon Lake waters (estimated at 2,000 gallons) in reserve for Womona, in very dry seasons.

Overground Mains.
If two wrought iron or steel mains, of only 18 inches diameter, are applied at this high elevation of 1,022 feet at point A, the pressure could be borne with perfect safety, and the velocity of the water delivery would be so great that no less than 4,270,801 gallons, with the 550 ft. pressure, could be delivered daily into a reservoir on the top of the Petersham and Castlereagh heights, by one pipe; and to the highest point at Warley, with 750 feet pressure, no less than 4,029,143 gallons daily by the other. In all, these two small pipes would deliver (by Eutaw's formula) 8,300,004 gallons daily. Present Sydney requirements and supply in summer 5,000,000 gallons daily.
These mains would be in three series of strength, according to the altitude of and the pressure on the pipes, namely, by boiler plates of 2 1/16ths, 3/16ths, and 4/16ths of an inch, in ratio and application same as at the Nevada Waterworks, where a pipe of 5/16ths of an inch bears the enormous pressure of a head of water of no less than 1,700 feet, which is equal to 750 lbs. to the square inch.

Lower Supply Service from the Port Hacking Rivulet.
At about six miles from point A down the Port Hacking Creek, and about twenty-four miles from Sydney, and from an elevation of 170 feet, another and large wrought iron main of 36 inches diameter could be laid on to the Crown-street reservoir, where, with only 34 feet pressure, a further delivery of 5,417,533 gallons daily could be made in all seasons. In all, including high service deliveries, equal to 13,717,537 gallons daily, as computed by Eutaw's formula.
N.B.—In order to keep up this immense additional supply to Sydney, by means of the low level delivery from Port Hacking Rivulet, it should be understood that a dam of 50 feet high, in concrete, would have to be made across a narrow gorge, and at a most favourable spot in the Hacking Valley, where the level of the rivulet is 120 feet over sea level, and from whence the low level main would have its entry for the waters of Sydney. Such a dam would be for the double purpose of giving a direct increased head of water to save 106 chains of elongation of the expensive main; and also for the purpose of storing a further immense supply of water in case of any excessive drought, as such dam would throw back a lake of water which could be about one mile and twenty-five chains long.

1875-6.

NEW SOUTH WALES.

SYDNEY SEWERAGE AND WATER SUPPLY.

(NINETEENTH ANNUAL REPORT FROM MUNICIPAL COUNCIL—1875.)

Presented to both Houses of Parliament, pursuant to Act 30 Vic. No. 36, sec. 75.

THE TOWN CLERK TO THE PRINCIPAL UNDER SECRETARY.

Town Clerk's Office,
Sydney, 9 March, 1876.

SIR,

I have the honor, by direction of the Right Worshipful the Mayor, to submit, for the information of the Parliament of New South Wales, the Nineteenth Annual Report of the proceedings of the Municipal Council of Sydney, under the Sewerage and Water Acts, during the year 1875.

I have, &c.,

THOS. A. BUTTERFIELD,
Town Clerk (*pro tem.*)

NINETEENTH ANNUAL REPORT of the Municipal Council of the City of Sydney, of their proceedings under the Water and Sewerage Acts.

WATER WORKS.

THE engines and pumping machinery at Botany have been working throughout the year 1875 in a most efficient manner; two engines out of the three have been constantly at work, excepting occasionally for three or four hours at a time when the reservoirs have been signalled full.

Early in December, 1874, it was found necessary to put on the third engine to keep up the supply during the dry weather; the three engines continued constantly at work until the end of March, 1875, night and day, except when on the high-level, at which time two engines only can be employed.

During the corresponding months of this year the third engine was never required to be put on, two engines having been found ample to keep up the supply; this is attributable to the increased storing capabilities of the Lachlan by the construction of new dams, and the enlargement of the old ones, the water from which is delivered in Sydney by gravitation; and also from the great saving effected in the consumption of water to closets by the enforcement of the provisions of the Water Pollution Act, which came into force on the 22nd July, 1875.

During the year no casualties have occurred to either the machinery at Botany or to the 30-inch main.

The several new works throughout both the Botany and Lachlan watersheds have stood remarkably well, and have only required ordinary attention to keep them in thorough repair.

As the capabilities of the Botany and Lachlan water supply have been so frequently questioned, and so little is really known as to their vast resources for a continuous supply of water, I think it necessary to furnish such information as will satisfy the public at large that there is no cause to dread the supply to the city running short; and with this view I append a return made after seven months of severe drought, which shows that there was more than half the quantity of water still stored in the dams than there was at the commencement of the dry season. If other dams be constructed, as proposed, on the present watershed, and also the Bunnerong dams, as sanctioned by the Council (the watershed of which is on the Church and School lands), 1,608 acres would be added to the existing catchment area, and the storing capacity would be more than doubled.

A contract has been entered into with Mort's Dock and Engineering Company for the supply and erection of an engine and pumping machinery to be erected at Crown-street Reservoir. When this work is completed it will relieve the Botany machinery considerably, as the engines would not then have to pump to the high level as they now do, which at present is found to be such a strain on them, besides enabling a much greater quantity of water to be sent in when the demand requires it.

A tender has just been accepted from Mr. W. Watkins for the enlargement of the Paddington Reservoir, and the work is now in hand.

The total quantity of water pumped up from Botany into the service reservoirs during the year 1875 was fifteen hundred and one millions eight hundred and twenty-five thousand six hundred and thirty-six (1,501,825,636) gallons, weekly average twenty-eight millions eight hundred and eighty-one thousand two hundred and sixty-two (28,881,262) gallons, being a decrease on the year 1874 of only six hundred and eighteen thousand eight hundred and twenty-two (618,822) gallons.

The quantity of coal consumed by the Botany engines during the year 1875 was 6,254 tons, being an increase on the previous years of 134 tons.

The number of houses connected during the year was nine hundred and fifty-nine (959), and the number of houses now receiving and paying for water is twenty thousand eight hundred and thirty-three (20,833).

APPENDIX C.

RETURN of the Condition of the Botany Dams from 1st July, 1875, to 31st January, 1876.

Total	829,565,616	177,815,586	48,665,500	1,056,046,702								46-031	9-055			171,107,625		

15th February, 1876.

FRANCIS BELL,
City Engineer.

NOTE.—The above return clearly shows that the actual decrease in quantity of water stored in the dams is for the month of January, 1876, 28 per cent. of the total quantity consumed by pumping to Sydney and by evaporation; therefore the 252,892,375 gallons in the dams at the end of January represents a total of 708,000,000 gallons actually contained in the watershed at that date.

1875-6.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

CATARACT AND NEPEAN RIVERS.

(DISCHARGE OF WATER FROM, DURING 1874 AND 1875.)

Ordered by the Legislative Assembly to be printed, 18 January, 1876.

Month.	Rainfall at Wilton.	Discharge over Weirs at Cataract River.	Discharge over Weirs at Nepean River.	Total Discharge over Weirs at Cataract and Nepean.

November	-70	17 " "	187 " "	204 " "
December	2-71	8 " "	106 " "	114 " "
Total for 1875 ...	34-83	20,710 millions of gallons.....	56,753 millions of gallons.....	77,463 millions of gallons.

Note.—The above returns do not give the full quantities which passed down the rivers, as it was found on recent examination that the gauges had been injured by floods, so that a considerable quantity of water passed away underneath without being registered. The gauges have now, however, been restored.

* For sixteen days during these two months there were no records kept of the discharges, in consequence of the illness of the officer whose duty it was to record them.

1875-6.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

BOTANY WATERWORKS.

(INFORMATION RESPECTING.)

Ordered by the Legislative Assembly to be printed, 1 June, 1876.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 31st of March, 1876, That there be laid upon the Table of this House, a Return showing,—

- “(1.) The number of gallons of water pumped from the Botany Waterworks per month, from its opening to date of Return.
- “(2.) The quantity pumped to low and high service per annum, from opening to date of Return.
- “(3.) The quantity received in Sydney per annum through Busby’s Bore, from and to same dates.”

(Mr. Sutherland.)

BOTANY WATERWORKS.

THE TOWN CLERK TO THE PRINCIPAL UNDER SECRETARY.

Town Clerk's Office,
Sydney, 31 May, 1876.

SIR,

Referring to your letters of 1st April last and 23rd instant, requesting to be furnished with information called for by the Legislative Assembly for the purpose of being laid on the Table of that House, I have the honor, by direction of the Right Worshipful the Mayor, to forward herewith a return prepared by the City Engineer, showing the quantity of water pumped from the Botany Waterworks during the years 1860 to 1875 inclusive.

I am desired by His Worship to inform you,—

1. That the City Engineer is unable to show the quantity of water sent from Botany during each month of the year, as the register has been made for each week.
2. That the quantity supplied to the Low and the High Reservoirs has not been kept separately up to 1869. (The High Service Reservoir was brought into operation in May, 1866.)
3. No account of the supply by means of the Tunnel or Busby's Bore has been kept. The supply was very uncertain for several years previous to 1872, in which year it was thoroughly cleaned out and repaired, and since that period the supply has been abundant, being estimated by the City Engineer at one and a quarter ($1\frac{1}{4}$) millions of gallons of water per day.

I have, &c.,

THOS. A. BUTTERFIELD,

Town Clerk, *pro tem.*

QUANTITY of water pumped from Botany during the following years. The engines were started for the first time on the 6th December, 1859.

Year.	Low Level.	High Level.	Total Gallons.
1860	326,008,080
1861	384,000,000
1862	618,344,882
1863	614,510,568
1864	657,267,552
1865	875,060,504
1866	958,649,221
1867	955,436,976
1868	1,222,540,272
1869	1,087,812,744	311,060,240	1,398,872,984
1870	1,174,489,200	425,894,256	1,600,383,456
1871	909,473,716	414,735,552	1,324,209,268
1872	1,016,415,534	474,425,856	1,490,841,390
1873	771,040,792	570,568,760	1,341,609,552
1874	872,670,682	629,773,776	1,502,444,458
1875	971,212,608	530,613,028	1,501,825,636

Town Hall,
31st May, 1876.

FRANCIS BELL,
City Engineer.

1875-6.

NEW SOUTH WALES.

LIVE STOCK.

REPORT

FROM

CHIEF INSPECTOR, FOR THE YEAR 1874.

Presented to Parliament by Command.

SYDNEY: THOMAS RICHARDS, GOVERNMENT PRINTER.

1876.

LIVE STOCK.

REPORT FROM CHIEF INSPECTOR, FOR THE YEAR 1874.

THE CHIEF INSPECTOR OF STOCK TO THE HONORABLE THE MINISTER FOR LANDS.

Department of Lands,

Sydney, 12 November, 1875.

I HAVE the honor to submit herewith my Report for 1874, and in doing so I would once more call attention to the very imperfect manner in which the information asked from the owners of stock has been given. In a great many instances the forms distributed were not returned, and in others the answers they contained were of the most meagre description. The consequence is that the abstracts furnished to me by the Inspectors are, to a large extent, their own opinions and estimates, and the present Report is framed not so much for the purpose of giving correct information on the subjects with which it deals, as to show how and to what extent that information might be given.

2. It is difficult to account for the reluctance shown by owners to give this information. It cannot be said that any of the particulars which have been given during the last four or five years were, so far as the owners are individually concerned, ever divulged; and it would put them to exceedingly little trouble to complete and return the forms sent them.

3. So far as the question relates to diseases in stock, it is absolutely necessary, if any real progress is to be made in eradicating them,—that the information asked for should be supplied, for it is only in this way that the nature, extent, and proper treatment of these scourges can be ascertained. So clearly was this fact impressed upon the members of the Stock Conference held in Sydney in November last, that a resolution was unanimously passed to the effect,—“that the several Governments should be invited to take power where they do not already possess it to obtain returns from owners of the number of their stock and the diseases affecting them”; and in keeping with that resolution I would suggest that, if the sketch of a measure which has been agreed to by the Conference for the prevention of Diseases in Stock, and which contains such a provision as this, is not to be put into shape and submitted to Parliament, the power here referred to should be obtained by bringing in a short Bill as early as possible.

4. Although it is not perhaps so essential that the other information asked from owners should be given, this also would be not only very interesting but very useful; for if owners generally were to answer the questions contained in the circulars addressed to them, the experience of the whole Colony would be obtained in regard to many important matters relating to the management and breeding of stock, and a great deal of highly valuable information would thus be supplied to owners in hundreds of ways which would tend most materially to their individual benefit, as well as to their interest as a class.

5. It is because I consider that the omission to which I have called attention arises chiefly through want of consideration on the part of owners, that I have taken the liberty of bringing it under notice, for it cannot for a moment be supposed that any owner of intelligence will go so far as to say that he is so very well acquainted with stock and their management, and all the ailments to which they are subject, that he does not consider the experience of all the other owners in the Colony of any value to him.

6. Only those owners who occupy 2,000 acres and upwards were asked to make returns.

HORSES.

1. THE NUMBER OF HORSES.

This, as given by the Registrar General for 1874, was 328,014.

2. THE DIFFERENT BREEDS.

By tabulated Statement No. 1 it will be seen that the different descriptions of horses are returned at about *one-fifth* each of draught and light harness, and *three-fifths* saddle horses.

3. HORSES FIT FOR THE INDIAN MARKET.

These are returned as numbering 2,487.

4. HOW HORSES ARE KEPT.

On 217 holdings horses run at large, on 680 they are in paddocks, while in 197 cases owners make no return.

5. INCREASE AND DECREASE OF HORSES.

In 217 cases they are reported as increasing, in 43 as decreasing, in 206 as stationary, and in 526 no information is given.

6. IMPROVEMENT OF HORSES.

On 347 holdings horses are reported as improving, on 26 as deteriorating, on 137 as stationary, and as to 620 there is no information.

7. STUD HORSES INTRODUCED.

The returns give 122 entire horses introduced, principally thoroughbred, and 31 mares.

8. WILD HORSES.

The wild horses in the Colony are estimated at 100,744.

9. DISEASE.

Beyond a few cases of strangles no disease is reported.

10. TAX ON HORSES.

There were 653 owners who did not offer an opinion on this question; 190 were in favour of a tax on entires; 46 for its being imposed on mares; 17 on either horses or mares; and 190 were against all taxation.

CATTLE (A).

1. THE NUMBER.

The number of cattle in the Colony as given by the Registrar General for 1874 was 2,710,374.

2. DIFFERENT BREEDS.

On 522 holdings the cattle are returned as Short-horn.
 On 44 " " Hereford.
 On 96 " " Short-horn and Hereford.
 On 38 " " Devon.
 On 402 " " cross and mixed breeds.
 On 231 holdings owners make no return.

3. INCREASE.

672 owners report an increase, 55 a decrease, 113 that their herds are stationary, and 523 give no information.

4. HOW KEPT.

In 591 cases the herds are returned as running in paddocks, in 335 as at large, in 140 as both in paddocks and at large, and in 309 no information is received.

5. IMPROVEMENT.

On 529 holdings owners report their cattle as improving, on 9 as deteriorating, on 121 as stationary, and in 722 cases they give no information.

6. PEDIGREE STOCK INTRODUCED.

Short-horn	848 bulls.	226 females;	total	1,074
Hereford	82 "	25 "	" "	107
Devon	2 "	10 "	" "	12
	<u>932</u>	<u>261</u>		<u>1,193</u>

CATTLE (B).

I.—PLEURO-PNEUMONIA.

1. *Inoculation*.—The returns show that 201 owners inoculated *once*, 36 *twice*, 20 *thrice*, 5 *four times*, 2 oftener than *six times*, and 70 *often*, in all 334; while 240 report that they never inoculated, and 550 give no information.

Of those who inoculated, 304 used the virus from the lung, 23 from the chest, and 7 do not say what sort of virus they used.

Of those who did *not inoculate*, 240 are reported to be *in favour of* inoculation and 64 *against* it, while 158 *do not offer an opinion* with regard to it.

Of those who tried *inoculation*, there are 310 *in favour of* it, 17 *against* it, and 25 do not offer an opinion.

2. *Other treatment*.—The other remedies tried were—bleeding, tar on the nose, doses of nitre, and fumigation with sulphur.

II.—OTHER DISEASES.

1. *Cancer*.—Only 14 cases of this disease are reported.

2. *Ophthalmia*.—This ailment is reported in only 11 instances.

3. *Fluke*.—There were only a few cases in a single district.

4. *Worms*.—Only in two districts, and very slightly.

5. *Cumberland Disease*.—Has prevailed slightly in one or two districts,—only 11 cases in all.

6. *Black-leg*.—A good few cases of this disease have occurred in several districts. The cures tried have been bleeding and inoculation with garlic in the dew-lap. The latter is reported as an effectual preventive.

7. *Poison Pea*.—A good many deaths are reported as having occurred in the North-western and Northern portions of the Colony, through the cattle eating this pea. It seems to be spreading.

SHEEP (A).

1. THE NUMBER.

The number of sheep in the Colony in 1874 was 20,709,338, and 22,767,416 in 1875, being an increase in 1875 of 2,058,078.

2. COMBING AND CLOTHING.

The returns give 6,100,000 combing sheep, and 5,490,000 clothing; while with respect to 6,420,000 it is not stated whether they are combing or clothing and in a good many cases owners give no information.

3. LONG-WOOLLED AND CROSS-BRED SHEEP.

Of these some 125,000 are returned; and they are given as being of the following breeds:—Leicesters, 15,881; Lincolns, 9,771; Downs and other breeds, 37,583; and Cross-bred sheep, 62,242.

4. HOW KEPT.

In 395 cases the sheep are returned as depastured in paddocks, in 504 as shepherded, in 88 as both in paddocks and shepherded, and in 381 cases no information is given on this point.

5. IMPROVEMENT.

On 681 holdings the sheep are reported to be improving, on 43 as deteriorating, on 72 as stationary, and 548 owners make no return.

6. STUD SHEEP INTRODUCED.

The returns show that of these sheep there were 23,412 introduced, of which 18,086 were Merino; 343 Leicesters, 4,741 Lincolns, and 42 Downs.

THE ADVANTAGES OF FENCING FOR SHEEP.

1. *Improvement*.—(1) in the health and soundness of the sheep; (2) in their size and stamina; (3) in the quantity and quality of the wool; (4) in the carrying capability of the holding.

2. *Saving*.—(1) In expense of management; (2) in the losses arising from shepherding, especially from bad shepherds.

3. *Advantages to Owner*.—It relieves him from the trouble of managing shepherds and hut-keepers, and allows him time to attend to the improvement of the breed of his sheep.

4. *General benefit*.—This is stated by owners to be an increase of the value of a run of from 20 to 60 per cent.

SHEEP (B).

I.—LAMBING.

The general average of shepherded flocks was 72½ per cent., of paddocked sheep 75 per cent., and of sheep depastured both ways 74½ per cent.

II.—CLIP.

		lbs. ozs.	
1. <i>Greasy</i> —			
	The average clip of greasy wool in shepherded sheep was ...	4	3½
	" " paddocked " 	4	15½
	" " both " 	4	10½
2. <i>Creek-washed</i> —			
	The average of shepherded sheep was	2	12½
	" paddocked " 	3	4½
	" both " 	2	12½
3. <i>Hot water washed</i> —			
	The average of shepherded sheep was	2	8½
	" paddocked " 	3	2
	" both " 	2	11½
4. <i>Scoured</i> —			
	The average of shepherded sheep was	2	2½
	" paddocked " 	2	8
	" both " 	2	10

III.—DIFFERENCE IN WEIGHT BETWEEN COMBING AND CLOTHING.

On this point 1,238 owners give no information, 75 cannot say, 4 that there is no difference, 32 that there is a slight difference in favour of combing, 4 put the difference at 8 ozs., 2 at 12 ozs., 1 at 16 ozs., 4 at more than 16 ozs., and 6 state that combing is the more profitable.

SHEEP (C).

FOOT-ROT.

1. *Prevalence of the disease.*

366 owners give no information on the subject; 333 report that their sheep have not been affected; 475 that theirs have been slightly affected; 9 that theirs have been badly affected; and 62 that theirs have been very badly affected.

2. *Cures tried.*

(1.)	has been used by	80 owners.
<i>Arsenic</i> alone		
" and bluestone	15	"
" tar	2	"
" lime	2	"
" tar and soft soap	2	"
" soda	1	"
" aqua fortis	1	"
" tar and bluestone	1	"

(10.)	<i>Allen's</i> "	"	4 "
(11.)	<i>McNevin's</i> "	"	1 "

443 owners give no information on this subject.

SHEEP (D).

I.—FLUKE.

301 owners give no information in regard to this disease; 528 report that none of their sheep were affected; 117, that their sheep had the disease slightly; and thirty-three, that theirs were badly affected.

II.—WORMS.

257 owners make no report; 565 return their sheep as unaffected; 145, that they were slightly affected; and thirty-two, that they were badly.

III.—CURES TRIED FOR FLUKE AND WORMS.

(1.)	<i>Salt</i> alone	was used by	74 owners.

(6.)	<i>Horchound</i> alone	"	1 "

GENERAL (A).

1. *New Roads required.*

In 928 cases owners make no return under this head; in 235, they say that no new roads are required; and in 158 cases they recommend new roads.

2. *New Reserves required.*

In 928 cases owners make no return under this head; in 161 cases they say that no new reserves are required; in forty cases they say that there should be reserves every 8 or 10 miles; and in sixty-four cases they recommend new reserves.

3. *Wells or Tanks required.*

In 927 cases owners make no return as to this; in 207 they say that none are required in their district; in eighteen cases that there should be wells or tanks at every 8 or 10 miles along the droving roads; and in sixty cases they recommend new wells or tanks.

THE COST OF WELLS, TANKS, AND DAMS.

1. *Cost of Wells.*

The average price per foot for sinking wells ranges, in the different districts, from 15s. to 30s.

2. *Cost of Tanks.*

- (1.) *Pick and shovel*—The price ranges, in the different districts, from 1s. to 1s. 6d.
 (2.) *Horse and cart* " " " 10d. to 1s. 3d.
 (3.) *Plough and scoop* " " " 6d. to 1s. 6d.

3. *Cost of Dams.*

- (1.) *Pick and shovel*—The price ranges, in the different districts, from 1s. to 2s.
 (2.) *Horse and cart* " " " 1s. to 1s. 3d.
 (3.) *Plough and scoop* " " " 4d. to 10d.

GENERAL (B).

I.—NATIVE DOGS.

1. *Extent of losses caused by them, and number of sheep destroyed.*

In 796 cases owners make no return; in 263 cases they report they have had no losses; in fifty-two, that their losses were slight; in thirty-nine, that they were considerable; in thirty-five, that they were great; and in other cases, 23,686 sheep are reported to have been destroyed by these dogs.

2. *Legislation for their extirpation.*

There were 339 owners in favour of a law being passed for the eradication of native dogs, and thirty-seven against it.

II.—TAME DOGS.

1. *Extent of losses, and number of sheep destroyed by them.*

In 680 cases owners make no return; in 207 cases they state that they have had no losses; in seventy, that they had slight losses; in twenty-six that their losses were considerable; in forty, that they were great; and other owners report that they had sheep destroyed by tame dogs to the number of 24,151.

2. *Extension of the Dog Act to whole Colony, and increased tax.*

There were 519 owners in favour of this, and sixty against it.

III.—ARTIFICIAL GRASSES GROWN IN SEVERAL DISTRICTS.

These were rye-grass, clover, cocksfoot, prairie, bokhara-grass, buffalo, lucerne, and couch.

GENERAL (C).

THE DIFFERENT SORTS OF FENCES ERECTED, AND PRICES PER MILE.

Wire (alone).

2 wires.	
3 "	£34 to £36 for cattle.
4 "	
5 "	£40 to £56.
6 "	£50 to £75.
7 "	£60 to £90.

Wire and battens.

6 wires and 3 battens with posts 18 ft. apart,	£60.
6 " 5 " " 25 and 30 feet apart,	£15 to £60.

Iron posts and iron wire.

6 wires, £100.

Posts and one rail (both split) with wires.

2 wires,	£35 to £45.
3 "	£60 to £65.
4 "	£50 to £75.
5 "	£55 to £84.
6 "	£70 to £95.

Posts and two rails (all split) with wires.

2 wires,	£80.
3 "	£63 to £95.

Posts and three rails (all split) with wires.

3 wires, £65 to £90.

Irregular Wooden Fences.

Rough and tumble, £45.

Chock and log, 2 rails, £20 to £50.

3 " £90.

Dog-leg, £25 to £40.

Drop fence, £20 to £30.

Log and brush, £20.

Brush with fork and top rail, £20.

Two-railed split fence.

£40, £48, £50, £55, £60, £67, £70, £72.

Two-railed split fence earthed up.

£82.

Three-railed split fence.

£57, £64, £68, £70, £80, £85, £90.

Four rails split fence.

£80, £100, £125.

Split posts and round rails.

£36.

Brush fence.

£12 to £30.

Sapling.

£25 to £35.

Stone.

£120 to £130.

For both sheep and cattle the most generally approved fence is split posts and one split rail (top) with five wires; the next, the same posts and rail with six wires; the next, six wires and battens. For cattle only, two-railed split fence generally approved.

ALEX. BRUCE,
Chief Inspector of Stock.

HORSES.

RETURN showing the number of Horses in the several Districts; the number fit for Indian market; the increase and decrease of Horses in the several Districts; their improvement; the number of Stud Horses introduced; their Breeders' names; and the opinions of Owners to a tax on horses.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

LIVE STOCK.

(REPORTS FROM STOCK INSPECTORS.)

Ordered by the Legislative Assembly to be printed, 13 June, 1876.

RETURN to an Order made by the Honorable the Legislative Assembly of New South Wales, dated 27 April, 1875; That there be laid upon the Table of this House,—

“ 1. Copies of the Reports of the various Stock Inspectors throughout the Colony, furnished in compliance with the Circulars issued to them by the Chief Inspector of Stock, under date 28th August, 1st September, and November, 1874, and which were directed to be furnished on 1st February, 1875.

“ 2. Maps of the various Districts forwarded to the Inspectors of Stock as per these Circulars, and showing the information marked on such in compliance with the fourth paragraph of Circular of November, 1874.” *

(*Mr. T. G. Dangar.*)

LIVE STOCK.

1.—ALBURY DISTRICT.

STOCK INSPECTOR LOCKHART to THE OFFICER IN CHARGE, OCCUPATION OF LANDS.

Albury Sheep District Office,
16 September, 1874.

SIR,

I do myself the honor to acknowledge receipt of your circular of the 28th ultimo, on the subject of obstructions being offered to travelling stock, through water reserves being fenced in, or partially so, by pastoral tenants or others, and from other causes.

In answer thereto, I do myself the honor to state that, nowhere within the limit of my district are stock detained by the narrowness of the gates from proceeding on their journey, nor am I aware of any of the main routes being closed, thus obliging stock to be taken many miles round.

I am aware, however, that water reserves left expressly for the use of travelling stock, are being diverted from the objects for which they were dedicated, by being continually used by the squatters and free selectors in their immediate neighbourhood, and are practically of no use to those for whose special benefit they were intended.

This is felt by owners of travelling stock and teamsters to be a very serious hardship, and one for which, at present, there seems to be no redress.

The land has been, as I think most unfortunately, alienated right up to the main roads, and as the country is being rapidly fenced in, upon these water reserves, small in extent, and situated at great distances from each other, do drovers and teamsters depend for the sustenance of the stock in their charge.

In very many cases also, the pastoral tenants and others have fenced in these reserves, thus depriving the public of the use of them altogether.

I am informed by Mr. District Surveyor Wood that he is recommending in many cases the cutting up of the reserves for sale, simply because they are being diverted from the use for which they were originally dedicated, and are of no benefit to those who were really intended to profit by them.

It would appear to me, that the only practical solution of the difficulty would either be by fencing in these reserves, and charging a small sum for their use, or giving some Government officer the charge of them, and furnishing him with ample power to see that they are being only used by those parties for whose benefit they were actually intended.

I have, &c.,
NORMAN P. LOCKHART,
Inspector of Stock.

MR. GORDON BRUCE to THE CHIEF INSPECTOR OF STOCK.

Upper Murray, 15 September, 1874.

SIR,

In reply to your inquiries in circular of the 28th ultimo, I have the honor to inform you that I do not find any of the reserves for travelling stock fenced in, or in any way cut from the use of the public.

It has, however, been the practice of settlers holding land adjoining those reserves to depasture their stock on them, so that little or no grass is left for travelling stock.

I find that (with very few exceptions) every settler along the line of road between Waleregang and Bowna has erected gates, and in some cases put up sliprails only of a width not exceeding 10 feet, which are a very great obstruction to travelling stock.

I am not in possession of a sufficiently accurate map of the roads to say, with certainty that any of the public roads have been completely shut up, but it was stated to me that Mr. B. Gray, pastoral tenant of Waleregang, had shut up the old route which had been in use for years, and thus compelled the traffic to be sent some 5 miles round.

I would also call your attention to the surveyed road through the conditional purchases of John M'Intyre, in the parish of Fantier, which is impassable for some months every year from the overflow of the Murray, and would suggest that a new line of road be marked out along the higher bank, which could be done at a very trifling cost, and would be a great boon to those travelling stock along that route.

I have, &c.,
GORDON BRUCE.

Albury Sheep District,
February, 1875.

REPORT on the state of the Roads, Reserves, &c., in the Albury Sheep District, by Norman P. Lockhart,
Inspector of Stock.

No. I.

1. Main Southern, from Albury to Kyamba Gap, 59 miles.
2. Upper Murray Road, from Albury to head of Murray, 100 miles.
3. Deniliquin Road, from Albury to Howlong, 20 miles.
4. Road from Germantown, joining road from Albury to Wagga Wagga at Cookardinea, 20 miles.
5. Road from Albury towards Wagga Wagga to the limits of district, 60 miles.
6. Road from Gerogery to limits of district *via* Walhalla, 22 miles.
7. Road from Albury to Piney Range *via* Jindera, 40 miles.
8. Road from Main Southern Road to Tumberumba *via* Carabost and Glenroy, 44 miles.
9. Road from Germantown to Piney Range *via* Carabubula, Round Hill, and Walla Walla, 45 miles.

10. Road from Main Southern Road to Tumberumba *via* Neal's, Yarrowan, and Copabella, 40 miles.

11. Road from Jengellin on the Murray to Tarcutta *via* Copabella, 25 miles.

Those are the main tracks used in this district. There are, of course, by-roads and bridle tracks, to which in this report it is unnecessary to refer.

No. 2.

There are no roads or tracks running on both sides of the same creek in this district.

No. 3.

This is a question most difficult to answer with any degree of accuracy, and I fear much that I can only give an approximate estimate. I shall deal with the roads as numbered.

1. On this main road there is not nearly as much traffic as might be expected, and during ordinary seasons I do not estimate that more than 3,000 head of cattle and perhaps 20,000 sheep pass along. No doubt this number will be much increased as railway facilities are opened up.

2. This road is very little used by travelling stock, the Upper Murray cattle almost invariably cross at Walerangang, whether bound for the Beechworth or Melbourne markets. Probably not more than 1,200 head of cattle and 3,000 sheep pass along this road in any one given year.

3. I am probably within the mark when I say that only 700 or 800 head of cattle and possibly 5,000 sheep use this road in any ordinary year.

4. This road has only been recently opened up, and is at present used by teamsters.

5. A considerable quantity of stock would be brought along this road were reasonable facilities offered for their travelling along in comfort. As it is, what with the land being alienated right up to the main roads on the one hand, and the reserves being either fenced in altogether or eaten up by the stock of settlers in their immediate vicinity on the other, the travelling of stock is attended with much difficulty and depreciation in value. I do not think that more than 2,000 head of cattle and 12,000 or 14,000 sheep use this road in ordinary seasons.

6. This road is little used for stock travelling, a few sheep-owners from Walla Walla, Wallandool and the vicinity send stock sometimes by this road to the Beechworth and Melbourne markets, but I don't think we can safely say that more than 800 or 900 head of cattle and 6,000 sheep annually pass along this road.

7. On this road there is no traffic of stock, it is now however very much used by wool teams, many from Urana, Mahunga, Wongaline, Brooking, and the Murrumbidgee.

8. In ordinary seasons little or no stock pass along this road; a few hundred head of cattle, say 500; may pass down for fattening purposes, and possibly 4,000 or 5,000 sheep. Of course now immense bodies of sheep are fleeing to the mountains, and the traffic will be very great for some months, but such a season as this has not been experienced for many years, and it is to be earnestly hoped may not occur again.

9. This road at this dreadful juncture is being lined with travelling stock; in general seasons it is scarcely used.

10. This road also is but seldom used for travelling stock; some hundreds, probably about 700 head of store cattle come down from the mountains by this route, and possibly 3,000 sheep.

11. I don't think this track is ever used for travelling stock; buggies and drays sometimes pass along, but it is most frequently used by horsemen.

No. 4.

I consider a very serious mistake has been committed in not having roads much wider. They should have been 5 chains wide; for the last thirteen years I have been lifting up my voice (feeble though it may be) on the subject. It is too late in many cases to undo the evil that has been committed or rectify the mistake, the land has been alienated on both sides in most places right up to the roads, which are generally two chains wide. None of the roads in my district are sufficiently wide, I should strongly recommend that even now where practicable roads should be proclaimed five chains wide.

No. 5.

None of the roads in my district have been, from causes stated in the fifth interrogatory, rendered unfit for travelling stock.

No. 6.

This question is disposed of by the answer given to No. 5.

No. 7.

If the reserves already in existence, and those which in the course of this paper I shall recommend, be properly looked after and appropriated to the uses for which they are intended, and to that use alone, travelling stock will be tolerably well provided for, although not nearly so well as might have been had action been taken before so much land was alienated.

No. 8.

I think the facilities for moving stock are in this district ample so far as roads, tracks, &c., are concerned, provided reserves, camping grounds, and watering places are properly supervised.

No. 9.

I do not think so.

II.—PUBLIC GATES.

10. One broad gate is much preferable to two folding ones. Gates ought to be made of light sawn material, 12 feet wide in the clear, and fastened to the posts with very strong bolts passing through the posts and screwed with powerful screws. The round posts ought to be of a very substantial description, at least 18 inches square, charred, and put 4 feet in the ground; where to be had, they ought to be red-gum and bound with iron. The lighter a gate is, always supposing it to be well put together and strapped, the longer it will last; the very weight of gates framed of heavy materials tears them to pieces. The gates should be self-closing.

11. There are no public gates in my district.

III.

III.—CROSSING-PLACES.

12. There are no crossing-places in my district which require to be dealt with in the way indicated in this question.

IV.—RESERVES FOR GRASS AND WATER.

13. There are not at present sufficient reserves for feeding and watering travelling stock in my district either in the vicinity of towns or anywhere else. If my recommendations be attended to, and officers be appointed to see that those reserves are applied to the uses for which they were dedicated and to those uses alone, then travelling stock and the cattle of teamsters would have something like fair play dealt out to them.

14. On separate enclosure the question has been very fully answered.

15. Travelling stock have not in many cases access to the half-mile to which they are entitled, and reserves are in many cases fenced off so that they are of no use to travelling stock. The remedy appears to me a very simple one: let officers be appointed with full powers conferred upon them to put all these things on a proper footing, and once put to rights to keep them so.

16. In this district the reserves set apart for travelling stock are invariably used by the stock-owners in their immediate vicinity, and are utterly useless for the purpose for which they were intended. There appears to be two methods by which these reserves and watering places may be properly utilized: either by having them fenced in and placed under the supervision of trustworthy and competent men, who might charge an almost nominal sum for their use (I question, however, whether this would answer), or appointing officers part of whose duty it would be to look after these various reserves and watering places.

V.—DAMS, TANKS, OR WELLS ON DROVING ROADS.

17. I have fully answered this question on separate enclosure.

I have made this report as full as possible, and have, to the best of my ability, marked on the maps the various reserves, both those which at present exist and those which I have recommended. The county of Hume is on such a scale that I have found it almost impossible to indicate all the reserves I would have wished; it would have been much better that a similar plan to those of the counties of Goulburn and Selwyn.

From my own knowledge, and from information which has reached me from various sources, I have no hesitation in stating that throughout the whole of the Colony reserves are fenced in, and used by lessees of the Crown who do not pay for them and have no right to them, and that in very many cases parties who are legitimately travelling their stock to market have very great difficulties to contend with through the obstructions that are thrown in their way. No doubt some trouble and difficulty will be experienced in putting these matters on a proper footing; parties will be unwilling to give up what they have so long been using, and using too free of expense, and small farmers in the vicinity of reserves, who think they have acquired a sort of pre-emptive right to them, will demur to relinquishing them. Nevertheless a very great boon indeed will be bestowed on owners of travelling stock, teamsters, and others, if the results of these investigations have the effect of placing the reserves, watering places, &c., under the supervision of officers who will be responsible for their being properly utilized.

NORMAN P. LOCKHART,

Inspector of Stock, Albury District.

Main Southern Road—Reserves, &c.

1. Mungalareena Reserve, extent about 125 acres.
 - a Proposed to be extended by the addition of about 100 acres, making in all 225 acres.
- N.B.—A most valuable reserve, from its proximity to Albury.
2. Watering-place, about 40 acres, Thurgoona.
3. About 700 acres, at Bell's Nine-mile Creek, *Gazette* No. 72. A most invaluable reserve, at present completely monopolized by the neighbours round.
4. Watering-place, about 60 acres.
5. Temporary reserve for passage to water, about 600 acres, No. 73 *Gazette*.
I propose this should be made a permanent reserve.
6. Mullengandra reserve, 500 acres at least, No. 32 *Gazette*.
No use except to immediate neighbours.
7. Woomagamo reserve, about 160 acres.
 - b Proposed addition of about 40 acres.
8. 320 acres over gap, No. 579.
9. Near Forty-mile Hill, Nos. 643 and 454.
10. Public reserve, No. 33.
 - c Proposed addition, about 60 acres, part of No. 339.
11. Gazetted reserve, No. , Four-mile Creek.
 - d Proposed reserve, about 240 acres.

Upper Murray Road, No. 2.

12. Watering reserve, about 60 acres, No. 611.
13. Reserve gazetted, but number illegible, about 40 acres.
14. Dora Dora reserve, No. 97, withdrawn from lease.
 - e Proposed reserve about 320 acres (Seven-mile Creek), part of reserve No. 233.
 - f Proposed reserve of 320 acres, if land vacant.
 - g Proposed reserve about 60 acres, part of reserve No. 236.
 - h Proposed reserve of about 640 acres, Murray River, part of No. 247.
 - i Proposed reserve of about 640 acres, Murray River, part of No. 249.
 - k Proposed reserve of about 320 acres, Murray River, part of No. 250.
 - l Village reserve at Webragang. Proposed to be made public. No. 973.
 - m Proposed reserve of about 40 acres, portion of No. 255.

Deniliquin

Deniliquin Road (to Howlong), No. 3.

- o* Proposed reserve of about 10 acres, for watering purposes. Can be very imperfectly shown.
15. Reserve No. 51, about 100 acres, enclosed by fence by Dight Brothers. Obstruction shown on plan.
16. About 60 acres, reserve No. 56.
17. About 960 acres, No. 36.

Road from Germantown to road from Albury to Wagga Wagga, No. 4.

18. Reserve at New Billabong Bridge for watering purposes, about 50 acres, No. 554.
19. Reserve at bridge over Back Creek, No.

Road from Albury to Wagga Wagga, No. 5.

20. About 60 acres, No. 68.
- p* Proposed reserve of 320 acres on Gerogery Creek, with access to reserve of 40 acres at Springs. Part of No. 159.
21. Reserve of 320 acres, No. 161.
Fenced in by Samuel Watson, Esq.
22. Reserve of 40 acres, No. unknown.
23. Reserve of 640 acres, Nos. 644 and 947.
This reserve is, I think, fenced in by Messrs. Henty and Balfour.
24. Village reserve, extending on both sides of the creek, consisting of about 640 acres. Not gazetted.
This is a most valuable reserve, not only for this road but also the road from Germantown to Piney Range, which intersects it. The run of the flocks of Matchett and Culnane upon it, however, renders it quite useless to the public.
25. Reserve 655.
This ought to be a very valuable reserve, as there is a never-failing spring upon it. This is however fenced in, to the very serious injury of travelling stock.
26. Village reserve, No. 112, about 1,280 acres.
This reserve would be invaluable if it were applied to its proper use. I think this is a place where a dam might be very beneficially constructed at a probable cost of £450.
27. Portion of reserve 624, about 400 acres.

Road from Gerogery to Walla Walla, No. 6.

28. Reserve No. 162. Fenced in by Samuel Watson, Esq.
29. Reserve No. 607. Fenced in by Samuel Watson, Esq.
30. Reserve No. 894. Used by the lessees of Walla Walla Station, about 1,000 acres.
31. Reserve No. 158. At crossing-place, 40 acres.

Road from Albury to Piney Range, No. 7.

32. Reserve No. 63, about 120 acres. I think this is a place where a dam might be very usefully made, at a probable cost of £350.
33. Reserve No. 67, about 200 acres.
q Proposed reserve of 400 acres if it can be obtained, in order that a dam may be made. This is a most important place for a dam, as in such a season as this many miles might be traversed without finding water. Probable outlay £630.

Upper Tumberumba Road, No. 8.

Branching off the Main Southern Road at the "Little Billabong Reserve," traverses thence about 15 miles; then at the dividing range between Williams and Carabut enters the Wagga Wagga District, runs through that for about 15 miles, and then at the dividing range between Carabut and Glenroy re-enters the Albury District, and on to Tumberumba.

- r* Proposed reserve at Springs of 320 acres.
34. Reserve 848. Considerable size.

Road from Germantown to Piney Range, No. 9.

This (in seasons of drought such as this is unfortunately turning out) is a road of great importance, and requires ample reserves to be left for the use of the travelling stock that flee to the mountains; at present it is most inadequately supplied with facilities for stock travelling.

35. Reserve No. 456, about 100 acres.
- s* Proposed reserve of 640 acres, portion of 327.
- t* Proposed reserve of 640 acres, portion of 325.
36. About 3,200 acres, village reserve, Wallandry.

Road from Main Southern Road to Tumberumba, via Riads, Yarara, and Copabella, No. 10.

37. On Four-mile Creek, portion of reserve 201.
38. Yarara, portion of reserve 241.
39. Copabella Reserve.
- u* Proposed reserve at Boggy Creek, 640 acres.

Road from Jingellie to Tarcutta, via Copabella, No. 11.

40. Jingellie Reserve, or any portion of it that may be available.
41. Portion of reserve No. 328.

It will be observed that there are three localities where I have recommended the erection of dams for the use of the public:—

1. On the road from Albury to Wagga Wagga, near Cookkindinea.
 2. On the road from Albury to Piney Range, near Jindera.
 3. Also on the road from Albury to Piney Range, near Burranbuttock.
- Those proposed sites for dams are marked on the plans with asterisks.

2.—ARMIDALE DISTRICT.

STOCK INSPECTOR MAISTER TO THE CHIEF INSPECTOR OF STOCK.

Sheep Inspector's Office,
Armidale, 15 June, 1875.

SIR,

Referring to your circular of the 30th November last, and memo. of 12th instant, requesting me to visit the different droving roads and reserves used in the passage of stock through my district, I have the honor to report as follows:—

I have visited all the chief roads, and am otherwise acquainted with the requirements of my district as regards the passage of stock.

The reserves proclaimed from time to time in the *Government Gazette*, and which I have marked upon the general map herewith in red, are those in use, and are in my opinion suitable, and meet all the requirements in that portion of my district.

I have, however, suggested on the respective county maps herewith additional routes for the coast districts, which I beg leave to recommend for your approval.

These routes are shown in red lines, and numbered 1, 2, and 3, on the maps of the counties of Sandon, Vernon, Hawes, and Sandon; and general maps and separate description of each route I beg also to enclose.

The camping reserves made along the routes on the creeks and rivers are suitable, and will provide pasturage in time of floods; in other localities the width of the stock routes afford their own camping sites.

In a district like New England, where grass and water are abundant, I consider 20 chains sufficient for the principal stock routes, and 5 chains on less important ones.

Stock from the coast and that bred in this district form for the most part the stock that travels through it, and they may be variously estimated at (say) 10,000 cattle and perhaps 30,000 sheep.

I do not think the droving roads laid down on general map can be shortened or improved, and I think they are all the district requires. I am not aware of any obstructions on any of them.

I have, &c.,

A. J. MAISTER,
Inspector of Stock.*Reserve No. 1.—Counties of Sandon and Vernon.*

The Crown Lands $2\frac{1}{2}$ chains on either side of the road from the already proclaimed cattle route at reserve 29, Salisbury Water, to the road from Walcha to Nundle, as shown on map herewith.

N.B.—I think from the abundance of feed and water on this road, and also from the nature of the soil, that the width proposed will be ample for all stock travelling.

Reserve No. 2.—Counties of Vernon and Hawes.

The Crown Lands, $2\frac{1}{2}$ chains, on either side of the road from reserve No. 1, at Walcha, to Mount Sea View, *via* Yarrowich, as shown on maps herewith marked stock route No. 2.

N.B.—I think, from the abundance of feed and water on this road, and also from the nature of the soil, that the width proposed will be ample for all travelling stock.

Reserve No. 3.—Counties of Sandon, Clark, Raleigh, and Fitzroy.

The Crown Lands within 5 chains on either side of the road from Blicke River, on the Armidale and Grafton Road to Woolomombi, and 5 chains on the left-hand side of the same, from Woolomombi to Armidale, by the new surveyed line by the Snowy Mountains.

N.B.—I think, from the abundance of feed and water on this road, and also from the nature of the soil, that the width proposed is ample for all stock travelling.

A. J. MAISTER,
Inspector of Stock, Armidale.

3.—BALRANALD DISTRICT.

STOCK INSPECTOR M'LEOD TO THE CHIEF INSPECTOR OF STOCK.

Euston, 20 September, 1874.

SIR,

I have the honor to acknowledge the receipt of your memo., accompanying a letter from the Officer in charge of the Occupation Branch of Crown Lands, relative to the fencing in of water reserves, main routes entirely closed against travelling stock, and that gates only 10 feet are left on stock roads.

I reply, I beg to state, that so soon as I can obtain the desired information upon the various matters above stated, I will communicate the result.

If I may be allowed to express an opinion with respect to the 10 feet wide gates, I cannot see that wider ones are necessary, unless in exceptionable instances, where the country is very boggy. I put 200 head of cattle through a gate that width a few days since; they went through the gate in about ten minutes, and without the slightest difficulty.

As for sheep, it is absurd to say that a gate ten feet wide is not sufficient for any travelling mob of sheep, even if they numbered 20,000. As you are aware, where large lots of sheep are driven from one part of the Colony to another, they are not brought up to a gate in a lot of 20,000, but (say) in eight different flocks, of something over 2,000 each; and I think you will agree with me, that a gate of the width in question is sufficiently large to carry a flock of that size through in ten minutes, which should be sufficiently quick not to outrage the patience of any drover.

In conclusion, I am of opinion that the drovers, as a class, have every consideration shown them, but unfortunately there is a sprinkling of bush lawyers among them who will not be pleased, and so make unfounded assertions.

I have, &c.,

J. M'LEOD,
Inspector of Stock.

Stock

STOCK INSPECTOR M'LEOD TO THE CHIEF INSPECTOR OF STOCK.

Euston, 24 February, 1875.

SIR,

I have the honor to inform you that I have forwarded by this mail my report in answer to the various subjects contained in your circular of the 30th November, 1874, so far as it affects the Darling part of my district. I did expect that the whole of the report would have been forwarded, but I find that I cannot complete it until I obtain some further information.

I have, &c.,
JOHN M'LEOD,
Inspector of Stock.

STOCK INSPECTOR M'LEOD TO THE CHIEF INSPECTOR OF STOCK.

Euston, 24 February, 1875.

SIR,

I have the honor to acknowledge the receipt of your circular of the 30th November, 1874.

In replying to the questions submitted to me, I am afraid there will be some difficulty in explaining clearly the labyrinth of roads traversing this district, and regret that I am not closer to Sydney, when a personal explanation would do more to enlighten you upon the various subjects than pages of writing.

You will notice that, in framing the maps that there are portions of other districts, in addition to my own.

My reason for including parts of other districts was that you might see how roads recommended by other Inspectors suited the roads advised by myself, or those roads at present running through my district.

I shall now endeavour to make my explanations as clear as possible, and commence with the western end of my district, or that portion adjoining the Wentworth District, at Colwang, on the river Murray.

Those very important roads—the one from South Australia, and the other from the Darling, meet at Wentworth, follow the Murray, and enter my district at Collwang, on the Murray.

This road is much used by stock from the Darling and South Australia—the Darling stock being fat ones for the Melbourne market, and those from South Australia store stock for sale. I have known 180,000 sheep and about 4,000 head of cattle to travel this road during one season.

Of late years the store stock from South Australia has greatly fallen off; there is still a considerable number of Darling and Queensland stock that make use of this road—say from 40 to 50,000 sheep and 3,000 head of cattle.

The country between the Wentworth and Euston is of inferior description, there not being an average of more than 3 miles in width of decent country between the river and the mallee. I am of opinion that a road a mile wide should be reserved from selection and sale along this line of route, and be given up to travelling stock if you deem it expedient to do so. I cannot see the use of reserves; the mile wide would give stock access to water, which is all that would be required.

There are two roads coming into Euston from Wentworth, one leaving the river at Bengallow Creek, and the other at Mount Desperation, as shown in the tracing.

The road leaving Bengallow Creek passes through some 8 or 10 miles of mallee, then middling country into Euston—(this is the road used by the mail)—but in ordinary seasons without water. There is at present a lake, called Lake Prill, filled during the high flood of 1869 and 1870, 8 miles from Euston, but that cannot last for any length of time.

The other road leaves the Murray near Mount Desperation, and passes through 10 miles of mallee, when it again strikes the river, and is the road generally used by travelling stock.

To follow the river round from Mount Desperation to Euston would lengthen the road quite 40 miles, there being a very deep bend between Mount Desperation and Euston, as shown in tracing. A great saving in distance could be made between Collwang and Euston, but quite unfitted for stock as it would be through dense mallee. I therefore consider it would be advisable to leave both of the roads before mentioned open, reserving the one *via* Mount Desperation 1 mile wide, and when the road reaches the Murray, 5 miles from Euston, to be so laid out as to head the waters during flood-time.

Should you think it advisable to leave the other road open, a reserve of 320 acres should be left on the north-west side of Prill Lake, as shown in the tracing.

There has been a great mistake made in the manner in which the township of Euston has been laid out, and if it could be remedied in any way I think it deserves some attention.

During high floods, in fact even ordinary flood, the town is within an area of 100 acres.

The town is built upon the most eastern boundary of the reserve, that being the only dry spot; the telegraph office, which is situated about the centre of the township, is within 100 yards of the boundary, along which runs a post and rail fence recently erected by the Crown lessee of Euston Station, thus hemming in the township in a small triangular piece of ground, as I previously mentioned, of about 100 acres; the land on the outside of the fence in question, or on the north-eastern side of the township boundary, is a good plain and the only high land where the township could have extended; this land has been recently alienated from the Crown, and is now in the hands of the Crown lessee of Euston Station.

The land in question has been parted with without reserving a road to Wentworth, which should have left the township boundary at the same place that the Balranald Road leaves the boundary of the township. This is a road which cannot be done without during even ordinary floods. I would therefore recommend that a road be run through this land. It is only through the courtesy of the late purchaser that people can reach the Wentworth Road without going some distance round. I would therefore strongly advise that a road be run through the land in question, and the reserve extended in a north-westerly direction beyond the purchased land.

During ordinary floods a great part of the reserve is under water, and that not under water is the most distant from the township, consequently of little use to the inhabitants.

The first 9 miles of the road leading to Balranald after leaving Euston, is fenced on the right hand or river side, with the exception of a small river frontage about half-a-mile above Euston station, and 3½ miles from Euston; this piece of land should be secured as a stock and water reserve; it has a frontage of about half-a-mile to the river, and is high land. I have marked its position in red dotted lines at the point of a bend in the river.

With

With regard to the 9 miles of fencing between Euston and Lake Benanee, I will leave the first 3 miles, as that encloses the horse paddock belonging to the station, and draw your attention to the next 6 miles, viz., from Euston Station to Lake Benanee. The whole of the land enclosed by this fence is Crown Lands; so far as I know, the country left for travelling stock is of inferior character, but as the distance from Euston Station to Benanee Lake is so short (6 miles) I cannot see that any very great good would be obtained by causing the fence to be removed. The country around Lake Benanee is very good, being open salt bush plains. There is a small reserve on the above lake, as shown in the tracing, on the western side. I do not know for what purpose the above reserve was left for, if not for stock purposes. I would advise a reserve 320 acres adjoining and on the north side; I would also recommend a reserve of 320 acres on Lake Proa, north side. Lake Proa is 3 miles nearer Balranald, and also close to the road.

When the road leaves Lake Proa it does not again touch the river until arriving at Mcilman Station, a distance of 7 miles: if a reserve were made there, it would be within a hundred yards of the home station; the river at this point takes a bend to the right, and this bend is the station horse paddock; 3 miles further on and the boundary is reached where a reserve was proclaimed during the high flood of 1870, for crossing stock by steamers; perhaps this would answer for a stock reserve—it is doubtful if it will ever be again used for the purpose it was reserved.

The reserve above mentioned is at the boundary of Meilman and a block not named but immediately under Merowa. The reserve is shown in the tracing.

The road leaves the Murray at the before-mentioned reserve and does not again touch that river, but follows creeks and branches of the Murray and Murrumbidgee until it reaches Lake Waldeara, between the last-mentioned reserve and Lake Waldeara. I have dotted in two reserves at distances of from 8 to 10 miles apart. There is a reserve at the lake, but for what purpose it was left I cannot say. I would advise a reserve on the north-west side of the lake and adjoining the present one; I have marked its position on the map. I believe the present reserve was marked by Mr. Surveyor M'Cabe many years since. Lake Waldeara is 16 miles from Balranald; if a reserve were left half way (1 square mile), I think it would meet all requirements.

The road from Euston to Balranald could be shortened quite 15 miles by following the telegraph line; it would be through Malee; the greater part of the way would necessitate the construction of tanks, as there is no water. The telegraph line is used by the mail and other vehicles.

Before leaving Balranald I may mention that I think it advisable to increase the size of the reserve by extending it up the Murrumbidgee say for 1 or 2 miles, not to be used by the inhabitants, but to be altogether a travelling stock reserve; the reserve only to extend up the river on the north side.

Balranald is a most important crossing-place; and when the approach, a wooden structure on piles, half a mile in length, is completed, and now in course of erection, a vast number more stock will travel that route.

Stock that now travel from the Darling *via* Booligal and Hay, during the flooded seasons will take the more direct road by Balranald, where they will be sure of a crossing *en route* for Victoria, I therefore consider that every facility should be afforded travelling stock at Balranald.

I have now concluded my observations upon the road leading from Wentworth to Balranald, but, before leaving the Darling district, would ask you to follow me into the back country between the Darling and Murray, and Darling and Murrumbidgee:—

The first road which I shall bring under your notice is the Great Northern Road, or main road leading from the Darling to Booligal. You will notice on the tracing that this road skirts the most northern end of my district, and is the road upon which tanks and wells have been made by the Government, and is a road over which a large number of fat stock travel to the Victorian markets. Immediately under the above described road is another travelling route for stock, tending in the same direction and joining near Booligal. This road also carries a large number of stock, and leaves the Darling close to where the upper road strikes out from that river.

I shall now draw your attention to one of the most important roads in this district. You will notice by the tracing that it leaves the Great Northern, or Main Booligal Road, on Kilfera block H, passing through Kilfera block F, D, and A, until it reaches Miparo, or Manfred, when it turns to the east *via* Clare block B; thence through the corner of Dolmore and Till Till, Yhoul, Chnowe, Saharra No. 2, to Darling block D; here it takes a westerly direction through Nillebad to Bedina, thence east by south through Toylandbool to Paika Lake and Balranald. There is another branch of this road leaving Darling block D, and passing through Juanbung and Yarrawal to Paika Lake, and thence into Balranald; this is something shorter than the other road.

The last-described roads bring more cattle and sheep to the crossing-place at Balranald than all the other roads put together; large numbers of fat stock from Queensland and the Upper Darling use this route as their most direct road to Melbourne; when the approach at Balranald is completed I calculate that three times as many stock will travel that road, for the reason that they are sure of crossing at any seasons of the year.

The above roads pass through excellent country, and after crossing the Murrumbidgee at Balranald continues its course (as shown in tracing No. 2) to the crossing-place at Tooleybuc or Swan Hill.

You will notice that I have drawn a red dotted line from Paika Lake to Clare block B, where there is a junction of a number of roads; the red dotted line is then continued to the fresh-water well marked in green; this proposed line would pass through good country, and curtail the distance very materially.

The reason why these back country roads are so crooked may be accounted for by teamsters and others following the improvements for the purpose of obtaining water, &c.

The number of stock that yearly make use of the above road cannot be less than 10,000 head of cattle and from 50,000 to 60,000 sheep, nearly the whole of these being fat and destined for the Victorian markets.

This is one of the roads which should receive the attention of the Government; in fact if that road was made a thoroughly practicable road for stock there would be but little more wanted in the way of water improvements.

The distance, if the road was made straight, would not exceed 100 miles, say seven tanks or wells. I cannot at present lay down the exact spots where these wells or tanks should be placed, but there will be no difficulty when it is determined the distance they shall be apart in finding suitable places.

Tanks

Tanks should be placed in such a position as to secure as large a shed of water as possible, at the same time giving every attention to the description of ground in which it is placed, clay being the best for such a purpose.

The next road in importance which I shall bring under your notice is one leaving the Darling at Pooncary and running a south-easterly course until it reaches Arumpo, when it turns direct south to Euston; there is also a branch of this road running east from Boomarecool to the Bedena Block, and thence south-east into Balranald; that part of the road leading from the Darling to Euston passes through very good country with the exception of a few miles after leaving the Darling, and also for a short distance before reaching Lake Benanee.

The branch road which leaves Boomarecool block also passes through fair travelling country. This is a line of route which would require tanks or wells—but I think for the present only the direct line into Euston—and for the reason that stock leaving the Darling at Pooncary can reach Swan Hill in the same distance *viâ* Euston that they can by going *viâ* Balranald if their object was the crossing place at Balranald, during the flooded season of the year, then there is generally sufficient surface water for travelling stock purposes.

Should you consider this road of sufficient importance to place wells or tanks on it, six tanks or wells would be sufficient for all purposes; the distance is about 100 miles.

You will notice that by making the road straight a considerable saving could be effected, but as it would be nearly all through malee perhaps it would be advisable to leave the road as it is.

There is a belt of malee following the Darling and Murray in a parallel line for a very long distance, and the nearer it gets to the confluence of the two rivers the more dense it becomes, and at last the open country ceases and there is nothing but malee, excepting a narrow strip along the rivers; it is the same on the Victorian side of the Murray as far up as Swan Hill. The number of stock which travel the above described road will be about 2,000 head of cattle and 20,000 sheep.

The next road which I shall bring under your notice is a branch road starting from Golgolon, on the tracing, and running in a south-easterly direction to Balranald. This road is occasionally used by stock from the Upper Darling; it is through very bad country, and a road which I do not consider of sufficient importance to induce the Government to make any improvements.

There is a road entering my district at Oxley, on the Lachlan, as shown in the tracing, and running north until it joins the road from the Upper Darling on Clare block B. This is a road which could be made much shorter, as shown by the red dotted line, and it is through excellent country; the only difficulty is a creek on Juambung, over which a stock bridge would be required.

This road is not made much use of at present, but in course of time will doubtless become an important road, as it leads to Hay; or by crossing at Maude, on the Murrumbidgee, is a direct line to Deniliquin or Moama.

There is another road in the Darling part of my district which I have neglected to mention; it leaves the Main Darling Road to Balranald on Meparo or Manfred Block, running through Meparo or Manfred, West Muruluru, Gol Gol, and upon reaching Golgolon strikes a road leading to Balranald, or by keeping the west and by south course intersects the road from Pooncary on the Darling to Euston. A great many stock take this route, more especially sheep coming into the frontage to be shorn, or fat sheep from the back blocks intending to cross at Euston for the Victorian markets.

This road should be reserved, but I cannot see that the Government are called upon to make improvements.

In concluding my remarks on the Darling portion of my district, I would strongly recommend that those great arteries for the supply of fat stock to the Victorian markets, such as the Great Booligal Road, and the road leaving the Booligal Road on Kilfera block D for Balranald, be the first to receive your attention; and I would recommend that those roads be reserved from selection and sale 1 mile wide, or reserves at each tank or well of 2 square miles.

I may here remark that the number of goats and other useless animals kept on the reserves belonging to the various townships require the interference of the Government. People are not content with keeping a sufficient number of goats to supply their wants with milk, but individuals go in for hundreds; the consequence is that useful animals are driven to find their food on the surrounding stations. I should think there must be from 800 to 1,000 goats at Balranald, Euston, and Moulamien in proportion.

I have, &c.,

JOHN M'LEOD,

Inspector of Stock.

PUBLIC GATES.

It is almost impossible for me to show the gates in the tracing, it being upon too small a scale, and would cause confusion; but I may explain that, with the exception of the unoccupied country, gates are to be found about every 5 miles, or as follows:—From Coultong to Euston, 5 gates; from Euston to Balranald, 14 gates; from Balranald to Moulamien, 9 gates; from Balranald to Swan Hill, 11 gates; from Balranald to Tooleybut, 5 gates; from Euston to Pooncary, 5 gates; from Euston to Kilfera, 18 gates; from Balranald to Oxley, 9 gates.

The gates vary in width from 10 to 12 feet; they are generally made of sawn stuff, and swung upon strong iron hinges that go through the posts, with a nut to prevent them coming out. Others are made of round stuff cut from the bush. I am of opinion that the gates are quite large enough, at all events those 12 feet wide, for the passage of stock. I occasionally meet with a gate that, from accident or carelessness on the part of the Crown tenant, has become disarranged and out of order, and consequently some trouble in opening and shutting from the fact of it not swinging truly, but upon the whole the gates in this district meet the requirements.

TANKS AND WELLS.

I have endeavoured to obtain an opinion from a number of people to whom I have spoken, how these wells or tanks are to be cared for when they are made, but it appears to be a question not easily answered; in fact, I have not got an idea from any of those that I have spoken to that is practicable.

I have two suggestions to make. The first is that when a line of tanks or wells is completed—for instance, from Balranald to Kilfera block H—they be put up to tender, the successful tenderer to keep the

the tanks or wells in order, for which he shall be paid by the owners of stock so much per 1,000 for sheep and per head for cattle:

The other suggestion is, that where the tanks or wells are finished, and properly secured by good substantial fences, that the Government appoint some one to each line of route upon which wells or tanks are placed. His duties would be to see that the property under his charge was kept in proper order, and receive fees from stock requiring water, say a farthing a head for sheep and 2d. for cattle.

Tanks should not be less than 15,000 to 20,000 yards. The present cost of that description of labour is from 1s. 3d. to 1s. 6d. per yard according to situation.

Boring costs 5s. per foot, while tank and troughing will cost about £200.

Well-sinking in the back blocks costs about 35s. per foot. There is then the uncertainty of procuring good water. I am of opinion that tanks would be preferable; the supply of water would then depend upon the size of the tanks.

A Mr. Toohay is said to have patented an invention in Melbourne which will very much lessen the cost of tank-sinking. By his invention tank-sinking is calculated to cost about 2d. per yard. Each machine is supposed to take out 30 tons per hour. The machine costs about £120.

I understand that the Hon. William Taylor, of Overwinton, Keilor, Melbourne, has purchased two of the above machines, and that they have been satisfactorily tried upon his property at the above place. The machines are intended for his back blocks in this district, and from whom you would gain every information.

The first road which I shall bring under your notice in the Murrumbidgee portion of my district, and making direct for Swanhill and Toollybuc crossing-places, at a distance of 25 miles from Balranald, the above road crosses the Wakool, a very large stream in the flooded season. The above crossing is known by the name of Talbett's Crossing-place. Nearly all the stock from the Darling and the intervening back blocks between the Murrumbidgee and Darling, which cross at Balranald, also cross at the above crossing. I find that I have laid down the road in the accompanying tracing slightly too much to the west; the pencil line in the tracing will be nearer its position. The two reserves which I have laid down between Yanga Lake and Talbett's Crossing-place should be on the west side of the road. It is 9 miles from Talbett's to the crossing-place at Toollybuc on the Murray. You will notice that I have recommended a reserve half-way between the two crossing-places. Stock can cross at Toollybuc when they cannot cross at Swanhill, and there are better appliances for the passage of stock; for instance, there is an excellent punt and good poutoon bridge. I would strongly advise that a road 1 mile wide be reserved from sale and selection between Balranald and Toollybuc, and do away with reserves. This will always be a very important road.

There is another road leaving Talbett's Crossing-place for Swanhill, which follows the Wakool for some 23 miles when it enters the Murray Downs property. For 13 miles the land is purchased on the river side of the road, in fact until it reaches Swanhill. There are two reserves left, one close to the Spewan Creek, as shown in the tracing, and another 5 miles further on nearer Swanhill. The road through the purchased land is 3 chains wide. You will notice that I have recommended three reserves between Talbett's Crossing-place and where the road enters the Murray Downs property. I understand that all the reserves on the Murray Downs property have been specially included in the run for assessment.

The two reserves inside the purchased land, the one in black close to the Spewan Creek, and the other in red and black 5 miles nearer Swanhill, should be made stock reserves if the road is to be made any use of as a stock road. The country is very flat on the New South Wales side of the river at Swanhill, and consequently in flood time the water flows out for a long way. Were it not for a bridge, erected by Mr. Officer on this purchased land, it would be impossible to reach Swanhill without swimming. I do not think that a permanent roadway could be made to the Swanhill Crossing-place under £2,000, if for that sum; the distance is about 1 mile.

The average number of stock that cross at Toollybuc and Swanhill cannot be less than 10,000 head of cattle, and from 60 to 70,000 sheep.

The next road I shall bring under your notice is one leaving the Main Balranald Road at Yanga Lake and crossing Yanga Creek by a private bridge. This line of route shortens the road to Moulamein, but there is a distance of something like 25 miles without water; there are some lakes about half-way that have water in them at present, and which were filled during the high floods of 1869 and 1870. Those lakes must have been dry for many years previous to the extraordinary flood of '69 and '70 and will shortly be dry again.

The road which stock take at present that wish to reach the Moulamein from Balranald, or *vice versa* is from Balranald, *via* Yanga Lake to Talbett's, and up the Edwards. The distance from Yanga Lake to Talbett's is about 20 miles, also without water; so, perhaps, it would be advisable to sink a tank half-way between Talbett's and Yanga Lake, and make that the stock road to the Moulamein as well as Swanhill; the distance saved by the first-named road, viz., by crossing the Yanga Creek, over which a bridge would be required, is not more than 7 or 8 miles. I may mention that no fat stock would take that road, as it is not in a direct line to any market. There are two or three squatters in the Deniliquin District who have back blocks between the Murrumbidgee and Darling in this district that would make use of the road, but with the exception of those persons, and perhaps an odd lot of store sheep purchased by some one, there would be little traffic on the road. There is another road that leaves Balranald and crosses the Yanga Creek at the private bridge before named, which winds its way up the Murrumbidgee to Maude and there to Hay. This is another useless road, and scarcely ever used by legitimate travelling stock, for the simple reason that it is not a direct road to any market or place; being a good frontage, loafers are the principal stock that take advantage of it.

The next road that I shall draw your attention to is the road from Talbett's Crossing-place up the Edwards to Moulamein, and thence to Deniliquin. This road is very much in want of two bridges, one over a creek about half-way between Moolpar and Talbett's. I do not know the name of the creek, but the cost of placing a bridge over it would not be much—say £150.

There is also a bridge very much required over Forest Creek, between Moolpar or Salisbury Plain and Moulamein. This a dangerous creek, more especially for strangers, and there is a considerable amount of traffic on the road. There is plenty of timber for building purposes close at hand. I do not think the cost would be more than £200.

I must now ask your attention to a very important road in this district, viz., the direct road from Moulamein to Moama, at present almost shut against the public.

A petition to the Minister for Lands is, I understand, in course of signature for the survey of the road in question. I may quote the following from a letter I received from an influential gentleman in that part

part of the district,—“ On Saturday last I received a petition addressed to the Minister of Lands requesting him to open up the road from Moulamein to Moama *via* Chowar; owing to these matters being in your hands I decline to sign it at present. It appears that about six years ago a road was surveyed from Moulamein through Nyang *via* Chowar on the Neimur to the centre of the Chowar Run, and there abruptly stopped; this road was only five chains wide. What is required is for this road to be proclaimed the usual width for stock, viz., a mile where not prevented by purchased land. From Chowar the road goes by North Wakool to Thule Lagoon, thence to Perecoota through Toorangabby and on to Moama. There is so much alienation of Crown Lands going on that you will see the necessity of speedy action.” I wrote to you concerning this road some years ago; there have been continual complaints as to the difficulty in getting through to Moama; if I recollect rightly, Mr. Cameron, of Chowar, purchased land at the crossing-place on the Neimur for the purpose of preventing stock travelling that way.

This road, if opened, would be much used by fat stock for the Melbourne market, and would be a great saving in distance, as stock from that neighbourhood have now to travel *via* Deniliquin, which I suppose must be quite 50 miles out of their direct route. I am sorry that I have not had time to inspect the line of route; I am quite unacquainted with the road excepting to the boundary of my district. You will observe on the tracing that the road crosses the Edwards at Moulamein, then following the Edwards up until it reaches the boundary of Nyang with Balpool, it then runs south-east through Chowar to Thule. I know nothing of the road after it leaves Nyang, but have marked it to Thule in the direction I suppose it would take. I would strongly advise that this line of road be reserved from selection and sale until it can be surveyed. I presume that Mr. Inspector M'Cullough, of Moama, has brought this road under your notice.

There is another road going direct south from the Moulamein to the Murray, and passing through Nyang, Noorong, and Gonn; this road has never been used by stock to my knowledge, but being a direct road to Sandhurst may at some time or other be made use of.

There is a road marked on the tracing leaving Swanhill and running through Murray Downs, Willikool and Melool to Gonn; this road is seldom used by travelling stock, still it is a road which should be kept open.

The road from Moulamein to Maude should be a mile wide; there will no doubt be a large number of stock travel that road when they can cross at Moulamein and make direct for Moama *via* Nyang, Chowar, and Thule.

In conclusion I may state that, as large areas of country are continually being alienated from the Crown by purchase and selection, that it is quite possible that some of the reserves laid down in the tracings may encroach upon such lands. I trust you will excuse the very rough manner in which the tracings have been got up, it being my first attempt at such work.

I do not know of any new roads required in the Murrumbidgee part of my district, but would recommend that neither sale nor selection be allowed where important stock roads are laid down, until the Government have determined upon what they will do in the matter.

I have, &c.,
JOHN M'LEOD,
Inspector of Stock, Balranald.

I shall now answer the questions contained in your circular of the 30th November, 1874, *seriatim*:—

1. The roads and tracks for travelling stock will be found in general report.
2. The Murrumbidgee and Edwards are the only rivers that have roads on both sides. The road on the west side is the one used by travelling stock; the road on the east side is seldom or ever used excepting it be by loafers. Neither can be used in the flooded season. The road on the north side of the Edwards, which is the main road to Deniliquin, is the road in general use. If the road is opened from Moulamein to Moama, the road on the south side will be made use of for a short distance.
3. This question is answered in general report.
4. All droving roads should be 1 mile wide.
5. Does not apply to this district—no metalled roads.
6. Any alteration is mentioned in general report, and shown on the tracing.
7. More direct roads shown on tracing, and mentioned in report.
8. Attended to in report and tracing.
9. If obstruction means when a road is fenced on one side and not on the other, there are several cases of the kind; but in all cases they have plenty of room on one side, by which I mean they can (the drovers) get the width allowed by law. There is a fence between Euston and Coltwang which runs along Bengallow Creek, which I think should be removed, or travelling stock allowed to go inside, for the reason that there is nothing but mallee scrub on the side they have to travel upon.
- 10 and 11. Will be found answered on a page headed “Public Gates.”
12. The crossing-places at all the punts, with the exception of Swanhill, are abrupt; an expenditure of £20 at each crossing would improve them very much.
13. The reserves recommended will be found in general report.
14. Refer to general report.
15. Answer given; refer to question 9.
16. When stock are running at large or in paddocks I cannot see how reserves are to be protected, unless they are fenced.
17. Wells and tanks are recommended in general report.

No. 4.—BATHURST DISTRICT.

STOCK INSPECTOR CROAKER to THE CHIEF INSPECTOR OF STOCK.

SIR,

Bathurst, 15 June, 1875.

I have the honor to acknowledge the receipt of your memo. of the 12th instant, in reference to your circular of instructions dated 30th November last. I beg to state that my report would have been sent in months ago, but that after many ineffectual attempts to mark the roads upon the maps I was convinced of my utter incapacity to comply with this request.

I

I enclose a report written in January last, but the maps (which are sent by this post) are not marked, for the reason stated—that I cannot understand them. Admitting my incompetency in this direction (which I exceedingly regret), I am conscious of having performed the duties of my appointment, as far as the means at my disposal would allow, with care and consideration.

I have, &c.,
T. L. P. CROAKER,
Inspector of Stock.

I.—DROVING ROADS AND TRACKS.

No. 1 *a*. From Shepherd's Creek, *via* Mulyan, Ophir, Icely, Swallow Creek, Mary's Lane, Bathurst, Macquarie Plains, Dirty Swamp, Mutton's Falls, Sodwalls, Rydal, to Wallerawang.

b From Orange, *via* Lees Paddock, Pretty Plains, Dungeon Creek, and along Rodd's line of road to Evans' Plains and Bathurst, running nearly parallel with main macadamised road, and always used by drovers.

c From Lachlan, *via* No. 1 Swamp, Caloola Creek, Back Creek, Mitchell's Plains, O'Connell Plains, Mutton's Falls, Sodwalls, Rydal, to Wallerawang.

d From Mudgee, *via* Crudine Creek, Sofala, Wattle Flat, Limekilns, Clear Creek, Winburndale, Kelso, to Bathurst.

e From Mudgee, *via* Blackman's Crown, Ben Bullen, Cullen Bullen, Lithgow Valley, and along Bell's old line to Currajong and Sydney.

f From Rockley, *via* Swallow's Nest, Native Dog Creek, Oberon, Duckmaloi, Marsden's Swamp, One-Tree Hill, along old mountain road to Sydney.

No. 2. No roads or tracks following rivers or creeks in this district continuously.

No. 3. On No. 1*a*, 8,000 sheep and 2,000 cattle; on No. 1*b*, 35,000 sheep, 10,000 cattle; on No. 1*c*, none, or very few indeed; on No. 1*d*, from 800 to 1,000 sheep and a few stud cattle; on No. 1*e*, 50,000 sheep, 15,000 cattle; on No. 1*f*, none, an occasional mob of cattle.

No. 4 (1). Half-a-mile on either side of road should be enough.

(2). Where the land is unalienated they are right; where it is not, of course no alteration can be made.

No. 5. The Main Orange Road is the *only* one rendered so, but it is not used for drovers. See remark No. 1*b*.

Nos. 6, 7. From Orange No. 1*b*, as already described, should be secured, and reserves made wherever practicable. Bell's line, all through to Currajong from Wallerawang, should also be reserved for stock travelling; and the line from Shepherd's Creek (No. 1*a*) to Bathurst *via* Ophir should be marked, and reservations made. There are no other roads in frequent use.

No. 8. I think not. But the present roads and tracks, wherever the land is not alienated, should be marked 1 mile wide, and good-sized reserves made at least every 10 miles, for the exclusive use of droving stock.

No. 9. None.

II.—PUBLIC GATES.

No. 10. The size and same description as those used at the Government tolls would answer very well; if double, the two supporting and centre posts securely capped.

No. 11. None.

III.—CROSSING-PLACES.

No. 12. Crossing-places good enough for stock passing.

IV.—RESERVES FOR GRASS AND WATER.

No. 13. No.

No. 14. Large reserve needed at or as near as possible to Wallerawang. At Raglan and Orange railway stations no land is available, nor within any such distance as would make it of any service to stock waiting for passage. Answered in Nos. 6, 7, and 8.

No. 15. Yes.

No. 16. I can find no reserves in this district set apart for travelling stock. Free selectors and other owners of lands are in the habit of using the commons, but as far as my information goes there are no obstructions.

V.—DAMS, TANKS, AND WELLS ON DROVING ROADS.

No. 17. Nothing of the sort necessary. Plenty of natural water.

Memo.—All the sheep now sent from here to the Sydney markets go by rail, and as soon as available preference will no doubt be given to this mode of transit from Orange. Only cattle and horses will be driven.

T. L. P. CROAKER,
Inspector of Stock.

No. 5.—BOURKE DISTRICT.

STOCK INSPECTOR FOOTT TO OFFICER IN CHARGE, OCCUPATION OF LANDS.

Bourke, 14 November, 1874.

SIR,

In reply to circular 74-1636 M, I have the honor to state that I am not aware of the existence of any such obstructions as those specified, on the main travelling roads in this district.

I have, &c.,
T. W. FOOTT,
Inspector of Stock.

Forwarded through Chief Inspector.

Stock

STOCK INSPECTOR FOOTT TO THE CHIEF INSPECTOR OF STOCK.

Bourke, 30 January, 1875.

Sir,

I have the honor to furnish the information concerning droving roads, &c., required in your circular of 30th November, 1874.—(74-1,820, S.B.)

I.—DROVING ROADS AND TRACKS.

1. *a* Road from Queensland Boundary, west of meridian 146°, crossing Culgoa and Darling Rivers, proceeding up the Bogan River, thence to Dubbo.
 - b* Road from same point, diverging from former at Erringonia, crossing Darling River at Bourke; thence *via* Oxley's Tableland to Pink Hills, where it rejoins the other road.
 - c* Road from Queensland boundary on the Paroo River, crossing Warrego River at Ford's Bridge, crossing Darling River at Bourke, and then joining *a, b*.
 - d* Roads from Queensland boundary down the Culgoa, Birie, and Bokhara Rivers, joining *a, b, c*.
 - e* Road up the Marra Creek.
 - f* Road from Bourke to the Lachlan *via* Cobar.
 - g* Roads on both sides of the Darling River through the district.
 - h* Road from Queensland boundary down both sides of the Paroo River to Wilcannia.
 - i* Road diverging from *h*, at Wurrumutty; thence to the Darling River.
 - j* Road from Queensland boundary down east side of the Warrego River to its junction with the Darling River.
2. *a* West side of Bogan River preferable in all seasons.
 - g* Both necessary.
 - h* Both necessary, as the one most used (east side) is impassable by stock in flood-time.
3. *a* Cattle, 5,000; sheep, 100,000.
 - b* Cattle, 1,000; sheep, 130,000.
 - c* Never knew of any. Sheep, 50,000.
 - d* Cattle, 3,000; sheep, 50,000.
 - e* Cattle, 5,000; sheep, 80,000.
 - f* Not long opened. Sheep, 100,000.
 - g* Cattle, 5,000; sheep, 100,000.
 - h* Cattle, 8,000; sheep, 120,000.
 - i* Sheep, 10,000.
 - j* Cattle, 4,000; none of late years.
4. Half-a-mile on each side of the road (3 chains wide), and in cases where a fence bounds the track on one side, a mile should be allowed from such fence to constitute the road? Yes.
5. None.
6. None unfit.
7. No change necessary at present.
8. None at present.
9. None.

II.—PUBLIC GATES.

10. One pair swing-gates, 12 ft. wide, for general traffic, with two slip-panels, each 10 ft. wide, adjoining for stock.
11. Seventy-one gates at present (indicated on map by blue stroke); number increasing, as fencing is progressing rapidly in this district. Those erected are of various sizes, generally as recommended in 10; but a few are too small for stock traffic.

III.—CROSSING-PLACES.

12. No alterations required in present crossing-places.

IV.—RESERVES FOR GRASS AND WATER.

13. No.
14. *a* Reserve on Birie Creek recommended, as that on the west side is useless to travelling stock, being on the wrong side of the river. 2 square miles.
 - b* Yes, at Culgoa Crossing-place, 1 square mile.
 - c* Yes, on north side of Darling River, at Brewarrina. 2 square miles.
 - d* Yes, at Pink Hills, on west side of Bogan River. 1 square mile.
 - e* Yes, at Gongolgon, on west side of Bogan River. 1 square mile.
 - f* Yes, at Mulrey, on both sides of the Bogan River. 2 square miles.
 - g* Yes, at junction of Marra Creek and Darling River. 2 square miles.
 - h* Yes, commencing on Darling River above Bourke, at boundary of permanent common, and extending up the river to junction of Bogan River. About 3½ miles frontage, and extending back to Sydney road. Very necessary.
 - i* Yes, on road to Ford's Bridge, about 15 miles from Warrego River. 1 square mile.
 - j* Yes, at each of the springs on road from Ford's Bridge to Paroo River. Small reserves sufficient.
 - k* Yes, at Two Waterholes, on Lachlan Road, between Bourke and Cobar. 1 square mile.
 - l* Yes, at Werrinia or Yellow Waterholes on same road. 1 square mile.
 - m* Yes, at Nullamut, same road. 1 square mile.
 - n* Yes, at Erringonia, on east side of Warrego River. 2 square miles.
 - o* Yes, at Ford's Bridge, on both sides of Warrego River. 2 square miles.
 - p* Yes, at Thauapatcha, on both sides of Paroo River. 2 square miles.
 - q* Yes, at Mullinia, commencing on Paroo River, 1 mile below boundary of Effluence Nos. 3 and 4. Both sides of the river. 2 square miles.
 - r* Yes, at Bilpa, on both sides of Paroo River. 2 square miles.
 - s* Yes, at Wurrumutta, both sides of the Paroo River. 2 square miles.

Yes

t Yes, at northern end of Kapabria Lake road from Paroo to Wilcannia. 2 square miles.

u The whole frontage to the Darling River on both sides, should be reserved.

15. The reserve at junction of Bogan and Darling Rivers has been, for the most part, fenced off, but is not adapted to the requirements of travelling stock, being inaccessible in flood-time.

16. The above reserve is trespassed upon by Messrs. Hope & Scott's sheep, it being partly included in one of their paddocks. The reserve at Ledbrinappa Tank on Warrego Road is trespassed upon by Messrs. J. and J. Doyle's sheep, but they do not use the Government tank. The reserve at Birie Creek is trespassed upon by Messrs. Gilchrist & Watt's sheep, being included in one of their paddocks. See IV. 14 *a*.

17*a*. Three required between Bourke and Cobar, on Lachlan Road. Marked K.L.M. on map.

b. One on road from Paroo River to Wilcannia. Marked T on map.

Probable cost of the above £1,000 each.

I would draw attention to the state of the Government tanks on the roads between the Darling and Warrego Rivers. Through misusage and neglect they have, with one exception (Ledbrinappa), become almost useless for watering stock. The roofs have fallen in, and the fences seem to have been appropriated as fuel. The repairs necessary to each of the three tanks would cost from £150 to £200.

I have, &c.,

T. W. FOOTT,

Inspector of Stock.

6.—BRAIDWOOD DISTRICT.

STOCK INSPECTOR ALDCORN TO THE CHIEF INSPECTOR OF STOCK.

Nowra, Shoalhaven,

30 January, 1875.

SIR,

Referring to your circular of 30th November, 1874 (74-1,820 s.B.) in regard to droving roads, &c., I have the honor to state generally that the travelling of stock in my district is very limited, consisting of occasional small lots of fat cattle brought by the butchers of the small coast towns, from the neighbourhood of Braidwood or Sutton Forest, near Berrima; and also for the last two years of small lots of young cattle purchased in the Illawarra District and taken to Braidwood or Goulburn Districts, the roads used being quite sufficient for the traffic, well watered and free from obstructions, viz. :—

The coast road from Wollongong to Ulladulla. The road branching therefrom at Nowra to Braidwood, and the roads from Sutton Forest, Berrima, &c., over the coast range to Nowra, Kiama, and Gerringong. The only difficulty on any of these roads is at the crossing of the Kangaroo River on the line from Nowra to Sutton Forest, &c., and the Government have recently advertised for tenders for the construction of a bridge at this point.

All the roads referred to are kept in repair either by annual grants from the Government or, where they pass through Municipalities, by the several Municipal Councils, and having regard to the limited traffic in stock I do not consider that any special expenditure is necessary.

I have, &c.,

JAMES ALDCORN,

Inspector of Stock.

7.—CARCOAR DISTRICT.

STOCK INSPECTOR ROWLANDS TO THE CHIEF INSPECTOR OF STOCK.

Carcoar, 15 September, 1874.

SIR,

I have the honor to inform you, for your information, that I have just received your memo. and circular from the Officer in charge of the Occupation of Lands, referring to reserves for travelling stock, and have written to the district surveyor for some information on the subject, and as soon as I receive the same I will forward you my report.

I also received your Report on Live Stock for the year 1873.

I have, &c.,

GEO. ROWLANDS,

Inspector of Stock.

STOCK INSPECTOR ROWLANDS TO OFFICER IN CHARGE, OCCUPATION OF LANDS.

Carcoar, 10 October, 1874.

SIR,

In reply to your circular of the 1st September, referring to obstructions on the water reserves on the travelling stock routes, I have the honor to inform you, for your information, that I have made strict inquiries on the subject, and I cannot find that any of the difficulties complained of exist in this sheep district, as none of the water reserves are fenced and no gates have been erected across the travelling stock routes.

The owners of land adjoining reserves for travelling stock are depasturing their stock on these reserves.

I have, &c.,

GEO. ROWLANDS,

Inspector of Stock.

Stock

STOCK INSPECTOR ROWLANDS to OFFICER IN CHARGE, OCCUPATION OF LANDS.

Carcoar, 12 October, 1874.

SIR,

I have the honor to inform you for your information that there is a number of men cutting and splitting timber on the Church and School lands in this district; these men are employed by the contractors for the erection of the Bathurst and Orange Railway, for which purpose the timber is being cut and split.

A large portion of these lands are now sold, and a very large portion of them is now being surveyed for the purpose of selling them; and as the men are getting the timber for road-making, will you be so good as to inform me if they are to be interfered with, or if they are to be compelled to obtain a wood-cutter's license.

I have, &c.,

GEO. ROWLANDS,
Inspector of Stock.

STOCK INSPECTOR ROWLANDS to THE CHIEF INSPECTOR OF STOCK.

Carcoar, 14 February, 1875.

SIR,

In reply to your circular of the 30th November, 1874, referring to droving roads and reserves for feeding, watering, and camping travelling stock, I have the honor to inform you for your information that I have examined the various roads and tracks used for that purpose, and have marked with red ink on the maps, which I now return, the places where I think reserves are required.

The principal roads used for stock from Forbes to Bathurst is by Bandon to Goolagon, Cowra, Wargoola, Number One Swamp, Caloola, into Bathurst; on this route there is a water reserve at Sapling Corner, about 2 miles from Goolagon on the Lachlan River; a reserve is required at the Back Creek new bridge, near Collet's and Flood's selection; also at the Cowra reserve, at Coota, on or adjoining the village reserve; one at or near the village reserve of Tintern; one at or near the village reserve of Wangoola; one about 2 miles from Grubbenbong Creek and about 7 miles from Wangoola; one about a mile from Mendumera Ponds; one at the Dead Man Flat, near the Yellow Swamp; one at Number One Swamp, near or on the village reserve; one at the Three Brothers, about 2 miles from G. Chesher's 640 acres; one at No. 162, T. Pye's 49 acres 1 rood 16 chains, in parish of Bringellet; one at the foot of the Oak Range, near B 192, J. Burnes's 85 acres on to Bathurst.

2. Some travel from Cowra to Number One Swamp by Sheet of Bark, by Lyndhurst and Mandumera Ponds, which route I have marked with red, for which route reserves are required at No. 12, adjoining Ausby's dam station, Cowra Road; at No. 13, near Flanagan's selection Sheet of Bark; at No. 14 near or at village reserve, Limestone Creek; at 15 on or near the village reserve of Lyndhurst; at 10 at Michael Burke's 28, 29 acres 2 roods, parish Somers, on the Number One Swamp, on to Number One Road.

3. Some travel from Forbes to Number One Swamp by Canowindra and Mandumera Ponds, for which route a reserve near Eugoura Creek No. 16 is required; at Nyrang Creek No. 17, near King's selection; on or near the village reserve at Canowindra No. 18; at No. 19, near Mat Dooley's selection, Jack's Creek; at No. 20 village reserve, Liscombe's Pools; at 21, midway between Limestone and Mullen-gulla Creeks; at No. 22 village reserve of Somers; on to Number One Swamp to Bathurst. About 10,000 cattle and 100,000 sheep besides loafers travel these three routes; the last described is most used, and the reserves marked are from 6 to 8 miles apart.

The route by Carcoar, Blayney, to Bathurst, being the high road, is not much used for driving stock.

The three routes that I have described are quite sufficient for the travelling stock that passes through this district, and (only in very dry seasons) there is plenty of grass and water, and not many lanes for them to pass through.

There is a route to Rockley, which requires a reserve about 2 miles from Joseph Pye's 640 acres in the parish of The Three Brothers, and one at or near Porter's 2,000 acres on Pepper Creek, parish of Arkell, on to Rockley, from which there is a good road to Bathurst or Macquarie Plains, which no doubt will be fully described by the Sheep Inspector of Bathurst. No very great number of stock travel this route.

There is a track used by drovers with stock from Mandumera Ponds to Goulburn by way of the Crookwell, for which a reserve is required near Harris's selection on Mandumera Ponds, parish of Lucan, and near Plum Pudding Creek; one at M'Kell's 30 acres at Tea-tree Springs, parish of Rosebery; one at the crossing-place at E. Ridley's, on the Abercrombie River, parish of Rosebery; one at B. Clement's sheep station, Davis's Creek; one at William Tranter's selection, Kangaroo Creek; one at Markdale; one at Long Swamp, near Henry Carr's selections; one near T. Bray's 1,147 acres; and so on to Crookwell, which no doubt will be fully explained by the Inspector for Goulburn.

There are several other minor tracks along which a few sheep and cattle are driven, which I have not marked, as they would require a large number of reserves to be made on them.

Question 2. There are no roads or tracks on both sides of the rivers or creeks in this district.

3. About 5,000 cattle and 100,000 sheep (not including loafers) pass along the three first roads that I have described in about equal portions.

4. Droving roads and tracks ought to be 2 chains wide. There is a lane at Macquarie Swamp, parish Neville, which requires widening.

5. The road from Cowra to Mandumera Ponds, and from Canowindra to Mandumera Ponds has been metalled, and so are the main high roads, but are used for travelling stock.

6. The best route for travelling stock from Cowra is by the old Lachlan Road to Number One Swamp. I do not see any way of making a new track from Canowindra only by a track that I have marked from Canowindra to Cowra.

7. The roads and tracks cannot be improved upon only in the way I have described above.

8. I do not think that any new droving roads or tracks are required.

9. There are no obstructions on the stock travelling roads or tracks.

10. There are no gates on the droving roads or tracks in this district.

11. Where there are any, they ought to be double swing-gates, each gate 10 feet so as to give an opening of 20 feet.

12. No alteration or improvements are required at crossing-places.
13. There are not sufficient reserves for feeding or watering travelling stock.
14. I have described where reserves are required. No reserve should be less than 150 acres, but larger if possible.
15. Travelling stock have free access to the Crown lands and reserves in this district.
16. The reserves are trespassed on by stock belonging to the neighbours. I do not see any way of protecting them unless by fencing.
17. No dams or wells are required in this district, as it is always well watered except in a very dry season.

The above are all the particulars that I have to make at the present time respecting the routes and reserves for travelling stock, with the exception of a track from Cowra to Canowindra, which I omitted to describe in the proper place, and which you will find marked on my sketch of the road from Forbes to Canowindra.

The track from Canowindra to Cowra is much used by sheep; about 50,000 passed along it last year. A reserve is much required near to Mrs. Sloan's Currajong Station, adjoining the North Logan estate, about 5 miles from Canowindra, from which place to Warwick Plains is about 9 miles, when they have the Lachlan River into Cowra, about 7 miles.

I have, &c.,
GEORGE ROWLANDS,
 Inspector of Stock.

No. 8.—COOMA DISTRICT.

STOCK INSPECTOR RYRIE to THE CHIEF INSPECTOR OF STOCK.

Cooma, 16 September, 1874.

SIR,

I have to acknowledge the receipt of your Report for 1873, and also of a memo. from you, accompanying a circular from the Occupation of Lands Office.

In replying to the latter I shall address myself to you, as I am quite unable to read the signature to the above-mentioned circular.

So far as I know there is not a reserve in this district wholly fenced in, though some of them may be partially fenced, where land has been purchased or selected alongside.

A large reserve is a great attraction to selectors, who select alongside of it on account of the run it will give them, as they consider they have as good a right to it as any one else.

For this reason reserves are generally the barest portions of country to be met with along the public roads.

I do not see how this is to be remedied unless by enclosing the reserves, as it would be utterly impossible otherwise to prevent the continual trespass of stock.

I am not aware of any public road having been closed in this district.

With respect to gates, I consider that a 10-feet gate is wide enough for all purposes, as a flock of sheep of 3,000 could pass through it easily in ten minutes.

I beg to observe that, if the Sheep Inspectors are to have anything to do with the reserves, or are expected to give information about them, it will be necessary for them to have a correct list of all the reserves in their respective districts, distinguishing those that are withdrawn from lease from those that are not so withdrawn, and mentioning the position and extent of each reserve, and the purpose for which it was made.

I have, &c.,
S. RYRIE,
 Inspector of Stock.

STOCK INSPECTOR RYRIE to THE CHIEF INSPECTOR OF STOCK.

Cooma, 25 January, 1875.

SIR,

I now beg to forward my report on the different droving roads, tracks, and reserves in this District, and shall reply to the questions contained in your circular of the 30th November, in the order in which they are asked:—

DROVING ROADS AND TRACKS.

1. The principal roads in this district used for travelling stock are,—

1st. The road from Micalago to Nimitybelle *via* Cooma; this is the Main Sydney Road.

2nd. The road from Cooma to Buckley's Crossing *via* Bobundarale, and from the Crossing *via* Nigebryrale to the boundary of Victoria; this is the Gippsland Road.

3rd. The road from Cooma to Kiandra *via* Adaminaby, being joined at the latter place by another track from Eden and Bobundarah; this is the Tumut Road.

4th. The road from Cooma to Braidwood *via* Big Badja or Jingery. This track is very little used.

There are of course, besides the above, other tracks too numerous to mention, along which stock may be driven now and then, as in this district people ask no questions but go wherever they please.

2. No case of the kind mentioned in number 2 occurs in this district.

3. Sydney Road,—Cattle, 4,000; sheep, 25,000; horses, 300. Gippsland Road,—Cattle, 18,000; sheep, nil; horses, 150. Tumut Road,—Cattle, 1,000; sheep, 6,000; horses, 100. Braidwood Road,—Cattle, 500; sheep, 2,000; horses 50.

4. Two chains wide, when fenced on both sides. No fenced in roads as yet in this district.

5. No road metalling to any large extent, only two or three hundred yards here and there, and no necessity for the stock to travel on it.

6. No need to make any change.

7. Do not see how they are to be improved.

8. No new roads required.

9. No obstructions by fencing.

II.

II.—PUBLIC GATES.

10. A common swing-gate is the handiest, and 10 feet is wide enough for any gate, unless where large bodies of stock are frequently passing.
11. No gates anywhere.

III.—CROSSING-PLACES.

12. Nothing of the kind required in this district except a good punt at Buckley's Crossing.

IV.—RESERVES FOR GRASS AND WATER.

13. Yes, when the temporary commons are allowed to be used. I am told by the trustees that travelling stock may stay on the Cooma temporary common for 48 hours.

14. I have marked on the maps in red dotted lines the places where I think it is advisable to have new reserves, or the old ones added to, but I cannot be certain that the land is not already taken up, or will not be taken up next land day.

15. Travelling stock have free access to the half-mile and to the reserves if the drovers choose to use them. I do not know of any obstructions.

16. Yes, constantly, by all the neighbours, but chiefly by the selectors, to whom the reserves are a great attraction for the sake of the run they afford.

17. Nothing of the kind required.

I shall now make a few remarks on the principal droving roads:—

1. The Sydney Road. From the peculiar position of this district, the road from Micalago to Nimitybelle will always be the main road, on which it is of the greatest importance that ample reserves should be secured at once from alienation, as in days to come they will be the sole dependence of stock going to market. If the reserves are made in time they will be there when they are wanted, but not otherwise; and I think that for the present, and perhaps for some time to come, it will not be necessary to reserve the land from lease, but only from sale, for the following reason:—At present the drovers neither know nor care about the reserves, but camp where they please, and feed their stock where they please, even on purchased land, without hindrance from any one. But such a pleasant state of matters will come to an end some day, and timely provision should be made in the prospect of such an end.
2. The Gippsland Road. This is the main cattle road of the district, and I would apply the above remarks to it also, at least as far as Buckley's Crossing. Soon after crossing the Snowy River the country becomes wild and rugged, and reserves are not of much consequence, as the country is not likely to be more than partially fenced for many years to come. I have however marked on the map the most desirable places for reserves in red dotted lines.
3. The Tumut Road. This road is used by stock going to and coming from the Western districts. I have marked on the map the most suitable spots for reserves, but it is only in a dry season like the present, when stockowners are sending their stock to their mountain runs for the summer season, that they will be required.
4. The tracks to Braidwood. One by Big Budja, the other by Braelbo and Jingery. Both of these tracks are very little used, and there need be no hurry in marking reserves that may perhaps never be required in such a wild rough country. I desire again to remark that the roads from Micalago to Nimitybelle and from Cooma to Buckley's Crossing are the two most important roads in the district; and as the country through which they run is all good, it is for that reason the more likely to be soon taken up and no more left for reserves. In fact, some of the land I have marked for reserves or additional reserves may be already taken up. I have made all due markings in pencil so that they can be rubbed out without any injury to the maps.

As the principal tracks diverge from Cooma I think it is desirable that a suitable slice of the large temporary common, which contains 24 square miles, should be permanently set apart for the use of travelling stock, or that the trustees should be instructed that travelling stock should be allowed to graze over the whole of it without its being considered a matter of favour.

I cannot give any reliable information with regard to roads, tracks, or reserves in other parts of the Colony.

I have, &c.,
S. RYRIE,
Inspector of Stock.

9.—COONABARABRAN DISTRICT.

STOCK INSPECTOR KENNEDY TO THE CHIEF INSPECTOR OF STOCK.

Coonabaraban,
29 October, 1874.

SIR,

In reply to your memo of the 1st ultimo, I have the honor to inform you that I have consulted Mr. Licensed Surveyor Conder, relative to the boundaries of the travelling stock reserves in this neighbourhood, and he informs me that he only knows of one instance where these reserves have been encroached upon by the lessee, namely,—at a place known as Honeysuckle on the Coolah Road. Mr. D. M'Master has fenced off a portion of one of these reserves, but allows travelling stock to take an equal scope on the opposite side of the road, which is unenclosed. He also allows travelling stock to water at his dam near by, which if closed in time of drought would render this route impassable. There is therefore, in this instance, no obstructions to speak of.

I have, &c.,
JOHN KENNEDY,
Inspector of Stock.

STOCK INSPECTOR KENNEDY TO THE CHIEF INSPECTOR OF STOCK.

Coonabarabran, 1 May, 1875.

Sir,

74/820—S.B.

In reply to your circular dated 30 November last, and numbered as per margin hereof, I have honor to forward you the following information :—

I.—DROVING ROADS AND TRACKS.

1. The road from Tambar Springs to Mudgee and Cassilis, *viâ* Bomera, Oakey Creek, Binnia, Coolah, and Denison Town, or Tungy to Cassilis, *viâ* Turce Creek, and Talbragar. The road from Coonamble to Mudgee along the right bank of the Castlereagh River *viâ* Galargambone, Breelong, and Mundooran, thence by Murrigon or Cobbara.

The road from Barradine to Mudgee, *viâ* Coonabarabran, Beelar, Greenbah, Rampadules, Butheroo, thence to Denison Town. Also the road branching off at Coonabarabran, *viâ* Ulimambra, Box Ridges, Ulindale Springs, Weetalabar to Coolah.

These are the principal roads and tracks used by travelling stock.

2. I think a road should be left on both sides of every main stream throughout the Colony.

3. Tambar Springs Road to Coolah, about 150,000 sheep and 6,000 head of cattle. Coonamble to Mudgee *viâ* Mundooran, sheep 50,000, cattle 5 to 6,000. Coonabarabran Road to Coolah *viâ* Belar and Greenbar, sheep 12,000, cattle 1,000.

4. 6 chains. All right except those on purchased land.

5. All fit for travelling stock but one.

6. The road from Oakey Creek to Coolah *viâ* Binnia is almost unfit for stock traffic, especially in wet weather, through the land being purchased and fenced along the road for miles. I think a better road could be made from Tambar Springs to Coolah, by cutting across Bowen Plains *viâ* Premer, through Bremen's Gap, thence down the Coolah Creek through the Boogamurra Plains to Coolah.

7. No alterations desirable.

8. New road required from Liverpool Plains to Coonabarabran *viâ* Bomera, Salt Water Creek, Purliwah, and Ullamambri.

9. No obstructions to speak of.

II.—PUBLIC GATES.

10. A double gate of wood, with iron hinges, 14 ft. wide.

11. There are five gates on the road between Coolah and Denison Town, 10 to 12 ft. wide.

III.—CROSSING-PLACES.

12. Repairs are necessary at crossing-place, Coolah Creek, on the road to Denison Town; estimated cost, say £30. Reserves are required at both sides of creek at crossing. Repairs required at Bremen's Gap, should that road be opened up for travelling stock; estimated cost of same, £200.

IV.—RESERVES FOR GRASS AND WATER.

13. A few more reserves are necessary at the undermentioned places, viz. :—

14. At the Little Plain, half way between Bomera and Oakey Creek. A dam could be made at this place at a cost of £150. At Oakey Creek, about 1 mile from homestead on the west side of road leading to Coolah. At the "Black Stump," on the east side of Coolah Road; on the road from Coonabarabran to Coolah, *viâ* Belar; at crossing of Belar Creek on both sides; at the "Reed Beds," about 6 miles from Belar, on the road to Greenbah; on the road from Coonabarabran to Coolah, *viâ* the "Box Ridges," at crossing of Baby Creek; at Box Ridges, east side of road; at the Ulindale Springs, at crossing of Weetalibah Creek, near Weetalibah.

15. Travelling stock have free access to the half-mile in width to which they are entitled on Crown Lands, but a great deal of purchased land intervenes.

16. No encroachments worth mentioning. These reserves could be protected by the Government impounding all stock found depasturing on them, other than travelling stock.

V.—DAMS, TANKS, AND WELLS, ON DROVING ROADS.

17. A few tanks and wells would be beneficial. The map is so imperfect that it is impossible for me to describe or mark their position with any degree of accuracy; neither can I show the position of the reserves on it. There are names on the map that I never heard of, while there are many others left out altogether. A reserve and well required at the crossing of Bogledi Creek, on the Baradine Road, 8 miles from the Baradine Township.

I have, &c.,

JOHN KENNEDY,
Inspector of Stock.

No. 10.—COROWA DISTRICT.

STOCK INSPECTOR HOWE TO THE CHIEF INSPECTOR OF STOCK.

Corowa Sheep District,
18 September, 1874.

SIR,

Your report for the year 1873, and circular from Occupation of Lands Office dated 28th August, with your memorandum of the 1st September, came to hand only yesterday, on my return from Urana District, and I will do myself the honor to forward through you, as soon as possible, a report as to any obstructions to travelling stock in my districts, and reply to your memorandum, after making some necessary inquiry into matters referred to.

I have, &c.,

E. HOWE,
Inspector of Stock.

Stock

STOCK INSPECTOR HOWE TO OFFICER IN CHARGE, OCCUPATION OF LANDS.

Corowa Sheep District,
22 September, 1874.

SIR,

Having been requested by the Chief Inspector of Stock to make strict inquiries into matters referred to in your circular to me of the 28th August, I now do myself the honor to report for your information,—

The water reserves on the travelling stock routes in the Corowa and Urana Districts are not fenced by the pastoral tenants or others, and none of the routes in my districts are entirely closed.

The gates on the travelling stock roads at the boundary fences are from 10 to 15 ft. wide, and the breaks so made as to prevent sheep from seeing from one paddock to another, viz., serpentine lanes or brush fences, or roadways in the place of gates, and some few feet wider; in some instances where the narrow gate-ways or lanes have been poached in wet weather, and difficult to pass stock through, drovers have pulled down fences.

Some of the difficulties complained about have been experienced to my knowledge.

I have, &c.,

E. HOWE,
Inspector of Stock.

STOCK INSPECTOR HOWE TO THE CHIEF INSPECTOR OF STOCK.

Corowa, 29 January, 1875.

SIR,

In compliance with your instructions I have travelled over the droving roads and tracks in my district, and, as far as the time fixed for me to report allowed, I have examined them. I enclose a tracing showing the roads that come under my instructions, and I have marked with red dotted lines three proposed new roads which I think it would be a public benefit to open, and half a mile reserved on each side to supply a present deficiency of reserves for travelling stock, particularly near Corowa, and secure access to North-eastern Railway (Victoria).

In memo. A. I have recommended dams to be made at Coreen and Burryjaa, a dam and well at Murray Hut, and large tank at the Boundary Gums. An outlay is necessary to clear a portion of new road near Urana; and the dam at Turnback Jimmey, between Holland's Inn and Jerilderie, requires improving.

I wish to recommend to be reserved for the use of travelling stock, and will send to you as soon as possible a description of some land near Corowa; reserves should be made with as little delay as possible, as selection is going on.

I have recommended watering-places only where they are absolutely necessary, and rendered so by the distance from other water.

The most important road in my district is that from the Murrumbidgee to the Murray; it has lately been made more direct by passing through Widgwa. The Surveyor General's Department have already reserved half a mile on each side of the proposed road; it will be surveyed within a very short time now, and the sooner it is opened the better for travelling stock.

I have, &c.,

E. HOWE,
Inspector of Stock.

Answers to Questions.

1. I have marked in red ink the roads or tracks used in my district for travelling stock. See maps and tracing.

2. I see no necessity at present for any change.

3. Estimate of travelling stock annually on road from Narandera to Corowa—Horses, 400; cattle, 18,000; sheep, 80,000. From Wallandool and down Billabong—horses, 200; cattle, 9,000; sheep, 20,000. From Jerilderie to Tocumwal—all horses that cross the punt, 740; sheep, 8,350; cattle, 4,356.

4. All main droving roads through the pastoral interior, and important outlets, should have half-a-mile reserve on each side. I consider a width of 5 chains on each side of other droving roads sufficient; the greater portion of the roads where the land has been sold are too narrow, particularly down the Billabong (not an agricultural country), but too late I presume to alter.

5. None at present; sufficient width now; will prevent this in the future.

6. See No. 5.

7. Yes. See map and tracing from Jerilderie to Corowa, from Wallandool to Corowa, and from Coreen to Mulwala.

8. See No. 7.

9. Yes; but I think any obstructions would be removed without the necessity of reporting to the Government.

PUBLIC GATES.

10. Great variety of opinions about the best kind of gates. I would recommend a light but strong double gate of simple construction, made to fall back in line of fence when opened. Gate posts cannot be too large or too deep in the ground. It is very necessary to have 50 yards of timber fence on each side of gates, with wide slip-rails on both sides to use when required in wet weather when gateway gets poached. Boundary riders have to visit gates, and will at times find them open, however well or expensively the gates may be constructed.

11. The whole of the stations and farms in my district being fenced, there are many gates on the roads, and some brush fences with serpentine brush roadways; the latter much objected to by drovers, and should be done away with if possible; very difficult at times to get cattle through them.

12. Nil.

13. I have not yet succeeded in obtaining much information from surveyors as to reserves. Roads and reserves along rivers and creeks have been so long established that any further provision beyond what has already been made would be impossible; but I beg to draw your attention to what I now recommend, and in answer to next No.

14. Additional are required, and marked on the map and tracing.

15. Yes, as far as I know; see answer to question No. 9.

16. Yes, by free selectors, small holders. Authority given to inspectors or their assistants (any person they may appoint in their absence) would, I think, in a great measure put a period to the evil, and greatly benefit travelling stock, for the most of the reserves are kept bare.

DAMS, TANKS, AND WELLS ON ROADS.

17. Yes, see memo. A. hereto.

2. Matters occurred to me when passing over the roads that I could not attend to, as my time was limited, and other matters may occur that I should bring under your notice.

3. Drovers tell me (what I believe is the case) that cattle can be brought better to the Melbourne market from Mulwala Crossing-place than any other in my district, and I have recommended a $\frac{1}{2}$ mile reserve road from Coreen. I am informed that squatters in many instances feed bare the travelling stock roads, but such is not the case in my district.

E. HOWE.

Memorandum—Estimate of Travelling Stock.

Question No. 3.—The greater portion of the stock before named pass into Victoria. About an equal number travel through the Urana district *via* Jerilderie to Deniliquin, and from the Wagga and Yanko Roads. The number of stock up and down the Murray bank road has been few during the last twelve months—about 15,000.

Memo. A.

Dams required to be made at Coreen near township reserve, blind creek here.

Dam required at Burryjaa, blind creek here, both of the above places are on the main travelling stock road from Murrumbidgee to Corowa.

Well and dam required at the Murray Hut, on road from Jerilderie to Tocumwal; good water 12 feet down.

Dam required at the Boundary Green; see tracing.

On part of the road lately surveyed from a point about 2 miles from Urana on the north side, to a point 7 miles from the same place on the same side of it, should be cleared for a width of 1 chain, as the country is very scrubby, and the surveyed line could not easily be followed without.

Some outlay is necessary to improve the dam between Simon Holland's Inn, Yanko and Jerilderie.

STOCK INSPECTOR HOWE to THE CHIEF INSPECTOR OF STOCK.

Corowa, 17 February, 1875.

Sir,

In my report to you, dated 29th January, I stated that I would forward a description of some land near Corowa that I would recommend to be reserved for the use of travelling stock.

Without the means of reference to any maps, I now do myself the honor to inform you that this land is situated about 5 miles from Corowa on the main travelling stock road, and occupied as grass rights; it is bounded on the south by John Dye, selector; Monohan's purchased land on the east, and Perrit and others on the west and north.

On a portion of this land near the roadway stock can and do generally get water, but with some outlay it may be made a permanent and most useful watering place.

1,500 acres of land may still be reserved hereabouts; there is a great deficiency of reserves near Corowa. This spot is much used and required for stock going to market and wool teams, and I bring the locality particularly under your notice for reserve at once, for if not it will certainly be selected before very long.

I have, &c.,

E. HOWE,

Inspector of Stock.

No. 11.—DENILIQUIN DISTRICT.

STOCK INSPECTOR GALL to THE CHIEF INSPECTOR OF STOCK.

Moama, 26 September, 1874.

SIR,

Referring to your memorandum of the 1st instant, attached to the letter of the Officer in charge of the Occupation of Lands Branch, dated 28th ultimo, I have the honor to report as follows:—

1. In my district, so far as I can ascertain, there are none of the water reserves fenced in, either wholly or in part, by the pastoral tenants or others.

2. There are no such obstructions as gates of any description in this district, neither are any of the main routes closed by fencing; although no doubt great inconvenience is caused to stock by being compelled to travel through lanes 3 chains wide—which are almost impassable in bad weather—the land on both sides having been sold.

3. The Conargo reserve is now and has been used for years by owners of adjoining land depasturing their stock thereon. I may mention two parties, viz., James M'Rees and D. Rogers, residing in above locality who have from 2,000 to 3,000 sheep constantly on the reserve, in consequence of which there is no grass left for the use of travelling stock; and carriers with teams are also seriously inconvenienced from the same cause.

I have, &c.,
JAMES GALL,
 Acting Inspector of Stock.

TELEGRAM FROM ACTING STOCK INSPECTOR GALL TO THE CHIEF INSPECTOR OF STOCK.

2/10/74.

SINCE sending my report, find Parker of Quiamong has fenced in from 50 to 100 acres best portion of Conargo Reserve.

STOCK INSPECTOR M'COLLOUGH TO THE CHIEF INSPECTOR OF STOCK.

Moama, 16 February, 1875.

Sir,

I have the honor to acknowledge the receipt of your letter of the 11th instant (75/268 S.B.), and in reply beg to enclose you the maps with the reserves marked.

Finding I was unable to mark them with accuracy, I got one of the surveyors to mark it for me, and am getting a tracing made on a large scale for my own guidance. Since answering your queries in the first, I have been informed that the reserve at Conargo, on the Billybong, is made useless to the public, part of it being fenced in by Mr. B. L. Parker, the lessee of Quiamong, and the balance of it used by two selectors as a sheep run. Please inform me if it is my duty to take notice of it.

I have, &c.,
A. M'COLLOUGH,
 Inspector of Stock.

STOCK INSPECTOR M'COLLOUGH TO THE CHIEF INSPECTOR OF STOCK.

Stock and Brands Branch,
 Department of Lands,
 Sydney, 30 November, 1874.

(Circular, '74-1,823 S.B.)

No. 1. Say what tracks or roads are used in your district for travelling stock.

The principal roads used by travelling stock in the district of which I have the honor to be in charge, are the Wanganella or Hay Road, the Billybong or Wagga Wagga Road, the Tocumwal or Albury Road, the Moulamein or Edwards Road, all of which converge at the crossing-place—the bridge Deniliquin—from which there is only one road to Moama, where they cross into Victoria, and on which 95 per cent. of all the stock travelling to market are obliged to travel. The only other track used is from a few stations on the south bank of the Edwards, and the stations on the Murray River, 40 miles below Moama, which in all do not amount to over 5 per cent.

No. 2. Where there are roads or tracks on both sides of the same river or creek, state particularly to which the preference should be given, and if different sides are preferred at different seasons say so.

There are only tracks or roads on one side of each creek or river, with the exception of the Edwards, which could be used by travelling stock, and which for the last twenty-five years have been preferred by drovers before the country was fenced in to the extent it is now, nor do I, with twenty years experience, see how the other sides of the rivers could be made available for travelling stock.

No. 3. Give an estimate of the number of cattle and sheep which, in ordinary seasons, annually travel on each of these roads or tracks.

I consider the traffic of the year 1874 must be taken as a fair average, in which 611,800 sheep and 23,330 cattle travelled to market, which would give as near as possible as follows:—Wanganella Road, 45%, 275,310 sheep and 10,498 head of cattle; Billybong Road, 33%, 183,540 sheep, and 6,999 head of cattle; Tocumwal Road, 10%, 61,180 sheep and 2,330 head of cattle; Moulamein, 10%, 61,180 sheep and 2,330 head of cattle; south bank of the Edwards and stations on the Murray below Moama, 5%, 30,590 sheep and 1,166 head of cattle.

No. 4. What do you consider a sufficient width for droving roads or tracks; are those in your district right in this respect; if not, say which are not?

I consider where the country is good the $\frac{1}{2}$ mile is ample; all the roads in my district have got this, and I consider drovers have no cause of complaint, but in the 50 miles between Deniliquin and Moama, in which 95% of all the stock travelling to market are obliged to travel, 25 miles of which lays through forest country, and most of the land on each side sold and fenced in, with the exception of the reserves for the use of travelling stock, nor can I see how this can be altered, or where another road could be made, as the stock must come to Moama, and the road at present used is the only one to insure water in the summer months. I consider even on this road eight months out of the year it is quite possible to maintain the condition of stock.
